## COMMON OFFENCES AND SANCTIONS IN THE MANAGEMENT OF DISCIPLINE IN HIGHER EDUCATION IN NIGERIA

**Daminabo, Dagogo Allen Frank\***

\*PhD

Department of Educational Foundation,  
Ignatius Ajuru University of Education,  
P.M.B. 5047, Rumuolumeni, Port Harcourt,  
Rivers State, NIGERIA

### ABSTRACT

*The study examined the sociological nature of common offences and sanctions in the management of staff and students discipline prevalent in tertiary institutions in Rivers State, Nigeria. The study is a survey research with a population of 9671, and a sample of 250 respondents made up of students were drawn using multi stage sampling approach. The theoretical framework used for the study are functionalist perspective of law and bureaucratic theory. Mean, percentages and t-test and ANOVA were used for the analysis of the research questions and hypotheses of the study. These common offences such as stealing, raping, examination malpractice, academic dishonesty, insubordination, arson, bullying, drug abuse, hazing, cultism, plagiarism and sexual harassment were discovered to be rampant and constitute a bane to the development and attainment of the objectives of higher education in Nigeria as the findings indicated. The common sanctions frequently used at the hands of the management includes detention, suspension, rustication, expulsion and withdrawal which are the commonly set standards within the law to regulate the discipline of students. The major recommendations made were that the principles of rule of law and due process should be implemented in order to develop good organizational culture in the higher educational institutions in Rivers State, Nigeria.*

**KEYWORDS:** *Hazing, Cultism, Arson, Bullying,*

## INTRODUCTION

Every society thrives on rules and regulations guiding its existence. The survival of any individual institution or society depends deeply on the ability of those in it to act in accordance with stated laws, rules, regulations, values, mores and approved behavior guiding the particular society. Failure to abide by the laws or rules of a particular society is seen as an unacceptable behavior and attracts some level of punishment as a deterrent for the enforcement of social control on deviants. The tolerance of deviant behavior in an organization generates indiscipline as an acceptable value. Consequently, every organization institutes rules and regulations which are designed to meet the disciplinary needs, protect the rights of members, privileges, responsibilities, obligations and define the nature of relationships with one another in their operations as regards the legal functions of the various departments in the organization.

The school, according to Oboada (2016), is a bureaucratic organization with high degree of specialization, explicit rules and regulations assigned to each member. These rules were made to guide the behavioral pattern of its members and are directed towards the attainment of its objectives. According to Sadker and Sadker (2005), the purposes of establishing school is to transmit society's knowledge and values, reconstructing society and demand for schools. These, he itemized as the four broad goals of the school, namely: academic, vocational, social and personal.

In all universities in Nigeria, discipline is very crucial in the actualization of the stated objectives, purpose, mission and vision of the society. Discipline enables the institution to train individuals, develop responsible behavior leading to self-disciplined person that have been cultured within the dictates and values of the university and society at large. Discipline encourages and exposes students to the art of self-control, and social disorder in the university. It can only be avoided if restraints are built into the character of students. Consequently, Were (2006) argued that discipline instills social control, social order and thereby reducing the incidence of social chaos. This is due to the fact that, discipline instills in the students the power and value of self-restraints. Discipline in the form of sanctions, exposes students and staff to ways of handling the challenges and delegations of living. It equips them with the personal strength needed to meet the demands imposed on them by the school and society.

The school is a type of service organization regulated by law for the purposes of enforcing social control and with the primary function of educating the students in accordance with the value system of the society. This value is reflected in the National Policy of Education in Nigeria. The policy highlighted the responsibilities of schools at all levels and the strategies to be applied in its implementation. The policy indicated that, the primary functions of universities is the acquisition, development and inculcation of proper value orientation to the students for their survival in the society. It further placed on the shoulder of the management of the universities the responsibilities of helping the students to develop physical, intellectual skills and intellectual capabilities that are geared towards the development of a better value system. This will enable them appreciate and understand their environment. These values will help build the individuals to develop into useful members of the university community and society at large.

These assertions above manifest into functions assigned to the management of the universities and it is indeed a complex one in the face of the dynamics of social change in the society. Consequently, for the efficient functioning of the university system, the school management

must be given powers to control the conduct of students through reasonable rules and regulations. In supporting this view, Daminabo (2004) opined that universities are organizations that are coffered with power or authority by the extent law to make or stipulate its internal rules and regulations to the extent it does not conflict with grand norm or constitution of the Federal Republic of Nigeria. Hence, it becomes deductible that the sole purpose of rules making in the universities is for the maintenance of state of equilibrium and the growth of the university in the attainment of the universal objectives of higher education and invariably become a catalyst for the growth of the society.

In the same vein, Agu (2011) argued that bureaucratic discipline stresses the maximization of actions that are accountable and acceptable through standardization of rules and procedures which carefully excludes all forms of uncountable actions. This implies that, common offences in the management of universities should be properly defined, processed for adjudication and adequately provided in order to achieve justice to the institution, students and society. Consequently, this study will examine the philosophy, nature of common offences, causes, and strategies to curb it through appropriate sanction mechanism.

### **Philosophy of Discipline or Sanctions in the University**

The efficient functioning of the universities devoid of unnecessary acts of deviants or common offences as the key to organizational success is the ability of the system to develop standardized disciplinary procedures that are consistent with the constitution, state laws, substantive and procedural laws. These laws enable the universities to operate unhindered and compel members to fit into their role expectations. In the event of violation of the rules and regulations of the university, the system should develop a mechanism that will automatically be activated by principal officers in charge of such responsibilities as specified in the staff and students hand book or manual.

This philosophy of discipline or sanctions is principally based on the administrative authorities of the universities to utilize management reserved powers to control the conduct of staff and students. This is possible through the reasonable application of rules, regulations and sanctions in a just manner, fair play and compliance to the due process of the law as a deterrence. It will be practically impossible for administrative authorities in the universities to ignore common offences within their environment without applying appropriate sanctions for the stability and sustainability of the institution as a learning environment conducive for teaching, research, entrepreneurship and community service.

It is equally important to note that a university is a micro society and requires law for self-regulation in order to make the life of the members of the university community safe, meaningful and worthwhile. This implies that the absence of law in the university creates disorderliness and injustice. Law under this circumstance provides checks and balances to avoid anarchy in accordance to functionalist perspective of law. In supporting this view, Daminabo (2016) argued that, educational institutions are characterized by distinctive values, culture and are united by common purpose of providing teaching and the pursuit of knowledge and research. Consequently, he pointed out that, the laws of universities outline the legal status, their structures of governance, the rights, privileges of its members and their responsibilities to the institution and society.

The stability of the university environment is vital for the successful execution of its mandates and thus, Ogbonda (2016) argued that, the survival of any institution depends to a great extent on the ability of its members to perform or act within the limits of approved behaviours. It is no longer news that, the Nigerian university environment have become increasingly fearful and insecure for sound academic activities due to the kinds of behaviour exhibited by the recipient of education and staff members. These behaviours are deviant in nature and not consistent with the norms of an ivory community in global sense and negates the expected behavioral patterns of staff and students as set out in the constitution, laws, rules and regulations of the universities in Nigeria. Consequently, common offences or deviant behaviour may be seen as an individual acting indifferent of accepted norms, rules and regulations of the society.

Staff and students' deviant is a prevailing problem affecting most universities in Nigeria but not limited to Nigerian environment alone; since most people made crime and deviance as a career and deviant behaviours in the classroom has disruptive tendencies towards the attainment of organizational objectives with the school as a whole and also interferes with teaching and learning. It is thought to be one of the major precursors to undergraduate dropout syndrome, teachers' stress and similarly; negative social outcome in our society according to Daminabo (2019).

### **Nature of Common Offences in Higher education**

The common offences are seen as acts of indiscipline which negatively affects the effective and efficient operation, administration and management of higher education for higher productivity in the society. These common offences, according to Oboada (2016), Amanchukwu (2013) and Daminabo (2014) that may be described as deviant behaviour among staff and students includes: dishonesty, stealing, disobedience, truancy, sex offences, assault, drug offences, suicide, mass demonstration, cultism, kidnapping, corruption, academic dishonesty, examination malpractice, murder, plagiarism, violation of rights of others, violation of professional standards, false declaration of information, intimidation, harassment, written abuse, hazing, possession of fire arms, unauthorized entry into control or restricted areas, drunkenness, prostitution, traffic offence and gabbling etc.

In the same vein, Amaele (2012) argued that, discipline among staff and students in their school is characterized by obedience, respect and self-control for the preservation of order. Consequently, the pursuit that staff and student discipline manifests itself in such qualities as punctuality to work and other engagement, rejection of gratification and pleasure from clients, simplicity and modesty in speech, appearance and approach to issues, neatness in dressing, sincerity, humour and truthfulness in action, patience as well as self-control. He further argued that, indiscipline is almost becoming institutionalized in institutions of learning and as such this posed some credibility questions on the moral integrity of the university products in Nigeria.

The concept of common offences in its simplest term are what constitute disciplinary problems among staff, students and management of the universities. Common offences, according to Daminabo (2004) are offences described to be deviant behaviours exhibited by staff and students in the form of policy and rule violation; which constitute grave disciplinary problems in the system that require sanctions on the offenders in order to accomplish educational objectives. This simply means that, any act or behavior that violates or is not consistent with the rules and

regulations that exist in the university community and beyond probably may likely be described as deviant behavior.

Common offences could be seen as activities engaged by students and staff which constitute act of indiscipline in the system. These acts may be described as undesirable and so constitute nuisance in the university system. Okay (2008) consequently identified some of these behaviours that constitute common offences as general unrest, demonstration, breach of school rules, drug abuse, hazing, bullying, examination malpractice, absenteeism, truancy, sexual harassment, noise making, stealing, cultism, rape, drunkenness and many others. Ololube (2011) sees it as a violation of social norms. He postulates deviance to be any thought, action or feeling that members of a social group judge to be a contradiction of their values, rules or regulations of their society. These acts are seen to be indifferent to the approved norms and expectation of the university laws which is detrimental to the wellbeing of the educational system. The above situation indeed has shaken the norms and the fabrics of our society due to the existence of the following common offences prevalent among staff and students that may lead to disciplinary problems in the universities according to Daminabo (2014) are as follows: academic dishonesty, withholding or giving false information, verbal or written abuse, threats, intimidation, harassment, violation of professional ethics, violation of rights of others, examination malpractice, plagiarism, stealing, fighting, drug abuse, financial mismanagement, armed robbery, murder, cultism, rape, sexual harassment, illegal possession of firearms, explosive, ammunition, use of fireworks, weapons, dangerous chemicals, obstructing the students and staff judicial process, arson, unauthorized use, possession and destruction of public or private properties.

Furthermore, adding to the volume of knowledge in this area of study Daminabo (2019) identified the following common offences associated with staff and students presently as examination malpractice, stealing, destruction of learning facilities, indecent dressing or appearance, sexual harassment, breach of school rules, cultism, lateness to school, bullying, truancy, drunkenness, cheating, forgery, embezzlement, nepotism, bribery and corruption, sorting for scores, unauthorized duplication of university keys, obstructing staff and students judiciary process, fabrication and falsification of information and misuse of university document and e-crime etc. Common offences or acts of indiscipline in the modern times interfere with the teaching, learning and research in the university and thus it is thought to be a precursor to later school dropout and similar negative social outcomes especially among staff that were dismissed from their job and students rusticated, or suspended or even expelled from the university.

### **Causes of Common Offences and Discipline in the Universities in Nigeria**

Discipline exists in the universities in Nigeria due to the incidents of common offences. The laws of the universities envisaged that it is common for members of the universities to test the competency of its policies, laws, rules and regulations which may not be consistent with the objectives of the institutions. Discipline, according to Agi and Adiele (2009), means compliance to acceptable standard or rules and regulations of a given system. It may also mean punishment. In another view, Ezeoha (1985) in Agi and Adiele (2009) defined it as a systematic training through education or mode of life which meets societal requirements. It therefore could be described as a process and an activity of insisting on socially acceptable standards of behavior which makes one self-controlled and obedient to authority in order to avoid sanctions or for the avoidance of punishment.

The motivating factors responsible for the existence of common offences may be attributed to the fundamental philosophy used in the explanation of the nature of crime and deviance in the society. Accordingly, Ogbondah (2011) highlighted six categories under which common offences may be classified and explained. These are innovation deviance, ritualism, excessive conformity, alienation and anomic.

In contrast, Henslim (1995) in his social control theory stressed that, everyone is propelled toward deviance by temptations, inner drives, hostility, resentment, pressure from peers and so on. It may also be argued that common offences may be attributed to individual status, and phenomenon that exist in the society such as poverty; and physical development of the individual involved in the infractions, conformity to common cultural norms, economic deprivation, drugs abuse, peer group influence, family background or condition, societal factors, unemployment, politics, cultism, social level of morality and value system, poor policing of the campus, security lapses which might result to robbery, burglary, automobile theft, phone and laptop theft, aggravated assault, arson, embezzlement, forgery, false pretenses, and possession of stolen goods, etc. (Daminabo, 2014).

These common offenses constitute a violation of values, norms, standards, rules and regulation of the university to the extent that learning, teaching, research and community service are affected. In this situation, common offences are disruptive and harmful to the university system. It should be discouraged in all its ramifications for the effective and efficient management of the system towards the attainment of organizational objectives.

In the same vein, on the causes of common offences, Okah (2006) opined that students come from different backgrounds and have individual differences; they often engage in certain activities that constitute indiscipline in the school system that results to disciplinary problems. He identified the following as factors responsible for common offences in the educational sector, namely, ineffective teaching, harsh rules and regulation, poor home training, poor school climate, moral laxity and poor physical classroom condition. Ogbondah (2016) argued that, common offences in the school are caused by poverty, social factors, lack of family upbringing, and physical body development etc. It is important for the school and university management to tackle issues of common offences critically in order to work towards the achievement of organizational objectives. This is necessary because of the disruptive effects of common offences in creating poor organizational climates in an organization.

Common offences that led to sanctions in the universities has become a reoccurring decimal that distract and affect the productivity of the university in the attainment of its stated objectives in the National Policy on Education and their laws of establishment. It is a common knowledge and concern that, common offences associated with student's discipline generates disruptive tendencies in the actualization of objectives, purpose, mission and vision, and the efficient functioning of the institution. It is more worrisome that, students and staff in universities are currently being arrested and charged to courts for unknown offenses that were never envisaged by the laws of establishment. These offences such as murder, kidnapping, armed robbery, obtaining with tricks (OBT), yahoo boys, gun running, assassination and militancy are the new generation offenses that are currently big challenge to effective and efficient management of the universities for higher productivity.

### **Significance of the Study**

This study will be relevant to university management, education law enforcement officers and students in the identification of common offences prevalent in Nigerian universities and help all those in the universities to understand the dynamics of disciplinary acts that may have destructive tendencies in the effective management of the universities as a community.

### **Purpose of the study**

The purpose of this study is to examine management roles and strategies to curb common offences in the universities in Rivers State, Nigeria. The study will further identify the types of offences, sanctions, management roles and strategies adopted by the university authorities to curb the abysmal situation that is threatening the peace in the university campuses in Nigeria.

### **Research Questions**

- (1) What are the common offences committed by students of higher education in Rivers State?
- (2) What are the common sanctions that exist in the management of common offences in the universities in Rivers state?
- (3) What is the perception of students on the roles of management and disciplinary committees in the management of common offences among staff and students in the universities in Rivers State?

### **Hypotheses**

1. There is no significant difference between the perception of students on the nature of common offences committed by students based on academic levels in the universities in Rivers State.
2. There is no significant difference between the perceptions of University students in Rivers State on the common offences based on academic levels.
3. There is no significant difference between the mean response of male and female students on the roles of management and disciplinary committee on student's common offences in University in Rivers State.
4. There is no significance difference between the mean responses of male and female students on the roles of management and disciplinary committee in the management of common offences in University in Rivers State

### **Scope of the study**

The content scope of this study covered the concept of common offences, nature, causes and management strategies to curb the negative impacts in the academic development of the institutions in Rivers State.

## **METHODOLOGY**

### **Population of the study**

The population of the study consisted is 9671 students in the three public universities in Rivers State. The universities are Rivers State University, Ignatius Ajuru University of Education and University of Port Harcourt; and all in the city of Port Harcourt.

### Sample and sampling technique

A sample of two hundred and fifty students participated in the study using multistage sampling techniques of four stages in the sample selection from the three universities at the ratio of 36:34:30 percent for University of Port Harcourt, Rivers State University and Ignatius Ajuru University of Education which was judgmental based on the needs of the study.

### Instrumentation

A fifteen self-structured instrument named "Common offences in the management of students discipline inventory"(CFMSD) was used for the collection of data with a fourpoint rating scale from strongly agreed to strongly disagreed. The face and content validity of the instrument were determined by three experts in education and the reliability of the instrument was obtained using the Cronbach Alpha (ra) method and put at a reliability coefficient of 0.745 which justified the use of the instrument. A total number of two hundred and twenty nine of the instrument was found useful out of the two hundred fifty issued and retrieved for the study.

### Data Analysis

The survey research study data obtained was coded, scored, and subsequently analyzed using mean, standard deviation to answer the research questions with a criterion mean cutoff of point of 2.5. while Analysis of Variance (ANOVA) and t test were used to test the four stated hypotheses at 0.05 level of significance. The results of the data analysis is presented below.

### Results

**Research Question 1:** What are the common offences committed by students of universities in Rivers State?

**TABLE 1 MEAN AND STANDARD DEVIATION ON THE NATURE OF COMMON OFFENCES COMMITTED BY STUDENTS OF THE UNIVERSITY IN RIVERS STATE.**

S/N	The frequently committed offences among university students in Rivers State include:	N = 229		Decision
		Mean	SD	
1	Stealing	2.69	1.16	*
2	Rape	2.92	1.02	*
3	Examination malpractice	2.52	1.27	*
4	Fighting or bullying	2.72	1.12	*
5	Cultism	3.21	.95	*
6	Truancy	3.31	1.02	*
7	Drug Abuse	3.03	.98	*
8	Absenteeism	2.83	1.03	*
9	Sexual harassment	2.73	1.07	*
<b>Grand Mean</b>		<b>2.88</b>	<b>1.07</b>	<b>*</b>

\* (Agree) =  $\geq 2.50$  while # (Disagree) =  $< 2.50$ .

Table 1: shows that the mean rating and standard deviation on the common offences committed by students of higher education in Rivers State. It further shows that the common offences committed by students in Universities in Rivers State includes: truancy ( $\bar{X}$  = 3.31) in item 6, cultism ( $\bar{X}$  = 3.21) in item 5, drug abuse ( $\bar{X}$  = 3.03) in item 7, rape ( $\bar{X}$  = 2.92) in item 2,

absenteeism ( $\bar{X} = 2.83$ ) in item 8, sexual harassment ( $\bar{X} = 2.73$ ) in item 8, fighting or bullying ( $\bar{X} = 2.72$ ) in item 4, stealing ( $\bar{X} = 2.69$ ) in item 1, while the least was examination malpractice ( $\bar{X} = 2.52$ ) in item 3. Furthermore, the grand mean score of 2.88 indicates that these common offences were committed by students in the universities in Rivers State.

**Research Question 2:** What are the common sanctions adopted in the control of student's common offences in then universities in Rivers State?

**TABLE 2: MEAN AND STANDARD DEVIATION ON THE COMMON SANCTIONS ADOPTED IN THE CONTROL OF STUDENT'S COMMON OFFENCES IN THE UNIVERSITIES IN RIVERS STATE**

S/N	The frequent common sanctions adopted by the University for acts of common offences include:	N = 229		Decision
		Mean	SD	
10	Detention	2.97	1.07	*
11	Suspension	2.89	.95	*
12	Rustication	3.06	.98	*
13	Expulsion	3.09	.93	*
14	Withdrawal	3.63	.80	*
<b>Grand Mean</b>		<b>3.13</b>	<b>0.95</b>	<b>*</b>

\* (Agree) =  $\geq 2.50$  while # (Disagree) =  $< 2.50$ .

**Table 2:** shows that the mean rating and standard deviation on the common sanctions adopted in the control of common offences among university students in Rivers State. It further shows that the common sanctions adopted include: withdrawal ( $\bar{X} = 3.63$ ) in item 14, expulsion ( $\bar{X} = 3.09$ ) in item 13, rustication ( $\bar{X} = 3.06$ ) in item 12, detention ( $\bar{X} = 2.97$ ) in item 10, while the least was suspension ( $\bar{X} = 2.89$ ) in item 11. Furthermore, the grand mean score of 3.13 indicates that these common sanctions were adopted in student's control of common offences in the universities in Rivers State.

**Research Question 3:** What is the perception of students on the roles of management and disciplinary committee in the control of common offences among university students?

**TABLE 3: MEAN AND STANDARD DEVIATION ON THE PERCEPTION OF STUDENTS ON THE ROLES OF MANAGEMENT AND DISCIPLINARY COMMITTEE IN THE CONTROL OF COMMON OFFENCES AMONG UNIVERSITY STUDENTS IN RIVERS STATE**

S/N	The roles of management in students common offences include:	N = 229		Decision
		Mean	SD	
11	Planning	3.32	.78	*
12	Organizing	2.63	1.15	*
13	Leading	2.66	1.16	*
14	Controlling	2.73	1.19	*
15	Setting laws and standards	2.39	1.19	#
<b>Grand Mean</b>		<b>2.75</b>	<b>1.09</b>	<b>*</b>

\* (Agree) =  $\geq 2.50$  while # (Disagree) =  $< 2.50$ .

**Table 3:** shows that the mean rating and standard deviation on the perception of students on the roles of management and disciplinary committee in the control of common offences among university students in Rivers State. It further shows that the perception of students on the roles of management and disciplinary committee includes: planning ( $\bar{x} = 3.32$ ) in item 22, controlling ( $\bar{x} = 2.73$ ) in item 26, leading ( $\bar{x} = 2.66$ ) in item 24, and organizing ( $\bar{x} = 2.63$ ) in item 23. Although, the respondents disagreed that setting laws and standards ( $\bar{x} = 2.39$ ) in item 26. However, grand mean score of 2.75 indicates that these were perception of students on the roles of management and disciplinary committee in the management of common offences in the universities in Rivers State.

### Test of Hypotheses

**H<sub>01</sub>:** There is no significant difference between the perceptions of University students in Rivers State on the common offences based on academic levels.

**TABLE 4: SUMMARY OF ANALYSIS OF VARIANCE (ANOVA) ON THE MEAN RATINGS ON THE PERCEPTIONS OF STUDENTS IN THE UNIVERSITIES IN RIVERS STATE ON THE COMMON OFFENCES BASED ON ACADEMIC LEVELS**

Source of variation	Sum of Squares	Df	Mean Square	F	Sig.	Decision
Between Groups	96.770	3	32.257	1.077	.359	NS
Within Groups	6736.121	225	29.938			
Total	6832.891	228				

**Decision rule:** if  $p < .05$  reject  $H_0$ , else retain  $H_0$ . NS = Not Significant,  $p > .05$ , S = significant,  $p < .05$

**Table 4:** shows that the academic levels of students have no significant influence on their perception on the common offences committed in Ignatius Ajuru University of Education ( $F_{3, 225} = 1.077$ ,  $p > .05$ ). The null hypothesis was retained. This indicated that the academic levels of students did not predict their perception of common offences committed in Universities in Rivers State.

**H<sub>02</sub>:** There is no significant difference between the perceptions of students in the sanctions adopted by management based on academic levels.

**TABLE 5: SUMMARY OF ANALYSIS OF VARIANCE (ANOVA) ON THE MEAN RATING OF THE PERCEPTIONS OF STUDENTS IN THE SANCTIONS ADOPTED BY MANAGEMENT BASED ON ACADEMIC LEVELS**

Source of variation	Sum of Squares	Df	Mean Square	F	Sig.	Decision
Between Groups	35.044	3	11.681	1.149	.330	NS
Within Groups	2288.144	225	10.170			
Total	2323.188	228				

**Decision rule:** if  $p < .05$  reject  $H_0$ , else retain  $H_0$ . NS= Not Significant,  $p > .05$ , S= significant,  $p < .05$

**Table 5:** shows that the academic levels of students has no significant influence on their perception on the sanction adopted by management in Universities in Rivers State ( $F_{3, 225}=1.149$ ,  $p > .05$ ). The null hypothesis was retained. This indicated that the academic levels of students did not predict their perception on the sanctions adopted by management.

**H<sub>03</sub>:** There is no significant difference between the mean response of male and female students on the roles of management and disciplinary committee on student's common offences in University in Rivers State.

**TABLE 6: SUMMARY OF T-TEST ANALYSIS ON THE DIFFERENCE BETWEEN THE MEAN RESPONSES OF MALE AND FEMALE STUDENTS ON THE ROLES OF MANAGEMENT AND DISCIPLINARY COMMITTEE ON STUDENT'S COMMON OFFENCES IN UNIVERSITY IN RIVERS STATE**

Gender	N	Mean	SD	T	Df	p-value	Decision
Male	84	12.0595	3.62173	.957	227	0.329	NS
Female	145	12.5103	3.91776				

**Decision rule:** if  $p < .05$  reject  $H_0$ , else retain  $H_0$ . NS= Significant,  $p > .05$ , \* significant,  $p < .05$

Table 6 shows that gender has significant influence on the roles of management and disciplinary committee on students common offences in University in Rivers State ( $t_{(227, .025)}=.957$ ,  $p=0.329$ ). The null hypothesis was retained. The mean difference was relatively close but in favour of the female students. The implication is that the roles of management and disciplinary committee on student's common offence control do not differ between the male and female students in University in Rivers State.

## DISCUSSION OF FINDINGS

The result in Table 1 revealed a grand mean score of 2.88 which indicated that the common offences committed by students of higher education in Rivers State include: truancy, cultism, drug abuse, rape, absenteeism, sexual harassment, fighting or bullying, stealing, and examination

malpractice. This finding is in agreement with earlier findings by UNESCO (2017) that truancy, cultism, drug abuse, rape, absenteeism, sexual harassment, fighting or bullying, and intimidation, stealing, arson, and examination malpractice are common offences committed by students in schools and institutions of learning. This continuous committal of these common offences affects the bedrock of progress, socialization and development in Nigeria's educational system (Nwogu, 2013).

The result in Table 2 revealed a grand mean score of 3.13 which indicated that sanctions adopted in the control of common offences include: withdrawal, expulsion, rustication, detention, and suspension. This finding is consistent with the views of Ohakamike and Agwu (2016) who asserts that common offences attract sanctions like withdrawal, expulsion, rustication, detention, and suspension in order to maintain and regulate students discipline in the institution, thereby maximizing efficiency, professionalism, and productivity.

The result in Table 3 revealed a grand mean score of 2.75 which indicated that the perception of students on the roles of management and disciplinary committee in the control of students' common offences includes: planning, controlling, leading, organizing, and setting laws and standards. This finding is in agreement with Nnokam (2011) that organizations or institutions are specifically conferred with the authority to set or stipulate its internal rules and regulation. Such rules are made to ensure it maintains equilibrium, growth, meet different needs of the subsystem and the individual member as well as enhance planning, effectively lead, control, and organize activities, operations and services in the institution.

The result in Table 4 revealed that the academic levels of students did not predict their perception of common offences committed. This finding is consistent with *Tack and Chan (2017) who stated that students feel, understand and perceive acts like: absenteeism, truancy, indecency, rape, cultism, examination malpractice, etc. as common offences that can attract sanctions on the students who commit such offences.*

The result in Table 5 revealed that the academic levels of students did not predict their perception on the sanctions adopted by management in the universities in Rivers State. This finding aligns with Ekpenyong (2011) that the incessant or increasing cycle of school-based offences committed by students individually or under the cover of illegitimate groups (like cults and other forms of unlawful assembly) in our higher institutions or educational system attract sanctions like withdrawal, expulsion, rustication, detention, and suspension, in order to fight or resist perceived injustices and place themselves in the pedestal of law and order.

The result in Table 5 revealed that gender influenced students' perception of the administrative procedures adopted by management on students' common offences in Universities in Rivers State. This finding is in agreement with Fry, Fang, Elliott, Casey, Zheng, Li, Florian and McCluskey (2018) that institutions or organizations sanction students across all levels as a way of adjudicating for violence, offences or actions that have contravened the laws, rules, and regulations set within the limits permissive by the management of such institutions or organizations.

The result in Table 6 revealed that gender did not influence students' perception on the roles of management and disciplinary committee on students' common offences committed. This finding is consistent with the position of Mertz and Mullins (2012) who opined that an organizations

stability and very existence depend on the roles and standard set by management in dealing with discipline and misconducts by individuals in that organization.

### **SUMMARY/CONCLUSION**

The purpose of the study was to investigate common offences in the management of students discipline in the universities in Rivers State. The key summary of the findings indicated that truancy, cultism, drug abuse, rape, absenteeism, sexual harassment, fighting or bullying, stealing, and examination malpractice were the common offences committed by students in the universities in Rivers state and the major sanctions adopted to sanction students were withdrawal expulsion, rustication, detention, and suspension students that were indicted.

Furthermore, planning, controlling, leading, organizing, and setting laws and standards were the perception of students on the roles of management and disciplinary committee in students' discipline and that, the academic levels of students did not predict their perception of common offences committed.

It should be noted that, the academic levels of students did not predict their perception on the sanctions adopted by management and gender influenced students' perception of the administrative procedures adopted by management on students discipline and gender did not influence students' perception on the roles of management and disciplinary committee on students discipline in the universities in Rivers State.

The study concludes that common offences like: truancy, cultism, drug abuse, rape, absenteeism, sexual harassment, fighting or bullying, stealing, and examination malpractice committed by students necessitated the adoption of sanctions like: withdrawal, expulsion, rustication, detention, and suspension in order to regulate students common offences in Universities in Rivers State.

### **RECOMMENDATIONS**

1. The University management is encouraged to adopt effective measures like timely teaching, class attendance/roll call, etc. to effectively engage students thereby leaving them with no time to commit offences like: truancy, cultism, drug abuse, rape, absenteeism, sexual harassment, fighting or bullying, stealing, and examination malpractice.
2. Management should ensure that proportionate sanctions are meted to students who violates the acts upon which sanctions imposed based on the due process of the law to avoid unnecessary litigations.
3. All students should be given equal opportunity of fair hearing at all levels beginning from the Departmental panel, Faculty panel and the University disciplinary committee before any sanctions is imposed.
4. The counseling unit should be established at all departments with students' advisors to meet the emotional and academic needs of the students.
5. Students handbooks should be produced and distributed during students' orientation programmes at all level.

### ABSTRACT

*The article reveals new methods of teaching English in higher education institutions. The shortcomings in this regard have been comprehensively identified and analyzed. Also, recommendations and suggestions on the introduction of new methods of teaching in the educational process and its methodological significance have been developed.*

**KEYWORDS:** *Educational Processes, Advanced Innovative Technologies, Teaching Methods, Teaching Methodology.*

### INTRODUCTION

The main purpose of the introduction of new pedagogical technologies in the process of teaching foreign languages is to ensure the achievement of the planned results in the current conditions and time given in the curriculum, thereby increasing the effectiveness of education, forming a new generation of foreign language teachers armed with advanced pedagogical technologies. is to turn them into professionals who can speak foreign languages fluently and read and understand foreign literature.

In modern foreign language teaching methods, the concept of teaching methods (Greek methodos) is used in the sense of the conceptual rules of the teacher's activity in the organization and management of students' learning activities on a particular topic, aimed at optimal learning. The method of teaching means the general ways of organizing and managing the joint learning activities of teachers and students, ensuring the achievement of the set educational goals.

One of the main criteria for the effectiveness of lectures and practical classes in foreign languages is to encourage students to work in pairs or groups, to exchange ideas. This method is often referred to as the interactive method. Interactive methods - involves active interaction of the teacher with the students, the student with the student, with all subjects of the educational process. Interaction can also be organized through multimedia tools. The higher the level of interactivity, the more effective the learning process will be.

The technological process involves the planning, design and application of differentiated and individualized, pair and group work (dialogue, polylogue), the interaction of teachers and students based on the principles of teaching the theoretical foundations of a foreign language, including communication. Such an organization of the educational process provides systematic and rapid communication between teachers and students, as well as students, continuous monitoring of the current results of the educational process, diagnosis, rapid assessment, analysis and adoption of optimal management conclusions.

Theoretical and practical lessons are based on the principles of the humanities, formed in the disciplines of philosophy, psychology and pedagogy. In pedagogy, this direction is interpreted as a referral to independent learning activities that take into account the individual characteristics and capabilities of students, clearly focused on the learner's self-awareness, self-awareness, conscious development of independent critical thinking.

In the process of teaching foreign languages, special attention is paid to the development of the student and the student's personality. Therefore, when planning lessons, the following tasks should be performed:

- To create a comfortable, non-confrontational and safe environment for the full free and creative development of the learner, taking into account his natural intellectual potential;
- Consideration by the teacher of the student or student's personality: understanding and appreciation of his goals, excitements, interests, views, attitudes, belief in him, his strengths and abilities;
- in the process of planning and implementation of educational technology to take into account the knowledge of the student or pupil in this field of knowledge, the general level of development of individual culture;
- take into account the psychological and physiological characteristics of the student or pupil;
- Organization of the educational process in accordance with the level of development of each student and his abilities;
- To help the student to determine his knowledge, identity, continuous development of his intellect, to monitor and diagnose him as a person;
- Development and implementation of general pedagogical technologies of student or pupil development as an individual.
- Teaching the technological process of teaching foreign languages involves planning by directing students to interactive activities. Orientation is carried out in the following ways:
- The teacher teaches students to independently search, analyze, compare, change, apply knowledge in the communication process, constantly update and supplement their knowledge;
- In this process, the teacher should be the organizer, consultant and supervisor of the learning process;

- organization of education in pairs and groups ensures high activity of students; in this process, the independent activity of learners in predicting outcomes, planning and organizing learning activities is supported.

It is known that the teaching of any foreign language involves the teaching of the rules of correct pronunciation of sounds, words and sentences in that language. Pronunciation learning is the starting point for the processes of learning to speak, hear, understand, read, and write in a foreign language. A word or sentence in a foreign language is understood through the sum of the sounds that occur as a result of the action of the organs of hearing, sight and speech. Hence, the sum of sounds and sounds is reflected in words, sentences, articulations and graphic symbols. In pronunciation training, these three components must be activated in a complex way.

When teaching pronunciation, special attention is paid to the development of the student's ability to hear correctly. Students who do not develop the ability to hear correctly even have difficulty pronouncing sounds and sentences that occur in our native language. Special exercises for differentiating sounds are organized for them. So, it is necessary to talk about the formation of auditory and pronunciation skills of students. Hearing and pronunciation skills begin to be formed in the first year of foreign language teaching, and these skills are gradually improved. The pronunciation material, which is complex with the lexical and grammatical materials included in the lessons, is distributed among the classes according to this principle. In the elementary courses, pronunciation training began with sounds that were spelled the same, pronounced the same, and lexical material in both languages. Gradually, sounds and phonetic phenomena that did not exist in the native language began to be taught.

Particular attention is paid to the study of the acoustic, articulatory aspects of difficult sounds to avoid the negative consequences of interlingual phonetic interference. Such interference can occur in the teaching of nasal sounds, semi-vowels, liaison, enchainement, élision phenomena, in distinguishing open and closed, short and long vowels, in teaching the expression of different sounds according to the position of the letter in the word, in teaching readable and unreadable consonants.

Teaching writing involves mastering the graphic representations of sounds in a foreign language alphabet, turning letters into sounds, words, and sentences, spelling them correctly, and using them to express an idea in writing. Thus, teaching writing is understood as the acquisition of phonetic units such as sounds, letters, syllables, lexical units such as words, phrases, sentences, paragraphs, text, the formation of skills and competencies related to the preparation of written information.

In the methodology, teaching to write and to express an idea in writing is taught as separate steps. Teaching writing is a complex psychophysiological process in which all speech analyzers are involved and play a key role in reinforcing written, read, understood, and reinforced material by making words from letters, word combinations, and sentences. Speech mechanisms are also involved in writing. In writing, meaning, sound symbols are interconnected with graphic symbols (letters), i.e., a literal symbol is added to the meaning and sound symbol that is used in

speech. The graphic representation is mastered in reading and writing and comes under the control of written speech analyzers.

Teaching writing and written speech is related to these aspects of speech activity with the types of teaching speaking, listening comprehension, reading comprehension. Therefore, in teaching speech activity, one is first taught to speak, listen, understand, read, and finally written speech. Graphical representations of the sounds used in the speech process in the primary grades, i.e., spelling, are taught in the middle and upper stages, with priority given to teaching the idea to be expressed in writing.

### ABSTRACT

*This scientific article sets the task of researching and studying the professional and spiritual qualities of pediatric doctors. Currently, the personality of the doctor is considered a central component of the system of medical activity, ensuring its focus and successful functioning in solving the humanistic goal of medical work. Professional and spiritual qualities determine the norms of the cognitive-behavioral system, regulating pedagogical activity, act as a mediator, and a link between pedagogical activity and the social worldview. The development of professional and spiritual qualities of students of medical universities is a complex, lengthy, and consistently developing process that requires the cooperation of all participants in the educational process - the teaching staff and students. The effectiveness of this process is primarily achieved due to the scientific validity of educational work, system aticity, creativity, spiritual and educational foundations, and the effectiveness of educational activities, creating the most favorable conditions for the spiritual and moral development of students.*

**KEYWORDS:** *professional and spiritual qualities (PSQ), pedagogy, psychology, social activity, pediatrician, patient, communication skills, training.*

### INTRODUCTION

Large-scale spiritual reforms carried out by the President of the Republic of Uzbekistan Sh.M. Mirziyoyev, the Development Strategy of Uzbekistan, accelerating reforms in the framework of the Concept for the Development of Higher and Secondary Special Education until 2030, the increasing demands on the spirituality of modern specialists are determined by the requirements to improve the moral level of future government employees, services and social workers in

general, it seemed to us It is interesting to find out the motivation of elementary students and graduates of a medical university to professional activity in the outpatient service.

Healing is a professional activity based on humanistic principles. This is evidenced by several accepted international legal normative documents on the deontology and ethics of doctors. These include the Geneva Declaration (1948), the Geneva Oath, the International Code of Medical Ethics (1949), the Helsinki-Tokyo Declaration (1964, 1975), the Sydney Declaration (1969), the Edinburgh Declaration of the World Federation of Medical Education (1988).

In the preparation of medical personnel, great attention has always been paid to the formation of not only professional knowledge and skills, but also its moral development. Currently, the personality of the doctor is considered as the central component of the system of medical activity, ensuring its focus and successful functioning in solving the humanistic goal of medical work (Ermolaeva E.V., Pavlova L.A, 2013) [2]. In the preparation of a modern doctor, great attention should be paid to the formation of communicative competence, since the success of the medical activity is associated not only with medical knowledge but also with communicative skills. A pediatrician is a profession, which is considered to be very popular in the labor market, and it is also linguistic speech, and communication skills are necessary for a doctor in medical, preventive, educational, organizational, and managerial activities.

Medical rhetoric as a theory and practice of effective speech behavior in a public monologue and dialogue can contribute to the training of future pediatricians. The new requirements of society and the market for future specialists reinforce the need for university students to form not only clinical skills but also specialists with several important social skills: the ability to communicate with various categories of people, be able to work in a team, interest and motivate others. In addition to skills, working in a dialogue mode plays an important role in the ability to assimilate information of a large volume and diverse content: the ability to analyze, structure, prioritize, select information blocks, and also draw independent conclusions, predict the consequences of their decisions and answer for them. The role of pediatricians is increasing in the world, and the requirements for their professional qualities are growing. In difficult conditions in the pediatric field, not just professionals are needed, but real devotees of their work, bright personalities who can overcome difficulties and work creatively.

Nevertheless, the triad founded by Abu Ali Ibn Sina, "when treating the patient, first of all, use the power of the word, if the word is not enough, use medicinal herbs and, last but not least, use the scalpel remains an axiom in modern world medicine.

In communicating with the patient, the doctor should help to overcome his fear and get rid of doubts arising before making a responsible decision, to calm and give hope for recovery.

That is why the famous doctor V.M. Bekhterev said, "if the patient does not feel relief after talking with the doctor, he is not a doctor. He must leave the medical profession".

It follows that the ability to inspire people should be a professional and spiritual quality of every doctor. Unfortunately, in recent years, a decline in professional and spiritual qualities has been observed in the relationship between the doctor and the patient, and there are tendencies to consider the patient as a passive object. In pedagogical science, upbringing is interpreted as cultural identification, the process of pedagogically controlled social adaptation, the disclosure of the individual's creative talents, and their direction (Asmolov A.G., Berulava M.N., Bratchenko

S.L., Vulfov B.Z., Gavrilovets K. V., Novikova L.I., Selivanova N.L.). This understanding of the phenomenon of education is reflected in the form of professional education in the professional sphere. However, many foreign and domestic studies did not address the issues of professional spirituality and the spiritual qualities of future doctors.

Assessing the effectiveness of problem-oriented teaching methods, revealing the theoretical and methodological foundations of the development of professional and spiritual qualities of future pediatricians and improving the system of measures aimed at improving the exchange of experience in the field of spiritual education between experienced and respected doctors with experience and future doctors-students at Based on the principle of "Teacher-student", as well as in practice, the technology of social cooperation "Stories of a pediatric on-call" was implemented. For this, the greatest effects were given by methods such as: posing a problem or a problem situation; discussion. The essence of this method is to present the educational material of the lesson in the form of an accessible, figuratively, and vividly stated problem that takes into account not only clinical but also social skills and knowledge of student's pediatricians. This method is close to the method of creative tasks but has a significant advantage in that it creates a strong motivation among students.

Discussion (organization of discussion of material) is a teaching method based on the exchange of opinions on a specific problem in which social thinking is improved giving a great opportunity to find the right approach to solving a particular problem.

The point of view expressed by students during the discussion can reflect both his own opinions and be based on the opinions of others. A well-conducted discussion has great educational and educational value: it teaches a deeper understanding of the problem, the ability to defend one's position, to reckon with the opinions of others.

Here it is necessary to develop the following qualities: - not to transfer the negative attitude of society to one or another way of solving the issues under discussion on yourself, to prove the correctness of your opinion not by offensive intonations and words, but by facts and examples (S. A. Smirnov, I. B. Kotova, R.G. Shiyanov et al., 2000) [3].

Thus, it is obvious that a pediatrician, as a subject of medical activity, must be comprehensively developed, as well as motivated to help everyone in need, and be humane. Undoubtedly, a pediatrician should not only possess knowledge, skills, analytical thinking, but also high spirituality, benevolence towards colleagues and patients, bear a positive emotional charge, which is a manifestation of professionally-spiritual qualities (Yas'ko B.A., 2005) [4].

The foregoing will help to improve the relationship between the doctor and the patient in communication, as well as combining clinical knowledge with professional and spiritual qualities that increase their work efficiency tenfold during the medical history, which in turn gives an advantage in timely and high-quality medical care. a complex aimed at promoting the development of professional and spiritual qualities of students of medical universities, scripts of spiritual and educational events "History of a pediatrician on duty", "Andijan doctors".

Practical significance is determined based on clarifying the pedagogical and psychological features of the development of professional and spiritual qualities of future doctors, determining the parameters, stages that make up the pedagogical support of this complex of professional and spiritual qualities, improving the content, forms and technologies of spiritual and educational

work to develop the spiritual and moral qualities of future doctors, the development of scientifically based proposals and recommendations for the implementation of historical and medical heritage in the modern system of higher medical education on the principle of "spiritual medicine".

The most significant factor determining the social status of the pediatrician providing primary health care to children is his relationship with his parents, which in turn depends on the amount of time allotted to the pediatrician to examine the child and talk with parents. Material incentives in many respects determine the motivation of the pediatrician's labor activity (86% of doctors and 94% of students decided that the salary of a pediatrician should be increased). However, working conditions and material and technical support of the workplace are no less significant (73 % of doctors and 85% of students). The daily supervision of patients carried out by students in a hospital and polyclinic, according to the work program, does not fully comply with the modern requirements for training a doctor who must have clinical skills, but also social ones that would be more developed when a medical student is directly involved in the correct definition and solving these problems, including carrying out preventive measures and medical examination, for this it is necessary to introduce a system of weekly practice and control over the level of formation and the use of professional and spiritual qualities. To correct these qualities of the identified deficiencies during practice, it is necessary to create objective criteria for assessing and monitoring students' knowledge over the stages and levels of knowledge and skills acquired, both clinical and social.

Particular emphasis was placed on the spiritual environment, contributing to the development of future doctors professionally-spiritual qualities by professional and spiritual values. Therefore, the integrity of the educational process, praxiology, devotion to the motherland, subjectivity, and reflexivity are the principles of the process of the formation of future doctors. It was understood that in determining a set of complex criteria for professional and spiritual components of a future doctor, a student should know professional and spiritual qualities, a good understanding of their true purpose and effectiveness, as well as the ability to substantiate appropriate behavioral algorithms and, if necessary, improve skills and skills needed in pedagogical situations.

The professional and spiritual development of future doctors is based on the achievements of scientific and pedagogical approaches and concepts developed in Uzbekistan and around the world, as well as the theoretical and methodological foundations of the development of professional and spiritual qualities of future doctors and the identification of emerging features and opportunities during their formation during training at the university.

## NOTION AND LEGAL REGULATION OF STARTUPS IN THE REPUBLIC OF UZBEKISTAN

**Tojiboev Akbar Zafar ugli\***

\*Senior Lecturer,  
Tashkent State University of Law,  
UZBEKISTAN  
Email id: azafarovic@gmail.com

### ABSTRACT

*The article studies the concept of startup, startup activity and its description from the legal point of view, the system of legislation aimed at regulating the activities of startups, the specifics of the activities of startups as an object of civil law regulation. Furthermore, an author's definition of the concepts on startup company and startup activity, signs that differentiate the startup from SME that use the usual technological production has been developed in the research.*

**KEYWORDS:** *Startup, Startup Activity, Innovation, Intellectual Property, High Risk, Legal Regulation.*

### INTRODUCTION

The term startup appeared several years ago and began to mean a business starting “from zero”. However, startups have their own and distinctive characteristics. So any business as an activity involves organizing company in order to profit or diversify activities already existing company with the aim of increasing capital and profits. Such actions can be carried out both at the expense of own and borrowed funds under responsibility of the head of the organization or its guarantor. Most practitioners believe that startup is fundamentally a new organization, most often conducting activities in the IT or Internet sphere. The main characteristic of startup is the potential for rapid growth, which achieved by creating new market segments or offering completely original and innovative products and/or services.

Last three years Uzbekistan has been also paying special attention to develop national innovation system, to support young generation engaged in the field of IT and other related directions, to accelerate the legislation basis on startup and so related innovative fields. One of the results of these reforms have been identified with the establishment of IT-Park and Yashnabad Technology

park specialized in researching different technology studies, IT, software and computer design and etc. State also have been offering various type of state research programs which aim to support startup in pre seed stages, as well as proposing new regulations to improve startups. There have been adapted and entered into force more than 20 normative legal acts that directly related to the startups. Namely, the Startups draft law, several decree and resolutions of the President and Cabinet of Ministries of the Republic of Uzbekistan are one of the main legal acts that should be noted.

## MATERIALS AND METHODS

Methods such as comparative-legal, logical, complex study of scientific sources, induction and deduction, analysis of statistical data were used during the article. The data were collected through the official websites of organizations in the field of regulation startups.

## Results

**Concept of startups in national and international scope.** The term startup first appeared in 1939 in the Santa Clara Valley, California, USA, which specializes in high-tech developments. At the time, Stanford University students David Packard and William Hewlett created their own small project, which he called a startup. Later, the startup gradually became a large and successful Hewlett-Packard (later known as HP) company.

Today, startups include Business Products & Services, Artificial Intelligence (AI), Internet Software & Services, Mobile Software & Services, Internet of Things, e-commerce, financial technology (Fintech), biotechnology (Biotech), advertising technology (Adtech), 3D printing (3D Printing), logistics transportation (Supply chain & Logistics).

There are 305 million registered startups worldwide, with 100 million startups operating each year. Of these, 1.35 million startups specialize in the field of technology. Each year 5.7 million startups from startups are successfully selected for accelerator programs, but 824 of them startups will be able to enter the global market by offering their goods, works and services. Other registered startups are usually forced to close down for a number of reasons, such as not choosing the right business model, not forming an effective startup idea, and not having a source of funding.

Since the concept of startup is of general one, it has been studied not only by legal scholars, but also by economists and technical scientists. According to Russian economists T.Bondarenko and E.Isayeva startup is a potential new organization specializing in information technology and the Internet. D.Urganova, a scientist in the field of business and management technologies, spoke about the infrastructure of startups, first of all, she emphasized the contractual relations that arise during the implementation of startups. According to her, a startup is a project or enterprise, which is short-lived and the main purpose of its activities is to make a profit. American entrepreneur S. Blank, one of the founders of the customer development method, considers a startup as a temporary structure that aims to implement and expand the business model (project). D.Bennett studies the dynamics of U.S. investment and business infrastructure from an economic point of view and evaluates startups as small business activities. I. Moroni emphasizes that the organization of startups in various fields is an innovative center of products and services that embodies the intention to “revolutionize” the market. National specialists in the field of economics and innovation also propose their views on startups and tried to distinguish its main

characteristics from simple business activity. As according to A. Khudainazarov any startup is a new small enterprise, but not every new small enterprise is a startup. Startup produces goods or provides services that are the result of an innovative approach to solving problems and high risk of bankruptcy compared to ordinary business projects.

Startups and their activities, similarities with innovation activities, aspects of the relationship with intellectual property, the contractual-legal relationship in their activities have not been left out of the eyes of foreign legal researchers and practitioners. K. Tondo-Kramer calls startups software companies. He also researched aspects of startups related to intellectual property, such as company names, trademarks, and patents. A. Reid and Monroe-Sheridan call startups from organizations that depend on a particular form of external financing. In our view, his above opinion is mainly important in the successful continuity of the startups.

National lawyers have also researched on startups in the field of innovation in their works. In particular, according to the opinion of O.Oktyulov, a startup company is a commercial entity that has a certain amount of material and financial resources and builds its business on the basis of innovation. Startups can also be organized as a structure in accordance with the provisions of Article 39 of the Civil Code of legal entities. In this case, the activities of startups begin with the definition of organizational and legal forms of the legal entity. A. Akhmedov said that it is necessary to include startups in the list of new entities engaged in innovative activities, coordinate the activities of state and economic authorities, commercial banks, scientific and educational institutions to promote the development of the technology park, the creation of favorable conditions for the creation of "startups" on the basis of innovative developments. K.Mehmonov studied the rights to computer programs and databases that collide during the activities of startups and the construction of related contracts. N.Raimova analyzed the issues related to startups at the stage of ideas or seeding, as well as the results of research and development of innovative activities and undisclosed information, production secrets (know-how). In turn, the above-mentioned scientific views show that startups are a risk-based and profit-oriented structure.

In accordance with Article 3 of the Law of the Republic of Uzbekistan On guarantees of freedom of entrepreneurial activity of 2012, entrepreneurial activity (entrepreneurship) is an activity carried out by business entities in accordance with the law, aimed at gaining income (profit).

In accordance with the Regulation on the procedure for selection and financing of startup projects, approved by the Cabinet of Ministers of the Republic of Uzbekistan dated March 9, 2020, a startup company is a legal entity established to promote and commercialize the results of scientific, scientific and technological activities. It is obvious that any startup company is a business entity. However, the above document does not specify the characteristics of a startup company that distinguish it from another business entity.

Based on the generalization of the above analysis the legal nature of the startups is deemed as:

- A. special type of innovative activity;
- B. results of intellectual property created as a result of scientific and creative activity;
- C. startups operate on a very high level of risk;
- D. the main purpose of its activities is to benefit, expand (scale), as well as support social goals;

e. one of the organizational and legal forms of innovative investment;

F. entrepreneurial activity based on scientific and creative process or intellectual property;

G. can operate in the form of a legal entity or sole entrepreneur, as well as, individuals who are the main part of the startup participants are allowed to carry out their activities without state registration as entrepreneurs.

**Legal regulation of startups in Uzbekistan.** Just as there are legal bases for any activity, there are normative and legal documents on the legal regulation of startups. In accordance with existing legal sources in the field, the regulation base of startups can be divided into the following subgroups:

a. legal documents defining the general principles of regulation of startup activities;

b. legal documents on relating tasks, functions of startup and startup support.

**A) Legal documents defining the general principles of regulation of startup activities.**

In general manner the startup activities like business activities are regulated by Civil Code of the Republic of Uzbekistan (1995, 1996), Limited Liability and Additional Liability Companies Law (2001), Joint Stock Companies and Protection of Shareholders' Rights Law (2014), Guarantees of Freedom of Entrepreneurship Law (2012), Investments and Share Funds Law (2015), Securities Market Law (2015) and various laws on intellectual property. Since the activities of startups are an innovative complex approach, the legal documents governing the organizational and legal, contractual and intellectual legal relations related to their activities are legal sources in the organization and implementation of the activities of startups.

According to the civil and business legislation of the Republic of Uzbekistan, any business activity must be registered by the state. Since the activities of startups also reflect the characteristics of business activity, they also need state registration. The general basis and rules for the state registration of business activity are established by Civil Code and Guarantees of Freedom of Entrepreneurship Law. But the detailed procedure and terms of the state registration of business entities are regulated by Regulations of the Cabinet of Ministers of the Republic On the procedure for the state registration of business entities from 2017.

Liquidation and bankruptcy order, basis and rules for business entities, including startups, are carried out in prescribed manner in accordance with the Bankruptcy Law (2004) and Civil Code.

Depending on the organizational and legal form of registration of startups as a business entity their activities will be regulated by a number of laws. In order to be more successful in revenues, to use effective risk management and distribute liability over founders and/or participants most startups are tent to register as LLD (limited liability company) in Uzbekistan, JSC also preferable in some cases. Very few startups select to commence their activity as registering sole entrepreneur, though no prohibition by legislation. On the other hand, startups in the form of sole entrepreneur is extremely risky due to improper liability management, no right to issue the corporate bonds, securities and no exchangeable shares. These factors, without any doubt, may lack startup-sole entrepreneur the opportunity to attract financial funds like venture funding, funding by business angels. Depending on the business form in which startups are established Civil Code, Limited Liability and Additional Liability Companies Law, Joint Stock Companies and Protection of Shareholders' Rights Law, Guarantees of Freedom of Entrepreneurship Law are the laws to regulate.

As one of the main features of startups is innovation in product, service and business model, it usually deals with intellectual property. For example, if a startup project is associated with the creation of a particular field of invention, utility model and industrial design it is regulated by laws On Inventions, Utility Models and Industrial Designs (2002) and On Copyright and Related Rights (2006). The main issue is the right to the result created in the framework of the startup project and the relationship with its management.

**B) Legal documents establishing the related tasks and functions of startup and startup support.**

In 2017 the Presidential decree "On the establishment of an innovation technology park in Yashnabad district of Tashkent" was adopted in order to ensure the advance of high technologies, sustainable development of science, technology and innovation entrepreneurship. The decree determined the establishment of small innovation enterprises, the creation of a favorable environment for the production and supply of competitive, science-intensive products in domestic and foreign markets. The Yashnabad technology park is established according to the decree which specializes to carry out its main activity and launch startup projects in the field of chemical technology, biotechnology, pharmaceutical and medical biotechnology, plant protection products, building materials, food industry, energy saving, production of alternative and renewable energy sources, robotics, mechanical engineering, electrical engineering.

Next Decree of the President of the Republic of Uzbekistan "On approval of the Strategy of innovative development of the Republic of Uzbekistan in 2019-2021" (2018) sets the Republic of Uzbekistan tasks to become one of the 50 leading countries in the world by 2030 according to the Global Innovation Index.

Currently, the Resolution of the Cabinet of Ministers "On measures to organize the activities of the technology park of software products and information technology" (2019) is important on the organization of startup projects, startups, their investment through venture funds. The IT Park Tashkent is established according to the resolution which specializes to carry out its main activity and launch startup projects in the field of software products and information technology. Furthermore, the resolution is identified and distinguished the terms like startup and business projects, is applied for the first time terms like accelerator and business incubator that to boost the startups through consultancy, training services. According to the website IT-Park.uz, in the second half of 2019, 15 out of 103 startup projects in the software and information technology IT-Park in Tashkent were selected for incubation and acceleration programs. These startups are mainly projects in the field of e-commerce, medical technology (Medtech), financial technology (Fintech), agricultural technology (Agrotech) and Internet of Things (IoT).

The Resolution "On investment and management companies" of the Cabinet of Ministers 2019 defines the procedure and forms of venture financing, as well as the rights, obligations and powers of the investment company, management company and venture fund. As a rule, four main actors are involved in the implementation of venture financing: investment company, management company, venture funds and qualified investors.

The Regulation on the procedure for selection and financing of startup projects, approved by the Cabinet of Ministers of the Republic of Uzbekistan dated March 9, 2020, defines the terms like a startup company and the procedure for approval, financing and implementation of startup projects.

On April 27, 2020, the Ministry of Innovative Development proposed the draft Startups law that consists of 33 articles, the main purpose of which is to regulate relations in the field of organization and development of startups, as well as incentive mechanisms and the use of innovative ideas in their activities. According to the draft law The Ministry of Innovative Development is determined as an authorized state body in the field of startups.

## CONCLUSION

The role and importance of startups in achieving economic stability in the country is great. Startups are different from other types of business as a form of innovation. In our opinion, these differences are mainly characterized by the distinctive features of startups. The main differences of startups from ordinary entrepreneurship are determined by the stages of formation and development of startups, their connection with innovation, high risk category, the specifics of the organizational and legal form, property and exclusive rights to intellectual property created on the basis of startup projects.

In our view, **startup** is a temporary structure in the form of a commercial legal entity or a simple partnership, as well as in the form of sole entrepreneur with innovative features and based on high risk, designed to seek and implement an expandable business model that requires specific investment.

Startups should be distinguished from small businesses that use traditional technological production by the following characteristics:

- A. not more than 5 years since the state registration as a legal entity;
- B. have an innovative business model;
- V. have innovative technologies to carry out their activities;
- G. be able to apply all types of legal protection of intellectual property in the stage of their activities;
- D. the existence of a plan for dynamic growth in profitability and job creation.

The activity of startups is the activity aimed at the development and introduction of new or improved products (works and services) on the basis of an innovative approach in high-risk conditions.

2. Issues such as state registration of startups, the concept and procedure for concluding crowd funding and option contracts in turn funding the startups, management measures of startup risks are not included in the Startups draft law. The establishment of mechanisms such as risk management, as well as the availability of organizational platforms for venture and crowd funding are very important not only for startups looking for an expanding business model by attracting investment, but also for investors. According to the above-mentioned views, in order to improve the relationship between the organization and development of startups, it is proposed to amend and supplement the Startups draft law which provides with enrichment of proposed law with the new items such as state registration, methods to manage, minimize risks and etc.

Above-mentioned proposals can serve as formalization and development of startup infrastructure in the Republic of Uzbekistan.

## THE METHOD OF APPROXIMATION OF THE SEQUENCE FOR SOME NONLINEAR BOUNDARY VALUE PROBLEMS

Baymuratova K\*; Erejepova Sh\*\*; Kilishbaeva G\*\*\*

<sup>1,3</sup>Karakalpak State University,  
UZBEKISTAN

### ABSTRACT

*In this paper, we consider a system of simple differential equations for boundary-value nonlinear problems. Nonlinear boundary conditions of the considered interval for the condition of the solution of the studied function of this side the considered boundary value problem is solved using the numerical analytical method of A.M. Samoylenko and is erroneously estimated. Therefore together with this nonlinear boundary condition for considering the right side interval instructions are given for solving the value of the function for investigation.*

**KEYWORDS:** Simple Differential Equations, Nonlinear Boundary Value Problems Numerical-Analytical Method For Solving Approximations.

### INTRODUCTION

For the first nonlinear ordinal differential equation it will be

$$\frac{dx}{dt} = f(t, x), \quad (1)$$

$$\Phi(x(0), x(T)) = 0 \quad (2)$$

the boundary value problem will be given, here is the function  $f$  function in the area  $[0, T] \times D$ , and  $\Phi$  function will be  $D \times D$  defined in the area  $n$  measurement functions of the vector. Let be nonlinear (1), (2) numerical-analytical method for solving boundary value problems of approximation in turn [1,2] using this method, let's consider the task of calculating the approximation.

If from (2)  $\det A \neq 0$  will be  $x(0)$  can be divided, then (2) will be

$$Ax(0) + Bx(T) = \varphi(x(T)) \quad (3)$$

written like this, here  $A$  and  $B$  matrixes  $n \times n$  measuring constants of the square matrixes. In this case (1),(3) boundary task for this  $\alpha = 0$  will be equivalent

$$x(t) = x_T - \int_t^T f(s, x(s)) ds + \alpha(T - t), \quad (4)$$

we can change with integral equation, here  $x_T = x(T)$ .

$\alpha$  to choose parameter (4) to (3) put to boundary condition

$$A \left[ x_T - \int_0^T f(s, x(s)) ds + \alpha T \right] + Bx_T = \varphi(x_T)$$

from that  $\alpha$  will have the meaning.

This meaning of  $\alpha$  will put instead of this (4)

$$x(t) = x_T - \int_t^T f(s, x(s)) ds + \frac{T-t}{T} \int_0^T f(s, x(s)) ds + \frac{T-t}{T} A^{-1} [\varphi(x_T) - (A+B)x_T]$$

or

$$x(t) = x_T + \int_0^t \left[ f(s, x(s)) ds - \frac{1}{T} \int_0^T f(s, x(s)) ds \right] ds + \frac{T-t}{T} A^{-1} [\varphi(x_T) - (A+B)x_T]$$

we will have such equation.

(4) if you use the method of approximation to the integral equation in turn

$$x_{m+1}(t, x_T) = x_T + \int_0^t \left[ f(s, x_m(s, x_T)) - \frac{1}{T} \int_0^T f(s, x_m(s, x_T)) ds \right] ds + \frac{T-t}{T} A^{-1} [\varphi(x_T) - (A+B)x_T], \quad m = 0, 1, 2, \dots \quad (5)$$

this will be, this order is defined as  $x_m(t, x_T)$  functions any  $m = 0, 1, 2, \dots$  and consistently  $x_T$  parameter (3) satisfies the boundary conditions, here will be  $x_0(t, x_T) = x_T$ . That's why our next aim is (5) determine the conditions for the collected sequence order of the function and limitation of these sequences (1) to satisfy the system of differential equations is to choose parameter  $x_T$ .

From (5) any  $m = 0, 1, 2, \dots$  will be this

$$\begin{aligned} |x_{m+1}(t, x_T) - x_T| &\leq \left(1 - \frac{t}{T}\right) \int_0^t |f(s, x_m(s, x_T))| ds + \frac{t}{T} \int_t^T |f(s, x_m(s, x_T))| ds + \\ &+ |A^{-1}[\varphi(x_T) - (A + B)x_T]| = M\alpha_1(t) + N \leq M\frac{T}{2} + N \end{aligned} \quad (6)$$

can take inequalities, here  $M$  and  $N$  constancies,  $|f(t, x)| \leq M$ ,  $|\varphi(x_T) - (A + B)x_T| \leq N$

will be taken the conditions of satisfaction of the inequality, here

$$\alpha_1(t) = \left(1 - \frac{t}{T}\right) \int_0^t ds + \frac{t}{T} \int_t^T ds = 2t \left(1 - \frac{t}{T}\right).$$

From (6) as can be seen (5) each approximation defined by the formula  $D$  to avoid leaving the area includes  $x_T$  taking this point and its  $M\frac{T}{2} + N$  circle with  $D$  located in the area  $D_1$  multitude should be, in other words the empty set should not be :

$$D_f \neq \emptyset. \quad (7)$$

As we know [1,2], (5) solved with the formula  $x_m(t, x_T)$  functions any  $m = 0, 1, 2, \dots$  and  $j = 1, 2, \dots$  is

$$|x_{m+j}(t, x_T) - x_m(t, x_T)| \leq (E + Q + Q^2 + \dots + Q^{j-1}) Q^m \left(M + \frac{\pi}{T} N\right) \tilde{\alpha}_1(t)$$

satisfies the inequality, here  $Q = K\frac{T}{\pi}$ ,  $\tilde{\alpha}_1(t) = \frac{\pi}{3}\alpha_1(t)$  and with this matrix  $K$  of  $f$  function is

$$|f(t, x_2) - f(t, x_1)| \leq K|x_2 - x_1| \quad (8)$$

defined by the condition of satisfying the Lipschitz condition.

Let  $Q$  matrix eigenvalues are the same small, that is

$$\lambda_i(Q) < 1, \quad i = 1, 2, \dots, n. \quad (9)$$

Then from (8)  $j \rightarrow \infty$  limit of efforts

$$|x^*(t, x_T) - x_m(t, x_T)| \leq (E - Q)^{-1} Q^m \left(M + \frac{\pi}{T} N\right) \tilde{\alpha}_1(t)$$

can take this inequality, here  $x^*(t, x_T)$  as said (5) defined with the formula  $x_m(t, x_T)$  sequence of functions  $m \rightarrow \infty$  limit of efforts.

But this limit (1),(3) to boundary value problem  $\alpha = 0$  equivalent for (4) tries to find a solution to integral equations  $\alpha$  equalize to zero,

$$\alpha = \frac{1}{T} A^{-1} [\varphi(x_T) - (A + B)x_T] + \frac{1}{T} \int_0^T f(s, x^*(s, x_T)) ds = 0 \quad (10)$$

From equality  $x_T$  to  $x_T^*$  if we define, then  $x^*(t, x_T^*)$  function (1),(3) it is an exact solution to the boundary value problem.

When these obtained results are generalized the following theorem is given.

**Theorem.** Let  $f(t, x)$  function  $(t, x) \in [0, T] \times D$  defined in this area, is a continuous function and in this area (7)-(9) conditions will be given.

There (5) defined with formula  $\{x_m(t, x_T)\}$  sequence of functions  $m \rightarrow \infty$  (4) solution of the integral equation  $x^*(t, x_T)$  efforts to equal function dimensions and  $x_T$  parameter (8) defined with formula (10) if you select equality turning to zero then the function (1), (3) it will be a solution to the boundary value problem.

Exact  $x^*(t, x_T^*)$  with solution  $x_m(t, x_T)$  error between approximation solution

$$\left| x^*(t, x_T) - x_m(t, x_T) \right| \leq \tilde{\alpha}_1(t) Q^m (E - Q)^{-1} \left( M + \frac{\pi}{T} N \right)$$

Estimated with inequality.

If from (2)  $\det A \neq 0$  will be  $x(0)$  not this, but  $\det B \neq 0$  will be  $x(T)$  if you can divide this, then (2)

$$Ax(0) + Bx(T) = \varphi(x(0)) \quad (11)$$

can write like this. In this case (1),(11) boundary value problem to  $\alpha = 0$  equivalent will be

$$x(t) = x_0 + \int_0^t f(s, x(s)) ds + \alpha t \quad (12)$$

Change with integral equation, there  $x_0 = x(0)$ . (12) put to (11), define  $\alpha$

$$\alpha = \frac{1}{T} B^{-1} [\varphi(x_0) - (A + B)x_0] - \frac{1}{T} \int_0^T f(s, x(s)) ds$$

this will be, in this case (5) sequence of functions will be like this

$$x_{m+1}(t, x_0) = x_0 + \int_0^t \left[ f(s, x_m(s, x_0)) - \frac{1}{T} \int_0^T f(s, x_m(s, x_0)) ds \right] ds + \\ + \frac{t}{T} B^{-1} [\varphi(x_0) - (A + B)x_0], \quad m = 0, 1, 2, \dots$$

The sequence of collecting these functions is proved similar to the previous case.

## RELEVANCE AND DEVELOPMENT OF DISTANCE LEARNING IN THE REPUBLIC OF UZBEKISTAN

**Saidmuratova Umida Rajabbayevna\***

\*Teacher,  
Tashkent State Agrarian University,  
UZBEKISTAN

### ABSTRACT

*A set of approaches to the educational process, in which the main focus is on organizing the widest possible access to educational and vocational training facilities, freeing students from attachment to time and place of study and using flexible methods of individual and group learning is distance education. Relevance and development of distance learning in the republic of Uzbekistan. Open and distance learning is one of the fastest growing areas of education, and its impact on the development of all educational systems increases significantly with the development of modern information technologies and the spread of the Internet.*

**KEYWORDS:** *Virtuality, Virtual Universities, Virtual Libraries.*

### INTRODUCTION

In this turbulent time of development of modern information technologies, information and communication technologies play a special role. Speaking about all spheres of life, it is impossible not to pay attention to the process of training specialists and experienced personnel. The adoption by the Republic of Uzbekistan of several laws on the development of information and communication technologies in many areas has provided a mechanism for the movement and promotion of technology and the higher education industry. To achieve such an environment, it is necessary to develop information of a professional degree and the only way is to ensure the activities of educational institutions with modern information and communication technologies. And to fulfill it as required, it is necessary to conduct basic research and implement the results in the process of educational institutions.

The concept of the process of informatization and automation of educational institutions is understood as a complex of measures built for the effective use of theoretical and practical knowledge in the areas of the activity process. Informatization of the learning process is an

organizational, socio-economic and scientific-technical process of creating the conditions for providing legal and physical information on the territory of the republic using information technologies and information systems. The process of informatization requires solving a number of the following problems:

1. The introduction of computer technology in all structures of educational institutions;
2. Training staff on the effective use of computer technology;
3. Ensure the full and effective use of the information resources of students and professors to meet their needs.

Reforms carried out by the state in this area place a great responsibility on the shoulders of employees of higher educational institutions and intelligentsia: delivery of documents to the appropriate higher institutions, confirming the full implementation of the curricula conducted by the state; providing information to the appropriate authorities on the implementation of the documents received within their time limits of the nature of laws and orders that serve for education, stability and development in the life of students, as well as other information related to personal life, meeting needs and others. Promising and timely solution to such problems largely depends on the effective use of computer technology. The era has come when learning continues throughout life. An ordinary person and a professional need to quickly acquire new knowledge and skills in a global, knowledge-based economy. The pace of economic development is driving a growing need for systematic training. This need is supported by the technologies for teamwork that the Internet provides, the ability to create and disseminate information electronically, to learn, to work on a network for teams scattered geographically. All these forces, gathered together, create the conditions for training in real time. Today, virtual learning has become a reality in academic and corporate education, and the word "virtuality" has become commonplace. The concepts of "virtual universities", "virtual libraries", "e-books and catalogs", "virtual stores and trading floors" are emerging.

We are witnessing the process of combining schools and universities into powerful "virtual universities", "corporate virtual universities", where a significant part of the educational process is carried out via the Internet. Competition in the training system is becoming global in nature, since the opportunity to receive education abroad has become real. For example, 560 thousand foreign students are currently studying in US higher education institutions, in the UK - about 200 thousand, in France - 130 thousand. Problems arose with the development of education both for a wide range of students (among them not only students receiving traditional full-time education), but also for older people who want to improve their professional level. To meet the needs of all categories of students, educational institutions need to provide educational conditions depending on the individual educational level, age and financial capabilities. Education has become a necessary factor for success and well-being.

We are witnessing the process of combining schools and universities into powerful "virtual universities", "corporate virtual universities", where a significant part of the educational process is carried out via the Internet. Competition in the training system is becoming global in nature, since the opportunity to receive education abroad has become real. For example, 560 thousand foreign students are currently studying in US higher education institutions, in the UK - about 200 thousand, in France - 130 thousand. Problems arose with the development of education both for a wide range of students (among them not only students receiving traditional full-time education),

but also for older people who want to improve their professional level. To meet the needs of all categories of students, educational institutions need to provide educational conditions depending on the individual educational level, age and financial capabilities. Education has become a necessary factor for success and well-being.

It is designed for those who, for various reasons (lack of time, remoteness of residence, financial difficulties) do not have the opportunity to study directly in an educational institution under the supervision of a teacher, but strive to obtain the same knowledge on their own. Using distance learning, sitting at a computer, you can study at any educational institution in any country of the world, get a special education, improve your professional level without leaving your home or office, at a convenient time, from anywhere in the world. Psychologists have long established that a person receives the deepest knowledge precisely when he independently works with textbooks, teaching aids, reference books, and task books. Distance learning develops independent thinking skills, teaches to think in a systematic way, analytically assess the situation, draw conclusions and predictions. It allows you to get acquainted with the latest information and helps to easily navigate in the discipline. It is these qualities that today show the high qualification of a specialist. The prospect of developing distance learning in Uzbekistan is very high and is growing rapidly. The following are some examples of this.

Today in the Republic of Uzbekistan prerequisites have been created for the development of distance learning, as well as a base for the development of multimedia lessons and video lessons, an opportunity has appeared for conducting video conferences, a number of projects are being implemented. Both public and private entities are interested in the development of distance learning. We will talk about some distance education projects.

**The Tempus-TACIS project** - "Distance Learning in Uzbekistan" ("Uzbekiston MasofadaKitishtizimi", "Long Distance Teaching System in Uzbekistan") together with the European Community. Project partners: Tashkent State Technical University (coordinator), Navoi State Mining Institute, Hamburg Technical University (Germany), Twente University (Netherlands), Aalborg University (Denmark). The project installed equipment at the Tashkent State Technical University for video conferencing and worked out video conferencing between partner universities.

**The project "Adaptation of the Distance Learning System for Economics: Case Studies for Uzbekistan"** is funded by the Soros Foundation. It is carried out at the Institute of Macroeconomic and Social Research of the Ministry of Macroeconomics and Statistics of the Republic of Uzbekistan. The project involves the study of macroeconomic patterns in the conditions of Uzbekistan, revealing the specificity and originality of the manifestation of various theoretical patterns.

**The project "Digital Library of the National University"**. A virtual library has been created at the National University together with the Ustoz Foundation.

**Project "Virtual Library of the Financial News Agency"**. Under the Financial News Agency, with the financial support of the Eurasia Foundation, a library on electronic media has been created. In the framework of the project, information disks were developed on the topics: new information technologies in the media, economics, the catalog of foundations and seminars, the catalog of educational institutions, law and legislation, the catalog of publications on economics,

business and law. The technology for creating informational electronic textbooks and video lessons has been worked out.

## COMMUNICATIVE COMPETENCE AS A PEDAGOGICAL MODEL IN THE CLASSROOMS

**N. A. Narzieva\*; N.Hasanova\*\***

\*Bukhara State Medical institute,  
UZBEKISTAN

\*\*Samarkand State Institute of Foreign Languages,  
UZBEKISTAN

### ABSTRACT

*This paper discusses the construct of “Communicative competence” as a pedagogic way utilizing to better learning second language. It is argued that second language learners satisfied with the model, since it has great impact on development of language proficiency. We will discuss the relevance of models such as Grammar Translation, Audiolingual models by comparing to Communicative Competence, moreover, the outcomes and effect while learning second language.*

**KEYWORDS:** Grammar Translation, Audio Lingual, Communicative Competence.

### INTRODUCTION

The passage discusses the efficient ways of learning second language and effect their learning trajectories. The negotiation between second and foreign language teaching and learning has been a huge matter.

As Mondada and Doebler(2004,pp. 502-503) stated it, "If interactional activities are the fundamental organizational tissue of learner's experience, then their competence cannot be defined in purely individual terms as a series of potentialities located in the mind/brain of a lone individual." Different theories and methods of language learning were acquainted.

### Main part

One of them is Grammar translation method, which has a huge role in the field of foreign and second language teaching for centuries and is still of use in some countries. The grammar translation method or classic method was based on drilling some activities like translating the texts and rote learning of vocabulary. The learners ability has not been enough explored by

teachers, as teachers also were taught by the same method, technique. The teachers and learners dissatisfied with prevailing grammar translation method and materials for their purpose, so there was a need to a new method instead to reach more in learning second language. Language was seen as a set of grammar or vocabulary but its wider notion. After such need brought to an audio lingual method which occurs writing, reading, speaking and listening. This method was claimed to promote. The method could prove that speaker need to know not only grammar structures, but also norms of usage and accuracy in given context. There has been a drastic change in teaching since the introduction of communication competence method. I will explore the term communicative competence in a foreign language. It shows how the term “Communicative Competence” comes into existence and how is its usage today and is it beneficial to acquiring second language. The role of communicative competence in the study is immeasurable and significant in pedagogy. Communicative competence is a term in linguistics which directs to a language learners grammatical knowledge of syntax, morphology, phonology and social knowledge about how and when to use patterns appropriately and accurately while making a communication. The second language users learn grammar, correct use of words, consistent spelling of ideas and clear and understandable pronunciation during communication. Although the term goes back to the distant past but has been used in linguistics since the 1970s. A number of scholars have done research on this issue and proved how it is considerable. Communicative competence undergoes the various definitions and some models of the communicative competence specifically those most common models of Hymes (1972) and Canale and Swain (1980) and Alcon (2000).

The term ‘communicative competence’ was first used by Dell Hymes in 1966 when he held a conference then it was published under the title Communicative competence in 1972 and republished in 2001. Hymes has introduced his notion ‘communicative competence’ in contrast to Chomsky’s differentiation between competence and performance. For Chomsky (1965), competence is “the ideal speaker-listener knowledge of his language”(p:3). He argued that the focus of the linguistic theory is “to characterize the abstract abilities of the speaker listener which enable him to produce grammatically correct sentences”

Hymes (1972) points out that communicative competence doesn’t only represent the grammatical competence but also the sociolinguistic competence. He has stated that “there are rules of use without which the rules of grammar would be useless” (Hymes,2001) and defined communicative competence as “the tacit knowledge” of the language and “the ability to use it for the communication”(p: 16). From the discussion above, we come to a conclusion that the term competence as used by Chomsky equals the grammatical or linguistic competence in Hymes’ model which represents only one part of the communicative competence. Savignon (1972) defined communicative competence as “the ability to function in a truly communicative setting” (p: 8). This means that, to her, communicative competence is close to Hymes’ view (1972). She considered communicative competence as an ability for functioning in communicative settings and this is something totally different from the linguistic competence by Chomsky (1965) as no one can function in real life situation with only grammatical competence.

For Savignon (1983), competence is “what one knows” and performance is “what one does” (p: 94). Terrel and Krahen (1983) have defined communicative competence as the use of language in social communications without grammatical analysis. They related communicative competence to the communication and didn’t give a focus for the grammatical competence. This

means that communicative competence is manifested in the communication. They argued that the primary goal of language learning should be the development of the communicative skills. They arrived at a principle that “language is best taught when it is being used to transmit messages, not when it is explicitly taught for conscious learning” (Krashen and Terrell 1983p:55).

Canale and Swain (1980) defined communicative competence as a synthesis of an underlying system of knowledge and skill needed for communication. This view agreed with Hymes and others that communicative competence includes various competencies. Knowledge here refers to one’s knowledge of the various aspects of language and language use, while skill refers to how one can use the knowledge in actual communication.

Widdowson (1978) defined communicative competence in terms of usage and use where usage means one’s competence of the linguistic structures and refer to one’s ability to use. (Sabri T.2018)

Grammatical competence is the branch of Communication Competence that includes lexical knowledge, morphology, syntax, sentence- grammar semantics, and phonology ( Canale and Swain, 1980, p.29)

Hymes referred to Communicative Competence as that aspect of our competence that enables us to convey and interpret messages and negotiate meanings interpersonally within specific contexts.

Sauvignon (1983,p 9) noted that “Communicative competence is relative, not absolute, and depends on the cooperation of all the participants involved”

According to Hymes theory Communicative Competence is due to the ability of a person to convey knowledge to the listener and its not individual capacity, but also cater with the collaborative work.

CC went through long way, to which was evidence to several methods:

Grammar Translation Method	1800-1900
Direct Method	1890-1930
Structural Method	1930-1960
Reading Method	1920-1950
Audiolingual Method	1950-1970
Situational Method	1950-1970
Communicative Approach	1970- present

## CONCLUSION

Learners always have a desire and motivation toward acquiring language in effective and consecutive way. The provided explorations on the learners wishes brought to invention of new methods. Every of them had impact on better learning the target language, however the role of Communicative Competence is immeasurable. Today the science defined how successful it is. Majority of the learners are satisfied with, since they see the progress in a short period of learning.

## FEATURES OF THE CLINICAL COURSE OF PURULENT THORACIC SURGICAL DISEASES AGAINST DIABETES MELLITUS

**O.M. Kurbonov\***

\*Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*A retrospective analysis of the clinical course of purulent thoracic surgical patients with diabetes mellitus (DM) and an assessment of the results of surgical treatment and their complications were performed. In 105 (30.1%) of 348 patients treated in the clinical base of BSMI, diabetes was diagnosed. As a result of the study, in patients with purulent thoracic surgical diseases against the background of diabetes, a complex peculiar clinical course is observed that is different from patients who do not have diabetes and leading to serious complications. Timely correction of hyperglycemia before and after surgery reduces the complications of diabetes mellitus, improves the effectiveness of surgical operations with purulent thoracic surgical diseases and leads to better treatment results. Such patients must be treated in conjunction with an endocrinologist.*

**KEYWORDS:** *Purulent Thoracic Surgical Diseases, Diabetes Mellitus, Clinical Course, Treatment, Surgical Intervention.*

### INTRODUCTION

Purulent thoracic surgical diseases are among the most common pathologies in patients with concomitant diabetes mellitus and are one of the leading causes of death. From a practical point of view, it is advisable to allocate lung abscess found in 30-35% of patients into the group of patients with purulent thoracic surgical diseases, Pleural empyema in 42-47% of patients, suppressed pulmonary echinococcosis in 32-36% of patients (1; 7; 18). The main reasons that contribute to the development of purulent thoracic surgical diseases in patients with diabetes mellitus (DM): reduced immunity and general weakening of the body; penetration of infection into the lung tissue and respiratory tract (2; 5; 8;) hyperglycemia which leads to a more severe course of the disease than in patients with normal blood sugar; pathological changes in the vessels of the lungs (pulmonary microangiopathy) which, according to medical statistics, are

found in patients with diabetes twice as often as in healthy people; the presence of focal cavities in the lungs (1; 6; 12). All these factors, as well as poor control of blood sugar in the human body create favorable conditions for the development of purulent thoracic surgical diseases. A general decrease in immunity in diabetes contributes to the severe course of the disease and can lead to various complications (4; 13; 17). For the growth of pathogenic microflora, lung tissue is the best nutrient medium (5; 11; 13). According to experimental studies (9), directly in the center of the lesion, it was noted the development of massive hemorrhages in the alveolar and interalveolar tissue with necrotic changes in the alveolar epithelium, severe edema and loosening of the interalveolar tissue, and the appearance of perifocal inflammation. Pulmonary microangiopathy, necrobiotic, discirculatory and inflammatory changes with the subsequent development of pulmonary necrosis are manifested by the appearance of microabscesses. These pathological changes are morphologically characterized by acute serous-purulent inflammatory disease. Despite many publications, a single tactic for managing patients with purulent thoracic surgical diseases against diabetes mellitus, the percentage of cases of purulent thoracic surgical diseases against diabetes mellitus and clinical features of this category of patients have not yet been developed. The solution to these problems will help to develop questions of tactics, the need and volume of surgical intervention of purulent thoracic surgical diseases with a concomitant pathology of diabetes mellitus.

**Purpose of the study:** Improving the results of treatment of purulent thoracic surgical diseases against the background of diabetes mellitus by studying clinical data with correction of hyperglycemic indices.

## MATERIALS AND METHODS

For the period from 2009 to 2019, in the clinical base of BSMI under our supervision there were 348 patients with various types of purulent thoracic surgical diseases, of which 105 (30.1%) patients were associated with diabetes mellitus, 72 were men (68.5 %), women 33 (31.4%) as a rule, the most active, able-bodied part of the population suffers from this pathology, the age of patients ranged from 19 to 74 years, the average age was  $47.8 \pm 2.7$  years. All patients are conditionally divided into 2 groups: I - control and II - main. The first group consisted of 243 patients with purulent thoracic surgical diseases without diabetes. The second group of 105 patients with purulent thoracic surgical diseases against diabetes mellitus. All patients were distributed by gender and age according to the classification of age groups adopted at the regional seminar of the World Health Organization. (Kiev, 1962)

**TABLE 1. AS CAN BE SEEN FROM TABLE 1, IN THE FIRST GROUP THERE WERE 152 (62.6%) MEN AND 91 (37.4%) WOMEN AGED 19 TO 80 YEARS (MEAN AGE WAS  $48.4 \pm 2.1$  YEARS). IN GROUP II - 64 (60.9) AND 41 (39.1%) AGED 19 TO 75 YEARS (AVERAGE AGE WAS  $49.4 \pm 1.8$  YEARS), PATIENT CHARACTERISTICS BY GENDER AND AGE.**

Groups	Age										Total
	Up to 19		20-44 years old		45-59 years old		60-75 years old		75 years and older		
	male	fem	male	fem	male	fem	male	fem	male	Fem	
I	18	14	52	30	56	35	19	9	7	3	243
II	7	3	14	8	21	14	14	10	8	6	105
Total	42 (12%)		104 (30%)		126 (36,2%)		52 (15%)		24 (6,8%)		348

Most patients (74.4%) were at the most difficult age. (from 20 to 59 years old)

A diabetic history revealed that out of 105 patients, diabetes mellitus was detected in 58 (55.2%) patients for the first time, 47 (44.7%) patients had 4 or more years, the average duration of the disease was 11 years.

## RESULTS AND DISCUSSIONS

When examining patients, the following types of purulent thoracic surgical diseases were detected against diabetes mellitus: lung abscesses in 34 (32.3%) patients; suppurative pulmonary echinococcosis in 23 (21.9%) patients; pleural empyema in 24 (22.8%) patients; abscesses and phlegmon of the chest wall in 17 (16.1%) patients, purulent endobronchial fistula in 7 (6.6%) patients. The localization of lung abscesses on the background of diabetes was as follows: abscess of the middle lobe of the right and left lung in 15 (14.2%) patients; the lower lobe of the right and left lung of the lung in 12 (11.4%) patients and an abscess of the upper lobe of the right and left lung in 7 (6.6%) of patients. Of these, 14 (13.3%) patients had a breakthrough into the right or left pleural cavity. The localization of suppurating echinococcal cysts on the background of diabetes was as follows: unilateral lesion was noted in 19 (18.9%) cases, of which 15 (14.2%) of solitary cysts, multiple-7 (6.6%) combined lung and liver damage in 8 (7.6%) cases. Complicated forms were observed in 14 (13.3%) patients, of which a break in the bronchus with suppuration and hemoptysis in 7 (6.6%) cases, suppurative echinococcosis without a break in 10 (9.5%) cases, a break in the pleural cavity in 7 (6.6%) cases and pulmonary hemorrhage in 5 (4.7%) cases. Giant cysts met in 9 (8.5%) cases. Most often, echinococcal cysts were located in the middle lobe of the right or left lung, which amounted to 9 (26.4%) of the total number of operated, the lower lobe of the lungs - 8 (23.5%) and the upper lobe of the lungs was 6 (17.6%) .

The clinical manifestations of acute abscess were dependent on the stage and period of the disease. As a rule, lung destruction does not develop suddenly. This was always preceded by acute, protracted pneumonia of various etiologies. Abscess of the lung markedly worsened the condition of the patients. At first, they were worried about weakness, malaise, and the appearance of low-grade fever. Later, in 67% of patients, chest pains intensified on inhalation,

unproductive cough. With the progression of the infectious process and an increase in the volume of destruction, the body temperature became hectic, its rises were accompanied by heavy sweats. Unproductive cough intensified, which was painful in nature. Intoxication, respiratory failure increased. Such a picture was observed in 72% of the examined patients with lung abscess without diabetes. However, in patients with a similar pathology against the background of diabetes mellitus, lung abscesses proceeded with scanty symptoms. Because of this, about 20% of patients were diagnosed a month or more after the occurrence. The clinical picture of the disease did not always correspond to morphological changes. So in 56% of patients with acute lung abscesses, weakness, malaise, the appearance of low-grade fever, and slight chills were observed.

When examining patients with acute lung abscess against diabetes mellitus, pallor of the skin with a grayish tinge, cyanosis of the lips and nail beds were noted. Due to pain in the chest, breathing is shallow. As a result of intoxication, respiratory failure and chest pain in patients, tachycardia is determined, hypotension is possible. All patients underwent a comprehensive examination: clinical blood and urine tests, a biochemical blood test, a coagulogram, a blood group and a Rhesus factor, panoramic x-ray of the chest and abdomen, ultrasound, tomography, ECG and consultation with a physician for patients older than 50 years. In a general blood test, 78% of patients revealed pronounced leukocytosis, a neutrophilic shift in the formula, and an increase in ESR. Clinical blood counts did not always correspond to morphological changes: in 62 patients (59%), leukocytosis was lower than  $9.0 \times 10^9 / l$ , and in 54 patients (51.4%) the percentage of stab forms did not exceed 10, which in most cases was observed in patients of advanced and senile age and, possibly, this is due to the body's reactivity during this period of life and due to the presence of diabetes mellitus. The maximum values of these indicators in the remaining patients reached: leukocytosis -  $26.4 \times 10^9 / l$ , metamyelocytes - 2%, stab - 32%, toxic granularity ++.

Of the biochemical parameters, creatinine, urea, ALT and AST increased most often in 27 patients (25.7%). Total bilirubin increased in 16 patients (15.2%) to  $32.8 \mu\text{mol} / L$ .

To confirm the clinical diagnosis of lung abscesses, polyposition fluoroscopy and chest x-ray were performed to confirm the diagnosis and determine the localization of the process. In acute lung abscess, prior to its communication with the bronchial tree, a regular rounded homogeneously darkened cavity with perifocal infiltration was determined (Fig. 1).

Figure 1. Abscess of the middle lobe of the right lung.

Chest x-ray in a direct (a) and right (b) lateral projection

After emptying the abscess into the respiratory tract - a cavity with a liquid level

Figure 2. Abscess of the upper lobe of the right lung.

Chest x-ray in a direct (a) and right (b) lateral projection.

X-ray examination was performed several times with the aim of dynamic observation before and after surgery.

The volume of operations consisted of thoracotomy, debridement and drainage of abscesses in 19 (55.8%) patients. In addition, in 6 (17.6%) patients with regional location of lung abscesses, the puncture method of rehabilitation and drainage under the control of fluoroscopy was used. In cases of breakthrough of abscesses in the right or left pleural cavity, we performed thoracocentesis and drainage of the pleural cavity in 14 (41.1%) patients of them in 5 patients with subsequent thoracotomy. Having examined the distribution of sepsis among various etiological groups of lung abscesses, it turned out that the most common severe forms of sepsis were found in patients with diabetes mellitus.

The volume of surgical interventions for suppurating echinococci of the lungs consisted of thoracotomy under general anesthesia followed by echinococectomy using one of the known methods, taking into account the anatomical location, size and stage of parasitic cysts. In all cases of combined lesion of suppurating echinococcosis of the lung and liver, we performed a two-

stage operation of echinococectomy, taking into account the dominant focus. In three (13%) cases, echinococectomy of the liver and then lungs first, and in 6 (26%) cases, echinococectomy of the lungs and then liver first. In 7 (30.4%) cases of the total number of patients operated on, we performed a lobectomy of the middle or lower lobe of the lungs. Thoracocentesis, debridement, drainage of the pleural cavity followed by washing with antiseptics were performed on all patients with pleural empyema 24 (22.8%) on the right or left. During bronchoscopy, 7 (6.6%) of the total number of examined patients had ligature fistulas with a picture of purulent endobronchitis. In our opinion (apparently) the ligatures are torn away from the residual cavity and accumulate at the mouth of the segmental bronchi. At the same time, during a bronchoscopy, a whole lump of ligatures is revealed on the bifurcation of segmental bronchi. In all patients, the ligatures were removed by a bronchoscope. Of the total number of patients, 105 (30.1%) revealed diabetes mellitus of varying severity. So of them in 49 (46.6%) patients with mild diabetes, in 34 (32.3%) moderate and in 22 (20.9%) patients with severe complications.

Severity	Glycemia (mmol / l)
Mild (49)	8,3 – 9,9
Average(34)	10,1 - 16,7
Heavy(22)	16,7 – 20,5

We distributed patients into three groups according to the clinical course: mild, moderate, and severe diabetes with a combined pathology with purulent thoracic surgical diseases. With a mild degree of diabetes, patients with purulent thoracic surgical diseases experienced pain in the chest area in 61% of cases, cough with poor sputum production in 48%, chills in 42 to 56% of cases, hyperthermia in 67% of patients, weakness and decreased performance.

With moderate severity, severe hyperthermia, chills, chest pain, cough with thick sputum, difficulty breathing, heavy sweat, irritability, irritability, weight loss of 20% or more were observed. Tachycardia pulse 100-120ud in 1min.

In severe diabetes mellitus, patients with purulent thoracic surgical diseases experienced severe intoxication, cough with fetid sputum, difficulty breathing, heavy sweat, shortness of breath, chest pain, hyperthermia up to 40-42 degrees, chills, fever.

A sharp drop in hemodynamics, a decrease in bcc, dehydration. Complete loss of performance. Weight loss by 50%, tachycardia, pulse more than 120 beats per 1min, arrhythmia, heart failure. Damage to the liver. Psychoses, delusions and hallucinations. In microbiological and serological examination of patients, the predominant pathogens were Streptococcus Pnevmoniae (33.4%) KlebsiellaPnevmoniae (13.4%) Streptococcus aureus (13.4%). Less common were Haemophilusinfluenzae (8%) Mycoplasma Pnevmoniae (7.9%) Enterobacteraerogenes (1.3%). Along with clinical manifestations, hyperglycemia indicators were analyzed. At the same time, persistent hyperglycemia and glucosuriawere detected in these patients. In patients with a mild form of the disease, glucosuria did not occur. In severe diabetes mellitus, the development of a purulent process was accompanied by an increase in temperature to 39-40 C. In some patients, consciousness was obscured. The purulent process proceeded with high hyperglycemia, expressed by glucosuria, ketonuria. Pronounced functional impairment of the kidneys and liver, a

significant increase in the number of leukocytes in peripheral blood, and an increase in ESR were also found.

All these disorders exacerbated the course of purulent thoracic surgical diseases, which was manifested by severe intoxication, exhaustion of patients, decreased immunity, and a slowdown in the purification of purulent cavities and healing processes. Traditional therapy in this category of patients without diabetes consisted of empirical antibiotic therapy based on data on the polymicrobial etiology of pleuropulmonary infection, prescribing the results of a microbiological study of the contents of ulcers. However, with the combined pathology of purulent thoracic surgical diseases with diabetes mellitus, it is necessary to correct hyperglycemia before and after operations. To the traditional treatment of these patients with the aim of correcting hyperglycemia, simple insulin was added taking into account the indicators of hyperglycemia. In moderate diabetes, daily administration of up to 60 units of insulin per day or its substitutes was required. Patients with a severe form of the disease needed the introduction of more than 60 units of insulin per day. Patients of this group often had complications of diabetes (retinopathy, diabetic nephropathy, angiopathy, etc.).

In the study of purulent thoracic surgical patients, a high treatment efficiency was revealed, where hyperglycemia was corrected by using simple insulin in the complex traditional therapy for diabetes. These advantages were mainly reflected in the improvement of the general condition of patients, reduction of ketoacidosis and intoxication, acceleration of purification of purulent cavities from infection, timing of resorption of infiltrate, early appearance of reparative processes than in patients in the complex of treatment of which hyperglycemia correction was not carried out. As a result, the average stay of the patient's bed decreased.

Thus, our retrospective analysis of the treatment of patients with purulent thoracic surgical diseases associated with diabetes mellitus revealed: a large percentage of the occurrence of purulent thoracic surgical pathology against the background of the most formidable endocrine pathology of diabetes. It is known that systemic damage to the body in the pathogenesis of diabetes negatively affects and complicates the treatment of this category of patients, which indicates the need for further scientific and practical research aimed at solving this problem.

## CONCLUSION

1. Purulent thoracic surgical diseases in up to 30.1% of cases occur against diabetes mellitus.
2. Diabetes complicates the treatment of patients with purulent thoracic surgical diseases.
3. The development of new methods for treating patients with purulent thoracic surgical diseases, taking into account concomitant endocrine pathology (DM), is an urgent problem in surgery.
4. Independent risk factors for mortality in purulent surgical diseases associated with diabetes mellitus are: persistent hyper or hypoglycemia, severe ketoacidosis, intoxication, extensive foci of necrosis, septic shock, inadequate drainage of purulent cavities and high levels of serum urea.
5. To maintain a good result after surgical operations in patients with purulent thoracic surgical diseases associated with diabetes mellitus, it is necessary to solve a number of really existing organizational and medical diagnostic problems. This requires: Regular monitoring of glycemic tests and biochemical factors in these patients and timely correction. Collaboration with an endocrinologist is required.

## **EQUITY PORTFOLIO CONSTRUCTION FOR INVESTOR'S IN INDIAN CAPITAL MARKET WITH SPECIAL REFERENCE TO PHARMACEUTICAL, LOGISTICS AND TELECOMMUNICATION SECTORS.**

**Dr P Varadharajan\***

\*Assistant Professor,  
PSG Institute of Management,  
PSG College of Technology, Coimbatore, INDIA  
Email id: sktrajan@rediffmail.com

### **ABSTRACT**

*This paper focus an optimal equity portfolio construction with reference to pharmaceutical, logistics and telecommunication sectors based on Sharpe's index model. To illustrate the model, a real portfolio selection problem is presented. The study is carried out to fulfill the objectives like (i) to construct an optimal portfolio by implementing Sharpe's index model. (ii) To know the proportion of each security in the optimal portfolio. This paper aims at developing an optimal portfolio of equity of Pharmaceutical, Logistics and Telecommunication sector, through Sharpe's Index Model. For the study, five companies in each sector traded in NSE were taken and the optimal portfolio was constructed with total 15 companies.*

**KEYWORDS:** Risk, return, residual variance, Sharpe index model and market variance, etc.,

### **INTRODUCTION**

These global trends have far reaching implications for Indian pharmaceutical companies across the entire value chain, from generic players like Dr. Reddy's to contract manufacturers like Piramal Healthcare. With the growth in US and developed economies expected to taper off, emerging economies like India are expected to drive future growth. The key growth drivers in these countries are increasing per capita income, growing insurance penetration, better health awareness, higher government expenditure, adherence to IPR norms and shift in disease profiles. The Indian market was estimated at USD 8 billion in FY2008 and is expected to grow at 10-12% CAGR for the next five years.

The growth in the Indian economy in coming decade is likely to be driven by the increased activity in the manufacturing and retail sectors. Logistics companies can leverage further economies of scale when operations are expanded. This may require industries to collaborate with logistic service providers to nurture their businesses, possibly in a way the automobile industry in India nurtured the auto-component companies. The future is bright for the logistics industry in India- the expectation is that a tipping point for the industry will soon be reached which will propel it to greater heights.

India's telecommunication network is the second largest in the world based on the total number of telephone users (both fixed and mobile phone). It has one of the lowest call tariffs in the world enabled by the mega telephone networks and hyper-competition among them. It has the world's third-largest Internet user-base with over 137 million as of June 2012. Major sectors of the Indian telecommunication industry are telephony, internet and television broadcasting. Telephone Industry in the country which is in an ongoing process of transforming into next generation network, employs an extensive system of modern network elements such as digital telephone exchanges, mobile switching centre's, media gateways and signaling at the core, interconnected by a wide variety of transmission systems using fiber or Microwave radio relay networks.

### NEED FOR THE STUDY

The three sectors taken in this paper for the construction of portfolio (Telecommunication, Pharmaceutical and Logistics) have a very good opportunity in future. The selection of companies by the investors to invest in it should be carefully selected so that they will get maximum return with minimum risk. They should split their money and invest in different baskets. The investors should get rid of the image of the company among public and should make some analysis before investing in it. So a study has to be made on which scrip the money has to be invested and how much percentage of money should be invested in each scrip.

### OBJECTIVES

- To study the relative market performance of 15 companies belonging to Pharmaceutical, Logistics and Telecommunication sectors listed in National Stock Exchange (NSE).
- To construct an optimal portfolio by implementing Sharpe's index model.
- To guide the investors to get optimal portfolio i.e., maximum return with minimum risk.
- To know the proportion of money to be invested in each of the security in the optimal portfolio.

### LIMITATIONS

- Only 15 companies in 3 sectors were taken into consideration for constructing optimum portfolio. If more companies from different sectors were taken, it would have given an accurate optimum portfolio.
- Stock prices considered were restricted to only five year's data. When considering many years' data, it would have given an accurate optimum portfolio. So time constraint is there.

---

## REVIEW OF LITERATURE

- Klement Joachim, Greenrod James, O'Neil Jay in their paper described how strong preference for domestic equities can erode the wealth of Australian private investors over the long term and proposed an optimal allocation to domestic equities for Australian investors. Private investors around the world tend to have an excessive preference for shares of companies based in their home country. This home bias may be further strengthened if domestic equities receive preferential treatment by local tax laws. Australia's franking credit system is one example of preferential treatment for domestic equities. Franking credits reduce investors' tax liability on the dividends received from domestic companies but not on those from foreign companies. This tax advantage, and the solid performance of the Australian equity market over years, has led to very high, even excessive, allocations to domestic equities in the portfolios of Australian investors.
- Madura and Abernathy (1985) also examined the performance of global stock portfolios prescribed by ex post models. Using weekly stock market index returns for eight countries for the period, January 1978 to January 1981 the authors segmented the data into five sub-periods of equal length and for each period; a mean variance algorithm was used to generate ex post efficient portfolios. The ex post optimal portfolio weights then formed the basis for investment in the subsequent ex ante period. Thus all information for the ex ante strategy was developed from the previous period. Madura and Abernathy (1985) considered the performance of three mean-variance efficient portfolios. A low-risk portfolio which exhibited the least variance in an ex post basis, a high risk-portfolio produce which showed the highest expected return, and an intermediate risk portfolio which displayed the highest ex post return per unit risk Sharpe Ratio (Sharpe, 1966, 1994). For the ex ante strategy to be described as effective, it was expected to outperform a naive portfolio of the international stocks and the US index. In constructing these ex post optimal portfolios Madura and Abernathy (1985) observed that the returns and standard deviations in each country performed differently in the various sub-periods. In other words the data was not stationary. Consequently performance of the ex post based efficient portfolios behaved poorly in subsequent periods. In particular on an ex ante basis the analysis showed that neither the naive nor the mean-variance international portfolios produced consistently higher returns relative to the US index. While in terms of risk, the mean-variance low risk portfolio was the only strategy, which consistently exhibited a lower standard deviation than the US index. Also no single strategy could be distinguished as superior when the risk-adjusted performance of the various strategies was compared. The authors concluding that the difference between "potential gains from an ex post analysis" and "realized gains from an ex ante analysis" may be substantial. Robichek Alexander A, Cohn Richard A, Pringle John J (1972) computes ex post rates of return and correlation coefficients for twelve alternative investment media for the period 1949-69 inclusive and analyzes the implications of the results for portfolio construction. Most of the prior work in the area of portfolio construction has focused exclusively on common stocks and the "riskless rate of return." Studies of rates of return on other investment media, such as bonds, real estate and commodities, generally have not included an investigation of covariance with other media. Maller Ross A, Durand Robert B, Jafarpour Hediah (2010) an approach that enables us to assess ex ante how close a given portfolio is to this ideal. It illustrates applications of the theory by analyzing a large

sample of US companies, comparing constant-correlation and momentum strategies with the optimal strategy. Simulations based on this data are also given for illustration. Choosing a portfolio from among the enormous range of assets now available to an investor would be facilitated if we could locate the return-risk ratio of a particular allocation along a spectrum of possibilities. A comparison between portfolio choices can tell us, for example, whether it is better to select a sub-optimal portfolio from a large class of assets or to perform a Markowitz optimal procedure on a subset of the assets. A common criterion for this assessment is the expected return-to-risk trade-off as measured by the Sharpe ratio. Given that the ideal, maximized Sharpe ratio must be estimated.

- Varadharajan P (2011), said to construct an optimal equity portfolio with help of the Sharpe index model. Portfolio construction is an important process of the investors for investment in the equity market. A good combination of portfolio will give maximum return for a particular level of risk. In this research, Banking and Information Technology sectors have taken into consideration for construction of equity portfolio. Five companies were selected from each sector and ranked them based on excess return to beta ratio. The cut-off point was calculated and highest value is to be taken as a base for calculation of money to be invested in each stocks. This research findings and suggestions would be helpful to investors. Kallman James(2003) Since 1952, financial analysts have known that each risk must be understood relative to the entire portfolio of risks. The failure to take this holistic perspective can result in the misallocation of scarce resources including money, people and time. The beauty of portfolio theory like many other valuable management tools is that it is surprisingly simple. Essentially, it states that adding non-correlated risks together decreases the portfolio's risk. Risk mapping and portfolio evaluation is taking risk management into a new dimension. It draws on well-understood financial principles and computer simulation to describe, both with mathematics and powerful graphics, an organization's portfolio of risks. When the portfolio is understood at this level, it empowers risk managers to provide advice on the optimal combination of risks and the optimal control of risks. The yield is more confidence in attaining the organization's financial and qualitative goals. Debasish Dutt in an article published in "The Management Accountant"- November 1998, found that all the stocks selected are bank stocks .He used Sharpe single index model in order to optimize a portfolio of 31 firms from BSE for the period October 1, 2001 to April 30, 2003 and used BSE 100 as market index. Asmita Chitnis optimized two portfolios using single index model and compared them and he found Portfolios tend to spread risk over many securities and thus help to reduce the overall risk involved. "The greater the portfolio's Sharpe's ratio, the better is performance". Weilin Zhao, Chihiro Watanabe (2010), investigated that, India, famous for its software outsourcing service, has achieved high growth rates in software exports in recent ten years. The figure of Indian software export destination shows that the US has been the dominant destination for more than a decade. From the perspective of risk management, this paper provides to give some suggestions for software outsourcing service vendors by means of the portfolio analysis of India's software export market constitution. Though it is a simple two-market portfolio analysis model, the implications are significant for raising outsourcing service vendors' awareness in risk management, future market strategy and industrial development.

## RESEARCH METHODOLOGY

This is a descriptive study on the construction of optimum portfolio using Sharpe index model. The data for this research was collected from various websites such as National stock Exchange (NSE), Reserve Bank of India(RBI) and from the database Proquest. Therefore, secondary research has been done. Random sampling is done and 5 companies were selected from 3 sectors namely Telecommunication, Pharmaceutical and Logistics . Therefore, the sample size of the study is 15. For the construction of optimum portfolio, five year's data (September 2008 to September 2013) has been considered.

## STATISTICAL TOOLS USED

### Return

It is the total gain or loss of a security in a given period. It is calculated by difference between the today's market price and yesterday's market price to yesterday's market price.

### Beta Coefficient

A measure of the volatility, or systematic risk, of a security or a portfolio in comparison to the market as a whole

Where,  $r$  = Correlation Co-efficient between individual stock and Market.

= Standard Deviation of Individual Stock

= Standard Deviation of Market

### Risk-free Rate of Return (RF)

Risk-free rate of return is the return on a risk free asset i.e. Government securities like 91 days T-Bill rate, 182 days T-Bill rate, 364 days T-Bill rate, 10 year bond rates, etc. Here 10 year bond rate has taken into consideration for risk free rate of return.

### Excess return to Beta ratio

It is the returns in excess of the risk-free rate.

Where,  = the expected return on stock  $i$

= the return on a riskless asset

= the expected change in the rate of return on stock associated with one unit change in the market return.

**Cut-Off Point**

This is the point at which an investor decides whether or not a particular security is worth purchasing. The formula is given by Sharpe model as follows:

$$\frac{R_i - R_f}{\sigma_i} \geq \frac{R_m - R_f}{\sigma_m}$$

Where,  $\sigma_m^2$  = variance of the market index

$\sigma_i^2$  = Residual variance i.e. variance of a stock's movement that is not associated with the movement of market index.

$$R_i = R_f + \beta_i (R_m - R_f) + \epsilon_i$$

Where,

$\beta_i$  is the proportion of investment of each stock

$$R_i = R_f + \beta_i (R_m - R_f) + \epsilon_i$$

Where,  $R_f$  = the cut-off point.

**ANALYSIS & DISCUSSIONS**

The first step is to calculate the return for each stock which indicates the total gain or loss experienced on an investment over a given period of time. Then, standard deviation and beta are calculated to measure the risk. The expected return on each stock ( $R_i$ ) is also calculated.

**TABLE 1.1 RETURN, BETA AND VARIANCE OF EACH STOCK**

Scrip Name	Beta $\beta$	Return $R_i$	Variance $(\sigma_i)^2$
Ranbaxy	0.2605	42.6959	8.4916
Biocon	0.3590	42.2804	8.2761
Cipla	0.2814	77.9879	3.2972
Dr Reddy	0.2449	154.8051	3.4613
Sun Pharma	0.2382	17.8961	11.1748
Aegischem	0.4342	51.9482	13.9017
Allcargo	0.1909	-122.6493	11.3462
Concor	0.0806	34.1789	3.3108
Jet Airways	0.6271	44.7893	16.1118
TCI	0.1973	-2.3012	9.2043
Airtel	0.1942	-43.9233	8.2876
Idea	0.5189	114.4812	7.8870
MTNL	0.4054	-178.3790	7.9948

Reliance	0.6170	-26.8537	13.7119
Tata Docomo	0.4125	-55.8334	6.8383

From Table 1.1 The companies which has beta value less than 1 shows it is less risky when compared to market risk.

**TABLE 2. EXCESS RETURN TO BETA RATIO**

Scrip Name	(Ri-Rf/ $\beta$ )	After Ranking
Ranbaxy	137.4	Dr Reddy
Biocon	98.54394	Concor
Cipla	252.6641	Cipla
Dr Reddy	603.9885	Idea
Sun Pharma	46.16026	Ranbaxy
Aegischem	103.7448	Aegischem
Allcargo	-678.527	Biocon
Concor	338.3258	Jet airways
Jet Airways	60.41915	Sun Pharma
TCI	-46.6395	TCI
Airtel	-261.7	Reliance
Idea	207.3169	Tata Docomo
MTNL	-457.03	Airtel
Reliance	-54.7057	MTNL
Tata Docomo	-152.074	Allcargo

From Table 1. 2: The excess return to beta ratio is found and it is ranked from largest to smallest (i.e. 1 to 15). Dr Reddy stands in the 1<sup>st</sup> rank whereas Allcargo stands in the 15<sup>th</sup> rank. The excess return of any stock is directly related to its excess return to beta ratio. The ratio provides a relationship between potential risk and reward. The Risk free rate of return (Rf) which is taken from RBI website which is 6.9% is used to calculate the excess return to beta ratio.

**TABLE 1.3. CUT-OFF POINT CALCULATION OF 15 COMPANIES**

New Scrip Name	(Ri-Rf)* $\beta$ / $\delta e_i^2$	$\sum (Ri-Rf)*\beta$ / $\delta e_i^2$	$\sigma m^2*\Sigma(Ri-Rf)\beta$ / $\delta e_i^2$	$1+\delta m^2*\Sigma\beta^2/\delta e_i^2$	Ci
Dr Reddy	10.4640	10.4640	28.3461	1.0469	27.0754
Concor	0.6643	11.1283	30.1456	1.0523	28.6487
Cipla	6.0660	17.1942	46.5778	1.1173	41.6884
IDEA	7.0782	24.2725	65.7522	1.2098	54.3508
RANBAXY	1.0982	25.3707	68.7272	1.2314	55.8111
Aegischem	1.4071	26.7778	72.5389	1.2682	57.1998
Biocon	1.5349	28.3126	76.6967	1.3104	58.5310
Jet airways	1.4747	29.7874	80.6917	1.3765	<b>58.6217</b>
Sun Pharma	0.2344	30.0218	81.3267	1.3902	58.4984
TCI	-0.1972	29.8245	80.7924	1.4017	57.6392

Reliance	-1.5188	28.3057	76.6780	1.4769	51.9182
Tata Docomo	-3.7843	24.5214	66.4266	1.5443	43.0137
AIRTEL	-1.1909	23.3305	63.2004	1.5566	40.6006
MTNL	-9.3950	13.9355	37.7501	1.6123	23.4135
Allcargo	-2.1800	11.7555	31.8447	1.6210	19.6448

From Table 1.3: The highest value is taken as the cut-off point ( $C^*$ ). From the table 3, it is evident that Jet Airways has the highest cut-off rate  $C^*=58.6217$ . All the stocks above the  $C^*$  value can be included in the portfolio.

**TABLE 1.4. SELECTION OF STOCKS AMONG 20 COMPANIES**

Script Name	Ci
Dr Reddy	27.0754
Concor	28.6487
Cipla	41.6884
Idea	54.3508
Ranbaxy	55.8111
Aegischem	57.1998
Biocon	58.5310
Jet airways	58.6217

From table 1.4: These are the 8 stocks which are selected for the optimum portfolio. The proportion of amount to be invested is calculated for these 8 stocks.

**TABLE 1.5. PROPORTION OF INVESTMENT IN EACH STOCK**

Script Name	Proportion of investment
Dr Reddy	49.87
Concor	8.80
Cipla	21.40
IDEA	12.65
RANBAXY	3.12
Aegischem	1.82
Biocon	2.24
Jet airways	0.09

From Table 5: The proportion of money to be invested in each stock is clear. The highest proportion of money (49.87%) is to be invested in DR REDDY and the lowest proportion of money (0.09%) is to be invested in JET AIRWAYS

**Figure 1.1: Proportion of Investment using Pie chart**

From figure 1.1 It is evident that 49.87% of the money is to be invested in RANBAXY followed by Cipla, Idea, Concor, Ranbaxy, Biocon, Aegischem and Jet Airways. The lowest proportion of money is to be invested in State Bank of India (SBIN).

## FINDINGS

When considering the three sectors, the performance of Pharmaceuticals sector is higher than that of Logistics and Telecommunication sector. Out of the 8 stocks in the optimum portfolio, four stocks are to be selected from Pharmaceuticals sector, 3 from Logistics sector and one from Telecommunication sector. The stock which has the highest return will definitely have high risk. The optimum portfolio which is constructed using Sharpe index model will help the investors for their investment decisions.

## RECOMMENDATIONS

Three sectors namely Pharmaceuticals, Logistics and Telecommunication sectors are considered for the construction of optimum portfolio. Using Sharpe index model, the top 8 companies out of 15 companies are selected for the portfolio. Of which, highest proportion of money (49.87%) has to be invested in DR REDDY, 21.4% in CIPLA, 12.65% in IDEA, 8.8% in CONCOR, 3.12% in RANBAXY, 2.24% in BIOCON, 1.82% in AEGISCHEM and 0.09% in JET AIRWAYS. Thus the investors are advised that the stocks of Dr Reddy, Cipla, Idea, Ranbaxy, Aegischem, Biocon, Concor, Cipla and Jet Airways should be held long.

## CONCLUSION

In this paper, the sectors considered for the construction of optimum portfolio are Pharmaceuticals, Logistics and Telecommunication sectors. The number of stocks considered for the construction of optimum portfolio was 15 stocks (5 from each sector). But, the optimum portfolio is constructed with the top 8 stocks with the help of Sharpe index model. The top 8 stocks which took place in the optimum portfolio are Dr Reddy, Cipla, Idea, Ranbaxy, Aegischem, Biocon, Concor, Cipla and Jet Airways. Out of the 8 stocks in the optimum portfolio, four stocks are to be selected from Pharmaceuticals sector, 3 from Logistics sector and one from Telecommunication sector. The optimum portfolio using Sharpe index model will be

helpful for the investors to make proper investment decisions and to get the maximum return with the particular level of risk.

## PERSONALITY-ORIENTED APPROACH TO MORAL CONSCIOUSNESS IS THE BASIS OF THE MODERNIZATION OF THE SYSTEM OF EDUCATION AND UPBRINGING OF THE YOUTH OF THE REPUBLIC OF UZBEKISTAN

**Khalilova Khabiba Маматкуловна\***

\*Teacher,  
Department of Pedagogy,  
Karshi, State University UZBEKISTAN

### ABSTRACT

*The article deal with the problems of the formation of the moral consciousness, which is the integral part of education harmoniously advanced generation and is a basis of modernizational system of education. It is necessary to introduce in educational process a new information and pedagogical technologies, to encourage the work of teachers and instructors. By a word, the system of education and bringing up is necessary to lift on a new qualitifed level.*

**KEYWORDS:** *Modernization Of The Education System, Personality-Oriented Approach, The State Program "Year Of Harmoniously Developed Generation" Of The Republic Of Uzbekistan, The Formation Of Moral Consciousness, The Humanistic Basis Of The Impact On The Pupil, Self-Actualization Of The Personality.*

### INTRODUCTION

Political and socio-economic reforms in the country have put forward new requirements for the education system. The role and place of education in the development of the country increased, which was reflected in its reforms. In matters of education reform including its quality is based on updating the content and raising the qualifications of teachers, as well as at the expense of the priority of the educational factor, especially on the formation of the moral consciousness of the new generation of the country.

President of the Republic of Uzbekistan Sh.M. Mirziyoyev saying about the goals of consistent and effective implementation of the youth policy, full support for young people, fundamental reform of the system of protecting their rights and legitimate interests, and taking into account the opinions and suggestions of the general public, especially representatives of the youth of our

republic, he noted, "In the years of independence, certain work was carried out in our country to educate young people in the spirit of patriotism, respect for national traditions and values, and spiritually developed and physically healthy generation, protecting the rights and interests of young people. At the same time, an analysis of the situation and the measures taken in the field shows that the work being done to resolve topical issues affecting broad sections of young people, especially to create decent conditions for unorganized young people to gain their place in life, to provide young people with all-round support, ensure their professional orientation and employment, stimulating its initiatives, is not organized at the required level ..."

The Law of the Republic of Uzbekistan "On State Youth Policy" adopted with the aim of fundamentally improving activities in this area has created a solid legal basis for bringing up harmoniously developed, independently thinking, enterprising and energetic young people who are able to take responsibility for the future of our country, to tap their potential in the name of interests of the people, as well as the realization of their intellectual and creative potential"<sup>1</sup>- and so, the President raises the system of education and upbringing in the field of policy at the national level. Ways of development of moral consciousness, based on the highest spiritual and universal values, should become a source of wisdom and strength in the noble work of educating and upbringing the young generation in the spirit of patriotism, loyalty to their land and Motherland.

According to the first President of the Republic, I.A. Karimov, "the need to educate our children in the spirit of patriotism," since "the idea of love for the Motherland" should be the priority in strengthening our independence in the worldview of our people, and love for the Motherland can solve any problem, and is able to win everything."Here, the first President stresses," the national idea, based on the highest spiritual and universal values should become a source of wisdom and strength in the noble work of educating the young generation in the spirit of patriotism, loyalty to their land and Motherland. "I.A. Karimov speaks of" adherence to universal values ", "strengthening and developing the spiritual heritage of our people, "claiming that" our spirituality will turn into all the overcoming force. The President of the Republic believes that new pedagogical personnel are needed - the cadres of the "new generation, with new thinking", speaks of the "new system of professional education, on qualitatively new curricula and programs." "And a person who is called to teach, educate others, should be comprehensively developed person by himself".

The President emphasizes that it is important to "ensure the spiritual and moral development of a person as an individual", which also requires "careful attitude to the cultural heritage of nations", "mutual respect for national cultures", and education of students on "harmony of national and universal human values". The President recalls: "The spiritual foundation of our home is the pillars of the future of our state — very ancient and very strong," the foundation of our people is the spiritual heritage left by our ancestors, which in itself is an invaluable treasure, and it must be used wisely, not allowing nationalism: "National dignity, national pride, pride that has nothing to do with nationalism or chauvinism, pride that gives strength in the struggle for belonging to this country, to this people, should be at the heart of any affair," "only with the proud of our past and future, we must educate the future generation, build our own national state".<sup>2</sup>

The issue of formation of moral consciousness is a priority among the most important socio-political tasks of the Republic of Uzbekistan.

The formation of moral consciousness is an integral part of the education of a harmoniously developed generation and is the basis for the modernization of the education system.

The State Program “Year of harmoniously developed generation” of the Republic of Uzbekistan (2010) notes that the issue of harmoniously developed generation is associated with the rational and efficient use of the material and technical base already created by significant forces and means in the field of education and upbringing. It is necessary to improve state, educational standards, curricula and textbooks, revision of educational areas and specialties in the system of higher and secondary specialized education, taking into account the requirements of today.

The focus should also be on issues of widespread introduction into the educational process of new information and pedagogical technologies, encouraging the hard work of teachers and mentors who bring up children in harmoniously developed personalities. In short, the system of education and upbringing must be raised to a qualitatively new level.

It is especially important to consider the formation of the moral consciousness of young people in the modernization of the education system.

The term morality comes from the word moral. In Latin, manners were called like *moralis* - morality. “Morals are those standards and norms that guide people in their behavior, in their daily actions. Morals are not eternal and not immutable categories, they are reproduced by the power of the habits of the masses, supported by the authority of public opinion, and not of legal provisions.”

At the same time, moral requirements, norms, morals receive a certain justification in the form of ideas about how a person should live, behave in society, etc.

Morality implies the voluntary acceptance by the majority of members of society of the rules of existence in it, ensuring the stability of society, the preservation and enhancement of material and spiritual values, and care for their own perspective.

History shows that in many cases the collapse of once prosperous states began with the destruction of the moral stronghold of society. And, on the contrary, it was possible to preserve the state, and in it themselves with their traditions, cultural values, those peoples whose moral principles constituted one of the main determinants of existence.

Awareness of the importance of members of the society mastering moral consciousness and behavior led to the creation of public institutions, formal and informal organizations of people whose task was the awareness, formulation and transmission of the norms of behaviour to the community.

This includes primarily the field of education. Its tasks include the implementation of the educational process. The efforts of collectives of educational and research institutions, public and political figures, the best representatives of all segments of the population are devoted to the achievement of this dual goal.

Moral education is carried out not only thanks to the official public institutions, but also in the depths of society itself: the family, the closest human environment, informal groups, teams, in everyday contacts with many people, through the media is carried out. Each of these groups of subjects of the educational process has its own arsenal of means of pedagogical and psychological impact on the person.

In the development of moral consciousness, the decisive importance is the activity, the real actions that a person performs in combination with their assessment of others and self-esteem.

Moral behavior is largely shaped by the example.

In educational institutions there are favorable conditions for solving a number of tasks of moral education.

First, in educational institutions there is the possibility of carrying out systematic work connected to the relative long-term stay of a particular student in them.

Secondly, the study is a reasonable activity that requires considerable effort, and, moreover, carried out in the background of cognitive interest. All this constantly creates objectively significant, problem situations for the individual. They represent a good material for educational influences.

Thirdly, educational work is carried out in groups, where meaningful relationships for a student's personality arise between peers, as well as with teachers, other training personnel, where there are representatives of different generations, people with different mentality, education, and interests.

In the course of moral education of young people in educational institutions the following tasks are solved:

**1. The formation of moral concepts and beliefs.** As it is known, students often vaguely imagine the essence of moral concepts. Often, negative actions are done precisely because the adolescent follows his ideas about what is right, proper, "legitimate" action.

The collective responsibility in group performance of antisocial acts is presented to students as following the laws of the partnership, physical punishment of a comrade as a measure of correcting his behavior is seen as quite acceptable, opposing himself to the group's assets, masters and teachers - as "heroism".

**2. Developing students' skills and habits of socially approved behavior.** It is known, however, that the significance of the norms of social behavior does not mean that a person will be guided by them in their actions. Moreover, often self-serving people demagogically use concepts denoting high moral categories to achieve personal goals. That is why it becomes necessary to organize the daily life of students in such a way that the norms of behavior are strictly observed; manifested not only in words but also in acts, even the most insignificant.

**3. Character development.** Character development Involves the formation of students' positive and overcoming negative character traits. The positive ones primarily include: discipline, integrity, dedication, initiative, persistence, ability to overcome difficulties. Among the negative traits most often faced with selfishness, deceit, rudeness, disrespect for elders. To solve educational problems various methods of educational influence are used. Some of them represent a relatively broad group and are used continuously, for a long time, often in accordance with a specific plan. It includes the methods of moral education. In other cases, it requires the use of a private method of exposure, which is situational and, as a rule, individual. These are methods of pedagogical influence. Together, they form a kind of complex that allows the fulfilling of the educational process. The following methods are used in the teaching to moral qualities:

conviction, schooling and exercise, an example as a method of education, encouragement and punishment.

**Methods of persuasion** affect pupils' consciousness, will, and feelings in order to form their positive moral qualities and eliminate negative ones. These include conversations, lectures and reports, debates and readers' conferences on ethical themes. In lectures and reports, the questions having been put before them find wider coverage. They can be accompanied by movies, slides, listening to sound recordings, organizing photo exhibitions and other expositions related to the subject of lectures. Here having information and emotional brightness is very important, on which the interest of the listeners and the measure of the psychological impact of the material largely depend. It is necessary the closely monitor of the organization of such events: the preparedness of the premises, the clarity of the work of technical means, and the observance of order when accommodating students in the hall.

**Dispute** is the effective way of moral education. In the course of the discussion of all the questions the pupils are involved. The dispute activates the person very much, encourages him to think, to search for arguments and the validity of his position. The truth is not always found in the course of the dispute. Often the discussion gives impetus to further reflection and conclusions.

**Teaching and exercise** are the repetitive activities and actions of students organized during the educational process, leading to the formation of the skills and habits of behaviour. *Means* of solving this problem can be various activities: educational, productive work, sports events, etc. In this regard, teachers and the administration should impose rather strict requirements on students.

Unfortunately, students are sometimes reluctant to accept the requirements of maintaining discipline, cleaning the premises, the conduct of duty. Fulfillment of these requirements at first is not their internal necessity.

Meanwhile, **conscious discipline** is one of the most important moral qualities. From the level of discipline depends on the effectiveness of the educational process. In turn, the clarity and organization of work in all parts of the teaching staff largely determine the discipline of students.

Formation of moral consciousness among young people will be effective if the teacher fulfills the following conditions:

- rely on positive age needs and interests, which create the effect of relevance;
- ensure the emotional richness of common activities; organize joint collective efforts and experiences that unite its participants;
- create an atmosphere of emotional volitional tension which lead to success;
- to affirm the joyous, major lifestyle of the collective and each person;
- take into account the positive impact of public opinion (interesting, important), performing the function of emotional infection;
- take care to create an atmosphere of friendly understanding.

It should be noted that if teachers show perseverance at the very beginning of training, this will quickly lead to the formation of necessary habits and greatly facilitate the organization of the educational process and then you can achieve:

- the formation of moral concepts and beliefs;
- developing skills and habits on youth of socially approved behaviour;
- character development;
- more active and positive relationships with others;
- the ability of quick adaption to new situations;
- higher results in education and upbringing;
- active and interested attitude to various fields of science, to the education.

The social order for education, the modernization of the education system, a person-centered approach to training and education, in which each person would have the opportunity to develop self-actualize individually and at the same time personal growth and direction of activity would be in the public interest is formed in the view of social attitudes of education. The principles establish the social orientation of education, the humanistic basis for influencing a pupil, taking into account the psychological requirements for the educational process and its organizational basis.

These principles should guide not only the staff of educational institutions, they should be reflected in the minds of every citizen.

### INTRODUCTION

Today the high school is one of the most important components of the system of continuous education. Changes in society have led to the significant steps of priorities in the higher structure of education. Here, the problem of personal development takes the first place.

Among the main directions of the educational policy of Uzbekistan, the leading and fundamental ones put forward the development of education, and in this process - the individual, therefore - the society and, thus, the country as a whole.

Reforming the system of education and upbringing, recognizing it as an authoritative direction of the state policy of the Republic of Uzbekistan, identified specific tasks, including the area of improving the training of future teachers.

The tasks of the Academy of Public Administration are defined clearly. Decree of the President of the Republic of Uzbekistan Sh. Mirziyoyev on measures for the further development of the system of training, retraining and advanced training of managerial personnel in the Academy of Public Administration under the government of the President of the Republic of Uzbekistan points the necessity of: "... the organization of the study of the disciplines of the specialty, history and national values of Uzbekistan, the work of national poets and writers, a foreign language and information and communication technologies." (2017, Resolution of the Republic of Uzbekistan #5119)

At the same time, careful attitude to the cultural heritage of people, mutual respect for national cultures, education of students in harmony of national and universal values is necessary. The spiritual foundation of our home - the pillars of the future of our state - is very ancient and very strong, the foundation of our people is the spiritual heritage left by our ancestors, which in itself is a priceless treasure. It is with this sense of pride in our past and future that we must educate the future generation, build our own national state. Studying and consciously understanding the works and pedagogical heritage of the great thinkers of the East to bring the spiritual revival of the people, the development of culture, science and education depends on the situation in other spheres, depends on how effective the general cultural level of human development in the system of education and upbringing will be the moral-aesthetic formation of the younger generation in all branches of the historical development of society has always been the object of research by scientists in various fields of science: philosophy, sociology, psychology, art history, pedagogy. This is due to the influence of the huge role of art on the formation of a developed personality, since moral and aesthetic formation is a multifaceted process of personal development. It includes the formation of moral, aesthetic views, tastes and ideals of active fighters for the beautiful in life, a systematic sequence to see the beauty in everyday life.

In order to cultivate a harmoniously developed personality that meets the new conditions, purposeful activity is needed, based on the ideas of national pedagogy and the experience of scholars and teachers.

The first President of the Republic of Uzbekistan Islam Karimov stressed the need to introduce the foundations of national pedagogics into the modern pedagogical process: "A new democratic concept of education is to be developed and implemented, in which the national, historical and cultural traditions, the moral experience of the Uzbek and other peoples living in the republic are would be originally included in the system of training and education" (Islam Karimov: Uzbekistan. National Independence, economy, politics, ideology. 1996, p.47)

The National Training Program emphasizes that "... the basic principles of the functioning of lifelong education, along with priority, democratization and humanization of education, is the humanization of education - the formation of students of an aesthetically rich worldview, high spirituality, culture and creative thinking, as well as the national orientation of education, which consists in its organic unity with national history, traditions and customs, preservation and enrichment of cultures s of the peoples of Uzbekistan, recognizing education as an essential tool for national development, respect for the history and culture of other nations." (National program on training cadres. 1996, p.45)

I would like to note that after the 90s a new scientific liberty began in Central Asia in the areas of national pedagogy of an ethnic character, and national pedagogy of historiographic nature, in the field of science of pedagogy. Nowadays, the solution of any national-pedagogical problems is impossible without a sober and realistic view, on the one hand, on the holistic panorama of the pedagogical culture of human society, on the other, on the ethnic characteristics of the pedagogical system of each nation.

And so, the historiographic and systemic-cultural approaches are essentially not used in the study of the moral and aesthetic education of national pedagogy, which makes it even more obvious that the problem of the moral and aesthetic education of national pedagogy in historical pedagogy is still insufficiently developed. Thus, the contradiction between the achieved level of study of national pedagogy and the needs of pedagogical science and practice in this study is deepening.

The solution of this problem sets before us the goal - to reveal the process of development of historical and pedagogical knowledge about national pedagogy in Uzbekistan and promising approaches to its further study. And so the solution of this goal we need to define the following tasks:- to identify and characterize the main stages of the development of historical and pedagogical knowledge of moral and aesthetic education about the national pedagogy of Uzbekistan;- to analyze the process of formation of scientific trends and directions in the

historiography of the moral and aesthetic education of national pedagogy, the dynamics, problems and geography of research;- to reveal the genesis and development of the concepts of “moral-aesthetic upbringing”, “national pedagogy”, “pedagogical culture”, “pedagogical historiography”;- consider the prospects of moral and aesthetic education in Uzbek national pedagogy as a component of the culture system in the light of the concepts of national and traditional household culture;- to substantiate the organic connection between the study of the moral and aesthetic education of national pedagogy and the general problems of the typology of pedagogical culture.

In the implementation of this problem, we need to find the source base, which is the work of scientists in this direction before the revolution and before the independence of the Republic of Uzbekistan, as well as foreign philosophers, cultural scientists, educators, historians, ethnographers on the topic of research. The main body of sources of research is the historical and pedagogical work of moral and aesthetic education about national pedagogy.

The results of the study expand the sphere of knowledge of the moral and aesthetic education of national pedagogy, enriches it with historical analysis of the experience of studying national pedagogy in Uzbekistan, as well as analyzing the general properties of pedagogical national and traditional household culture.

In addition, in Uzbekistan, the first research was carried out (by me) for the academic degree of a candidate of pedagogical sciences on the subject “Scientific theoretical problems of the historiography of Uzbek national pedagogy (1956-2001)”.(Sokhibov.A 2004, p.21. Scientific and Theoretical problems of national Uzbek pedagogy )

In the dissertation substantiated the process of formation and development of modern historical and pedagogical knowledge of Uzbek national pedagogy and developed perspective areas of pedagogical historiography. The research was based scientifically:-for the first time in

pedagogical science, the problems of studying Uzbek national pedagogics from the historical and pedagogical points were developed;-the notion of “national pedagogy” is scientifically differentiated and its features are defined;- identified the stages of development of ethno pedagogy;-principles of periodization of the historiography of national pedagogy were developed;-the role of national pedagogy in the formation of the ideology of national independence was clarified scientifically.

So, the study of national pedagogy in the historiography aspect gives the information about the results of activities done by scientists in the field of pedagogical science of national pedagogy. This gives researchers the right

approach to open branches in the field of pedagogical science of the study of Uzbek national pedagogy.

Practically, the study about the scientific work on national pedagogy are analyzed, systematized and summarized and methods for using their results in the system of university teaching are developed.

### ABSTRACT

*The article about development cinema and theatre in Uzbekistan at years of the Second World War. The First, cinema and theatre developed in Uzbekistan at soviet years. Come up for the last years of XIX age cinema thereafter and before present-day day alongside with increasing mankind was used for influence on thinking and consciousness of the person or as optimum facility of the material enrichment.*

**KEYWORDS:** Cinema, Art, Project, Uzbek's Film, Soviet Power, Film, Cinema Product, Cinema Production, Cinema Studio.

### INTRODUCTION

The Second World War formed a new generation of people capable of alternative, critical thinking. An internal spontaneous protest against the regime increased. It was possible to suppress it only by cruelty. The repressions weakened in the war renewed with renewed vigor in the second half of the 40s. The ideological basis for them was the decisions of the Central Committee of the All-Union Communist Party of Bolsheviks / On the magazine Zvezda and Leningrad (1946), On the repertoire of drama theaters, On the film Great Life, On the Opera of V. Muradeli Great Friendship '(1948). This became the basis for freezing the creative democratic development of literature and art, a new round of etching dissent.

The writers and poets of Uzbekistan, covering the ancient history of the people, were accused of idealizing the past, they were labeled "nationalists". Poets and writers were arrested on charges of "anti-Soviet nationalist activity." Thus, the names of Uzbek writers Aybek, Abdullah Kakhkhar, M. Babayev, U. Rapgadov, Mirtemir, M. Sheikhzadeh, and editors of the magazines

Shark Yudduzi and Star of the East were blamed. The "harmful" practice of creating and propagating opera, ballet, musical and dramatic performances on legendary folklore plots: "Farhad and Shirin", "Leili and Majnun", "Tahir and Zuhra", "Alpamysh," Tuland was condemned. the culture of the Uzbek people was immorally destroyed. Repressed art, science, and culture became innocent victims of lawlessness and arbitrariness during the totalitarian regime. After Stalin's death, the crackdown on repressions was suspended, and after the XX Congress of the CPSU (1956) there was a period of "thaw" when they began to rehabilitate innocent convicts. The restoration of violated law was proclaimed in political life. Some functions previously belonged to the center were delegated to the Union republics. Parts of the deported peoples (Chechens, Ingush, etc.) were allowed to return to their homeland. There was a revival in public life, culture, art. However, the processes of some liberalization in public life did not last long. In the mid-60s ideological pressure intensified again.

However, despite this, in the period under review there have been shifts in the field of culture. The republic expanded its network of educational schools, opened music, sports schools, schools of fine and applied art. In the 1975-76 academic year, the republic mainly completed the transition to universal secondary education. The number of teachers in 1970-75 amounted to more than 200 thousand people, the proportion of people with higher education increased.

The restructuring of the public education system has affected higher and secondary specialized educational institutions. During the period under review, a number of universities were opened, the network of research institutes expanded in the system of the Academy of Sciences and outside it, the number of employees increased. If in 1960 there were 222 doctors of science, then in 1975 there were 745 of them. The number of academicians and corresponding members of the Academy of Sciences of Uzbekistan has reached 96 people. The works of Uzbek writers were published: Askad Mukhtar "As if there is peace in the storms"; Gafur Gulyam "Steppe Violets", "Immortality"; Adyl Yakubov "Treasures of Ulugbek", "Conscience"; Mirmukhsin "The son of the caster", "Architect", "Chatkal tiger"; S. Ahmad "Horizon"; P. Kadyrov's "Starry Nights"; J. Abdullakhanova "Barca Kelmes" and others.

The Uzbek poets worked fruitfully: Zulfiya, R. Babadjan, A. Mukhtar, Shukurullo, A. Aripov, G. Nurullaev, E. Akhunova; playwrights: Ibrahim, Izzat Sultan, U. Umarbekov, K. Lshen; publicists: Sh. Rashidov, Uygun, N. Safarov, H. Nazir, T. Tula, U. Khashimov, J. Dzhabbarov. Uzbek artists Ch. Akhmarov, R. Akhmedov, R. Charyev, D. Umarbekov, B. Dzhalalov and others were well-known. A number of Uzbek specialists worked in 50 countries of the world. The ambassadors of Uzbekistan worked at the national economic facilities of Siberia, the Urals and the Non-Black Earth Zone of Russia. Machines and equipment with the brands of the plants of Uzbekistan were sent to Afghanistan, India, Algeria and other countries.

The public of Uzbekistan maintained cultural contacts with 117 states. Conferences and symposia were held in Uzbekistan. In 1979, an exhibition dedicated to Uzbekistan was exhibited in Sri Lanka. Friendship days passed between Uzbekistan and Syria (1971), Iraq (1975), Libya (1979), etc. Since 1968, the International Film Festival of Asia, Africa and Latin America was held every 2 years in Tashkent.

In the development of the culture of peoples, art, including cinema and theater, plays an important role. Especially, after the establishment of Soviet power, in the Turkestan region, where a violent policy was pursued for a long time, cinema and theater art were fruitfully used to

introduce ideological concepts such as party spirit and class, which completely contradict national traditions, into the consciousness of the population.

As the First President I. A. Karimov noted, "... The Soviet socialist state was forcibly introduced into our lives, from the side. The form and essence of this state was based on a system that did not correspond to the spiritual and psychological values of our people. "

It is well known how these events took place in our area in 1920-1956. It can be noted that in Turkestan, cinema and art were called "shaitan photographs" among some religious strata. They believed that these "Shaitan shots" were contrary to Sharia, and urged people not to attend movie shows, as this is an unforgivable mortal sin.

People were very attracted to art, later traveling cinema even penetrated into remote villages and auls. Thus, the popularity of cinema grew, and it turned into the most beloved form of art. Films promoting the Soviet ideology and its advantages began to be shown in the created cinemas. Women could attend movie theaters for free. The steady increase in the number of viewers gave impetus to the opening of new cinemas in Uzbekistan. Thus, cinemas have become places of recreation for people.

During this period, amateur actors, professional actors from neighboring republics worked on various roles, then became famous as a director, screenwriter and cameraman Nabi Ganiev, Sulaimon Khodjaev, Ergash Khamroev, Kamil Yarmatov, Yuldash Agzamov, Malik Kayumov and others. Films they shot today are of great interest to the audience.

During the Second World War, cinema and theatrical art continued to develop, and the figures of theatrical and musical art of Uzbekistan joined the ranks of active fighters against fascism.

In those years, 51 theaters operated in Uzbekistan, including the Khamza Academic Theater (now the Uzbek National Academic Theater), the A. Navoi Opera and Ballet Theater, the Mukimi Musical Drama Theater, M. Gorky Russian Drama Theater and other theaters . On the stages of these theaters, such performances as "Death to the Invaders" and "Oftobhon" by K. Yashen, "Flight of the Eagle" by I. Sultan, "Mukann" by H. Alidjan, "Alisher Navoi" by Uygun and I. Sultan and etc. In general, from July 1941 to 1944, 203 new productions, 13568 performances and concerts were staged in theaters of Uzbekistan [1].

Despite the war, many artists, namely theatrical groups of Uzbekistan, masters of the arts, actively participated in the work of military patronage, visited military units, hospitals, manufacturing enterprises, dekhkan farms and raised the morale of soldiers with their performances.

During the war years, art workers of the republic, consisting of more than 30 brigades, gave more than 35 thousand concerts at the fronts in active units of the army. These concert teams included Tamarakhonim, Halima Nosirova, Sora Eshonturaeva, Mukarram Turgunboev, Abror Khidoyatov, Olim Khuzhayev, Gavkhar Rakhimova, Muhiddin Kori Yakubov, Karim Zokirov, Shukur Burkhonov and other figures of Uzbek art.

The basis of musical art, cinema and theatrical art is patriotic themes. Patriotism remains a leading topic in both documentary and art cinema. During the war, Uzbek cinema workers created a series of short films - film short stories, film stories, essays, satirical sketches, and also

special films for warriors on the fronts - concerts - "Friends on the front", "Gift of the Motherland" and others.

Famous cinematographic figures Y. Protazanov, L. D. Lukov, E. Gabrilovich, I. E. Kheifits, N. A. Zarkhi and others were engaged in creative activities in the Tashkent studio. Together with major Uzbek directors I. Agzamov, N. Ganiev, K. Yaramatov, S. Mukhamedov, they created 10 sound feature films that are included in the golden cinema fund of the republic. Among them, such films as Sukhe-Bator, Two Fighters, Nasruddin in Bukhara, Tahir and Zuhra won the most popularity [2].

So the head of our state I. Karimov writes about this in his book "High spirituality is an invincible force": "If we take for example the most popular form of art - cinema, then it can be noted with satisfaction that in our time a kind of creative school. "

At the suggestion and initiative of the head of state in one of the beautiful corners of Tashkent on the Yunusbad massif, on the banks of the Bozsu canal, a memorial complex "In memory of victims of repression" was opened. Citizens of the republic were infinitely satisfied that on May 12, Friday, 2000; the opening ceremony of the memorial took place. So, in 1937, the times of terrible repressions here, in a place called Alvasti Kuprik (Besovsky Bridge), at midnight, a number of fighters for the freedom and happiness of the people, the best representatives of culture, literature and art, their like-minded people were shot by Stalin's killers .

Now there is a place of worship, people who have come here, remember their ancestors, pay tribute to them. Now this square has become a saint for us. From the first years of independence, the head of our state pays close attention to the revival of our national values, respect for national history, traditions, and the initiator of this work is the President of our country.

As the head of our state I. Karimov noted: "The support of our people - the legacy of our ancestors is a great treasury. We must use it rationally. We must be faithful and worthy of the instructions of our ancestors"[3].

Indeed, today we cannot imagine our life without the world of cinema. For it has the power to influence the psychology of man, his spirituality. So, at present, there is a great need for films aimed at improving the spirituality of youth, calling them to selflessness, serving as an example.

To summarize, we can say that our cinema and theatrical art over the past years have faced numerous tests. Our outstanding cultural figures have done much to preserve the cultural values of our people in their original form. It should be noted that the territory of Uzbekistan and Central Asia from the 1860s to 1991 remained colonies of Russia. The negative trail left by this period in the spirituality of the peoples of Central Asia can be said and removed. And even in such a problematic time, we have not lost our national pride, our Uzbek values, spirituality, culture and art. The age-old dream of our people - independence has always lived in our hearts.

A scientific study of the history of Uzbek cinema and theater during the Second World War suggests paying attention to the following important aspect: all the complex facets and problems are reflected in Uzbek cinema and theater.

For, no matter what time cinema and theatrical art are created, no matter what topic they are dedicated to, they remain a chronicle of events from the time of their creators.

## DEVELOPMENT OF CREATIVE ABILITIES OF FUTURE PRIMARY SCHOOL TEACHERS IN THE PROCESS OF TEACHING PRACTICE

**Farmonov Uktam Nematovich\***

\*Lecturer,

Department of Pedagogy and Management,  
Tashkent Regional Chirchik State Pedagogical Institute,  
City Chirchik. UZBEKISTAN

### ABSTRACT

*The article is devoted to the consideration of interactive teaching methods and their role in the formation of key competencies among future specialists in the transport systems of the aviation industry. The proposed content of training primary school teachers in the aspect of pedagogical creativity, implemented using innovative pedagogical technologies, non-traditional forms, active teaching methods, in our opinion, will contribute to improving the quality of this training. Often the stereotypes of pedagogical thinking of primary school teachers do not provide a trinity of teaching, educational and developing functions of the modern education of primary school students.*

**KEYWORDS:** *Business Games, Simulation Games, Interactive Teaching Methods, Case Study Method, Stage Method, Incident Method, Case Study Method, Training.*

### INTRODUCTION

In the conditions of modernization of the educational space, the problem of training highly qualified creative primary school teachers, capable of ensuring the comprehensive development of the child as a holistic personality, the development of her creative abilities and talents and enriching the intellectual potential of the people, their spirituality and culture, and the formation of a citizen of Uzbekistan, is becoming important. The effectiveness of solving these problems largely depends on the professionalism of the teacher in building such a learning process in elementary school and, above all, in mathematics lessons, which would strengthen the child's interest in learning, discovering new things, ensure the strength and reliability of acquired knowledge, and at the same time time, contributed to the formation in each child of rice of cognitive activity, a real and creatively thinking, self-critical personality [2].

Pedagogical science and practice convincingly prove that only a creative person can bring up the same creative person. It follows that the relevance and importance of vocational training of primary education teachers to develop the creative abilities of primary school children in mathematics is stimulated by modern scientific achievements, as well as changes in the socio-economic sphere of public life.

Orientation of modern educational reforms to the formation of a professional specialist places high demands on the preparation of primary school teachers, especially in the aspect of professional and pedagogical creativity. At the same time, priority is given to the creative development of the future teacher, his openness to innovations, experiments, pedagogical artistry, the ability to self-knowledge, self-development and self-actualization in professional activities [1].

Creativity in pedagogical activity requires the formation of future teachers of primary grades a wide range of professional and creative, professional and methodological skills, abilities and abilities. However, as school practice shows, the elementary school teacher's readiness for the original design of educational material, the use of non-standard forms, teaching and upbringing methods, their combination and implementation in educational and extracurricular activities of primary school students, the ability to cooperate, collaborate, create with different subjects of the educational process is not always sufficient, which could negatively affect the creative development of students. Therefore, the identified contradictions between:

- changes in the content of the pedagogical activity of an elementary school teacher, due to the reform of the modern education system, and the content and forms of its preparation in educational institutions of higher education;
- the existing and required levels of readiness of future elementary school teachers for professional and creative activities for the development of students' creative personality have updated the direction of our scientific research [2].

Analysis of studies related to the problem of creativity, creative personality, its creative abilities and creative activity, allows us to state the significant interest of scientists in its various aspects. The studies of D. Epiphany, L. Vygotsky, V. Molyako, A. Meneghetti, V. Nikolko, Y. Ponomarev, V. Romenza and others are devoted to the nature, essence and content of creativity. The formation of the teacher's creative personality is studied in the scientific works of N. Guziy, V. Zagvyazinsky, I. Zyazyun, S. Konovets, N. Kichuk, M. Nikandrova, O. Pekhoty, S. Sysoeva and others. Professional and pedagogical training of future teachers has become the subject of research of scientific works of N. Demyanenko, O. Dubasenyuk et al.

However, despite the significant achievements of scientists in this direction, we believe that the question of the readiness of future primary school teachers for professional and creative activities to develop the creative potential of elementary school students and their creative abilities is still being partially solved. Often the stereotypes of pedagogical thinking of primary school teachers do not provide a trinity of teaching, educational and developing functions of the modern education of primary school students. Traditionally, the efforts of teachers are focused on the formation of knowledge, skills, solving purely educational problems and absolutely insufficient attention is paid to the development of creative thinking of younger students, their ability to originality of reasoning, ingenuity, the generation of new ideas, development of imagination, fantasy, intuition, and the ability to find the optimal. There are several possible solutions, etc. ..

So, an analysis of the scientific literature shows that most scientific studies focus on improving the quality of teacher training for professional and pedagogical duties, but insufficient attention is paid to the creative component of this preparation [3].

The presentation of the main material of the article. A generalization of scientific psychological and pedagogical literature on the problem of creativity allows us to state that creativity is a process of creating a new, previously non-existent one. In most cases, the concepts of “creativity” and “creative activity” are identified. However, pedagogical creativity has its own characteristics in comparison with the general meaning of this concept.

In scientific research, pedagogical creativity is recognized as the most important criterion for the qualitative formation of the personality of a teacher in a modern school, which is manifested primarily in the social need for creative work. Pedagogical creativity is determined: activities aimed at the formation of the personality of the student as a subject of life creation; integrative quality of the teacher’s personality, the structural components of which are: professional orientation, professional self-awareness, professional thinking, diagnostic culture; activities related to the study of pedagogical experience, pedagogical skills of teachers, self-knowledge, self-development, self-improvement. So, pedagogical creativity is a mutual creative activity of the main subjects of the educational process of the institution of higher education (teacher and student) in their interconnection and interdependence, the results of which lead to their development and self-development [2].

Professional and pedagogical activities of primary school teachers are diverse. The student must master all its types while studying at a higher pedagogical institution, in particular:

- Subject - to know the subjects that are taught in elementary school, master the methods of teaching them, understand the place of each subject in inter subject communications;
- Pedagogical - to design the content of subjects, to conduct classes; plan extracurricular activities, individual work with students, etc.;
- Innovative - transfer the innovative experience of other teachers to their own; to develop innovations; conduct a pedagogical experiment;
- transfer their own innovative experience;
- Collective self-government - maintains a favorable climate in the team; ensure the effective work of methodological associations;
- ensure the work of problem groups of teachers; participate in the development of collective decisions, etc.;
- Self-development - to be ready for professional, general cultural self-development, etc. [3].

All these types of pedagogical activities require a high level teacher of pedagogical skill from primary school teachers. “Pedagogical mastery,” notes I. Zyazyun, “is a complex of personality traits that ensures self-organization of a high level of professional activity on a reflexive basis” [2]. At the same time, the important characteristics of the teacher’s personality are the humanistic orientation of his activity, professional competence (professional knowledge, a high level of professionalism in pedagogical activity), pedagogical abilities (ability to quickly improve

himself), as well as pedagogical techniques based on knowledge and abilities, which allows revealing the inner potential teachers, harmonizing the structure of pedagogical activity).

For the modern requirements for the training of specialists in the pedagogical industry, the master teacher should be a creative person, characterized by a high degree of development of orientation towards pedagogical activity, a desire for self-realization in this profession, the development of professional qualities, creative skills that contribute to success in pedagogical activity. It is professional mastery in unity with pedagogical competence, the primary creative skills of primary school teachers that largely determine the effectiveness of his leadership in shaping the student's creative personality. Creativity in teaching requires the teacher:

- The ability to modify, combine the content of educational material in a non-standard direction;
- Readiness to develop original approaches to the planning of the educational process with students in educational and extracurricular educational activities;
- Possession of methods, techniques, non-standard forms of organization of creative educational and extracurricular educational activities of students;
- Readiness of pedagogical experimentation - to search for ways to improve the educational process in order to develop the creative potential of students, etc.

So, in order for the elementary school teacher to be able to act creatively, he must have a number of properties, professionally important qualities that ensure the professional self-development of his personality and through him the development of the student's personality.

We consider the preparation of future primary school teachers for creative pedagogical activity, on the one hand, as the ability and willingness of a teacher to contribute to the formation of the schoolchild's creative personality, the development of his creative abilities, and on the other hand, as constant self-improvement, raising the level of creative pedagogical activity. The emphasis on self-improvement involves self-education, self-upbringing, self-determination, which is the whole development of the personality of the future teacher.

We understand the process of preparing primary school teachers for creative pedagogical activity as an objective creative process, which should correspond to modern trends in the development of higher education in the republic, taking into account integration into the European educational space, the achievements of psychological and pedagogical science and pedagogical practice, predetermined by the specificity and patterns of the process of personality development and self-development. We consider this process as a phased process, which is carried out by students mastering the educational program. An analysis of the curricula for the preparation of future primary school teachers of the educational and qualification level "Bachelor" showed that the courses of disciplines that make up their structure have significant potential for the creative development of the personality of the future teacher, but are fragmented and fragmented. A clear orientation of students to the formation of the creative personality of the student and teacher and the mutual development of their creative abilities is aimed at mastering by students the discipline course "Pedagogical excellence". The content of preparing primary school teachers for creative pedagogical activity includes: theoretical and methodological substantiation of the basic concepts of pedagogical creativity and the nature and specificity of creative pedagogical activity of primary school teachers; determination of the structure of the creative personality of a primary school teacher, stages and levels of development of his creative personality; the study of the

main directions of scientific research of pedagogical creativity; determination of the creative qualities of the student's personality, their content and assessment criteria; identification of psychological and pedagogical conditions, factors of success of creative development of primary school students; substantiation of the characteristics of the activities of primary school teachers in the creative development of students; study and improvement of pedagogical experience; the use of pedagogical technologies as the creativity of primary school teachers [1].

The implementation of the content of the course is based on the phased formation of professional and creative knowledge, skills and practical skills of students.

Stage I is informational and indicative. The goal is to ensure students' awareness of the laws and laws of pedagogy of creativity as a branch of pedagogical knowledge about the creative development of the individual.

Stage II - meaningful and active. Goal: students to master the technologies of development, self-development, self-improvement, self-education of the individual's creative abilities; consolidation of practical skills in planning, organizing and creating favorable psychological and pedagogical conditions for the creative development of students.

Stage III - control and reflexive. The goal is control, generalization, assessment of the level of students' preparation for pedagogical creativity.

In our opinion, it is advisable to prepare for creative pedagogical activity on the principles of:

- Humanization of education - providing the student with the opportunity of constant self-development, self-improvement, development of creative abilities in pedagogical activity;
- Organization of interaction with students on a dialogical basis - orientation to the comparison of different points of view, tolerant attitude to other thoughts;
- Creation of situations of creative cooperation, co-creation, community;
- professional and creative orientation - generalization and synthesis of psychological and pedagogical knowledge, professional practical skills of students, the formation of readiness to optimally and creatively use them in professional and pedagogical activities on the basis of a theoretical understanding of the essence of the pedagogical process as an integrated system;
- innovation - the continuous updating of the content of professional and pedagogical training of future teachers by the achievements of pedagogical science and practice, the results of pedagogical creativity;
- The use in the training of future specialists of innovative pedagogical technologies with an orientation on the creative development of the student's personality.

Preparing students for the development of creative abilities of elementary school students provides for an active research position in the classroom in order to critically analyze, comprehend and evaluate the effectiveness of studying all professional disciplines, professional activities during teaching practice; the formation of future teachers's attitude towards themselves as an actor, which manifests itself in the ability to change (modernize) the learning process and education of primary school students, to weigh and evaluate the consequences.

Of particular importance is the creation by students of individual projects, the assimilation of the content of the programs of the relevant disciplines, the acquisition of skills in the application of innovations in educational work in practice, participation in scientific and practical, scientific and methodological conferences, seminars, olympiads, the creation of their own innovative pedagogical technologies, the implementation of course , theses, etc., That is, the active involvement of young people in scientific activities. So, preparing a teacher for the development of students' creative abilities in mathematics lessons is a specially organized and focused process that involves changing the fundamental, general scientific and vocational training of future teachers, organizational and methodological reorganization of educational activities, a special selection of content, forms, methods and means of vocational training , as well as the creation of special psychological and pedagogical conditions that would activate the mechanisms of personal and professional development of each student and teacher.

## CONCLUSIONS

So, the modern requirements for training specialists in the field of education, especially primary school teachers, require improving their readiness for creativity in professional pedagogical activity. The proposed content of training primary school teachers in the aspect of pedagogical creativity, implemented using innovative pedagogical technologies, non-traditional forms, active teaching methods, in our opinion, will contribute to improving the quality of this training. Prospects for further research in this direction are enriched in the study of the problem of continuity in the work of preschool educators and elementary school teachers to develop children's creative abilities.

Creativity is an integral element of the teacher's pedagogical culture. The preparation of an elementary school teacher for the development of creative abilities of primary schoolchildren is based on the methodological recognition of the priorities of the student's personal development, his needs, motives, goals, abilities, and individual psychological characteristics; involves the restructuring of the pedagogical process in the direction of its focus on increasing the professionalism of the student, the formation of the teacher's professional and creative personality, the development and self-development of the subjects of pedagogical interaction, the development of psychological and pedagogical mechanisms for their self-improvement and familiarization with the creative process.

UZBEKISTAN

### ABSTRACT

*This following article deals with the role of improved questions and assignments in the development of native language education, as well as classifies and interprets the types of assignments according to their function. In recent years, a number of scientific and methodological researches have been conducted on the methods of teaching the native language. Including Sh. Yusupova<sup>2</sup> and N.Yuldasheva<sup>3</sup> and others in their research promoted the teaching of the native language on the basis of new pedagogical technologies. When the task is used in the native language teaching methodology, speaking skills and competencies begin to develop faster. Existing exercises are used in existing textbooks and manuals.*

**KEYWORDS:** *Questions, Assignments, Tests, Knowledge, Skills and Competencies, Assignments, Teaching Materials, Exercises, National Methodology.*

### INTRODUCTION

While the process of globalization is accelerating in the world, the issues of language preservation, improvement and teaching are becoming more urgent. Today, various interactive methods of language teaching are widely used in practice. The basis of any teaching methodology is a system of learning tasks, ie questions and assignments. The scientific literature on the teaching of English, French, German and other advanced foreign languages pays special attention to the quality and diversity of assignments and the effective use of questions in the educational process. In the world experience, learning assignments are characterized by a variety of sections or topics. The questions and assignments given in the current textbooks and manuals do not adequately shape the student's life speaking skills.

The teaching of languages in the world is based on a competency-based approach, and the formation of linguistic competencies in the classroom leads to the development of speech

competencies. The levels set out in the native language are also applied. Listening, speaking, reading and writing skills are formed on the basis of these requirements for language learning. Using this approach creatively, it is also possible to effectively organize native language classes.

In most countries, native language teaching is based on a competency-based approach. Improving the content of educational tasks in the general secondary education system, the formation of the necessary speaking skills in students, as a result of which to increase communicative literacy is one of the most pressing issues at the level of public policy today. It is necessary to develop creative thinking skills in students through native language teaching. "We will mobilize all the forces and capabilities of our state and society for the development and happiness of our young people as independent thinkers, with high intellectual and spiritual potential, who will not be idle to their peers in any field around the world," said Shavkat Mirziyoev<sup>1</sup> and emphasis is placed on the urgent task of educating the youth of our country as independent thinkers who are able to express themselves freely and competently, both orally and in writing. In this sense, there is a need to improve the methodological support of teaching materials on phonetics in general secondary education through the teaching of the native language to fully develop students' speech and linguistic competencies, in particular, literary pronunciation skills, spelling literacy, vocabulary and independent thinking.

In recent years, a number of scientific and methodological researches have been conducted on the methods of teaching the native language. Including Sh. Yusupova<sup>2</sup> and N.Yuldasheva<sup>3</sup> and others in their research promoted the teaching of the native language on the basis of new pedagogical technologies. A.Gulyamov<sup>4</sup>, M.Saidov<sup>5</sup> and N.Alavuddinova<sup>6</sup> and conducted researches on the methodology of independent work, creative thinking skills through mother tongue teaching.

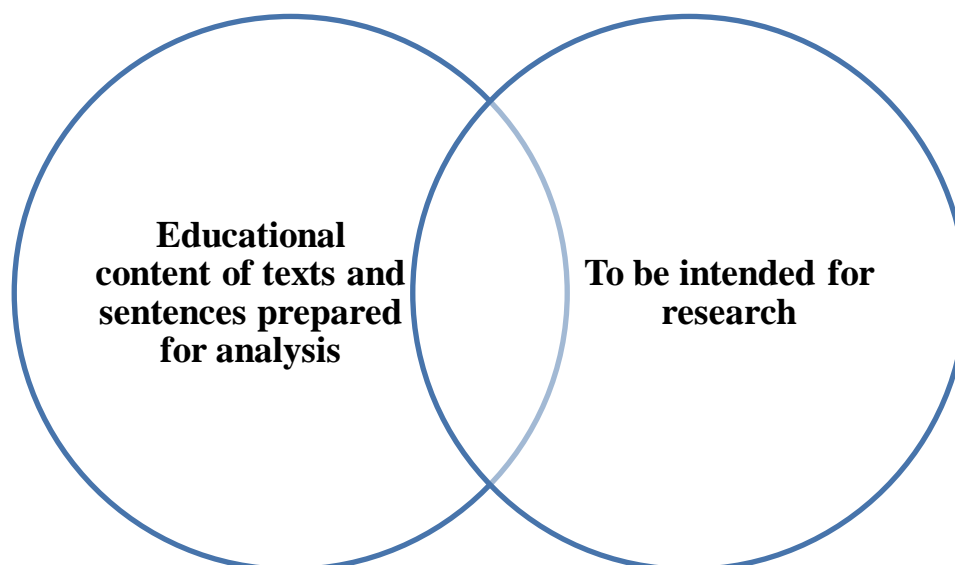

In his research work on the tasks and methods of using them in the process of teaching the native language in the 5th grade of Uzbek schools, M. Saidov partially touched upon the issue of teaching the "Phonetics" section of the native language, as well as "Introduction" and "Vocabulary". In the process of teaching phonetics, it is mainly aimed at developing exercises and assignments for the development of thinking. However, the primary function of mother tongue teaching, i.e., teaching literary pronunciation, pronunciation exercises, and the effect of pronunciation on spelling, has been neglected. The aim of this study is to improve students' creative thinking, respect for the mother tongue, correct and appropriate use of words, the formation of a culture of communication by improving the content of teaching materials, which are the content of native language teaching materials.

In teaching practice, such assignments in textbooks are not universal, but it is not possible to build the required skills and competencies based on them. Learning assignments are not designed to be easy to evaluate based on clear criteria. If the assignment is simply unstructured, well thought out, purposeful, and versatile, the lesson time will be used effectively. If the task is focused on building a single skill, it is difficult to fully meet today's demand. The time has already come to form multiple skills while completing a task. Exercises and assignments are not used effectively in most textbooks and manuals. That is, one task is enough.

In our opinion, giving more than one task at a time is more effective:

- First, it expands the use of language;

- Secondly, it is not difficult for students to ask questions about other subjects taught at school, including Mathematics, Physics, Chemistry. This is because she will be accustomed to performing tasks that are often encountered in this form of problem-based assignment in mother tongue classes and are tasked with a step-by-step solution. It is advisable for any assignment to have the following two features:

Assignments mainly serve to form linguistic competence, acquire knowledge, develop students' independent thinking skills, so it is also necessary to identify their areas of application.

More assignments should be relied upon in teaching the following sections:

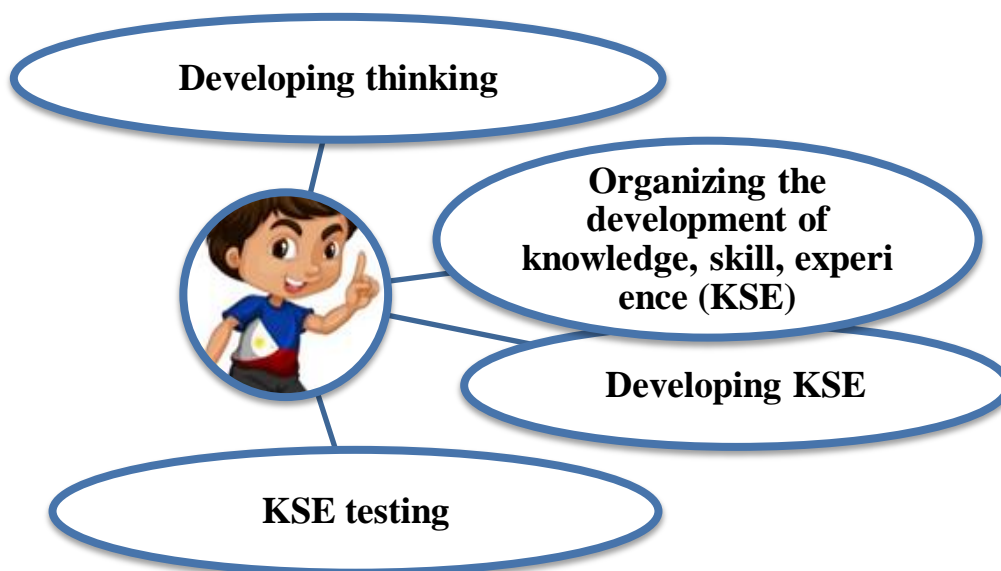

**Figure 2.Places of application of the task.**

In teaching the following sections, it is important to keep in mind that there is a greater need for exercise than for homework to form effective speech types, as well as *orthography*, *orthoepy*, *spelling*, *punctuation*, and, of course, *calligraphy* in lessons related to calligraphy.

Different types of assignments are used in the education system. In particular, the adaptation of native language teaching methods to modern requirements is vital, but the use of teaching tasks is often outdated. Forming a single skill through a whole head task is lacking from today's perspective. In modern textbooks, assignments act as a device for memorizing information.

Without enriching the student's thinking and vocabulary, it is impossible to talk about his fluent, logically coherent, effective speech. Tasks such as "Write a text", which are widely used in the classroom today, no longer justify themselves. Because the reader, with his helpless vocabulary, narrow-mindedness, cannot write the required content at the expected level. Important, useful, influential information related to the same topic in the reader is scarce or non-existent. In this sense it is possible to obtain the necessary information through assignments, only if it is used appropriately.

Tasks have several forms in terms of their functions in the educational process, but in the national methodology they are still used in combination without classification. It is expedient to conditionally classify the tasks used in the methodology of teaching the native language as follows:

In the national methodology, assignments, unlike exercises, can perform a variety of tasks based on their content. In the history of native language teaching, exercises have always been a priority over assignments; in fact, assignments should include exercises and lead. When the task is used in the native language teaching methodology, speaking skills and competencies begin to develop faster. Existing exercises are used in existing textbooks and manuals. The basic exercises that form the basis of repetition first form the knowledge-related skills acquired by the student, and then the skills. Questions and assignments enrich knowledge, strengthen, develop thinking skills, and most importantly, knowledge that is neglected in Uzbek language teaching methods to determine the level of formation of skills and abilities performs the task of testing. Purposeful and effective use of questions and assignments leads to quick and easy formation of verbal competence.

## SCRIPTURES OF EASTERN SCIENTISTS ON SCIENCE

**Malikova Dilrabokhon Mahmudovna\***

\*Doctoral,

Candidate of Uzbekistan Scientific Research Institute,

Pedagogical Sciences. UZBEKISTAN

Email id: dmalika11@gmail.com

### ABSTRACT

*The following article deals with the views of Eastern scholars on science and intelligence. We have examined the views of Eastern Renaissance thinkers. The scholar emphasized that the best way to study a thorough and in-depth science is to combine the learned knowledge with practice. In doing so, he interprets the human mind as the basis of activity, which, in turn, goes far ahead of his contemporaries, arguing that this activity is the basis for the creation of new knowledge. The Arabic translation of the works of ancient Greek philosophers on philosophy and logic aroused great interest among al-Ma'mun and all the scholars of the time. The country, where the ruler gathered ignorant ministers around him, was in a state of unspoken decline. Kaykovus said this in the "Kobusnoma" about knowledge and wisdom.*

**KEYWORDS:** *Eastern Renaissance, Hadith, Bayt ul-Hikma, Ulugbek Academy, thinker, knowledge, science, intellect, education, wise man.*

### INTRODUCTION

In our country with an ancient history, the attitude to science has been various at different times. In the past, any natural phenomenon was miraculously spread by people, while in the days when religious fanatics held leading positions, the rise of science was equated with satanic deeds. All pre-Islamic artifacts were religious. Therefore, very few examples of science, art and culture have survived from ancient times.

As the representatives of Islam achieved their goals, the scholars gradually began to manifest themselves. Now not only religious but also secular sciences have become a necessity for mankind. Caliph Harun al-Rashid was founded in Baghdad in 766-809. Bayt ul-Hikmat (or "Khizonat ul-Hikmat") was a scientific institution that unites scholars. Al-Ma'mun Baba al-Mansur multiplied the number of books collected in the palace by his father Harun al-Rashid.

The library in the palace was called Bayt al-Hikma during the time of Harun al-Rashid. He then left the library to work as a translator. As a result of al-Ma'mun's constant attention was paid to the Bayt al-Hikma, his name has always been associated with historical sources.

In Uzbek works it is called "House of Knowledge" or "House of Wise Men". It should be noted that most of the sages gathered in the Bayt al-Hikma were scholars from Khorasan and Central Asia. They met al-Ma'mun in Marw and later moved to Baghdad at the invitation of the caliph. In the palace of Al-Ma'mun - among the Central Asian scholars studied Muhammad al-Khwarizmi, Yahya ibn Abu Mansur, Habash al-Hasib al-Marwazi, Khalid al-Marwarrudi, al-Abbas al-Jawhari, Ahmad al-Farghani. 'teeth are possible. In general, al-Ma'mun paid a great attention to science led to a number of achievements in almost all the sciences of the time, including Mathematics, Astronomy, Medicine, Chemistry, Geography, Philosophy, Logic, Literature, and religion. The Arabic translation of the works of ancient Greek philosophers on philosophy and logic aroused great interest among al-Ma'mun and all the scholars of the time. Muslim authors began to write commentaries, commentaries, and abbreviations on these works, and as a result, they published new works on Philosophy, Logic, and Theology.

It should be noted that the work of Central Asian scientists in Baghdad has made a significant contribution to the development of Humanities. In particular, the names of such scholars as Muhammad al-Khwarizmi, Abu Bakr al-Razi, Ahmad al-Farghani, Abu Nasr al-Farabi, Ahmad as-Sarakhsi, Ahmad as-Saghani are mentioned with deep respect all over the world. Indeed, Central Asian scientists took part in the revival of the ancient sciences, systematizing a number of natural sciences with their works, shaping them as a science and enriching them with new ideas.

It is obvious that in our past not only scientists but also the immortal stars of the scientific pick have matured.

The following ideas about knowledge and acquisition of knowledge are stated in the hadiths:

"Striving for knowledge is both an obligation and a duty for every Muslim."

" Study from the cradle to the grave."

"One hour of study is better than one night of prayer."

"If a scientist does not speak enthusiastically when asked about his knowledge, he will be put on fire on the Day of Resurrection."

"Be a scientist first! At least be a student or a listener, a lover of science. "

"The advantage of charity is that a Muslim learns knowledge and then teaches it to other Muslim brothers."

**Abu Rayhan Biruni** said the following about knowledge: For example, "Monuments of Ancient Peoples" (original name "Alosar al Baqiya an alqurun alholiya") - the work tells about almost all areas of knowledge, passing from science to science. : "The goal is not to prolong the sentence, but not to bore the student. Because constantly looking at the same thing leads to boredom and impatience. As the student moves from science to science, it is like walking in different gardens. Before managing to do one thing, the other begins, and the person is interested in seeing and

wanting to see them, as it is said, "Every new thing has its own flavor." One thing is tiring, it is tiring to remember. "

Beruni said that a good idea is "ignorant" even for those who do not implement it. It is useful to argue that "riding on ignorance and arguing with someone who keeps his word will not benefit the owner of the goal or the goal".

"Ignorant people are prone to superstition."

"Knowledge is the fruit of repetition and revision".

#### **Abu Nasr al-Farabi said about science and scholars:**

1. "Education is about words and learning."
2. "Education is done through practice, that is, through experience will be increased".
3. "Whoever speaks of knowledge and wisdom, let him start from his youth, let him keep his word, let him abstain from evil deeds, let him stay away from betrayal, deceit and trickery, let him be pious, let him not deprive himself of knowledge and the people of knowledge".

#### **Ahmad Yugnaki's Hibbat al-Hakayik echoes these ideas.**

Knowledge opens the way to happiness, so

Be knowledgeable, seek the path of happiness.

The following remarks of Yusuf Khas Hajib are also noteworthy.

He reads intelligently, he knows knowledge,

Achieves an educated, intelligent wish.

All goodness is due to knowledge. It is as if knowledge leads to the sky. The word came down from the green sky. Man glorified himself because of his word.

The IX-XII and XIV-XV centuries were not the golden age of scientific development of the East. Although many scientists were born and left an indelible mark on the history of mankind with their discoveries before and after it in our country. Encyclopaedic scholars, who had a place in world civilization during the Golden Age, worked for centuries to appear. Only Ibn Sinna's Laws of Medicine (Al-Qanun fit-tibasari) were used in the world's leading medical schools until the 19th century. Mirzo Ulugbek's book "Ziji Jadidi Koragoniy" was a necessary guide for astronomers. They are just like a drop in the ocean. Bobur's book was not only geographical, but also ethnographic, biological, and educational.

From time immemorial, science has been likened to a lamp that illuminates the path of humanity, and scientists have been the pioneers carrying the torch. In particular, if the horns gathered wise ministers around them, the state prospered. The country, where the ruler gathered ignorant ministers around him, was in a state of unspoken decline. Kaykovus said this in the "Kobusnoma" about knowledge and wisdom.

While glorifying the importance of knowledge and intellect, Kaykovus puts the knowledge above than wealth: It is better to be intellectually rich than to be financially rich, because one can accumulate wealth with one's mind, but one cannot learn wisdom with one's wealth. Know that

the mind is a mold that cannot be stolen by a thief, that it does not burn in fire, and that it does not flow into water”.

Nizomulmulk wrote in his “Siyosatnoma” (Policy) the following.

"It's a public event, and it's the right thing to do".

"If the news spreads in the country that the king will receive the oppressed for two days, punish the oppressors, punish them and listen to the words of the people and punish the oppressors, then the oppressors will not commit atrocities for fear of the consequences".

This is evidenced by the fact that our ancestors paid great attention to the justice of the state.

However, there were cases when scholars refused to create important works. Ibn Sina, who did not want to live in the Sultan's palace, went to Khorasan in search of knowledge, and Beruni went on a trip to India.

Given the vast potential of the scholars of that time, they were given the rank of encyclopedic scholar.

For example, the works of Ibn Sina that have come down to us. (Various sources state that he wrote more than 450 works, but 242 (160) of them have come down to us. Of these, 80 are related to philosophy, 43 to medicine, and the rest to logic, psychology, nature, and astronomy. However, not all of these books have been studied by scholars in the same way.

The state flourished during the reign of Timur and the Timurids, because the kingdom was enriched with scientists and artists brought from other countries. In the Middle Ages, Movarounnahr and Khursan were remembered not only for their architectural monuments, but also for their high scientific development. Leading scientists of the world began to hold scientific conferences at the Ulugbek Palace. In particular, the great astronomer and historian Mirzo Ulugbek created a unique school of astronomy in Samarkand. Along with Ulugbek, the famous mathematician and astronomer of his time Kazizoda Rumi (Salahiddin Musa ibn Muhammad), Giyosiddin Jamshid Kashiy, a student of Ulugbek, "Ptolemy" of his time! Ali Kushchi (Alouddin ibn Muhammad) and others, who became famous by the name of, carried out scientific research together and made a significant contribution to the world's scientific treasury. The famous philosopher Ali ibn Muhammad Jurjani, the famous physician Mevlana Nafis, the poet Khayali Bukhari, the author of the epic "Yusuf and Zulayho" Durbek, the well-known representative of the genre of kasida, Uzbek poet Sakkoki Calligrapher Abdurahim Khorezmi and others lived and worked in Samarkand under the auspices of Ulugbek. Also, many famous scientists, poets and scholars of the East often visited Samarkand. During Ulugbek's reign a unique school of historiography appeared. Well-known historians of the 15th century, the author of "Zubdat at Tavorix" (upper part of the history) Hafiz Abror Matla as-sadayin and the complex al-Bahrain "(The union of two seas and the melt of two blessed stars) Mirkhand, the author of "Gardens of Paradise", Khandamir Ulugbek, the author of "Habib us siyar" (Letter to a friend) and a number of other works. they grow up in a cultural environment. The cultural center of the Ulugbek period, later renamed the Ulugbek Academy, was first recognized by the famous French writer and scientist Voltaire (1694-1778). After the Mamun Academy, founded in 1010 in the history of our ancestors, Uugbek academy emerged as the second academy in Central Asian history.

At a time when Ulugbek and other scholars were working in Samarkand, Shahrukh Mirzo and Gavharshod Begim were collecting the world's rarest books in Herat.

In the second half of the 15th century, the heirs of this scientific heritage did a lot of work. The names of Gadoi, Atoi and others were also known and popular.

Speaking about the importance of science, Abdurahman Jami explained the role of the book in the acquisition of existing knowledge and the virtues of the book. For example:

Turn to the book, O my dear child,

Enjoy the book, listen to me.

Munising in solitude, if you know, is a book,

It is a book that shines on the dawn of wisdom.

The scholar compares the book with a "skin-covered scientist". Abdurahman Jami emphasized the need to acquire knowledge from a young age. At the same time, he condemned ignorance and pits the wise and the ignorant against each other:

First of all, child, enjoy knowledge,

Get out of the land of ignorance, the path to knowledge.

**Navoi in his work "Nazm ul-javohir" describes the following about education:**

Whoever is a scholar, at the right time,

When a party is held, paradise is absolute.

Anyway, at least I didn't go down without explaining myself first.

If it's Urn in the meeting, it's time to fly.

In the content of these verses, he is knowledgeable: a wise man overcomes any difficulty in achieving his goal, and if he takes the perfect as his support, he will never stumble, because science serves to ensure human happiness. The idea is reflected.

Hussein VoizKashifiy emphasized that "Knowledge is necessary for living, not for gaining wealth and the world". The scholar emphasized that the best way to study a thorough and in-depth science is to combine the learned knowledge with practice. In doing so, he interprets the human mind as the basis of activity, which, in turn, goes far ahead of his contemporaries, arguing that this activity is the basis for the creation of new knowledge. In particular, in "Ethics of Muhsini" was emphasized the interaction between mind and activity of speaking connection, all people feel the need for the mind, and the mind feels the need for the organization of practical activity. In the eyes of the scientist, action was as a mirror of the mind.

Wars over the throne destroyed the two great empires, so in the early 16th century, another educated heir to the throne, Babur, renounced his homeland and was forced to wander in foreign lands. If that was not happened maybe TajMahal would have adorned one of the cities of Movarounnahr!

In conclusion, we can say that the Eastern Renaissance became a force that significantly satisfied people's scientific faith and thirst for knowledge. The Middle Ages made a significant

contribution to the awakening of the sleeping West. The works of ancient Greek, Roman and other ancient scholars, which had almost reached the point of oblivion, saw the world for the second time and have now become a vital necessity. Thus, the East truly became the cradle of Western science and scholars.

## VIDEO CONTENT AS A TECHNOLOGY FOR THE FORMATION OF PROFESSIONAL COMPETENCE OF A FUTURE GERMAN LANGUAGE TEACHER

**Suleymanova Nilufar Kamilovna\***

\*Lecturer,

Department of Theory and Practice of the German Language,  
Uzbekistan State University of World Languages,  
UZBEKISTAN

### ABSTRACT

*The article discusses video content as a technology that allows the formation of the professional competence of a future German teacher, built on authentic, audio-visual symbols and capable of programming the thinking and behavior of a future teacher in a certain way. The use of non-standard forms of learning through technology using ICT in the classroom. Developing the creative potential of the imagination of future teachers with the help of skills in working with films and fragments of films of various genres, adaptation of literary works, social advertising, interviews.*

**KEYWORDS:** The Use Of ICT In The Classroom, Future Teacher, Video Content, Audiovisual Media, The Development Of Creativity, Critical Thinking, Motivation, The Function Of Video Content.

### INTRODUCTION

The current stage is characterized by the impact of technological acquisitions of modern communication resources (computer technology, video, Internet, television), which require a “radical improvement of the system of teaching the younger generation the German language, in the training of specialists who are fluent in them, by introducing advanced teaching methods using modern pedagogical and information and communication technologies and on the basis of creating conditions and opportunities for their wide access to the achievements of world culture and world information resources, the development of international cooperation and communication.” [1]

The foregoing directs the state policy of our Republic to "training highly qualified personnel in accordance with the modern needs of the labor market, increasing the availability and quality of educational services." [2]

The qualified training of future teachers is inextricably linked with their training in higher pedagogical educational and the process of their preparation for professional and pedagogical activities. In this regard, the need arose "to radically revise the entire system of our education, expand the opportunity for mastering professional knowledge, and strengthen the orientation toward training specialists who are able to work in new conditions, using new, modern technologies". [3]

Such a new condition is "information support of the pedagogical process based on information technologies, computerization, Internet information in educational conditions" [2], which allow future specialists to independently learn the German language according to modern requirements, independently analyze the necessary information, be able to put it into practice in order to communication, the ability to conduct a dialogue of cultures, to experience aesthetic satisfaction in the process of studying works of art and in the development of media texts with aesthetically valuable content.

Modern communication technologies, including video, computer technology, the Internet and mainly in the form of foreign media texts, contribute to a more active and fruitful cultural dialogue.

There was a need for future teachers to develop competencies aimed at independently obtaining the necessary information with the ability to analyze and synthesize it. The aforesaid necessitates teaching future teachers of the German language to practice various types of media, perceiving their "language", studying the large flow of information recommended by video content, applying it for pedagogical purposes, determining the manipulative effect of video content, and expressing oneself on the basis of video content.

"The use of modern information technologies in the educational process will significantly increase the effectiveness of teaching methods and will improve the work of teachers to improve their pedagogical skills" [4].

Researcher Sh.Kh. Kadyrov notes that "the active use of information and communication technologies in vocational education not only provides a fresh look at the pedagogical process, but also provides the necessary scientific and methodological basis for its analysis and updating." [5]

"Information technologies have methodological functions and certain didactic properties that allow their introduction into the learning process." [6]

Professor L.T. Akhmedova believes that "the meaning of the new educational approach is in the free creativity of teachers and students working using new teaching technologies, and not in strictly following the algorithm of certain techniques." [7]

Video content - content work with video when creating your own videos, the process of creating video material, one of the non-standard forms of learning through technology using ICT in the classroom.

The use of video in lessons is “one of the most effective means of optimizing the educational process, developing the creative potential of a person, as well as ensuring the possibility of effective self-realization” (EA Pepelyaeva, V.I. Pisarenko, S. A. Valetko).

According to G.K.Selevko, in order to make a lesson rich and interesting, simply viewing and analyzing a literary text is often not enough, other forms of educational activity should be involved. In this case, the use of visual materials, including videos, is suitable for developing the creative potential of future teachers. It should be noted that if the video is created by future teachers themselves, there will be much more benefit from the pedagogical point of view. [8]

Video content is an indirect expression of the environment, which is a form of representation of reality that requires decoding. From the point of view of German scientists RöstlerDietmann, Würfel Nicolas “the peculiarity of the media sign system is that the media contain a large number of sign systems: language, non-verbal (clothing, gestures, facial expressions), visual (video, film, television, Internet, graphics, photography), verbal (voice, intonation, articulation)”, etc. Video content, according to German scholars, is a symbolic form of expression similar to other forms of symbolic expression, such as theater, dance, literary works, and musical compositions.

In the course of the study of the problem of training qualified teachers with the help of video content, our attention was drawn to the study of A.P. Zhdanko, dedicated to the problem of using video content in teaching English. A.P. Zhdanko notes that video content helps to penetrate deeply into the content of the text being studied, to better understand its emotional side and its meaning, develop a reflection of the student of a foreign language. Also A.P. Zhdanko believes that the video clips created using video content technology develop the individual characteristics of those who study a foreign language, express themselves and present their culture in a creative way. [nine]

In the context of this work, we consider video content as a technology that contributes to the formation of professional competencies of a future German teacher, based on authentic audio-visual signs aimed at programming the thinking and behavior of a future teacher. Such video content has certain functions.

Analyzing the works of domestic and foreign researchers A. Abdukadirov, U.S. Begimkulov, R. Dzhuraev, H. Sh. Kodirova, O. A Baranova, E. A Bondarenko, S. N. Penzina, Yu. N. Usova, A. V. Fedorova N.F. Khilko involved in the study of information and communication and audio-visual teaching aids, we have identified the originality of video content based on 8 functions: developmental, creative, reflective, informational and communicative, rehabilitative, cognitive-heuristic, aesthetic, recreational and suggestive.

Features of video content are that:

- Video content creates “reality” in a certain way and for a specific purpose (advertising, opinion formation, etc.); (Zhdanko A.P.)
- Each of us interprets video content in its own way: the perception and interpretation of video content depends on factors such as gender, age, culture, life experience, etc. ;
- The axiological approach is traced in video content, i.e. the system of values necessary for studying the culture of native speakers;

- The creation of video content should give an advantage to the future teacher of the German language for creative expression of himself.

Our definition of the types and contents of video content functions and their application for the formation of the professional competence of a future German teacher through video content is presented in the following table below. [1]

TABLE 1.

№	Video Content Features	Content Content Features
1.	<b>Educational and creative</b>	The need for self-fulfillment becomes personally significant for students due to their age-related psychological and pedagogical features. Creative, creative activity provides them with this opportunity. Video content allows you to harmonize your personality, to reveal and develop creative abilities, to unite the team, contribute to the disclosure and realization of the potential and abilities of the future German language teacher.
2.	<b>Information and communication</b>	The future teacher can use images, sound, music as a means of expression and communication. With motivation, communication begins, both verbal and audiovisual. This function of video content is expressed in their dual nature. It is necessary for the future teacher to explain that, on the one hand, a film / video is a work of art in which the author expresses his worldview, attitude to reality, and on the other hand, "screen arts have their own, special language, that this language is different from that which is spoken with him music, art, dance, theater." And any language is a sign system.
3.	<b>Reflective</b>	It develops figurative, associative, logical creative thinking, helps to develop a value attitude to people, develops organs of sensory perception (hearing, sight, smell, touch, taste), sense of rhythm, composition, atmosphere of space; forms the ability to model the plot, contributes to the socialization of the individual. The function of video content is expressed in the creative comprehension and interpretation of visual narration. A feature of the future teacher's perception of the film / video is that they perceive the events of the film and the characters as really existing.
4.	Rehabilitative	The function of video content is to restore spiritual harmony, relieve tension. Art, including theatrical and audiovisual, has a healing, therapeutic effect and helps get rid of neurosis.
5.	Cognitive heuristic	Video content helps to identify the presence of unusual,

		highly specialized abilities and, with their help, to form skills and motives, ways of thinking and activities that can make up an arsenal of a competent reporter, photographer, cameraman, guide, translator in the future. Someone is attracted by the preparation of the scenario plan, and someone will gladly act as an actor, the third is interested in video, the fourth is editing, etc. The function is that video content is a means of knowing the world and self-knowledge. The diverse content of video content allows you to take into account the interests of each student and contributes to the self-determination of the future teacher.
6.	Aesthetic	There is a huge amount of scientific research on the impact of art on the inner world, the development of the future teacher. Developed aesthetic perception has a beneficial effect on cognitive, emotional, motivational development. The function of video content is to form an aesthetic perception and taste, a desire for beauty and creativity. Video art gives a value orientation to a esthetic consciousness.
7.	Recreational	The function of video content involves the use of video content to relieve tension, cultural entertainment, recreation.
8.	Suggestive	Function affects the human psyche. This function is a kind of indicator of one's own importance and need for others. If it is filled well, then the individual's self-esteem is growing. Criticism is perceived calmly.

Of no small importance is the principle of authenticity. Authentic video content contains an appeal to the viewer, that is, the ability to enter into dialogue with the characters, the author of the video content; diverse in style and topic, working with them is of interest to future teachers; illustrate the functioning of a language in a form accepted by native speakers and in a natural social context; are the best way to teach the culture of the country of the language being studied contain the most communicatively significant lexical units, common in typical communication situations. must successfully solve communicative problems and achieve a communicative goal, using a foreign language as a means of communication in various communicative situations. "

At the present stage, problem-based learning is an effective teaching technology that forms the necessary teacher competency system for the future teacher, develops the necessary personality characteristics for the future teacher, which are necessary for professional activities such as self-development, self-education, self-education, independence. In the process of creating our model, we relied on the requirements of the State educational standard of higher education, containing requirements for a foreign language for future teachers, based on the theory of "dialogue of cultures" M. M. Bakhtin. [10]

### **ABSTRACT**

*Brand equity is the intangible value added to a product by the effective use of promotion and other marketing tools. On dimensions like image, distribution and physical design, it can provide strong competitive advantages in product categories where most alternatives provide the same benefits. Consumer behavior is an important consideration when constructing a marketing plan. While revenue, sales numbers and all profit generating departments are important, when it comes down to it consumer behavior is a big part of the marketing puzzle. The present study investigates the Influence of brand equity on consumer purchase behaviour. The sample was selected from the population of consumers in Cargills branded products. For the purpose of data collection from the respective consumers, the 200 consumers were selected as sample from consumer's population. Based on the mean value, the influence of the brand equity on purchase behaviour are categorized into two levels. Brand element and brand perceived quality are in higher influence to purchase of Cargills branded products. Brand awareness, brand imagery,*

*brand performance, brand resonance and brand association are in moderate influence to purchase of Cargills branded products.*

**KEYWORDS:** *Brand Equity and Buyer Behaviour*

## 1. INTRODUCTION

Today is consumer face a growing range of choice in the products and services. They can buy; they are making their choice on the basis of their perception of quality, services and values. How the customer choose a brand among many brands depend on the brand behavior. It implies the companies to understand the brand behavior of the consumer in order to attract to buy their goods and services (Kotler, Leong, Ang and Tan, 2005) . The consumer decision-making, regarding purchase and utilization of different products and services, is influenced by many internal as well as external factors. Among the external factors, the most important and significant are the attributes of the product itself, the brand and the package in which it is in cased. Attributes are those descriptive features that characterize a product or service- what a consumer thinks the product or service is or has and what is involved with its purchase or consumption.

Consumer buying behavior is affected by many socio-cultural factors like social class, demographics, personality, and beliefs etc. However, besides these, the product itself also makes their decision for them because of the message it transmits, the visual impact it makes, the significant colours and logo of the brand, the brand image and awareness, and the price. Price is a particularly important attribute association because consumers often have strong beliefs about the price and value of the brand and may organize their product category knowledge in terms of the price tiers of different brands.

A successful brand name is the most valuable resource a company has the brand name encompasses the years of advertising , good will, quality evaluation, product experience and other beneficial attributes the market associate with the product (Philp R Cateora and John L.Graham 2005 ).A brand is a unique and identifiable symbol, association, name or trademark which serves to differentiate competing products or services; it represents not only a physical trigger but moreover an emotional hooks to create a relationship between consumers and the product/service (Blackston 2000).

The creation of an effective brand not only captures a greater share of the market, but optimizes marketing effectiveness as well. Successful branding requires a strategic perspective. Strong and durable brand concepts communicated to well target segments result in favorable brand images which reflect the brands identity. Brands signal a level of quality to consumers and can be effectively used to gain a competitive advantage. Branding has been generally recognized as the key to success in nowadays business, especially in rapidly developing fields. It provides value to the consumer through the buying process and thus assures value to the company by attracting consumers and stimulating loyalty. Brand image represents a set of associations established within the minds of customers, implying a promise to them and representing what the brand currently stands for (Batra & Residencer 2004). Image represents what consumer's think of you, while identity represents who your brand is and what it stands for.

The brand name is quite often used interchangeably within brand, although it is more, correctly used to specifically denote written or spoken linguistic elements of any product or image of company. Brand image are typically the attributes one associate with a brand. Here we want to consider, the brand owner will seek to bridge the gap between the brand image and brand identity. Effective brand names build a connection between the brand personalities as it is perceived by the target audience. Typically, sustainable brand name is easy to remember, transcends trends and have positive connection. Brand identity is fundamental to consumer recognition and symbolizes the brand's differentiation from competitors. Therefore, it is important, to empirically examine the actual impact of brand name on Purchase behavior. Such understanding or finding will help to organization (special reference to Cargills brand products) and customers of the Cargills brand products in Jaffna district to establish the better management of firm –customer relationship and to induce the buying behavior.

### **1.2 car gills in Sri Lanka**

Cargills Food City has been hailed the most valued retail brand in Sri Lanka for 2006, with the company being placed third in the top ten list of the most valued brands behind Dialog Telekom and DCSL. The Brand Index 2006 issued by Brand Finance Lanka has also rated Cargills Food City as AA- for Brand Strength, a rating, which is conceptually similar to company credit ratings. Ruchi Gunawardena, Managing Director Brand Finance Lanka noted that: "Cargills Food City has been rated as the most valuable Retail brand in Sri Lanka for creating value through reinventing retail heritage by bringing super marketing to the masses." Gunawardena added, "Basically Cargills Food City has had the ability to re-invent itself to reach the masses. Their strategic innovation has created great value". Commenting on the rating Ranjit Page, Managing Director of Cargills (Ceylon) Limited said: "We are proud and honoured to have been recognised as the most valuable Retail Brand in Sri Lanka. But our success has not stemmed from expansion alone." Page noted that the business philosophy that has underpinned this success has been simple. "We try to make sure that through our core business we enrich the lives of the masses and empower their livelihoods. We are proud to have masterminded a unique business model enabling the direct purchase of rice, vegetable and fruit from our local farming community. In line with our ethos of fair trade Cargills currently partners over 7000 such farmers guaranteeing them a minimum price, which is about 20% above the cost of production," he said.

Cargills Food City has also introduced the innovative "Best Buy" campaign, which is an unprecedented drive to bring down the cost of living. The year long campaign slashes the prices of over 100 products every month and offers the lowest market price for over 25 essential items and the best price for another 15 items. "We identified that it is meaningless to offer a few gifts to a handful of customers just for the New Year or Christmas. Cargills decided that our offers should be extended to all customers across the board throughout the year. So we use our position as the leading Retailer to get the best price for the consumer," explained Sidath Kodikara, Executive Director, Cargills (Ceylon) Limited. Cargills Food City currently operates 110 outlets spread across 17 districts with its latest addition in Nittambuwa.

### **1.3 Research objectives**

- To study on the influence of brand equity on purchase behavior
- To find out influence of brand element in the Cargills Brand name on purchase behavior.
- To find out influence of brand awareness in the Cargills Brand name on purchase behavior.

- To find out influence of brand imagery in the Cargills Brand name on purchase behavior.
- To find out influence of brand resonance in the Cargills Brand name on purchase behavior.
- To find out influence of brand performance in the Cargills Brand name on purchase behavior.
- To find out influence of brand association in the Cargills Brand name on purchase behavior.
- To find out influence of brand perceived quality in the Cargills Brand name on purchase behavior.

## 2. LITERATURE REVIEW

### 2.1 brand equity

Brand equity has been defined as “outcomes that accrue to a product with its brand name compared with those that would accrue if the same product did not have the brand name” (Ailawadi, Lehmann, and Neslin 2003, p. 1), i.e., the benefits a product achieves through the power of its brand name. Keller and Lehmann (2003) delineate three approaches for assessing brand equity: customer mind-set (e.g. Aaker 1996, Keller 2008), product-market (e.g., Park and Srinivisan 1994), and financial-market (e.g., Mahajan, Rao, and Srivastava 1994). These approaches have different strengths and weaknesses (Ailawadi, Lehmann, and Neslin 2003). While financial-market measures theoretically capture current and future brand potential, they often rely on subjective judgements or volatile measures to estimate future value (Simon and Sullivan 1993). Product-market measures are more closely related to marketing activity but don't capture future potential (e.g., Kamakura and Russel 1993; Swait et al. 1993). More importantly, both approaches have limited diagnostic value. Customer mind-set metrics, on the other hand, identify brand strengths and weaknesses (Keller 1993). While these provide insights for strengthening brand equity, they provide little information about brand performance in terms of market share or profitability.

Keller (2008), and this paper, focus on customer mind-set equity, which Keller refers to as “customer-based brand equity.” According to Keller, the “power of a brand lies in what customers have learned, felt, seen, and heard about the brand” (p. 48), i.e., the customer mindset. He develops a theory that identifies two key elements of mind-set equity (see also Keller and Lehmann 2003): (1) awareness and familiarity, and (2) strong, favourable brand associations. It is therefore imperative that any customer mind-set measure of equity include both awareness/familiarity and brand associations.

### 2.2 Buyer behaviour

The topic of consumer behaviour is one of the massively studied topics by the researchers and marketers in the past and still being studied. Researchers show different reasons as to why consumer behaviour has been the topic of many academics and researchers. One of the common views is that understanding consumer behaviour has become a factor that has a direct impact on the overall performance of the businesses (Kotler and Keller, 2012). Another view suggests that understanding consumer behaviour has become crucial especially due to fierce competition in retail industry in the UK and worldwide (Lancaster et al, 2002). This chapter will introduce some other areas of research background of consumer behaviour addressing the works of researchers and marketers.

It is worth noting that consumer buying behaviour is studied as a part of the marketing and its main objective is to learn the way how the individuals, groups or organizations choose, buy and use

and dispose the goods and the factors such as their previous experience, taste, price and branding on which the consumers base their purchasing decisions (Kotler and Keller, 2012).

One of such studies of consumer buying behaviour has been conducted by Acebron et al (2000). The aim of the study was to analyze the impact of previous experience on buying behaviour of fresh foods, particularly mussels. In their studies the authors used structural equation model in order to identify the relationship between the habits and previous experience on the consumer buying decision. Their findings show that personal habits and previous experience on of the consumers have a direct impact on the consumers' purchase decision in the example of purchasing fresh mussels. They also found that the image of the product has a crucial impact on the purchasing decision of the consumer and further recommended that the product image should continuously be improved in order to encourage the consumers towards purchasing.

Another study conducted by Variawa (2010) analyzed the influence of packaging on consumer decision making process for Fast Moving Consumer Goods. The aim of the research was to analyze the impact of packaging for decision making processes of low-income consumers in retail shopping. A survey method has been used in order to reach the research objectives. In a survey conducted in Star Hyper in the town of Canterville 250 respondents participated. The findings of the research indicate that low-income consumers have more preferences towards premium packaging as this can also be re-used after the product has been consumed. Although the findings indicate that there is a weak relationship between the product packaging and brand experience. However, it has been proven by the findings of the research that low-income consumers have greater brand experience from the purchase of 'premium' products when compared to their experience from purchasing 'cheap' brand products.

### **3. METHODOLOGY**

#### **3.1 Sample selection and Sample size**

The sample was selected from the population of consumers in Cargills branded products. For the purpose of data collection from the respective consumers, the 200 consumers were selected as sample from consumer's population.

#### **3.2 Sampling method**

The study had been organized to collect information from the respective consumers who are currently using the Cargills branded products. Convenient sampling method had been used for the sample selection.

#### **3.3 Method of Data Collection**

It refers to what are data are used to carry out this research study and how the data will be collected. The reliability and credibility of the research is depending on data collection. The study largely depends on the primary and secondary data. The primary data were collected through questionnaires with the respondents of 200 people those who are using Cargills branded products. The data collection has mainly two types. Primary data and Secondary data

#### **3.4 Structure of the Questionnaire**

The questionnaire developed based on two parts namely personal information and research information from 200 samples. In the research one of the ordinal measures called "Likert's five

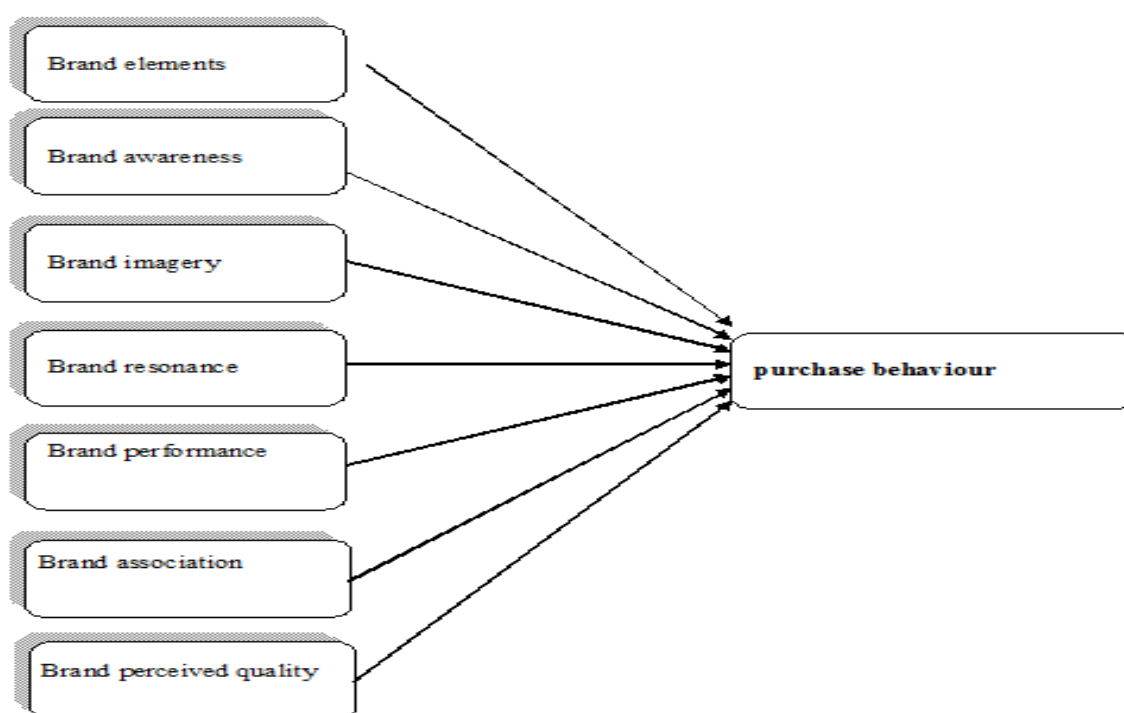

points rating scale” is used to require respondents to order their answers. The questionnaire was designed to measure the influence of Cargills brand on purchase behaviour. Therefore 200 questionnaires were issued to the consumers. The questionnaire consists of two parts, part I intended to collect the customers’ personal information and Part II intended to collect the information regarding research.

### 3.5 Method of Data Analysis

For this study univariate analysis (descriptive statistics) has been adopted using the SPSS (16.0) computer package. The population will be analyzed by central theorem analysis of mean, standard deviation. At the same time data will be presented Based on the values indicated in the questionnaire a mean value for each question is calculated.

### 3.6 conceptual frame work

## 4. Results and analysis

### 4.1 Results of descriptive statistics

The gender distribution represent of the consumers of the Cargills brand products has been represented by out of 200 respondents. Out of these 200 respondents 56% of the respondents were male and remaining 44% were female. Age distribution pattern of the consumers is represented by the out of 200 respondents. Age distribution was categorized into four classes. Among the sample, 29.5% represented the age category of 18-25 years. The high percentage of sample 30% were found between 26 and 45 years. 28.5% represented the age category of 46-55 years in remaining categories, 12% of consumers were found above 56, following table 5.2 shows the age distribution of the sample.

The educational qualification of respondents were classified into six categories in the questionnaire, and out of 200 respondents 5% of the respondents had the qualification of the primary level, and 7% of the respondents had the qualification of secondary level and 18% of the respondents had the qualification of up to O/L, 42% of the respondents had the qualification of up to A/L, 19% of them had a bachelor degree, where remaining 9% of them had some other Professional qualification. Eight groups of respondents according to their nature of designation. 9% of respondents were in professional jobs, 9.5% of the respondents were doing business, 21% of respondents were doing government jobs, 9.5% respondent were Retired persons, 15% respondent were doing Self employment, 13% respondent were officers, 11.5% respondent did not do any other employment but 11.5% were no jobs among the out of 200 respondents.

The monthly income distribution of the consumers of the Cargills brand in Jaffna district has been represented by out of 200 respondents. For the research purpose the monthly income range divided into five ranges. 20.5% of the respondents found to get Below Rs.5000, 27.5% of the respondents found to get 5000-15000 as salary, 23% of the respondents found between the income level 15000-30000, and 17.5% of the respondents were getting 30000-50000 rupees, and 11.5% of respondents were getting above 50000 rupees. The consumer's residence situated close to the particular Cargills food city has been represented by out of 200 respondents. Out of these 200 respondents 39.5% of the respondents were close to the food city and remaining 60.5% were far away from the food city. The consumers work place situated close to the particular Cargills food city has been represented by out of 200 respondents, Out of these 200 respondents 34% of the respondents were close to the food city and remaining 66% were far away from the food city.

#### 4.2. Results of mean value

##### 4.2.1 Brand elements

The average value of the brand name (Mean value is 3.59) indicates that the extent of brand name is high in the Cargills brand in Jaffna district. In addition to this most of the respondents have merely somewhat different opinion regarding the Brand name (Standard deviation is 0.577). This variable includes three indicators which are Publicity, Memorable, and Easy to pronounce; all of these indicators show that the extent of brand name is high in the impact of Cargills brand. These indicators have the mean value of 3.65%, 3.55%, 3.57% respectively.

The Average value of the loyalty (Mean value is 3.04) indicates that the loyalty is moderate in the Cargills brand in Jaffna. Further as far as this dimension most the respondents are given equally different opinion about loyalty of Cargills brand. (Standard deviation is 0.602) .This dimension includes two indicators which are customer preference and customer loyal; all of these indicators show that the loyalty is moderate in the impact of the Cargills brand. These indicators are the mean value is 2.87%, 3.22% respectively.

The dimension of Attachment includes one indicator is estimation of the brand. That is explained by the following table 5.16. The Average value of the Attachment (Mean value is 2.93) indicates that the Attachment be in the Cargills brand in Jaffna. Further as far as this dimension most the respondents are given opinion about attachment of Cargills brand. (Standard deviation is 0.916) .This Dimension includes one indicator which is estimation of the brand, this indicator show that the procedure attachment is be present in the Brand of the Cargills. This indicator has the mean value of 2.93% respectively.

The average value of the Dimension Community (mean value is 2.98) indicate a moderate level of Community in the brand of Cargills. The standard deviation is 0.752 which indicate quiet different opinions of respondents regarding each statement of this dimension. This dimension includes two indicators which are people's relation with the brand and customer affiliation. All of these indicators show that the procedure is moderately relationship by the Community of the Cargills brand. These indicators have the mean value of 2.98%, 2.98%, respectively.

The average value of the Dimension Engagement (mean value is 2.98) indicate a moderate level of Engagement in the brand of the Cargills. The standard deviation is 0.786 which indicate quiet different opinions of respondents regarding each statement of this dimension. This dimension includes two indicators which are customer learning from Brand and perception. All of these indicators show that the procedure moderately Relationship by the Engagement in the brand of the Cargills. These indicators have the mean value of 2.9%, 3.06% respectively.

#### **4.2.5 Brand performance**

The average value of this Dimension (mean value 3.16) represent that the supplementary features is moderate level the Brand name of Cargills in Jaffna, and . The standard deviation is 0.833 of this dimension. This dimension includes one indicator which is special features. This indicators show that the procedure moderately Relationship by the supplementary of features in the brand of the Cargills. This indicator has the mean value of 3.16% respectively.

The Average value of the style and design (Mean value is 3.24) indicates that the style and design exist in the Brand name of the Cargills in Jaffna. and The standard deviation is 0.864 of this dimension. This dimension includes one indicator which is design aspects. This indicators show that the procedure moderately Relationship by the style and design in the brand of the Cargills. This indicator has the mean value of 3.24% respectively.

The Average value of the brand product price (Mean value is 2.69) indicates that the brand product price is moderate Brand of Cargills . Further as far as this dimension most the respondents are given equally different opinion about Brand product price of Cargills Brand. (Standard deviation is 0.720) This dimension includes two indicators which are Price and frequently adaptation of price; all of these indicators show that the Brand product price is moderate in the Brand of the Cargills. These indicators are the mean value is 3.15%, 2.23%, respectively.

#### **4.2.6 Brand association**

The Average value of the strong (Mean value is 3.18) indicates that the Strong is moderate in the brand of the Cargills . Further as far as this dimension most the respondents are given equally different opinion about strong of the Brand name of Cargills. (Standard deviation is 0.665) .This dimension includes two indicators which are strong relevant and strong consistency; all of these indicators show that the Strong is moderate in the Brand name of the Cargills. These indicators are the mean value is 3.24%, 3.12%, respectively.

The average value of the Dimension favorable (mean value is 3.17) indicate a moderate level of favorable in the brand of Cargills. The standard deviation is 0.665 which indicate quiet different opinions of respondents regarding each statement of this dimension. This dimension includes two indicators which are favorable durability and favorable selection. All of these indicators

show that the procedure is moderately Relationship by the favorable of the Cargills brand. These indicators have the mean value of 3.18%, 3.16%, respectively.

#### **4.2.7 Brand perceived quality**

The average value of the Dimension Brand quality (mean value is 3.60) indicate a high level of Brand quality in the brand of the Cargills. The standard deviation is 0.737 which indicate quiet different opinions of respondents regarding each statement of this dimension. This dimension includes two indicators which are assessment and satisfaction.. All of these indicators show that the procedure high Relationship by the Brand quality in the brand of the Cargills. These indicators have the mean value of 3.66%, 3.54% respectively.

The average value of the Creditability (Mean value is 3.73) indicates that the level of brand name is high in the Cargills brand . The standard deviation is 0.895 of this dimension. This variable includes one indicator which is Innovative aspects; this indicator show that the extent of creditability is high in the Brand name of Cargills. This indicator has the mean value of 3.73% respectively.

The Average value of the Superiority (Mean value is 3.34) indicates that the extent of Superiority is moderate in the brand of Cargills . Further as far as this dimension most the respondents are given equally different opinion about Superiority of the Cargills brand. (Standard deviation is 1.029). This dimension includes one indicator which is Advantages; this indicator show that the extent of Superiority is moderate in the brand name of the Cargills. This indicator has the mean value of 3.34% respectively.

#### **4.2.8 Overall analysis of Cargills brand name on purchase behaviour**

Having completed the Dimension wise analysis of the brand name of Cargills it helps to make analysis of overall Level of the influence of brand name of Cargills on purchase behaviour. Eventually when observe the influence of brand name of Cargills on purchase behaviour , it clearly disclosed that the influence of Brand name are moderately level (mean vale is 3.21) , and most of the respondent's common opinions toward influence of brand name is moderately level and also support to identify the influence of Cargills brand name on purchase behaviour.(standard deviation is 0.360)

### **5.DISCUSSION**

From the results of this research some important features are found on the influence of Cargills branded products on consumer purchasing behavior in Jaffna district. Followings findings have established based on research. When considering the gender, male mostly prefers to purchase the Cargills branded products based on the quality of Cargills branded products is high. Consumers who mostly use Cargills branded products are in the age of 18 to 25 and 26 and 45, because many varieties of Cargills branded products are available their and they are familiar to the products. G.C.E O/L, A/L and degree completed consumers mostly purchase Cargills branded products, because they are much aware of Cargills branded products. Government staffs, self employees and officers mostly purchase Cargills branded products, because the location is much convenient to them. Survey data reveals that most of the consumers are not closed to city, because most of the employees are out of the city and the do purchasing on the way to their residence. Consumers who are earning between 5000 – 15000 and 15000 – 30000 mostly purchase Cargills branded products.

Brand element: - According to the data analyzed, in Jaffna district Cargills name, logo, packaging and symbol are well known among consumers. It is influencing high level on Cargills branded products. Brand awareness: - brand awareness is influencing moderate level on Cargills branded products. brand awareness on Cargills branded products is less among consumers do not know what type of Cargills branded products are available. Brand resonance: - Brand resonance is moderately influencing on Cargills branded products. Male prefer Cargills branded product while purchasing than female. Female visit Cargills food city only for purchasing purpose, not considering Cargills branded products. Brand imagery: - Brand imagery is influencing moderate level on Cargills branded products. Students and secondary educated groups give less important on Cargills branded products. Higher numbers of students visit Cargills food city, but they feel that security, social approval and self respect on Cargills branded product are less, they consume with lack of knowledge and without any idea. Brand performance: - Brand performance is moderately influencing on Cargills branded products. Consumers in the category of above age 56 and secondary education have lack of involvement in Cargills branded products. They do not look in to the special features and price offer and it's frequently adaptation of pricing system. Brand association: - Brand association is moderately influencing on Cargills branded products. All income, occupational and educational groups expressed moderate level on Cargills branded products regarding brand association. Strength and favorable evaluation of Cargills branded products also moderately expressed by both male and female consumers. Brand perceived quality: - Brand perceived quality is highly influencing on Cargills branded products. All groups perceived the high quality of Cargills branded products like Cargills Meats, Cargills Magic, Cargills KIST, Cargills Lanka Milk and Cargills Supremo based on their perception. They satisfied with the products, so they expressed high level of satisfaction.

## 6. CONCLUSION

Based on the mean value, the influence of the brand equity on purchase behaviour are categorized into two levels and discussed in detail with possible causes. Brand element and brand perceived quality are in higher influence to purchase of Cargills branded products. Brand awareness, brand imagery, brand performance, brand resonance and brand association are in moderate influence to purchase of Cargills branded products.

## ON THE ISSUE OF THE CHRONOLOGY OF THE HISTORY OF THE BAIHUA LANGUAGE

**Khasanova Feruza Mirzabekovna\***

\*Senior Lecturer,  
Tashkent State University of Oriental Studies,  
UZBEKISTAN

### ABSTRACT

*This article discusses the concepts of «Baihua» and «wenyan », their similarities and differences, as well as the burial language of these two realities of the Chinese language. The grammatical and lexical-semantic features of classical Chinese and Baihua, as well as their mutual influence are noted. As it is known, in Chinese before the declaration of Putonghua in standard Chinese, in parallel, there were two realities, this is the classical Chinese language - wenyan , which was relevant in China until the end of the twentieth century, and Baihua "spoken language". Laconic sayings on wenyan, texts of classical works of Chinese literature contain about half the number of hieroglyphs than the same text on Baihua. In wenyan, monosyllabic words (written in one hieroglyph) predominate, while in Baihua, disyllabic words (written in two hieroglyphs) dominate; in the Wenyan texts, transposition is a frequent phenomenon, when many hieroglyphic words in different situations can be different parts of speech; reliance on context is used, in particular, to avoid unnecessary pronominalization (use of pronouns), frequent non-use of subjects in general; no punctuation; no affixation. According to Chinese linguists, the first works on Baihua appeared in the period of the Song dynasties (960- 1279) and the Yuan (1271-1368). The flourishing of Baihua prose falls on the Song-Yuan epoch (10th-14th centuries), when significant changes took place in social and cultural life, reflected in literature as well. One of the most important features of spiritual life is the development of folk forms of culture: folk theater, different types of folklore (narrative genres, narratives). Prose on Baihua , i.e. in the literary language, which is close to the Conversational Speech ( Baihua Xiao Shan ), is one of the most important types of Chinese literature of the Middle Ages and one of the main directions of the creative activity of Writers since the XI century. In the twentieth century, this type of literature became the basis of modern prose (novel, story). The name Baihua Xiao Shan is a*

*concept of a late period, when in Chinese culture the distinctions between two literary languages were clearly designated: the classic "wenyan" and the colloquia "Baihua".*

## INTRODUCTION

The Chinese language has a history of four thousand years in terms of development and has undergone many changes. The changes are mainly related to the grammar, vocabulary and phonetics of the Chinese language, and have been the subject of much controversy to date. So far, world sinologists, **Bernhard Karlgren, Herbert Allen Giles, Henri Paul Gaston Maspero**, A.A. Dragunov, I.T. Scientific researches of Chinese scholars such as Zograf, S.E. Yakhontov, A and in Uzbekistan Khodjaev, M.X. Maxmudxo'jaev, A.A. Karimov, Sh.I. Shozamonov, Liu Shusyang, Xu Shiyang in China, Hu Shi those who did their investigation on the Chinese historical periods serious attention to the issue and they have tried to study certain aspects of that topic. But over time, their ideas on the chronology of the Chinese language require new approaches to linguistic theory. In fact, to date, there have been a number of studies on the history of the Chinese language in the PRC itself.

Although most of the research is devoted to the history of the Chinese language, it is studied from the perspective of the classical literary language - Wenyan. The lexicon of a known work of art is analyzed. Accordingly, the history of the Chinese language can only be interpreted in terms of the practical development of Wenyan. However, a classical ancient Chinese language only wenyan literary legal works, written in everyday language Baihua works. At this point, the study of the clear distinction between Wenyan and Baihua, the study of the lexical-semantic features of both aspects of a language, the influence of Baihua on modern Chinese Putonghua, determines the relevance of our study.

Much of the work studied has served as a theoretical source in determining the methodology of the topic of the article under analysis. At the time of writing the article, A.A. Dragunov, I.T. The works of Zograf, S.E. Yakhontov, Vanl Li, Liu Shusyang, Xu Shiyi, and Hu Shi were used as sources. The aim was to study the periodization of the history of the Chinese language, the emergence of the Wenyan and Baihua, and their periodicity.

The following have been identified as article objectives:

- 1) A critical study of scientific research on the periodization of the Chinese language;
- 2) Classical Chinese - Wenyan and the language of everyday communication - to determine the periodic boundaries of the Baihua;
- 3) Summarize the views on the periodicity of Baihua.

Article and others that benefit from a number of sources related to Lanier. Accordingly, the lack of coverage of the differences in the historical evolution of the Wenyan and Baihua languages, in contrast to the Wenyan, the lack and incomplete coverage of the history and narrowing of the Baihua determine the novelty and importance of the article.

### 1.1. General theoretical views on the history of the Chinese language

Bernhard Karlgren is the first European scholar to conduct research on the Chinese language using the historical comparative method. His research is devoted to the phonology of the Chinese language, advancing the idea of the phonetic reconstruction of ancient and medieval Chinese. Because Karlgren did not pay attention to the phonological structure of language in his research, his research was rejected by the scientific community. However, his scientific work was the first step in this field [ 1 ] .

Henry Paul Gaston Maspero, mainly engaged in research on the history of Chinese phonetics [ 2 ] . There were many Chinese and European scientists who have carried out scientific research work on chronology on Chinese language. Chinese linguists have taken phonetics as a criterion for analyzing the stages of development of the Chinese language. Continuing this tradition, Maspero also devoted his research to the study of terms of Buddhist teaching.

Russian sinologists have done a tremendous amount of research on this subject. Of these, A.A. Dragunov [ 4 ] , I.T. The scientific researches of Chinese scholars such as Zograf [ 6 ] , S.E. Yakhontov [ 15 ] deserve special recognition. Their research focuses on the history of the Chinese language, historical phonology, and analysis of works in Wenyan and Baihua.

Although the Uzbek school of Chinese studies were formed later than the European and Russian Chinese studies, some research has been done in this area. In particular, A. Articles by Khodjaev [ ] , MH Mahmudkhodjaev [ ] , AA Karimov [ 7 ] , Sh.I. Shozamonov [ ] were published.

In China , the issue of the historical chronology of the Chinese language has received serious attention by Wang Li [ 2 3 ] , Liu Shusyang [ 1 7 ] , Xu Shiyl [ 1 9 ] , and Jiang Lianshen [ 2 2 ] .

#### 1.2. The question of the chronology of the history of the Chinese language

a) The theory of the chronology of Chinese history by Chinese linguists:

In the history of Chinese linguistics, three historical aspects of the periodization of the Chinese language (moreover, in the history of the Chinese language) are distinguished. In particular, the great linguist scholar 王力 Wan Li " 汉语史稿 Chinese history" [ 2 3 ] manuscripts of the ancient Chinese language (wenyan or not Baihua the whole provided by the Chinese) to provide development point of view of the three major periods: 上古期 the archaic period , 中古期 medieval period and 近代期 modern era. 上古期 archaic period before the third period to 商, 秦 and 汉 periods; 中古期 period of the Middle Ages, IV century AD in the XII century, the period that 六朝, 唐 and 宋 periods; 近代期 modern twelfth century to the nineteenth century, the 元, 明, periods.

Linguist Xu Shiyl, in his monograph on the history of Baihua, states: "In their work, the history of the Chinese language is chronology as follows: some use pure pronunciation (phonetics) as a criterion for the chronology of the Chinese language; a number of scholars take the two as the norm, but no definite conclusion has yet been reached on the matter." [17]

The first and lower frontiers of the history of the Chinese language have their own scientific interpretations from a linguistic point of view. In addition, the medieval history of the Chinese language can be said about chronology points: 王力 Wang Li's "古代汉语 Gudang hanyu-ancient Chinese language" in the preface to the booklet two types according to their nature, the ancient Chinese written language system: "The pre-Chin period (the pre -Chin period includes the Chjungo and Zhang period, until 221 BC) was the first Chinese literary language formed on the basis of oral speech, and later the language of works written in imitation of that ancient Chinese (Wenyan); The second period refers to the ancient Baihua language, which was formed on the basis of northern dialects from the reign of the Tang (618-907) and Sun (960-1279) dynasties. However, speaking of the stages of the gradual development of the Chinese language, it interprets the two fronts as a whole, without dividing them into separate periods. However, between the classical literary language and the language of everyday communication, there is a big difference in the use of their lexicon.

江蓝生 Jiang Lansheng, in his scholarly work "古代白话说略 Ancient Baihua Summary, discusses the issue of chronology of Baihua as follows: "Ancient Baihua is inextricably linked with the nationalization of the ancient Chinese language. For a long time, the Chinese language taught in universities was divided only into "ancient Chinese" and "modern Chinese". "May 4 Movement" from the previous "Chinese ancient Chinese referred to as" 2 [2] . In this case, the difference between Wenyan and Baihua was not clearly distinguished and the exact norms of the range of both languages were not specified, and this view was not scientifically based.

胡竹安 Hu Djuan expresses the following opinion on the periodicity of the medieval Baihua language: The views of different linguists on the periodization of the medieval Baihua language are different, but it is necessary to rely on the "lexical-semantic" norm. This issue requires discussion. Because "vocabulary and semantics" are the most vital (especially in oral) language factors " [2 4] .

吕淑娴 Luǐ Shiyang, a Chinese linguist, writes in his book, An Essay on Chinese Grammar: "If the writing of each epoch changes according to the change of oral speech, the people of the 周 Zhōu and 秦 qin periods communicated in their language. They were the records; 唐 Tang and 宋 Song also spoke the language of the period, the people of their records. That would be a reference to the speech of that period. In this case, the issue would have been much easier. However, by the time of 周 Zhōu and 秦 qin , there was a gap between writing and speaking. The authors of the work began to use and imitate the written language of the 周 Zhōu and 秦 qin , period. As a result, " 文言文 wényánwén Wen Yan Wen reproduction of literary language" was formed. 文言 wén yán i.e " 古文 gǔ wén that " - also known as the old written language". Spoken language is called " 白话文 bái huà wén - the language used by the general public" [1 7] .

Relying on the above considerations, the ancient Chinese language chronology 文言 wén yán and 白话 bái huà two research areas, such as Red perfect has an important role. There are opinions of a number of scholars on the chronology of the ancient Chinese language, and each opinion has its own basis. From the above considerations, it is clear that Chinese linguists did

not rely on a clear norm in the chronology of the Baihua language. Although the two fronts, such as the classical literary language and the language of everyday communication, have been in parallel for some time in Chinese, the stylistics of the sources written in them are radically different. At this point, the issue of the periodization of the Wenyan and Baihua languages requires a serious approach.

The differentiating approach to language and speech phenomena was first introduced in the linguistic methods of Arabic linguistics formed in the VIII-IX centuries, and later in V. We find it in Humboldt's "energy" (motion, process, force) and "ergon" (product) in language, in A. Stendhal's "stable essence" and "forces in motion" in language, and in Bedouin de Courtenay's "stability and variability in language." But the scientific-theoretical and practical distinction between language and speech phenomena and their peculiar units; ways of revealing the essence of language and speech units, giving a completely new meaning to the concepts of "language" and "speech" are related to the doctrine created by F. de Saussure and his followers.

F. De Saussure tried to explain the dichotomy of language-speech by the example of the rules of the game of chess. In fact, the 64 squares on a chessboard are divided into two groups of two different colors in an equal position, opposite each other, the pieces in both groups are equal in function and value, the specific order of the pieces and the rules of movement are the same. The rules of the game of chess are mandatory for players, known in advance; they are always stored in the memory of the players. Even if both players have the same chances and follow the same rules of the game of chess, the players themselves will be in a position of one strong and one weak according to their ability to use the opportunities. Whichever chess player is able to consistently subdue opportunities in the path of his goal, he defeats an opponent who has not been able to take advantage of these opportunities. []

When comparing language and chess devices, it should be noted, first of all, that there are general similarities between their units (constituents).

In general, F. de Saussure's analogy of language and chess is widely used in explaining the essence of language and speech.

In modern system linguistics, based on the opposition of language and speech, it is stated that speech activity consists of the following three components: a) language; b) speaking ability (language skills and competencies); v) speech. []

Only when the relationship between language and speech is approached from a dialectical point of view, our perception of it, our knowledge, becomes complete and perfect. To better understand the relationship between language and speech, we must first feel the language itself, what kind of device it is.

Based on this doctrine, if Wenyan is the language of ancient classical Chinese, we can consider Baihua as speech. According to F. de Saussure, language and speech units are divided as follows: language units - phoneme, lexeme, morpheme, construction (device); units of speech - sound, background (letter), syllable, affix, morph, word, word form, phrase, sentence, and micro text.

Language is always changing. Although these changes are not noticeable in a decade, the changes in language are noticeable hundreds of years later. Of course, there have been many changes in the development of the Chinese language, which has a history of more than four

thousand years, which is confirmed by historical facts. These changes in three areas: phonetics, language and speech are reflected in the device binary " [15] .

Hence, in the study of the evolution of a language, it is expedient to interpret it in three main ways. At the same time 吕叔湘 Liu Shusyang found the following in mind, 《魏晋南北朝小说词语汇释》 the brochure at the beginning of the following points: "the mention of the Chinese language, grammar and vocabulary, 秦 Qin period ( er.av.221-207 y ) , and 汉 Han (202 BC - AD 220). Period of previous ancient Chinese language, Chinese, 宋元 (960-1368). A new era in Chinese language after Chinese as the language is no problem. 三国 (220-280). The three branches period to 唐 period (618-907 years) will not be the last days of the seven-year period, distribution, and name? This time, he argues 秦 Qin and 汉 Han period compared to the previous Chinese language course is very different to that of oral, but written speech, the Conservative cause, or some elements of it can be met here, only the late period of the Tang traditional classical literary language, in addition to oral classical literary language to the point you can see that the column " [17] .

Based on the views of 吕叔湘 Liu Shusyang and earlier Chinese linguists, ancient Chinese can be divided into two major systems, the Wenyan and the Baihua. At the same time, 徐时仪 Xu Shi across that ancient and medieval Chinese, approval of a new era in Chinese. Because Baihua language, both ancient and modern period. 汉 Xan and 魏 Wey days of each period Baihua language Baihua a new era, including some of the difference between the words or wenyan belonging to, or belonging to Baihua language, it is a new era Baihua old language of the word " [19] . 徐时仪 Yi Xu, a Shiite promote this idea of ancient Chinese fundamental research, based on the idea of becoming a number of linguists, based on his own personal reasons and Baihua chronology different approach to the language. In doing so, he explores the lexical-semantic development of the Baihua language, the evolution of the Baihua lexicon over time. As a result, 徐时仪 Yi Xu, a Shiite Baihua language of origin period (露头), Baihua language development period (发展) and Baihua language and mature period (成熟) to allocate three periods, and the Periods in the following order:

1. Baihua language of origin period (露头) – 秦- Qin and 汉 Han period to the 唐 Tang period, that is, 207 years BC, AD 618 year period;
2. Baihua language development period (发展)-唐 Tang period, until, that is, the period of 618 years, until 1368;
3. Baihua language and mature period (成熟) - 明 Ming period 清 Qin since the end of the period, i.e. 1368 until 1911.

As a result, the Baihua studied the evolution of language; we have tried to study in detail the views of the Chinese language on this topic, 徐时仪 Yi Xu, Baihua language, the history of

ideas as a science-based. This is because the author admits in his scholarly treatise that the history of the Chinese language refers not only to the history of Wenyan, but also to the Baihua language, which has dominated in all fields since the Sung period, not to mention Wenyan. It is clear from this that Wenyan remained only a classical literary language, and with the development of the state and society, the Baihua language changed and improved.

b) Views of Soviet-Russian Sinologists on the chronology of the history of the Chinese language:

S.E. Yakhontov's "Literary and Conversational Chinese Language VII-XIII centuries. B.C. ", I.T. Zograf's "Medieval Chinese monograph," Gurevich failure "Diachronic aspects analyze of the text different Genres s identical plot line (XIV-XVI vv.): Obtained Results" article shows that the use of resources such as, in this scientific work an analysis of works created at some stages in the history of the Chinese language is given. However, the history of the Chinese language does not contain detailed information about the formation and periodization of the Baihua language. I.T. Zograf only dwells perfectly on the medieval Baihua language. S.E. Yakhontov reveals the peculiar lexical features of the classical literary Chinese language Wenyan and Baihua, Gurevich S.I. also analyze and draw conclusions from the literature of various genres of the three centuries, i.e. the fourteenth and sixteenth centuries. At the same time, the specific lexical features of each work and period reflect the different aspects of the works created in Baihua and Wenyan.

M.V. Sofronov, in his monograph Chinese language and Chinese writing system, also discusses Wenyan and Baihua in detail: "There are two written languages in Chinese, Wenyan and Baihua. While the linguistic basis of Wenyan is ancient Chinese, the linguistic basis of Baihua is medieval Chinese. In the Middle Ages, a language are considerable differences in these two spheres, wenyan literature, philosophy, religion, science, politics styles of "high" art and literature, Baihua "low" genres : drama, novels, stories, novel, such as the works of the world came. " Although the difference between wenyan and Baihua is not clearly stated in these opinions, the author cites the basics of wenyan and Baihua. In wenyan is the main sources of literature, philosophy, religion, science, and politics. This indicates that the wenyan is only active in writing. Baihua points out that since speech is the language of everyday communication, it contains novels, stories, dramas, and narratives.

In the Uzbek school of Chinese studies, Candidate of political sciences Sh.I. Shazamanov and I.N. Bekmuratov's analysis of the language policy and the situation in China (sociolinguistic) " prospectus the following comments: "Some VIII - XV century China Baihua (Baihua) - a simple language, literary language, language and social life of the Polish community had generalized. Baihua relied on the norms of oral speech. It created the main literary genres of that period: short stories (later novels), poetry, and dramas. Hieroglyphs were used in the writing of Baihua texts, just as in Wenyan. Since that time, the tradition of using these two languages has been preserved in China's nationwide internal communication: from Wenyan to the medieval Devonian language and from Baihua to fiction used in literature, culture, and science. The fact that they had a single geographical record ensured their widespread use as a language throughout the country. In oral communication, the tradition of using unwritten dialect is still preserved. Sinologists ideas, combined with the above-mentioned Russian scientists sinology ideas, their ideas once again confirms. However, even in this pamphlet, there is no idea of the exact chronology of the Baihua and wenyan [29] .

### 1.3. The emergence of the Wen language and its role in the development of the Chinese language

Modern research shows that in ancient China there was no significant difference between classical literary language and oral speech. The content of Confucius' "论语 - Conversations and Reflections" was clear when reading. The first differences between oral and written point began to be observed in the II-III centuries AD. As oral language continued to evolve, vocabulary and grammar gradually began to change, while written speech remained, as it were, in shell, in isolation [13].

Until the early twentieth century, Wenyan was used as a literary language, but also as a means of universal Chinese communication, thus serving as a connecting medium between different dialects. This situation is similar to the situation of medieval European Latin, where Latin was known in medieval Europe everywhere, written almost identically in Latin, but with a different pronunciation. Like the Latin in the West, the Wenyan in the Far East<sup>1</sup> was considered the language of culture. National modifications of the Wenyan language have been used as canonical books, the language of elegant literature in countries such as Japan, Korea, and Vietnam. Anyone who knew wenyan could read the literature written in wenyan in any of the above-mentioned states.

Until the early twentieth century China alone there is a delay between the written and spoken language, the wenyan -Latin like a dead language, and has hardly changed over the centuries [6].

In Chinese language old literary language “文言 wényán” and “白话文 báihuà” two sessions.

Moreover, an object itself may be expressed in other words in the present and in the past. For example, the word "eye" of the ancient Chinese 目 mù said, the current Chinese 眼 yǎn the word "foot" is the ancient Chinese 足 zú says, the current Chinese 脚 jiǎo said, "lie" is the ancient Chinese 卧 wò says is now called 躺 tāng the word "to call" in ancient times 呼 hū in modern Chinese it is represented by the word 叫 jiào. Third, changes are also observed in the structure of speech. For example, in the 春秋 Chūnqiū period<sup>2</sup> “爾何知 ěr hé zhī - that is, what do you know?" With that in mind, today's " 你知道什么? style. 宋 Sòng period<sup>3</sup> " “吃不得這就成 chī bù dé zhè jiù chéng - I cannot drink this wine," said, nowadays he is "in the form of used like this. “吃不成这席酒 chī bù chéng zhè xí jiǔ”.

If we do not take into account some changes in the reading of ancient hieroglyphs, i.e., differences in the ancient and modern pronunciation and spelling of hieroglyphs, and from the point of view there is no phonetic nature of Chinese writing, ancient hieroglyphs can still be used today. Therefore, the difference between ancient and modern Chinese hieroglyphs cannot be overstated. However, changes in two major areas of language, such as lexical structure and grammar, are clearly reflected in writing.

Wenyan has undergone a number of changes over its two-thousand-year history. The change of periods is observed first of all in the lexical structure of the Wenyan. There were also certain changes in its grammatical structure. The written language of the Zhou-Qing period maintained a certain connection with oral speech. Consequently, the change of periods and territorial

differences in ancient Vienna were reflected. Wenyan grammar became a bit more complicated and unusual. As a result, the creative mind developed and selected certain rules, imitating the literature of the Zhou Qing period, and standardized the selected rules. However, not all grammatical rules became the norm; some grammatical rules of the Zhou-Qing period became incomprehensible to subsequent generations, and eventually began to fall out of circulation.

As a result of the change of historical periods, a two-pronged approach to language has emerged. Some of the ancestors of the creatures that continued use of the words written language by imitating the ancient word, for example, the military commander 軍長 jūnzhǎng not but 將軍 jiāngjūn in the form of 学生 xuésheng reader word of 生徒 shēngtú form of expression. The works of writers who created in this way were written much closer to the original. This direction could be called "classical wenyan" - 正統文言 zhèngtǒngwényán [15].

By the Zhou-Qing period, there was a gap between written and spoken Chinese. Many poets and writers began to write in their works, imitating the written language of the Zhou Qing period. At the same time, 文言 wenyan - classical literary language has been written. It is also commonly referred to as 古文 "old written language". The written form of the modern language is called 语体文 yutiwen (written form of the living spoken language) or 白话文 baihuawen (the popular written form of the Baihua language) [15].

However, there have been other authors in the past who have been patient about the impact of oral speech on written speech. While they, too, tried to create in their own Wenyan style, they kept pace with the times and incorporated elements of oral speech into written speech.

Accordingly, many examples of personal correspondence and correspondence can be cited. This pattern can be observed especially in business papers and sales contracts. Wenyan this type of 通俗文言 tōngsú wenyan that can be considered "rude" Wenyan. If this "rough Wenyan" is relatively much enriched with living point elements, we can easily consider it as a style of spoken language. This situation can be clearly seen in the literary style of oral discourse, conversations, and sermons in works founded by Buddhist monks and later developed by the Sung and Min neo-Confucians.

#### 1.4. Origin, formation and influence of Baihua language on modern Chinese

From the Sun period (960-1279), two languages existed in parallel: the Wenyan and the Baihua. Wenyan philosophical prose (古文) and novels (传奇). In addition, science, politics, administration, family lar records, medicine, Taoism and Buddhism, literature Wenyan. In turn, Baihua communication between people, along with the city novels (话本), stories (短篇小说), drama (据本) and novels (小说) as the communication [7].

More accurately, 宋 Sung period (960-1279) Baihua written into the circulation, Wenyan, as well as to be used. First of all, this was reflected in the literature, and the Viennese language retained its status as the official language of communication [6].

As the objective world is constantly changing, so is the language it is a reflection of. Since language is a social phenomenon, of course, changes in society are reflected in it. On the other hand, language itself is a "living" system, which changes according to its own internal

laws. Language changes are not a fast-paced process. It changes slowly, consistently over the years. Language changes are faster and brighter at the lexical level. Among the linguistic changes at the lexical level, the change of lexical meaning is a long-term process, and determining the cause, nature, and ways of change is a labor-intensive study. The study of lexical meaning change relies on historical, comparative methods. The change of lexical meaning takes place in national languages in specific ways [12] .

On this subject, 吕叔湘 Liu Shusyang states in his “Statement of the Grammar of the Chinese Language”: “Every human society has its own language. ” 汉语 hanyu ” the people of China, in its written form we call 中文 zhongwen .

When language is spoken as a means of conveying information, literary language is the reflection of that language in writing on paper, while oral speech is the expression of language in the mouth, that is, by speaking. Oral and written speech differs according to the style of language, oral speech develops and enriches with time, and literary language is refined in detail according to the norm. When language is spoken as a communicative medium, it is distinguished as a means of verbal and written information exchange. If spoken language is an oral form of speech, literary language is a written form, but oral speech can also be recorded and expressed in literary language, such as dialogues in dramatic works; on the contrary, literary language can be expressed orally, for example, in the transmission of news. Spoken speech is the language of speech and hearing, the foundation of literary language, as well as the source of literary language; our written speech is based on oral speech, it is a written and visual language, it is a source of information through writing. In general, oral speech is a natural form of language, literary language is a reworked form of oral speech, but literary language is not a reflection of the original form of oral speech, but a reworked form.

By the time of the Sun, Baihua, the language of communication, had gradually become a written language, and in parallel until the early twentieth century, the two languages, Wenyan and Baihua, were treated equally, each with its own distinctive expression in literary genres. By the beginning of the twentieth century, the Baihua language had become the only literary language out of circulation. This situation was first reflected in the literature, while in the official dialogue the Wenyan had not yet lost its influence [ 8 ] .

Liu Shusyang writes in his “中国文法要略 - Essay on Chinese Grammar”: “Language is constantly changing. While these changes have not been felt for decades, they will be felt centuries later. Chinese is a language with a history of three thousand years, sealed in written documents, and has certainly undergone a number of changes. These changes are manifested in three areas: first, in pronunciation: for example , the word 文法 “grammar ” was pronounced as “ muen-bap ” before the Tang period ; secondly, the lexical structure of the language is distinguished by the introduction of new words, such as "electric lamp", "railway", because in the language of the ancients there were no such words, and thirdly, on the contrary, we can give the example of words that were in circulation in antiquity " [17] .

Liu Shusyang also said, “Although the non-phonetic nature of our writing has undergone a number of changes in pronunciation, that is, there are certain differences in the ancient and modern pronunciation of the same hieroglyph, it allows us to use the hieroglyph used today. If we interpret it only on the basis of writing, there is almost no significant difference in the

phonetics of ancient and modern Chinese. However, changes in vocabulary and grammar can be clearly seen in the target language. ” [17]

In this style, we can include the Yuan period dramas, which were created in a highly mixed genre of poetry and prose during the Tang () and Five Dynasties () periods, with narrations accompanied by drums, prose poems of the Sun period, and rhyming texts of folk songs and folk songs. . Almost all of these works contained many elements of Wenyan. An example of such works as the Sun period and legends 平話 píng huà of them. This style works Liu Shusyang 平話體 píng huà tǐ calls. Liu Shusyang admits that the ancient novels were written in this style, and when it comes to Baihua, it is precisely this style that is meant. In the early twentieth century, the Baihua language was used only in popular literature, and in other fields it could not compete with Wenyan. The last years of the twentieth century were a period of great change for Chinese society. Liu Shusyang argues that the biggest reason for the change was its contact with Western civilization, which had a great impact on the Chinese language.

Liu Shusyang, the author of fundamental scholarly works on modern Chinese grammar, calls Baihua grammar 語法 yufa "oral grammar" and Wenyan grammar 文法 wenfa "written language grammar". However, since it aims to describe the general aspects of Baihua and Wenyan grammars, it is difficult because there is no single term that covers Baihua and Wenyan grammars. That is why he uses the term 文法 wenfa when writing his works . The commentary quotes Baihua and Wenyan only where required.

It was not until May 4, 1919, that the period of learning modern Chinese began in China. At this point, we can recognize Professor Li Jin's famous book on the study of the national Chinese language [23]. Now 40-years of the last century, the study of Chinese language and then went to a large-scale implementation of this Liu the same period in Hong Kong, Wan Li, Gao Min-Kay saw the face of the great works of the world [17] .

Zograf I.T.'s pamphlet, The Srednekitayskiy Yazyk, also notes that the term “Srednekitayskiy Yazyk - medieval Chinese” refers to the oral Chinese of the Sun and Yuan periods.

As in every language and in every age, the Baihua also had a dialectal structure. Zograf I.T. analyzing the written monuments that have come down to us distinguishes between two northern and southern native species of Baihua [8]. At this point, the Russian Chinese scholar Zograf I.T. and we can see that the Chinese linguist Xu Shi'yi's views on the Baihua period are the same.

## CONCLUSION

Based on the above, we have come to the following conclusions: Chinese language, according to its formation, has developed and perfected in the mutual harmony of the Ba'athist language, the literary language of Wenyan and everyday communication. Both aspects of a language have played an important role in the formation of this language over the centuries. One formed the perfection of the Chinese language without excluding the other, and vice versa, complementing each other.

Both the classical written form of the ancient Chinese language and the form of everyday communication, both had their own charm and linguistic sources. As there are works recognized in world literature on both fronts, we can understand the features that distinguish Chinese from

other languages in the world by studying the peculiarities and characteristics of the two fronts of one language.

In particular, the Wenyan is of particular importance in the ancient classical Chinese literary language with its brevity and brevity of lexical units, while in the Baihua it is of relative clarity, i.e., the ability to express any concept without explanation. After all, 白话 the Baihua term in the opposite direction to the latter, the Chinese is the arguments in public 老百姓 referred to with the term; it is Baihua arguments to communicate using language the public significance. The works written in Baihua allow us to see the linguistic description of Chinese literature, the language of a certain period, in the vernacular for centuries. In turn, the works written in Wenyan and Baihua remain of special importance in our understanding of the lexical-semantic, grammatical essence of the Chinese language. There are a number of scientific works of Chinese linguists and Russian Chinese scholars in this field.

Since Wenyan and Baihua are two facets of the same language, as we have a clear idea of Wenyan history and stages of development, research on Baihua history, its chronology, the role of Baihua in the formation of modern Chinese language - Putonghua, little or no information about the transition from Baihua to Putonghua the absence determines the relevance of this research topic.

### ABSTRACT

*This paper presents a classification of algorithms for random and pseudo-random number generation methods. A new improved key generation has been developed based on a comparative analysis of key generation algorithms used for symmetric cryptosystems and existing key generation.*

**KEYWORDS:** *Pesdo Random Departures, Encryption, Crypto-Resistant, Generation Of Keys, Symmetric Encryption, Checking For Randomness.*

### INTRODUCTION

The main cryptographic characteristics of the generators generated by PTKK, which form the basis of continuous encryption algorithms, are given.

Shows an analysis of the operations, key length, and crypt currency tolerance of a pseudo-random number generator.

As can be seen from this table, generators based on push operations, displacement operations, and one-way functions are better than others in terms of speed and tolerance characteristics. mainly divided and classified into three different directions.

Such categorization (classification) shows the direction of methods for assessing the cryptocurrency tolerance of newly created continuous encryption algorithms, showing what types of reflections of existing algorithms are based on complex problems [16,25].

Let's analyze the shortcomings of PTSKK generators, ANSI X9.17, FIPS-186 and Yarrow-160, created using one-way functions.

The ANSI X9.17 generator has the following shortcomings [13,14]:

- ✓ Deficiencies in TDES, which is an encryption algorithm, although not proven in practice;
- ✓ Is based on time synchronization and can be generated;
- ✓ Keys used in encryption do not change;

The following methods should be used to address these shortcomings: [14]

Foydalanish use of cryptographic enumerated symmetric encryption algorithms (GOST 28147-89, AES, etc.);

- ✓ Improving time synchronization or replacing this process with another random access parameter;
- ✓ constant updating of encryption algorithm keys;
- ✓ Use of randomly calculated sources when generating a seed parameter.

Disadvantages of the FIPS-186 generator [14]:

- ✓ The use of DES encryption algorithm (currently it is possible to attack this algorithm from a practical point of view);
- ✓ The ability to control the incoming parameter and other shortcomings.

The following changes are recommended to address these shortcomings:

- ✓ Replace the encryption algorithm with another symmetric encryption algorithm that is considered cryptographic;
- ✓ use of cryptographic hash functions;
- ✓ replace the initial input parameters with random system parameters;
- ✓ Replace mathematical operations with cryptographic expressions

Defects in the Yarrow-160 generator were rectified by Bruce Schneier and Niels Ferguson and patented under the new name Fortuna.

The Fortuna generator also retains the existing stages in the yarrow-160, and also includes the following changes:

- ✓ the number of randomly calculated sources is increased, ie all incoming parameters are generated by data collected from system resources;
- ✓ The DES encryption algorithm has been replaced by the AES, which is considered to be the most cryptographic algorithm of the 21st century, and some mathematical expressions have been changed.

The randomness of the initial data (switches) entering the generators is important in the formation of the PTSKK. This is because the primary keys entered by the user are subject to some kind of law or are stored in memory, and as a result, the system may be compromised. In order to avoid this shortcoming, the use of random values from the computer source of the unwanted parameters is highly effective. The durability of this method is determined by the inability to fully control the intruder system. Typically, PTSKK generators can include operating system information, device information, and so on.

For a sequence of numbers defined by a linear and multiplier congruent generators  $z_n, z_{n+1}$  if the bits are known, then it is possible to find the remaining limits of the generated sequence [16, 27].

Symmetrical encryption algorithms based on the problems of number theory (division into multiple factors and discrete logarithm) are useful in the generation of robust keys, because the ability to determine the front or back parts of a sequence using these generators is difficult. is calculated.

The "Xi-square" criterion for checking the randomness of the distribution. All possible cases of the results of an experiment  $y_1, y_2, \dots, y_k$  and their number is equal to  $k$ , so that the experiment is performed  $n$  times independently of each other. That's it  $y_1, y_2, \dots, y_k$  - the problem of estimating the extent to which cases are deviated from the same number of repetitions (from a flat distribution or having the same frequency) in an experiment conducted  $n$  times is considered. To do this, enter the following designations:

$P_s$  - the result of an experiment  $y_s$  probability value;

$Y_s$  - experimental results  $y_s$  number of equivalents.

In this case, this is the criterion of distribution called "Xi-square" in relation to these definitions

$$V = \sum_{s=1}^k \frac{(y_s - n * P_s)^2}{n * P_s}$$

determined by the formula.

Always if the experiment is repeated  $n$  times  $y_1, y_2, \dots, y_k$  - cases are equal  $Y_i$  repeated (evenly distributed or of the same frequency), ie  $Y_1, Y_2, \dots, Y_k$  if so  $p_1 = p_2 = \dots = p_k = \frac{1}{k}$  it is concluded that and

$$V = \sum_{s=1}^k \frac{(y_s - \frac{n}{k})^2}{\frac{n}{k}} = \sum_{s=1}^k \frac{(\frac{n}{k} - \frac{n}{k})^2}{\frac{n}{k}} = 0$$

formula  $Y_1 = Y_2 = \dots = Y_k = \frac{n}{k}$  from an equal distribution  $Y_1 = Y_2 = \dots = Y_k$  - represents the unequal distribution of the average quadratic deviation. This is the final formula  $y_s - \frac{n}{k}$

the expression is bounded by a constant number, i.e.  $\left|y_s - \frac{n}{k}\right| \leq C = \text{const.}$

$$V = \sum_{s=1}^k \frac{(y_s - \frac{n}{k})^2}{\frac{n}{k}} = \frac{k}{n} \sum_{s=1}^k (y_s - \frac{n}{k})^2 \leq \frac{k}{n} \sum_{s=1}^k C^2 = \frac{(kC)^2}{n} \rightarrow 0, n \rightarrow \infty \text{ if}$$

From this last formula, if the period of the pseudo-random sequence generated by a generator is long enough that the distribution of all possible bits, bytes, and part blocks is almost flat (evenly distributed), then the “Xi-square” distribution the value of the criterion relative to this sequence is close to zero, and its degree of randomness is high.

Below we will see how the random generation of a secret key for the standard DES, GOST 28147-89, AES-FIPS-197 and other symmetric encryption algorithms is carried out by Xi-square distribution.

We create the following table for the given key block:

Value (s): 0 1;

Probability ( $p_s$ ):  $\frac{1}{2} \frac{1}{2}$ ;

Tracking number ( $y_s$ ):  $N_0, N_1$ ,

here:  $N_0$  and  $N_1$  zeros and ones, respectively, in the key block,  $N_0 + N_1 = n$ , determines the length of the key through, e.g.  $n = 256$

$$\text{expected number } (n * p_s): \frac{n}{2} \frac{n}{2};$$

According to the Xi-square distribution formula [10]:

$$V = \sum_{s=1}^{k-1} \frac{(y_s n * P_s)^2}{n * P_s} \text{ is calculated}$$

In this case:  $k=2$ ;  $5 = 0,1$ ;  $p_0 = p_1 = \frac{1}{2}$ ;  $Y_0 = N_0$ ;  $Y_1 = N_1$ ;  $n = 256$ ; then we have the following magnitude:

$$V = \frac{(N_0 - 128)^2 + (N_1 - 128)^2}{128}$$

To calculate this magnitude, we need a table called the table of critical points of the Xi-square distribution.

Table xi-square criterion  $v = k: -1 = 2-1 = 1$ , from the line we find the range of values  $v$ . If the value of  $v$  is in the range  $p = 25\%$ ,  $p = 25\%$  of the table column, then the sequence of key block bits generated using a pseudo-random generator is considered random.

Although the sequence of key block bits generated using a pseudo-random generator received a positive response to randomness when tested by the “Xi-square” criterion, the sequence of bits

under consideration to obtain a more reliable and perfect answer is different. existing randomness tests should also be checked. The more positive responses to these criteria, the better the outcome. In addition, the following process also has a significant effect on the positivity of the conclusion drawn in the randomness test, i.e., the process of representing the mean value of the mean square deviation of switches developed using a pseudo-random generator from practically established tolerable switches.

Let's say a key block generated using a pseudo-random generator: here  $k_i \in \{0;1\}$  checked for randomness according to the above criteria and received a satisfactory answer Unbearable keys detected when working with ciphers in practice  $k = k_{n1}, k_{n2}, \dots, k_{nm}$  as we define.

Key block generated using a pseudo-random generator:  $k = k_1, k_2, \dots, k_n = k_1, k_2, \dots, k_{256}$  and found to be intolerable during practice  $k = k_{n1}, k_{n2}, \dots, k_{nm}$  the difference between the keys is considered:

$r_1 = k_{n1} \oplus k = r_1(1)r_2(1) / \dots r_{256}$  (1) the number of bits 0 and 1, respectively, for this difference

$N_0(1); N_1(1);$

$r_2 = k_{n2} \oplus k = r_2(2)r_2(2) \dots r_{256}$  (2) the number of bits 0 and 1, respectively, for this difference

$N_0(2); N_1(2);$

$r_m = k_{nm} \oplus k = r_1(m)r_2(m) \dots r_{256}$  (m) the number of bits 0 and 1, respectively, for this difference

$N_0(m); N_1(m);$  using these quantities, we calculate the following:

$$V_1 = \frac{(NO(1) - 128)^2 + (N_1(1) - 128)^2}{128}$$

$$V_2 = \frac{(NO(2) - 128)^2 + (N_1(2) - 128)^2}{128}$$

$$V_m = \frac{(NO(m) - 128)^2 + (N_1(m) - 128)^2}{128}$$

$$V = \frac{V_1 + V_2 + \dots + V_m}{m}$$

From the table of the criterion "Xi-square"  $v = k-1 = 2-1 = 1$ , we find the range of values V. If the value of V is in the range of  $p = 25\%$ ,  $p = 25\%$  of the table column, then the sequence of key block bits generated using a pseudo-random generator is considered random.

**Random Excursions test.** This test shows the number of iterations of an existing K event within the sum of a given sequence. This sum is added by substituting 0 for 1 and 1 for +1. The random sequence is divided into parts in the area equal to zero, and testing is performed for each part. The purpose of this test is to check in which part of a given sequence the situation in a random sequence occurs. This test is divided into eight intervals. These are: -4, -3, -2, -1 and +1, +2, +3, +4. In this test, the length of the incoming sequence is required to be at least 106. If the value of

the parameter P obtained by the calculations is greater than 0.01, the given sequence is considered random. In the remaining cases, it is considered non-random.

**Random Excursions Variant test.** This test shows the number of repetitions of a particular situation in a random sequence. The purpose of the random visit option test is to find that the number of occurrences of different situations in a random sequence does not eat the same. This test is a set of 18 consecutive tests, consisting of a single test and conclusions for each case (-9, -8, ..., -1 and +1, +2, ..., +9). ladi. In this test, the length of the incoming sequence is required to be at least 106. If the value of the parameter P obtained by the calculations is greater than 0.01, the given sequence is considered random. In the remaining cases, it is considered non-random.

Comparative analysis of randomness tests. Randomness and pseudo-randomness sequences have been tested above. Randomized tests play an important role in the selection of PTSKK. Accordingly, the more randomness tests PTSKK passes, the more cryptographic the generator is considered to be.

The following table provides a comparative analysis of the tests that test this randomness.

TABLE 1

Test/Features	Incoming sequence length Incoming sequence length	Asoslanishi	Purpose	Computing Level
<b>Monobit test</b>	At least 100 bits	To calculate the amount of zeros and ones	Calculate the difference between zeros and ones	Approximate
<b>Block Frequency Test</b>	At least 100 bits	Find the number of ones in m bit length	Calculates the amount obtained as equal to the expected amount ( $m / 2$ )	Approximate, depending on the length of the block
<b>Cumulative Sums (Cusum) Test</b>	At least 100 bits	To calculate the amount of ones and zeros	Calculate the equality of the sum of one and zeros	Approximate
<b>Runs Test</b>	At least 100 bits	To calculate the amount of ones and zeros	Equals the number of intervals of ones and zeros to the expected amount	Approximate
<b>Long Runs of Ones Test</b>	At least 128 bits	To count the number of ones that come in a row	How close the amount of ones in each section is to the expected	Approximate
<b>Discrete Fourier Transform</b>	At least 1000 bits	Discrete Fure Replacement	Check the periodicity	Approximate

<b>Non overlapping Template Matching's Test</b>	1 mil. bit at least	Calculate the number of generated sequences	The amount of invisibility of the selected sequence	Approximately, the part to be checked depends on the bit
<b>Overlapping Template Matchings Test</b>	1 mil. bit at least	Calculate the number of generated sequences	The amount of invisibility of the selected sequence	Approximately, the part to be checked depends on the bit
<b>Approximate Entropy Test</b>	In length	frequency of occurrence of parts	the frequency of occurrence of two parts (mvam + 1 length)	Approximate
<b>Serial Test</b>	In length	frequency of occurrence of parts	Find the level of occurrence in the m-bit check	Approximate
<b>Random Excursions Test</b>	1 mil. Bit	Calculate the number of views of the expected event in the interval	andom part checking of sequences	Exactly
<b>Random Excursions Varian Test</b>	1 mil. Bit	Calculate the number of views of the expected event in the interval	andom part checking of sequences	Exactly
<b>Non overlapping Template Matchings Test</b>	1 mil. bit at least	Calculate the number of generated sequences	The amount of invisibility of the selected sequence	Approximately, the part to be checked depends on the bit
<b>Overlapping Template Matchings Test</b>	1 mil. bit at least	Calculate the number of generated sequences	The amount of invisibility of the selected sequence	Approximately, the part to be checked depends on the bit
<b>Approximate Entropy Test</b>	Great Length	frequency of occurrence of parts	the frequency of occurrence of two parts (m and m + 1 length)	Approximate
<b>Linear Complexity Test</b>	1 mil. bit at least	Sequence Interval Calculation	Calculate the length between similar parts	Approximate, depending on block length

<b>Xi-kvadrat</b>	Great Length PTSKK	Calculate the difference between the results obtained and the expected	Calculate the percentage of PTSKK units and zeros	Approximate, unbearable key connection
<b>Kol-Smirnov</b>	PTSKK	Calculate the difference between the results obtained and the expected	Calculate Small and Large Deviations	Exactly

These randomness testing tests differ in their input parameters and verification method. It should be borne in mind that the Xi-square test is the basis of all tests and a prerequisite for testing.

When using this set of tests to check the randomness of the PTSKK, it should be borne in mind that the more tests a pseudo-random sequence passes, the higher its randomness.

## CONCLUSION

Classification of algorithms for random and pseudo-random number generation methods is given. Comparative analysis of key generation algorithms used for symmetric cryptosystems is given. A one-way function was applied to the key generation process of the .RC4 stream encryption algorithm and it was proposed to use it.

## **PRACTICAL FORMS AND METHODS OF "IMPROVING ENVIRONMENTAL EDUCATION TECHNOLOGIES THROUGH PROTECTION OF NATURAL AREAS FOR STUDENTS"**

**Aydarov Erkin Bakitovich\***

\*Chirchik State Pedagogical Institute Tashkent Region,  
UZBEKISTAN

### **ABSTRACT**

*Practical application of spiritual heritage of domestic thinkers in ecological education of schoolchildren by protection of natural territories in lessons, study of modern forms and methods of ecological education of schoolchildren in extracurricular activities through protection of natural territories.*

**KEYWORDS:** *Natural Science, Medicinal Plants, Morphology, Type, Epyriology, Autecology.*

### **INTRODUCTION**

Abu Ali ibn Sina, who lived in the Middle Ages, studied the morphology, origin, composition and geography of medicinal plants and left information about them.

Environmental information can be found in the works of Mahmoud Kashgari, who lived in East Turkistan in the 11th century. His books contain ecological, morphological and geographical information on 200 plants.

Botanical and geographical data on plants and animals of Central Asia We meet in the work of Babur.

In the Middle Ages Albert the Great dealt with environmental issues. He studied how plants become inactive.

Data on environmental observations were collected by 18th-century naturalists - K. Linnaeus, J. Buffon. We meet in the works of P.S.Pallas and I.I.Lepyokhina. In the 19 century, the German naturalist A. Humboldt studied the temperature-dependent distribution of plants and gave a classification of life forms.

K.F. Roule, a professor at Moscow University, did a lot of work in animal ecology and left a number of works. It was a species of aquatic and terrestrial as well as other animals. N.A. Lepöxin studied plant distribution in different climates and found that plants growing in high mountains were similar to tundra plants.

Botanist Augustus Pyrama Decandol singled out the science of epirology or outecology as a study of the relationship between plants and the external environment.

One of the scientists who founded the science of ecology is Alphonse Decandol, son of O.P. Decandol. In his book "Plant Geography," he gives a classification of the environment in which plants live, based on heat, light, moisture, and soil. He was the first to show that plants are associated with different soils.

The chapter of Darwin (1859) theory of evolution opened a new era in the history of ecology. In 1877, the German scientist K. Möbius introduced the concept of biocenosis. Worming 's book "The Distribution of Plants under the Influence of the Environment" was published in 1895.

Drought resistance of plants was studied by N.A. Maksimov, Yu.A. S. Gregory learned. The effect of light was studied by N. A. Ivanov, the ecology of photosynthesis was studied by V. I. Lubimenko, A. A. Niciporovich, O.V. Zalenskiy, V.A.Voznesenskiy; G. Plant radiation resistance. A. Genkel, frost resistance was studied by I.I. Tumanov and others. The contribution of L.G. Ramensky, A.P. Shennikov to the development of ecology is also great. Ecology of the population of British scientist C. Developed by Elton (1930). He said that it is necessary to move from studying individual organisms to studying populations, as adaptation processes occur at the population scale. In the development of the ecology of the population. A. Severtsov S. S. Schwartz, H.; P. Naumov P. A. Victor V. N. Sinskaya, T. A. Worknov and A. A. Uranov made a great contribution.

A. In 1935, Tensley introduced the concept of "ecosystem" to science. The concept of "biogeocenosis" was introduced in 1942. N. Kashkarov E. P. Korovin. M. G. Popov K. 3. Zokirov I. Y. Granitov T. 3. Zoxidov A. T. A lot of scientific work was done by Tulaganov and others.

For the first time in the former Soviet Union, Daniil Kashkarov developed a methodology for complex zooecological observations. He left scientific writings that played a role in solving a number of environmental problems. These are "Environment and Communities," Animals of Turkistan, "Foundations of Animal Ecology" and others.

Another founder and organizer of environmental observations in Uzbekistan was E.P. Korovin. He said that in the 1930s the plant community and environment needed to be studied together. Such scientific observations were made at the time at Central Asian State University. At that time, complex expeditions were organized to study desert zone plants and E. P. Korovin and I Y. Under Granitov 's leadership, phytomeliorational works were carried out in the desert zone, and the first experiments were carried out.

In 1950, on the proposal of E. P. Korovin, an ecological laboratory was opened at the Institute of Botany under the leadership of V. A. Burygin. The adaptation of desert and semi-desert plants to drought has been studied. Later, under the direction of Y.S. Gregory, the problems of xerophilization in higher plants were studied in this laboratory and ecological classification of plants was given. In 1967-1987, under the leadership of O.H. Hasanov and R.S. Vernik,

comprehensive environmental observations were carried out in the conditions of the Fergana Mountains. The arid adaptation of plants was first systematically studied by T. Rahimov, and an ecological classification of Adyrian plants was given. This classification serves as the scientific basis for selective planting of feed plants on arable land.

Anthropogenic changes in nature as a result of increased human influence in the second half of the 20th century.

Thus, according to the leading didactic task and structure, education is divided into the following species:

- 1) Combinatorial education (teacher explains, supports, repeats, controls new material);
- 2) study of new material;
- 3) Education to strengthen knowledge, skills and skills;
- 4) Exercises and practical work;
- 5) generalized repetitive environmental education;
- 6) Control, inspection and environmental education of students, in addition to non-standard, innovative forms of education are widely used: conferences, role-playing games, integrated forms of education.

Training for storytelling new material. It informs teachers about work on new material and is successfully used in the study of large and complex materials in middle and high school. Such an educational structure: involvement of students in education, setting educational goals; Brief overview, homework. Enhancement of learned material and development of practical skills and skills are aimed at its deeper understanding and learning, application of practical skills and skills in practice, focusing on repetition of material after study of a certain topic or section in all classes.

The lessons of repetition, systematization and generalization are related to the repetition of large sections of the curriculum and are conducted immediately after the study of the topics or at the end of the school year. Course structure is fundamental in modern pedagogical practice and theory that determines efficiency and outcome in such education.

There are moral and ethical norms based on the protection of natural territories, strict observance of which allows not only to preserve the original natural biocenosis, but is also an important condition for ensuring the safety and health of human life. For this reason, for centuries the relationship between nature and man has been oriented towards achieving its rationality. I am convinced that the issues of environmental education through the protection of natural territories, familiarization with the available geography and environmental resources, responsible approach to environmental education through the protection of natural territories have long been studied. In recent years, a number of studies have been carried out in this field, which show how relevant the problems of nature and society, personality and environmental change are.

The study considered it useful to make some comments on the historical nature of environmental education based on this source, as well as on the views expressed in research and work in this field.

One man committed a crime and was hanged. The king asked him, "What do you want before you die, do you have a wish?" he asked. The sinner said: "I have a dream, I have a desire."

What is harmony? the king asked.

I'm going to lose the heads of three people in the world. the sinner told.

Who are they?

These are the farmers who flooded the road.

The shepherd pasts cattle on the road. It is a point that is digging the way, - said the culprit (R. Usmanov. Saolatnom)

During the construction of the house, the Uzbek people pay special attention to the natural and geographical environment. After all, buildings built on the basis of natural and geographical environment have a unique microclimate. For example, the hotel window was built to the north, so the temperature in such a room was cool in summer and moderate in winter. The window of the room for the children was facing east, contributing to their healthy growth. Consequently, such rooms were directly exposed to the sunlight that heated them. Silent stage bars with several holes were installed on top of the gate to maintain air cleanliness in the house in winter and summer. Such arrays performed a certain function of air purification. It is true that before the development of science and technology, that is, before the last civilization, the population of the world was slightly smaller than today, the level of urbanization was low, and the needs of social actors were not as broad as today. However; In these times, people had a great sense of love for nature, above all, and the sense of nature consumption from consumption, without replacing what was mastered, was not prevalent. II. The sacred book of Zoroastrianism, Avesto, focuses on the relationship between man and nature as well as geographic information. In particular, information is provided on two rivers flowing through Central Asia - Amudarje and Syrdarje, nature, climate, natural resources, plant and animal world, attitude of people to nature and existing countries in the area between them. According to the source, "There are many mountains, pastures and streams. Herds of sheep flock in these pastures. There are many deep lakes and rivers here. "

The play examines the problems of the environment as a whole on the basis of the idea that "a person throughout his life is obliged to contain water, soil, fire and all good things in the world clean and busy."

The source also focuses on cleanliness and storage of land, water, floor, room, body, clothing, food. It contains ideas for creating cemeteries away from towns and villages, surrounding them, maintaining special cleanliness, dressing corpses and spreading land. Stream, ditch, pool or well where a human or animal corpse falls.

Avesto states the following as a means of maintaining a clean environment and preventing disease: 1. Collection of garbage, contaminated areas with soil, stones, ash to bury page. Disaster and distress with fire and cold. Smoke ashes, vinegar, wine, various herbs (Isfand, cloves. Pearls, onions, sandals).

The play also notes the spread of various diseases through birds, animals and birds and their harmful effects. However, although it is recommended to destroy pathogenic animals and insects, it is important to take care of pets.

Avesto also refers to heat, cold weather, hunger and bribery, mental suffering, food of spoiled food, poor hygiene, and worms, mosquitoes, and other insects sent by Ariman, as well as bad weather as causes of various diseases.

It can be said that the source's ideas about the relationship between nature and man may have been a specific "ecological concept" of the period. Information on environmental education provided at Avesto is still relevant today. III. Approaches to the use of material and spiritual values from a spiritual and moral point of view, attitudes of social actors to nature are "good," bad, "curses." He was proud of criteria such as "unclean," honest, "majority ownership" ("majority right"), and the weight of these criteria was high. Much attention was paid to the cleanliness and tidiness of dwellings, and built-up places were regularly repaired.

The Qur'an [147] and the Hadith [18-19] also focus on the conservation of nature and man and the achievement of rational relations between them. In particular, these sources place particular emphasis on the issue of human factor (and hence human ecology), and ideas in this regard can be classified by their content in the following areas: Protection of flora and fauna (for example, "God will condemn in hell a man who cuts down a tree using his shadow," God will punish those who torment animals in this world on Judgment Day, "If you have time, plant it." "If your suffering animals are forgiven, many of your things will be forgiven," Don't call it the target of shooting on a living creature, "Sing the body, because it's a blessing,"... about stupid animals. You saw them from Allah. Settle them in a state of massacre, kill them and eat them. "Good is written on the horse's forehead until Resurrection Day. Whoever cares about it will get good," A Muslim who plants a tree or a crop.

## TRADITIONS OF ALISHER NAVOI IN THE WORKS OF ERKIN VAHIDOV

**Shomurodova Sitora Xoshimqizi\***

\*Basic Doctoral Student,  
Samarkand State University, UZBEKISTAN

### ABSTRACT

*This article discusses AlisherNavoi's literary-critical views in the preface to the devon of "Badoeul-Bidoya", his demands on the devon and how the "Yoshlikdevoni" compiled by ErkinVahidov meets these requirements. Scientific remarks on the poetic content and order of the "Yoshlikdevoni" are given and information on the tradition of creating thedevon is provided. This article also provides insights into Erkin Vahidov's literary aesthetic views.*

**KEYWORDS:** *Devon, Tradition, the Verse Of Poetry, Alphabet, Theme, Content, Order, Art Tradition Of Creating The Devon.*

### INTRODUCTION

For centuries, literature has been a reflection of human and his feelings. The importance of poetry in this regard is immeasurable. As different forms of poetry reflected emotions from different angles, verses such as aruz, finger, free, and white poetry emerged. At the beginning of the last century, our Jadid poets Fitrat and Chulpon, who specialized in aruz verse, introduced finger and free verse. By the 60s and 70s of the twentieth century the creativity in the aruz verse had declined. Literary critic Abdulla Azam makes the following remarks in the foreword of the book "Khushqadam" by the young poet AlisherMukimov: "The process of forgetting the aruz verse began at the beginning of the twentieth century and by the middle of this century it was almost forgotten. As a result, many people still understand that "a gazelle is a finger-verse poem that is rhymed only in the form of a-a, b-a, v-a-...."ErkinVahidov wrote poems, which were set aside as "obsolete"at that time, and collected them in the "Yoshlikdevoni". ErkinVahidov is also a child of the 20th century and like many others had no knowledge of aruz. It was astonishing that the atmosphere in the house of the future poet's uncle aroused in him an interest in the verse of aruz. If we look at the biography of ErkinVahidov, the young poet, who was orphaned from his parents, grew up in the hands of his uncle.His uncle was an enlightened man,there were

poetry meetings chaired by Alikhan Tora Soguniin their house. In these meetings the theory of aruz was not discussed. But examples of works of such poets as Hafiz, Navoi, Fuzuli, Bedil are told in a aruz tone and there is no doubt that it made the young ErkinVahidov love aruz. Devon was published in 1969. As we read the Devon, we see that the author continued the traditions of HazratNavoi with dignity. Devon's first ghazal is called Debocha. In the same preface, ErkinVahidovcommentedon the neglect of the petition:

Eymunaqqid, seng'azalniko'hna deb kamsitmagil,

Sevgi ham OdamAtodanqolganinsonqonida.

Translation:

O critic, do not despise the gazelle as old,

Love is also in the human blood left by Adam.

As long as love is eternal, so is gazelle, because the meaning of the word gazelle is to speak beautifully to women. So, it was ErkinVahidov, a poet, who created truly modern works in the gazellegenre, in aruz verse, which were considered to be ancient. Abdulla Azamwroteabout it: "The "Yoshlikdevoni" plays an important role in the history of Uzbek literature. He proved that the gazelle genre can also be modern, revived the interest in classical literature and created the basis for the revival of the aruz verse." Indeed, the "Yoshlikdevoni" was born as a modern version of the devons. The variety of topics, humor and word games, which are unique to ErkinVahidov, formed in the student the ability to enjoy and enjoy the classical forms. At the same time, it is worth noting that ErkinVahidov programmed AlisherNavoi'straditions in creating his devon. If you remember, AlisherNavoi also wrote "Debocha" for"Badoeul-bidoya"., He described gazellism, in general, the peculiar rules of formation of the devonin this preface. ErkinVahidov emphasized that the gazelle is non obsolete genre and asked the reader to apologize for his mistakesin his Debocha:

Do'stlarim, shoirdemang, Erking'azalshaydosidir,

Yoshdenguma'zurtutingsahvo'lsa gar devonida.

(My friends, don't call me a poet, I'm – Erkina fond of Gazelle,

Forgive me if I made mistakes in the devon because of my youth).

AlisherNavoi, while writing a preface to his devon, humbly expressed that he was not yet able to arrange the devon in the following verse:

Ishangajunun, manzilangamayxona,

Devon yasamoqni ne bilurdevona?!

(Work is madness for him,his address is tavern,

What does mad know how to do devon?!)

During the acquaintance with "Yoshlikdevoni", we realize that it was created in accordance with classical traditions. It is well known, that in classical poetry there were strict rules for the formation of the devon. According to it, the gazelles on the devon were arranged in order of Arabic alphabet according to the last letter of the verse. "In the East, the creation of devons was a

sign of the poet's maturity, and poets paid attention to the diversity of content and form of their devons. The formation of the Devon began in the X-XI centuries, the period of its formation dates back to the time of Sheikh Saadi." [3; 227]

AlisherNavoi perfected the tradition of creating Devon. After Navoi, our classical poets such as Babur, Nodira, Ogahi continued this tradition. By the twentieth century, poets such as Habibi, Sabir Abdulla, ErkinVahidov created gazelles in the style of aruz and arranged the devon. It should be noted that the first requirement of HazratNavoi in the "Devon" order was the alphabet. For example, the poet emphasizes that the gazelles in the devon should be written not only for the 28 letters of Arabic script, but also for the 32 letters, taking into account the 4 letters added by the Persians to this inscription: "The poets who arranged the devon used not only 32 letters, but also 28 letters of the Arabs. The bride's beauty is perfected by adorning the bride's silk dress with 32 rubies instead of 28 rubies." there are gazelles for all letters of the Cyrillic alphabet, except for the letters "o" and "ŷ (o')" in the "Yoshlikdevoni". Due to the peculiarities of Uzbek language, there are no gazelles ending with the letter "ц (ts)" of the Cyrillic alphabet. Their statistics can be seen in the following table:

Letters in the Cyrillic alphabet	"A"	"G"	"I"	"L"	"M"	"N"	"R"	"U"	"Sh"	"Q"	Gazelles ending in other letters
The number of gazelles ending with the same letter	8	3	3	4	5	10	8	3	2	3	One by one

It can be seen from this table that gazelles ending with "n", "r" and "a" are relatively numerous. This situation can be explained by the lexical and phonetic features of Uzbek language. AlisherNavoi also spoke about the location of gazelles in "Debocha" and said that when placing gazelles, it is necessary to pay attention to their content: Gazelles in the form of praise (praise to God - Sh. S.) and na't (accolade to the Prophet - Sh. S.) should be placed first, then it would be advisable if there were gazelles of the sermon type. "It is inevitable that the Prophet (peace and blessings of Allah be upon him) would not be unaware of a single command in every command, as evidenced by the praise of Allah (peace and blessings of Allah be upon him) or the Messenger of Allah (peace and blessings of Allah be upon him). ... May Devon be found, may our enlightenment not be a gazelle, and may your sermon not be only two line." [2; 11] We did not see Navoi's approach in order of gazelles in ErkinVahidov's collection. If we take into account the period of creation of the "Yoshlikdevoni", the censorship of that period, it is not difficult to feel that it was a great courage to organize this collection. While thinking without deviating from the content of the gazelles, HazratNavoi strongly condemned the change in the content of the gazelles to the praise (the type of gazelles in scattering - Sh. S.). He says that one bayt (two lines) of such gazelles sings spring, one bayt sings autumn, which leads to a deviation from this semantic integrity: "If a verse of a gazelle tells a story, they do not continue the subject until the gazelle is over. But if the content of the two lines to the end of the gazelle sings about the flower ornament from the spring of love, the other two lines humiliate the treasure of separation". While

reading Devon, I became convinced that almost all of ErkinVahidov's gazelles are single gazelles, and some of them are connected gazelles. In general, ErkinVahidov created gazelles that could meet the above requirements of HazratNavoi.

Writing about the structure of the devons, HazratNavoi noted that in addition to gazelles and ode, they should contain musammat types, rubais, qitas, mustazads, fard, muammo, tuyuk, lugz, tarjiband and components, which would ensure the colour of the devon. As for the genre structure of the “Yoshlikdevoni”, there are 61 gazelles, 4 muhammas, 4 comics and 1 poem. We know from the Devonian tradition that gazelle was the leading genre in Devon. Musuammats are placed after the gazelle, and sub-genres are placed after the musammats. All four muhammas are among the tahmismuhammas: the author has linked muhammas to the gazelles of AlisherNavoi, Fuzuli, Bobur and the Kazakh poet JumakentNajmiddinov.

Although Navoi did not mention verse in Debocha, it is clear from “Badoeul-bidoya” or other devons that the great poet created in various circles of aruz. In this sense, if we talk about the verse of the gazelles in the «Yoshlikdevoni», we will see that most of the gazelles were written in the RamalCircle, and the rest in the Muzore and Hazajcircles. If we look at the exact statistics, sixty-one poems in the devon were written in the Ramal, ten in the Hazaj, and nine in the Muzareh. There are, of course, objective and subjective reasons for the abundance of poems in the Ramal. In the last century, the aruz was almost never studied, and the allotted hours were spent to prove that the aruz was outdated and did not meet modern requirements. That is why in one of his discussions with ErkinVahidov, the poet said: “We are taught only the gazelles of aruz that correspond to the circle of ramal”.

Thus, the ramalcircle (foilotun-long, short and two-long syllabic - S. Sh.), Along with its conformity to Turkic words, also served as a key figure in the author's imagination.

Based on the above considerations, we can conclude that ErkinVahidov worked hard to ensure that his devon could meet the requirements set by AlisherNavoi. We can see this in the structure, composition, content and art of the gazelles in Devon. It also influenced the next generation of devons as a first step in modern devonism. For example, Ismail Mahmud Margilani's "Dildavaslingmuddao", FarmonQarnabi's "Devon", young poet AlisherMukimov's "Khushqadam" devons show that significant changes are taking place in modern devonism.

## CYCLE OF SONNETS IN THE KARAKALPAK POETRY

**Orazymbetova Marjangul Kelimbetovna\***

\*Assistant Teacher,  
Berdakh Karakalpak State University,  
UZBEKISTAN

### ABSTRACT

*Mostly, every national literature genres develop due to external influence. The genre of sonnet came to Karakalpak literature in the 1960s and 70s under the impact of West literature and became one of the genres of lyrics. Therefore, any given literary work cannot be considered as a cycle. The cycle has its own principles and theoretical bases. They are the problems which interest literary critics. Every verse in the cycle is a separate independent composition as well as being part of the whole. The independence or freedom of the poems in a cycle depends on whether they have been given titles or not. Six sonnets of these collections are the same, only the last collection having two new ones. However, the collection of poems "Keuildegi keng dunya" (The Wide World of My Soul) included "Sorsha" sonnets, other old sonnets and three new ones all making up one cycle.*

**KEYWORDS:** *Cycle, Sonnet, Garland Of Sonnets, The Lock Of Sonnets, Composition, Emotional Opinion, Didactics*

### INTRODUCTION

Sonnet (from Italian sonetto) is a lyrical genre consisting of fourteen lines. It consists of two quatrains and two triplets, or three quatrains and one couplet. A verse of four lines is called quatrain, while the triplet is called tercet. Quatrains rhyme like abab, abab or abba, abba, whereas tercets rhyme like vgv, gvg or vgd, vgd. The main point is brought up in the first quatrain, the second quatrain develops it, and the first tercet gives the solution to the point, whereas the second tercet draws conclusion on the point [1:188].

Italy is the motherland of sonnet later it was adopted by French, English, Spain, German and Russian literature. In the world literature sonnets were written by Dante, F. Ponsard, W. Shakespeare, I. Goethe, V. Tredyakovskii, A. Sumarkov, A.S. Pushkin, M. Yu. Lermontov, and

in Uzbek literature they were composed by Usmon Nosir, Shukurullo, Mirmukhsin, Ramis Bobojon and Barot Baikabulov [2:45].

The sonnet has a strict form, but the themes are not limited. In the Karakalpak literature this form of poem was developed by the poets I. Yusupov and V. Karabaev. Especially, M. Karabaev enriched this genre by composing garlands of sonnets. They also wrote cycles of lyrical sonnets.

The sonnets by the masters of the genre Petrarch and Shakespeare were improved greatly in the form and content. In Uzbek literature, B. Baikabulov not only developed the genre of sonnet but also was among the first authors who wrote a garland and a cycle of sonnets.

Above we said that sonnet genre is a genre requiring strict form structure. The emergence of sonnets in the Karakalpak literature was its great achievement. M. Karabaev's "Kaspîi sonetlery" (Caspian Sonnets), the collection "Armen guldastesi" (Armen Bouquets) belong to the type of sonnets about travels.

The cycle is combining several works in accordance with one principle. Therefore, any given literary work cannot be considered as a cycle. The cycle has its own principles and theoretical bases. They are the problems which interest literary critics. There are some special research works on cycles, especially on lyrical cycles. For example, V.N. Darvin pays a special attention to the typology of cycles. In the Russian literature the cycle became a leading literary form back in 19<sup>th</sup> century. In the scholar's opinion, the lyrical cycle is the highest form among the genres of this literary style. [4:4].

The lyrical cycle by its nature has its own unique character compared with cycles in other genres. In lyrics, the lyrical character's i.e. "lyrical ego's internal feelings, thoughts, views are reflected. The poet can express his feelings, inner world in all his works. "The main feature of lyrics is the loneliness of the character, his lyricism (the author's trying to act as a character), the prevalence of monological thinking, depicting inner emotional experience, relying on emotional thinking" [1:57]. Therefore, the lyrical works in the cycle develop interactively and logically. One lyrical work seems to be the sequel of another lyrical work or a work completing it ideologically or thematically.

However, lyrical works of different types cannot unite to make one cycle. One common topic or similar emotions of the author play a significant role in uniting several works in one poetic structure. Every work in the cycle completes the intended thought of the poet and will be able to get across to the reader the outlook of the lyrical character as a whole. Every verse in the cycle is a separate independent composition as well as being part of the whole. The independence or freedom of the poems in a cycle depends on whether they have been given titles or not. In free cycles each poem normally has its own title. The independence of the untitled poems, numbered with Roman or Arabic figures or separated with various graphical marks such as asterisks or hyphen, weaken in the cycle. One can easily see the independence of the titled poems in a cycle than that of untitled ones.

The cycle of sonnets "Sorsha" included in the I. Yusupov's collection of poetry "Keulidegi keng dunya" (The Wide World of My Soul) consists of 13 sonnets. The cycle has a general title "Sorsha" and every sonnet in the cycle is numbered with an Arabic figure. Thus, the poet indicated that it is a whole work. "Sorsha" is the name of a large cemetery in Nukus. As the cycle of sonnets was based on a profound philosophical content, the author used the folk

proverb, “When you are in the blues, walk along the flowing water, when you are elated walk in the cemetery” as its epigraph. The epigraph is used to define the main idea of the whole work. In all his sonnets, the poet expresses his philosophical opinion on human’s coming into this world, his living in it and the end of his life. Critic Kh. Orazymbetov said the following about this sonnet of the poet: “He used the unique forms of sonnet genre to convey his thoughts. The opinion started in the first quatrain continues in the second one, a concise conclusive opinion is given in the third one, and the solution to the opinion is given in the last quatrain. The whole content of the sonnet is aggregated in the last quatrain. Therefore it can be named the lock of the sonnet” [2:52].

It is the border between being and nonbeing,  
 Reaching here, traces get lost,  
 The soul thinking arrogantly, ”There’s no world without me”  
 Reenters its own waterskin here.  
 Here flowery lips stop smiling,  
 Tear comes to eyes, mind hesitates,  
 Your friend goes back home without you,  
 Or he can’t follow you when you go back.  
 No soul can escape the death,  
 It never miscounts, nor loses,  
 However, even if it gives orders to spite you,  
 Only one power won’t obey it,  
 Long live fighter, tireless life!  
 If its one branch brakes, it’ll become a thousand [5:91].

In the first quatrain the poet expresses his opinion on the end of man’s life, on the second quatrain he develops further this opinion, and in the third one he continues the first opinion by asserting that the death is the most powerful thing. However, in the last crucial verse he draws a conclusion after giving an artistic feature to the word “life”, the opposite of the notion death. Birth, growing-up, and living- are the dialectics of life. It is the process which has been repeating itself for thousands of years. The quatrains in the sonnet are rhymed as abab, abab, whereas triplets rhyme as vvb, vbv.

In the second and third sonnets of the cycle the poet thinks over the question, “What role does every man play in the life?” In the first quatrain the poet writes, “If a man who pays his last tribute to you, Doesn’t shed a drop of tear”, in the second quatrain he develops this idea even more, “If your death doesn’t make anyone grieve, If the life doesn’t mourn to your death”, in the third verse the idea is strengthened further “If your name doesn’t resurrect like a flower, If your good deeds are not remembered, and in the last fourth quatrain the author concludes, ”So you haven’t lived a normal life”

Thus the poet develops the idea in the first three quatrains and gives the conclusion in the last fourth quatrain which is considered as the lock of the sonnet. When choosing rhymes, the poet pays attention to their impact on the content. The rhyme of this sonnet: abba, abba, vvb, vbv differs from the previous one. In the fourth sonnet the poet believes that the idea of happiness does not mean long living, on the contrary it means living an interesting life, getting old and passing away together with your peers.

In the fifth sonnet of the cycle, with the help of a folk humour, the poet expresses his idea against building too high pompous mausoleums in cemeteries, which are being built by some conceited people. The spiritual counsellor of the main character of Karakalpak national humour Omirbek exclaimed looking at the mausoleum built for him during his lifetime: "My tomb has been built perfectly, and asked him what else should be done?" The poet described this concisely with the answer was : "Only you are needed ...". Such criticizing of pomposity is provided convincingly in the tenth sonnet of the cycle. In fact, the respect for the dead is not shown by pompous mausoleums built to them, but by feeling respect for one another during the lifetime. The sixth sonnet of the cycle is based on the deep philosophy of life. To make it more understandable, we will quote the whole text:

Inscription on the tomb: This man  
 Lived forty days. He was a judge ...  
 "Maybe, I am reading incorrectly?"  
 Afendi asks the wayfarers.  
 "You are not mistaken, we have a custom:  
 Everything will be remembered before dying,  
 The happy days of the life,  
 Should be counted one by one.  
 Only those days will be counted as your life..."  
 Afendi said: "What wisdom it is!"  
 If suddenly I die in your country,  
 My request to you, don't blame me:  
 Write on my tombstone "Poor Afendi  
 Died no sooner had he come to this world" [5:93].

The compositional structure of the sonnet, producing dialogues, transferring each speaker's words into the next quatrain adds a poetic expressiveness to the poem. The introduction to the intended idea is given in the first verse, additional explanations to the first idea are given in the second verse, and in the third quatrain the idea reaches culmination point. The idea finds its solution in the fourth quatrain. The philosophical conclusion of the idea consists of the following: every man's role in this world is measured by his noble deeds, happy days, and his help to others. This opinion is in harmony with the opinions expressed by Eastern classical writers.

The sonnet in the cycle which starts with the words, “Plane tree, how can you live three hundred years,

Standing in one place? Do teach me! ” has ideas with a propound didactic meaning. It turns out that living a long life depends on the man himself. The poet comes to a conclusion that if a man has kindness in himself, and looks only for beauty in the world, is well-educated, humane, and kind to others, he can live a long life. This is revealed perfectly through the image of Plane tree. However, there have been the conceptions of friendship and hostility since man was created. This idea is reflected in the next ninth sonnet. The sonnets in the cycle are closely connected with one another; the idea in one of them continues in the next. There are many nations in the world who live in friendship as if they were born by one mother, and there are some people who argue not finding enough space for themselves in the boundless world. The poet stressed in this poem that the ideas of peace and friendship should be glorified. The eleventh and twelfth sonnets of the cycle are closely connected with each other. This is a story of a good and bad man and what kind of impression they made on people. The last sonnet of the cycle gives a conclusive idea as closing remarks. The lyrical hero describes the situation when he was setting out for a long travel:

So I died. “May he rest in peace! He was a good man ...” say people and carry the coffin.

Thus the first sonnet of the cycle starts with the words, “It is the border between being and non-being”, in the following sonnets the poet depicts the whole life of man, his activities, noble and ignoble deeds, and expresses his opinion on his course of life all the way up to the last breath. “The sonnet has a strict quatrain and rhyme system just like the ghazal. All the same, such strict artistic form cannot prevent from expressing internal feelings and profound philosophical ideas.” [6:123].

Having studied I. Yusupov’s creative work, we notice the fact that the poet was inclined to publish his songs in cycles in his last collections. Some above cited sonnets from the cycle of sonnets were also included in other collections of the poet. For example, his collection “Iosh” published in 1977 had 6 sonnets in the chapter “Sonnets”, the second volume of his collection published in 1979 had eight sonnets gathered under the title “Sorsha”. Six sonnets of these collections are the same, only the last collection having two new ones. However, the collection of poems “Keuildegi keng dunya” (The Wide World of My Soul) included “Sorsha” sonnets, other old sonnets and three new ones all making up one cycle. His poem which starts with the words “Plane tree, how can you” is included in some of his poems alone [7:74]. All the same the content of the sonnet with profound philosophical meaning is revealed more wholly within the cycle. It completes the content of the other poems of the cycle, enters into topical and artistic relations with them. After having analyzed the cycle, we have come to the following conclusion.

## CONCLUSIONS

1. “Sorsha” sonnets cycle is considered as forming a cycle according to the structure, because thirteen poems in the cycle are written in sonnet genre, they have two quatrains, two tercets and rhyme as abab, abab, bbv, or abba, abba, bbv, and vbv.
2. Even though the poet did not use the term sonnet, these sonnets are part of one cycle. Because the poet gathered all his sonnets with a similar content in one chapter, named them Sorsha, and numbered them with Arabic numerals.

3. The sonnets in the cycle have a certain ideological and compositional structure. Because the idea of each sonnet in the cycle is continued in the next one.
4. The cycle is united not only in the form but also in the content as it gives connected ideas.
5. Along with it, each poem in the cycle can be a separate creation on its own.
6. The poet's profound philosophical ideas are given in generalized form through all his sonnets.
7. The cycle includes poems of humoristic, didactic and philosophical content.

### ABSTRACT

*The article reveals the scientific and theoretical basis of the rapidly changing system of ecological management in connection with the transition of many countries to market relations on the example of the Republic of Uzbekistan.*

**KEYWORDS:** *Management, Administration, Ecology, Requirements, System Management, Efficiency, Uzbekistan, Cadastre, Control, Expertise, Audit.*

### INTRODUCTION

In the practice of a market economy, words like “management” and “administration” are very common. But a single approach to their understanding has not yet been identified (Table 1).

**TABLE 1 DEFINITIONS OF THE WORDS “MANAGEMENT” AND “ADMINISTRATION” IN THE SCIENTIFIC LITERATURE**

management	The function of an element of organized systems of different nature (biological, social, technical, etc.); keeping these systems in a certain structure, keeping the order of activities in a rhythm, ensures the implementation of their programs and goals [1, 1988].
	The process of regulating and directing the state of the economic system of the business entity; means the purposeful influence of subjects, agencies on people and economic objects, aimed at directing their activities and achieving the desired results [2, 2001].
	Edit something by a particular method or appliance, direct, use [, 1961].
	Method of state administration [4, 2006].
administration	The process of regulating and directing the state of the economic system of the economic object [3, 1961].
	Something Management movement. For example—the management of Public Administration bodies, an organization or an institution, the management of a complex of equipment, the formation of words (syntactic management), human actions in the conduct of Management [4, 2006].

From the table above, it can be concluded that *management* is a *state* and *administration* is a *process*. Ecological management also falls into a social category, i.e. a form of regulating relationships between people. It will need to be nurtured in order to regulate social relations. But one important requirement of sustainable development in ecological management is the principle that "everything is for the benefit of man and his well-being". That is why the phrase "for present and future generations" is of primary importance in the field of "Ecology", in the field of education and practice. Ecological management is a mechanism for applying the powers, functions and methods of implementation of the bodies regulating social relations that protect the environment and ensure ecological security [5, 2020].

### THE MAIN FINDINGS AND RESULTS

Ecologically safe living (living beings) and functioning (human) environment - a clean, healthy and favorable environment for organisms to safely reproduce, grow and develop in certain ecosystems [1, 1988]. *The goal of ecological management is to provide regulation of social relations in ensuring the ecological safety of the living and working environment of living beings.*

In order to achieve the goals of ecological administration, it is necessary to regulate the process of performing the following tasks in *ecological science, education and practice*: formation of a system of training, retraining and advanced training in the field of ecology and ecological protection in full compliance with modern requirements;

- popularization of ecological education, ie training of "ecologically cultured person";

- development of well-known scientific and theoretical bases of ecology, which are inextricably linked with practice;
- determine its history, current status and future prospects on various scales (*global, regional, national, local*);
- accounting, assessment, control and monitoring of natural resources at various levels;
- wide implementation of the requirements of the community, the state and society in the field of ecology and ecological protection;
- establishment of activities in the management of ecological civil society institutions (non-governmental non-profit organizations and public associations);
- establishment of a mechanism for the establishment of ecological control and their widespread use in the management of data of the recommended force;
- improvement of ecological and legal norms, concepts, plans and programs aimed at the future at various levels, depending on the ecological situation, and the creation of a working mechanism;
- creation of a system of inquiry, prosecution and judicial bodies;
- development of a legal system to encourage or motivate ecological relations;
- organization of "ecological ambulance" service of various scales;
- resolving ecologically critical land (such as the Aral Sea, Chernobyl, Central Africa) and water areas (such as the Aral Sea, Balkhash and Lake Chad) through the international community;
- development of ways to prevent ecological terrorism and corruption on various scales;
  - to implement a form of ecological attitude of society towards nature, etc.

If you look closely at the ecological tasks mentioned above, the phrase "on a different scale" has been used a lot. One of the internationally recognized ecological principles is that "ecosystems of different scales are inextricably linked and are not subject to any administrative boundary rules" [6, 1974]. Especially at a time when the process of globalization is expanding, in your neighborhood, district, city and republic, both positive and negative ecological activity will certainly be reflected in the living space, which is at the top of the hierarchy of ecosystems. This should never be forgotten in ecological management. For example, the non-ecological policy of the former Soviet Union on land reclamation and irrigation in Central Asia has led to a global "Aral Sea tragedy". Excessive emissions from countries such as China, India and the United States continue to be the cause of "global warming".

In order to carry out ecological management effectively, it is divided into a number of structured parts (Figure 1). The hierarchical arrangement of the parts of the ecological management system is placed in the strict sequence specified in it and it is implemented [7, 2013].

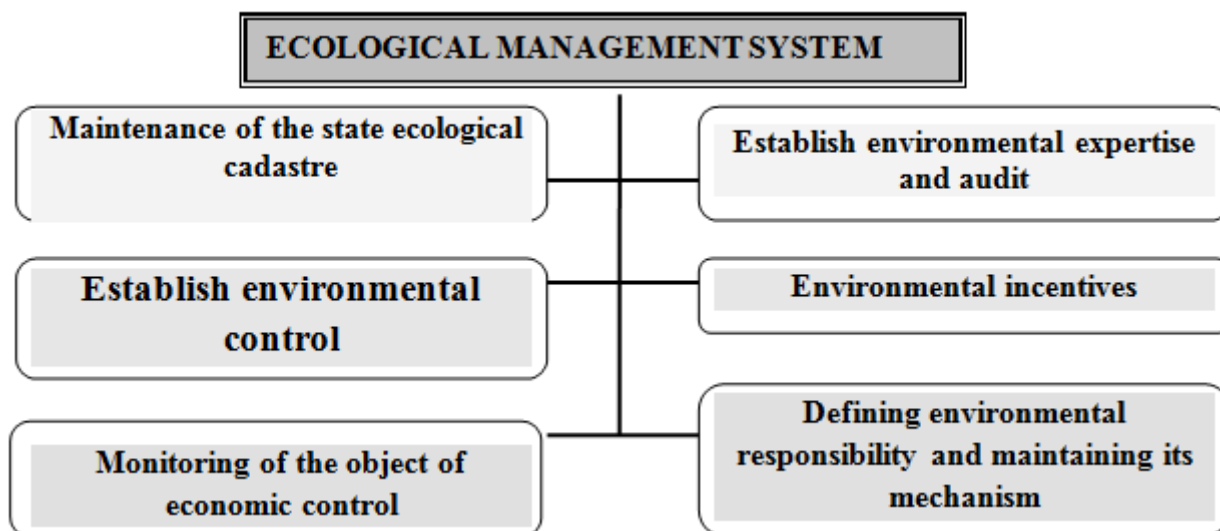

Figure 1. *Parts that serve the ecological management system*

Ecological management begins with the maintenance of the *ecological cadastre*, more precisely, the cadastre of natural objects. Cadastre - in French, "cadaster" - means register, list. Typically, this list does not apply to general objects, but to specific objects, including natural objects. According to Article 3 of the Law of the Republic of Uzbekistan "On State Cadastres" of December 15, 2000, the ecological cadastre is an integral part of the unified system of state cadastres. This unified system will be created as a multi-purpose system designed to ensure a single nationwide accounting and assessment of the natural and economic potential of the republic and its specific regions.

Ecological cadastre is a system of updated (changing) information and documents on the location, legal status, quantity, quality characteristics and value of ecosystems. Ecological cadastre objects are defined differently in different countries. For example, in Uzbekistan, 10 of the state cadastres can be included in ecological cadastre objects (Figure 2).

The ecological cadastre is based on legal principles such as full coverage of the territory, the use of a single system of spatial coordinates, the generality of the methodology, the accuracy and publicity of information. These cadastres are carried out by the executive, specially authorized state and local state authorities, mostly at

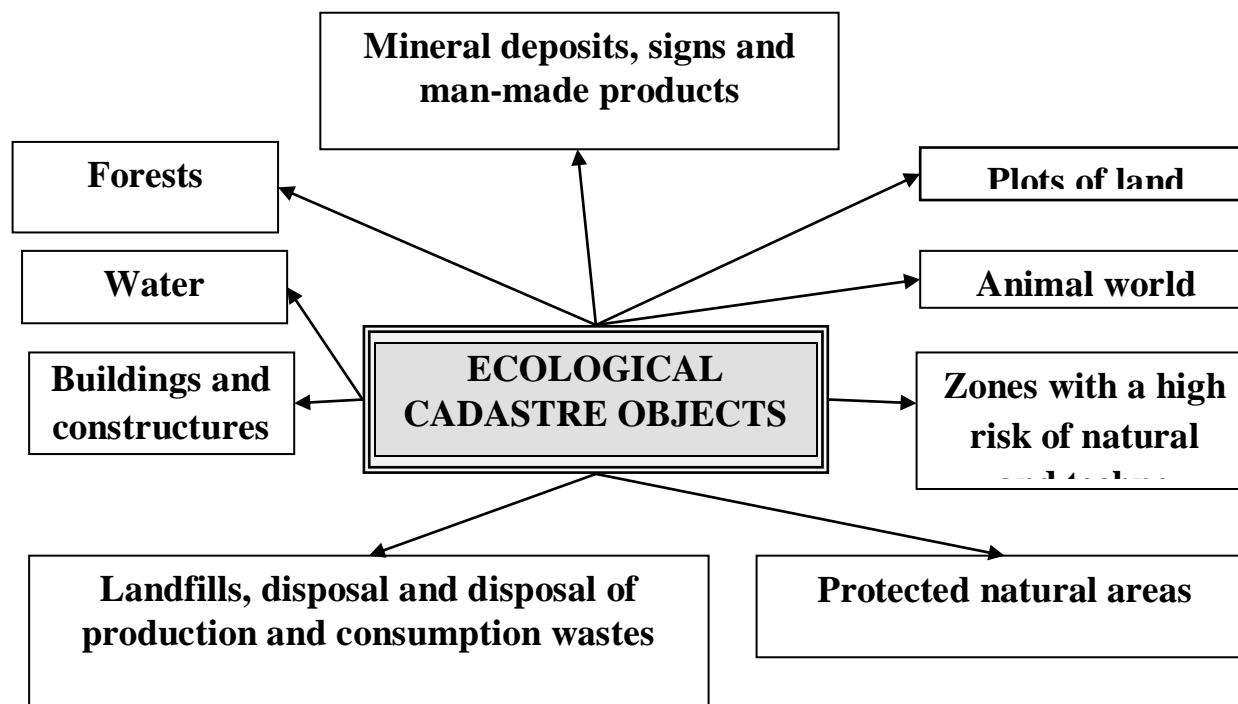

Figure 2. *Objects of ecological cadastre*

Assessment of state ecological cadastre is a natural element and qualitative and value aspects of ecosystems. Documents on the objects of ecological cadastre - documents confirming the right of ownership and other rights to the ecosystem and its components, contain information about the collection folder, map (plan), book, status. Information on ecological cadastre objects is provided to public administration bodies free of charge, and to other legal entities and individuals in the prescribed manner for a fee.

Ecological cadastre can be the economic, social, natural, legal basis of ecological control. In accordance with Article 3 of the Law of the Republic of Uzbekistan "On Ecological Control" dated December 27, 2013: *ecological control is a system of state and public measures aimed at preventing, detecting and limiting violations of the legislation in the field of ecological protection and rational use of natural resources, increasing the effectiveness of nature protection activities.*

According to the Regulation "On the procedure for state ecological control", approved by the Cabinet of Ministers of the Republic of Uzbekistan dated August 5, 2014 No 216, its objects, forms, types and methods are summarized in Figure 3.

**Areas of ecological control in Uzbekistan:** formation and development of ecological control systems; creating a favorable environment for the life and health of citizens; specially authorized state in the field of ecological control (Cabinet of Ministers, State Committees for Ecology and Ecological Protection, Industrial Safety, Veterinary and Livestock Development, Land Resources, Geodesy, Cartography and State Cadastre, Ministries of Health, Water Resources and Interior, Cabinet of Ministers State Inspectorate for Plant Quarantine), local state authorities, state and economic administration, business entities, citizens' self-government bodies, non-

governmental non-profit organizations, organizational and legal mechanisms for cooperation with citizens on ecological protection and rational use of natural resources improvement; development of international cooperation in the field of ecological control.

As we can see from the above, ecological control is a very comprehensive and multifaceted activity. Therefore, it is integrated into a single system.

*The system of ecological control services includes: the service of state ecological inspections; ecological monitoring service; service of state law enforcement agencies; services of internal administrative and production bodies; services of public associations.*

Ecological control inspection is carried out by public authorities and administration, as well as specially authorized government agencies. They are also divided into general and special ecological regulatory state bodies in accordance with their ecological management powers.

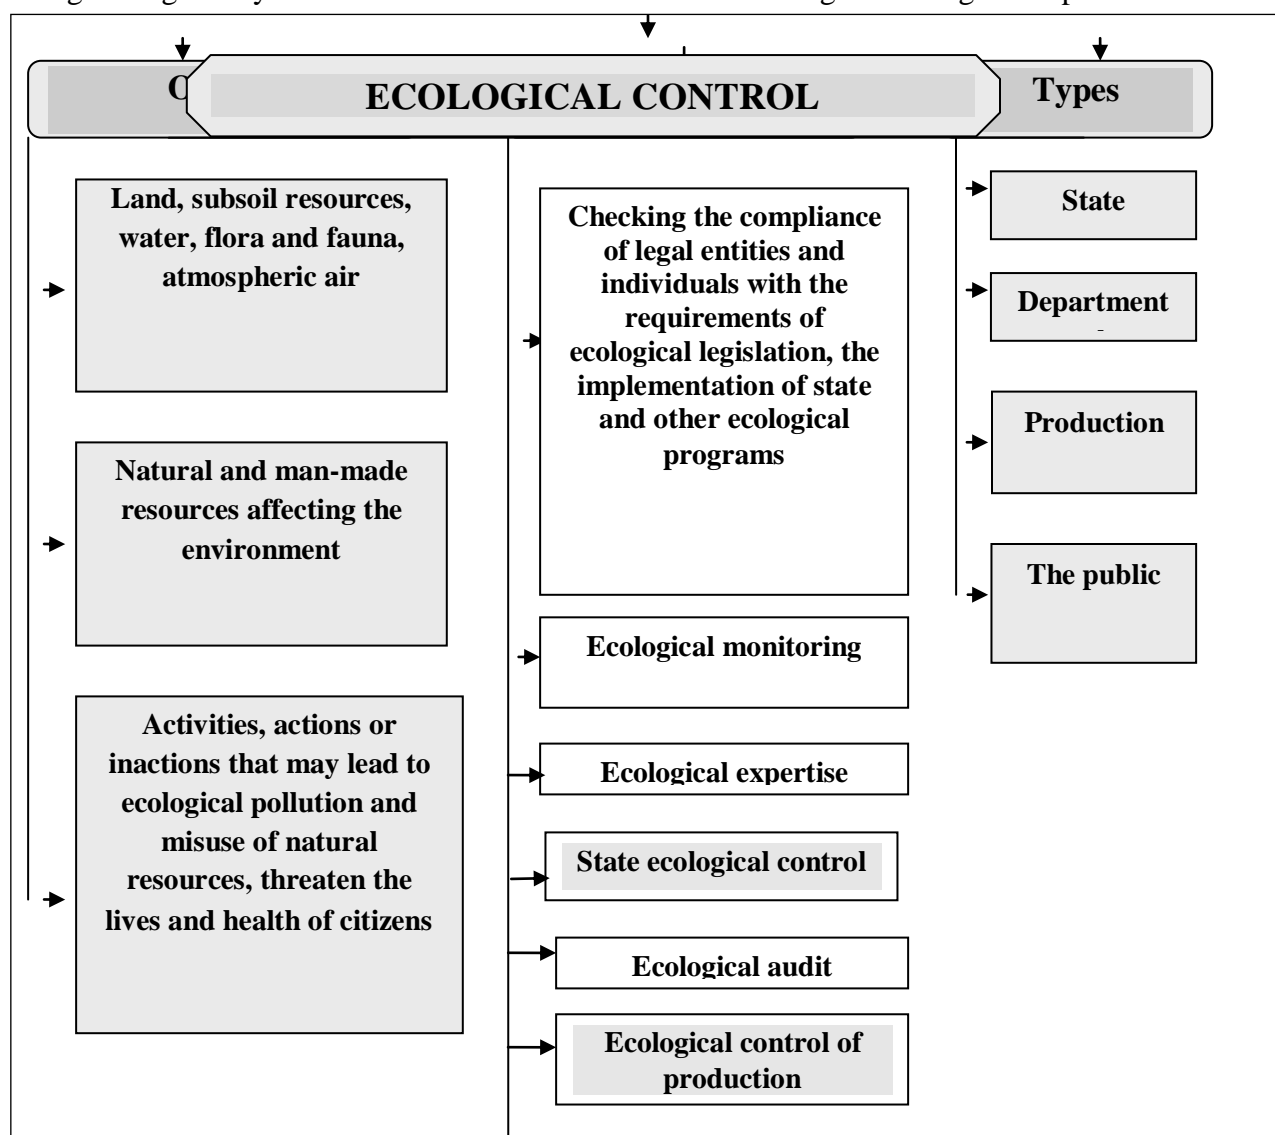

Figure 3. *Objects, forms and types of ecological control*

*Ecological monitoring is the first stage of ecological control, which is a system of monitoring, recording, assessing and forecasting periodic changes in the state of the environment (or rather ecosystems) (based on cadastral data). It is conducted locally, nationally, regionally and globally.*

The national ecological monitoring system in Uzbekistan is carried out in accordance with the principles set out in the 1972 UN Stockholm Conference on Ecological Protection. Its legal basis is Article 28 of the Law "On Nature Protection", the Regulation "On State Monitoring of the Environment", approved by the Cabinet of Ministers on April 3, 2002 No 111, the Regulations of specially authorized state bodies and other by-laws is calculated. However, in Uzbekistan, ecological monitoring is called "ecological monitoring" and it is incorrect to say that it is carried out only by government agencies. Unlike the ecological cadastre, ecological monitoring is a type of control specific to non-governmental organizations and self-governing bodies.

The Ecological Monitoring Service is the basis for the accurate and expeditious conduct of the activities of the specially authorized state inspection service in the field of ecology through the timely provision of information on the state of the environment (ecosystems) to the head of state, authorities and executive bodies. Ecological monitoring data should be conducted in a transparent manner. This information is primarily summarized and evaluated by ecological authorities. Monitoring data on the negative ecological situation is required to be made public immediately.

Maintains the state cadastre of natural resources to take into account the quantity, quality and other indicators of ecosystems, the volume of their use, the principle of order. Objects that may have a detrimental effect on the state of ecosystems, pollutants, their amount, volume and composition of industrial and municipal wastes are also monitored and accounted for by the state.

Governments may not always have staffs who understand ecological rules and regulations. In this case, the supervisors have to get an expert opinion. In science it is called **ecological expertise**. The word expertise is derived from the Latin word "expertus" - "experienced", which means the conclusion of a particular issue by an experienced expert.

For the first time in the ecological legislation of the Republic of Uzbekistan, ecological expertise is covered in Articles 24-27 of the Special Section VI of the Law "On Nature Protection" adopted on December 9, 1992. Article 4 of this law establishes the principle of mandatory ecological review. However, the Law on Nature Protection has only established the imperative (strict) conditions for ecological expertise. Its essence, types, methods, terms, principles and objects were not covered. It is no exaggeration to say that the Law of the Republic of Uzbekistan "On Ecological Expertise", adopted on May 25, 2000 and entered into force on July 1, 2000, has made a significant contribution to the formation and implementation of the legal and ecological mechanism.

**Ecological expertise** is the determination of the compliance of the planned or carried out economic and other activities with the ecological requirements and the feasibility of the object of ecological expertise. The main goals and objectives of ecological expertise are to determine the extent to which these activities may affect ecological requirements, in particular, the health of citizens, as well as measures to protect the environment, rational use of natural resources before

planning and implementing other activities. is to determine whether it is sufficient and scientifically sound to meet ecological requirements (Figure 4).

Development of state programs, concepts, projects for the location and development of productive forces, social and economic sectors as an object of ecological expertise; allocation of land plots for all types of construction, preparation and transfer of documents; preparation of documents for the creation of new types of equipment, technology, materials, substances and products; granting the status of specially protected natural areas and ecological emergency and ecological disaster zones (tegras); the development of urban planning documents, the mechanism of their practical application will also be the object of expertise, and they, of course, need the opinion of experts.

Ecological expertise can also be conducted by *state, public and specialized firms*. However, passing the state ecological expertise is mandatory for all the above-mentioned aspects of human activity. Therefore, it can be conducted by expert units of different statuses of specially authorized bodies. If the business or other business entity (customer) is not satisfied with the conclusion of the state ecological expert commission, it has the right to file a claim for consideration in the general or economic courts.

The timing of the state examination is determined differently. For example, in Uzbekistan its term does not exceed 30 days and in some very difficult conditions can be extended for a period not exceeding 2 months with the permission of the chief state expert. Funding for this expertise is provided by the customers.

Citizens have the right to conduct public *examinations by citizens' assemblies*, self-government bodies, and non-governmental non-profit organizations. From the point of view of ecological expertise, they can conduct ecological expertise at their own expense, independently of the state expertise. Only the conclusion of the public ecological expertise will have the force of a recommendation and will allow to review the conclusion of the state expert examination and to go to court with a claim.

In order to conduct a public ecological review, citizens, citizens' assemblies or public organizations must submit an "Ecological Consequence Statement" to an independent expert commission. In this application, they should cover two issues: *the consequences of ecological degradation, taking into account ecological risks; take the necessary measures to eliminate the consequences of ecological damage, restore and moderate the state of the environment*. The task of the experts is only to prove the correctness or incorrectness of this situation or situation. If the public examination does not correspond to the conclusion of the state examination, the matter shall be clarified by applying to the state body, the prosecutor's office or the judicial authorities appointing the state ecological examination.

One of the peculiarities of market relations is the formation of various types of audit activities. Audit "audit" in English – means "verification", that is, the inspection of accounting books, reports and documents. The legal regulation of the audit activity

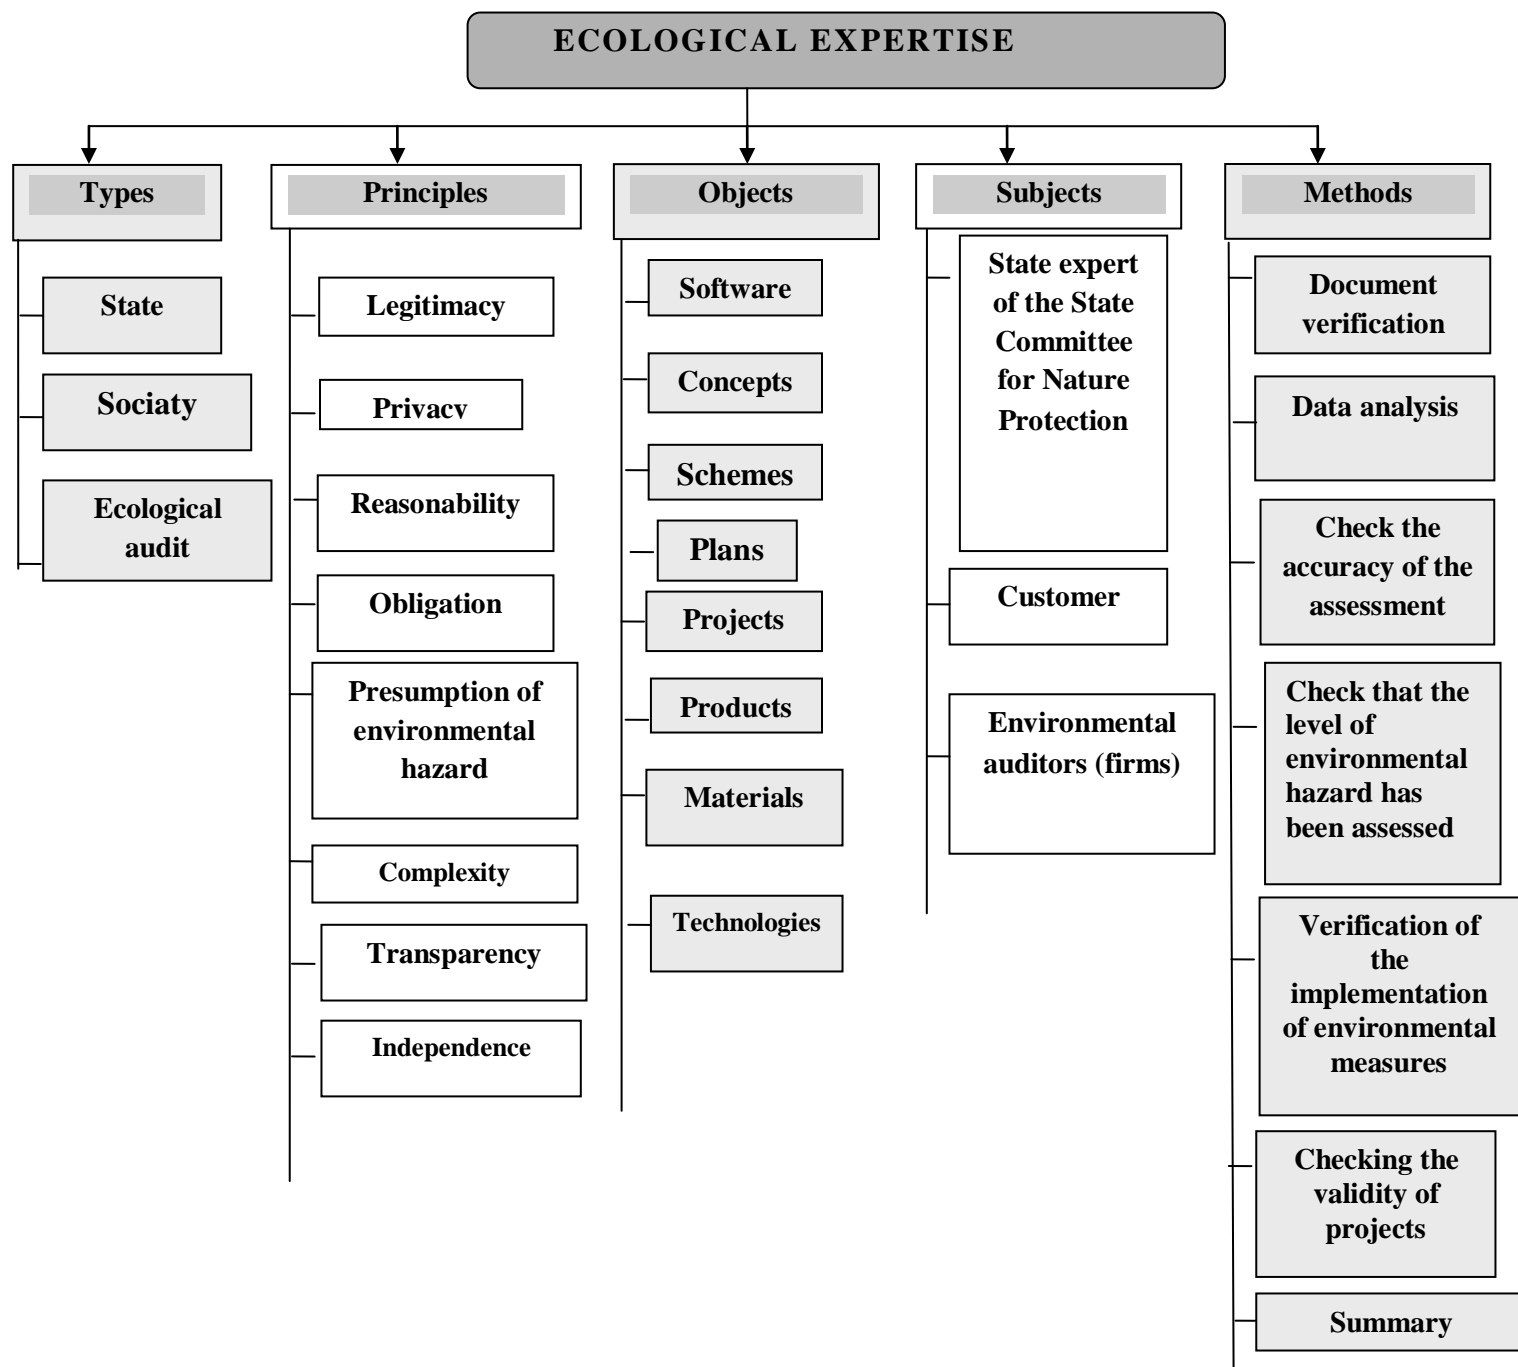

Figure 4. *Types, principles, objects, subjects and methods of ecological expertise*

in Uzbekistan is regulated by the law “on auditing activity” dated 26 May 2000 and the documents adopted on this basis.

Ecological audit is the inspection of accounting books, reports and documents of the subjects of ecological attitude. Auditing activities are carried out by auditors (audit firms) in the form of entrepreneurial activities. Ecological audit has some specific look. Ecological audit three types:

- 1) Ecological expertise in production;
- 2) Regional ecological expertise;
- 3) Conducted in the form of ecological consulting.

*The purpose of ecological audit of production facilities* is to ensure compliance of financial and economic activities of enterprises with the requirements and regulations for Ecological Protection, preparation of recommendations for nature protection measures, as well as verification of expenditure in the use of Natural Resources. Such verification work is carried out before financing and in conflict situations with the supervisory authorities.

*Territorial ecological audit* is used to assess the natural resource potential of a particular plot of land or territory to determine the impact of adverse natural phenomena and man-made processes on the environment and their types. This type of ecological audit deals with real estate and land transactions; to formulate an initial conclusion and present it to the public; submission of expert opinion and approval by higher authorities; dispute resolution, etc.

## CONCLUSION

To conclude, ecological cadastre, control, expertise and audit are systems that increase the effectiveness of ecological management. Adherence to its sequence has a positive effect on the healthy lifestyle of children and staff in preschool education, regardless of the form of ownership.

## REGISTRATION OF NEUROLOGICAL PATIENTS IN PRIMARY HEALTH CARE

**Babadjanova Zamira Khikmatovna\***

\*Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*The effectiveness of dispensary records has been studied by examining ambulance records of 460 patients with chronic illnesses. The following results have been defined: recovered 2.1%, satisfactory 70.2%, stable 2.2%, disability 4.5%, the illness got worse 2.5%.*

**KEYWORDS:** *Neurological Patients, Primary Health Care, Rural Medical Center, Dispensary Records.*

### INTRODUCTION

**Relevance:** The problem of the quality of medical examination in the new economic conditions is one of the most urgent in healthcare. The Concept of Development of Health Care and Medical Science in the Republic of Uzbekistan pay great attention to the quality and effectiveness of the medical examination. In recent years, a number of works [1-3] have been published on certain aspects of the clinical examination of the population, but so far there have been insufficient studies to study its quality.

Clinical examination is a complex of measures, including a medical examination by medical specialists, laboratory and instrumental diagnostic methods carried out in relation to certain groups of the population. The development of all non-communicable diseases occurs gradually and is determined by certain risk factors. Risk factors are conditions under which the likelihood of the onset of the disease becomes higher. Identifying these factors is easier and cheaper than subsequently diagnosing and curing an already developed disease- they can be detected long before the first signs of the disease appear. Also, the influence of risk factors can be significantly reduced, and this can completely prevent the development of diseases. To do this, it is enough to adjust the lifestyle of a person.

The aim of this study was to develop scientifically based recommendations for hanging the quality and effectiveness of medical examination for neurological diseases of the population in the conditions of rural medical centers

The study was conducted in 2015-2019. in three rural medical centers (Geophysics, Zarmanak, Kasri-Orifon) of the Bukhara region.

The quality of the clinical examination was studied based on expert assessment of 460 cards of outpatients with chronic neurological diseases. For the observation unit in the study, a patient who was registered in the dispensary was accepted. In accordance with the purpose and objectives of the study, statistical, expert and sociological methods were used.

A special "Card of expert assessment of the quality of medical examination of the population from 5 to 65 years in rural medical centers " was developed, which included the following sections; regular monitoring of children and adults, completeness and timeliness of laboratory and instrumental studies; quality of the implementation of medical and recreational activities; the effectiveness of the rehabilitation treatment of the outpatient card.

To assess the quality of the clinical examination, the most common nosological forms were identified: migraine, tension headache, radiculitis, discirculatory encephalopathy, neuritis and neuralgia, epilepsy, cerebral palsy, polyneuropathy, acute cerebrovascular accident, etc.

Data on the regularity of observation of patients in rural medical centers are presented in table 1.

The research materials showed that children on average in 23.1% of cases were observed irregularly by district pediatricians, in 38% by district nurses, in more than 68.3% of cases by doctors of narrow specialties. Especially often this happened with migraines, tension headache (33.2%), sciatica (36%), discirculatory encephalopathy (40.7%), neuritis and neuralgia (49.4%).

According to experts, the cause of irregular monitoring in an average of 42.8 cases was the lack of discipline of parents, in 31.6% - the absence of a mother and a child at the place of residence, in 9.2% - the absence of an appropriate neurologist, in 6.8% - an overloaded doctor, in 9.6% - other reasons.

#### Regularity of observation of patients in rural medical centers (% of total)

TABLE 1

Disease	Regularity of observation			
	Local doctor		neurologists	
	resp ec ted	Not com p liant	Res pec ted	Not com plia nt
Migraine,tension headache	66,8	33,2	31,8	68,2
Radiculitis	63,5	36,5	37,6	62,4
Encephalopathy	59,3	40,7	14,5	85,5
Neuritis and Neuralgia	50,6	49,4	35,7	64,3
Epilepsy	88,7	11,3	34,7	65,3
Cerebral palsy	80,5	13,5	18,3	81,7
Polyneuropathy	83,5	16,5	36,0	64,0
Transient cerebrovascular accident	87,3	12,7	26,9	73,1
Acute cerebrovascular accident	88,7	11,3	46,2	53,8

Conditions after transferred	81,7	19,3	45,1	54,9
Convulsive syndromes	86,8	13,2	29,3	70,7
Parkinson's disease	65,4	34,6	27,6	72,4
Average	76,9	23,1	31,7	68,3

The research materials showed (Table 2) that an untimely examination took place on average in 19.9% of cases, in particular with convulsive syndromes in 24.2%, with migraines, tension headache - in 25.7%, with transient disorders cerebral circulation - in 27.3%, with cerebral palsy - in 33%, with radiculitis 34.7%. When analyzing the completeness of the survey, it was found that in 23.6% of cases it was carried out in incomplete volume. Particularly high is the proportion of insufficiently examined migraine headaches, tension headache, radiculitis, cerebral palsy, transient cerebrovascular accident, conditions after a history of stroke (from 27.1 to 34.7%). The reasons for this in 22.5% of cases were the lack of diagnostic equipment and apparatus, in 21% - the lack of control by the doctor, in 15.5% - the overload of laboratories and diagnostic rooms, in 15% - the lack of discipline of parents.

An important aspect of the effectiveness of the clinical examination is the quality and completeness of the implementation of the plan of medical and health measures. At the same time, according to expert estimates, in 17.5% of cases they were carried out inadequately. An expert assessment revealed that in 16.4% of cases the dispensary patients needed planned hospitalization, but it was not performed in 7.5% of cases.

An important indicator of the quality of the clinical examination is the completeness of the use of physiotherapeutic methods of treatment. According to experts, in 24.5% of cases, physiotherapeutic treatment was not prescribed, in 17.5% of cases it was inferior. The reason for this situation in half of the cases was the lack of discipline of the parents, in 22.5% - there was no necessary treatment, in 27% - insufficient control of the healing process by the doctor.

One of the important stages of the clinical examination is the rehabilitation treatment, which, according to experts, was needed by more than 90% of the population. However, in 24.8% of cases it was carried out poorly, and in 13.1% it was completely absent. Particularly high is the proportion of inferior rehabilitation treatment among patients with migraine, tension headache, radiculitis, cerebral palsy, transient cerebrovascular accidents and conditions after a stroke. The main reason in 42.4% of cases was the lack of appropriate types of rehabilitation treatment, in 32% - lack of discipline of parents, in 12.7% - overload of specialists, in 16.5% - lack of control by the doctor.

**TABLE 2 QUALITY INDICATORS OF MEDICAL EXAMINATION OF CHILDREN IN RURAL MEDICAL CENTERS BASED ON EXPERT ASSESSMENT (% OF TOTAL)**

Disease	Timeliness of the survey		Survey volume		Conducting medical and recreational activities	
	timely	untimely	full	incomplete	full	inferior
Migraine, tension	74,3	25,7	74,3	25,7	77,7	22,3

headache						
Radiculitis	65,3	34,7	65,3	34,7	69,2	30,8
Encephalopathy	94,5	5,5	84,5	15,5	94,5	5,5
Neuritis and Neuralgia	82,1	17,9	72,1	27,3	74,8	24,2
Epilepsy	93,1	6,9	87,1	12,9	93,3	6,7
Cerebral palsy	66,6	33,0	66,6	33,4	67,6	32,4
Polyneuropathy	94,5	5,5	74,5	25,5	94,3	5,7
Transient cerebrovascular accident	72,7	27,3	72,7	27,3	74,8	24,2
ONMK	96,0	4,0	91,0	9,0	95,5	4,5
Conditions after transferred stroke	72,9	27,1	72,9	27,1	74,8	25,2
Convulsive syndromes	75,8	24,2	75,8	24,2	77,6	22,4
Parkinson's disease	78,9	21,1	78,9	21,1	80,6	19,4
Average	80,1	19,9	76,4	23,6	82,5	17,5

Equally important in improving the quality of medical examination is the timely consultation of patients with narrow specialty doctors and general practitioners. However, according to expert estimates, in 21.9% of cases, consultations were held out of time. The reason for the untimely or failed consultation in 61% of cases was the lack of a specialist, in 6% of cases the attending physician did not appoint a consultation. An important criterion for clinical examination is the assessment of its quality and effectiveness. For each nosological form, criteria for the effectiveness of medical examination were developed.

In diseases of the nervous system, the following criteria were taken into account: improvement of motor functions and motor skills, increase in the amplitude of movements; reduction in relapse rate; reduction or disappearance of pathological reflexes; reduction in relapse rate; reduction or disappearance of contractures and deformations of joints and bones, etc.

We analyzed the dynamics of the health of the population under dispensary observation in rural medical centers. The following results were obtained: recovery - 2.1%, improvement - 70.2%, no change - 22.8%, transition to disability - 4.5%, worsening - 2.5% of patients. In the "no change" group, the main share falls on patients with cerebral palsy, the state after suffering a stroke, which may indicate an insufficient volume of medical and health measures, including rehabilitation treatment.

It is known that indicators of the cost-effectiveness of medical examination of the population is a decrease in the frequency of cases of temporary disability in connection with patient care.

It is known that the card of an outpatient is a legal document, which can speak "for" and "against" a doctor in case of lawsuit. However, according to expert estimates, in 46.3% of cases defects in the maintenance of this document were noted. In particular, an insufficient description of the medical history was detected in 23.2% of cases, and the absence of a doctor's records.

There was also a lack of data on the outcome of the disease, in some cases, recommendations were not given to patients. The materials of the expert assessment showed that in every third case

there is no continuity in the examination and treatment of patients between outpatient and inpatient facilities.

Thus, an in-depth study of the quality and effectiveness of clinical examination in rural medical centers with expert assessment showed that there are significant reserves for improving the quality of medical examination, which depend primarily on the level of professional training of general practitioners, nurses, the monitoring system for their activities and the availability of methodological recommendations for providing medical examination and quality control.

Identified defects in the organization and quality of the clinical examination indicate the lack of effectiveness of existing systems of departmental and non-departmental control over this process.

Based on the materials of the study, we developed guidelines for improving the organization and improving the quality of medical examination in the conditions of rural medical centers. They, in particular, include organizational and methodological issues of ensuring the quality of medical examination of the population, indicators of the quality and effectiveness of medical examination; methods of analysis and assessment of the quality of medical examination using expert assessments; information support for the quality management process of the clinical examination; continuing education programs for general practitioners and nurses; rational organization of the work of the local therapist; proposals for improving the relationship of general practitioners and narrow specialists.

Clinical examination is a complex of measures, including a medical examination by doctors of several specialties and the application of the necessary examination methods, which are carried out with the aim of early detection of chronic non-infectious diseases (conditions), which are the main cause of disability and premature mortality of the Uzbekistan population and risk factors for their development as well as in order to form health groups and make recommendations for patients.

Regular medical examinations and preventive medical examinations are the most important mass and highly effective medical technologies for preserving health and reducing premature mortality. Regular medical examinations will significantly reduce the likelihood of developing the most dangerous diseases that are the main cause of disability and mortality in our country or identify them at an early stage of development. When their treatment is most effective.

### IMPACT OF INFLATION ON CONSUMER BEHAVIOUR TOWARDS GOLD – A STUDY

**Dr. Puja Archana Sahu\***; **Dr. Mudita Srivastava\*\***

\* Professor,  
AMC College, INDIA

\*\*Professor,  
AMC College, INDIA

#### ABSTRACT

*India throughout its history has always considered gold as a valuable commodity. Indians not only consider gold for the purposes of investment but also as a status symbol. The obsession of Indians for gold is well known around the world. The strong price increase seen for gold in recent years has been the result of a complex of short-term factors including a weak dollar, low real interest rates, and high levels of financial stress and central bank quantitative easing policies, which may have raised the tail risk of high inflation. The researcher has tried to find out the relationship between the purchases of gold with respect to Inflation. For this study we have collected the response of 30 respondents & analysed using simple percentage method.*

**KEYWORDS:** *Gold, Consumer Behaviour Inflation,*

#### INTRODUCTION

Gold has been used as a store of value and form of currency since ancient times. Since the seventeenth century it has been formally traded over the counter in London and by the nineteenth century it underpinned the largest fixed exchange rate system the world has ever known (the Gold Standard). In the twentieth century it was again used as the backbone to a formal exchange rate mechanism (Bretton Woods) but the collapse of the system in the early 1970s left the price to float freely for the first time in over 250 years.

Since 2007 the world has seen a period of striking economic and financial volatility, featuring the deepest recession since the 1930s and steep declines in the value of many financial assets – both traditional ones such as equities and newly developed ones such as mortgage-backed

securities. Against this background, however, gold has performed strongly with its price roughly doubling since the global financial crisis began in mid-2007.

Another article How to invest in gold( Mrs. Shweta B H )states different views of investing; she suggests protecting wealth rather than creating wealth and states that gold is one such investment. The article also states that gold is an asset which has long term intrinsic value which helps to shield from inflation, currency debasement and equity market bears.

Gold, although not specifically mentioned as an artefact, is also a valued possession according to its significant role in Indian culture (Dempster, 2006). Gold is an artefact because the status it holds in the Indian culture designates membership to that culture (Craig and Douglas, 2006).

Gold is unique, however, because it is not necessarily a 'cherished' possession. Cherished possessions carry reminiscences about life and '... create a personal and durable sense of identity' (Price, Arnould and Curasi, 2000, p 187). Initial interest in this study developed from observing gold-buying activities in the Dubai Gold Souk after being introduced to the intricacies of supplying, manufacturing and retailing gold to Indian consumers (Siroya et al, 2005). Possessing gold is firmly embedded in Indian customs and traditions (Dempster, 2006) although little academic attention has been paid to its significance within the consumer culture. Rituals include consumer behaviours as well as occasions such as religious holidays, festivals, and marriage (Craig and Douglas, 2006).

### **Scope and Objectives of the Study:**

The purpose of this research is to find out effect of Inflation on consumer behaviour on purchase of Gold with the objective to get the feedback about various factors affecting consumer behaviour towards the purchase of gold and evaluating gold as an investment decision. This research began with questions whether Indians have distinctive consumer [culture] actions when buying gold. The study narrowed to the question 'have gold-buying activities become ritualized in the Indian consumer culture?' The main objective of the study is to:

- (1) Find out when Indian customer purchase gold,
- (2) Why they buy Gold
- (3) How – described by actions and behaviours do they buy.

### **LIMITATION:**

The study was restricted only to Bangalore. So the results cannot be generalized. Some of the customers were not serious in their responses to the survey and as a result there are some difficulties in reaching to the right conclusion. The results may help people to understand about the factors that influence the satisfaction of customers towards Gold.

### **RESEARCH METHODOLOGY**

The research design used in this study is descriptive research design. In order to fulfil the chalked up objectives a present study of 30 respondents are taken. The present study is based on primary as well as secondary data. In order to receive the responses of 30 people, questionnaire method and personal contact method is adopted.. The secondary data is collected from journals, text books and through internet. Random sampling method is adopted used to select the

consumers for collecting data. The data has been collected and analysed using simple percentage method.

### ANALYSIS & INTERPRETATION

**TABLE 1: DEMOGRAPHIC &SOCIO ECONOMIC CHARACTERISTICS OF RESPONDENTS**

Particulars	No of Respondents	Percentage of Respondents
<b>Age</b>		
Below 30	13	20.63
30-40	23	36.51
40-50	18	28.57
Above 50	9	9.52
<b>Family Income</b>		
41,000-60,000	6	9.52
61,000-80,000	17	26.93
81,000 -100000	21	33.33
1,00000 and above	19	30.16

Table 1 shows the demographic & socio economic characteristics of the respondents. The age of the respondents varies but the respondents of an age group between 30 to 40 years are 36.51% followed by the persons between 40-50 at 28.57% & below 30 at 20.63% respectively.

The above table also portrays that 30.16% of the respondents are in the income group of 81,000 to 1, 00,000 where as only 9.52% are in the income group of 41,000-60,000.

**TABLE 2: TYPE OF INVESTMENTS**

Particulars	No of Respondents	Percentage of Respondents
Stock & shares	15	23.81
Real estate	20	31.74
Gold	18	28.57
Others	10	15.87
Total	63	100

The above table states that the preference of the respondents towards the type of investments they would like to invest. Real estate has the highest percentage at 31.74% ,gold at 28.57%, stock & shares at 23.81% and other avenues at 15.87% respectively.

**TABLE 3: AMOUNT INVESTED IN GOLD**

Particulars	No of Respondents	Percentage of Respondents
Below 30,000	14	22.22
30,000-40,000	26	41.27
40,000-50,000	15	23.81
Above 50,000	08	12.70

The above table shows that 41.27% of the respondents have invested in gold for 30,000 to 40,000. 23.81% of the respondents have invested between 40,000-50,000 where as 22.22% have invested below 30,000.

**TABLE 4: WHETHER THE DECISION TO INVEST IN GOLD DEPENDS ON THE MARKET PRICE**

Particulars	No of Respondents	Percentage of Respondents
Yes	49	77.78
No	14	22.22
Total	63	100

The above table shows that 77.78% of respondents are investing in gold on the basis of the market price where as 22.22% have responded that their decision to purchase is not dependent on the market price.

**TABLE 5: FACTORS WHICH ENCOURAGES OR WOULD ENCOURAGE YOU TO INVEST**

Particulars	No of Respondents	Percentage of Respondents
Appreciation in value	12	19.05
Social status	18	28.57
Cultural values ,Rituals	26	41.27
Others	7	11.11

The above table shows that cultural values or rituals have encouraged 41.27% of respondents to invest in gold where as 28.57% have chosen social status as their reason for investing in Gold. The other 19.05% consider gold as an investment as it appreciates in value.

**TABLE 6: IMPORTANT AREAS TO SEARCH INFORMATION BEFORE MAKING INVESTMENT DECISION IN GOLD**

Particulars	No of Respondents	Percentage of Respondents
Friends & acquaintance	25	39.68
Market analysis	29	46.03
Others	9	14.28

The above table states that 46.03 % of the respondents are taking an investment decision to purchase gold by doing the market analysis through internet, newspapers etc. 39.68% of respondents make the decision to invest on the advice of their friends.

## FINDINGS

- 1) 36.51 % of respondents belong to the age group of 30 to 40years. & the family income ranges between 80,000 to 1,00,000
- 2) 31.74 % prefer real estate investment but 28.57% prefer their investment to be gold.
- 3) 41.27% of the respondents have made an investment of 30,000 to 40,000 in gold.
- 4) The respondents responded favourably at 77.78% to the market price as an indicator to invest in gold.
- 5) 41.27% still consider cultural & social values or rituals as the main factor to encourage gold buying
- 6) 46.03 % of respondents search information from internet, newspapers etc . About the market analysis before making a investment decision in gold.

---

**CONCLUSION**

With steep prices in real estate market, gold investment should be encouraged as it is a suitable form of investment to every pocket of an individual. The effect of inflation has reduced the total amount invested in gold but there is a steep increase in the prices of gold in the recent times thus making it a solid investment. Gold is also an accessory and an indicator of social stature. Therefore gold as a commodity is always in demand

## TAX SYSTEM ON THE TERRITORY OF KYRGYZSTAN DURING THE KOKAND KHANATE

**Hatamova Zumradkhon Nazirjonovna\***; **Nuriddinov Mirsaidjon Abdumannobovich\***

\*Lecturer,  
Department of the “History of Uzbekistan”,  
Ferghana Polytechnic Institute, Ferghana,  
UZBEKISTAN

### ABSTRACT

*The article analyzes the tax policy in Kyrgyzstan during the period of the Kokand Khanate, historical reasons and the importance of the emergence of an uncontrolled tax system. The author describes the peculiarities of studying the system of taxation in Kokand Khanate. This information is very important for researchers and a wide range of interests about the tax system in Kokand Khanate.*

**KEYWORDS:** *Administrative Development, Auxiliary Tax, Finance, Kokand Khanate, Revenues To The Treasury, Social-Political, Source, Tax System, Tax, Uncontrolled Arbitrary Types Of Taxes.*

### INTRODUCTION

During the Kokand Khanate, the population was subject to various types of taxes. The decrease in landholdings and the inaction of Khan's policy led to a sharp decrease in the volume of revenue into the treasury of the Kokand Khanate. Because of which, the amounts of taxes levied from the population were increased. Politics was governed by the concept of “the highest owner of the land”. The land was the most important possession and wealth of the state and at the same time the government was “the highest owners”.

“Khan is a state” this concept was dominant. This situation led to the emergence of a tax policy that met only the requirements of the feudal elite.

### MATERIALS AND METHODS

Khan and the state are the same, so the treasury of the state was considered as the personal property of the khan. This circumstance led to the emergence of an uncontrolled tax system. The

amount of taxable tax was determined not by legal means (sharia, adat), but in most cases by the need of the khan, hakim and bek. Such a system, instead of sustainable taxation, has created confusion, increased the unjustified taxation of ordinary people.

Archival documents in Russian of that time show that 18 types of taxes were withdrawn from the population in the Kokand Khanate. This can be seen in the records of State Councilor G. Weinberg, as well as in the notes of Kaufman dated November 10, 1874, it was recorded that 18 types of taxes were withdrawn from the population on the territory of the Kokand Khanate. Researchers of the East A.P. Khoroshkin and N. Pantusov in their works divided the collected taxes in the territory of the Kokand Khanate into two groups: main and auxiliary.[1]

These taxes, taking into account the conditions of the sharia, were as follows: The haraj tax for the use and cultivation of land by peasants, this type of tax was taxed by peasants in kind; from irrigated land 1/5 part of the harvest, from baguer 1/10 part of the harvest; tanap - taxation of orchards, seized in the form of money or in-kind from the harvest; zakat - tax taxable from merchants, from artisans the amount of tax was 1/40 part of the money that was received in the form of profit from the production of sales or services. Zakat was also taxed by nomadic tribes. For example, nomads paid taxes on the volume of animals available, from 40 sheep 1 sheep, from 40 horses 1 horse, from 30 cattle 1 cattle, from 5 camels 1 camel [1.2]

Moreover, there were auxiliary taxes that belonged to household taxes and the amount of this tax was determined at the request of the hakim. These taxes belonged to the adat taxes. For example, "Jailoo pulu" - money taxed for the use of pastures, "Kemi pulu" - for the use of fords of river crossings or for the transfer of private land, as well as paid money from trade caravans and herds of animals for the transition of private land. They had a view for passing through the land zakat pool, for using the skeletons seized the "kopuro puluu" tax. As well as taxes "Tagijai pulu" - for the place of trade - were seized from merchants; "Nekahzhanatarikhane Pulu" - taxed upon marriage and when making an inheritance;

"Lukata pulu" is a tax on the property without an owner after the death of the owner; "Pool cockroach" - for the use of measuring instruments or scales and balances during trading; "Tamaki pulu" - for the land used for sowing tobacco; "namak pulu" - a tax taxable for salt extraction. And there were also various taxes in the form of zakat levied for collecting nuts from the wild nut forests of Arslanbap, Sarah-Chelek, Kyzyl-Unkur, as well as for collecting pistachios. [1.3] Taxes were also seized for grazing sheep and cows and for collecting fruit berries in the form of zakat.

Later, Khudayar Khan introduced an additional auxiliary tax "haraj ata" for the use of horses; "Karagai Pulu" - for the wood material sold for construction; "o'tun pulu" - for the cost of firewood intended for sale; "Dallal pulu" - for mediation in the market; "Kuk pulu" - for the use of pastures (jailoo) for grazing; "Suu pulu" - for the use of water for watering and other purposes.

The increase in taxes gave rise to discontent among the population. As a result, poor households that failed to pay taxes to pay off taxes were forced to give their native children to rich people. The entire population living in the Kokand Khanate was subject to the most difficult tax, which was called "kylkuiruk". This tax was imposed on the population before military campaigns. Each settlement was supposed to supply for the army with each family (Tutun) one equipped soldier (chokar) and 2 horses. The heavy tax burden gradually increased the discontent of the population

accelerated the collapse and weakening of the Kokand Khanate. Despite the existence of uncontrolled arbitrary types of taxes, it can be concluded that there was a tax system in Kyrgyzstan, which was an integral part of the unified tax system of the Kokand Khanate. It follows from the above that the taxes under the Kokand Khanate were unrealistic compared to the present one. [2]

At the same time, the lack of a theory of taxation, the recklessness of practical steps led to serious consequences. An example of bad practice can be seen in wars with each other, that is, between khanates. These wars required huge expenses. And the poorest part of the population suffered greatly from the same. The burden of this policy fell on the shoulders of ordinary people. Therefore, repeated uprisings against the ruling system were recorded and liberation movements intensified. If you give the tax system under the Kokand Khanate an assessment in three areas; the following can be seen in political, economic and legal terms:

- The Kokand Khanate ruled an absolute monarchy whose regime was authoritarian.

The legal side of the tax system at the above time did not have a stable structure, being an amorphous entity, which changed depending on the political situation and nomenclature. [3]

For example, during military events, taxes increased prohibitively. The tax system could not accumulate funds for emergencies.

- The economic side of the tax system on the time of the Kokand Khanate shows that it was not effective, because the existing tax system increased the enrichment of the rich part of the population and the impoverishment of the poor part of the population.
- The industry did not develop; the level of artisanal production was at a very low level.
- The legal characterization of the existing tax system shows that the growing contradiction between rich and poor caused strong popular outrage. Especially those segments of the population that were held in the Kokand Khanate with the help of military forces. Repeated uprisings of subdued peoples undermined the power of the khanate.

As we know, the tax system arose and is developing together with the state, at the early stages of the state organization. And of course, one should not think that it was based solely on voluntary principles. Today, taxes occupy the most important place among the sources of revenue to the state budget. We need to know that taxes are mandatory payments levied by the state. Here it is necessary to recall: Taxation policy "When collecting taxes," - he wrote, "they should not be allowed to prove to be a heavy burden on the people or lead the land to poverty. The ruin of the people leads to the impoverishment of the state treasury, which means the weakening of military power and, therefore, to its disunity, which in turn causes the weakening of the state". - Amir Temur. [4] It is necessary to take into account the past historical experience, lessons of our country and other countries. [5]

## CONCLUSION

Based on the above considerations, the following conclusions can be drawn:

1. There was a tax system in Kyrgyzstan, despite its uncontrollability and arbitrariness.
2. Taxation on time of the Kokand Khanate on the territory of Kyrgyzstan differed little from previous tax systems of various dynasties, was prohibitively large and did not contribute to the development of economic infrastructure.

3. The dissatisfaction of the population with the policy of taxation of the Kokand Khanate caused contradictions between sections of the population, which is why people's liberation movements and uprisings intensified in Kyrgyzstan, bringing the death of the Kokand Khanate itself closer.
4. Despite a number of negative facts, there are several positive factors, one of them is the integration of the Kyrgyz economy into the international arena.

\*\*Senior Lecturer,  
The Department of Architecture,  
Fergana Polytechnic Institute, Fergana,  
UZBEKISTAN

### ABSTRACT

*The authors propose to use gardens on the roofs which from the ages to modern time's parks were created on the roofs of buildings, and today the application of them, to turn the ecological environment - is considered one of the pressing problems of our society.*

**KEYWORDS:** *Uncomfortable Negative Emotions, Ultraviolet Radiation, Bio-Interior, Megacities, Green Bio Inclusions.*

### INTRODUCTION

Architecture, in accordance with the laws of convenience and beauty, plays a large role in the formation of the material life environment in which a person lives, works and rests. Even more important is the problem of the connection of nature and climate with architecture nowadays, when the most perfect consideration of microclimatic effects on humans becomes one of the important tasks in the design, reconstruction and improvement of buildings and structures. With this relationship, the greening of roofs is a topical moment, because living plants on urban roofs are a wonderful symbol of ecological improvement of the urban environment, unfortunately, is not yet sufficiently and timidly perceived by architects and builders.

---

## MATERIALS AND METHODS

The research was based on the following methods: scientific and historical literature on the topic of research, scientific analysis of monuments, study and synthesis of scientific experience.

Huge areas of roofs of industrial, residential and public buildings, underground structures represent an indispensable reserve of urban areas. They can be used in different ways - for car parks, for placing household units, or engineering devices on them. But, at the same time, they can be a kind of artificial basis for gardens, evils and other objects of landscape architecture. On the one hand, landscape inclusions play an aesthetic role in the city layout, and on the other, they protect the roof structures of buildings and structures from damage. Plants, absorbing moisture, protect roofs from destruction, reduce the load of effluents. Plants in the city, which serve as "light," will acquire additional assistants, because modern buildings, overheating, emit heat, and harmful volatile substances, which characteristically worsen the state of the climate in the city. These impacts can be reduced by greening the roofs. German scientists have found that green roofs can reduce air temperature by three times, and in our hot climate it is very relevant.[1,2] Despite the decrease in air temperature, aesthetics and protection of roofs, plants on roofs have other positive sides. They help reduce dust by keeping dust on the surface of the leaves. Even a small lawn holds up to 50% dust in the passing airflow, and when watering, the percentage increases. In our hot climate, we should not forget about ultraviolet radiation, which also decreases when planting plants on the roof. In summer, plants on roofs help to achieve a reduction in noise background, due to foliage, however, in winter this effect does not work.[3,4] Those areas along the highways, or near the airport area, i.e. where noise is much greater, planting of plants on the roof is necessary. Plants clean the air from microbes, absorbing carbon dioxide, dust, saturating the air with oxygen, so they are so necessary to us in the life of megacities, cities and districts. We must also appreciate the effectiveness of roof greening. It remains to assess and determine what extent the garden, square, lawn on the roof meets the needs of people, their psychology, habits, lifestyle. At present, we are more committed to environmentally friendly housing, namely, building houses from natural materials, separating them with modern, environmentally friendly materials, so we need the presence of plants in our bio inter layers. In our interiors, plants can be used in the form of winter gardens on balconies and lodges, used on the facades of buildings. And if we combine plants inside the house, with plants next to the house and plants on the roof, in our opinion, it will be the ideal house of the future, to which man increasingly aspires.

### **Environmental benefits of roof greening:**

A - Greening reduces the temperature of the roof surface and air;

B - Plants absorb dust and toxic emissions;

B - Plants reduce noise with sound-absorbing effect;

D-plants partially absorb rain precipitation, thus protecting roofs.

Current citizens living in apartment buildings, especially on the upper floors, working in offices that lack green bio-connections, are largely deprived of those beautiful contemplations of wildlife.[5,6] The sense of "separation" from the ground can be felt in such premises, and if the apartment or office is located on floors above the previous buildings, people also feel a certain visual discomfort, which arises when viewing non-aesthetic roofs of urban development. What

will you say about the green spaces of roofs, to some extent roofs -shades, which by their improvement, by their aesthetic beauty can remove discomfort negative emotions. The improvement of roofs and their greening can be directed to the cultural and educational regime, namely, to use the greening of the roof for the rest, short-term walks, communication, even for some sports, to raise children, and to train them to a beautiful aesthetic moment, which, in turn, will enrich our modern and rapid life with new content. On a properly prepared cover, you can create an attractive corner of the garden.[7,8] General view of the "Spanish" garden "Derry & Tomes" on a multi-storey building in the London Example of a roof garden at a private apartment in one of the terraces of a skyscraper in New York City.

## CONCLUSION

Short-term rest in breaks between work and work among plants will definitely improve the health and will increase working capacity. The architecture will be more progressive and more fully meeting the requirements of creating a full-fledged material environment of society, satisfying practical and aesthetic demands, the more complete and wider a person will enjoy the benefits of nature, armed with the latest scientific, technical and artistic achievements of his time, using not only natural landscapes on the ground but also roofs.

## WAYS TO ATTRACT INVESTMENT AND IMPROVE ITS ACCOUNTING

**Kunduzova K.I.\***

\*Associate Professor,  
Department of accounting and Audit,  
Fergana Polytechnic Institute, UZBEKISTAN

### ABSTRACT

*The article presents the types and sources of investments and the theoretical foundations of their role in the country's economy, as well as analyzed the structure of investments in the economy of the Republic of Uzbekistan and their impact on the socio-economic development of the country. Proposals and recommendations were made for the correct organization of the accounting of investments in enterprises and their timely accounting, as well as their reflection and improvement in the reporting forms.*

**KEYWORDS:** *Economic Growth, Gross Internal Product, Investment Activities, Investment Policy, Investments, Investments, Labor Productivity, National Economy, Social Development, The Centralized The Decentralized Investments, The Investment Environment.*

### INTRODUCTION

The economy of any country should develop and grow on the basis of economic growth. Because without economic growth, no society, no state can develop, or, to be more precise, there can be no social development. Economic growth fully provides the basic material conditions for social development, and in practice it is measured by an increase in output or an increase in the volume of goods and services created per capita. At this level of growth, the minority is the main economic condition for the transition from the well-being of the population to the well-being of the whole nation.

An investment resource can be the most important additional and effective factor in the country's socio-economic development. It is also important to note that since this resource is directly oriented towards the development of production, it also represents the concept of investing in the economy in a broad sense.

---

## MATERIALS AND METHODS

The multifaceted impact of investment on the social and economic development of any country can be seen, firstly, in increasing labor productivity through the introduction of new technologies, and secondly, in creating additional jobs. As a result, new jobs will be created in production and jobs will be provided (the number of workers will increase), and thirdly, new natural resources will be put into economic circulation (production will be provided from natural resources.). It can be seen that the investments involved provide additional capacity to accelerate the movement of all factors of production, which leads to increased productivity and socio-economic growth. "World experience shows that a country that pursues an active investment policy has achieved sustainable growth of its economy. That is why without exaggeration we can say that investment is the driving force of the economy, in Uzbek - the heart of the economy. Along with investments, new technologies, best practices, highly qualified specialists will come to various industries and regions, and entrepreneurship will develop rapidly. " [1] Investment is therefore an important factor in economic growth, and the following challenges can be met. It,

Firstly, the construction of new enterprises that will be in demand on the domestic market - the production of products that will replace imported goods will create new jobs.

Secondly, the expansion of production and the promising development of enterprises operating in the country complement the volume of private capital of national enterprises.

Thirdly, the national economy will undergo technological modernization, and new equipment and modern equipment will be installed in national industrial production, as a result of which national products capable of competing in the world market will be produced.

Fourth, national producers will be able to implement promising projects through loans.

Fifth, the national economy will be integrated into the global economy.

The multifaceted impact of investment on the socio-economic development of any country can be seen, firstly, in increasing labor productivity through the introduction of new technologies, and secondly, in creating additional jobs. As a result, new jobs will be created in production and jobs will be provided (the number of workers will increase), and thirdly, new natural resources will be put into economic circulation (production will be provided from natural resources.). It can be seen that the investments involved provide additional capacity to accelerate the movement of all factors of production, which leads to increased productivity and socio-economic growth. Therefore, attracting foreign investment to the domestic economy and ensuring the development of investment activities requires the creation of a favorable investment climate. It is known that a lot of work is underway in our country on foreign investment and the formation of an investment climate. In this regard, the Foreign Investment Act, adopted in 1998, and the Foreign Investors Guarantees and Measures Act, adopted in 2014, the Investment Activities Act (new version), adopted in 2014, and more than 50 laws. The adoption of documents can be a vivid confirmation of our opinion. Given the current changes and reforms in the field of investment and investment activities, as well as the lack of directly applicable laws in this area, the entry into force of the single law "On Investment and Investment Activities" of January 26, 2020 will improve the investment climate in Uzbekistan. It is no exaggeration to say that the next step towards improvement has been taken.

The process of attracting foreign investment in the Uzbek economy began in 1995, and many production enterprises have now been created. Particularly noteworthy is the ongoing work on attracting investment for the implementation of projects on the structural restructuring of the economy, modernization of industries, technical and technological updating. [2]

As a result of the active investment policy in the country, in 2019, investments in fixed assets amounted to 189.9 trillion soums (21.5 billion US dollars), or 133.9% compared to 2018.

High growth rates of foreign direct investment and loans are a key factor in achieving high growth rates of investment in fixed assets. Compared to 2018, they increased 3.9 times and amounted to 31.0% of the total investment in fixed assets, of which 19.6% (or 3.6 times more) of foreign direct investment. Also, external loans under the state guarantee of the Republic of Uzbekistan - 14.7% (or 142.4%), budget funds - 7.6% (or 117.7%). Analyzing the total volume of investments in fixed assets by region, the main share of total investments in fixed assets in 2019, i.e. 52.5%, in four regions of the country, including Tashkent - 21.8%, Kashkadarya region - 12.4%, Navoi region - 9.4%, and in Tashkent region - 8.9%. The highest growth rate of fixed capital investments in the regions was 195.2% in the Jizzak region (7919.3 billion. Sumov), 194.3% (6129.2 billion. Sumov) in the Syrdarya region, 167% in the Khorezm region. 1% (5566.8 billion. Sumov), in the Surkhandarya region - 148.8% (1,2232.4 billion. Sumov), in the Navoi region - 145.7% (17775.3 billion. Sumov), in Tashkent - 142.5% (41497.9 billion. Sumov), in the Andijan region - 142.3% (8183.7 billion. Sumov) and in the Ferghana region - 140.1% (9164.2 billion. Sumov).

Depending on the direction of investment, it can be financial or non-financial. Financial investments include money, securities, loans, shares of legal entities in the authorized capital.

Investments in intangible assets are capital investments in fixed assets, which include the purchase of fixed assets, their repair, the acquisition of intangible assets (patents, licenses, know-how, land rights and other rights to use, copyright), the creation of material and production reserves and spent on others. In practice, such investments are called real investments, and their importance is growing in the context of the modernization of the current economy. By form of ownership, the sources of investment are:

- state budget funds;
- funds of enterprises and population;
- bank loans and borrowings;
- foreign investment and loans;
- extrabudgetary funds.

Depending on the source of financing, investments are divided into two groups:

- centralized investments - foreign investments and loans, which are directly financed from the state budget and extrabudgetary funds and attracted under the guarantee of the government;
- Decentralized investments - investments financed by households and enterprises, foreign direct investments and loans from commercial banks.

Currently, more than 73% of all investments in fixed assets are formed at the expense of decentralized investment sources, i.e. funds of enterprises and population, foreign direct investments and loans of commercial banks, which are increasingly involved in the investment process. In 2019, 86653.1 billion will be spent in our country. Sumov. At 9.8 billion. The sums, or 2.5 times more than in 2018, foreign investments and loans were made in fixed assets, of which 50686.8 billion. US dollars - from centralized funding sources. The total amount of investments from decentralized funding sources is 139237.5 billion soums (26.6% of total investments) respectively. UAH. Sums (73.4 percent of total volume of investments) made up investments in fixed capital. In the technological structure of investments in fixed assets the share of construction and installation works in the country is 43.3%, purchase of machinery, equipment and inventory - 49.2%, and the share of other expenditures - 7.5%.

The sources of financing of decentralized investments were carried out mainly from direct and other foreign investments and loans (31.0% of the total investment), own funds of enterprises (20.7%). Due to loans from commercial banks and other borrowed funds in the regions, significant investments were spent in the Navoi region - 25.8% of total investments in fixed assets, respectively in the Samarkand region - 22.3%, Syrdarya region - 20.0%, Ferghana region - 16.6% and Andijan region - 16.1%. Foreign direct investment in 2019 amounted to \$ 37171.3 billion or 3.6 times more than in 2018. The share of investment in gross domestic product was 37.1 per cent, indicating a dynamic increase in investment processes in the country. Positive qualitative changes are taking place in the sources of financing of capital investments and their use. Investment policy is one of the important directions of economic development and expansion of production of any state, which requires a new approach in a market economy. As a result of the intensive investments and reforms implemented in the year of social development, the volume of investments in fixed assets increased sharply and amounted to 33.9 percent compared to last year.

Special attention from the government of our country is paid to attracting investments in the economy of the Ferghana region, every year the volume of attracted investments in the economy increases. In particular, the total volume of investments in fixed assets in 2019 amounted to \$ 9,164. 2 billion. the amount or growth rate compared to the corresponding period in 2018 was 140.1 percent. In particular, the total volume of foreign investments and loans in fixed assets in 2019 amounted to 3538.2 billion soums (398.0 million USD), an increase of 2.8 times compared to 2018. In addition, foreign investment in the total amount of attracted foreign funds amounted to 2 708.8 billion soums (303.9 million USD), of which 2 415.9 billion soums (271.5 million USD) of foreign direct investment.

In 2019, the share of foreign direct investment and loans in the private sector in the total volume of foreign investment and loans in the region amounted to 98.5%. Manufacturing accounts for a significant share of foreign investment and credit in economic activity, amounting to 1906.2 billion. Sumov. sum. The share in the total volume of foreign investments and loans is 53.9%, in the mining industry - 786.5 billion sum. The share of total foreign investments and loans in the total volume of foreign investments and loans amounted to 22.2% and 3.7% (130.4 billion. Sumov) of total foreign investment and loans in agriculture, forestry and fisheries. In addition, 42.0 billion sum was spent in the field of information and communications. sums and 18.3 billion sums for water supply, sewerage, garbage collection and collection. sum. According to our analysis, in 2019, the use of foreign investments and loans for these types of economic activities

increased compared to 2018. This, in turn, is the result of the conditions created in our country for foreign investors, in particular, the timely formation of a regulatory framework. From the first days of independence to date, the number of enterprises with foreign capital is more than 10,903 people, of which 668 were newly created foreign enterprises in the first quarter of 2020. It is important to develop and improve it.

## CONCLUSION

Based on the scientific analysis of attracting investments in the transition economy of the country and improving the investment market and accounting for investments in enterprises, we can say that it is necessary to ensure the effectiveness of domestic and foreign investments, to implement the following conclusions and recommendations for improving their accounting:

1. Further economic and legal improvement of measures to prevent inflation, strengthen the national currency and develop products that meet international standards, to increase its confidence in the world market, provide foreign investors with detailed information about the investment climate in the country, create opportunities and encourage them;

Strengthen the attraction of investment funds, solve the problems of energy resources, communications, transport, communications, reduce the cost of goods and services, establish minimum tax rates; [4]

It is necessary to achieve harmonization of the goals of using a foreign investor and his investments and create appropriate conditions for the full use of domestic capital in the economic development of Uzbekistan;

2. We believe that in order to attract large foreign investments, foreign investors should be provided with the following guarantees from the state;

In order to improve state insurance of political, legal and economic risks, remove existing restrictions in order to increase the interest of investors in transferring foreign currency to foreign currency and other countries, as well as to create a favorable investment climate;

Increasing the responsibility of public authorities for damage in case of violation of the rights of foreign investors;

3. The direction of most foreign investments in our economy to the development of small and medium-sized businesses, i.e. technological modernization of small and medium-sized businesses will be beneficial both for the investor and for the future of the enterprise.

In general, increasing investment activity and reducing the cost of products to increase the attractiveness of foreign investments, reducing the amount of raw materials and energy costs in the production of goods will increase national savings and investments in the economy.

With the efficient use of attracted investments, it is important to accurately and fully reflect them in the accounting.

This is due to the fact that accounting and auditing occupy an intermediate link between receiving information and making investment decisions;

1. Identify and leverage opportunities to improve business efficiency;
2. scientific justification of management decisions;

3. Perform all managerial duties;
4. Improvement of the investment mechanism;
5. Economic entities serve as an instrument for the economic education of workers. [3]

In our opinion, it is practically impossible to make sound and scientifically sound investment decisions without improving the accounting and audit of long-term investments.

For this, we consider it necessary to do the following:

- before starting investment activities, it is necessary to calculate the return on investment and its effectiveness;
- it is necessary to organize and keep records when making investments and determine the difference between what is planned and what is not;
- it is necessary to correctly classify and group financial investments;
- accurate and timely assessment of financial investments;
- the status and movement of financial investments must be correct, timely and documented using appropriate source documents;

After investments are made, an audit is carried out on the basis of accounting data, on the basis of which management decisions are made on investment activities. An important condition for the successful development of the country in a market economy will be the correct reflection of the investment activities of business entities in accounting and the deepening of the audit, further development and improvement of its methods.

### ABSTRACT

*Grain storage is a dynamic process during which it can change its properties. Support of grain mass quality is the main goal of grain storage technology. The technology is selected depending on raw material quality and grain storage type. Its observance allows reducing the volume of natural losses of the product and keeping it in a healthy environment. One of the most important elements in this process will be the preservation of grain by cooling.*

**KEYWORDS:** *Cooling, Grain Breathing, Grain Drying, Grain Storage, Grain, Preservation, Self-Heating.*

### INTRODUCTION

The nature of grain is unique. Under favorable conditions the viability of wheat grain at the level of 40-80% remains for more than 25 years!

Healthy, made and whole grain is reliably protected from external adverse factors by shells. The biological nature of the grain makes it possible to regulate life processes depending on environmental conditions - to include commands and mechanisms that allow the grain to be in a

state close to anabiosis for a long time or to exhibit the highest activity associated with germination.

## **MATERIALS AND METHODS**

From the moment of separation from the ear, the grain becomes an independent unit with all its inherent properties, and getting into the mass, it acquires new qualities, depending on the properties and state of all components:

- the grain of the main crop;
- impurities;
- microorganisms (mold fungi, bacteria, yeast);
- Bread stock pests (insects and mites).

The conditions that determine the breathing intensity of the grain and impurities itself, the vital activity of microorganisms and pests of bread stocks depend on the humidity and temperature of the grain mass. To ensure the safety of the harvest, its humidity should not exceed 14%, clogging 2% and temperature - 10 ° C.

Accordingly, it is necessary to clean, dry the grain mass and further protect it from infestation by insects, mites, moulds and rodents.

## **RESULTS AND DISCUSSION**

As the experience of recent years has shown, grain storage has proved to be almost the most important link in the grain business. The storage itself allows the manufacturer to get a higher price for the grown products. Analyzing the cost of a ton of wheat in terms of several years, there is a clear trend of falling purchase price during harvesting and by the beginning of October. The fall in prices is mainly due to an increase in grain supply from producers who are unable to store grain and/or need financial resources.

Starting in mid-autumn, prices gradually rise, and only then comes the time of the manufacturer. One thing is obvious: if the autumn pair is where to store grain, no real or fictional conspiracy of grain traders will force the manufacturer to sell the whole crop directly from the field. Every year more and more grain producers understand this and repair, build, buy and rent various kinds of storage facilities.

However, storage is also not a simple thing, requiring constant study, improvement and search for new possibilities to ensure that the precious harvest with minimal losses and optimal costs waits for its price. Thus, the question arises not only about the storage itself, but also about its quality.

In addition to the traditional technologies and approaches to grain storage that are known in our country, there are new ones. One of them - cooling (cold preservation) of grain - certainly deserves attention. In particular, corn producers and processors will be interested (there is no need to move grain to prevent warming), oilseeds (the process of oil oxidation is delayed), organic grain (allows to exclude fumigation), etc.

Cellular respiration of grain followed by arbitrary self-heating is the cause of spoilage of harvested grain. These processes depend on the temperature and humidity of the grain: the higher the temperature and humidity of the grain, the more intense it breathes. Self-heating causes dry

mass loss and favors the development of pest insects and fungi. It is known that there is significantly less storage loss in temperate zones during the cold season than in the summer months. Preservation by cooling allows to artificially create winter climatic conditions immediately after harvesting.

Due to high humidity and heat, the risk of grain spoilage is particularly high in tropical climate areas. Therefore, it is particularly important to apply cooling preservation in such areas. The features of grain structure and surface, as well as its low thermal conductivity, are the best prerequisites for cooling. Once, the cooled grain mass maintains a low temperature for a long time. The benefits of using this technology will now be described in more detail in this article.

The process of grain ripening reaches its peak by the time of harvest. But even after harvesting, the grain keeps ripening, it breathes. Under the influence of oxygen, the carbohydrates decompose, releasing heat to carbon dioxide and water, which leads to the loss of dry matter. The chemical formula for this process is given below:

Carbohydrates + oxygen - > carbon dioxide + water + heat

Figure 1 shows a diagram of heat emission versus grain temperature and humidity. Next in the table is the formula for calculating the losses, and several possible options (examples) for storing the grain batch. This will allow to estimate dry mass losses during storage.

**TABLE 1 GRAIN LOSS CALCULATION FORMULAS**

Data		
Grain	Wheat	
Moisture content	14,5%	
Grain temperature	30°C*	
Grain cost	2 200 000 soum/ton	
Period of storage	4 months	
Quantity	10 thousand tons	
Formula		
Dry weight loss (t) = [heat formation (MJ/t/day) x shelf life (days) x stored quantity (t)]/15000 (MJ/t)		
Result		
	Loss of dry mass, tons	Losses/expenses, sum
Without cooling at 30°C**	64	Twelve thousand eight
Without cooling at 25°C	32	hundred
Cooled at 10°C	insignificant (<1)	6400
		1800 (electricity)***

\* Grain is taken after drying or directly from the field in summer;

\*\* See. the picture above;

\*\*\* Assumptions: 4.5 kWh/t - electricity consumption, 0.04 sum/kWh - its cost.

**Figure 1. Diagram of dependence of heat emission on grain temperature and humidity**

Cooled grain storage technology was originally developed to preserve moist grain before drying. Dry grain is now cooled more often than wet grain - mainly to prevent insect pests from developing. Fig. 2 shows some of the most common insect pests and optimal conditions for their life and reproduction. Some pests are more common in temperate zones, others prefer tropical conditions.

Cooling the harvested crop to temperatures below 13°C effectively prevents losses from insect damage. At sufficiently low temperatures, the insects hibernate and do not harm the granary.

If the temperature and humidity are favorable for insects, there are significant losses from grain damage by pests and from contamination with excrement. These losses grow due to the rapid reproduction of insects under favorable conditions. Most bugs have a very short development cycle - in ideal conditions, the weevil's reproduction cycle takes only 25 days.

**Figure 2. Some species of insect pests and optimal conditions for their life and reproduction**

Currently, the chemical processing of grain is strictly regulated. Fumigation creates significant costs for chemical materials and expensive technology. It should also be borne in mind that methyl bromide, often used for fumigation, has been banned in many countries since 2005.

Depending on the weather and crop rotation, damage to crops by Fusarium fungus can occur in a certain area (region) with different frequency and strength.

In addition to significant economic losses, there is a danger of the formation of mycotoxins, which are poisonous to humans and animals. For example, pigs are sensitive to vomitoxin and zearalenone. This is expressed in reduced appetite, reduced grazing and deterioration of animal reproductive capacity.

The development of fungi and their life products - mycotoxins (e.g. aflatoxin) - is accelerated at elevated temperature. Cooling the grain stops these processes (Figure 2).

Wheat after harvesting is dried depending on purpose to 14-16% moisture content. For this purpose, air is heated in a special drying unit. This warm air takes moisture from the grain and takes it out into the atmosphere. The moisture required for normal storage of maize, rice and oilseeds is lower than for wheat.

**Figure 3. Grain shelf life circular diagram**

In conventional storage without cooling, it is often necessary to fill the grain. Mixing and associated intense contact of grain with air leads to elimination of hot spots. For this purpose, a free silage is always required, and at each overflow due to friction, approximately 0.3% of the total grain weight is lost. Plus, we need energy consumption for grain transportation, which can be estimated at 1-3 kWh per 1 ton of grain. Chilled grain does not need to be sprinkled.

The resting grain mass absorbs energy very slowly. The reasons for this are the insulating effect of the air in the space between the grains and the small area of contact between the grains. Therefore, the warm grain remains warm for a long time even at low ambient temperature. Accordingly, the cooled grain remains cold for a long time. The table lists the shelf life of the cooled grain depending on the moisture content and the climatic zone (in months). The calculation of shelf life is shown in the diagram.

**TABLE 2 SHELF LIFE OF COOLED GRAIN DEPENDING ON MOISTURE CONTENT AND CLIMATIC ZONE**

Humidity of grain, %	Temperate zone	Continental zone
12-15	8-12	6-8
15-17	6-10	3-5
17-19	4-6	1-2
19-21	1-4	0,5-1

A circular shelf life diagram shows that reducing the grain temperature with a humidity of 14.5% from 24 °C to 10 °C increases the allowable shelf life by about 5 times (points a and b) (Figure 3). In order to obtain values for other conditions, it is necessary to connect the existing moisture content with the actual temperature with a line on the circular diagram. The intersection of this line with the vertical axis of the chart shows the allowable shelf life of the grain. The second point of intersection shows extended shelf life at reduced temperature and given humidity. However, the values given are indicative. In any case, it is necessary to regularly monitor the temperature of the grain and, if necessary, further cool it.

Numerous advantages of cooling preservation are, however, associated with certain costs. In addition to the investment in the cooling plant, electric power is required for its operation. Electricity consumption depends on ambient temperature, relative air humidity, grain moisture content, and grain temperature. Empirical data of power consumption for single cooling of grain and oilseeds are given in Table 3.

**TABLE 3 POWER CONSUMPTION FOR SINGLE COOLING OF GRAIN AND OILSEEDS**

Средняя температура	10 °C	25 °C
Регион	Европа	Азия
Климатическая зона	Умеренная	Жаркое
Потребность в электроэнергии, кВт*ч/т	3-6	11-14

The grain cooler fan sucks in the atmospheric air (Fig. No. 4). This air is cooled to the desired temperature and dried in an evaporator air cooler. Water is released. Then cold wet air is heated in the unit, which reduces the relative humidity of the air.

**Figure 4. Grain cooling technology**

The unit uses energy from the refrigeration circuit and does not require electricity costs. Dry cold air is supplied by hose to air distributor of storage and blown through grain mass. This technology can be used in both floor storage and silo type elevators. Waste air is discharged through holes into atmosphere, bringing with it moisture and heat taken from grain.

## CONCLUSION

The savings when using cooling preservation are due to the following:

- Each single cooling additionally dries the grain. It reduces moisture content of grain by another 0.5-1.5% when it is cooled by 20K. With high grain humidity (more than 18%), the effect of additional drying is stronger than for dry grain (humidity less than 14%).
- The residence time of the grain in the drying unit can be reduced by optimising drying and cooling; Note here that energy is saved and drying efficiency is increased.
- Reducing drying time and intensity makes this process more sparing for grain; There are fewer cracks and grain damages from drying.

### ABSTRACT

*The article highlights the scientific and practical significance of the activities of international partnership expeditions in our country in the study of the Paleolithic period, as well as the state of new data in the field of paleoecology and paleo landscape in Uzbekistan in archaeological research. Research work carried out on important monuments of the history of our Motherland, and several successes achieved.*

**KEYWORDS:** Angillak, Homo Sapiens, Kolbulak, Kotirbulak, Mousterian Culture, Obirakhmat, Paleoanthropology, Paleoecology, Paleo Landscape, Palaeolithic, Radiocarbon, Samarkand, Stone Industry, Teshiktash 2, Thorium-Uranium, Todahotin, Trasology.

### I. INTRODUCTION

Palaeolithic monuments in the regions of Uzbekistan have long attracted the attention of foreign specialists with their variety and originality. However, only after gaining independence did they have the opportunity to come to our country and establish scientific cooperation with local experts. The Institute of Archaeological Research of the National Archaeological Center of the Academy of Sciences of the Republic of Uzbekistan conducts research with more than 20 international partner groups of archaeologists on various periods of our ancient past. Staff exchange and training with international research centres have been established. Only joint international expeditions to study the Paleolithic period, such as Uzbekistan-Poland, Uzbekistan-America, Uzbekistan-Russia-Belgium, Uzbekistan-France, operate in our country and open important pages in the history of our country.

## II. MATERIALS AND METHODS

As a result of studies of international joint expeditions in our country, new monuments of the Paleolithic period were discovered and studied, such as Angillak, Todahotin, Ahangaron, Teshiktash-2, Ayokogitma, Bukantog. Research work was continued at the monuments of Kolbulak, Kizilolma 2, Obirakhmat, Kotirbulak, Zirabulak, Omonkoton and others. As a result, several world-class achievements have been achieved.

**2.1. In the field of palaeoecology and paleo landscape.** The Obirahmat Cave and its surrounding areas have been explored in this area. The dynamics of occurrence and change of rocks and ecological situation in the Paltov region are fully shown. As a result, it turned out that the Paltov area was gradually filled with layers of Cretaceous, Paleogenic and Neogenic periods. Also in the Quaternary period river terraces and alluvial deposits were formed here. The Loess coatings in the Paltovo basin are not connected with its terraces, and the flat terrain ensures the preservation of the Loess layers. As the terraces age, the Loess pavements thicken [6, 9]. The thickness of the terraces in the Paltov Valley is 50-60 m, and the loess layers are from 0.5-1 to 5-6 m. The microclimate of the Paltov Valley is scientifically justified because it is protected from cold currents by blocking the high mountains on the north side and as a result is covered with less arid vegetation (pine). These studies allow the reconstruction of ancient climatic conditions, as well as paleoecological conditions. It is known that primitive people influenced natural landscapes in terms of living and working conditions. Primitive people showed their anthropogenic impact on the natural flora and fauna, as well as in the process of stone extraction, which is the main raw material for the manufacture of stone tools. The study of these effects today is one of the problems of landscape archeology. From the materials received it is known that in ancient times, the regions of Uzbekistan were rich in natural flora, mega and microfauna. At the same time, the evidence found in the monuments proves that primitive people from an early age had an anthropogenic impact on nature. [22.424-29]

### 2.2. In the field of technical typology.

Thanks to the efforts of international partner expeditions, thousands of monuments have been collected on the monuments of our country. Most typological nomenclatures in these sectors were already known to us. However, there are new ones among them. For instance, a joint Uzbek-Polish international expedition to the territory of Kotirbulak has for the first time identified the type unknown in science - "arrowheads of Kotirbulak type" and introduced it into scientific circulation. In 1995. A joint Uzbek-Polish international expedition has conducted studies of Paleolithic monuments of Kotirbulak and Amankotan in the Zeravshan oasis [2, 3]. As a result, the stratigraphic state of Kotirbulak has been revealed. It was found that the layers of monuments are intertwined due to natural and anthropogenic impacts [21].

For the first time, it became known that basalt stones were mainly used in the Stone Industry of Kutirbulak. Another important aspect of these scientific studies is that a completely new term "Kutirbulak arrowheads" was introduced into the nomenclature of the typology of world Paleolithic studies, which can be gladly defined in Uzbekistan [18, 17]. Now it is natural that this term or genus name is included in all dictionaries of the world. Also, we can give an example of the Tudakhotin 1, 2 space industry, characteristic of the last Paleolithic period, investigated by the Uzbek-Russian joint expedition [9, 92]. These monuments date back to the end of the late Paleolithic era, the presence in their industry of microlithic tools characteristic of the Mesolithic

period makes it possible to clarify the genesis of Mesolithic cultures not only in Uzbekistan but throughout Central Asia. These finds indicate that in our country cultures of the Paleolithic and Mesolithic era developed, and innovations of the Mesolithic era appeared at the end of the Late Paleolithic era. In general, the introduction of microlite weapon types found in the Tudakhotin space requires a review of the genesis of the Mesolithic communities of Uzbekistan [15, 45].

**2.3. In the field of chronology.** In the 2009 season, an Uzbek-Russian-Belgian joint international expedition discovered 18 m<sup>2</sup> of the upper Paleolithic layer of Kolbulak. [10.] Late palaeolithic horizons of the site are located in the second lithological layer and have a pluvial genesis consisting of green-grey clay (soup), sand-gravel mixtures of various sizes. Although this layer is pluvial in nature, archaeological materials in it are rarely mixed. This is evidenced by the presence of a large number of stone fragments among the artefacts of the collection, as well as the fact that stone objects lie horizontally with the stomach. [16]

The materials of the 2nd layer are in a concentrated state in two separated layers, which indicates that during this period people have mastered space twice in a short period. Therefore, the 2nd lithological layer is divided into two, while the upper 2, the 1-cultural layer assimilates in a short time, and the second 2, the 2-cultural layer is intensively inhabited by a primitive person for a long time. According to technical and typological data, the industry of the 2nd cultural layer of Kolbulak can be attributed to the second half of the Late Paleolithic. The complexes of both layers of the monument are unique in terms of cultural identity and genetically close. Also, by the composition of the studied industry, it can be called a workshop for the production of fuel and stone weapons for a long time.

Chronologically, the materials of the upper layers of Kolbulak look younger than the Tudahotin industry. This is evidenced by the fact that the upper layers of Kolbulak do not contain lightning or retouching using stone crushing methods, and this technical tradition is widely used in the Tudahotin 2 industry. It can also be added that in the industry of the upper Kolbulak layers there are no plates without ribs at all, but the rehearsed Kolbulak plates are similar to such objects in the lower layers of the Tudahotin space that were used in the manufacture of pistols. [9] Currently, samples were taken from 2-10 cultural layers of Kolbulak and counted by the OSL method, and results were found relating to the second half of the Late Paleolithic, 24,000 BC. During the expedition to Obirahmat, many stone objects were collected from its cultural layers, and ancient paleoecological conditions were reconstructed. [3, 6; 4,] Excavations at the monument were carried out based on modern archaeological methods, and analysis of each artefact was found in the laboratories of leading countries of the world. The study was conducted with the participation of the "Leakey Foundation", and the exact date of the cave layers of Obirahmat was determined. Analyses based on radiocarbon, EPR, OSL and thorium-uranium methods determined that the date of the monument was between 80-70 thousand years BC and 40 thousand years. [11, 23] Radiocarbon analysis was performed in the scientific laboratories of Arizona, USA. [9, 13,] Two of the samples totalled  $23800 \pm 190$  years (coal remains), and the bone remains obtained from here -  $23600 \pm 330$  years. One of the samples gave a much younger date -  $21850 \pm 180$  years. However, experts do not deny that most of the uranium in the arsenic layers fall out as a result of work on cleaning the spring, carried out in later periods. [2,10] In any case, such a relatively young date seems less likely for rabies. The results of this census were also questioned by the authors. Because there is a possibility that the resulting samples will be contaminated as a result of natural impacts. In particular, the exact date of 14 thousand years,

obtained on the basis of the c-42 method of Anguilla cave probes, is distinguished by the originality of its industry, which has a Mustier appearance. [20, 21, 22]

#### **2.4. In the field of paleoanthropology.**

In the summer of 2003, the remains of a bone of an ancient man from the 16th cultural layer of the Obirahmat cave, dating back 60-70 thousand years, were found. [4, 5, 8, 11] Paleoanthropological finds included 6 individual teeth and about 150 small fragments of the skull. With the help of scientists from Uzbekistan, Russia, the USA and Austria, outstanding results were achieved, computer tomography of teeth and ear bones was carried out at a medical centre in the Austrian city of Insburg and the Institute of Nuclear Physics in Novosibirsk, and a 3-dimensional model was created. The result of this was that the man Obirahmat showed the features of both the Omoneanderthals and the homo sapiens. [8] In paleoanthropological finds, it became known that dental bones are characteristic of a Neanderthal person, and the skull is of a modern type for a person (homo sapiens sapiens). In general, the found remains of an ancient man demonstrate a harmonious image of a person of the modern type with Neanderthals, due to which many of his morphological features are unique and still do not have a paleoanthropological analogue. [6] The scientific community claims that the man Obirahmat is in a hybrid image, but these interpretations are quite contradictory. There are several reasons why, on the one hand, it is difficult to solve the question of whether the individual bone of the skull, found on the one hand, means that it is 9-12 years old, and on the other hand, it is scientifically justified that the age of the find is at least 60 thousand years. It should also be remembered that several such factors prevent the find from being considered the bone remains of a modern type of person, including 6 teeth of an individual - Neanderthal. [14] Consequently, such scientific foundations or interpretations remain debatable. It is difficult to say with complete certainty that the man of Obirahmat today is characterized neither by an anthropological man of the modern type, nor by non-nuclei, nor by the archaic man Homo sapiens. [11] The findings of the Obirahmatian man indicate a revision of existing ideas about the emergence and development of Neanderthals and people of the first modern type, dominating world science.

After the discovery by A. P. Okladnikov in 1938 of the tomb of the famous Neanderthal in the Teshiktash cave, the discovery of the man Obirakhmat is the first anthropological find that allows restoring the physical appearance of the ancient inhabitants of the Stone Age in Central Asia. In practical terms, it was discovered for the first time that the transition industry is associated with a specific physical type of person. Currently, there are practically no such conclusions in the world. Today, the regions of Uzbekistan play a key role in finding solutions to pressing global problems, such as the emergence and spread of modern man, his dependence on the past population and changes in the material culture of people of the Stone Age. As a result of the intensification of the study of the Paleolithic period outside Europe, the scheme in which the development of material cultures dominated primitive archaeology in recent years was associated with changes in anthropological types has lost its versatility. The new data require significant changes in previous concepts. If in the past the appearance of modern man was considered an event that coincided with the transition from the Middle Paleolithic to the Late Paleolithic, then modern materials show that the appearance of modern people, on the one hand, and elements of the Late Paleolithic culture, on the other, is much older. From the Angillak cave, primitive man discovered the remains of one metatarsal bone of his right leg, and now it is difficult to determine whether it belongs to Neanderthals or modern man. [20] However, judging by the

discovery in 2003 of the remains of the 16th cultural layer of the Obirahmat cave and a hybrid man of more than 60 thousand years, Angillak man can also be attributed to Homo sapiens.

### **2.5. In the field of trasology.**

Despite the fact that the materials of the Samarkand region, which is the main monument of the Paleolithic period of the Zeravshan oasis, are well studied, this still attracts the attention of specialists. Tracological studies of M. J. Jurakulov and the Russian scientist G. F. Korobkov on these materials deserve high praise. [7] As a result of this study, it was found that the Samarkand space was dominated by a complex and specialized economy based on deep mineralogical and economic knowledge, which at first glance seemed simple. According to him, the stone industry of Samarkand has a much more complex appearance than we know, the primary raw materials are skillfully selected in accordance with its morphological appearance, primitive savings and quality and morphological structure of raw materials in the technique of lightning and weapons production. [7] These studies allow us to imagine the economic life of the population of Samarkand, the development of stone processing technologies and the impact of primary raw materials on this development.

The studies of M. J. Jurakulov and G. F. Korobkov proved that for the first time in paleolithology of Uzbekistan, based on the materials of the Samarkand site, it is possible to combine formal typological and tracological methods and obtain maximum information from the Kalmyk stone industry. Tracological studies were also carried out in the Obirakhmat cave industry. As a result, the functional value, relative time and characteristics of monumental stone tools were determined. [1]

### **III. The practical relevance of international studies**

Since the independence of our country, as in all spheres, the path to scientific research has opened up great opportunities for the most advanced schools in the world. With the help of foreign partners, our young researchers were trained on a grant basis in various European research centres and improved their skills, which, in turn, has a significant impact on the development of scientific work in our country. With the help of foreign partners, our young researchers are trained on a grant basis in various scientific centres in Europe, which, in turn, has a significant impact on the development of scientific work in our country. In 1997, with the participation of Professor T. Sh. Shirinov and the head of the joint Uzbek-French expedition, Professor F. Grene, the signing of an agreement between A. de Lumley, a professor at the National Museum of the History of Material Culture in Paris, was one of the important steps in this direction. [17] To develop such responsible competence, researcher B.Q. Sayfullayev was elected. B. Sayfullayev improved his knowledge and skills in several laboratories dating back to the Paleolithic period in France. He carefully studied the advanced de Lumley system of the Bord research method and was translated into Russian for the first time. [18] At the same time, this method of research was successfully used in the study of Zarafshan, Akhangaron oases and Kyzylkum palaeolithic materials in our country. As a result, the number of new data was obtained. B. Sayfullayev also conducted peer-to-peer studies together with Uzbek-Russian, Uzbek-Polish and Uzbek-French international joint expeditions and used the knowledge and skills that he acquired in Europe. Currently, the specialist teaches young scientists the secrets of Stone Age archaeology. The study of the Paleolithic crafts of the Zeravshan oasis has reached a new level based on modern methods used by B. Saifullayev in the study of archaeological

materials. In particular, since 2007, in addition to research work as part of a joint Uzbek-Russian expedition, the educational project "School of Field Research of Students and Researchers" has been successfully implemented. [6] The mission of the school is to actively involve young specialists in research in order to integrate science and higher education, provide local scientific schools with a ready and highly qualified world-class young generation and develop international cooperation with students, researchers and young specialists. Young researchers from Uzbekistan, Russia, Kyrgyzstan, Kazakhstan, Germany, Spain, South Korea, Iran and China took part in the research work of this school. The School of Field Studies teaches the younger generation the principles and methods of archaeology, as well as the latest methods and results of absolute, relative counting and reconstruction of the paleoclimate. Also, leading scientists organized scientific reports on primitive archaeology on current problems of that time. Due to the international nature of the expedition, young specialists established mutual scientific contacts for further study. Many representatives of the youth of the republic took part in the expedition. In particular, young specialists directly involved in the Paleolithic period were trained. These include such talented young people as Z. Shodiev, A.A. Muhammadiev, A.Razhabov, X.B. Hoshimov. [17] Currently, they conduct independent research, as well as participate in international expeditions.

The study of the Angillak site in Kashakadarya was carried out by an international Uzbek-American student scientific archaeological expedition. [19] In addition to students, teachers and students of the National University of Uzbekistan, as well as specialists of the Department of Anthropology of the University of Colorado, the excavations were attended by employees of the Institute of History and Archeology of the Academy of Sciences of the Republic of Uzbekistan. As a result, strong links have been established between the above-mentioned research centres and our country's young researchers. In addition, our young scientists are improving their skills in this international and interdisciplinary study.

#### IV. CONCLUSION

In conclusion, it is worth noting the following:

- The activities of international partnership expeditions have acquired both scientific and practical significance in the study of the Paleolithic period in our country. Although from a scientific point of view new aspects of paleolithology of our country were discovered, in practice, the efforts of international expeditions attracted many prestigious foreign grants to study the palaeolithic of Uzbekistan, as well as several young specialists.
- As a result of these studies, it was possible to restore the paleoecological conditions of the Stone Age in Uzbekistan.
- New information on the paleo-landscape of Uzbekistan was obtained based on the materials received.
- As a result of research, world-class innovations in the field of paleoanthropology were made.
- Important innovations in the field of technology and typology, including the most important of them - a completely new term "Tips of arrows of the Kotirbulak type" was added to the nomenclature of the typology of world paleolithology.
- As a result of a comprehensive study of important innovations in the field of chronology, new archaeological materials were extracted from the stratigraphic layers of ancient monuments of the Stone Age, as well as samples were taken to count its layers. Based on the

involvement of modern and natural sciences, new analyses were obtained to obtain new information on the history of Paleolithic monuments of Uzbekistan.

## FOREIGN EXPERIENCE IN THE FORMATION OF PERSONAL QUALITIES OF PRESCHOOL CHILDREN IN COLLECTIVE RELATIONS

**Yarmanova Yulduz Burievna\***

\*Researcher of Karshi State University,  
UZBEKISTAN

### ABSTRACT

*This article provides information on attention to the system of preschool education, on the content of the formation of personal qualities of preschool children in collective relations, on the importance of using traditional and foreign experience in the formation of personal qualities in preschool children and on the participation of the teacher in this matter.*

**KEYWORDS:** *Attitude, Collective Relations, Collective, Education, Educator, International Experience, Personality, Preschool Children.*

### INTRODUCTION

Currently, the only goal of a constantly developing independent State is to create a humanistic, democratic and legal society, as well as to increase the level of socio-economic and cultural development, the realization of noble goals aimed at a worthy place in the ranks of the world community. This depends on the quality of education given to the younger generation. Today, in our country, the system of continuing education pays special attention, more than ever before, to one of the main links of the preschool education system. After all, the knowledge transferred to the younger generation is improved in the activities of the child, is embedded in the formation of his skills and skills, the basis of personality formation is formed, first of all, in the system of family and preschool education.

### MATERIALS AND METHODS

As a basis for the organization of large-scale work carried out in this area, we can indicate all regulatory acts related to this area. All these normative legal acts are aimed at developing and further improving the system of preschool education in the Republic, providing this system with qualified educators - teachers, and most importantly, forming preschool children as comprehensively mature people and fulfilling other tasks. In particular, the development of

organizational and methodological support for the development of preschool education based on advanced foreign experience is currently of great importance. As stated in the Presidential Decree "On measures to fundamentally improve the management of the preschool education system," "... preschool education is a primary part of the continuing education system, which plays an important role in the upbringing and preparation of a comprehensively healthy and harmoniously developed child. The analysis of best practices of foreign countries is characterized by the focus of modern preschool educational institutions on creating conditions for the development of children of preschool age, aimed at demonstrating the possibilities of positive socialization of the child, his comprehensive personal, moral and conscious development, developing initiative and creative abilities based on the corresponding types of activities of preschool age, revealing opportunities for cooperation with adults and peers in the framework of dialogue". The formation of a socially active and comprehensively developed person, as well as his ability to find his place in society in accordance with individual abilities and capabilities, is an urgent social need. The identity of the child is manifested directly in conditions close to him. The characteristic of the manifestation of individuality is determined, on the one hand, by the characteristics of the group, on the other hand, by the characteristics of the child. He strives to ensure that the group has such a situation that it must provide him with recognition, assistance, support, protection in a sense in the children's team, and at the same time he seeks to take a position demonstrating his individual abilities and talents. The child especially needs a team as a basis and as a factor that stimulates individual development than adults who have managed to find their way, profession. The team needs the child's life to cope with the difficulties in his path, "show what he is capable of." The child must still find his place in life. Of course, helping smart, smart and sensitive people in these studies is very important, but ultimately helping adults is helping older people, which can be good advice, guidance, and sometimes prohibition. And community support is recognition or recognition of personality by the public. This is a direct basis for the younger generation, able to find its way in life and look for its correctness. The value that always belongs to individuals does not serve to enrich the team.

For example, the spiritual values of one child will not be the property of the children's community. They can remain closed in an individual and individual space. This can happen either in the conditions of the teacher's reaction to the indifference and inaction of the teacher, or because of the inability to reveal the wonderful features of his pupil, or because of the reluctance to perceive him as a whole.

How to determine the degree of education of personal qualities in a child? This is usually determined by the environment in which the child grows and how much this environment contributes to his comprehensive development, supports and improves his personality. The formation and development of personal qualities, their manifestation in activity is an important pedagogical task. The formation of the personality of each child is an important indicator of quality for the child to come of age and achieve his goal. Our own experience in this regard is that when forming personal qualities in a child:

- a) the formation of moral feelings;
- b) proper communication with the children's team, family members;
- c) diligence;

- d) paid particular attention to the correct allocation of free time and the acquisition of other positive qualities of the content.

Also, one of the factors for achieving the goal is the study of foreign experience and the use of personal qualities in the child in the desired places of content. In foreign countries, special attention is currently being paid to the maintenance and socialization of the personal qualities of preschool children. Teachers of developed countries of the world, including Japan, the USA, England, France, propose to individually approach each age period in the development of personal qualities in children and use certain methods of upbringing.

In Germany, which is one of the developed countries, every child begins to pay serious attention to the formation and development as a person, mainly at the age of 3. They attach great importance to the development of the communicative abilities of children in the German state. Therefore, German mothers take their children to special development groups from the very beginning. The main goal of special development groups is to adapt children to the team environment through playing the team, realizing individual abilities, and developing communication skills in children. German parents send their children to kindergartens precisely after visiting these special groups. Because by this time, the child will be able to easily adapt to the conditions of kindergarten. Also, children feel free in an educational institution. In German gardens, children are taught to behave mainly in a team, to be disciplined, lean, with attention and responsibility to the world around them. These qualities are strictly taught based on ethical standards. In Germany, children are taught their rights from childhood. In the minds of children, it is absorbed that they cannot be hit, intimidated, offended.

In Japan, the child's hidden abilities and human qualities play a key role in finding the content of the child's personal qualities. That is why the Japanese use specific methods of raising preschool children. The purpose of kindergartens is to develop the mental and physical abilities of children, to develop the skills of independence and internal routine, to teach the right attitude to the events of society. The Japanese emphasize various problems of education at different ages. For example, in 1 year, a child has a feeling of self-confidence, in 2 years - a manifestation of practical artistic work, in 3 years - an upbringing of a sense of duty, in 4 years - training in distinguishing between good and evil, educating him a sense of knowledge of skills of a careful attitude to the world around him, and in 5 years - attention to raising the child leadership qualities, independence, drawing up plans and their implementation.

In the process of activity, individuality implies free consciousness, emotions, behaviour in the child, including taking into account his abilities, but personal freedom is formed depending on the environment. Since a preschool child is among peers in a preschool institution, it will be necessary to study issues related to the "children's team," the team and find the best ways to interact with this team and the child. It is important that a person realize his abilities, develop his moral potential and help form collective relations. We can observe this on the example of one of the developed foreign countries on the example of the United States. In the United States, the trust and freedom afforded to a child in the search for the content of a child's personal qualities are recognized as the main method of upbringing. At the same time, in their relationship with the child, they widely use the word "Eng" in expressing confidence in him. The smartest and... this way of raising, of course, forms the child's independence. In the United States, they ignore the

need to allow the child to search for the content of personality qualities in the child. In the tribe, "blind, trying again" is given the opportunity.

This approach in the US parenting method creates the basis for the full use of the child's opportunities.

Unlike other foreign countries, Sweden prefers the method of convincing children of their personal qualities in searching for content. Therefore, in Sweden, their children are treated as mature people. Also, Sweden does not deny their rights and obligations when forming a child as a person. If the child has a human attitude towards himself and others, the child has a psychophysiological disadvantage among friends, comrades of the artaf, then the view of him on the principle of tolerance is absorbed into the consciousness of the younger generation from childhood. This is the leading method of socializing a child. Indeed, awareness of one's own activity, assistance to another person can be an indicator of the child's readiness for collective relations, an indicator of the moral development of the person, and the moral basis of collective relations. Mutual assistance is provided in the process of sympathy and sadness in the joint activities of preschool children.

The French state occupies a leading place in adapting children to a command environment, gaining their independence. In France, parents give their children to kindergarten from childhood, and this is typical of the French. In this state, parents never raise their children. Their most important function is to pay attention to the healthy development of the child. In France, children from a young age go to kindergarten to adapt to the environment, their community, their place of residence, where they find education, act independently, solve their problems. For this reason, French children from 6-7 years old independently attend school, easily seclude themselves in their home, acquire a culture of free trade.

In the UK, they unusually approach the development of personal qualities of children. English parents advocate the gradual upbringing of their children. They pay serious attention to how the child ripens and ripens. Since the British needs to treat their children from 2-3 years old, first of all, how to behave in a family environment, around the table, correctly treat those around the child, raise their feelings in the child (joy, law, crying, laughter, etc.), It is important that children treat community relations...) teach to hide from others. An example of this will be the English mothers who will lead as an example. Mothers will not pursue their children in front of the majority, in public places. In England, kindergarten teachers pay special attention to educating adolescents as an independent person.

## CONCLUSION

In summary, it can be said that a distinctive feature of the child's upbringing in the development of his personal qualities is that he is an adult who organizes a positive ethical experience, and children should be his assimilators, bearers of moral values. At the same time, each of the educators is a special child who expects a separate attitude towards himself, and the educator must skillfully use this circumstance. As a result of closer attention to negative things than to positive in the behaviour of the child, comrades cannot always give him an objective and objective assessment. Only the teacher can quickly notice the uniqueness, greatness of the child. It is for this reason that the status of her wonderful child should be formed by the teacher. Only an adult can see the desire and ability for creativity, which is a condition for active social development. The creative activity of a child largely depends on the social environment in which

he falls. To use traditional and foreign experience in the education of personal qualities in children of preschool age, the teacher must pay attention to:

- Be able to enjoy their people and their spiritual heritage;
- Tolerance towards the child;
- Takes into account the possibilities of the child;
- humanity.

After all, one of the tasks of pedagogical science is the development and improvement of the content of the life of children, various elements of the life of children, the upbringing of each of them personal qualities that correspond to the current state of cultural development of society.

### ABSTRACT

*The article covers the development of zonal systems for managing soil fertility and the productivity of agro ecosystems in intensive agriculture with an increase in the productivity of arable land in Uzbekistan. It is proposed to develop principles and create reclamation systems that ensure, in conjunction with agricultural measures, a high increase in soil fertility, uniformity of the reclamation background and environmental cleanliness of the environment.*

**KEYWORDS:** *Agricultural And Land Reclamation Activities, Clay Soils, Climate, Drainage Network, Global Change, Heavy Loamy Soils, Increasing Soil Fertility In Agriculture, Irrigation System, Land Resources, Meliorative Systems, Rational Use, Conservation, Water Quality.*

### INTRODUCTION

Effective implementation of reforms outlined in the Strategy of Agricultural Development of the Republic of Uzbekistan for 2020-2030, ensuring the rational use of land and water resources, the widespread introduction of market mechanisms in the sector. At the same time, we must recognize that in agriculture, first of all, there are great opportunities to increase soil fertility, agro-technical, modern agro-technologies, further development of selection and seed production, labor organization and incentives.

Indeed, today the problem of maintaining and increasing soil fertility in agriculture, especially in cotton, has become a pressing issue. Due to the introduction of crop rotation in recent years, the

problem of introducing short-term crop rotation systems remains an important task in cotton growing.

However, at the same time, efforts are being made to increase the yield of cotton, wheat and other crops at the expense of mineral fertilizers and other chemicals. As a result, their negative impact on soil fertility leads to reduced yields and poor quality crops.

According to the data, the amount of humus in the soils of irrigated lands of the country has been decreasing recently. Farms use 700-800 kg of cotton fields, 400-500 kg of wheat fields, sometimes 800 kg/ha to increase productivity. mineral fertilizers are added to.

It is necessary to apply local and mineral fertilizers to get the desired yield from crops. This is because the crop removes a very large amount of nitrogen from the crop. Hence, the decrease of organic matter in the soil, in turn, leads to the deterioration of the physicochemical properties of the soil and a decrease in fertility. Therefore, it is necessary to apply high-yield measures in agriculture, reducing the number of mineral fertilizers.

Also, in the experience of introducing crop rotation systems, it was noted that in some years the amount of humus increased or was optimally maintained. The data show that the introduction of repeated and intermediate crop rotation in the current system of short-term crop rotation in the current crop rotation is one of the most important issues in cotton growing.

## METHODOLOGY

Scientific research was continued in a new field each year in a short rotation (1: 1) system in crop rotation. Therefore, experimental options were conducted in 2007–2011, depending on the type of crop. (Table 1) In the experiment, winter wheat “Kroshka”, “Pobeda-104”, soybean “Orzu” and cotton Navruz and Andijan-36 varieties were planted. The experimental options were carried out according to the system given in Table 3, with 3 repetitions. Scientific research was continued in a new field each year in a short rotation (1: 1) system in crop rotation. Therefore, experimental options were conducted in 2007–2011, depending on the type of crop. (Table 1) In the experiment, winter wheat “Kroshka”, “Pobeda-104”, soybean “Orzu” and cotton “Navruz” and “Andijan-36” varieties were planted. The experimental options were carried out according to the system given in Table 3, with 3 repetitions. In the experiment, phenological observation, soil and plant sampling were carried out in accordance with the manuals "Methods of field experiments" (Dospekhov) "Methods of state varieties of agricultural experiments" and "Methods of field experiments".

Quantities of humus in soil samples, general and mobile types of NPK were carried out in accordance with the methods "Methods of the agrochemical, agrophysical and microbiological research in polyvinyl cotton fields" and "Methods of agrochemical analysis of soil and plants of Central Asia."

## EXPERIMENT

Also, the reduction of nutrients in the soil leads to negative environmental and economic consequences. With the depletion of land resources, their deterioration (degradation) leads to a significant decrease in nutrients, decreased crop yields, reduced soil moisture capacity, heat and water permeability, and increased water and wind erosion. Among soil microorganisms, worms are also important. They significantly improve soil properties. Their quantity and size fluctuate considerably under the influence of mineral and local fertilizers.

The above factors have a major impact on fertilizer efficiency and therefore on crop yields. Therefore, one of the most important factors in increasing the economic efficiency of agriculture is to ensure the optimal ratio of chemical fertilizers to the use of local fertilizers, as well as to replace plant protection in agriculture with environmentally friendly means and combine their protection with biological methods.

In particular, there are a lot of nitrogen reserves in the atmosphere. According to the data, nitrogen columns are weighing 8 tons per square meter of the globe. One hectare of land holds 80,000 tons of nitrogen, and if used properly, the available nitrogen reserves can reach one million years. Crops are constantly in need of nitrogen they cannot absorb it as they grow among nitrogen, in other words, free nitrogen in the air is useless for the plant.

Today, maintaining and increasing soil fertility is one of the most pressing tasks for all human being. Therefore, it is necessary to introduce a system of biological conservation of soil fertility in farms and ranches.

## RESULTS AND DISCUSSION

If cotton, wheat, corn reduces the amount of humus (humus) in the soil, it depends on the annual legumes (soybeans, moss, beans), alfalfa and other perennial grasses enrich the amount of humus and nutrients [1].

Soybean is the most important crop in the transition to the biological method of increasing soil fertility. Since the soybean plant planted after winter wheat grows without mineral fertilizers, a favourable environment for the survival and growth of microorganisms in the soil microflora is created. Soybean roots absorb biological nitrogen from the atmosphere with rhizobium bacteria and provide the plant itself with pure biological nitrogen during the growing season, resulting in partial removal of harmful chemical salts and other elements from the soil layer. The liquids in the soybean root make the phosphorus salts, which are insoluble in the soil, ready for plant absorption.

In our study, mosh crop also had a positive effect on maintaining and increasing soil fertility. Our farmers will be able to sow moss as a secondary crop and get a yield of 19.3-20.6 ts/ha per hectare, leaving an average of 1.8-2.8 tons of roots and stalks in the soil. According to the results of agrochemical analysis, 1 ton of roots and stalks of moss contained 27.5 kg of nitrogen, 13.2 kg of phosphorus and 27 kg of potassium. Thus, the average organic residue of moss is 2.3 tons per hectare, while the average return of 63.2 kg of nitrogen, 30.3 kg of phosphorus and 62.1 kg of

potassium per hectare has been proved. According to the researches of A.A. Iminov[5] B.M. Xalikov, F.B. Namazov, and X. Bazarov, as a result of growing legumes as a secondary crop in autumn wheat, the agrophysical and agrochemical properties of the soil changed positively, the humus content in the topsoil (0-30 cm) increased by 0.008-0.012%, the total nitrogen content increased by 0.006-0.010%. The total amount of phosphorus increased by 0.007–0.010% [2].

Many scientists have studied and conducted many scientific types of research on soybean crop which is one of the legumes that improves and enhances the structure of the soil. In particular, Isroilov I. [3], H.S.Romanov, K.M.Mirzajonov, R.T.Tolibulin [4], A.A.Iminov.

It is also possible to expand the use of municipal and industrial waste to the manure exchange system, for which municipal waste is collected in a centralized manner and buried in the ground.[6.7.8.9.10] The following year, the rotten waste is cleaned of various solids and waste, i.e., sieved and used as a manure.

## CONCLUSION

As a conclusion, it was of the most important economic, social, and spiritual importance facing farms today. It will be necessary to carry out the responsible tasks of increasing soil fertility through the introduction of more efficient and rational methods of land use. As a result, the total amount of nitrogen in the stems and roots will reach an average of 60-70 kg of nitrogen, 25-28 kg of phosphorus and 40-45 kg of potassium per hectare in an average of 3 years. We are confident that farm managers will use their knowledge, experience and entrepreneurship to fulfil these lofty and responsible tasks.

### ABSTRACT

*Now a day cooperatives act in a very different environments. The need to compete in an open and globalized market has obliged them to rationalize structures and professionalize many boards of directors. The most important reason for the down fall and dormancy state of many multipurpose cooperatives in the region currently is the absence of effective leadership qualities and skills among their cooperative leaders. With this backdrop, the study investigated the leadership skills among the leaders of multipurpose cooperatives. Out of 31 primary multipurpose cooperatives operating in the town, 16 primary cooperatives were selected purposively as the study units. By adopting census method all the 128 board of directors representing from 16 primary multipurpose cooperatives were selected as study population. The study was heavily dependent on primary data which was collected from the board of directors by administering structured questionnaire. Econometric model viz., binary logistic regression was used to assess the determinants of leadership skill among the board of directors. The results of binary logistic regression analysis shows that variable such as: age, access to training, leadership experience, media exposure, leader member relations and government interference were found to be the major variables that strongly determines the leadership skills. Those variables such as: age, and leader member relations were found to have negative significant effect whereas leadership experience, media exposure, access to*

*training, and government interference were found to have positive significant effect on leadership skills. Based on the findings it is suggested that the leaders of cooperatives need to be given training on leadership qualities, skills and on the functionalities of cooperatives.*

**Keywords:** *Board of Directors, Cooperatives, Leadership, Leadership Skills.*

## INTRODUCTION

### 1: Background of the Study

In an increasingly globalized world, cooperative organizations are more needed than ever, as a balance to corporate power and as anchor to the grassroots level of society. Cooperatives hold the potential of being a driving force in the developing world; they can operate in a democratic environment. For the poor around the world, cooperatives can provide much needed opportunity for self determination and empowerment (ICA, 1963). Cooperatives are ideal vehicles for democratization and economic empowerment in developing countries: they instil basic democratic values and methods; foster self reliance through collective action; and shape relationship between institutions and civil society that encourage participation and conflict resolution.

Now a day, agricultural and rural cooperatives are facing new challenges in response to institutional restructuring, rapidly changing technology, and the rapid concentration of the agro food industry. Not unlike other cooperative organizations, agricultural and rural cooperatives sometimes fail as cooperatives, disenfranchising their members, even though they may be viable businesses. Members' interests may be increasingly non-homogenous so that leading process becomes more difficult (Fulton M, 2001). At the same time, there is evidence that co-operative conversions are rarely members-driven indicating the need for greater cohesion between members and leadership interests. Generally speaking, agricultural cooperatives face numerous challenges, since they serve more than one purpose, often with a transaction. Multipurpose cooperatives have multi-dimensional objectives and management of diverse, multipurpose organization is that much more difficult (Cook, 1994).

Within this context, leading cooperatives would benefit from innovative strategies that incorporate leadership skill in to different areas decisions. In Ethiopia, Cooperatives are challenged by problems sourced from different angles: low capacity of cooperative leadership and management, inadequate capacity building support by agencies, literacy gap from the cooperative leaders, and low interest of the management committee due to low incentives (Bezabih E.2012). In fact, leading a cooperative is not easy task; it will be challenging and difficult. It involves not only managing resources and business operations, as in other businesses, but also dealing with problems stemming from the cooperative's distinctive characteristics.

Different writers and scholars of the field have justified the cause for the poor performance of cooperatives in Ethiopia from different perspectives. The causes are interventions at local level, rampant embezzlement by the leadership, weak and passive management, and lack of access to credit, illegal and unethical competition from private traders (GRSO, 1990). It is also noted that poor member participation, poor leadership, poor accounting and record keeping system, poor bargaining power are common problems that sluggish Ethiopian cooperative movement (Chogo, 2008). All writers mentioned leadership problem inter alia contributing to low performance and

in efficiency of Ethiopian cooperatives. Cooperative leaders in the country were identified as weak, passive and ineffective. Since leadership plays a significant role in voluntary member drive organizations like cooperatives, it is crucial to answer the question why cooperative leaders are inefficient, weak, and passive by identifying different variables associated with cooperative leadership skills. Therefore, the study on determinants of leadership skills among the board of directors of primary multipurpose cooperative societies was initiated.

## **2: Statement of the Problem**

Cooperative organization is one form of social enterprise and considered as a mechanism for country's economic and social development (Prabhu, 1999). The cooperative model is utilized for all kinds of social and economic enterprise. It also agreed by scholars the importance of cooperative as a mechanism for social and economic growth for many countries worldwide. Especially, for country striving to escape from poverty the expansion of cooperative society has dramatic implication in changing the living standards of members and citizens (Befikadu B, 2009). In order to survive and serve their members, cooperative organizations need to have a strong, dedicated and vibrant leadership with basic leadership skills. Because it is believed that above all the successes of cooperative societies depend on the skill level of leadership they possess. But, today's cooperative leaders are facing many competing forces which emanates from stakeholders interest, democratic nature of cooperative organizations, and competitive environment in order to reconcile these competing forces, cooperative leaders should recognize and incorporates cooperative practice with its own professional people centered ethic as core part and with cooperative principles and values as fundamental to its practice.

Cooperative leaders must recognize their leadership role as one of "Servant Leader", whose source of power comes from their superior professional qualification and skill but from the cooperative purpose for which their leadership is exercised (Devis, 2004). In countries where cooperative movement is weak and ineffective, the absence of dynamic leadership is one of the major causes (ICA, 1963). These indicate that there is strong and direct relationship between cooperative leadership skill level and cooperative performance. Because members mobilization, internal harmony, better external relation with the government institutions, key suppliers & promoters and generally overall smooth internal & external relationship of cooperative organizations are depends on leadership skill of cooperative leaders. On the other hand, the issues in cooperative organizations such as board of member's manipulation, weak leadership, poor supervision, mismanagement, financial outrages and failure of democracy have been revealed by scholars (Banishree Das, 2006). As a special purpose of organization, cooperative need effective board members to lead the cooperative and their members. Reflected in the issues, it is suggested to encourage effectiveness and skilled board of directors in managing cooperative. But, what are the effective leadership skills to be practiced for cooperative? What factors determine the leadership skills of board of directors of cooperatives are not yet known owing to dearth of empirical findings in the context of Ethiopia in general and study area in particular? Hence this study was undertaken to answer the intended research questions.

## **3. Empirical studies on determinants of leadership skills in cooperatives**

Franklin (2006) categorized all factors affecting leadership into four major types. They are: leaders related factors, follower related factors, organizational related and external factors. The leader related factors are those factors originated from the leaders personal characteristics. These

are the leader education, Behavior and leadership style (Franklin, 2006). Those factors can determine the cooperative leadership skills. The other factors are follower related factors, are those that out of followers that mean members in cooperatives situation. Member's relationship with leaders can determine the effectiveness of leadership in cooperative organizations. Organizational factors that affect the effectiveness of an organization are significant to organizational characteristics. The nature of task performed, linkage among committee members and incentive policy of the society are the major ones. Every organization has its own internal policies and capabilities up on which the payment and benefit depends. The nature of the task performed in an organization also determines the type of technology needed to perform the task. The degree of the functional interdependence among the different departments of cooperative organization, enhance the extent of exchange of ideas and experiences through training enhances the effectiveness and quality of the task performed and thereby contribute to the quality of the leadership. The External and environmental factors like government interference and extent of competition from outsiders (especially private organizations) can also determine the quality of leadership in cooperative organization, so that part of the factors are included in the study.

Dwaraki and Subburaj (1990) in their analysis of the factors promoting the selection of cooperative leaders in Tamil Nadu (India), identified factors that affect leadership as; size of land holding, social participation, knowledge of cooperatives, participation of cooperative organization and preferred leadership attributes.

Perusal of available literatures on leadership and related aspects, it is understood that there are few studies undertaken in the field leadership skills in general, and in particular to cooperatives, and that too conducted in other countries. No attempt has been done to analyze determinants of cooperative leadership skills in Ethiopian context. The researcher found this research gap, and investigation was made to analyze the determinants of leadership skills level among multipurpose cooperative leaders.

#### **4: Objectives of the Study**

The main objective of this study is to assess the determinants of leadership skills among the board of directors of primary multipurpose cooperatives societies in Gambella Town.

#### **5: METHODOLOGY**

As the study is empirical in nature field survey method was adopted. The study population includes all the board of directors and control committee members of the sample primary multipurpose cooperatives in Gambella Town.

##### **5.1: Sampling design**

As far as sampling design is concerned, two stage sampling technique was used. At first stage, primary multipurpose cooperatives in Gambella town were selected purposively as study unit as these cooperatives are found more in number in the Region as well as in the town. At present there are 31 PMCs in Gambella town. But, among these the researchers' selected 16 cooperatives that were only established before or in the year 2005 E.C. These cooperatives are spread throughout 5 major Kebeles (Villages) in the town. At second stage, 128 total numbers of BODs and control committee in these cooperatives that stood to be 80 and 48 respectively (Table 1) had been selected by census basis representing PMCs in all Kebeles of the town.

**TABLE 1: SELECTION OF BOARD OF DIRECTORS**

No. of Kebele	Sample PMCs	Male BoDs	Female BoDs	Male Control Committee	Female Control Committee	Total Respondents
Kebele 1	02	10	00	06	00	16

<b>Total</b>	<b>16</b>	<b>66</b>	<b>14</b>	<b>43</b>	<b>05</b>	<b>128</b>

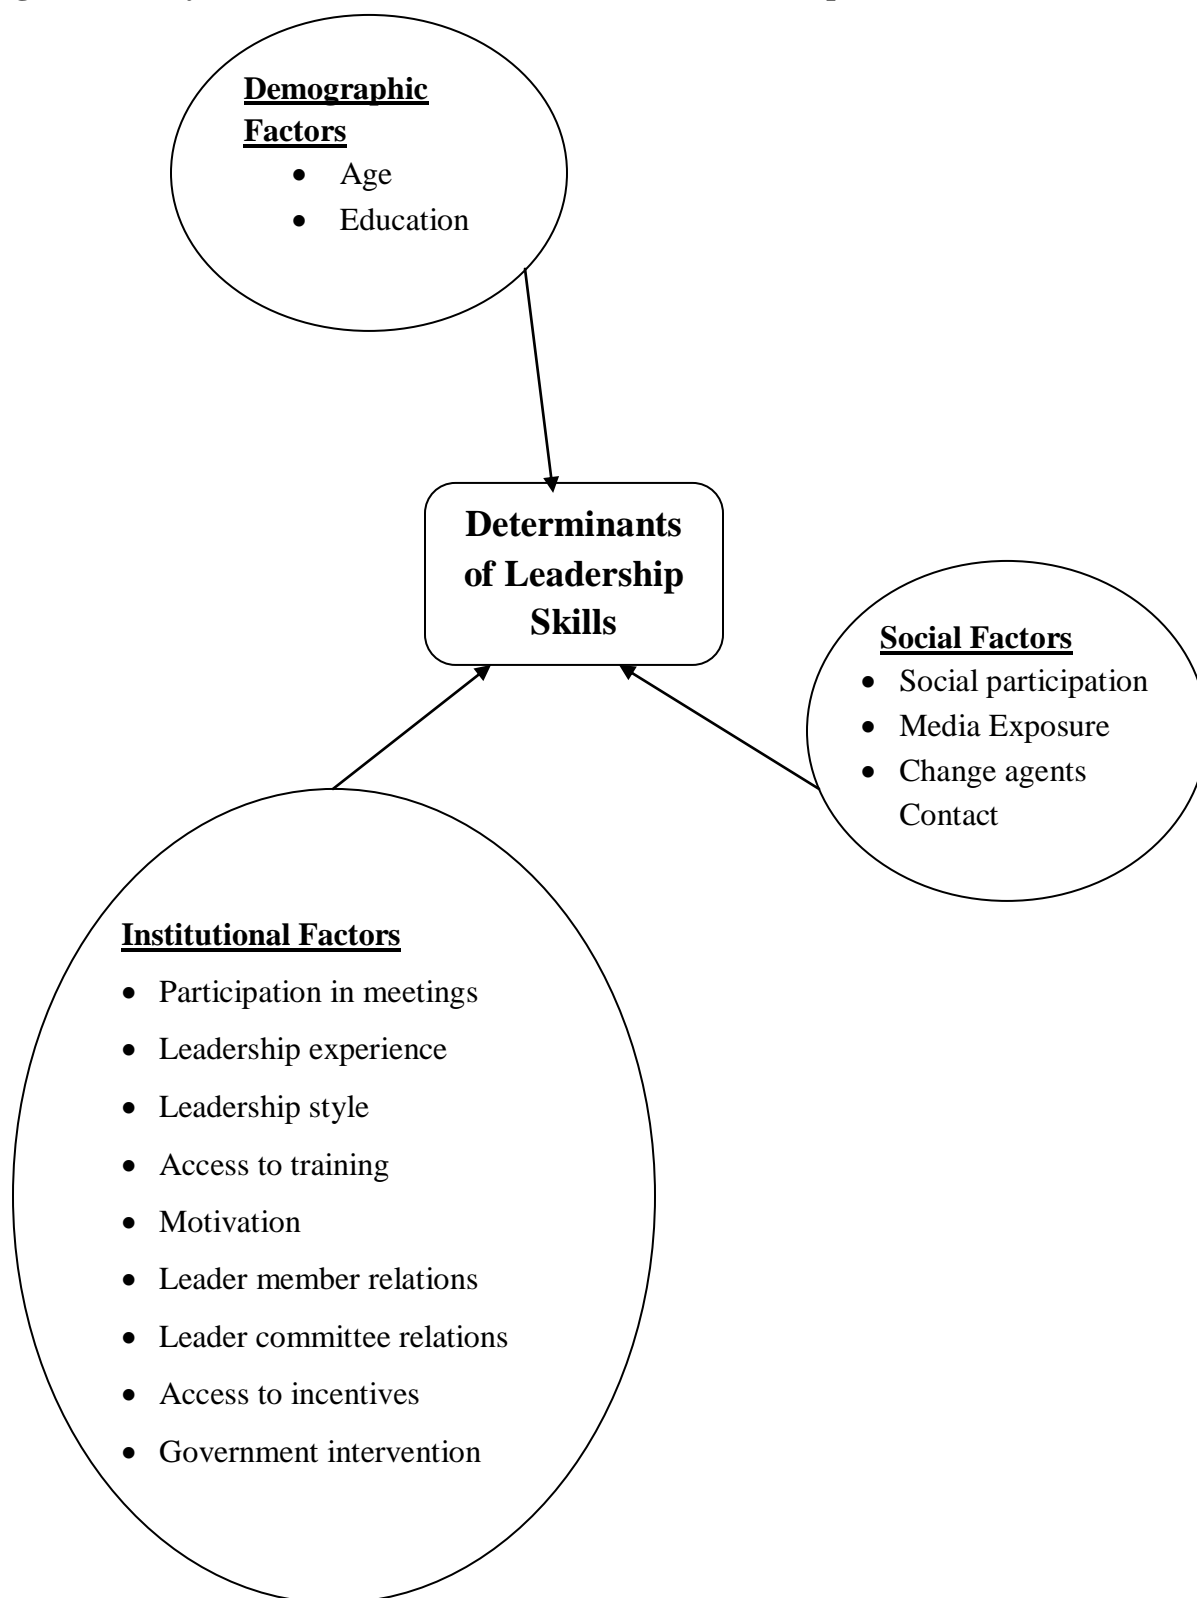

*Source: Gambella Town Agricultural Development Office, 2016*

**5.2: Sources of Data:** For this study purpose, both qualitative and quantitative data were utilized from primary data source. Primary data was generated by distributing questionnaire to the respondents.

**5.3: Tools and Methods of Data Collection:** A well structured questionnaire was used to get the needed information from the board members and control committee members of the selected primary multipurpose cooperatives. The questionnaire was pretested on other cooperatives in the same area to control the clarity of the questionnaire to those leaders for whom the real questionnaire was prepared.

## **6: Method of Data Analysis**

Data collected from selected respondents were organized in such a way that quantitative data were analyzed using descriptive statistics through the use of the statistical software called SPSS. In order to assess the determinants of leadership skills among board of directors, binary logistic regression model was used.

**Figure 1: Analytical framework for determinants of leadership skills**

## 7: Results and Discussion

To assess the determinants of cooperative leadership skills, first the relationship between independent variables and dependent variable was analyzed one by one using *Chi-square* test in order to identify their independent relationship.

**TABLE 2: RELATIONSHIP BETWEEN INDEPENDENT VARIABLES AND THE LEADERSHIP SKILLS**

Independent variables	Leadership skills	
	$\chi^2$ cal	P value
Age	40.185	0.000
Education	52.193	0.000
Participation in committee meetings	10.966	0.061
Leadership experience	57.587	0.000
Social participation	65.736	0.000
Media exposure	70.282	0.000
Contact with change agents	69.096	0.000
Leadership style	06.875	0.083
Access to training	16.439	0.011
Motivation	10.639	0.065
Leader member relations	91.909	0.000
Leader-committee relations	72.876	0.000
Access to incentives	02.620	0.106
Government intervention	65.987	0.000

Source: Field survey, 2016

It is evident from Table 2 above that the association between each independent variables and dependent variable was conducted by cross-tabulating each predictor variables against the outcome variable. Determining variables were categorized under different factors and they were analyzed one by one using *Chi-square* test in order to identify their relationship with leadership skills. For this purpose fourteen relevant independent variables were identified through review of literature and tested one by one using *Chi-square* test. Among them eleven variables were also found to be significant and further examined their cumulative effect by binary logistic regression.

In order to further examine the relative importance or net effects of each independent variable binary logistic regression was carried out. Before using the model, multicollinearity problem among the independent variables was tested using contingency coefficient and it was found that there was no such problem among the variables.

**TABLE 3: OMNIBUS TESTS OF MODEL COEFFICIENTS AND MODEL SUMMARY**

<i>Chi Square</i>	<i>Df</i>	<i>Sig.</i>	<i>Cox &amp; Snell R Square</i>	<i>Nagelkerke R Square</i>
130.6***	1	.	.483	0656
	1	0

Source: Field survey, 2016

The *Chi-square* result ( $\chi^2=130.6$ ,  $df=11$ ,  $p<0.001$ ) from the model summary in the Table 3 above indicates that the overall model is significant when all independent variables (age, education, leadership experience, social participation, media exposure, contact with change agents, access to training, leader member relation, linkage between committees, access to incentive and government intervention) are entered. The “pseudo”  $R^2$  estimates indicates that approximately 65.6% of the variance in leaders leadership skills can be predicted from linear combinations of the eleven independent variables.

According to binary logistic regression output in the Table 4 shows that, out of eleven variables which were included in the model, six predictors were found to have significant effect on leadership skills of cooperative leaders. Furthermore, since it has no value to present insignificant variables (education, social participation, contact with change agents, linkage between committees and access to incentive) the following few paragraphs describe only the significant variables.

**Age of the Leader:** This variable has a significant negative influence on leadership skills at 1%. As the age increases by one year, the probability of giving good leadership skills to the society will decline by 0.449. This is because the older the age of the leader, the less they are active in managing the affairs of cooperative. Even though elder leaders had ample life experience that is beneficial for the societal decisions, the success of modern cooperative management inclined towards leaders who are active in shouldering responsibility and tasks of the organization. It was confirmed that historical background of cooperatives movement in the past regimes that was based on compulsion and coercion also created a “bad image” in the minds of the senior parts of the society (Zemen, 2005).

**TABLE 4: THE EFFECT OF INDEPENDENT VARIABLES ON THE LEADERSHIP SKILL**

Independent variables	$\beta$	S.E	Wald	P Value	Odds Ratio
Age	-0.8000***	0.294	7.400	0.007	0.449
Education	0.496	0.280	3.121	0.077	1.641
Leadership experience	0.713*	0.301	5.615	0.018	2.040
Social participation	-0.349	0.280	1.556	0.212	0.705
Media exposure	0.819**	0.298	7.564	0.006	2.268
Contact with change agents	-0.171	0.301	0.324	0.569	0.843
Access to training	0.764*	0.333	5.254	0.022	2.147
Leader member relations	-1.150***	0.268	18.479	0.000	0.317
Leader-committee relations	0.186	0.315	0.347	0.556	1.204
Access to incentives	0.597	0.340	3.083	0.079	1.816
Government intervention	1.121***	0.287	15.215	0.000	3.068
Constant	-5.402	2.508	4.639	0.031	0.005

Source: Field survey, 2016 \*\*\* Significant @ 1% level; \*\* Significant @ 5% level; \* Significant @ 10% level

**Leadership Experience:** The number of years leaders worked as cooperative leaders has a positive implication on their leadership skill at 10%. The odds ratio result of the logit model shows that an increase in year of leadership experience will increase the probability of

success in leadership skill by 2.040. In line with this finding, Franklin (2006) argue that experience had over guides for decision making through helping decision makers to discriminate and generalize past situations in their process of decision-making. In cooperative organizations, the duration limited to be 3-6 years in the Proclamation (FDRE, 147/1998) would hamper the probabilities of using genuine leaders.

**Media Exposure:** It has a significant positive influence on leadership skills at 5%. As the frequency of exposure to mass media increase by one unit, the probability of rendering good cooperative leadership skills marginally increased by 2.268. That means the more the leader has exposure to mass media, the more the leader have information to make conscious decisions. Because mass media create awareness among the leaders about the market price for their products, business opportunities in the environment and other aspects regarding the direction of the government and other aspects that are important to uplift their decision making capacities.

**Access to Training:** Cooperatives are managed specially at primary level by group of dedicated leaders who are willing to serve their members at free of cost. In relation to this finding, the logit model shows that, access to training has a positive influence on leadership skill at 10%. Thus, getting training would increase the probability of success in cooperative leadership skills by 2.147. This was due to the fact that lack of leaders training in critical areas, such as how the cooperatives perform their role, responsibility, duty, function, business management skills, financial management and general administration would contribute to poor leadership skills.

**Leader Member Relations:** Leader member relationship has a significant negative influence on cooperative leadership skill at 1%. That means an increase in the level of relationship among leaders and members by ten units; it will decrease the probability of success in cooperative leadership by 0.317. Since, the more the leaders have a close relationship with their followers, the more the chance to depend on existing good relationship rather than on their leadership skills. Therefore, as to the findings of this study only moderate level of relationship is required so as to deliver an effective leadership skills in cooperative enterprises.

**Government Interference:** This variable has a positive influence on cooperative leadership skill at 1%. That means increasing the degree of government genuine participation would increase the probability of success in cooperative leadership skill marginally by 3.068. Genuine participation of government is important to cooperative especially in the areas of training, financial and administrative assistances although it contradicts.

## 8. CONCLUSION

Concerning the factors that determine leadership skills, the binary regression model shows that leader's age, leadership experience, media exposure, access to training, leader member relations and Government interferences are the major significant determinant factors that affect the leadership skills in the selected primary multipurpose cooperatives of Gambella Town. The variables such as leader's age and leader member relations have negative influence on leadership skills. While leadership experience, media exposure, access to training and government interventions have positive significant influence on leadership skill.

## 9: Recommendations

1. The cooperative agency at the Regional and Zonal level need to provide continuous, reasonable and standardized trainings to improve the existed undesired conditions of leadership skills and qualities among cooperative leaders. Besides this, the cooperative change agents need to undertake a serious follow up on cooperatives through inspection, auditing and legal advices.
2. The concerned authority for cooperatives' growth and development must also create strong and continuous trainings for cooperative leaders in order to improve their existed lower understanding levels about cooperative leadership attributes, functions and roles for modern leadership development in cooperatives.
3. For better quality and skillful leadership the multipurpose cooperatives' members must take the age of leaders in to account when they go for election to choose matured and skillful leaders for reasonable decision makings.
4. The multipurpose cooperatives need to take in to account the significance of leadership experience for leadership positions and must elect their leaders based on this criterion.
5. The cooperative change agents need to inform the cooperative leaders seriously about the advantages of regular follow up of media for cooperative business and leadership skills development in multipurpose cooperatives.
6. The cooperative leaders need to understand thoroughly about the importance of strong and close linkages with cooperative members. But, when they relate to the members they should realize that, the more they relate to the members, the more chance for them to lose full confident on their leadership skills during decision making.

### ABSTRACT

*Based on the data obtained, we conducted laboratory experiments to determine the dependence of the degree of salinity of the soil using various biostimulants on the seeds of smooth licorice. In the laboratory, its germination was improved by the effective use of Geogumat Aminomax IFO and Califos IFO biostimulants.*

**KEYWORDS:** *Geogumat, Aminomax IFO And Califos IFO, Seeds, Seedlings, Licorice, Meadow – Alluvial;*

### INTRODUCTION

Today, one of the urgent tasks is to conduct scientific research on the effect of stimulants in the cultivation of medicinal smooth licorice (*glycyrrhiza glabra* L) from seeds in the grassland-alluvial soils of the Aral Sea.

The aim of the study was to determine the optimal timing and criteria for the use of geogumat, aminomax IFO and caliphos IFO biostimulants in order to propagate smooth licorice from seed in the saline soils of Karakalpakstan.

**Research methods:** Studies have been performed on the germination of smooth licorice seeds with various biostimulants in the laboratory. An experimental system conducted in a laboratory setting is given. The effects of Geogumat Aminomax IFO and Califos IFO biostimulants on licorice seed germination were studied.

Laboratory experiments were carried out in three repetitions, 100 per days seeds were sown on demand for each variant, and the degree of germination of seeds sown in the soil in the greenhouse for three days was determined and phenological observations were made.

**Experimental results:** Sweet licorice seeds germinate in 4-5 days when sown in spring when the soil temperature reaches 10-15 degrees. However, the young shoots that sprout are very thin in the first period, and with a slight change in conditions, many of them die (A.J. Kuziev, 2000). Due to the fact that the data on the germination of smooth licorice seeds obtained sufficient results in the laboratory, we conducted experiments on the effect of stimulants Geogumat, Aminomax IFO and Califos IFO on the optimal growth and development of smooth licorice in the field.

The soil of the experimental field is of the grassy alluvial type and is mechanically sandy to the depth of 0-50 cm, layered downwards. For the field experiment, saline leaching was carried out in the autumn at a rate of 3500-4000 m<sup>3</sup> / ha. Before the experiment, when we determined the water-soluble salts, the field soil was found to be low salinity, pushed to a depth of 28-30 cm and pressed three times.

In the field experiment, smooth licorice seeds were sown with Geogumat, Aminomax IFO, and Califos IFO stimulants, while in the first year when the full-blown side branches benefited, and during flowering they were sprayed at different rates with stimulants.

When the effect of stimulants is detected in 3-4-leaf cycles in the first year of smooth licorice, Geogumat, Aminomax IFO and Califos IFO stimulants are found to increase the survival and resistance to adverse conditions of licorice seedlings. Rapid growth and development of the plant was observed. On June 1, we observed that the sweetener grew 4.3-7.1 cm in height using a biostimulator.

In the experiment, the growth and development of the first year smooth stimulant of the stimulator was observed on July 1 and August 1. According to the data obtained, Geogumat, Aminomax IFO and Califos IFO stimulants had different effects on the growth and development of smooth sweetness. On July 1, the control version had a smooth sweetness height of 38.3 cm, Geogumat stimulator 56.7 cm, Aminomax IFO stimulator 50.5 cm and Califos. As a result of the IFO stimulant effect, it reached 44.5 cm. In the observations made on August 1, the check was 48.5-cm :, 65.7-cm :, 50.7-cm :.,

Before collecting the smooth candy 15 X. When we performed X-observations, the control variants were 56.7 cm. It was 83.7 cm when we sprayed the geogumat stimulator, 78.5 cm when we used the Aminomax IFO stimulator, and 70.5 cm when we used the Califos IFO stimulator.

In studies, the effect of a stimulant on dry mass accumulation during the first growth and development of smooth licorice was studied at the end of the growth period.

According to the data obtained in the control variant, the dry mass of the rhizome of licorice is 24.7-31.1 g, the stem is 28.5-35.5 g, the leaves are 15.4-33.9 g and the total dry mass of one plant is 121.7-144.6 grams were higher than the year-end dry mass control of the plant in the variants in which the stimulants were used. In particular, at the end of the first year of growth of sweeteners in the variant treated with Geogumat stimulant was 144.6 g, in the variant using Aminomax IFO stimulator 121.7 g and in the variant using Califos IFO stimulator 136.1 g (Table 1).

In the second year, the growth and development of the smooth sweetness was good, and during the ripening and flowering periods, it was treated with Geogumat, Aminiomax IFO and Califos IFO stimulants.

In the study, smooth sweeteners were treated with Geogumat, Aminiomax IFO and Califos IFO stimulants during the application period, in the first flour day of June in height control variant 58.4 and on stimulants 62.5-58.9-51.6 cm respectively on height stimulator on July 1. respectively 82.3 ;, 71.4 ;, 68.2 cm and 71.3 in the control variant. On August 1, the height was 82.1 in the control variant, 97.5 ;, 90.4 ;, 83.2 in the stimulator, and on September 1, the height in the control variant was 91.7; , 4 ;, was found to be 98.2.

Plants grow well in the third year of the terrestrial part. There was also a difference between the options. (Table 2)

**1-TABLE THE EFFECT OF STIMULANT ON SMOOTH GROWTH IN THE FIRST YEAR GROWTH AND DEVELOPMENT (2017)**

№	Option types	Power thickness	H e i g h t \ s m				The dry mass of a plant\gr			Total plant mass\gr	Total surface dry mass\gr
			1.06	1.07	1.08	1.09	stem	leaves	root

2	G e o g u m a t	12,5	62,5	82,3	97,5	107,5	8,4	20,1
3	Aminomax IFO	10,4	58,9	71,4	90,4	100,4	7,6	18,6
4	Caliphate IFO	9,7	51,6	68,2	83,2	98,2	6,5	18,0

#### 4.2.3-TABLE THE EFFECT OF STIMULANT ON SMOOTH GROWTH IN THE THIRD YEAR GROWTH AND DEVELOPMENT (2019)

№	S t i m u l a n t s	H e i g h t \ s m					The antlers of a flower	The number of pods per plant
		1.05	1.06	1.07	1.08	1.09		
1	<i>C o n t r o l</i>	56,7	68,7	90,7	100,5	105,6	5 , 6	2 1 , 5
2	<i>G e o g u m a t</i>	75,4	84,9	101,5	110,7	118,6	7 , 8	3 2 , 3
3	<i>Aminomax IFO</i>	70,2	76,1	95,6	103,6	110,9	7 , 0	2 8 , 5
4	<i>Caliphate IFO</i>	62,5	74,3	93,2	100,7	110,1	7 , 0	2 6 , 4

However, with the placement of the stimulator, the smooth sweetener enters the generative phase and affects the accumulation of the flowering crop. According to the data obtained, the use of stimulants influenced the growth and development of smooth sweeteners in the third year. (Table 3)

**CONCLUSIONS:** The germination of smooth licorice seed was improved under laboratory conditions using Geogumat, Aminomax IFO and Califos IFO stimulants. That is, seed germination in Geogumat soils was 87.3%, Aminomax IFO 73.5%, and Califos IFO 68.7%. In field experiments, the germination rate when planted with a Geogumat stimulator was 80.7%. Meadow-alluvial soils of the Republic of Karakalpakstan require the introduction of non-traditional crops in agriculture.

The effectiveness of optimal norms and ratios in improving the militar condition of moderately saline soils was determined by increasing the soil fertility of the stimulant seeds and mineral fertilizers by germinating the sweet licorice from the seeds.

### ABSTRACT

*Appeal to the cultural heritage allows you to better understand the features of culture in different periods of human existence, allowing you to answer many questions. Therefore, the problem of preservation of cultural heritage is particularly relevant now in Uzbekistan.*

**KEYWORDS:** *Culture, Heritage, Protection, Threat, Monument.*

### INTRODUCTION

Considering the great cultural heritage inherited by us, President of Uzbekistan I. Karimov at the first session of the Oliy Majlis said: "Preserving and restoring unique historical monuments created by the Uzbek people and being a national treasure is an essential part of our spiritual program. This national wealth was inherited from our ancestors. It means that we also need to take care of it like the pupil of the eye and pass it on to future generations."

Uzbekistan became a full member of the UNESCO international organization, the following monuments located in the Ichan-Kala reserve in Khiva in 1991 and the historical center of Bukhara in 1993, monuments of architecture of the Temur and Temurids in Shahrisabz in 2000, monuments in the city of Samarkand in 2001, included in the list of the World Cultural Heritage.

Fig. 1.Oksaroy Palace

Cultural heritage is one of the main ways of culture. During his life, a person manages to master only a small part of the entire cultural heritage, acting as a common heritage for all mankind. This circumstance may be updated subject to its preservation. Therefore, the preservation of cultural heritage coincides with the preservation of culture in general.

Appeal to the cultural heritage allows you to better understand the features of culture in different periods of human existence, allowing you to answer many questions. Therefore, the problem of preserving cultural heritage is particularly relevant now in Uzbekistan. As a culture scientist Yu. M. Lotman notes: "Culture is memory. Therefore, it is always connected with history, always implies the continuity of the moral, intellectual, spiritual life of a person, society and humanity. And therefore, when we talk about our culture, modern, we, perhaps without knowing it, we are talking about the great way that this culture has passed. This path goes back thousands of years, transcends the boundaries of historical eras, national cultures and immerses us in one culture - the culture of humanity".

The architectural monuments located on the territory of our country reflect the history of the development of science, art and culture of the epochs of their construction. The study of historical monuments, their careful preservation and restoration is our duty to our descendants. Recently there has been an intensive destruction of these structures, the cause of which is a long service life, atmospheric, seismic, man-made impacts, etc.

In the scientific works of academicians Ya.T. Gulyamova, I.Muminova, BAkhmedov, G.A. Pugachenkova, A.Askarov, doctors of sciences, Professors P.Zakhidov, M. Bulatov, A. Uralov, K. Ahmedov, and others. Issues of archeology, architecture, art history, the history of the epochs

of historical monuments are well enough reflected. Analysis of the above-mentioned scientific works, archival materials shows that the work on the study of the design features of these structures that are carriers of all loads, on which the strength, stability, seismic resistance and durability of structures mainly depends on insufficiently studied.

Therefore, the task of identifying, eliminating or reducing the influence of these factors on the state of the structure is relevant in solving the problem of ensuring the durability of architectural monuments. From a practical point of view, it allows more efficient use of funds allocated for repair and restoration work.

Many of the outstanding monuments of the end of the 14th century and the first half of the 15th century, the era of the highest flourishing of medieval architecture, are preserved in Shakhrisabz.

The city of Shakhrisabz is Timur's birthplace. His development as a person is connected with Shakhrisabz and the palace Oksaroy was built on his initiative and under his leadership. The palace served as the government residence of the ruler of Amir Temur. Currently, the Palace of Oksaroy is listed in the UNESCO International Organization as one of the greatest creations of mankind.

The first of the Europeans who mentioned the unfinished palace of Oqsaro in his work is the ambassador of the Spanish king Ruy Gonzales de Clavijo, who visited him in 1403. After the conquest of Central Asia by Tsarist Russia, in 1870 A.Kun visited the remains of the palace. In 1928, B.N. Zasyupkin, Bachinsky A.M. conducted the first survey of the monument. In 1936, the architect MF Mauer attempted to study the facade and foundation of the pylons of the Oksar, in 1942 M. Masson and GA Pugachenkova were engaged in the study of the palace[3.42].

In the early 1950s, repair work was undertaken on the monument, which touched the liner of its basement parts. Subsequently, in different years, research work of the foundations was carried out according to specially designed programs. In particular, the opening of the pits was established depth of the foundations, their material, groundwater level, etc.

According to the descriptions of contemporaries, the palace with its scale, size and grandeur shook the imagination of contemporaries, it was a vast complex consisting of public and residential buildings. At present, only two separated pylons of the entrance portal, which were once connected by the arch, which was the largest by the standards of that time, have survived from the majestic palace.

The surviving portal testifies that the palace was made in the typical forms of Temur, which amaze the viewer not only with the scale, but also with the sophistication of the architectural decor, samples of which can be seen on the portal.

The effect of grandeur was achieved by the solidity of brick masses, decorated entirely, over the entire surface of the main facade, with mosaic ornaments. Large planes of the vault of corner minarets are clad with brick mosaic shells.

The catastrophic consequences of a number of strong earthquakes of recent years have revealed a number of problems that require more detailed study and an urgent solution to increase the seismic resistance and reliability of the supporting structures of architectural monuments.

Especially, recently, for various reasons, the condition of architectural monuments has greatly deteriorated.

Under these conditions, care for their conservation and restoration is of particular relevance. At the same time it is necessary to ensure first of all the seismic resistance and reliability of their supporting structures. In this connection, architectural monuments of Shakhrisabz, erected in the epoch of Timur and timurids (the palace of Oxara,), Samarkand, Bukhara and Khiva are accepted as objects of research.

According to prof. GP Gorshkov "The intensity of modern tectonic processes within Central Asia is higher than anywhere else on the Asian continent (with the exception, perhaps, of some parts of the Himalayas). When seismic vibrations of the soil in buildings and structures occurs along with the translational and torsional vibrations. They can appear not only in the presence of an eccentricity between the center of gravity and the center of rigidity of the structure, but also in its absence. One of the reasons for the occurrence of torsional vibrations of buildings can be the fact that the direction of displacements and accelerations of a seismic wave can coincide with the direction of wave motion, and be perpendicular to it.

In this case, the forces that act in addition to the translational displacement will tend to turn it around the center of gravity will act on the monuments of architecture. If, moreover, the length of the building is commensurate with the length of the seismic wave, then the torque caused by the action of inertial forces can reach a significant value. Research prof. I.L. Korchinsky found that the additional loads from torsional vibrations can reach up to 20-25% of the main seismic loads. In the works devoted to engineering analysis and inspection of the effects of earthquakes are the actual data on the significant effects of torsional vibrations on buildings and structures

The behavior of various buildings and structures during earthquakes suggests that it is not always possible with the necessary accuracy to describe one-dimensional calculation schemes.

Seismic impact is a multicomponent motion of the soil, propagating the final velocity. The last factor determines the angular displacement of structures of monuments relative to the vertical axes. The presence of this factor requires a transition to calculations using complex computational models, which take into account the real properties of structures and seismic effects.

The seismic reactions of high-rise structures in a non-uniform impact field are not well understood, and for this reason the existing regulatory documents do not contain sufficient guidance to ensure their seismic resistance. The solution to this problem requires the study of new types of seismic reactions, which are not always considered essential. Therefore, the study of issues such as the influence of the final velocity of seismic waves in the ground on the magnitude of seismic effects and the nature of the stress state are very relevant.

### ABSTRACT

*Some scholars have traced the earliest diplomatic relations between the Khoqand Khanate and India to 1825, but the archival documents and manuscripts reveal important information about diplomatic relations which were actually established much earlier. While there were several key factors that contributed to the development of these relations, the primary concern of the rulers of Khoqand was to establish a close relationship with India that could be used to their advantage within the Central Asian region. However, despite the historical importance of these diplomatic relations, the relations of the Khanate with India (especially with the Maharajah of Djammu and Kashmir), and the role of religious leaders ('ulemas) as ambassadors has remained poorly studied. In many sources belonged to the 19<sup>th</sup> century it was established that the Khoqand Khanate actively pursued diplomatic relations with India. Written sources also contain information about embassy missions led by religious leaders. Miyan Khalil Sakhibzada, Tash Khodja sudur and Khodja Bek led an embassy mission sent to India by the Khoqand Khanate. Written sources and archival documents dedicated to the history of the Khoqand Khanate contain information about their activities as ambassadors. This paper aims to study these issues and to analyze the dynamics of the embassy missions between the Khoqand Khanate and India.*

**KEYWORDS:** Khoqand Khanate, India, Relations, Diplomatic Relations,

### INTRODUCTION

It is true that in Central Asia were formed and developed several states and they faced to crisis with the influence of some factors. However, countries obliged to governing the existed political, socio-economic life and used several means of statehood to implement their duties proficiently.

Particularly, they tried to solve some problems appeared in political, socio-economic life through establishing international relations. One of these states was the Khanate of Khoqand which formed in Central Asia in 1709. In the beginning its territory consisted of only the Fergana valley. Later, some territories of modern Kirghizstan, Tajikistan and Kazakhstan were united under the Khanate.

Each country used the talented and capable statesmen, merchants and religious leaders in establishment of own diplomatic relations. In partly, rulers of the Khanate of Khoqand tried to hold diplomatic relations with neighboring countries for developing political, military, trade-economic and cultural spheres.

It was fixed in written sources that the Khanate conducted diplomatic relations with China concerning Eastern Turkestan in the 18<sup>th</sup> century. Since the 19<sup>th</sup> century, Khoqand started to adjust diplomatic relations with other countries also. Certainly, these processes were promoted by some reasons. *The first*, in this time elements of the statehood has been rather generated in the Khanate, and the state strengthened own political and economic status, recognized by other countries. *The second*, Tashkent borrowing strategic and special place in the trade of Central Asia has been joined to the Khanate, *and the third the* Russian empire threatened to the sovereignty of the state.

Despite the fact that the history of diplomatic relations between the Khanate of Khoqand and India was poorly studied, researches only studied trade and cultural relations of two countries on the basis of data of the National archive of India and the Ottoman archive, and activities of ambassadors are not explicitly learnt. Also, it were not enlightened in those works main factors and results of the establishment of diplomatic relations, the role of personalities such as Sufis, religious leaders and others took part in embassy missions.

Scholars who studied the history of the Khanate paid more attention to its foreign relations. They especially investigated the relationship of the Khanate with the Russian Empire, Ottoman Empire, China, Eastern Turkistan, the Emirate of Bukhara and the Khanate of Khiva. However, relations of the Khanate with the India begun and developed in the first half of the 19<sup>th</sup> century was left out of the sight of scholars.

Historical compositions, official correspondences and archival documents written in the 19<sup>th</sup> century show that religious leaders actively took part in establishment of these relations. Sufi leaders got more results in their ambassadorial activities than merchants and political leaders. Historical compositions also contain information about that religious leaders led embassy missions. Religious leaders studied in *madrasahs* and had perfect knowledge and skills. Also the tolerance of *Hanafi* trend and its strong influence on the ethics of religious leaders have led to positive results in their activities.

### **Reflexion of relationships between the Khoqand Khanate and India in legends**

It is known that the rulers of the Khoqand Khanate tied their genealogy with Zahiriddin Mukhammad Babur through the legend of "Golden Cradle" ("*Oltin Beshik*"). The question of legitimating the authority of the Khoqand Khanate learnt by Uzbek and foreign historians like Miyon Bukruk Solikhov, A.Qayumov, T.Beisembiyev, Kh. Bobobekov, A. Erkinov, S. Levi and others. Some of them suggested that rulers of Khoqand in fact were descendants of Babur. And others concluded that it was a fiction invented to justify the right of rulers to the political

authority. According to the legend of the “Golden Cradle” when Babur went to India in 1512 and he became a father. To protect his son from the dangers of the road, he leaved him in banks of *Nayman-say* (little river in the Fergana valley) which flowed from the south side of Khoqand. Representatives of Uzbek tribes found this baby who was wrapped in gold and precious things. They cast lots and divided the found things among themselves. As a result the tribe of *Ming* got this baby and called him as *Oltin Beshik-Khan*. Babur after creation of own Empire in India sent his ambassadors to Khoqand in order to bring his son. But the tribe of *Ming* which brought up the child sent their representative to Babur asking about that when *Altin Beshik-Khan* grows up to make him their ruler. Certainly this story connected with the genealogy of rulers (Khans) of Khoqand took an important place in ideology of the Khanate which was formed in the 18<sup>th</sup> century and shows that the dynasty of *Ming* tried to tie their first state relationships with India.

### **Citizens of the Khoqand Khanate and India**

Ways of Hajj Pilgrimage had a significance in the lives of Muslim people and political processes determined directions of the road. A part of Khoqand citizens went to pilgrimage to Mecca through territories of India in the 18<sup>th</sup>-19<sup>th</sup> centuries. It is known that there were three directions of the way of the Pilgrimage from Central Asia to Mecca: the *first* through India, the *second* through Iran and the *third* through territories of the Ottoman Empire. Data of archival documents show us that among these three ways the way through the Ottoman Empire was often used by citizens of Khoqand. But Hajj pilgrimage travelers written by pilgrims about their pilgrimage stories give us information about that some of citizens of Khoqand went to Mecca through India also. In the 18<sup>th</sup> – 19<sup>th</sup> centuries, the way through Iran did not used at all by reasons of religious conflicts between Sunni and Shia confessions.

The Hajj pilgrimage way took an important place in the integration of various cultures. Here we could give as an example coming the Naqshbandia-mujaddidia Sufi order to Central Asia especially to the Khoqand Khanate from India. Relationships between Indian and Central Asian Sufi orders learnt by scholars like Stephen Dale, Alam Payind, Jo-Ann Gross, Scott Levi, T.Beisembiev. In the beginning they studied an extension of the Naqshbandia-mujaddidia Sufi order in India in their works, then they analyzed the spread of the order in the territories of Central Asia from India at the second half of the 17<sup>th</sup> - the 18<sup>th</sup> centuries. Here should be emphasized that the Naqshbandia-mujaddidia order spread in the Bukharan Khanate from India as a result of activities of famous Sufi leader MusaKhan Dakhbedi. Musa Khan Dakhbedi went to the pilgrimage to Mecca through India, and in Kashmir, he met Miyan Abid who was descendants of famous Sufi leader Akhmad Sirkhindi. MusaKhan Dakhbedi became his murid (follower) and after returning to Bukhara founded here a branch of the Naqshbandia-mujaddidia order. But there are not special works which studied the spread of the Naqshbadia-mujaddidia order from India to Central Asia. In our article dedicated to the role Sufi leaders in diplomatic relations within the framework of the topic we try to tell something about the extension of Naqshbadia-mujaddidia order in the Khoqand Khanate from India.

The first cultural interrelations between the Khoqand Khanate and India connected with first processes of the extension of the Naqshbandia-mujaddidia Sufi order in Fergana valley, in part with the activity of the traveler from Margilan Sayyid Abdullah Khan Tura. The Japanese scholar Yayoi Kawahara wrote that Abdullah Khan Tura went from Kashgar to India in order to get an education from Miyan Abid. Then Abdullah-Khan with the recommendation of Miyan

Abid came back to Margilan and lived there. As a result of lack of written information related the activity of Abdulla Khan Tura Yayoi Kawahara in her article called oral data about him as a legendary But Abdullah Khan Tura brought from India the unique copy of the Holy Quran and this copy now is stored by his descendants. Yayoi Kawahara learnt the unique copy of the Holy Quran and suggested that indeed it made in India. She did not ignore the story of bringing of the Holy Quran to Khoqand, visit of Abdullah Khan to India and becoming a follower of the leader of naqshbandia-mujaddidia Sufi order sheikh Miyan Abid.

The wide spread of the Naqshbandia-mujaddidia Sufi order in Khoqand connected with the activity and life of Miyan Khalil Sakhibzada Ishan in Khoqand. Also Miyan Khalil Sakhibzada took an important place in establishment of diplomatic relations between the Khoqand Khanate and India. First interrelations between two countries began in 1825 with initiative of the ruler of Khoqand Mukhammad Ali-Khan. According to the local historical sources of Khoqand Mukhammad Ali-Khan sent special embassy to India and through it asked Miyan Khalil Sakhibzada to come and live in Khoqand. But the sources did not indicate the date of sending of ambassadors. However, it is known that Miyan Khalil Sakhibzada came to Khoqand in 1826.

### **The role of Miyan Khalil Sakhibzada in relationships between the Khoqand Khanate and India**

Little diplomatic ties were established between the Khoqand Khanate and India, thereby only the work of Muhammad Anwar Khan contains brief information about them. (Since the work of Mukhammad Anwar Khan was not dedicated to Khoqand-Indian relations, and it highlights relationships between Central Asia, Russia and England). The most detailed study on the relationships of Central Asia and India carried out by Professor Mansoura Haidar.

In diplomatic relations of Khoqand Khanate took an important place the ambassadorial activity of Muhammad Khalil Sakhibzada, who was from descendants one of leaders of the naqshbandia-mujaddidia Sufi order – Imam Rabbani Akhmad al-Sirkhindi. In the sources, which contain information on the history of Khoqand Khanate his name is fixed as Sakhibzade Khazrat, Khazrati Sakhib, Khazrati Ishan Sakhibzada, Miyan Khalil Sakhibzada and etc. In the archival documents, the full name of this person was Muhammad Khalil Sakhibzada, and the people called descendants of Miyan Khalil Sakhibzada and Imam Rabbani as *Miyans*.

Miyan Khalil Sakhibzada Ishan arrived to Khoqand in 1826 by the invitation of its ruler Muhammad Ali-Khan. In the written historical sources there are different data on his native place. In one copy of the manuscript of the composition of “Tarikhi Shakhrukhi” (the History of Shahrukhi) of Niyaz Muhammad Khuqandi it was fixed that he came to Khoqand from Bukhara, and in other copy it was written that he came from Peshawar. Also Pulatjon Qayumi in own composition of “*Khoqand tarihi va uning adabiyoti*” (History of Khoqand and its literature) wrote that this person came to the Khanate from Delhi. But it should not be confused him with the person, who was famous with the name of Sakhibzada kalon, who came into Bukhara and was a *pir* (patron, spiritual guide) of Amir Khaidar. The name of Sakhibzada Hazrat was Miyan Fazl Akhmad Sakhibzada and both of these two persons were representatives of one dynasty.

There is some information about Miyan Khalil Sakhibzada below. He was born in 1785 and died in Khoqand in 1869. This person was a patron of the Naqshbandia-mujaddidia Sufi order in the Khoqand Khanate and had a lot of murids (followers) not only in Central Asia, but also in

Russia. Moreover, Miyan Khalil Sakhibzada got a title of *naqib* in the Khoqand Khanate and played certain role in the state administrative system.

What was a reason for the invitation clerics and leaders of the Sufi orders by Khoqand rulers to own country or the country has not such people. It is impossible to assume that this kind of persons did not live in Khoqand. Of course, in Khoqand lived own domestic Sufi scholars. But Khoqand rulers (Khans) more trusted to ancestors of Imam Rabbani in foreign affairs, rather than local leaders of Sufi movements. Below we offer assumptions on this issue.

Descendants of famous Khodja Akhrar and Makhdumi A'zam lived in Khoqand Khanate before coming there Muhammad Khalil Sakhibzada and they occupied various administrative posts in the Khanate. In part, Ma'sum Khan Tura who was a grandson of Ortiq Khodja from descendants of Makhdumi A'zam and Jahangir Khan Tura who was from descendants of Khodja Khidoyatulloh (Afaq Khodja) lived also in Khoqand. But Khoqand rulers Umar-Khan and Muhammad Ali-Khan tried to control of the activity of Jahangir Khan Tura. Main reasons for this kept normal relations with China. This factor was fixed in written sources. Khoqand Khans got the right for privileges for free trade and levying of custom duties on behalf of themselves on the territory of Eastern Turkestan thanks to the tight control of the descendants of Afaq Khodja and not giving them permission to leave the territory of Khoqand. If we pay our attention to other side of the problem Bukharian ruler Amir Khaidar (1800-1826) was a murid (follower, adherent) of Miyan Akhmad Sakhib (Sakhibzade Kalon) who was from descendants of Imam Rabbani. It is known that interrelations between Khoqand Khanate and Bukhara emirate were not good. Khoqand ruler Muhammad Ali-Khan through being a *murid* (follower) of descendants of Imam Rabbani and involving them into social-political life tried to not complicate interrelations with Bukhara emirate. Also Central Asian Sufi branches' (*tariqat*) leaders honored descendants of Imam Rabbani. Bukharian sheikh Khusain when he was informed on that Muhammad Khalil Sakhibzada was ordered to his followers Azim Khodja Ishan and Jalaliddin Khodja, who finished their study in Bukhara and were returned to local place to not entering Khoqand as a sign of respect for the sheikh. Azim Khodja Ishan and Jaloliddin Khodja were sheikhs (leader, schoolers) of the Nashqbandia Sufi order. Moreover, it is fixed in written sources that Azim Khodja Ishan took an important place in social-political processes in the Khanate in 1840-1842.

Miyan Khalil Sakhibzada was one of the persons, who took an important place in social-political life of the Khanate and below we can try to analyze his ambassadorial mission. Written historical sources on the history of Khoqand contain data about his activity. The first embassy mission of this person to the Russian empire begun in August of 1841. Khoqand ruler (Khan) Muhammad Ali-Khan (1822-1841) appointed him as an ambassador for a reason. Firstly, Muhammad Ali-Khan respected him as a person, secondly the name of leader of the Naqshbandia-mujaddidia Sufi branch Imam Rabbani Akhmad Sirkhindi was famous in all part of Central Asia, including Muslim regions of the Russian Empire and Ottoman Empire. In part Muhammad Yunusjan shigovul who took a position in administrative system in that time wrote in his work "Tarikhi Aliquli Amir-i lashkar" that "this person have a lot of followers (*murids*), pupils and friends among *noghays* who are under Russian ruling and others people". These data fixed also in "India office letters" stored in the British library. In part, it is written in them that this person has a lot of followers among Kypchak, Kazakh and Kyrgyz tribes.

### New step of Khoqand-Indian relations

We met certain difficulties in the investigation of the topic due to the fact that Khoqand-Indian relations hardly been studied. K. Warikoo wrote that the first embassy mission from Khoqand to India sent in 1837. But he did not describe the aim of this diplomatic mission and did not give information about ambassadors. By us were discovered archival documents in the Ottoman archives in Istanbul, which contain important data about relationships of the Khoqand Khanate with India. Khoqand ambassador Mukhammad Zakhid Khodja was sent to Istanbul in 1837 and who was from descendants of Juybar Sufi leaders (*sheikhs*) presented to the Ottoman sultan Makhmud II (1808-1839) the letter of Khoqand ruler which contained information about Khoqand-Indian relations. Mukhammad Zakhid Khodja told about that, military specialists came from India to Khoqand a year before and conducted military exercises with Khoqand soldiers using modern methods. So, it can be assumed according to Ottoman documents military specialist came from India to Khoqand in 1836 and before it perhaps in 1835-1836 Khoqand sent diplomatic mission for this purpose. Since the Khoqand Khanate to improve, its military system tried to establish diplomatic relations with the Ottoman Empire and India, which is confirmed by documents stored in “the Ottoman archive” and “National archive of India”.

Also Ottoman sultan Makhmud II (1808-1839) asked Mukhammad Zakhid Khodja about that with which countries the Khoqand Khanate established friendly relations. The Ottoman sultan offered to the ambassador of Khoqand to strengthen diplomatic ties with India, and through it with Great Britain. Despite the fact that this diplomatic mission was established between the Ottoman Empire and the Khoqand Khanate, it raised Khoqand-Indian relations to new step and the activity of Muhammad Zakhid Khodja Ishan, who was the representative of the dynasty of Juybarid Sufi leaders (*sheikhs*), took an importance in the development of relationships.

In 1854 the Khoqand ruler Khudayar-Khan (1845-1858) sent to India next embassy mission and written sources of Khoqand did not enlightened it. However documents stored in Indian National archive contain full information about this diplomatic mission. In documents kept in Indian archive the name of chief of this embassy mission was given in two variants: in some documents was written as Shahzada sultan and in others as Shahzada Sultan Mukhammad-Khan. But we could not find a person with the name of Shahzada Sultan among representatives of the ruling dynasty in Khoqand. There is a possibility to assume that the name was changed for security purposes. It should be emphasized that names of some rulers of Khoqand were differential in written sources and in their seals. In part, the name of Sherali-Khan (1842-1845) was written on his seal as Sher Mukhammad Ali-Khan. Also the name of Miyan Khalil Sakhibzada was written in the form of Mukhammad Khalil Ishan naqib in the letter sent to the Russian Emperor and these things show that the official names of famous person and their names spread among the people were differential. The funds of the National Archives of India has also kept the English translation of the letter of Khoqand ruler. The letter shows us the main purpose of the Khoqand Khanate from sending this embassy mission. The Khoqand Khanate asked India to send specialist which can work with chemical substances and metals for increasing its military power.

In 1864 from the Khoqand Khanate to India went two consecutive embassy missions: the *first* embassy led by Mulla Khodja Bek *udaychi* came to Lahore and the *second* led by Tash Khodja *sudur* went to Kashmir. The sources related to the history of Khoqand gave little information about these embassy missions in part only the work “*Tarikhi Aliquli Amir-i lashkar*” of

Muhammad Yunusjan Shigovul briefly described it. Also archival documents contain data on the activity of Mulla Khodja Bek as an ambassador, but embassy mission of Tash Khodja *sudur* is not described in details. In general, both of Tash Khodja *sudur* and Mulla Khodja Bek were influential religious leaders in the Khoqand Khanate. Processes of their destination as ambassadors after can help us to clarify some facts. Muhammad Yunusjan Shigavul which we have mentioned above took a post of *shigavul* in 1863-1865. *Shigavuls* were responsible for nomination of the candidates for leading embassy missions to the ruler (Khan) and for acceptance and safety of foreign ambassadors in the Khoqand Khanate. According to his composition "The history of Aliquli Amir-i lashkar" (*Tarikhi Aliquli Amir-i lashkar*) the candidacy of influential Sufi and religious leaders of Khoqand and Tashkent was nominated by Mukhammad Yunusjan for general (*mingbashi*) of Khoqand Aliquli Amir-i lashkar in 1863-1865. In part Mukhammad Yunusjan emphasized that the Sufi leaders performed their mission more successfully in compare with other ambassadors and gave examples of supporting his position. As the Sufi leaders were respected not only by the common people, as well as by government officials, which could lead their ambassadorial missions to successful outcomes. Here as an example he told about the diplomatic activity of Miyan Khalil Sakhbizada. Thereafter on behalf of the ruler (Khan) of Khoqand Sultan Sayyid-Khan chief vizier Aliquli Amir-i lashkar sent Tash Khodja *sudur* to Kashmir in 1864 and Mulla Khodja Bek to Lahore. Main purpose of the Khoqand government from this embassy mission was to find allies in its struggle against annexation of its territories by the Russian empire. In response to this, the embassy mission led by Gulam Rabbani sent from Peshawar to Khoqand in 1865. Naturally, for Khoqand these were hard times since the Russian Empire began military campaigns in the northern territories of the Khanate (Tashkent and southern Kazakhstan). According archival documents of the British library Miyan Khalil Sakhbizada gave information about that Gulam Rabbani lived in Bukhara. In our opinion by reason of the beginning of annexation of the Khoqand Khanate by the Russian Empire Miyan Khalil Sakhbizada Ishan wanted to send the ambassador Gulam Rabbani to Bukhara to keep him from falling under the influence of the Russian Empire or to ensure his safety. But some documents gave us information about that Gulam Rabbani in 1867 was in Khoqand.

In its turn some ambassadors sent to Khoqand by India were representatives of the Naqshbandia order. In part, the ambassador Khodja Akhmed shaikh was from very influential leaders of the Naqshbandia Sufi order. He came with special diplomatic mission into the Khoqand Khanate from India, on behalf of British administration in India.

We could not find documents, which contain data about the life and activity of Khodja Akhmed sheikh. Thereby we continue our researches concerning with the activity of Khodja Akhmed sheikh and hope in the future we can find new facts about him.

## CONCLUSION

Analysis of the data of written sources show that ambassadors sent for diplomatic missions specially selected and had noble origins. In letters were written their statuses and titles in the Khanate also that they fixed as *sayyids*. Thereby ambassadors, who were selected from representatives of religious leaders, highly were respected by the population and rulers of every country. In addition we can say that Sufi leaders appointed as ambassadors took special place in

Islamic world and Khoqand rulers (Khans) tried through them to solve regional problems in foreign affairs.

The purposes of sending of embassy missions from the Khoqand Khanate to other countries were differential. In partly, if through sending diplomatic missions to India and to the Ottoman Empire Khoqand rulers (Khans) attempted to rely on its spiritual aid and strengthen the military power, so diplomatic missions to Russian Empire were connected with trade relations of the Khanate. Activities of Sufi leaders as ambassadors took an importance in the development of these relations.

**ABSTRACT**

*The influence of the structure of monoesters of ethylene and diethylene glycols on their phagostimulating activity for Turkestan termite (*Anacanthotermes turkestanicus*) was studied. The phagostimulating activity of ethylene glycol monomethyl, monobutyl ethers and diethylene glycol monoheptyl ether is shown. The obtained experimental data allow us to recommend using of diethylene glycol monobutyl ether as a slow acting toxicant in the matrix of termite baits.*

**KEYWORDS:** *Trail-following pheromones, anacanthotermes turkestanicus, ethylene glycol monomethyl ether, ethylene glycol monoethyl ether, ethylene glycol monobutyl ether, diethylene glycol monoethyl ether, diethylene glycol monobutyl ether, diethylene glycol monoheptyl ether, diethylene glycol monoheptyl ether.*

---

**1 INTRODUCTION**

Baits containing slow-acting toxicants and insect growth regulators (IGRs) to control termites are promising both in terms of efficacy and minimizing environmental impact. The amount and rate at which these compounds enter a termite colony, however, are not easily controlled. The effectiveness of baits depends on termites locating the bait and the rate at which they consume and distribute it to other colony members. Consequently, a considerable amount of research over years has focused on devising more attractive baiting systems and bait matrices [1-10]. Baiting systems are more effective if termites feed more regularly on the baits[11-13].

There are two species of termites populated in Uzbekistan, *Anacanthotermes turkestanicus* and *Anacanthotermes ahngerianus*. They are among the most dangerous pests that cause enormous damage to buildings and structures, including historical cultural monuments.

Termites press their abdomen parts against the substrate and release trail-following pheromones which is secreted by sternal glands. Such pheromone encourage foragers to leave the nest and locate them approach the food source [14,15]. Several authors found specific substances that cause a trail- following reaction in termites. Some of glycol ethers [16], might cause a trail-following behavior in many types of termites.

It was indicated that diethylene glycol monoethyl and monobutyl esters can cause trail-following behavior in 36 species from the families *Mastotermitidae*, *Kalotermitidae*, *Termopsidae* whilst monoethyl ether and monobutyl ethers of ethylene glycol - in 16 species from the families *Mastotermitidae*, *Kalotermitidae*, *Termopsidae*.

Shatov K.S. [17] have conducted trail-following behavior bioassay on *Anacanthotermes ahngerianus* by using glycol ethers which were causing trail-following reaction in other species of termites. Six substances have been tested including diethylene glycol monomethyl ether and ethylene glycol monoethyl ether. However, none of them was effective in relation to the species *Anacanthotermes ahngerianus*.

We were first to study some of glycol ethers as the phagostimulants for the Turkestan termite species *Anacanthotermes turkestanicus*. The aim of our study was to understand the phagostimulating effect of monoesters of ethylene and diethylene glycols as the potential components of a matrix of bait termite against the species *Anacanthotermes turkestanicus*.

---

## MATERIALS AND METHODS:

We have conducted several trail-following bioassays for the study of trail-following behaviour of *Anacanthotermes turkestanicus* to monoesters of ethylene glycol and diethylene glycol (ethylene glycol monomethyl ether, ethylene glycol monoethyl ether, ethylene glycol monobutyl ether, diethylene glycol monoethyl ether, diethylene glycol monobutyl ether, monogethyl ether, diethylene glycol monobutyl ether. In our experiments, it was established that the monoesters of ethylene glycol and diethylene glycol did not cause any a trail- following reaction in both *Anacanthotermes turkestanicus* as well as *Anacanthotermes ahngerianus*. [18].

However, glycol monoesters are used in termite baits, among other chemicals as components or solvents in US Pat. No. 5,024,832 Omata et al. [19] patented the use monoethyl ether, diethylene glycol monobutyl ether. These substances enhance the effect of trail-following pheromone for termites of *Japanese subterranean*. In the patent No. 20100292323 Fujii et al. [20] upon formulation of microemulsions containing pyrethroids, acetates of ethylene glycol monoesters and diethylene glycol were used as solvents. The resulting microemulsion was effective against various types of insect pests, including termites.

Termites were collected in the Navoi region, Khatirchi district, in the farmer association named after E. Abdievin 2012 spring. In order to investigate the reaction behavior of termites on ethylene glycol and diethylene glycol monoesters, the technique [22] was adapted for our conditions. Small discs of brown hygienic paper (2.5 cm in diameter) have been cut in half and both halves were weighed. One half was immersed in a 2% solution of the substances, and the other half was immersed in distilled water. They were dried out at room temperature for 24 hours and then weighed up again.

Both halves of the disk were placed on the bottom of a plastic Petri dish (inner diameter 2.5 cm). Plastic cups with discs were placed in a plastic container (25 × 15 × 10 cm), where 100% humidity was maintained all throughout the process. The discs were in the container for 24 hours before the test.

Ten worker termites of the same size and weight were placed in each Petri dish. Termite Petri dishes were covered with lids, maintaining high humidity, and kept in the container for 5 days. Appropriate controls were used to check mortality additionally. Five repeats were implemented for each concentration and each substance. of bait composition comprising, as a main ingredient, a trail- following pheromone (3Z, 6Z, 8E) dodecatrienol and components that increase its inducing effect, including ethylene glycol monomethyl ether, diethylene

On the fifth day, termites were removed. Both halves of the disk were separated, carefully brushed from fecal material and dirt on them, and dried for 24 hours. The halves of the discs were weighed again.

**Synthesis of diethylene glycol monobutylether.** 5.6 g (0.1 mol) of potassium hydroxide grinded in a mortar, 10.6 g (0.1 mol) of diethylene glycol, 30 ml of dry acetone and 2 g of potassium iodide were placed in a three-necked flask 15.07 g (0.11 mol) of butyl bromide was added dropwise over 1 hour with stirring. The reaction mixture was refluxed at room temperature for 4 hours. The residue was extracted several times with ethyl ether, then the ether extracts were combined and dried with Na<sub>2</sub>SO<sub>4</sub>. The solvent was removed and the residue was distilled in vacuum. Yield 9.72 g (60%), R<sub>f</sub> = 0.85 (acetone- benzene 2: 1), n<sub>D</sub>20 = 1.4315.

Obtained substance has been separated with column chromatography (Chemapol L 100/250 silica gel, 2: 1 acetone-benzene system. The NMR spectrum was recorded in a deuteromethanol solution on an NMR- UNITY 400+, ICPS spectrometer. A methyl group triplet is located in the field of strong fields ( 0.96 ppm), multiplets of methylene protons (1.41 ppm and 1.55 ppm). All signals of oxymethylene protons are located in a narrow range of 3.7-3.4 ppm.

Diethylene glycol monoethyl ether has been prepared similarly. Yield 65%,  $R_f = 0.87$ ,  $n_{D20} = 1.4263$ . Diethylene glycol monoheptyl ether. Yield 30%,  $R_f = 0.84$ ,  $n_{D20} = 1.4412$ . Ethylene glycol monoethylether. Yield 55%, because = 1330C,  $R_f = 0.87$ ,  $n_{D20} = 1.4065$ . Ethylene glycol monobutylether. Yield 45%,  $R_f = 0.65$ ,  $n_{D20} = 1.4179$ . [23]

## RESULTS AND DISCUSSION

Paper disks immersed to 2% diethylene glycol monobutyl ether were practically never tasted by termites, possibly due to its toxicity and the death of all termites (10 pieces) in the first three days. In case of the 0.2% solution of diethylene glycol monobutyl ether for paper disks (10-fold dilution), the disk edibility was at the standard level, and termite mortality was nevertheless quite high (30%), while the average mortality for other monoesters and standard was 10-30%.

1. Ethylene glycol monomethyl ether 2%. 2. Ethylene glycol monoethylether 2%. 3. Ethylene glycol monobutylether 2%. 4. Diethylene glycol monoethylether 2%. 5. Diethylene glycol monobutyl ether 2%. 6. Diethyleneglycol monoheptyl ether 2%. 7. Diethylene glycol monobutyl ether 0.2%. 8. Control

**TABLE 1.AVERAGE MORTALITY OF THE TERMITES**

№	Name of the compound	Mortality%					Total, %
		1 <sup>st</sup> day	2 <sup>nd</sup> day	3 <sup>rd</sup> day	4 <sup>th</sup> day	5 <sup>th</sup> day	
1.	Ethyleneglycol Monomethylether 2%.	10	10	-	-	-	20
2.	Ethyleneglycol Monoethylether 2%.	-	-	-	-	20	20
3.	Ethyleneglycol Monobutylether 2%.	-	10	-	-	-	10
4.	Diethyleneglycol Monoethylether 2%.	10	-	-	-	-	10

5.	Diethyleneglycol Monobutylether 2%.	30	-	70	-	-	100
6.	Diethyleneglycol Monoheptylether 2%.	-	-	-	-	30	30
7.	Diethyleneglycol Monobutylether 0.2%.	10	-	-	-	20	30
8.	Control	20	-	-	-	-	20

It should be pointed out that only in the case of afore-mentioned monoester termites preferred to eat untreated paper. In other cases, termites prefer to eat treated semi-disks, which confirm the phagostimulating activity of monoesters of ethylene and diethylene glycols.

According to that, it is necessary to conduct field tests of diethylene glycol monobutyl ether as a toxicant in the matrix of termite bait in the field

## CONCLUSION

As conclusion, the results of the experiments, suggest that the phagostimulating effect of monoethyl ethers of ethylene and diethylene glycols is at the standard level, that is, untreated paper disks. Ethylene glycol monomethyl, monobutyl ethers, diethylene glycol monoheptyl ether have a pronounced phagostimulating effect and can be recommended as components of the termite trap matrix.

### ABSTRACT

*Anisotype heterojunctions  $p\text{-Cu}_2\text{ZnSnS}_4/n\text{-Si}$  were fabricated by sulfurization of metal precursors which were deposited on a poly-Si substrate. Current - voltage characteristics are discussed and the dominating mechanisms of current transfer are determined: at a direct bias tunnel recombination processes prevail with participation of defect states on interface of heterojunction, when voltage increases Newman's tunnel mechanism dominates. The reverse current through the heterojunctions under investigation was analyzed within the tunnel mechanism.*

**KEYWORDS:** Heterojunction, Silicon, CZTS, Current-Voltage Characteristic, Current Transport.

### INTRODUCTION

The interest in quaternary compound semiconductor  $\text{Cu}_2\text{ZnSnS}_4$  (CZTS) having grown up in recent years is associated with the prospect of their use in solar cells (SC) [1-3]. CZTS components are common, easily accessible, non-toxic and cheap items. This compound has an optimal band gap (1.5 eV) [1] and a high absorption coefficient in the visible range (about  $10^5 \text{ cm}^{-2}$ ) [2], making it promising for making an absorbent layer for SC. Based on hetero structures  $\text{CdS/Cu}_2\text{ZnSnSe(S)}_4$  we obtained solar cells with an efficiency of 12.6% [3]. However, given the toxicity of cadmium, in recent years the search for substituting material for CdS in heteropair [4,5]. While obtaining semiconductor heterostructures the choice of substrate material is very important. For combining with the other components of semiconductor electronics one needs structures on silicon based substrate. CZTS and Si have well matching lattice parameters [6].

Heterostructures  $\text{Cu}_2\text{ZnSnS}_4/\text{Si}$  are also promising for the making thin film solar cells [7]. Further improvement of their parameters is impossible without understanding the physical processes that determine characteristics of heterojunctions.

In this paper, we study the electrical properties of anisotypichetero structures p-Cu<sub>2</sub>ZnSnS<sub>4</sub>/n-Si obtained on a substrate of monocrystalline Silicon.

### EXTERMINATE SECTION

To create p-Cu<sub>2</sub>ZnSnS<sub>4</sub>/n-Si heterojunction, synthesis of CZTS layers is carried out through sulfurization of base metal layers. Initially, on a silicon substrate basic component layers - copper, zinc and tin in different sequences - were formed by vacuum deposition. The process was carried out in vacuum of order  $5 \cdot 10^{-5}$  mm Hg. The ratio of components in the initial sample was taken in accordance with the stoichiometric composition of the compound. In the next stage of the process we carried out sulfurization of the metal layers from unlimited source in a closed evacuated volume. To do this, samples of silicon with deposited components of compound on surface were placed in vacuum ampoule evacuated to  $2 \div 3 \cdot 10^{-5}$  mm Hg. For saturation of growing film with sulfur and prevention of its evaporation from the sample, sulfur was placed in ampoule in the amount necessary to provide the appropriate vapor pressure during the synthesis of compound. The synthesis of CZTS films was carried out at 550°C over 45 minutes.

We measured the electrical parameters of the films. All samples obtained without special doping had p-type conductivity. It seems that during the formation of films structural defects appear such as vacancy of copper atoms -  $V_{Cu}$  and its substitution of zinc knot -  $Cu_{Zn}$  [8]. These defects with shallow acceptor levels determine the type of conductivity of obtained films.  $V_{Cu}$  ionization energy is  $\sim 0,02 \div 0,08$  eV, the ionization energy of  $Cu_{Zn}$  is  $\sim 0,10 \div 0,15$  eV [8]. The surface resistance of CZTS films was within 20-50 Om.kv.

Stationary current-voltage characteristics (CVC) of obtained heterojunctions were measured at different temperatures. The ohmic contacts to the structures were obtained by depositing eutectic alloy of indium-gallium.

### RESULTS AND DISCUSSION

In general, the direct current of HJ consists of above-barrier, recombinationary current in the space charge region and tunneling current [9]. As follows from CVC of p-Cu<sub>2</sub>ZnSnS<sub>4</sub>/n-Si (1) HJ, the voltage at which rapid increase of current occurs decreases with increasing temperature, which indicates the decrease in the potential barrier height when the temperature rises.

The height of potential barrier  $\phi_k$  corresponding to different temperatures was determined by extrapolation of linear sections of the CVC. Temperature dependence of  $\phi_k$  (T) is described by the following expression:

$$\phi_k(T) = \phi_k(0) - \beta_\phi T, (1)$$

where  $\beta_\phi = 3,2 \cdot 10^{-3}$  eV/K is the temperature coefficient of the potential barrier height,  $\phi_k(0) = 1,55$  eV is the height of the potential barrier GP at absolute zero temperature. Significant difference in the value of  $\beta_\phi$  compared with a temperature coefficient of band gap width of silicon ( $\beta_{Eg} = 2,3 \cdot 10^{-4}$  eV/K), apparently due to surface defects in the interface of SC p-Cu<sub>2</sub>ZnSnS<sub>4</sub>/n-Si. CVC of HJ upon application of direct voltage in semi-log coordinates for different temperatures is shown in Fig. 1.

Fig. 1. Direct current-voltage characteristics of heterostructure branches in semi-log scale ( $3kT/e < V < 0,7\text{eV}$ ). T, K: —■— 278, —●— 293, —▲— 308, —▼— 318. Temperature dependence of the current cutoff is in the inserted figure

It can be seen that for voltages  $U > 3kT/e$ , CVC has straight sections, indicating at the exponential dependence of current on voltage. In the voltage interval  $3kT/e < U < 0,7\text{ V}$ , the slope of the dependence is not related to temperature, therefore we exclude the possibility of studying current transfer on the basis of generation-recombination processes in space charge area [10].

Constant slope of  $\ln I = f(U)$  at different temperatures is evidence for the tunneling mechanism of current transfer. However, at low voltages width of the transfer region is still thick for tunneling. Although, the existence of sufficient number of discrepancy dislocations on the interface HJ p-Cu<sub>2</sub>ZnSnS<sub>4</sub>/n-Si suggests that one can assume that the basic mechanism of current transfer is tunnel-recombination processes involving surface states. In this case, the dependence of current on voltage is given by [10]

$$I = B_0 \exp \{-\alpha [\varphi_k(T) - eU]\}, (2)$$

where  $B_0$  is the value which weakly depends on temperature and voltage,  $\varphi_k$  is height of potential barrier.

We rewrite expression (2) as

$$I = B_0 \exp [-\alpha \varphi_k(T)] \exp (\alpha eU) = I_0 \exp (\alpha eU), (3)$$

where  $I_0 = B_0 \exp [-\alpha \varphi_k(T)]$  is current cutoff, which is independent of voltage. As can be seen from the expression (3), tilting  $\Delta \ln I / \Delta U$  initial sections of the CVC (Figure 2) determines the value of  $\alpha$ , which is equal to  $9.5\text{ eV}^{-1}$ .

Substituting equation (1) into the expression cutoff current we obtain

$$I_0 = B_0 \exp \{-\alpha [\varphi_k(0) - \beta_\varphi T]\} = B_0 \exp [-\alpha \varphi_k(0)] \exp (\alpha \beta_\varphi T) = I_c \exp (\alpha \beta_\varphi T),$$

where  $I_c$  is constant.

The inserted figure in Fig. 1 shows  $\ln I_0 = f(T)$  in a semi-log coordinates. The coefficient  $\alpha$  can be determined from the slope of the linear dependence  $\ln I_0 = f(T)$ :

$$\alpha = (\beta_\phi)^{-1} (\Delta \ln I_c / \Delta T) = 9,8 \text{ eV}^{-1}, (4)$$

Relatively close values of coefficient  $\alpha$  determined from various dependencies confirm the accuracy of the analysis of the initial portions of CVC for p-Cu<sub>2</sub>ZnSnS<sub>4</sub>/n-Si structures in the framework of multi-tunnel-recombination mechanism of current transfer involving local states at the interface of HJ.

At voltages  $U > 0,8 \text{ V}$  the dependence of  $\ln I = f(U)$  is described by Newman formula for the tunneling current [11]:

$$I \sim \exp(AU) \exp(BT), (5)$$

where A and B are constants, independent of voltage and temperature. From Fig. 2 we can see that the slope  $\Delta \ln I / \Delta U$  of primary areas of straight branches of CVC is determined by coefficient A (5), and  $A = 1.9 \text{ V}^{-1}$ . Based on the slope of the temperature dependence of the tunneling current the value of B is determined,  $B = 2,7 \cdot 10^{-2} \text{ K}^{-1}$ .

Fig. 2. Direct branch CVC HJ in semi-log scale ( $U > 0,8 \text{ V}$ ). T, K: —■— 278, —●— 293, —▲— 308, —▼— 318. Temperature dependence of the current cutoff is in the inserted figure

Consider the mechanism of current transfer through HJ p-Cu<sub>2</sub>ZnSnS<sub>4</sub> / n-Si under reverse bias. Figure 4 shows the dependence of  $\ln I_{\text{rev}(t)} = f(\phi_k - eV)^{-1/2}$  for different temperatures.

The magnitude of tunneling current at sharp heterojunction under reverse bias is expressed by the formula [12]

$$I_{\text{rev}(t)} = a \exp [b/(\phi_k - eU)^{1/2}], (6)$$

where a and b are coefficients that do not depend on voltage. As one can see from Fig. 4, dependencies  $\ln I_{\text{rev}(t)} = f(\phi_k - eU)^{-1/2}$  are composed of linear segments with certain slopes. Therefore, we can assume that the mechanism of current transfer in HJ p-Cu<sub>2</sub>ZnSnS<sub>4</sub>/n-Si under

reverse bias ( $3kT/e < |U| < 1,0$  V) is the tunneling through a potential barrier with deep energy level in the metallurgic boundary of HJ [10]. At higher reverse voltages one ( $|U| > 2,5$  V) observes soft breakthrough.

Fig. 3. Inverse branches of CVC p-Cu<sub>2</sub>ZnSnS<sub>4</sub> / n-Si at T, K: 1- 278 K, 2 - 293 K, 3 - 308 K, 4 - 318 K

## CONCLUSION

We studied electrical characteristics of HJ p-Cu<sub>2</sub>ZnSnS<sub>4</sub>/n-Si obtained by sulfurization of base metal layers deposited on a silicon substrate. Based on analysis of the temperature dependence of the straight branch of HJ p-Cu<sub>2</sub>ZnSnS<sub>4</sub> / n-Si CVC we found that at low voltages ( $3kT/e < U < 0,7$  V) the main mechanism for transferring current is staged tunnel-recombination processes involving defect states at the interface of HJ. For voltages  $U > 0,8$  V tunneling mechanism of Newman prevails.

In the case of reverse bias ( $3kT/e < |U| < 1,0$  V) the main mechanism of current transfer through HJ is tunneling through the potential barrier with deep energy level. At reverse voltages  $|U| > 2,5$  V soft breakthrough is observed.

Namangan State University,  
UZBEKISTAN

### ABSTRACT

*This article covers the organization, structure, types, functions, activities of air transport, as well as materials on the history of air transport of the Republic of Uzbekistan. One of the types of transport widely used in air transport is a helicopter. A helicopter is a heavy-duty flight from the air that rises and descends vertically, in which one or more (most often, two) shoulder screws bring the lifting force into the body. Aviation is divided into civil aviation and military aviation. Civil Aviation is used in the transportation of passengers and cargo. It is intended for Transport, sanitary service, educational and sports and special works, as well as in agriculture, communications, geological-exploration works, there are species used in fishing. The most important and main part of the airport is the airfield. The structure of the airfield includes corridors for risk-free flight and landing of aircraft and helicopters (poles), as well as land sections specially prepared for their maintenance.*

**KEYWORDS:** Aircraft, Aircraft, Helicopter, Airport, Airfield, "Open Sky" Mode.

### INTRODUCTION

The XX century gave mankind great discoveries and inventions. For centuries, the seemingly impossible flight of a man on a winged car became a reality, and this aroused the dream of an impenetrable flight for humanity. Most of the flights that have been going on for several centuries have ended tragically, finally in the last century a person has found a way to fly higher and longer. As a result, he developed as a separate sphere. As a common name, it was called aviation.

Aviation is a frantic word aviation, latin avis – bird, that is, the concept associated with the flight in the air space around the Earth (atmosphere) in heavy flying apparatus from the air. In aviation, planes, helicopters, planers are used. The organization (service) that uses the same apparatus for

flight (flight) is also called Aviation. Aviation is divided into civil aviation and military aviation. Civil Aviation is used in the transportation of passengers and cargo. It is intended for Transport, sanitary service, educational and sports and special works, as well as in agriculture, communications, geological-exploration works, there are species used in fishing. To ensure constant transportation of passengers and cargo, the composition of Civil Aviation includes a fleet of aircraft and helicopters, various services that provide flight, airfield and airport. Originally entered Uzbekistan as a mode of transport in 1924. As for military aviation, it acts together with the onshore troops, the naval and air defense forces, as well as performs independent tasks.

The main task in aviation is assigned to aviationortorti. The basis of the aircraft is an aircraft and a helicopter.

The plane in Russian means " Sam " – myself and letat – fly, and also Aeroplan-Heavy flight from the air. Depending on the location of the wings of the aircraft in one or two planes, the monoplane (wing in one plane) and the biplane (wings in two planes), depending on the number of engines, 1, 2, 3 and 4 motors (sometimes, five and six motors); depending on the type of engines, helical (piston and turbovintli), reactive engine, one, two and multi-seats, depending on the number of seats There are types of aircraft-amphibians, that is, gidrosamolyot equipped with a wheeled chassis), which can rise from landslides, water (gidrosamolyot), as well as from both water and landslides. The aircraft is the fastest moving air transport in all types of transport, the speed of its passage without landing at a long distance is 900-1000 kilometers per hour. The main feature of air travel is a large speed of aircraft, a reduction in passenger, mail and cargo transportation time. The aircraft is also produced in Uzbekistan.

At the Tashkent Aviation Plant (later on the place of "Tashkent aviation Production Association" state Stock Company, now "Tashkent mechanical plant"), ИЛ-14, АН-10, АН-8, АН-12, АН-22, "Антей", superlayner ИЛ-76 and ИЛ-114 aircraft were produced. During the years of independence, Boeing 767/757, A-310, RJ-85 aircraft were used on international flights. The national aviation company "Uzbekistan Airways" started the commercial exploitation of "linliners" from 2016.

On July 27, 2017, the first continuous flight from Tashkent to New York was carried out for the first time in the history of our national airline. Today, modern and comfortable airliners of Uzbekistan fly to more than 40 cities of Europe and Asia and carry out charter flights from Alaska to New Zealand.

One of the types of transport widely used in air transport is a helicopter. A helicopter is a heavy-duty flight from the air that rises and descends vertically, in which one or more (most often, two) shoulder screws bring the lifting force into the body. The helicopter rises from the standing position, descends to the steep, can hang in one place in the sky, bend around the vertical axis to the desired side, can fly in the desired direction correctly. In 1956, the first two MI-4 helicopters were adopted by the aviators of Uzbekistan, one of which was the first helicopter pilot Uzbekistanis B.M.Borisov managed. Today, it is widely used in the rescue work, from the helicopter to the people's farm (fighting with agricultural pests, transporting passengers and cargo), carrying out geological exploration work, gravimetric photographing, tracking glaciers, extinguishing fires in the forest, transporting and installing large equipment, construction, carrying doctors to inaccessible places.

The basic technical operating instructions of aircraft and helicopters include capacity, load carrying capacity, flying speed and flying without landing masofasi. Flight distances, depending on the capacity of passengers and the carrying of cargo, passenger carriers are divided into pilot aircraft on the trunk and local air routes.

Airports are one of the enterprises of air transport and are engaged in passenger, cargo and postal transportation and reception, preparation of aircraft for flight and organization of flight. Airports can include airfields, special engineering buildings and facilities of shokbekat, as well as landing areas of helicopters. Airports are divided into airports that, in their function, serve as pilots on international, CIS domestic highway routes and domestic routes. Special attention is paid to the development of airports in the Republic of Uzbekistan.

In particular, on June 12, 2020, the order of the minister of transport of the Republic of Uzbekistan on the introduction of the “open sky” regime was signed at the airports of the Republic of Uzbekistan. This order was developed in order to increase the effectiveness of the reforms carried out in the spheres of Civil Aviation and tourism of the Republic in accordance with the decrees of the president of the Republic of Uzbekistan “on measures of radical improvement of the system of Public Administration in the field of Transport” № PE-5647 and “on measures of further development the”open sky” regime will be introduced from August 1, 2020, using the right of “fifth airspace” in the Airports of the Republic of Uzbekistan against Nukus, Termez, Bukhara, Navoi, Urgench, Andijon, Fergana, Namangan and Samarkand, with the possibility of changing the conditions or setting it for a period of two years until the end of the “winter 2022/2023” season. According to the order, the “open sky” mode: Karshi, Nukus, Termez, Bukhara, Navoi and Urgench without any restrictions at the airports; Taking into account their technical capabilities to the airports specified in Andijon, Fergana, Namangan and aviacompanies of the member states of the International Civil Aviation Organization at the airports in the city of Samarkand, with the right to carry out “fifth airspace” and passenger airspace in the directions not used by the carriers appointed by the Republic of Uzbekistan without restrictions on the number In accordance with this regime, foreign aircraft carriers are granted the rights up to the “seventh airspace” in order to carry out cargo transportation at the airports in Navoi and Termez. Foreign aircraft companies interested in opening new air routes or planning to increase the number of flights should submit the necessary documents to the aviation agency under the Ministry of Transport and the Air Transport Development Department in accordance with the established procedure.

The most important and main part of the airport is the airfield. The structure of the airfield includes corridors for risk-free flight and landing of aircraft and helicopters (poles), as well as land sections specially prepared for their maintenance. According to the classification of airfields: it is divided into regular operatives, seasonal, fast-acting. According to its functions, it is divided into primary, intermediate and most recent airfields, as well as reserve airfields for landing in emergency situations.

A terminal is a building or a building where air transport passengers are served and cargo operations are carried out in airports, complex. The structure of the air terminal includes the reception area of the railway station (along with the city transport parking area), the apron in which the aircraft stands, the apron-technical service buildings, the food preparation complex for passengers on board the aircraft, hotels, a set of basic facilities including the command-

dispatching punktini. As a rule, these buildings and structures are built together with the building of the air terminal. There will be a variety of Air Terminal Services for domestic and international lines. In the provision of services to passengers in the air terminal includes the following: the sale and registration of tickets; reception of cargo on the flight, formalization, fastening and sending of cargo to the flying passengers; providing information on the flight and landing of aircraft, including the provision of postal, household, medical services. The size of the air terminal depends on the size of the passenger transportation of the airport. The air terminal at the Tashkent airport is part of the major air terminal. In order to facilitate the work of the air terminal in large cities, a city air terminal is built, which is connected with the airport by means of the city transport.

In conclusion, the study of the history of transport communications, especially air, plays an important role in the development of democratic legal state and civil society in Uzbekistan as a topical subject of ensuring sustainable social development through the implementation of the fundamental goals of the National Action Strategy. Since the aviation network is a problem that has not yet been worked out in the historical sciences from the point of view of industry and production, it is necessary to carry out a thorough analysis and interpretation in the context of issues related to the development of the airspace, relying on historical sources.

### ABSTRACT

*The demand for renewable energy in Uzbekistan is high. This article discusses the basics of calculations for introducing renewable energy sources into power supply systems. In the work results are shown below materials research sensors that were considered the main one components, providing devices and equipment signals monitoring systems and management define uninterrupted operation work of sources electrical supply.*

**KEYWORDS:** *Sensor, Converter, Reactive Power, Power Supply, Synchronized Compensators, Capacitor Bank, Electric Power Transmission Network.*

## INTRODUCTION

In today's event time renewable sources energy is entered into practice and at the same time, attention is paid to great value control and management electric power station energy and its use change, via devices conversions electrical values and sensors on the generated data in sources energy. In systems electrical supply (Sea) element and the device monitoring and management energies renewable energy sources source includes sensors, allowing reliable monitoring and providing services managers signals. Sensors that were considered the main one components, providing devices and equipment signals monitoring systems and management define (install) uninterrupted operation work of sources electrical supply, reliability, a number of technical features and economic ones indicators [1-3].

In same practice electrical supply system (Sea) one of the main problems — uninterrupted operation, reliability, efficiency and accuracy changes signals remain up-to-date. Today's date time in our city state annual volume the main ones consumers electricity, consumed data municipal services consumers it makes up To 11.5-12.0 billion kWh.h [3].

General quantity consumers electricity generation of this type moving over 6.5 million, out of of which more than 2.5 millions live there cities (annual consumption electricity generation Of 5.5-6.0 billion kWh.h) and 4.0 million consumers they live in rural areas localities (annual consumption electricity generation 6.5-7.0 billion kWh.h) [4,5].

Analysis results research they showed that you can allow it a number of problems production, transfer to distance, distribution and consumption electricity generation using usage renewable sources energy (solar, vetryanoy, hydroelectric power station etc.), as well as with the use of special features sources reactive ones capacity [5].

On figure 1.1. shown basic information scheme of the complex applications in sea, renewable sources energy and reactive materials capacity.

*Fig. 1.1. basic Information scheme of the complex applications in the sea renewable energy source and reactive ones capacity.*

On individual territories regions of the Republic (for calculations expenses on installation devices renewable sources energy efficiency (RES) for 4.0 million consumers sources electricity, installation equipment it will cost 1 kW by 8.2 million soums, if you count it average power one

user 16.4 million soums, then for consumers 4.0 million consumers and there will be more make up 64 trillion soumsor 7.8 billion Yandex units. This indicator during production electricity generation it makes up quantity saving 8000 MW active power [5-8].

In addition information, provided above is necessary consider the following preferred ones renewable energy facilities [9-14]:

- ♦ Small need large area for construction purposes;
- ♦ Small need for the device substations, power lines and the other equipment with large ones by size;
- ♦ Minimum requirements maintenance costs (maintenance electrical installations, cleaning panels and others.);
- ♦ Little loss of electricity;
- ♦ Uninterrupted operation software electricity household consumers;
- ♦ Availability features complete deactivation consumers from centralized ones networks in summer or on peak days consumption electricity generation;
- ♦ Cost-effective sources natural gas and electricity (2.7 billion cubic meters per year natural gas or 402.0 million Yandex units
- ♦ In reduction account consumption energy reduction specific consumption for generating data electricity generation;
- ♦ Creation features for collection electricity generation;
- ♦ Education small businesses for installation renewable sources energy and their properties technical support maintenance;
- ♦ Small waste to the atmosphere

Availability peculiar ones disadvantages Renewable energy sources:

- ♦ Generating companies electricity based on a constant RES current is not they produce reactive part of the electricity supply;
- ♦ In systems where applied RES, limited features regulation voltage drop (performed mostly via centralized users sources electricity generation);
- ♦ Cheap pricing plan for electricity generation and long-term ones deadlines for payback period;
- ♦ When individual installation electrical supply with RES (at scale one subscriber adjusted for consumption electricity generation for monthly payments payment terms payback period very few installations big ones;

In as the main ones disadvantages considered the fact that RES does not generates reactive power and capacity resolution disadvantages leads to improvement working conditions electrical equipment not just for home use equipment, i.e. compensated reactive ones power factor in the entire system electrical supply based on regulation voltage drop electrical supply improving indicators quality assurance electricity.

For RES compensation reactive capacity has great value, it is a the main one from <url> to increase your sales Efficiency, improvements economic factors and high-quality ones indicators systems. Currently growth time reactive the power factor is that's enough high than growth of active capacity, in individual businesses reactive the load is relative active power 130%. Transmission reactive capacity on the long distances via ad networks transfers power lines results in deterioration technical and economic aspects indicators electrical supply systems.

In systems electrical supply active power mostly with generator sides centralized electrical supply systems and renewable energy, and reactive power generated cosine function condensing system with a battery, generators power stations synchronous compensators, synchronous propellers, line, sources thyristor devices reactive ones capacity.

When process design features electrical supply systems improvement indicators the coefficient reactive capacity responds delivered goals. Quantity the coefficient reactive user capacities defines technical and economic aspects indicators electrical supply systems, that is correct resolving the issue compensation reactive capacity provided by efficiency how the system works electrical supply, inclusive includes consumers, transmission networks electricity, installations distributions electricity, transformers, generators, control sensors and monitoring [14-18].

Systems electrical supply with RES transmitting a reactive program capacity via transmission networks electricity generation and transformers results in additional energy losses, increase voltage losses on line and at increase expenses on systems [14]:

1. When it appears on transmission networks electricity generation and on transformers it's happening additional losses active power and energy losses. If via a line that has active resistance —  $R$  the active line will flow —  $P$  and reactive —  $Q$  capacity, at this is a loss factor active power calculated by the formula [14]:

$$\Delta P = I^2 R = \left( \frac{S}{U} \right)^2 R = \frac{P^2 + Q^2}{U^2} R = \frac{P^2}{U^2} R + \frac{Q^2}{U^2} R = \Delta P_a + P_p \quad (1.1)$$

In the result jet transfers power electric power station sea energy via ad networks electricity, transformers it's happening additional information active loss capacity ( ),  $\Delta P_p = \frac{Q^2}{U^2} R$  her the value is direct proportionally square  $Q$  — reactive power. On this basis you can conclude, what about generators power stations inappropriate pass it on reactive power.

2. During transmission electricity generation with the active one capacity —  $P$  and reactive capacity —  $Q$  through Sea consisting of from elements active —  $R$  and reactive —  $X$  resistance levels (transformer, lines and so on further) losses voltage drop defined by the formula [14]:

$$\begin{aligned} \Delta U &= IR \cos \varphi + IX \sin \varphi = \frac{UI \cos \varphi}{U} R + \frac{UI \sin \varphi}{U} X = \\ &= \frac{P}{U} R + \frac{Q}{U} R = \Delta U_a + \Delta U_p \end{aligned} \quad (1.2)$$

where  $\Delta U_a$  — voltage losses, related to transmission active power;

$\Delta I_r a$  — voltage losses, related to transmission reactive power consumption.

In conclusion you can say, what is the result jet transmission what's going on additional features voltage losses ( $\Delta U_p = QX/U$ ), her number is directly proportional to jet power —  $Q$  and reactive resistance —  $X$ .

3. Upload from a large number reactive capacity *Sea* with *RES* results in increase cross-section cross-sections of air lines and cable systems transmission networks *Sea* and selection of transformers with magnification capacity. It is known that cross section wire cross section *Sea* and capacity transformers accepted rated current —  $I_x$  and full power —  $S_x$ .

$$S_X^2 = P_X^2 + Q_X^2, \quad (1.3)$$

$$I_X^2 = \frac{P_X^2}{U_X^2} + \frac{Q_X^2}{U_X^2} \quad (1.4)$$

In conclusion it can be stated that what are the values *Sh* va *IX* additional information they increase at the expense of  $Q$  and as a result why reactive power flowing using elements *Sea* reduces pass rate ability elements *Sea*.

## METHODS OF TEACHING STUDENTS TO CLASSIFY MATHEMATICAL PROBLEMS

**Nurillo Aliyev\***

\*Fergana State University,  
UZBEKISTAN

### ABSTRACT

*In this article, mathematical tasks: problem-solving tasks are described. The mathematical tasks are classified according to their teaching purpose and these tasks can provide students with opportunities to learn new mathematics and to develop mathematical processes including problem-solving strategies. The classification of mathematical tasks will help teachers to understand more about the purpose and characteristics of the diverse types of tasks so that they can choose appropriate tasks to enhance the students' mental structures and to assess the various aspects of their learning.*

**KEYWORDS:** *Mathematical Task, Problem Solving Tasks, Mathematical Problem, Teaching Math, Teaching Purpose.*

### INTRODUCTION

It is known that Math teachers must know the differences between the types of mathematical tasks how to use them in order to develop the various aspects of the students' mental structures since different tasks are used to cultivate different types of skills and thinking skills. It is crucial task for all math teachers to understand the differences between the tasks according to their teaching purpose, so that they can choose more suitable tasks for their students.

### MATERIALS AND METHODS

#### What is a mathematical problem?

Many Math teachers use the word 'problems' to describe the tasks in mathematics textbook. However, are they really problems? According to Henderson's and Pingry's (1953), there are three necessary conditions for a situation to be a problem for a particular individual:

"1. The individual has a clearly defined goal of which he is consciously aware and whose attainment he desires.

2. Blocking of the path toward the goal occurs, and the individual's fixed patterns of behavior or habitual responses are not sufficient for removing the block.

3. Deliberation takes place. The individual becomes aware of the problem, defines it more or less clearly, identifies various possible hypotheses (solutions), and tests these for feasibility." (p. 230)

There are three criteria in the first condition to clearly define the goal towards encouraging the students to do mathematical tasks. If the student is unable to solve the tasks, are they still problems to him or her? This has a serious pedagogical implication. If these tasks are not problems to the student, the math teacher does not have to do anything to help the student. However, from the perspective of the student these tasks are still problems as he or she has to solve the problem. It would seem that interest on the part of the person is not a criterion to determine whether a situation is a problem to him or her.

According to Macmillan English Dictionary for Advanced Learners, the word 'desires' means 'wants' and a person may want something out of necessity or responsibility rather than out of interest. In the classroom, an uninterested student may want or need to solve the tasks, be it willingly or unwillingly, and so if we interpret the word 'desires' as 'wants' or 'needs' in Henderson's and Pingry's (1953) first condition and a situation will still be a problem to a person if he or she *wants* or *needs* to attain the goal but is unable to do so. It is a problem as "a situation in which a person *wants* something and does not know immediately what to do to get it".

The second condition is that the person must "be *unable to proceed directly* to a solution". According to Lester (1980) and Reys (2004), this difficulty must require "some creative effort and higher-level thinking" to resolve. Due to Schoenfeld (1985), the "difficulty should be an intellectual impasse rather than a computational one". Schoenfeld gave the example that inverting a  $27 \times 27$  matrix would be a tedious task for him but inverting a matrix was not a problem to him. So *tediousness* in applying a computational procedure is not a factor in determining whether a situation is a problem. But what if a student does not know how to invert a  $27 \times 27$  matrix? Students might have learnt how to invert a  $2 \times 2$  matrix but not many of them are aware of how to invert a square matrix of higher dimensions. So the problem can still be a *procedural* one.

The third condition is that the person must "make a *deliberate attempt* to find a solution". According to Lester (1980), what happens if the person does not attempt the task? For instance, if a person tries to run away from his or her problem instead of trying to resolve it, does it mean that the situation is no longer a problem to the person in real life? Imagine an ostrich which buries its head into the ground when it senses danger. As long as the ostrich does not see the source of the danger, is the danger still a problem to the bird? What is worse is that the danger may even cause the ostrich its life. There are two different perspectives here. From the viewpoint of the person or the ostrich, the situation is not a problem to the person or the ostrich. But from another viewpoint, the problem is still there. Which perspective you take depends on the situation itself. If the situation is serious, then taking the first viewpoint may not be so helpful to the person although it may so happen that the situation just resolves by itself after some time. If the situation does not concern the person, then taking the second viewpoint may not be so helpful. For example, there are many questions on physics that we cannot answer. Taking the second viewpoint that these questions are problems to me will mean that I have a lot of problems in my life and I may feel so burdened by them when these questions do not actually concern me.

Thus whichever perspective you take depends on whether the situation concerns you or how serious it is.

In the classroom, if a student does not attempt the tasks set by the teacher, then from the first viewpoint, these tasks are not problems to the student. But is this perspective helpful to the student? Let us look at it from the perspective of a teacher. When a teacher designs or chooses a task for his or her class, the teacher will usually target the task difficulty at the level of the average students in the class. But if the average students are not interested in doing any work at all, then the task will not be a problem to these students and so does it mean that the teacher can set a very difficult task since it will pose no problem to these students? From the viewpoint of the teacher, in deciding whether a task is suitable for the class, it may be more useful to just use Henderson's and Pingry's (1953) second condition that a task is a problem to a person if he or she is unable to proceed directly to a solution. Whether the students want to do the task or actually make an attempt on it should not be a factor when deciding whether the task will be a problem to the average students in the class. Of course, if the students do not want to do the task, then it will still be a concern for the teacher but it will be an entirely different problem for the teacher.

## RESULTS AND DISCUSSIONS

**Tasks: *Solve mathematic thinking and reasoning sum in small groups.***

### **1.The table shows some exchange rates.**

£1 is worth 1.80 American dollars
£1 is worth 200 Japanese yen

Shoira buys a camera in America and pays 270 dollars. Sherzod buys a similar camera in Japan and pays 20 000 yen. In which country is the camera cheaper and by how much? Give your answer in GBP (£).

2. Maria earns \$3.00 an hour for her first hour of work, \$7.00 for her second hour, \$11.00 for her third hour, \$15.00 for her fourth hour and so on. How much money will she earn in her 12th hour of work?

The main purpose of these tasks is for the solvers to make use of some problem-solving strategies, such as looking for patterns and to solve it. These tasks require some problem-solving strategies and not just a direct application of a procedure.

The phrase 'problem-solving tasks' can be misleading as the term 'problem-solving' suggests that the task is a problem to the person when it may not be so. Nevertheless, this phrase will still be used to emphasise the problem-solving strategies involved in this type of tasks, even if they may not pose a problem to some people.

Teachers usually tell their students to 'solve' such 'problems' although the term 'practise procedural tasks' may be more appropriate, especially if such tasks are not problems to the students and their main purpose is for them to practise procedures learnt in the class earlier. The classification according to purpose helps teachers to see that practising procedural tasks and solving 'word problems' are just two of the many different types of mathematical tasks.

---

**CONCLUSION**

There are many kinds of mathematical tasks that help students to learn new mathematics or to develop mathematical processes which are useful and essential for students to solve unfamiliar mathematical and real-life problems. If the Math teachers classify the mathematical tasks according to their teaching purpose and these tasks can provide students with opportunities to learn new mathematics and to develop mathematical processes including problem-solving strategies.

## **A WAY TO WORK CREATIVELY ON MULTIPLE SOLUTIONS USING INFORMATION TECHNOLOGIES**

**Asimov Alijon\*; Mamasaidova Muhabbat Abdusalom kizi\*\***

\*Associate Professor,  
UZBEKISTAN

\*\*PhD Student,  
Fergana State University,  
UZBEKISTAN

### **ABSTRACT**

*This article describes ways to create a problem that has a single solution by changing the context of the multi-solution problem with using information technologies. As the pupils will be able to create a problem based on the information provided and prepare it for solution in the future.*

**KEYWORDS:** Multi-Solution Problem, Single-Solution Problem, Problem Condition, Problem Question, Change Problem Condition, Change Problem Question, Create A New Problem From The Problem.

### **INTRODUCTION**

It is known that the problem solving is one of the most important parts of an elementary math course. By solving problems, pupils form and develop the properties of arithmetic operations, different relationships between numbers, the essence of geometric concepts, different quantities, their units of measurement and the relationships between quantities.

In elementary school, a great deal of attention is paid to teaching problem-solving and problem-solving in elementary school. As the pupils will be able to create a problem based on the information provided and prepare it for solution in the future.

Here are some suggestions on how to create or change the problem.

Change the problem question, problem condition, numerical data in the problem, create a similar problem (mathematical model is the same), create an inverse problem, create a problem based on

the illustration (picture and diagram), solve the problem according to the given solution (according to the numerical expression)

## MATERIALS AND METHODS

Providing an initial notion of multi-solution problem (non-single-solution) problems, especially in the elementary school will help pupils to gain new knowledge in mathematics in the future.

In this article, we will focus on some of the ways to create problems that have a single solution from multiple solutions by changing the condition and the question. Here are some examples of how to change a question and a condition.

Problem1. Karim has 6 notebooks and Salim has 2 less. How many notebooks does Salim have?

Solution:  $6 - 2 = 4$  Answer: 4

Let's change the subject.

Masala 1 (a). Karim has 6 notebooks and Salim has 2 more. How many notebooks does Salim have?

Solution:  $6 + 2 = 8$  Answer: 8

Let's change the question.

Masala1 (b). Karim has 6 notebooks and Salim has 2 less. How many notebooks do they have in total?

Solution:  $6 - 2 = 4$ ,  $6 + 4 = 10$  Answer: 10

Now let's look at a few ways to turn a problem with multiple solutions into a problem with a single solution. We explain this by the following issues:

Problem 2. If the distance between cities A and B is 40 km and the distance between cities B and C is 50 km, find the distance between cities A and C.

There is no single solution to this problem, as cities A and C may be located differently.

We will change the terms of the issue so that this issue has a unique solution.

Problem 2 (a). The distance between cities A and B is 40 km and the distance between cities B and C is 50 km. If you go to city C through city B, what is the distance between cities A and C?

Solution:  $40 + 50 = 90$  km Answer: 90 km.

There is only one solution by changing the question...

Problem 3. Anwar, Sarvar and Akmal have pigeons. If Sarvar's pigeons are 7 and Akmal's are 5 more than his, how many Anwar, Sarvar and Akmal's pigeons are there?

This problem does not have a single solution. As there is no information about Anwar's pigeons.

We will change the question so that this issue has a unique solution.

problem 3 (a). Anwar, Sarvar and Akmal have pigeons. If Sarvar's pigeons are 7 and Akmal's are 5 more than his, how many Sarvar and Akmal's pigeons are there?

Solution:  $7 + 5 = 12$ ,  $7 + 12 = 19$  Answer: 19

In some cases, it is possible to create a problem with a unique solution by changing both the condition and the question.

By changing both the above condition and the conditional question, we create a problem that has a unique solution.

Problem 3 (b) Anwar, Sarvar and Akmal have pigeons. If Anwar has 6 pigeons, Sarvar has 7, and Akmal has 5 more than Sarvar, how many pigeons are there in all?

Solution: How many pigeons does Akmal have ?  $7 + 5 = 12$ ,  $6 + 7 + 12 = 25$  Answer: 25

From the above problem it can be seen that in some cases it is possible to create problems with a single solution by changing the condition of a multi-solution problem or by changing the problem question or by changing the condition and question at the same time.

## RESULTS AND DISCUSSIONS

It is not possible to specify the exact number of solutions to the above multi-solution problem.

In some cases, it is possible to enumerate the number of solutions to a multidisciplinary problem. Here are some examples of such issues.

Problem 4: You can make a rectangle out of 4 squares with a roof of 1 cm.

There are 2 solutions to this problem.

Problem 4: Two passengers set out on foot from two villages at a distance of 25 km at the same time. If the speed of the first passenger is 4 km / h and the speed of the second passenger is 5 km / h, what is the distance between them in 2 hours?

The solution to this problem is 4 depending on the direction of passenger traffic.

a) If the passengers are moving towards each other, then the solution is as follows:

Problem 4. Two passengers set out on foot from two villages at a distance of 25 km at the same time. If the speed of the first passenger is 4 km / h and the speed of the second passenger is 5 km / h, what is the distance between them in 2 hours?

- a) The solution to this problem is 4 depending on the direction of passenger traffic.  
 b) a) If the passengers are moving towards each other, then the solution is as follows:

1-situation

2-situation

1 situation:

- 1) How far does the first passenger travel in 2 hours?  $4 \cdot 2 = 8$  km;
- 2) How far does the second passenger travel in 2 hours?  $5 \cdot 2 = 10$  km;
- 3) How far is the second passenger from A?  $25 - 10 = 15$  km
- 4) Distance between passengers  $15 + 8 = 23$  km

Answer: 23 km

2 situations:

- 1) How far was the first passenger B from the village?  $25 - 8 = 17$  km
- 2) What is the distance between them?  $10 + 17 = 27$  km
- 3) Answer: 27 km

c) if the passengers are moving in the opposite direction, then the solution is as follows:

- 1) How far did the first passenger travel?  $4 \cdot 2 = 8$  km
- 2) How far did the second passenger travel?  $5 \cdot 2 = 10$  km;
- 3) What is the distance between them?  $25 + 10 + 8 = 43$  km

Answer: 43 km

From the above, there are 4 possible solutions.

This means that in order to turn problem 4 into a single solution, it is necessary to specify the directions of movement of passengers.

From the above considerations, it follows that while many of the problems to be solved can be infinitely, it is possible to specify the number of solutions to some.

In short, creative work on multifaceted issues prepares pupils to find solutions to a variety of problems that arise in life in a market economy.

*The following questions may be suggested to pupils:*

Which of the following problems has multiple solutions or a single solution? Turn multiple problems into single problems.

*Problem 1:* Two passengers from cities A and B set off in opposite directions at the same time at a speed of 15 km / h and 14 km / h, respectively. What is the distance between them in 4 hours?

*Problem 2:* How many rectangles can be made from 7 squares with side 1 cm?

*Problem 3:* Ali, Vali and Soli planted fruit seedlings in the school garden. If Soli planted 5 seedlings more than Vali, how many seedlings did Soli and Vali plant?

*Problem 4:* Ali, Vali and Soli planted fruit trees in the school garden. If Soli planted 5 seedlings more than Vali and Ali planted 3 seedlings less than Vali, how many seedlings did the three pupils plant in total?

*Problem 5:* Ali, Vali and Soli planted fruit trees in the school garden. If Vali planted 8 seedlings and Soli planted 5 more seedlings, how many seedlings did Vali and Soli plant in total?

*Problem 6:* In the morning, Salim brought 6 bags of carrots, each weighing 50 kg, to the market. If he sold all the products in the evening, how much did he sell for?

*Problem 7:* An entrepreneur has 2,000 chickens. If chickens lay an average of 1,500 eggs a day, how much does an entrepreneur sell eggs for in a month (30 days)?

*Problem 8:* An entrepreneur has 2,000 chickens. One chicken eats an average of 100 g of grain per day. If all the hens lay 1,500 eggs a day, how much will the entrepreneur earn in 1 month (30 days)?

## CONCLUSION

To conclude briefly, as the problem solving is one of the important parts of the elementary math course at schools, pupils learn and develop the properties of arithmetic operations, different relationships between numbers, the essence of geometric concepts, different quantities, their units of measurement and the relationships between quantities through various mathematical problems.

## THE LEARNING HISTORY OF THE PROBLEM OF ANCIENT BACTRIAN CITIES AND THE ARCHAEOLOGICAL LOCALIZATION OF POLITICAL AREAS (4<sup>TH</sup> CENTURY. B.C)

**Nigora Egamberdiyeva\***

\*Assistant Professor,  
Candidate of the Subject of History,  
Tashkent State Pedagogical University,  
UZBEKISTAN

### ABSTRACT

*The article describes the archaeological localization of the names of the ancient Bactrian cities in the 9<sup>th</sup> century B.C. The findings of the archaeological researches of Alexandria, Branchidae, Aorn, Baqtra and the political regions of Gabaza, Paretakena and Bubakena in the ancient Greek and Roman sources were analysed by the basis of explorations. The city of Alexandria in the surroundings of Oxus is thought to be the Kampirtepa monument in the Surkhandarya region, and maybe the monument to the city of Tallkantepa is Branchidae. Aorn is reported to be a submarine of Afghanistan, while Bactria is as Balch. Territorial-political associations - Gabaza – is localised in a mountainous place between the Surkhandarya region and the Kashkadarya region (both are in the Republic of Uzbekistan), the north-western part of Paretakena-Surkhondarya region, and Bubakena - in the territory of Kafirnigon(Tajikistan), Vakhsh and in Kukcha-Kunduz-Talukan.*

**KEYWORDS:** Oxus, Alexandria-On-The-Oxus, Branchidae, Aorn, Bactra, Gabaza, Paretakena, Bubakena, Localization, Termez, Tarmida, Antakya, Talashkantepa, Erkurgan, Surkhandarya, Aykhanim, Altindiliortepa, Balkh, Afghanistan, Kampirtepa, Frurion, Pristan, Port Beacon, Harbors

## INTRODUCTION

Alexandria, the city of Branchidaes, Aorn, Bactran cities, Habaza, Paretakena and political areas of Bubakena around the Oxus, which was related to a 4<sup>th</sup> century B.C Bactria, were written by the works of ancient Greeks and Romans' authors<sup>1</sup>. The problem of their localization has been discussing among scholars till now (Table 1.2). However, many issues have been revealed as a result of archaeological explorations in the area of Northern Bactria in recent years.

Alexandria around Oxus is considered to be founded by the Alexander the Great. But there is not a single idea about localization of Alexandria city around Oxus among explorers (Table 1). V.Tarn and Sh.Pydaev thought that this city is the old Termez monument in Surkhandarya valley<sup>2</sup>. E.V.Rtveladze localized it with Kampirtepa monument in this valley<sup>3</sup>. French scholar P.Bernar concluded that Alexandria around Oxus might be the monument Aykhanim in Southern Bactria.

Aykhanim monument was regarded to be the only city, which was found in the memories of Amudarya areas, was launched by Greeks till the sixty's years of 20<sup>th</sup> century. That's why; explorers advanced the opinion of Alexandria around Oxus. But this idea has not found its confirmation during the recent.

Aykhanim was built the north-eastern part of Afghanistan, right bank of Amudarya and the confluence of Kukcha river to Amudarya<sup>4</sup>. According to the opinion of French archaeologist B.Leone, the time of foundation of the city has not been defined adequately till now<sup>5</sup>, because the deal of the exploration was stopped in the eighties of 20<sup>th</sup> century due to the Civil war in Afghanistan.

P.Bernard linked the period of the construction Aykhanim with Alexander the Great era whereas B. Leone connected it with Antiochus I (281-261 y, B.C) and some explorers did it with Seleucus I<sup>6</sup>. E.V.Rtveladze suggested that Aykhanim was constructed in the reign period of leader Euthydemus (235/230-200 y, B.C) or others that came after him by comparing the shapes of bricks which was used to build Kampirtepa and Aykhanim memorials<sup>7</sup>, because quadrangle bricks were used to the construction of citadels in Central Asia until the attack of Alexander the Great. The quadrangle bricks were used widely in the epoch of Hellenism. An initial construction step of Kampirtepa was built with quadrangle bricks, then square bricks were used in the next stages. As Aykhanim memorial, they used square ones. E.V.Rtveladze linked the usage of square bricks with Greek-Bactria eras. Furthermore, the researcher argued that Aykhanim was not *Alexandria around Oxus*, by showing the Ptolemy's map which demonstrated Alexandria was in the left-bank of Amudarya and north side of the Bactria, Aykhanim was located in the northern-east side of Bactria and on the right coast of Amudarya<sup>8</sup>.

Old Termez was situated 7 km. far from western side of Surkhandarya region Termez city in the Republic of Uzbekistan and the right coast of Amudarya. An archaeologist Sh.Pydaev pointed that Old Termez was founded in the middle of the first millennium B.C.<sup>9</sup> Furthermore, citadel firstly formed as a village and built on the natural hill. Coming to the II-I centuries B.C., fortress occupied 10 hectares area<sup>10</sup>.

V.Tarn mentioned that after being destroyed Alexandria around Oxus in 293-year B.C. by Saks, Antioch I who was the Empire of Seleucid restored it in 3<sup>rd</sup> century B.C. The scholar suggested that Old Termez was "Alexandria around Oxus", which was founded by Alexander the Great, on

the basis of showing Antioxia-Tarmida in the map “The table of Pevtingar” of an unknown Ravenna geographer relating to 7<sup>th</sup> century A.D. Initially, his mind was supported by many explorers. An archaeologist Sh. R. Pydayev proved this idea with the pieces of crockery relating to IV-III centuries B. C. which was found in Old Termez city as a result of explorations in the eighties of 20<sup>th</sup> century and he connected it with Alexander the Great period<sup>11</sup>. But there were no foundations belonging neither the trace of architectural constructions connected with Alexander the Great period nor crockery pieces related to that era during the researches that have done in recent years in Old Termez<sup>12</sup>. As a result, the point of being Termez was Alexandria around Oxus was under the doubt. After that, an archaeological scholar E. V. Rtveladze, who usually does explorations in Kampirtepa memorial, suggested at the beginning of 2000 years that Kampirtepa was the Alexandria around the Oxus<sup>13</sup>. This idea was proved after 2010 years during the procedure of the explorations in Kampirtepa memorial<sup>14</sup>.

Kampirtepa monument located in the right coast of Amudarya in the northern area of Bactria and was in west 0,6 km far from the village of Shurab in the district of Muzrab in the region of Surkhandarya in the Republic of Uzbekistan<sup>15</sup>. Memorial has been investigated since 1972 till now by an archaeological expedition with the command of E. V. Rtveladze. Nowadays, chronological chain of the monument is determined as in the late of 4<sup>th</sup> century B.C. and in the middle of 2<sup>nd</sup> century A.D.<sup>16</sup>. The improvement period of the monument was also defined on the basis of the result of radiocarbon analysis<sup>17</sup>. As a result of recent years explorations shows that monument was the frurion of Greeks, it means that it functionated as a defence point or harbour. The city occupied 5 hectares territory and its length was 400 metres from west to east side along the bank. It had strong defence system. While excavating Kampirtepa, there were (from frurion) streets, temples, the treasury of the city and workshops of handicraftsmen<sup>18</sup>. Explorers identified comfortable gulf for boats, pristan and the trace of harbour beacon in there. E. V. Rtveladze grounded that Kampirtepa was Alexandria around Oxus through comparing the results of written sources and archaeological deals during his exploration.

Arrian was the biggest city in Bactria and it called Bactra and Aorn<sup>19</sup>. The capital city of Bactria was Bactra and it existed from the middle of millennium B.C. till III-IV century A.D. It was situated on the territory of southern Bactria. Bactra city was called as Zariaspa in Pliny works.<sup>20</sup> Nowadays, Bactra is considered as an ancient fortress of Afghanistan's Balkh.

According to the archaeological data, Bactra was founded in the reign of Achaemenids in the fourth and fifth century B.C. In that period, it occupied 120 hectares area and it was on the place of top city “Bala-Hissar”. In the period of Greek-Bactria kingdom, new Balkh-bottom city was also founded. Its general land consisted of 400 hectares<sup>21</sup>. At that time, the whole territory of Bactra city was 550 hectares.

Even though there were many opinions about the localization of Aorn city, E. V. Rtveladze compared the information of written and archaeological sources and he came to the conclusion that Aorn city was Altindiliyartepa in the land of northern Afghanistan<sup>22</sup>. Altindiliyartepa was regarded as the second biggest city after Bactra (Balkh) according to its territory. And this was appropriate to the information of Arrian.

Branchidae's city and its eradication by Alexander the Great was mentioned in the works of Quintus Curtius Rufus and Strabon. There were not any definite solution about Branchidae's city though it was analyzed<sup>23</sup> many times by researches.

Priests, who were moved from temple located in Apollo at Didymus near Miletus, lived in Branchidae's city<sup>24</sup>. After being ruined the Apollo Didymus temple by the leader of Achaemenid Xerxes I (481-465 y, B.C.) priests gave the treasury of the temple to him. Greeks considered this deed of priests as a betrayal. Priests, who did not stay at Miletus, Xerxes moved to Bactria<sup>25</sup>.

ApolloDidymus temple stayed ruined till the period of Alexander the Great. After capturing these lands, Alexander the Great tried to restore the temple<sup>26</sup>. In its own period, Apollo Didymus temple and its priests had got higher status in the world of Greeks that is why their betrayal had not been forgotten for a long time. This was seen precisely from the attitude of Alexander the Great towards Branchidaes. According to the point of Quintus Curtius Rufus, Alexander the Great attacked to Branchidae's city crossing Amudarya river. He made carnage all population in the city and destroyed it wholly. He cut all trees around the city in order to make it desert<sup>27</sup>. In this way, the generation of Branchidaes were punished because of the guilt of their ancestors after 150 years<sup>28</sup>.

Nowadays, there are a lot of discussions about the localization problem of Branchidaes among scholars<sup>29</sup>. However, they cannot come to the single conclusion.

Academicians E. V. Rtveladze and A. S. Sagdullayev said that the city of Branchidaes was the Talashkantepa monument near the garbage village of Talashkan, a deserted village located 15 km southwest of the Sherabad district of Surkhandarya in thje Republic of Uzbekistan<sup>30</sup>. The memorial had a cirul shaped diameter 130 metres, it was 1,6 hectares<sup>31</sup>. The life in Talashkantepa continued only in the fifth and fourth centuries B.C.<sup>32</sup>. After being destroyed in 4<sup>th</sup> century B.C., it had not been occupied<sup>33</sup> again by population, because they consider this place was cursed. That is why, it might take the name of damned and cursed among local people.

However, E. V. Rtveladze mentioned in his work which was edited in 2002 "Alexander the Great in Bactria and Saghdiane" that this idea should be renounced and reviewed<sup>34</sup>. He demonstrated that there were not any findings relating to the culture of Hellenism as a main reason<sup>35</sup>. While analysing written and archaeological resources widely, he commented Branchidae's city might be Yerkorgan city in Kashkadarya valley<sup>36</sup>. The basis for this is the Grecian man of the Archaic era, found in the territory of the II-III century AD in Ergurgon, in the reverse part of the cache coin, as a lion or a bearded man with a sword and a sword in the back and a Greek inscription on the II-I centuries justified. In addition, Alexander the Great did not destruct all population of the city of Branchidaes, their offspring lived next periods<sup>37</sup>. If we analyse the information of written sources with scholar's mind, there will be seen inappropriate sides. Firstly, Quintus Curtius Rufus wrote that Branchidae's city was small. (Quintus Curtius Rufus VII.5.28). Yerkorgan was the biggest city in the southern Sughd at that time. Secondly, population who were moved had a particular independent control symbol not the capability of making coins. Thirdly, evidences had been given by scholar may be the heritage of Hellenism era. The culture of Hellenism reigned from 4<sup>th</sup> century B.C. till 4<sup>th</sup> century A.D. in the territory of Central Asia. We think that the localization of Branchidaes was near to Talashkantepa was more precise. First of all, there was a life only in 5<sup>th</sup>-4<sup>th</sup> centuries. Then, the life in the city was destroyed due to the horrible invasion. Thirdly, after 4<sup>th</sup> century B.C. this land was not acquired. Fourthly, Talashkantepa was constructed in the shape of temples as round. Fifthly, the city was in the left coast of Amudarya river and the crossing place of it was called with Greeks word as "Pardagvi(hotel)". According to the point of researches, Pardagvi was developed many years ago from Alexander the Great, and

it means that this crossing had got great impact in Greece nation<sup>38</sup>. In the period of Achaemenids, crossing place of the river of Amudarya was in the territory of Shurab. These analyses proved that Branchidae's city was Talashkantepa, but there were not any things belonging to Greek-Bactria's culture and it demands extra materials to the problem of localization. It is clear that the life disappeared in 10 monuments from learned 17 monuments in 1973 after the attack of Greek-Romans. E. V. Rtveladze connected it with the commander of Alexander the Great Krater and his attempt to subdue the insurrection in northern Bactria in 327-years B.C.<sup>39</sup>. But the constructive peculiarities of Talashkantepa such as, the differences of making crockery dishes, the means of names and attitudes of people to this place do not refuse this place will be a city of Branchidae's.

There are also some thoughts that Branchidae's city was in the territory of Turkmenistan, Kelif. However, the archaeological interpretation of this area does not correspond to this idea.

Recent year's archaeological research is likely to give more concrete evidence.

The ancient Greek and Roman resources also refer to lands where the Alexander the Great troops attacked - Gabaza, Paretakena and Bubacena. While doing the research, it was discovered that they were a specific regional-political association. In Sh. Shaydullayev's research shows that these territories are the "nom" state in Bactria. E.V.Rtveladze also recognizes them as an independent country. Currently, these independent countries are highly likely the agricultural oasis' that are being suggested by archaeological researches. During the analysis Gabaza, Paretakena and Bubacena were localized to the ancient Bactria region<sup>40</sup> (Table 2).

Gabaza- (Gabaza, Gobzon) is a part of the southwestern Xisor Mountains, from the Amu Darya to the TemirDarvoza (Iron Gate)<sup>41</sup>. It is a mountainous area between the Surkhandarya and the Kashkadarya region of the Republic of Uzbekistan.<sup>42</sup> It might be the lands of Sherabad agriculture. Its biggest city is considered Jondavlattepa. In the valley of agriculture there are Pshaktepa, Kuchuktepa, Talashkantepa I monuments. The activity of Jondavlattepa, Pshaktepa, Talashkantepa I was stopped in the 4<sup>th</sup> century B.C

Paretakena-Surkhandarya region unites mountainous regions, situated in the northwest-western part of the region. E.V.Rtveladzedemonstrates that the centre of the Paretakean can be the Qiziltepa monument<sup>43</sup>. Also, according to the archaeological study carried out here, 20 monuments of XI -IV centuries BC were discovered and are located in 6 oases along with the river network.

Archaeological evidence indicates that this region is a part of Boysun farming oasis. The central fortress of the oasis is the Qiziltepa monument. Moreover, Bandihon II, Qizilcha I -IX, Nomsiz tepa, Yalangtushtepa, Kultepa were discovered.

During the Bubacena localization process, researchers have developed various ideas. In his research, E.V.Rtveladze places Bubacena on the basis of archaeological sources in the subzone of Kafirnigon, Vakhsh, Kukcha-Kunduz-Talukan. He develops his ideas via French explorers' discovery of many monuments of the VI-IV centuries, including Baitudasht, Kalaimir, Tomashatepa.

As a result of recent studies, many memorials belonging to the Akhamonies' era have been discovered in this area. There are six monuments of Achaemenid's period in southern Tajikistan:

2 monuments from the upper Kofarnihon, 2 from the lower Kofarnihon, 1 from Vakhsh, 2 from Yavansu and 7 from Baitudash<sup>44</sup>.

Even though ancient Bactria did not find its archaeological interpretation problem relating to city and political territories in the 4<sup>th</sup> century B.C., but many ideas that are given by academicians E. V. Rteveladze have got its own basis. He proved by comparing written and archaeological resources Alexander around Oxus with Kampirtepa and Aorn with Altindiliyartepa monuments. However, there are problems that wait for their solution, such as Branchidaes.

**TABLE 1. ANCIENT BACTRIA CITIES AND THEIR INTERPRETATION**

	City names in written sources		Ideas about archaeological localization		Scientists who put the ideas forward
	Territory	Author	archaeological monument	Geographical location	
1	<i>Alexandria-on-the-Oxus</i>	Arrian, Quintus Curtius Rufus	Old Termez	Termez district of Surkhandarya region	W.Tarn, Sh.Pidayev, C.Rapin
			Ai-Khanoum	Afganistan, Toxar province	P.Bernard
			Kampirtepa	Muzrobdistrict of Surkhandarya region	E.V.Rtveladze

## STREET VENDORS IN INDIA: AN OVERVIEW

**Rachna\***

\*Assistant Professor,  
Shaheed Bhagat Singh College,  
Delhi University, INDIA

### ABSTRACT

*Street vendors form a very important segment of informal sector. Street vendors offer goods and services for sale without having a permanent built up structure to satisfy the demands of urban poor's and urban youth. They ensure the distribution of benefits in favour of the disadvantaged group. The objective of this paper is to identify the causes behind street vending, challenges faced by street vendors, highlight the importance of street vendors, what measures are taken by the Government to prevent the harassment of street vendors by police and other authorities, improvement in the working conditions, social protection and life skill development to improve the level of profitability.*

**KEYWORDS:** *Informal Sector, Street Vending, Town Vending Committee (TVC), Street Vendor Bill*

### INTRODUCTION

**A Street Vendor** is a person who offers goods or services for sale to the public without having a permanently built structure but with a temporary static structure or mobile stall (or head - load). Street vendors could be stationary and occupy space on the pavements or other public/private areas, or could be mobile, move from place to place carrying their wares on push carts or in cycles or baskets on their heads or could sell their wares in moving buses. The government of India has used the term "urban vendors" as inclusive of both traders and service providers, stationary as well as mobile and incorporates all other local/region specific term used to describe them, such as hawkers, pheriwala, rehri –patriwala, footpath dukandars, side walk traders and more. (National Policy on Urban Street Vendors ,2004.Department of Urban Employment and Poverty Alleviation , MUPA,GOI)

### **Role of Street Vendors in India**

Street vendors play very important role in India by generating employment and income opportunities. They sell different kinds of goods like clothes and hosiery, leather, moulded plastic goods and different kinds of goods necessary for household, which are manufactured in small scale or home based industries where large numbers of workers are employed (Bhowmika, 2001). The manufactures could have hardly marketed their products. Apart from non-agricultural product, street vendors also sell fruits and vegetables. Street vendors provide the market for home based manufacturing product as well as agricultural products. In this way, street vendors help generate employment in the home based and small scale industries and traditional sector. Therefore we can say that several manufacturers are linked with street vendors to sell their product. Urban youth prefers to purchase clothes and accessories from them because products sold by them are cheaper than those found in formal retail outlets. Street vendors provide benefits to Lower income group people who spend a higher portion of their income on purchase from street vendors because their goods are cheap and affordable.

Eleven major arguments in support of street vending:

1. Street vending contributes directly to overall level of economic activity and to the provisions of goods and services.
2. Citizens have constitutional right to choose their occupation and to engage in entrepreneurial activities.
3. Street vending is an actual or potential source of government tax revenues.
4. Street vending serves as a social safety-net.
5. Street vending is a laboratory for entrepreneurship, family business and social interactions.
6. Street vending provides entrepreneurial opportunities to people who cannot afford to buy or rent fixed premises.
7. Street vending greatly expand the range of places and times where goods and services can be provided, and sometimes they also offers goods and services which are not available in off-street locations.
8. Street vending brings life to dull street.
9. Because of its low capital requirements and its potential mobility, street vending is a very effective way to cater for seasonal, sporadic and special demands.
10. Street vending offers its workers considerable flexibility in working hours and levels of activity.

### **Objectives**

- (1) To identify the role of street vendors in the developing countries.
- (2) To identify the causes behind street vending.
- (3) To know about the challenges being faced by street vendors.
- (4) To know different policies and bills passed by the government to protect the rights and interest of street vendors.

(5) To know the ways to improve the conditions of street vendors.

### **Causes behind street vending**

1. Effect of an increasing population growth in the era of globalization was compounded by a rapidly accelerating migration from rural areas to urban areas. This accelerated pace of urbanization led to employment problems both a quantitative and qualitative nature. Insufficient capacity of the modern economic sector to provide employment for the rapidly expanding labour force, as a consequences of which a large number of person who are looking for work, are forced to find or create other income opportunities.
2. The fall in self-employment and stagnation or even relative decline indicate the great and growing significance or huge dependency in the informal sector employment.
3. In the most Indian cities the urban poor survive by working in the informal sector primarily due to poverty, but also due to a variety of factors such as lake of gainful employment in the rural areas, shrinkage of employment in the formal sector, and low levels of skills and education required for the better paid jobs in the formal sectors.
4. The formal sector offers higher salary than the traditional rural employment. The cities become magnets that attract rural labours. Unfortunately most of the agricultural workers do not possess the skills demanded by modern occupations. Hence they are not employable in the formal sector. To survive they have no resources except creating employment using their only assets, themselves.
5. Another cause of street vending is surplus labours in rural agriculture sector. Land does not expand, while population keeps on growing. Thus over time there is insufficient agricultural land to accommodate all of the rural labours. Also, progress in technology can manage the land efficiently and produce even more. So, more and more rural labour is crowded out of the agriculture sector. They have no place to go but to the cities, hoping to improve their lots. Cities become overcrowded, no employment opportunities are available for surplus labours, hence they start vending on sidewalks, roads and weekly markets, etc to earn minimum wage for their family.
6. Globalization is a cause of street vending. Facing tough import competition, domestic firms cut costs by any mean they can. The easiest way is by outsourcing, contracting some of the work to informal sector (ILO, 2005). The informal sector operates with cheaper labour due to non-existent labour protection in terms of no legal contract, no minimum wages, no health insurance, no unemployment insurance, no work safety standard etc.
7. One more reason for inflating number of street vendors in developing countries is unending economic and political crisis. These crisis causes increasing rate of unemployment, poverty etc.

### **Challenges faced by Street Vendors**

1. Street Vendors faces many problems as they are vulnerable population, who are neither protected by government, NGOs, labour union nor by any labour law. They are deprived by laws made by government in respect of labour union.
2. The street vendors always suffer competition with other street vendors because of fluctuation in market prices, insecure and irregular employment. Their incomes are often minimal and their

sales fluctuate. Another reason for decrease in income of street vendors is that they are forced to pay 15 to 20 percent of their daily income as bribes to local police.

3. Street vendors is usually associated with encroachment of public spaces, causes traffic congestion, inadequate hygiene, and poor waste disposal. Safety of food has been increasingly become a concern in regard to street vendors. No Government agency is authorized to verify the content of food as they are not regulated by any government agency.

4. The government does not recognize the contribution of street hawkers towards economic and social well-being of urban population. They survive without government support. But lately, government has passed “Street Vendors Bill 2013”, which protects the rights of street vendors.

5. Negative impact of online shopping on retailers and street vendors- Online shopping is a form of electronic commerce whereby consumers directly buy goods or services from a seller over the internet without an intermediary service. Online shopping has become the trend and the new mode of purchasing. There are around 1000s of online marketing enterprises selling cosmetics, clothes, shoes, accessories, vitamin supplements, etc. literally the entire range of consumer items. The trend is very clear, retail shop demand will fall and even shrunk. Online shopping is indeed having an adverse impact on the retail sector.

6. Uncertainty and insecurity: The basic problems of street vendors is insecurity and uncertainty as their profession is considered illegal, but according to government of India assessment done in 2004 shows around 2.5% of local poor urban population survive by working in this occupation. If government provide license to street vendors, they can be protected by harassment and eviction by local authorities and local police.

7. Walmart v/s street vending: Walmart is an American Multinational Retail Corporation that runs chains of large discount department stores and warehouse stores. The company is the world’s second largest public corporation, according to the fortune global 500 test in 2013, the biggest private employer in the world with two million employees and is the largest retailer in the world. Walmart ensures that they do work in the consumer and farmers interest. They eliminate middlemen and guarantee fair prices. It means walmart runs counter to the street vending and they may not have beneficial impacts on the street vendors.

8. Lack of financial resources: Access of capital is an important economic linkage that ties street trade to the economy which affects the vendor’s economic activities, profits and potential business growth .Capital is needed for initiating the business and later, for running and expanding the business through buying new merchandise. Seven sources of capital have been identified which are personal savings, family, money lenders, banks and co-operatives, organization, local retails and whole sellers etc. Street vendors have only above two sources for their business activities.

### **Upliftment of Street Vendors**

1. Commercial banks have been empirically proven to be unable to support the informal sector resulting in micro-financing. Grameen Bank is a Nobel Peace Prize-winning microfinance organization and community development bank founded in Bangladesh by Professor Muhammad Yunus. It makes small loans (known as microcredit or “grameen credit”) to the impoverished without requiring collateral. Micro-credit loans are based on the concept that the poor have skills that are under-utilized and with incentive, they can earn more money.

2. Management plays an important role in success of any activity. There should be proper management in street vending also. There are good examples of street vending management in several cities in Indonesia. In these cities, the street vendors provided standardized carts. The size of their lots was also standardized. These create uniformity and order. The carts were then wheeled in and out at certain time. Roads were closed and reopened at certain times. During off operating period carts were neatly stored somewhere unobtrusive, thus the cities stay clean and the roads uncongested. Proper management working environment provide income, health and safety benefits to street vendors.

3. Provide safety at work place: Street vendors are not trying only to earn a livelihood but also provide valuable service to urban population. Thus, it is the duty of the state government to protect the right of these segments of population to earn their livelihood since article 39(a) of constitution stated that “any citizen, men and women, have equal right to an adequate means of livelihood”.

4. Creation of member based unions: These unions are mainly association of active hawkers. Since the street vendors have no legal permission to survive, the main role of these committees (unions) is to negotiate with local authorities such as Municipal Corporation, local police stations for occupying public space to sustain their activities. These unions also help to set up welfare goals and labour commission for their social security and cooperatives for their access to credit for their economic activities. Union acts as intermediaries between individual street vendor and local authorities. Union also tries to provide license to legalize them. This helps to remove the problem of illegal trade.

### **Legal Aspects**

#### **1. National Policy on Urban Street Vendors, 2009**

##### **Highlights of the policy**

1. This policy recognizes the positive role of street vendors in providing essential commodities to people at affordable prices and at convenient places. It also recognizes the need for regulation of street vending by way of designated ‘Restriction-free Vending’, ‘Restricted Vending’ and ‘No Vending’ zones based on certain objective principles.

2. This Policy also aims to reflect the spirit of the Constitution of India on the right of citizens to equal protection before the law (subject to reasonable restriction) as well as their right to practice any profession, occupation, trade or business; and the duty of the State to strive to minimize the inequalities in income, and to adopt policies aimed at securing that the citizens have the right to adequate means of livelihood as enshrined in Article 14, 19(1)(g), 38(2), 39(a), 39(b) and 41 of the Constitution.

3. This Policy recognizes that to be able to practice any profession or to carry on any occupation, trade or business is a fundamental right of every citizen in our country. A person who wants to buy some items in wholesale and sell the same in retail by hawking is actually exercising such a right.

4. This Policy recognizes that street vendors constitute an integral and legitimate part of the urban retail trade and distribution system for daily necessities of the general public.

5. A centre piece of this Policy is the role of Town Vending Committee (TVC) to be constituted at City/Town level. A TVC shall be coordinated by a convener who should be nominated by the urban local body concerned. The Chairman of TVC will be the Commissioner/ Chief Executive Officer of the concerned urban local body. The TVC will adopt a participatory approach and supervise the entire process of planning, organization and regulation of street vending activities, thereby facilitating the implementation of this Policy.

6. This Policy adopts the considered opinion that there should not be any cutoff date or limit imposed on the number of vendors who should be permitted to vend in any city/town, subject to registration of such vendors and regulation through the TVC.

7. The objective of this policy is to provide for and promote a supportive environment for the vast mass of urban street vendors to carry out their vocation while at the same time ensuring that their vending activities do not lead to overcrowding and unsanitary conditions in public spaces and streets. There are some specific objectives of this policy which give legal status to street vendors, provide civic facilities and to promote access of street vendors to such services as credit skill development, housing, social security and capacity of building etc.

## **2. The street vendors (Protection of Livelihood and Regulation of street vending) Bill, 2012**

### **Highlights of the Bill**

1. The Bill aims to protect the livelihood rights of street vendors as well as regulate street vending through demarcation of vending zones, conditions for and restrictions on street vending.

2. Any person intending to undertake street vending needs to register with the Town Vending Committee (TVC). He may then apply for a vending certificate that will be issued based on various criteria.

3. The state government shall frame a scheme for street vendors. The local authority shall, in consultation with the planning authority, frame a street vending plan once every five years.

4. The TVC comprises of the municipal commissioner, representatives of street vendors, local authority, planning authority, local police, resident welfare association and other traders associations.

5. This Bill shall not apply to Railways land, premises and trains.

### **Key Issues and Analysis**

1. The Bill does not specify principles to be followed by governments in issuing vending certificates, allocating vending zones and the number of vendors per zone. Absence of such norms could defeat the purpose of enacting a law to ensure uniformity in the legal framework.

2. The Bill does not require the stakeholders to be consulted in the formulation of the street vending plan. This could lead to a lack of safeguards in ensuring that the plan is determined in a fair manner.

3. The central law will have an overriding effect on state laws that are inconsistent with the Bill. Current state laws differ with the Bill in terms of powers of the TVC, and mechanism for dispute resolution.

4. The Standing Committee suggests making the Bill applicable to the Railways, incorporating specific provisions of the scheme in the Bill, and consultation with the TVC on the vending plan.

### **3. Street Vendors Bill, 2013**

The Upper house of the Indian Parliament passed the street vendors (protection of livelihood and regulation of street vending) Bill, 2013. The bill aims at creating a conducive atmosphere where street vendors are able to carry out their business in a fair and transparent manner, without the fear of harassment and eviction. Some features of street vendor Bill 2013 are as follows:

1. The bill provides for constitution of a Town Vending Authority in each local authority, which is the fulcrum of the bill, for implementing the provision of the bill.
2. In order to ensure participatory decision making for aspects relating to street vending activities. It has been provided that 40% members of the Town Vending Committee will be from amongst street vendors to be selected through election, of which one-third shall be women.
3. It has been provided that no street vendor will be evicted until the survey has been completed and certificate of vending issued to the street vendors.
4. The mechanism is to provide universal coverage, by protecting the street vendors from harassments and promoting their livelihood.
5. Relocation of street vendors should be exercised as last resort. It means re-allocation should be avoided as far as possible unless there is clear and urgent need for land in question.
6. The bill also provides for promotional measures to be undertaken by the government towards availability of credit, insurance and other welfare schemes of social security, capacity building programs, research, education, training programs etc. for the street vendors.
7. The bill specially provides that the rules under the bill have to be notified within one year of its commencement, and schemes have to be notified within six months of its commencement to prevent delay in implementation.

### **Contribution of Street vendors**

Street vendors contribute to the well-being of urban population by providing inexpensive goods to the urban poor and generating employment for a large number of people especially, women. A World Bank Report 2002, based on data from all countries available, showed that informal traders mainly "street vendors" make up 73- 99% of employment in trade and 50-90% of trade gross domestic product. This shows a considerable contribution of street vending to the overall economy in strategic location that is convenient for customers. Street vendors have an important role in the informal economy by making a significant contribution. Globally over 25% of workers operate in the informal sector, and in India almost 80% of workforces are engaged in this informal sector. The increasing urban population with limited income to meet the needs of housing, food and clothing of themselves and their families generates a significant demand for a variety of products and services which can be supplied by informal sector vendors. The street and pavement vendors form a substantial proportion of the informal sector which earns their livelihood through vending. They have flexible vending hours ensuring the economic viability and dynamism of the city. It also creates employment thereby alleviating the hardships of employment. According to Ministry of Urban Development and Poverty Alleviation, there are

over one crore vendors in India contributing to over 50% of country's savings and 63% of the GDP come from vendors.

## CONCLUSION

Street vendors are very important part of the informal sector in the country. It is estimated that around 80 percent of the population are engaged in street vending profession. Women form a large segment of street vending in almost every city. Street vending is not only a source of self-employment to the poor in cities and towns but also a means to provide 'affordable' as well as 'convenient' services to a majority of the urban population. Street vendors are often those who are unable to get regular jobs in the remunerative formal sector on account of their low level of education and skills. They try to solve their livelihoods problems through their own meager financial resource. They are the main distribution channel for a large variety of products of daily consumption like fruits, vegetables, readymade garments, shoes, household gadgets, toys, stationery, newspapers, and magazines and so on. If they were to be eliminated from the urban markets, it would lead to a severe crisis for fruit and vegetable farmers, as well as small scale industries which cannot afford to retail their products through expensive distribution networks in the formal sector. The importance of this sector cannot be undermined, especially considering that the government does not have the capacity to provide jobs to the millions of unemployed and underemployed people in India. Even the corporate sector is able to absorb only a tiny proportion of our expanding work force. Overall employment in the formal sector is actually declining. This means most people in India have to fend for themselves. People in the informal sector ought to be encouraged to grow and prosper if the governments want to reduce unemployment and poverty in our country. They contribute significant role in local economic growth and development of the urban economies. Public authorities considered street vendors as a nuisance and as encroachers of sidewalks and pavements and do not appreciate the valuable services that street vendors provide to the general population of the world. Street vendors provide valuable services to the urban masses while making out a living through their own enterprise, limited resources and labour. Street vendors have been demanding protection from civic agencies and the state government so they can earn their livelihood without fear. Recently Delhi chief minister has assured vendors the government will write to municipal corporations not to evict vendors.

### ABSTRACT

*This article provides information on the fact that since the XVIII century the Kokand Khanate has become an intermediary state, which established trade relations with the peoples of Central Asia, as well as China and East Turkestan. It is also explained that Chinese goods entered the Bukhara and Khiva khanates through the Kokand khanate, and through them to the Eastern countries. Some information is given about the importance of the relations of the Kokand khanate with Russia, the entry of Russia into the Kokand khanate with the annexation of Tashkent to the khanate. The article also provides an overview of some of the details of the foreign economic relations of the Central Asian khanates.*

### INTRODUCTION

With the independence of our country, radical changes have taken place in various spheres of our society, including in the field of history. A wide range of opportunities for the coverage of true history has been opened, all opportunities for researchers have been created by our state, and the main requirement and goal in this direction is only the objective coverage of history. This article

also pays great attention to the memories of ambassadors and tourists in trade, economic, cultural, social and diplomatic relations of the Russian Empire, Britain and other neighboring countries with Central Asia, including the three khanates. Central Asian states have long had economic, political and cultural ties with China, India, Iran, Afghanistan and other countries in the East, as well as with Russia. In particular, the roots of Uzbekistan's close and friendly relations with its neighbors go back to that long historical period.

### MAIN PART.

The Kokand Khanate established intensive trade relations with the Central Asian khanates, the steppes of neighboring China, India, and Kyrgyzstan. But the relations between the two neighboring states in the eighteenth and nineteenth centuries have not been sufficiently studied. However, important manuscript sources for studying the history of this period contain interesting information in the reports of Russian tourists and ambassadors. Zahiriddin Muhammad Babur's "Boburnoma", Mahmud ibn Wali's "Bahr ul-asror", Sang Muhammad Badakhshi's "History of Badakhshan", Mirza Olim Tashkendi's "Ansab us-salatin" about the relations between Central Asia and East Turkestan and China in the XVI-XVII centuries. and tavorix ul-havoqin", Niyaz Muhammad Hoqandi's "Tarihi Shohruhiy", Qurban Ali Ayoguzi's "Tavorihi khamsayi sharqi". Zahiriddin Muhammad Babur's information that there were a thousand people in the Andijan caravan coming from China testifies to the fact that economic relations between the two countries go back a long way.

The relative development of the Kokand khanate can be attributed to its favorable geographical area, the intersection of caravan routes and the ancient development of agriculture. According to Kokand, the center and capital of the khanate, it is more than 2,000 years old. In the first half of the XVIII-XIX centuries, the city of Kokand was not only one of the largest cities of the khanate, but also one of the largest cities in Central Asia. In the past, the city of Kokand has been looted and destroyed several times by the enemy. It is known that in the 13th century, when the Mongols invaded Central Asia, many cities were destroyed and razed to the ground. Among such cities was Kokand. After that, Kokand was rebuilt only in 1709 and in 1740 the city became the capital of the khanate. Kokand is surrounded by a sturdy defensive wall. Kokand became the political, economic and cultural center of the khanate.

Foreign trade also played an important role in the economic life of the Kokand khanate. The country has extensive trade relations with Bukhara, Khiva, Afghanistan, Iran, Turkey, India in the west and south, China in the east (via Kashgar), Dashti Kipchak migrants in the north, and especially Russia. Some sources mention that Japanese and English merchants also came to the khanate.

The khanate exported mainly silk and silk fabrics, cotton, leather, precious stones, gold, silver, jewelry and other products. Imported mainly tea, metal, porcelain, household goods, ready-made fabrics, clothes, shoes and others.

The khanate had such large cities as Kokand, Tashkent, Andijan, Namangan, where handicrafts were widely developed. For example: In Kokand there were the following types of handicrafts: coppersmith, jeweler, carver, gunsmith, potter, paperworker, weaver, doppi tailor, embroiderer, bridge maker, blacksmith, baker, cartwright, velvet weaver. bujgun, dyer, gilkor, dorikash, jibachi, walled, degrez, yormadoz, tanner, rifleman, najjar, spearman, grill maker, silkworm, skinner, takachi, tobrez, paranjidoz, tent, chevar, chitgar, carpet. Kokand had a market on

Wednesdays and Sundays. The development of a wide range of handicrafts in the Kokand khanate allowed it to establish trade relations with neighboring countries.

The development of jewelry may be due to the presence of gold deposits in the area belonging to Kokand. For example, gold was obtained from Kosonsoy, the Kokrev River north of Karatag, the Chirchik River, and the upper reaches of the Chatkol River.

In the XVIII-XIX centuries, when paper production in Samarkand was in decline, paper production began to be established in Kokand. The production of this product is associated with the relocation of Samarkand paper masters to Kokand. As a result, Kokand has become a monopoly on paper supplies from the Aral Sea to China. The Kokand paper was taken to Kashgar and even to northern Afghanistan. The paper workshop is located next to the mausoleum behind the Moi Mubarak Gate in Kokand. The paper shed consists of a simple palace, 25-30 square meters in size, with a shed on one side of the porch and a large facility for paper dough on the other side. The master made 300 sheets of paper a day with the help of his caliphs. Paper was produced in places other than Kokand. But Kokand paper was far superior to them in its quality and abundance. In the late Middle Ages, Central Asian scholars, historians, and poets wrote their works on Kokand paper. These papers were also widely used in the office. Local manuscripts and various diplomatic documents are written on Kokand paper. According to Maksimov, a Siberian Cossack who was in Tashkent in the early 19th century, ... paper is made in Kokand and Tashkent. ... leaves information [8:28 P].

The size of the paper was 58 cm long and 50 cm wide. Its 240 leaves are 1 garden, and on the eve and at the beginning of the First World War the first grade cost 6 rubles, the second grade 4 rubles, and the third grade 3 rubles. [9: 124 P]

Kokand also had high-quality paper made of silk. There was little need as silk paper was very expensive. Silk paper is made to order.

The Kokand Khanate was connected with the Central Asian khanates, China, India, Iran, Russia and other countries by caravan routes, with which the khanate entered into intensive trade relations. Russia's trade and political relations with the Kokand khanate developed a little slower than with other Central Asian khanates. This is due to the fact that the khanate is far from Russia and is distinguished by the principality of Tashkent. Political and trade relations between Russia and the Kokand Khanate began to be established in the second decade of the XIX century. The issue of trade and economic relations of the Kokand Khanate with foreign countries is reflected in the reports of Russian ambassadors and tourists, as well as in special works. In particular, in 1813, the translator of the Siberian Corps, Philip Nazarov, came to Kokand on a special mission to resolve the conflict in Petropavlovsk, which resulted in the assassination of the ambassador of the Kokand khan from St. Petersburg. As a result of F. Nazarov's trip to Kokand khanate in 1813-1814, in 1821 the book "Notes on some peoples and lands of Central Asia" was published. The work has a historical and ethnographic character. The book reports on the Kokand trade relations with Kashgar, China, Khiva, Bukhara and Eastern Iran. He attended the reception of the ambassadors of the Kokand Khan and saw the ambassadors of China, Khiva, Bukhara and other countries during the reception. F. Nazarov writes about the city of Uratapa, where the population lives in mud (cotton - A.B.) houses and weaves fluffy handkerchiefs in their homes. The play states that the people of Uratapa traded with Turkmens, Iranians, and nomadic Arabs in the territories belonging to Bukhara.

An article published in the Asian Herald in 1826 reported that the people of Kokand were engaged in the cultivation of cotton and silk, and that the Kokand people traded with China, Khiva, and Iran [6: 229-230].

One of Kokand's main trading partners was Tashkent (during the reign). Tashkent has always had a special place in the foreign economic relations of Central Asia with the eastern countries. Tashkent has a history of more than 2000 years, and the first data are mentioned in ancient Eastern sources from the II century BC. In Russian sources, the city of Tashkent was included in the "Book of Bolshoi Drawing" in the XVI century under the name Tashkura. In the second half of the 16th century, Tashkent was annexed to the Bukhara Khanate. In the Middle Ages, Tashkent was famous for its goods. Mahmud ibn Wali writes about the goods taken from Tashkent, about the captives of Kalmykia, about medicinal plants, including plants used to stop bleeding [5:57-p]. These drugs have also been exported to China. Mahmud ibn Wali in his work gives information about a perennial semi-shrub called darmana, which contains terpenoid santonin in its leaves and flower clusters, which has the property of killing worms. Darmana was transported from Tashkent to many European countries. According to the data, in the 30s of the XVIII century, traders transported the seeds of medicine grown in Tashkent to Iran and Turkey, and from Turkey to the German states [3: 96-97-p].

From the 17th to the 18th centuries, Tashkent's trade and economic relations with Russia began to develop. Tashkent merchants often visited Siberian cities. In 1739, the first Russian trade caravan arrived in Tashkent from Orenburg. By the second half of the 18th century, an independent Tashkent principality was formed. In the 19th century, Tashkent lost its independence and came under the rule of the Kokand Khanate. In the second half of the 18th century, as the Central Asian khanates developed trade relations with Russia and Kazakhstan, Tashkent became the center of trade relations. During this period, the city of Tashkent was divided into the following mahallas, depending on the area of handicrafts: knife-maker, coppersmith, dog-breeder, archer, miner, degrizon-pot maker. Residents of Takhtapul, Sebzor, Labzak, Karasaray mahallas were engaged in gardening, handicrafts and others. The inhabitants of Akhunguzar, Parchabof, Jangoh were engaged in handicrafts, weaving and trade. Tashkent weavers wove gray, bekasam, alacha, and velvet, and traders took these goods to neighboring countries for sale.

There were several caravanserais in Tashkent, where merchants from different countries stopped, including Sayidazim, Nurmuhammad Kushbegi, Namangan, and others [12: 307-p]. AP Khoroshkhin reminds that there are 29 caravanserais in Tashkent. He also noted the number of stalls selling goods in the city market [15:29-b].

It is known from history that Tashkent, like the cities of Central Asia, is located on the Great Silk Road, which connects East and West. The caravan route came from Kashgar to Tashkent via Osh. Tashkent is one of the most important cities in Central Asia, and Kokand has also acted as a mediator in trade relations with Russia. At the same time, the Russian government tried to trade with the Central Asian khanates through Tashkent and even through China.

The Russian state was interested in establishing trade and diplomatic relations with the Kokand Khanate through Tashkent. Because Russia could go to Kashgar via Tashkent and Kokand. Russia saw the role of Tashkent traders as a mediator in trade relations with East Turkestan. The Russians benefited greatly from Tashkent's supply of Kashgar goods to Russia via Kokand.

According to the data, in the late 18th century, Semipalatinsk customs documents contain information about the growing role of Tashkent traders in Russia's relations with East Turkestan.

As a confirmation of our opinion, at the end of the XVIII century, in November 1791, the following goods were delivered to Yamishev: 612 rubles 50 kopecks 19 pounds 30 pounds of Tashkent white paper, 814 rubles 70 kopecks 894 arshin floral and road Tashkent fabric, 9735 arshin Tashkent curtain, 799 pieces of Tashkent chaponi, chakmon, blue zenden. In October 1792, the following goods were brought to Yamishev: camel hair for 22 rubles 64 kopecks (unit of measurement not specified), 1301 sheep for 1,479 rubles for 20 kopecks, 340 head of cattle for 3902 rubles, 4 pieces of Tashkent white goat, 119 pieces of blue goat and others. In the same year, along with Tashkent goods, Chinese and East Turkestan goods, including 17 rubles 17.5 (weight unknown), 1 ruble 80 cups 18 pounds of black tea, 1 ruble 50 cups 10 pounds of wooden tea, 5 rubles 15 pounds of green tea and others [17: 140 p].

In Semipalatinsk there are courtyards of Tashkent residents, where Chinese, Kashgar and Tashkent goods are exchanged for Russian goods. The trade was done through barter and was also sold for cash.

According to sources, the active involvement of the Kokand Khanate in the political process and relations in Central Asia dates back to the time of Umarkhan. It is known that Umarkhan's envoys were sent to Khiva, China and Turkey.

According to the data of the middle of the XIX century, 16,000 camels came to Tashkent every year from Kokand and other cities of the khanate. Of these, 4,000 camels brought cotton, 200 camels spun yarn, 10,000 camels spun cotton, semi-silk and silk fabrics, coats, blankets, chador (stuffed with leather), etc., and the remaining 2,000 camels brought wet fruits. Annual import of goods is 4580 thousand rubles. reached [12: 313 p]. More Russian goods were brought to Kokand and other cities of the khanate from Tashkent. Because trade with Russia was carried out through Tashkent. The trade turnover between Kokand and Tashkent is about \$ 7 million a year. rubles. The proximity of the distance between Tashkent and Kokand has given Tashkent traders a great opportunity to trade actively. Given the annual turnover, the relations of Tashkent traders with Kokand were more important.

The Kokand khanate has long established traditional trade relations with the southern and southeastern regions of Kazakhstan. Kokand traders exchanged coats, blankets, and various fabrics for the livestock, leather, oil, wool, and fur of Kazakh nomads [7: 186-p].

In the 20s and 30s of the 19th century, the rulers of Kokand built a number of fortresses in South Kazakhstan, including Yangi-Kurgan, Julek, Din-Kurgan, Ak-Machit, Qamish-Kurgan, Avliya-Ota and others. In each of them he built military units, mosques, warehouses and blacksmith workshops, houses for merchants, shops and markets.

Most of the goods that Kokand traders brought to the Kazakh deserts were cotton yarn and dried fruits. Up to 15,000 camels are brought to the desert each year, and up to 3,000 camels are brought to the desert [12:40 p.]. G. According to Kolmogorov, every Kazakh family bought ready-made clothes from Bukhara, Kokand and China [4: 159-p]

Central Asian traders reportedly exchanged their goods for small and large cattle. For example, every year 200,000 sheep are driven to Tashkent, about 100,000 to Kokand and 100,000 to

Bukhara. In the exchange of goods, sheep was considered a means of circulation (instead of money). The price of a sheep ranged from 1 ruble 50 kopecks to 20 rubles silver.

In February-May 1852, a merchant from Rostov, S.Ya. Klyucharev, visited Tashkent and wrote in his diary the events he witnessed. VV Velyaminov-Zernov used the diary, enriched it with comments and additions, and wrote "Historical News of the Kokand Khanate, at Muhammad-Ali do Khudayar-Khana" [2: 363-p]. The evidence presented in the diary helps to shed more light on the political ties and trade relations between the khanates. In particular, on April 3 and 29, trade caravans arrived in Tashkent from Bukhara. Most of the goods in the caravan that arrived on April 3 were opium. The diary stated that "traders in Gulja, Chuguchak, Kashgar, and all the border towns of China immediately bought all the opium in cash because they knew that there would be a lot of profit from this commodity" [2: p. 364].

There were Kokand traders in Tashkent at that time. Kazakhs began to bring cattle to the desert from Tashkent, and 20,000 sheep were sold in one day. On April 8, a caravan left Tashkent for Troitsk and Gulja. The caravan that went to Gulja had nothing but gold (in the form of coins and money) and opium. On April 13, a caravan left Tashkent for Troitsk, Petropavlovsk, Bukhara, and on April 15 for Petropavlovsk and Semipalatinsk.

According to VV Velyaminov-Zernov, Tashkent was the central mediator between the Central Asian khanates, as well as between Russia and Kokand, and the Kokand khanate's trade relations with China. However, as a result of the unrest in Tashkent, caravans coming to Tashkent brought less goods and, conversely, more goods.

According to AP Teterevnikov, in the 60s of the XIX century, traders estimated that the total amount of trade in Tashkent could be 10,000,000 rubles [11-56-p].

The trade relations of the Kokand khanate with Kashgar were similar to those of the Bukhara emirate, with opium, porcelain, silver, Chinese silk fabrics, fiber and carpets brought from Kashgar to Kokand. The subjugation of the Kazakh juzes to Russia led to the cessation of civil wars between the ruling classes, which opened the way for trade relations with Central Asia, including the Kokand khanate with Siberia, the Urals, and the Volga region.

The Khanate also maintained regular trade relations with India. According to sources, between 10,000 and 15,000 camels are shipped annually from India to Kokand, Tashkent, Bukhara and Kashgar via Kabul. Among them were yarn fabrics, silk, goat hair, horses, and so on. Horses were one of the most lucrative sources of trade. There are also reports that Indian merchants lived in the cities of the khanate and engaged in trade and even usury. The merchants of the khanate had regular trade relations with Bukhara and the cities on the borders of the emirate. The traders of both countries took an active part in trade, and the Kokand merchants brought to the Emirate of Bukhara Russian iron, steel and cast iron, tobacco, handkerchiefs, rice and some Chinese or local silk fabrics, tea, porcelain, which were necessary for economic life. Indian tea, surp cloth, silk, dyes, opium (taryok), gold jewelry, yarn and cloth were brought to Kokand.

Russian Chiti played a special role in Bukhara's trade with the Kokand Khanate. This fabric was brought from Orenburg or Petropavlovsk to Kazalinsk, and from there to Kokand via Bukhara, Samarkand and Khojand. The khanate also brought British fabrics from Mashhad, as well as a small number of Kabul tunics and turbans, and Indian attire.

The continuity and development of trade relations depended on the condition of transport and caravan routes. Trade relations between Kokand and Bukhara had a special place here. The caravan route between them was flat and carts were used to transport the goods. According to N.V. Khanikov, the first of the two main Kokand caravans arrived in Bukhara in early summer and the second in late autumn, and the smaller caravans traveled throughout the year. In addition to local handicrafts, the Kokand people brought to Bukhara not only local handicrafts, but also Chinese goods - tea, silver ingots, porcelain and necklaces, and other Russian goods [14: 175 p]. The main goods exported from Kokand to Bukhara are silk and silk fabrics, which are imported annually up to 8,000 pounds. The highest quality silk is called "chilla" and it is produced in Kokand.

Good trade relations have been established between Kokand and Bukhara. Kokand goods were sold not only in Bukhara markets, but also from Bukhara to Kabul. Kokand silk was superior to Bukhara silk in terms of quality. Therefore, its price was 16 gold coins per pound, and Khojand silk was 15 gold coins [10; 414 p].

Tea, porcelain, partly Chinese and Kokand silk fabrics, and many Russian iron, cast iron, and steel products were sold in Bukhara markets. The proximity of Tashkent to the Siberian border has allowed Tashkent traders to deliver goods to Bukhara markets in a short period of time. Most of these iron, cast iron and steel products were taken to Gissar, Badakhshan, Khulm, Maymand and other places and sold by traders from Tashkent and Khiva [14: 175 p].

Silk fabric called "chilla" was transported from Kokand to India and Afghanistan. It should be noted that, as in Bukhara, Kokand was inhabited by Indians and Afghans, who played an important role in Kokand-Bukhara relations. According to reports, they were about 70 in Bukhara.

Kokand traded with India through Bukhara. In particular, Anglo-Indian goods were brought from Peshawar to Kokand via Bukhara. Annually, 10-15,000 camels are brought to Central Asia from Peshawar via Kabul, Karshi, Samarkand and Kokand. The goods cited were mainly white goods, floral-embroidered shirts, sugar, indigo, thick surp, and chit. Of the 10-15,000 camel goods brought from Peshawar to Central Asia, 1,000 camels were bombey teas.

In India, the demand for Kokand silk was high. Every year, 1,000 camels of silk are shipped from Kokand, Bukhara and India.

In the 19th century, in order to gain trade in the Central Asian khanates, the British used the help of Indian Muslims living near Peshawar in northern India as one of the ways to distribute goods to the Bukhara and Kokand khanates [11:53 p]. British traders, known as parachutes, lent their goods to parachutes for a period of three years, which in turn sold parachute goods on credit in Bukhara and Kokand. Some of the parachutes were located in Bukhara and Kokand, and in this way tried to spread British goods more widely. British goods entered Central Asia via two routes, Kabul and Mashhad. It was brought to Tashkent by Indians who were in constant contact with it. The Indians brought local Indian goods along with British goods. The author says their main job was usury. A.N. Teterevnikov writes that he has recently noticed that British goods are rarely imported to Tashkent, and only the rest of the previously imported goods are sold.

Some of the parachutes were located in Bukhara and Kokand, and in this way tried to spread British goods more widely. British goods entered Central Asia via two routes, Kabul and Mashhad. It was brought to Tashkent by Indians who were in constant contact with it. The Indians brought local Indian goods along with British goods. The author says their main job was usury. AN Teterevnikov writes that he has recently noticed that British goods are rarely imported to Tashkent, and only the rest of the previously imported goods are sold.

According to researcher A.Sh. Shomansurova, every year from Bukhara, Kokand, Tashkent via Kabul 10-15 thousand camels loaded with 160-200 thousand pounds of various goods were transported to India. In this trade he played an important role in the povin, who was mainly from the Lohani tribe of the Afghans. Povinda benefited greatly from this trade [16:12 p]

Kokand traders also reached Turkey and Arab countries with trade caravans. A.Vamberi writes that he saw that the pilgrims took with them "40 dujas (12 pieces) of silk, Bukhara handkerchiefs, about 2,000 knives, 30 pieces of Namangan silk cloth, many Kokand skullcaps" [1: 374 p].

Kokand-Russia trade relations also play a special role in Kokand's foreign relations. According to sources, the rapid development of Russian industry after 1861 and the growing demand for raw materials and foreign markets were one of the main reasons for Russia's active occupation of the Kokand market and its unlimited use. Iron, copper, steel, cast iron and iron products, chit and low-quality fabrics, small quantities of velvet, sugar, glass, leather, sheep and its skins, leather and leather products, felt from the Kazakh deserts, which were subject to Russia, were brought to Kokand from Russia. Cotton was mainly exported from the khanate to Russia.

### CONCLUSION.

In conclusion, it should be noted that the Kokand Khanate established trade and economic relations with the Central Asian khanates, China, including East Turkestan, India, Iran, Turkey, Russia and other countries. The Kokand Khanate had close trade relations, especially with China, including Kashgar. In addition to direct trade with Kashgar, Kokand also acted as an intermediary in China's trade relations with the Central Asian khanates, India, Iran, and Russia. The Kokand caravanserais contain goods imported from India, Tibet, Kashgar, Bukhara, Afghanistan and Russia. It should be noted that Tashkent has a special place in these trade relations.

## THE ROLE OF NATIONAL-CULTURAL COMMUNICATIONS IN THE CULTURE OF NAMING

**Daniyarova Z.J\***

\*Doctoral student of the Karakalpak,  
Research Institute of humanitarian Sciences,  
Karakalpak branch of the Academy of Sciences of the  
Republic of UZBEKISTAN

### ABSTRACT

*The article explains the role of national Karakalpak cultural relations in the culture of naming, as well as the features that should be considered when choosing names. In addition, the meanings of the names have also been studied in detail, and the necessary conclusions have been drawn in this paper.*

**KEYWORDS:** *Karakalpak Folklore, Central Asia, Karakalpak Language, The Word "Jan" , "Gul" And Etc, New Karakalpak Alphabet*

### INTRODUCTION

The folklore of the Karakalpak people is the basis of the spiritual world of our people. The role of oral folklore in educating future generations as spiritually rich and perfect people deserves special attention. In particular, the personal names used in the 100-volume Karakalpak folklore provide valuable information about the centuries-old naming culture of our people. Oral folklore is one of the most important issues in Karakalpak linguistics, which requires a specific study of personal names.

In ancient times, when our ancestors named children, they believed that their happiness and fortune depend on the name given to them. Clearly, the name becomes a guardian of man, gives him or her strength, becomes a weapon that will be his or her lifelong companion.[1,591].In the lexical structure of Karakalpak folklore there are many words of both Arabic and Persian.Indeed, the words of the Persian language have been associated with the widespread assimilation of science, culture and religion in Central Asia and Kazakhstan since ancient times, as a result of the close interdependence of the Turkic and Iranian peoples. So that, it was said that in some places Turkic-speaking peoples spoke both Sogdian and Turkic languages [2, 24]. This situation

influences the introduction of some words, terms and human names from Persian into Karakalpak language and folklore along with some Turkic languages.

In particular, the Persian words **jan, dos, dana, pir, perde, taza, durys, gul, pakhta** and etc. come from the anthrop componential service in the formation of Karakalpak human names and are used in conjunction with Persian words to form human names.[3:163]. For instance:

Jaskelen loved,  
His only one friend,  
He called him **Jandos** (Jaskelen, volume 44, page 220).  
Gulbazar`s sister **Uljan**,  
No one would say good things about them  
(Bekimbetbaksy, 65-v,439-p).

The word "jan" in the works of O. Bekbawlov is an Arabic word meaning "human soul, living creature, living man." [4, 34], in Begmatov's [5, 137] and Dospanov's [6, 28] works, human names beginning with the word jan are derived from Persian.

The word "gul" in Persian means "beautiful as a flower, or its life as open as a flower" [5, 91].

In the land Jiydeli-Baysyn,  
The daughter of Erman bay, darling  
I was his beauty—**Gulbiybi** (4-t, Alp, 466-p).  
Utesh said to **Kurbangul**: apay, you  
Accept my advice to you (Utesh batyr, 62-v, 340-p)

Sayimbetov said that in the Karakalpak language it means pampering in the names of people connected with women and is used effectively, sometimes it can be the first component of human names connected with men [3, 48]. Such names are often found in folklore.

After some years, the son of the khan **Gulbulbul** was sixteen .(69-v, Btert, 244-p).

Turken`s great-grandfather **Gulmurat** koregen (83-v, Awyzgur, 380-p).

The word "pir" is called in Persian "an old man and a saint, the founder of a certain profession" [7, 219]. In another work, "teacher, head" [8, 178] and in the explanatory dictionary of the Karakalpak language, "a man who has lived a long life or religious leader, supporter, helper," [9, 111]. Human names beginning with this word are rarely used in folklore. For instance:

The man named **Pireke**, from the uruwmuyten and from tiyresamat, who was ready to answer heard about the girl and visited her home afternoon (94-v, Juwapaytys, 292-p).

In this case, the affix -ek in the name of Pireke is used in the Karakalpak language to abbreviate human names and mean to lessen and pamper.

The eldest son of **Pirlepes** - Yusup,  
There is no cure for quarrel (62-v, Uteshbatyr, 329-p).

The name Pirlepes means the miracle, the power of the “pir”. [6, 51]. The word "Dos" in Persian is "1. A person who has a close friendship with someone, who lives in peace, 2. A supporter of something or a person, his protector. Indir. A caring person, spiritual nourishment" [9, 82]. Begmatov's works mean "friend, adviser to his father or older brothers and sisters" [5, 121]. Currently, in the Karakalpak language, human names consisting of the only "dos" component do not occur. However, anthroponyms are used in folklore as follows.

At these times, brave guys called **Dos**, Kos moved around Tamdibulak from Kir and they also began to rule their surroundings. (82-v, Sheshenliksoz, 318-p)

**Dosan** listened Esen's words. (62-t, Ot b, 356-p)

One day, when khan Alewshe was sitting on the throne with his wallahs, Karakalpak **Dosimbiy**, Kazakh Erimbiy, Saraman, Mulkaman, Kalkaman, Hakim gazed at khan curiously. (28-v, Ersayim, 111-p)

Once upon a time, there was a rich man called Kawender. A poor boy called **Dosbergen** borrowed a thousand tilla from Kawender and made a trade to another land. (67-v, Qiyaert, 172-p).

Menglibay had a karatamir friend called **Dosekbay**. (83-v, Aw gu'r, 370-p).

Not sleeping at night, after walking seven days without rest, **Dosmambet** came to see his father, and told him some words. (1-v, Alpamis, 33-p).

The word “taza” is a Persian word which means “clean, pure. 2. Truth, reality, without adds”. [9, 257]. People's names which comes with the word “taza” are rarely found in folklore. For example,

After coming back, Let's invite Tazabaypadishah as a guest. (68-v, Siyqert, 184-p).

People's names which consist of words “dana, perde, duris, paxta” stated above are not encountered in folklore works.

O. Bekbawlov includes the words “**dar, tar, biy, nama, xan, xor, xosh, zar, dat, dara, darg'a, du'r, jipek, za'n'gi, miyir, dil**” and etc. in Persian words.

The word “dar” is “a pillar tightened to the rope which is used for people who were sentenced to death punishment. 2. It makes nouns which means profession when it used as a helping affix”. [4, 99].

It is used in people's names as following forms.

**Kaldar**'s son Hasen from Ispahan,

My dear king who took away him with forth. (30-v, Awezhan, 175-p).

I'll go to Bukhara khan **Muraydar**,

Taking a letter from Kokan khan MollaAliy. (46-v, Izzetqiz, 156-p).

My son died, world seemed narrower,

I missed him so much being passionate,

Played happily my son **Tilladar**

(43-v, Ja'ha'nsha, 50-p).

Professor E.Berdimuratov divides the words into two periods which came to Karakalpak language from other languages through Russian and other languages over Russian language when giving description to the historical relations coming from earlier times between Karakalpaks and Russian people: the period until 1917; 2.the period after 1917 [2,169]. If we show some examples from folklore works of those periods, a number of personal names which came from Russian are rarely found. For example:

Khan of Khiva had the head of Khiva garrison of the army of Russian king put into dungeon not relying on only the help of **Kolosovskiy**. (An'izlar, 79-v, 124-p)

In one thousand eight hundred,

And ninety-two,

At the time of tyrant **Nikolay**,

Ruled the khanate Madreyim,

Sitting on the gold throne (56-v, Yusipmergen, 56-v, 423-p).

They don't know a Russian boy **Sergey**,

(Shayirlaraytisi, 95-v, 370-p).

My daughter-in-law's mother's name is **Maria**, too

Made it known being fed up (Bekimbetbaqsinin' bayazi, 65-v, 440-p).

If we pay attention to the cultural language scene of nature surrounded us as depicting object, folklorist tries to portray folkloric meanings about the model with his own conceptions whereas linguist tries to depict semantics of word [10, 15]. Each nation expresses certain national customs and traditions which they have. That is to say, we are aware of national customs and traditions of each nation. Each person is dependent on certain culture, language, history or literature which expresses ethnic nationality on them. Specifically, language is rather related with culture as well as being social incident. Kept samples of language and culture like this are giving good result in our language. We can observe custom of giving name of Karakalpaks as an example of our national folklore. Stating specifically, custom of giving a surname in Karakalpak folklore has also certain peculiarities. Scientist O.Sayimbetov mentioned in his work that there were not any surnames until 40s, formalizing people's names were carried out together with people's fathers' names. We can be witness to this case in folklore works. Especially, naming the person with his father's name can be marked precisely in epic poems. We characterize this through the following examples.

#### **Tolibay's son –**

Tolibay's sons are Tinis, Saribay,

Saribay's son is Badekbay,

There was Bazargul. (Shejire, 80-v, 215-p)

#### **Shakhan's son Akshakhan –**

Shakhan's son Akshakhan,

In the land of Akshakhan,

In karakipshakuriw,

Sadirbay's son Kidirbay,

He's satisfied with his wealth. (Qoblan, 13-v, 377-p)

**Shonkara's son Aymirza** – Shonkara's son Aymirzabiy (Shej, 80-v, 216-p)

**Janibek's sons Haydar, Aliybek** – Janibek's sons Haydar, Aliybek. He had two sons (Shejire, 80-v, 215-p)

**Kassap's son Awez Khan** – Kassap's son Awez Khan, I would like him to be eater to you (Ba'zirgen, 16-v, 199-p)

New Karakalpak alphabet was accepted based on Russian graphics from 1940. From this year, particular changes appeared in the structure of Karakalpak anthroponomy. Firstly, this case was apparent on formalizing issues of people's names together with their fathers' names, that is to say, they became known with Russian samples of surnames. The form of -ov(ev) for men, and form of -ova(eva) for women in Russian language were took in Karakalpak language. This kind of sample can be found in karakalpak folklore, too. For instance,

**Asan Begimov** – While Asan Begimov was a representative in one region(unknown), he sent letter with poems in it to Dawletiyar Kasimov. (Shayirlaraytisi, 95-v, 367-p)

**Abdikerim Atajanov** – Agronomist of this town Abdikerim Atajanov also went to a party in Kegeyli, there was Palwaniyaz, too. (Awizekigu'rrin'ler, 83-v, 414-p)

**Bekbawli Turjanov** – The agronomist called Bekbawli Turjanov was a person who is always cheerful singing some lines of songs. (Awizekigu'rrin'ler, 83-v, 413-p)

**Jubatkan Bulakbaev** – Shepherd Jubatkan Bulakbaev took care of sheep for many years in Nazarbay. (An'izlar, 79-v, 163-p)

**Mateke Jumanazarov** – M. Jumanazarov was the head of the brigade of representatives. (Awizekigu'rrin'ler, 83-v, 405-p)

These surnames are formed by adding some elements of their fathers' names. In the basis of surname, there should be the name which means the personal background and the origin of people. In Korea among today's world nations, from mid-centuries, even earlier, the names of people served two duties; the name and surname. According to I.A.Soberevskiy, in Russian, the surname was visible in composition of people's names from XIV. T.Januzakov stated that the names of uriw were used as surnames in Kazakh nation in earlier times.

We represented samples of giving surnames in Karakalpak folklore and clarified them with samples based on our national culture during our work. By means of this, we make known that people's names which inform our history were used in Karakalpak folklore and they play an important role in our today's life. Studying the issues of other people's names related to our national culture in Karakalpak folklore will be our obligation in the future.

## THE EFFECTIVENESS OF FINANCING HIGHER EDUCATIONAL INSTITUTIONS IN A MARKET ECONOMY

**Husen Ahadovich Khudoykulov\***

\*Researcher at Bukhara State University,  
UZBEKISTAN

Email id: mm-husen@mail.ru

### ABSTRACT

*The article gives the basic principles and directions of increasing the effectiveness of financing state and non-state higher educational institutions, and according to the requirements of regulatory documents shows the calculation of the amount of budgetary funds for higher educational institutions using cost standards and correction factors.*

**KEYWORDS:** *State Higher Educational Institutions, Non-State Higher Educational Institutions, Financing, Efficiency, Educational Services, Market, Highly Qualified Personnel, Competitive Environment, Budget, Self-Financing.*

### INTRODUCTION

Any state at each stage of the educational development, which is located at the intersection of the demand curve and various intersection curves, sets its own nature of financing. However, to simplify this process, only one demand curve is given, although the curves also take on a different character.

It should be noted that in the market of educational services, prices are quite optimized, although in the case of excess demand for a certain cost of educational services (for example, the cost of one semester study at a university) as a result of competition between buyers, i.e. in the presence of competition, there should be an increase in value until this excess appears. However, this does not happen. In our opinion, this is explained by the fact that education refers to industries with a financed production cycle. Although, in contrast to other industries where production is set by changing the level of prices, in education, one of the factors that affects to decision-making on the cost of training for a new set is the number of students enrolled in the past year.

In accordance to the regulatory documents [1,3], a decision was made to gradually transition to a system of self-financing of higher education institutions since 2020, taking into account the high demand of certain areas of undergraduate (graduate specialties) and financial stability of HEU. These documents define the following tasks of universities that are transitioning to a self-financing system:

The provision of additional educational services, advanced training of specialists in various sectors of the economy and the introduction of other paid services;

The organization of scientific research aimed at solving urgent problems in the relevant field, the preparation of scientific and scientific-pedagogical personnel in this field;

Conducting fundamental, practical and innovative research aimed at solving the scientific problems of the industry in cooperation with research institutions;

Continuous improvement of the scientific and pedagogical potential of higher education institutions by regularly sending prospective young graduates to master and doctoral programs in domestic and foreign universities and research centers;

Introducing to the practice of concluding one-year contracts between higher education institutions and teaching staff in order to select highly qualified professors and teachers who can widely use modern teaching technologies and conduct research.

It is necessary to take into account that in the market of educational services in the field of higher education, due to their significant price differentiation, adequate to solvent demand, and subject to a limited number of services financed by the state, an excess of supply encourages the manufacturer to switch to goods - substitutes and adjust the marketing policy. In Uzbekistan, this situation can be traced to the strategy of technical, technological, economic and other professional universities.

A specific factor affecting to the formation of equilibrium prices is government financial policy. Whereas non-priority specialties are mainly not subject of budget financing. Obviously, in the current conditions of the development of new educational and information technologies, solvent demand will seek supply in countries that implement market or mixed education models. If the state provides the institution of higher education with the opportunity to provide educational services on a paid basis, the non-market model is manifested in the fact that the funds earned by the university are state revenue and must be transferred to the state budget.

Exactly this option that was reflected in the Law "On the Budget" of the Republic of Uzbekistan, which regulates relations in the sphere of execution of the state budget. At the same time, extra-budgetary funds received by educational institutions from carrying out independent activities in the market are budget revenues. Obviously, this provision characterizes the non-market model of education, since the centralized distribution means covering the budget deficit.

In market conditions, the choice of priority, in essence, means state budget support. This is due to the fact that in recent years, state policy in identifying priority projects and activities has become more open. The same applies to the requirements, the compliance with which gives educational institutions a formal right to apply for budget financing.

In higher education, according to opinions of some scholars, both foreign and domestic, based on the experience of reforming higher education in post-industrial countries, focused on the

widespread use of high technologies and creating optimal conditions for the development of personality and improving the quality of life, the following priorities are highlighted today:

1. Training of engineers, manufacturing technologists, specialists in information and communication technologies and the digital economy of high qualification, with innovative potential, able to organize the production of highly competitive products, ensure the permanent introduction of high technologies and the promotion of goods, especially high-tech products, to international markets.
2. Training of young scientists for the accelerated development of basic, applied and technological research in those industries and areas in which our country can take a leading position and identify competitors.
3. Retraining of highly qualified specialists, providing further high quality production and economy management.

Currently, in Uzbekistan there are more than 8620 thousand business entities. This means that for the effective functioning of the market, along with a large number of specialists in technical and technological areas, the training of economists, financiers, lawyers, managers and marketers is still relevant. In view of the foregoing, forecasting the training of highly qualified specialists should be aimed at increasing, rather than reducing, the training of necessary specialists for industries (fields) and the economy as a whole.

When the government continues to take the path of reducing its share of financing for the training of specialists, of course, the possibilities of training the necessary specialists for sectors of the economy will be reduced.

Neither need to be guided by the fact that a market economy will put everything in its place. Moreover, Uzbekistan is the only country in the world where 35 percent or more of the state budget is allocated to education.

At the same time, higher educational institutions should not take a hibernation position in this direction. They should be active in seeking additional financial resources to expand the training of highly qualified specialists. It is known that in a market economy there are many sources of financing and investment in industries and sectors of the economy. In this regard, the sphere of education is not excluded.

In the initial period of transition to the market, significant changes occurred in the financing of higher educational institutions. In order to develop forms and methods of teaching, the use of new pedagogical technologies were involved to the various international funds and grants. It is no coincidence that in 2012 year Uzbekistan was in the second place among the countries of the world in the ranking the innovative technologies using in the educational process.

In modern conditions, for example, Ishina I.V., Makarenkov E.V., Morgan E.V., Khalin V.G. [5-9] and other researchers are supporters of the development of extra budgetary resources in higher educational institutions. Perhaps this is when universities fully put their products on the intelligent market. However, if universities have not reached this level of development, then it will be necessary to provide funding for educational institutions through the state budget. Therefore, we are supporters of mixed financing, both budgetary and extra-budgetary funds.

In addition, it should be noted that one of the main requirements for increasing the effectiveness of higher educational institutions is government funding. At the same time, state funding of

universities can be expanded on the basis of many criteria. For example, used in practice in many developed countries, not only on the basis of the number of applicants to universities, but also those who received the highest scores on the results of testing (entrance exams), educational and research works conducted at higher educational institutions, the level of organization of state grants and the volume of contractual work, updating and restoration of fixed assets, efficient use of management costs and more. Moreover, the most important thing in educational institutions is the creation and development of a competitive environment. The fact is that the development of supply and demand determines the number of those enterprises and organizations for which solvency for contractors can be increased. This in turn prevents a decreasing of government funding.

In accordance with Resolutions [2,4], the Ministry of Finance and the Ministry of Higher and Secondary Special Education of the Republic of Uzbekistan take measures and in accordance with this regulatory document, the calculation of the budget funds for a university using cost standards and correction factors is carried out according to the following formula:

$$BCB = (BH31 * K1 + BH32 * K2 + BH33) * N + (BHД1 * N_{dc} - N_{dce}) + BHД2 * N_{dce}$$

where: BCB - the amount of budget funds for the university; BH31 - the basic standard of current costs per university student, which includes labor costs, a single social payment and scholarships, hourly wages, as well as allowances from the funds of the special material incentive fund and other allowances and surcharges provided by law; BH32 - the basic standard of current costs per university student in 4 groups of expenses; BH33 - the basic cost standard for expenses on the development and improvement of the material and technical base of the university, which determines the amount of funds allocated for the acquisition of fixed assets and major repairs; N is the average annual number of students in all areas and courses of education (coefficient 0.1 is applied for correspondence students).

The average annual number of students is determined taking into account the planned changes in the student continent during the financial year for courses (admission, graduation, expulsion) and is calculated by the formula:

$$N = Y_H + Y_n / 3 - Y_B / 2 - Y_O * 0,6$$

where: N- is the average annual number of students;  $Y_H$  - student population at the beginning of the year;  $Y_n$  - the expected contingent of student enrollment;  $Y_B$  - the expected student population;  $Y_O$  - is the expected contingent of deductions; K1 - correction factor for increasing the university's expenses on wages, a single social payment and scholarships, based on the specifics of the educational process of the university; K2 — correction factor for increasing the university's expenses for the 4th group of expenses, applied based on the specifics of the university's educational process; BHД1 - the basic standard of expenses for providing one university student from among orphans and children left without parental care and who are fully supported by the state; BHД2- the basic standard of expenses for providing one university graduate from among orphans and children left without parental care and who are fully supported by the state;  $N_{dc}$  - the number of university students at the beginning of the year among orphans and children left without parental care and who are fully supported by the state;

Ндсв - the number of university graduates in the current financial year from among orphans and children left without parental care and fully supported by the state.

In Western countries, three financial and economic models of education are currently formed to finance the education system: 1) a model based on the free market; 2) a model that determines the role of the state in financing vocational education; 3) a model based on the principles of the state market. The first model is used in many countries of the world. Here, priority is given to public funding. However, other sources of financing are also used, such as foreign investment, sponsored and other private funds.

In addition, this model facilitates the transition of educational institutions to market entities, i.e. adjusted to the demand of institutions to the demand of the labor market. The essence of the third model is that higher educational institutions are more focused on the principle of self-financing, i.e. development of private universities. This model to some extent removes budgetary tension for the state. However, with this model, children of wealthy families can receive higher education. So this model is used in limited countries of the world. In the second model of the education system, the main place is given to state financing.

Education is formed only at the expense of the state budget. This model is common in selected Asian and Scandinavian countries. First of all, the state, regions and municipal structures all budget funds are allocated under the responsibility of higher educational institutions and the state constantly monitors the effectiveness of the allocated funds. At the same time, the state, allocating huge amounts of money, supports the policy of legal independence of HEU. In addition, the decrease in the financial responsibility of HEU is not able to provide education to all sectors of society.

Proponents of this model argue that improving equity in education should be based on the following factors: 1) the development of voucherization of education; 2) tuition fees on credit and in stages; 3) payment for the training of modern highly qualified personnel mainly at the request of organizations and enterprises; 4) payment for social training through the implementation of productive activities based on the achievements of modern "know-how".

Thus, considering the effectiveness of financing higher education institutions in a market environment, it should be noted that all financing measures are aimed at training highly qualified personnel to improve the quality and competitiveness of specialists with higher education.

## DEVELOPMENT OF ARTICLE IN CRITICISM OF UZBEK LITERARY

**Khudoykulova Marhabo Ahadovna\***

\*Researcher at Bukhara State University,  
UZBEKISTAN

Email id: mm-husen@mail.ru;

### ABSTRACT

*The article analyses the development of the controversial article genre of the early twentieth century that has been little examined in literary criticism, literary process and attitude of the poet, prose writers. The problem is clarified in the example of creative works of Chulpan, Aybek, Fitrat.*

**KEYWORDS:** *Literary Criticism, Dispute, Discussion, Controversial Article, Literary Process, Critic.*

### INTRODUCTION

Genres of literary criticism are diverse and has a different character, and there is an equal struggle for the development of literature. Genres belonging to a certain group have a character of propaganda related to the writing and publication of a work of art: reviews, literary-critical articles, literary letter genres mainly perform such a function. Another group of genres has the character of generalizing the life and work of the writer: portrait-article, literary portrait, critical-biographical essay, essays serve such a purpose. Thus, all genres serve the same purpose, serve to promote literature as a unique tool of scientific and artistic thinking, have the ability to draw holistic conclusions about the creator and his work, creating a single scientific and artistic system.

Among the genres of literary criticism, the literary-critical article is the most common. The article is interpreted in the Glossary of Literary Terms as "a journalistic work written on issues of daily important socio-political, cultural and literary life for newspapers and magazines[1.78]". This means that the article is intended to provide information. Indeed, articles in the daily press are intended for the public, are written in an understandable language and in an interesting style, and are largely the product of journalistic research. The author of the article should use a variety

of terms in the field in order to make the essence of the chosen topic understandable to the public and provide explanations and dictionaries to make it understandable.

Depending on the topic, content and essence of the article, it has internal views such as political article, scientific article, journalistic article. "An article on research in the field of literature is an expression of literary and aesthetic views. In such articles, some kind of work, variety of literary problem is analyzed and the scientific and aesthetic conclusions arising in the process are described. Due to this feature, such articles are called literary-critical articles" [2,28].

A type of literary-critical article is a problematic article that plays an important role in literary criticism. It poses a clear problem and reveals its scientific and theoretical essence. In a problematic literary-critical article, deep issues of literature and literary criticism, current problems can be solved. Issues such as problematic articles, their types and development are rarely studied in Uzbek literature, and their study is one of the urgent tasks.

### **Main body**

A problematic article can be in the form of a scientific-theoretical discussion or research that focuses on the poetics of a work and illuminates the intended scientific event in a monograph, on the basis of the aesthetics of artistic creation. By this quality they are common in two forms:

- 1) Literary-critical article of a debating nature, it has become a tradition to summarize it and express it in the form of "debate-article". It is sometimes called a "conversation-article" because it is conducted in the form of a conversation. Debate research is more inactive in the press than scientific problem articles, and their proliferation further enhances the quality of scientific problem articles. The debate has evolved since the 1920s.
- 2) The research article is of a research character. For example, in the articles of the critic O. Sharafiddinov, it is clear that the vital and literary evidence is completely subordinated to the drawing of scientific and theoretical conclusions. A true scientist illuminates the essence of the evidence, refraining from counting it dry.
- 3) The difference between a discussion article and a research article is that more than one or several dozen literary scholars can comment on the issue raised in it. Some of them, of course, can stand in one position and defend one point of view, while others can defend a different point of view. "Will literature die?" By Sh.Kholmiraev. the article was of a controversial nature, to which many had expressed their opinion. This debate, rich in perspectives, lasted a long time. The very fact that the reader is somewhat thought-provoking shows that the article of a controversial nature has a certain significance.

Although the internal diversity of the article is evolving in Uzbek literary criticism, there is still no formal diversity in this area. This can be illustrated by looking at the literature of other nations. For example, the German poet Johann Hyote expressed his literary-critical views in his articles on Shakespeare's work, which were written in the form of an "emotional lyrical monologue." It can be seen in the same articles that Shakespeare Hyote has fascinated him throughout his life. That is why the literary critic O. Togaev was right when he said that Uzbek criticism was "still very poor in form" [3,132].

The controversy has been the subject of literary criticism since the 1920s. Many writers and critics have dealt with topical issues of Uzbek literature. Fitrat, A.Qodiriy, Cholpon, A.Sa'di,

Elbek, and from the youth H.Olimjon, G.Gulam, Mirtemir, Botu, Sh.Sulaymon, Sotti Hussein, A.Qahhor, Altai, O.Hashim, Yunus Latifs often appeared with their critical, scientific-educational works in the press. They discussed the most important issues in the formation of Uzbek literature.

The development of literature and literary criticism in the context of a sharp class struggle is an important feature of them since the late 1920s. An example of this is the fact that Cholpon's works have caused serious controversy in literary criticism.

The fact that Cholpon's work has caused serious controversy is a proof that the controversy intensified at that time. Discussions in the literary process were conducted in two directions. The first direction is an objective, accurate assessment of the poet's work. This includes articles by A. Qodiriy, A. Saadi, V. Mahmud, A. Alaviya, and in part by Z. Bashir and Oybek.

The second direction includes articles written by Ayn, Usmonkhan, Miyonbuzruk Salihov, and since the 1930s by A. Sa'di and Tuygunlar, which accelerated the tragedy of the poet's fate when evaluating Cholpon's work from a purely "Marxist-Leninist" aesthetic point of view [4].

Cholpon's collection "Renaissance" was published in 1922. In this regard, the newspaper Turkiston (1923) published a review by critic Zarif Bashir. In the review, he describes Cholpon as "not a folk poet, but an intellectual close to the people," describing Cholpon as "very rich in comrade imagination ... his imagination flies only in the realm of nature and the world of humanity".

V. Mahmud correctly analyzes and interprets the essence of Cholpon's poems in the review of the poet's collection "Springs".

Articles named "Uzbek young poets", "Cholpon" was published in two issues of the newspaper "Zarafshon" in 1924. Its author, A. Sa'di, examines Cholpon's work in great detail and describes the poet with a very "short description": "it burns and burns."

Similarly, in a very concise form, A. Qodiriy refutes the accusation that "Cholpon's tears are a poet"... in his preface to Cholpon's book "Secrets of the Dawn". Although there are many tears in the poet's poems, Cholpon reveals that "he wants to make flowers out of them".

On February 14, 1927 in the newspaper "Kizil O'zbekiston" under the signature of Ayn was published "Uzbek poets. Cholpon" will be published. In a statement at the end of the article, which was attached as an appendix, the editors announced that the article had begun a discussion about Cholpon's work and encouraged "all interested comrades" to take part in the discussion.

Ayn (O.Sharafiddinov) in the article "Uzbek poets. Cholpon" pays more attention to the ideological content. In connection with the publication of the poet's collection "Awakening" (1922), Z. Bashir wrote an erroneous opinion that Cholpon was "not a people's poet, but a poet of intellectuals close to the people." "Cholpon is a nationalist, patriotic, pessimistic intellectual poet," he said.

The same article tries to present itself as objectively as possible. He also dwells on the positive qualities of the poet. Recognizing that Cholpon was "the most prolific writer" and "the most influential poet in literature," he praised the poet's language. "Undoubtedly, today's Uzbek literary language is Cholpon. The whole literary youth recognizes his language as an example. He imitates her". Бироқ мунаққид синфийлик кўзойнагини тақиб олиши билан шоир

шеърларига хавфли айблар қўя бошлайди ва шоирга "Чўлпон йўқсул халқнинг шоири эмас, у миллатчи, ватанпараст, бадбин зиёлилар шоиридир". Унинг мафкураси шуларнинг мафкурасидир. У шу мафкура йўлида уринадир, талпинадир. Уни қайнатган, илҳом берган нарсалар шулардир" деб айб қўяди, шу билан бу фикр фожиали айбномага айланади.

Shortly afterwards, young Oybek came out with an article called "Cholpon. How to examine a poet?". Oybek's article, written in response to this controversy, was a counter-response, realizing that Ayn was "restricting creative freedom, immersing literature in a swamp of" ideology "and pushing it into a dead end, and gradually undermining the art of literature." Oybek urges to think about literature not on the basis of dominant ideological stereotypes, but on the basis of the laws of art. Oybek cites the example of how much Russians love Pushkin, and on this basis says, "We can't give up on Cholpon either". Because Cholpon's contribution to literature is great: "Cholpon created something new in new literature. Instead of Muvashshah literature, he created beautiful (artistic) poems according to the artistic taste of the day. Today's young generation loves his simple language, sweet style and technique. Oybek, who wrote at the time, was also falsely accused of writing the article.

Oybek deeply analyzes Cholpon's poetry as a poet and correctly emphasizes its necessity and importance for the people. Oybek's article on Cholpon's poetry is one of the most bold. Thus Cholpon's poetry and dramas caused serious controversy in literary criticism.

Usmonkhan, who wrote the controversial article named "The Critic of the Critic", unilaterally criticized Oybek, accusing him of misunderstanding the relationship between content and form in Cholpon's work. Oybek is included in the list of those who "look at the bourgeoisie" in literature because he wants to use Cholpon's artistic form. He said that Cholpon and his "salt", "Cholponism" is very harmful for young people, "Cholpon has no stability, no vision of the independent world", "He lands from one branch to another", "Cholpon does not understand his poetic mission". "Cholpon is not a progressive artist, he is a degenerate dreamer". At the time of writing, Cholpon had published three collections of poems, staged dozens of plays, published hundreds of articles, translated many works, and was recognized by the public as a talented artist. Is it possible to insult such a person as "does not understand", "does not have a worldview", "unstable", "betaine", "degenerate" without thinking, - writes O. Sharafiddinov. Yes, it was possible - Marxist literature and Soviet criticism became famous for this ignorance"[4,28]. (Unfortunately, despite being so modern, Osman Khan himself, like other talented intellectuals, was a victim of repression, no matter how much he defended that ideology).

It should also be noted that Oybek's response to Usmonkhan in the August 29, 1927 issue, entitled "The Critic of the Critic's Article," acknowledged that it was a "great mistake" to distinguish between the content and form of a work of art. remains faithful to his belief in the "analysis" of ideas from the language of art to the language of sociology, defending his views.

Certain positive conclusions can be drawn from these discussions. "In particular, Oybek's articles had such a place that they could be a good basis in the fight against fanaticism and vulgar sociology in literature, to protect artists from useless beatings, inappropriate oppression" - writes Ozod Sharafiddinov[4.29]. But the ideology defended Ayn and Usmonkhan, and thus the great Uzbek poet Cholpon was unjustly persecuted. Of course, the debates between Ayn, Usmonkhan, and A. Sa'di showed a certain influence on the development of Oybek's work and his critical

skills. This is a shining example of Oybek's deep understanding of the intellect and art of debate: he was seen in the debates as a cultured, calm, sharp critic who could scientifically substantiate his views.

Although Oybek compares Cholpon to Pushkin in his article, he agrees with the critic's views on the ideological flaws of Cholpon's work, but still seeks to evaluate Cholpon's work from the point of view of pure artistic criteria. Both Oybek and Z. Bashir were young and had not yet mastered the basics of criticism, so they were not able to fully demonstrate their professional skills, and therefore could not prove their point through the analysis of specific works. Therefore, they could not become a true defender of Cholpon's work. It was also difficult to win in such a confusing and complex environment.

Following in the footsteps of Ayn and Oybek, Usmonkhan (Eshonkhodjaev), who wrote the article "Munaqqidin munaqqidi", accused Oybek of one-sidedness and included him in the list of those who view literature as bourgeois. Oybek again wrote a reply to Usmonkhodja, admitting some of his mistakes, sometimes standing firm in his opinion. It must be acknowledged that the attitude of literary criticism in the early twentieth century to Cholpon's work continued in two directions. The discussion ends with this article. A. Ikramov will finish the debate.

"I am convinced that this debate will play an important role not only in the fate of Cholpon, but also in determining the further development of young Uzbek literature, as well as in tracing the trends in literary criticism and literary criticism" he said. Therefore, it would be useful to think in more detail about its content, what issues were discussed, what conclusions were reached, and what guidance was given to young artists entering the literature. Because the roots of many of the "qualities" of Uzbek literature as the literature of socialist realism go back to the same debate"[4.29].

Unfortunately, in the process of the birth and formation of Uzbek literature and criticism, more precisely, in the 20-30s of the XX century, such an approach to talent began to take shape. In particular, the first secretary of the Central Committee of the Communist Party of Uzbekistan, Akmal Ikramov, based on the ideology of the time and the wrong approach to Cholpon's work, exacerbated this process. Such one-sided views led to the unjust imprisonment and tragic execution of writers such as A. Kadyri, A. Cholpon, A. Fitrat.

We divided the participants of the debate on Cholpon's work into the above two groups. V.Mahmud, A.Sa'di (partially), A.Qodiriy, Oybek, who belonged to the first group, can be said to have given an objective assessment of the poet's work.

The views of Z. Bashir, Ayn, Usmonkhan, A. Ikramov, belonging to the second group, who gave a subjective assessment of Cholpon's work, were not supported by the environment of that time. The ideology of independence, on the other hand, has come to this day, showing how true the critics of the first group are.

The poet and critic Botu also commented on the debates in the literary criticism of the time. Academician B. Nazarov emphasizes that Botu has a special place not only in the history of Uzbek poetry, but also in the history of literary criticism "[5,55].

Боту биринчилардан бўлиб, ўзбек танқидчилиги ва адабиётшунослиги олдига муҳим талаблар қўйди, унинг келажакдаги вазифаларини белгилашга интилди. 1928 йилда “Нафис адабиёт соҳасида ўз-ўзини танқид” деб номланган баҳс-мақоласида айни шу

масалаларни кўтариб чиқди. Адабиёт бадиий томондан ҳам баркамол бўлиши керак деган фикрнинг айтилиши нафақат, ўзбек танқидчилиги, балки умумиттифоқ танқидчилигида бадиий асарлар асосан ғоявий-сиёсий жиҳатдан туриб баҳоланиши авж олган ва асарларга уларнинг бадиийлигини ҳам инобатга олган ҳолда киммат бериш бир қадар суст бўлган бу даврда назарий жиҳатдангина эмас, балки амалий жиҳатдан ҳам катта аҳамиятга эга эди.

Botu was one of the first to place important demands on Uzbek criticism and literary criticism, striving to define its future tasks. In 1928, he raised the same issues in a debate entitled "Self-Criticism in the Fine Arts." The idea that literature should be artistically perfect is not only theoretical, but also theoretical in this period, when Uzbek criticism, as well as all-Union critique, is based on the ideological and political evaluation of works of art and their value in terms of art. was also of great practical importance.

In the 20-30s of the XX century in Uzbek criticism there was a lot of controversy over the ideology of the work of art [5,136]. One of the debates on this subject began with an article by K. Trigulov "Fine literature on the way to the healing of our face" (1928); The discussion continued with Altai's article, "Fine Literature Needs Healthy Ideology and Healthy Criticism." Botir, in an article entitled "Discussion on Fine Literature", commented on the issues raised in the debate. However, the common denominator for these articles is that they focus on the study of all aspects of art in relation to the issue of ideology, and the connection of the idea of the work with the image, the protagonist, especially in matters of art and form. S. Hussein paid attention to these shortcomings. Critics say that an artist's work should be analyzed not only ideologically, but also in terms of form, and that it is critical of the way in which the form that represents it in terms of its ideological content is studied in relation to form.

In art, a true work of art is created only when ideology and art are combined to such an extent. Putting one of them above the other, explaining the essence of artistic creation in the light of the laws of social development, leads to vulgar sociology, the development of literary-artistic, scientific-aesthetic thinking.

Should Classical Heritage Be Used or Not? J. Boybulatov was one of those who chose the vulgarization method in the debate on and his nihilistic attitude to inheritance, even to the point of insulting him, is evident in his assessment of the Uzbek Literature Collection. He does not hesitate to insult both Fitrat, who wrote "Samples", and O. Hashim, who wrote the foreword to it. His article called "Uzbek Literature and Chigatoychilik" is a critique of the works of classical artists from beginning to end. In particular, he writes: "... in short, the exquisite literature of Chigatay is irrigated with mysticism in terms of content, in Arabic and Persian in terms of form [5.140].

It was impossible not to respond to such baseless allegations in J. Boybulatov's controversial articles. Although O. Hashim wrote two articles under the headline "Literary Heritage and Chigatay Adabiyati" and started an argument with him, the ideology of that period could not escape the pressure. He writes: "Jadid literature is the literature of the Uzbek bourgeoisie. Jadid literature reflects the thoughts and experiences of the Uzbek bourgeoisie, works for it, laughs and cries for it" [5,141]. In essence, this was an assessment based on the stereotypes of "Stalinist" policy. Father Hashim later tried to correct the mistakes he had made in evaluating classical literature, which was a characteristic of true critics. He emphasizes that there are several stages in the use of heritage, which need to be studied carefully. "Chigatay admits that literature has given

many examples of art, and that there are a number of artistic poets in this literature," he said. Lutfi, Navoi and other masters of words give examples from their poems and focus on the issues of artistic mastery. According to him, "the shortcoming of modern proletarian poets is the same," that is, the lack of skill. In order to better explain their ideas and learn how to master the art of artistic creation, V. Mayakovsky gives examples from his book named "How to write a poem?" .

The article can be seen in the work of A. Saadi, one of the most active critics of that period. In 1924, A. Saadi in his article "Young Uzbek poets" unjustifiably criticized the work of Fitrat. In response, Wadud Mahmud's article, A Look at Literary Criticism, came to the fore. He defends Fitrat with a sharper argument than Saadi. Fitrat also followed Wadud Mahmud's literary and theoretical speeches. Even in the "Folk Literature" section of the "Rules of Literature", he supports Wadud Mahmud's views on the differences, similarities and differences between written and folk literature, and the peculiarities of oral literature.

A. Saadi makes a factual mistake by saying that "Fitrat's work began with the February Revolution of 1917" without seriously examining Fitrat's work and without even determining when it was written. In any case, Fitrat has been known in Turkestan as a poet and writer since 1910. At that time, his poems were passed from hand to hand, even in writing, Wadud Mahmud told A. Saadi.

In the general spirit of Saadi's article, there is a strong tendency to criticize. He hardly considers Fitrat to be a poet, but he wants to know him as a philosopher and gives some weak evidence. Wadud Mahmud Fitrat defends his work from such unjustified criticisms: "First of all, it is not a literary criticism, because there is nothing in it in terms of the meaning of 'literary'. nor is it a scientific thing in terms of prestige," he wrote in A Look at Literary Criticism (1924).

Of course, from the point of view of modern literary criticism, both articles do not have controversial places. In the 1920s, A. Ismoilzoda and A. Saadi wrote about the press, Zhulkunboy and Nazir Turakulov about the press, Zhulkunboy and Ghazi Yunus about the magazine "Mushtum" and satire and humor, about Abdurauf Fitrat and Nemat Hakim, Elbek and Zeyniy Uzbek. were engaged in a debate. There were many such debates in the press of that period. The literary-scientific dispute between A. Saadi and Wadud Mahmud is a vivid and typical example of the genre of literary debate in literary criticism of the 1920s"[6,59].

A. Saadi and Wadud Mahmud's articles "Against Literary and Historical Illiteracy" and "A. Saadi's Literacy" are distinguished by the fact that they are based on such a debate.

## CONCLUSION

It seems that since the beginning of the twentieth century, the genre has been in a period of rapid development, but with the advent of the Soviet era, subjectivism in literary criticism has led to changes in the dynamics and content of the genre.

The increase in the number of debates on various topics in recent years is a sign that the genre is gaining popularity and that scholars are seeking to uncover unexplored or controversial issues in the literature.

### ABSTRACT

*The method of evaporation and crystallization of biological fluids for diagnostic purposes is now widely used, and much attention is paid to the study of the prospects of analysis. Increasing the use of biological fluid (saliva) in clinical analysis can help speed up the diagnosis. The main directions of research on the evaporation and crystallization of biological fluids (saliva) (the disappearance of the liquid system during the transition to the solid phase) depend on the substances present in the liquid and their amounts. to study the possibility of informing the process of intermolecular composition of biological fluids, which occurs during the dehydration process.*

**KEYWORDS:** *Biological Fluid, Evaporation, Form Element, Crystallization.*

### INTRODUCTION

**1. Relevance of the study.** Biological fluid is a complex tool that reflects the dynamic stability of the body's internal environment; however, oral fluid can have different, physicochemical and biological properties under the influence of various factors and is one of the indicators of the body's reactivity. An important argument for the use of fluid in diagnosing the functional state of the body is the simplicity of the process of obtaining biological fluid.

Numerous scientific findings have led us to conclude that human body fluids (saliva) are a unique substance with great potential for use in basic research and medical diagnostics.

The widespread use of physical changes in the evaporation of biological fluids and methods for estimating the solid phase in laboratory diagnostics, as well as the availability of information, is one of the current problems under study.

**2. The purpose of the study.** Currently, the method of evaporation and crystallization of biological fluids for diagnostic purposes is widely used, and a great deal of attention is paid to the study of the prospects of analysis. Increasing the use of biological fluids (saliva) in clinical analysis can help speed up the diagnosis.

Typically, when using this method, the physical processes that take place during the evaporation of a certain amount of biological fluid (saliva) under test, which takes the form of droplets, and the sediment in the form of a solid phase formed after evaporation (facies) morphology is studied. Biological fluid (saliva) can be a source for studying human DNA and clinical analysis in the body because the composition of certain molecules in saliva reflects their concentration in the blood. Using saliva for various laboratory tests, especially in children and the elderly, is much simpler, safer, and cheaper than using blood for testing.

The main directions of research on the evaporation and crystallization of biological fluids (saliva) (the disappearance of the liquid system during the transition to the solid phase) depend on the substances present in the liquid and their amounts. and to study the possibility of informing the process of intermolecular composition of biological fluids, which occurs during dehydration.

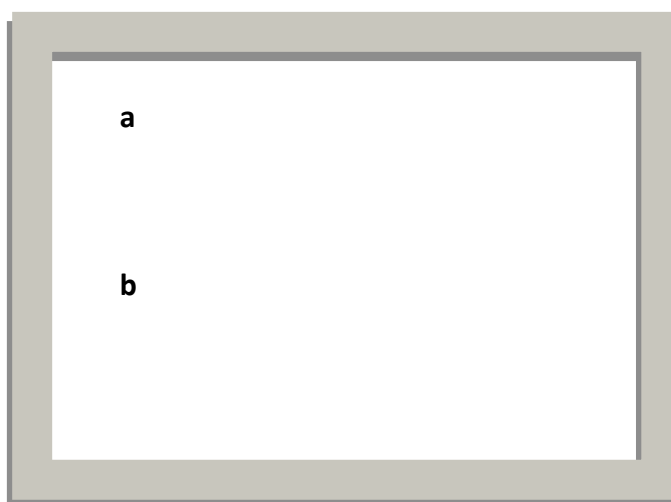

**3. Research method.** Every day, a person excretes 1-1.2 liters of body fluids (saliva). The main components of biological fluid (saliva) are water, mucus, proteins and inorganic substances. Human saliva contains 99.4% water and 0.6% various substances (dry matter). The dry residue contains about 0.2% inorganic and 0.4% organic matter. Inorganic substances in biological fluids (saliva) contain sodium, potassium, calcium, and other trace elements. Organic matter in biological fluids (saliva) consists mainly of proteins and salts. The following method has been developed to study the evaporation of biological fluids and the structure of the solid phase. Biological fluid with a volume of  $1\text{ mm}^3$ - $10\text{ mm}^3$  is dropped horizontally on a flat glass. The diameter of one drop is in the range of 2-5 mm, and the temperature is observed at a temperature of 22 °C and without changing the relative humidity. Methods for evaluating the evaporation process and solid phase of biological fluid (Figure 1 (a) - view from the horizontal position, Figure 1 (b) - view from the vertical position) are widely used in laboratory diagnostics [1.2] .

**1- picture**

The process was first studied by placing a biological liquid in a glass beaker in the form of a drop, and from the initial appearance, i.e., from the evaporation process to the solid phase. If a drop of liquid is placed on the surface of a clean glass window, its height decreases during evaporation, the diameter of the base does not change during drying. Takes the view state in Figure 2 (b).

To study this process, we used a modern biological microscope that can meet the requirements of the time, the main function of the microscope is not only to show the object in an enlarged view, but also to take pictures, transfer the captured object to the screen, Determining the parameters consists of creating a video image.

The size of a rainbow-shaped biological fluid (saliva) is determined by its height and the radius of its base.

**2- picture**

To calculate the volume of a rainbow-shaped biological fluid (saliva) rising into the air as a result of evaporation from the surface in a unit of time, we can include the following formula

$$v = V/t$$

$v$  –volumetric velocity formed by the evaporation of biological fluid (saliva),

$V$  –The volume that evaporates from a rainbow-shaped sample,

$t$  –the time required for a certain volume of biological fluid to evaporate.

From our observations, it can be seen that the sample dripped on the glass began to form shaped elements from the edge to the middle.

After mixing the biological fluid (saliva) and the substance contained in it (a mixture of 0.9% NaCl), the rate of formation of the form element in it was determined.

$$\vartheta = S/t$$

we can get by the formula

$S$  –the distance from the end point of the sample to the center

$t$  –the time taken for the droplet-shaped sample to form a droplet on the glass.

**4. Object of inspection.** The object of our study was a sample of a mixture of NaCl with a concentration of 0.9% in the amount of biological fluid (100% Biological fluid (saliva)) in the human body (50% of this biological fluid (saliva)), and pure 0.9%. Taking a sample of NaCl, a drop of it was dropped on a glass beaker using a pipidka, and the processes that take place in it, that is, the volume of liquid that evaporates from its surface over time and the formation of shaped elements, are connected to a computer. The following results were obtained by observing under a microscope (horizontal and vertical position).

#### 5. The result of the inspection.

Amounts of biological fluid and NaCl solution	The central height of the drop (mm)	The radius of the base (mm)	the time required for a certain volume of biological fluid to evaporate (minutes)
100% saliva, 0.9% concentration NaCl is not present.	0,899	2.112	36
50% saliva, 50% NaCl in 0.9% concentration	0,899	2.112	42
100% NaCl, 0.9% concentration, no saliva.	0,899	2.112	45

Using the data in the table, we determine the volume of the biological fluid and the volume rate formed by the evaporation of the biological fluid using the above formulas and the rate of formation of the form element.

Volumetric velocity of biological fluids			
Amounts of biological fluid and NaCl solution	drop size (mm <sup>3</sup> )	the time required for a certain volume of biological fluid to evaporate (minutes)	Volumetric velocity of biological fluids (mm <sup>3</sup> /minute)
100% saliva, 0.9% concentration NaCl is not present.	6,68	36	0,185
50% saliva, 50% NaCl in 0.9% concentration	6,68	42	0,163
100% NaCl, 0.9% concentration, no saliva	6,68	45	0,148

the rate at which a formal element is formed			
Amounts of biological fluid and NaCl solution	The radius of the base (mm)	the time required for a certain volume of biological fluid to	formation element rate (mm/min)

		evaporate (minutes)	
100% saliva, 0.9% concentration NaCl is not present.	2.112	36	0,0587
50% saliva, 50% NaCl in 0.9% concentration	2.112	42	0,0515
100% NaCl, 0.9% concentration, no saliva	2.112	45	0,0469

It can be seen that as a result of changes in the amount of a substance present in a biological fluid, its rate of dehydration and solidification, that is, the rate of formation of the element and the rate of volume of the liquid, decreases.

## 6. CONCLUSIONS:

In the study of the process of dehydration of biological fluid droplets, the study of changes in its volume and surface was carried out experimentally for the first time, and as a result the amount of substance (0.9% NaCl solution) in biological fluid (saliva) As a result of the change, the volume of fluid leaving the dehydration process decreased, and the time of the dehydration process increased, but the volume rate also decreased.

The transition of biological fluid (saliva) to the solid phase, ie the process of formation of the form element, the formation of the form element as a result of the addition of the substance contained in it (0.9% NaCl solution). It was observed that the process of formation takes less time and the rate of formation of the form element is higher.

## **EFFECTIVE USE OF ELECTRONIC AND DISTANCE LEARNING TO INCREASE THE NUMBER OF STUDENTS IN THE HIGHER EDUCATION SYSTEM BY CORRESPONDENCE COURSE**

**Bekchanova Shoiraz Bazarbaevna\***

\*Teacher of the Department,  
Distance Education, Ph.D. ped sciences,  
Tashkent State Pedagogical University,  
Named after Nizami, Tashkent, UZBEKISTAN

### **ABSTRACT**

*This article discusses the role of e-learning, distance learning, blended education, their types, methods and applications, effective results in the development of our economy to increase the number of students in higher education now and in the future in the continuing education system. In this state, we will increase the number of students in the current education system in the future through e-learning, DO, blended learning, methods and areas of use, such an impact on the development of our economy.*

**KEYWORDS:** *Distance Learning, Online System, Autonomous System, Computer, Network, Module, Platform, E-Learning, Internet, Credit System, Video Lesson, Audio Lesson, Presentation, Technical Means.*

### **INTRODUCTION**

Over the past three years, thanks to large-scale reforms carried out in our country under the leadership of President ShavkatMirziyoyev in order to bring the development of Uzbekistan to a new level, radical changes are taking place in all areas, the worldview and consciousness of our people is growing. It is important to create a modern system of continuing education through reforms in the formation of new values and traditions in our society. Improving the quality of education in the fourth priority area of the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021, approved by Decree of the President of the Republic of Uzbekistan dated February 7, 2017 No. 4947. Much attention is paid to the development of continuing education in the education system using modern technologies. In his Message to the OliyMajlis on January 24, 2020, the President said that in 2019 there will be 4 presidential schools with a completely new content and form.

The creation of correspondence and distance learning in the field of continuing education as an integral part of the reforms is a step of the President of the Republic of Uzbekistan “On measures to improve the system of training engineers and technicians for industrial production in the Tashkent region”. Decision No. PQ-3153 of July 27, 2017 and Cabinet Decision No. 930 of November 21, 2017 were published. Appendix 1 to the resolution provides for the creation of a correspondence (special correspondence) department at the Nizami Tashkent State Pedagogical University in accordance with the Regulation on the organization of correspondence (special correspondence) education at higher educational institutions. On August 23, 2019, the Department of Distance Learning at the Tashkent State Pedagogical University named after Nizami began its work with teachers who gathered in 11 areas. [3, p.1-3]

## MAIN PART

At the department of distance education, each teacher must have a computer, a foreign language and a mature specialist in his subject. It is very important that every student studying for special part-time programs knows the computer and his specialty. Because a student who does not conduct an independent study of computers and specialties will not be able to answer intermediate exams and will be expelled from the university.

Currently, on the e-learning platform of the Tashkent State Pedagogical University, all students studying at all special correspondence and correspondence departments have their personal identification code and password, which they can use personally on the website [www.talaba.tdpu.uz](http://www.talaba.tdpu.uz). access to your online dashboards.

There, subjects taught for them in the spring and fall semesters, lecturers, seminarians, practitioners, laboratory teachers are included on the site [www.tdpu.uz](http://www.tdpu.uz) with all the information and posted on the site for students. You can use it at any time to see, read and use. It can be copied to your digital equipment and retrofitted at any time. There are also teachers who supervise coursework and answer questions as part of self-study, and students can easily get advice and guidance from the teacher on issues that they don't understand. [1, p. 91-93]

The learning process is such that the student does not recognize the teacher. Because when sending electronic tasks to a student, if there are 20 students in a group, professors prepare 20 tasks for each student, and the platform program on the computer rotates the parameters and displays one task for each subject in the student's personal account. If a student studies 7 subjects in each semester, the student can see the tasks for these 7 subjects in his personal account, download them to his computer and see when the deadline for sending an answer to the task comes.

Intermediate control grades can only be obtained if students send answers to assignments in electronic form to the platform. Each student sends answers to assignments in electronic form only from his personal account. Nothing written on paper is sent. Our students have a great opportunity to use it when writing answers to assignments. On the site itself, each student can download to his computer, phone and use at any time: electronic literature; lectures of our teachers on science; instruction for practical exercises; laboratory work; seminar classes;

educational literature; guidelines; teaching aids; articles; open lessons; video lessons are available on the website [www.majmua.tdpu.uz](http://www.majmua.tdpu.uz) so that students can download and use it on their technical device from anywhere in the world at any time.

In addition, each teacher will be able to share his experience with the teachers of the department and other teachers of the department who will be able to work in their classrooms, in open classes using innovative world-class methods. At the same time, in an open lesson, our teachers put their grades, teachers are evaluated, recommendations are given, skills are studied and taught. Each open lesson should be posted on the teacher's personal page.

At present, the department "Distance Learning" conducts testing for online systems in conjunction with the offline system, that is, in combination with e-learning, distance learning is organized at a certain distance.

This responsibility is assigned to us by the Law of the Republic of Uzbekistan "On Education", at present, significant changes are taking place in the education system, in particular, the DO method is one of them. This is a new form of DO. DO is independent, it develops a person's ability to think independently, assess the situation, draw conclusions and predict. Another advantage of pre-university education is that the student has the opportunity to study at a convenient time and this system is widely used in the modern world, and many large enterprises use this method to improve or change the qualifications of specialists, which saves millions of dollars a year.

At the same time, the role and importance of information and communication technologies in the global economy is growing, including computer and telecommunication technologies, software development and the provision of a wide range of interactive services based on them. Extended information today with the help of communication technologies, the DO system is developing and brings benefits worldwide due to its convenience. [2, p.76]

Distance learning (DL) is a process of interactive communication between students and teachers using the purpose, content, methods, teaching aids and Internet technologies of the educational process. Another advantage of this education is that the teacher in this subject is selected by the student, the student begins to study in accordance with the time set by the teacher, and the materials are mastered under the supervision of the teacher. Mastery is determined upon completion of assignments and tests after each lecture. The sooner a student has mastered this program, the sooner he or she will graduate and receive a diploma. If he does not get the required score after mastering the program, he will be given the opportunity to work independently and continue his studies. Taking into account the needs and capabilities of each student, continuing education programs in the country are external. Currently, the introduction of subsidiaries is in demand in our country. Distance learning was usually for those who work and study in order to get a specialty or improve their skills.

DL are particularly cost effective for developing countries. There are also organizational and economic advantages of pre-school education, such as the fact that students do not need classrooms to study or dorms to stay. Financial expenses are mainly spent on the preparation of training materials, special classrooms. Most of the costs are in the process of organizing this

process, of course, spent, then the costs will decrease. Therefore, as the number of students increases, the cost of training (contract) will also decrease. In distance education, the main attention should be paid to the preparation of training materials. Because the quality of teaching materials in distance learning is one of the most important quality factors. The more understandable and detailed the training materials, the more useful they will be for the student. That is, the material should be methodologically sound. [4, p. 88-90]

In addition to audio lessons, video lessons, animations, diagrams, presentations, color illustrations, instructions, guidelines, practical lectures, video lessons for students using various methods, tests, crosswords, educational and methodical complexes should be prepared using codes.

The analysis of university programs in the field of digital technologies allows us to note the following:

- For university teachers who have mastered office technology when working with science teachers, the approach to the implementation of the program aimed at primary computer literacy in network technology and Internet resources is typical;
- The program often does not provide enough or no space for fundamental training in the field of informatics, without which it is difficult to fully use the capabilities of digital technologies for educational purposes;
- In teaching students to use digital technologies, the main attention is paid to the development of standard software packages and devices, there is no clear focus on the use of their capabilities in pedagogical activities;
- Insufficient use of digital hardware, modern hardware and modern software to increase the efficiency of the educational process. In our opinion, today it is not enough for a modern educator to use the usual approaches to the formation of ACC. The organization of a modern pedagogical process in MTC, ensuring the adaptation of the individual to the conditions of self-expression and creative abilities involves the widespread use of modern tools and the optimal combination of traditional forms and methods of education with modern digital technologies.

This requires the development of unique educational technologies. The main principles of the educator's formation of ACC are distance orientation and complex information of the educational process. The principle of career orientation involves the integration of theoretical education and interdisciplinary links to prepare the teacher for the active use of digital technologies in remote activities in accordance with their personal interests and educational tasks.

The principle of complex information of the education system involves the identification of a set of digital technologies that allow the teacher to form the ACC at the required level. The introduction of digital technologies in the educational process in the context of person-centered education will help to improve the quality of education. The formation of the teacher's readiness to organize person-centered education using digital technologies leads to an increase in the effectiveness of the educational process.

Today, information and education systems are complexes that include computing and communication equipment, software and personnel, providing support for a dynamically

changing information model of the education system to meet the information needs of all participants in the educational process. We are talking about the application of the information system of education and the information-educational system of the whole education in the context of person-centered education. In recent years, research has focused on the use of computers, local area networks, as well as the psychological and pedagogical capabilities of the global Internet in the education system (at all its stages). It is possible to study the psychological and pedagogical potential of modern information technology (IT) in this context and develop effective options for their introduction into the educational process. In conclusion, during the current corona virus pandemic, distance learning video lessons were continued by specialist teachers, and distance learning departments were opened in universities. Students in this subject can have clear and fully covered knowledge. To do this, the lesson will need to be conducted by specialist teachers, not amateur, compulsory teachers, who will cover the lesson in full. Only then will we be able to achieve the goal set by our professors and teachers, based on the skills of experts and foreign standards, without mistakes and shortcomings.

The more interesting the educational process of a teacher, the more students will be in the science class of this teacher. The number of students in the DO system is not limited, since the audience is not used. With the increase in the number of students there will be no noise, the quality of the lessons will not suffer, and the audience will not be crowded. As the number of students in the admission quota increases, the amount of the contract may decrease. This means that, as the president said, the number of people with higher education in continuing education will continue to grow. Personnel problems are reduced. Economically, our country is experiencing rapid development. Using distance education in the field of continuing education, we can achieve material and scientific development in our country.

## CONCLUSION

Currently, during the coronary virus pandemic in Uzbekistan, kindergarten students, schoolchildren, lyceums and colleges, university students, as well as kindergarten teachers, school teachers, college lyceum teachers and university professors also provide distance education and upbringing without interruption in their activities, using distance and e-learning. [5, p. 91-93]

### ABSTRACT

*The article describes integration relevance and opportunities (differentiation), differentiation (stratification) and distance education in foreign educational practice. A computer is a simple and convenient way to access data. The person working with the data should be able to get it, no matter where the data is located, whether it's in the city or anywhere else in the world. These and other similar problems are now being solved with the help of computers. This new structure is created by synthesizing elements that were previously separate". Genetically integrated, interdisciplinary, interdependent, and ultimately complementary, expansive, and deepening, is a form and logically complete content level that synthesizes the subjects content at least at the educational standards level. It is not easy to cover the level of misbehavior among students in Japanese educational institutions. In Japan, the environment of educational discipline does not directly affect student achievement. After all, students who have experienced violence have lower test scores than those who have never experienced violence.*

**KEYWORDS:** *Integration, Differentiation, Distance Learning, Pedagogy, Didactics, Methodology.*

### INTRODUCTION

Human society development modern level is reflected in the radical changes taking place in all social life spheres in our independent republic. Such changes are undoubtedly closely related to well-rounded personality formation. This issue is reflected in "Education law " and "National Training Program".

Finding solutions to the socio-economic, ideological, political, educational problems facing human society, as well as the people of our independent republic today depends on the

interdependence and interaction of natural, social and technical sciences. Because all of them are structural in nature, content, nature, form and scale, they can be studied and solved using the right approach. This, in turn, implies systematic approach use in education.

Numerous sources, in particular the analysis of pedagogical practice areas, testify to problems existence that hinders the educational process development. This is mainly due to the fact that, in our opinion, some aspects and properties of the studied objects are formed in fragments form, which are not logically connected and systematized. An integrated approach plays an important role in overcoming such situations in practice. Although the concept of "integration" was used in science by G. Spencer as early as the eighteenth century, it was not given sufficient importance until recently, as required by the times.

From a scientific point of view, integration basis is the universe integrity and constituent elements interdependence. According to well-known Russian psychological scientist G.S. Kostyuk.

"Differentiation leads to an increase in mental processes and states (features), integration-regulation, subordination and the results placement in a certain sequence. Through integration, a new psychological process, a new structure of activity is formed. This new structure is created by synthesizing elements that were previously separate". Genetically integrated, interdisciplinary, interdependent, and ultimately complementary, expansive, and deepening, is a form and logically complete content level that synthesizes the subjects content at least at the educational standards level. Because of any interdisciplinary connection lower level is established between certain didactic units within the studied subjects framework, it involves the content coordination and timing of their study, in contrast, an educational subject organized on integrative connection or an object basis, event or process being studied in an integrated way requires interpretation in terms of relations and relationships comprehensive system, integrated system. This, in turn, allows you to form a qualified professional person who meets the requirements of the present and the future, who thinks independently and works creatively. Because it requires learners not only to perform operations of analysis and synthesis, but also high-level thinking operations such as abstraction, algorithmization, categorization, expression using conditional symbols, identification of causal relationships, analysis, synthesis, systematization, modeling. These operations are carried out by distinguishing (stratifying) all the important aspects and features of the object under study, understanding the essence and content and generalizing them. This means that integration always develops on the basis of differentiation, which is the other side of it, or vice versa.

Pedagogical scientists and practitioners recommend studying the issue of integration in the following areas:

- a) Content within the range of subjects and disciplines integrated learning;
- b) Persons studying various subjects integration of activities;
- c) Integration of forms of organization of educational work, etc.

### **Main part**

Each of these directions has a clear purpose and requires an appropriate form, method, means and conditions to achieve it. It should also be noted that in practice, the intended purpose can be achieved only if they are used properly.

In the field of pedagogy since the 80s of the twentieth century, scientific works have appeared that use such concepts as integration, "interdependence", "interaction", "synthesis", and the urgency of the problem of integration in educational work began to be felt. Until now, the idea of an integrated approach to the work of education has become a matter of universal importance, not limited within the framework of private sciences.

Integration (Lat. Integration-restoration, filling, merging. Integer-whole) is understood in the sense of synthesizing and uniting as a whole, making it a logical whole. Integration of the content of education means the synthesis of the content of interdependent, interdependent, expanding, deepening subjects, that is, logical integration into a single whole.

Integration (integration) and differentiation (stratification) do not exist in isolation from each other, nor do they arise from each other, but they always appear at the same time as two sides of the object under study. In scientific knowledge, one of them may also have a temporary definite advantage. Both sides of the problem can be shown as a result of the development of science and technology, the emergence of different professions in agricultural production, ie stratification, mechanization, automation and more joint professions or the dialectical development of highly qualified specialists.

The process of integration, in contrast to the interaction of modern scientific knowledge, can take place in the following areas:

- As an internal scientific development within a separate science;
- Within the framework of interdisciplinary interaction, within one or more areas;
- Within the framework of special integrated scientific knowledge.

The combination of the above directions can be thought of as an integrative approach. It may be the result of merging-integrating processes taking place in two or more relatively independent parts.

Integrative connections are also important in building an integrated system, and they are also called internal scientific connections. The main purpose of systematization is to create integrity through the regulation of internal scientific relations. The integrity created in this process will have new quality indicators. The essence of integration is to achieve a new level of learning outcomes as a means of theoretical synthesis.

The integrated study of specialty disciplines is aimed at solving the following issues:

- study the essence, content and conditions and means of integrated study of disciplines related to the specialty;

- To get acquainted with the scientific-theoretical and pedagogical-methodological bases of integration of the content of different disciplines;
- To prove the relevance of knowledge in the integrative increase of the level of educational activity, independence and knowledge of students;

-identification of requirements and opportunities for the synthesis of socio-economic, organizational, psychological and pedagogical, technical and technological knowledge.

In many cases, integrative, systematic and integrated approaches in educational work are interpreted as synonymous. The commonalities of these concepts are the various aspects, aspects, and properties of the objects being studied. But they also differ in essence.

The implementation of an integrative approach in the educational process can be carried out with knowledge of the internal and external relations of the system or the whole object of the existing form, the laws of its organization and management. An integrated approach to the training of junior specialists is used to ensure the integrity of the knowledge, methods of action and personal qualities and qualities of the specialty.[1. 13-18]

An integrative approach is used to integrate content-bound, interconnected, logically interdependent, and mutually reinforcing and expanding disciplines that incorporate holistic logic, perfect knowledge, action patterns, and personal qualities.

The effectiveness of the subject "Pedagogy" as an integrative science depends on how it solves the following problems:

1. The role of each integrative subject in ensuring the solution of any task;
2. Subordination of relatively narrow subjects to a common goal in the process of integration of didactic tasks;
3. Integrated development of methods, forms, techniques, tools and conditions for the study of an integrative subject.

In conclusion, there are commonalities between the structural, integrated, and integrative approaches, as well as specific differences. In general, an integrative approach can be seen as the result of a systematic and integrated approach.

The didactic study of the problem of integration requires its interpretation as a principle of education. From a methodological point of view, integration is the study of conditions and methods that improve the educational process and guarantee the desired result.

The integrative approach is carried out in conjunction and in harmony with didactic principles such as scientific, professional orientation, polytechnicism, membership, regularity, system aticity, demonstration, comprehensibility, stratification. The integrative approach, in turn, never gives the teacher a ready-made recipe like other didactic principles, but uses it to determine the solution of didactic and methodological problems.

The integration of the content of the study material as a didactic process is a multifaceted, multidimensional, system-shaped object of research. Its analysis (study) requires a systematic-structural approach. Because its function, composition, structure, and similar important properties are to be studied. The integration of special disciplines involves the synthesis of the most important and general ideas, problems, rather than the synthesis of all their characteristic features.

Integration is manifested as a means of theoretical synthesis, carried out within the boundaries of individual disciplines, and in the form of interdisciplinary synthesis, which involves the direct formation of general scientific knowledge. It is a high level of integration-synthesis. In the

process of cognition, analysis is manifested as the division into parts, and synthesis as their aggregation (generalization).

During the transition to the new curricula and programs implemented in our country, the issues of harmonization of relations between society and the environment, the establishment and formation of a serious attitude to the environment will play an important role.

Gegel presents style in philosophy as a form of content movement. In the learning process, through different systems, the teacher and with it the students express their knowledge, abilities and skills in the form of deduction, induction, synthesis, generalization, definition, comparison.

All logical processes form the inner side of the style that is inextricably linked with the content. The learning process in the primary grades is characterized by a variety of methods, techniques and forms used.

It is well known that the foundation of a serious relationship with the environment is taught in the primary grades. Therefore, the outcome of education depends on the 1st stage of school education. New psychological and pedagogical research allows us to review the previous understanding of the limited learning activities of young school students. This lays the foundation for changing and updating all components of primary education. A key issue for such an update is to identify a goal that meets the age characteristics of the primary school students and meets the course requirements.

A number of works are devoted to interdisciplinary and intra-subject relations in primary education. These challenges are an area of imminent development in the transition to the integration of academic disciplines. There is a lot of controversy among scholars about the importance of the integration links of primary school sciences.

Let's look at what integration is as an event in terms of terminology and methodology.

Integration is derived from the Latin word integration, restoration, replenishment, integer-whole. We have two concepts in this regard:

1. A system is a concept that expresses the state of interdependence of individual stratified parts and functions of an organism and the process that leads to that state.
2. The process of convergence of disciplines carried out in conjunction with stratification processes.

An integrative approach reflects the objective integrity of systemic relationships at different levels. (nature-society-man). It leads to an increase in the level of integrity and coherence of the system elements.

During integration, the volume of interdependence increases and is regulated, which regulates the performance of system components and the integrity of the learning object. Modern didactics and methodology emphasize that the success of teaching, development and upbringing of students depends on the formation of their understanding of world unity, the need to conduct their activities on the basis of general laws of nature, to solve interdisciplinary and interdisciplinary links in science. Integration in education is considered through a systematic approach to the design of the content of academic disciplines.

Different levels of integration are distinguished: primary is combining elementary knowledge about nature; intermediate is integration of divisions of disciplines; final is the integration of the final stage of education associated with the study of natural sciences. At the same time, the possibility of a fuller and wider integration of science education is not ruled out.

The simplest of the connections that form the simplest knowledge of nature or object is a local imagination bounded by a particular place or concept. This connection is separate from other knowledge and therefore provides the simplest mental activity. This is typical of a small school age. The cross-sections that belong to a system are the simplest structural cross-sections. They are formed on the basis of the study of a subject, object or event. Knowing an object, selection of new evidence and concepts is done by comparing them with one knowledge. The simplest generalization of knowledge occurs, but it would be just as useful if the knowledge gained was linked to knowledge that was all close to it. This results in students' analytical and generalization activities. Intuition within the system ensures that students know the whole system of sciences (physical, chemical, biological, knowledge system), there is a wide use of knowledge in the studied discipline. The cross-sections within the system reflect time, environment, and numerical relationships. Interdisciplinary perceptions are the highest stage of mental activity. They combine different systems of knowledge, allowing us to know the diversity of an event or process. Based on this knowledge, general concepts emerge. The formation of inter-systemic perceptions allows them to use knowledge, to subordinate them to each other, to limit the gaps in the boundaries of knowledge.

Using the stated psychological evidence, it is possible to identify the main features of the integration of primary, incomplete secondary and high school education. S.P.Baranov, L.R.Palatin, V.A.Slastenin's book "Pedagogy" shows a link to the science used in the lessons, but does not reflect the problems of integrated education.

From the views of scientists, it can be concluded that integration-differentiation processes together with the process of convergence and linking of sciences is a high form of interdisciplinary communication, which helps to create new, whole, integrated sections.

Integration between subjects does not negate the system of subjects, and such an approach, aimed at deepening the connections and connections between subjects, is based on understanding the relationship between differentiation and integration, as a way to improve the system of integration, to overcome shortcomings.

The purpose of pedagogy is to assist teachers in carrying out integration aimed at bringing together elements and parts of different disciplines with the same objective tasks. Many years of observations show that primary school students, and later graduates, find it difficult to study one subject or another, lacking the skills of independent thinking, similarity to acquired knowledge, or the ability to move to new situations.

All this is happening due to the mismatch of lessons in different subjects during the lesson. In this case, integration is not the transfer of knowledge from one subject to another and the exchange of activities, but the process of creating new didactic equivalents that reflect the direction of integration of modern sciences. While some scholars focus on the importance of integrating school education, some see integration as a means of effectively organizing the lesson, a form of taking subject relationships to new heights.

Hence, integration is a source of finding new evidence that confirms or deepens a student's observations and conclusions in a variety of disciplines. They prevent students from getting tired and nervous by alternating different forms of activity.

### **Differential education**

The creation of public secondary schools in developed countries has exacerbated the problem of educational differentiation. This situation has led to the need for a different system of quality levels of general education diversification. Enhancing and complicating differential training according to students abilities, interests, and mastery has become a global trend of the modern school.

The main forms of differentiation are the division of educational institutions into different types, streams and profiles within a school, and groups into classes. The problem of differential education is not the same solution and has contradictions. Social differentiation becomes a method of social choice. The system of paid education and examinations is a means of selection. Usually stratification (differentiation) begins after graduating from primary school. It is carried out in different types of educational institutions. For example: grammar and modern schools in England, real school, gymnasium and basic schools in Germany, technological, vocational and general education lyceums in France, ordinary high school, lyceum, college, gymnasium in Russia, etc. The main hallmark of differentiation in these educational institutions is the programs. Differentiation is widespread within an educational institution. For example, large high schools in the U.S. and Japan have 2 types of general education and special programs. They explore different groups of students in different perspectives. In Germany, the gymnasium offers 6 profiles of education, while the primary school carries out the differentiation on the basis of the PEBP system. According to him, education is organized according to the following options of the program: professional course (K), extended course (K), basic course (A), personalized course (M). Incomplete high school is a means of differentiation. In the 1930s in the United States, in the 1950s in Japan, in the 1970s and 1980s in Western Europe, and in the 1990s in Russia, educational institutions began to appear with differential education. We are talking about a small high school in the US and Japan, a joint school in the UK, a single college in Germany, a 6-year high school in Russia. In such educational institutions, students aged 11-12 to 15-16 are taught. The pedagogical complications of stratification in these educational institutions are positive. With a natural goal-oriented nature, the capabilities of different groups of students are taken into account. The general program is designed to increase the level of preparation of students. For example, the percentage of good graduates in the first single colleges in France was higher than the number of good graduates in parallel educational institutions of the same age. Incomplete secondary education is provided in small secondary schools in the United States and Japan. This program has a number of advantages. Elective subjects include continuing education or starting a career.

In the late 1950s, a group of educators led by D.J. Konant proposed a comprehensive school model. According to this model, all children, regardless of social status, abilities, interests, study in a general education institution, but a variety of educational programs are implemented. Conant's recommendations were used to introduce differential education in small secondary schools in the United States. In the UK, integrated schools include small grammar classes and modern schools. In the first 3 years, students are engaged in a modern school program, then

either continue this program, or study in a grammar school program. In joint schools, 90% of teenagers are engaged by age.

In Germany, 5% of students are educated in general schools by age. Cooperative and integral types of general school have emerged. Cooperative schools combined basic, real schools and gymnasiums. After 9th grade, students receive a diploma just like in elementary school, and after 10th grade, the diploma is equivalent to the middle school of a real school and gymnasium. Classes in cooperative schools are a combination of compulsory and elective programs.

In France, group education is organized on a regular basis in single colleges. Different types of groups are formed: homogeneous groups - the same level of readiness, semi-homogeneous groups - close, the level of heterogeneous - different. Divided into groups on the recommendation of teachers, psychologists, counselors in the field. The groups master the school program options. There are strong and weak stage groups in the two graduating classes. The next types of education are recommended to college students who graduate from these two different groups.

Group education has a good position in Japanese schools, it is organized in the form of competitions. The groups in the class compete in memorizing many English words, hieroglyphs, and poems. Ratings are given to the whole group. Japanese educators look at group education from different perspectives. Group education is considered to be pedagogically correct, but there is a risk of narrowing the worldview of children and adolescents engaged in groups. For example, when a group is divided into a strong and a weak group, 2 situations occur: either the strong or the weak are focused, which is detrimental to both groups.

### **Educational Discipline in Chile (Florence Torch, Alexandro Mizala)**

The Chilean education system has a unique organizational structure. The Chilean education system underwent organizational changes in 1981, meaning that the education system, which was centrally controlled by the government, was transferred to a universal voucher system controlled by local authorities. Today, educational institutions are divided into socio-economic strata. These include public schools for the poor, public schools with vouchers for the middle class, and private schools for the rich. The high rate of violence among students in Chile may be the result of widespread bullying in Chilean schools. While Chilean schools are characterized by sharp stratification, the order in schools where the rich study is not much different from that in lower schools. In turn, the rate of disorder in the countryside is much lower than in the city [2. 74-80]

### **Educational Discipline and Achievements in Israel (Yossi Shavit, Carmel Blank)**

There is a strong and significant link between the disciplinary climate in Israeli education and student achievement. The test results show a negative correlation between supervisors' reports on student engagement and teachers' class discipline reports. Violence among students and against teachers by students has been widely covered by the media in recent years. Israeli students receive mixed information about obedience and respect. In schools, Israeli students are assessed in the same report for both discipline and science. In turn, students can be expelled if the grade for the discipline is below a satisfactory level. On the other hand, Israelis attach great importance to the culture of patient youth who value independence and courage [2. 104-107]

---

**Presence, discipline and activities of immigrants in Italian educational institutions (Paolo Barbieri, Stephanie Sherer)**

Violence among Italian students is a major obstacle to academic performance. The negative impact of high levels of violence is an acute issue in the activities of immigrant students. They face more violence than Native Italians and their academic performance is also relatively low. Immigrants in Italy come from all eras of the world. Most of them came from Morocco, China, Romania, Ukraine, Moldova, India and the Philippines. The difference between northern and southern Italy is also dramatic. The South lags far behind the North in having fewer financial resources than the North, and this backwardness can also be seen in education.

In the south, students, teachers, and leaders report higher levels of disorder than those in the north. [2. 138-143]

**Educational Discipline and Academic Achievements in Japan (Hiroshi Ishida, Satoshi Miva)**

It has been shown that the incidence of disorder and crime in Japanese educational institutions is very low. The high level of education in Japanese schools is due to the high demands on parents and school staff, as well as the hierarchical ordering in secondary and post-secondary education. It is not easy to cover the level of misbehavior among students in Japanese educational institutions. In Japan, the environment of educational discipline does not directly affect student achievement. After all, students who have experienced violence have lower test scores than those who have never experienced violence. [2. 163-170]

**Educational Discipline Environment in Holland, Educational Challenges, and Academic Achievements (German G. Van de Verfborst, McBteld Bergstra, Rene Veenstra)**

The fact that the educational disciplinary environment in Holland has only a small impact on student performance shows the independence of its influence on the composition of the student group, and the unique structure of Holland education system shows that student activity is limited. The education system in Holland is highly standardized; however, there is more room for school-level autonomy. There is a dramatic difference in education. A high level of educational security is provided in educational institutions that offer only academic orientation compared to both academic and vocational-oriented educational institutions. In general, the Holland is characterized by a very high level of cultural tolerance [2. 180]

**Distance learning**

The world is evolving so fast now that today's innovation is becoming obsolete tomorrow. Therefore, in order to obtain information in a timely manner, mankind has created information technology. A computer is a simple and convenient way to access data. The person working with the data should be able to get it, no matter where the data is located, whether it's in the city or anywhere else in the world. These and other similar problems are now being solved with the help of computers. Computers are rapidly penetrating all aspects of human life and their number and scope of application in the world is expanding exponentially. This allows computers to evolve day by day. All this has an impact on the education system as well. Nowadays, it is necessary to change the information technology in order to have a thorough knowledge, because the education system must always meet the requirements of the times. The modern requirement is a new learning environment, that is, the acquisition of knowledge in any place with the help of new

---

information technologies, communication with voluntary educational institutions and obtaining information from anywhere in the world. The Internet can help us with this. Through the Internet, it can be observed that schools, colleges and educational institutions where the education system has been established are now being merged into the evolving 'virtual schools'. This reduces the distance between educational institutions and ensures maximum data exchange.

The introduction of new technologies in education leads to the emergence of new educational technologies and forms of teaching based on electronic means of information transmission and processing.

Distance learning uses technical tools and technologies such as trainers, testers and communication tools. Teaching aids include annotated dictionaries, search tools, e-learning manuals, video courses of lectures, and more. Test tools include test questions, self-test tools. The means of communication are forums, mail, audio and videocassettes.

In distance learning, the teacher performs the function of teaching and testing tools (fully automated, complete software products), as well as performs video and electronically published methodological material that forms an automated learning environment.

The possibilities of the e-textbook can be expanded with the use of modern means of animation and video. These can be video lectures on the training course, demonstrations of production processes, speeches of famous scientists, and more.

Didactic programs for modern computers (electronic textbooks, computer assignments, multimedia electronic textbooks, etc.) are among the multimedia teaching aids. Multimedia provides a highly comfortable and visual presentation of didactic material, which in turn increases students' interest in learning.

Until recently, concepts such as distance learning, distance learning, open learning, etc. were almost inseparable. But so far, distance education has proven its importance and necessity. But so far, the question of whether it is a form of education or a technology remains relevant. Because the concept of this question depends on the strategy of distance learning, implementation tactics and the readiness of teachers to work in distance learning.

At present, it is described by researchers and practitioners of distance education as follows:

Distance education is a synthetic, integrated, social form of education in the widespread use of traditional and new information technologies and their technical means, used in the delivery of educational materials, independent learning, communication between teacher and student. Distance learning is built with the same goals as in the context of full-time education (if it is built on a curriculum that is appropriate for learning), but the form of material delivery, the form of interaction between teacher and students, as well as students will be different. The basic didactic principles of distance education are the same as other types of education, but the organizational principles of distance education are different, they are specific to distance learning, because they are characterized by form features, Internet media capabilities, its services (chats, forums, email, videoconferencing). Specific features of distance education include modularity, mastering the role of a teacher, distance separation of subjects of the learning process, virtual cooperation of education, establishing their own control over the control exercised by the teacher, the use of modern special education technologies and tools.

The main areas of use of distance learning include:

- Professional development of teachers in certain areas;
- Preparation of schoolchildren for certain subjects in the expert examination;
- Preparation of schoolchildren for admission to educational institutions of a certain direction;
- Organization of school education for students;
- Additional training on interests;
- retraining;
- Professional training.

Comparing the forms of distance and distance learning with distance learning, it can be concluded that distance learning, learning based on the use of personal computers, video and audio technology, space and fiber optic technology can be seen as a new stage in the development of distance learning.

Distance learning differs from the form of distance learning in that a significant part of the material is not independently mastered, but is carried out in constant communication with the teacher (telephone and Internet, online consultations in lectures and seminars). Also, the main differences between distance learning and distance learning are constant communication with the teacher using telecommunications, the ability to communicate with him promptly on any questions that arise.

There are new types of educational institutions in developed countries. Such educational institutions became known as "open", "remote" universities, "electronic", "virtual" colleges. They have a unique organizational structure and use appropriate pedagogical methods and economic mechanisms.

## CONCLUSION

In the world educational experience, the issues of differential and integrated education, in particular, the main directions of development of world education, the essence of the content of differential and integrated education as a pedagogical problem were studied and the following conclusions were drawn:

1. Integration (Lat. Integration-restoration, filling, merging. Integer-integral) is understood in the sense of synthesizing and uniting as a whole, making it a logical whole. Integration of the content of education means the synthesis of the content of interdependent, interdependent, expanding, deepening subjects, that is, logical integration into a single whole.
2. Genetically integrated, interdisciplinary, interdependent, and finally complementary, expansive, and deepening is the form and level of logically complete content that synthesizes the content of subjects at least at the level of educational standards. A learning subject organized on the basis of integrative connection or an object, event or process being studied in an integrated way requires interpretation in the form of a holistic system in terms of comprehensive connection and relationship. This, in turn, allows you to form a highly qualified professional who is an independent thinker and creative person who meets the requirements of the present and the future.

3. Integrative education requires learners not only to require analysis and synthesis operations, but also high-level thinking operations such as abstraction, algorithmization, categorization, conditional expression, causal relationship identification, analysis, synthesis, systematization, modeling. These operations are carried out by distinguishing (stratifying) all the important aspects and features of the object under study, understanding the essence and content and generalizing them. This means that integration always develops on the basis of differentiation, which is the other side of it, or vice versa.

4. Integration and differentiation do not exist in isolation from one another, nor do they arise from one another, but they always appear at the same time as two sides of the object under study.

5. The authors of the integrated curriculum try to integrate all the adjacent curricula around the core subject and idea, which helps students to think creatively.

6. Developed countries recommend in-depth courses in specific subjects as well as the inclusion of integrated courses in the curriculum. For example, in Western European countries, 15 percent of students study physics in depth.

7. The main purpose of the use of step-by-step differentiation technology is to teach each student at the level of their capabilities and abilities, as a result of which each learner will have the opportunity to acquire knowledge and realize (apply) their personal potential.

### **Recommendations**

1. Foreign experience shows that haste in the process of restructuring the content of education is unacceptable. We believe that a more effective way in this area is to create curricula based on integration and specialization.

2. In the pedagogical process, an individual and differential approach to students is an important factor in the development of personality, because such an approach implies the ability to see the talents and abilities in children, to create conditions for personal development.

3. Differentiated learning differentiation should be widely used at different stages of the learning process: learning new material, differentiated homework, measurement of knowledge in the classroom, current verification of the subject, independent and control work, work on mistakes, reinforcement lessons.

4. Often, when homework is requested in the classroom, gaps in students' knowledge are sought. In fact, achievement, knowledge, skills need to be determined, because when homework is requested, the main task is to teach, help and support. At this point, it is necessary to use differential teaching methods when asking students for homework.

5. Differential education should be carried out in order to know the individual characteristics of students, if necessary, to achieve a corrective effect, which requires teachers to study the individual abilities and learning opportunities (level of development of attention, thinking, memory, etc.), knowledge, skills, competencies .

6. Differentiated education is the organization of the learning process taking into account the leading characteristics of the group of students, while individual education is provided depending on the abilities and talents of each student. Therefore, in order to effectively organize differential education, it is necessary to create new versions of the program, textbooks, didactic materials.

## **DETERMINANTS EFFECTING COMPANIES' LEVERAGE: A STUDY OF PANEL DATA IN SRI LANKA.**

**Lingesiya. Y\***

\*Lecturer

Department of Financial Management,  
Faculty of Management Studies and Commerce,  
University of Jaffna, SRI LANKA

### **ABSTRACT**

*The purpose of the study was to carry out empirical testing, to find the factors that influence financial leverage of Sri Lankan companies. The sample covered 72 companies listed on Colombo Stock Exchange (CSE) and the analysis was based on the year end observations of five consecutive years running from 2006-2010. In this study, panel data methodology was used and six variables profitability, tangibility, risk, non-debt tax shield, size and age of companies were analyzed as the firm specific determinants of the companies' financial leverage. This paper was studied determinants of total debt ratio (leverage) as well as determinants of short term and long term debt ratio. Fixed effect regression analysis was applied for explanatory variables to measure their effect on leverage ratio. Three of variables were significantly related to leverage ratio whereas the remaining three variables were not statistically significant in having relationship with the leverage ratio. Analysis illustrated that variables of non-debt tax shield revealed a positive association with the leverage ratio, however, profitability, and tangibility revealed inverse relation with debt level. Risk, size and age of companies were not statistically significant to determine the leverage of companies. There was significant differences in the determinants of long and short term form of debts.*

**KEYWORDS:** *Financial Leverage, Determinants, Listed Companies*

### **1. INTRODUCTION**

Theories of capital structure give explanations in questions like how much companies should borrow, what is the relationship between capital structure and company value, how companies choose their capital structure and so on. Even there is no exact formula available for the

establishing optional target debt and capital ratio, empirical studies indicate all influencing factors should consider when formulating capital structure policy.

The purpose of this study was to find the factors that influence financial leverage of Sri Lankan listed companies. It was attempted to find whether companies' features are important concerning financial borrowing. Financial leverage, in the context of this study was defined as the degree to which a firm utilizes borrowed money as leverage has been measured by Gill and Mathur in their study in 2011. Reasons for listed companies have taken into the consideration to this study is listed companies are contributing much for the Sri Lankan economic growth. In 2010, the Sri Lankan economy recorded an impressive growth of 8.0 per cent, the highest annual rate of growth reported in the last three years. It shows burgeoning growth after ended 30 years lasting civil war in May 2009 and moves to a higher sustainable growth path. All key sectors of the economy demonstrated a commendable performance in 2010, underpinned by the peaceful domestic environment, improved investor confidence, favorable macroeconomic conditions and gradual recovery of the global economy from one of the deepest recessions in history( Central Bank of Sri Lanka annual report – 2010). The Colombo Stock Exchange (CSE) is only one Sri Lankan stock exchanges financial market which has 241 companies representing 20 business sectors as at 31st December 2010. CSE has a responsibility to the nation at large to serve as a dependable platform for capital market activity whilst evolving towards a more robust and sustainable future. The improved performance of CSE's all key factors contributed towards the economic growth in 2010. The CSE rose to activity at the historically high levels in 2010, and the CSE became one of the best performing stock exchanges in the world with all indicators recording high performance. Such a superior corporate performance need to develop for the country's economic growth. To organize the enhanced corporate performance effectual investment decision making is fundamental to corporate survival and long term success. In this situation capital structure policies are decisive to boost corporate performances.

## 2. Previous studies

“Capital structure basically refers to the combination of funds, in the form of debt and equity, a firm uses to finance its assets investments” (Muzir, 2011 pp.87). Further, Muzir argued that that capital structure choice that provides the greatest appeal to investors and shareholders results in the lowest cost of capital and maximized firm value in presence of efficient investment strategies and is called optimal capital structure. In another way, capital structure refers to a mixture of a variety of long term sources of funds and equity shares including reserves and surpluses of an enterprise (Brealey and Myers, 1992, Gitman, 1997). From this point, the researchers found that it is important to study the financial decisions of the managers in determining the ratio of debt, the impact on the cost of funds and therefore the market value of the business and the indicators of the companies when they are choosing the company's financial structure.

Research on the theory of capital structure was pioneered by the seminal work of Modigliani and Miller (1958). Significant empirical and theoretical extensions followed and the broad consensus paradigm, at least until recently, has been that firms choose an appropriate (optimal) level of debt, based on a trade-off between benefits and costs of debt. The main benefit associated with debt was the tax advantage of interest deductibility. More recently, it has been argued that the monitoring engaged in by lenders was another significant benefit associated with debt, as this may reduce the agency costs of manager-stockholder conflicts (Jensen, 1986). The costs of debt

include bankruptcy and agency costs. According to this view, the leverage decision is fundamentally an exercise in balancing the costs and benefits at different levels of debt. Gill and Mathur (2011) indicated in their study, capital structure choices are the tough choices because higher leverage can lead to risk of bankruptcy. They explained further this does not mean that financial leverage is always bad. Financial leverage can increase shareholders return on investment and often there are tax advantages associated with borrowing. Therefore, financial leverage decision is important and a firm can use a specific mix of debt and equity to finance its operation (Abot, 2005 cited in Gill and Mathur (2011)).

### **Determinants of Capital structure/ financial leverage**

#### **Profitability**

The pecking order theory, based on works by Myers and Majluf (1984) suggests that firms have a pecking-order in the choice of financing their activities. This theory states that firms prefer internal funds rather than external funds. If external finance is required, the first choice is to issue debt, then possibly with hybrid securities such as convertible bonds, then eventually equity as a last resort (Brealey and Myers, 1991). This behavior may be due to the costs of issuing new equity, as a result of asymmetric information or transaction costs. There are conflicting theoretical predictions on the effects of profitability on leverage (Rajan and Zingales, 1995), while Myers and Majluf (1984) predict a negative relationship according to the pecking order theory, Jensen (1986) predicts a positive relationship if the market for corporate control is effective. However, if it is ineffective, Jensen (1986) predicts a negative relationship between profitability and leverage.

#### **Asset structure/ tangibility**

The asset structure of a firm plays a significant role in determining its capital structure. The degree to which the firm's assets are tangible should result in the firm having greater liquidation value (Titman and Wessels, 1988, Harris and Raviv, 1991). (Bradley et al., 1984) assert that firms that invest heavily in tangible assets also have higher financial leverage since they borrow at lower interest rates if their debt is secured with such assets.

#### **Non-debt tax shield**

According to Modigliani and Miller (1958), interest tax shields create strong incentives for firms to increase leverage. But also the size of non-debt related corporate tax shields like tax deductions for depreciation and investment tax credits may affect leverage. Titman and Wessels (1988) use the ratio of tax credits over total assets and the ratio of depreciation over total assets as measures of non-debt tax shield.

#### **Firm risk**

The level of risk is said to be one of the primary determinants of a firm's capital structure (Kale et al., 1991). The tax shelter-bankruptcy cost theory of capital structure determines a firm's optimal leverage as a function of business risk (Castanias, 1983). Given agency and bankruptcy costs, there are incentives for the firm not to fully utilize the tax benefits.

**Size**

Size has been viewed as a determinant of a firm's capital structure. Larger firms are more diversified and hence have lower variance of earnings, making them able to tolerate high debt ratios (Titman and Wessels, 1988; Wald, 1999). Smaller firms, the relationship between firm size and leverage is also unclear. If the relationship is a proxy for probability of bankruptcy, then size may be an inverse proxy for the probability of bankruptcy, since larger firms are more likely to be more diversified and fail less often.

**Age of Firm**

Age of the firm is a standard measure of reputation in capital structure models. As a firm continues longer in business, it establishes itself as an ongoing business and therefore increases its capacity to take on more debt; hence age is positively related to debt. If the investment is profitable, shareholders will collect a significant share of the earnings, but if the project fails, then the creditors have to bear the consequences (Myers, 2001). To overcome problems associated with the evaluation of creditworthiness, (Diamond, 1989) suggests the use of firm reputation. (Petersen and Rajan 1994) show that leverage decreases with age of the firm, although they cite agency issues as a potential explanation, age of the firm may also proxy for lower information asymmetries. As firms grow older more information regarding their future viability becomes available. Lower information asymmetries imply higher leverage. Bondholders would be more likely to lend to firms they know more about than lending to firms they know less about.

This paper investigates the capital structure of companies listed in the Colombo Stock Exchange. The main objective is to examine the factors correlated with leverage in the cross section. There is limited published work on the determinants of leverage in Sri Lankan companies. Followings are some previous studies related to leverage on the Sri Lankan stock market which has been published in Journals.

**2.1 Related Literature in Sri Lanka**

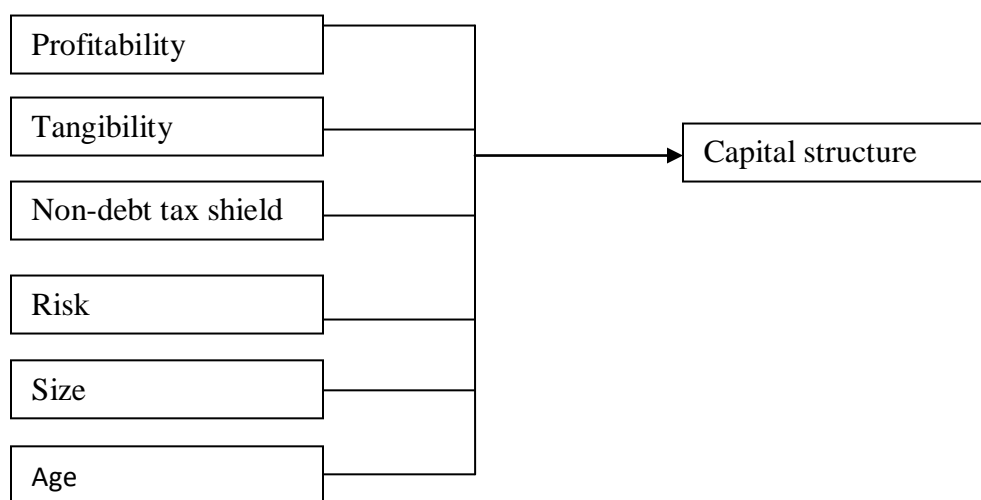

Samarakoon (1997) investigated the ability to market beta, book to market equity, leverage and earnings price ratio to explain the cross sectional variation in expected returns in Sri Lanka. This study is similar to Fama and French (1992). Senaratne (1998) tested the applicability of the pecking order theory of financing in Sri Lanka. The empirical results suggested that Sri Lankan companies follow the pecking order partially. Although companies prefer internal finance to external finance and straight debt to convertible debt, equity is preferred to debt in raising external finance. The study also revealed that Sri Lankan firms consider that ability to pay interest financial flexibility, interest tax savings, restrictions by bondholders, cost of issue as some of the more important factors in the choice of the financing method.

Samarakoon (1999) investigated the capital structure of Sri Lankan companies. He considered profitability, tangibility, firm size, growth opportunities as explanatory variables to determine the capital structure of the companies. His result indicated that the use of long-term debt is relatively low in Sri Lankan listed companies. The tangibility and growth opportunities are not related to leverage. Firm size is reliably positively related to leverage indicating a tendency for large firms to use more leverage. Profitability is reliably negatively correlated to leverage suggesting that more profitable firms tend to use less leverage.

## 2.2 Conceptual frame work

This study examines the factors that influence financial leverage of Sri Lankan firms, a variety of variables that are potentially responsible for determining leverage decision in companies can be found in the literature. In this study, the selection of exploratory variables is based on the current empirical studies on capital structure. The choice is sometimes limited, however, because of lack or relevant data.

Figure 1: Factors which are influencing the capital structure.

This study has tested the following null hypotheses on relations between defined variables and capital structure of companies.

H01: There is no significant relation between the profitability of the firms and financial leverage in the Sri Lankan companies

H02: There is no significant relation between the assets structure (tangibility) of the firms and financial leverage in the Sri Lankan companies

H03: There is no significant relation between the non debt tax shield of the firms and financial leverage in the Sri Lankan companies

H04: There is no significant relation between the risk of the firms and financial leverage in the Sri Lankan companies

H05: There is no significant relation between the size of the firms and financial leverage in the Sri Lankan companies

H06: There is no significant relation between the age of the firms and financial leverage in the Sri Lankan companies

## 3. Methods

Population of the study was listed companies in Sri Lanka. From the listed companies 72 companies were selected in order to carry out the research for the period of 2006-2010. Stratified random sampling method was used to select the sample to show the proportional representation

from different sectors of Colombo Stock Exchange Market. The selection was determined by the availability of data for five years.

Annual data extracted from the financial statements of these companies over five year's period has been used for analysis. The entire set of variables used in this study is based on book values. Myers (1984) advocated that the book values are proxies for the values in place. Panel data analysis allows studying the dynamic nature of the capital structure decisions at the firm level of listed companies.

Secondary data for the study was drawn from audited accounts (i.e., income statement and balance sheet) of the concerned companies as fairly accurate and reliable. Therefore, these data might be considered reliable for the study. Necessary checking and cross checking were done while scanning information and data from the secondary sources. Sample of this study extracted from listed companies in Sri Lanka. Also Sri Lankan Colombo Stock Exchange is functioning under the government rules and regulations and adopting the international and Sri Lankan Accounting Standards. All these efforts were made in order to generate validity data for the present study. Hence, researchers satisfied content validity.

It has estimated equation by the panel data method to obtain the estimates of the parameters of the fixed effect model. The fixed effect model assumes a common slope but each cross-section unit has its own intercept, which implies that the intercepts vary over cross-section units.

Paradigm of this study emanated from positivism as objectives of this study were empirically borne out and observe how the concepts operate. It is clear that this research stands on positivistic epistemological position of the principle of deductivism. On the basis of a positivistic approach to the investigation of knowledge and methodology used, and this paper is mostly appropriate to quantitative study. That is, the knowledge is objective and quantifiable. This study applied co-relational and non-experimental research design. As indicated above the process of measurement is central quantitative research because it provides the fundamental connections between empirical observation and mathematical expression of quantitative relationships.

### 3.1 Mode of Analysis

This study applied panel data regression analysis. As indicated in the study of Song (2005) it has become more and more popular to estimate panel data regression model in economic research, and so also in empirical research on corporate finance. One reason for this is an increased availability of panel data but also an increased awareness of the advantage of panel data over cross section or time series data (Baltagi, 2002 cited in Song 2005).

It is separately considered short term and long term debts. It is cited with the study of Song (2005). He mentioned in his study, Bavan and Danbold (2000), Barclay and Smith (1999), Huchinson et al (1999), Chittenden et al (1996), and Vander Wijst and Thurik (1993) they all argued that analysis of the determinants of leverage based on total debt may mask important differences between long-term and short term of debt. Also, since the cost / benefits of short term debt and long term debt differed to a great extent. Therefore, separate analysis could better explain the relationship.

The following regression equations were used in the analysis.

$$1. LEV_{it} = \beta_0 + \beta PROF_{it} + \beta TANG_{it} + \beta NDTs_{it} + \beta RISK_{it} + \beta SIZE_{it} + \beta AGE_{it} + e$$

$$2. \text{STD\_TA}_{it} = \beta_0 + \beta \text{PROF}_{it} + \beta \text{TANG}_{it} + \beta \text{NDTS}_{it} + \beta \text{RISK}_{it} + \beta \text{SIZE}_{it} + \beta \text{AGE}_{it} + e$$

$$3. \text{LTD\_TA}_{it} = \beta_0 + \beta \text{PROF}_{it} + \beta \text{TANG}_{it} + \beta \text{NDTS}_{it} + \beta \text{RISK}_{it} + \beta \text{SIZE}_{it} + \beta \text{AGE}_{it} + e$$

Where:

1.  $\text{LEV}_{it}$  is total debt divided by the total assets of firm  $i$  in time  $t$ . Total debt pertains to sum of total fixed liabilities and current liabilities except shareholder's equity. Assets included all assets at their book value.

2.  $\text{STD\_TA}_{it}$  is short-term debt divided by the total assets of firm  $i$  in time  $t$ . Short term debt included all liabilities, which are required to be discharge within one year, alternatively, these cover those obligations whose liquidation is expected to be made out of current assets. They are usually incurred in the normal course of business and are required to be paid at fairly definite dates.

3.  $\text{LTD\_TA}_{it}$  is long-term debt divided by the total assets of firm  $i$  in time  $t$ ; Long term debt included all liabilities other than the short term debt and Shareholders' equity.

4.  $\text{PROF}_{it}$  (Profitability) is Earning Before Interest and Tax divided by total assets of firm  $i$  in time  $t$ . Profitability was measured by commonly used ratio by many researchers i.e. Return on Assets (ROA).

5.  $\text{TANG}_{it}$  (Tangibility) is Fixed Assets divided by total assets of firm  $i$  in time  $t$ . It explains the assets structure of the company.

6.  $\text{NDTS}_{it}$  (Non\_Debt Tax Shield) is depreciation divided by total assets of firm  $i$  in time  $t$ ;

7.  $\text{RISK}_{it}$  is Sales divided by operating income of firm  $i$  in time  $t$ ;

8.  $\text{SIZE}_{it}$  is the log of sales for firm  $i$  in time  $t$ . Natural logarithm of sales has been taken as proxy for firm size (SIZE). This measure was the most common proxy for size (Titman and Wessels, 1988).

9.  $\text{AGE}_{it}$  is log of number of years since the date of incorporation of firm  $i$  in time  $t$ . The age of a firm may also have an impact on firm's performance, Stinchcombe (1965) argued that older firms can achieve experience- based economies and can avoid the liabilities of newness. Natural logarithm of number of years since the date of incorporation of the company has been considered as age of companies.

10.  $e$  is the error term.

#### 4. RESULT AND DISCUSSION

**TABLE 1: SUMMARY STATISTICS OF THE DETERMINANTS AND LEVERAGES**

Determinants	Mean	Maximum	Minimum	Std. Dev.
Profitability	0.0985	0.6718	-0.2886	0.1136
Tangibility	0.3321	5.5824	0.0014	0.3845
Non debt tax shield	0.0242	0.4361	0.0001	0.0299
Risk	4.4848	28.3265	0.1220	4.3761
Size	7.7242	10.1812	4.6513	1.4367
Age of companies	1.3069	2.0607	0.3010	0.2891
<b>Leverages</b>				

Leverage (Total debt_ Total Assets	0.4627	1.9967	0.0103	0.2759
Short Term Debt _Total Assets	0.2937	1.9449	0.0058	0.2410
Long Term Debt_ Total Assets	0.1690	0.8802	0.0001	0.16643

Source: Survey data

Average value of profitability over five year period was 9.8 % (it was nearly 10% ) that demonstrate a not remarkable performance of the companies in the period under study because minimum profitability was -28.86%. Mean value of tangibility was 33% which indicated 33% of fixed assets were in the total assets. Only 2% was depreciation on the total assets. Average of short term debt to total assets was 29 % that depicts a noteworthy portion of assets was financed with the short term debt. This suggested that short-term debt tends to be easily available therefore companies used short term debt as their major source of financing. Long term debt to total assets as compared to the short term debt to assets was low i.e. 16%. The under developed nature of the long term debt market might be one of the possible reasons. Overall 46% assets were financed with the debt that depicts listed companies was moderately leveraged.

#### 4.1. Regression Statistics

Results of the regression equations used in the analysis were exhibited in this section. The results were discussed separately that enable us to make comparison of the different debt financing options. The separation of results also permitted us to observe inherited almost opposite characteristics of short term debt and the long term debt

**TABLE 2: ESTIMATION RESULTS OF FIXED EFFECTS PANEL DATA REGRESSION**

Explanatory variables	Total debt ratio	Short-term debt ratio	Long-term debt ratio
C	0.27637 (0.60402)[0.54630]	0.34499 (0.82790)[0.40840]	-0.06348 (-0.31670)[0.75170]

Notes: Base year is 2006. (*t*-statistics) [*p*-value].

#### 4.2 Hypotheses testing

In order to test the hypotheses, considering the probability of *t* test of profitability was less than 5%. Hypothesis ( $H_{01}$ ) states that there is no significant relation between profitability and capital structure. Since *t* test of *p*-value was  $.0146 < .05$ , which illustrated that there was a significant negative relationship between profitability and capital structure as a result  $H_{01}$  was rejected that there was a significant negative relationship of profitability and capital structure ( $\beta = -0.3385$ ,  $p = 0.0146$ ,  $t = -2.4566$ ). This means lower profitable use high debt. This finding is in line with the results of Hammes (1998), Gleason et al (2000), Samarakoon (1999), Majumdar and Chibber (1999) and Biger et al (2008). Findings of this study are inconsistent with the finding of Long and Maltiz (1985) in which they indicated the positive relationship between leverage and the profitability.

Further, result depicted that empirically significant negative relationship existed between the long term debt and profitability ( $\beta = -0.1248$ ,  $p = 0.0395$ ,  $t = -2.0684$ ). It indicated that higher level of long term debt in the capital structure lower the profitability. But there was no significant relationship between short term debt and profitability ( $\beta = -0.2140$ ,  $p = 0.0892$ ,  $t = -1.7055$ ).

Probability of *t* test of tangibility was also less than 5%. Hypothesis ( $H_{02}$ ) states that there is no significant relation between tangibility and capital structure. Since *p*-value of  $.0393 < .05$ , illustrated that there was significant negative relation between tangibility and capital structure as there was clear evidence of the significant negative relationship of tangibility with capital structure  $H_{02}$  was rejected that there was significant negative relation between tangibility and capital structure ( $\beta = -0.1537$ ,  $p = 0.0393$ ,  $t = -2.0703$ ). That means, tangibility is the determinant of capital structure in the Sri Lankan companies. This finding is in the line with the result of Cassar and Holmes (2003). He reported in his study a negative relationship between assets tangibility and debt financing. Findings of this study are inconsistent with the finding of Samarakoon (1999) in which they indicated there was no relationship between leverage and the tangibility.

Further, result illustrated that there was no significant relationship between the long term debt and tangibility ( $\beta = -0.0161$ ,  $p = 0.6195$ ,  $t = -0.4971$ ). But there was a significant negative relationship between short term debt and tangibility ( $\beta = -0.13627$ ,  $P = 0.0448$ ,  $t = -2.01547$ ). It is concluded that tangibility was a significant negative relationship with leverage ratio and short term debt ratio. Even long term debt ratio was negative relationship with tangibility but it is not statistically significant.

According to the result, non debt tax shield significantly positively related with total debt ratio ( $\beta = 1.9172$ ,  $p = 0.0303$ ,  $t = 2.177$ ). Hypothesis ( $H_{03}$ ) states that there is no significant relation between non – debt tax shield and capital structure. Since *P*- value of  $0.0303 < 0.05$ ,  $H_{03}$  was rejected that there was significant positive relation between non-debt tax shield and capital structure. This finding is in the line with the finding of Harris and Raviv (1991). Even though there was no significant relationship between non debt tax shield with long term debt ( $\beta = 0.6086$ ,  $p = 0.1157$ ,  $t = 1.5778$ ) and short term debt ( $\beta = 1.2962$ ,  $p = 0.1071$ ,  $t = 1.6163$ ).

As per the result there was no significant relationship of risk with total debt ratio ( $\beta = 0.0078$ ,  $p = 0.0622$ ,  $t = 1.8726$ ) and long term debt ( $\beta = -0.0022$ ,  $p = 0.2548$ ,  $t = -1.1406$ ). But there was a

significant positive relationship of risk with short term debt ( $\beta = 0.0085$ ,  $p = 0.0259$ ,  $t = 2.2399$ ). Hypothesis ( $H_{04}$ ) states that there is no significant relation between risk and capital structure. Since p-value of .0622 > .05, illustrated that there was no significant relation between risk and capital structure as there was no clear evidence of the significant relationship of risk with capital structure therefore hypothesis ( $H_{04}$ ) was accepted. Finding of the study is in the line with the result of Cassar and Holmes (2003).

As result illustrated in table 2, in this study, there was no significant relationship of size and age with all three debt measures. Therefore hypotheses  $H_{05}$  and  $H_{06}$  were accepted that there is no significant relationship of size as well as age with leverage ratio as there was no clear evidence with the illustrated result. That means, firm size and age of company are not the determinant of capital structure in Sri Lankan companies. This result is consistent with the result of Cassar and Holmes (2003).

Model 1:  $LEV_{it} = \beta_0 + \beta PROF_{it} + \beta TANG_{it} + \beta NDTS_{it} + \beta RISK_{it} + \beta SIZE_{it} + \beta AGE_{it} + e$

For the model 1, value of the coefficient of determination of factors which was; ( $R^2$ ) is 0.7461, whilst this result implied that 75 % percent of the total variance in leverage, could be explained by the selected factors. As the model revealed the remaining 25% of the variability was not explained. An Analysis of Variance (ANOVA), indicated that;  $F = 10.08902$ ,  $p < 0.05$ , that the model was significant. It means that the regression results were acceptable for this analysis.

Model 2:  $STD\_TA_{it} = \beta_0 + \beta PROF_{it} + \beta TANG_{it} + \beta NDTS_{it} + \beta RISK_{it} + \beta SIZE_{it} + \beta AGE_{it} + e$

For the model 2, value of the coefficient of determination of factors which was; ( $R^2$ ) is 0.7240, whilst this result implied that 72 % percent of the total variance in short term debt to total assets ratio, could be explained by the selected factors. As the model revealed the remaining 28% of the variability was not explained. An Analysis of Variance (ANOVA), indicated that;  $F = 9.0077$ ,  $p < 0.05$ , that the model was significant.

Model 3:  $LTD\_TA_{it} = \beta_0 + \beta PROF_{it} + \beta TANG_{it} + \beta NDTS_{it} + \beta RISK_{it} + \beta SIZE_{it} + \beta AGE_{it} + e$

For the model 3, value of the coefficient of determination of factors which was; ( $R^2$ ) is 0.8659, whilst this result implied that 87 % percent of the total variance in long term debt to total assets ratio, could be explained by the selected factors. As the model revealed the remaining 13% of the variability was not explained. An Analysis of Variance (ANOVA), indicated that;  $F = 22.1659$ ,  $p < 0.05$ , that the model was significant.

## 5. CONCLUSION

This paper examined the factors influencing companies leverage using 72 listed companies in Sri Lanka between 2006 and 2010. Three different leverage measures based on the book value have been applied: total debt ratio (leverage ratio), long term debt ratio and short term debt ratio. The empirical evidences provided that there existed significant differences in the determinants of these three leverage measures. The paper searched to fill the gap in the literature as a result of limited studies that had been conducted so far in this area using Sri Lankan data.

On the basis of findings, it was documented that profitability and tangibility are negatively related with leverage while non debt tax shield is positively related to leverage. At the same time risk, size and age of the company did not have significant relations with leverage of the Sri Lankan companies. Also, there was a negative relationship between tangibility and short term

debt to total assets ratio while there was a positive relationship between risk and short term debt to total assets ratio. There was no relationship of profitability, non debt tax shield, risk and age with short term debt to total assets ratio. But profitability only had a significant negative relation with long term debt to total assets ratio. Tangibility, non debt tax shield, risk size and age did not have significant relations with long term debt to total assets ratio. The most interesting finding in the study is thought that there exist significant differences between short term debt and long term debt.

## ARCHAEOLOGICAL STUDY OF THE MONUMENTAL STRUCTURES OF YERKURGAN

**Razhabova Nilufar Nasrillaevna\***

\*Assistant professor of the pulpit to World history,  
Karshi state University, UZBEKISTAN

### ABSTRACT

*In given article are analysed results of the study in settlement Yerkurgan, which is a large monument Kashkadarya oasis. Of particular interest is a fragment of one of the largest sculptures - a life-size brightly painted female face. On the surface of the western column, a number of symbolic signs were found, drawn in black lines on a red background, as well as two silhouette figures of donor-bearers facing the altar. The results of excavation work 3 showed that it was urban Zoroastrian dakhma, which was a monolithic, rectangular, tower-like structure in the upper part 34x23 m in size, built of mud brick and clay. The only factor that shaped the building structure was the street, or rather the road that ran from the inner wall gate to the southeast gate of the outer wall. Only in the VIII century AD some parts of the city settle in again. At the site of the bastion, a round fortified structure with office premises is being built, which is until the X century.*

**KEYWORDS:** Museum-Local History Department, Uzkomstaris, Urban Planning, History, Culture, Ancient Population, Trade And Money Relations, Ruins Of Medieval Cities, Historical And Archaeological Past, Senmurv - Mythological Dog-Bird, Ceramic Finds, Medieval Sources.

### INTRODUCTION

Systematic studies of archaeological sites in the Kashkadarya valley were begun only in 1946, with the inclusion of the topic "Historical topography and archaeological sites of the r. Kashkadarya". In the archaeological work of the Institute, this topic occupied a small place: the main task was to identify and initially study the monuments of the region, almost not affected by archaeological research [1].

Work on mapping and fixing all the settlements and cities of the Karshi oasis made it possible to systematically approach the establishment of the role of the central city of Nakhshab in the socio-settlement structures of ancient Sogdian society as a whole.

The largest city of ancient Nakhshab, the vast area of which made it possible to create developed urban development, was the capital Yerkurgan, which represented a sufficient variety of types of monumental architecture. Its structure was determined by monumental high-rise public buildings. Forming the silhouette of the city, they were the main spatial landmarks of social life, functionally being the centers of administrative, economic, ideological and military life, both of the city and the oasis as a whole. These central nodes, which determined the aesthetic imagery and the individual look of the city, were connected by the main street highways, which cut through the ordinary urban development, going out onto the square in front of the main facades of these structures.

The citywide palace and temple complexes of Yerkurgan are unique in their individuality, but the general composition scheme, structural elements and details of their decoration find the closest analogies in the wide region of the Middle East and Central Asia, starting from antiquity.

Most of the Yerkurgan settlement is a system of hills of the remains of urban architecture of public, residential and industrial purposes [2]. In different years, the hill fort was repeatedly examined, which was reflected in monographs, reports and articles.

An important object of study of the Kashkadarya expedition of the Institute of Archeology of the Academy of Sciences of the Republic of Uzbekistan was - "eastern hill", which, as represented by the ruins of the city temple. The excavation laid here showed that on the top of the hill there was a cella of a large city temple, erected in about the 3rd century AD and finally launched in the VI century AD. A significant part of the central sanctuary of the temple was opened. The walls are marked with large and small niches covered by circular arches, and in the center of the south wall a wide entrance was opened.

During the excavation, a complex of cult tools was discovered: ceramic vessels for ritual incineration and incense, vase-shaped incense burners on the leg, lamps in the form of a round stucco bowl with a large loop-shaped roaster handle, bronze mirrors, and individual jewelry. Researchers concluded that the temple was dedicated to a female deity. During each perestroika, the painted clay figure of the deity was broken and their fragments were walled up in the masonry of walls, sufs and floors.

In the stratigraphic pit laid on the temple complex, it was revealed that under this building of the upper construction horizon lay the leveled remains of earlier buildings of a temple character.

In the stratigraphic pit laid on the temple complex, it was revealed that under this building of the upper construction horizon lay the leveled remains of earlier buildings of a temple character.

Continuation of excavations of the city temple of Yerkurgan revealed 5 building periods of the building. Samples of the plot polychrome wall painting were obtained, fragments of ganch gilded and painted clay sculpture were discovered. Of particular interest is a fragment of one of the largest sculptures - a life-size brightly painted female face. On the surface of the western column, a number of symbolic signs were found, drawn in black lines on a red background, as well as two silhouette figures of donor-bearers facing the altar.

In the northwestern part of the city, between its inner and outer ramparts, excavations of a hill 70 m long and 7 m high were started. The results of excavation work 3 showed that it was urban Zoroastrian dakhma, which was a monolithic, rectangular, tower-like structure in the upper part 34x23 m in size, built of mud brick and clay. The southern and eastern facades of the tower, facing the city, were decorated with frequent pilasters. By definition, R.Kh. Suleymanov, dakhma functioned in the II century BC, for a short while and was soon thoroughly walled up, thanks to which it was perfectly preserved in the lower part[3].

In the northeastern part of the settlement, the quarter of ceramists was investigated for the first time examined by S.K. Kabanov in 1947-1948 Excavation No. 5, located in the center of the quarter, revealed the corridor, kilns, a lot of ceramics and coins of the Nakhshab coin from the 5th-6th centuries along the upper level of the building.

In 1974, six excavations were laid at various sites in Yerkurgan, and defense walls were studied at seven sites. In all sections of the internal defensive wall, the original masonry of coarse raw material was revealed, a format that was considered characteristic of the middle of the 1st millennium BC.

Much work on the study of the fortifications of Yerkurgan since 1975 was carried out by M. Turebekov. In the southern part of the settlement, they discovered the remains of the outer wall of the 1st century BC, with rhythmically repeating towers with a radius of more than 5 m from a very durable well-mixed groin [4]. In the southeastern corner of the inner wall of the walls, a citadel of the settlement was excavated, the upper layers of which consisted of early medieval deposits.

At E-5, in the quarter of ceramists (M.Kh. Isamiddinov), in the dump of the ceramic workshop, an extensive series of samples of dishes of the 1st century was obtained. AD: glasses, bowls, goblets, dishes. To obtain comprehensive data on the ceramic complexes of the settlement, the fixation of the material was carried out on micro-layers [5]. In the quarter of the ceramists, another excavation site was laid (E-13), in the lower part of which fragments of molded painted ceramics were found, known from such monuments of the early Iron Age as Yaztepa and Kuchuktepa and dating from the 9th-7th centuries BC. Together with finds from E-5, his materials made it possible to trace the stages of the development of ceramic forms and complexes of Yerkurgan from the late Bronze Age to the early Middle Ages. These findings already indicated the venerable age of Yerkurgan numbering at least 2700 years. M.Kh. Isamiddinov was the first for the western part of South Sogd to develop fractional periodization of the development of ceramic complexes [6]. A detailed comparison of the ceramics of Bactria and Sogd made it possible to trace the development of ethno-cultural ties between the regions.

During the excavations at R-5, a print of the seal on a cone-shaped fragment from semi-burnt clay was found. In the center there was an image, a profile of a person, and along the perimeter there was an inscription in Sogdian writing. It was read by M. Iskhakov as part of the name of the owner of the press and is transmitted in transliteration - "Anush" - the root from which many ancient proper names such as Anushirvan, Anushancha, Anushbam and others come from. "Anush" also occurs in the common sense - "immortal, happy. According to paleography, the inscription dates back to the 5th-6th centuries AD, which corresponds to the last stage of the life of the ancient city[7].

Archaeological work of 1974-1975 on the settlement Yerkurgan allowed to clarify the periodization and the life time of the city. It was found that this earliest metropolitan center of the Karshi oasis appears in the 9th-7th centuries BC, reaches its maximum prosperity in the era of chionites and ephthalites in the IV-VI centuries AD and in the VI century. the conflagration dies in the fire, after which life on it freezes. Only in the VIII century AD some parts of the city settle in again. At the site of the bastion, a round fortified structure with office premises is being built, which is until the X century. served as an observation tower of medieval Nasaf, as it was, for example, in the system of Bukhara Kampirduval and medieval Khorezm.

As the author finds out, the compositional and planning structure of these two main monumental buildings of Yerkurgan belongs to the widespread type of complexes of ancient and early medieval Central Asia, consisting of a hall built on one axis, introducing its lobby or aivan and, further, the courtyard. This basic scheme in the form of a hall with a lobby or a portico in specific cases varies greatly, then, forming the center of the overall composition of architectural complexes, it is sometimes found as an integral element in large complex complexes.

The unique memorial structures discovered as a result of work on Yerkurgan give an idea of the funerary customs of the urban population of Sogd, from the time of antiquity. The first of them in time is the dahma of Yerkurgan. Typologically, it differs from the circle of the above architectural complexes, and chronologically precedes them. DahmaErkurgan II century BC, built and finished in compliance with the basic elements of ancient oriental architecture. As R. Suleymanov notes, it functioned for a very short time - no more than several decades, within the 2nd century BC.

During archaeological work in the quarters of potters and blacksmiths, differences in their structures were noted, which allowed R.Kh. Suleymanov assumed that the quarter of the potters was privately owned and belonged to the producers themselves, as a result of which the structure of its development took shape spontaneously for a long time. The quarter of potters of Yerkurgan has a structure since ancient times characteristic of urban and proto-urban development, dating back to the tradition of the proto-urban stage, when the living and industrial premises of artisans formed an indissoluble whole.

The addition of the smith's quarter in the outer city went a different way. The only factor that shaped the building structure was the street, or rather the road that ran from the inner wall gate to the southeast gate of the outer wall. All artisan farms are built here along the street, on which facades one or two rooms of each of the farms go, the rest go deep [8]. R.Kh. Suleymanov gives summary typological complexes of Yerkurgan ceramics, combining the most saturated and chronologically seasoned collections of layers, giving material of a given time at different excavations of the ancient settlement.

Thus, the observations of R.Kh. Suleymanov's on a systematic analysis of synchronous ceramic complexes of products by masters of different quarters of Yerkurgan, different in origin and function of the utensil complexes of the oasis settlements, within a single time interval, led the author to conclude that the so-called stratigraphic columns of ceramic types used methodically in practice in no way can claim to provide the full amount of information and reflect the whole richness and diversity of the typology of ceramic dishes of a particular era in a particular region.

### ABSTRACT

*According to the task performed, transformers are divided into the following types: 1) Power Transformers 2) Special Transformers. Power transformers in turn: it is divided into general-purpose and sectoral types. Electricity intended for transmission, reception and use of energy change of electrical energy in the network and equipment (voltage increase or decrease) function transformer power it is called a transformer. In this article highlights of improvement of transformer protection elements.*

**KEYWORDS:** *Transformer, Energy, Protection Elements.*

### INTRODUCTION

Transformer (lot. transformo) - in technique-any important property of energy or objects (eg. the device is designed to change the voltage (current, voltage, etc.). Electric transformer, gidro Transform at or, photo transformation, engraving (extremely high frequency) transformer and other types are included. The electric transformer is designed to change (increase or decrease) the alternating current voltage. His work is based on the phenomenon of electromagnetic induction. It consists of a single primary cell, single or multiple secondary cell and basically a type ferromagnetic core (magnetic conductor). All freckles are wrapped in a ferromagnetic core and are inductively connected to each other. Primary wrap ends (transformer input) are connected to the alternating current voltage source, secondary wrap (or wraps) ends (transformer output) consumers. For the first time an electric transformer N.Y.Yablochkov 1876 used in the electric lighting network. M. A. Dolivo Dobrovolsky 1890 created a three-phase electric transformer. Other scientists and inventors later discovered that the transformer could be improved, improved,

and f.i.k.ni they have been doing a great deal of work to increase, improve insulation, compact and so on.

The most common type of electric transformer are power transformers. They are installed on power transmission lines (PTL). Such transformers provide the voltage of the current produced by the generators of electric motors from 10-15 kV to 220-750 kV. The moldings of transformers are made of copper, electro technical steel, from which magnetic conductors are cold rolled. There are dry and oil types of electric transformer. The dry transformer is cooled in the air without oil. The magnetic conductor and conductor of the oil transformer are placed in a bag filled with mineral oil. The oil serves as insulation and cooling.

In addition to power transformers, there are also Transformers such as measurement transformer, voltage transformer, current transformer, impulse transformer, factor transformer.

It is also called small transformer (substation), which is designed to increase or decrease the voltage in the alternating current network as well as dividing power consumers. It will include a power transformer, devices, automatic control and protection device, additional facilities. Strong in some reduction transformer substations with high power, at home compact autotransformers are used.

What are the types of Transformers?

The transformer is mainly the use of electromagnetic induction principles, changing the AC voltage of electrical equipment, the main component is yellow, the two yellow and the core. Its main functions are: voltage mining, current conversion, impedance conversion, insulation, regulation, etc.

Sorting by cooling medium

It is divided into dry type transformers, oil-conducting transformers and air-exchanging Transformers. Dry type transformers usually rely on air convection cooling, which is used for local lighting, electronic constructions and other small-volume Transformers. Oil conductor Transformers rely on oil as a cooling medium.

Accordingly, the pressure regulator points it is divided into a device for changing the non-moving voltage transformer and load cranes.

According to the basic form

- 1) Core transformer: for high voltage power transformers.
- 2) Shell transformer: for large flow Transformers, such as electric furnace Transformers, welding Transformers.

Classified by purpose

- (1) Power transformers.

Mainly in energy systems, for example, improved Transformers, downstream transformer distribution transformers, contacttransformators and plant Transformers.

- (2) Special Transformers.

It refers to the use of other Transformers from electrical systems such as voltage regulators, instrument transformers (voltage transformers and current transformers), mining Transformers, test Transformers, Rectifiers Transformers, electric furnace transformers and rotary Transformers.

Structure and operation of the transformer Devices that change the voltage from one value to the second value without changing the frequency of the alternating current are called Transformers.

In Transformers, two coils are put on a common core (figure 199). This is called the first reel ores – the primary ores, and the second reel ores – the secondary ores.

Connecting the primary switch to the  $U_1$  voltage alternating current. The alternating current forms an alternating magnetic field in the chunks. The magnetic force lines of this wrap go to the secondary wrap on the core.

As a result, a  $U_2$  voltage alternating induction current is formed in the secondary coil. The frequency of this current is the same as the frequency of the current in the primary cell.

The amount of  $U_2$  voltage in the secondary coil depends on the number of dies of the wires in the primary and secondary coil. Experience shows that the number of times the number of ores in the secondary wrap is less than in the primary wrap, the voltage of the current formed in the second wrap is so many times less. And vice versa, how many times the number of ores in the secondary wrap is more than in the primary wrap, the voltage in the second wrap is so many times greater.

The number of dies in the primary cholera is  $n_1$ , the voltage given to it is  $U_1$ , the number of dies in the second cholera is  $n_2$ , the voltage generated in it is  $U_2$ . In that case, the following expression will be appropriate:

$$\frac{n_1}{n_2} = \frac{U_1}{U_2} \quad \text{yoki} \quad U_2 = U_1 \frac{n_2}{n_1}$$

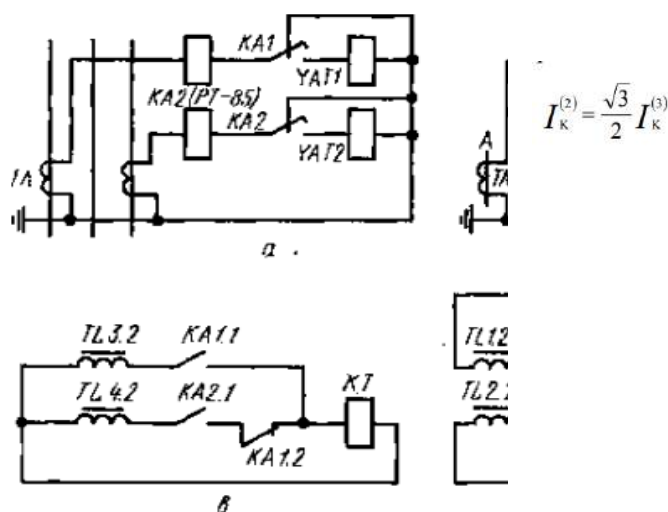

This means that it is possible to change the voltage of the alternating current. This is an important feature of the alternating current.

Basic conditions of maximum current protection account for networks 35, 10 kV non-starter on voltage for reducer transformers maximum buckle protection can also be applied for selection. The protective device current is also detected so, only the reliability improvement coefficient is slightly more acceptable, since the KHC transformer has a voltage regulator.

The determination of the sensitivity K coefficient is determined from expressions on secondary tokens.

In the case of accounting damage, the 2-phase short-circuit mode after the transformer is obtained.

Maximum current in 2-phase short circuit without taking into account the load the relays in the protection schemes are listed in the expressions of the identification of the account currents. The maximum amount of current that can pass through a 2-phase short circuit from the relay steppes is accepted as the calculated current. In order to simplify practical calculations, the table is represented by a 3-phase short circuit current. In the electric network, two-phase clamping can be expressed through a short circuit current of 3 phases:

Schemes for the implementation of maximum buckle protection. a) full Star, b) full star with 3-wire additional relays. c) triangle with 3 relays g) triangle, with 2 relays.

## PEDAGOGICAL TECHNOLOGIES AND PRINCIPLES OF INFORMATIZATION IN EDUCATIONAL PROCESSES

**R. B. Tursunov\***

\*Base Doctorate

National University of UZBEKISTAN

### ABSTRACT

*The article describes the principles and technologies of informatization of educational process in higher education institutions in accordance with modern requirements. The last three years also highlight some of the reforms and advances and shortcomings in education. In the meantime, the quality of information transmission, storage, processing and imaging has increased significantly, while computer literacy has become an important sign of culture. The sustainable growth of the economy is associated with the development of Science and its capacity building. But today, there is no single consensus on increasing scientific technical activity in our country, providing and providing support. Principles of informatization the study of science serves to look for easy, accessible ways to solve the existing problems in it.*

**KEYWORDS:** Education, Training, Development, Information, National Spirit, Modern Methods.

### INTRODUCTION

The growth rates of economic development of our country are highly recognized by the world community. At the same time, it is the result of large-scale reforms aimed at the development of Science, the reform of the educational sphere, the comprehensive support of scientific and innovative activities.

Decree of the president of the Republic of Uzbekistan "on measures to further expand the participation of economic sectors and sectors in the quality of training of specialists with higher education" PE-3151 dated July 27, 2017, as well as attracting doctoral students and junior students conducting scientific research at higher education institutions of the Ministry of Higher and secondary special education of the, priority tasks such as implementation of the order "on improvement of conditions for experimental testing work in research and project institutes" are defined.

Radical improvement of the system of Higher Education, radical revision of the content of Personnel Training due to the priority tasks of socio-economic development of the country, creation of the necessary conditions for the training of specialists with higher education in the country, having an independent, stable life position corresponding to the level of international standards, is a topical issue of today.

If initially it was spent 50-100 years on the introduction of inventions and discoveries into practice, then today there was an opportunity to use them in 10-20 and even in 2-3 year. At this level, the existing circle of knowledge kengay that has emerged the process of “acceleration” of the flow of information. This process is expressed in the phrase “informed society”. [1] While it offers a wide range of opportunities in all spheres of social life, at the same time, it is still necessary to protect today's person from “information attack”. Today's era requires high potential from young people. After all, our President Sh.M. Mirziyoyev noted “innovation means the future. If we are going to start restoring our great future from Steam, we should start it on the basis of innovative ideas, innovative approach.” [2] The changes, reforms and updates that are taking place in various spheres of the social sphere of our modern society are primarily aimed at accelerating social progress.

Currently, with the development of information technology, the existence of only one computer for teaching using technical and software has become sufficient. Previously, the computer successfully assumed the functions performed by television, video recorder, film projector, diaproector and others. In the meantime, the quality of information transmission, storage, processing and imaging has increased significantly, while computer literacy has become an important sign of culture.

Computer literacy is necessary for every person in the future to become a fundamental tool in the way of life and in the process of work. So, computer work, it is no doubt that teaching to use a computer will become a common activity in the nearest time. Among the tools of modern information technologies are: computer, scanner, video camera, interactive electronic whiteboard, fax modem, telephone, email, multimedia tools, Internet and intranet networks, mobile communication systems, database management systems, artificial intelligence systems. Modern information technology tools are mastered in the conscious and planned implementation of certain actions.

Education process the use of pedagogical software serves to improve the quality of education and to increase the interactivity of education based on innovative technologies.

As a result of the implementation of the tasks set before us, in 2019, very large reforms in the sphere of education have been carried out in a completely new content and form. In particular, four presidential schools, three schools of creativity began to work. Last year 19 new higher educational institutions, including 9 prestigious foreign universities, were opened for the development of higher education, in cooperation with leading foreign universities, training on 141 joint educational programs was launched. A total of 146 thousand 500 students or 2 times more students were admitted to higher education institutions than in 2016[3].

The sustainable growth of the economy is associated with the development of Science and its capacity building. But today, there is no single consensus on increasing scientific technical activity in our country, providing and providing support. Also, the single system, which includes features such as the gradual development of scientific potential in the future, the implementation

of research of significant scientific and practical significance on a global scale, the wide application of their results, the uniqueness of scientific work, has not been restored. To do this, it is necessary to create a new system of management, which includes modern methods, an organizational system of introducing innovations into practice, a production system that includes the use of resources, new methods of increasing efficiency, a technical system aimed at reconstructing production and raising its technical level, and, in short, a unified concept that includes the socio-economic, financial, this policy ensures a constant connection with the production of science and innovation processes, extensive use of results and the creation of the necessary regulatory and legal framework in this area.

Emerging in the development of modern education “innovative approach”, “innovation activity”, “innovation pedagogy” style concepts are based on needs, and their ultimate goal is to introduce changes, updates that guarantee the result of the educational process in the field of education.

The system of education is an important factor in the development of every country. In the global environment, the socio-economic development of countries requires a higher quality of Education, a wider use of innovative educational technologies. This makes continuous attention to the continuous education system an object of necessity. The First President of the Republic Of Uzbekistan I.Karimov pointed out,“... to bring our children to adulthood as independent and broad-minded, conscious living perfect people-should be the main goal and function of the educational sphere”[4].

Effective use of information technologies in the educational process is one of the main tasks. In general, in pedagogical practice, the main goal of information technology represents the complete achievement of a high result in education. Definitions are given on the basis of various scientific approaches to the concept of pedagogical technology, which have been used since the last century. A complete and only definition has not yet been adopted to this concept. Within these definitions, the definition given by UNESCO is expressed as follows:

Pedagogical technology is a systematic method of creating, applying and identifying all processes of mastering training and knowledge, which set the task of optimizing forms of education, taking into account technical resources, people and their interaction.”[5]

Although different definitions are given to the concept of pedagogical technology, its main purpose is the thorough assimilation of the knowledge given in education by the educators. Although the participants of the educational process cover such parties as the educator and the educator, it is distinguished by its complexity and relevance. In it, the presence of a constant goal and the fact that it can be achieved through various methods, expresses the complexity of this process, while in the conditions of transition to an innovative economy, its relevance increases. As a result of each process, the result of which is considered a structural element of this process, means the degree to which the goal is achieved. The main essence of pedagogical technology in general is the achievement of full self-education and knowledge of interested educators in education. In a holistic case, it expresses the activity of forming a harmonious person. The thorough mastering of the knowledge given in education by the majority of students is the main goal of the introduction of pedagogical technology. In the application of pedagogical technology, the method of teaching, forms of education, educational tools are widely used, one of the important components.

The method of teaching is a way of organizing the interaction of educators and educators in order to achieve the stated purpose of teaching, it can be classified as follows: lecture, story, narrative, demonstration, demonstration, video, exercise, laboratory method, practical method of work, work with a book, conversation, discussion, smart attack, pinboard, method of training projects, case-Study, etc. The introduction of information tools into these methods will not only improve the educational performance but also save time.

And the forms of education are grouped as follows: mass work, collective work, group work, individual.

This means that pedagogical technology, which is considered an integral element of the pedagogical system, is important in ensuring the result of this process-that is, the purpose of the training. The effective introduction of pedagogical technologies in the process of training leads to the independent functioning of educators in the educational process.

**In conclusion**, it can be noted that it is necessary to organize all the sections of education in such a way that it will provide deep and thorough knowledge to the educators, as well as teach them a wide range of coverage thinking, timely and productive use of the achievements of modern culture and scientific activity. Because the formation of the need for independent knowledge in the student in the process of education is a requirement of the present day. This means that the main issue of pedagogical technology is to ensure the achievement of the educational goal by developing the knowledge of the educators.

Our President Sh.M.Mirziyoev noted in his appeal to the Oliy Majlis on January 24 this year "...The broad introduction of digital technologies, both in the public and public administration, in the social sphere, can improve the efficiency, in a word, dramatically improve the living of people" [6].

Principles of informatization the study of science serves to look for easy, accessible ways to solve the existing problems in it. Applying the principles of informatization to the educational process creates an opportunity for active participation, high interest of students in the educational process, their acquisition of independent knowledge, narrowing of the resource quickly in the conditions of "informed society" and comfortable working with it, ultimately ensuring high efficiency of education and expected results.

## THEORETICAL WAYS OF ACHIEVING SUCCESS IN TEACHING ENGLISH TO DEAF CHILDREN

**Nodira Nabiyeva Rustamjon qizi\***

\*Student,  
Namangan State University,  
UZBEKISTAN

---

### ABSTRACT

*This following article about how to achieve success in teaching English to children who are deaf. And also author mentions that General stage of teaching English for deaf children. It is given essential information on teaching English for deaf students. A pre-school and a boarding school for children with hearing impairments have the necessary facilities. Children with moderate hearing loss can hear a spoken word in a loud whisper from a distance of 1 to 3 m. As mentioned above, in deaf pedagogy, hearing-impaired children include children who were born deaf and later became hearing-impaired. A wide range of conditions is being created for students to be able to do it in practice without fear or shame. Pupils' pronunciation is clear and their range of hearing is chosen from light to complex.*

**KEYWORDS:** Deaf, In Native Deafness, Non-In Native Deafness, Psychological Condition, Speech, Signal System.

---

### INTRODUCTION

It is natural that disabled children will have more difficulty learning a foreign language than healthy children. However, using these child-friendly methods and creating psychological conditions in teaching foreign languages can eliminate any problems that may arise. For this purpose children with disabilities, who are deaf, are separated into special groups[1].

- Low hearing ability;
- lost hearing ability;
- In native deafness;
- No - In native deafness.

There are special groups for children with hearing impairments in pre-schools and vocational colleges in Uzbekistan. Children with mild hearing impairments can be educated in public preschools and Scholl's along with their healthy peers. Education in these institutions is based on the state requirements and programs of 11-year general education.

### **Theoretical Basis**

Deaf educators are making great strides in working with children with hearing impairments. Boarding school for this category of children have a pre-school education department. This category of anomalous children successfully graduates from higher education after studying in special evening schools and works equally with everyone in various enterprises of the country. The main task of educators and teachers is to separate healthy children from hearing-impaired children and to ensure that they receive education in special institutions or are involved in integrated education if they need a special approach. Hence the elimination of hearing loss can compensate for the fibres. A student who feels he or she is unable to express himself or herself orally in a private institution should be able to express himself or herself in writing. To this end, students are taught to express themselves orally and in writing on the basis of practical speaking skills and competencies. In deaf and hard of hearing students, teachers and student activities are organized on the basis of exercises in a certain system of lessons and classes on the formation of spoken and written speech. In order to ensure the practical acquisition of speech materials, situations that require special written problem-solving and written explanations are planned in advance. It is required to be able to adapt all types of didactic tools to the speech process. In this case, the speech materials are predetermined in the planning of the curriculum of the correctional pedagogical process is carried out on the basis of a certain system. Speech materials for each lesson are prepared in strict accordance with the principles of the correctional utility system. A wide range of conditions is being created for students to be able to do it in practice without fear or shame. Pupils' pronunciation is clear and their range of hearing is chosen from light to complex. Their extensive communication and warm relationship with a deaf child develops the child's ability to receive and transmit speech information to the neat deaf and hard of hearing children. Nurturing the need for conversational speech begins in the family. The speaking skills and competencies acquired in the new school should be strengthened in the natural environment of the family. In addition, the development of deaf and hard of hearing children requires the use of loudspeakers in special institutions. These conditions are created with the participation of family members. Deaf and hard of hearing children acquire their mother tongue on the basis of corrective communicative principles adapted to the mental and speech abilities of the child, arising from the features of the laws of this language.

Classroom are specially equipped, the formation of boarding school in accordance with the direction of the material and technical base increases the effectiveness of educational content. Because, now, he has the skills on how to receive information. It is also possible to learn a foreign language in the same way after mastering one's mother tongue. They should be able to motivate children when needed. Deaf and dumb children need to be in constant contact with their parents and teachers to prevent them from developing depression when they reach adulthood. This means that the mental state of children is a priority in order to achieve positive results in learning foreign languages. Learning a foreign language seems a little easier for a child than learning his or her mother tongue. Teachers and educators have a great responsibility. If the child is approached with the right intention and strategy, he will develop positive qualities and will be

able to learn foreign languages fluently. Because at that time, he has the skills on how to receive information. Speech is a complex mental action. It effects to growing to children with mental and generally mature. Speech is based on hearing organ and it becomes developing a way of comparison. A hearing analyser, the moving speech analyser which effects of speech. The moving speech analyser works with hearing analyser as a companion. Developing of the hearing analyser depends on pronunciation. Developing speech of children belongs to speech sounds, physiological and phonetical progressing. Most importantly, it is also characterized by the ability to distinguish the structure of words in one's own speech and the speech of others, the structure of sound. Both signals systems, as well as the interaction of speech with cognition, form the basis of mental development. According to dermatologists (T.A. Vlasova, R.M. Boskis, D.V. Neumann, etc.), The level of development of a child with hearing impairment depends on the stage of the child's life and the severity of the defect. In deaf pedagogy, children with hearing impairments are studied as a group of children who become deaf, hard of hearing, and later deaf. Absolute deafness in both ears during congenital infancy leads to deafness. Children with speech impairment as a result of partial hearing impairment are included in the group of hearing-impaired children. Children who become deaf after speech development are later included in the group of those who become deaf. Even if the defect occurs after the speech has been composed, there may still be hearing loss due to a defect in the ear. Deafness can be congenital or acquired due to the causes of permanent hearing loss 25-30% of deaf and dumb children have congenital hearing loss. This due to various disease of the mother during pregnancy, such as influenza. Acquired defects in hearing may be due to defects in the structure of the ear or hearing analyser. This is caused by changes in the upper nerve centre, conduction pathways, or the ear itself. Children with hearing impairments are included in the category of anomalous children. Because this defect has a negative impact on the children overall development and mastery of the application materials. Causes a number of specific difficulties in mastering kindergarten and school programs. After hearing development in young children, for example, after the age of two, the child does not hear the speech of others as a result of deafness. He even slowly forgets what he knows. The deafness in the child gradually merges with the deafness and he becomes deaf and dumb. Teachers and educators in special instructions should help such children to receive an appropriate education. If the child is not given special care in time, he will also show signs of mental retardation.

## Results

However, a positive result is achieved if the necessary measures are taken to compensate for the defect. Children with mild hearing impairment hear a spoken speech at a distance of 6 to 8 m from the ear scores 3 to 6 m. Hearing-impaired children, in turn, are divided into children with mild to moderate hearing loss, depending on the degree of hearing impairment. A pre-school and a boarding school for children with hearing impairments have the necessary facilities. Children with moderate hearing loss can hear a spoken word in a loud whisper from a distance of 1 to 3 m. As mentioned above, in deaf pedagogy, hearing-impaired children include children who were born deaf and later became hearing-impaired. Hearing impairment results in several deficiencies in the child's speech Poor spelling Poor grammatical component Words in a sentence Misuse of words inability to connect them inconsistent word-formative modifiers inability to use suffixes. In the severe hearing loss, the child hears a moderately spoken speech from a distance of 0.5 m. Misleading similar-sounding consonants, and so on. Some educators and teachers mistakenly

treat the child as a lazy, irresponsible bully, as a result of which the child's whimsical cries become slurred, which leads to secondary mental changes.

## DISCUSSION

The conclusion is that every teacher working with children with disabilities should have sufficient psychological qualifications in addition to being a teacher.

It is clear that minor actions can have a negative impact on the character of the child in the future. In addition to the profound knowledge of the English language, the use of effective, well-rounded techniques is the key to achieving good results. Every student with disabilities can learn a foreign language, If we create the right atmosphere for them, if teacher use right, efficient methods and strategies if parents support their children.

## ABOUT A TYPE OF ADVERTISING TEXT

**Abdullaev Bekzodbek Kholdaralievich\***

\*PhD Student in Applied and Computer Linguistics,  
Andijan State University, UZBEKISTAN  
Email id: fayllar@bk.ru

### ABSTRACT

*This article also describes the specific conditions for the use of creolitic text in the preparation of advertising products. The position of verbal means in conveying serious understanding, convenience, and news to the consumer must take precedence over that of visual units. At this point, nonverbal units serve to persuade and engage.*

**KEYWORDS:** *Creoleization, Multimodality, Verbal, Nonverbal, Polycode Text*

### INTRODUCTION

Taking into account the fact that in some respects, depending on the age, gender and worldview of the consumer some features may be attractive to him or her, verbal and nonverbal elements are used in the texts of advertising products. Such texts are called creolized or creolitic text. The concept of creolitic text was introduced in 1990 by Yu.A. Sorokin and E.F. Tarasov. Children of mixed marriages of locals with Spanish and Portuguese immigrants were called Creoles (French Creole, Krillo, Crioulo, port Crioulo, Latin). Creoles were born and live in Latin America. [1] In linguistics, the term refers to the formation of a mixed language as a result of the interaction of two or more languages. When the same principle is applied to text, creolization represents the concept of text combined in linguistic and paralinguistic methods. [2] Creole texts are “semiotically enriched” texts.

As the American sociologist James Sidbury describes, “Creolization is the process of assimilating other cultural values.” [3] In the twentieth century, a new “visualized era” emerged in the development of society as a whole. Due to the abundance of information, the problem of time for the process of receiving it in the human mind began to dominate. The widespread use of visual elements in solving this problem began. Visual elements surpass verbal information in their versatility, charm, and inclusion of a lot of information.

As V.M. Berezin noted, "...picture is becoming more and more an element of text formation. As a result of the integration of all graphic tools, as well as other symbolic forms, it will become a single text field for print and electronic publications." [4]

Today, the world of mass media is constantly evolving. Creole text helps at a point where the verbal world is failing to convey information to humanity within its means. Looking back, we are convinced that Creole texts are used to attract attention with their role in conveying information to the recipient, which is also its advantage. The desired result is achieved when the knowledge and experience of representatives of the fine arts are used in the development of Creole texts. Historian and fine arts scholar Yu.A. Gerchuk, in his book *The World of Fiction*, wrote: "Initially, the artist drew a picture with contrasting lines and local colors, in the modern sense it was an art speech, not a picture." [5]

The synthesis of word and image in the process of communication became the basis for the emergence of a number of new genres and visual arts. By creolizing verbal texts, the presence of graphic content, as well as content or components that include all the designs that affect the textual content, was identified. Among them, the font, color, text background (colored or illustrated), language units, pictorial prints (pictograms, ideograms, etc.), the graphic appearance of the oral text (in the form of pictures, etc.) should have a special place.

**Creole text** consists of two parts, verbal and nonverbal. Such texts are used in advertising products, cartoons, movie posters and placards. In Creolithic texts, the verbal and visual components are inextricably linked. When one of the components is deleted, the remaining component stops transmitting data: it is not fully executed or can be interpreted as bad. The earliest examples of the Creolithic text are found in A. de Exupéry's novel *The Little Prince*, where the verbal text and the author's lines form a single whole. [6]

According to the Finnish linguist L. Quikka and the English linguist Carey Jevit, "A mixture of verbal and pictorial text is called creolized (multimodal) text. Multimodality combines one or two organizational parts to create meaning, such as an ad-creole text, made up of visual and verbal pieces." [7]

The interaction of semiotic elements is an important topic in the multimodality front. These include the interrelationships between the components, such as the relationship between picture and written speech.

A. Nazaykin defines it as follows: the word "creolization" in the metaphorical sense means a non-identical semiotic text consisting of different characters by nature and consists of verbal (natural language) and nonverbal (picture, music, formula) components. [8]

Multimodal text is text that is presented in several ways of perceiving a communicative situation, i.e., through viewing and hearing. [14] Multimodal text analysis is based on verbal and visual theory as well as Cress and van Leeuwen's image theory. This combination explains to us the visual "grammar" that identifies the main motives of verbal and visual elements and takes into account the relationship between verbal and nonverbal text.

In linguistics, the term “creolization” refers to the interaction of two or more languages to produce a new language with a mixed vocabulary and grammar.”[9]

During the Creoleization process, a simplified language gradually emerged as a result of interaction with other languages. [10]

The involvement of nonverbal components in creolitic texts varies depending on the type of advertising and is divided into different hierarchical systems accordingly. Creole text units consist of a picture, text, music, color, font size, sound, which provide impression and appeal, showcasing cultural innovations. When different character system elements are used in text construction, ambiguous or creolized text emerges.

Well-known Russian linguist E.E Anisimova evaluated the degree of integration of verbal and non-verbal (nonverbal) components in the text. These are divided into verbal, partially Creolite, and fully Creolic texts. [11]

E.E. Anisimova describes the creolized text as follows: "Creoleized texts use descriptive means along with spoken words, as well as other semiotic codes (color, font, etc.)." [11] In the views of the linguist E.E. Anisimova covers all the main possibilities of interaction between verbal and nonverbal components in the Creole text.

Not all of them can be described at once. An appropriate definition should be included for the general characteristics of all paralinguistic active texts. A.A. Bernatskaya suggests using the term "polycode text" in this case. [12] This term clearly describes the presence of several components in the advertising text, so it can be used for the purposes we have indicated.

There are many forms of Creole text in society, and these texts do not only serve for advertising products. They have specific types and functions.

According to the Russian linguist A.A Musakhranova, it is expedient to group Creole texts for the following reasons:

1. According to the degree of creolization.
2. According to the socio-cultural direction.
3. According to the type of connection.
4. According to the number of components.
5. According to the complexity of the hypertext.
6. According to the level of coverage of the listener groups.
7. According to the level of compositional complexity. [13]

Advertising texts are created to make an impact on the listener and to control his or her thoughts or actions. More specifically, an advertising product not only conveys information about a new product in the sales area, but also serves to motivate the consumer to purchase that product. In this case, the consumer is not a person who buys the product on display or offered, but a person who thinks positively (buy the product) or negatively (not buy the product) to the idea (advertising).

Nowadays, it is impossible to imagine a society without advertising. Because advertising is a reality that illuminates the availability of activities, services and products that consumers need, their convenience and preferences.

The advertiser uses different ways to achieve the goal. But the advertising of the product on display goes beyond specific unwritten laws. As a result of increasing competition, the creation of an effective advertising product has become a complex process, and there is a need for more research and the discovery of modern mature professionals.

There are also specific barriers depending on the areas of distribution of the advertising product. Advertisers have to reckon with the leading values, experiences in a particular area to find a solution to the problem. Because the scope of an advertising product is related to culture, values, religious concepts, and consumption.

Commenting on the advertisement, Sarpavaara said that "it is not a mirror of a society that clearly reflects culture, values and ideals". It is more appropriate to look at advertising as a means of developing and absorbing new values in a particular culture: once it emerges, it can change existing cultural ideas, patterns, and skills. [15]

As the availability of modern media products and information expands, new opportunities are emerging in the world of advertising. Because in today's world, the exchange of information is growing, and in the minds of consumers there is a problem of the ability to receive different information and the regulation of time as a social unit.

In the advertising text, each component (title, main part and slogan) has its own function. In particular, the text should not only attract the attention of the consumer, but also have the ability to motivate and persuade to buy the product.

Figure 1.

The banner of the State Service Agency and the phrase "Documents move, not citizens" are written in capital letters on the banner to attract consumers. But the task of convincing the consumer is assigned to the sentences "My job is done", "30 minutes". The "under the Ministry of Justice" phrase indicates that the owner of the advertising product is a high-ranking organization. It means that the advertised product is more reliable with the legitimacy of being open and more displayed to the consumer.

The use of visual units in advertising is also a unique modern trend, and the performance of the assigned task can be an effective tool for the formation of reality in the minds of consumers in different forms. The combination of visual and verbal units results in a complex whole, involving people with disabilities as well, leading to an expansion of the consumer ranks. The ad text consists not of a simple sequence of verbal units, but of their interrelationships and the integrity of the content categories. The main task of the advertising text is to ensure that the components of the text adhere to the linguistic categories and adequately reveal the content. The basis of the advertising text is a holistic complex semiotic element that is designed to bring the advertised product to market, combining an independently structured character unit. [16]

The ad text has a hierarchy that takes into account the size of the letters, i.e. the text consists of a title in uppercase letters and a descriptive main part in the secondary uppercase letter, lexical units representing address information in lowercase letters. There is a culture of finding and using appropriate words in advertising text. The correct or incorrect use of words will determine the future of the advertised product in the sales area.

In short, the Creole text is the object of study of linguistics, psychology, fine arts, computer science, music, sociology, linguoculturology. As consumer consciousness and worldviews grow in a developed society, there is a need to pay more attention to the unity of form and content in the creation of an advertising product. In order to absorb advertising into the consumer, it is advisable to raise its morale, create a positive environment and gradually demonstrate the main content. More complex forms of information communication are being discovered, and it is likely that other texts will be created due to the constant updates in the field of advertising.

## DEVELOPMENT OF PROFESSIONAL SPEECH CULTURE OF MEDICAL STUDENTS

**Dzugaeva Zarina Ruslanovna\***

\*Department of English Language,  
Urgench branch of Tashkent Medical Academy,  
Urgench, UZBEKISTAN

---

### ABSTRACT

*The article is devoted to the study of the problem of improving the foreign language vocational culture, in other words, amelinguistic competence, in the conditions of a medical higher educational institution. Currently, much attention is paid to improving the technology of preparing future specialists for amelinguistic competence. Issues related to the cultural and speech aspect of the formation of the personality of a future medical professional remain little studied.*

**KEYWORDS:** *Amelinguistics, Competence, Speech Culture, Pedagogical Acmeology, Communication, Professional Education, Technology, Linguistics, Science.*

---

### INTRODUCTION

The reforms carried out in the Republic and changes in the state's foreign policy contributed to the expansion of international contacts, as a result of which the need for cadres with linguistic competence increased. Such changes are aimed at improving the technology of preparing future specialists for amelinguistic competence in our study of medical education students. Unfortunately, an analysis of the practice performed by us indicates that the state of professional speech culture (PSC) of medical education students is considered satisfactory in terms of speech etiquette. As a result, it was determined that medical education students not only do not speak foreign languages, but also have a very low level of vocabulary, inability to communicate at a professional level. While the ability to communicate is an attribute of the integral communicative activity of a future specialist, the development of a foreign-language professional-speech culture is an important link in the preparation of students of higher medical education.

In this regard, there is a need to study the problem of the formation of a foreign-language professional speech culture of medical education students in the process of their professional training. However, the problem of improving foreign-language professional-speech culture, in

other words, acmelinguistic competence, is insufficiently reflected in the conditions of a medical higher educational institution, although studies of this kind represent an actual direction in the theory and methodology of professional education. A number of issues related to the cultural and speech aspect of the formation of the personality of the future medical worker remain poorly developed. In particular, the problem of the formation of acmelinguistic competence of students of a medical higher educational institution has not been sufficiently studied. Issues requiring development remain questions regarding pedagogical methods, technologies, conditions and mechanisms for improving the acmelinguistic competence of medical students in the process of training. The fundamentals of the acmelinguistic competence of a doctor are laid in the process of training, therefore, the subject of scientific interest is the acmelinguistic competence of medical students. As part of this study, it is necessary to study the content, structure and features of this concept. In this connection, we turn to the analysis of the definitions of the concept of "acme", "linguistics", "pedagogical acmeology", "competence". In this study, we settled on the study of a new direction in linguistic science - acmelinguistics. Acmelinguistics, from our point of view, should be studied as a section of pedagogical acmeology, as a necessary component of professional speech activity of a specialist. Pedagogical acmeology - the science of ways to achieve professionalism and competence in the work of a specialist. [1]

One of the constituent components of pedagogical acmeology should be the acmeological concept of specialist skill, which is a way of being a specialist and the feasibility of the potential of his personality, as well as a condition for climbing to achieve "acme". Based on the foregoing, from our point of view, the essence of pedagogical acmeology consists in determining the ways for a specialist to achieve professionalism, which has a clearly expressed humanistic orientation towards the development of the personality of another person. From the above it follows that the acmeological approach in the modern system of vocational education is to provide increased professional motivation, stimulation of the realization of creative potential, identification and fruitful use of personal resources to achieve success in the professional activity of a teacher. We can talk about the acmeologization of the personality of a professional and the acmeologization of the process of his preparation, which is possible only if there is an acmeologically educated specialist and an acmeologically oriented system of his training and retraining. There is no such system today. The foregoing determines the following: the need for a scientific study of the fundamental foundations of creating such a system; a high degree of urgency of the problem of creating an acmeologically oriented specialist training system. Recently, the relatively recently appeared term acmelinguistics is actively used in pedagogical literature. [3]

The name comes from the Greek "acme" - "peak" and the Latin "linguistics" - "linguistics". Historically, acmelinguistics has arisen from acmeology, a science formed at the intersection of natural, social and humanitarian disciplines that study the laws and mechanisms of human development when they reach the highest level. The latest achievements in psychology, pedagogy, sociology, psycholinguistics, linguodidactics have allowed to form a new science, designed to solve current problems of language learning. Acmelinguistics is a field of not only scientific, but also practical activity of a specialist, which examines and uses the laws, factors and mechanisms of development and self-development of an adult student in order to achieve the highest results in language learning, that is, language acts as a means of achieving personal "acme". [2]

The following main features of this concept should be noted: acmelinguistics “studies the patterns of achievement by a person of an acme level, the productive manifestation in life of all the essential forces of an individual, focused on solving value-significant problems - through language acquisition” [4]; acmelinguistics “not only used the general methodological principles of modern knowledge, but also itself“ sets ”an acmecentric vector orientation capable of determining its interaction with other sciences” acmelinguistics “carries a certain continuity of psychological categories of reflection in the student’s personality and activity, synthesizing psychology and pedagogy, however, in contrast to them, acmelinguistics takes a “subject-centric” position in which the learner from the object becomes the subject of training with the establishment of integrative relationships with all participants and components of the educational process ”Thus, the main features of acmelinguistics are recognized: the patterns of achievement by a person of acme level through language and speech activity.

### INTRODUCTION

The work "Tarikh ar-rusul val muluk" written by the scholar Ja'far Muhammad ibn Jarir at-Tabari, who made a great contribution to the development of the science of history and tafsir, became famous as "Tarihi Tabari". This work contains information about the most ancient history, as well as the history of the kings of Iran, Roman and Byzantine emperors, the lands of the caliphate, in particular, Khorasan and Movarounnahr until 915.

A significant part of this great work is dedicated to the socio-political events that took place in Movarounnahr, in the words of the ancient Turanian authors of that period, from the 7th century to the beginning of the 10th century. The author provides important information about the history of Bukhara, Samarkand, Khorezm, Sughd, Nasaf, Termez, Kesh, Ustrushana, Shosh, Fergana regions and cities, their condition, lifestyle, military strengths and shortcomings of the people through the historical events of those times. It contains many ancient place names, some of which have survived to the present day. Historical events such as the famous Qutayba ibn

Muslim invasion, the political movement of Abu Muslim, the revolt of Hashim ibn Hakim, known as Muqanna, and the popular uprising led by Rofe ibn Lays are interesting stories. They help the person of today's society to clearly imagine the social events that took place in our country one and a half thousand years ago. The contribution of this work to the study of the glorious past of the nation, the illumination of its vast ambiguities, the discovery of identity is great and invaluable.

"History of ar-rusul wa-l-muluk" is one of the main and most authoritative sources on the history of Muslim countries, as well as Movarounnahr VIII-IX centuries, which had a great influence on the further development of historical science. There is also a Persian edition of Tabari's work, written in 963 by al-Balami (d. 974), a minister of the Samanid Abu Salih Mansur ibn Nuh (961-976), a well-known patron of science. This work is called "Tavarikh Tabari Persian" ("Tabari's stories in Persian").

During the Camoni period we can find many sources in various fields of scientific work. As W. W. Barthold noted, "The information we have collected about the Samanid period of Turkestan will be perfect not only for today, but also for future periods."

Abul Fazl Muhammad ibn Ubaydullah al-Balami was the minister of Ismail ibn Ahmad, the Emir of Khorasan. Abul Fazl al-Balami was a wise, prudent, learned man and a great statesman of his time. Abu Ali Muhammad Balami also left a significant mark on the development of science and the cultural development of the country during his tenure as Minister of the Samanid State for about 20 years (second half of the 10th century). It is noteworthy that he reworked many chapters of this valuable book. This work of his also brought him fame. Indeed, Tarihi Tabari became a favorite book of many kings in the following centuries. The reason we are writing about this for our readers who are interested in history is that the book "Tarihi Tabariy" provides detailed and reliable information about important historical events that took place in the East and in some parts of the West from ancient times to the author's time (X century). this work was very popular in all the countries of the East, was considered an example in historiography, and was widespread in manuscripts.

His translation into Persian by the Minister of State was the most widely used book for the kings of Movarounnahr. The great Sahibkiran Amir Temur also loved to read and teach. It can be said that Alisher Navoi received almost all historical information from the book "Tarihi Tabariy". It is also preserved in the tombs of later Timurids, including Umar Sheikh Mirza, Babur Mirza and other princes. Even the amirs of Bukhara, Khiva and Kokand khans used it.

This work deals with the history of horns and dynasties, pre-Islamic Muhammad s.a.v. The period before the prophecy, as well as information about the early history of Islam, contains valuable information about the Sassanid Persians and the legendary history of Iran, which began with the traditional method of writing historical works, namely, praise and glorification of Allah, the Prophet.

In the introductory part of the work, the author says, "In this play we rewrite everything that has been said about the history of the world, about astronomers, and about Zoroastrians, Christians, and Jews."

While translating the work, Minister Balami mentions some chapters, saying, "Tabari did not say this, but we did quote it." The appendices of the translation are more devoted to the history of Movarounnahr.

Balami's editing is not just a simple translation, but a reworking of the work and in some cases enriched with new facts. It contains, first of all, information which is not found in the abridged edition, which Balami took from the full copy of the work of Tabari. Second, the Balami edition was supplemented with new information based on other sources.

Tarikh Balami is one of the oldest surviving books of prose in Persian, and its writing style is very simple and does not contain unfamiliar or poetic words. The sentences were also short, and the author tried to write in as simple a style as possible. In the introductory part of the work, Balami gives the information that Tabari in Arabic, in contrast to the original text, did not follow the chronological sequence.

Balami pays great attention to the principle of sorting Arabic poetry. Tabari often cites examples from Arabic poets, and in the Balami translation process he uses poetic examples of peoples who are directly and indirectly related to Persian-speaking peoples. Balami added about 60 bytes and poetic fragments in his work. A number of other additions have been made by Balami and have been recognized by experts in the field.

He tries to give a concise account of the prophets and kings peculiar to Tabari, as well as to bring down the chain of stigma in the description of historical data.

Balami removed some specimens of the Sassanid chronicle (224-615) from the Khwadai salt, and in some cases the information given by Tabari was summarized in detail in some passages from the Khwadai salt. Tabari also briefly details the appointment of Bahrom Chubin as commander of the Iranian army set aside for Chubin's military struggle against the Turks, limited to information about Bahrom's career and the number of his troops. Bal'ami, in addition to him, gives a number of details about the military council from which the commander was elected.

The socio-political and cultural intellectual conditions of the translation of the work, as well as the uniqueness, independence of the translator, have a special place in terms of historical and literary significance of the work. The study of these issues will help to better understand the essence of pre-Islamic traditions, the formation and development of the Persian language in the literature. Tarihi Bal'ami is one of the first works to use the Dari language in scientific literature.

Various manuscripts of this book are preserved in the funds of the world today, in particular, the oldest manuscript of the work is a copy of the XIV century. There are about a dozen copies in the Bodleian Library of the British Museum, the Leningrad Manuscripts Fund of the Institute of Oriental Studies, and the State Public Library named after M.E. Saltykova-Shedrina.

## CONCLUSION

Ibn Jarir al-Tari's Tarih ar-rusul val muluk, a Persian translation, and Tavarikhi Tabariyi Farsi, are historically and geographically related to tenth-century Arab and Iranian history, particularly the geographical classification of the ancient Near East and historical events. is an ancient work in the Persian language that illuminates its peculiarities. The translation of Tarikh ar-rusul val muluk in other languages is not as famous as the Persian translation of Tarihi Bal'ami.

The work "Tarihi Bal'ami" provides valuable information in the study of historical processes. The relationship of Iranian ethnic groups with other peoples provides valuable information on the historical processes of classifying the history of ethnic groups. This historical work is a description of the origins of the Iranian people, the borders of these peoples, their languages, the customs and cultural traditions of Iranian cities and villages, and a number of other issues.

Balami Tabari is a historian who has involved all the materials and information in the work "History ar-rusul val muluk" for scientific analysis and research. Based on Balami's "Tarikh ar-rusul val muluk" and other historical works, he created a new interpretation of the work "Tarikh ar-rusul val muluk" in Persian. We can see from his work that he resigned from the broader data.

## THE IMPACT OF SENSORY BRANDING (FIVE SENSES) ON CONSUMER: A CASE STUDY ON KFC (KENTUCKY FRIED CHICKEN)

**Sharafat Hussain\***

\*Operations Manager, 406, Tausch Technologies Pvt. Ltd,  
Andhra Pradesh, Hyderabad, INDIA

### ABSTRACT

*Sensory branding is based on the idea that consumers are most likely to form, retain and revisit memory when their all five senses are engaged during the process of buying products or services. By going beyond the traditional marketing media of only sight and sound, brands are now taking advantage of all other senses to establish a stronger and longer-lasting emotional connection with consumers. This marketing strategy appeals to multiple senses and the efforts are multiplied, creating powerful brands with lasting consumer connections. This study reveals the impact of sensory branding on consumers of Kentucky Fried Chicken (KFC). This study analyses all five senses applied to KFC to identify the impact of each sense on consumer. The study was conducted using survey method and respondents were the people who have eaten KFC at least once in one of the thirteen outlets in the city of Hyderabad, India. A sample of 116 respondents was taken for analysis. The study concluded with the impact of sensory branding strategy by KFC and brings out the results, which can be adopted by marketers for the other products of same genre.*

**KEYWORDS:** *Sensory Branding, Sensorial Marketing, Branding, And KFC Branding*

### I. INTRODUCTION:

For many marketers (and consumers), the affectivity, perception and pleasure are more important than the price, since many products are now technically similar: they have to be differentiated in another way. Sensory branding is based on the idea that human beings most likely to form, retain and revisit memory when all five senses (taste, smell, sight, sound and touch) are engaged. Sense, as per Oxford English Dictionary, is any of the faculties, as sight, hearing, smell, taste, or touch, by which humans and animals perceive stimuli originating from outside or inside the body. Keeping marketing in perspective, marketers started using these human instincts as a

strategy to sell their goods or services by creating such environment that appeals to senses at the point of sale. Kotler (1973) defined the atmosphere of point of sale as “the creation of a consumption environment that produces specific emotional effects on the person, like pleasure or excitement that can increase his possibility of buying”. He considered the creation of this atmosphere as the most important strategic way of differentiation for retailers.

As the cost of reaching consumers rises in the traditional media, competition for securing their attention increases likewise. Brands are struggling to compete in today’s crowded marketplace, strategic use of sensory information can provide a critical advantage. Sensory marketing strategy appeal to multiple senses, efforts are multiplied, creating powerful brands with lasting consumer connections. According to Lindstrom by using all the five senses “a total sensory experience would at least double, if not triple, the consumer’s ability to memorize the brand.” (Lindstrom 2005, p 23). Motive of sensory branding is to find ways to engage all consumer senses to strengthen the brand experience.

## **II. ABOUT KENTUCKY FRIED CHICKEN (KFC):**

KFC (the name was originally an initialism for (Kentucky Fried Chicken) is a fast food restaurant chain that specializes in fried chicken and is headquartered in Louisville, Kentucky, United States (US). It is the world's second largest restaurant chain (as measured by sales) after McDonald's, with 18,875 outlets in 118 countries and territories as of December 2013. The company is a subsidiary of Yum! Brands, a restaurant company that also owns the Pizza Hut and Taco Bell chains.

Harland Sanders, an entrepreneur who began selling fried chicken from his roadside restaurant in Corbin, Kentucky, during the Great Depression, founded KFC. Sanders identified the potential of the restaurant franchising concept, and the first "Kentucky Fried Chicken" franchise opened in Utah in 1952. KFC popularized chicken in the fast food industry, diversifying the market by challenging the established dominance of the hamburger. By branding himself as "Colonel Sanders," Harland became a prominent figure of American cultural history, and his image remains widely used in KFC advertising.

In December 2013, there were 299 KFC outlets in India. As well as the standard KFC offerings, the chain sells a chickpea burger and hot wings with chilly lemon sprinkles. A major franchise holder is QSR Brands (M) Holdings, which operated 26 outlets as of 2012. The first Indian KFC was a two-storied outlet on the fashionable Brigade Road in Bangalore in June 1995. KFC began to expand outside of Bangalore in 2004, with a localized menu that was the most extensive meat-free menu across the chain's worldwide operations. It introduced a vegetarian menu that included rice meals, wraps and side dishes and, like McDonald's, served eggless mayonnaise and sauces. Unnat Varma, marketing director of KFC India, states "The vegetarian offerings have made the brand more relevant to a larger section of consumers and that is necessary for KFC's growth." KFC also began using Indian spices and cooking techniques to localize its chicken dishes. By 2008–09, KFC operated 34 outlets in India.

## **III. IMPACT OF SENSES ON CONSUMER:**

Sensory branding, the idea that brands should engage consumers on a variety of touch points and it is hardly new to the market. Obviously senses play a very important role in our experience, choices of brand/products. Brand can’t impart an aroma via a television set or newspaper hence it

must come from the product itself. As matter of fact, the unique aroma, texture and sound has very little to do with the quality and the performance of the product. However, these components play a great role in building relationship of consumer with the product. The sensory stimulation not only attracts consumer choice but also helps distinguish a product from others. These get attached in our sensory memory and finally become a part of decision-making process and bring a way towards future brand building for a product.

Fig.1: Sensory Branding Diagram

**(i) Sight (Visual):** Ever since advertising was born, it was oriented on our sight, mainly because that sense is most responsive to the environment. 92.6% of the population puts most importance on visual factors such as color and shape when buying products. We make our first impressions within 90 seconds of the initial viewing, and between 62%-92% of that impression is based on color alone. When talking about on-shelf visibility, 80% color can increase brand recognition. According to research, 42% ads in color are read more than the same ads in black and white. White is the basic colour, as it brings out everything else. White Sign of purity, cleanness and coolness. In a restaurant, white is used everywhere the customer expects for cleanness (plates, kitchen...). On a packaging, black is symbol of quality and sobriety. As it is the darkest colour, black is exclusively used to create a very specific environment. Market researchers have also determined that color affects shopping habits. With our sight we notice and recognize shapes and colors really fast, but we can't experience a brand only by looking at it, at least not at its full potential.

**(ii) Sound (Auditory):** Human-beings are naturally sensitive to sounds and their meanings. The first sound we could hear was our mother's heartbeat. What is so great about sound is that it doesn't need our full attention to be noticed. And also it has been proven that sound evokes certain memories and experiences. Then, music has been introduced, in commercials (with the apparition of TV spots) as in the point of sales. Today, there is no point of sales without music in the background, and 99% of advertising is focused on what we see and hear. Experiments conducted in restaurants show that when music slower than rhythm of a heartbeat is played, we can eat more. Audio branding is a new branch that relates only to sensory branding through sounds. Sound designers are developing audio identities for brand and that involves: audio logo, brand theme, soundscape, brand voice. Sound of a steady heartbeat, a piano, a breath were chosen as most convenient sounds for an Audi audio branding. Mercedes Benz formed a team to get the most appealing sound for a closing car door.

**(iii) Smell (Olfactory):** Scientific studies have shown that 75 % of our emotions are generated by the smell. Humans are able to distinguish over 10,000 that are being transmitted to our olfactory system in the brain where it is closely tied to memory, mood, stress and concentration. Our sense of smell has been proven as most impressionable and responsive of our five senses, while it invokes memories and appeals directly to feelings without being filtered and analysed by the brain (as our other senses work). Smell was used a lot in real estate business, somehow houses sold better if they smelled like vanilla, fresh baked cookies or popcorn (evoking memories of early childhood. Mahogany wood, motor oil and the smell of leather were used and combined to recreate the unique smell of the 1965 Silver Cloud Rolls Royce interior. Now every Rolls Royce leaving the factory is equipped with a diffuser in the underside of the car's seat to convey this unique luxurious identity of the brand. Starbucks is one of the companies that is well aware of the power of sensory branding. Through their characteristic cozy interiors, nice Barristas and of course the smell and taste of fresh grinded coffee they occupy all of our senses. They even stopped serving breakfasts because the smell of the eggs interfered with the smell of the fresh grinded coffee.

**(iv) Taste (Gustative):** People can sense 5 basic tastes bitter, sour, umami (savory, or meaty), salty and sweet. For all other flavor tastes we must thank to our sense of smell, for that is the one that gives flavor to our food. We can say that taste is the sense that fuses all different senses together to create a holistic brand experience, but is also linked to emotional states, so it can alter mood and brand perception. Most famous campaign that included taste was the one made for the launch of Škoda Fabia in 2007 in London. It cost more than a real car (\$800,000). Idea was to advertise it as tasty, so they decided to bake a life-sized cake that looked like Škoda. They hired the best chocolatiers, bakers and bricklayers to construct and bake the car, and filmed the whole process. According to Škoda, in the first week of the campaign, the visits to car dealerships went up by 160 percent.

**(v) Touch (Tactile):** Our skin has more than 4,000,000 sensory receptors that can be easily manipulated through materials, weight, softness and comfort of the product. Haptics refers to the sense of touch (comes from the Greek word haptikos that means "I fasten onto, I touch"). Today haptics is mostly considered as a tactile feedback technology which takes advantage of the sense of touch by applying forces, vibrations, or motions to the user (we can see examples in user-interface design and product design) Haptics also plays a great role when it comes to packaging design, or even in some advertising campaigns. Packaging - and by that I mean form, material, size, weight - can give a huge impact on our brand awareness. It is a perfect way for getting close to consumer's unconsciousness, their perceptions, feelings and tastes. Some great examples can be found is the work of conceptual designers, architects and enthusiasts.

#### IV. THE STUDY:

Study on 116 respondents from different age groups is done. Each responded to following statements -

- a) "KFC" brand is differentiable or identifiable through its taste.
- b) "KFC" brand is differentiable or identifiable from its Smell.
- c) "KFC" brand is differentiable or identifiable through seeing the logo.
- d) "KFC" brand is differentiable or identifiable through touching the fried chicken piece.

e) “KFC” brand is differentiable or identifiable through listening the jingle/advertisement.

## V. OBJECTIVE OF THE STUDY:

The objective of the study is to find or investigate the impact of sensory aspects of (five senses) “KFC” on consumer.

## VI. SIGNIFICANCE OF THE STUDY:

As brands struggle to compete in today’s competition, strategic use of sensory information can provide a critical advantage. Before using the strategy of sensory branding it’s helpful for marketers if they have an idea about the impact of sensory aspects of brand on customer. So, my purpose of the study is to provide a view to marketers as they decide to incorporate sensory marketing strategy in their products and services.

## VII. METHODOLOGY:

There were 116 respondents selected for the study. These respondents took the survey through an online survey form. These respondents were residents of Hyderabad, India. All respondents had eaten at least once in one of the 13 KFC branches in the city. While analyzing, data was divided into five elements of senses namely Sight, Smell, Taste, Sound and Touch.

## IX. ANALYSIS AND MAJOR FINDING:

This part provides the empirical findings that I have gathered data for my study through questionnaires. In empirical part, I used diagrams to make the connection between the text and study conducted clearer KFC is a global brand and has entered into Indian market recently. People giving survey might have very low brand awareness. Sample size is 116, which is very small KFC being a global brand, and limited to city of Hyderabad, India. I asked several questions to the respondents. The findings from the questionnaires are given below

Q1. “KFC” brand is differentiable or identifiable through its taste.

Fig. 2: Identifiable through taste.

The diagram shows (Figure-2) represents the result of question asked to the respondents about the brand identity of KFC based on taste. The respondents replied, 52.59% with agree, 26.72%

with strongly agree, 7.76% with neither agree nor disagree, 10.34% with disagree and 2.59% are strongly disagree with that statement.

Q2. “KFC” brand is differentiable or identifiable from its Smell.

Fig. 3 : Identifiable through Smell.

The diagram (Figure- 3) represents the result of question asked to the respondents about brand identity of KFC based on smell. The respondents who agreed are 57.76%, 13.79% strongly agree, 10.34% neither agree nor disagree, 16.38% disagree and 1.72% strongly disagree with that statement.

Q3. “KFC” brand is differentiable or identifiable through seeing the logo.

Fig. 4: KFC is identifiable through logo

The diagram shown (Figure-4) represents the result of question asked to the respondents about brand identity of KFC based on the logo. The respondents replied, 53.45% agree, 31.9% strongly agree, 5.17% neither agree nor disagree, 7.76% disagree and 1.72% are strongly disagree with that statement.

that statement.

Q4. "KFC" brand is differentiable or identifiable through touching a piece of chicken.

Fig. 5: KFC is identifiable through touch.

The diagram shown (Figure-5) represents the result of question asked to the respondents about brand identity of KFC based on the touch. The respondents are replied with agree which is 39.66%, 22.41% replied with neither agree nor disagree, 25.86% are replied with disagree and 2.59% replied with strongly disagree and 9.48% replied with strongly agree.

Q5. "KFC" brand is differentiable or identifiable through listening the jingle/advertisement.

Fig. 6: KFC is identifiable through sound.

The diagram shown (Figure-6) represents the result of question asked to the respondents about brand identity of KFC based on the jingle. The respondents are replied with neither agree nor disagree which is 25%. On the other hand, 37.07% replied with agree, 12.93% replied with strongly agree and 22.41% replied with disagree, 2.59% replied with strongly disagree.

To summarize, following data is determined from my research according to the questionnaire

answered by KFC consumers:

Senses	Number of respondents who Identified or recognized KFC	Percentage
Taste	61out of 116	52.59%
Smell	67out of 116	57.76%
Sight	62 out of 116	53.45%
Sound	43 out of 116	37.07
Touch	46 out of 116	39.66%

Fig. 7: Number of respondents who identified or recognized KFC

## X. CONCLUSION:

Sensory branding is based on the idea that consumers are most likely to form, retain and revisit memory when their all five senses are engaged during the process of buying products or services. The research was conducted to get the impact of sensory branding strategy of KFC on consumer for building brand identity and brand awareness. The study found that of all five senses olfactory has highest impact on KFC consumers followed by visual and gustative aspects of it. On the other hand, tactile and auditory impacts on the sensory aspects (five senses) of KFC consumers are lesser respectively. Nevertheless, KFC brand equity is highest though there have been many competitors selling similar products along with many street vendors.

### **ABSTRACT**

*Nowadays, due to the phenomenon of interlinguistic and intercultural incompatibility, which arises as a result of communication between languages and cultures, the problem of understanding and interpreting the concepts of another language and culture by the owner of one language and culture is becoming more actual. Concepts specific to a particular language and culture, in most cases, create complex situations in the translation process. Such words are called culture-bound words in the language of translation. In the translations of the novel "Bygone Days" by the talented Uzbek writer Abdullah Qodiri, such words are often found, and they are relevant in terms of the fact that they are still involved in linguocultural analysis and do not draw the appropriate scientific conclusions. The article discusses specific words that represent measurements and currencies and their translation options based on a linguocultural approach. In the linguocultural approach to translation, the author sought to determine the degree of conformity of the translation to the originality, based on a complete component analysis. In fact, the analyzed sema units are identified, the main sema is separated according to the function of application in the context, and the semantic function of the lexeme in the context is indicated. The degree of adequacy of the translation to the original is determined by the fact that the content of the sema is restored in the translation, and at the same time, the purpose allocated in the context to the unit of the original is realized in the translation as well.*

**KEYWORDS:** *Specific Words, Linguocultural Analysis, The Recipient Of The Translation, Adequate Translation, Anachronism, Functional Analogue, Transcription.*

---

## INTRODUCTION

Translation as a form of activity involves, on the one hand, the establishment of linguistic communication in order to adequately convey the content of the work expressed by means of one language, and, on the other hand, the differences in cultures manifested in these languages. This means that translation is not only a comparison of different language systems, but also a connection of different cultures. The Slovak scholar A. Popovich, in his book "The Problems of Literary Translation" [3], describes the clash of cultures in translation as follows: "In the so-called "ours" field, the boundaries of other cultures disappear completely, and the sense of "translated" in the translated text disappears. Emphasis on the cultural pole of authenticity, on the other hand, leads to a situation in translation in which the recipient, i.e., the recipient of the translation, falls into another cultural environment without any warning or condition. In the third case, there is a "creolization", ie the merging of two cultures in translation. In this case, the fields of originality and the language of translation have an approximate similarity.

It is important to take into account the pragmatic component of the expression in the translation process. In this case, the adaptation of the text between the students of the original and the translation, taking into account the socio-cultural differences, plays a key role. The principle of taking into account the culture of the student in linguocultural studies can be an alternative to this consideration in translation studies. One of the main problems in the delivery of specific words is the pragmatic aspects of translation. In this case, it is important to take into account the functional role of culture-bound words in the text of this or that message.

The problem of finding equivalents of another language in translation, in turn, is divided into such areas as ecological, socio-cultural and material-cultural. For example, the image of the sun creates unique associations for each nation according to its geographical location. "Blue eyes," a standard of beauty for Europeans or Russians, do not evoke similar feelings in Uzbeks. The associations associated with the swallow, which is the herald of the spring, are strange to the American, who accepts the swallow as a species that belongs only to a group of birds, and so on. The undeniable factor is that a change in an extralinguistic being certainly leads to a linguistic change in turn. This means that in translation, the process of adaptation to the new reader of the text is established, and this leads to changes in the information in the original.

Depending on the pragmatic function of the characteristic word, it can be omitted in translation, conveyed in a generalized way without national coloring, or translated as adequately as possible with special attention as the main characteristic of the image. The "exotic images" in the translated text, while seemingly unnatural to the representative of another language, can give a vivid impression that complicates the process of understanding the text and does not justify itself. Therefore, the interpreter works on the basis of a separate approach for each situation, primarily taking into account the functional dominance of the image.

Specific words denoting weight, length, area, volume, and fluid dimensions are one of the groups that require special attention in translation. Different situations are observed in works of art in relation to units of measurement, and differences in translations also require a serious approach to this issue. We will analyze some of them using examples.

The units of measurement associated with words denoting numbers and other quantities are data carriers that represent a certain distance, weight, or volume in a text of any genre. In order to be able to adequately receive this information, the reader of the translation must be aware of the real

or approximate dimensions of these units, and of course this issue must be resolved by means of certain methods in translation. As in the "Bygone days" by Abdulla Kadiri, the fact that historical information about the measurement system is well understood by the translator saves him from cases of anachronism. We will analyze some of examples and their translation versions below.

Example:

*Darbozaning ikki biqinini o'rab olg'an loyig'a gullar, naqshlar tushirilib ishlangan sakkiz **gazlar** yuksaklikda o'rda qo'rg'oni [6,66].*

1. Two clay walls, eight **arshin**\* high, decorated with colourful, carved patterns... (\*arshin – may refer to an old Turkic measurement, equivalent to a yard or to an obsolete Russian measurement equivalent to one cubit) [2,70].

2. The flowers covered the walls of the gate on both sides, inlaid patterns of decorations on the wall of eight **gaz**\* high (\*the measure of length) [4,71].

3. the defensive walls, whose battlements displayed an intricately carved floral design, reached a height of eight **meters**... [1,134].

In all three translations of this example, we can see that three different options were used for the original unit. Before analyzing which of them is an alternative translation to the original, let us consider the interpretation of the archaic units of measurement, "gas" and "arshin." 1918 - Before the introduction of the metric system in the world, certain units of measurement were used in Central Asia, and now they are obsolete, which can be found only in encyclopedias or dictionaries. In particular, "gas" is the distance from the middle of the chest to the fingertips, a unit of measurement that has been used at different lengths in each city or village in Uzbekistan. 1 Gas is a unit of length equal to 0.71 meters. The word "arshin" is derived from the Persian words "arash", "oron", which means elbow. The word passed from Turkic languages to Russian in the 16th century. Arshin is also found in various forms in Ukrainian, Belarusian, Polish, Czech, Slovak, Bulgarian, Serbo-Croatian. 1 Arshin taken as - one step, and 1 step (in Central Asia) - 63–71 cm.[7]. The size of the gas and the arshin coincide, and the use of the "meter" in Qadiri's work leads to anachronism. In this case, the transcription of "arshin" and "gas" as an alternative to the unit of measurement of "gas" justifies itself in this case. Only in this case would it be expedient if the interpreter gave a more detailed underline explanation of the gas unit of measurement. Let's look at another example:

Example:

*... paxsaning enidan bir **gaz** chamasi joy ochilg'an![6,240].*

1. We have already dug about an **arshin** into the clay-covered layer of the duval. [2,228].

2. I have already dug two **feet deep**! [4,243].

3. We removed approximately one **meter**. [1,385].

Besides the "meter" (anachronism) in the third version of the translation, both of the above translations reflect the unit of measurement intended by the author.

When entering the language of images, specific words denoting units of measurement should serve not only to convey precise information, but also to significantly embody in the reader's imagination a particular portrayed piece of reality. For example, the author may draw the reader's attention to a detail of his choice by using the phrase "ten meters high" to indicate the height of a hill, or the phrase "thousands of miles" over a very long distance. The given examples allow to define some bases in application of such formation of artistic images. Digital indicators, as expected, do not play a decisive role, as is the case in the scientific and technical text, but in this case, predictability comes first. In addition, it is possible to determine the approximate meaning of the units of measurement in a narrow context, for example, the "only" distance in "only fifty meters" clearly shows that the distance is not very large.

Example:

A) *Ko'zi uyqusizliqdan bir **qarich** ichiga tushib ketibdir.* [6,230].

1. *He looked dreadful after his sleepless night.* [2,217].

2. *His eyes were deepened so much because of sleeplessness.* [4,231].

3. *His eyes were sunken; he looked exhausted after a sleepless night.* [1,367].

B) *Zaynabning bir yarim **qarich** osilib ketkan qovoq-dudog'ig'a istehzolanib tomosha qilar edi* [6,350].

1. *...all the while throwing mocking glances at Zainab, enjoying the sight of her furrowed brow and pouting lips.* [2,319].

2. *... and she watched Zaynab getting frustrated and upset with an irony.* [4,352].

3. *... the same with Zainab, from whom she also walked one step removed, observing her gloomy countenance with suspicion.* [1,537].

As noted, in both of the above examples, the unit of measurement is used to emphasize the mental and physical state of the protagonists, not to express a precise numerical dimension, and the translators used the correct translation method to describe the state of the image.

Each nation has its own standard-images on different concepts within its worldview. In the author's work, in most cases, the native language makes extensive use of such popular terms of dimensions, and the need to preserve the national and historical color of these lexical units requires that they be translated in the same style in translation. This can be achieved either by using a literal translation or a functional analog (a unit with such coloring in the language of translation). For example, the following example shows the active use of the number "seven" in units of measurement, which is of great importance in the Uzbek mentality:

Example:

*Toshkandning yetti yosharidan yetmish yosharig'acha bilganlikdan...* [6,86].

1. *Here in Tashkent, young and old alike knew and revered him.* [2,89].

2. *He was the respectful person for the people in the city, to everybody from seven to seventy.* [4,91].

3. *They were from all walks of life, both young and old...* [1,162].

The fact that the second translator followed the literal translation was able to retain the pragmatics of the text more than the other two neutralized translations (from the age of seven to seventy - there are signs of exaggeration). Or let's analyze the translations of examples involving another vernacular unit of measurement - the word "qarich".

Example:

A) **Qarich**g'a keladigan uzun soqollar [6,80].

1. *Those long beards* [2,82].

2. *Long beards* [4,84].

3. *beards of a **pious hand`s length** ...* [1,152].

B) Olti **qarich** kenglikda uzundan-uzoq tor ko'cha, tor ko'cha boshida kichkinagina bir eshikcha edi. [6,245].

1. *The narrow, interminably long ginnel, no wider than five **hand-spans**, led to a small wicket gate.* [2,227].

2. – *A narrow, perhaps **half a foot** in width but infinitely long side street ended at a small gate.* [1,383].

*In all three translations of the following example, the communicative purpose of the translation is achieved:*

Example:

*Chunki tepaning boshqa tomonlari yuqorida aytilgandek bir necha **terak bo'yi** jarlik bo'lg'anliqdan...* [6,85].

1. *...since as we have already mentioned, the other sides presented a sheer drop **the height of several poplar trees**.* [2,87].

2. *Because the other side of the hillock above mentioned was a deep ravine with the **height of several poplar trees** ...* [4,89].

3. *Because the other side of the hill **measured the height of several poplar trees** ...* [1,158].

Sometimes it is contrary to the principles of realistic translation that the reader of the translation should receive information about the specific word from the context only in general lines. The reader is imaginary, however, in an attempt to compare a specific word in a foreign language to the units of measurement in his own language, and as a result a state of image clarity is distorted. Therefore, when he encounters a familiar word in his work, the created image is embodied in the precision required in his imagination. In general, if the painting of a work does not depend on a given unit of measurement, or in other words, does not impair the painting, then it is better not to confuse the reader with a foreign word? Of course, it is necessary to be vigilant in cases of analogy and anachronism.

Example:

*Suv bir do'konning ostidan chiqib, bu havlida uch-to'rt **quloch** chamasi ochiq havoda oqar va ko'prik-tom ostig'a ketar edi.* [6,31].

1. The water flowed from beneath a shop, gushed through a few *sagenes*\*(*sagene* – equivalent to about seven feet or one fathom) of open space, then disappeared once more under a little bridge. [2,34].

2. Water gushed out from under a bench, ran three-or four *fathoms* of open space, and again hid under the bridge. [4,32].

3. The stream flowed under a workshop, with part of it twisting three or four *steps* through the yard into the open air before again disappearing under the bridge house... [1,82].

In the first translation of the above example, when the translator uses the archaic unit of measurement - the "sajen", we can see that he allowed analogue, given that it was known only throughout the territory of old Russia. This is, of course, a deviation from the requirements of realistic translation. The fact that the word fathom, used in the second translation, means not only the English naval unit of measurement, but also "embrace", also helped to ensure the adequacy of the translation. The unit used by the third translator can also be called an equivalent translation. Hence, when using analogues in the language of translation, it is also important to consider to which audience they are intended.

Example:

*O'rda darbozasining sahni botmonlab hisoblang'an mevazor bo'lib, bunda olma, o'rik, nok va tut yog'ochlari xilig'ina bor edilar.* [6,66].

1. A large orchard spread out before the gates, spanning several *acres*, with apple trees, sweet uryuchina apricots, and pear and mulberry trees. [2,70].

2. The Orda's gate is with its wide area, surrounded with fruit trees like apple, apricot, pear and mulberry trees. [4,71].

3. An Urda used to stand near the city walls in the district of Yormazar but now *acres* of orchards with apple, apricot, pear and mulberry trees have been cultivated in that area. [1,134].

Given the fact that the example in the example means "in large quantities", all three translators were able to give an alternative. Depending on the context, the neutral substitution in the second version serves a communicative purpose, while the English "acre" in the other two translations did not lead to the nationalization of the original (as we have discussed in the dissertation on the concept of "nationalization").

A complete neutral substitution can be successfully used due to the reduction of the national dye load in specific words denoting individual units of measurement (depending on the function within the context, of course).

Example:

*...siz mana shu pulga guzardan chiqib bir chorak\* et keltirib, sho'rba qilib bersangiz. (\*bir chorak – uch yarim-to'rt qadoq chamasi toshdir)* [6,180].

1. ... go to the little bazaar at the crossroads, buy *some* meat and cook us up some shurpa\* [2,169].

2. ... you go to the bazaar, buy *some* meat and cook soup for us, please. [4,177].

3. ... *could you go to the bazaar on the corner, purchase **some** meat, and make us a soup?* [1,296].

In this example, the author's interpretation of "quarter" as another specific word "packaging" does not necessarily mean that the same should be done in translation. It seems that all three translators did the right thing by translating with the neutral word "some", given that "quarter" means "a little" in the context and it does not have a historical or national color load.

And, of course, in the context in which the exact numbers are required, the translator has no choice but to refer to the transcript. It also depends on the skill of the translator: no matter what type of transcript the subtitle uses, whether it is an in-text explanation or not, he must be able to do so in such a way that the translator does not stumble when he encounters an unfamiliar word in the text. In this case, it is useful for the translator to have knowledge of the units of measurement that are common in many nations.

Example:

*Ammo imorat qismi darboza bilan bir qatorida bo'lib, so'l biqinida devonxona, uning qatorida bo'yiga qirq, eniga yigirma **olchin** joy olg'an o'n besh darichalik kattakon chorzari uy...* [6,66].

1. *To the left of the house was the ruler's chancery, then a sizable structure with fifteen windows, forty **arshin** wide and twenty **arshin** long.* [2,70].

2. *On the left side there was a reception area and in the same line was a house with forty **olchin** height and twenty containing windows width.* [4,72].

3. *On the north face, a substantial keep stood behind the inner gate, measuring forty **meters** by twenty **meters**.* [1,136].

Given that "olchin" is equal to the values of "gas" and "arshin", we can see that the first translation was done correctly. The fact that in the second version of the translation "olchin" is not given any subtitle commentary leads to the misunderstanding of the reader of the translation. We have mentioned above that the "meter" in the third translation does not correspond to the translation of this work in terms of time.

Example:

*Maydon ikki **tanob** kenglikda bo'lib, janubi qutidor va qo'shnisining imoratlari orqasidan va boshqa uch jihati ham shunga o'xshash binolardan iborat edi.* [6,246].

1. *The yard covered about **half a hectare** of ground and backed onto the rear wall of Kutidor's house and that of his neighbour.* [2,227].

2. *The yard was **rather large** and there were the qutidor and his neighbour's houses with their back walls facing the yard....* [4,242].

3. *The width of the square yard was about two **tanob\***. The southern section consisted of Qutidor's property... (tanob/tanap\* – a unit of measurement often for agriculture.... explanation)* [1,384].

In this context, a detailed description of the place requires an indication of the exact unit of measurement, and this was successfully reflected in the third translation.

In our opinion, the frequent occurrence of analogy and anachronism in the translation of specific words denoting a unit of measurement with a bright historical or national color undermines the national-cultural and historical value of the work in translation, so a translator looking for an alternative functional analogue in the target language should not overlook these aspects. Next, let's think about another measurement word - currency translation.

It is expedient to study the lexicon denoting currencies in the context of specific words in two types: 1. national currencies (ruble, soum, pence, kopeck, pound sterling, etc.); 2. Currencies (tillo, grosh, centim, etc.) that have lost their exact value for a number of reasons (usually historical reasons) as well as bright national coloring. The lexicon of the first group is recognized as proper words; and those in the second group are only specific words in a diachronic order, i.e., historically specific words. Also, as mentioned earlier, when used in a figurative sense, the original word loses some of its connotative meaning, and this also applies to currencies: when it comes to the figurative sense, they lose their accuracy and material value and fall into the second group of specific words (shuncha xarakat bir pul bo'ldi, dunyoniki miri kam ikki, etc.).

The functional analog method seems to be the most optimal way to naturally translate specific words denoting currencies into the translated text. In this case, it is justified to refer to the specific words belonging to the second group in the language of translation. Another method is to replace the concepts of the same type, for example, with the words "money", "funds" or, if necessary, to omit the currency, which is difficult to translate.

Before proceeding to the analysis of some examples, let us give information about the ratio of mutual values in the lexicon, which represents the currencies used in the play. So, in the novel "Bygone Days" we come across the following typical words:

Tilla (oltin) - a gold coin worth ten soums.

Tanga (white coin) is a silver coin worth 15 tiyn in Bukhara khanate and 20 tiyn in Kokand khanate.

Pul (chaqa) - a unit of money equal to half a penny in some places, and a penny in some places, and a small coin of the same value. It is mainly made of copper or brass.

Miri - Five cents.

In general, in cases where quantitative accuracy is required, the above currencies can be translated into single equivalents and used throughout the work. In these cases, we would recommend giving gold in the form of gold coin, tanga in the form of coin or small coin, and miri in the form of miri. Then the confusion of monetary value will disappear in the eyes of the reader of the translation, and the national coloring will also be preserved to a certain extent. In the following examples, let's look at the translators' approach to this:

Example:

... Otabekning bobosi o'n besh **tillo** barobariga sotib olgan edi... [6,9].

1. ... Atabek's grandfather had bought him for fifteen **gold tilla**\*... (**tilla – a gold coin**) [2,13].

2. Actually, his grandfather had bought Hasanali from a Turkmen guy for fifteen **gold coins**... [4,8].

3. *Otabek's grandfather had bought him for fifteen **pieces of gold**... [1,49].*

In this example, the use of the word “tilla” in the transcription by the first translator in conjunction with “gold” results in a situation of excessive transcription when the equivalent is present. The fact that the other two translators resorted to the “gold coin” option in terms of their affiliation with the second group is a sign that they were right.

In the following example, we can see that another mistake was made:

*...uch yuz **oltin pul**, mundan keyin olib berish va'dasi bilan Marg'ilondan o'rdadek bir havli... [6,58].*

1. *Three hundred **gold tilla**; the groom would pledge to buy a spacious house in Margilan after the wedding...[2,60-61].*

2. *... three thousand **gold coins**, after marriage to be bought a great big house from Margilon... [4,62].*

3. *Three hundred **gold coins**, a house with a large walled yard... [1,122].*

Let's analyze a number of more examples. In the following examples, the difference in value of tilla-tanga-pul (chaka) relative to each other is also understood in context.

Example:

A) *Menga qolsa bu kunlarda o'ttuz ikki **tanga** emas, o'ttuz ikki **qora pul** solish ham og'iridir. [6,105].*

1. *It would seem to me that even thirty-two **pul**\*(pul – a Kokand coin of a low value) could only be raised with difficulty, let alone thirty-two **tanga**. [2,105].*

2. *Let them rectify their condition in ten days, and then... [4,108].*

3. *In my opinion, it is hard to collect thirty-two copper pieces, not to mention thirty-two tengas, even for me\* (**tenga – a description of the currency**) [1,188].*

B) *O'zingiz ip yigirib, kun ko'rib turgan bo'lsangiz, sizga uch **tanga** emas, uch **pul** berish ham og'ir ekan...[6,195].*

1. *If you live solely from spinning yarn, it will be arduous for you to pay **three pul**, let alone **three tanga**! [2,182].*

2. *If you live hardly due to spinning threads, it will be difficult to you to pay not those **three coins**, but even three **old small coins** as well. (tinges\* coins) [4,192].*

3. *... it will be hard for you to save three **tengas** for payment... [1,317].*

In the above two examples, by contrasting the tanga and the chaqa, the differences between them and the financial condition of the images are exaggerated. In order not to obscure this artistic purpose, it is also necessary to provide accurate information about the currencies without confusing the reader of the translation. The use of "copper pieces" in the third translation of the first example is close to the author's goal (it is known that almost all nationalities make the lowest value of copper). In the second example, the skill of the second translator can be assessed - the interpreter was able to achieve the goal in the context by comparing small old coins to coins.

Let's look at another example:

*Men javob o'rniga **chaqalarni** sanab chiqdim, bitta oltmish **pullik tangasidan** boshqasi bir pullik, besh **pullik** zang bosqan **chaqalar** bo'lib... [6,194].*

*1. Instead of replying, I counted out her **money**: apart from one **sixty-pul-coin**, they were all **coppers** covered in green... [2,181].*

*2. I counted her **money**: except **one coin in sixty pennies**, all were **rusty coins-old small coins, three-kopecks**, pieces...[4,191].*

*3. instead of quoting a price, I counted the **coins**. With the exception of a **sixty-tengas piece**, the rest were **small copper coins**... [1,315].*

We can take the third as the most adequate translation option of this example; while the first translation contains an incorrect transcription of “pul”, the second translation uses the foreign words “penny” and “kopecks” as functional analogs, which does not justify in this case, as currency is not used figuratively in this context. As for the expression of currencies used in the figurative sense, the translator has a wide choice of options, and it can be considered that the introduction of such foreign words into the translation for a specific communicative purpose does not contradict the principle of translation. Let's analyze one of the following situations:

Example:

*...ular Otabekka **uch pullik** ham ro'zg'or qildirmaydirlar. [6,162].*

*1. ... they have not taken even **one penny** from Atabek to spend on running the household. [2,153].*

*2. ... I know well that they have not allowed Otabek to spend **any penny** for the household. [4,160].*

*3. ... they will not allow Otabek to spend **three coins** on household goods. [1,270].*

Thus, the use of the penny as the smallest currency in the first and second versions of this example in translation as required by the context (mainly for the purpose of exaggeration) does not detract from the national color.

The translation is made for "his" reader; if the transcribed original words in the text remain outside the limits of its comprehension, then the communicative purpose of the translation has not been realized. If the original words are conveyed in a special way and the dyeing is lost, the same result is achieved "[5, 102]. Therefore, when giving specific words in translation, it is also necessary to take into account how familiar they are to the reader of the target language; if they are unfamiliar, whether they can be understood through context, otherwise what to do - these questions must be answered.

As the reader reads the translated work, he, too, must approach this level as much as possible, even if he cannot get the exact impressions of the original reader, and this complex task must fall entirely on the shoulders of the translator. The interpreter is the person who maintains the balance between the two languages - he must restore the deviations from the desired norm by all available means.

### ABSTRACT

*About the majority of patients with neurological diseases with such diagnoses as migraine, dyscirculatory encephalopathy, radiculitis, vascular brain syndromes in cerebrovascular diseases, the disease was independently diagnosed by primary health care doctors. Doctors of General practice correctly performed a full volume treatment of patients with these pathologies. A more in-depth analysis of the state of this issue revealed a lack of knowledge among DGP in assessing the volume and quality of medical care provided by DGP for neurological pathology. Most often, DGP provided independent medical assistance for facial nerve neuritis, various pain syndromes in the lumbar region and lower extremities, and migraines. They prescribed adequate treatment for the treatment of these diseases. The same pattern was observed when analysis the compliance of the prescribed treatment with approved standards.*

**KEYWORDS:** *Primary Health Care (PHC), In The Doctor General Practitioners (DGP), The Quality Of Medical Care.*

### INTRODUCTION

The quality of medical care is a set of characteristics that confirming the compliance of the provided medical care with the existing needs of the patient (population), their expectations, and the current level of medical science and technology. In many foreign countries use the who definition, which invests in this concept is the following: "Each patient shall receive such medical care, which would lead to optimal health outcomes in accordance with the level of

medical science, the patient's age, diagnosis, response to treatment; when it should be brought the minimum funds risk of additional injury or disability should be minimal, but the result and satisfaction from the process of care maximum" [4]. The quality of medical care is assessed according to the who standard (1997), which includes:

- Quality of patient information collection (complaints, anamnesis, objective status);
- carrying out the necessary diagnostic measures;
- the correct formulation and justification of diagnosis;
- Quality of treatment measures implementation;
- High-quality maintenance of medical documentation;

providing regular medical records of the patient's condition and the observed dynamics of the disease, interpretation of the obtained laboratory and instrumental research methods, justification of the need for surgical and other medical interventions, the presence of records of consultations and consultations and their decisions, stage, transfer and discharge epicrisis.

During the examination of the quality of medical care are evaluated:

- Sufficiency and timeliness of prescribing and conducting diagnostic measures;
- Correct and timely diagnosis;
- The adequacy of treatment measures to the diagnosis made or the patient's existing symptoms;
- Compliance of medical documentation with approved standards and regulations;
- correct implementation of instructions on the procedure for issuing a disability certificate in cases of temporary disability.

The volume and quality of medical and diagnostic care provided by General practitioners to neurological patients was assessed in the group of patients observed in the Hospital with a total number of 5738 people.

We assessed, in particular, the amount of assistance provided by the GP independently, in addition, we studied in which cases the GP resorted to the advice of a neurologist of the CRH, to specialists from the regional center. In addition, we assessed the degree of compliance of medical care provided to patients with neurological diseases by DGP with official standards of management of such patients. Most often, as it turned out, DGP provide independent diagnostic assistance for diseases such as migraines and sciatica of different localization. [2]. In more complex cases requiring urgent care, more subtle, including topical diagnostics, such as hemorrhagic stroke, epileptic status, subarachnoid hemorrhages, etc., as a rule, specialists were consulted.

Table 1 shows that the main part of patients with such diagnoses as migraine, dyscirculatory encephalopathy, radiculitis, vascular brain syndromes in cerebrovascular diseases, the disease was self-diagnosed by doctors of the Medical center of the Russian Federation .General practitioners performed fairly correct treatment of patients with these pathologies (table 2).

A more in-depth analysis of the state of this issue revealed a lack of knowledge among DGP on the management of these diseases. The same pattern was observed when assessing the volume and quality of medical care provided by DGP for neurological pathology. Most often, DGP provided independent medical assistance for facial nerve neuritis, various pain syndromes in the lumbar region and lower extremities, and migraines. They prescribed adequate treatment for the treatment of these diseases. The same pattern was observed when analyzing the compliance of the prescribed treatment with approved standards. This indicates that DGP have sufficient knowledge to treat these diseases.

Repeat referrals and referrals of patients to specialists: abased on the number of cases of referrals The DGP neurological patients to other specialists is of particular importance. GP refers to the category of cost-effective specialties, and its main feature is both to ensure preventive activities among the population, and to meet the needs of patients as much as possible during initial treatment for diseases. [1]. This makes clear the importance of analyzing the frequency and reasons for each GP to refer their patients to other specialist doctors.

It is possible to identify the features of the work of DGP working in primary care and doctors specialists of the Central district clinics and hospitals, and in hospitals at the oblast level.

The list of registration of referrals to other specialists reflects all the main information about the direction: date, reason, specialist, referral number. The diagnosis is not indicated in this list. [3]. It is indicated both in the diary of the medical card, and in the blank form of the referral itself.

The introduction of this sheet into the developed form of the medical card allows the GP to control the patient's referral to other specialists and, accordingly, facilitates monitoring of the results of these referrals by the GP (table 1).

*The incidence according to referral data includes:*

1. General and primary morbidity, which is studied according to the following documents: "Individual card of an outpatient patient", which has a "list of updated diagnoses", which allows you to record the incidence according to the data of referrals to a medical institution, to identify groups of frequently and long-term ill patients who require special attention of the GP. When registering the final diagnosis by filling in the "Statistical coupon for registration of updated diagnoses" (F -025-2u), the doctor must necessarily enter the registered disease. In the "list of updated diagnoses" of the individual outpatient card (F.-025u), this will ensure the completeness of accounting for diseases.

2. "Statistical card for recording the final diagnoses" (F. 025-2u) is filled for each case identified by the physician of acute illness with the sign (+), in each case first identified by a physician of a chronic disease with a plus sign (+), and if the first request in the current calendar year to the previously identified chronic diseases with the sign (-). When studying the overall incidence of treatment data, all statistical coupons filled in during the year are taken into account to record the final diagnoses (both with a "+" sign and with a "-" sign). When studying the primary morbidity of the population, according to the data of referrals, filled out statistical coupons are taken into account to record final diagnoses only for diseases first detected in the course and year (with a "+" sign). When analyzing the incidence based on referral data, it is necessary to take into account factors that allow you to get complete information about it: the availability of medical care, availability of doctors, the ability and desire of the population to seek medical care at their place of residence, and in specialized institutions, the medical activity of the population and the level of its sanitary culture, etc.

Currently, DGP work mainly in state-run outpatient medical institutions (family and district polyclinics, urban and rural medical centers); a relatively small part of them work in non-governmental institutions and as private practitioners. In a generalized form, we can talk about the following forms of GP work: individual patient reception and group practice (departments or teams). Usually, the team consists of (except GP), dentist, surgeon, obstetrician-gynecologist, less often pediatrician. [1].

Primary care practitioners or pediatricians who have passed special training at the faculties of advanced training of physicians or graduates of medical universities with a diploma of primary care work as DGP. Primary training of DGP is currently being carried out in all medical universities in Uzbekistan. The Ministry of health of the country has developed and approved a training program for DGP and General practice nurses. DGP not only perform the functions of district internists and pediatricians, but also conduct the reception of patients with neurological,

ophthalmological, surgical and ENT diseases. Based on the results of the study, the composition of patients who turned to specialist doctors was analyzed.

The lowest rate of such requests is observed to the surgeon and traumatology's. These indicators are very low because in most cases patients go to the doctor 1 time and during this visit receive all the necessary medical and preventive assistance and recommendations.

Referrals to an obstetrician-gynecologist are usually aimed at questions of contraception or pregnancy. Contraception is one of the forms of preventive work aimed at preserving the reproductive health of the population, which is recognized in our country as a priority area of public health, and therefore appropriate forms of state reporting have been established.

The primary and repeated visits of patients to RMC specialists (internist, pediatrician, obstetrician – gynecologist, surgeon, and traumatology's) are shown in table 3.

**TABLE 3 PATIENTS ' ACCESS TO THE GP OF A RURAL MEDICAL CENTER**

#	RMC specialists	Primary Up take		Repeated Negotiability	
		Availability of abs.	%	Of abs.	%
1	Therapist	7434	35,0±0,33	4898	31,5±0,37*
2	Pediatrician	8053	37.9±0.33	5987	38.4±0.39
3	Obstetrician-and gynecologist	3390	15,9±0,25	3001	19,3±0,32*
4	Surgeon-traumatologist	2387	11.2±0.22	1679	10.8±0.25
	Total	21264	100	15565	100

Note: \* - significantly compared to the initial uptake ( $P < 0,001$ ).

These data show that the greatest number of referrals is to therapists and pediatricians.

The state of a woman's health during pregnancy has a significant impact on the course of pregnancy itself, its outcome, the course of childbirth and the postpartum period, and largely determines the health of the born child. Currently, the situation with the health status of women of fertile age, and especially during pregnancy, cannot be considered a good one.

Thus, the state of health of pregnant women is an important medical-c and social problem. [6]. To solve this problem, it is necessary to develop comprehensive medical and social programs aimed at the formation of reproductive health, starting from childhood and contributing to improving the quality of health of the female population, taking into account, first of all, its childbearing function (table 1).4).

**TABLE 4 COMPARISON OF PRIMARY AND SECONDARY REFERRALS  
TONEUROLOGICAL SERVICES PATHOLOGY**

RMC specialists	Primary turnover in General		Primary neurological turn ability		Repeat conversion rate		Repeated neurological	
	reversibility of abs.	%	of abs.	%	Abs.	%	of abs.	%
Therapist	7434	48,0±0,40	2077	27,7±0,52*, Ah	4898	45,0±0,48	702	14,0±0,50*, Ah

Pediatrician n	8053	52,0±0,4 0	2105	26,0±0,49 <sup>*</sup> Ah	5987	55,0±0,48	855	14,0±0,45 <sup>*</sup> Ah
-------------------	------	---------------	------	------------------------------	------	-----------	-----	------------------------------

Note: \* - significantly compared with the overall primary and primary neurological referral rate(P); a-significantly compared with all primary treatment and repeat treatment of patients(P<0,001).

Patients' access to a pediatrician for neurological problems is higher than that of a therapist. This is due to the large volume of preventive work that pediatricians carry out.

In particular, the pediatrician's preventive work includes patronage of children up to 1 year old at home, vaccination, work with schoolchildren up to 12 years old, etc.

Table 5 shows that the largest share of visits therapeutic or Advisory purpose, and the purpose of follow-up, what was the total number of applications for neurological diseases 2016 year to 27.6% (1581); 2017 year – 32,9% (1893), and in 2018-year – 39,5% (2264) (table.6). Visits for diagnostic purposes and documentation processing had the lowest share.

General practitioners in cases of neurological patients in most cases try to provide assistance on their own. Specialists are usually sent to the dispensary patients or in cases of complicated course of the disease.

## CONCLUSIONS

Thus, in the main part of patients with neurological diseases with such diagnoses as migraine, dyscirculatoryencephalopathy, radiculitis, vascular brain syndromes in cerebrovascular diseases, the disease was independently diagnosed by doctors Of the hospital. General practitioners

performed fairly correct full-volume treatment of patients with these pathologies. A more in-depth analysis of the state of this issue revealed a lack of knowledge among DGP on the assessment of the volume and quality of medical care provided by DGP for neurological pathology. Most often, DGP provided independent medical assistance for facial nerve neuritis, various pain syndromes in the lumbar region and lower extremities, and migraines. They prescribed adequate treatment for the treatment of these diseases. The same pattern was observed when analyzing the compliance of the prescribed treatment with approved standards. Analysis of primary and repeated referrals of patients to specialists PMC (therapist, pediatrician, obstetrician –gynecologist, surgeon and traumatology) showed that the greatest frequency of visits is observed to therapists and pediatricians, while the greatest proportion falls on visits to the PMC for medical or consulting purposes, as well as for the purpose of dispensary observation. Visits for diagnostic purposes and documentation processing had the lowest share. According to the data obtained, the following conclusion can be drawn: DGP in cases of neurological patients in most cases try to provide assistance on their own. Specialists are usually sent to the dispensary patients or in cases of complicated course of the disease.

### **ABSTRACT**

*The article presents the results of studies on the effectiveness of using sociolinguistic theory in teaching the Russian language in a comprehensive school (with the Uzbek language of instruction); The importance of integrated vocabulary suggesting the intralinguistic and extra linguistic characteristics of the word is shown. The article shows that the use of the Russian language is oriented, on the one hand, to its preservation in the country, and on the other, to active study and everyday use as a means of communication and internationalization of culture.*

**KEYWORDS:** *Sociolinguistics, Competence, National-Cultural Component Of The Word Meaning, Integrated Approach To The Presentation Of Vocabulary, Historical And Literary Text.*

### **INTRODUCTION**

The new socio-economic and political situation requires the implementation in society of a language policy in the field of foreign language education, aimed at satisfying both social and personal needs in relation to foreign languages. In the current conditions of the development of the Republic of Uzbekistan, the use of the Russian language is oriented, on the one hand, to its preservation in the country, and on the other, to active study and everyday use as a means of communication and internationalization of culture.

Teaching the Russian language in a comprehensive school (with the Uzbek language of instruction) requires a linguistic description that is most consistent with the goals of

communicatively-oriented learning. A communicative-activity approach is defined as the theoretical basis for teaching the state (Uzbek) language, which has received sufficient theoretical justification in the methodology of teaching the non-native (Russian) language.

**Main part.** The development of international relations in politics, economics, culture and other fields requires the modern methodology of teaching the non-native (Russian) language to be guided by the real conditions of communication. Communicative competence as the end result of training involves not only the possession of appropriate foreign-language technology, but also the assimilation of the vast extra-linguistic information necessary for adequate training and mutual understanding.

The main problem in learning a foreign language is that the student is faced with difficulties related not only to the field of vocabulary, grammar, phonetics or stylistics, but also to the areas of regional geography of social, everyday or historical features of culture expressed in the language being studied. The correct use or understanding of certain words or phrases often requires knowledge of their origin, situations in which they can be used, or basic information from the history, literature, political reality of the country of the language being studied. But teaching does not always rationally combine the methods of co-learning a language and culture. The specific features of teaching the Russian language to Uzbek students have not yet been fully studied, as evidenced by the known difficulties of graduates of Uzbek schools when studying in higher educational institutions with the Russian language of instruction. All this determines the relevance of the topic of the article.

The issues of the connection of language and culture, which underlies sociolinguistics, have long been the focus of attention of linguists, linguodidacts and methodologists (F.I. Buslaev, A.A. Shakhmatov, N.V. Krushevsky, Ya.A. Komensky, K. D. Ushinsky, V.V. Vinogradov, V.L. Zhirmunsky, L.V. Sherba, E.D. Polivanov, R.A. Budagov, V.A. Andriyanova, etc.). Special branches of linguistics have developed - social linguistics, as well as psycholinguistics, ethnopsycholinguistics, ethnolinguistics, dealing with issues of the connection between language and culture.

One of the most relevant concepts of modern linguodidactics is communicative competence, the sphere of manifestation of which becomes an activity process, and speech activity acts as a necessary link.

Starting from the 70s of the last century, the concept of communicative competence became effective, as the structural elements of which linguistic, sociolinguistic, discursive, socio cultural, strategic and social sub competencies began to be distinguished.

In Russian linguodidactics, the term communicative competence was introduced by M.V. Vyatyunev. He suggested understanding communicative competence "as a choice and implementation of speech behavior programs depending on a person's ability to navigate in a particular communication environment; the ability to classify situations depending on the topic, tasks, communicative attitudes that students have before the conversation, as well as during the conversation in the process of mutual adaptation "[2].

V.I. Andriyanova emphasizes that the communicative principle is the basis for teaching the Russian language as non-native. The scientist considers it necessary "to create such a training system that would ensure mastery of the language in its main functions - as a means of

communication, communication, cognition, planning and organization of activities (especially collective), emotional, aesthetic and moral influence and upbringing - with the priority of the communicative function" [1].

Mastering a foreign language as a means of international communication is impossible without knowledge of the socio cultural and sociolinguistic features of the country of the language being studied.

Like communicative competence, sociolinguistic competence is associated with the selection and implementation of speech behavior programs depending on the communication environment. Sociolinguistic competence reflects the socio cultural conditions for using the language (orientation on social norms of communication between different generations, genders, classes and social groups, decoration of rituals). The area of sociolinguistic competence includes, inter alia, the ability to organize pedagogical communication and take into account a specific pedagogical situation, consists of the ability to use realities, special turns of speech, specific rules of verbal communication characteristic of the country of the language being studied, that is, a peculiarity in the language that indicates the influence of customs, culture. In connection with the orientation toward social norms (rules of good form, norms of communication between representatives of different generations, genders, social groups, linguistic consolidation of certain rituals adopted in this society), the sociolinguistic component has a great influence on the linguistic design of communication between representatives of different cultures. Thus, sociolinguistic competence is an integral component of communicative competence. Since the requirements for the level of sociolinguistic competence are somewhat vague, it is necessary to identify individual components, the requirements for which can be described more accurately, and accordingly, can be measured and controlled. This is especially true for schools with the Uzbek language of instruction, since the sociolinguistic component has a great influence on the speech interaction between representatives of different cultures, since it focuses not only on the language (the Uzbek and Russian languages are typologically and genetically completely different), but also on social norms.

When studying a non-native (Russian) language, information on the cultural and historical experience of the people, reflected in the semantics of the language, must be assimilated to a certain extent. From a linguistic and didactic point of view, this means that the obligatory installation in ensuring the lexical aspect should be such a presentation of the semantics of Russian words, which takes into account the meaning of the word as a reflection of a certain phenomenon of reality from the point of view of its occurrence, place and functioning in society, i.e. a description of the cultural-historical aspect of semantics. The object of reality, called the word, should be considered as an object of culture, understood in this case as the unity and totality of the material and spiritual values of the people.

In teaching the non-native (Russian) language, appropriate cultural and linguistic differences should be identified in comparison with the native (Uzbek) language, "special efforts are required for the results of cognitive activities and information exchange to be systematized, included in the general knowledge system and made available for later use "[6]. The word of the Russian language, when it is presented in a foreign language audience, should not be torn off from the cultural-linguistic situation that develops with its natural functioning in the Russian language environment. During its semantization, all relations of the subject denoted by it, with

other objects accompanying it, related to it, and the constructive-subjective attitude of native speakers to these subjects, as well as the cultural and linguistic situation in which they operate, should be disclosed. The analysis of the word in this aspect should be based on specific facts from the history and culture of society and the history of language. Such an analysis of words with national-cultural specificity does not exclude the lexicological approach, but rather complements it.

Sociolinguistics as an element of linguodidactics is the most acceptable interpretation of the theoretical foundations of linguistic science for the presentation of the problem of the national-cultural specificity of the language. A special role is given to vocabulary, in which the cumulative function of the language is most pronounced, due to the direct appeal of the words to the phenomena of objective reality, the close connection of vocabulary with the history and culture of the people.

The words of two languages - studied (Russian) and native (Uzbek) - are conceptually equivalent, can have completely different associations between the student and the native speaker of the studied language. The function of the concept is to classify a specific subject indicated by a word as a specific set of homogeneous objects. But there are additional elements of the meaning of the word that are not related to its conceptual basis.

In the methodology of teaching the Russian language as non-native, its solution was proposed by E.M. Vereshchagin and V.G. Kostomarov of the linguistic and regional theory of the word, the central for which was the concept of the lexical background of the word, new to semasiology and linguodidactics. In classical linguistics, academician V.V. Vinogradov answered these questions fully and convincingly: "To the extent that the word contains an indication of an object, it is necessary to understand the language of objects indicated by words, it is necessary to know the whole circle of the corresponding material culture. The same names in different eras mean different objects and different concepts. On the other hand, each social environment is characterized by the peculiarities of its designations. The same objects are interpreted differently by people of different backgrounds, different worldviews, and different professional skills. Therefore, the same Russian word as an indication of an object includes different contents in the speech of different social or cultural groups "[3].

## RESULTS AND DISCUSSIONS

Based on the point of view of academician V.V. Vinogradov and on the fact that the meaning of words lying at the junction of internal and external linguistics can be limited by significance, which refers to internal linguistics, or expanded to the concept, image, cultural and historical fact that implemented in speech activity and relates to external linguistics, we consider effective in the course of the official language a comprehensive approach to the analysis of vocabulary, which includes an "intra-linguistic" characteristic, i.e. traditional lexicological systematic approach and "external linguistic" characterization, i.e. cultural and historical aspect of the consideration of the word content.

The effectiveness of using the techniques and methods of the sociolinguistic approach in presenting the vocabulary of external linguistics, from the point of view of the cultural and historical content of words, is due to the fact that sociolinguistics was initially oriented toward teaching the language as a "linguodidactic analogue." Sociolinguistics studies the extra linguistic plan for purely cognitive purposes. Sociolinguistics deals with the extra linguistic plan of the

language in terms of the educational process, i.e. with applied goals [5]. And it is most acceptable for teaching Russian non-Russian.

## CONCLUSION

Thus, the problems of the connection of language and culture, the national-cultural specifics of the language, vocabulary in its practical interpretation quite successfully constitute both the subject of study and the subject of teaching within the framework of sociolinguistics, which serves as the basis for the ability to use its main provisions, methods, means, techniques in the practice of teaching the Russian language in a foreign audience.

The sociolinguistic aspect is quite successfully “introduced” into the teaching of the Russian language by non-Russians both at school and at the university. It should be noted that the content and value orientation of the studied concept is changing: the subject of co-study becomes, as in the courses of the Russian language as a second language, Russian culture, which is not for students a culture of a completely foreign country.

Being a foreign-language and foreign-language culture for them, it is at the same time (in the conditions of becoming unified in spirit, in content and in the language of interethnic communication of culture) partly familiar and to some extent “own”. This is one of the sections of the field of knowledge that relates in this case to the culture of the people who have, with the people to which the students belong, a common history, traditions.

Thus, the sociolinguistic side is based on the following theoretical premises, linguodidactic principles and methodological techniques:

- recognition of the reflection in the language, in particular in vocabulary, of the cultural and historical experience of the people;
- the need to teach the Russian language as a non-native co-study of the language and culture with the aim of adequate perception by students of the studied language in its various manifestations and forms;
- development of vocabulary principles and criteria for a specific recipient;
- selection, classification of sociolinguistically valuable vocabulary depending on the specific addressee and the goals of its presentation;
- selection of historical and literary texts, where this vocabulary is presented most fully and which contain the most valuable cultural and historical information;
- the use of common methods and techniques for the presentation of cultural and historical information, concluded, broadly, in the content of historical and literary texts and, in a narrow sense, in the semantic structure of the word.

### ABSTRACT

*It is well known that the lexicon of formal and journalistic styles in Chinese is one of the styles that retain relatively many elements of classical Chinese Wenian. In the framework of this article, on the basis of the speech of the Chinese leader, the peculiarities of the lexicon of the text of political speech in modern Chinese, the role of Wenian elements in the lexicon of the language of this direction today were identified. The analysis was based on Xi Jinping's speech at a special summit of the G20 leaders. Relevant conclusions were also stated statistically.*

**KEYWORDS:** *Xi Jinping, Coronavirus, Lexicon, Venyan, Independent Words, Auxiliary Words, Phraseological Units, Stable Compound, Lexical Content, Modern Chinese, Political Speech.*

### INTRODUCTION

Political speech is not only an integral part of political activity, but also a means of connecting the speaker, often the state, with the people. Therefore, it is very important to have an error-free structure of speech in the state language, the correct choice of lexical units, the appropriate use of stylistic tools, on the other hand, speech requires serious attention, as it quickly reaches the consciousness and consciousness of the people, as well as reflects the intellect and wisdom of the speaker.

This article analyzes the speech of the President of the People's Republic of China Xi Jinping at the G20 Special Summit of the G20. The text of the speech was taken from the website of the Chinese Xinhua Agency (26.03.2020).

This speech is aimed at the coronavirus pandemic 《携手抗疫 共克时艰》*Xiéshǒu kàng yì gòng kè shí jiān* It is called “Let's fight the epidemic hand in hand, let's overcome the hardships of the time in unity.”

When attention is paid to the vocabulary of the speech title, the words are chosen with great care, but far from the modern Chinese spoken language. The words in the title are simple in structure, with only the first component 携手 *xiéshǒu* in the form of a compound, 携 *xié* usually requires an object after itself, in this place 手 *shǒu* The word “hand” is the object of the verb. The following explanation of this compound is given in Chinese annotated dictionaries: 1) 手拉着手 *shǒu lā zhuóshǒu* “Holding hands”, 2) metaphor: means to do something together [1, 1507]. In the second source, only its first meaning is given “holding hands” [2, 737].

抗 *kàng* 1) return; to resist; 2) to refuse; 3) comparison, equalization [1, 764] [2, 369]. The meaning of this word is explained in the dictionaries using the following examples: 1) 抗灾 *kàngzāi* “disaster relief” | 抗旱 *kànghàn* “киргоқчиликка қарши туриш” | 皮大衣旧点儿没关系, 只要挡风抗冻就行。 *Pí dàyī jiù diǎn er méiguānxì, zhǐyào dǎng fēng kàng dòng jiùxíng.* Even if the outerwear is old, the main thing is that it protects from the cold (returns the cold). 3) 抗衡 *kànghéng* such as equalization.

疫 *yì* epidemic This word is interpreted as a synonym in both dictionaries [1. 1616] [2. 796].

共 *gòng* 1) general : 共性 *gòngxìng* | 共通 *gòngtōng*. 2) together, unanimously : 同甘苦, 共患难 *tóng gānkǔ, gòng huànnàn*. 3) together, together : 和平共处 *héping gòngchǔ* | 共进晚餐 *gòng jìn wǎncān*. 4) in total : 这两个集子共收小说十二篇 *Zhè liǎng gè jí zi gòng shōu xiǎoshuō shí'èr piān*. 5) Applies to the Chinese Communist Party [1. 478] [2. 227].

克 *kè* There are four dictionary articles in the Modern Chinese Dictionary, which have the following meanings.: 1) be able to: 不可分身 *bùkěfēn shēn* inability to be in two places at the same time. 2) to overcome; to take control : 克己 *kè jǐ* self-management | 以柔克刚 *yǐróukègāng* overcome with gentleness (softness). 3) to strike; to surrender : 克服 *kèfú* to conquer, to conquer | 克敌 *kè dī* to surrender the enemy. 4) digest: 克食 *kè shí* digestion | 克化 *kè huà* digestion, absorption [1.773]. In the second lexicographic source, dictionary articles are combined [2, 372].

时 *shí* 1) applies to a slightly longer period of time (in the sense of time, period): 古时 *gǔ shí* in antiquity, in ancient times | 宋时 *Sòng shí* Sun period. 2) known, specified time: 按时 *ànshí* in time | 准时 *zhǔnshí* a total of twelve meanings are given as at the specified time [1. 1234] [2. 609].

艰 *jiān* hardship [1. 662][2. 318]. This lexeme is used in only one sense in both sources.

So, this speech of the President of the People's Republic of China can be translated as “Let's fight the epidemic hand in hand and overcome the hardships of the times together.” Apparently, the subject of the speech is in the context of a call and an invitation.

As can be seen from the title of the speech, modern Chinese words are almost never used, most of which have Wenyang features.

尊敬的萨勒曼国王,

各位同事 :

*Zūnjìng de Sàlěimàn guówáng,*

*gèwèi tóngshì:*

The speech began with the traditional address words, namely: Dear King Salmon, dear colleagues! It should be noted that the choice of words and punctuation in the sentence is specific to the Chinese language. Since the names of foreigners are much longer than Chinese names, the choice of the main part of the name in the Chinese variant is not considered disrespectful, but is a normative case due to the nature of the language. Although the word “respectable” is not reused before the next word “colleagues,” this lexeme, which appears at the beginning of the introductory sentence, also applies to the second part of it. It is expedient to translate this introductory sentence as “King Salman ibn Abdul Aziz al Saud, esteemed colleagues, ...” (this translation belongs to Ikhtiyor Niyazmuradov).

After the application part, the following greetings are given:

大家好！首先，我谨对萨勒曼国王和沙特方面为这次会议所做的大量沟通协调工作，表示衷心的感谢！

*Dàjiā hǎo! Shǒuxiān, wǒ jīn duì Sà lěi mǎn guówáng hé shā tè fāngmiàn wèi zhè cì huìyì suǒ zuò de dàliàng gōutōng xiétiao gōngzuò, biǎoshì zhōngxīn de gǎnxiè!*

Peace be upon you. First of all, I would like to express my sincere gratitude to King Salmon and Saudi Arabia for the large-scale work done on communication and organizational issues for the organization of this summit (translated by Samida Mustafaeva).

The two lexemes in the sentence require special attention: 谨 *jǐn* 1) carefully. 2) with respect [1. 711] [2. 342]. It is in the second sense that the word is used to express respect, mainly when expressing gratitude [2, 342]. 衷心 *zhōngxīn* sincerely, wholeheartedly [1. 1768] [2. 866]. This word is also often used when expressing gratitude. The two lexemes mentioned above in this sentence are of special importance, although 谨 *jǐn* is not an independent word. That is, it is these lexemes that express the humility of the speaker (the speaker) and his deep respect for the interlocutor (the party to whom the speech is directed).

面对突如其来的新冠肺炎疫情，中国政府、中国人民不畏艰险，始终把人民生命安全和身体健康摆在第一位，按照坚定信心、同舟共济、科学防治、精准施策的总要求，坚持全民动员、联防联控、公开透明，打响了一场抗击疫情的人民战争。经过艰苦努力，付出巨大牺牲，目前中国国内疫情防控形势持续向好，生产生活秩序加快恢复，但我们仍然丝毫不能放松警惕。

*Miàn duì tūrúqílái de xīnguān fèiyán yìqíng, zhōngguó zhèngfǔ, zhōngguó rénmin bù wèi jiānxiǎn, shǐzhōng bǎ rénmin shēngmìng ānquán hé shēntǐ jiànkāng bǎi zài dì yī wèi, ànzhào jiāndìng xīnxīn, tóngzhōugòngjì, kēxué fángzhì, jīngzhǔn shīcè de zǒng yāoqiú, jiānchí quánmín dòngyuán, liánfáng lián kòng, gōngkāi tòumíng, dǎxiǎngle yī chǎng kàngjǐ yìqíng de rénmin zhànzhēng. Jīngguò jiānkǔ nǚlì, fùchū jùdà xīshēng, mùqián zhōngguó guónèi yìqíng fáng kòng xíngshì chíxù xiàng hǎo, shēngchǎn shēnghuó zhìxù jiākuài huīfù, dàn wǒmen réngrán sīhào bùnéng fàngsōng jǐngtì.*

Suddenly facing a new coronavirus pneumonia epidemic, the Chinese government, without fear of hardship and danger, put the safety and health of human life first, firmly in the body, scientifically prevent and treat the disease, respond to the demands of government policy developed at a level that would allow, with tolerance at the level of the national movement, to be controlled in an organized manner, and with openness the whole people's struggle against the disease began. With tremendous effort, with great sacrifices, the epidemic control situation in China is changing for the better. Production and social life are rapidly returning to their place, but we must still not lose vigilance, even in the slightest (translation S.M.).

In this part of the speech, a number of lexical units are of particular interest. 突如其来 *tūrúqílái* It is hard to say that the word meaning “to happen suddenly, to happen suddenly” is widely used in modern Chinese speech. The first part of the compound, 突如 *tūrú* is synonymous with the quality of 突然 *tūrán* keng, which is widely used in modern Chinese literary language, the second component, 其来 *qílái* consists of two components, where 其 *qí* 1) the third person singular pronoun singular (he) and plural forms (they); 2) show diamond (that, he, like him); 3) in the function of the show pronoun (in this case it is an auxiliary word and does not mean an independent meaning). Ravish is used as a word in the category of rhetorical content and in the formation of sentences with the content of the command or request. There are also cases when this morpheme comes as an affix [1. 1069]. In the above combination, the third meaning of this unit given in the dictionary article is observed, that is, the meaning of the pronoun “he, that” is understood, but it is not reflected in a separate translation as an independent word.

Just as 忘其所以 *wàng qí suǒyǐ* is used in the phrase “to be arrogant and forget everything”.

In both places it does not manifest itself as a completely independent word, although the meaning of showing, pointing to it (they) is understood in its content. 来 *lái* and in the sense of “coming.”. 其来 *qílái* together they are considered neutral vocabulary today 发生 *fāshēng* Means “to happen”.

不畏艰险 *bù wèi jiānxiǎn* the first components in this compound 不畏 *bù wèi*, бунда 不 *bù* is considered a morpheme meaning denial, 畏 *wèi* “To be afraid, to be confused” [2. 697] not used alone in modern Chinese. The second part of the compound 艰 *jiān* “difficulty, hardship” [2. 318] and 险 *xiǎn* “danger, danger, frustration” [2. 724] these words are also not used alone in modern Chinese together “困难和危险” *kùnnán hé wéixiǎn* Used as a short form of the phrase “hardship and danger”. In this respect, too, the phrase with this equal relation reflects the ancient Chinese Wenian character. Similar verb conjugations can be observed again in this part of speech: 防治 *fángzhì* accumulation 预防 *yùfáng* “prevention; protection” and 治疗 *zhìliáo*

“treatment”, 联防 *liánfáng* “sympathetic (joint, organized) protection” and 联控 *lián kòng* “joint control, management”, 抗击 *kàngjī* *цъи* 抵抗 *díkàng* “resistance; resist” and 反击 *fǎnjī* formed from the combination of the words “counter-attack.”, 防控 the word in turn 预防 *yùfáng* “prevention” and 控制 *kòngzhì* “management” reflects the basic components of control lexemes.

在中方最困难的时候，国际社会许多成员给予中方真诚帮助和支持，我们会始终铭记并珍视这份友谊。

In difficult times for China, many members of the international community have spared no effort and support. We will always keep this in mind and cherish this friendship immensely.

Although the above 铭记 *míngjì* sentence means "to remember, to remember," the first component of the word "carving on stone (or metal)" means that the Chinese leader in his speech praised the international community's support for China. It is understandable that it expresses a relatively high recognition and that it will forever remain in the memory of the Chinese people.

In this sentence 珍视 *zhēnshì* the combination of verbs in a complex structure is noteworthy in the context, it 珍惜 *zhēnxī* “appreciation” and 重视 *zhòngshì* “pay close attention” verbs denoting meanings are formed from a combination of basic morphemes. However, in most cases, especially in colloquial speech, the phrase “cherish this friendship” is given in Chinese as 珍惜这份友谊, however, the Chinese leader used the word 重视 *zhòngshì* as a morpheme meaning “to pay serious attention” to enrich the content of the above sentence, as well as China's attitude to the support of the international community.

Such peculiar lexical units can also be found many times in the following sentences of Xi Jinping's speech.

In the next paragraph of the speech, a number of strict syntactic units (fixed compounds) were also used, 坚定信心 *jiāndìng xìnxīn* “with firm confidence”, 齐心协力 *qíxīn xiélì* “to work together”, 团结应对 *tuánjié yìngduì* “in unison” such as compounds that have meanings.

The phrase 携手 *xiéshǒu* “holding hands” in this paragraph is also a written alternative to the phrase 手拉着手 *shǒu lāzhuó shǒu*, which is often used in oral speech.

In the following sections, the speaker makes a number of points about the situation. In this case, the word 此 *cǐ*, which belongs to the ancient Chinese language, is used in place of the modern Chinese 这 *zhè* “this, this” pronoun. 愿 *yuàn* “to want”, 以下 *yǐxià* “following” such words also actually manifest themselves as elements of ancient Chinese.

## CONCLUSION

In the lexicon of Chinese political discourse, the elements of ancient Chinese venyen occupy a more prominent place than the other stylistic lexicons of the language. We can see that Xi Jinping's weight in the lexicon of speech has increased even more. A total of 536 independent words (the total number of characters in the text is 1412) were used in the speech of the Chinese leader on the surface of the coronavirus pandemic, of which 35 (excluding repetitions in the text), ie about 7% fully reflect the characteristics of Venus. Most of these words are verbs, a

certain part belongs to the category of diamonds. Also, about 80% of the auxiliary words used in the text of the speech are venyan-specific auxiliary words. This, in turn, demonstrates the effective use of classical language elements in the lexicon of political speech in modern Chinese (especially Xi Jinping's speech). Phraseological units were also used in the text of the speech, which shows the closeness of the speech to the people and the appreciation of national traditions. Although speech is related to the coronavirus pandemic, complex terminological units in speech are extremely rare, accounting for about 0.5% of speech vocabulary.

## INDUSTRIAL IMPACT OF INDUSTRY IN SAMARKAND REGION

**Raximova Gulchexra Sobirjonovna\***

\*Doctor of Philosophy in History (PhD),  
Kokand State Pedagogical Institute,  
UZBEKISTAN

Email id: raximova.80@bk.ru

### ABSTRACT

*The article is based on historical sources on the implementation of industrialization policy in Samarkand region in the 40-80s of the XX century, the dense and very close location of industrial enterprises in a particular city, the rapid fulfillment of obligations of industrial enterprises, the interests of industrial enterprises in the former Soviet Union. described. There are reports of the damage caused to the environment by waste due to the neglect of the material and technical base of industrial enterprises due to the rapid implementation of production.*

**KEYWORDS:** *Industrial Enterprises, Environment, People, Manufacturing, Water, Soil, Health, Atmospheric Air, Disease.*

### INTRODUCTION

Speaking at the 72nd session of the UN General Assembly at the 72nd session of the UN General Assembly, President of the Republic of Uzbekistan Shavkat Mirziyoyev spoke about security and stability in Central Asia as one of the most important issues of international importance. The current state and sustainable solution of complex and global issues related to the use of [1].

A number of mistakes in the policy of cotton monopoly and industrialization pursued by the Center in relation to Uzbekistan in the former USSR, years later, caused socio-economic difficulties and environmental problems in the country. Mexmonov, H. Oblamurodov, A. Razzoqov, D. Bobojonova, H. Yunusova described in her monography [2]. Including, d. In her monograph, Bobojonova notes that "the economy of Uzbekistan has become an integral part of a single centrally managed national economy" [3].

In addition, X. Yunusova said: "The local population is mainly engaged in cotton growing, and it is one of the last countries in the world after the former Soviet republics in terms of food production and even consumption of these products. The delivery of agricultural products grown

in the republic itself was a manifestation of socialist homelessness. This situation in the whole country has disturbed the balance of nature and aggravated the ecological situation.”[4]

### **Main part**

In 1957, the industrial management authorities, the leaders of the party leadership decided on the Samarkand economic central region. In 1957, compared to 1913, the industrial sector in Samarkand increased 83 times. In the Samarkand economic region were built mineral fertilizers for agriculture, silicate bricks, building materials [6], spare parts for tractors and cars, a high level of leather, wine, grapes, factories and garments, silk, food factories.

The Samarkand Tea Factory [7], the only supplier of high-quality tea among the former Soviet republics, has also been recognized. The uninterrupted operation of factories and mills could be seen in the second half of 1957, when production increased by 11 per cent compared with the first quarter of 1957, when the annual plan was immediately fulfilled by 100 per cent as of December 20 [8]. In order for such production to reach a high level, of course, the support system for industrial enterprises must also be high.

Therefore, before the opening of the Angren coal mine, valuable Karaganda and Kuzbass coal was imported to provide Samarkand industrial enterprises with sufficient capacity. Expensive coal was used only in the power supply of heavy industrial enterprises. By the 1960s, with the construction of the Jarkok-Bukhara-Samarkand-Tashkent main pipeline, natural Bukhara gas had served to increase the capacity of all industrial enterprises in the Samarkand region. In addition, the Dargam canal hydroelectric power station has been a great help in supplying power to industrial enterprises. Samarkand economic region is divided into 3 important industrial enterprises: central, eastern and north-western. In Samarkand, KrasnyDvigatel, Kinap electromechanical plant, refrigeration plant, superphosphate, ammophos, tire repair, porcelain, leather factories, tea packaging plant, cotton ginning plant are among the largest industrial enterprises of the city. The total area of Samarkand region was 16.4 km<sup>2</sup>, districts - 16, cities - 11, urban districts - 3, towns - 12, villages - 125 [10]. During the former Soviet Union, the relocation of industrial enterprises to densely populated areas in Samarkand also led to a change in the ecological balance. The spread of chemical waste during the operation of industrial enterprises for the production of chemical and organic fertilizers, which are especially important in agriculture, has exacerbated social problems in the environment. In 1954, a superphosphate plant was built in Samarkand, which produces mineral fertilizers, which play a key role in agriculture. By 1958, the superphosphate plant began to produce seric acid using karatauskihphosphorites imported from the Kazakh SSR [12]. Other additional raw materials were brought from the former (city of Khibinogorsk) from the Kols Peninsula. The Serno acid plant is a source of accelerating basic operating activities for technical equipment in the fields of radio engineering, electrical engineering and telemechanics. According to the decision of the Central Committee of the CPSU, the Samarkand Chemical Plant took the lead among the world's chemical industries in the implementation of the plan in May.

In 1967, the location of Samarkand industrial enterprises [13]

Region Name	Production Quantity	Gross Products Remaining	Manufacturing Products
Central	37.3	31.2	20.3
West	27.9	19.0	11.9
Northeast	21.3	41.3	15.0
Near the city	13.5	7.8	52.8

The Chashma canal passed through the center of Samarkand and was very close to the central nuclear zone of industrial enterprises. During the operation of industrial enterprises, ChashmaArigi played an important role, the main users were metal processing, machinery and other food, light industry enterprises. The Central Spring Fountain was important not only in the supply of water, but also in the washing of various technical equipment in production.

So we know that industrial enterprises have been dumping more of their wastewater into nearby canals. In this regard, on the map of Samarkand region, we observed the flow directions of the Chashma stream. The spring flows through the border areas of Samarkand with the former Gagarin, M. Gorky, Titova and Agalik streets. In turn, the population has been using Chashmaaryg for farming, livestock and melons.

Territorial division of industrial enterprises in Samarkand in 1966 [14]

Territories of industrial enterprises	Mechanical engineering and metal processing	Chemical industry g food	Wood processing	Building materials	Light industry	food	Other production
Central	47,2	-	47,0	26,5	51,5	16,4	20,1
West	16,3	-	-	0,3	27,8	16,7	-
Northeast	29,9	-	38,1	14,3	20,7	66,9	79,0
Near the city	6,6	100,0	14,9	58,8	-	-	0,9

In 1965-1970, the growth of new industries in Samarkand region increased. In particular, a porcelain factory, refrigerators factory, home refrigerators, elevator construction plant, textile factories have been built and put into operation in the city center.

In order to ensure the implementation of the Resolution No. 169 of April 16, 1976 "On the impact of industrial enterprises on environmental pollution in the organized society" Uzplodrovinprom in 1976-1980 ", the situation of industrial enterprises in Samarkand region was studied. During the inspection, Samarkand winery named after Khovrenko, Samarkand cast iron

plant "KrasnyDvigatel", Samarkand stone processing, porcelain, tannery, cannery "Serp imolot", Samarkand distillery, Gazalkent cannery dumped their wastewater into the central canal of the city. identified [15].

The discharge of wastewater into the surrounding canals by industrial enterprises has had an impact on the drinking water of the population.

In 1978, the harmful effects of meat processing plants in the Samarkand region on the environment were identified [16].

№	Harmful substances	The amount of untreated wastewater	The amount of waste released into the atmosphere
1	Solids and gaseous substances	36,9	36,9
2.	Carbon monoxide	31.6	31.5
3.	Nitric acid	5.2	5.2

## RESULTS AND DISCUSSIONS

In the practical control work of the state "On the results of the implementation of the plan for environmental protection in 1979 and the results of work in the field of nature protection" as of 1979, only 60% of environmental measures at Parkent-1 And at the Samarkand Serp i Molot cannery, 40% of the demand was found [17].

During the inspection of the areas, it was reported that the technical equipment for environmental protection at the plant did not meet the requirements, as well as the wastewater from the plant was discharged into nearby ditches without proper treatment. It was clear that the effluents of the enterprises and the toxic dust emitted into the atmosphere had been polluting the environment by passing through the facilities that did not meet the demand.

In the 1980s, 26.7% of the population in Aqdarya district, 34.8% in Ishtikhon district and 37.1% in Kattakurgan district of Samarkand region were provided with tap water [18]. The rest of the population has been consuming drinking water from open water reservoirs. The protection measures of the reservoirs were not monitored. In Samarkand, the work on protection of the environment and water resources was not carried out at the required level. The Samarkand winery named after Khovrenko dumped untreated wastewater into open ditches [19].

Supervisors noted that the directors of industrial enterprises were negligent in protecting the environment, and imposed fines on them by the heads of industrial enterprises in Samarkand, Bukhara and Kokand for their damage to the environment. Although these fines were collected, the material and technical base for the company's facilities was not updated. The techniques that have been damaging the environment have not been updated over the years, and the damage to nature has only been solved by changing leaders and paying them fines.

Unfortunately, the situation was similar at the chemical plants in Samarkand. Looking more directly at the issue of water, why it is so important today, its vital role in the sustainability of human life, human society and the natural environment is the focus of not only experts and scientists, but also the leaders of countries it can be felt that the level has become a rising problem [20].

In 1983, due to the technical failure of the Samarkand SFZ (Super Phosphate Plant), Kattakurgan Oil and Gas Combine Wastewater Treatment Plant, 10,000 tons of cubic meters of wastewater were dumped into nearby ditches. Due to the fact that the fluorine in the wastewater of superphosphate production plants was discharged into the water basins of the population, the water became unsuitable even for irrigation of agricultural crops. The discharge of industrial wastewater into canals has led to an increase in the amount of fluoride in drinking water and a deterioration in water quality. An increase in fluoride in water has led to an increase in fluorosis diseases among children [21]. The Samarkand Super Phosphate Plant has been dumping its wastewater into the Dargam Canal for years.

In the 1970s, 300 m<sup>3</sup> of wastewater was chlorinated for one day at the Samarkand Silk Factory, and then discharged into the Obirahmat Reservoir. Such water contained microbes such as cocoon worms, seripin, streptococcus-bombicus. There was a layer of curtain on the surface of such dirty water, which made it very difficult to clean the water. At the same time, water is the lifeblood of nature, and this factor, which has changed the ecological situation in the watershed, has also begun to cause disease in living things in the watershed. The internal affairs of the enterprise are also poorly organized in terms of life safety. The human life factor is not taken into account at all. Workers and employees of the Samarkand Chemical Plant do not pay any attention to safety in the preparation of various chemical fertilizers used in agriculture. However, the workers have been working in the open with various chemicals. Atmospheric air pollution is also the most painful point in ecological change. Because all living things and plants in nature, especially fresh air in human life, are important. One of the enterprises that has caused damage to the environment of Samarkand region is the Samarkand foundry, which emits 7 times more wastewater and 948 tons of metal dust into the atmosphere. Such harmful emissions and dusts that have been discarded over the years have, of course, led to drastic changes in the environment and the spread of disease among humans. If we look at the comparison of Samarkand region with other regions, it has the following indicator.

Amount of harmful emissions into the atmosphere in Uzbekistan [22].

№	Regions	1980	1985	1986	1987
1.	Tashkent	61.3	47.6	51.7	68.3
2.	Samarkand	65.3	71.2	72	72.8
3.	Angren	51.9	75.5	74.9	68.0
4.	Chirchiq	31.9	83.0	84.5	84.1

These statistics show that these cities also have chemical plants, such as Samarkand region. However, the deplorable situation in Samarkand region indicates that the enterprises in the region are concentrated. If the toxic dust emitted into the atmosphere at the enterprises of Samarkand region were caught by technical equipment, the ecology of its atmosphere would not have changed and would be clean. During the study of the operation of filters and cleaning equipment installed at the enterprises during these years, it was reported that they did not meet the technical requirements. The indicator showed that over the years, emissions of harmful dust into the atmosphere have increased. The amount of dust released into the atmosphere in Samarkand region can be seen.

Use of equipment to trap harmful wastes, gases, dust [23].

Years	Amount of hazardous waste (thousand tons)	Amount of recycled hazardous waste (thousand tons)
1980 й	2037.0	76.4
1985 й	1824.3	63.6
1986 й	1952.4	64.4
1987 й	2495.7	68.7

Sources of soil contamination with heavy metals consist mainly of wastes from the metallurgical industry. Therefore, any waste dumped in the environment has a negative impact on the soil. This is because in the biological system, water, atmospheric air and soil move in the same system. The fact that industrial wastes damage such environmental factors has led to qualitative and biological changes in them.

## CONCLUSION

In short, industrial enterprises set up during the former Soviet era produced only agricultural-oriented cotton-growing and development-oriented products. It was not the interests of the Uzbek people, but the interests of the former Soviet Union. In addition to the country's natural resources, its biodiversity, environmental degradation, and environmental degradation have shown that the interests of the union take precedence over the lives of the people. The consequences of this have led to the emergence of various diseases in the health of the population, the pollution of water in the environment, the increase in soil quality.

### ABSTRACT

*This article discusses the role of phraseological metaphors in the Uzbek language and views on its enrichment. Derivative meanings of metaphor. Based on examples from T. Murad's story "Stars Burn Forever" (Yulduzlar mangu yonadi), it is analyzed from a linguocultural point of view.*

**KEYWORDS:** *Metaphor, Language Of Fiction, Linguocultural Units, Phraseological Metaphor, Symbol, Lexeme, Phrase And Precedent Units, Speech Phraseological Metaphor*

### INTRODUCTION

The language of a work of art is diverse in terms of its lexical structure, which shows that the ability of a word to perform various stylistic functions in works of art is as wide as the use of lexical means. The talent of each writer as a word artist, the ways of using words, as well as the writer's worldview are reflected in the language of the work of art in the process of effective use of linguocultural units, including metaphors. A well-known representative of cognitive linguistics, J. Lakoff and the famous philosopher M. Johnson explains metaphors as follows: "Metaphors penetrate not only our daily lives, not only language, but also our thinking and activities. Our everyday conceptual system is also metaphorical in nature" [1,387-416].

T. Murad is one of the masterful creators who used the colorful layers of language, in particular, phraseological metaphors in his works. Here are our observations on the author's story "Stars burn forever".

### THE MAIN FINDINGS AND RESULTS

Commenting on the writing of this story, the writer said, "I grew up fighting in circles since I was a child. Wrestling is in my ancestor, wrestling is in my blood. I was moved by that wrestling

blood (*qonim qo'zg'alldi*) . I was prepared to suffer from my enemies. I hit a big piece (*qo'l urdim*) to show who I am. Finally ... in a very few days I created the first story, "Stars Burn Forever"(Yulduzlar mangu yonadi) [2, 265]. In this passage, which is related to the work, my blood is stirred (*qonim qo'zg'alldi*) (blood boils - to become bitter, hot) [3,290], I clap my hands (*qo'l urdim*) (1. Touch; 2. to start a work) [3,304] are phraseological metaphors.

It is no coincidence that T.Murad called his first great work "Stars Burn Forever"(Yulduzlar mangu yonadi). Candidate of Philological Sciences Umida Rasulova writes about the title of the work: "Through the title, the writer conveys to the reader the subject, the thoughts, the views expressed in the play, thus creating a closeness between the reader and the reader. If we pay attention to the title of the work, "The stars will burn forever." At first glance, the beauty of the sky, though tiny, seems to be described as a celestial body that is striking with its brilliance. However, if we pay attention to the understanding of the essence in the title, mainly through the symbol, a special interpretation emerges"[4,11].

Metaphor is an active participant in the interpretation of the worldview. If we consider the metaphor as a translator of the inner world of man (N.Aryutunova) and a conceptual phenomenon that carries information to the cognitive apparatus, the symbol is one of the organizers of the metaphor. [5,165] From this point of view, we have reason to say that the writer also used a metaphorical method in naming the work. The protagonist of the story is a wolf wrestler. The author also explained the title of the work in his language: "Every slave has his own star (*ko'kda o'z yulduzi*) in the sky, my friend. The burning of this star (*yulduzning yongani*) is the burning of this slave. The extinction of this star (*yulduzning so'ngani*) is the extinction of this slave"[6,64]. It is obvious that in the passage from the work itself, "the burning of the star" (*yulduzning yongani*) and "the extinction of the star"(*yulduzning so'ngani*) are expressed in a peculiar way.

The story of "Stars burn forever" begins with a picture of a wedding at the wrestler Zulfiqor: "Lying on the roof, the elder Nabi watched (*ko'z- quloq bo'ldi*) the events of the wedding (watching, hearing; lurking [8,412]) and gave appropriate instructions (*yo'l- yo'riqlar berdi*) (advice, guidance [8,353]). In particular, it did not ignore future guests (*e'tibordan chetda qoldirmadi*)(look, pay attention [3,366]). As soon as guests turn black at the beginning of the street (*qora berishi bilanoq*)(as soon as they appear - U.X.), Nabi elder (*ovoz berdi*) (to vote - to call out aloud or to respond to a call [8,518]): — Come on, guests, come on!..."[6,6] .In this passage, fixed metaphors such as ignoring, blacking out, voting, (*e'tibordan chetda qoldirmoq, qora bermoq, ovoz bermoq*) give the work a special charm.

Here is an excerpt from a play on children's play: "The children chased around ... Five or six children gathered. Inside a house, he drew a circle around the ground. He called the circle gir... Whoever squints into his eyes (*ko'zini shamg'alat qilib*)(without noticing, left [8,396]) and deftly enters the ring is the winner .. the boy ran towards the entrance and was caught (*qo'lga tushmoq*) "(arrest - to be found guilty [8,635]). The above text from the story "Stars Burn Forever" uses phraseological metaphors such as blinking and catching (*ko'zini shamg'alat qilmoq, qo'lga tushmoq*).

Phraseologisms and metaphors that exist in language, and the cultural connotations attached to them constitute knowledge, i.e., cognitive assimilation, so phraseologies and figuratively motivated words, i.e. metaphors, are indicators of cultural characteristics [9]. In the story "Stars

burn forever", T. Murad used linguocultural units to depict the struggle of the Uzbek people as a national symbol. We observe this by analyzing the events of the work: ... "What do you think if we entrust this person to lead the circle". — Well, the wrestler's grandfather's bones were frozen in a circle! (*Suyaklari davrada qotgan*) (hardening of the bones - hard work [10,602]) ... don't hurry, a cut of seven scales (*etti o'lchab, bir kes*) (Proverbs. See carefully [3,86]). Notice the right and left of the shurchiliks. Again, just look at the shurchiliks (stare - watch; don't overlook [3,133]) .. — Save our Tilovberdini to the end of the round with a couple of braves. It is useful for our day when the thick is stretched and cut thin (*Yo'g'on cho'zilib, ingichka uzilganda*) (Proverb. In a difficult, difficult situation - U.X.) (it is useful when necessary, it hardens - U.X.). Who else is there? - This is Bakirboy's son Janibek, who is studying in Samarkand. Although there is a good take. When he came last year, he made Sariosia a *mom* (the winner of the round) [6,12]. The lexemes, phrases, and precedent units whose meanings are explained above emerged as a product of popular thinking and imagination. The explanation of some of the phrases is given again in our sources. An example of this is the expression "staring" in the form of "to review". This indicates the richness of our language, the role of phraseological metaphors in the expression of units in the language.

In T. Murad's story "Stars burn forever", the metaphorical twisted product effectively used sememas in accordance with its aesthetic purpose. In the words of Professor B. Mengliev, who makes a worthy contribution to the development of Uzbek linguistics, "Metaphor is one of the most important means of artistic style, speech, as a common way of creating sememas" [7,156]. In general, figuratively motivated words, phrases and metaphors play an important role in ensuring the beauty and attractiveness of the language of the work. We will continue our analysis with examples:

"At that moment, the Shurchi elder stood up and said in a thick voice (*so'zni qalin-qalin qilib*): Brethren, we are not jealous of the main dish ... Khojasoat residents brought our rain to the ground (*yag'rinimizni yerga tekkizib*) last week in Shurchi! .. So we tied our waists in five places (*belimizni besh joyidan boylab*) [6,53].

"Abay wrestler Tilovberdi did not take his eyes off the wrestler (*ko'zlaridan ko'z olmadi. Ko'z ayirmadi*). He did not take his eyes off. Tilovberdi kicked the wrestler until his foot hit the ground. Xap-a-a-a! He shouted. Before the end of the shout, Tilovberdi fell on his shoulders! (*ikki yag'rini bilan gupillab tushdi!*)" [6,58]

In the above two passages from the story "Stars Burn Forever." The phraseological metaphor of "speaking the word in bold" (*so'zni qalin-qalin qilib aytmoq*) is given, as well as metaphorical phrases: *qoqib yubormoq*, *ikki yag'rini bilan gupillab tushmoq* units such as verbally defined dynamic semantics (action), *yag'rinini yerga tekkizmoq*, *belini besh joyidan boylamoq*, *ko'zlaridan ko'z olmoq*, *ko'z ayirmoq* such phrases serve to express the dynamics of the nonverbal character.

Our observations show that the similarity of action and state in the metaphor used in "The Stars Burn Forever" (Yulduzlar mangu yonadi) is the basis for the formation of many expressions in language. In linguistics, there are attempts to distinguish a phrase from a metaphor, [11] which is a scientific error, in our opinion, to ignore the phenomenon of metaphor, the primary factor that creates a phraseological fund of language, which is a valuable source of information of folk culture and mentality. Because phraseological units as a whole are built on the basis of the

portable meaning of one of its components. This suggests that phraseological units in language occur mainly on the basis of metaphor. We explain our opinion through the following piece analysis:

"Come on, buddy, I'm leaving. When the light came out of the girls (*yorug'lik chiqib*) (the light came out - to benefit someone [12,48]), now it comes out. I call them human and carry rocks ... Don't tell anyone, beast, there's a girl over there, and she was my heart. My dear friend dusted my heart (*ko'nglinga chang soldi*) (dusting - grabbing with a fork; aggression [13,454])! Uh, let's see! I trusted my friend, beast. He trampled on my trust (*ishonchimni oyoqosti qildi*) (to trample, to crush [10,89]) ... Think for yourself, beast, Nasim was looking at Momoqiz knowingly (*ko'z olaytirdi*) (to look (at) is a bad intention, to look at it with a bad eye [10,105]) - yes! .., that's it, I'm not going to see Nasim anymore (*yuz ko'rishmayman*) (face to face - to see each other, to be face to face [12,468])".

The protagonist of the author's story "Stars Burn Forever" describes the experiences of the wolf wrestler in the above passage *yorug'lik chiqmoq, ko'ngliga chang solmoq, ishonchini oyoqosti qilmoq, ko'z olaytirmoq, yuz ko'rishmoq*. He used appropriate phraseological metaphors to describe the mood of the protagonist, the anguish of the heart. It is known in the literature that when mutual trust between man and man is lost, man sometimes expects encouragement from other creatures, animals in nature. We can observe the same situation in this play. After the betrayal of his true friend, the wolf wrestler tells his words about the pains of the heart to the animal, i.e. the bull. This reception further enhanced the impact of the context.

In "Stars Burn Forever", the creative and heroic thoughts and psyches are harmoniously depicted under the torture of mental torture. The author's individual methodological skills and the extent to which he was able to use the capabilities of the language system in writing a work of art are reflected in the vivid depiction of the spiritual world of images. According to the Russian literary critic and folklorist AA Potebnya, "the environment is regulated by the human mind, artistic creation is a product of the creative state of mind, while the creative process enriches and deepens the human spiritual world" [15,262]. We base our opinion on the text analysis of the story:

"... Karim's heart is black (*ko'ngli kir*) (annoying, malicious [3,159]). The wolf wrestler did not have a quarrel with the chairman (*osh-qatiq bo'lmadi*) (to have a quarrel - to come and go with someone, to have a close relationship [10,175]). The wolf wrestler picked up the Otan wrestler and knocked him down. He raised the glory of Surkhandarya (*surhandaryoning shon sharafigi ko'tardi*) (defended the honor - U. X.)! The adults' mouths touched their ears (*og'zi qulog'iga yeti*) (to put one's mouth to one's ears - to rejoice, to be glad [3,203]). Bakovul touched the hearts of the wrestlers (*ko'ngliga qo'l soldi*) (to touch the heart - to try to know the most secret thought [3,159]), made an emergency error... The wolf scratched the inside of the wrestler (*ichini it tirnamoq*) (scratching the inside of a dog - secretly annoying, anxious [3,116])" [6,22].

## CONCLUSION

For many phrases (expressions) in language, expressive-emotional coloring is an integral feature, however, the main part of the expressions is methodologically neutral. Because the expression expresses not only the name of this or that object, event, but also the expressive attitude of the speaker to that object or event, person [14,7]. In the same passage above, such phrases as filth, filthiness, glorification, touching the mouth, touching the heart, scratching the inside of the dog, (

*ko'ngli kir, osh-qatiq bo'lmoq, shon-sharafini ko'tarmoq, og'zi qulog'iga yetmoq, ko'ngliga qo'l solmoq, ichini it tirnamoq*) a total of six metaphorical phrases were used. These are the character's characters (*ko'ngli kir*), relationship with people (*osh-qatiq bo'lmoq, ko'ngliga qo'l solmoq*), situation (*og'zi qulog'iga yetmoq, ichini it tirnamoq*), purpose (*shon-sharafini ko'tarmoq*) expressed and reflected as memorable details that shape the national, linguistic landscape.

In short, In "Stars Burn Forever", T.Murod effectively used figuratively motivated words, metaphorical phrases, which have a verbal and nonverbal character, and thus contributed to the enrichment of the Uzbek lexicon and the discovery of new aspects of metaphors.

## METHOD OF APPLICATION OF GAME RECEPTIONS IN THE FORMATION OF ELEMENTARY MATHEMATICAL REPRESENTATIONS IN PRESCHOOLERS

**Mamazhonova Khushruiy Shavkatovna\***

\*Senior Lecturer,  
Preschool Education Department,  
Kokand State Pedagogical Institute named after Mukimi,  
UZBEKISTAN

### ABSTRACT

*The article considers the development of mathematical representations of preschoolers. A special place is given to the use of didactic games for the development of perception, mental operations (comparison, abstraction, symbolization), attention, memory, and contributes to the development of logical thinking and cognitive abilities of preschool children. Mathematics provides ample opportunities for the development of perception, mental operations (comparison, abstraction, symbolization), attention, memory, contributes to the development of logical thinking and cognitive abilities of preschoolers. The educational process for preschoolers should be entertaining, because only in this case children do not lose interest in educational activities and are actively involved in it, as well as in the formation of elementary mathematical representations, the use of game methods and techniques makes the learning process more effective.*

**KEYWORDS:** *Preschool, Education, Mathematical Representations, Multitude, Relation, Number, Magnitude, Feeling, Pupils, Integration Of Subjects, Relevance, Modern Pedagogy*

### INTRODUCTION

In his resolution approving the concept of development of the preschool education system of the Republic of Uzbekistan until 2030, President of the Republic of Uzbekistan Sh. Mirziyayev said: "Over the past period, the country has brought up a healthy and comprehensively mature generation. Extensive work has been done to establish an effective system of preschool education, aimed at the introduction of effective forms and methods of education and upbringing

in the educational process. The favorable conditions created for the development of public-private partnership in the field of preschool education have laid a solid foundation for further increasing the number of non-governmental preschool institutions and expanding the range of services they provide. At the same time, the analysis shows the need to address the issues of estimating the coverage of children with preschool education, filling preschool education institutions with modern teaching materials and literature, attracting qualified teachers and management staff to the field. "It's showing." (Tashkent, May 8, 2019, No. PQ-4312). In this regard, it is planned to retrain preschool teachers and educators on the basis of modern technologies and methods and to create "appropriate conditions for the upbringing of children." [1]

Preschool age is short in duration in a person's life, however, it is extremely important and eventful, including from the point of view of cognition and acquisition of knowledge about the world. The source of knowledge for a preschooler is sensual and intellectual experience. The issues of familiarization and training of preschool children in mathematics are the subject of the discipline "the formation of elementary mathematical representations in preschoolers." Full-fledged mathematical development is ensured by an organized, purposeful activity, during which the teacher consistently poses cognitive tasks for children, helps to find adequate ways and solutions. Mathematical representations in children are formed gradually, in the process of cognition of the surrounding world. One of the most important and urgent tasks of preparing children for school is the development of logical thinking and cognitive abilities of preschoolers, the formation of elementary mathematical representations, abilities and skills in them.

Several classes are devoted to the solution of each problem, and then, in order to consolidate it, they are repeatedly returned throughout the year. Among the main tasks of mathematical preparation of children in kindergarten, according to the program of upbringing and education, the following are distinguished:

1. Formation of a system of elementary mathematical representations in preschoolers. The assimilation of the concepts of "multitude", "attitude", "number", "magnitude".
2. Formation of mathematical ideas and abilities (teaching children to count, developing ideas about the number and number within the first ten, dividing objects into equal parts).
3. The formation of the prerequisites for mathematical thinking and individual logical structures (classification, generalization, ordering).
4. To form the ability to make simple generalizations, comparisons, conclusions, to prove the correctness of certain judgments,
5. To form the ability to use grammatically correct turns of speech. Expanding children's vocabulary and improving coherent speech. [2]

The tasks are not solved separately, but comprehensively, in close connection with each other. Despite the fact that they are mainly aimed at the mathematical development of children, they are combined with the fulfillment of the tasks of moral, labor, physical and aesthetic education, develop organization, discipline, that is, contribute to the comprehensive development of the personality of preschool children. In addition, the child mastering mathematical representations in the classroom, is in a peer team, this expands the scope and experience of collective relationships between children.

The most effective mastery of knowledge in mathematics is facilitated by the following conditions:

1. accounting for individual, age-related psychological characteristics of children;
2. creating a favorable psychological and emotional atmosphere;
3. The developing nature of the tasks.
4. change and alternation of activities in connection with the rapid fatigability and distraction of children;
5. integration of mathematical activity into other types: game, musical, motor, visual.

When explaining the new material, it is necessary to rely on the knowledge and ideas available to preschoolers, to support the interest of children throughout the lesson.

### **Main part.**

When solving any mathematical problems, in order to keep the educational process entertaining, it is necessary to apply game methods, game elements and a variety of didactic material, to increase attention in the classroom, bring them to independent conclusions, learn to argue their reasoning, and encourage various answers to children.

Achieving the goals and objectives in mathematics helps the implementation of the following principles:

1. The principle of consciousness and activity;
2. The principle of accessibility and individualization;
3. The principle of science;
4. The principle of systematicity and consistency;
5. The principle of developmental learning;
6. The principle of visibility.

The gradual complication of the material allows children to feel the successes in their work, their growth, which in turn contributes to the development of their growing interest in mathematics.

The role and importance of game techniques in the formation of elementary mathematical representations in preschoolers.

With the help of the game you can develop attention, memory, thinking, imagination of the baby. Playing, the child acquires new knowledge, skills.

The most important properties of the game include the fact that in the game children achieve a very high level of activity, and always voluntarily, even unconsciously for the child.[5]

The following features of the game for preschoolers are distinguished:

1. The game is the main and most accessible type of activity of preschool children.
2. The game is an effective means of forming the personality of a preschooler, his moral-volitional qualities.

3. The game is an important means of mental education of the child, where mental activity is associated with the work of all mental processes. The game contributes to the formation of all aspects of the personality of the child. In the process of teaching mathematics to preschool children, the use of didactic games is necessary, as they contribute to the participation of the child in the cognitive process, help the perception of the material.

The following types of classes are distinguished:

1. classes in the form of didactic games;
2. classes in the form of didactic exercises;
3. classes in the form of didactic exercises and games.[4]

Their selection is conditional and depends on what is leading in the lesson: didactic game, didactic material and activities with it, or a combination of both. With any type of activity, the teacher actively leads the process of learning children knowledge and skills.

The didactic game, depending on the age of the children, the purpose and content of the lesson, can be used as a training task, an exercise aimed at performing a specific task of forming ideas.[4]

Classes in the form of didactic games are widely used in younger groups. In this case, the training is playful. Classes in the form of didactic exercises are used in all age groups. Training on them becomes practical. Performing exercises with demonstrational and distributing didactic material leads to the assimilation by children of certain methods of action and the corresponding mathematical representations.

Classes in the formation of elementary mathematical representations in the form of didactic games and exercises are most common in kindergarten.

This option combines the previous ones. Didactic game and various exercises form independent parts of the lesson, combining with each other in all possible combinations, the sequence is determined by the program content

Didactic games are divided into games with objects, desktop-printed games and word games.

However, the main goal of all types of games is to develop the ability to establish the simplest patterns: the order of alternating figures in color, shape, size.

Also, when using math games, you must vary game actions and questions, individualize the requirements for children, repeat games, complicate with time.

The widespread use of special educational games is important for awakening interest in mathematical knowledge among preschoolers, improving cognitive activity, and general mental development.

So, there are various methods and techniques that help to formulate elementary mathematical representations in children. The leading role among them is given to classes in the form of didactic games and exercises.

Didactic games that contribute to the formation of elementary mathematical representations.

The main purpose of didactic games is to provide children with knowledge in distinguishing, highlighting, naming many objects, numbers, geometric shapes, directions.

## RESULTS AND DISCUSSIONS

The following tasks are solved in the article:

1. Analyzed the psychological and pedagogical literature on this issue.
2. A general description of the content of the concept of “the formation of elementary mathematical representations is given
3. The effectiveness of the use of gaming techniques in the formation of elementary mathematical representations in preschoolers was investigated

Didactic games for the formation of mathematical representations are conditionally divided into the following groups:

1. Games with numbers and numbers.
2. Games - time travel.
3. Orienteering games in space.
4. Games with geometric shapes.
5. Games for logical thinking.

Tricky tasks vary in degree of difficulty, the nature of the transformation. They always require vigorous mental activity, the creation of a new method of solution, they cannot be solved simply in a previously learned way.

Conventionally, for children 5-7 years old, the tasks of ingenuity can be combined into 3 groups:

1. Tasks for drawing a given figure from a certain number of sticks: make 2 equal squares of 7 sticks, 2 equal triangles of 5 sticks.
2. Tasks for changing figures, for the solution of which it is necessary to remove the specified number of sticks.
3. Tricky tasks, the solution of which is to shift the sticks to transform the given figure.

In the course of training, methods for solving the problem of ingenuity are given in the indicated sequence, starting with simpler ones in which children apply skills acquired by children and gradually complicating actions.

<b>Games with numbers and numbers.</b>	<b>Games - Time Travel</b>	<b>Space Orienteering Games</b>	<b>Games with geometric shapes</b>	<b>Logical thinking games</b>
Teaching children to count in the direct and reverse order.	Introducing children to the days of the week.	To develop the ability to determine in word the position of an object in relation to another.	Develop knowledge about the shape of geometric shapes. To teach children to recognize in the surrounding objects the shape of a circle, triangle, square.	Formation of elements of logical thinking.
The formation of numbers within 10 (20) by comparing equal and unequal groups of objects.		Teach children to use words to indicate the position of objects.		The formation of the ability to reason, to make their own conclusions.
he composition of the number.			Acquaintance with the ways of joining, building one form from another. Familiarization of children with the method of constructing figures by dividing a geometric figure into several (a quadrangle or square into two triangles, into two squares).	

## CONCLUSION

Currently, the problem of the formation of elementary mathematical representations is one of the most important and urgent tasks in the framework of preparing children for school. Mathematics provides ample opportunities for the development of perception, mental operations (comparison, abstraction, symbolization), attention, memory, contributes to the development of logical thinking and cognitive abilities of preschoolers.

Preschool age plays an important role in the formation of a person's personality, and one of the tasks of a preschool institution during this period of life is to interest a child, arouse his interest

in new things, knowledge, arouse a desire to learn, and help a child believe in himself and his abilities.

The educational process for preschoolers should be entertaining, because only in this case children do not lose interest in educational activities and are actively involved in it, as well as in the formation of elementary mathematical representations, the use of game methods and techniques makes the learning process more effective.

The study of theoretical premises, justifications, usefulness and practical examples of the use of gaming techniques in the formation of elementary mathematical representations in preschoolers in order to increase their own level of knowledge and application in further practical work.

In their work, educators strengthen and develop the cognitive interests of preschoolers. The regular use of game tasks and exercises, didactic games in math classes allows educators to make the learning process more diverse, exciting and productive, and contributes to the development of cognitive opportunities for children and their mathematical development.

### **ABSTRACT**

*This paper examines how television advertisement is linked with children's behavior in Jaffna district in the post-war market situation. Researchers examine whether these children paying attention on television advertisements are influenced by the characteristics of the child's early home environment and parental behaviors. In Sri Lanka, Parent – Children conflict is one of the most vital issues. Especially, in the post-war Jaffna market situation, the Parent-Children conflict' created by television advertisement is most considerable problems for Jaffna district parents and marketers. Therefore, there is a need for accomplish various researches concerning the outcomes of parent-children conflict derived by television advertisement. This research explored methodological implications by using qualitative approach; data were collected via purposive sampling method as of 10 parents from Jaffna district by using preset questions based on a primary interview questions as open-ended question format. Researchers found that the children's behaviors of purchasing request to buy particular advertised product from their parents. Until the end of time, emotions in the television advertisements attract the children very much. This paper is a key resource for marketing practitioners wanting to focus on future quandary regarding unconstructive children's behaviors shaped by television advertisement and*

*outcomes of parent-children conflicts created by television advertisement. The researchers have found that numerous negative outcomes are there in Jaffna district regarding parent-children conflicts derived by television advertisements. Especially there are negative outcomes of conflict over a request to buy particular advertised product among Jaffna children.*

**KEYWORDS:** *Television Advertisement, Children, Behaviors, Attention & Colorfulness & Outcomes.*

## INTRODUCTION

Children behavior is an important measurement of children's mental health and has consequences for outcomes in later life (Carol Propper, 2007). In the war situation Jaffna people didn't consider about anything other than their needs. Whatever there was availed for their living purpose, they purchased. There was no any consideration about commercials. But, now it has been changed. In this situation, we need to find out the actual impact of television advertisement on parent-children conflict in Jaffna peninsula which means in post-war Jaffna market situation how extend television advertisement influences on parent-children conflict. This study is to explore how parents can solve problems and resolve conflicts caused by television advertisements.

Now-a-days marketing strategies that involve mass production, mass targeting, mass media and mass developments in the market place-specially by changing consumer needs and wants through variety of promotional mix tools like advertising, sales promotion, personal selling, direct selling, public relation & so on (Garland Wood, 1958).

Strengths of television advertisement are high reach, ability to demonstrate, high-impact medium & prestigious. Therefore, television advertisement attracts its viewers with images, graphics, accounts & stories of live. If we take in to the consideration the children, they are more interested in advertisements & their music and they identify the advertising when the music starts to play. Television advertisement is the most influential media even there is no acting of purchase the product still remains in our consciousness (CheeHuat, 2008).

Television advertisement impacts on attitude, values, customs, norms, ethnicity, culture, religion and some other behaviors. Sometimes advertisement may change our life style; especially child's attitude. It can shape our way of life also (Belk and Pollay, 1985; Kumaran, 1987). Television advertising exposure is positively related to children's purchase requests which leads to increased number of product denials from parents, then causes conflict between parents and child (MoniekBuijzen and Patti Valkenburg, 2003).

In the advertising promotional mix tool, there are lot of different mediums. Such as; television, radio, newspapers, magazines, direct mail, bill boards etc. Even though, appealing of television advertisement to reach the greatest number of targeting consumers, because there are no homes without television. It plays major role everywhere in the homes and act as an agent of consumer socialization competing with some traditional agents such as school, working place & even parents (Guinn and Shrum, 1997). The characteristics of the specialized media and their audiences are essential for the advertiser who makes them a part of the media mix (Anderson, Simon and Gabszewicz, Jean, 2005).

Some consumer commodities are popular among people not only because of the special quality of the product, but also the creativity of the advertisement. Therefore, advertising has become key factor for both consumers and producers in the market economy (Samaraweera and Samanthi, 2012). Because, television advertising act as a source of new product information, providing children with some knowledge of the range of goods & services available and the attributes & criteria that they can employ in evaluating various purchase alternatives (Rhonda Jolly, 2011).

Commonly children do not like traditional concepts & life styles. Children like fun & happiness information rather than to provide any factual product related information. Advertising by using television considers this strategy to attract child consumers (Barcus, 1980; Doolittle & Pepper, 1975; Kunkle & Gantz, 1992).

### **RESEARCH GAP**

A variety of researches related to children & advertising and children & television have been done by academic researchers and they focused on following topics; Children's television advertising viewing behaviors (Ward Levinson & Wackman, 1972), Children's exposure to TV advertisement & social development (Atkin, 1975), Children's responses to commercials (Breen & Powell, 1973), Children's awareness, interest, desire & product preferences (Frideres, 1973) and How children learn through TV commercials (Siegel, 1974), The effects of television food advertisement on children's food purchasing (YasareAktasArnas, 2005), How children learn through TV commercials (Siegel, 1974) and Some past researches investigated the effect of television advertising on parent – child conflict (Goldberg & Gorn, 1978). Even though, in a deep manner researchers have neglected some topics like; the specific ways in which kind advertising can often lead to children's product request, children force parents to buy unnecessary items after seeing advertisements, Children's attention level on viewing television advertisements, the level of parent – children conflict & its consequences or outcomes & etc.

There is wider range of markets & choices of products in the Jaffna post-war marketing situation. There are no barriers for marketers & customers. Television advertisements also make longer impacts on marketing activities as well. In this particular situation there is a gap for researchers to find out the children's behaviors regarding television ads & its consequences.

### **RESEARCH PROBLEM**

One of the main promotional tools is advertising. Especially television advertising effects, such as; advertised product desires are not only deer mind by cognitive responses to a message, but also by effective responses (Brown & Stayman, 1992; Narin & Fine, 2008). Through the children's emotions like; fantasy fun & peer popularity that commercials aimed at young children & influencing their strategy for taking product purchasing decisions (Roberts & Pettigrew, 2007). According to the present business environment of post – war Jaffna market it is a need to explore the influences of television advertisement on children's behaviors. Hence, this study is most important to advertising policies makers & publics in the post-war marketing context, for the reason that parent-children conflict is one of the off-putting issues of television advertisements. Number of Television channels and Television advertisements are proliferated in the Jaffna market, and it is a need to design an appropriate strategy for this special context.

## LITERATURE REVIEW

Considerable research has examined advertising's cumulative effect on children's eating habits. Several studies have found strong associations between increases in advertising for innutritious food and rates of childhood obesity and also, exposure to television food advertising is parent-child conflicts that may arise regarding food choices. These conflicts can have a negative impact not only on children but also on relationships within the family (Buijzen and Valkenburg, 2003).

In Sri Lanka there are nine television channels fighting for airwaves, the competition is tough. The list of Sri Lanka TV channels are; VasanthamTV, NethraTV /Channel eye, Dan Tamil Oli, ShakthiTV, SirasaTV, National television, ITN &Swarnawahini and the India TV channels are; Sun TV, KalaingarTV, Zee tamil, Jeya TV, Raj TV, Polimer, Vijay TV, Comedy channels like; Adithiya TV, Kids channels like; ChuttiTV, ChithiramTV, Cartoon network & Pogo TV. Major channels like; Rupavahini, Sirasa, ITN &Swarnawahini compete with each other from about 7.30 pm in the evening (Samaraweera & Samanthi, 2012).

People in the Jaffna district are more aware of Indian television advertisements, because they always watch drama serials, which are telecasted by the Indian channels. The Indian advertisements which are telecasted in between the breaks are likable, match with consumer culture & perfectly designed (Shivany, 2013)

If we take in to the consideration of Jaffna children's favorite channels and programs, we can observe children's Chutti TV Channel viewing amount and Sun TV channel's KuttiChutties program viewing interest levels. Because, ChuttiTV is a 24hrs Tamil language television channel owned by sun network. This channel is dedicated to children aged between 3 & 12. It was launched in 2007, marketing it sun network's first ever television channel dedicated to kids (Pilot study).

Advertisement creators are using child actors in their advertising strategy. Therefore, children reacted very positively. Child can easily identify the advertising character that appeared to be the similar in age & life style (Kinsey, 1987).

The advertising market has been rapidly promoting in Jaffna for recent years. Fast foods are highly focused in advertisements (Sumaraweera & Samanthi, 2012). Consumers who are returned to the normal life prefer enjoyable, cultural match & fun associated advertisement rather than the long message content advertisements & also they like the celebrities who match their social patterns & ethnicity. Therefore, the celebrities used to promote the advertisements in TV commercials are very friendlier to the audience in the past conflict environment. Celebrities in the local TV commercials & their dress code also match with the people.

Marketers who try to penetrate the Past - conflict market might need to develop TV commercials in an enjoyable manner, background music should be enjoyable. The experienced gained in the conflict environment, consumers have become more knowledgeable, less naïve & less easily influenced, at the time of war consumers were more conscious on the product accessibility & didn't consider the other promotional aspects in the purchase, but in the post- conflict marketing environment they search for information & compare quality aspects in each marketing activities (Shivany, 2011).

Several authors argue that advertising may cause unhappiness in children. Most of these authors have investigated a direct relation between exposure to commercials & unhappiness (Richins,

1991). Even though, several others hold a contrary view, they maintain that children are generally unable to understand an advertisement's persuasive agenda and thus tend to become easy targets for commercial persuasion (Wilcox, 2004). Past reviews have clearly shown that advertising aimed at children can have certain undesirable consequences for the family, such as; increased parent – child conflict & materialistic & disappointed children (Buijzen&Valkenburg, 2003). Growing up in a world of advertising with the emergence of a new media landscape implies consumer socialization with the various ways and different agencies that operate to instill consumer learning in children. As children have limited disposable personal income they have to negotiate within the family for goods & services. This can have negative consequences often called “Pester Power” or the “Nag Factor”. By definition, the “nag factor” is the tendency of children, in response to marketing, to never stopping request advertised items. Packaging, characters and commercials were the three main factors that motivated children to nag. Parents deal with the nagging through some strategies, such as; ignoring, distracting, staying calm & so on, because successful nagging of children will lead to more nagging (Brian Young, 2003).

Approximately 80% of all advertising targeted to children falls within four product categories, such as; toys, cereals, candies and fast food, not only these categories but also sweets drinks, music, films & clothing to children which are aimed at children currently on television advertisements (Lionel Wijesiri, 2012). Children are a key target for advertisers as brand preferences often remain unchanged throughout life. Children's segment is now being target by many consumers' Product companies, because children are important potential customers as they not only decide about their own buying as they can influence the buying decisions of their parents also (Muhammad, Shabana & Hafiz, 2008). Consumers in the post conflict environment are more aware of Indian Television advertisements, because they always watch drama serials, which are telecasted by the Indian channels (Shivany, 2013). Most popular Indian channels among Jaffna people are; Sun TV, KalaigarTV, Zee tamil, Polimer, Vijay TV, and So on.

Television advertisement the stimuli in the form of marketing messages are competing with each other on the consumer's attention, both in the form of other commercials as well as the program itself (Mc clung, park & saur, 1985).

Attractive advertisement makes a deep influence on children's attitudes & behavior, which especially leads to purchase behavior as well as purchase request. Children can be categorized into positive & negative attitudes, while children who have positive attitudes toward advertisement, their behavior remain consistent with their attitudes and they tend to make purchasing of that particular product whose advertisement they have seen. On the other hand, children who have negative attitude toward advertisement they don't take any step to purchase that particular advertised product (Erra, 1990).

Atkin (1981) found that respondents who reported heavier exposure to children's television (& its advertising) also reported making more requests for advertised toys, cereals, & fast foods. Kraak & pelletier (1998) stated that the television advertisements & prime – time programs have been identified as important influences on the types of food that children ask their parents to buy for them and food they buy for themselves. Research has also shown that by the age of nine, children start to lose interest in toys & develop a preference for products with a social function, such as music and sports equipment (Buijzen&Valkenburg, 2000). Past researches have indicated, if television advertising based on the experiences which are strictly influence to the

minds of children by using the most appropriate & best strategies, this directly influences on the food pattern of the children (Livingstone & Helsper, 2004).

Previous studies have shown that children's attitudes & behaviors and television advertisements are co relational. So, it is difficult to determine whether advertisement influence children's attitudes & behavior or whether attitudes & behaviors determine what television programming or advertising will be viewed (Ann Sanson, 2000). Marketers, who try to penetrate the post- conflict market should need to develop television advertisements in an enjoyable manner, background music should be enjoyable. Because, children can be easily memorized by those ear – catching jingles & endorsement by animated characters commercials & they often imitate what the animated characters endorse such as; jingles or lines (Neeley & Schumann, 2004). Post conflict marketing environment is unique and exclusive; there is vast opportunities for marketers to sell their product & services to the potential customers who returned to their normal life (Shivany, 2013).

The evidence indicates under the other undesirable consequences of advertising by Atkin (1978) that, the first parents reject approximately one- third to one – half of child requests for products. This leads to parent – child conflict in about half of all families; such arguments are generally mild & infrequent. The evidence shows that children who see the most advertising have considerably more conflict. About one- third to one – half of the children become unhappy, angry or disappointed after denials of food & toy requests; again, the rate is considerably higher among those seeing the most advertising. In addition, some children may become dissatisfied when actual products fall short of the advertised image. Advertising interruptions of program enjoyment produce irritation in many viewers.

## METHODOLOGY

### Introduction: Qualitative Research

A qualitative exploratory research has been adopted for this study. Because, in Jaffna peninsula, there are few researches on the topic of television advertisement & parent-children conflict via qualitative research method like; “*Age variances of children and conflict with their Parents instigated by television advertisements*” (Dilogini and Shivany, 2014). Therefore, a research design was employed for this study.

First, the strength of qualitative research is its ability to provide complex textual descriptions of how people experience a given research issue, it provides information about the “human” side of an issue- that is, the often contradictory behaviors, beliefs, opinions, emotions & relationships of individuals, although findings from qualitative data can often be extended to people with characteristics similar to those in the study population (Natasha Mack, 2005).

The second one is the goals of exploratory research are intended to produce the following possible insights, such as; familiarity with basic details, settings & concerns, well-grounded picture of the situation being developed, determination about whether a study is feasible in current situation and direction for future research & techniques get developed.

Harry Wolcott (1999) maintains that one of the main problems in qualitative work is having too much of data rather than not enough, because the research is meant to provide details where a small amount of information exists. Normally, qualitative research means; investigation in to a problem or situation which provides insights to the researcher.

---

### **Population of the Study**

The population for the present study consisted of parents in Jaffna district between 25 to 45 years of age with at least one child between the ages of four & twelve. In 2012, Samaraweera & Samanthi have done a case study from Galle district about “television advertising and food demand of children in Sri Lanka. This is an accountable past study in Sri Lanka.

### **Sampling Technique**

One of the most common sampling strategies is purposive sampling. According to preselected criteria relevant to a particular research question sample size, which may or may not be fixed prior to data collection depend on the resource & time available. Purposive sampling is therefore most successful when data review & analysis are done in conjunction with data collection (Natasha Mack, 2005).

In qualitative research sample selection has a profound effect on the ultimate quality of the research (Kitson, 1982). Miles and Huberman (1994) suggest that sampling strategies can be evaluated in terms of six different attributes, according that the sample should be likely to generate rich information on the type of phenomena which need to be studied & the sample should enhance the ‘generalizability’ of the findings. Because of these attributes, Purposive Sampling technique is applicable to this study.

The purposive sampling technique is called as judgment sampling. It is a nonrandom technique that does not need underlying theories or a set number of informants. Simply put, the researcher decides what needs to be known and sets out to find people who can and are willing to provide the information by virtue of knowledge or experience (Bernard 2002, Lewis & Sheppard 2006). This research was consisted a purposive sample. Sample was restricted to 10 parents for the diversity of the sample, so the researcher recruited some of the parents from the different division from Jaffna district.

### **Instruments/ Materials**

This qualitative approach using in depth interviews with the parents were conducted. In depth interviews is an appropriate method for capturing & understanding informants’ experiences & words (Taylor, 1994).

A great deal of qualitative material come from talking with people whether it be through formal interviews or casual conversations the researcher must listen carefully to what participants say, engage with according to their individual personalities & styles and use “probes” to encourage them to elaborate on their answer.

This study fully concentrated on in depth interviews by using preset question based on primary interview question as open- ended question format.

### **Data Analysis Methods**

Data analysis method begins almost immediately with primary analysis. Later on, after more data collection in interaction with primary analysis, a second stage occurs with category & concept formation (Peter Woods, 2006).

Commonly there are four steps in qualitative analysis, such as; interim analysis memoing, data entry & storage and coding & developing category system. At the same time there are some

forms do qualitative data take. Such as; field notes, audio recordings & transcripts. In this manner, researcher conducted in depth interviews and those interviews were digitally recorded, translated & transcribed (Bryman & Bell, 2011).

In the first stage of the analysis, the researcher wrote all the themes which researchers found. Next, researchers chose major common themes with which most participants were concerned. Then, the researchers discussed some common themes that emerged from the first interview to last interview, so that the significant issues were discussed and analyzed more thoroughly. Because, the researcher read through the transcripts of all ten interviews and looked for themes or categories. As the method of analysis, this study used analytic induction which tries to find common patterns in the data. Coding is defined as marking the segments of data with symbols, descriptive words or category names. In this research, inductive codes were developed by the researcher by directly examining the data.

### **Questions for In-Depth Interviews**

Questions was asked about whether their child pay attention to TV commercial when watching TV, What does he/she typically do when a commercial comes on and whether they believe their child's product requests are influenced by televised advertisements; If so, how is she/ he influenced, the usual outcomes of conflict over a request to buy a particular product and parents were answered very generously.

### **Coding and Findings/Concepts**

In qualitative research, the goal of coding is not to count things, but to "fracture" the data and rearrange them into categories that facilitate comparison between things in the same category and that aid in the development of theoretical concepts (Maxwell & Joseph, 2005).

Therefore, the researcher was done 1<sup>st</sup> coding through line-by-line analysis and identified important concepts from transcribed interviews, and then the researcher done axial coding as a 2<sup>nd</sup> coding, finally the researcher was found the concepts that emerged from data. Those coding steps and concepts are presented here below in the annexure.

### **Reliability and Validity of Analysis**

A good qualitative study can help us "understand a situation that would otherwise be confusing" (Eisner, 1991). The validity and reliability are two factors which any qualitative researcher should be concerned about while designing a study, analyzing results and judging the quality of the study (Patton, 2002).

'Reliability means dependability of consistency' & that qualitative researchers 'use variety of techniques (interviews, participation, documents) to record their observations consistently' and 'Validity means truthful' it's referring to the bridge between construct and the data. It can be seen that validity means the correct correlation between data and conclusion (Lawrence Neuman, 2003).

Moreover, there are some criteria for reliability and validity of qualitative research, such as;

- Credibility; (in place of internal validity), that is, the extent that the constructions adequately represent the participant's reality.

- Transferability; (in place of external validity), that is, an adequately and thickly described account so that those who wish to transfer the implications to another context can do so with an adequate data base.
- Dependability; (in place of reliability), that is, the data is internally coherent.
- Confirm ability; (in place of objectivity), that is, the extent to which the theoretical implications are grounded in the data (Guba and Lincoln, 1981).

One of the most important strategies for establishing dependability is “The outside researcher experienced” (Lincoln and Guba, 1985). Here, dependability could be achieved by using an outside auditor to examine the research process and to determine if the findings and interpretations are supported by the data. Therefore, in this study; the researcher submits an account of her findings for checking (Alan E. Bryman, 2008).

On the other hand, one of the most important strategies for establishing credibility is “Respondent validation”. Respondent validation occurs during the period of data collection when feedback is obtained from the participants about the accuracy of the data they have given, and also the researcher's interpretation of that data. (Such as a short report or interview transcript) (Lincoln and Guba, 1985). In addition, feedback after the completion of the research project on the interpretation of all the data that has been obtained and interpreted can provide another type of validation.

To achieve validity in qualitative research is to reduce the gap between reality and representation and the more data and conclusions are correspondent the more a piece of qualitative research is valid (Bryman, 2008). Since in this study, all the interviews were translated, transcribed and findings sent back to the respondents in order to determine the accuracy of the interview findings.

Therefore, the researcher was done open coding through line-by-line analysis and identified important concepts from transcribed parent's interview answers, then the researcher done axial coding and assembled them into second-order themes, finally the researcher was presented the strategies that emerged from data were presented & how the coding were done and the final analysis are clearly shown in this chapter.

## DATA ANALYSIS

This study aimed to explore children's attention level on TV commercial when watching TV & subsequently their behaviors. The researchers have obtained the findings to this objective through interview questions. All respondents' answers were coded by the researchers. Through the final concepts, the researchers have conducted the data analysis.

***“They won't even move when they watch ads on the TV. They just watch those more attention ally”***

***(Sivanya, Teacher)***

Jaffna children in the post – war market are more attention to Indian kid's advertisements, because of the attractiveness & colour fullness of the advertisements.

***“But it depends on the advertisement.***

***If there is kid dish music, dance come on they watch those.”***

***(Sasikaran, Tailor)***

Children in Jaffna don't watch TV & ads all the time, but when commercial comes on the TV, they watch that without blinking an eye & immediately request some products and also remind the parents at the purchase places. Moreover, they follow them in the ads something related to children.

***“They'll be more concentrating on them and specially is it's something related to them they will watch that without blinking. As I said earlier, it influences more than 90 %. I think those are rally colorful.”***

***(Raveeswaran, Lecturer)***

This study tried to find the influence of televised advertisement on Jaffna children's product requests. In Jaffna district parents believe their child's product request are influenced by televised ads, through impressionable way of techniques like colour, shape, size because of that children believe, remind & adamant on it.

***“Yes, it does, it does. There some chocolate ads, which comes up. She takes the chocolates whenever we go to food city she takes it because she watches the ads about it. Kids watch that they wouldn't ask without watching 'He eat chocolates and he is grown up. Drink Boost, eats chocolate... There are so many like this.”***

***(Balaputhiran, Lecturer)***

***“Yes there is a link between them. That's an attraction isn't it? They eat noodles by spoon as shown on the ads.”***

***(Pirabhakar, Housewife)***

And also, this study tried to find the usual outcomes of conflict over a request to buy a particular product. The researcher has obtained the findings to this objective through interview question regarding the usual outcomes of conflict over a request to buy a particular product.

***“She will say that she wouldn't eat anything. When the elder kids argue and disobey the younger ones follows them.”***  
***“They get told off by me”***

***(Shahila, Bank staff)***

***“They got angry with us.”***

***(Anandasayanan, Lecturer)***

There are so many negative outcomes of conflict over a request to buy particular product among Jaffna parents and children like children disobey the parents, they would cry, get angry with parent, they will be depressed & show the sadness on child's studies, eat, sleep as well as, this usual outcomes will lead affections on the overall child's behaviors.

***“She forgets as she is a kid. But she will say “I won't come the next” as soon as we get back home.”***

***(Krishnakumar, Teacher)***

***“He wouldn’t, but he’ll show his anger on his studies.***

***It we switch off the TV, He wouldn’t eat. He won’t be happy. So we need to prefund that we are on his side just to keep the things on the right track so he ask mom to boils the milk, ad that on it and eat that. He does the same things as shown on the TV”.***

***(Balaputhiran, Lecturer)***

Crying at home /avoiding food/crying at the shops/comparing with other parents who always buy products for their children are negative outcomes of parent-children conflicts derived by television advertisements. Go against with their parents and argue with their parents are very unlikable outcomes of conflicts with their parent, other than these affects, the main affection on children’s studies. Jaffna parents mainly concentrate on their children’s studies. So, it’s a major negative outcome of these kinds of conflicts.

***“They will be angry. They Show the sad face. They won’t even sleep without eating.***

***It’s a bit worrying. There are some situations when we can’t afford.”***

***(Ajantha, Housewife)***

***“They’ll be depressed... Destructive behavior....When we tell her that we can’t, she’ll be..... “I wouldn’t study if you don’t buy that now”. But we misguide her when getting the things she asked. They might think that even though Amma has money she is not buying that for me. It’ll accept it if they have positive attitude otherwise they will get confused.”***

***(Raveeswaran, Lecturer)***

Not only the children’s behaviors, but also these outcomes can affect on the happiness of the whole family. The issue of depression in children is very serious one, because thinking negatively greatly affected the likelihood of developing a depression and maintaining it during stressful events in a person's life. It’s not that much easier to develop positive attitude in children’s mind.

## **CONCLUSION**

The outcome of this study shows some limitations. The first limitation of this study is that this research relied only on the perception of parents. Therefore, the knowledge from this study might be a little bit biased by the parents’ particular viewpoints toward the issues in this study. Even though the parents’ perspectives were considered the most important for this study, it is possible that there may be gaps in information that can be filled in by asking questions from the perspectives of other family members, including the children themselves, because the answers by the children might be different. Therefore, one possible future study would include the children, or other family members as participants.

Another limitation is that this research consider only children segment in Jaffna Peninsula in the post – war market situation. The research result states that the potential researchers should consider the other segment in Jaffna Peninsula while evaluating the impact of TV advertisement on conflict for other segments, like; grown-ups children (12-18ages) or adults (18-25).

The other limitation is that the sample is geographically limited. The research has been done only in Jaffna district. It can be done in other parts of the country, like; Mannar, Kilinochchi, Vavuniya as well or for the whole country.

A qualitative exploratory research method has been taken into consideration for this study. Therefore in the future, the researchers should be taking into account of the other methods, like; quantitative research method or mixed method as well.

Based on this research finding, there is a conflict exist between Parent and children in the post-war Jaffna context. Because of the adamant behaviors & nagging behaviors parents in the post-war marketing context are persuading to conflicts between their children & themselves. In the peaceful marketing situation, mass media developed environment, children are requesting advertised products to never stopping is called as “Pester Power”. Behaviors of continuously asking particular advertised product are creating parent-children conflicts often.

Present study found that because of heavy advertisement and proliferated Tv channels children are confused, and nag their parents to purchase unwanted products. Parents are struggle to solve these conflicts because of the heavy inspirations of the motives and colours in the advertisements. Marketers should follow the correct advertising strategies when they create children’s related products advertisements. It also will reduce these types of conflicts and diminish those types of negative outcomes as well.

In the post-war Jaffna market unethical and business behaviors are encouraged by this unwanted purchase intentions. According to the past studies (Livingstone & Helsper, 2004) advertisement strategies should be in a good manner, and marketers should consider the appropriate Television commercials otherwise, these will affect the society.

This study has the implication that organization should design proper Tv advertisement, which will not affect the Parent-Children relationships, it is an ethical responsibility of the organization, which operates in the Post-War context.

## ANNEXURE

### Examples of Coding: Four Tables.

(Source: Author constructed)

#### IQ1: Does your child pay attention to TV commercial when watching TV?

1st coding/open coding	2nd coding/axial coding	Findings/concepts
1. They give more attention to ads. 2. Ads are very colorful. 3. watch ads on chutty TV 4. It depends on the Ads. 5. There is a kid dish music, dance. 6. They love to watch. 7. We got 45 channels now. 8. Change the channel. 9. Indian Ads. 10. Girl on the lux ads also pretty 11. They are more interested in kid’s ads. 12. Very much interested. 13. Songs, music are very much attractive.	1. More attention. 2. Colour full & attractive. 3. They are more interested in kid’s advertisements, 4. It depends on the advertisements. 5. Watched Indian advertisements.	1. Attention toward attractiveness 2. Attention toward colour images

#### IQ2: What does he/she typically do when a commercial comes on?

1st coding/open coding	2nd coding/axial coding	Findings/concepts
------------------------	-------------------------	-------------------

1. They wonder why it takes such a long time. 2. They don't watch all the time. 3. They got more interested on it 4. They tell the place where that item is available. 5. Elder one goes away. 6. Younger ones have interest on the ads. 7. Depend on the ads. 8. They will sing. 9. Observes it so attention ally. 10. They play good music in the background. 11. They watch chutty TV. 12. They have no idea about ads 13. They won't even move. 14. Just watch more attention ally. 15. She has the option. Change the channels. 16. Follow them. 17. More concentrating. 18. Watch that without blinking. 19. Something related to them. 20. Repeat the once on it. 21. Immediately request. 22. Remind us at the super market. 23. Something related to them.	1. Don't watch all the time. 2. Watch that without blinking an eye. 3. Remind us at the purchase places. 4. Something related to them. 5. Immediately request.	1. Very interesting
--	--	---------------------

**IQ3: Do you believe your child's product requests are influenced by televised advertisements? If so, how is she/ he influenced?**

1st coding/open coding	2nd coding/axial coding	Findings/concepts
------------------------	-------------------------	-------------------

<ol style="list-style-type: none"> <li>1. Yes, there is a link between them.</li> <li>2. That's an attraction.</li> <li>3. As shown on the ads.</li> <li>4. It has the influence.</li> <li>5. Kids want everything they see.</li> <li>6. "We need this" when they watch the ads.</li> <li>7. This is the place we saw on the TV.</li> <li>8. Some time they ask following ads.</li> <li>9. She asks for kinder Joy.</li> <li>10. So adamant on it.</li> <li>11. There are some chocolate ads, which come up.</li> <li>12. Whenever we go to food city.</li> <li>13. Because she watches the ads about it.</li> <li>14. Those are rally colorful.</li> <li>15. Noodles were colorful.</li> <li>16. Different ads are more impressive.</li> <li>17. The technique.</li> <li>18. Shape looks different.</li> <li>19. Colour, shape, size are all has influences</li> <li>20. Ask after watching the TV ads.</li> <li>21. Drink boost.</li> <li>22. Boost them or grew them or have energy.</li> </ol>	<ol style="list-style-type: none"> <li>1. There is a link between child's product request &amp; TV ads.</li> <li>2. ## USE OF INTERACTIVE METHODS IN THE FORMATION OF CREATIVE QUALITIES OF STUDENTS

**Oripova Feruza Melievna\***; **Soyibnazarova Muqaddas Norpulatovna\*\***;

### ABSTRACT

*The article gives a brief information on pedagogical and interactive teaching methods and the effective results of their use in the educational process. Each student expresses his / her opinion orally to the question asked by the educator in oral form. Learners state their answers clearly and concisely. In the written form, students write their answers to the question on paper cards in a short and visible way. The answers are fastened to the board (using magnets) or to the "pinboard" board (using needles). They need to be able to find a solution to the problem posed, otherwise when they fail to find a solution, the learners lose interest and lose their self-confidence. When using the "problem situation" method, learners learn to think independently, analyze the causes and consequences of the problem, find a solution.*

**KEYWORDS:** *Interactive Methods, Brainstorming, Project, Role Play, Problem Situation, Role-Playing Method and Etc.*

### INTRODUCTION

We all know that the modern field of education requires the abandonment of outdated trends and uniform teaching methods and the search for new methods that meet the requirements of the times. In order to fulfill this important task, today interactive teaching methods are widely used in the educational process. The application of modern teaching methods not only leads to high efficiency in the teaching process, but also plays a vital role in shaping their creative qualities.

In the selection of methods in the educational process, it is advisable to choose based on the didactic function of each subject studied. These methods are called interactive or interactive methods.

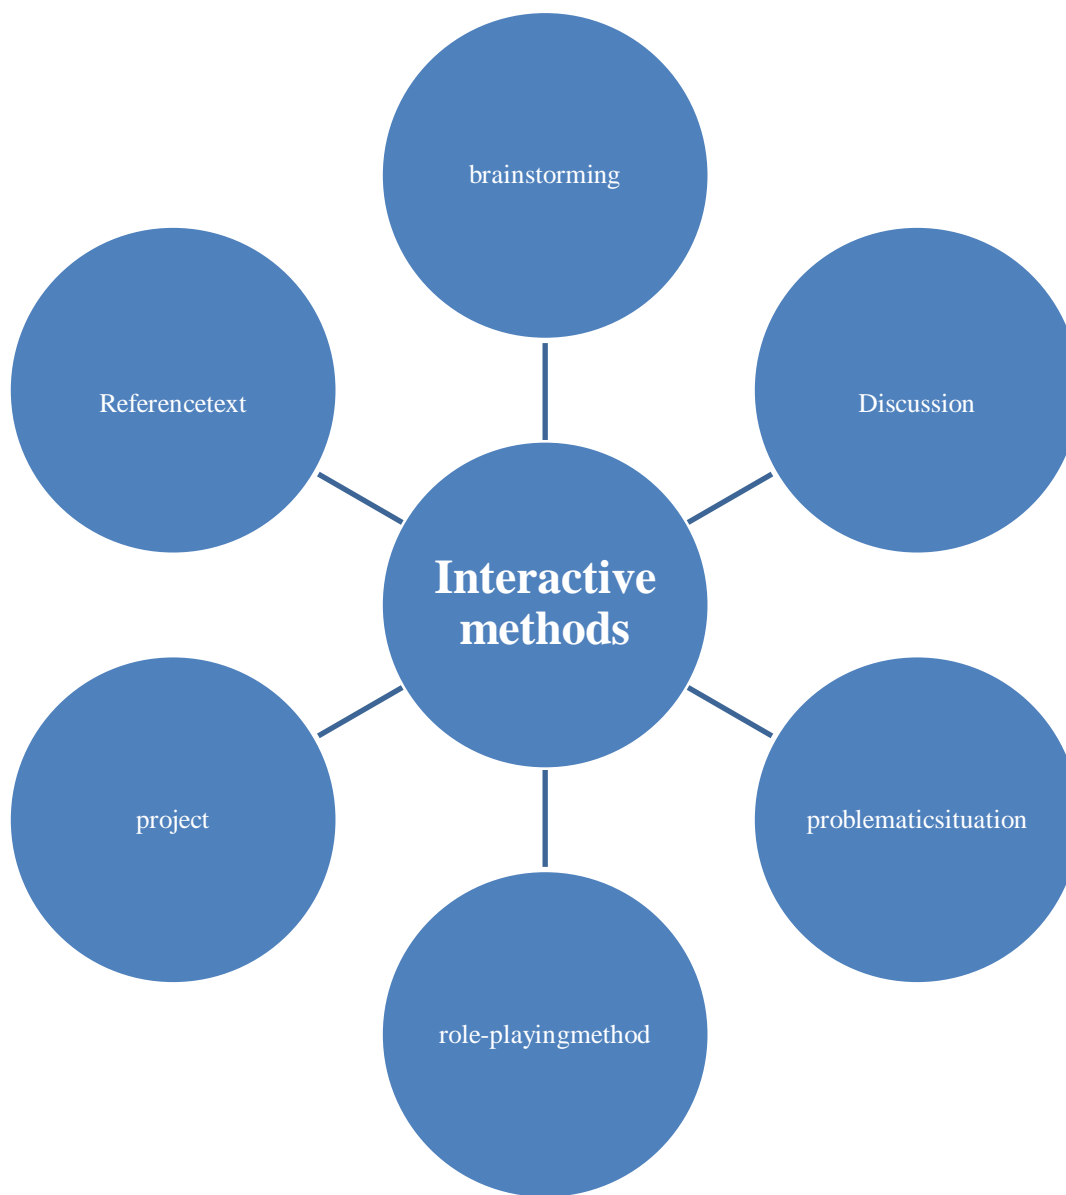

*Interactive methods* are methods that activate learners and encourage independent thinking, learning at the center of the learning process. When these methods are used, the educator encourages the learner to actively participate. The learner is involved throughout the whole process. The benefits of a student-centered approach include:

- + more effective learning;
- + high level of motivation of the student;
- + taking into account previously acquired knowledge;
- + adapting the intensity of reading to the needs of the learner;
- + support for the initiative and responsibility of the student;
- + Study through practice;
- + creation of conditions for bilateral discussions.

The use of interactive teaching methods, enriching them with methods that activate the activities of learners, leads to an increase in the level of mastery of learners.

To do this, the lesson process should be organized rationally, the teacher should constantly stimulate the interest of students in the learning process, divide the teaching material into small pieces, open their content, brainstorm, debate, problem situation, reference text, project, role-playing techniques and encouraging learners to perform practical exercises independently.

“*Brainstorming*” is a method of collecting free ideas and feedback from learners on a problem and using them to come up with a solution. There are written and oral forms of the "mental attack" method. Each student expresses his / her opinion orally to the question asked by the educator in oral form. Learners state their answers clearly and concisely. In the written form, students write their answers to the question on paper cards in a short and visible way. The answers are fastened to the board (using magnets) or to the “pinboard” board (using needles). In the written form of the method of "mental attack" it is possible to group the answers according to certain characteristics. When used properly and positively, this method teaches a person to think freely, creatively, and non-standardly. When using the method of "brainstorming" it is possible to involve all learners, including the formation of a culture of communication and discussion in learners.

Learners develop the ability to express their opinions not only orally but also in writing, the ability to think logically and systematically. Failure to evaluate the opinions expressed leads to the formation of different ideas in learners. This method serves to develop creative thinking in learners. The method of "mental attack" is carried out depending on the purpose set by the teacher:

- ✚ When the goal is to determine the initial knowledge of the learners, this method is done in the introductory part of the lesson.
- ✚ This is done in the transition section to a new topic when the goal is to repeat the topic or link one topic to the next topic.
- ✚ Reinforcement of the topic covered is done in the reinforcement part of the lesson, after the topic, when the goal is set.

*"The role-playing method"* is a method in which learners demonstrate different life situations by staging them. The difference between role-playing games and business games is that evaluation is not conducted. At the same time, while role-playing learners are content to play roles in a scenario developed by the educator, business learners are free to decide for themselves what tasks to perform in a given situation.

In a role-playing game, the participants work together to solve a problem, such as a business game. Role-playing games develop interpersonal skills in learners. The role-playing educator must have prior knowledge of the learners. Because in playing roles, the individual character and behavior of each learner plays an important role. The topics chosen should be appropriate to the level of mastery of the learners. Role-playing games help to motivate learners in the learning process.

The *"project" method* is the process by which learners collect, research, and implement information on a specific topic over a specified period of time, individually or in groups. In this method, learners participate in the planning, decision-making, implementation, verification, and inference and evaluation processes. Project development can be individual or group, but each project is a coordinated result of the collaborative work of the study group.

In this process, the learner's task is to develop a new product or find a solution to another task within a specified time. From the learners' point of view, the task should be complex and it should be a task that requires learners to be able to apply their existing knowledge in other situations. The project should be able to serve learning, put theoretical knowledge into practice, and enable learners to independently plan, organize, and implement.

*The "problem situation" method* is a method aimed at developing students' skills in analyzing the causes and consequences of problem situations and finding solutions to them. The complexity of the problem selected for the "problem situation" method should be appropriate to the learners' level of knowledge. They need to be able to find a solution to the problem posed, otherwise when they fail to find a solution, the learners lose interest and lose their self-confidence. When using the "problem situation" method, learners learn to think independently, analyze the causes and consequences of the problem, find a solution. The use of interactive teaching methods, enriching them with methods that activate the activities of learners, leads to an increase in the level of mastery of learners. This, in turn, serves as a key tool in shaping the creative qualities of learners.

In the Action Strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021, paragraph 4.5 on improving the state youth policy, the following *“Support and realization of creative and intellectual potential of the younger generation, formation of a healthy lifestyle among children and youth, their participation in physical culture and sports goals and objectives such as broad involvement”*. Achieving these goals and objectives requires the use of new, modern interactive methods in the educational process.

In conclusion, the rational organization of the educational process for the formation of creative qualities requires the teacher to increase the interest of students and constantly encourage their activity in the educational process. At the same time, the learning process requires the use of interactive teaching methods such as brainstorming, discussion, problem situation, reference text, project, role-playing games, and encouraging learners to perform practical exercises independently.

### ABSTRACT

*We currently use a number of roles in our pedagogical work. It is important to note that they are not artificially selected, but are real real roles that can be played by students of the relevant specialization. This paper presents a number of ideas on the relevance of information modeling based on imitation role from the perspective of modern economic theory.*

**KEYWORDS:** *Information Modeling, Prediction, Imitation Role, Methodology, Computer, Computer Telecommunications.*

### INTRODUCTION

We explain the relevance of the role modeling information modeling (IRAAM) methodology from the perspective of modern economic theory. We can express the famous proverb that “we are responsible for who we teach”. We want our students to not only be successful people, but to contribute to the betterment of society. Because we cannot escape taxes, trade, and the like.

### Purpose

It was emphasized that the need for marketing research in modern society from an economic point of view is related to three situations: “growth of market scale; transition from price to priceless competition; transition from consumer needs to consumer needs”. In terms of our study, the third case is the most interesting. Indeed, “consumer demand” is a need that has a

specific form depending on the individual of the individual. People's needs are well known and here higher education graduates cannot compete with experienced professionals who have worked in the goods and services market for a long time. Consumer needs are often difficult to predict, predicting them to "feel" requires intuition.

### **Scientific novelty of the article**

George Poya said, "Let's learn to guess!" "There is no absolutely correct method for guessing, so there can be no absolutely correct method for teaching how to guess," he said. It should be noted that the assumption that leads to discovery, the original solution, comes only to those who work diligently to solve any problem.

Therefore, A.D. De Grot concluded that "any creative product is not the result of intuitive perception, innate genius, etc., but rather the result of a person's unique development associated with long-term accumulation and stratification of experience that is always useful for that field of activity".

We believe that IRAAM will help increase the competitiveness of future professionals as it helps to "feel" the needs of people working in different roles. To teach students to predict exactly what this or that consumer wants or this or that market segment, it is necessary to teach students to rely on different perspectives in developing data models, to organize the discussion of developed information models in terms of this or that role.

One of the most important concepts in role theory (J. Mead, G. Bloomer, E. Hoffman, M. Kun) is to "accept the role of another," that is, to put yourself in the shoes of your partner and understand his or her role. In addition, a person conducts his or her role in relation to that person in a way that is appropriate to his or her social role. Without such adaptations, there can be no interaction, and man may not understand the importance and responsibility of his own actions and deeds.

In his book *The Art of Being Different*, V.L. Levi writes, "If you divide your attention to yourself and to others in a ratio of 1: 2, you will achieve everything, you will survive and you will win." To study the psychologist is to "look, listen, pay attention, observe, understand the essence, achieve, grieve, put oneself in the place of another, accept his point of view, values, way of thinking." By teaching this, the scientist has developed a system of specific tasks and exercises that consist of the need to perform certain actions (real) or specific actions through an imaginary existing or imagined character. In addition, the author describes ten practical results of such actions, called "exercises for spiritual refreshment": improving mood, lifting; increase confidence; strengthening the will; sensitivity and attention to memory; increase performance; facilitating communication; increase the ability to understand and be understood; development of creative power; noted the expansion of the scope of talent.

The use of the 'roles' approach is well known in the pedagogy of children of preschool and primary school age. A.A. Gin (1999) cites nine roles for learners who have proven themselves in practice: "why", "knowledge sponsor", "communicator", "navigator", "lawyer", "disbeliever", "conclusion-maker", "psychologist", "time saver." For example, as a communications officer, a student should establish a link between today's material and previous knowledge, including other academic disciplines. A law student, for example, should collect all complaints about homework and rationally defend students' interests. A.A. Gin has divided all the roles applied into didactic and organizational aspects.

Apparently, the author of this work, in his video lectures "Computer. Lessons for Beginners" proposed a humorous classification of users of personal computers (senior bosses, junior bosses, experienced users). Each of the suggested roles allowed the teacher to effectively demonstrate some of the features of the programs studied (at the time it was the NORTON COMMANDER shell).

Subsequently, the author (along with H.H.Yunova) successfully used role-based information modeling to study database functions when working in a spreadsheet environment (the role of a football commentator required to obtain information in real time, which can only be achieved in a computer setting using special tool functions) was possible). They used the role of sports journalist and others in the generalization phase of the repetition of the material.

The author's student, V.A. Akininina, in particular, suggested the roles of travel agency executives, which allowed students to explore non-trivial opportunities to learn text editing, spreadsheets, and databases. In A.P. Telengi's research, the role of a member of the network community to implement the content of "Computer Telecommunications" content, etc., has been very effective.

S.A. Beshenkova and E.A. Rakitina points out that "during training, a person plays several roles at the same time, which are often associated with different behaviors and different modes of activity ... entered. "

The authors used three roles in teaching programs in their practical pedagogical activities: programmer, user, and external observer. It should be noted that the first two of the roles proposed by eminent scholars are used in the process of implementing information preparation for our higher education students. Today we use a number of roles in our pedagogical work. It should be noted that these are usually not artificially selected, but rather real-life roles that can be played by students of the relevant specialization.

### **Results and practical applications**

Modeling is basically an algorithmic activity, so there are no clear recipes, algorithms for selecting optimal roles in various aspects of data preparation. Role selection can be formalized in solving some didactic tasks, while for others it depends in many ways on the teacher's experience and level of intuition.

As for this antinomy, (it is defined as follows: "antinomy is the union of two real positions with the same opposite, and antinomism is a method of combining these contradictions and balancing them, not averaging and eliminating them)" , in particular, pedagogy antinomically combines the rationalism of science and the emotional improvisation of art ".

We list some of the roles we use, providing a description of the didactic functions that are dominant for them.

Used roles	Didactic tasks that are dominant
Sports commentator	“Spreadsheets” are a way to motivate students to explore a more complex topic in database functions. Role selection is related to the need for real-time selection of sports commentator data.
Sports journalist	A sports journalist increases the effectiveness of the organization of a generalized repetition of the studied software features, which have specific features in their professional activities
Assistant Chief	Creating motivation in students to learn document preparation technology through collaboration.
Software product customer	To motivate students to critically analyze electronic documents in terms of their appearance, protection, and adaptability to editing all the objects that make up the document.
Bad teacher	Encourage students to independently search for the most difficult questions asked by a “bad” teacher; look for “problems” in electronic documents that he definitely pays attention to.
Prospective Chief	Emphasizing not only the functional but also the operational features of the developed information models helps students to develop the skills of correctly defining the tasks used in information technology.

## CONCLUSIONS AND SUGGESTIONS

It should be noted that the peculiarity of IRAAM, its advantage and perhaps perhaps one disadvantage is that it can be used only by sufficiently qualified educators (teachers) in practical work. The slightest change in task setting not only develops students' active, independent thinking, but also requires teachers to have an in-depth knowledge of the many possibilities of the ever-improving media. Therefore, one of the important tasks of the modern education system should be to develop effective mechanisms to motivate teachers who are constantly improving their skills in the field of computerization.

### ABSTRACT

*The purpose of this article is to identify the current development, principles, norms and tools of Islamic finance. The second is Islamic financing opportunities. The third is the Challenges of Islamic finance. This article reveals the many reasons that lead to the development and growth of Islamic finance and the challenges facing this system. Despite the fact that a number of measures have been taken to introduce this system, it still faces many challenges. However, the differences between theory and practice, as well as the diversity of opinions of practitioners and financial professionals, pose great challenges.*

**KEYWORDS:** *Islamic Finance, Islamic Finance Development, The prohibition of usury, Sharing risks, Money as "potential" capital, Prohibition of speculative behavior, Murabaha, Leasing, Modaraba, Musharaka, Sales contracts, Opportunities, Challenges.*

### 1. INTRODUCTION

Islam is a belief that encompasses not only man's relationship with God, but also the law that governs the entire way of life of Muslims. The Qur'an contains concepts that form the basis of justice, equality, morality and other Islamic systems. Based on Islamic law (Sharia law), Islamic finance dictates the distribution of risk and profit, prohibits the payment of interest, and encourages moral investment that contributes to the growth of society. Islamic finance does not belong to any particular jurisdiction, but there are Muslims anywhere in the world who want to conduct financial transactions in accordance with their beliefs. In Uzbekistan, for example, there

is a great need for Islamic finance and the economy in a predominantly Muslim society. The Islamic financial system allows you to exchange interest on income from investment activities and operations that bring additional wealth. This article is divided into four sections. After an introduction to the topic, the second section describes the Islamic financial system. The third section discusses opportunities for the development of Islamic finance. The fourth section discusses the challenges of Islamic finance.

## 2. Islamic financial system

### 2.1 The emergence of Islamic finance.

Although the history of Islamic finance dates back to the late seventies and eighties, its foundations certainly date back to the time of the Prophet Muhammad (peace and blessings of Allaah be upon him). Allah has forbidden usury because usury has harmed the economy and people of the country, causing funds to accumulate in the hands of large capitalists.

Most appeals against commercial or commercial activities in accordance with Islamic principles were made under the umbrella of “interest-free” or “Islamic” banking. Prohibition of the receipt and payment of interest is at the core of this system, but it is supported by other principles of Islamic teaching that protect the sanctity of the distribution of risks, the rights and obligations of individuals, property rights and contracts. Similarly, the Islamic financial system is not limited to banking activities, but covers all forms of capital formation, capital markets, and financial intermediation (Osmani, 2005; Pervez, 2008).

### 2.2 The basic principles of the Islamic financial system can be summarized as follows:

**The prohibition of usury**, as stated in verses 2: 275 of the Holy Qur'an, prohibits usury, which means paying usury for the use of money. More precisely, it means that money is added to the loan without any added value. This prohibition is based on social justice, equality, and property rights. **Sharing risks** involves the supplier of financial capital and the entrepreneur sharing business risks in return for a share of the profits. **Money as “potential” capital**. Islam recognizes the temporal value of money, but it is realized not only when there is no “potential” capital, but also when it acts as capital. **Prohibition of speculative behavior**. The Islamic financial system prohibits fundraising and prohibits transactions involving excessive uncertainty, gambling, and risk. (Job, 2005) A Shariah - approved activity is a business activity that does not contradict the rules of Sharia.

### 2.3 Instruments of Islamic Finance.

-The **murabaha** means that The investor undertakes to supply specific goods or commodities, incorporating a mutually agreed contract for resale to the client and a mutually negotiated margin.(Usmani 2005).

-**Leasing** is designed for financing vehicles, machinery, equipment, and aircraft. Different forms of leasing are permissible, including leases where a portion of the installment payment goes toward the final purchase (with the transfer of ownership to the lessee).(Pervez, 2008).

-**Modaraba** is a contract between an Islamic bank and a Client whereby the Islamic bank provides a specific amount of funds to the Client for an enterprise for defined purposes in exchange for a reasonable and highly predictable profit. The Client receives a share in the profit as compensation or a fee for his know-how and management. (Usmani 2005; Pervez, 2008)

- **Musharaka** financing is the same financing contract as Modaraba except that the Client also provides a part of the capital, in addition to providing management and know how. On the other hand, the Investor may provide a part of the management and know-how, in addition to capital.

- **Sales contracts** . Deferred-payment sale (bay' mu'ajjal) and deferred-delivery sale (bay'salam) contracts. In a deferred-payment sale, delivery of the product is taken on the spot but delivery of the payment is delayed for an agreed period. Payment can be made in a lump sum or in installments, provided there is no extra charge for the delay. A deferred-delivery sale is similar to a forward contract where delivery of the product is in the future in exchange for payment on the spot market. (Usmani, 2005; Pervez, 2008).

### 3. Development opportunities of Islamic finance

Islamic finance is one of the fastest growing markets in the global financial industry. In the early 1990s, the field of Islamic finance emerged from the “field of experimentation” as a noteworthy but yet very young participant in the global financial market. Naturally, there are a number of important and favorable factors for the development of Islamic finance in the world, including Uzbekistan. Including:

- Acceptance of the idea of Islamic finance by the international community;
- The use of English, which is now the world's financial language, in the field;
- Growth and expansion of Islamic banks and financial opportunities;
- The emergence and development of Sharia councils in Islamic banks;
- Establishment of various international coordination centers (agencies);
- Activation and development of ijtihad in the field of fiqh of commercial agreements;
- Consensus among lawyers of the four sects on most important issues;
- Islamic finance contracts should be clear to both traditional investors and access to international financial / capital markets;
- The position of coordinating organizations and political leaders of the countries that have introduced the Islamic banking and financial system and laid a solid foundation for the development of Islamic finance.

In general, the development of Islamic finance can be attributed to the high demand for this system among the population of a number of Muslim countries and the favorable economic situation. Aware of the potential of Islamic finance, as well as the limited capabilities of classical Islamic finance contracts, a number of major Western banks, law firms and other stakeholders have created complex Islamic finance products and contracts that meet modern requirements and international standards and practices. will be a factor contributing to the spread of Islamic finance in countries around the world.

International bankers and advocates of the harmonization of the Islamic financial system with the world financial system have begun to work closely with lawyers in the field of Islamic jurisprudence to ensure high growth rates, as well as the creation of new financial products. creates easy opportunities to do.

The widespread use of English in Islamic finance has also been a factor in expanding its capabilities. In general, the introduction of English is a matter of course for Islamic banks in the context of the globalization of financial markets. Until now, however, agreements have been legally reviewed, approved and monitored in Arabic (especially in the Gulf states). The fact that most Islamic lawyers, who are members of the Shariah Councils of banks, do not speak English, has greatly complicated the communication between bankers and Shariah councils. Therefore, instead of examining the relevant documents and agreements in detail, the members of the Shariah Councils only considered the summary information prepared by the employees or advisers of the Islamic banks. Naturally, such summary data do not allow for a complete and detailed coverage of all the processes, indicators and factors required for a legal assessment of the document and the correct formulation of products. Of course, as a result, the original meaning is completely or partially lost, and the result is the same. This situation has slowed down the development of Islamic finance to date.

#### **4. Problems of Islamic finance**

The Islamic Financial Movement faces many serious challenges. Differences between theory and practice, as well as the diversity of opinions of practitioners and financial professionals, pose great challenges. The level of reliability of the Islamic financial system is causing controversy among Sharia scholars and modern financial experts. The subsequent growth and development of Islamic finance faces a number of other challenges, including system constraints and the development of problems. What are the obstacles, prospects and tasks on the agenda of the new generation of Islamic financiers?

a) As mentioned above, since the 1990s, Islamic finance has come into play in a large area of traditional financial systems and secular legal systems. In other words, Islamic banking and financial institutions have entered into direct competition for customers with the traditional banking and financial system, which operates smoothly and efficiently. This has shifted the attention of the Islamic financial system from the creation of unique and complete proposals to the "reverse engineering" of traditional financial products, ie traditional lawyers and Islamic bankers have been able to comprehensively study traditional banking and financial products. and began to create Islamic products that would give customers a similar financial result in mathematical terms. Naturally, all the documents were drawn up in accordance with the required standards. The same assimilation of Islamic finance and its focus on "lending" has led to serious criticism and accusations. Critics have argued that Islamic finance is losing its unique character, its role and importance in reducing poverty in society, increasing the financial coverage of vulnerable groups, creating new jobs and economic growth. According to them, if Islamic finance continues to take such a "formal" approach to the issue, it will lose its essence and become one of the "pillars" of the existing traditional banking and financial system.

Therefore, the turning point and the main problem for the industry is the development and activation of the real economy, fair and efficient distribution of funds among economic entities, as well as the creation of an alternative financial system to the traditional banking system. is to have a clear understanding of the original goals and objectives in increasing coverage.

b) Increasing the share and importance of Islamic microfinance institutions. Today, two-thirds of Islamic finance is concentrated in Islamic banks. Most of the population and small businesses in most Muslim countries do not have access to Islamic banking due to the lack of stable and

sufficient income of potential customers, lack of collateral and credit history, high risk of projects and business activities, and other reasons. . Although Islamic microfinance institutions have all the necessary tools to work with the most vulnerable segments of the population, this opportunity is rarely used in practice. As a result, large sections of society are stranded in poverty. Moreover, the share and importance of such institutions in the Islamic financial system is very small. At the same time, there is a great opportunity to use tools such as hasanah, zakat, waqf and modern financial methods (fintek) to finance the needs of the population in need of social protection and reduce poverty.

In this sense, increasing the importance of Islamic microfinance institutions, creating financial products that meet the needs of vulnerable groups and small businesses and their ability to pay, and the use of information and communication technologies and social financing methods will alleviate the mass poverty observed in many countries. It is able to overcome and involve a large segment of the population in the financial and economic process, thereby accelerating economic activity and creating the necessary conditions for healthy economic growth.

c) There are a number of countries where the population is predominantly Muslim or where the majority of the population is Muslim. At the same time, for various reasons, there is a misconception or bias towards Islamic finance by the population, at the state level or within the traditional banking community. This is one of the main reasons for the low importance of the industry in society, its low level of implementation, development and use.

Therefore, the experience of international Islamic organizations, the scientific community, educational institutions, Islamic banking and financial institutions and groups, and the experience of countries that have successfully introduced Islamic finance among the population and national coordinating organizations, financial market participants and officials it should be widely disseminated and thereby increase the level of acceptance and understanding of the essence of Islamic finance.

Islamic finance has successfully overcome the global financial crisis, proven its resilience to systemic risks, its resilience and resilience in a secular legal environment, and has made a significant contribution to overall economic growth. At the same time, it provides opportunities for those who apply to Islamic finance based on their religious beliefs, as well as for those who intend to meet their financial needs more fully through this system.

Another problem is that the traditional banking community exaggerates the “threats of the Islamic banking system” by worrying about its declining share of the financial market and the mass transfer of customers to Islamic banks. However, the experience of the development of the Islamic banking and financial system over the past 30 years shows that even in Muslim countries, which have preserved their religious traditions and beliefs, the main share of the financial sector is in the traditional banking system. is coming. For example, if we look at other Gulf countries besides Saudi Arabia (where the share of both systems is equal), Pakistan, Bangladesh, Malaysia, Indonesia, Egypt, Turkey and other countries, all of them have a lot of Islamic banking system. has been satisfied with a very small share for years. At the same time, it is the Islamic banking system that is pulling large amounts of free money out of the hands of the population and attracting it to the real economy, thereby significantly boosting the economy, trade and welfare of the population. Therefore, within any legal system and under any

circumstances, Islamic banks can be seen as a source of economic activation and growth, as well as an alternative system that provides healthy competition in the banking and financial sector.

**d)** Islamic finance is successful in a number of countries. The Islamic financial system, which has evolved over the years into a startup, has gained enough experience, and now it is time to go international to share that experience. Islamic banks and representatives of the entire sector are encouraged to enter new markets (i.e., beyond their national borders), engage in business cooperation, and engage in a 'south-south' approach (i.e., between developing countries, such as the Organization of Islamic Cooperation) To promote and support international trade between the OIC members, as well as to cooperate with local coordinating organizations to create a full-fledged Islamic financial infrastructure in countries implementing the Islamic banking and financial system It is advisable to put.

There are a number of other challenges facing Islamic finance, as "complexity and problems" are common to any system. Understanding and acknowledging problems is the starting point for finding effective solutions. This makes the system and all its "components" healthier. Even if the industry solves at least some of the problems mentioned above, it would be a huge step forward in the development and growth of the system.

### ABSTRACT

*In this article, it is given data about influence of fertilizers and inoculated nitrogen before soybean seedling on the efficiency of the soil and productivity of the crop, climate and conditions for conducting research on the field, method of experiment by using manures and inoculated nitrogen, and taken result of them in the research are described.*

**KEYWORDS:** Soybean, Frequentative Crop, Mineral Fertilizers, Ore Fertilizers, Rhizobium, Gray Soil, Humus, Layer, Duration, Crop Rotation, Vegetation, Growing Season.

## INTRODUCTION

The acceptance of Presidential Decree № 2832 from March 14, 2017 by the President of the Republic of Uzbekistan on “the measures of increasing planting soya and organizing planting soya legumes in the Republic during 2017-2021 years” provides growing soya beans on the 92 266 hectares of the land as a main crop, on the 40 557 hectares of the land as a repeated crop and serves on improving the productivity of the land, satisfying the demand of population for food and animal feeding products.

In the soil of the Republic of Uzbekistan does not contain the bacterium named “*Rhizobium*” (that exists on the roots of legumes), therefore it is preferable to inoculate with the drug of *Rhizobium* bacterium (nitrogen) before planting the seedlings of legume and grain.

As for Atabaeva (2004), Atabaeva, Mamedov (2007) who note that soybean plays the main role in increasing the efficiency of the soil and the existence of *Rhizobium Japonica* in its roots enriches the soil with nitrogen and leads to gathering average 70-100 kilo/ha of biologic nitrogen in a year. For this reason, the remaining roots and residuals from the crop is considered to be crucial in preserving and increasing the efficiency of the soil.

According to the information of Z.Islamova (2011), using mineral fertilizers with nitrogen, more specifically, versions of  $P_{90} K_{60} + \text{nitrogen}$  and  $N_{30} P_{90} K_{60} + \text{nitrogen}$  provides the highest amount of gathered *Rhizobium* and the increase in productivity by 3.3-5.4 cent/ha. Increasing the amount of nitrogen leads to decreasing *Rhizobium* or non-existence at all, increased productivity is observed only due to the increased amount of nitrogen.

The data of B.Mavlonov, A.Hamzaev, Z.Bobokulov (2018) shows that *Rhizobium* that lives in the roots of legume-grain products inhabited the nitrogen in the atmosphere and enriches the soil with nitrogen. Asian bean, soybean and pea gather easily from 40 kilos to 120 kilos of nitrogen from each hectare of the land in the condition of Uzbekistan. The most of nitrogen inhabited by legume grain products stays in the plant itself and some part of it stays in the root and returns to the soil in the form of residuals after the crop has been gathered.

The researches of I.Anarboyev, M. Sattarov (2012) and E.R.Ollohberdiev indicate that the soya which is planted after autumn cereal products as repeated crop enriches the soil with nitrogen. Moreover, it leaves 40-50 kilos fresh biologic nitrogen from each hectare.

## MATERIALS AND METHODS

We conducted research and experiments on the effectiveness of processing the different norms of mineral fertilizers before planting soya beans as a frequentative crop after wheat on the efficiency of the land and productivity of soybean crops during 2015-2017 years on the experimental land fields of the Scientific-Research Institute of Selection, seeding and growing cotton agro technology.

Field experiments have been conducted on the environment of typical gray, sandy with heavy mechanical content, irrigated from the past, located in deep irrigated (18-20 m) unsalted soil of Tashkent region.

In the experiment, processed and unprocessed nitrogen *Bradyrhizobium japonicum* SB5 with the following types of unfertilized mineral fertilizers: PK 90:60, NPK 30:90:60, NPK 60:90:60 and NPK 90:90:60 kilo/ha with different norms are tested before planting soybeans.

In order to detect agrochemical component of soil of experimental land before conducting experiment, samples from 5 points of diagonal layers 0-30 and 30-50 cm have been checked.

## RESULTS

According to obtained results, the soil of 0-30 cm layer of experimental lands consist of 0.725% humus, 0.061% total nitrogen amount, 0.116% phosphorus.

The arable base of the land, 30-50 cm layer contained 0.598% of humus, 0.598% of total nitrogen and the phosphorus between 0.099%.

According to information on mobile shapes of nutritional elements, the followings have been detected: the amount nitrogen on the arable layer of the soil (0-30 cm), 2.26 mg/kilo on the underneath of arable layer (30-50 cm), the mobile phosphorus on the 0-30cm layer of the soil - 15.2 mg/kilo, 11.80 mg/kilo on the 30-50cm layer of the land. The amount of substitutable potassium was 318 mg/kg in the 0-30 cm layer of soil and 282 mg/kg in the 30-50 cm layer.

### Chart 1

**The impact of norms of mineral fertilizers and frequentative crops on the amount nutritional substance, in percentage term (2016 year)**

№ treat	The layers of the soil, cm	Total form, %			Mobile form, mg/kg		
		Humus	N	P	N-NO <sub>3</sub>	P <sub>2</sub> O <sub>5</sub>	K <sub>2</sub> O
	The beginning period of praxis (2016 year, summer)						
	0-30	0,725	0,061	0,116	3,81	15,20	318
	30-50	0,598	0,053	0,099	2,26	11,80	282
	The ending period of praxis (2016 year autumn)						
1	0-30	0,724	0,059	0,115	3,92	15,14	315
	30-50	0,596	0,052	0,097	2,33	11,65	279
2	0-30	0,749	0,063	0,119	4,25	16,01	324
	30-50	0,608	0,054	0,100	2,74	12,10	288
3	0-30	0,755	0,070	0,126	5,18	17,42	330
	30-50	0,611	0,056	0,104	3,02	12,94	294
4	0-30	0,751	0,068	0,122	5,01	16,25	326
	30-50	0,610	0,054	0,102	2,89	12,66	290
5	0-30	0,727	0,062	0,118	3,95	15,21	320
	30-50	0,599	0,053	0,099	2,36	11,92	283
6	0-30	0,754	0,067	0,122	4,36	16,84	328
	30-50	0,610	0,056	0,103	2,81	12,19	290
7	0-30	0,762	0,073	0,130	5,33	17,53	336
	30-50	0,616	0,061	0,107	3,15	13,01	298
8	0-30	0,758	0,071	0,125	5,10	16,42	330
	30-50	0,612	0,059	0,104	3,05	12,83	296

It shows that, the typical gray soil of researched land area (Scientific Research Institute of Agro technology of Cotton seed breeding and cultivation) is found to be provided with the very low

amount of nitrogen and phosphorus, and the high level of interchangeable potassium, based on the classification of nitrogen and phosphorus (presented in the chart 1).

The impact of using mineral fertilizers norms for planting and growing soybean seedlings as a frequentative crop on the agrochemical properties of the soil is observed. During the ending period of vegetation, processing the soybean seedlings before planting, using different norms of mineral fertilizers showed its effect on the amount humus in the soil. The amount of humus in the arable layer of the soil (0-30cm) is equal to 0.727% when none of mineral fertilizers have been used before soybean seedlings, while it is equal to 0.762% when NPK 30:90:60 kg/ha mineral norms is processed with nitrogen. It provided the increase in the amount of humus by 0.037% in comparison with initial indicators, while 0.033% increase was detected in the version NPK 60:90:60 kg/ha in comparison with initial indicators.

The total amount of nitrogen in the arable layer of the soil (0-30cm) is equal to 0.0627% on the occasion of not using any mineral fertilizers before soybean seedlings, while it is equal to 0.073% in the method of processing nitrogen with NPK 30:90:60 kg/ha mineral norms. This, in turn, led to the increase of 0.012% in comparison to the initial indicators before planting soybean seedlings. 0.01% increase in comparison with initial indicators was obtained in the case of implementing NPK 60:90:60 kg/ha. The above law was also observed in the total amount of phosphorus and nutritional on the mobile shapes of the composition of the soil.

The crop productivity of soybean gave the following results: The highest level of soybean productivity is obtained in the eighth version of processing soybean seedlings with Rhizobium which actively inhabits nitrogen and mineral fertilizer with the amount of NPK 60:90:60 kg/ha before planting them as frequentative after autumn wheat, the average crop is equal to 26.9 c/ha in three years; the version of experimenting without fertilizers yields 14.2 c/ha, 17.1 c/ha in the case of processing Rhizobium which actively inhabits nitrogen and without fertilizers. In the fourth version of using NPK 90:90:60 kg/ha norm yields 24.7 c/ha crop (chart 2).

**Chart 2**

**The impact of norms of mineral fertilizers on the productivity of soybean, c/ha**

№ treat	The norms of ore fertilizers, Kg/ha (NPK)	Productivity of the crop by years, cent/hectare			average
		2015	2016	2017	
1	Without fertilizer	13,1	13,6	15,8	14,2
2	N <sub>30</sub> P <sub>90</sub> K <sub>60</sub>	21,9	22,2	23,0	22,4
3	N <sub>60</sub> P <sub>90</sub> K <sub>60</sub>	25,4	26,4	27,0	26,3
4	N <sub>90</sub> P <sub>90</sub> K <sub>60</sub>	23,2	24,6	26,2	24,7
5	Without fertilizer + Nitrogen	16,2	17,1	18,0	17,1
6	P <sub>90</sub> K <sub>60</sub> + Nitrogen	19,5	20,7	21,9	20,7

---

## CONCLUSIONS

The above studies indicate that, in the system crop rotation for short period, processing soybean with nitrogen before planting its seedling as frequentative crop after autumn wheat provides reduction in the expenditure of processing ore fertilizers during the growth of soybean by 20-25%, as well as serves to reduce processing norms of ore fertilizers which are used to care agriculture products during the growth of upcoming years.

### ABSTRACT

*This article is devoted to the study of the importance of the relationship between language and culture in the reflection of the traditions of "Family and marriage" inherent in the linguocultural culture of the English and Uzbek peoples. An anthropocentric approach to the study of linguistic phenomena in linguistics requires the study of the interconnectedness of language and culture, and the results of such research demonstrate their importance in interethnic relations. The connection between language and culture has been studied by many scholars since the last century. However, there are no studies devoted to linguocultural, linguistic research in the analysis of family traditions with national-cultural color, which are characteristic of the linguocultural culture of the English and Uzbek nations. The article outlines the following ways to solve the above problems. First, the theory of the interdependence of language and culture, the views of scholars on the importance of this theory in the study of the specific national and cultural characteristics of language phenomena in the linguistic culture of two or more languages are presented in the theoretical part of the article. Second, the main part of the article provides information about the concepts of "family", "family traditions" in English and Uzbek, and explains their content. Third, the types of "family and marriage" traditions inherent in the linguistic culture of the English and Uzbek peoples were identified, as well as the analysis of family traditions in English and Uzbek through English, Uzbek proverbs and sayings reflected in the linguistic landscapes of the English and Uzbek worlds. The concluding part of the article reveals the differences and peculiarities of the "family - marriage" traditions of English and Uzbek linguoculturology. To achieve this goal, content analysis methods were used, which are*

*comparative, descriptive and linguoculturological methods, as in the research methods of linguistics. Proverbs and sayings reflecting family traditions from the English and Uzbek paremeological funds were selected as the subject of the study. The results of the comparative analysis will contribute to the study of English and Uzbek languages, cultures, the development of intercultural dialogue and the prevention of conflicts and misunderstandings that may arise in it, as well as in the field of translation studies.*

**KEYWORDS:** *Linguoculturology; Uzbek Languages; Culture; Family Traditions; Intercultural Communication.*

## 1.INTRODUCTION

The growing demand for learning a foreign language can be clearly seen in recent years. One of the main reasons for this is that in the XXI century, under the influence of the development of science and technology, it has become easier to communicate with foreign countries. However, the help of technology alone is not enough to communicate with people of other nationalities. Language is the most important tool in communicating fully with people of other nationalities and cultures. After all, a person who knows a foreign language can not only speak with native speakers, but also get acquainted with the history and culture of speakers of this language, learn their worldview, thinking. Hence, language learning is directly related to a number of vital factors. One of such factors is the culture of the country where the language is studied, because in order to fully understand the opinion of a representative of a particular nation, it is necessary to be aware of his worldview and mentality. As a result, since the middle of the twentieth century, scientists have become increasingly interested in studying language not as a system but as a living organism. The study of language in relation to culture has dramatically changed attitudes toward this theory of language. The reason is that culture and language are closely intertwined, that they require each other, that culture is reflected in language. Such research contributes to the above-mentioned intercultural and interethnic dialogue. Communication between the two nations will be facilitated, the development of interstate relations in various fields: social, political, economic, cultural, etc. In strengthening the national-cultural, social relations and ties of the English and Uzbek peoples, it is possible to study the comparative, linguoculturological study of the "family traditions" of the linguistic culture of the peoples of these nations. This study examines the similarities and differences between family traditions in English and Uzbek linguoculturalism. The aim of the study is to facilitate intercultural dialogue between the British and Uzbek peoples, to provide the two nations with their first understanding of the family in their own culture, and to differentiate between the two different cultures. to prevent misunderstandings and conflicts. The results of this comparative analysis are expected to be an acceptable theoretical basis for future learners of foreign languages (English, Uzbek), researchers in culture, sociolinguistics, psycholinguistics.

As the first scholars to study the interdependence of culture and language, the American anthropologist F.J. Boas and British social anthropologist B. Malinowski should be mentioned. Boas emphasized the importance of learning by linking language and culture in 1911, noting that each of them played an important role in the development of language and culture (F. Boas, 1906). According to Professor Z.K Tarlanov, language and ethnos are inextricably linked. "Language is not only a means of communication within the ethnic boundaries of the speakers,

but also a source of knowledge passed down from generation to generation, the memory and history of the people, its culture, worldview, psyche, upbringing and preparation for life" (Z.K. Tarlanov, 1993). From the point of view of linguoculturology, the linguistic landscape of the world has a national character and reflects the national-cultural character of the speaker, and the national identity of the linguistic landscape of the world is determined by the cultural, historical development, traditions and customs, national mentality, stereotypes. "To describe the national peculiarities of the linguistic landscape of this or that world is to determine its historical and etymological origin, to show the process of linguistic formation of a particular nation's perception of the world" (R.X. Khairullina, 2001). As proof of his word, he compared words from a dictionary of two cultures. This can be seen in the following example: in the Uzbek dictionary there are two words for the baby to rest - "beshik" and "swing". Even if two devices are used for the same purpose, they are two different things. In particular, the "cradle" is a value of the culture of the Uzbek people, an element of the pineapple. In English and Russian culture, we did not find the national-cultural sign of the words "cradle" and "kolybel". In addition to objects, a certain nation reflects a particular nation, people's nationality, climate, geographical conditions, and similar factors. For example, we know that the climate in the UK is humid and its territory is often covered by rain and fog, for example, in the works of Jerome K. Jerome one can often find depictions of the English weather (J.K. Jerome, 1889). Probably, the purpose of the creation of such works is to reflect the climate of the land, the culture of that people, the richness of vocabulary. It is obvious that the English people are eager to discuss and talk a lot about nature, today's weather, natural phenomena. An even clearer example is the word "fog" mentioned above. In English-Uzbek and English-Russian dictionaries (<https://www.context.Reverso.net>), the word "district" is often used in both Russian and Uzbek. The English dictionary is much richer than this word - fog- mist, mist- gira-shira mist, haze- smoke / dust mist, brume - mist (<https://woordhunt.ru/word/fog>). This means that the number of climate-related words in English lexicon, both in terms of content and number, has become a stereotype in the linguistic landscape of the English world. Yu. S. Stepanov writes: "Language is created in the human model, and this dimension is sealed in the structure of language itself, and language must be studied accordingly" (Stepanov, 1985). In this opinion, the scientist wants to emphasize that language is the most important thing in human life, it is a human model, a copy.

Today, language is also studied by psycholinguistics and sociolinguistics. Regarding the study of the relationship between culture and language, we can cite the opinion of V.A. Maslova: "Language is inextricably linked with culture: language emerges from culture, develops in it and expresses culture" (V.A. Maslova, 2001). As a confirmation of the above idea, E. It is worth quoting Bartminsky's comment: "The process of stereotyping of culture and language is a question of the development and socialization of this ethno-society. Therefore, it is one of the most important questions to be studied" (E. Bartminsky, 2005). Much here is determined by the physiological and psychophysiological capabilities of speech activity. For example, in all the languages of the world, the existence of a chain of exchange of vowels and consonants, as well as many sounds, is connected with nature, not with culture. Consequently, man cannot form a speech with vowels or consonants alone. Russian sociologist N. B. Mechkovskaya claims: "On the relationship between language and culture, he writes: "Nature determines the deep features of the structure of language and the laws of text formation and reception. Culture, on the other hand, determines the content of language" (Mechkovskaya, 2000). For centuries, the problem of language and culture has been multifaceted, which is why cultural scientists, linguists,

philosophers, psychologists, ethnographers and literary critics have different approaches to this issue. However, the linguistic side of the issue is largely twofold, as language and culture are interrelated. Accordingly, two questions arise: 1) how do different cultural processes affect language? 2) How does language affect culture? The opinion of the Russian linguist G.O. Vinokur that “any linguist who studies a language, of course, the language of his choice becomes a researcher of the culture of which it is a product” (Vinokur, 1959) has already been confirmed. Gerder writes, “The four basic phenomena of human activity are intertwined: language, culture, society, and national spirit. Language, by its very nature, is associated with culture, and it evolves with society. The organic connection of language with culture makes it an important component of the national spirit ”(Gerder, 1977). The relationship between language and culture is described in detail in Wilhelm von Humboldt's *The Differences in the Structure of Human Languages and Their Influence on the Spiritual Development of the Human Being* (Humboldt, 1984). 2) any culture is national, its national character is expressed in language through a specific means of seeing the world; the language has its own internal form peculiar to each nation; 3) the internal form of language is an expression of the "spirit of the people" and its culture; 4) language is the ring between man and the world around him (V. Humboldt, 1984). Sepir can be mentioned the scholar who has studied the connection between language and culture most deeply and comprehensively. E. Sepir's "Selected Works on Linguistics and Cultural Studies" covers issues related to "language and culture". It also raises the question that causes the most observation - did language come into being first or was it culture? He answers: “... language originated before culture, because language was considered a means of expressing meaning in relation to culture. Language appears as the main form of national culture and its expression, but according to Sepir, language is a product of social and cultural development, and language is a socialized part of culture ”(Sepir, 1993). Both culture and language require conceptual choice. Second, both languages and cultures are rarely self-sufficient. E.Sepir explained the difference between these two phenomena as follows: “Culture can be determined by what society does and thinks, and language by how it thinks” (E.Sepir, 1993). In determining the place of language in intercultural communication, GS Ter-Minasova concludes that language is not only a means of communication, a way of communicating to the listener, but also a way of life, its cultural level, the culture of a particular nation, tradition. -The main weapon in the expression of customs, traditions, values, their world is the weapon of culture (G.S.Ter-Minasova, 2000).“Thus, language, thought, and culture are so closely intertwined that, in practice, they form an integral whole consisting of the same three elements, none of which can exist or exist without the other two. Together, they interact with the real world, oppose it, depend on it, reflect it and at the same time shape it ”(G.S.Ter-Minasova, 2000) writes G.S.Ter-Minasova. Indeed, if we take the culture of a nation, how will that nation pass on its cultural heritage to the next generation over the centuries? How do the values and traditions of a community, a family, come to life? The only answer to these questions is, of course, through language, speech, and oral or written expression. K. Levi-Strauss writes: “Language is both a product of culture and an important component and a condition of the existence of culture. In addition, language is a factor in the code of culture formation, a unique way of culture's existence ”(K. Levi-Strauss, 2001). In other words, learning a language and culture is learning the whole and half of it.

The family is a social stratum formed by the division of a vast generation. The main components of the family are husband and wife, children. Family members will be interconnected with each

other as spiritual, social, material and other needs. The Arabic word “family” is a horse with the suffix at (un) of the verb “ala” meaning “looking after the dependents” and means a social group in which parents and children live together (Dictionary, 338). “However, the cultural context of the family also includes the extended family. They are non-blood members who entered the family through marriage”(Williams, Sawyer & Whlstorm, 2005).

Recognition of the interdependence of language and culture serves for a deeper understanding of the concepts that exist in language. However, each concept belongs to a particular people, nation, culture. One such concept is "Family Traditions", which is unique to the culture of each nation. The family traditions that have been formed since ancient times, passed down from generation to generation, and have been formed to this day, have been reflected in the linguistic culture of the English and Uzbek languages. According to the Glossary of Modern Uzbek Active Words, “tradition” is “... attitudes, customs, rituals, attitudes, customs, traditions, etc., passed down from generation to generation over the centuries (Glossary of Modern Uzbek Active Words, 2001). “Family is not only a concept described by its family members, but also defined by its dynamics. Family dynamics refers to the ways in which families communicate with each other. These include traditions, behaviors, types of communication, and emotional freedom (Bowen, 2011).

## 2. MATERIALS AND METHODS

### 2.1. *Instruments.*

To conduct the research, a dictionary of articles containing English and Uzbek folk proverbs and examples from the literature were used. was made. The dictionary of proverbs includes articles on family traditions, in particular, family and marriage - rituals, customs, values, traditions in both languages, and according to the content of the articles they are divided into the following subgroups:

- 1) The tradition of choosing a future spouse;
- 2) Matchmaking traditions
- 3) Wedding ceremonies;
- 4) Peculiarities of married life

So, the articles were selected and they were compared between the two languages. In the process of comparison, similarities, differences and peculiarities of the above-mentioned family traditions in English and Uzbek linguoculturology were identified.

#### 2.1.1. *For example.*

The Uzbek proverb "Let there be a wedding, even if it is Atala" means that the wedding is such a good event, it ends with the formation of a new family, which is why you have to have a wedding, even if it is small. The process of marrying the children of both parties is said to be the most interesting and exciting part of the wedding. It is known that the wedding of the Uzbek people is impossible without advice. The owner of the wedding usually makes a wedding plan in consultation with relatives, neighborhood, friends. The same relationship is reflected in these proverbs: "The wedding will be with the council", "The wedding belongs to everyone, to the bride". In English culture, the day and the moon play an important role in the wedding: "Marry in May, rue for age", that is, they believe that a certain moon is unlucky for a wedding. The

proverb “One wedding brings another” is considered to be an event that brings joy and happiness to a wedding. However, in the culture of the English people, marriage is also manifested as an event that deprives a person of liberty, which is likely to be half-true, half-joking. This can be understood in the following articles: “Better to marry than to bury”, “Wedlock is a padlock”.

### **3.Results.**

The analysis shows that family traditions in English and Uzbek linguoculturologys are similar, different and unique, that is, have unique features. There are sharp differences in the tradition of choosing a future spouse, if the representatives of English culture say that the person who wants to get married is the right decision, in the Uzbek nation a young girl or boy usually chooses a husband or wife with the thoughts and advice of parents. The tradition of courtship is a kind of irony and humor in English culture. We came to this conclusion after analyzing the examples in the studied English classical literature. Since there are traditions in English culture that are now disappearing, there are no English proverbs and sayings that express this tradition. In Uzbek linguoculturology, on the other hand, the opposite is true, the tradition of gift-giving has survived to the present day, and this tradition is reflected in Uzbek proverbs. In addition, Uzbeks are positive about the tradition, emphasizing that it has a role to play in helping young people get married in the future. We found that a comparative analysis of wedding ceremonies was largely based on religious beliefs. English weddings are held in the church on the basis of Christianity, following certain customs, and in the Uzbek nation, marriages are performed in accordance with the rules of Islam. The main similarity is that in both Uzbek and British weddings take place in the company of family and friends with joy, fun, celebration. Life after marriage is life in marriage, and the proverbs of both nations have henceforth studied the proverbs that reflect the traditions of husband and wife living together in the same house. If the English people consider marriage in most proverbs to be a prison, a lock, a deprivation of liberty, in the Uzbek people it symbolizes happiness on the one hand, and the struggle to overcome the difficulties of marriage on the other.

### **4.DISSCUSSIONS**

The analysis confirms the hypothesis put forward in the results of our study. The comparative analysis showed that the family traditions of English and Uzbek linguistics are not identical and do not differ radically, on the contrary, the family traditions of both nations are derived from the culture, mentality, worldview, religion, beliefs, climate, geography of these nations.

This research work we have conducted is interrelated with scientific research in the fields of linguistics and linguocultural studies. Because the main purpose of linguoculturology is to illuminate the linguoculturology of a nation through these linguistic language units. The results of this research will naturally contribute to the development of linguoculturology, sociolinguistics, psycholinguistics, because tradition, values are part of a higher level of culture, these traditions have their own social status among people, so family and family traditions are unique to each nation greatly contributes to the improvement of the sciences.

Future research on the comparative study of family traditions requires not only linguistic, linguoculturological, but also sociolinguistic and psycholinguistic approaches.

## 5.CONCLUSION

The family traditions reflected in the linguistic landscapes of the English and Uzbek worlds more clearly explain the concept of the direct family. However, the definition of the concept of family in a cultural context shows that universal experience serves as a general condition for learning. At the same time, the uniqueness of these traditions is reflected in English and Uzbek lexicons, proverbs as well. Figurative national components such as "Sovchilik" and "Toi" are strengthened in English and Uzbek languages through the actualization of certain situations, stereotypes, national mentality and psychology in the understanding of the English and Uzbek peoples. What defines "Uzbekness" in the linguistic landscape of the Uzbek world? In our opinion, it is primarily due to the spirit of the Uzbek people, its way of life, the quality of the phenomena of "Uzbek pride", "childish people", formed over thousands of years of history and culture of the Uzbek people and embodied in their ideas about life, people, traditions and mentality. determined. Thus, in the linguistic landscape of the Uzbek world, the originality of family and marriage traditions arising from the Uzbek character is reflected. The landscape of the "English" world in English is characterized by original national-cultural traditions and ceremonies. The nature of calmness, courtesy, gentleness, gentleness of the representatives of the Royal State developed and formed on the basis of the established rules of etiquette of the Royal Family, and the name "English character" is passed down from generation to generation. Thus, the family and marriage traditions of the English people, reflected in the linguistic landscape of the English world, reflect not only the national mentality, life experience, but also the rules of etiquette and morals established thousands of centuries ago, the emotional, positive qualities of the English people.

Our research consists of analyzes that support the multifaceted relationship between the British and Uzbek peoples over a number of years, and to some extent contribute to the solution of problems and issues that may arise in the social sphere between the representatives of these two nations.

The analysis of family and marriage traditions of the two nationalities compared in the article is not only a practical aid to the learner of this or that language and culture, but also rich in facts aimed at resolving possible conflicts and misunderstandings between them.

## THE PROBLEM OF CLASSIFICATION OF LITERARY TERMS IN “THE CONCISE OXFORD DICTIONARY OF LITERARY TERMS” BY CHRIS BALDICK

**Saidova Mukhayyo Umedilloevna\***

\*PhD Student of the English Linguistics Department,  
Bukhara State University, Bukhara, UZBEKISTAN  
Email id: mukhayyo1981@mail.ru

### ABSTRACT

*The degree of study and significance of literary terms are carried out in the given article. The article gives information about the significant aspects of dictionary by Chris Baldick “The Concise Oxford Dictionary of Literary Terms” and semantic analysis of literary terms. Terms belong to epic, lyric and dramatic literary forms are discussed and the analyses of some literary terms given by Chris Baldick are explained in the article.*

**KEYWORDS:** Terminology, Literary Terms, Concept, Etymology, Dictionary, Prose, Poetry, Epic, Lyric, Drama, Chiasmus, Decorum.

### INTRODUCTION

The analysis of scientific literature indicates that the terms in different spheres were not studied identically. The study of terminology in former USSR was led off in 1931 publishing D. Lotte's work on the technical terminology [see Lotte 1931], followed by E. Drezen in 1934, by G. Vinokur in 1939 and in 1986 by A. A. Reformatsky. On the basis of these studies, the main directions of working on terminology were defined: A.A.Reformatsky (1986), B.N Goloven (1981), N. P. Kuzkin (1962), L.Kapanadze (1965) and others studied the terminology, O.S.Akhmanova(1990), V.P.Karpovich (1978), R.Yu. Kobrin(1991), V.M.Leychik (1986), V.D.Tabanakova (1998), E.N.Tolikina and others worked on semantic features of terminology, A.S.Gelt (1991) focused on the relationship between terminology and nomenclature units, M.V. Oganisyan (2003), O.V.Dovbysh (2003), S.V.Sakhneevich (1998) on translation problems of terminology and Z.M. Polyutina (2002) studied civilization approaches on terminology.

## MATERIALS AND METHODS

The scientific and practical studies about linguistic terms are based on ideas of Akhmanova (1966, 1990), Vasileva (1998), Gwishiani (1986, 1990), Golovin (1976), Kulikova (2002), Petrosyants (2004), Podolskaya (1988), Slyusarova (1983, 2000), Shelov (1998) and others. In recent years, studies on linguistic terms have been published and we can see these studies on Roman language terminology in works of Nikulina (1990), Utkina (2001), Emelyanova (2000), Vermeer (1971), Zakharenkova (1999), German (1990), Golovkina (1996) [7, 11-41].

If we pay close attention to the aforesaid studies, we can see that literary terms which is the object of our research project has been studied relatively rarely in Slovenian, Roman and German languages. Therefore, the study of philosophical, cultural, ethical, aesthetical, religious, linguistic, and especially literary terms are one of the pressing issues.

According to E.G.Petrosyants, there are currently more than 70 dictionaries, encyclopaedias and reference books on linguistics. However, dictionaries, encyclopedias and reference books on literary terms are relatively rare. This situation indicates that the terms of literature have not been adequately studied and information on them is not systemized [7; 11-41].

The problem of literary term system has already been one of the most controversial issue that is not a completely new field of study. It has developed and is still developing from the simple human need to name and identify. Its precise definition and scope are, however, still not clearly defined. During the past several decades, the theory of terminology has been a subject of debates in various circles. According to certain sources there are four scholars can be identified as the intellectual fathers of terminological theory: “Alfred Schulman from Germany, the first one to consider the systematic nature of special terms; the Swiss linguist Ferdinand de Saussure, the first one to have drawn attention to the systematic nature of language; E. Dresen, a Russian, a pioneer in underscoring the importance of standardization; and J. E. Holmstrom, the English scholar from UNESCO, who was instrumental in disseminating terminologies on an international scale” [3; 56].

Chris Boldick's “The Concise Oxford Dictionary of Literary Terms” was first published in 1990 and republished in 1991 by Oxford University Press. This was followed in 1996 by a revised edition of the new volume. The second edition, which was chosen to investigate for our work was published in 2001. “The Concise Glossary of Literary Terms” by Chris Boldick is a book of hard words alphabetically arranged and briefly explained. It cannot purport to fulfil the functions of a balanced expository guide to literary criticism or literary concepts, nor does it attempt to catalogue the entire body of literary terms in use. It offers

instead to clarify those thousand terms that are most likely to cause the student or general reader some doubt or bafflement in the context of literary criticism and other discussion of literary works. Rather than include for the sake of encyclopaedic completeness all the most common terms found in literary discussion, I have set aside several that I have judged to be sufficiently well understood in common speech (*anagram*, *biography*, *cliche* and many more), or virtually self-explanatory (*detective story*, *psychological criticism*), along with a broad category of general concepts such as *art*, *belief*, *culture*, etc., which may appear as literary critical problems but which are not specifically literary terms. This policy has allowed space for the inclusion of many terms generated by the

growth of academic literary theory in recent years, and for adequate attention to the terminology of classical rhetoric, now increasingly revived. Along with these will be found hundreds of terms from literary criticism, literary history, prosody, and drama. The selection is weighted towards literature and criticism in English, but there are many terms taken from other languages, and many more associated primarily with other literatures [2; 3].

## DISCUSSION

This article is devoted to the semantic classification of “The Concise Oxford Dictionary of Literary terms” written by Chris Baldick that includes literary forms: prose, poetry and drama. Before starting our classification it would be better to give some brief information about these literary forms.

Poetry evokes a concentrated imaginative awareness of experience or a specific emotional response through language chosen and arranged for its meaning, sound, and rhythm. It is a vast subject, as old as history and older, present wherever religion is present, possibly—under some definitions—the primal and primary form of languages themselves [8; 119].

It is known that prose is a form of language that exhibits a natural flow of speech and grammatical structure rather than a regular rhythmic structure as in traditional poetry, where the common unit of verse is based on metre or rhyme. Though, as T. S. Eliot noted, while “the distinction between verse and prose is clear, the distinction between poetry and prose is obscure” [5; 76]. Developments in modern literature, including free verse and prose poetry have tended to blur any differences. And the drama is a mode of fictional representation through dialogue and performance. It is one of the literary genres, which is an imitation of some action. ... In simple words, a drama is a composition in verse or prose presenting a story in pantomime or dialogue.

## Results

We tried to classify 1060 literary terms of “The Concise Oxford Dictionary of Literary terms” by Chris Baldick. We have found out that 160 of these terms are devoted to prose, while of terms are 328 to poetry, 109 terms belong to drama, 210 terms can be included to all three literary forms: prose, poetry and drama and 56 terms which defines figurative language were included to this group as well. When working with the dictionary, we came across terms that do not belong to any of the thematic groups we have identified. Although they are literary terms, they do not belong to any of the literary forms or genres, they are simply literary concepts. We have formulated similar terms as a separate group. And remained 197 terms were included into this group.

Here we will try to give examples of terms related to prose, poetry, and drama: *chiasmus* [ky-az-mus] (plural-mi), a \*FIGURE OF SPEECH by which the order of the terms in the first of two parallel clauses is reversed in the second. This may involve a repetition of the same words ('Pleasure's a sin, and sometimes sin's a pleasure'—Byron), in which case the figure may be classified as \*ANTIMETABOLE, or just a reversed parallel between two corresponding pairs of ideas, as in this line from Mary Leapor's 'Essay on Woman' (1751):

***Despised, if ugly; if she's fair, betrayed.***

*The figure is especially common in 18th-century English poetry, but is also found in prose of all periods. It is named after the Greek letter chi (X), indicating a 'criss-cross' arrangement of terms [2; 38].*

The definition of the term above refers to figure of speech, that is, concrete concept. It is known that in any type of literary form or genre we can face the usage of such devices. The author also gives a few examples to prove his point. As with all terms, the author relies on broad and narrow meanings in his interpretation of the term. And, as always, it goes from narrowly interpreting the term to its broader meaning. In general, since figures of speech are found in prose, drama, and poetics, we decided to include this term in this group.

***decorum** [di-kor-um], a standard of appropriateness by which certain styles, characters, forms, and actions in literary works are deemed suitable to one another within a hierarchical model of culture bound by class distinctions. Derived from Horace's *Ars Poetica* (c.20 BCE) and other works of classical criticism, decorum was a major principle of late \*RENAISSANCE taste and of \*NEOCLASSICISM. It ranked and fixed the various literary \*GENRES in 'high', 'middle', and 'low' stations, and expected the style, characters, and actions in each to conform to its assigned level: thus a \*TRAGEDY or \*EPIC should be written in a high or 'grand' style about high-ranking characters performing grand deeds, whereas a \*COMEDY should treat humble characters and events in a 'low' or colloquial style. The mixture of high and low levels, as in Shakespeare, was seen as indecorous, although it could be exploited for humorous effect in \*BURLESQUES and \*MOCK-HEROIC works. The strict application of these principles of decorum was overturned by the advent of \*ROMANTICISM; although in a general sense writers always suit style to subject-matter according to their purposes [2; 61].*

This term is a term that falls into the last group, which does not belong to any of the literary forms or genres, it is simply a literary concept. According to this definition, there must be differences between each literary genre. It is emphasized that there should be differences in their writing style, characters, and even the behavior of the characters. It is also expected that there are differences between the different genres belonging to the same forms. For example, comedy should be distinguished from tragedy by the actions, lives, and even speech of the protagonists. As in the definition of all terms, the history of the origin of the term and the stages and manifestations of its development are given first.

**CONCLUSION**

The formation and development of literary terms are inextricably linked with the development of word art and literary criticism, as well as literary language. The main purpose of *The Concise Oxford Dictionary of Literary Terms* by Chris Baldick was not to explain common terms, but to explain pure literary terms that are difficult to understand. . The terms in the book are arranged alphabetically, and the dictionary contains more than 1,000 terms. On the whole, it does seem that "The Concise Oxford Dictionary of Literary terms" written by Chris Baldick is one of the most important and useful dictionaries with full of literary terms. We have found out that 32 percentages of the terms are devoted to poetry, while 16 percentages of terms are on prose, 10 percentages belongs to drama, 26 percentages can be included to the group of terms which takes prose, poetry and drama. And other 16 percentages terms do not belong to any of the literary forms or genres, they are simply terms which define literary concept. To conclude, we can say

that definitions and explanations given in “The Concise Oxford Dictionary of Literary terms” are plain and easy to understand, especially for those who are interested in literary terms.

### ABSTRACT

*This article is devoted to the development of testing methods that allow to diagnose the psychological predisposition of students to religious and scientific views. The aim of the work is to develop a convenient and effective software tool that allows you to determine and psycho-diagnose the predisposition of young people, especially students, to follow various misguided religious movements*

**KEYWORDS:** *Engineering Psychology, Psychological Testing, Psychological Diagnostics, Virtual Portrait, Virtual Psychologist, Psychological Prevention And Technical Logic.*

---

### INTRODUCTION

There is no doubt that to organize the monitoring of mastery of student knowledge through a computer system, it is impossible to diagnose the quality of teaching in a modern education system, that is, to effectively manage the process and achieve a specific goal in education without diagnosing its condition. It is possible to determine the final knowledge and skills of students based on various criteria and approaches in the educational process, to check the validity of their compliance with didactic requirements as a result of the use of information technology in these processes. [1]

In it, pedagogical diagnosis includes determining the level of formation of knowledge, skills, and abilities of students, monitoring, evaluation, analysis of collected and statistical data, as well as predicting the future development of this process.

---

## LITERATURE REVIEW

The strategy we used to create the search strings was as follows [4] [20]: • Finding papers about engineering in education sector. Listing keywords mentioned in primary studies which we knew about. Use synonyms word (usage) and sub subjects of cloud computing in education such as (E-learning, management systems in education). Use the Boolean OR to incorporate alternative spellings and synonyms. Use the Boolean AND to link the major terms from population, intervention, and outcome. The complete search string initially used for the searching of the literature was as follows: psychological diagnostics AND psychological prevention and technical logic. It has been highlighted in [7] [20] that there are two main issues on conducting an SLR search which are the sensitivity and specificity of the search. In our preliminary search, when we used the complete search string defined above we retrieved a very high number of articles. For instance, Google scholar, Scopus, ProQuest education, IEEEExplore, Science Direct, Springer Link retrieved more than two hundred results. Therefore, we have deepened our search and used this search string: (Adoption OR Usage) AND (engineering psychology OR — psychological testing) AND (virtual portrait, OR virtual psychologist). The revised search string has given us a reasonable number of studies and we finally selected relevant empirical studies

## METHODOLOGY

Diagnostic tests in the educational process are important in that they help to some extent choose an effective methodology. When managing knowledge, its prognostic function serves to obtain information about the educational process, about its future, that is, about a situation that may be known in advance. [2]

At each stage of the learning process, it is possible to verify the prediction that the specific knowledge, skills and abilities intended for a particular piece of learning material are sufficiently formed or not formed. The results obtained from certain scientific predictions are used to create a model of students' future activities. Such a prediction is a great help in drawing clear conclusions for planning and implementing future training. [3]

Methods of psychology such as testing and analytical diagnostics effectively help in carrying out this work.

In the process of analyzing the results of activities, it is not the result itself, but the activity involved in generating that result that is psychologically evaluated. This method is widely used, especially in student psychology. By studying the activities of students, information about their psyche and development is obtained. [4]

In the era of computer and information technologies, in order to increase the efficiency, speed and convenience of psychological testing and diagnostics, two opposing areas, such as psychology and computer science, are currently mutually contradictory. working in communication and complementing each other. In the end, just as technical psychology exists, so psychology has its own technique. [5]

To be more precise, many modern technical devices, software of various psychological tests, diagnostics and analysis of other psychological processes and events are now available using a wide range of software tools with incredibly good capabilities that can be implemented in any field. and technical equipment is being created. [6]

Based on the above considerations, the Department of Modern Information and Communication Technologies of the International Islamic Academy of Uzbekistan has developed a program for psychological diagnosis "Psychological diagnosis of students' propensity to religious sciences (on the example of psychological diagnostic testing program)." This program is a diagnostic system that, unlike ordinary diagnostic programs, has the ability to determine the direction of the spiritual-enlightenment and religious orientation of students, diagnose it and direct it correctly. [7].

The program includes a set of psychological tests as a repository of data, based on the nature of the answers entered by the student after the test, the degree to which the student's consciousness has developed, the level of knowledge and the scope of knowledge, the direction of existing knowledge. (conscious) or false (unconscious), a tendency to deviate from the wrong currents in his verb, a diagnosis (diagnosis) of the presence or absence of extremist and terrorist ideas formed in the mental and intellectual world, the physical, mental and the formation of a virtual portrait of the mental trinity is then a "virtual psychologist" system that advises the student according to the result achieved. [8]

The main goals and objectives of the software system are:

- a) To study the personal (individual) psychological characteristics of the subjects of the educational process;
- b) Monitoring the development of students' social maturity and professional qualities;
- c) Determining the psychological and pedagogical readiness of students for vocational education;
- g) Identify the psychological causes of defects in the intellectual and personal development of students;
- d) Determining students' professional abilities, skills, competencies and attitudes towards their chosen profession;
- e) Determining the social role of students and their place in the group, and so on.

After the stage of psychological diagnosis, the process of psychological prevention is carried out and it includes:

Ensuring the personal development of the psychologist in collaboration with the team leader, medical staff and officials, while maintaining the individuality of the student;

Identify the causes of deviations (negative deviations) in student behavior and prevent such cases;

Identify and prevent the causes of stress, depression, conflict, negative emotional experiences;

Provides psychological support to students with disabilities. [9]

Creating a program based on the right structure and logic will require the program to be perfectly linked in terms of both psychology and technical logic. Testing is a standardized, often psychodiagnostic method designed to identify individual psychological differences that are specific to a quantitative and qualitative type, limited in time overtime during the experiment. [10]

The purpose of the test is to understand a weapon with a special feature that performs the function of assessing the psychological characteristics of individuals. It consists of a set of

conditions (tasks) or questions designed to reveal categories of different parts of behavior, taking into account a certain standard condition. [11]

This psychological diagnostic test program serves not only as a system to diagnose the individual, unique features of the user's mental and spiritual world, to conduct additional interesting tests, to help him increase his knowledge in the field of psychology, to deliver useful literature. One of the biggest advantages of the system is that it runs both a test mode for the experimenter, a working mode, and a diagnostic mode for the experimenter. [12]

That is, in this case, the test taker works by giving sincere answers to the test, thinking that he is taking the test just to get information about himself, because he is not given any notes or tests that indicate that his religious affiliation will be checked. However, the observer receives enough information to determine the level of his mental and emotional aptitude on the basis of the results, and the program automatically records them in the database [13].

Based on this, the main sections of the program consist of the following menus: "About the program" menu; "It's interesting" menu; "Terms" menu; "Recommended" menu; "Search" menu; "Start test" menu;

In the "About the program" menu: help with the installation and launch of the program, its purpose and rules of use. Information about the creators of the program will be available.

In the "It's interesting" menu: users are faced with a set of interesting, humorous tests on a variety of topics, which allow them to identify different aspects of their individual characteristics and behavior. Examples of such tests are: temperament detection, various picture and shape tests. They go through a testing process and are diagnosed on the surface of the results. [14]

In the "Terms" menu you can get acquainted with the Uzbek translation and interpretation of terms and terms in more than a few hundred fields of psychology. The "Recommended" menu is a small virtual library of national and foreign literature: lectures, works, textbooks, which serves to enrich the mental and spiritual world of various students. It contains useful and interesting literature in the field of religion, psychology, spirituality, enlightenment and other areas. [15]

"Search" menu - it is possible to search all the information contained in all available databases in our program in the form of a site. These include: psychological terms, useful literature, types of tests, user lists by administrator password, and so on.

The "Start test" menu is the main menu of the program, in which the process of diagnosing the level of religious affiliation of the student is carried out. [16]

There is also a list of other similar software and websites that reflect the goals and objectives of the disclosure within our software tool, as well as the convenience of accessing them directly via a link.

By pressing the "Exit" menu button, the user can end the program and leave it.

The program view is in the form of a website, and its main window consists of four main parts: top, bottom, left and main parts. [17]

Unlike other psychological programs, the questions are not selected in a one-way and primitive form. The tests themselves are divided into five stages, which include:

Optional tests serve to reveal subtle points about a subject's inner psychological state, his or her character and behavior. Such cases include: his will;

Approved motivation (yes-no answer) tests - determine the degree to which the test taker's traits such as persistence, skepticism, honesty or deceit, cowardice;

Picture (aggression) tests help to determine the degree of irritability, that is, the nature of aggression, which has existed in the subject's character and behavior for a long time and occurs when faced with certain situations. The level of propensity is so high in a person with strong aggression. [18]

Logical tests - reveal how well the test taker's logical thinking ability has developed. Explains independent thinking, mental level, well-developed and well-formed logical thinking ability.

Formal or IQ tests are a collection of antique and very interesting tests that report IQ, that is, the level of intellectual ability developed in individuals, the speed of logical and mathematical thinking. [19]

The main purpose of dividing the tests into such groups is: to increase the interest and courage of the test taker.

The program is based on web technologies, designed to attract users in terms of design, ease of interface, analysis of current psychological diagnostic data, using JavaScript, JQuery library, HTML, CSS, PHP, PhotoShop software and AJAX technologies. [21]

## CONCLUSION

The above method is used for research purposes. In addition, some psychological methods are also used for testing purposes. The aim is not to introduce any innovations in the science of psychology, scientific knowledge, to discover the law. These methods are to determine the presence of a trait in the person being studied, its level of development, the degree of compliance with various criteria. The software system is used to study a person's professional ability, level of mental development, level of knowledge and voluntary inclinations. The effectiveness of the program is determined by the methodology on which they are based, the suitability of the test structure for many requirements, the conditions of conduct, and the adequacy of the requirements.

### ABSTRACT

*The benefit is administered by a central organization such as a government agency, private business, or not-for-profit entity. Even then large amount of people are there who are not able to take the advantage of the same due to some reasons mainly concerning to income. Rashtriya swasthya bhima yojana is such a scheme that mainly focuses on the low income category and enables them to have better and cashless hospitalization. Pre-existing conditions are covered from day one and there is no age limit. Coverage extends to five members of the family which includes the head of household, spouse and up to three dependents. Beneficiaries need to pay only Rs. 30/- as registration fee while Central and State Government pays the premium to the insurer selected by the State Government on the basis of a competitive bidding. The benefit is administered by a central organization such as a government agency, private business, or not-for-profit entity. According to the Health Insurance Association of America, health insurance is defined as "coverage that provides for the payments of benefits as a result of sickness or injury."*

**KEYWORDS:** Hospitalization, Pre-Existing, Sickness Or Injury, Beneficiaries

### INTRODUCTION

Insurance is the equitable transfer of the risk of a loss, from one entity to another in exchange for payment. It is a form of risk management primarily used to hedge against the risk of a contingent, uncertain loss.

Health insurance is insurance against the risk of incurring medical expenses among individuals. By estimating the overall risk of health care and health system expenses, among a targeted group, an insurer can develop a routine finance structure, such as a monthly premium or payroll

tax, to ensure that money is available to pay for the health care benefits specified in the insurance agreement. The benefit is administered by a central organization such as a government agency, private business, or not-for-profit entity. According to the Health Insurance Association of America, health insurance is defined as "coverage that provides for the payments of benefits as a result of sickness or injury.

RSBY has been launched by Ministry of Labour and Employment, Government of India to provide health insurance coverage for Below Poverty Line (BPL) families. The objective of RSBY is to provide protection to BPL households from financial liabilities arising out of health shocks that involve hospitalization. Beneficiaries under RSBY are entitled to hospitalization coverage up to Rs. 30,000/- for most of the diseases that require hospitalization. Government has even fixed the package rates for the hospitals for a large number of interventions. Pre-existing conditions are covered from day one and there is no age limit. Coverage extends to five members of the family which includes the head of household, spouse and up to three dependents. Beneficiaries need to pay only Rs. 30/- as registration fee while Central and State Government pays the premium to the insurer selected by the State Government on the basis of a competitive bidding.

Rashtriya Swasthya Bima Yojana or RSBY started rolling from 1st April 2008.

### **CONCEPTUAL BACKGROUND OF STUDY**

The root cause for the emergence of study is the increased number of health issues among the common public and the unavailability of sufficient resources to get rid of the same. The study gives an insight and an increased amount of awareness regarding cashless hospitalization for the deprived group of society.

### **OBJECTIVES OF STUDY**

- To elicit the public opinion regarding RSBY.
- To know the merits and demerits of the RSBY scheme
- To analyze the extent of success in implementing the scheme in Malabar Region.
- To estimate the type of disease for which maximum the scheme is utilized in relation to age.
- To assess the hospitalization care provided for the RSBY card holders.
- To measure the satisfaction level of beneficiaries of RSBY scheme.

### **SCOPE AND LIMITATIONS OF THE STUDY**

The study is aimed at identifying the role played by RSBY scheme in developing the health sector in entire Malabar region. The study is intended to analyze the extent of success in implementing the scheme in Malabar Region and to know the hospitalization care provided for the RSBY card holders. Further, focus is put on measuring the level satisfaction of beneficiaries of RSBY scheme.

This study is not exception to limitations because, people were reluctant to give answers as they had a thought that it may affect them adversely. There is lack of awareness among people regarding the scheme hindered them from giving more reply. Further, the sample size is too small when compared to the total population.

**RESEARCH METHODOLOGY****RESEARCH DESIGN**

Descriptive research has been made use in the work.

**SAMPLING METHODOLOGY****POPULATION:**

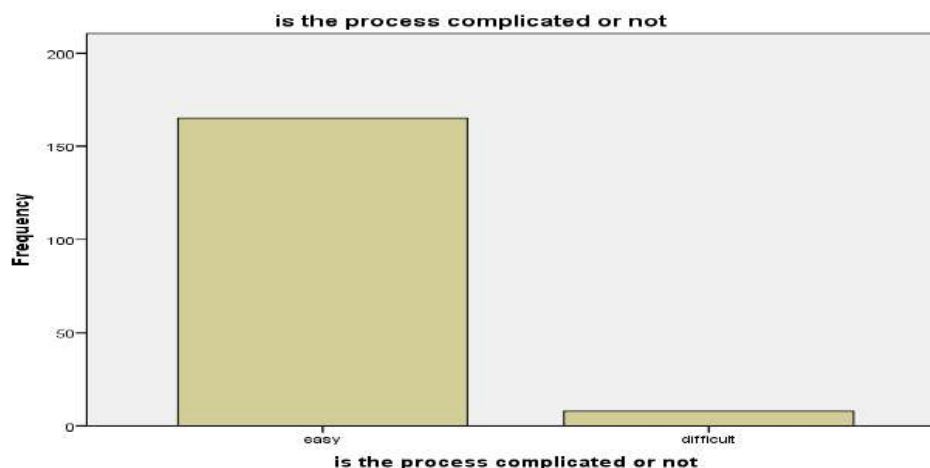

RSBY beneficiaries of Malabar region forms the population of the study

**SAMPLING TECHNIQUE:** convenient sampling

**SAMPLE SIZE** : sample size of the study is 173.

**RESULTS AND DISCUSSIONS:****OBJECTIVE1****TO IDENTIFY THE PUBLIC OPINION REGARDING RSBY****RSBY PROCESS**

	Frequency	Percent
Easy	165	94.4
Difficult	8	4.6
Total	173	100

About 94.4% people opines that the process of getting enrolled under RSBY scheme is easy, whereas 4.6% opines that it is difficult

**ENROLLMENT CAMP AND RESIDENCE**

	Frequency	Percent
Within 2 kms	158	91.33
2-5 kms	12	6.93
5-10 kms	3	1.2
Total	173	100

Most of the enrollment camps are situated within 2 kms from the respondent's residence that is 91.33%

#### SCHEME WITHDRAWAL BY GOVERNMENT

	Frequency	Percent
yes	170	97.8
No	3	1.2
Total	173	100

About 170 respondents are against the decision if the scheme is withdrawn by the government and it is not an area of concern for 3 respondents

#### OBJECTIVE:2

#### TO KNOW THE MERITS AND DEMERITS OF RSBY SCHEME

#### MERITS

The merits and demerits are arrived at after studying the RSBY website and also through direct interview with the respondents

- Cashless hospitalization
- Enrollment of whole families under single scheme
- Premium free insurance coverage
- Helpful for low income people

### DEMERITS

- Not fully advantageous for joint families
- Low income people who falls under above poverty line are excluded
- The amount provided for 5 members is insufficient in many cases.
- Claim settlement process is too lengthy

### OBJECTIVE3:

#### TO ANALYZE THE EXTENT OF SUCCESS IN IMPLEMENTING THE SCHEME

#### EXTENT OF SUCCESS FOR RSBY SCHEME

	Frequency	Percent
highly successful	2	50.0
successful	1	25.0
neutral or average	1	25.0
Total	4	100.0

According to the hospital authorities, the scheme is highly successful that is about 50% and 25% opines it is just successful and rest 25 is neutral

### OBJECTIVE:

4

TO ESTIMATE THE TYPE OF DISEASE FOR WHICH MAXIMUM THE SCHEME IS UTILIZED IN RELATION TO AGE.

### CHI-SQUARE TEST

H0: there is no significant association between age of the respondent and the disease suffered

H1: there is significant association between age of the respondent and the disease suffered

		Disease For Which Treatment Is Aailed				Total
		Medical	Surgical	Obstetrics/Gynecological	Others	
Age Of The Respondent	21-30	35	0	0	0	35
	31-40	49	0	0	0	49
	41-50	29	36	0	0	65
	More Than 50	0	14	8	2	24
Total		113	50	8	2	173

	Value	df	Asymp. Sig. (2-Sided)
Pearson Chi-Square	144.737 <sup>a</sup>	9	.000
Likelihood Ratio	155.440	9	.000
Linear-By-Linear Association	87.130	1	.000
N Of Valid Cases	173		

From the above table it is clear that the Chi square value is 0.000. Since the value is lesser than 0.05, null hypothesis is rejected and alternative hypothesis is accepted. There is significant association between age of the respondent and diseases suffered

## OBJECTIVE: 5

### OVERALL SATISFACTION LEVEL OF BENEFICIARIES TOWARDS THE SCHEME

Particulars	Frequency	Percentage
Highly Satisfied	114	65.5
Satisfied	28	16.1
Neutral Or Average	20	11.5
Dissatisfied	8	4.6
Highly Dissatisfied	3	1.7

The overall satisfaction level of the respondents towards the scheme is high. 114 people are highly satisfies, 28 satisfied, 20 neutral, 8 dissatisfied and 3 respondents highly dissatisfied

#### CHI SQUARE TEST

4. H0: there is no significant association between number of patients treated and success of the scheme.
5. H1: there is significant association between number of patients treated and success of the scheme.

		To What Extent Do You Think The Scheme Is Successful			Total
		Highly Successful	Successful	Neutral Or Average	
How Many Patients Have Been Treated Under This Scheme Till Now	400-500	0	1	0	1
	Above 500	2	0	1	3
Total		2	1	1	4

Chi-Square Tests			
	Value	Df	Asymp. Sig. (2-Sided)
Pearson Chi-Square	4.000 <sup>a</sup>	2	.135
Likelihood Ratio	4.499	2	.105
Linear-By-Linear Association	.091	1	.763
N Of Valid Cases	4		

From the table we can see that the chi-square value is greater than 0.05 so we accept the null hypothesis and reject the alternative hypothesis. There is no significant association between number of patients treated and success of the scheme

### FINDINGS

- Among the total respondents, majority portion is occupied by males rather than females.
- Major consumers of this insurance scheme are Muslims and that too mainly with a family size of 4 members.
- Majority of the respondents have not acquired higher studies. most falls under the category up to 10<sup>th</sup> class
- Scheme is having high confidence in the minds of public with regard to enrollment process, further formalities and claim settlement.
- According to the hospital authorities, the scheme is highly successful that is about 50%
- Age of the respondent and the disease suffered are having greater amount of association.
- The overall satisfaction level of the respondents towards the scheme is high.. 114 people are highly satisfies, 28 satisfied, 20 neutral, 8 dissatisfied and 3 respondents highly dissatisfied

### SUGGESTIONS

- More mount of awareness must be provided about the scheme so that all the low income people can avail to this insurance scheme.
- Claim settlement must be made faster.
- Implementation of latest software should be made.
- Proper training and education to be given to the associated people.
- Efforts must be made to increase the money amount and also the number of members that can be covered under the scheme.

### CONCLUSION

Health insurance sector is improving day by day. Even then large amount of people are there who are not able to take the advantage of the same due to some reasons mainly concerning to income. Rashtriya swasthya bhima yojana is such a scheme that mainly focuses on the low income category and enables them to have better and cashless hospitalization. This enriches the

health of the general public by availing better treatment. It covers about 5 members in a family and provides sufficient amount for each year of enrollment. This has drastically improvised the health sector in Malabar region.

### ABSTRACT

*Due to the spread of the 2019-nCoV coronavirus, which the World Health Organization has recognized as a pandemic, thousands of popular tourist destinations around the world have been banned. The article examines the impact of the pandemic on the tourism sector. Forecasts and reports of the WTO and other international organizations are analyzed. Recommended ways to resume air traffic, which were adopted by a Special Commission of the Republic of Uzbekistan.*

**KEYWORDS:** *Impact of Pandemic On Tourism, Long-Term Existence, Red Flights, Safety Of Tourism, Health Risks, Tourist Arrivals*

### INTRODUCTION

The COVID-19 pandemic has had a significant impact on tourism industry due to the resulting travel restrictions as well as slump in demand among travelers. The tourism industry has been massively affected by the spread of corona virus, as many countries have introduced travel restrictions in an attempt to contain its spread. The United Nations World Tourism Organization estimated that global international tourist arrivals might decrease by 20-30% in 2020, leading to a potential loss of US\$30-50 billion. In many of the world's cities, planned travel went down by 80-90%. Many tourist attractions around the world, such as museums, amusement parks and sports venues are closed.[1]

Today, tourism is among the sectors most affected by the effects of the COVID-19 pandemic. According to UNWTO estimates, the number of international tourist arrivals at the global level may decrease by 30% this year, which will consequently lead to a reduction in international tourism revenues by about 450 billion US dollars.<sup>1</sup>

During such a difficult period, the COVID - 19 pandemic affected all sectors of the economy, and the tourism industry was also vulnerable to the threat of corona virus. Experts have begun to forecast the state of the economy in recent months, and estimate that the world economy is at the stage of the crisis, along with this, the tourism sector has also lost huge billions. However, each subsequent crisis created opportunities for the development of other types of services in the tourism industry. For example, after the financial crisis in 2008, sales of tour packages fell sharply, but services such as Airbnb and BlaBlaCar began to develop, allowing consumers to travel and create their own tours economically.

### **Literature review on the topic**

After the World Health Organization declared the situation associated with the corona virus outbreak a pandemic, many scientists around the world began to devote their scientific work to forecasts of its impact on various sectors of the economy of both countries and the world.

“Compared to other major sectors of the economy, tourism has suffered the most from the [COVID-19] pandemic: because countries have closed their borders, people are staying at home,” said Zurab Pololikashvili[2], Secretary-General of the World Tourism Organization. He called on governments to quickly ease and then lift restrictions on movement as soon as it is safe to do so.

Tourism, he claimed, “is vital for the millions of people employed in this sector, especially in developing countries.” The restoration of tourism will allow people to return to their jobs and ensure the flow of funds necessary for the development of countries as a whole.

In foreign and domestic scientific literature and journals on tourism, it is the lack of research work to assess the impact of the COVID-19 corona virus pandemic on the tourism industry and the lack of coverage of scientific research on the safety of tourists in tourist destinations that shows how this problem is scientifically relevant. This research work was studied only by foreign scientists, and in our country research in this direction was not conducted. One of the main reasons for this is that such a large-scale negative impact on the economy of our country has not been observed in practice.

The safety of tourism in a destination is a factor that has a positive impact on the development of the tourism industry and tourists choose the destination where the safety risk for travel is the lowest. (Reisinger, Mavondo, 2005) In the scientific literature in the field of tourism, there are different approaches to assessing the risks of tourist security in different crisis periods, which are studied in three groups:

- 1) Risk in an era of crisis that covers the entire world and as a result of which very difficult situations arise. For example, SARS, the COVID-19 corona virus pandemic.
- 2) The risk of a crisis caused by a natural disaster or epidemic that occurred in the country or tourist destination. For example, the earth is shaken, floods, forest fires, tsunamis, volcanic eruptions, and so on.
- 3) The risk of a crisis that threatens the safety of tourists as a result of circumstances involving the human factor. For example, a terrorist act or a coup d'état.

When assessing the health risks of tourists in the tourism sector, studies were also conducted on the prevalence of infectious diseases and non-compliance with hygiene requirements (Mason et al., 2005; Vall, 2006; Jonas et al., 2011; Chien et al., 2016).

In the field of tourism, there are models for overcoming the crisis, which is recommended for the duration of the crisis process related to the safety of tourists and the validity of the activities of the entities involved in it, they are considered similar in terms of creation and consist of 3-6 stages. These models consist of at least 3 phases in terms of periodic continuity: pre-crisis, crisis, and post-crisis.

All scientific work and research in the field of forecasting the impact of the pandemic on the tourism sector are not accurate since no one knows how long the pandemic may continue. So, in our opinion, the forecast of the impact of corona virus on the tourism sector cannot be predicted accurately, as the second wave of corona virus and its long-term existence is expected.

### Data source and research methodology

Analysis and synthesis, scientific abstraction deduction, classification, generalization, comparative, theoretical interpretation, and analytical methods were used in the methodology of this article, as a result of the bibliographic study, the direct and indirect factors affecting them and the prospects for further development were identified.

The information used in the article is mainly obtained through two sources: the official web pages of the State Committee of the Republic of Uzbekistan for Tourism development and UNWTO.

### Analysis and results

As for statistics, as of April, the UNWTO estimates a decrease in tourist activity by 20% - 30 %, as a result, the world economy will receive less than \$35 billion. up to \$60 billion. Many tourist organizations have already started to close or declare bankruptcy.

**Figure 1. International tourist arrivals, Jan, Feb, March 2020 (% change)<sup>2</sup>**

As can be seen from figure 1, international tourist arrivals fell sharply in March and continue to fall as the borders of countries are still closed due to the isolation regimes imposed by the governments of the countries.

Travel marketers believe that it is now necessary to wait for the recovery of outbound tourism for a few more months and until full recovery for another year. We believe that first of all, it is necessary to pay attention to domestic tourism. In addition, we assume that there will be refusals from mass tourism, as it is impossible to allow the accumulation of people. People will start to travel individually and choose a place and book everything they need online.

Domestic tourism will also be targeted in other countries affected by the COVID-19 pandemic. As soon as the quarantine is completed and restrictions are removed, the loading of hotels, restaurants and other establishments will depend on their own citizens. And foreign tourists will distance themselves for a few more years for fear of being charged with the virus. An extremely likely consequence of the crisis will be a much greater attention of travelers to their safety, sanitary and epidemiological situation.

Currently, the State Committee of the Republic of Uzbekistan for tourism development is working on a new Online Tourism platform. This is the first time in Uzbekistan and encourages everyone to create Online Tourism owners of restaurants, hotels and other establishments will be able to send photos of establishments. Tourists will be able to view photos of places to visit from the Internet in advance. It is no secret that this type of tourism already exists in many countries.

As for the state's support for the tourism industry, they are provided with a number of benefits during the pandemic. They are exempt from land tax and pay social tax at a reduced rate (1%) for accommodation facilities, restaurants, and other entities.

It is possible to mitigate the consequences of the pandemic on the world tourism market, including Uzbekistan, in stages. According to experts, the spread of the coronavirus is expected to decrease very soon, so that all sectors of the economy will slowly return to their activities. To restore the tourism sector, it is proposed to make changes in the pricing policy of some of its sectors. At first, the demand will not be the same as before, since people lost a lot of money during their stay in quarantine. Given this fact, some countries can give tax incentives to entrepreneurs in the field of tourism, and the States themselves can facilitate the visa regime or reduce the number of visa fees. It is also recommended to reduce the burden of airports and facilitate tax policy, including reducing or eliminating taxes on travelers, such as airport, port and hotel fees, which increases the cost of travel. The recovery of tourism around the world, as well as the economy, will undoubtedly happen, but it will take time.

Restrictions on international travel of tourists imposed in connection with the pandemic by all states, without exception, will lead to huge losses in the tourism industry. In March alone, the number of international tourists decreased by 67 million and resulted in economic losses of \$ 80 billion. The World Tourism Organization is calling for the restoration of tourism as soon as possible.

In total, there are 217 tourist destinations in the world: this includes countries, territories and islands. Today, travel restrictions continue to apply to everyone. And 156 States and territories – 70 percent of them - have completely closed their borders to international tourism. To date, these measures have not been lifted or relaxed in any of the areas.

The World Tourism Organization is monitoring measures taken since the end of January when the World Health Organization declared COVID-19 a public health emergency of international significance.

According to available data, international tourism was banned in 83 per cent of destinations in Europe, 80 per cent in the Americas, 70 per cent in Asia and the Pacific, 62 per cent in the Middle East and 57 per cent in Africa.

The World Tourism Organization works closely with international organizations, governments and the private sector to ensure that they can start restoring tourism in a timely and responsible manner. Over the past two weeks, the Secretary-General of the Organization has repeatedly appealed to the Ministers of the G20 and the EU to give priority to tourism in overcoming the crisis.

According to the UNWTO interim report “Global review of travel restrictions related to COVID-19”, from the end of January to April 6, 2020, 209 countries around the world have introduced travel restrictions, which is 96% of the total. The main conclusions drawn from the report are as follows:

- 90 countries have completely or partially closed their borders;
- 44 countries implement border closures in a more differentiated manner, restricting entry to the country for travelers from countries such as China, the Republic of Korea, Iran, and the EU;
- 56 countries have completely or partially suspended international flights;
- 19 countries apply various restrictive measures, such as:
  - a) A requirement for immediate self-isolation or quarantine during the
  - b) 14 days after entering the country;
  - c) Cancellation of the visa or termination of the visa on arrival;
  - d) Travel bans for passengers arriving from certain regions;
  - e) Requiring medical certificates for passengers crossing the border with negative COVID-19 results.

Regionally, all countries (100%) in Africa, Asia and the Pacific, and the Middle East have imposed travel restrictions, while in the European region – 93% of the total number of countries in Europe and in the Americas – 92%.

Travel restrictions have expanded geographically as the number of confirmed cases has increased. After the WHO declared COVID-19 as a pandemic between 9 and 24 March this year, the number of countries that adopted travel restrictions increased 2.2-fold (from 81 to 181).

In addition, as indicated in the report, as of April 6 this year, none of the countries had lifted the travel restrictions imposed in the context of COVID-19.

It should be noted that on February 27, 2020, an official Procedure for the implementation of measures by tourists arriving in Uzbekistan was developed and introduced. Since March 16 of the same year, the entry and exit of citizens across state borders is prohibited, and it is recommended to suspend measures for organizing domestic tourism. Since March 17, tourist

companies, public organizations and large industrial enterprises have been recommended to suspend activities for the development of domestic tourism until the situation with the spread of corona virus in the country stabilizes. Since March 20, passenger transportation by buses, cars, railways and air transport to international destinations has been suspended. Since March 27, traffic between the regions has been completely suspended. At the moment, the restrictions have been extended until May 10 of this year.

However, the World Tourism Organization, in cooperation with all countries, is taking measures to reduce the impact of corona virus on the industry, providing them with various recommendations and suggestions. According to the data, from the end of January to April 6, 2020, 209 countries have introduced travel restrictions, which is 96% of the total.

The World Tourism Organization in connection with the pandemic has announced three possible scenarios for the development of tourism in the near future. (Fig. 1)

**Figure 1. International tourist arrivals in 2020: three scenarios (YoY monthly change, %)<sup>3</sup>**

As stated in the WTO report, the above three scenarios for the development of international tourism in 2020 are not forecasts and should not be interpreted as such.

They reflect three possible patterns of monthly changes in arrivals from April to December 2020, assuming that travel restrictions will begin to be lifted and national borders will open in early July (Scenario 1), early September (Scenario 2), or early December (Scenario 3). They are based on available tourism data for January-March and other information, such as the closure of all national borders as of the end of April, although they are still subject to high uncertainty.

However, these scenarios have already lost their relevance, as since June, many countries that have overcome the corona virus, open their borders mainly to the same countries that have eased the isolation regime in the country.

In particular, starting from June 15, Uzbekistan opened air links with other countries. At the same time, the most optimal way to ensure the safety of air travel was selected as next: “Green”, “yellow” and “red” flights<sup>5</sup>

The category of countries with a stable sanitary and epidemiological situation (“green” flights) includes Japan, South Korea, China and Israel. If arrivals have been in these countries for 14 days, they will not be quarantined upon arrival.

The category of countries where the number of cases of coronavirus is decreasing includes the countries of the European Union, Malaysia, Thailand and Singapore (“yellow” flights). If arrivals have been in these countries for 14 days, they will be taken into home quarantine upon arrival.

The category of countries where the number of cases of coronavirus is not decreasing includes other countries, including the UAE, Turkey, Iran, Afghanistan, Russia and other CIS countries (“red”, evacuation flights). Upon arrival, passengers will be placed in a 14-day quarantine.

In our opinion, the leaders of all countries need to implement the above-mentioned mechanisms for resuming air traffic.

## CONCLUSION

As a result of the global pandemic outbreak in the world, outbreaks of corona virus pandemic, COVID-19 in the world, the crisis in the economic sectors through the spread of global pandemics could also negatively affect the tourism sector of our country and require a long period of time to restore this sector to have been made following research proposals to attenuate the adverse effects of corona virus pandemic and the global crisis on the tourism sector of our country:

- implementation of a standard based on uniform sanitary and hygienic standards for businesses and tourists serving the tourism sector;
- develop a special plan of measures to support economic entities operating in the tourism sector, which is under the jurisdiction of the state;
- planning of the crisis recovery process adapted to different phases of the scenario model, mainly to the form of service and type of activity provided by a foreign enterprise engaged in tourism activities;
- implementation of diversification of tourist services;
- develop a strategy for digitizing a specific tourism sector for each region, city, and tourist destination;
- development of information and communication technology infrastructure for the development of the digital economy in the tourism sector of our country;
- development of mobile applications in foreign languages aimed at improving individual tourist monuments and architectural monuments, museums and other attractions for each tourist destination;
- preparation of audio and video materials in foreign languages with a wide coverage of historical monuments, natural monuments and natural resources of our country;
- knowledge of tourism activities through further development of domestic tourism to maintain existing jobs by providing income to employed businesses;

- ensuring the safety of visitors through the introduction of innovative technologies in the field of tourism;
- regular disinfection of elevators, rooms, halls and other places in hotels and other accommodation facilities;
- compliance with the rules for maintaining social distance in restaurants and other public catering establishments, shops and entertainment establishments;
- encourage the scientific study of Persian cases and crises that may arise in various sectors of the economy.

### ABSTRACT

*The article is devoted to the study of specific aspects of the history of the art of the book in the Timurid period. It says that the Timurid rulers and masters of the art of the book who worked in the court-libraries made a great contribution to the development of Oriental art of the book. The artistic and technical aspects of the manuscripts of the Timurid period are described. It is written about the patronage of the Timurid rulers Shahrukh Mirza, Baysunghur Mirza, Husayn Bayqara to the art of the book.*

**KEYWORDS:** *Timurids, Art of the Book, Manuscripts, Library-Workshops.*

### INTRODUCTION

The technology of book-making occupied a special place in the division of labor in the Middle Ages. The increased demand for books due to the demands of cultural life ensured the creation of book production enterprises. Manuscripts are a collaboration product, their creation is a unique process based on the exchange of creative experiences between different cultural centers and traditions that have been used for a long time, masters in various fields of book art worked in this process. The presence of mutual coherence and proportionality in their creative and practical work ensured unity, integrity and technical perfection in the style of the manuscript. In Central Asia, the term “book work” was originally used to refer to the process of preparing manuscripts. The Arabic script, which is one of the strong bonds that unite all Muslims, is also of universal importance for the expression of fine arts and ornaments. This position of this writing is due to the fact that Islamic teachings, primarily the Quran, are expressed through this letter. The ancient manuscripts of the Qur'an of the 8th-9th centuries are written on parchment with the letters Kufic

and Hijazi, which is one of the earliest forms of Arabic writing. The discovery and mass production of paper as a written material led to a significant change in the history of the book, an increase in the number of books, and an improvement in their quality. The history of paper production in Movarounnahr is connected with the city of Samarkand. Samarkand paper was of high quality. The famous calligrapher Ibn al-Bawwab (d. 1022) wrote about the restoration of the pages of the manuscript of the Koran, which was written by the Baghdad calligrapher Abu Ali Muhammad ibn Ali ibn Mukla al-Shirazi (885-940): "I went to the library and searched among the old paper for a paper resembling that of the Qur'an. There were several sorts of old Samarqand and China paper in the library" (Bosch G., Carswell J., Petherbridge G., 1981, p. 26).

### **The development of the art of the book in the Timurid period**

The emergence of a powerful centralized state in Central Asia at the late of the fourteenth and fifteenth centuries contributed to the development of the economy, the restoration of caravan routes, the expansion of trade, the growth of crafts and agriculture, cultural and spiritual progress. In this period the production of artistic manuscripts than ordinary manuscripts began to develop, and from the same period, book work rose to the level of book art. The creators of the manuscript - a group of masters of various fields - were involved in the workshops of the palace libraries and another group of masters involved in the bookmaking process came together separately and worked individually for readers, including intellectuals and the common people, because in addition to books rich in ornaments made to order by high-ranking officials, there was also a high demand for ordinary books for literary, scientific and book lovers. Since the end of the 14th century, the masters of art of book brought by Amir Temur to Samarkand, the capital of the country, have made a significant contribution to the formation and development of book art. At that time, there were neighborhoods in Samarkand inhabited by craftsmen working in various areas of book art, such as Kouyi Nakkashan (this refers to the streets of carving masters) (Pugachenkova G.A., Galerkina O.I., 1976, p. 6).

According to historical sources, many artists of the Amir Temur Library in Samarkand in the late 14th and early 15th centuries were led by the famous Baghdad master Abdulhay. Describing the biography of fourteenth-century artists, Dost Muhammad (d. 1560) writes: "After the Khwaja Abdul-Hayy's death all masters imitated his works" (Dost-Muhammad, 1989. p. 345).

Amir Temur's interest in large-scale books is expressed in the story about famous calligrapher of that time Umar Aqta in the book of the historian Kazi Ahmad Qummi (d. 1546), "Gulistan-I hunar" ("Rose Garden of the Art"): "Omar Aqta wrote another copy, extremely large, each of its lines being a cubit (dhar') in length, and even longer ... the sultan came out to meet him, accompanied by all the clergy, dignitaries, amirs, and pillars of the state, and rewarded the calligrapher with great honors. One folio of this copy was in the possession of Maulana Malik" (Minorsky T., 1959, p. 64). From the middle of the 18th century, this manuscript became known as the Qur'an of Baysunghur Mirza. The pages of the manuscript are today preserved in various book treasures, including the Metropolitan Museum of Art in New York (New York, The Metropolitan Museum of Art. No. 1972.279.).

The historian Ibn Arabshah (1392–1450) in his book provides valuable information about the cultural environment in the palace of Amir Temur and cites the names of Ibn Bandgir, Abdul Qadir, and Tajuddin Salmani as the most skilled calligraphers of that period (Ibn Arabshah, 1992, pp. 82-83). The first artistic manuscripts made during the reign of Amir Temur and

preserved to this day are the volume manuscripts, which were made under the patronage of Prince Pirmuhammad of Timur (1374–1407). The first manuscript (Dublin, The Chester Beatty Library. Ms. 114) is “Shahnama” (“Book of Kings”) by Abu’l Qasim Firdausi (935–1020), was copied by Muhammad Said Hafiz al-Qari in 800/1397-98 in Shiraz (James D., 1981, p. 14).

The second manuscript (London, The British Library. Or. 2780.) consists of Asadi Tusi's (d. late 1080) “Garshaspnama” (“The Epic of Garshaps”), Ahmad Tabrizi's “Shahanshahname” (“The Book of the King of Kings”), Hakim Azari Tusi's (1380–1462) “Bahmannama”, and Hakim Iranshan ibn Abulkhay's (XI-XII centuries) “Kush-nama”. The manuscript is dated Šafar 800/October 1397. [Rieu C., 1894. №201).

After Amir Temur, during the reign of the Timurids, more attention was paid to the development of book art. But the division of the kingdom into Movarounnahr and Khorasan did not fail to have an impact on the cultural life of the region. But the patronage of rulers and princes in various fields of science, culture and art laid the foundation for the development of cultural and spiritual life. In 1411, the Timurid ruler Shahrukh Mirza (1377–1447) appointed his son Ulugbek (1394–1449) as governor of Movarounnahr and Turkestan. Ulugbek decides to return most of the masters brought to Samarkand by Amir Temur. As a result, opportunities were created for the organization and operation of art workshops in different regions of the kingdom. Patronage of art was not limited to the palace of Shahrukh Mirza, governors appointed to different provinces competed with each other in the creation of works of fine art. During the reign of Shahrukh Mirza Iskandar Sultan (1384–1415) and Ibrahim Sultan (d. 1435) in Shiraz, Mirzo Ulughbek in Samarkand, Baysunghur Mirza (1397–1433) in Herat contributed to the formation of the Timurid's the art of the book. The patronage of the Timurid princes in various fields of art led to the formation of the relationship between art and ideology.

As today's Afghanistan, Iran, and Central Asia were ruled by the Timurids as a single state, the culture of the Turkic peoples developed in part in Khorasan, especially in the capital, Herat. That is why this stage is one of the brightest periods of Uzbek culture. During this period, along with Herat, the most beautiful examples of Timurid manuscripts were created in art centers such as Bukhara, Tabriz, Mashhad, Shiraz, Baghdad. At the beginning of the 15th century, in Tabriz there was a center of book art under the patronage of Sultan Ahmad Jalairi, and in Shiraz - under the patronage of Iskandar Sultan. Events such as the enthronement of Shahrukh Mirza in Herat, the death of Sultan Ahmad in 1410, and the overthrow of Iskandar Sultan in 1414 led to the eastward shift of the center of the art of the book art. Shahrukh brings the book treasure of Iskandar Sultan to Herat, inviting masters of the art of bookmaking.

Historical sources have very little information about the book process under the patronage of Shahrukh. The historian Davlatshah Samarkandi (c. 1436 / 37–1495) mentions the name of Mavlono Khalil as an artist of Shahrukh Mirza's library (Samarqandi Mir Davlatshah, 1989. p. 21). Qazi Ahmad Qumi wrote that after the conquest of Iraq by Shahrukh, the calligrapher Mawlana Maruf brought the Calligrapher Baghdadi to Herat to work in his library. In addition, Qazi Ahmad Qumi mentions that Abdullah Tabbakh was a native of the capital, Herat, was an excellent calligrapher, wrote admirably and was a remarkable master in “gold sprinkling” and restoration (Minorsky, T., 1959, p. 64). Manuscripts (Istanbul, Aya Sofya. No.3353, Suleymaniye Library. No.4155, Topkapi Saray Library. Bagdad 282, Hazine 1653, 1654, Ahmet III 3059, Turk ve İslam Eserleri Muzesi. No. 1992; London, India Office Library. Persian MS.

232, The British Library. MS. Add. 7628; Paris, Bibliothèque Nationale de France. Suppl. pers. 1113, 67, 209, Suppl. Turc. 190; Vienna, Österreichische Nationalbibliothek. A.F. 112; Saint-Petersburg, Hermitage VR-1000) that have survived from the books of Shahrukh Mirza's library testify to his interest in historical, religious and scientific literature

Prince Giasiddin Baysunghur ibn Shahrukh (1397–1433), known in the Islamic world as a book lover, founded the palace's scientific institution and library, which ushered in a new era in the development of Oriental book art. Prince Giasiddin Baysunghur ibn Shahrukh (1397-1433), known in the Islamic world as a lover of books, founded a scientific institution and a library of the palace, who ushered in a new era in the development of oriental book art. Baysunghur himself was a skilled calligrapher and artist, and wrote poems in Turkish, Arabic and Persian. During the reign of the Timurid ruler Shahrukh Mirza, the first steps were taken to create the Herat style of book art in the center of the country, and under the leadership of Baysunghur Mirzo, Herat developed as a center of book art.

In 1420, the leader of the Kara-Kyunli (1375–1468), Kara Yusuf (d. 1420), was defeated and Tabriz was recaptured. Dust Muhammad (d. 1560) wrote that Baysunghur Mirza came to Tabriz on November 21, 1420, and from there he brought with him the masters of art of book Sidi Ahmad Naqqash, Khoja Ali Musavvir and the binder Qavammiddin Mujallid Tabrizi to Herat (Dost-Muhammad, 1989, p. 346). At that time, calligraphers Kamaliddin Ja'far Ali Baysunghuri Tabrizi (d. 1433) and Khoja Ghiyasiddin (second half of the 14th century) worked in the workshop of the ruler in Herat. Hoja Ghiyasiddin Naqqash participated in the embassy of Shahrukh Mirza, who was sent to China in 1419–1422, as one of the two representatives of Baysunghur Mirza (Samarkandiy A., 2008, p. 375). The establishment of diplomatic relations between the Timurids and China, as well as the creation of opportunities for not only political but also cultural contacts as a result of embassies, influenced the activities of the Herat Workshop. In particular, in the works of masters working in the library, the emergence of symbols typical of Chinese art, led to a change in the style of decoration (Sugimura T., 1981; Yu Y., 2018).

The library of Boysunqur Mirzo gathered specialists in various fields of book art and created masterpieces of book art, most of the masters created under the name of Baysunghuri. The main calligrapher of the library Kamaliddin Djafar Ali Baysunghuri Tabrizi (d. 1433) from time to time informed Baysunghur Mirza about the activity of masters. The official report Arzadasht, prepared for Boysung'ur Mirza between 1427 and 1431, lists 25 masters of art of the book working in the library (Arzadasht, 1989). Mustafa Ali (1541–1600) in his work “Manaqibi hunarvaron” states that there were 40 calligraphers in the palace library of Baysunghur Mirza (Mustafa Ali, 2011, p. 206).

Under the patronage of Mirzo Boysungur, many manuscripts of a high artistic level were created, and today they are kept in various book treasures around the world (Berlin, Museen für Islamische Kunst. I. 4628, Staatsbibliothek Preussischer Kulturbesitz. Petermann I. 386; Dublin, Chester Beatty Library. No. 119, 120, 4183; Istanbul, Topkapi Saray Library,. Hazine 2310, 362, R. 1022, Türk ve İslam Eserleri Müzesi. № 1454; London, Gobineau collection of British Library. Or. 2773, Keir Collection. VII. 62, Oxford, Bodleian Library. Elliott no. 210; Vienna, Nationalbibliothek, Cod. N. F. 382; St. Petersburg, National Library of Russia, Dorn, № 268,

PNS. 233, 49; Library of Oriental Studies, St. Petersburg University № 578, Institute of Oriental Studies. B. 132; Tehran, Gulistan Palace Library. No. 61, Malik Library. № 6531).

After the death of Baysunghur Mirza, the workshop-library passed to his eldest son Alauddavla (1417–1460). After the death of Shahrukh in 1447, Mirzo Ulugbek brought some of the masters to Samarkand to continue the creative style typical of Herat, but in 1449, after the death of Mirzo Ulugbek, the workshop was abolished. It is known that Qutbiddin Shirazi's (d. 1311) work, copied by Muhammad ibn Ayaz ibn 'Uthman ibn Sadiq in 690/1231, was kept in the palace library of Mirzo Ulugbek. On the first page of the manuscript, Mirzo Ulugbek wrote in his autograph that he had read this work. The manuscript was put up for auction on October 15, 1984, at Sotheby's (Catalogue, 1984, №292). In addition, during the reign of Mirzo Ulugbek, several manuscripts were prepared. One of them is a copy of Abdurahman as-Sufi's (d. 986) *Suwar al-Kawakib al-Sabita*, prepared for the library of Mirzo Ulugbek in about 1430-1440, which contains images showing the exact location of the stars (Paris, *Bibliothèque Nationale de France. Suppl. Arabe. 5036*). The manuscript of Mirzo Ulugbek's "*Zij-i Koragoniy*" prepared for the author in 1440 is kept in the personal collection of Abolala Sudavar in the United States (Abolala, 1992, p. 67).

The Timurid book art flourished in Herat during the reign of Sultan Husayn Bayqara and his minister Alisher Navoi (1441–1501). Khorasan, especially Herat, was crowded with scholars, unique creators, each engaged in a particular craft. Zahiriddin Muhammad Babur (1483–1530) wrote, "The period of Sultan Husayn Bayqara is a wonderful period." Many manuscripts have been prepared in the library-workshop of Sultan Husayn Bayqara. Abolala Soudavar, *Art of the Persian Courts*. New York: Rizzoli, 1992. p. 67. cat. no 36; Cairo, General Egyptain Book Organization, *Adab Farsi* 908; Geneva, Bodmer Foundation. *Pers. Ms. 30*; Istanbul, *Türk ve İslam Eserleri Müzesi. №1905, №1926*; Paris, *Bibliothèque Nationale de France. Suppl. Turc. 993*; Tashkent, Institute of Oriental Studies of the Academy of Sciences, №1995; Tehran, Gulistan Palace Library. No.709). Initially, Mawlana Fasihiddin was the head of the Husayn Bayqara's court library. Mawlana Haji Muhammad Naqqash (d. 1507) first headed the library of Husayn Bayqara, then until 1499 in the library of Alisher Navoi, then Alisher Navoi's library was headed by Khandamir (d. 942 / 1535-36). Mawlana Haji Muhammad left Herat in 1498 and headed the library of Badiuzzaman (d. 1514) in Balkh. Kamoliddin Behzod (1456–1537), a great medieval artist and a representative of miniature art, first headed the library in the palace of Husayn Bayqara in 1500, and later, after leaving Herat for Tabriz, the library of King Ismail I (1502–1524) (Akimushkin O., 2004). Alisher Navoi's personal library had 11 calligraphers and 6 artists (Kadzyuki K., 1991).

In addition to the palace libraries, the Sufi khanaqah can also be cited as an institution where books are created. Muhammad ibn Muhammad ibn Mahmud al-Hafiz al-Bukhari (1345–1420), a Sufi known as Muhammad Porso, established a public library in Bukhara in the early 15th century. This library functioned until the XIX century (Dodhudoeva L., 1998).

The Timurid Herat library workshop underwent the last stage of its development under the leadership of Alisher Navoi during the reign of Husayn Bayqara and was destroyed by the Shaybanids after the conquest of Herat in 1507. Some of the masters spread to different parts of the Middle East and took with them Herat-specific artistic styles, the Herat style has influenced the artistic manuscripts created in various cultural centers.

In conclusion, from the late 14th century to the 15th century, the reign of the centralized Timurid state in Central Asia became a new period in the development of book art.

The development of Central Asian book art during this period was closely linked with the rulers' desire to respect and preserve the spiritual heritage, their interest in books, their efforts to earn the respect of the people through their attention to books, the establishment of permanent contacts between cultural centers and the rise of urban culture.

Manuscripts with beautiful calligraphy, gold and colorful ornaments made during the reign of Timurids testify to the golden age of this art, the high artistic spirituality of the period and the highly qualified circle that created them, as well as the great creative power of the masters. These manuscripts are distinguished among the art of all periods and peoples by their technical and artistic features and express the common qualities peculiar to the peoples of the East.

The role of general ideology, religious and secular views in the formation of artistic culture is high, and the masters of the East used in their works forms and methods belonging to both traditional and neighboring peoples, and this is reflected in the manuscripts of Timurids.

### ABSTRACT

*The article provides information on the ecology and anatomy of the sheet Vincaerecta Regel. E.t Schamalh and Vinca minor. They purify the soil from heavy metals by accumulating those in the leaves; these types are promising for optimizing the urban environment.*

**KEYWORDS:** Vincaerecta Regel. E.T Schamalh, Vinca Minor, Epidermis, Mesophilus, Xylem, Phloem, Sheet.

### INTRODUCTION

In the current globalization, the Republic pays special attention to the biological improvement of the environmental situation, and laws are being adopted.

Decree of the President of the Republic of Uzbekistan dated February 7, 2017 N UP-4947 Implementation of measures to further develop the pharmaceutical industry in five priority areas of the development of the Republic of Uzbekistan for 2017-2021 and the need to prevent environmental problems that could damage the gene pool.

Given these pressing problems, the use of promising evergreen herbs to improve the urban environment is an urgent problem.

Our scientific observations are devoted to the study of the anatomy of leaves of green species, which are green all year round, which provide a good psychological mood to people and are used

as a lawn. Scientific observations were carried out at the experimental site of the Department of Ecology in the Botanical Garden of NUU in 2018.

### THE MAIN FINDINGS AND RESULTS

Cormorant is a perennial herb that contains strong alkaloids (vinervin, tombosin, vineredin, venin, pebescin and minor) in the upper and lower parts of the body and is used in medicine to treat nervous and vascular diseases [1, 1983; 2, 2016].

For the study, rhizome species (*Vincaerecta* Regel. Et Schmalh.) And a small wolf (*Vincaminor* L.) from the species of the Apocynaceae family was obtained.

Purpose of work. The study of the morphological and anatomical structure of the leaves of wolf species and the determination of their adaptation to living conditions.

*Vincaerecta* is an endemic plant in the mountainous regions of Central Asia [3, 2018].

The stem of a straight vein grows vertically and does not branch. Length 15-35 cm, diameter 0.1-0.4 cm. Leaves simple lanceolate or ovoid, without stripes, in the stem opposite the grass, whole without cut edges, 5,5-6 cm wide, 2,5-3 cm wide.

The leaves of the *Vincaerecta* plant are covered with cuticle and epidermal tissue above and below. The upper cells of the epidermis are larger than the lower. The upper epidermis has no mouth. In the middle cells of the epidermis with a parasitic type of mouth, there are many oral mammals (Fig. 1, a, b).

Figure 1 Upper (a), lower (b) tissue structure of the epidermis of the leaf of the straight crown (40x7).

W - word of mouth.

EC - epidermal cells.

*Vincaerecta* is a mesophilic dorsoventral leaf type, with two rows of columns under the upper epidermal tissue, and pores (cloud) tissue cells with 6-7 rows of wide cell ranges are located below them (Fig. 2 a, b).

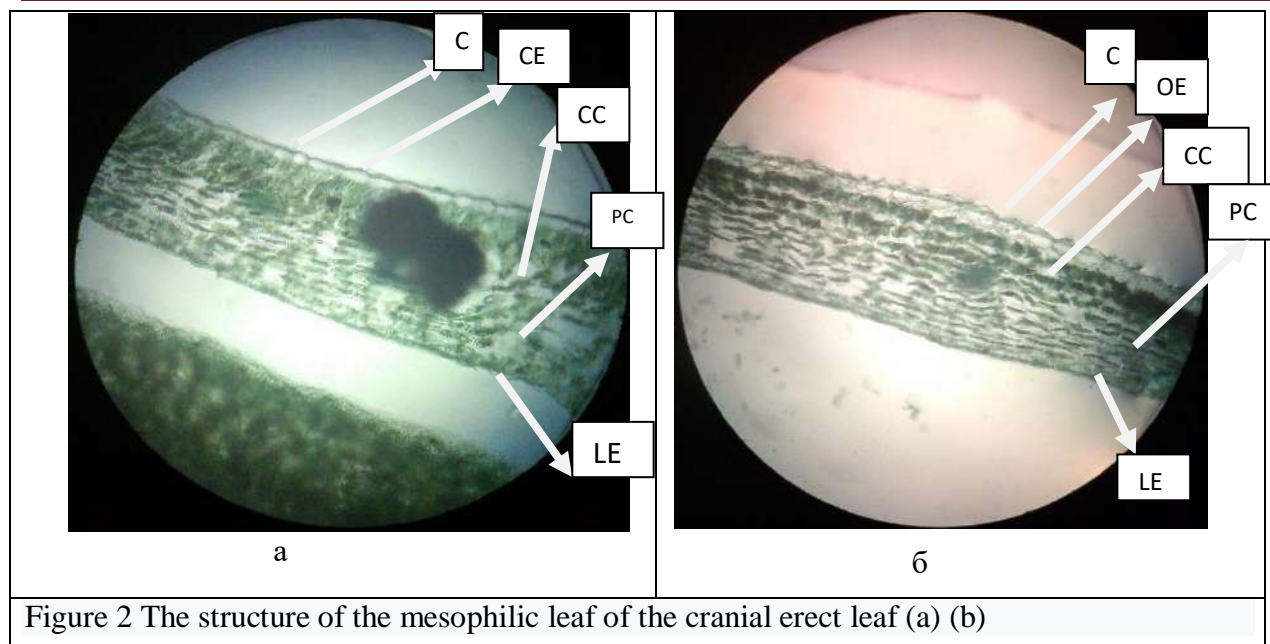

Figure 2 The structure of the mesophyll leaf of the cranial erect leaf (a) (b)

**C - cuticle.**

**CE - the old epidermis.**

**CC - columns of cells.**

**PC - porous cells.**

**LE is the lower epidermis.**

The main root of the leaves protrudes from the upper and lower sides of the leaf. In this appearance, the upper cells of the epidermis formed a single cell with short hairs. The conduction system of the main vessel consists of one ligament collateral type. The upper and lower layers of connective tissue (a type below the epidermal tissue) are surrounded by thick mechanical tissue (Fig. 3).

Figure 3. The structure of the main vein of the erect leaf vinca (Vincetoxicum).

F - Feathers.

MT- mechanical tissue

XT - xylene tubes

Ph - Phloem

LE - lower epidermis

The periwinkle tower is always green, the root is stem, multiple (hemispherical, hemispherical), the upper part of the plant consists of two types of generative and vegetative stems. The joints of the generative branches are short and grow vertically, 30-35 cm in length. Vegetative shoots are long, spaced horizontally, with branches 100-150 cm long.

The leaves are simple elliptical, pointed, whole, shiny, thick, green on top, grayish below, 3-5 cm long, 1.5-2.5 cm wide, with short stripes opposite the stem.

Vinca Tower is a plant that is mainly grown in the shade, as well as in open, sunny places.

The leaves of the small periwinkle are covered with a thick cuticle and rows of epidermal tissues above and below. The cells of the outer tissue of the epidermis are curved, without a mouth. The crust of the underlying epidermal cells is strongly curved, with a large number of mouths. The lung apparatus belongs to the pacific type (Fig. 4 a, b).

**Figure 4 Cells of the upper (a) and lower epidermis (b) of the small leaf of periwinkle. (VincaminorL.)**

O- oystic

C – Cuticle

UE - upper epidermis

CC - column cells

IBC - Interval between cells

PC - porous cells

LE - lower epidermis

The main middle root of the leaves protrudes from the upper and lower sides of the leaf. The conduction system of the main vessel consists of many xylem tubes and phloem tissue. The type of binding is a calligraphic type surrounded by mechanical tissue with a thickness of the cell membrane above and below (Fig. 6).

**Figure 6 The structure of the main middle root of the small leaf of periwinkle. (Vinca minor L.).**

UE - upper epidermis

MT - a mechanical tissue

CC - column cells

XT - xylene tubes

P - phloem

MC - mechanical cell

LE- the lower epidermis.

Features of adaptation of wormwood species: thickness of epidermal cells with a thick curvature of curvature, absence of oral cavities in the upper epidermis, the presence of numerous mucous membranes in the upper mesophyll, the base of the dorsal cells, spinal cord Mechanical closure of tissues in the lower and lower parts, which indicates a large accumulation of dust and heavy substances in mesophilic tissues.

### CONCLUSION

These studied species are promising for optimizing environmental conditions, such as cleaning soil and air from waste, and they should be planted around new homes as lawns in urban areas.

Given the healing properties, they are recommended for the preparation of medicines in a clean environment, which plays an important role in protecting human health.

## THEORETICAL ISSUES OF NATIONAL CLASSICAL MUSIC IN THE SCIENTIFIC WORKS OF UZBEK MUSICOLOGISTS OF THE XX CENTURY

**Sherimmatov Juratbek Shukhratovich\***

\*Teacher of Music Education Department,  
Urgench State University, UZBEKISTAN  
Email id: sherimmatov17@gmail.com

### ABSTRACT

*This article is devoted to the study of the theoretical foundations of Uzbek maqoms, the emergence of the theoretical foundations of Uzbek music in the twentieth century, their reflection in the work of various musicologists. What is the theory of Uzbek maqoms and what aspects of the theory should be considered in the analysis of maqoms, the means of musical expression in the composition, the relationship of mood and form, the characteristics of the structures are also considered there.*

**KEYWORDS:** *Uzbek Music, Maqom Art, Maqom Theory, Shashmaqom, Lad, Oriental Thinkers, Musicology, Maqom Studies, Music Theory, Music Forms.*

### INTRODUCTION

National maqoms are a specific system of musical culture developed on the basis of classical values. In practice, this system is now called the Uzbek Maqomat, and refers to the Bukhara Shashmaqom, Khorezm Six Half Maqom and DutorMaqom, Fergana-Tashkent Maqom. Recognized as an intangible heritage of world music culture, Shashmaqom is part of this system. That is why today the art of national maqom is the brightest example of our musical culture, a set of maqoms that form a whole system. Its general structure and practical foundations are known to the music community. However, some undiscovered aspects, in particular important features of the theory, require extensive scientific study.

### Main part

In the twentieth century, Uzbek musicology began to enter new concepts of social needs. The articles of the famous enlightener A.Fitrat "Uzbek classical music and its history"<sup>[1]</sup> and the

Russian ethnographer V.Uspensky "Classical music of Uzbeks"<sup>[2]</sup> published in 1927 in the Uzbek language can be noted on these bold steps.

In these studies, the issue of lad is given priority as a central scientific-theoretical problem. It should be noted that two priority synonymous terms in Uzbek and Russian languages are used in the researches of Fitrat and Uspensky. When Fitrat mentions "Uzbek classical music", he means classical maqoms. Therefore, the term maqom in the play refers to the concept of lad in Russian music. V.Uspensky, in his research, uses the term lad in Russian terminology to refer to the basics of status.

Even if we refer to the periods before Fitrat and Uspensky, we see that the terms lad and maqom were used in the same sense. A. Fitrat describes the Shashmaqom system as "consisting of six rows of melodies"<sup>[3]</sup>. From this point of view, first of all, what can be seen is a series of methods in the Shashmaqom complex and a set of maqoms based on six maqoms (lad).

In the research of twentieth-century Uzbek musicologists Fitrat and Is'hak Rajabov, we see that the terms maqom and lad, which we take as synonyms, are meant here.

Thus, the question of the mode of musicology from Farobi to Fitrat and I. Rajabov was used as the main foundation of scientific and theoretical doctrine.

From the point of view of the 1000-year history of Uzbek musicology, the notion of status and mode, which focuses on the basics of music and curtains, is a central problem of musical ideology, regardless of the language in which the terms are used.

Academician Yunus Rajabi is a well-known Uzbek musician and composer of the 20th century. As a collector and devotee of the Uzbek folk musical heritage, Yunus Rajabi also showed a special zeal in modernizing and promoting the performance of maqom, and disseminating them to the general public. In particular; it is possible to appreciate the work of Uzbek folk music and national classical music in the formation of a certain order. The fact that the sources of these notes are now widely used in music testifies to the brilliant knowledge of Uzbek music by Yu. Rajabi. His works on Uzbek music include Uzbek Folk Music (1955-19), Shashmaqom (1966-1975), and A Look at Our Musical Heritage (1978). In this unique study, he notes the system of Uzbek maqoms, classical instruments and songs, samples of folk music, as well as special comments on their theoretical and practical features. The role of this work in the Uzbek musical consumption today is invaluable.

Ishak Rajabov is a brilliant maqom scholar of his time, who studies the musical sources of medieval oriental scholars and expresses his views on the theoretical and practical aspects of maqoms. He studied these aspects of Uzbek music in his books "On the issue of maqoms" (1963), "Maqomlar" (doctoral dissertation 1970), "Fundamentals of maqom". The book "On the issue of maqoms" provides information on the process of historical formation of status, the theoretical basis of status, the Twelve status and status of Shashmaqom, Shashmaqom branches and their structures, types, other categories of status and performance. It should be noted that the scholar's views on status can be said to be an important basis for the emergence of the doctrine of authority today.

In the person of Ishak Rajabov, various specialties important for this field (musicologist, source scholar, philologist, orientalist) were harmoniously represented. On the one hand, he is a brilliant representative of the famous Rajabi dynasty, a great performer in the words of maqom, tanbur

and dutar, and on the other hand, he is well versed in the rules of classical poetry (aruz) and an expert in interpreting written sources of the past.

In the monograph "On the issue of maqoms" published in 1963, the Shashmaqom complex was initially widely used in palace music, formed as a natural development of the system of twelve maqoms, and its curtain-system, melody, percussion, avj-namud and the fact that the laws of other formal structures are components of this very whole system has been conclusively resolved. The study also discusses the Khorezmmaqoms and the Fergana-Tashkent maqom roads, which are other forms of the maqom system, and describes their relationship with the Shashmaqom. "The maqoms are examples of the classical style of folk music", said the scholar, who is now well-known among scholars. In fact, I. Rajabov, knowing the practical performance of the maqoms, was able to create a scientific concept that combines the historical and theoretical problems of this complex art.

Yu.G.Kon described the theoretical aspects of Uzbek music in his research. He also studied composition on a large scale. In particular, the introduction to the Uzbek folk music (1955), volumes III, V, VI, VII of the Uzbek folk music (1959-1960), "On the theory of folk modes" (1961), "Some issues of the modal structure of the Uzbek folk song and its harmonization"(Candidate's dissertation 1962).

Yu.Kon's musical-theoretical views on Uzbek music are described in his dissertation "Some questions of ladovogostroeniyauzeksoknarodnoy pesni i eyogarmonizatsii." It studies the moods of Uzbek folk music on the basis of the musical systems of medieval musicologists. In addition, valuable information and scientific-theoretical analysis of the general characteristics of the melody of Uzbek songs, the internal structures of the scales, the variability of the scales and the features of the theoretical harmony of melodic scales are provided.

Yu.Kon describes his work as follows: "Theoretical study of folk and national classical music and reliance on existing evidence helps to solve certain problems and opens a great way for the formation of composer's creativity. Based on Asafev's definition<sup>[4]</sup>, it is necessary to pay attention to the relationship between social consciousness and lad features. It is the fret that embodies important features in most people's understanding of music. Lad is also a leading factor in the formation of artistic images as art"<sup>[5]</sup>.

In a number of his books, the modern Uzbek scholar Otanazar Matyakubov has studied in detail the curtain systems, methodological frameworks, and form structures that are the constituent elements of statuses. In particular, his research on the tanbur line gave rise to new views on maqoms. On this topic O. Matyakubov's – "Farabi about the music of East" (1986), "Maqomot" (2004), "Bukhara Shashmaqom" (2018), "Khorezmmaqoms and the Six and a Half Status" (2018), "Uzbek classical music" books could be mentioned.

The book "Uzbek classical music" consists of 2 volumes, the first part of which describes the history of the development of Uzbek status. In the second volume, the theoretical side of the status quo is described in four chapters. The first section examines the basic concept of status - the basis of the mode. The historical formation of maqom lad systems, Farabi's views on lad, the transition from general lad circles to Shashmaqom's practical lad theory, the main lad units, their organization as a system, the use of types and averages, important features of lad composition are studied. We have prioritized the approach to the analysis of these modes in the process of

analyzing the key positions of this work. Because in this book we will see that the basics of Shashmaqom are studied in detail.

It should be noted that this study has a special place in terms of the history of the theoretical study of Uzbek status. Because today this research should be noted as an important source in the formation of the theoretical image of Shashmaqom and in-depth study of each of its components.

## RESULTS AND DISCUSSIONS

The study of the theoretical and historical process of Uzbek makoms has not lost its relevance today. The first views on this topic were formed in the early twentieth century, and continue to this day, and a number of works on the subject have emerged. In the formation of theoretical details of Uzbek classical music, in particular, on the structure of mood and form. In the works of V.Uspensky, A.Fitrat, Yu.Rajabiy, Yu.G.Kon, I.Rajabov, Yu.Plakhov, S.Galitskaya, R.Sultanova, N. Kokulyanskaya, O.Matyakubov, R.Yunusov, O.Ibrokhimov and other scientists we see the views of this topic.

## CONCLUSION

The problem of studying the patterns of Uzbek classical music has always attracted the attention of musicologists. Theoretical study of musical means of expression - lad, rhythm, form and other elements creates some difficulties, and the solution of these problems is controversial not only for musicologists but also for composers. Consequently, relying on proven data (materials) is very helpful in revealing important aspects. Accordingly, we will try to apply some of the methodological guidelines for the theory of status in this and other cases in a generalized way. Concepts on the structure of the mood and form of Uzbek maqoms, analytical methods are generalized on the basis of the views of some of the above musicologists and used in the analysis process.

### ABSTRACT

*Artistic thinking, which is an integral part of human conscious activity, and, accordingly, artistic and creative activity, are of great importance in the process of historical development of mankind. This article reflects the views of the European traveler H. Vamberi on the historical monuments and history of Bukhara, one of the centers of culture and development of world civilization, recognized as the "power" of Islam.*

**KEYWORDS:** Folk, Applied Arts, City, Monument, Historical, Heritage, Palace, Tourist, Decoration, Magnificent, Building, Wood, Unique, Ancient, Master, Artist, Tradition, Mosque, Development, Value, Youth, Baitullah, Ornament, Appearance, Construction, Harmony, Craft, Art, Work.

### INTRODUCTION

The art of decorative decoration serves as a specific criterion in the daily life and way of life of each period, directly the people. For this reason, applied art has a centuries-old history. The President of Uzbekistan Sh.M.Mirziyoev spoke about folk arts and expressed the following views: "Folk art, which is an integral part of universal culture, has a special place in the life of every nation in the world, in the development of its way of life and values. The emergence of handicrafts in the conscious life of mankind is the most important historical step towards civilization."

Bukhara has been the capital of various dynasties several times during its centuries-old history. In particular, in the second half of the VII century and VIII century dynasties such as the Bukhara gods, the last quarter of the IX century and the Samoni in the X century, the Shayboni in the XVI century, the Ashtarkhani in the XVII century and the first half of the XVIII century,

the Mangits from the second half of the XVIII century to 1920. Bukhara was their capital at the time.

For centuries, Bukhara was a city of feudalism, trade and crafts. Along with trade along the Great Silk Road, various nations and peoples, religions, the constant influx of news related to science, industry and other spheres of life, the abundance of minerals such as gold, silver, iron, zinc, favorable climate and natural conditions its existence was undoubtedly an important factor in the economic, political, cultural and enlightenment of this land and, of course, in the rapid development of handicrafts.

## THE MAIN FINDINGS AND RESULTS

In the centuries-old history of the Uzbek people, the folk arts and crafts, architectural monuments, its centuries-old traditions are rich and colorful and form the most world-famous part of our cultural heritage. One of the urgent task of today is to carefully preserve, enrich and bring to the world the unique applied arts, folk art, historical formation processes, artistic features and peculiarities, unique traditions. One of the important tasks of the further development of this field is to study the formation of applied art in architecture, inherited from our ancestors, in different periods.

Ancient and modern Uzbekistan is one of the centers of culture and development of world civilization, a fact known to many and recognized by the world today. Historical cities, architectural monuments and examples of applied art in the territory of our country are very ancient and unique, as well as scientifically based on a clear geometry. Many of them are included in the UNESCO World Heritage List and are an expression of the high respect of the world community for our priceless spiritual treasures.

When we think about these things, we involuntarily think of our ancient city, one of the glorious cities recognized as the "strength" of Islam - Bukhara. In particular, about the city of Bukhara and its historical monuments, our First President I.A. Karimov expressed the following views: "Bukhara Sharif is a sacred place that has introduced our nation and people to the world with its great children, dear saints and unique historical monuments.

When I say Bukhara, I mean, first of all, a hard-working people, whose heart is in Allah, whose faith is strong, who has endured many trials and tribulations. "

Indeed, Bukhara is a city with a long, tragic history and a difficult history. We turn to the information given by the involuntary Hungarian traveler Herman Vamberi in his memoir "History of Bukhara or Transoxiana". The translator of this book into Uzbek, Tahir Qakhkhor, begins the introduction as follows: "I think only the past shows the way to the future, that path passes through the chest of today. If the present is strong and powerful, it can lift the heavy bridge of the past and the future. For the construction of this bridge, through which the entire life of our people will pass, we need guides, knowledge of history. Herman Vamberi, a Hungarian scholar whose native land is old Turkestan, and his book "History of Bukhara or Transoxiana " are one such guide. In 1220, Genghis Khan invaded Bukhara, and the Bukhara army continued to resist the Mongols, who were several times more powerful. Nevertheless, they attacked the Mongols and were almost completely annihilated. A small number of them entered the city and survived. The people of the city were terrified and sent their elders to Genghis to ask for mercy. The Mongol khan entered the city with them. Genghis Khan's eye first fell on the mosque, which

was built by the great Samoni with magnificent ornaments. He and his son Tuli entered the mosque without dismounting and went to the pulpit and stopped. Tuli stood in front of the pulpit without dismounting. Genghis asked, "Is this the sultan's own palace?" He was told, "This is the House." He then dismounted. He climbed a few steps from the pulpit and shouted at the Mongols behind him. "The meadow is cut, feed your horses!" It was a sign of permission to loot. It is easy to imagine how the savage Mongols attacked the unfortunate Bukhara, how greedily the deserts, blinded by the splendor of the Central Asian capital, were thrown. All the houses were destroyed, all the chests were destroyed, countless treasures were looted. They did not spare even the sacred things, which seemed to have no value. The books were torn and scattered like straw under the feet of the animals. The boxes in which the holy was kept were used as stables for horses. The mullahs, who were the stars of knowledge, the sheikhs, like the slaves, served the distinguished warriors, and sometimes, to the Mongol bakhshis, for ridicule. Many dignitaries were forced to feed donkeys and mules. The Muslim historian narrates: "While it is a bit of an exaggeration to say that religious sentiment was insulted, after this first Mongol invasion, Bukhara undoubtedly suffered a lot and suffered terrors."

It is said that when the people of Bukhara disobeyed Genghis's order, he became extremely angry and ordered the city to be set on fire. Bukhara, which consisted mostly of wooden buildings, burned to the ground in a matter of days. Only mosques and palaces built of stone and brick became black stones and dots in the sea of grass. The administrative city over Zarafshan has become a wasteland.

However, the emergence of Temurbek from the Karegon branch of the Barlos clan was a great event. Amir Temur's contribution to the abolition of the Mongol invasion of Turkestan and the unification of our country into a single state is invaluable. This great man highly valued Bukhara, he made a great contribution to the prosperity of the country. As Herman Vamberi points out, he was primarily an Asian commander. He built a number of architectural monuments with his great creativity, and the unique prey of any country he conquered was the artists and craftsmen of that country. He loaded the books from the Bursa library onto the animals and moved them to Samarkand. Timur was determined to celebrate every success, every joyful event by creating an architectural masterpiece. To this end, he brought hundreds of skilled bricklayers from India, famous masters from Sheroz, Isfahan and Damascus to Transoxiana, who built beautiful buildings.

## CONCLUSION

In a word, today the magnificent buildings built by Sahibkiran Amir Temur in our country with their splendor are in the center of attention of tourists from all over the world. At the same time, in our country, as well as in the most developed countries of the world, architecture and creativity continue to flourish today. The construction of buildings and structures, residential buildings is improving, combining national and modern styles. The examples of architecture created by our ancestors, luxury buildings, in short, the transmission of our national cultural heritage to future generations should become our highest goal.

The difference between applied art and other types of art is that it is not only a work of art, but also used in everyday life for a specific purpose. That is, the objects of applied art have a social significance, and therefore applied art has become an integral part of the way of life of the

people. In particular, the connection of applied art with architecture further enhances its importance in everyday life.

In particular, Bukhara preserves many historical and architectural monuments, built during the IX-XX centuries, which are passed down from generation to generation without changing their original appearance. The interest in these architectural monuments, the works of art reflected in them, attracts the attention of people all over the world and most tourists who come to our country. Preserving these masterpieces of art that have come down to us from our ancestors and passing them on to future generations should be one of our priorities.

## INTRODUCTION

Shoes for children are selected in accordance with the sizes determined by the length of the foot: the distance between the most protruding point of the heel and the end of the longest toe. The millimeter is taken as the unit of measurement, the difference between the numbers is 5 mm. Shoes for children and adolescents are made in strict accordance with the length and width of the foot. When trying on shoes, you should pay attention to the fact that there is a space of 0.5-1 cm in front of the thumb. To do this, when trying on shoes, the child should stand, not sit. Only if the foot carries the entire mass of the body, you can find out the actual length and width of the foot. It should be borne in mind that the length of the foot does not remain unchanged, but increases, especially during movement or as a result of fatigue caused by long walking.

The child needs to change the size of the shoes approximately every six months. Shoes are better to buy light, bright colors.

## THE MAIN FINDINGS AND RESULTS

Shoes are part of the outfit. Various types of shoes are produced for children: round-season, summer, winter, spring-autumn. And also - everyday, model, home, sports, etc. Shoes from a hygienic point of view should protect the body from cooling and overheating, protect the foot from mechanical damage, help muscles and ligaments, keep the arch of the foot in a normal position, provide a favorable microclimate around the foot, help maintain the necessary temperature and humidity conditions under any microclimatic conditions of the environment. Shoes should meet hygienic requirements - be lightweight, comfortable, not restrict movements, fit the shape and size of the foot. Then the toes are placed freely and they can be moved. But it can cause a large number of deformities and diseases of the feet.

Tight and short shoes make walking difficult, shakes a leg, disrupts blood circulation, causes pain and, over time, changes the shape of the foot, disrupts its normal growth, deforms toes, promotes the formation of hard-to-heal ulcers, and in the cold season - frostbite, increases sweating. Too loose shoes are also harmful. Walking in it quickly tires, and abrasions may occur, especially in the area of lifting. Teenagers are not recommended to walk in tight shoes. Wearing it often leads to curvature of the fingers, ingrown nails, the formation of corns and contributes to the development of flat feet. Flat feet are also observed with long walking in shoes without any heels, for example, in slippers. Everyday wearing shoes with high (above 4 cm) heels is harmful for teenage girls, because makes walking difficult, shifting the center of gravity forward. The emphasis is transferred to the fingers.

The area of support and stability sharply decreases. The body leans back. Such a deviation, at an

age when the pelvic bones have not yet grown together, causes a change in its shape, changes the position of the pelvis, which in the future can adversely affect the generic function. In this case, a large lumbar bend is formed. The foot rolls forward, the fingers are compressed in a narrow toe, the load on the forefoot increases, as a result of which flattening of the arch of the foot and deformation of the fingers develop. In shoes with high heels, it is easier to tuck a foot in the ankle joint, it is easy to lose balance.

The sole should bend well. A rigid sole makes walking difficult (the angle of bending is limited, the back of the shoe is pulled down from the heel), reduces the working capacity of the ankle joint muscles, raises the temperature of the skin of the legs and perspiration.

As far as it is necessary to ensure maximum mobility of the forefoot, it is equally necessary to ensure maximum stability of the heel. The back should be strong, not allowing slipping of the foot. The back should protect, tightly cover the heel, prevent its deformation.

In winter, the shoes must be warm. For this purpose, fur, felt, cloth, felt are used. In cold winters with a stable snow cover, felted shoes (felt boots) are used. Its advantages are high heat-shielding properties and low weight, the disadvantage is the limitation of foot mobility. On cold winter days, at least –10 degrees Celsius, schoolchildren can wear boots and boots with porous rubber insulated with synthetic fur (polyester with cotton) or with a wool or felt lining. With chronic cooling of the legs, vasospasm occurs and serious nutritional disorders of the leg tissues develop due to obstruction of blood flow.

In the summer months, lightweight open-cut shoes with a wide neckline are the most hygienic - anklets, sandals, leather shoes, or shoes on a leather sole with a top made of textile and other materials with a porous structure (gunny, denim, etc.). Such shoes contribute to good ventilation and rapid evaporation of sweat due to air circulation around the foot (due to the selection of material, but more often the openwork pattern of the upper of the shoe).

In wet rainy weather, rubber boots or shoes with soles made of waterproof materials, rubber, rubber, nylon, etc. are comfortable. However, these shoes are characterized by low air permeability, so you need to wear them only with insoles that absorb sweat: felt, felt, and in summer from wicker straw or cardboard. Care must be taken to ensure that the lining does not become wet. It is recommended to wear thin woolen socks on the legs, as wool absorbs moisture well. Sometimes rubber shoes have to be worn in the cold season. In this case, it must be worn with two pairs of socks or stockings, as the air between the socks creates additional thermal protection.

Children are very susceptible to various diseases caused by prolonged exposure to various factors, therefore, hygiene requirements for it are very important.

Hygienic requirements for shoes for children and adolescents consist of requirements for the design of shoes, due to the peculiarities of the structure of the foot during the growth period, and to the materials from which the shoes are made. The size, style and rigidity of the bottom of children's shoes should not impede the development of the foot.

The foot of a child at an early age differs significantly from the foot of an adult in anatomical and physiological structure. For the children's foot, a radial shape is characteristic, in which the greatest width is noted at the ends of the fingers. The foot becomes fan-shaped. A different ratio of the heel and forefoot is that children have a relatively longer back (heel), which should be

taken into account when designing shoes. The skeleton of the foot in childhood is formed by cartilage. Ossification is completed only with the end of growth (approximately 21 g), so the child's foot can easily be deformed under the influence of mechanical stress. In this regard, such qualities as thickness, sole flexibility, weight of shoes, as well as heat-shielding properties are subject to hygienic regulation.

The main elements of the shoe are the top - this is the toe, back, vamp, tibia and bootleg, and the bottom is the sole of the insole, the heel.

The toe should be wider than the bundle (part of the foot at the level of the metatarsophalangeal joints).

Toe - the outer part of the upper shoe, covering the surface of the toes to the level of metatarsophalangeal joints. A toe cap is a detail of the top located between the lining and the top in the toe portion to maintain its shape. It protects the toes of the foot from injury, and its length should not exceed the area of the metatarsophalangeal joints.

The backdrop is a detail of the upper of the shoe located in the heel of the foot to maintain its shape. The back should protect the heel, prevent its deformation, not allow the foot to slide up and to the back. For the manufacture of a backdrop, thicker genuine leather is used. Production of shoes without a backdrop is allowed for children over 11 years old.

Union - a leather patch on the toe and raising the boot, as well as the front of the shoe.

The bootleg is the part of the boot that covers the bootleg.

The height of the shoe is normalized depending on its type and kind. From shoes (insole, sole, heel) - must have optimal stiffness indicators - resistance (expressed in n / cm) to bending along the connecting head and metatarsal bones to an angle of 25 degrees.

"The flexibility of shoes is regulated and should be 7 n / cm for hussar shoes, 10 n / cm for preschool shoes, 9–13 n / cm for boy's school shoes, and 8–10 n / cm for girls's school shoes. "

The sole is the main element of the bottom of the shoe. The sole should have optimal flexibility, thickness, weight and heat-shielding properties. Thermal protective properties of plantar materials depend on their thermal conductivity. The lower the thermal conductivity, the higher their heat-shielding properties. Porous rubber in terms of heat-shielding properties significantly surpasses the skin and monolithic rubber. At the same time, with an increase in environmental humidity, the heat loss of natural leather made of wool (felt boots) increases, and the heat-shielding properties of porous rubber do not change. This creates the advantage of using porous rubber for soles in children's shoes, which can provide not only heat-shielding properties, but also the thickness, flexibility and anti-slip properties of shoes. In the summer, wearing shoes with rubber soles, including microporous ones, leads to increased sweating of the feet due to the complete absence of steam and air permeability.

For children's shoes, thread and combined fastening methods are allowed, which provide greater flexibility in the beam region, ease of use of porous rubber, polyurethane and other materials. It is possible to use adhesive and injection fastening methods that provide waterproof shoes, which is necessary in the autumn-spring and winter periods. The thickness of the sole is normalized depending on the materials and type of shoes.

The insole is an internal part of the shoe that has contact with the skin of the foot and contributes to the creation of a comfortable temperature and humidity regime in the footwear space. It must have high air and vapor permeability. It should be made only of genuine leather.

Heel - artificially increases the arch of the foot, increasing its springiness, protects the heel from bruises on the soil, and also increases the durability of shoes. When relying on a footless foot (without a heel), most of the load falls on the back of the foot. The lack of heels is allowed only in shoes for young children (booties), while the child does not walk. In shoes with a heel of 2 cm, the load is distributed evenly between the front and rear foot. In shoes with high heels, that is, above 4 cm, most of the load falls on the forefoot (with a heel height of 8-10 cm, the load on the forefoot is 7 times more than the back). Heel height: for preschool children - 5-10 mm, for schoolchildren 8-10 years old - no more than 20 mm, for boys 13-17 years old - 30 mm, for girls 13-17 years old up to 40 mm.

Children's shoes should have a reliable and comfortable fastening on the foot, not interfering with movements. For this, various types of fastening are used: lacing, Velcro, belts, zipper, etc. "Open shoes without fasteners (such as "boats") are not allowed for school shoes."

The weight of the shoe depends on the materials used, the design and type of attachment. The norm of mass of boots is normalized.

Genuine leather is recommended for the top of all-season children's shoes, as it has high air and vapor permeability, softness, flexibility and heat-shielding properties for summer shoes along with leather, various textile materials or their combinations with leather are used: gunny, jeans and others. In warmed shoes for the upper, cloth, drape, wool and half-woolen are recommended materials, felt, felt, etc. For lining, genuine leather and cotton materials are recommended. For the manufacture of children's shoes can be used polymeric materials or natural with the attachment of chemical fibers, which are regulated by sanitary norms and rules. Shoes for everyday wear on the street or at school should be simple, comfortable in shape, with a wide low heel (1-2 cm). Then walking will not be tiring. The output shoes of older girls can be on average, but be sure to have a stable heel, not more than 3 cm high. Fanciful styles should be avoided.

An analysis of the modern market for children's shoes shows that products manufactured by domestic manufacturers do not always meet customer needs.

Children's shoes are one of the most difficult to prepare and design. The difficulty lies not only in the fact that the children's foot has its own structural features and is in constant development, but also in the fact that it is rather difficult to determine the needs for shoes of one or another gender and age group.

Today, the method of forming an assortment of light industry products based on marketing research is widely practiced. Unfortunately, according to manufacturers, this is not enough to create a cost-effective assortment. Undoubtedly, the use of marketing research allows us to analyze the situation on the market and make adjustments to the range of products, but to make forecasts, other forecasting tools and techniques are needed.

Forecasting the trading assortment based on anthropometric studies is a laborious and expensive process. It requires large-scale anthropometric studies of the feet. Such studies in different years were carried out by leading scientists in this field: Zybin Yu.P., Fukin V.A., Klyuchnikova V.M., Kochetkova T.S., Gorbachikov V.E., Kostyleva V.V. and their students. In addition, some shoe

manufacturers themselves conduct anthropometric studies. The data of such measurements are scarce. Their results, as a rule, are not disclosed and therefore cannot give a reliable picture.

Planning of commercial assortment should be connected with the characteristics of consumption of each region, as in these calculations, the demographic situation takes on significance. However, at present there is no reliable information on the basis of which manufacturers could create shoes in the right dimensional and weight scales for various age groups. Ultimately, non-compliance with regional characteristics in terms of anthropometric and demographic indicators leads to unsatisfied demand for it.

Previously conducted scientific research, as a rule, was focused either on marketing research or anthropometric, while it is necessary to solve the complex problems of forming an effective children's assortment of shoes.

An important direction of research on the formation of the industrial assortment is the improvement of approaches to the development of shoe designs for children, since the child's body is constantly evolving and in order to maintain the health of the child, reasonable data are needed.

An analysis of the assortment of children's shoes by foreign and domestic manufacturers and the situation on the market for children's products showed that increasing the competitiveness of enterprises is associated with predicting not individual characteristics of shoes, but their combination, both in the field of artistic modeling and in the field of ergonomic design.

International practice shows that the company that uses forecasting methods that take into account all product requirements for any age group of consumers wins. Of interest to study are the "preschool" and "primary school" shoe groups, because it was at this time that both the body and the personality as a whole were actively formed. During this period, the cognitive, social, physical and psychological development of the child is laid, the foundations of a universal human culture are developing. External attributes are involved in the development of these systems.

An important point for forecasting the industrial assortment is the volume of the assortment produced. For a children's assortment, it may not be stable, as this is due to the birth rate of children by year. That is why the total curve of the normal distribution of foot sizes does not have a characteristic horizontal section; it is replaced by a concave or convex one. Therefore, the demographic factor is important.

Types of forecasts differ in time as operational, short-term, medium-term, long-term and long-term. It is proved that in order to increase the competitiveness of the enterprise, it is advisable to carry out medium-term and long-term assortment forecasts.

The forecasting approach that requires less money and time to obtain a forecast can be considered preferable. Especially if the forecast model can be used repeatedly, only being adjusted and supplemented in the future.

When forecasting the size and species assortment, it is necessary to use different approaches, a forecast for the design of shoes and a forecast for the volume of output.

When assessing the specific assortment of shoes, consumers use their personal preferences. The choice is influenced by the social relations and psychophysiological characteristics of the buyer

that have developed in society.

To clarify the characteristics of the factor, its specificity and position when constructing the forecast from a possible list, we can distinguish socio-psychological, constructive-ergonomic and anthropometric groups of factors.

Changes in anthropometric parameters are relatively simple to calculate, as well as to predict the population. The group of socio-psychological factors is the most laborious in assessing, analyzing, and obtaining numerical values of the criteria.

The interconnection of anthropometric and socio-psychological factors is carried out using constructive-ergonomic. Constructive-ergonomic factors are a material representation of verbal preferences. When forming the criteria for evaluating these factors, the capabilities of the production itself are taken into account, and the issues of shoe comfort are addressed.

Methods for predicting factors are presented from the aesthetic category: socio-psychological and constructive.

To work with socio-psychological factors and criteria for their assessment, a study was conducted of consumer preferences when choosing children's shoes on the example of local markets. A survey was conducted not only among direct buyers, that is, parents, but also created graphical questionnaires for interviewing children. The results are transferred to the disposal of regional industrial and commercial enterprises.

In order to forecast structural factors, a database of the design characteristics of children's shoes was formed. Illustrative materials for the period 2010 - 2019 are considered. In the period under review, several criteria could be popular. For this reason, in some cases, the number of criteria is increased. For the formation of databases, preparatory tables on designs taking into account the type of shoes were compiled. The specificity of forecasting design factors is the use of non-numerical characteristics of shoes for predicting.

To verify the reliability of the selected mathematical apparatus, a preliminary forecast is made based on the available data. Since the database of designs for children's shoes was formed before 2019, the forecast was made for the nearest 2020. The reliability of the forecast is confirmed by real models of 2020.

The analysis of design factors made it possible to identify for each of them the areas of acceptable values that must be used in the development of a mathematical model for predicting shoe designs for preschoolers, schoolchildren - girls, and schoolchildren - boys.

A completely different approach to forecasting requires a group of anthropometric factors. Forecasts of this group of factors are based on data obtained as a result of measurements of the feet of the population, medical data and are more reliable than factors relating to the prediction of the aesthetic component. To forecast the size assortment, it is also necessary to study demographics. As a rule, demographic forecasts are presented in the middle version of the calculation, considered as the most likely outcome.

## CONCLUSION

Our analysis of modern methods of forming the assortment of light industry products allows us to identify the relationship of enterprise competitiveness with the concept of assortment

formation. In addition, it is possible to predict the demand for the assortment for preschoolers and primary schoolchildren in the shoe market.

Approaches to forecasting the structure of the assortment are considered. Learn the types of forecasts. To show that in the current economic situation, medium-term and long-term forecasts are most relevant for shoe manufacturers. To propose the forecasting of new shoe models using modern modeling methods.

### ABSTRACT

*This article reveals pedagogical conditions aimed at the effective instruction of prospective teacher of biology: strengthening of inter-subject links between the curricula for studying methods of teaching chemistry and biology in a pedagogical higher educational institution; improvement of the curricula for studying methods of teaching chemistry and biology in a pedagogical higher educational institution due to introduction of pedagogical teaching technologies.*

**KEYWORDS:** *Inter-Subject Links, Pedagogical Technologies, Chemistry, Biology, Prospective Teacher, Pedagogical Conditions.*

### INTRODUCTION

Having gained independence, Uzbekistan is experiencing a new period of socio-economic development in order to gain a foothold in the world. At the same time, the Concept of Education for Sustainable Development, adopted globally until 2030, emphasizes that "the science of

chemistry has a practical, convenient and sustainable solution that is closely connected with other areas of achieving sustainable development” [1].

In the process of ongoing reforms, new requirements for the content of education are moving in the context of professional training of teachers. In this regard, graduates of vocational schools should be competitive in the labor market. A future teacher should be able to organize not only collective, but also individual activities of students, as well as, comprehending innovative pedagogical technologies, creatively implement them in his own professional pedagogical activity.

In this regard, a higher school is able to prepare teaching staff adapted to work in a modern school. A future biology teacher is required to possess modern technologies of pedagogical influence on students, which can increase the attractiveness of studying the basics of biology with the prospects of the individual in further professional education. The preparation of a biology teacher for work at school is intensively conducted at the Kokand State Pedagogical Institute [10; -pp. 191-194]. Modern scientific and pedagogical experience of teaching biology teachers at the university has shown that it is necessary to clarify and rethink in many ways the goals, content, forms and methods of preparing a future biology teacher for work at school. One of the conditions for such improvement is the establishment of a system of holistic and continuous training for students of a pedagogical university, including the specialty “Chemistry and Biology” [2; -pp.131-132].

### THE MAIN FINDINGS AND RESULTS

In this direction, the following trends have developed, aimed at effectively preparing the future biology teacher:

- 1) The strengthening of interdisciplinary relations between courses in teaching chemistry and biology at a pedagogical university and special-scientific disciplines;
- 2) Improvement of courses in teaching chemistry and biology at a pedagogical university through the introduction of more effective pedagogical teaching technologies.

One of the basic scientific disciplines studied by students of chemical and biological specialties of a pedagogical university is the course “Chemistry”. Its importance for teacher training is increasing due to an increase in the volume of biochemical content in school courses in organic chemistry and general biology. However, the methodological potential of the course, based on inter-subject communication, is not used to the full extent in a pedagogical university.

Consider each of the trends we highlighted in preparing the future biology teacher for pedagogical activity.

In our study, by interdisciplinary relations we will understand the reflection of relations between sciences, in the content of educational material, in its structure and teaching methods [3; pp.10-20].

A survey of the faculty of the Kokand State Pedagogical Institute showed that 76% of respondents attribute the implementation of interdisciplinary ties in the educational and cognitive activities of students to promising areas of activation of this activity, contributing to the improvement of the content of higher education [9; pp. 223-224].

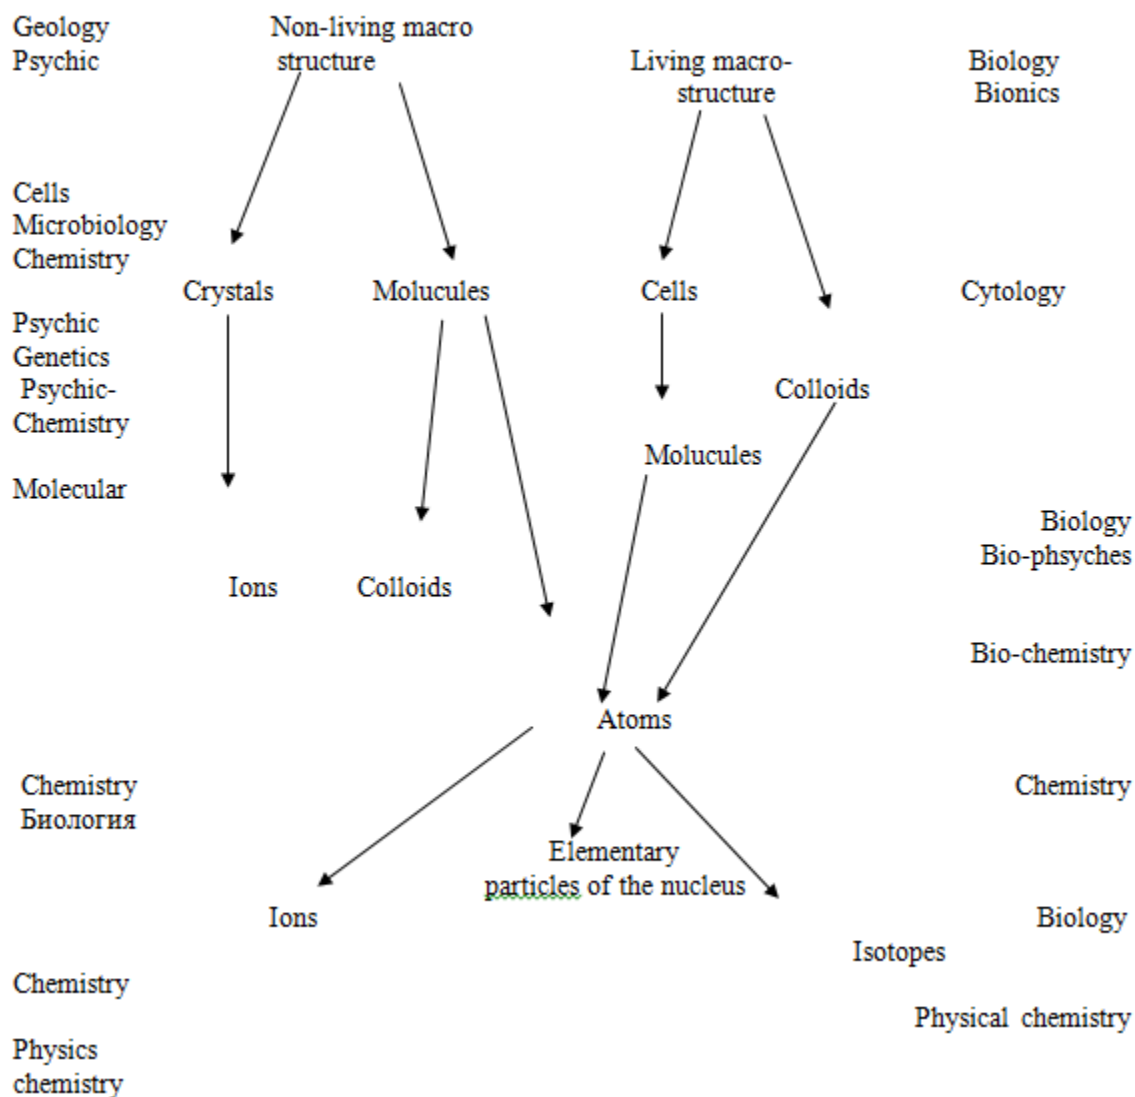

Interdisciplinary integration is a combination of knowledge, conviction and practical action at all stages of specialist training, a synthesis of all forms of classes regarding each specific goal of education at a university.

It is indisputable that the natural sciences are in organic connection with each other, i.e. such a connection in which they “relate to the very essence, the internal integrity of something” [5; P.459].

V.T. Fomenko identified types of interdisciplinary communication by the way content is deployed over time. “Vertical” interdisciplinary communication - logical and temporal relations do not coincide. “Horizontal” connection - blocks of selected disciplines are studied simultaneously, in parallel, but with varying degrees of interpenetration. [4; pp. 208-209]. Horizontal interdisciplinary communication involves the identification of several major courses, which include other courses. Each discipline is divided into block modules. Vertical interdisciplinary communication determines the sequence of training at different levels of training, as well as a unified methodology, methodology, terminology of the approach to the study of the cycle of natural sciences. In this case, it is necessary to carry out organizational and methodological measures, including editing the existing curricula, covering the interconnection of natural science disciplines. The foregoing makes it necessary to prepare the future biology teacher for the ability to develop an individual plan for the implementation of inter-subject communications in biological courses. This requires knowledge of the methodology of the teacher’s creative work, which includes a number of stages:

- 1) Studying the section "Inter-subject communications" for each biological course and supporting topics from programs and textbooks of other subjects, reading additional scientific, popular science and methodological literature;
- 2) Lesson planning of inter-subject communications using course and thematic plans;
- 3) The development of tools and teaching methods for the implementation of inter-subject communications in specific lessons;
- 4) Development of methods for the preparation and conduct of integrated forms of organization of training;
- 5) The development of methods for monitoring and evaluating the results of the implementation of inter-subject communications in training.

As you know, chemistry and biology are related sciences in the educational process of higher pedagogical educational institutions. They complement each other and fully participate in the formation of a universal natural-scientific picture of the world [7; pp. 58-59]. Given the fact that the material world is divided into inanimate and living nature, the role and relationship of the natural sciences can be represented as follows:

**Non-living nature****Live nature****RESULTS AND DISCUSSION**

An analysis of current state educational standards (GOS) and the content of education in the field of education “Methods of Teaching Chemistry and Biology” show that there is a whole system of concepts that is universal for the sciences of the natural science cycle:

1. Substances and their elemental components.
2. Elemental units of substances involved in occurring phenomena and processes.
3. Material units that provide the relationship of animate and inanimate nature.

We consider it appropriate to carry out inter-subject communications in the teaching of chemical and biological disciplines in the following areas:

1. The structure of substances and mechanisms of occurring phenomena and processes that are universal for chemical and biological sciences.
2. Generality in the essence of the laws available in the scientific foundation of chemistry and biology.
3. The relationship and complementarity of theories of chemistry and biology.
4. The use of chemical knowledge to explain the mechanisms of biochemical processes.
5. The use of biological knowledge for the formation of chemical, environmental and environmental concepts.
6. The mutual application of the methods, means and methods of these sciences in the teaching of chemistry and biology.

Inter-subject communications of chemistry and biology, as a powerful lever, can fruitfully serve to form a natural-science picture of the world and a holistic and general scientific worldview [8; pp.78-83].

Interdisciplinary connections at the level of facts (actual) are the establishment of the similarity of facts, the use of general facts studied in chemistry, biology courses, and their comprehensive consideration in order to generalize knowledge about individual phenomena, processes and objects of nature. So, in teaching biology and chemistry, future teachers can use data on the chemical composition of the human body. Conceptual inter-subject communications are the expansion and deepening of the attributes of subject concepts and the formation of concepts common to related subjects (general subjects). The general concepts in the courses of the natural science cycle include the concepts of the theory of the structure of substances - body, substance, composition, molecule, structure, property, as well as general concepts - phenomenon, process, energy, etc.

## CONCLUSION

These concepts are widely used in the study of the processes of assimilation and dissimilation. Moreover, they deepen, concretize on biological material and acquire a generalized, general scientific character. A number of general biological concepts reflect such complex processes of living nature that it is impossible to disclose even at the first stage of their introduction without involving chemical concepts. So, the concept of photosynthesis has developed in science as a result of studying this process by plant physiology and borderline sciences - biophysics and biochemistry. Theoretical interdisciplinary communication is the development of the basic principles of general scientific theories and laws studied in the lessons on related subjects, with the aim of assuming students a holistic theory.

### **ABSTRACT**

*Today's business success hinges on strategic agility and the ability to execute in a timely manner. In a continually evolving global business environment, opportunities for growth are juxtaposed against a shrinking pool of high-performing Talent that can quickly seize those opportunities. The ability to anticipate Talent needs, optimize a Talented workforce, and keep retention rates high—despite constant change—is the key to a company's sustainable competitive advantage. According to the Price Waterhouse Coopers 11th Annual Global CEO Survey, "access to Talent" remains a major issue. Less than half of all CEOs agreed that their HR teams were equipped to handle the change required to compete for Talent. Talent Management is one of the biggest challenges facing organisations this century. The demand for superior Talent far outweighs supply, and more and more companies are feeling the impact as they compete in the global market (Frank & Taylor, 2004). Globalization, workplace reform and changes in the demographic composition of the workforce have affected how Talent needs to be managed (Nankervis, Compton & Baird, 2005). These factors also reinforce the importance of having a flexible Talent Management system. The growth potential of organisations worldwide depends on the ability of companies to have the right people, in the right place at the right time. Research demonstrates that companies with enlightened Talent Management policies have higher returns on sales, investments, assets and equity (Caudron, 2001). "Savvy companies understand the competitive value of Talented people and spend considerable time identifying and recruiting high caliber individuals wherever they can be found. The trouble is that too many companies pay too little attention to allocating their internal Talent resources effectively." (Bryan, Joyce & Weiss, 2006)*

**This research paper aims to understand :**

1. The dynamics of Talent Management
2. Significance of Talent Management in IT Industry
- 3What are the fundamental talent acquisition practices followed in the organization

**RESEARCH METHODOLOGY:**

**Population:** Large Scale IT Industries in Pune Region Sampling frame: Software companies in software development, services, applications management etc. **Sampling Method:** Convenience sampling **Sample Size:** 30 large scale IT Companies in Pune Region **Data Analysis:** was conducted by ascertaining the population proportion and frequencies – maximum data points for a particular question. 1. The dynamics of Talent Management
2. Significance of Talent Management in IT Industry
- 3What are the fundamental talent acquisition practices followed in the organization

## Business Challenges

In a world where knowledge doubles every year and skills have a half-life of 2.5 to 5 years, leaders need constant development. This ongoing need to develop leaders is also driven by the changing expectations of the workforce and the evolving challenges businesses are facing, including two major themes: globalization and the speed and extent of technological change and innovation.

Talent acquisition and access continues to be one of the most important things companies do. In a skills-constrained environment, a company's ability to find, attract, and access highly skilled people is critical to success. This area is going through a significant disruption as a result of globalization, technology, social media, changing workforce expectations, and the shrinking half-life of skills and technical knowledge. Tools such as LinkedIn, Facebook, Twitter, and others are changing recruiting into a strategic function focused on marketing, branding, and new tools and technologies.

**Figure 1. Perceived urgency of 12 global trends**

## II. Talent Management for the New Generation

Most of the organizations do not feel much about managing their Talent. Here is why they should

- Typically, labor accounts for about 65 % of every business in any industry. The percentage is more for labor intensive businesses for example those in manufacturing.
- The performance difference between Talented and lesser talented employees is huge.
- Employees and how they are managed is the most important source of most organizational competencies and strengths.

Talent Management is not only important for hiring people as per the need, it is also important for determining when to hire. In the traditional model of hiring supply meant developing people internally for future. There was an upfront investment in candidates recovered through an enhanced performance over time. This was a good perspective; there were equal chances of making and losing money by investing in your people.

Hiring from outside or temporary employment on the other hand was seen as something that cannot fetch you substantial returns and or act as potential source of knowledge and competitive advantage.

These trends lost sheen over a period of time with the rise of the great corporate career. Consider this - In 1950's — 1960's an average fortune 500 executive had been with his/her company for average 24 years. Not anymore, the traditional and lifetime model was breaking up and giving way to a new model. Outside hiring increased along with the increased employee turnover.

The change was brought over by organizations failing to plan. Increased pressures from market for speed of delivery and variety of goods, the third wave of corporate restructuring and failure to keep up with new management practices brought chaos to planning.

In a survey conducted in 2003 by SHRM it was found out that 60% of the firms have no succession planning of any kind. Surprisingly more than 70 % had it in that late 1970's! IPMA-HR survey of the workforce as a whole in the year 2004 found out 63 % have no workforce planning of any kind; the same was an integral component of virtually all companies in 1950's. A new trend had taken shape, shortage - go outside and hire!

On the employee side, the trend of lifetime employment has diminished now. Talking in terms of the percentage of lifetime employees - in 1980's 53 % of employees worked as life time employees, the same decreased to 34 % in 2009. The questions that arises is how do we manage the next generation employees and what exactly do people expect from jobs.

The new generation employees it seems do not believe in the old philosophy of 'we will stick around till you need us'. They are more enterprising and will to take risks in their career; they accept failures easily and are prepared for them. People now prefer flat hierarchies, build careers around jobs and want a clear performance management system.

There are work-life balance concerns, issues of job flexibility all of which calls for renewing the social contract with the employees. The employees, their psyche, their beliefs and most important their attitudes are changing - Talent Management can't afford to sit back. It needs evolution.

### **III Talent Management in IT Industries:**

Today where the new mantra for the development is "Information Technology", this mantra has changed the image of India in the global arena. Even if the results of development of IT in India are more visible after globalization, its development got rooted almost before 50 years

Panchamukhi (2000, 840) noted this potential of IT industry and opined "*If the sectors of agriculture, knowledge and information industries are encouraged to grow in a consistent manner then the problems of poverty, unemployment can be solved*". Further as rightly observed by Unni and Rani (2000) IT allows leapfrogging which can help countries skip generations of technology and stages of growth and place them directly in a service-dominated economy. That's why even without having a fully matured manufacturing sector, India is experiencing shift in its economy due to its service sector development which is dominated by IT.

**Information technology (IT)** industry in India has played a key role in putting India on the global map. IT industry in India has been one of the most significant growth contributors for the Indian economy. The industry has played a significant role in transforming India's image from a slow moving bureaucratic economy to a land of innovative entrepreneurs and a global player in providing world class technology solutions and business services. The industry has helped India transform from a rural and agriculture-based economy to a knowledge based economy.

Information Technology has made possible information access at gigabit speeds. It has made tremendous impact on the lives of millions of people who are poor, marginalized and living in rural and far flung topographies. Internet has made revolutionary changes with possibilities of e-government measures like e-health, e-education, e-agriculture, etc. Today, whether its filing Income Tax returns or applying for passports online or railway e-ticketing, it just need few clicks of the mouse. India's IT potential is on a steady march towards global competitiveness, improving defense capabilities and meeting up energy and environmental challenges amongst others.

India's Information Technology industry is expected to touch the Rs 1.75 lakh crore mark by 2016, helped by rise in IT services and software segments, a report by Boston Consulting Group (BSG) said.

"The domestic IT industry is expected to grow at 12 per cent over next 4 years, reaching a size of Rs 1.75 lakh crore by 2016, driven primarily by the services and software segments," the BCG-CII report added.

#### IV. Challenges faced by Indian IT Industry

Still this growth is not free from some inherent problems and criticisms. **Sustainability of this growth itself is questioned by the researchers for several reasons.** Too much export orientation besides the composition and direction is a cause of concern.

There lies huge gap between actual and potential performance. On an average the Indian software industry is utilizing less than 50% of their potentiality. The average technical efficiency of Indian software companies recorded highest at 45.22% in 1996 and it declined thereafter. Further they found more of a negative effect on the efficiency of software companies in India due to deregulation. Inadequate attention to the domestic market" as Kumar and Joseph (2005) observed, the Enclave nature of the operation of IT industry generated little knowledge spill over for the domestic economy. Emerging competitors like Ireland, Canada, China, Mexico, Russia, Philippines, Thailand and other countries are in the race. It is posing serious threat to the Indian IT industry. Because attrition pushing up the manpower cost which is eroding the cost advantages and other countries are becoming comparatively cheap. Problem of attrition and shortage of manpower is haunting IT industry. After recession again it reached double digit. Shifting of companies from employees in search of better salary, status, growth opportunities and other reason is quite common. This is increasing the costs of the firms in two ways. To retain the employees firms have to increase their expenditure on pay and perks at another side attrition leads to increased HR costs for further recruitment, training etc. Already Indian IT industry is experiencing the shortage of technical manpower. And as per NASSCOM the shortage is of 2 million for the year 2008

#### V. RESEARCH METHODOLOGY

##### Why Talent Acquisition?

We define Talent acquisition as "a strategic approach to identifying, attracting and onboarding top talent to efficiently and effectively meet dynamic business needs."

An organization has to develop blended talent acquisition strategies to attract and hire top candidates — creating sourcing plans that include social media and employer branding. You also have to find recruitment technology not only to reach candidates but also to assess and provide analytics on those candidates. Find the right individuals who will transform the company, and build comprehensive talent recruitment plans that unify business goals and talent aspirations.

- It is estimated that at least 1/3 of business failures are due to poor hiring decisions and inability to attract and retain the right talent.
- The average cost of replacing a manager or professional is 1.5 to 3 times salary.
- The cost of working around an under-performer can run as high as six figures

- The cost of consistently failing to attract and retain good talent – including declining productivity, morale, culture and reputation - is inestimable.
- Each vacant position costs an organization Rs. 60,000 on average. For some management positions, it can easily run into six figures...

Bad Hire Calculator	
<b>Cost to Advertise the Position</b>	
4 Number of ads placed	\$ 550.00 Price of each ad

<b>Recalculate</b>	
<b>Total Cost of a Bad Hire</b>	
\$ 50,379.15	

\*Averages were compiled from: *USA Today* 2004 Classified Advertising Rates; *Workforce Management*, March 2003: "Estimating the Financial Value of Staffing-Assessment Tools" by Dr. Charles Handler and Dr. Steven Hunt; 2002 SHRM/EMA Cost Per Hire Survey; *HR Magazine*, November 2003: "HR Compensation Special Report"; *Workforce*, January 2001: "The Importance of Cost Per Hire" by Barbara Davison.

Despite continually high unemployment rates, employers are still challenged with acquiring qualified talent, as evidenced in a recent CareerBuilder survey. More than half of employers from the world's ten largest economies reported that they have experienced a bad hire. In the United States, the rates are even higher: two out of three U.S. employers reported making a hire that ended up not meeting expectations, or was a poor fit for the position. Emerging economies, like China, India, Brazil, and Russia, had greater incidences of bad hires, with rates near 90 percent. The impact of a poor hire can reverberate throughout the organization and can be costly. In the United States, 27 percent of employers reported that the cost of a bad hire exceeded \$50,000.

Other costs of a bad hire cited by respondents to the survey include:

### Research Question:

What are the fundamental talent acquisition practices followed in the organization?

**Geographical Scope:** The study was carried out in large scale IT companies in Pune Region.

### Data Sources:

**Primary Data :** In this research the primary data was collected by interviewing the HR Managers/Heads through structured questionnaire.

**Secondary Data:** The secondary data was collected through various research Journals/ text books/ reference Journals and Internet

### Sampling:

**Population:** Large Scale IT Industries in Pune Region

**Sampling frame:** Software companies in software development, services, applications management etc.

**Sampling Method:** Convenience Sampling

**Sample Size:** 30 large scale IT Companies in Pune Region

**Data Analysis:** was conducted by ascertaining the population proportion and frequencies – maximum data points for a particular question. The interpretation was then based on the frequency outcomes.

**VI. Data Analysis****Data MAP of Strengths' & Weaknesses of factors for : 'Talent Acquisition Practices'.**

Sr. No	Process	Frequency Parameter (Maximum)	Frequency	% companies	Strong/ Weak
1	We have an effective internal job posting process and policy that facilitates growth and movement within the organization	'Often'.	19%, 54%	36.66% have effective internal job posting	Weak
2	We provide incentives for employees to refer candidates	'Always'.	42%, 78%).	60% provide incentives	Moderate
3	We have processes in place that ensure compliance with government regulations and laws	'Always'.	46%, 81%).	63.33% have processes in place	Moderate
4	<b>Use of Technology and Integration</b> Leverage recruitment technology in all aspects of the recruitment process	'Agree'.	26%, 61%	43.33% leverage recruitment technology	Weak
5	Interview job applicants using competency-based and/or behaviorally-based techniques	'Agree'.	35%, 71%	53.33% -interview on competency/behaviorally based techniques	Weak

**H<sub>0</sub>:** Talent Acquisition practices are practiced in IT companies

**H<sub>a</sub>:** Talent Acquisition practices are less practiced in IT companies

**From the above data analysis we can conclude that all the factors in “ Talent Acquisition Factors are weak “ hence H<sub>0</sub> is rejected and H<sub>a</sub> is accepted**

## VII. FINDINGS

### **Part1: Fundamental Talent Acquisition Practices**

1. 36.66% have effective internal job posting
2. 60% always provide incentives for employees to refer candidates
3. 63.33% 'Always'. have processes in place that ensure compliance with government regulations and laws

### **Part2: Use of Technology and Integration**

1. 43.33% agree Leverage recruitment technology in all aspects of the recruitment process
2. 53.33% Agree. Interview job applicants using competency-based and/or behaviorally-based techniques
3. 40% Agree Linking candidate screening criteria to other talent management processes such as performance management, development, and succession planning

### **Part3: Attracting Quality Candidates**

1. 40% agree to have a strong pipeline of diverse candidates
2. 43.33% Agree, high quality applicants tend to accept their job offers
3. 40% Agree, on consistently attracting high quality applicants

**Part4: Recruiting Metrics Tracked**

1. 26.66% track new hire first year performance rating, between '80 – 100%'.
2. 23.33% track Percent of critical/key positions filled '60 – 80%'
3. 33.33% track metric percent of external hires between '40 – 60%'
4. 23.33% track diverse hires almost equal distribution to all categories
5. 26.66% offer acceptance rate between 80-100%
6. 40% have avoided giving answer 36.66% have said that between 40- 60% applicants per hire
7. 26.66% say that they require 40 – 60 days to fill open positions
8. 36.66% have not answered. 30% reported rehire percent between 3-5%
9. 26.66% companies reported referral hiring between 20% and above
10. 23.33% reported internal management hiring between 10 -20% 36.66% have not answered this question

**HR innovations in Talent Acquisitions:**

Companies face an urgent need to develop leaders at all levels—from bringing younger leaders online faster to developing leaders globally to keeping senior leaders relevant and engaged longer. Leadership remains the No. 1 talent issue facing organizations around the world. 21st-century leadership is different. Companies face new leadership challenges, including developing millennial and multiple generations of leaders, meeting the demand for leaders with global fluency and flexibility, building the ability to innovate and inspire others to perform, and acquiring new levels of understanding of rapidly changing technologies and new disciplines and fields.

Talent Acquisition has evolved from a tactical back office process to a strategic endeavour that directly impacts organizational growth. Organizations struggling to identify and attract talent must rethink their current strategies in order to align with corporate objectives

**Following HR innovations can strengthen Talent Acquisition process in the organizations.****Online Candidate Assessments**

To ensure that managers see candidate slates that include high quality prospects, hiring managers are relying more heavily on technology for initial screening. More than ever, candidates are being required to complete online forms to help determine skill sets.

**Shortened Hiring Process**

Delays in the hiring process wastes time and virtually assures losing talented candidates. To remedy this, many companies are taking steps to streamline their hiring process by eliminating unnecessary steps and multiple rounds of interviewing.

**Pursuit of Global Leaders**

Due to continued globalization and the demand for top skills and management experience, companies are on the prowl for global leaders at a greater rate. Companies are seeking to recruit professionals with global exposure, corporate acumen and cultural understanding.

**Growing Importance of Soft Skills**

Companies are requiring more from candidates than academics, knowledge and experience. They are looking for the right set of "soft skills" that will complement their company culture and ensure high performance on the job.

**Mobile Recruiting**

Through mobile recruiting, hiring managers are able to reach out to prospective talent through a variety of mobile devices. It is a very effective way for hiring managers to keep in touch with job seekers anytime and anywhere.

**Employer Branding**

More and more companies are learning how to effectively communicate their employment brands through social media outlets. Facebook and Twitter are the favorites. However, their content needs to improve. More often than not, their posts are a bit boring and self-promoting when they should be interesting and engaging.

**Positive Candidate Experience**

Creating a positive candidate experience is helping companies to attract the best talent and stay competitive in the job market. A positive candidate experience includes everything from an easy to navigate website and career page, favorable social media presence, pleasant interactions with personnel, shortened interview process as well as a smooth on-boarding process.

**Behavioral Interviews**

Based on the premise that past performance is the best predictor of future performance, behavioral interviews assess how a candidate deals with situations in the workplace. Companies utilizing behavioral interviews are able to better determine if there is a fit between the skills of a candidate and the position.

**CONCLUSION:**

As workforce demographics shift and average employee tenure shrinks, the competition for hiring the best job candidates is fierce and getting more so every day. As such, human capital management (HCM) directors and recruitment professionals face a host of challenges, including:

- Difficulty attracting “best fit” job candidates to the organization.
- Inability to reach candidates that fit job profiles for critical roles at the moment of need.
- Frustration of desirable candidates due to complex processes.
- Misalignment of localized recruitment and hiring processes with the needs of a global organization.
- Inflated cost-per-hire or inability to assess talent acquisition costs.

Today, it's more important than ever for employers to have strategies in place to fill key roles within their organizations. Most employers are aware that talent is no longer available on demand, and that talent acquisition strategies require a forward-thinking approach. According to Manpower Group's 2013 Talent Shortage Survey, 35 percent of employers worldwide are having trouble finding staff with the right skills. When organizations don't have the right talent at the

right time, the cost comes in the form of missed opportunities, dissatisfied clients and a negative impact on the bottom line. The companies that come out on top will be the ones that plan for talent shortages today and learn when it's best to buy talent (hiring from outside the company) and when it's more effective to build it (creating a talent pipeline from within the organization).

## ADAPTATION OF MODERN TEACHING TASKS ON THE DEVELOPMENT SPEAKING

**Yusupov Azat Atakhanovich\***

\* Teacher of the Uzbek Language and Literature,  
Karakalpak State University,  
UZBEKISTAN

### ABSTRACT

*The following article deals with the methods of developing modern learning tasks to develop speaking skills in Uzbek language classes in groups of higher education institutions teaching in other languages, the mechanism of formation of listening comprehension, speaking, reading and writing skills through a single text.*

**KEYWORDS:** *Speaking Skills, Development, Modern Assignments, Reading Assignments, Listening Comprehension, Reading, Speaking, and Writing Skills.*

### INTRODUCTION

In higher education institutions, texts are mainly used in a simple conversational style. However, the specialization of the student in other language groups must be taken into account. Introduction of innovative approaches to Uzbek language teaching methods, PISA, PIRLS international assessment requirements should be developed to meet the existing assessment requirements in the world's advanced teaching methods. Of course, these requirements should be based on the specifics of the Uzbek language.

In recent years, a number of scientific and methodological studies have been conducted on the methodology of teaching Uzbek as the state language. The teaching of Uzbek to other speakers began in the late 19th century, leaving some information about teachers who taught Uzbek in Russian-language schools, early curricula, and dictionaries. However, scientific-methodical and educational-methodical research related to the teaching of the Uzbek language in Russian groups began to develop after the 60s of the XX century. Scholars such as H. Asalov, IA Kissen, K. Kholikberdiev, M. Usmanova, E. Azlarov, O. Azizov, G. Sharipov, who worked on the methodology of teaching the Uzbek language during this period, also studied the issues of comparative grammar of the Uzbek and Russian languages. were also engaged in. Scholars such

as R.Yuldashev, R.Tolipova, R.Rasulov, N.Mahmudov, B.Tukhliev, A.Rafiev devoted their activities in the field of teaching the Uzbek language in Russian groups, mainly to the creation of textbooks, manuals, dictionaries. It should be noted that until the 1990s, only a few Methodist scholars were engaged in teaching Uzbek in Russian groups, but after independence, the scope of research in this area expanded, and a number of studies on Uzbek language teaching at various stages of education. In particular, M.Ergasheva, M.Rixsieva, Q.F.Umarova, G.Ahrorova, D.Tashkhodjaeva, G.Muhamadjonova, G.Akhmedova in schools where Russian language of instruction is used to increase the speech of foreign language groups, increase their vocabulary, their text His work on teaching composition has been studied.

In the researches of N.Dadajonova, G.Kurbanova, L.Yu.Akramova, M.Karahojaeva, S.Adilova, M.Juraev, N.Umarova, higher education institutions in Russian groups should enrich the speech of students with professional-sectoral terms, the use of special combinations in the Uzbek language issues of teaching, use of modern pedagogical and computer technologies in Uzbek language lessons. In particular, A.Rafiev on the teaching of Uzbek language in groups with other languages of instruction<sup>1</sup> I.Mirzaev, M.Boltaev for Russian groups; M.Buronov, Sh.Yuldasheva and D.Kabulova conducted a number of scientific and methodological researches for Karakalpak language groups. However, the rapidly evolving textbook, methodical manual and methodological recommendations require modernization and improvement of the content of educational tasks.

Learning tasks do not fully form speech competence in pupils and students. Monographic research on the teaching of the Uzbek language in groups with other languages of instruction in the system of continuing education is carried out systematically by Doctor of Pedagogical Sciences, Professor H. Muhitdinova. It should be noted that this study focuses on the issue of continuity in the content of programs and textbooks in the teaching of the Uzbek language, mainly in Russian groups.<sup>2</sup> H. Mirzohidova thinks about the convenience of teaching phonetics in Uzbek schools in comparison with the Kyrgyz language and sister languages.<sup>3</sup> In this case, G. Khamroev<sup>4</sup> it is worth mentioning the theory of didactic differentiation of exercises and assignments in the course of the lesson. There are two main types of homework assignments used in Uzbek language teaching practice. These are exercises and assignments. In fact, repetitive exercises are almost non-existent in Uzbek language textbooks and manuals. The content of assignments is not as fully specialized in the formation of skills and competencies as in the practice of foreign language teaching. Exercises and assignments, in general, learning assignments should be designed to form speech competence rather than generating knowledge. In teaching Uzbek, the initial lesson should be pronunciation exercises. In doing so, the teacher must, of course, organize the process of comparison based on comparative pronunciation. Then other sections are effectively mastered based on this approach. It is important to keep in mind that a student will usually learn another language or subject based on their native language.

In this study, a bank of non-traditional texts and a modern system of assignments - new methodological recommendations have been developed, which will allow to develop the speaking skills of students in groups taught in other languages through Uzbek language classes.

Modern learning tasks are formed on the basis of texts, so all the criteria should be taken into account when choosing a text.

It is recognized in many countries that **listening comprehension, reading, writing and speaking skills in language learning**, which are recognized in the world experience, allow the development and assessment of the student's speaking competence. In particular, it is bearing fruit in teaching foreign languages in our country. This foreign experience can be used directly in the teaching of Uzbek as a second and state language. If the level of knowledge of the Uzbek language of other nationalities living in Uzbekistan meets the minimum requirements for **listening comprehension, reading, writing and speaking** (as in English, for example), the science of the Uzbek language will fulfill the social order.

Below are examples of modern learning assignments. These learning assignments are an approach designed to develop speaking skills that are easy to assess. Stages of working with the selected text for the lesson:

**I. Reading:** Practice reading the text "The bell that changed my life" about the fact that Jenisbek Piyazov who has achieved a lot despite his young age

Jenisbek Piyazov was born in Nukus in 1988, and has achieved a lot despite his young age: at the age of 19 he was awarded the "Nihol" Prize, at the age of 22 he was awarded the Medal of "Shukhrat", at the age of 23 he was awarded the title of Honored Artist of Karakalpakstan, and at the age of 25 he was awarded the title of Honored Artist of Uzbekistan.

During the meeting, young reporters asked Jenisbek Piyazov various questions:

- What are you doing today?
- There is a lot of work to be done these days, both politically and creatively. Creative trips are like creative meetings.
- It is well known that your live concert in Tashkent caused quite a stir. Do you plan to give a similar concert in Nukus?
- You know, 120 people were behind the concert, they are choir, orchestra and other assistants. Their equipment, machinery, apparatus, lamp supply. There is a lot of work to be done on this. But, God willing, we have a plan: to give a concert in front of the Savitsky State Museum this year.
- What was the last phone call for you?
- The most memorable thing is that they called me and told me that in 2007 I was awarded the Nihol Prize. At that time, no one knew that I was preparing for the opera. Because I have been preparing for 2-3 years. When I said that I was participating in the opera and passed to the republican stage, they didn't pay much attention to me. Here I am, the winner. This is the first time I've been on a plane (laughs) and I can say that that day and the bell were sealed as one of the most memorable events in my life.
- What did you have to give up to reach this level?
- Tchaikovsky said that success depends on 1% talent, 99% hard work. There are people who can show their talent, and with it they can reach many heights. I can't say I have sacrificed much to reach this level. Because when you come up with something out of the ordinary, then they have to re-think their position. If you can be where you need to be. Show me what you can do! Don't be shy. A person is not jealous of anyone. That's the way to go. 30

- What qualities do people enjoy without you?

"I don't choose people, but I don't approach them." In addition to my family members, I have a number of relatives. I feel like I can't get my relationship with someone who once abused my trust back to normal.

During the conversation, Jenisbek Piyazov said that a gala concert dedicated to the works of Muslim Magomaev will be held on April 21-22 at the Istiqlolsan Art Palace. I would like to mention that Jenisbek Piyazov won a grant at the Muslim Magomaev Opera Competition in Moscow in 2012. It was because of his respect for the singer's work that he named his son Muslim.

## **II Speaking:**

Say an important sentence in the text.

Please tell, what's the story of them big puppies .....

Read lines 30-35 and tell yourself what qualities make you happy and what you don't like.

## **III Grammar:**

When composing a biographical text, the part of speech is in the first person singular, mainly in the past tense:

I was accepted to study, I was born.

I Read; we read

II Read; did you read

III Read ; read.

## **III Writing:**

In lines 15-20, write the verbs that have the past tense suffix separately.

Read lines 25-30 and express your opinion about talent and hard work in one sentence.

Based on the content of the text, state in writing what the secret to success using what you have learned, write a short biography text about yourself.

In conclusion, when a modern system of assignments is developed, listening comprehension, speaking, reading and writing assignments are used systematically in existing textbooks and manuals, and ethnographic materials are used effectively in teaching Uzbek in other language groups, students' interest in lessons will increase. At the same time, a sense of national pride and patriotism emerges, recognizing the importance of the material and spiritual heritage left by our ancestors. The study used a modern approach to working with text. It was found that the presented methodological recommendations, along with the study of the Uzbek language, allow students to think logically, to demonstrate the skills learned in the classroom, to stimulate interest in reading and work, to evaluate their own performance. In order to develop students' listening comprehension, speaking, reading and writing skills, the topics of the selected texts should be relevant to the reader, relevant to the requirements of the time, and examples of all speech styles should be available. In the lessons, students should be age-appropriate, motivated to read with enthusiasm to strive for great goals. If the teacher directs the student to think in a creative approach to the text, he will learn the language and improve as a person.

## THE USE OF INTERACTIVE METHODS IN THE DEVELOPMENT OF CRITICAL AND CREATIVE THINKING

Khidirov Sukhrob Norbutayevich\*

\*International Islamic Academy,  
UZBEKISTAN

### ABSTRACT

*This article raises the problem of that the essential traditional system of communicative preparation of students is isolated from life and work of a specialist. It is over-theorized, limited in terms of time and content, which is manifested in the fact that students are deficient in communication, suffer from the lack of its active methods; form the insufficient level of the students. Emphasized in the article the value of the development of the technological cards of the lessons, which combines the lesson plan with the dosage time, purpose and objectives, conceptual contents, methods, techniques and means, guaranteed result, the list of necessary literature and sources, and other components of the lesson.*

**KEYWORDS:** *The Critical Thinking, The Creative Thinking, Training, Brain Storm, The Education System, Syndikate, Modern, Method, Teacher, A Method Of Discussion.*

### INTRODUCTION

New millennium determines hopes of people for favorable changes, expectations accomplishment of far-reaching plans. It is difficult to speak about plans for the future without education. In many respects the education defines human life, his prosperity and the main thing - an opportunity of self-realization. Moral and intellectual principles are necessary for the person for his most full development in compliance with his abilities and inclinations. Correct thinking and kind customs – are a basis of the education formed already in the 8<sup>th</sup> century.

To bring up the free moral person, it is necessary, first of all, to aspire to form and develop intellectual skills of independent critical and creative thinking.

The critical thinking allows to the person to analyze the information, to select the necessary facts, to comprehend them logically, to draw conclusions and summaries, allows to form own point of view on various social, cultural and political phenomena of the life.

The creative thinking allows to the person to predict development of those or other phenomena, events, to generate own ideas, to search for arguments in confirmation of the position.

The development of the critical and independent creative thinking should become a basis of education and development of the person. In this sense we understand essence of the developing training. The 21<sup>st</sup> century demands essentially new approaches to the education. The training should be developing in contest of the plan for development of the independent critical and creative thinking. But it is insufficient the presence in the system of teacher and a book, which reflecting one point of view accepted in certain society for reaching of this purpose. It is necessary wide field of information activity, various sources of the information, various sights, the points of view on the same problem, inducing pupils to independent thinking, search of own argued position. It needs new methods and means of the training for reaching of this purpose.

The education system – is integral, but open system, one of which essential characteristics is its self-descriptiveness. This information system does not mean that in the education system is supposed only the mastering of the information. The main thing is an active work with the information in which basis is provided independent critical and creative thinking. Now it is considered insufficient the purpose of transfer and mastering of the experience which has been saved up by mankind. Only an active purchase of own experience of knowledge, independent purchase all new knowledge on the basis of application of before acquired things can meet needs of modern generation of youth.

“The critical thinking can be formed only on problem statement of the material, necessity of search of the additional information, discrepancy of the points of view” [3]. The creative thinking is formed also at presence of the problem demanding of search of the decision, sometimes original approach, and needs of self-expression. The modern education system, basing on traditional sources of the information and the control of process of knowledge, such as school textbooks, the manuals, sold under the direction of the teacher, demands an expansion of the information field. Such system demands also other didactic methods, other methods and technologies of the training adequate to the personal-guided approach in the education.

Pupils receive the information besides the specified sources from mass media, global telecommunication network like Internet, which's recognition, comprehension and analysis also it is necessary the existence of the critical thinking.

For the formation of the critical and creative thinking it is possible to result some strategy of the pedagogical technologies which are activating an independence of the pupils during the training.

### **1. A method of discussion.**

Discussion is an exchange of opinions, ideas or knowledge between the teacher and students under the certain circuit and with observance of the order.

Advantages of the discussion:

- Understanding of many factors and motives;
- Persuasiveness of conclusions;
- Activation of students.

**2. Brain storm.**

Brain storm – is a well-known, widely used method of the decision of the problems, stimulating participants to use own imagination and creativity. It helps to find the big number of decisions of any set problem.

Rules on carrying out of brain storm:

1. During considering it is not allowed to do any estimation.
2. It is necessary to encourage all on consideration of big circle of the most unexpected ideas
3. Everyone can be based on another's ideas and changes of them.
4. All ideas are fixed by group of people which are not participating in discussion

**3. Syndicates, as a method of the training.**

Syndicate (subgroups) are created in the big group for discussion, carrying out of exercises or business games, work on the project or other practical work. In syndicates it is provided personal participation of everyone in work, and it pushes each pupil to considerate the phenomena, well determines knowledge of pupils.

**4. Role-playing games (RPG).**

This method allows to beat and dramatize, that what can take place in real vital situation and to discuss, analyze the basic revelations of the problem.

Advantages of RPG:

- Storage;
- Availability;
- Entertaining character;
- Immersion in process of the training;
- Alive, visual obviousness;
- To reveal strong and weaknesses of pupils.

In the conclusion it is possible to note the statement of remarkable teacher Ya.A.Komenskiy "...the method of the training should reduce difficulties of the training so that it did not raise in pupils displeasures and not avert them from the further learning"[4].

## ORGANIZATION OF INNOVATIVE APPROACHES TO METHODS OF TEACHING MATHEMATICS

**Kadirova Charos Turobovna\***

\*Teacher of "Definite Subjects",  
Department Chirchik state Pedagogical Institute,  
Tashkent region, UZBEKISTAN

### ABSTRACT

*The following article deals with the organization of an innovative approach on improving the effectiveness of teaching Mathematics with sources which students study. They stressed the need to pay special attention to the development of the primary education system, which is the main link in the upbringing of a harmoniously developed generation with a high level of knowledge and spirituality. The need for innovative pedagogical activity in society, culture and education in modern conditions is determined by a number of factors. Socio-economic changes that require radical changes in the education system, innovations in the education system, the need to use methods and technologies in organizing the educational process. This, in turn, has a positive effect on improving the quality and effectiveness of training. Also, one type of pedagogical innovation is the use of interactive methods to increase the interest of students in science. Increasing interest in science means achieving the goal set in the lesson.*

**KEYWORDS:** *Method, Innovative Education, Explanation, Analysis, Comparison, Problematic.*

### INTRODUCTION

"Innovative education" usually means the introduction of new (useful) elements into the educational process. Therefore, innovation in education is directly related to changes in the system. Such changes in the education system: purpose, content, method, technology, form of organization and management system, specificity of pedagogical activity and the organization of the learning process, the system of monitoring and evaluation of educational levels, teaching aids, the system of educational work, teaching depending on the plan and curriculum, student and teacher activities. The need for innovative pedagogical activity in society, culture and education in modern conditions is determined by a number of factors. Socio-economic changes

that require radical changes in the education system, innovations in the education system, the need to use methods and technologies in organizing the educational process. Innovative orientation of pedagogical activity is manifested as a means of updating educational policy, strengthening humanistic ideas through changes in the amount and composition of educational subjects in education, the introduction of new subjects that require regular organizational innovations in the education system. In such a situation, pedagogical knowledge and status among teachers will increase, and the professional skills of teachers will increase significantly. A change in the approach of educators to the application and assimilation of innovations. In conditions where the educational process requires strict adherence to time norms, teachers had certain limits not only in the voluntary choice of programs and textbooks, but also in the choice of methods and tools in their pedagogical activities. Today's innovative pedagogical activity is noteworthy for its selective and research nature. They stressed the need to pay special attention to the development of the primary education system, which is the main link in the upbringing of a harmoniously developed generation with a high level of knowledge and spirituality. To solve these problems, modern teachers need to be able to clearly understand the integrative nature of education, both organizationally and semantically, the integrative orientation of their future careers. In other words, the methodological training of teachers is effective only when viewed from the perspective of an integrative approach. Improving the organization and management of integrated-innovative approaches in education, modern approaches and international experience in the development of primary education, state requirements for their development, educational programs, the most active trends in the development of social competence of teachers and creative potential of primary education to discuss the existing problems in the creation of educational technologies and the work to be done.

The issue of systematically enriching and updating their teaching methods is one of the most important aspects in achieving high results in teaching and education in general. Teaching and learning methods are ways in which teachers and students work together to gain new knowledge, skills, and abilities. Novelty or innovation is characteristic of a person's various professional activities and as a result leads to interest, study and application. Innovations do not arise spontaneously, but emerge as a product of scientific research and the long hard work of qualified educators.

Teachers' abilities and thinking develop. Therefore, teaching methods enriched on the basis of advanced achievements of modern science and technology and information technology play an important role in increasing the effectiveness of education. In order to consciously choose from the existing teaching methods in practice that are relevant to the new content and new tasks of education, it is first necessary to consider all teaching methods and the classification of existing teaching methods. Teaching methods involve organizing, motivating, and supervising the interaction of teacher and students.

Interactive methods are methods that activate learners, encourage independent thinking and become learners at the center of the learning process. In using such techniques, the educator encourages learners to actively participate. Learners participate throughout the process. Interactive techniques include brainstorming, working in small 10 groups, problem situation, referral text, quiz, role play, business game, and more. The advantages of using interactive methods are:

- Leading to better mastery of teaching content;
- Ensuring timely feedback;
- High level of motivation;
- Good recollection of the material covered;
- Improving communication skills;
- Growth of self-esteem;
- Promote the formation of students who can think independently;
- It does not only help to master the content, but also helps to develop critical and logical thinking.

The purpose of any education is to form knowledge and skills and abilities to apply it in practice, as well as the necessary personality traits. As all the components of the goal are realized in the movement of learning activities, it is necessary to use different methods together. Therefore, the most important factor in choosing a method is the didactic function of the lesson. Each class can be selected in order to increase the effectiveness of the lesson, taking into account the age potential of the students and their relevance to the topic. The methods chosen by the students on the sources of knowledge create special conditions for the development of students' thinking. That is, if we consider the following methods:

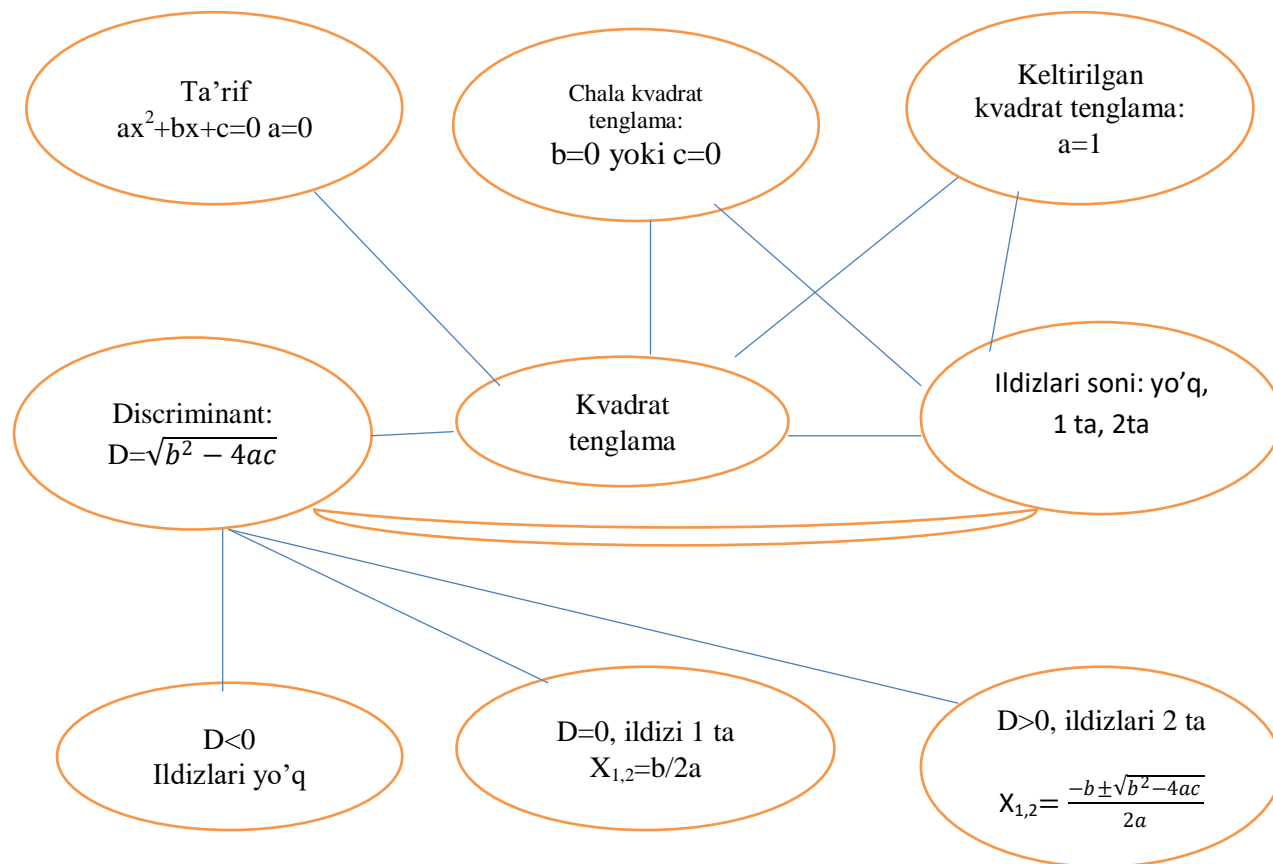

Brainstorming is about encouraging students to work creatively and interact on a common problem. Stages: causing a problematic situation; engaging students to find a solution; hear presentations of various solutions; comparing and selecting solutions, summarizing can be a great help in students working creatively on mathematical exercises, interacting, and understanding them.

Cluster method - *Cluster* (English Cluster - link) - refers to the combination of several single-element elements with specific properties into a single independent object according to their common properties. , helps to understand them and clearly describe their components and interrelationships. In this way, this method also helps to develop memory and self-assessment of the student's own knowledge. This method requires the identification of a structure that allows thinking about the relationships between different ideas. This method serves to ensure that the thinking activity is consistent until the learner has mastered a particular topic in depth and thoroughly.

For high school students, students will be given the following assignment after completing the quadratic equations topics and exercises.

**Task.** Create a concept link that is a “Quadratic equation”.

*At the end of the session you can create a cluster of the following appearance:*

Methods related to the process of forming and perfecting skills and competencies are practical methods. This includes oral and written exercises, practical laboratory work, and some types of independence. Exercises are mainly used as a method of strengthening and applying knowledge. An exercise is a repetitive performance that is organized in a planned way in order to master or reinforce an action. Exercises are used to develop numeracy skills, numeracy skills and competencies, and arithmetic problem solving skills. Exercises should be used in a particular system, following the principle of transition from light to complex. Exercises should develop students' independence in preparation, practice, and creative exercises. The first exercises to strengthen this or that practice, method, problem solving are performed under the guidance of a teacher. The teacher shows this or that help to the students for a while. After that, it is advisable to perform the exercises independently. Exercises of a creative nature include solving problems and examples in different ways, problem-solving on expression, problem-solving according to a short writing scheme, cognitive, puzzle-solving. Quantities are used in practical and laboratory work in the measurement of vapors. Conducting practical and laboratory work allows students to actively acquire knowledge, skills and abilities, elements of independent judgment and inference develop research skills, enrich students' imagination and expand their knowledge. That is why practical and laboratory work is one of the most effective methods of teaching.

**Research Method** The research method is the highest level of mastery. In this method, students conduct individual or joint research on a small issue that has not yet been explored based on their

knowledge, check and prove the correctness or incorrectness of the hypothesis based on the evidence sought.

### **Stages:**

- Identifying the nature of object of interest in the lesson or ask a question about it;
- Collecting of data for its study, research;
- Making assumptions, predictions about the solution of the problem or issue;
- Analyzing and prove the accuracy of each prediction based on the collected data;
- Drawing conclusions;
- To make a presentation in front of the class.

One of the main advantages of interactive teaching is the constant interaction of the teacher with the students. Interactive teaching methods help students to develop their intellectual abilities, analytical thinking and take responsibility for their own learning process.

Interactive teaching in the classroom can be organized at any stage of the study of the content. Different interactive methods can be used in the lesson depending on the content of the teaching material, the level of preparation of the class and other factors.

Any interactive method teaches students to think independently when used correctly and purposefully. Changes and updates in the education system provide students with new knowledge, skills and competencies. Interactive teaching methods affect the learning process. The theoretical foundations of interactive methods have been extensively studied by pedagogical scholars. The use of collaborative teaching in the learning process increases the effectiveness of education

In conclusion, it can be said that innovative education is aimed at developing professional skills in students and improving their quality related knowledge and relevant practical skills are achieved. This, in turn, has a positive effect on improving the quality and effectiveness of training. Also, one type of pedagogical innovation is the use of interactive methods to increase the interest of students in science. Increasing interest in science means achieving the goal set in the lesson.

National University of Uzbekistan named after Mirzo Ulugbek,  
UZBEKISTAN

### ABSTRACT

*The following article deals with the main issues of optimal management and how to achieve the goal of developing creative competence in students. Therefore, the acmeological nature of the teacher's creative activity is reflected in his readiness to accept different children, their real learning abilities, peculiarities of behavior, providing them with appropriate care, regardless of their mental and physical state of health [3]. The proliferation of the need for higher education and the proliferation of personal computers among students remain one of the significant factors leading to a decline in interest in learning mathematics in higher education. This is the basis for the development of creative competence in students. The development of creative competence in students requires special attention to it. The process of working with such students is complicated. During the implementation of mathematical activities (activities aimed at the formation and development of mathematical competence of the subject), the student also realizes creativity, which we believe is the basis for the development of creative competence.*

**KEYWORDS:** Competence, Ability, Creativity, Creative Competence, Differential Equation, Optimal Management.

### INTRODUCTION

In order to improve the education system in our country, great attention is paid to the creation of a mechanism for training highly qualified specialists with modern knowledge and skills to apply pedagogical technologies, who make a worthy contribution to the socio-economic development of our country.

In the training of future professionals, it is important to increase the effectiveness of the process of formation of modern personnel with high culture, practical professional skills, thorough

knowledge of education, teaching methods and evaluation criteria. Therefore, it is necessary to increase the interest of students in education, to increase their motivation for academic subjects. The proliferation of the need for higher education and the proliferation of personal computers among students remain one of the significant factors leading to a decline in interest in learning mathematics in higher education. In this context, the acquisition of mathematical knowledge, skills and abilities of students, the stimulation of interest in science and the activation of independent creative thinking in the formation of mathematical culture are of particular importance. This, in turn, will be the basis for the development of creative competence in future teachers. In solving such problems, it is necessary to use a problematic learning environment.

It is well known that today, in addition to the scientific training of a specialist, it is important to have a number of qualities such as independence, ability to make important decisions, creative approach to any work, constant learning, initiative, cooperation and professional responsibility. This is the basis for the development of creative competence in students. The development of creative competence in students requires special attention to it. The process of working with such students is complicated. The reason is that to spend a lot of time working with them (especially in the early stages), it will be necessary to create conditions for them to be able to tell each other their results (for example, to organize small seminars).

The words "*creativity*" and "*creative*" came to us from the English in the 80-90s of the twentieth century, "*creativity*", "*creative*" and were used first in the business community, and later in other areas of society.

The first use of the term "*creativity*" in 1922 was the ability of a person to break the same stereotypes in thinking A. Simpson additionally states.[1; 632-p.]

The American psychologist Alice Paul Thorens wrote in 1974: "Creativity is the individual's non-standard, creative thinking ability, the individual's passion for problems and solutions, the ability to promote new ideas, the sensitivity to inconsistencies with existing knowledge. gave the definition. This definition can be compared with the definition of creativity in the psychological dictionary: "A person's creative abilities are determined by his intellectual variability, creative development of assumptions and intuition, ability to overcome the same stereotypes, high motivation to seek innovation, personal demand for self-formation." It is understandable that some points of the definitions of creativity and creation (variability of thinking, aspiration to search for novelty, ability to overcome stereotypes) are consistent, which indicates that these phenomena are of the same nature [2].

The starting point for the implementation of creative activity by the subject is his ability to surprise and know, as well as to generate ideas. The development of these personal qualities is the analysis and synthesis of existing information, the search for solutions to "specific" problems in non-traditional situations, work with professional issues that require the transfer of knowledge from other disciplines (especially mathematics), the development of rights, characteristics, relationships, student imagination and occurs in processes such as mold removal.

Creative activity, like others, has its own characteristics that apply to the type of professional activity.

Therefore, the acmeological nature of the teacher's creative activity is reflected in his readiness to accept different children, their real learning abilities, peculiarities of behavior, providing them

with appropriate care, regardless of their mental and physical state of health [3]. Another important aspect for pedagogical skills is the ability to work with another educator to develop a child's individual development program, which requires the ability to design, analyze and synthesize a comfortable learning environment, to enjoy different situations. The ability to master creative thinking skills, while acquiring new (or subjectively new) knowledge in this way, ensures that the teacher works on himself, which is an integral part of pedagogical activity.

This means that future teachers will have to gain creative experience in higher education. Thus, the formation and development of the skills and abilities of the educator listed above is one of the important areas of his professional training.

All this implies the presence of significant professional competence, creativity in the modern specialist. Some modern researchers recognize that a teacher's professional activity consists of creativity, i.e., only a high level of formation or professional competence in a subject.

We believe that not all students will be able to achieve such a result in the learning process, so the preparation for creative activities at that time should be available to every teacher, including primary school teachers. Accordingly, the need to develop creative competence arises as a full-fledged component of the professional competence of the educator.

The analysis of the presented scientific literature allowed to identify the following main directions of the study of problems of formation of creative competencies: formation of the existing creative educational gap in the process of higher pedagogical education; development of creativity in high school students as future entrants in the field of pedagogy; creative pedagogical activity in students and pedagogical training for the implementation of creativity.

The term "creative competence" was originally used by the American scientist Joseph Chilton Pierce to mean the creative mastery of the environment. R. Epstein defined the concept of creative competence as a readiness for adaptive application of acquired knowledge, independent completion of the knowledge system and the pursuit of self-improvement.

I.E. Brakova said about creative competence (future language teachers), she combines the ability to effectively solve professional problems and achieve maximum results, efficiency and success. In this case, the personality trait, which combines motivational, cognitive, operational, oxiological, reflexive components, understands the multifactorial phenomenon [22, p. 18]. It follows from this definition that the author focuses more on solving professional problems, and understanding creativity in terms of activities.

Based on the works of A. G. Nafieva, O. F. Chuprova, I.E. Bryakova, A.M. Davtyan, they recommend the following teacher's definition of creative competence: "knowledge, skills, stable characteristics of the person representing the relativistic experience of innovation in the pedagogical process" [42]. The authors try to integrate the personal and motor aspects of the concept of creativity, which we think is appropriate for this purpose.

In order to organize the development of creative competence of students in the educational process, mathematics teachers are required to have special methodological knowledge and skills, methodological training necessary for pedagogical practice.

Lets say the lesson covers the main issue of optimal management. Suppose we write the motion of an object and the effect of control on that motion by the following system of differential equations:

$$\frac{dx^i}{dt} = f^i(x^1, x^2, \dots, x^n, u^1, \dots, u^r) = f^i(x, u), i = 1, 2, \dots, n \quad (1)$$

Or as a vector,

$$\frac{dx}{dt} = f(x, u) \quad (2)$$

Here  $f(x, u)$  is a vector coordinates  $f^1(x, u), f^2(x, u), \dots, f^n(x, u)$ .  $f^i$  functions vector changes  $x \in X$  and  $u \in U$  determined at arbitrary values, and imagines as unlimited. We consider  $x^1, x^2, \dots, x^n$  as continuously differentiable by variables [6].

If the law of motion  $u = u(t)$  if permissible management is clear, equation will be as:

$$\frac{dx}{dt} = f(x, u(t)), \quad (3)$$

more optional  $x(t_0) = x_0$  the law of motion of the object under initial conditions or (3) equation  $x = x(t)$  solution a value is defined in some range. Really if to us  $t_0 \leq t \leq t_1$  in the range  $u(t)$  management is given,  $\theta_1, \theta_2, \dots, \theta_k$  — their (first type) and if there are breakpoints and lets imagine they are in  $t_0 < \theta_1 < \theta_2 < \dots < \theta_k < t_1$  order, (3) equation  $t_0 \leq t \leq \theta_1$  in the range of  $x(t_0) = x_0$  the initial condition can be said to be a typical Cauchy problem because the right-hand side of equation (3) is continuous in this interval. By  $x(t)$  the following equation  $x(t_0) = x_0$  we define the solution in the initial condition. If this solution is whole  $t_0 \leq t \leq \theta_1$  is defined in the range of  $y$  in  $\theta_1$  point  $x(\theta_1)$  assumes a value, in which case we obtain equation (3)  $\theta_1 \leq t \leq \theta_2$  in the range of  $x(\theta_1)$  we can look at the initial condition. We also define this solution through  $x(t)$ . So,  $x(t)$  solution continuous at all points in its field of detection and  $\theta_1$  “connecting” point as well. If  $x(t)$  solution is wholly defined  $t_0 \leq t \leq \theta_2$  in the range of  $\theta_2$  points  $x(\theta_2)$  we assume a value, we obtain equation (3)  $\theta_2 \leq t \leq \theta_3$  in the range of  $x(\theta_2)$  we can look under the initial condition, etc. Equation (3) obtained by this method  $x(t)$  solution is unlimited and  $\theta_1, \theta_2, \dots, \theta_k$  points will be continuously differentiable at other points. This solution (1) of the system  $x(t_0) = x_0$  satisfying the initial condition  $u(t)$  we call it as suitable management solution. This solution may not be defined in the entire range of  $t_0 \leq t \leq t_1$ .

Lets consider management of  $u(t)$ ,  $t_0 \leq t \leq t_1$  spatial point to pass from  $x_0$  condition to  $x_1$  condition, if (2) or (3) equation  $x(t_0) = x_0$  the one that satisfies the initial condition corresponds to it  $x(t)$  solution entire  $t_0 \leq t \leq t_1$  in the range of  $t_1$  is defined and in the final moment if

passes  $x_1$  point, that if satisfies  $x(t_1) = x_1$  task. Lets imagine Фараз қилайлик, another of  $\frac{\partial f^0}{\partial x^i}$ ,  $i=1,2,\dots,n$ , whole with special crops  $X \times U$  spatial unlimited  $f^0(x^1, x^2, \dots, x^n) = f^0(x, u)$  function is given. In that case, the key issue of optimal management can be described as follows.

$n$  dimensional  $X$  cases spatial two  $x_0$  and  $x_1$  points are given. From spatial point  $x_0$  condition  $x_1$  passes to  $u = u(t)$  find one of the permissible controls (if any exists) then

$$J = \int_{t_0}^{t_1} f^0(x(t), u(t)) dt \quad (4)$$

let the function take its smallest possible value; here  $x(t)$ —(2) equation satisfying the task  $x(t_0) = x_0$   $u(t)$  suitable solution to management,  $t_1$ — is  $x_1$  passed condition moment.

Once the topic is well explained, students are asked to create two questions about each of the concepts used, for example, at the beginning. If students are having this difficulty, examples are given and the subject is returned again, and so on. Let's give them examples: 1) Write the equation (1) in the form of a spread, write it in the form of a second-order linear system; 2)  $U$  collection can be a set, square, cube, parallelepiped, in what cases? 3)  $U$  collection is the set of a circle in the plane, write it analytically; 4) Can a permissible control be a fixed function with a fraction? 5) Write  $J$  the appearance of a function when  $f$  are simple functions [7].

Thus, solving problems on this topic selected from the course of differential equations is of great importance in identifying creatively gifted students and developing their creative activity. At the same time, solving and analyzing these types of issues allows students to develop creative competence.

Based on this, we define students' creative competence as an integrative dynamic personality trait that manifests itself in the ability to find original ways to solve certain problems, find new problems, and solve them using mathematical methods.

According to P.L. Kopitsa, the above-mentioned personality traits “can develop in the following main areas: the ability to scientifically generalize, - induction: the ability to apply theoretical conclusions to predict processes in practice - deduction and, finally, the contradictions between theoretical generalization and processes occurring in nature discovery is a dialectic” [8, 114 p.]. During the implementation of mathematical activities (activities aimed at the formation and development of mathematical competence of the subject), the student also realizes creativity, which we believe is the basis for the development of creative competence.

Thus, the competency-based approach of future teachers to teaching is important to talk about incorporating the development of the teacher's creative competence and mathematical activity into the structure of professional competence in the final process of implementation.

## **SPECIFIC FEATURES OF USING TRAINING AND COMPETITION METHODS IN ADAPTIVE PHYSICAL CULTURE AND PARA-OLYMPIC SPORT PSYCHO-EMOTIONAL FACTOR**

**Palibayeva Zulfiya Halmakhanovna\***

\*State Conservatory of Uzbekistan,  
Tashkent UZBEKISTAN

### **ABSTRACT**

*Reviewed questions of introducing and adapting new and tested by world practice (including sport of the highest achievements) technologies of scientific and methodological support of training and competitive processes in physical education and sports activities for people with disabilities, taking into account its specific features. Particular attention paid to the directed, conscious regulation of the psycho-emotional state of athletes during training, as a leading factor for such adaptation and as an important factor of the training process as a whole.*

**KEYWORDS:** *Physical Culture, Sport, Sports Medicine, Training Process, Neurophysiology, Adaptive Physical Culture, Psycho-Emotional State, Para-Olympic Sport.*

### **INTRODUCTION**

Solving the problems of socialization for persons with disabilities began to acquire great importance. Around the world, considerable attention given to strengthening the role of physical education and sport in physical and social adaptation of persons with disabilities. One of the most important tasks of the adaptive physical education and para-Olympic sports is the introduction and adaptation of common technologies to scientific and methodological support of the training process according to the specific features of physical education and sports activities for people with disabilities.

Adaptive physical education integrates three areas of knowledge: physical education, medicine and corrective pedagogy. It includes a large number of educational and scientific disciplines: the theory and methodology of physical culture and sports, physical education, motor recreation, physical rehabilitation, etc. [2]. Therefore, an integrated approach to the training process and to the biomedical and psychological support of persons with disabilities is important, since only such approach provides the required effectiveness. This is not a simple accumulation and

unification of knowledge in the above areas, but the actual creation of new knowledge, theoretical, methodological and empirical foundations that allow us to solve specific goals and objectives of adaptive physical education and para-Olympic sports.

In modern practice of adaptive physical education, the introduction and application of new technologies occurs in the following main areas of development:

- Study and development of biomechanical aspects;
- Development of biomedical support;
- Creation of sports training systems taking into account the pedagogical aspect and specific features;
- Development of psycho physiological support, the study of psychological aspects: motivation, improving the quality of life, personality development [3].

Currently, the following components (types) of adaptive physical education are distinguish, according to the needs of persons with a temporary deviation in health status and for persons with disabilities:

- Adaptive sport (para-Olympic sport);
- Adaptive physical training (education), satisfying the needs of apersonality in his preparation for life and activity, in the formation of his positive, active attitude to adaptive physical culture;
- Adaptive physical rehabilitation, satisfying the need for treatment, restoration of temporarily lost functions;
- creative (artistic and musical) body-oriented practices that satisfy the needs for self-actualization, creative self-development, self-expression of a spiritual essence through various means of art; extreme types of motor activity, satisfying the need for risk, increased excitement, the need to test oneself in unusual, extreme conditions [4].

One more component should be singled out - adaptive motor reaction, which allows satisfying the needs of people in physical activity, relaxation, entertainment, interesting leisure activities, enjoyment, communication, which contributes to the restoration of psychophysical forces and the creation in their life of harmony and joy.

The main tasks of adaptive motor recreation are:

- The ability to switch from one type of activity to another;
- Restoration and optimization of the psychophysical state;
- Introduction to a healthy lifestyle and active rest;
- The formation of interest and need for various types of adaptive physical education, extreme and creative types of physical activity, etc. Getting pleasure and satisfaction from physical exercises;
- Expansion of social integration, overcoming psychological barriers, discomfort (insecurity, closeness, shyness, etc.), improving the overall quality of life [4].

In fact, adaptive motor recreation, although highlighted as a separate component of adaptive physical education, however, based on its tasks, goals and functions, is more likely the integral part and even a support (basis) for all other components. The psychological and emotional preparation of athletes take on leading roles, they should be consider as a set of motivational, meditative, fitness and neuro-programming methods, as indispensable component of all other methods.

Motivation and motives is one of the main issues in the study of sports psychology. For the physical culture and sports activities of people with disabilities, it is even more important. Motivation in adaptive physical education should reveal its current level and development prospects for each of athletes with disabilities and the sports team as a whole. The formation of motives is consider as a holistic process of situational and personal development of athletes with disabilities during the training and competitive processes [5].

An equally important factor is adjacent psycho-emotional (psychophysical) factor. Previously, the concept of the dichotomy of the mind and body prevailed; according to it, mental and physical health are consider as separate components of human well-being. Modern research casts doubt on these views. The harmony of the psycho-emotional and physical forces increases the reserves of health, creates the conditions for creative self-expression and is the fundamental basis for the harmonious development and well-being of the individual. he results of research and the practical application of psycho-emotional techniques emphasize their direct impact on the effectiveness of training exercises, the formation of sustainable motivation in achieving sports results and harmonizing the life of an individual in an ethical and social aspect.

The development of psycho-emotional techniques is directly relate to the development of research in such fields as emotional intelligence, physical intelligence and biological feedback. Currently gained popularity ideas about concepts such as:

- “comfort zone” is a state in which necessary, but not always sufficient, basic (physiological, mental and social) needs are realized;
- “enter the flow state” is the achievement of the peak state of a person’s activity when he focused on one thing and completely immersed in its implementation.

In doing so, usually implied that necessary, for personal (and physical) development, to leave the comfort zone (i.e., upset the positive emotional balance). In addition, conflicting techniques and practices are often recommended for enter the flow state (due to underestimation of the need to maintain, again, a positive emotional balance).

It seems more effective approach in which the training process and psycho-emotional preparation are based on the methodology of expanding the "comfort zone", when the process of performing exercises is organically included in this zone. Moreover, “enter the flow state” is present as a peak expansion of the “comfort zone”, which will use when performing exercises to increase strength and endurance, closely to the limit of possibilities. Most often, this happens spontaneously and is perceived as a useful but concomitant factor, however, it can be assumed, based on practice, that are the basis of almost all significant sports achievements, this expansion of the psycho-emotional state played a significant, and, sometimes, decisive role.

Based on the foregoing, a direct relationship traced between the physical, mental and emotional state (health) of a person, the mutual influence of physical exercise, mental stability and positive

emotional balance. It is necessary to develop a systematic, integrative approach to general physical training, especially in the field of adaptive physical education, to create complex types of training.

In the development and practical application of physical culture and sports technologies for athletes with disabilities, it is especially important to strive to ensure that sports activities and trainings are interesting and attractive, arouse feelings of joy and satisfaction in them, which will provide increasing training efficiency and consolidate the need for them. Therefore, it is especially promising and relevant to develop and apply complexes of physical education and sports exercises based on purposeful, conscious regulation of the psycho-emotional state in the training process - the so-called psychophysical training.

### ABSTRACT

*The following article is devoted to the study of the indicators and dynamics of infection with the organism Setarialabiatopapillosa in cattle. In the conditions of S.labiatopapillosa in Uzbekistan, transmissible damage of animals during transmission by mosquitoes and Stomoxys calcitrans mosquitoes, which act as intermediate hosts of the parasite, and the intensity of the study of blood samples of cattle infected with S.labiatopapillosa have been studied. The rate of setariotic attacks at different times of the year was also studied. The collected results were analyzed and conclusions were given.*

**KEYWORDS:** *Setaria Labiatopapillosa, Cattle, Helminths, Epizootic Process, Nematodes, Pathological Processes, Microfilariae, Microstariiasis.*

### INTRODUCTION

Nowadays the livestock industry is a leader in the production of livestock products in the world. Milk, meat and other productivity features in the further development of the industry, in addition to improvement of the following sphere, much attention is paid to the detection of helminthiasis of large horned animals and the implementation of preventive measures against them. In many countries of the world, including Uzbekistan, helminthiasis is widespread, the destruction of livestock under their influence and a sharp decline in productivity is observed [2]. According to the prevalence of some trematodes of cattle, in particular paramphistomatosis, the intensity of the invasion was observed in animals of different ages at 40.7-75.4% [5]. The actuality of development of animal husbandry was emphasized in the law of the Republic of Uzbekistan "On

Veterinary Medicine", and resolution of the president "On Veterinary and Animal Husbandry of the Republic of Uzbekistan" which was adapted on March 28, 2019 №PP-4254.

Extensive research is being conducted on a large horn in the scientific centers of many countries of the world species diversity of animal helminthes, biology, life cycles, ecology, molecular biology and systematic development of methods for detection and control of helminthes. However, in the cattle of the unique Zarafshan valley, which is considered a vast region [5,6] our species diversity of parasitic helminthes, dominant until our study distribution of helminthiasis pathogens, cattle quantitative and qualitative indicators of damage, epizootic process specific features and damage to the final masters deadlines have not been determined. Disease control in animals effective methods have not been developed. Therefore, a variety of cattle diversity and density of helminthes in age groups identify, assess the epizootic status of dominant helminthiasis and taking into account the specific characteristics of the region the development of preventive measures against diseases is urgent issue.

In recent years, the livestock sector in the country has accelerated comprehensive measures taken for the purpose of development resulting in various infectious and invasive diseases of livestock significantly reduced. In the "Strategy of Actions of the Republic of Uzbekistan" was emphasized about livestock, to increase the productivity of farm animals, veterinary, to improve services and ensure epizootic tranquility development on a scientific basis.

From foreign scholars S.J.Sonhson, Th. Mercky, R.C.Anderson, K.I.Skryabin, V.M.Ivashkin and others, Uzbek scientists V.I.Gekhtin, M.A.Sultanov, D.A.Azimov, S.D.Dadaev, B.S.Salimov, A.S.Daminov and others have conducted extensive research on the study of faunal complexes, the distribution and ecology of helminthes, diversity and epizootology of bovine helminthiasis, the biology of the dominant pathogens common in wolves. Adequate study of the helminthological situation and epizootiology of helminthiasis in cattle in various biogeocenoses in Uzbekistan, as well as the improvement of modern prevention and control measures is one of the most actual issues today.

### **Used methods in the experience**

The methods of helminthological, parasitological, ecological, molecular-biological, biometric, statistical and comparative analysis were used in the research.

By the method of complete helminthological cleavage (K.I.Skryabin, 1928) a total of 96 heads from Samarkand (30 heads), Bukhara (33) and Navoi (33) regions the animals were examined. In addition, complete and incomplete helminthological cracking district and of the above regions using imaging methods separately in meat processing plants and poultry farms located in cities 926 sets of slaughtered animal organs were examined.

Collected helminths are generally fixated by the methods (Ivashkin, Kontrimavichus, Nazarova, 1971), parasitological the material was then processed under laboratory conditions. The study and identification of parasites were conducted temporary and permanent by local and foreign researchers on the basis of drugs (Ivashkin, Mukhamadiev, 1981; Azimov, 2015; Anderson, 2000 and others) were carried out in accordance with the identifiers and images given in their work.

Determining the degree of infestation of cattle with helminths invasive intensity for - IE (%) and invasive intensity - II (head) were used.

For the identification of some species of nematodes of the genus *Setaria* generally accepted methods in molecular biology (Favia et al., 2000; Kuznetsov, 2009; Abramato, 2012). In the biocenoses of cattle helminths Zarafshan valley dominant groups involved in the formation of the parasitic system and range of intermediate hosts of species (trematodes and nematodes) families of Lymnaeidae, Planorbidae, Physidae and Melanoididae for identification 3978 specimens of aquatic mollusks belonging to Muscidae, Simuliidae and Culicidae 3604 specimens from two-winged blood suckers known methods (Jadin, 1952; Kruglov, 2005; Zdun, 1961; Ginetsinskaya, 1968; Agrinskiy, 1961; Anderson, 2000).

### Part of the experience

Mature nematodes are absent in all infected animals located in different parts of the cavities. Large of cattle *S. labiatopapillosa* found in the lymph nodes of the laryngeal cavity (about 30%). This confirms for the first time that this type of setaria occurs in the lymphatic system of animals [2,3].

Pathologically altered lymph nodes rupture and setaria the release of animals into the surrounding spaces is recorded. Probably microfilariae born from females accumulate in the veins of the vaulus between the lymph nodes, then descend into the veins and accumulate in the peripheral veins. It is logical to explain this by the dispersion mechanisms of *S. labiatopapillosa* microfilariae in the affected vertebrate host organism. will be.

In the case of *S. labiatopapillosa* in Uzbekistan, the animals are transmissibly transmitted by the sucking blood of *Aedes caspius*, *Culex pipiens*, *Culex hortensis* flies and *Stomoxys calcitrans* flies, which act as intermediate hosts of the parasite. This usually happens during the warmer seasons of the year, from June to the end of October. Infection of animals can occur in pastures (*Stomoxys calcitrans*), on the territory of livestock farms and cattle ranches (*Ae. caspius*, *Sx. pipiens*, *Sx. hortensis*) is formed. It is known that microfilaria enter the stomach of the intermediate host with the blood sucked from the infected cattle, are released from the sheath, and pass into the breast muscles of the insect, where they reach the stage of invasion. From the muscles of the mosquito, they pass into the larynx of the insect. When bitten by two-winged blood-suckers, the invasive larvae pass through the injured skin into the blood of the last host animal. During migration, they enter the lymphatic system and the abdominal cavity and develop there until sexual maturity [5].

The intensity of the study of blood samples was studied as a function of the age of the cattle. At the same time, cetariosone invasion in young cattle was 1.3%, in animals from 1 to 4 years - 6.3%, in cattle from 6 to 10 years - 34.4% and in cattle over 10 years - 30.4%. 2.0; 4.5; 12.3 + 2.27; 1 ml of blood contains 15.8 + 2.50 and 11.4 + 2.36 microsetars. It is known that as cattle gets older, his infection with *Setaria labiatopapillosa* increases and at the same time the number of microcetarias in the blood increases.

The maximum attack by *Setaria labiatopapillosa* on large cattle was detected at 6–9 years of age. Infection in cattle at this age was 33.3%, with an average of 15.8 + 2.50 microsetariae detected in 1 ml of blood.

Setaria was found in animals of all ages except calves under one year of age. In cattle from 1 to 3 years of age extensinvasiveness is 11.5%, from 4 to 6 years of age - 22.7%, from 7 to 10 years of age - 40.0% and from 10 years and older to 31.6% of the intensity is 2.3 + 1.22, respectively. an

attack;  $4.6 + 0.84$ ;  $7.8 + 0.75$  and  $6.2 + 0.97$  ind / target. In livestock, the migration of larvae and young helminths through the surface of the serous membranes of the blood and internal organs leads to tissue damage.

Thus, the results of helminthological observation of the abdominal cavity confirm that blood test data show an increase in the prevalence and intensity of infection. Adult cattle were found to have maximal infection by ceteria.

According to blood sample studies, adult cattle are attacked by caterpillars at all times of the year. The intensity of attacks of catarrh in adult cattle ranged significantly from 18.4 to 56.2% during the year. The average rate of aggression was 34.5%. The maximum rate of attack in cattle was recorded in the summer period (50.0 - 56.2%), during which the maximum amount of microstaria in ml of blood was detected (17.9 - 19.3 ind.). The increase in the intensity of the summer invasion can be explained by the success of all, with the registration of puberty, as well as an increase in their reproductive capacity, which ensures the spread and circulation of the attack. In the fall, and especially in the winter, invasiveness dropped significantly in January to 18.4%, followed by an increase in invasion in the spring.

The average number of microstars in one ml of blood of adult cattle was  $14.0 + 3.21$  ind. with a decrease to the index of  $9.7 + 2.72$  in the autumn-winter period (January) and increased to  $19.3 + 1.90$  index in summer (in July).

According to the results of helminthological separation of the abdominal cavity and the study of serous membranes of this cavity in adult cattle, the rate of excitation by *S.labitopapillosa* was slightly higher, averaging 32.0 in January, 38.1 in April and 42.1 in August and 35.3% in October.

Thus, the rate of setariotic attacks at different times of the year was almost unchanged ( $P > 0.05$ ). Thus, helminthological autopsy data of the abdominal cavity are more objective. According to the results of the study of blood samples, the significant difference in the intensity of the attack of the parasite at different times of the year is explained not by an increase in invasion intensity, but by a change in the reproductive capacity of the samoka setaria.

## CONCLUSION

*Setaria labitopapillosa* in most biogeocenoses of Uzbekistan the biology of the nematode involves two blood-sucking birds, *Aedes caspius*, which acts as an intermediate host of the studied nematode, *Culex pipiens*, *Culex hortensis* mosquito species and *Stomoxys calcitrans* mosquito also plays the first *S.labitopapillosa* nematode population adult form parasitism in the lymph nodes of cattle detected. *S.labiata papillosa* nematode in the lymphatic system of cattle parasitic properties have been identified.

It is known that as an adult cattle gets older, his infection with *Setaria labiatopapillosa* increases and at the same time the number of microcetarias in the blood increases.

In all seasons, cattle are infected with *S.labitopapillosa*, the number of which remains almost unchanged throughout the year, except for a slight increase in the intensity of invasion in the spring. In this regard, the diagnosis of cetariosis in adult cattle can be made at any time of the year.

However, the presence of the largest amount of microsetars in the blood during the summer period allows diagnostic tests to be performed during this period.

### **Recommendation**

The most sensible way to prevent large cattle setariosis is the use of drugs from the group of macrocyclic lactones in parasitic mosquitoes may be before the early summer, as a single tool, they have a microfilicidal effect for 6 months, preventing the spread of intermediate host infection and invasion.

## ISSUES OF ENERGY DEVELOPMENT IN THE ARALSEA CONDITIONS

**Kdyrbayeva Gulan Utebayevna\***

\*Senior Teacher,  
Department of Land Cadastre and land use  
Nukus branch of Tashkent State Agricultural University,  
UZBEKISTAN

### ABSTRACT

*The following article is devoted to the development of the energy sector in the Aral Sea region. Particular importance in the conditions of the Aral Sea are the modeling of the design and operating parameters of micro-hydropower plants, the improvement of their design, the development of technology to increase their efficiency. Therefore, the article focuses on the use of micro-hydroelectric power plants operating in low-pressure watercourses in the Aral Sea region to achieve high economic efficiency.*

**KEYWORDS:** *Micro-Hydroelectric Power Plant Operating In The Aral Sea Region, Energy Sector, Low-Pressure Watercourses, Structural Modeling.*

### INTRODUCTION

The country is implementing a long-term strategy for the development of the oil and gas, electricity, coal, chemical and construction industries, aimed at ensuring sustainable economic growth and improving the welfare of the population, continuously meeting the demand for fuel and energy resources.

At the same time, the existing capacity of the fuel and energy sector does not fully meet the growing demand for energy resources; the volume of energy consumption of the economy of our country is much higher than the average of developed countries.

Currently, the share of renewable energy sources are mainly generated by hydropower plants, accounts for only ten percent of the total electricity generated in the country. Despite its enormous potential, the potential of renewable energy sources such as solar and wind is not being fully exploited.<sup>1</sup>

In this regard, improving the energy efficiency of economic sectors and the social sphere, the widespread introduction of energy-saving technologies and renewable energy sources should remain one of the current directions of public policy at this stage.

Taking into account the advanced foreign experience, comprehensive organization of work to increase energy efficiency through the use of available resources and untapped potential, the widespread introduction of energy-saving technologies and renewable energy sources, drastic reduction of energy consumption in the economy and social sectors, as well as fuel - ensuring the rational and efficient use of energy resources is one of the most important issues of our time.

Scientific research is aimed at expanding the use of non-conventional and renewable energy sources, saving hydrocarbon fuel energy resources and stabilizing the ecological balance is gaining importance in energy practice worldwide. In this regard, the long-term national energy programs of developed countries are set to increase the share of renewable energy sources to at least 20%. In this regard, in the world practice, the use of micro-hydroelectric power plants, one of the largest sources of renewable energy in the power supply system of consumers, is carried out at a rapid pace, and in turn, special attention is paid to the development of this industry. In the world, special attention is paid to the scientific supply of reliable and environmentally relevant technologies for electricity generation. Particular importance is the development of the energy sector along the Aral Sea, modeling the design and operation parameters of micro-hydroelectric power plants, improving the design, the development of technology that increases the efficiency of use in the Aral Sea region. Also, special attention is paid to the qualitative development of the energy sector, which is an important sector of the economy, and the modernization of the technical and technological level of the industry on the basis of modern requirements, including the development of the energy sector along the Aral Sea. The Action Strategy for the further development of the Republic of Uzbekistan for 2017-2021, including "... reducing energy and resource capacity of the economy as a priority in the near future, the widespread introduction of energy-saving technologies in production, expanding the use of renewable energy sources ..." <sup>2</sup> functions are defined. One of the most important issues in the implementation of this task is including the development of the energy sector in the Aral Sea region, and to calculate the mode of operation [1, 2].

## RESEARCH METHODS

In the process of research have been used mathematical modeling theory, mathematical statistics in data processing, probability theory, and experimental planning methods.

Reliability of research results is that, the used methods meet the requirements, and determined by the use of methods of mathematical and statistical analysis, in the process was obtained empirical results and the reliance on statistical criteria of reliability and inevitability in the interpretation of quantitative indicators.

## Results of scientific research

The results of the development and testing in laboratory conditions of the development of the first sub-model of the hydro-hydroelectric power plant with the basic technological solutions of the mathematical model and design of the development of a hydro-hydroelectric power plant operating at low pressure water flows are given.

The dimensions of a micro-hydro water turbine depend on the flow velocity  $v$  of the water, the volume  $Q$  of the water hitting the blade at a fixed time moment, and the depth  $N$  of the water surface. The compactness and efficiency of the wheel when the outer diameter of the wheel is  $D/H \geq 2$  have been reported in the available literature [3,4].

Based on the above mathematical model, the numerical calculation of the wheel is given in Table 1.

**TABLE 1 DIMENSIONS OF MICRO-HYDROELECTRIC POWER PLANT**

№	Naming	Dimensions, mm
1	Outer diameter	$2000 \pm 3,72$
2	Inner diameter	$1000 \pm 2,3$
3	The inside of the blade	$509,44 \pm 0,875$
4	The outer part of the blade	$799 \pm 15$
5	Number of blades	12 pieces
6	Pulley diameter	350

**Results of testing and testing of a small model of a micro-hydroelectric power plant in the Table 2**

**TABLE 2**

Number of observations	Angle of wings, degree	Power electricity A	Voltage, B	Power, Vt
1	5	0,18	212	38,16
2	10	0,20	218	43,6
3	15	0,22	221	48,62
4	20	0,19	215	40,85
5	25	0,19	215	40,85
6	30	0,17	212	36,04
7	35	0,16	210	33,60

In Table 2, experimental work was carried out by changing the angles of the water wheel of the micro-hydroelectric power plant to an angle of  $5 \div 35^\circ$ . When the electricity generated by the generator connected to the device was checked using a measuring instrument, it was found that its voltage varies up to  $210 \div 221$  Volts, and the value of the measured current varies up to  $0.16 \div 0.22$  Amperes. According to the results of experimental studies, when the blades are placed at an angle  $\alpha = 15^\circ$ , the value of the electric current generated by the generator connected to the device (0.22 A) is high, and its voltage is much closer to the standard (221 V). Hence, the corresponding angle of the theoretically calculated feathers ( $\alpha = 16^\circ$ ) is optimal according to the results of experimental studies, so that the impact force depends on the mass of the affected water at the moment when the feathers of the waterfowl start to interact with water, and the minimum when the feather leaves the water is minimal [3].

It is difficult to compare the electricity generated by a generator connected to the proposed device with the definition of a centralized power supply system or other types of decentralized

power sources (high and medium pressure microelectric power plants, solar power plants, wind power plants). The reason is that the formation of other types of electricity sources requires specific geographical conditions. The developed device works in low pressure water streams. Such streams are often found in remote villages of the republic. Therefore, it is advisable to use this device in rural and coastal conditions.

## CONCLUSIONS

Based on the generalization of the results of the study, the following conclusions can be drawn:

1. Improving the modeling and design of the design and operating parameters of the micro-hydroelectric power plant operating on low-pressure watercourses, allowed to increase the efficiency of their use in low-pressure watercourse systems.
2. The functional scheme of a low-pressure hydroelectric power plant is based on mathematical modeling, on the basis of which a new model of a low-pressure hydroelectric power plant is created.
3. On the basis of mathematical modeling to test and test the operating modes of the device in the laboratory, the first improved sub-model of a micro-hydroelectric power plant operating in low-pressure water streams was developed and successfully tested. The test results made it possible to develop a large-scale experimental sample of a theoretically based microhydroelectric power plant.
4. The quality indicators (voltage (V) and frequency (F)) of electricity generated using the test sample were checked. The results were compared with the value limits set out in the International Standard Normative Document. The identified sizes were found to fully comply with the specified requirements of the document. As a result, it is possible to provide consumers with quality electricity.
5. The design dimensions of the developed device are compact and easy to use. As a result, it is possible to reduce the costs associated with its production.
6. The use of micro-hydroelectric power plants operating on low-pressure watercourses in the conditions of the Aral Sea leads to high economic efficiency.

## THE EFFECT OF PROPERTIES OF ELECTRONIC ADVERTISING IN UNITED ARAB EMIRATES

**Dr. Entisar Alobaidi\***

\*Assistant Professor of Public Relations,  
Department of Mass Communications, School of Arts and Social Sciences,  
Al Dar University College Al G, DUBAI  
Email id: entisar543@yahoo.com

### ABSTRACT

*Electronic advertising is promoting that uses the Internet and different types of digital media to enable a business to advance and offer products and enterprises. It includes special commercials and messages conveyed through email, online advertising on search engines, and websites of social media, banner ads on Web sites or mobile and affiliates programs.*

*The reason for utilizing Electronic advertising is to achieve aextensive scope of potential customers by interfacing with them over the web. It is additionally significantly more financially effective as you can fund your advertising within the boundaries of your own budget. Another extravagance of Electronic advertising is 'Target Marketing'. This implies you can target your desired group of clients in light of an extensive variety of criteria, for example, age, area, sex and religion, in addition to significantly more.*

**KEYWORDS:** *Electronic Advertising, Target Marketing, Digital Media, Promotion, Online Promotion.*

### 1. INTRODUCTION

Electronic advertising is a marketing strategy that involves the use of the Internet as a medium to obtain website traffic and target and deliver marketing messages to the right customers. Electronic advertising is geared toward defining markets through unique and useful applications.

Since the early 1990s there has been an exponential increase in the growth of Electronic advertising, which has evolved into a standard for small and large organizations. Electronic advertising is also known as Internet advertising or Digital Advertising. (Tutaj et al, 2014)

A major advantage of Electronic advertising is the quick promotion of product information without geographical boundary limits. A major challenge is the evolving field of interactive advertising, which poses new challenges for Electronic advertisers.

Electronic advertising are purchased through one of the following common vehicles:

- Cost per Thousand: Advertisers pay when their messages are exposed to specific audiences.
- Cost per Click: Advertisers pay every time a user clicks on their ads.
- Cost per Action: Advertisers only pay when a specific action (generally a purchase) is performed.

Examples of online advertising include banner ads, search engine results pages, social networking ads, email spam, Electronic classified ads, pop-ups, contextual ads and spyware. (Farahat et al 2012)

## 2. The concept of Advertising

The term advertising refers to paid types of communication that are circulated at the activity of economic operators by methods for TV, radio, daily papers, flags, mail, Internet, and so on.) as part of an deliberate and systematic effort to influence individual attitudes and decisions in relation to the utilization of goods and services. (Briggs et al 1997)

This is obvious that a very wide conception that encompasses all types of promotional communication, paying little heed to e means or methods of distribution. Concerning promoting strategies and methods, a determined procedure of innovation continues to be driven by the imagination of advertisers, development of new marketing techniques and technological developments. New advertising means such as the Internet keep on emerging alongside traditional distribution methods, like dailies and periodicals, television, banners, direct marketing (phone calls, mailings and door-to-door sales), cinema, radio and product packaging itself. What it does exclude is exposure that is non-commercial, as in it makes no reference to financial exercises, for example, political purposeful publicity and social attention. (Lucian 2015)

Comparative advertising is referring to an advertising method in which the businesses use to promote their products and services by making comparison with the products of their competitors. The identification of genuine contenders may be implicit or explicit. The previous is known as indirect comparative advertising, and the last is known as direct comparative advertising. The structure of Electronic advertising is that it is distributed on the Internet, Electronic advertising give a hyperlink that redirects to the company's site, and it can involve animated movements in the advertisements. (Anand et al 2009)

## 3. History of Electronic Advertising

Electronic Advertising has become the fastest, and one of the most influencing advertising means in history. Nowadays, it is one of the major of a successful business, a media platform that facilitates interaction with customers in the creative and interesting ways, although there continues to be a large majority of irritated web users. (Goldfarb et al 2011)

For more sympathetic understanding of Electronic Advertising, let us tracing the history of Electronic advertising.

## The Origin of Spam

In 1970's, Monty Python 'a British comedy' first used the word "spam" in an early sketch of a couple at a restaurant, he was trying to order food without "spam" on it. This comedy had influence on forum users who began to use the word in their posts. After that, online marketers began to over post and flood users with junk mail, that repeatedly recounted spam.

By 1980, web marketers had replaced from 'flooding Usenet forums' to 'sending out emails', this practice that continues until today. The quantities of spam messages that are sent each day is a astounding 90 million, which isn't difficult to accept since 85% of our inboxes are screaming spam every hour. As a advertising procedure however, spam emails have little viability since most of people barely read any. (*Pieters & Rik 2008*)

The year 1994 saw the first online ad that was immediately followed by a period of experimentation on sponsor and publisher advertisement formats and technology. This phase ended with the launch of one of the main ad technologies, the 'Double Click in 1995'. The earliest advertisers knew of the contrasts between traditional and electronic advertising and undertook a objective statistical research. In any case, it wasn't until many years in following that the Internet was used as a 'full-blown medium' for powerful advertising. (*Jansen et al 2008*)

At the end 1990s, billions were invested in electronic advertising. Advertisers established the standard "468×60 pixel" banner ads that were highly demanded. With increase in market competition, there was a lot of money behind developing banner ads. At the time, Yahoo may charge anywhere between "\$30-\$100" to run banner ads. (*Li et al 2012*)

Banner advertisements today, as they were over 10 years back, are not viable online advertising mediums. With considerable outlining required, they are tedious and costly to create. Besides, the low profit for income spent on creating banner ads renders them useless to most online publicists. Of course thusly, by mid-2000, banner advertisements began to go away, and have turned out outdated at the time of writing. (*Laczniak, 2015*).

The effectiveness of search engine technology has supported online advertising. Due to its high dependability and rate of premium, the search engine market has demonstrated a steady development throughout the years, pulling online advertising numerous scores. Google began as a search engine however clearly, is a hundred times more than that today. Google's calculation shows the most suitable outcomes and for a long time, Google took a shot at its usefulness. Without selling anything, it kept on driving traffic until 2000, when it first presented Google Ad Words. Drawing far from banner advertising, still a famous form at the turn of the centuries, Google revolutionized online advertising by utilizing relevant text ads to offer. (*Johnson et al 2013-03-01*)

Google's success laid on presenting the click through rate that would gauge the significance of the advertisement, likewise ensuring host installment only when clients clicked on the ads. Pay-Per-Click advertising was not a Google unique. Google culminated PPC and changed the approach sponsors took to online advertising. Google AdWords urged advertisers to come up with comprehensive, significant ads instead of mere selling. (*Lee et al 2012*)

## Social Media Advertising

Social media is all over and has been in vogue since the previous five years. At its center, social media is a correspondence and networking tool, whose prevalence has been always ascending since its users can connect, share and communicate among themselves. Rather than being a minor informative reading interface, social media enables users to remark, rate and share news, views and data. (Schlee et al 2013-10-01)

*Social media can be divided into:*

- Social Networking Tools – Twitter, Facebook.
- Social News – Digg Propeller, Reddit
- Social Bookmarking – Simpy, Del.icio.us
- Social Photo & Video Sharing – YouTube, Flickr, Photobucket

Targeting the correct market is critical for any business and this is one of the greatest focal points of social media advertising. By gathering a user's demographic data, social media discloses to you where a business' objective market is most wide and dynamic. Advertisers would then use this information to tap their planned market. Social media advertising is viral, sweeping and free. Although genuine conversions cannot be followed from 'friends', 'follows', or 'likes', social media remains the best online promoting mediums. (Robinson et al 2007)

## The Current Face of Online Advertising

Electronic advertising has recovered and has been consistently rising since 2004. With the number of hours an Internet client spends browsing sites, advertisers have understood the significance importance and advantage of exploiting user tendency to scour the web. From blogs, SEO marketing and social media to sophisticated advertisements, interactive tools and marketing advancements, advertisers are presently utilizing a wide array of platforms to build business visibility.

Viral marketing is now a prominent method of advertising using video advertisements to market products. Websites like YouTube, Metacafe, and so forth, are famous product advertising platforms. But online advertising has barely been idealized. Irritating pop-up ads still exist while free sites like YouTube now incorporate commercials or pre-roll ads that cannot be avoided to the actual video. (Chen & Stallaert 2014)

## 4. Types of Electronic Advertising

Online advertising has developed since its humble beginnings as a static picture that pops up at the highest point of a site. Now, there is a wide assortment of advertising types you could utilize. We've listed the seven best types here.

### 1. Display Ads

The essential form of online advertising, these are visual advertisement that appeared on third party websites.

Display advertisements have created from the basic type of banner ads. display ads come as:

- Text - text ads: Those are developed by statistics to create text ads appropriate to the surrounding content.

- Static images: which is your essential banner or square ads that shown around the content.
- Wallpaper: these change the background of a website, filling the entire page.
- Floating banners: these float above the regular website's content or move across the screen.
- Popup ads: these are new windows which appear in front of the website content; displaying full ad on newly opened window, so visitors can see.
- Video: small video ads that auto-play.
- Flash - moving ads that flash different content at the viewer.

Display ads are usually very reasonable. In the event that you contact the third party site directly, their rates will differ from site to site. If you use a marketing site, they will charge you a base rate.

Some third party site like Google Display, take into account statistic for geographic, demographic, and behavioral targeting, these will help advertisers to reach the customers that are interested in your service or product. (*Hu et al 2012*)

## 2. Social Media Ads

Social network advertising, describe forms of web based advertising that emphasis on social networking services. One of the significant advantages of this type of promoting is that advertisers can exploit advantage of the users' demographic data and target their advertising appropriately.

Social media focusing on combines current targeting options (for example, geo-targeting, socio-psychographic targeting, behavioral targeting, and so on.), to influence the identification detailed target group. In social media targeting, adv are circulated to users based on data gathered from target group profiles.

Social network ads are not always the same as social media targeting. Social media targeting is a technique of optimizing social media ads by using profile information to convey advertisements directly to individual clients. Social media targeting refers to the way toward coordinating informal organization clients to target bunches that have been determined by the advertiser. (*Mai Frandsen et al 2014*)

## 3. Search Engine Marketing (SEM)

Search Engine Marketing (SEM) refers to multiple methods that utilized to enhance market visibility and exposure for a brand, item or administration. SEM mechanisms involve "Search Engine Optimization" (SEO), "social networking", bid "placement, pay-per-click" (PPC), contextual promotion, paid inclusion, geo-mapping, AdSense and AdWords, multiple media formats (e.g., YouTube and geo-specific marketing, like Foursquare).

### Search Engine Marketing tools include:

- **Search Engine Optimization (SEO);** Maximizes search result exposure by focusing on and driving Web traffic and ultimately delivering increased deals. The larger part results of search engine page come from organic or unpaid search. SEO enhances websites to guarantee top search engine arrangement, e.g. Google, as just 15 percent of searchers proceed beyond page one.

- **Social Media Marketing (SMM);** Focuses on marking, reputation improvement and upgraded client benefit through social networks like (Facebook, Twitter, YouTube and LinkedIn). Smaller SMM channels include; Wikipedia, Digg, Delicious, and MySpace. Social networks are visited by a more than one-billion people. Subsequently, even the simplest marketing efforts, like paid advertising contact possibly huge groups of people.
- **Paid Search;** Examples of paid search incorporate include banner, sponsored links, and sidebar ads, where relevantly produced advertisements are depend on organic search results. (Mai Frandsen et al 2014)

#### 4. Native Advertising

Native advertising is a type of paid media where the advertisement encounter takes after the common shape and capacity of the client involvement in which it is put.

The biggest social platforms in the world monetize with native, in-channel advertisements, including "Facebook, Instagram, Twitter, and Tumblr". The publishing business is rapidly following suit, as organizations for example, "Time Inc., Forbes, New York Times, Wall Street Journal, and USA Today", keep on to introduce new advertising mixes on mobile and desktop that match both the form & capacity of their editorial feeds. (Interactive Advertising Bureau 2013)

#### 5. Remarketing-Retargeting

The most ideal approach to market to individuals who already know about your product and administration is to remarket to them. Or on the other hand retarget. Depends upon who you're conversing with.

At the point when people visit your website site, you drop a cookie on them so that, as they travel around the web, your advertisements will show up again over and over to remind them about your product or administration.

This type of advertising is cheap and, if done right, can be more successful than PPC. It expands conversions because it helps individuals to remember you who already know your identity.

You can endeavor to set this up yourself on "Google Remarketing, Facebook Remarketing and more". (Interactive Advertising Bureau 2013)

#### 6. Video Ads

These include online display advertisements that encapsulate video within them, but it is generally accepted that it refers to promoting that occurs previously, during as well as after a video stream on the web.

The advertising units utilized as a part of this occurrence are pre-roll, mid-roll, and post-roll and all of these advertisement units resemble the traditional spot advertising you see on TV, although they are "cut-down" to be a shorter rendition than their TV partners if they are run online.

Communicate sites, for example, Sky.com and itv.com have such promoting on their sites, for example newspaper websites such as The Telegraph, and The Guardian. In 2010, video advertisements represented for 12.8% of all videos saw and 1.2% of all minutes spent survey video online.

In July 2014 Facebook paid an about \$400 million to gain Live Rail, a video promoting distributor which uses Real-time offering to place in excess 7 billion video advertisements a month. (Richang Hong et al 2013)

## 7. Email Marketing

Email marketing is the focusing of consumers through email. Regularly associated with information mining, email marketing can be used to affect consumers in a variable ways. email marketing is a more advanced, digital type of traditional direct mail advertising.

Email marketing is otherwise called as direct email advertising.

In a common email marketing situation, an organization manufactures an email list to reach or advise established and prospective clients. An email rundown might be supplemented by a marketing database that takes into account customization, information mining, precise targeting or different purposes. However, universal and spontaneous email, also called as spam, has made it troublesome for moral email marketers. Most email and Internet service organizations providers have huge filters to block spam, so getting real messages crosswise over is simpler than done. Email marketing has advanced into a specific specialty in computerized marketing.

(Mari Hartemo 2016)

## 5. Advantages of electronic advertising

### A. Cost

The low price of electronic communication decrease the cost of displaying electronic ads compared to offline advertisements. Electronic ads, and in certain social media, provides a low cost means for marketers to engage with huge established population. Electronic ads shows better returns than in other media. (R. Dedrick, 1995)

### B. Measurability

Electronic advertisers can collect information on their effectiveness of ads', like the size of the potential audience or real audience response, how a customer's reached their ads, and whether the ads resulted in a sale, and if an ads actually loaded within a customer's view. (Farah at et al 2012)

### C. Formatting

Advertisers have a wide assortment of methods for exhibiting their promotional messages, including the capacity to pass on pictures, audio, video, and links. Not at all like numerous offline ads, can online advertisements be interactive. For instance, a few promotions let clients input questions or let users follow the sponsor via social media. Online promotions can even join games. (Li et al 2012)

### D. Targeting

Publishers may offer promoters the ability to achieve limited market sections for targeted advertising. Electronic advertising may utilize geo-focusing to show relevant ads to the user's geography. Advertisers can redo every individual advertisement to a specific user based on the user's past preferences. Advertisers can know whether web users have just observed a certain

advertisement in order to reduce undesirable exposures and give sufficient time gaps between exposures. (Farahat et al 2012)

#### E. Coverage

Electronic ads can reach international market, and online ads can influence offline sales. (Li et al 2012)

#### F. Speed

When advertisement configuration is finished, electronic ads can be sent immediately. The delivery of online advertisement does not need to be linked to the publisher's production publication schedule. Besides, online advertisers can change or replace advertisement copy more quickly than their offline counterparts. (Farahat et al 2012)

### 6. Regulation

The consumer insurance laws apply similarly to online and offline activities. In any case, there are inquiries over which locale's laws apply and which administrative agencies have requirement authority over trans-border action.

As with offline promoting, industry members have undertaken various efforts to self-manage and create industry standards or implicit rules. Many US promoting industry associations published together Self-Regulatory Principles for "Online Behavioral Advertising". (Stephanie Flosi et al 2013)

European advertisement associations published a comparative document in 2011. Essential fundamentals of the two reports incorporate purchaser control of information exchange to third parties, information security, and consent for accumulation of certain health and financial information. Neither structure, however, punishes violators of the codes of accepted rules. (Goldfarb et al 2011)

#### Privacy and data collection

Privacy control regulation can require clients' consent before an advertiser can track the client or communicate with the client. agreed consent can be troublesome and costly to get 60 Industry members.

Different wards have adopted distinctive strategies to privacy issues with advertising. The USA has particular restrictions on online following of children in the Children's "Online Privacy Protection Act"

Conversely, the European Union's 'Privacy and Electronic Communications Directive' confines sites' capacity to use consumer data much more comprehensively. The EU limitations limit focusing by online advertisers. (Evans et al 2009)

### 7. CONCLUSION

Electronic Advertising on Website has numerous favorable circumstances and hindrances. I think that the favorable circumstances exceed the impediments. Having on the online advertisement, enabling your ad to be seen internationally all around the globe, takes your business to an unheard of level focusing on significantly more gathering of people. Its ease, offers private

venture to put resources into internet promoting chopping down in introductory cost of advertising.

Web's huge scope additionally enables every day users to encounter more services gave by business and makes it a helpful spots for customers. It permits individuals get additional time out of their life, that other conventional traditional methods, for example, heading to a store to pay bills. With the assistance of the web, it has helped us people in many ways. It turns out to be the premier commercial technique along all other media, and ensures comes about without fail.

### ABSTRACT

*The present paper is devoted to 2-local multipliers on associative, Lie and Jordan rings. It is proved that every 2-local left (right) multiplier on an arbitrary associative or Lie ring is a left (respectively right) multiplier. Also, it is proved that every 2-local Jordan multiplier of a Jordan ring is a Jordan multiplier.*

**KEYWORDS:** Associative Ring, Multiplier Operator, Lie Ring, Jordan Ring, 2-Local Mapping  
 2010 MSC: 16W25, 46L57, 47B47, 17C65

### INTRODUCTION

The present paper is devoted to 2-local multipliers on associative, Lie and Jordan rings. In 1997, P. Semrl [1] introduced the notion of 2-local derivations and described 2-local derivations on the algebra  $B(H)$  of all bounded linear operators on the infinite-dimensional separable Hilbert space  $H$ . A similar description for the finite-dimensional case appeared later in 2004 [2]. In the paper [3] Y. Lin and T. Wong 2-local derivations have been described on matrix algebras over finite dimensional division rings. In 2012 Sh. Ayupov, K. Kudaybergenov suggested a new technique and have generalized the above mentioned results for arbitrary Hilbert spaces [4]. Namely, they considered 2-local derivations on the algebra  $B(H)$  of all linear bounded operators on an arbitrary (no separability is assumed) Hilbert space  $H$  and proved that every 2-local derivation on  $B(H)$  is a derivation. Later Sh. Ayupov, K. Kudaybergenov and F. Arzikulov extended the above results and give a proof of the theorem for arbitrary von Neumann algebras [5], [6].

In the given article it is introduced and studied a concept of 2-local left (right) multipliers on an arbitrary associative or Lie ring. It is proved that every 2-local left (right) multiplier on an arbitrary associative or Lie ring is a left (respectively right) multiplier. Namely, we prove that for any element  $x \in \mathfrak{R}$  there exists an element  $a \in \mathfrak{R}$  such that  $\varphi(x) = ax$ .

Besides, in the present paper, it is introduced and studied a concept of 2-local Jordan multiplier on an arbitrary Jordan ring. Finally, it is proved that every 2-local Jordan multiplier  $\varphi$  of a Jordan ring  $J$  is a Jordan multiplier, i.e. there exists an element  $a \in J$  such that  $\varphi(x) = ax$  for every element  $x \in J$ .

### 1. 2-local left multipliers.

**Definition.** Let  $\mathcal{R}$  be an associative ring. Then, if for a map  $\varphi: \mathcal{R} \rightarrow \mathcal{R}$  and for every pair of elements  $x, y \in \mathcal{R}$  there exists  $a \in \mathcal{R}$  such that  $\varphi(x) = ax$  and  $\varphi(y) = ay$  ( $\varphi(x) = xa$  and  $\varphi(y) = ya$ ), then  $\varphi$  is called 2-local left (right) multiplier.

**Teorema 1.1.** Let  $\mathcal{R}$  be an associative unital ring, and let  $\varphi: \mathcal{R} \rightarrow \mathcal{R}$  be a 2-local left (right) multiplier. Then there exists  $a \in \mathcal{R}$  such that

$$\varphi(x) = ax \text{ (respectively } \varphi(x) = ax) \forall x \in \mathcal{R}.$$

**Proof.** By the definition for every  $x \in \mathcal{R}$  and identity element  $e \in \mathcal{R}$ , there exists  $a \in \mathcal{R}$  such that

$$\varphi(x) = ax\varphi(e) = ae = a.$$

In its turn, for every element  $y \in \mathcal{R}$  and  $e \in \mathcal{R}$  there exists  $b \in \mathcal{R}$  such that

$$\varphi(y) = by\varphi(e) = be = b.$$

Hence,  $a = b$ . Since the elements  $x$  and  $y$  are chosen arbitrarily we have there exists  $d \in \mathcal{R}$  such that

$$\varphi(z) = dz \forall z \in \mathcal{R}.$$

The proof is completed.

**Theorem 1.2.** Let  $\mathcal{R}$  be an associative (non necessarily unital) ring and, let  $\varphi: \mathcal{R} \rightarrow \mathcal{R}$  be a 2-local left (right) multiplier. Then there exists  $a \in \mathcal{R}$  such that

$$\varphi(x) = ax \text{ (respectively } \varphi(x) = ax) \forall x \in \mathcal{R}.$$

**Proof.** Let  $\mathcal{R}_1 = \mathcal{R} \oplus Z$  be the unitization of  $\mathcal{R}$ . For every left multiplier  $L_a$  on  $\mathcal{R}$ , we define  $\tilde{L}_{(a,0)}$  on  $\mathcal{R}_1$  by  $\tilde{L}_{(a,0)}((x, \lambda)) = \tilde{L}_{(a,0)}((x, \lambda)) = (a, 0)(x, \lambda)$  for all  $x \in \mathcal{R}$  and  $\lambda \in Z$ . It is easy to check that  $\tilde{L}_{(a,0)}$  is a left multiplier on  $\mathcal{R}_1$ . Similarly, we define  $\tilde{\varphi}$  on  $\mathcal{R}_1$  by  $\tilde{\varphi}((x, \lambda)) = \tilde{L}_{(a,0)}((x, \lambda))$ , where  $a$  is an element in  $\mathcal{R}$  such that  $\varphi(x) = L_a(x)$ .

First, we show that  $\tilde{\varphi}$  is a 2-local left multiplier on  $\mathcal{R}_1$ . Since  $\varphi$  is a 2-local left multiplier we have for  $a, b \in \mathcal{R}$  there exists a left multiplier  $L_a$  on  $\mathcal{R}$  such that  $\varphi(x) = L_a(x)$  and  $\varphi(y) = L_a(y)$ . From this it follows that  $\tilde{\varphi}((x, \lambda)) = \tilde{L}_{(a,0)}((x, \lambda))$  and  $\tilde{\varphi}((y, \mu)) = \tilde{L}_{(a,0)}((y, \mu))$ . This implies that  $\tilde{\varphi}$  is a 2-local left multiplier on  $\mathcal{R}_1$ .

By theorem 1.1  $\tilde{\varphi}$  is a left multiplier on  $\mathcal{R}_1$ . This completes the proof.

Let  $\mathcal{R}$  be an associative ring.

**Definition.** Let  $\varphi: \mathcal{R} \rightarrow \mathcal{R}$  be a linear mapping. If, for any  $x, y \in \mathcal{R}$ ,  $\varphi(xy) = \varphi(x)y$  ( $\varphi(xy) = x\varphi(y)$ ), then  $\varphi$  is called a weak left (respectively right) multiplier.

Let  $L: \mathcal{R} \rightarrow \mathcal{R}$  be a mapping. If there exists  $a \in \mathcal{R}$  such that  $L(x) = ax$  ( $L(x) = xa$ ) for any  $x \in \mathcal{R}$ , then  $L$  is a weak left (respectively right) multiplier, i.e. every left (right) multiplier is a weak left (respectively right) multiplier. Such weak left (right) multiplier we denote by  $L_a$  (respectively  $R_a$ ). Every weak left (right) multiplier of a unital associative ring  $\mathcal{R}$  is a left (respectively right) multiplier [7].

By theorem 1.2 we have the following theorem.

**Theorem 1.3.** Let  $\mathcal{R}$  be a unital associative ring, and let  $\Delta: \mathcal{R} \rightarrow \mathcal{R}$  be a 2-local derivation on  $\mathcal{R}$ . Suppose that there exist a 2-local left multiplier  $\varphi$  and a 2-local right multiplier  $\psi$  such that

$$\Delta(x) = \varphi(x) - \psi(x), x \in \mathcal{R}.$$

Then  $\Delta$  is an inner derivation on  $\mathcal{R}$ .

**Proof.** By theorem 1.2 there exist  $a, b \in \mathcal{R}$  such that

$$\varphi(x) = ax, \psi(x) = xb, \forall x \in \mathcal{R}.$$

By the definition for the identity element  $e \in \mathcal{R}$

$$\Delta(e) = \varphi(e) - \psi(e) = 0.$$

Hence,  $a = b$  and

$$\Delta(x) = ax - xb, x \in \mathcal{R}.$$

The proof is complete.

## 2.2-local Lie multipliers

**Definition.** Let  $\mathcal{R}$  be a Lie ring. Then, if for a map  $\varphi: \mathcal{R} \rightarrow \mathcal{R}$  and for every pair of elements  $x, y \in \mathcal{R}$  there exists  $a \in \mathcal{R}$  such that  $\varphi(x) = ax$  and  $\varphi(y) = ay$ , then  $\varphi$  is called 2-local left multiplier.

**Teorema 2.1.** Let  $\mathcal{R}$  be a unital Lie ring, and let  $\varphi: \mathcal{R} \rightarrow \mathcal{R}$  be a 2-local left (right) multiplier. Then there exists  $a \in \mathcal{R}$  such that

$$\varphi(x) = ax \text{ (respectively } \varphi(x) = xa) \quad \forall x \in \mathcal{R}.$$

**Proof.** By the definition for every  $x \in \mathcal{R}$  and identity element  $e \in \mathcal{R}$ , there exists  $a \in \mathcal{R}$  such that

$$\varphi(x) = ax\varphi(e) = ae = a.$$

In its turn, for every element  $y \in \mathcal{R}$  and  $e \in \mathcal{R}$  there exists  $b \in \mathcal{R}$  such that

$$\varphi(y) = by\varphi(e) = be = b.$$

Hence,  $a = b$ . Since the elements  $x$  and  $y$  are chosen arbitrarily we have there exists  $d \in J$  such that

$$\varphi(z) = dz \quad \forall z \in \mathcal{R}.$$

The proof is completed.

Similarly we can prove the following theorem.

**Teorema 2.2.** Let  $\mathcal{R}$  be a (non nesserally unital) Lie ring, and let  $\varphi: \mathcal{R} \rightarrow \mathcal{R}$  be a 2-local left (right) multiplier. Then there exists  $a \in \mathcal{R}$  such that

$$\varphi(x) = ax \text{ (respectively } \varphi(x) = xa) \quad \forall x \in \mathcal{R}.$$

**Proof.** Let  $\mathcal{R}_1 = \mathcal{R} \oplus Z$  be the unitization of  $\mathcal{R}$ . For every left multiplier  $L_a$  on  $\mathcal{R}$ , we define  $\tilde{L}_{(a,0)}$  on  $\mathcal{R}_1$  by  $\tilde{L}_{(a,0)}((x, \lambda)) = \tilde{L}_{(a,0)}((x, \lambda)) = (a, 0)(x, \lambda)$  for all  $x \in \mathcal{R}$  and  $\lambda \in Z$ . It is easy to check that  $\tilde{L}_{(a,0)}$  is a left multiplier on  $\mathcal{R}_1$ . Similarly, we define  $\tilde{\varphi}$  on  $\mathcal{R}_1$  by  $\tilde{\varphi}((x, \lambda)) = \tilde{L}_{(a,0)}((x, \lambda))$ , where  $a$  is an element in  $\mathcal{R}$  such that  $\varphi(x) = L_a(x)$ .

First, we show that  $\tilde{\varphi}$  is a 2-local left multiplier on  $\mathcal{R}_1$ . Since  $\varphi$  is a 2-local left multiplier we have for  $a, b \in \mathcal{R}$  there exists a left multiplier  $L_a$  on  $\mathcal{R}$  such that  $\varphi(x) = L_a(x)$  and  $\varphi(y) = L_a(y)$ . From this it follows that  $\tilde{\varphi}((x, \lambda)) = \tilde{L}_{(a,0)}((x, \lambda))$  and  $\tilde{\varphi}((y, \mu)) = \tilde{L}_{(a,0)}((y, \mu))$ . This implies that  $\tilde{\varphi}$  is a 2-local left multiplier on  $\mathcal{R}_1$ .

By theorem 2.1  $\tilde{\varphi}$  is a left multiplier on  $\mathcal{R}_1$ . This completes the proof.

Let  $\mathcal{R}$  be a Lie ring.

**Definition.** Let  $\varphi: \mathcal{R} \rightarrow \mathcal{R}$  be a linear mapping. If, for any  $x, y \in \mathcal{R}$ ,  $\varphi(xy) = \varphi(x)y$  ( $\varphi(xy) = x\varphi(y)$ ), then  $\varphi$  is called a weak left (respectively right) multiplier.

Let  $L: \mathcal{R} \rightarrow \mathcal{R}$  be a mapping. If there exists  $a \in \mathcal{R}$  such that  $L(x) = ax$  ( $L(x) = xa$ ) for any  $x \in \mathcal{R}$ , then  $L$  is a weak left (respectively right) multiplier, i.e. every left (right) multiplier is a weak left (respectively right) multiplier. Such weak left (right) multiplier we denote by  $L_a$  (respectively  $R_a$ ).

**Theorem 2.3.** Every weak left (right) multiplier of a unital Lie ring  $\mathcal{R}$  is a left (respectively right) multiplier.

**Proof.** By the definition, for every pair  $x, y \in \mathcal{R}$  of elements,  $\varphi(xy) = \varphi(x)y$ . Let  $e$  be an identity element of  $\mathcal{R}$ . Then, for every  $x \in \mathcal{R}$ ,

$$\varphi(x) = \varphi(ex) = \varphi(e)x.$$

Here  $\varphi(e)$  is a constant value. Let  $a = \varphi(e)$ . Then

$$\varphi(x) = ax, \quad x \in \mathcal{R},$$

i.e. the element  $a$  generate the mapping  $\varphi$  and  $\varphi$  is a left multiplier. This completes the proof.

By theorem 2.2 we have the following theorem.

**Theorem 2.4.** Let  $\mathcal{R}$  be a unital associative ring, and let  $\Delta: \mathcal{R} \rightarrow \mathcal{R}$  be a 2-local derivation on  $\mathcal{R}$ . Suppose that there exist a 2-local left multiplier  $\varphi$  and a 2-local right multiplier  $\psi$  such that

$$\Delta(x) = \varphi(x) - \psi(x), x \in \mathcal{R}.$$

Then  $\Delta$  is an inner derivation on  $\mathcal{R}$ .

**Proof.** By theorem 1.2 there exist  $a, b \in \mathcal{R}$  such that

$$\varphi(x) = ax, \psi(x) = xb, \quad \forall x \in \mathcal{R}.$$

By the definition for the identity element  $e \in \mathcal{R}$

$$\Delta(e) = \varphi(e) - \psi(e) = 0.$$

Hence,  $a = b$  and

$$\Delta(x) = ax - xb, x \in \mathcal{R}.$$

The proof is complete.

### 3.2-local Jordan multipliers

**Definition.** Let  $J$  be a Jordan ring. Then, if for a map  $\varphi: J \rightarrow J$  and for every pair of elements  $x, y \in J$  there exists  $a \in J$  such that  $\varphi(x) = ax$  and  $\varphi(y) = ay$ , then  $\varphi$  is called 2-local multiplier.

Similarly we can prove the following theorem.

**Teorema3.1.** Let  $J$  be a unital Jordan ring, and let  $\varphi: J \rightarrow J$  be a 2-local multiplier. Then there exists  $a \in J$  such that

$$\varphi(x) = ax \forall x \in J.$$

In its turn theorem 3.1 allows us to prove the following theorem.

**Theorem3.2.** Let  $J$  be a (non necessarily unital) Jordan ring and, let  $\varphi: J \rightarrow J$  be a 2-local multiplier. Then there exists  $a \in J$  such that

$$\varphi(x) = ax \forall x \in J,$$

i.e.  $\varphi$  is a Jordan multiplier.

### ABSTRACT

*The content of this article deals with improving the cultivation, storage and drying of persimmon varieties in Uzbekistan in various ways. At the same time, 6 varieties of persimmon grown in Uzbekistan were studied as the object of research as a qualitative and quantitative composition, raw materials for storage and processing. When persimmons are dried, the change in quality indicators is scientifically based. Physicochemical changes in the fruits of oriental persimmon during the drying process lead to changes in their chemical composition, as well as some changes in their nutritional, taste properties. It also reveals the theoretical and practical significance of the collected results, provides recommendations for the implementation of research results in practice.*

**KEYWORDS:** *Persimmon Varieties: “Khachiya”, “Khiakume” “Jiro” “Sidles”, “Zanjimaru”, “Tamopan”, Processing, Storage, Drying Of Date Fruit.*

## INTRODUCTION

Fruits grown in Uzbekistan have long been known for their taste and high quality. At the same time, processed products from fruits grown in Uzbekistan are of high quality (dried fruits, juices, syrups, etc.). The level of development of horticulture and viticulture in Uzbekistan does not fully meet the requirements of modern horticulture. Therefore, we need to increase the efficiency, productivity and area of horticulture and viticulture in our country by using modern technologies.

Persimmon is a subtropical plant that has many species. Persimmons are grown wild in China and imported from Japan and CIS countries. They grow on the coasts of Georgia, Azerbaijan, Tajikistan, Crimea and the Black Sea. They are deciduous, 6-12m tall, unisexual or bisexual plants. Flowers appear on annual branches. Persimmon change shape, color, and taste depending on the type and navigation of the fruit. The fruit is eaten in wet days; it is very useful for human health. The fruits are thinner at first and sweet when slightly ripe, and propagated by sowing and grafting seeds.

Yields are bred in 3–4 years after planting and they are resistant to frost in subtropical plants. Most are pollinated from the outside, only some of them can bear fruit without seeds, without grazing [1,2].

The fruits are finished at the ends of annual branches, and ripen in November; the fruits of most varieties ripen after harvest. The fruit is cut with garden shears and then the fruit band is removed.

Persimmons often do not choose land, but grow well in fertile soils and give abundant yields and they are eaten wet and dried.

In addition, the fruit is used in the preparation of various desserts, such as jam and trees can withstand 18 ° C frost, when the cold reaches 20 ° C, surface branches severely damages if annual branches exceed it. More resistant to dry air, but moist enough in the soil otherwise it will shed its fruit. It is a light-loving plant. In Uzbekistan, the planting of persimmon begins in February.

Persimmons are mostly found in Surkhandarya region and Fergana valley. But in recent years, with the help of amateurs began to multiply in the gardens of the region, where winters are cold.

Here are some common **widespread varieties** of persimmon:

**Zanju-maru** – Variety adapted for planting in Sukhandarya region. Other date varieties do not pollinate well. The branch is black. The average weight of the fruit is 100-120 g, round, oblong-round, the seeds in the fruit are numerous, the growth period lasts 220-230 days. Seedlings are harvested from 3–4 years after planting. When fully harvested, 50-60 kg of dates can be obtained from each bush. The fruit contains 12-17.5% sugar and 0.13-0.16 acid. The trees are self-pollinating. The fruits are stored up to 2–3 months.

**Tamopan** – Localized date variety for Surkhandarya region. The tree grows on the ground, frost tolerant, and fruits are big (about 400gr).

The skin is thick, shiny, the flesh is juicy, fibrous, and the sour taste disappears when fully cooked. The fruits are stored for 2–3 months. This variety is suitable for sending to distant places.

A fertile bush yields 150 kg and more. The fruit is eaten as dried and candied forms. This tree is native to Central Asia not damaged by pests and diseases.

**Khiakume** – The height of the bushes is 5-6 m, the branches are dome-shaped. The fruit is round; the surface is covered with waxy powder, light red in color, dark red when ripe. The flesh of the seeded fruit is brown and the sweet, seedless fruit is flat with a bright red color. The meat will be sour until fully cooked. The fruits ripen in late October. It is well preserved without spoiling after harvesting. The flower is pollinated from the outside. Among the persimmon varieties, the Xiakume variety differs in that it can withstand considerable cold. Yields in 3-4 years, full yield begins to bear fruit in 7-8 years. The average yield is 60-80 kg. In late October, November fruits are harvested [1,2,3].

Currently, persimmon growing is one of the leading fruit crops in Uzbekistan. They are very diverse in terms of quality according to varietal characteristics. As there is a demand for fruits both in fresh form and in the form of raw materials for processing, the issues of improving the technological processes of fruit storage and processing are relevant.

#### **Research methods and state standard features:**

1. "Methodical recommendations: on the primary study of Oriental persimmon" (Paseykov A.K.);
2. "Study of subtropical fruit crops. Methodological guidelines" (Vitkovsky V.L. and others, 1989);

3. "The order of research work"

4. "Frozen fruits and berries. General specifications";

5. "Guidelines for research with fast-frozen fruits, berries and vegetables" (Anisimov V. Ya. and others 1984) [4,5]

The objects of study were oriental persimmon varieties: Jiro, Zanzi Maru, Sidles, Khachia, and Khiaku.

The research program provides the following experience:

1. Experiment №1: Variety, commodity-technological and biochemical evaluation of oriental persimmon fruits (A).

2. Experiment 2: Storage of Eastern persimmon fruits at different temperature conditions (B).

3. Experiment 3. Development of processed products from oriental persimmon (B).

### **Scientific research works**

The research is focused on: the characteristics of the formation of quality indicators of persimmon fruits during planting are analyzed; technological features of fruit storage according to varietal characteristics; the data used in the processing of persimmon have been discussed in detail.

The object of research was the qualitative and quantitative composition of the fruits of 6 varieties of persimmon are grown in Uzbekistan, as a raw material for storage and processing. Special attention has been paid to the technological parameters of storage and processing.

***Storage and drying of persimmon fruits.*** Red persimmon varieties last for 4 months or more when stored at temperatures between -1 and 0 degrees. The non-perishable Fuyu variety is usually stored at a temperature of 5 degrees, but if each fruit is placed separately in 0.06 mm thick polyethylene bags, at 0 degrees the fruit can remain intact for up to 5 months. Mature, hardy varieties can be stored in a cold room for at least 1 month. These fruits can be frozen and stored for 6–8 months [1,4,5,6].

**Drying of fruits.** Outdoor drying of persimmon is a common activity in Japan and Brazil, as after the ripe but not yet softened fruits are cut, the peel is peeled off and hung from the band. When pruned, a small amount of peel should remain on the tip of the fruit, otherwise a lot of liquid will flow out. Hanging fruits are dried in the sun for 30–50 days. It needs to be hand-kneaded every 4–5 days to have a uniform texture and improve the taste. After drying, it is wrapped in balls for “sweating”. As a result, sugar crystal grains are formed on the surface of the palm. Finally, it is hung again to dry in the wind.

In Japan and China, Khachiya fruits are harvested in a tense manner. The skin is peeled off. The wire is attached to poles or poles for air drying. It is dried under the roof for 30–50 days. Sugar crystal grains are formed on the skin of the fruit. The composition of the fruit can contain up to 50% sugar. Drying eliminates redness. Use “Khachiya” and “Khiakume” varieties for drying. Dried fruits should be stored in tightly closed containers to prevent spoilage.

Drying of fruits can be done in a home oven at room temperature. Fruits arching part of the peel. Cut into slices 6 mm thick. Place on a baking tray (list). Set the oven temperature to 60 degrees. Fruits are considered dried when they lose their stickiness. Store dried fruits in a tightly closed container, otherwise they may spoil. Do not dry Fuyu, Jiro, Suruga varieties. Drying non-malt varieties does not give good results. The fruit part hardens and hardens.

The above-mentioned varieties were selected for drying palm fruits, which accumulate more than 16.0% soluble solids and have a durable structure. The fruits are dried with whole fruits and sliced in a dryer with infrared rays (IR rays), which reduces the drying time by an average of 1-2 hours and maintains the attractive appearance of the finished product.

Physicochemical changes in the fruits of Eastern persimmon during the drying process, along with changes in their chemical composition, lead to some changes in their nutritional, taste properties (Table 1).

**TABLE 1 WHEN PALM FRUITS ARE DRIED, THE QUALITY INDICATOR CHANGES**

Variety	water (%)	Купы к модда (%)	General amount of sugar (%)	Glucose amount (%)	Fructose (%)	Acidity	Vitamin C (%)	Carotene (%)	Pectin substances (%)	Degustative valuation in points
Khiakume	0,9	7 9,1	6 3,0	4,1	4 8,9	0 ,69	1 78,2	1 8,2	0 ,17	4 ,6
Jiro	9,7	8 0,3	7 1,8	4,9	5 6,9	0 ,45	1 62,3	2 1,1	0 ,16	4 ,5
Khachia	7,0	8 3,0	6 6,7	3,8	5 2,9	0 ,66	1 84,4	1 7,3	0 ,17	4 ,1
Sidles	8,5	8 1,5	5 9,6	2,6	4 7,0	0 ,39	1 75,7	2 0,9	0 ,16	3 ,7
Zanjimaru	1,2	7 8,8	5 5,2	3,1	4 2,1	0 ,51	2 02,0	2 2,4	0 ,16	3 ,1
<b>average</b>	9,5	8 0,5	6 3,3	3,7	4 9,6	0 ,54	1 80,5	1 9,9	0 ,16	4 ,0

On average, the moisture content of the varieties is 19.5% - from 17.0% in Khachia fruits to 21.2% in Zanj Maru. The amount of solid dry matter ranged from 78.8% (Zanji Maru) to 83.0% (Khachia) - an average of 80.5%. The total amount of sugar in dried fruits increased almost 4 times compared to fresh ones and averaged 63.3% for varieties [6].

An increase in vitamin C, carotene and acids has been noted in the dried fruits of Eastern persimmon.

During drying, the content of pectin and tannins decreases sharply, which leads to evaporation and loss of astringent taste and improvement of organoleptic properties.

## CONCLUSIONS

The fruit is characterized by the largest variety of Khachia, that fruits are round, slightly conical in shape, with a ratio of fruit length to width 1.04. Sidles fruits are rectangular in shape, with a length and width of 0.59. The small Maru fruit has an almost round shape, with a coefficient of 0.97.

Oriental date fruits contain 14.6 (Hyakume) to 17% (Zanji Maru) sugar, depending on the variety, and have a low content. titratable acids - from 0.14 (Hyakume) to 0.22% (Khachia). The daily norm of carotene is 3.4 mg% (Hachia) to 4.2 (Khyakume) which is 5 mg. Vitamin C from 48.8 (Khyakume) to 93.6% (Zanji Maru) requires 90 mg per day. Pectins range from 0.46 to

0.55%, tannins from 0.48 to 0.81%. Persimmons are rich in minerals, especially with iodine (0.11-0.23 mg / product).

The chemical composition of persimmon fruits was found to vary depending on the specific characteristics of the growing season and weather conditions, but varietal dependence was maintained. Small varieties of Tamopan, Gosho-Gaki, Sidles, Fuyu, Zanzi Maru with very high solubility (up to 20.0%) and sugar content (16.0%) were identified. In terms of vitamin C content (more than 30 mg / 100 g) - Giro, Sidles, XX century, Gosho-Gaki; Giro, Nitari, Sidles, Khachia, Fuyu, Tamopan small, containing vitamin R (256.0-278.0 Mg / 100 g); in terms of p-carotene content (2.8-3.1 mg / 100 g) - Giro, Khachia; in terms of amino acid content (up to 199, 3 mg / 100 g), and Tamopan is relatively small.

### **Recommendation**

1. The fruits of Khachia, Khyakume, Jiro, Zenji-Maru varieties of dates are recommended for growing fast-frozen Eastern persimmon when ripe.
2. It is recommended to use Oriental persimmon in different proportions to produce multi-component mixtures with increased nutritional value.

### ABSTRACT

*The article considers the specifics of general creative abilities, their difference from special abilities, defines the essence of such general creative abilities as variability, hypothetical, improvisation and transference. The indicators on the basis of which it is possible to judge the level of their development are identified, the ways of developing general creative abilities in the educational activities of schoolchildren are determined. Possible directions of the study of general creative abilities in educational psychology and pedagogy are indicated.*

**KEYWORDS:** *Personality Traits, Individual Characteristics, Abilities, Creativity, Creative Activity, Creativity.*

### INTRODUCTION

One of the urgent tasks of educational psychology is to identify the conditions for successful mastery by each rising generation of the necessary social experience accumulated by previous generations. Among such conditions, undoubtedly, the development of individual personality abilities can be called. Therefore, the solution of the above problem is impossible without a detailed and deep psychological analysis of the problem of abilities.

The concept of abilities is one of the controversial, debatable in psychology.

Often, any processes, states and functions of our psyche are unreasonably attributed to abilities. So, people still sometimes talk about a person's ability to think, to perceive, to remember, about the ability to experience emotions, etc. Of course, we are not talking about abilities in the strict sense of the word. With the same success, this list can include a person's ability to walk directly and to digest food.

Until the turn of the 19th and 20th centuries, it was widely believed in psychology and pedagogy that abilities are a high level of knowledge, skills, which provides a person with a certain level of success in performing various types of activities. This understanding of abilities is partly used at the present time. Indeed, the high level of formation of these characteristics largely ensures the success of the activity. But with such an understanding of abilities, it cannot be explained why, for different people in the same activity, knowledge, skills are developed at different speeds and with different successes. As far back as the 40s of the 20th century, one of the classics of Russian psychological science S. L. Rubinstein [4] pointed to "abuse" of the concept of "ability" in psychology, as a result of which this concept was discredited. And to this day, the overly wide use of this term in psychology, pedagogy leads to a erosion of the deep meaning, the essence of the concept of "ability".

By analyzing the literature, one can find various definitions of abilities, which can be divided into two main general directions.

The so-called functional-genetic approach to determining abilities was proclaimed by L. S. Vygotsky [1] and was also considered in the works of Ya. A. Ponomarev [3] and others. According to this approach, abilities are defined as properties of functional systems that implement individual mental functions having a certain measure of severity, manifested in the success and quality of the originality of the development and implementation of individual mental functions. In this definition, abilities act as general essential qualities of mental functions, in contrast to the definitions of another approach, in which abilities are divided by type of activity.

This second approach, personal-activity, goes back to the works of S. L. Rubinstein [4]. S. L. Rubinstein defines ability as a complex synthetic formation, which includes features without which a person would not be capable of any activity, and properties that can be developed only in the course of a certain way of organized activity. Moreover, it can be specific types of activities or any of its generalized manifestations. Thus, in the context of the above approach, abilities act as individual psychological properties necessary for the successful performance of an activity (one or more of its types). It is this approach that has been fixed as the most commonly used in Russian psychology.

The content of the concept of "ability" highlighted above, as we have already indicated, goes back to the point of view of S. L. Rubinstein. It was he who said that "all ability is the ability to something, to some kind of activity. The presence of a certain ability in a person means his suitability for a certain activity. ... The ability should include various mental properties and data necessary due to the nature of this activity and the requirements that come from it "[4].

A modern understanding of abilities cannot reduce them to experience, to knowledge, to skills, although it emphasizes the close connection of these sides of our personality with each other. According to S. L. Rubinstein, abilities have two components. Firstly, the system of operations and methods of activity, which are the essence of the activity itself and provide the possibility of

its implementation. Secondly, the quality of the processes governing these operations. The quality of the processes is the “core” of abilities, which provides not only the opportunity, but also the success of the activity. The “core” of abilities is the so-called “by-product” of an activity, an additional effect of its fulfillment, a by-product of gaining experience. This is what makes abilities a property of the personality, its inalienable quality. In this regard, the concept of “ability” should be considered as a level characteristic of the personality, which determines the degree of transition from the process to the personality property, indicating the degree of stability for a given person of the corresponding level of activity.

Currently, the development of creative abilities is gaining the greatest relevance. The division of abilities into creative and reproductive is carried out depending on the degree and nature of the novelty of the product obtained in various types of activities that realize and form different abilities. In addition, it is known that the concept of “ability” determines the success, ease and speed of the activity both in the presence of complete information and in conditions of its deficit. It can also serve as a possible basis for the division of abilities into reproductive and creative.

Reproductive abilities are distinguished by the fact that they determine the success of human reproduction of the experience already accumulated by mankind. They are realized in conditions of complete information and are expressed in the success of a person’s mastery of knowledge, skills, in the success of the formation of personality traits. Moreover, the experience a person receives, although it has a subjective novelty for him, but does not have an objectively new character, this is just a reproductive assimilation of the experience of previous generations.

The special significance of creative abilities for the psychological and pedagogical problems of today is due to the specifics of modern social experience that subsequent generations must learn, due to the dynamic and unstable nature of this experience.

Firstly, at present, the information flow is sharply increasing, and its volume is such that it is fundamentally impossible to master it. Creative abilities allow you to successfully carry out activities in the face of a lack of information. Secondly, in conditions of an ever-accelerating process of development of various aspects of society, the ability to see and find the right solutions to constantly emerging new problems is becoming more important than before. Thirdly, the emergence of more and more new professions, significant changes in the requirements for existing professions require a certain mobility of the person, which also requires the development of creative abilities.

The volatile nature of social experience requires modern people to develop not just creative abilities, but creative abilities of a general nature. The division of creative abilities into special and general is determined by the range of activities in which they are implemented.

Special creative abilities are associated with specific types of creative activity and ensure success in certain areas of creativity. We can distinguish musical, artistic, choreographic, literary abilities, as well as the ability to visual, technical, scientific, managerial, pedagogical activities, etc. In each case, special abilities rely on certain specific inclinations and require the development of a unique set of intravitaly formed personality traits that develop precisely in this type of activity. Most clearly, special creative abilities are manifested in a person’s inclinations, that is, in the preference of precisely those types of creative activity for which there are inclinations, in deriving pleasure from performing this particular activity, in the most complete self-realization of the personality in it.

General creative abilities, unlike special ones, are realized in a wide range of activities and ensure success in the most diverse fields of creativity. These abilities provide the individual's readiness for successful activity, regardless of its specific content. This type of creative ability not only gives a person the opportunity to adequately reflect the world around him in his essential connections and relationships, but also allows him to choose creative ways of interacting with the surrounding reality as habitual and sustainable. It is due to these qualities that success is achieved in the most diverse types of creative activity (as they say, a talented person is talented in everything). So, we can say that creative ability is a level characteristic of a personality, which implies the presence of a certain property that ensures novelty and originality, ease and speed of performing various types of activities, i.e., creative ability is a fairly high level of development of any human ability. Indeed, as soon as the manifestation of the ability leads to the novelty and originality of the product of activity, it becomes possible to interpret this ability as creative. The question of what kind of abilities can be attributed to the general creative, as well as the definition of abilities, is debatable in nature and is decided differently by different authors. In foreign psychology, the problem of general creative abilities is often considered in the aspect of the problem of creativity and creative personality traits.

"Creativity (lat. Creatio - creation) is a systemic (multidimensional, multilevel) mental education, a system of general creative abilities and individual personality traits that contribute to the independent advancement of problems, their unconventional solution, and the generation of a large number of original ideas." J. Guilford [7] identifies a number of common abilities in the structure of creativity: originality - the ability to produce distant associations; semantic flexibility - the ability to highlight the functions of an object and offer it a new purpose; figurative adaptive flexibility - the ability to change the shape of the stimulus so as to see new opportunities in it; semantic spontaneous flexibility - the ability to produce a variety of ideas, relatively not limited by the situation.

The listed characteristics show that the author considers general creative abilities as qualities of thinking. At the same time, creative thinking, according to the author, differs from standard thinking with a divergent (divergent) character, that is, a varied search for a solution to a problem. The same "cognitive" line is continued by E. Torrens. Both of these authors include common creative (creative) components in the structure of human intelligence.

There are many more authors' points of view on the allocation of general creative abilities, but no matter how many were considered, one can see that many of them often characterize similar psychological phenomena, although they use different terms to designate them.

There are four creative abilities: the ability to vary, the ability to be hypothetical in the process of solving problems, the ability to improvise in various situations, and the ability to transfer. In order to give a specific characterization of these abilities in the aspect of pedagogical psychology, it is necessary, firstly, to determine their essence and outline the basic psychological mechanisms that underlie each ability; secondly, to identify indicative indicators of their development; thirdly, to determine the general directions of the focused development of the allocated abilities. In this logic, we consider each of the common creative abilities.

Variability is a general creative ability that allows you to highlight a variety of original ways to solve problems, both practical and theoretical, to generate a large number of different ideas. The psychological mechanism of the functioning of this ability is primarily based on the analytical

components of thinking, which make it possible to specify the general problem in the form of a set of particular properties, signs and conditions. In addition, the so-called divergent thinking - productive thinking, aimed at the possibility of obtaining a whole fan of the right solutions to the problem (as opposed to convergent thinking, striving for the only right solution) can serve as the psychological basis for variability. Also, the psychological mechanism of variability is associated with individual properties of creative divergent thinking - with its fluency and flexibility, which determine not only the total number of ideas put forward, but also their wealth, the variety of associations that arise, logical connections.

When considering indicators of the development of variability, it is first of all necessary to determine how many possible solutions are proposed when solving a problem. It is necessary to monitor not only the total number of proposed solutions, but also the number of groups, classes of these solutions. It is important to consider whether an assumption is made about the various ways to solve a particular problem, how substantiated are these assumptions, what a person relies on, proposing solutions. An indicator of the development of variability can also serve as a positive attitude to this action arising in the process of searching for solutions. One can also judge the development of variability by the extent to which the subject is aware of the need and significance of the search for various solutions to the problem. Another significant indicator can be the breadth of manifestation of this ability, that is, how widely represented are all these characteristics when solving standard and non-standard tasks, tasks related to educational activities, communication and moral behavior. Highlighted indicators allow you to see the main directions of the targeted development of the ability to variability. The formation of the ability to variability involves a special selection of tasks that require finding different solutions, and with their sequential complication in all of the intended parameters. It is necessary to form a stable positive attitude towards this personal property, revealing its importance and significance for a person's creative activity, thereby increasing the level of awareness of the search for varied solutions. It is important that the proposed tasks be both standard (at first) and non-standard in nature, and also gradually expand the scope. So, students can be offered not only learning tasks of a variable nature, but also variational tasks in the field of communication and moral behavior.

Hypotheticity is a general creative ability, which consists in the ability to express various, well-grounded assumptions about the prospects and reasons for the development of any phenomena of reality. The psychological mechanism underlying hypothesis is primarily associated with the functioning of the general mental action of establishing causal relationships. The ability to see the connection of causes and effects in the phenomena of the real world allows us to successfully put forward hypotheses both perspective (facing the future) and retrospective (facing the past). Also, for successful hypotheses of a promising nature to be put forward, it is necessary to carry out a general mental planning action that allows one to mentally calculate the course of events. In addition, as in the case of variability, divergent thinking with its flexibility and fluency properties is required for the manifestation of hypothesis, which allows us to put forward a significant number of various hypotheses. According to our assumption, several parameters may serve as indicators of the development of hypothetics in its experimental study. In assessing the development of this creative ability, one can focus on the number of hypotheses put forward, although in this case this indicator is not paramount, it is more characteristic of variability. For hypothesis, it is important that it acts as the basis for hypothesizing how fully and thoroughly the hypotheses are justified. First of all, it is necessary to pay attention to the correctness of

hypotheses, the peculiarities of their verbal expression, accuracy and correspondence to reality. The formation of the ability to hypothetical, as in the case of variability, should be carried out with a constant complication of the proposed tasks, which creates conditions that increasingly make it difficult to advance and substantiate hypotheses. Based on the psychological mechanism of hypothesis, when it is formed, it is necessary to develop the mental actions of planning and establishing causal relationships with the help of appropriate tasks.

It is advisable to start the process of the targeted development of this ability with training in the development of retrospective hypotheses, that is, looking into the past, since this provides the subject with the appropriate experience of activity to a greater extent. In this case, hypotheses, as in the formation of variability, can relate not only to educational tasks, but also to problems of communicative and moral content. Improvisation is a general creative ability, consisting in the ability to generate creative products in a short period of time on the basis of intuitive creative activity. You can give another definition of this ability: improvisation is a general creative ability that allows you to see the essence of the problem without preliminary preparation for solving a problem that has suddenly arisen, and also to solve it in an original way for a limited period of time. As a psychological basis of this ability, one can consider a person's experience of creative activity, the variety of methods for solving creative problems accumulated by him in this experience. In addition, improvisation is based on intuitive unconscious processes associated with the activity of the right hemisphere of our brain, providing incubation and the birth of a creative idea. For successful improvisation, in our opinion, special properties of higher nervous activity are also necessary, such as a high rate of the course of nervous processes and their lability. In addition, the functioning of improvisation is associated with a motivational orientation on the publicity of creative activity.

The interconnection of these components determines the psychological basis of the improvisational process and the improvisational qualities of a person. An indicator of the development of the ability to improvise, first of all, should be a characteristic of the reaction speed to changing conditions, and the change in conditions should be quite unexpected in nature, generated by a lack of information. To evaluate improvisation, it is important to consider the measure of transformation of existing experience in solving an improvisational task. Another important indicator of the development of this ability is a positive attitude towards improvisational activity. Perhaps, it is equally important when studying improvisation to monitor the process of awareness of one's own actions, the possibility of explaining them, describing hidden unused one's own abilities in such situations, and clarifying other possible reactions to changing conditions. However, it is rather difficult to use these indicators due to the unconscious nature of the core of improvisational activity, and in addition, such indicators can only be used in relation to adult subjects, but not to children, whose level of awareness of activity is much lower compared to adults.

Since improvisation is a reaction in conditions of lack of information, the formation of this ability should be carried out in conditions of changing the maximum available measure of this information. It is also necessary to consistently increase a person's ability to fill in the missing information, learn to rely on existing experience and become more fully aware of the system of actions that must be carried out for sound improvisation, anticipate the consequences of improvisation and be responsible for its outcome. A special direction in the formation of improvisation should be devoted to the development of the ability to heuristic solutions, which in

principle cannot be taught, but can and should be taught. A gradual change in the maximum available measure necessary to solve the creative problem of information stimulates the possibility of heuristic thinking, and contributes to the development of a search for approaches to heuristic solutions. The ability to transfer takes a special place in the proposed classification of general creative abilities, since the development of the above abilities as stable personal characteristics is possible only in conditions of transfer. But transference can also be considered as an independent creative ability. Transfer is a general creative ability that allows the subject to use the existing knowledge, abilities in new, unusual conditions in an unusual and original way.

The psychological basis of the transfer can be considered: the existing experience of various types of activities (including creative ones), the methods of solving various problems (including non-standard ones) accumulated in this experiment. In addition, transference is based on general mental actions of generalization and abstraction, as well as fluency and flexibility of thinking. In addition, for the successful transfer, high general adaptive abilities of the individual are necessary, that is, the possibility of its flexible and adequate response to changing environmental conditions. The generally accepted main indicator of the development of transfer in the experimental study of this ability is its breadth or, in other words, the degree of remoteness of the new conditions in which it appears. Indirect indicators of this can be the level of development of abstraction and the flexibility of thinking, the rate of adaptation in changing conditions.

To form the ability to transfer, on the one hand, it is necessary to learn to isolate the invariant, common in increasingly distant objects, phenomena, and on the other hand, to find different things in ever closer objects and areas. It is also important to carry out focused work on the formation of mental actions of generalization and abstraction. At the same time, as in the case with all other abilities, the content of developmental tasks can concern not only educational and cognitive activity, but also moral behavior, as well as the sphere of communication. In identifying the areas of purposeful development of the above-mentioned general creative abilities, along with the specifics of each of them, we were faced with the possibility of identifying common approaches that ensure their development.

Considering all of the above abilities as stable personal properties, psychological characteristics of a person, it is necessary to include the cognitive (knowledge about the essence of this ability), emotional (stable attitude to ability) and behavioral (ways of implementing the ability in activity) components in the structure of each of them. Thus, the formation of any common creative ability implies purposeful development in the relationship of their three structural components. This will allow developing abilities as stable characteristics, mental properties that are part of the structure of a person's personality. In addition, these areas are universal in nature and can contribute to the formation of all creative abilities of a general nature.

Research work in these areas will allow to establish the dependence of the development of such general creative abilities as variability, hypothetics, improvisation and transference on several factors. From our point of view, these factors are the specificity of the creative ability itself, the type of creative activity (artistic, technical, research) in which these abilities are manifested, the age and sex of the students, their individual personality characteristics, and the conditions of their learning. Establishing the relationship of these factors will allow us to substantiate ways to optimize the process of purposeful development of common creative abilities among the younger

generation, which will undoubtedly contribute to solving urgent problems of educational psychology.

## ABDURAUF FITRAT IS ONE OF THE EARLIEST RESEARCHERS OF UZBEK FOLKLORE

**Amonov Ulugmurod Sultonovich\***

\*BSU PhD of Philology Sciences,  
UZBEKISTAN

Email id: [ulugmurod.amonov@mail.ru](mailto:ulugmurod.amonov@mail.ru)

### ABSTRACT

*The following article deals with Abdurauf Fitrat's activity as a folklorist and his role in the Uzbek folklore of the 20th century of the Uzbek Literature. While the first line confuses folklore with tradition, the second interprets it only from a literary point of view. Neither direction is correct, of course. In recent years, folklore has been described as "Folk Art", "Folk Art", "Folk Oral Art". In this way, young people realize that their country is eternal, has its own sacred history and unique traditions, and national values. With this in mind, from time immemorial, scholars and poets have focused on the collection and study of samples of folk literature.*

**KEYWORDS:** *Abdurauf Fitrat, The History Of Literature, Literature, Literature Sciences, Folklore, "Nation's Literature", Folklorism.*

### INTRODUCTION

Along with a number of social sciences, such as language, literature, philosophy, and history, Fitrat's contribution to the development of folklore was great. Fitrat has a role in the formation of Uzbek folklore and in determining its methodological basis.

It can be said that Fitrat is one of the founders of twentieth-century Uzbek folklore and this can be fully confirmed by his theoretical views on folklore. Because the scientific ideas expressed by Fitrat in this regard were further developed in the later stages of our folklore and played an important role in defining its theoretical foundations, and its specific poetic laws.

The Uzbek scholar Temur Khoja oglu, who lives in Turkey, wrote in his article "Forgotten works of Turkestan scholar Abdurauf Fitrat in the field of Turkology" that "to describe Fitrat literally ... we would like to cite some of these qualities: reformer, politician and statesman, publisher,

editor, publicist, he is a storyteller, poet, playwright, literary historian, literary critic, linguist, music historian, and folklorist as well.

This means that Fitrat's work as a folklorist is well known abroad. After all, folklore is one of the areas of activity of the owner of a comprehensive, encyclopedic heritage. The aspects of his activity as a literary critic, linguist, historian, lawyer, musicologist, folklorist, pedagogical scientist have been studied to a certain extent nowadays, but it is also necessary to study the contribution of a great talent to folklore.

Looking at Uzbek folklore as a whole system, Fitrat put forward the first ideas about the theoretical problems related to its specific genres, which then has served as a program for our researchers. Especially noteworthy is his 1926 book, *The Rules of Literature (A Guide for Literary Teachers and Literary Enthusiasts)*, which was written to train literary scholars. In this book, which served as a textbook on literary criticism for scholars of the 1920s, literature, that is, concepts related to the theory of folklore. The important point is that Fitrat's views on this subject have not lost their validity from the point of view of literature and folklore.

Fitrat, trying to reveal the peculiarity of folklore, said of him: "We have a literature which strives to preserve itself with its solitary sincerity. These are the works of our poets, who came from among the people, wrote and spoke to the people and nation" he said.

It should be noted that Fitrat uses the verb "wrote" here. However, folklore works are considered to be oral works.

Folklore works help the current generation to learn about our long-standing culture, artistic traditions, our struggle for freedom and liberty, as well as the sense of patriotism and creativity inherited from our ancestors. In this way, young people realize that their country is eternal, has its own sacred history and unique traditions, and national values. With this in mind, from time immemorial, scholars and poets have focused on the collection and study of samples of folk literature. Many artists have created unique folklorism using the simple form and style of folklore, traditional epic images and motifs, playful and lively tone, in order to quickly reach the hearts of the people.

Abdurauf Fitrat, a brilliant representative of Uzbek literature of the 20th century, a literary scholar, a brilliant poet, prose writer and playwright, is notable for combining these two aspects in his work.

Fitrat's passion for folklore awoke from an early age under the influence of his mother's singing of popular songs, and this passion accompanied him throughout his life. Fitrat, first of all, paid great attention to "folk literature" and put forward valuable theoretical views on its nature, genre system and composition. His views on this issue played an important role in laying the foundation stone of Uzbek folklore. In particular, the difference between folklore works and written works, specific features of folklore, his comments on the nature of the genre of Uzbek folk songs, his attitude to various genres of folklore still retains its scientific value.

Fitrat's knowledge of folklore is also further illustrated by the example of the works of art he created. The folklorisms found in the poems, prose and dramatic works of the artist are distinguished by their uniqueness.

Fitrat, as one of the profound scholars of folk art in his time, became its tireless propagandist. For the first time in his anthology "Samples of Uzbek literature" (1928) there are examples of folk literature. However, so far in Uzbek literature and folklore, these services of Fitrat have not been specially studied and evaluated objectively. However, it is necessary to study Fitrat's multifaceted activity as a scholar, propagandist and researcher of Uzbek folklore, folklore in his art. Because this issue is very important, first of all, in terms of the use of folklore in the early twentieth century, its peculiarities, as well as Fitrat's style and skill in the use of folklore in poetry, prose and drama.

Abdurauf Fitrat was not only the founder of realistic Uzbek literature and literary criticism, but as a comprehensive theoretical scholar, he achieved great results with the aim of solving a number of theoretical problems of literature, music and folklore. His theoretical views on this subject are reflected in a number of scientific treatises, such as "Rules of Literature", "About Aruz" and music "Uzbek classical music and its history." In these works, along with a number of sources of classical and modern Uzbek literature, various materials of folklore are addressed and commented on, because folklore is an important part of the national culture of each nation. In this regard, Abdurauf Fitrat published a small study on folklore called "Folk Literature" in the "Rules of Literature". The oral tradition of the Turkish people attracted the attention of writers such as Mahmud Kashgari, Abulqasim Mahmud Zamakhshari, Alisher Navoi, Abulgazi Bahodirkhan, Muhammad Sharif Gulkhani centuries before Abdurauf Fitrat. They collected samples of folklore in the genres of song, lament and proverb and included them in their works. At the same time, some theoretical ideas about them were also expressed. This is proof that our folklore has an extremely ancient origin. By the beginning of the twentieth century, folklore was formed as a science in many countries of the world; the collection of samples of folk art, their study had already begun. In our case, let alone the formation of it as a science, special collection work had not yet begun. This shortcoming did not go unnoticed by the sensitive Abdurauf Fitrat. He was captivated by the fascination with the oral art of the people. Therefore, one of the main tasks of the circle "Chigatay Gurungi", organized by the encyclopedic scholar, was to collect folklore materials. The Crimean-Tatar Turkologist Bakrbek Choponzoda (1893-1937) briefly describes the path taken by the Gurungs: and were also active in educating poets, collecting folklore materials, and organizing popular theaters. In the 1920s, with the enthusiasm and call of Abdurauf Fitrat, the recording of examples of folklore began. As a result, dozens of folk epics, hundreds of folk tales, songs, lapars, riddles and proverbs were recorded. On this basis, Uzbek folklore was formed as a science. Hisao Kumatsu, a professor at the University of Tokyo, wrote in his article "Chigatay Gurungi" that Fitrat is recognized as the organizer of this literary circle, was attracted to the world of science by talented young nationalist scholars of his time, who wrote folklore materials.

So, Abdurauf Fitrat is one of those who made a worthy contribution to the formation of this science, laying the foundation stone on its foundation. However, this aspect of the writer's work has not yet been specifically studied.

For a hundred years, the question of "folklore" has been hotly debated. Although Russian folklorists have cleverly clarified the issue, the debate is still ongoing. The mistakes stem from a different understanding of what is often called "folklore". In the past, the concept of folklore included reality, such as ancient customs, rituals, myths, proverbs. In the following periods, two contradictory trends emerged in defining the object of folklore, the scope of the concept: one - to

consider the whole folk culture as folklore, to expand the boundaries of the concept, the other - to limit the object of folklore only to works of art extremely narrowed. While the first line confuses folklore with tradition, the second interprets it only from a literary point of view. Neither direction is correct, of course. In recent years, folklore has been described as "Folk Art", "Folk Art", "Folk Oral Art". According to Russian folklorists, the concept of "folk art" accurately and completely expresses the essence of folklore. They still say that folklore is not the whole folk art (for example, folk applied decorative art is not included in it), but folklore, as V.E. Gusev defines, is the part of folk art that artistically reflects the existence of collective folk art in word-musical-choreographic and dramatic forms). So, Abdurauf Fitrat is one of those who made a worthy contribution to the formation of this science, laying the foundation stone on its foundation. However, this aspect of the writer's work has not yet been specifically studied.

For a hundred years, the question of "folklore" has been hotly debated. Although Russian folklorists have cleverly clarified the issue, the debate is still ongoing. The mistakes stem from a different understanding of what is often called "folklore". In the past, the concept of folklore included reality, such as ancient customs, rituals, myths, proverbs. In the following periods, two contradictory trends emerged in defining the object of folklore, the scope of the concept: one - to consider the whole folk culture as folklore, to expand the boundaries of the concept, the other - to limit the object of folklore only to works of art extremely narrowed. While the first line confuses folklore with tradition, the second interprets it only from a literary point of view. Neither direction is correct, of course. In recent years, folklore has been described as "Folk Art", "Folk Oral Art". According to Russian folklorists, the concept of "folk art" accurately and completely expresses the essence of folklore. They still say that folklore is not the whole folk art (for example, folk applied decorative art is not included in it), but folklore, as V.E. Gusev defines, is the part of folk art that artistically reflects the existence of collective folk art in word-musical-choreographic and dramatic forms. [2]

In other words, Russian folklorists believe that folklore as a science should study not only the artistic creation of the people, but also the creation of folk music and folk performing arts (such as folk theaters, dance).

Abdurauf Fitrat called the phenomenon "folk literature" and, tried to reveal its aesthetic essence, and was able to accurately and clearly express a number of features at that time. It is true that in the early twentieth century there was not a single term for the expression of folk art, and when the phenomenon was called by various terms such as "folk literature", "public literature", "folk art", Abdurauf Fitrat called it "folk literature". Although the term "to some extent" indicates his peculiar approach to the phenomenon, there was a certain flaw in the term. Indeed, the term "folk literature" has a broad meaning and refers to literature in general, including written literature, but because it could not express the oral nature of folklore, the people could not be equally equivalent to oral poetic creativity. The fact that the scientist clearly defined the boundary of written literature and folk literature, that is, the object, is significant in that it coincides with the scope of understanding that the oral poetic creativity of the people now represents.

Commenting on the differences between oral and written literature, Abdurauf Fitrat noted that "the difference is that it is not written, or the owner is unknown," noting that "every epic, proverb, riddle, song is written mainly by one person and then generalizes" he said, noting that the work of folklore also begins with individual creativity, and then "generalizes" into a product

of collective creativity. At the same time, he sees the essence of folklore in the infusion of the folk spirit: "What separate folk literature from "Literature" (narrow artistic literature) is not its unwritten things, but its SPIRIT. It's simple, it's natural, and it's fun for everyone!"[1]

In this sense, folklore is a science about the people themselves, who are the creators of symbolic oral artistic and spiritual wealth.

In our scientific work we have tried to reveal and substantiate another aspect of the encyclopedic scholar by studying the activities of Abdurauf Fitrat in the field of folklore and folklore, his theoretical views, as well as the influence of folklore on the writer's art.

## PSYCHOLOGY OF PERSONALITY OF THE HEAD OF MODERN COMPREHENSIVE SCHOOLS

**Aliyeva Kamola Saidnegmatovna\***

\* Teacher of the Department “Pedagogy,  
Training of Public Education Workers,  
Psychology and Technology of Education”,  
Regional Center for Retraining and Advanced,  
UZBEKISTAN

### ABSTRACT

*The psychological portrait of the head of modern comprehensive schools, the influence of management style on the general climate in the team, the modern requirements of managers is one of the urgent problems. In addition, the modern director of the school must have adequate professional self-esteem; otherwise he will not be able to analyze his activities and the activities of the teaching staff. High self-esteem does not allow the leader to grow, because he is sure that he is competent in all matters and does not seek further self-improvement. A leader must have different qualities and abilities for comprehensive management. The same requirements apply to high school principals. Organization is the creation of a system consisting of the following three components: implementation groups, economic relations and technical means that are logically interconnected.*

**KEYWORDS:** *Leader, Management, Manager, Abilities, Managerial Functions, Team.*

### INTRODUCTION

One of the tasks of our time is to educate a healthy and independent person who must be perfect in every way. Man is the foundation of society. In his report at an expanded meeting of the Cabinet of Ministers dedicated to the results of the country's socio-economic development in 2016 and the most important priority areas of the economic program for 2017, “Critical analysis, strict discipline and personal responsibility should become an everyday norm in the activities of each leader,”[1] said The President of the Republic of Uzbekistan his opinion on managers and management style.

If you look more deeply at the nature of management, you will see that it is very diverse. A leader must have different qualities and abilities for comprehensive management. The same requirements apply to high school principals. Modern high school principals should not only be pedagogue, they should also be able to manage.

One of the earliest work on management is the work of Henri Fayol,"[5]. In 1916, Henry Fayol published his "14 Principles of Management" in the book "Administration Industrielle et Générale. "Fayol's "14 Principles" was one of the earliest theories of management to be created, and remains one of the most comprehensive. He's considered to be among the most influential contributors to the modern concept of management, even though people don't refer to "The 14 Principles" often today.

#### Principles of Fayol:

1. Division of Work – When employees are specialized, output can increase because they become increasingly skilled and efficient.
2. Authority – Managers must have the authority to give orders, but they must also keep in mind that with authority comes responsibility.
3. Discipline – Discipline must be upheld in organizations, but methods for doing so can vary.
4. Unity of Command – Employees should have only one direct supervisor.
5. Unity of Direction – Teams with the same objective should be working under the direction of one manager, using one plan. This will ensure that action is properly coordinated.
6. Subordination of Individual Interests to the General Interest – The interests of one employee should not be allowed to become more important than those of the group. This includes managers.
7. Remuneration – Employee satisfaction depends on fair remuneration for everyone. This includes financial and non-financial compensation.
8. Centralization – This principle refers to how close employees are to the decision-making process. It is important to aim for an appropriate balance.
9. Scalar Chain – Employees should be aware of where they stand in the organization's hierarchy, or chain of command.
10. Order – The workplace facilities must be clean, tidy and safe for employees. Everything should have its place.
11. Equity – Managers should be fair to staff at all times, both maintaining discipline as necessary and acting with kindness where appropriate.
12. Stability of Tenure of Personnel – Managers should strive to minimize employee turnover. Personnel planning should be a priority.
13. Initiative – Employees should be given the necessary level of freedom to create and carry out plans.
14. Esprit de Corps – Organizations should strive to promote team spirit and unity.

As well in the countries of the CIS and Uzbekistan, such scientists as R. Lippit (1958), B. G. Ananiev (1969), B. Parygin (1971), E. S. Kuzmina (1974), A.N. Leontiev (1975), I.S. Mangutov (1975), A.L. Svintsitsky (1986), A.G. Kovalev (1978), F. Fidler (1978), V.S. Ageev (1986), N.N. Obozov (1990), M.G. Davletshin (1998), B. B. Shaumarov (1998, 1999), E.G. Gaziev (1999), V.M. Karimova (1994), O.R. Shamiev (2000) and others conducted their research on the problems of management and personality the leader.

In his article, "Substantial Characteristics of the Psychological Portrait of the Personality of the Head of a Modern Secondary School," Falunin V.F. and Falunina E.V. define several criteria for a successful school leader [2]:

- To understand the existential value of life "here and now";
- to take a humanistic position as a value priority of interaction, which gives the actions, behavior and relations of the leader clarity, stability, poise, confidence and justice;
- share the values of a self-actualizing personality;
- believe in people and the power of human capabilities, which can become a solid foundation for building true interpersonal relationships and lead to natural sympathy and trust in social interaction;
- To be open to new experiences and ready for the ever-changing reality of the modern world;
- Strive for self-realization - a feeling and awareness of one's need, relevance and value in the modern world;
- To be a mentally healthy, holistic, harmonious person;
- have a strong sense of confidence in their abilities and capabilities in a harmonious combination with sincere trust in the world around us, other people;
- Along with clear planning and existential logic, be prepared for spontaneous action;
- have a high level of autosympathy, which is the basis of mental health and integrity of the individual;
- have the ability to establish strong and friendly relations with others;
- be flexible in communication, adequate in self-expression, free of social stereotypes, prone to self-disclosure, ready for self-feeling and oriented towards empathic listening;
- have developed empathy, which correlates with a person's high ability to feel the problems of others;
- It is distinguished by well-being in life - it is successful and attractive not only in the professional sphere, but also in the personal space;
- have a pronounced level of development of self-confidence, which, according to the theory of V.D. Shadrikov characterizes him as a person who is able to act in accordance with the rights and freedoms of other people, without prejudice to his rights and personal freedoms. He achieves the desired goal without harming others;
- to have a high level of development of tolerance as the ability to recognize and accept the personal, ethnic and professional subjectivity of the Other, with an understanding of his rights to

a different lifestyle, free expression of his views and values, a positive attitude towards ethnic, social and sub cultural differences;

- Combine own interests with state guidelines and universal values, be focused on the future;
- respect the past, which has become history, and focus on the future, while bearing full responsibility for the present at the level of personality, socio-cultural and universal.

Also, the leader must have several management functions: planning, organization, control [3].

Planning is the beginning and the basis of managerial activity. Prepared plans show when and by whom planned activities will be completed.

Planning includes past experience, analysis of current conditions and setting real tasks for the future.

Organization is the creation of a system consisting of the following three components: implementation groups, economic relations and technical means that are logically interconnected.

Control is the organization, classification and evaluation of events in a predetermined form. With the help of the control, an initial classification of the socio-psychological characteristics of objects according to their severity (expert assessment) is carried out.

In addition, the modern director of the school must have adequate professional self-esteem; otherwise he will not be able to analyze his activities and the activities of the teaching staff. High self-esteem does not allow the leader to grow, because he is sure that he is competent in all matters and does not seek further self-improvement. Low self-esteem, on the contrary, inhibits the development of personality, the leader is not confident in himself, is afraid to introduce innovative technologies into the educational space of his school. Adequate professional self-esteem (namely, the most realistic assessment of their professional abilities, their place in the team, and the consequences of decisions) is the path to professional success. Professional self-esteem must be formed in the process of training at a university, but in the process of labor activity, the formation of professional self-esteem [4].

Summing up the above, it is possible to determine some aspects of the psychological portrait of the director of a modern school: this is, first of all, adequate personal and professional self-esteem, a locus of control with a tendency towards internationality, and, of course, professional orientation of the business. These qualities will help the leader to be successful in modern conditions, adequately make decisions and be responsible for the results of his activities.

## RELIGIOUS SPEECH AND PHONETIC INTERFERENCE

**Yusupova Shahzoda Tohirjon qizi\***

\*Ferghana State University,  
Ferghana, UZBEKISTAN

Email id: [abdurahimova\\_shahzoda@mail.ru](mailto:abdurahimova_shahzoda@mail.ru)

### ABSTRACT

*The lexical units connected with religion in Uzbek are borrowed from Arabic. In the process of assimilation, phonemes that do not exist in the Uzbek language are replaced by similar alternatives, and this is the norm for the speakers of the Uzbek language. However, in the speeches of religious preachers, we see that Arabic phonemes are pronounced in accordance with the rules of the Arabic language, not Uzbek alternatives. This is a feature peculiar only to the religious texts.*

**KEYWORDS:** *Phonetic Rules, Orthoepic Norms, Arabic Borrowings, Speech Of Religious Preachers.*

### INTRODUCTION

Phonetics is one of the independent branches of linguistics that studies sounds and their inherent properties. As a phonetic feature of a text, first of all, the place of the emergence of sounds, the peculiarities of their pronunciation are studied. In religious texts in Uzbek, the basic vocabulary is derived from Arabic, therefore in the speeches of religious preachers, even if they preach in Uzbek, we observe the phonetic peculiarities of Arabic in borrowings. Our study is the first scientific study to analyze the phonetic features of religious texts specific to the Uzbek language, and the article describes the orthoepic features of Arabic assimilations in the speeches of religious preachers.

### LITERATURE REVIEW

Religion is closely connected with language in its social nature and features. Religion also plays an important role in human life as part of culture and is reflected in the language. For this reason, in the 60s of the twentieth century, a new field of linguistics related to religion - theolinguistics - emerged and began to develop as one of the fields of study of the relationship between language and the human factor.

The term theolinguistics is derived from the English words *theo* - religion, god and *linguistics*. In dictionaries we find the following definition of the term theolinguistics: "Theolinguistics is the study of religious language" (www.definitons.net). Theolinguistics as a new direction of linguistics is a science that studies the relationship between language and religion; human language and religious views are the object of study of theolinguistics.

A number of studies were conducted on the relationship of theology and linguistics. The issues between religion and language have been studied extensively by philosophers, theologians, sociologists, psychologists, and linguists, and the first insights into the nature of religious linguistics were created by linguists such as David Crystal, Jean-Pierre van Noppen, and William Samarin.

While Western linguistics began to study theolinguistics in the 1960s, it was not until the 1990s that the first ideas about the field began to emerge in the countries of the former Soviet Union. Religious linguistics is being studied in detail by Russian and Polish linguists. A major part of these researches consists of ideas on religious style. Works on the study of religious vocabulary also play an important role. Linguists such as V.Postovalova, K.Timofeev, M.Voytak, Yu.Mikhaylova, M.Goryushina, S.Bulavina, A.Gadomsky, I.Matey have conducted research on the issue of religious style and religious vocabulary.

Few studies have been conducted in Turkology on the problems of religion and philology, including the language and style of translation of the Qur'an into Turkic languages (Suyargulova), the Qur'anic tradition in Kazakh literature (Serikbayeva), Plot of the story of Yusuf in the Qur'an and the plot of Kul Gali's "Qisai Yusuf" (Sharyafetdinov).

Religious linguistics is one of the developing branches of Uzbek linguistics. Theolinguistics is relatively little studied in Uzbek linguistics, and the researches of linguists such as N.Ulugov, T.Yuldashev, M.Umarkhodjaev, M.Galieva, Sh.Sultanova cover some features of religious linguistics.

Whereas religious style and religious lexis were studied widely, a little attention was paid towards phonetic features of religious texts.

Russian researcher O.A. Prokhvatilova focuses on the intonational features of religious sermons, as well as research on the external dialogism that manifests itself at the phonetic level of the sermon was done by her. E. Roslova studies the prosodic structure of the speaker's speech on the example of liturgical sermons, and determines the characteristics of the temp, accent, pause, etc. in religious sermons. In her article, the scientist V. Postovalova studies the features of words and silence in the works of the religious poet Aygi. Turkish scholars Zahide Buyukatalay, Muhammed Gokmen, Sibel Yildirim, and Gursel Dursun have studied voice-related pathologies specific to religious figures and teachers. Religious preachers, like teachers, are recognized as professionals whose voice is important in their work.

Our investigation is the first research in Uzbek linguistics in the field of religious phonetics.

## MATERIALS AND METHODS

Va'zs (lectures) of Sheikh Muhammad Sodiq Muhammad Yusuf, one of the most famous religious scholars in Uzbekistan and the entire Islamic world, were chosen as materials to conduct this research. 38 videos recorded on tape during the life of the Sheikh were used. These

videos were downloaded from the telegram channel of the press secretary of the Tashkent Islamic Institute – Abror Mukhtor Ali (official channel address: t.me/AbrorMukhtorAliy). The study used video materials with a duration of 01 minute 31 seconds to 25 minutes 11 seconds.

Method of observation and comparative method were used in the study.

## RESULTS AND DISCUSSIONS

“Every phoneme, whether it is vowel or consonant, is required to adhere to the orthoepic norms of literary language. Because each phoneme has a formal tone specific to literary speech. When a person belonging to one language community reads a text belonging to another language, he reads the phonemes of that language in the pronunciation specific to his own language. As a result, the orthoepic norm of the second language is "violated" at the moment of speech. This is one of the peculiarities of interference at the level of language phonemes”. (Berdialiyev)

In the speeches of those who are unfamiliar with the rules of the Arabic language and its pronunciation, or who have not mastered them well, we observe such an Uzbek pronunciation, a violation of the Arabic orthoepic norms. However, a characteristic feature of religious texts and the speeches of religious preachers is that there is no negative interference in their speech, religious scholars pronounce each phoneme according to the orthoepic norms of the Arabic language.

During the research, it was found that in the Arabic borrowings, mainly in the pronunciation of the sounds  $\text{إ}$  i,  $\text{و}$  v,  $\text{ه}$  h,  $\text{ع}$  ' ,  $\text{ض}$  z and  $\text{غ}$  g' we encounter peculiarities.

It is known that most of the religious words and terms in the Uzbek language were borrowed into Uzbek by learning Arabic. Not all the Arabic words were taken into the Uzbek language as they are pronounced in Arabic, but to a certain extent, they were adapted to the sound system of the Uzbek language. This is evident in the phonetic features of the words.

### Vowels

It is known that in Arabic there are 3 short vowels (a, u, i) and 3 long vowels (a :, u :, i :). But Uzbek vowels correspond to short vowels, therefore the short vowels in the structure of Arabic words taken into the Uzbek language did not change significantly. In the current system of literary Uzbek vowels, there are no long vowels, so long vowels in words derived from Arabic are usually replaced by short vowels. One of the vowels in Arabic, the pronunciation of the “i” sound, differs from that in Uzbek and is pronounced in an elongated form. While interference, the long sound “i:” in Arabic words was adopted into a short form. However, according to the phonetic rules of the Arabic language, this sound must be pronounced longer. For this reason, we find that in the speeches of religious preachers, unlike others, it is pronounced longer in accordance with the Arabic rules. For example: *himmat* - a form adopted in the Uzbek language; *hi: mmat* is a form peculiar to the speech of preachers.

### Consonants

The sound “ $\text{و}$ ” of Arabic differs from the Uzbek sound “v” in its formation. “V” in Uzbek is a fricative sound, and “ $\text{و}$ ” in Arabic is a labial sound formed by the convergence of two lips. For example, in English there are the phonemes fricative “v” and labial “w”. That is why in English when pronouncing Arabic words, labial sound is pronounced and it is represented by the letter

“w” in writing. However, the Arabic labial consonant “و” does not exist in Uzbek, so the fricative consonant “v” is accepted as an alternative. While the pronunciation of Uzbek fricative “v” is usually the norm in Arabic words, we observe that in the speeches of religious preachers the labial sound “و” in words borrowed from Arabic is pronounced according to the rules of Arabic phonetics. For example, in words such as *va*, *avvalgi* when the public pronounces the sound “v” as a fricative sound, in the speech of religious scholars it is pronounced as a labial sound.

In addition, in Uzbek, usually if there is consonant after the “v” sound, the sound is changed and “v” becomes “f”. But according to the phonetic rules of the Arabic language, each sound must be pronounced in its own way, without changing into another sound. For example, the word *tavsiya* is pronounced in the Uzbek language as “tafsiya”. But in the speech of religious scholars, the word is pronounced as “tavsiya” in the form of “v”.

The sound “ه” is pronounced lighter than the sound “h” in Uzbek. The lighter, softer pronunciation of the “ه” sound in Arabic is evident in the sermons of religious scholars: the pronunciation of the “h” sound in words such as *hisob*, *Hayyon*, *harakat*, *hifzi himoya*, *Ahmad ibn Hanbal*, *hakim*, *himmat*, *muhabbat*, *suhbat*, *halovat* differs from the speakers of Uzbek.

There are 8 peculiar consonants in Arabic. One of them is the consonant ع. It is a deep throat sound according to its formation, explosive according to the method of formation, resonant according to the presence of sound and noise. During the pronunciation of this sound, the walls of the deep throat touch each other, and the air coming from the lungs explodes here. The pronunciation of ع is difficult and requires a lot of practice from the learner.

Due to the complexity of the pronunciation of the consonant ع, in Uzbek this sound is almost not pronounced, it is represented by the sign “ ’ ” in the text. In the speech of religious scholars, this sound is pronounced in the same way as in Arabic. In words such as *jome’*, *ne’mat*, *ma’rifat*, *vog’e’a*, *va’da*, *ta’lim*, *ma’sum* we observe specific features in the pronunciation of this sound.

Another consonant specific to the Arabic language is the consonant ض. In order to pronounce it, the front part of the tongue must be pressed firmly against the upper palate. In the Uzbek language, there is no phoneme presenting ض sound.

Therefore, in the Uzbek language, the letter ض, which represents the sound "d", is pronounced as "z". For example, Uzbek people pronounce as “roziyallohu anhu”. On the contrary, in the speeches of religious preachers, we see that this compound is pronounced as "rodiyallohu anhu" according to the rules of the Arabic language.

The consonant غ is not the consonant peculiar to only Arabic, but in pronunciation we find features that are different from the Uzbek language. In the Uzbek language, after the sound “ g’ ”, if there is a consonant, the sound “ g’ ” is replaced by the sound “h”. But according to the phonetic rules of the Arabic language, this sound should not be exchanged, it should be pronounced as “ g’ ”. For this reason, we observe that it is pronounced as “ g’ ” in religious speech. For example, we see that the word *mag’firat* is pronounced as "mag’firat" in religious speech and not as “mahfirat” or “mahpirat”.

---

**CONCLUSION**

One of the traits of religious texts is the must of pronunciation as in the Arabic script. But lack of knowledge and skills, ignorance of the Arabic pronunciation or the absence of such sounds in the Uzbek language for Arabic sounds lead to negative phonetic interference. However, in the speeches of religious scholars and preachers, words that have undergone certain changes in the process of borrowing into the Uzbek language are pronounced in strict accordance with the phonetic rules and orthoepic norms of the Arabic language.

IRAN

### ABSTRACT

*We are all aware that self-purification and self-improvement play an important role in one's worldly, hereafter, social, and individual happiness. So that it can be boldly said that a person who is unable to conquer the inside and dominate his soul will be prevented from achieving happiness and attaining perfection. All the problems in the world and the kinds of troubles that human beings are facing today are all due to human negligence in their spiritual and moral construction. The death of moral values causes great spiritual crises and bends the human back. Spiritual light, which enlightens hearts and calms hearts, is completely destroyed, and the principles and standards that are necessary for a healthy human life are forgotten. All the progress that is not accompanied by the reformation within man is like the soaring palaces built on top of a volcanic peak. When the compass of the soul, which is called Amara, is released unbridled, and there is no force in front of the crooked faces and forerunners of this pious horse, this is the time when the fall of man into the regression of darkness is inevitable. Just as victory over this great enemy means overcoming all the enemies of human happiness and perfection. The very famous hadith of the Prophet (PBUH) (which has been said: "The number of enemies of the soul between the prophets" is also a proof of this. As Rumi has also written: Hear in the news, do not listen to this advice between my prophets, but I will listen to you. Make ugliness ugly, make ugly ugliness suspicious Mawlawi, 1731/064) Of course, in the culture of mystical terms, six types of nafs have been mentioned: Second, it is a matter of patience, contentment, humility, repentance, patience and endurance 1. Third, it is certain that it includes trust, humility, worship and contentment, and fourth, statistics that include stinginess, greed, resentment, arrogance, anger and jealousy. The fifth is Razieh, which includes dignity, sincerity, piety, austerity, and remembrance, and the last of which is called Marzieh, which is thought. Considering that the*

*subject of this article is to examine the characteristics of anger, resentment and jealousy in the behavior of some heroes of Shahnameh, in this article we have tried to trace the effects and signs of these characteristics which are the characteristics of Astenic type and Octomorph character in the behavior of some heroes of Shahnameh. Let's take a picture .By Allah Tawfiq and Against Taklan Zahra Safari, PhD student in Persian Language and Literature, Fall 1111 The present article, entitled "Study of the characteristics of" anger, resentment and jealousy "in asthenic people) of ectomorphic personality (based on the theories of two psychologists named Karchammer and Sheldon), is a type of theoretical research that has been done using documentary and descriptive-analytical methods. The purpose of this article is to identify these behavioral characteristics among the characters of Ferdowsi's Shahnameh. The German psychiatrist Ernest Krechmer, according to physical measurements, such as shoulder width, slimming or obesity, divided people into three types: Picnic 1, Asthenic 2, and Atlantic 7 split, followed by William Sheldon, an American scientist, using statistical methods and given the further growth of each embryonic layer, three personality traits: ectomorph, mesomorph, and endomorph (in specific individuals). In Shahnameh, Ferdowsi seems to believe in the various types of characters in his stories, a kind of correspondence between behavior and physiological type. It makes all sense.*

## INTRODUCTION

The character, along with the plot, is the most central and important element of the story. The element of character in old and new fiction is a constant and important element, and forms the cornerstone of a literary work.

Suffice it to say that if there is no character in the story, there will be no adventure. Ferdowsi in Ferdowsi's Shahnameh, which can be considered as a fictional work, has had a lot of insight and attention to the character element as well as other elements of the story. Characterization is a factor by which the characteristics, moods, thoughts and other characteristics of the character can be clarified for the reader. Therefore, in this research, an attempt has been made to analyze Ferdowsi's approach to his characters and his characterization methods according to psychological theories.

One of the important teachings of Shahnameh is Ferdowsi's careful presentation of subtle points that are related to human psychology and the search for their psychological motives. In fact, it should be said that Ferdowsi, like a modern novelist, while organizing the general aspects of the stories and unique scenes of Bazm, Gham and Shadi, while paying attention to his speech, puts the characters of his story in a way that It is very wise to show the influence of human sensibilities in making decisions. For example, by showing off some of the good qualities and good qualities of the characters, he admires them and vice versa. With such psychological work, Ferdowsi shows us the inner heroes of the Shahnameh. He is very careful in doing such a thing and insists that it can be said that he does not say anything in the language of the characters in his workEven if Ferdowsi has not shown us the psychological-psychological background for telling

it. Sometimes we know the characters of epic stories even better than the people around us. This is because in the stories of Hamaziria, especially the Shahnameh, the characters are usually depicted in their lifetime, which ultimately leads to the revelation of their inner characteristics; The author can tell us what the character of the story thinks and feels, and this is how we become aware of the characters in the epic story. While in real life we cannot find people's inner thoughts based on their external actions, because sometimes there is a deliberate feeling or thought; In other words, one can recognize the different dimensions of fictional characters, while in the outside world the story of such a thing is not possible) Ahmadian, 1714: 188.)

One of the people who established the theory of nature more than anyone else is Ernest Kretschmer (who introduced his theory in 1914).

Kretschmer was a German psychologist who, over the years, came to the conclusion that the relationship between people's physical characteristics and their behavior, especially those with schizophrenia and depression, was close.<sup>7</sup> There is) Karimi, 1731: 128 (Kretschmer pursued goals in his classification: one was to invent methods based on which to divide people into a limited number of physical categories. Second, to combine these physical types with Connect schizophrenia, manic, and depressive illness, and third, to determine the link between physical activity and the behavior of healthy people.

According to Kretschmer, human personality types are divided into three main categories and a fourth type; Kretschmer was very meticulous in measuring physical construction, using objective methods to achieve three main types or types of human body over a long period of time. The first type of thin, thin-bodied and bony person whose body fat is low is called the "asthenic" type. The second type is the athlete's type, which has a muscular and active body and is called "athletic" and the third type is the fat type, the main indicator of which is having a lot of fat in the body's organs, which is called "pycnic". Kretschmer also mentions the fourth type, which is called the "rugged build" and includes people who are physically abnormal and abnormal. Same: 130 (the most important result that natural psychologists, including Kretschmer, from Research has shown that the physical structure of a human being should be considered in the evaluation of his whole being, and that physical characteristics may be very important signs for recognizing a person's personality so that their importance is not less than environmental factors. Although closer to biological and behavioral scientists in recent years, psychologists have become more aware of the importance of biological and biological factors, and therefore have justified the theory of natural psychologists (ibid .: 117).

Along with Kretschmer's classification, William Sheldon is one of the most prolific and influential individuals in the field of natural psychology. Sheldon's theory is not only a statistical correlation between physical structure and human psychological or behavioral characteristics, but he also believes that the structure of human nature is the determining factor and, in fact, the most important reason for the creation and evolution of human behavior.

Jamal Far, 1337: 733 (William Sheldon, in his theory, attached great importance to biological-hereditary factors in the formation and evolution of personality and to know human behavior, he needed to know about those factors and to obtain the criteria that By doing so, it is possible to recognize the behavior and personality of individuals. He conducted his research in three stages:

A. Octomorphic aspect: which is associated with the dominance of the nervous system and skin. The members of this group are thin and tall; Which are known as asthenics in Kretschmer's theory.

OB- Mesomorphic aspect: which is determined by the growth and strength of muscles and bones; like athletes and strong people. This brigade is a character in the Kratchmer classification of the Atlantic.

C - Endomorphic aspect: which is associated with the growth and prominence of internal organs such as organs and viscera. People in this group are obese and have horizontal growth. This type is called the picnic type in the crackers category.

Sheldon's second attempt was to investigate the psychological characteristics and personality traits of people who classified them in terms of their physical appearance. To do this, he first collected hundreds of phrases used to describe the character. Among the collected traits, he selected sixty traits and gave them to the students of the universities (in terms of these sixty traits). Statistical study of the obtained scores showed that these sixty traits are classified into three groups. In each group, twenty attributes (the first group was called Wiserton, because all twenty attributes under this title were associated with kindness, well-being, hedonism, and happiness. The second group was called Somatotonic traits, because this Attributes were related to physical activity, movement, competition, aggression, expression of personality, and activity. Selfishness, resentment, and anxiety were associated. Sheldon also rated his subjects in this way. If an adjective in a subject reached its maximum, it would give him a score of 3, for example, if a person got a score of 311. The concept was that in terms of Visrotonia, good living (very good, and in terms of somatotonia) the interest in physical (and cerebrotonic) physical activities was thoughtful and sensitive (weak).

The third and last kaR Sheldon was to find out whether there is a relationship between body and mind, that is, between physical and mental characteristics. In other words, is it possible to predict people's behavior in terms of appearance? To investigate this issue, Sheldon, with the help of his colleagues, rated a group of students, both physically and mentally, as mentioned above, and calculated the correlations between the scores, and found that That:

There is a high correlation between endomorphism and visceronia, between mesomorphic and somatotonic, between ectomorphic and serotonin; Therefore, it can be concluded that endomorphic individuals, ie those in whom the abdomen and its internal organs are more developed, are people who follow well-being, well-being, pleasure-seeking and happiness. Mesomorphs, those who are muscular and large, are very interested in physical activity, mobility, competitive aggression, and leadership. Octomorphs, that is, those 8 Weight loss will be followed by fatigue and constant tiredness, which can lead to isolation, hypersensitivity, overeating and mood swings.

Table 2-2- List of personality traits from Sheldon's point of view Serbrotonia Somatotonia Visrotonia Self-complexity and resentment. Stress and stiffness of the body and movements. Weakness and softness in body posture and movements .Uncontrollable reactions. Lack of adventure and physical activity. Interest in physical comfort devices .Excessive anger and sharpness in reactions. Strength and power in movements. Slow reactions .Tendency to empathy and empathy. Need to exercise and enjoy it. Abdominal worship.

Excessive tension, worry and anxiety. Seeking excellence; Power-seeking. The desire to eat at the company of others .Confidentiality, hiding emotions. Love the dangerous things and the pleasures of digestion .Face and eye movements indicate anxiety. Fearless behavior. Attachment to ceremonial customs .Fear of society and avoiding that physical courage in struggle and

struggle. Interest in socializing and friendship .Refrain from associating. Defiance. Get everyone friends .Weakness resistance of spontaneous movements. Emotional numbness. Intense interest in the love and agreement of others .Dizziness when crossing open fields. Fear of loneliness. Pay attention to the other Unpredictable situation. Lack of compassion and decency. Emotional similarity and uniformity .Slow voice and fear of noise. Sound out of size. Tolerance) Tolerance . Excessive sensitivity to pain. Too much indifference to pain. Satisfaction with peace and quiet . Lack of sleep; Chronic fatigue. The tendency to make noise. deep sleep .Childish sharpness in movements and appearance is too much cooked and firm. Weak character .Introversion. Extroversion; Show off. Ease of expressing emotions and extraversion The need for loneliness) Isolation (during distress Requirement for action during distress. Need for another during distress) .Pay attention to the distant periods of life. Attention to youth activities. Attention to childhood

Now a question arises, is the classification of Sheldon and Krechmer's personality types different? With a little bit of precision, it turns out that the Kerchmer classification is fully consistent with the Sheldon classification. Endomorph with picnic, mesomorph with athletic and ectomorph with leptosome or stenic; Sheldon considered each feature as an attribute and gave it a score between 1 and 3, depending on the severity; So in 6 Sheldon's classification shows the appearance of each person using a three-digit number. The figure on the left shows his endomorphic status, the middle figure shows his mesomorphic status, and finally the right figure shows his nectar form in terms of ectomorphic; For example, if someone is given a score of 013, it will mean that he is mediocre in terms of endomorphism, weak in terms of mesomorphs, and (strong in terms of octomorphs).

Of course, many criticisms can be leveled at the methods of recognizing and classifying personality from Kerchmer's point of view

He also entered from Sheldon's point of view. The first is that; Basically, placing people in certain categories causes many other personality traits to be overlooked, which may be present in people of that type.

On the other hand, people in each brigade may not have many of the traits mentioned. The second is that; Among the different people, many common traits can be found, for example, emphasizing the thinness of thin people means that obese people and the type of heroism lack thinking. The third drawback of such classifications is that; If there are changes in the classification of people due to diet or other factors, will their personality traits also change? One of the major drawbacks of this theory is that Karchammer and Sheldon did not pay attention to the age of the patients (for example); for example, people get fatter and older when they are older. Physical obesity with manic-depressive mental illness may have been a function of age, not because of biological correlation, as Kerchmer believed.) Jamal Far, 1737: 31 (which, of course, points to and explains the conclusion of the discussion. M.

Now, to get into the main point of this article, which examines behaviors such as anger, resentment, and jealousy in some of the heroes of Ferdowsi's Shahnameh stories, we need to take a closer look at the type of octomorphic or asthenic personality that such people sometimes encounter. Placed.

Kerchmer describes the asthenic type as having a long, slender body, and most of their growth is vertical. Prominent bones, prominent ribs, a sunken abdomen, a slender face, and long arms and

legs are common. According to the German psychologist, parasympathetic nerve activity is severe in lean people and they are more likely to have headaches. They are people of reason and logic, and they are prejudiced in their beliefs. They are strict and domineering and adhere to the principles. They are very sensitive and quick-tempered and complain of adversity and hardship. Stick to something late

## BIOLOGICAL

They can, but if they are attached to something, they will be very late. They are pessimistic and hold grudges in their hearts. According to Galen, the leaner type is part of the biliary part of the temperament and, according to Jung's classification, is part of the introverts.) Karimi, 1131: 301  
The book lists:

هستند They are often passionate; They are not participants and are difficult to understand.

.It doesn't seem to matter that they are praised or criticized by others.

.They often choose activities that are done alone.

☐ They usually do not have a close friend and do not communicate easily.

.Do not attend meetings spontaneously.

It's worth noting that schizoid characters are not schizophrenics; Even if both words have their roots in the Greek root of schizophrenia, schizophrenia is not a personality but a disease. Patients who suffer from schizophrenia have delusions and their mental abilities are impaired, but People with schizophrenia have little desire to communicate with others, which means they have a discrete personality and are introverted.

According to these explanations, now pay attention to the characteristics of the following characters from the heroes of Shahnameh:

- Health and Tour: Jealousy and behavioral inconsistency are characteristics of the asthenic type and the character of the ectomorph.

Ferdowsi, from the division of the property into three parts, by Fereydoun and giving Iran to his younger son, Iraj, and the jealousy of the Iraj brothers. The envy that reminds us of the story of Joseph (pbuh): "And Israel loved Joseph more than any of his other sons, because he was the son of his old age, and he made a great robe for him.

"Because his brothers saw that his father loved him more, they resented him and could not speak to him in good health." Toure - Travel of Genesis, quoted by Islami Nodoshan, 1701: 1881 (Salm and Tour were also jealous of Iraj and wrote to their father in protest:

No, we are less likely to be on the throne than our mothers and fathers Kazazi, 11414: 1/34)

In this regard, it can be said that this jealousy is due to the feeling of why this benefit is given to us

It hasn't happened, or what we wanted, someone else has enjoyed. In short, if we want something and someone else steals it, we are in a state of sadness called "jealousy," and this state 1,

It angers and nurtures the desire for revenge. In Shahnameh, the source of this jealousy is considered Az.

Rak: Eslami Nodooshan, 17701: 187

Why did you open such a crazy demon in Aztec ?Kazazi, 11414: 1/32 (332)

But they ride on a compound of breathlessness; A compound whose destination is the house of sorrow and regret! Sometimes hand

Oppression opens and sometimes greed; Today, language opens to pride, and tomorrow, the heart of jealousy. We cannot escape from it, except wearing a small belt to keep it safe. Thought and wisdom that did not grow in peace and tranquility and was captivated by the soul and created such an end; The jealousy that finally put its hand on Iraj's life with Salm's hands and broke his body with the dagger of Tor's anger. The elders have spoken out about the jealousy and have written down the erosions so that maybe there will be a way out so that we do not get caught up in this evil devil and the suffering does not overshadow us.

"They asked Hakimi what would help man to quit jealousy? He said: To know that jealousy is a suffering that he endures and to no avail, and that he will not be harmed by the loss of a blessing from its people, and that his jealousy will not lead to harm except to his own soul. He only harmed himself. They said, "How can a corrupt person suffer from the one who is jealous of him?" He said, "How can he suffer because he suffers from it with his heart, and Mehsud is unaware of it, and if Blessings from Mehsud, if he disappears, it will not benefit him. That is, in all circumstances, the corrupt will suffer" .

But Iraj is also unaware of the jealousy of the brothers, and because he was burned in the fire of jealousy that the brothers had kindled, he benefited nothing but suffering, resentment, enmity, and finally war and bloodshed.

- Farasiab: Octomorphic personality (psychotic and uncontrollable behavior).

Afrasiab, too, at the beginning of his presence in Ferdowsi's Shahnameh, after hearing the news of the defeat and killing of his commanders "Kalbad" and "Khazravan" by Zal, suddenly became very sad and cried loudly. However, he is still the winner of the war and it is not long before his successive victories and his eulogies.

Afterwards, because of its tremendous and uncontrollable reactionary movements, it is one of the characteristics of ectomorphs (suddenly angry and unable to concentrate and decide, while unable to control and control themselves with complete violence and without the ability to recognize the consequences of work, The Shah of Iran separates:

He reached out to the king of the Turks, and he became famous in the world. He became empty-hearted<sup>1</sup>. They put Shah Nozar on an army full of troubles and conversations He said Weber was confused and wanted a sword He said that whatever is bad is punishable To put the tension on the ground and eat Khosrow Tajdar's neck Ferdowsi, 1714: 1161)

Afrasiab has not calmed down even after killing Nozar, and in the end, he intends to slaughter the captive relatives of Nozar, who refuses to kill them with the mediation of his brother Aghirith :Forgive them, listen to Ovi Choo's words, tell them to fight with pain, take them to Sari, take them to Ghol, and take them to poison and humiliation (.Same: 162)

Another case in point is that Afrasiab's behavior is very similar to that of Actomorph's behavior, killing his brother Aghrirth in a state of anger and inability to control his behavior. Asthenic-type

people have unpredictable behaviors. Unnecessary ones are characteristic of them, and a childish and awkward sharpness is seen in their actions, behavior, and speech. He gives and starts blaming his brother.

He blames Afrasiab in a sharp tone. The release of Iranian prisoners of war and the harsh words of his brother are enough stimuli to show signs of illness in Afrasiab. Symptoms such as aggression, lack of concentration and the ability to make the right decisions, excessive anger, inability to recognize the consequences of actions, and ultimately loss of control and control in Afrasiab cause him to do something that lasts until the last moment of his life as Shame on his forehead and bring him a constant feeling of guilt. The use of the adjective "unconscious" by Ferdowsi is a good proof of this:

He split his brother in two so that the stone of the unconscious man's heart died (Same: 168)

Afrasiab's first encounter with Rostam took place during his war with the Qiqbad army. Afrasiab, due to his previous victories, has a great sense of self-worth and has an illusory belief in his abilities. For this reason, he sees the ability to confront Rostam and goes to war with him one by one. However, this fierce struggle leads to Afrasiab's severe humiliation in the face of the power and force of Rostam's arm, and in the end, he can happily escape from the clutches of Rostam Ghooi Panjeh.<sup>14</sup>

He blames his father for the Iranians and even for killing Aghirs. For Afrasiab, killing Aghriath is not an ordinary death that he can forget. The guilt he feels for killing his brother is always evident in his words. For example, since Afrasiab blames his father for all this (actomorphs), he usually does not accept the consequences of his actions (and begins to blame him:

His tongue was full of speech and shortness of breath. He went to the river Peshang from this river to seek guilt.

The old elders did not see the way ... one is to break the covenant with the king

He played Sepah for a long time ... He played you in the Iran Cho war

The defeat that never came to an end that Aghrirat was killed in a small way.

If I was dishonored Ibid .: 111-131 (Afrasiab's uncontrolled anger against Gersios indicates an ectomorphic trait:

In the case of Siavash, many of the personality actions attributed by Ferdowsi to Afrasiab are remarkably consistent with the behaviors of a sick person. The disease, now known as mania-depression, is a pathological type (referred to as the first encounter between the Turan Corps under the command of Gersius and the Iranian Corps under the command of Siavash. The Turanians were defeated and Siavash encamped in Balkh. Zand and wait for the command

His father remains Kikavus. Gersius came to Turan and told his brother about his defeat. Afrasiab is so angry to hear this news that he is about to kill Grecius like his other brother :Look at Gersios Ander in such a way that you said he wants to be in the middle of it( Same: 712)

Afrasiab is furious when he hears this news and, like an arrow drawn in a bow, is ready to be released to fight and unleash the extra force that has arisen in him. But suddenly, in a few hours, it turns around. Afrasiab has a terrible dream in which his whole being trembles and wakes up

with a terrible cry. With this dream, Afrasiab has a completely opposite state to his condition a few hours ago, and all his tireless energy for war becomes fear and restlessness.

Fear of community, fear and anxiety = Actomorphic character (Afrasiab wakes up and asks his brother Gersios to comfort him. This is Afrasiab, Afrasiab Parhibat, Afrasiabi from the wind and 11

It is fire and its nature is not from God, the same black demon of the battlefields, the Turk who is in the battle of races.

Afrasiab suddenly wakes up with a shout full of horror and trembles in his bed and needs brotherhood; A brother who may remind him of his legacy so that he can find peace in the warmth of his arms. ) Tendency to empathize with Vance = Octomorph character When it got dark, I came to Gersios' advertisement Vera saw on the sleeping ground on the way to come sharply near the king Tell this story to your brother Don't tell me this time, Hitch, talk to me and make it hard for me .He replied, "Don't ask me to stay until I regain my sanity ("Ferdowsi, 1714: 717)

In the case of Siavash's death, many signs can be seen in Afrasiab's behavior, all of which are based on his character Ectomorphic disease is indicated. For example, after Siavash's death, he does not take the blame for his decisions, and considers Siavash's death to be the work of the times and says:

The wise man of the people does not suspect anyone, the sky (same: 761)

But when Rostam marches to Turan at the request of Siavash and breaks the Turanian army, Afrasiab feels remorse and sadness for his previous behavior and decisions:

Listen, Afrasiab, this is a sad word for old deeds (same: 710) Suzogdaz Afrasiab, in the death of his son, portrays him as a two-faced person who does not match his previous face. Afrasiab cries loudly when Sorkheh is killed. It should be noted that it is Afrasiab who weeps, the same Afrasiab who brutally kills his brother. Someone who for

Saving himself and concluding the peace treaty with Siavash, he agrees to send 100 of his loved ones as hostages to the altar. Now Afrasiab mourns the death of one of his sons, Sorkheh :He slowly pulled his hair and spilled water on Afrasiab's head and crown Rada Namdar, Yala Bakhrda also said, "Rada, Sara, Mobda ".He put all his clothes on himself The same: 713 (roaring on the ground 12

At the end of the work, Ferdowsi shows another side of his character; Afrasiab has fallen and his tongue is daring and fearless against Afrasiab. It is noteworthy that in the whole Shahnameh, only Rostam has the ability to compete with Afrasiab, but now before his death, an anonymous ascetic who even belongs to the group of heroes and soldiers. No, he can arrest him and drag such a hero to the ground and humiliate him. Does this destiny reflect the nature and bipolar nature of life and its essence!?

He went inside the regiment, grabbed it, and approached Choo's hand. He grabbed his arm. He went away and attacked him .Same: 1.27 ) Grecius; Cruelty character: Actomorph type

From a behavioral point of view, Gersius can be an example of Octomorph's character. Such characters do not think about the end of their work, but their decisions are immediate. They are

indifferent to the sincerity of truthfulness and are not afraid to lie in order to achieve their goals. They are ruthless and ruthless towards everything and everyone) (Faraji, 1788: 14) (Reflecting on Gersius' behavior, an example of this feature can be seen throughout the story. The killing of Siavash at the end of the story is depicted in Garciose's vindictiveness. He is:

He started by saying that Garsiuzi Shahriar Siavash has other than that. The religion and the work of the association became a lot (.Ferdowsi, 1714: 786)

Grace's jealousy is evident throughout the story. The successes of Siavash and his popularity with Afrasiab and Piran made Garsiuzi's sword of jealousy sharper and :Siavash's religion and intelligence did not change anyone's mind All the treasure, both knowledge and the IRGC were twisted and turned yellow Garsiuzi's heart and brain boiled and he told her to spend a year like this It is all a kingdom, and it does not find its crown and sometimes its secret (Same: 787) 17

He did not give up until the last moment, until he finally ruined the youth of Siavash, but in the end, the ashes of the fire of his jealousy ignited the body of his life with the spark of Ah Del Kikhosrow and saw the result of his efforts and conspiracies. In The Foundations of the Pious Idea, we also read that man should not speak Chinese to others because Chinese speech is deadly to three people: himself and the person who spoke Chinese to him and the person who spoke Chinese before him. . Rak: Vahidy, 1711: 710 (From the point of view of the mythical world, Gersius is a devil, and Siavash Gerd is a paradise. He kills the tongue, and this fire must destroy one, Siavash or Gersius. Chapter 2 of Mohtashami's ethics states that "like the common people, houses

See the properties, envy them, and the like, and wish them well, and repent of that envy when they see the pests and effects of the houses. ) Khajeh Nasir, 1733: 211 (And we see in this story that Gersius, once regretted

It is possible that no one benefits anymore. Certainly, if Gersius had been aware of the plagues and calamities that befell Siavash in the land of Siavash, he would never have planted the seeds of jealousy in his heart, and he would not have created such a bitter end for Siavash by plotting.

- Jealousy's jealousy and fear sit in the Astenic brigade.

In another story, Hakim Toos tells of Tus Nozar, who has repeatedly referred to the hero's worthlessness in wisdom. It is the greed of Tus - you will recognize it, and when the seed of malice is born, it will bear a bitter and poisonous fruit, and it will lead people like Tus to do catastrophic deeds. Rak: Dostkhah, 1711: 22)

But in despicable terms, the root of Tus's rebellion and disobedience must be traced to his jealousy of the Kikhosro dynasty, because in his view Kikhosrow and Froud are not of Turanian descent and royal merit, and perhaps he wonders why. Now the eldest son of the Manouchehr dynasty, he should not now rely on the throne, and the thought and jealousy caused by it caused the sunset of Omar Froud to set very soon, and this is what the readers see from the point of view of the foolish Tus, who rules his intellect. Had been handed over to the air of the breath and had become obedient to him<sup>30</sup> .

Ferdowsi, on the other hand, finds fear and anxiety in Tus and turning his back on the enemy, which is one of the characteristics of the asthenic or ectomorphic type :He came from the heart of Turan Sepah to Tus. Heartbroken from Iran. He killed a lot of Sepah. He was sad.

Ferdowsi, 1714: 714)

- Gorgin and selfishness from seeing the abilities of others: the character of Octomorph

Gorgin's most important adventures in the story are Bijan and Manijeh. Kikhosrow sends him and Bijan to destroy the hogs that roamed around the city of Arman. There, Gorgin becomes jealous of Bijan's bravery and deceives him to go to the border of Turan. In Turan, Bijan goes to the feast of Afrasiab's daughter, Manijeh, and the two fall in love with each other. There, Afrasiab's soldiers recognized him and arrested him and imprisoned him in a well. After waiting for Bijan for a while and finding no sign of him, Gorgin returns to Iran and falsely tells Kaykhosrow that Bijan is missing while following Gori. Kaykhosrow, who is informed that Gorgin has lied, chains him. He was imprisoned, but after that, with Rostam's mediation, Gorgin was released and went to Turan with Rostam to free Bijan from Afrasiab's clutches.

Knowing that Gorgin Shurideh went to one side of the forest, she came to Choo Taft. All the woods came. I saw her. She turned blue. She created happiness. She turned to him .Wrap your heart, Ahrmana did a bad job with Bijna In spite of the increase and increase of the name, the young man went to the trap (Ferdowsi, 11414: 641 .1) Sheghad: Jealousy, resentment and malice = Ectomorphic personality type

Characteristics of jealousy, behavioral inconsistency, inferiority contract (we see in the character of Sheghad; that is, Ferdowsi in describing the important characters of Shahnameh has marked and illustrated in such a way that with psychological analysis one can hide the psychological layers and Their personality has been achieved. This indicates the poet's precise and insightful view of human nature and psyche. Among the complex psychological and influential but negative characters of Shahnameh is Sheghad, Rostam's half-brother, that Ferdowsi is so artistic and accurate in presenting signs<sup>18</sup> , .

Describes his behavior and motivating reasons for killing Rostam. By examining all these descriptions and signs and comparing them with the well-known psychological abnormalities in psychology, it can be concluded that Sheghad suffers from a mental disorder of inferiority, and this feature is more evident in the typology of Kerchmer and Sheldon in the octomorphic brigade. According to Ferdowsi's report, the reasons for the emergence of this feeling and its transformation into a contract of inferiority in Sheghad towards Rustam can be considered in these cases:

Mother, webmaster of Yasel and Nasab - Toldend Shom - deportation from the country and family at the age of adolescence and Jahangir Rostam's song.

Looking at Sheghad's character, we see that some of the behavioral characteristics of people with inferiority complex are based on Alfred Adler's theory. These include: anger, hatred, jealousy, arrogance, behavioral contradiction, fear, and instrumental use of values. RK: Adler, 1173: 117 (Ferdowsi reveals the contradictions of Sheghad in such a way that he does not consider himself guilty in the death of Rostam and on the one hand, considers the killing of Rostam as the result of the justice of existence:

That's what Knox Shaghad replied when he gave you the wheel

Ferdowsi, 1714: 1401 (On the other hand, in the same speech, addressing Rostam as the perpetrator of his murder, he considers them demons:

When it comes to you, you will be caught in the trap of the demons(.Same: Same)

According to Haghir, Rostam, who was considered one of the victims of jealousy, was captured by the Shahnameh, according to the conspiracy and trickery of his inequality, Shaghad. Shaghad, who was outraged by Rostam's taking a ransom from the Shah of Kabul, used this as an excuse to cover up his jealousy of Rostam. We do not see his presence in other stories of Shahnameh, and this is the first point of this jealousy, because surely, he thought to himself why he should have a base less than Rostam, and most likely, honor and respect and

The titles given to Rostam have angered him. A complex that did not calm down for a moment to find a place to be present in Kashan, the heart of a humble man whose name was Sheghad and what good they said:

"Al-Hassoud Laisud" drew the vengeance of the hearts of Sheghad, Rostam, Rakhsh and Zavareh inside him, and the spears of his jealousy fell on them one by one, and another black leaf added to the history.

..."Yes, now the lion of Iran / Kuhan Mountain / Men of men / Rostam Dastan...

In the well of this well, the poison of sword and sword was lost, the hero of Haft Khan, now / it was the greed of livestock and the mouth of Khan the eighth<sup>16</sup> «« ... And the conclusion is that:

Given that literary works can be examined and analyzed from different points of view, we also decided in this article to relate two periods of time with a new perspective and the old text based on theories. Let's examine contemporary psychology. In fact, in this study, the characters of Shahnameh have been introduced as Iranian models for "Karchammer" and "Sheldon" theories, and it seems that the theories have been mentioned. It does not belong only to the twentieth century, and even in the distant centuries it has been efficient and practical, and Ferdowsi in Shahnameh, in various types of characters in his stories, has believed in a kind of correspondence between behavior and physiological type.

The author has tried to look at the characters of Shahnameh with a different perspective, to examine them at the same time as the story is intended. At the same time, sometimes the characters have changed their faces over time; But in general, the design that Ferdowsi shows in the Shahnameh of the characters in his stories seems to have an ups and downs, in the sense that sometimes we encounter an exalted human being in terms of inner characteristics, such as Iraj and sometimes the characters in The Shahnameh, as can be traced to any other epic work, finds a moral decline; Like Salm and Tour. Ferdowsi's art is very clear in drawing the exact lines of the characters in the story, and especially in showing their inner aspects. He does not suffice to describe the generalities about his heroes, and sometimes he has drawn the exact lines of his personality and the expression of their details and moods.

But the summary of Ferdowsi's Shahnameh is on the one hand the position of Ferdowsi's narration of civilization, culture, myths and history of Iran and on the other hand the scope of his analytical insight and poetic view of various events and characters. Meanwhile, Ferdowsi's detailed and in-depth look at the characters of his work is such that the genius of this poet can be created by creating a balance between thought and speech and work.

Characters Especially when it comes to describing and explaining the inner layers of their behavior and psyche.

Ferdowsi's descriptions and illustrations of Shahnameh characters are such that by comparing them with personality theories in the field of psychology, one can understand the type of their personality. As this article has been a handful of examples<sup>13</sup>.

### ABSTRACT

*Robots have been used in diverse areas and for the purpose of ball catching. This paper takes a review on selected techniques on research of ball catching robotic arm. Our priority basis upon some factor including speed of ball, initial distance of ball from the robotic arm, vision algorithm complexity to calculate results and their final accuracy in catching the ball. The given papers are selected according to the vision and control capabilities of the current research in the given field. To begin with we explore the control, planning and visual sensing aspects, and then a brief survey of the selected techniques on research of ball catching robots both from the hardware and software perspective is presented.*

**KEYWORDS:** Ball Catching, Computer Vision, Robotic Arm, Trajectory Perception

### INTRODUCTION

Catching a moving object with a hand is one of the most difficult tasks for humans as well as for robot systems. In order to perform this task, several capabilities are required to a robot system, such as smart sensing, object tracking, motion prediction, trajectory planning, and fine sensory-motor coordination. [1] Visual guidance of robot manipulators has found limited use outside of

laboratory and industrial settings, in part because it typically requires complete information about the robot's state and the work space geometry. [2] Segmentation itself has already been a challenging task over decades. Those vision methods were very time consuming and produces the results which are not accepted in the out-of-lab environment. In this paper, we analyze human arm movement for catching a moving object. This kind of task is frequently performed by humans in daily life; therefore there will be many cases where robots are required to do it in the future. To make robots accomplish this task as human does, it is necessary for us to know how human plans his motion and controls his arm movement [3]. So far many studies concerning with human arm movements are reported. Flash and Hogan [4] presented the minimum jerk theory, which reproduce human arm movement between two fixed points. For the same movement For the same movement, Uno et al. [5] also reproduce a human-like arm motion by resolving the objective function, which minimizes the rate of change of motor torque. These models deal with voluntary arm movement between two fixed points and do not discuss dynamic motion planning for adjusting arm movement to the changes of the environment. [3]

In robotics, dynamic motion planning for catching or tracking a moving target is frequently reported as one of visual feedback problems. In this field, presented methods are designed in terms of smoothing the trajectory, reducing the motion time and decreasing tracking error. However, we do not know whether any of them can apply to the characteristics of human arm movement or not. In addition, rather than only one method, human seems to select suitable strategy according to the kind of the object and its motion [3]

Ball catching has been used for almost 20 years now as a challenging benchmark system to develop and robotics key technologies, In all the works the general setup is in principle the same: a stereo vision system tracks the ball and predicts the balls trajectory, then the point and time, where and in which orientation the robot should intercept the ball on its trajectory, is determined. Next, the robot configuration to reach the catch point is computed and finally a path is generated, which brings the robot from its start configuration to the desired catch configuration. [5]

### COMPUTER VISION ROLE

Figure 1 gives an overview of the vision framework, emphasizing the role played by vision in each of the various subtasks of a hand/eye coordination problem.

**Figure 1**

In the initial stage of a manipulation task, visual cues or vision are used for target recognition, here this all is done in the real time mode i.e. the object or target is flying out in the air and accordingly that the given is recognized.

At the next level, vision is used to estimate the target trajectory. This, in turn, is used in generating a trajectory plan for the robot that would achieve the goal specified.

The last stage involves the generation of the sequence of controls to the robot for following the planned trajectory. Here, vision plays the role of providing continuous feedback for tracking the hand position.

### **FACTORS INFLUENCING THE DESIGN OF THE BALL CATCHING ROBOTS**

**MINIMUM TIME:** The primary difference between catching a stationary object and a moving object is that the stationary can be grasped at any desired time, whereas the moving object must be grasped while it is passing through the given area. The moving object must also be grasped soon as it enters in its catching area. Furthermore, for grasping the object when it just enters the given catching area some operations are also needs to be executed. For these three reasons, the main goal in our approach is to generate a minimum-time trajectory from the initial manipulator status to the grasping point. By ‘minimum’, we do not mean an absolute minimum, but rather the minimum within a family of trajectories.

**GRASPING CONDITIONS:** In the static case, successful grasping depends on the type of gripper, the grasping algorithm, and the positioning of the gripper with respect to the object. In the case of a moving object, however, the dynamics of both object and manipulator must also be considered. A difference in velocity at the grasping instant may result in slippage, damage to the object, or even damage to the manipulator. A large difference in acceleration can cause similar problems depending on the mass of the object.

**ACTUATOR CONSTRAINTS:** In general, time taken by the actuator to reach to the destination to catch the given object may also be bound by some given constraints like maximum output torques of the actuators, there is a resulting lower bound on the traveling time.

**COLLISION AVOIDANCE:** Collisions can be separated into two broad classes: (1) between the object and the end-effector, and (2) between the end-effector and the links. The first type of collision is avoided by ensuring that the gripper is in the correct position while catching the object or ball. The second type of collision is more difficult to avoid. Since it depends not only on the trajectory of the moving object but also on the configuration of the manipulator.

### **LITERATURE REVIEW**

Catching a thrown ball with a hand is not easy. It demands for a tight interplay of skills in mechanics, control, planning and visual sensing to reach the necessary precision in space and time.

In this section the proposed work in this field is presented

**A. Barbara Hove et al** [6] present an approach for the Real-time coordination of visual information with high speed manipulator control in the context of three-dimensional robotic catching. The research planned a path for the catch occurs in real-time during the half second that the targeted object is airborne. Here barbra presents a trajectory-matching algorithm that have an initial motion algorithm. The results are demonstrated experimentally using a real-time vision system and a four degree- of-freedom, cable-driven arm with a workspace of 42 cubic meters and speed capabilities of up to 2.0 m/s. The catching method described here allows the

robot arm to consistently track balls in space. The distance between the end effector and the ball during the tracking period typically ranges from 0-5 m.

*Performance* for the system is about 75-80% of the balls thrown within the ball's workspace. Failure was most often attributed to inaccurate visual data from noise, the distance is up to 5 m and the speed is 2m/s

**B. U. Frese et al** [7] presents system for catching a flying ball with a robot arm using off the shelf components for visual tracking. The ball is observed by a large baseline stereo camera, comparing each image to a slowly adapting reference image. They track and predict the target position using an Extended Kalman Filter. The calibration is achieved by simply performing a few throws and observing their trajectories, as well as moving the robot to some predefined positions.

*Performance* of the system is about 2/3 of 100 throws the majority of faults was due to the camera's limited horizontal field of view resulting in the system seeing the ball too late.

**C. Akio Namiki et al** [8] introduce high-speed multi-fingered robotic hand with dual vision with a massive parallel vision system called CPV (column-parallel high speed vision system) photo detectors with an all pixel parallel processing. The CPV is performed in order to achieve segmentation of the image, extraction of the target area, and computation of the image moments.

*Performance* of the given system is about 90% with a rubber ball with radius of 4cm as a target, and dropped from about 1m in height. The speed of the falling ball is about 4 d s just before it hits the ground.

**D. Chyi-Yeu Lin et al** [9] presents a DSP Based system that separates the thrown-in target (uses stereo based camera) from the paired images and then calculate the centroid coordinates of each target image, thereby determining the space location of the object. The Lagrange interpolation formula and the linear function is used to simulate the ball trajectory and predict the catch position, after that the control data is sent by the serial port to the robot for desired action.

*Performance* of the given system is about 65% as the fixed mechanical hand throw balls at a fixed distance of 4 meters. The laboratory has stable light source and no air flows. We have thrown 500 times of balls not faster than 16m/s and all of them are within the catching range.

**E. Tasuku Yamawaki et al** [10] discusses the grasp configuration after the catching, this paper presents a three finger robotic hand strategy that enables the robotic hand to catch the object with a high manipulability grasp configuration. Overall the paper proposes the strategy for a robotic hand to catch a free-flying object with a high manipulability grasp configuration.

They proposes a three phase strategy for ball catching 1) Standby phase 2) Pre-processing phase 3) Catching phase, On the standby phase, the robotic hand keeps the standby configuration, means it stays ideal on the next phase when the ball crosses the standby phase, they measure the height of the ball with a high-speed camera, At the same time, the robot hand starts the preshaping to form the high manipulability grasp configuration at the prospective catching point, at the last step the system prepares itself for the catching.

*Performance* of the robot hand accomplished the catch of the flying-ball with the high manipulability grasp configuration. The success rate for the experiments was about 30%. The

largest cause of the failure is that the trajectory of the rebound rubber-ball deviates from the vertical plane due to its elasticity and the friction between the rubber-ball and the ground

**F. Berthold Bauml et al [5]** presents a multipurpose four-fingered hand (DLR Hand- II) to grasp the ball. They propose Extended Kalman Filter based prediction of the ball trajectory are used providing a new prediction every 20ms. The visual tracking is quite robust with successfully tracking >80% of the thrown balls. Moreover they present quite good algorithms for the arm movements.

The system architecture here provides distributed computational resources while meeting hard real time constraints. In current system currently the visual ball tracking is the limiting factor for the catch rate, whereas the mechanics and control of the arm and especially of the hand work highly reliable in grasping the ball. The given system achieves a catch rate of > 80%.

**G. Oliver Birbach et al [11]** presents a real-time trajectory perception system for catching flying balls with DLR's humanoid Rollin Justin. They use the multiple hypothesis tracker (MHT), they first detect balls as circles and feed these measurements into a MHT, they use a circle detection scheme for detecting ball as circle, they place the camera on the humanoid's head for detection of the ball, the MHT (multiple hypothesis tracker) includes 1) pose detection, which detect the person which throwing the ball 2) circle detection, which detect the ball coming towards the humanoid.

The given work faces some computational complexities as they use the Hough transformation for the circle detection and the add one new parameter MHT(multiple hypothesis tracker), which adds pose detection algorithm which incur few more complex calculations and make system slow.

*Performance* of the system is > 80% but the system is slow as compare to the previous one, major contribution of this research work is it adds robotics in to the sport activities. Where the robots can easily track the objects and catch them

**H. Thomas Wimbock et al [12]** presents The visual tracking system, based on stereo cameras provides a new prediction of the ball trajectory. Over 80% of the thrown balls are tracked successfully. Another important tool that they used to determine the *Performance* was a off-the-shelf high speed camera running at 300 frames per second by that they were then able to see the dynamic ball motion within the hand

**G. Magnus Linderoth et al [13]** presents research which determine the position of a static object in 3D space by means of computer vision, it has to be seen by cameras from at least two different viewpoints. The same applies for measuring the position of a moving object based on images captured at one single time instant. They use series of images where no pair has to be captured simultaneously. It even allows tracking of a point object in 3D space using a single static camera. The tracker was implemented and tested on series of images of a flying dart, captured by two cameras. The images had a resolution of 656× 480 pixels and were captured every 20 ms. the darts were detected in real-time with a processing time of less than 4 ms per image on a desktop PC.

*Performance* of the ball catcher was limited by the accuracy of the image analysis and the speed and acceleration of the robot. The catch rate was approximately 50 %. performance was the lowest for trajectories that were far from normal to the box front or that forced the robot to move

far from its initial position.

### **Comparative Analysis**

### **CONCLUSION**

In last two decades, research in humanoid robots has made rapid progress. Even so, this domain is still at its infancy stage. Tracking of the targeted object by the robot and trajectory perception is one of the main domains that received a lot of attention from the authors. A lot of new heuristics and algorithms were introduced to solve the problems in this domain. Our main goal is to develop a efficient vision algorithm which provides better results than the previous work which ultimately increases the accuracy rate for catching the ball with the robotic arm

## READING SEQUENCES AND PRINCIPLES IN TEACHING ENGLISH

**Babadjanova Umida Baxodirovna\***

\*Head of the English Language Department,  
Urgench branch of Tashkent Medical Academy,  
UZBEKISTAN

Email id: umida.baxodirovna.84@gmail.com

### ABSTRACT

*This article is devoted to teaching reading by using its principles and sequences. There are expressed reading principles and sequences in teaching English in the given article. The ability to sequence events in a text is a key comprehension strategy, especially for narrative texts. Finding meaning in a text depends on the ability to understand and place the details, the sequence of events, within some larger context—the beginning, middle, and end of a story. Learners choose what they what to read. The principle of freedom of choice means that learners can select text as they do in their own language, that is, they can choose texts they expect to understand, to enjoy or to learn from.*

**KEYWORDS:** *SLL, Foreign Language Teaching, Reading Skill, Effective Reading, Principles And Sequences.*

### INTRODUCTION

Reading is the skill of understanding written words and using in teaching foreign languages. Reading is a part of the way we use language in daily life to gather information, communicate with others and also for enjoyment. Reading always occurs in context, that is, what we read is part of a broader situation or an extended text .

### Main part

Reading is connected with sequencing. Sequencing is one of many skills that contributes to students' ability to understand what they read. Sequencing refers to the identification of the components of a story or a topic such as the beginning, middle, end to the ability to retell the events within a given text in the order in which they occurred. The ability to sequence events in a text is a key comprehension strategy, especially for narrative texts. Finding meaning in a text

depends on the ability to understand and place the details, the sequence of events, within some larger context—the beginning, middle, and end of a story. The ordering of events in a story, along with connecting words such as once upon a time, then, later, afterwards, and in the end, are good examples of textual features, an understanding of which gives the reader a way of integrating the story's individual parts into its larger framework—and thereby understanding the author's purpose.

**Why Is It Important?** As students listen to or read text, they are best served if they can understand the information as it is presented and then recall it at a later point. One of the easiest ways to recognise the order of events is to look out for the sequencing words or transitions that are used to connect the various parts of the text. Some of these words and phrases also act as signals to provide an indication of whether the event will be located in the beginning, in the middle, or toward the end of the text's chronology. There are a wide variety of 'signal words' and the following represent just a few of the most common, as well as where they are most likely to occur. For example, in stories we can use such kind of words.

#### Beginning

- Once upon a time / Once there was
- In the beginning
- First of all

#### Middle

- Meanwhile
- After that
- Suddenly

#### End

- in the end
- Finally
- After all.

When we cannot remember the names of people, places, things we can use reading sequences in order to teach such kind of words for instance, so as to remember the sequences of names of Smith, Martin, Igor, Lucy, Emily, we can use the first letter of these names such as "SMILE" for above mentioned names.

It is important reading principles for teaching foreign languages as reading sequences. There are a lot of reading principles in teaching foreign languages, for instance, the reading material should be easy for learners also suitable for learners' level and age. In helping beginning readers select texts that are well within their reading comfort zone, more than one or two unknown words per page might make the text too difficult for overall understanding. Intermediate learners might use the rule of hand—no more than five difficult words per page. Hu and Nation suggest that learners must know at least 98% of the words in a fiction text for unassisted understanding 1.

It follows that, for extensive reading, all but advanced learners probably require texts written or adapted with the linguistic and knowledge constraints of language learners in mind. A variety of reading material on a wide range of topics must be available. The success of extensive reading depends largely on enticing students to read. To awaken or encourage a desire to read, the texts made available should ideally be as varied as the learners who read them and the purposes for which they want to read. Books, magazines, newspapers, fiction, non-fiction texts that inform, texts that entertain, general specialized, light, serious. For an inside track on finding what your students are interested in reading, follow William's advice: "Ask them what they like reading in their own language, peer over their shoulders in the library, ask the school librarian". Varied reading material not only encourages reading, it also encourages a flexible approach to reading. Learners are led to read for different reasons. Learners choose what they want to read. The principle of freedom of choice means that learners can select text as they do in their own language, that is, they can choose texts they expect to understand, to enjoy or to learn from. Correlative to this principle, learners are also free, indeed encouraged, to stop reading anything they find to too difficult, or that turns out not to be of interest [3;51] Certain instructional methods are more effective than others. Many of the more effective methods are ready for implementation in the classroom.

To teach reading well, teachers must use a combination of strategies, incorporated in a coherent plan with specific goals. A teacher who addresses only one area of reading or uses one instructional approach will probably not be successful.

Reading comprehension – understanding what is read – is best supported when teachers use a variety of techniques and systematic strategies to assist in recall of information, question generation, and summarizing of information. Teachers must be provided with appropriate and intensive training to ensure that they know when and how to teach specific strategies. Teachers must know how children learn to read, why some children have difficulty reading, and how to identify and implement instructional strategies for different children.

## CONCLUSION

Reading sequences and principles are very important for teaching reading because they include effective methods and ways of teaching reading skills. According to reading principles reading skill needs to be practiced every day. Learners read further reading materials such as newspapers, journals, fiction books two hours a day in order to improve reading speed and widen their outlook. The purpose of reading is usually related to pleasure, information and general understanding. According to reading sequences, we need reading sequences in order to read instructions, stories, activities such as a picture story. Reading sequences also help us to understand the meaning of topics, activities, games .

## CONCERNING THE STUDY OF HEMERONYMS IN THE UZBEK LANGUAGE

**Sapaeva Boljon Kadamovna\***

\*Urgench State University,  
UZBEKISTAN

### ABSTRACT

*This article highlights the concept of hemeronym in the Uzbek language and the scope of their study. According to the results of linguistic research on hemeronyms, specific proposals and recommendations will be developed for editing media names, naming new ones with scientifically based names that reflect the mentality of our people. Newspaper and magazine titles were rid of ideological views, personal attitudes and inclinations, as well as various other negative attitudes. The issue of linguistic study of hemeronyms in Uzbek linguistics is very relevant. One of the most important issues in modern Uzbek linguistics is the study of the types of hemeronyms of the Uzbek language according to their motives, methods of formation.*

**KEYWORDS:** *Proper Noun, Hemeronym, Newspaper, Magazine, Means Of Mass Media.*

### INTRODUCTION

In the society, it is impossible to distinguish one nameless thing from another. In most cases, because of the fact that everything has its own name, so they must be called by those names. In the same sense, the name (s) serves as a compass to guide people. While experts use a compass, a special device, to find out which side is south and which is east so they don't get lost, people use names to know exactly who their interlocutors are, where they are, what they stand for, and what they are called. In order to call people and to appeal them by name, it is possible to distinguish their names, surnames, nicknames, pseudonyms and proportions, names of tribes and peoples, places, hydronyms, names of celestial bodies, plants, animals, horoscope names and so on. In order to find out them, it is possible to know what words they are pronounced and called with. To do this, people need to be introduced to the problems of naming, onomastics, giving a name, changing names at the request of a person or a population, saying and writing them correctly and clearly.

Proper nouns, in addition to linguistic features, also contain valuable historical, cultural, ethnographic, aesthetic and geographical information. Therefore, in recent years, there has been an intensification of efforts to study names related to the past and present. So, proper nouns are a great cultural, linguistic heritage. The historical memory of our people is reflected in this heritage.

In recent years, it is no coincidence that the state pays special attention to the media, freedom of speech and press, and most of the republican, regional, district and city newspapers and magazines are serving active. Newspaper and magazine titles were rid of ideological views, personal attitudes and inclinations, as well as various other negative attitudes.

The resolution of the President of the Republic of Uzbekistan "On additional measures to ensure the independence of the media and the development of information services of state bodies and organizations" shows that according to the analysis of the current situation in the media, the challenges in the media space are not being responded to quickly and appropriately. Moreover, it demonstrates, the needs of society in the timely provision of comprehensive information on large-scale reforms in the country require a significant increase in the work in the field of information, as well, bringing the activity of mass media information services of state bodies and organizations to a qualitatively new level. The scope of this issue also includes the problem of linguistic study of mass media names. Because the names indicate the subject matter of a particular publication, what type of readership it is intended for, and also serve an aesthetic function.

In Uzbek onomastics, toponyms, anthroponyms, partial ethnonyms are satisfactorily researched. However, the issue of linguistic study of many other types of proper nouns, including hemeronyms, has not been studied in detail as the object of special research. Periodicals are newspapers, magazines, appendices to them, information and reference publications, digests, posters, collections of normative and legislative acts, brochures published in two or more periods a year. Also, the study of the names of television and radio, Internet sites will contribute to the development of the state language, raising the image of Uzbekistan. According to the results of linguistic research on hemeronyms, specific proposals and recommendations will be developed for editing media names, naming new ones with scientifically based names that reflect the mentality of our people. This is in line with our goals, such as supporting research on the development of the state language, the implementation of international cooperation in this area.

Great number of decrees and resolutions adopted by the state to further develop our spiritual life, including the organization of educational work in accordance with modern requirements, the improvement of culture, art and literature, the culture of reading, directly contribute to the development of the Uzbek language. Speaking about this, it should be noted that in recent years, hundreds of kindergartens, schools, universities, **new newspapers and magazines, TV and radio channels**, publishing houses, cultural and educational institutions, libraries operating in our native language are being established.

In the dictionary of N.V.Podolskaya, it is mentioned that the term hemeronym derives from the words hemero "day", onym (onuma) - "name", and means the concept of the names of periodicals. In Kryukova's research, it is determined that periodicals are a type of media, as well, radio, television, video, and newsreels are also studied under the term hemeronyms. It should also be noted that the names of Internet sites were also analyzed in the studies on

Russian hemeronyms. In her research, O. Fedosova was able to determine the linguistic status of hemeronyms.

Uzbek hemeronyms, like other proper nouns, are an integral part of the richness of our language. The Uzbek language is very rich in various hemeronyms that have emerged over the last century and a half, and these names are one of the great masterpieces of the long cultural and spiritual values of the Uzbek people. The development of publishing and printing led to the emergence of hemeronyms. Because these names reflect the conflicting historical path of our people, the various aspirations, philosophical, religious, spiritual, moral, educational and aesthetic views of the general public, the beliefs that testify to different political periods, the attitude to people. From this point of view, it would not be a mistake to say that history is hidden in some hemeronyms as well. The issue of linguistic study of hemeronyms in Uzbek linguistics is very relevant. One of the most important issues in modern Uzbek linguistics is the study of the types of hemeronyms of the Uzbek language according to their motives, methods of formation.

The Uzbek dictionary is rich in proper nouns, but not all of them are fully summarized, and although they are mentioned in scientific sources in one way or another, they have not been specifically studied. One of the less well-known proper nouns is the hemeronyms.

Some opinions are expressed about the names of periodicals in the works of H. Bektemirov, N. Ahunov, I. Toshaliyev, but there is given no special research. The bibliographic index compiled by E. Begmatov contains two articles on the subject.

Journalists themselves have commented on the reasons for choosing names for periodicals, in particular the names of the publications they publish.

There are no monographic researches on hemeronyms in Uzbek linguistics. In Russian linguistics, certain work has been done in this area.

The lexical bases of hemeronyms, the motives of their selection should be studied by grouping as follows:

- 1. Abstract words that correspond to the direction of the media are the basis of hemeronyms.
- 2. Hemeronym refers to the nature of the media.
- 3. Hemeronym refers to the type of media.
- 4. Hemeronym refers to the place of publication of the media.

The nominative function of hemeronyms requires their study as a proper noun.

Because proper nouns also serve as naming conventions. Hemeronym also refers to the subject matter of newspapers and magazines, as well as to whom they are intended. As people begin to read a newspaper or magazine, they become interested in its content. So the name of a newspaper or magazine also means something other than always being a name. For example, the names of magazines and newspapers “Sihat-salomatlik” (Health and Wellbeing), “Soglom avlod” (Healthy Generation), “Khorezm tibbiyoti” (Medicine of Khorezm) show that they are related to medicine.

The research of the types, formation, classification, genetic description, functional properties of hemeronyms according to the motive of naming on the basis of certain theoretical principles and methods allows to elucidate in detail the linguistic features of onomastic units.

## TEACHING STUDENTS TO STUDY READING IN TERMS OF THE REQUIREMENTS OF THE INTERNATIONAL PIRLS SYSTEM

**Xurramov Mansur Musurmonugli\***

\*Student of the DVO Faculty,  
TSPU named after Nizami, UZBEKISTAN

### ABSTRACT

*The article outlines the basic principles of the international program for assessing the level of knowledge of PIRLS students, considers techniques and methods for effective teaching of reading skills. This will lead to a lack of the necessary result and a senseless loss of time in the lesson. For reading to become productive, students must take an active position, performing various mental operations. It should be remembered that learning to read is an important task facing the school. The attention paid to improving the culture of reading is an important factor in the education of young people with deep knowledge, independent thinking and high spirituality.*

**KEYWORDS:** *International Study, Principle, Knowledge Level, Skills, Reading Literacy, Learning Reading, Pretext And Post – Text Stages.*

### INTRODUCTION

Decree of the President of the Republic of Uzbekistan Shavkat Mirziyoyev, "On approval of the concept of development of the public education system of the Republic of Uzbekistan till 2030", dated 29 April 2019 the main directions of development of the public education system in the long term, particularly the entry of the Republic by 2030, the number of the first 30 leading countries in the rating of the program student assessment of the International level PIRLS is an assessment of the level and quality of reading and text comprehension students elementary schools, PISA — assessment of mathematical literacy, reading and science literacy of 15-16-year-old students, TIMSS-assessment of mathematical and science literacy of students in grades 4 and 8.

As early as 2021, Uzbekistan plans to participate in international programs to assess the level of knowledge of students in PISA and PIRLS.

So what is PIRLS? What are the principles of PIRLS? What contributes to improving the quality of reading and understanding of the text by students and achieving high results?

The PIRLS international study of reading and comprehension compares the level and quality of reading and comprehension of primary school students in different countries of the world, as well as identifying differences in national education systems. The study has been conducted in five-year cycles since 2001, with participation from 35 to 50 countries.

The study examines two types of reading:

- Reading for the purpose of acquiring a reader's literary experience;
- Reading for the purpose of mastering and using information.

PIRLS tasks are aimed at testing four skills: the ability to find information, formulate conclusions, interpret and generalize what is read, as well as analyze and evaluate the content, language features and structure of the text.

Students need to read the text and give answers to questions. At the same time, some tasks involve choosing an answer from the proposed options, while others require freely constructed responses.

In order to improve the level of reading literacy and the ability to work with text, it is necessary to develop a culture of reading, in particular, such a type of reading as learning reading.

Reading, which was previously given little importance in the system of teaching Russian as a non-native language, has gradually become one of the important aspects of learning, and today it is not only one of the means of learning, which serves for entering new words into the student's vocabulary, but also a starting point for a variety of statements of a dialogical and monological nature. Reading has become a source of new intellectual and aesthetic information, a real form of using the acquired language competence.

As a type of speech activity, reading has its own specific communicative tasks that must be solved first of all when the object of work is learning to read. Such a communicative task in reading is to understand what is being read. It is not enough to simply ask students to open a book on the right page, read the material, and answer the question. This will lead to a lack of the necessary result and a senseless loss of time in the lesson. For reading to become productive, students must take an active position, performing various mental operations.

Learning reading is the most detailed type of reading. The purpose of this type is not just a thorough study, but also insight into the meaning of the text, a detailed analysis of the text. The final result is aimed at understanding all levels of the text, as well as the perception of various information contained in the text (factual, conceptual and subtext).

Let's look at the techniques of working with text that are used for learning reading. Preliminary oral work should not affect the content of the text, students should get acquainted with it during reading. At the end of reading the text, the object of control should be its understanding. At the same time, the comprehension test should be organized so that it does not destroy the necessary

skills in the process of reading. Students must learn to understand the text themselves, so the first reading of the text should be done by the students themselves.

It is not advisable to repeatedly read the same text, since if the content of the text is clear, then reading is deprived of its communicative value and becomes an exercise. Repeated reading of the text is justified if it is aimed at clarifying the understanding, i.e. if the communicative task is modified.

Preliminary questions are saved until the end of the work on the text. The understanding test should not be limited to just answering these questions. Questions can be asked by one of the stronger students, which other students answer. You should especially encourage the response with your own words.

Teaching a learner to read in a non-native language consists of three stages: pre-text, text, and post-text.

The pre-text stage involves familiarizing yourself with lexical units that may cause difficulties, as well as predicting the content of the text. Exercises for the pre-text stage:

- correlating the meaning of a word with the subject: filling in gaps in a sentence from a number of suggested words;
- • expansion of potential vocabulary of students: preview the text and find words of common root;
- • recognition of the meaning of grammatical phenomena: highlighting certain parts of speech and their selective translation;
- \* predicting language tools and text content: reading aloud only those parts of sentences that answer the teacher's question.
- The text stage involves reading the text and working on its lexical and grammatical material. Exercises for the text-mode portion:
  - \* reading text and highlighting key sentences and words in it;
  - \* text comprehension control: identifying correct and incorrect statements; answering questions;
  - \* highlight the main parts of the text;
  - \* correlating individual parts of the text: reading certain paragraphs to confirm the facts;
  - • reduction or paraphrase of the text: the replacement of the proposals is synonymous with speed;
  - • Selective translation of the text.
- The post-text stage is necessary for improving the skills of monologue and Dialogic speech. Exercises for the post-text stage:
  - \* determining the cognitive value of reading: comments on certain parts of the text;
  - \* development of skills of monological and dialogical speech based on the text: create a dialogue or situation on the topic of the text, logical and semantic maps of the problem;
  - • writing an abstract, summary of the text;
  - \* drawing up a plan or graphic diagram that will help you identify the structure of the text, as well as the relationship of its individual parts;

- \* text processing, creating a new text based on what you read;
- \* making comments.

These methods of working with text are the main ones, but they are not the only ones. Their use is largely determined by the experience of the teacher, his desire to work creatively and look for new effective ways to solve problems in the classroom. The choice of certain techniques also depends on the level of preparation of students and their educational motivation.

It should be remembered that learning to read is an important task facing the school. The attention paid to improving the culture of reading is an important factor in the education of young people with deep knowledge, independent thinking and high spirituality. "It is necessary to introduce our children to reading from kindergarten age, primary classes, to educate them to love the book. Only then will the reader's culture be established in our society and people will return to the book," President of Uzbekistan Sh.M.Mirziyoyev repeatedly emphasizes.

### ABSTRACT

*The research paper discusses the prospects for the application of AR and VR technologies in trade. The methods of using auxiliary and virtual reality technologies have been studied and analyzed on the basis of world experience. The use of auxiliary and virtual reality technologies has been studied and analyzed on the basis of world experience*

**KEYWORDS:** *Gemification, AR, VR, Advertisement, Distance Shopping.*

### INTRODUCTION

Digitalization is one of the most far-reaching transformation processes in the recent past. Famous as “New age technologies” AR and VR is being utilized throughout numerous industries, marketing is not only one of them but also the one promising prosperous future. Currently, many marketer are encountering problems concerning the issue of making attention grabbing and captivating commercials which will work as an effective driving force for making new purchase. Especially, in the world where people always strive to more convenience the attitude to advertisements are required to be changed, the distort of their function has badly affected and eventually created a wrong conception that advertisements are deceptive and convey misleading information in order to sell a certain product. Today, Ar and Vr digital appliances can be utilized as a powerful solution to existing matters. As the technology will undergo further development, without any hesitation it can be stated that the demand for these appliances will increase drastically over the years and use cases will widen continuously and have a great contribution to business development. It is predicted that, to the end of 2020 total Ar/Vr worldwide spending will comprise 18.8 billion U.S dollars[1]

## Methods

Scientific analysis, analysis and synthesis, induction and deduction, systematic approach, logical methods of analysis and methods of scientific organization of the result were used based on the sum of specific methods of cognition.

New technologies continue to contribute to the rapid transformation of the way we do business. AR-augmented reality and VR-virtual reality, the technologies of the digital economy, are expected to lead to major changes in the field of commerce. Although, the first attempts to create a non-existent reality began in the early 1960s, this term came into use in the late 1980s. These digital technologies, which are now widely known through video games, have a number of useful features that we need to study in depth and use effectively. A unique feature of VR is its comprehensiveness. Via a short travel to a virtual reality the things or situations complex to describe in words and cannot be shown in a real life will be experienced, seen, felt by mankind. This feature allows to deepen education, reduce unnecessary cost risks in production, will be the elimination of endanger human life in research purposes, and in trade- to attract customers purchase goods in a more attractive/modern way, to produce goods by making decisions according to consumer perspective.

The role of VR and AR technologies in streamlining the sales process and meeting customer needs is invaluable. They create a number of conveniences. Including:

- ❖ Opportunity to shop regardless of time and place
- ❖ Availability of the result which demonstrates result of entire list of demand-meeting goods, when comparing the quality and price of the product with other products
- ❖ Automatic analysis of the composition of the product and, as a result, avoid purchases of goods that are harmful to our health
- ❖ Plain and understandable appearance of customer feedbacks about the product (represented by symbols, asterisks)
- ❖ Shelf life of the product, the accuracy of information about its composition
- ❖ When you say a certain type of food when shopping, the list of necessary products will be instantly presented to us in a hologram version
- ❖ The purchase process does not take much time (going to the point of sale, queuing, searching for the desired product, reading the market information about the product, searching for consumer feedback on the product on the Internet)
- ❖ The buyer can get acquainted with the products that he thinks are not enough Maximum satisfaction of needs, minimize the likelihood of losing customers by buying the goods that are acceptable to them.

It is natural that the digitalization of product advertising will definitely move producer's focus on improving its quality rather than working on products' outer look. By means of digital technology, we can understand the composition of the product, the level of its affordability, the opinion of consumers about this product. So, it can be argued that AR and VR are one of the tools we use to achieve our targets. It should be emphasized that, in our fast-paced society, the demand for automation of all activities is growing over time. Long queues when we go to the

may have a direct effect on delaying their activities in either personal or social life by taking time. Obtaining new, modern home appliances can be a daunting task in our daily lives. We need to have a strong imagination to realize that the color and style of our chosen furniture does match and is suitable for the interior of the room. AR technology has taken to the world stage as a solution to this problem. Now, when choosing any home appliance, we have the opportunity to assess whether any furniture in front of us is suitable or not for our interior by using AR.

IKEA has secured the future of its business in an innovative way by presenting this form of offer to the public. Another example, when we analyze the process of buying a dress, it takes a little time for a person to choose a dress model in the style one wants that suits him. Digital AR technology not only accelerates the process, but also significantly simplifies it. Moreover, one doesn't need a lot of expensive equipment to use AR technology, just a mobile device like tablets and touch screen phones is enough. Timberland is using this low-cost technology to promote its new season clothing.

Experts from the Bureau of Economic Analysis and Euro monitor estimated the home appliance market at \$ 180 billion and the clothing market at \$ 260 billion. [2]

As a modern technology AR is earning interest of many, it serves to create new customers and increase the level of purchases by making the shopping process more interesting. Because AR has a gamification attribute, one perceives the purchasing process as an inclusive game, and the process does not evoke aggression in person as it used to do, but leaves a positive impression and motivates the purchase of the product. Bill Bernbach, who has studied advertising sphere in depth and gained the peak of his fame by working in this field, said, "Nobody counts the number of ads you run; they just remember the impression you make". VR and AR technologies, on the other hand, give the result that experts expected. This is because now the potential buyer not only observes but also participates in the advertising process. Another widely used advertising tool is social media. Suppose an entrepreneur has won the attention of a client using AR, a client who has witnessed a miracle of new technology will definitely be eager to share their impressions with their friends through social networks, who are aware of the possibilities of AR people will want to know it in their own experiences. This means that the entrepreneur will get the desired result. Beavers Brothers uses AR to please its customers as a New Year's gift. It is estimated that the number of people who have downloaded augmented reality applications will reach half a billion by 2022, and currently the number of users of AR is 900 million. [3] Under the Toms shoes brand, the shoe company has accelerated the sale of its products with its new approach. It uses virtual reality to show customers who will benefit from each their purchase.

Virtual reality is a bit different from augmented reality. Because of its inclusiveness and interactivity, technology devices are also more expensive. According to statistics, 7 out of 10 advertising professionals want to use AR to attract consumers, and 71% of buyers want to know by experiencing how AR is used in sales. [4] Gigi Capital estimates that the size of the AR market could reach \$ 90 billion by 2020, up from \$ 1 billion in 2016. Goldman Sachs predicts that sales of virtual reality software will reach \$ 9 billion by 2025. [5] In short, digital technologies, which have completely changed our outlook for the future, are important in the reform and development of trade, one of the most important sectors of the economy. is an important factor in the production of competitive, high-quality and world-class goods.

**CONCLUSION**

To sum up, to business and policy markets, the engaging questions about how to appeal consumers attention or getting rid of banal and conservative adds, how to make permanent clients by creating for them an appropriate atmosphere, produce customer friendly products which in fact assures making revenue have found resolution named Digital AR and VR technologies.

## RELATIONSHIP BETWEEN PENALTY AND GUILT IN CIVIL-LEGAL LIABILITY (EXPERIENCE OF UZBEKISTAN)

**Adham Sa'dulloyevich Odinaev\***

\*Independent Researcher,  
Academy of the General Prosecutor's Office,  
Republic of Uzbekistan, Tashkent, UZBEKISTAN  
Email id: [adham\\_os@mail.ru](mailto:adham_os@mail.ru)

### ABSTRACT

*This article highlights the role of penalty in the civil legislation of the Republic of Uzbekistan as a method of enforcement and a form of civil liability on a scientific basis. It also examines the views of lawyers from national and foreign countries, analyzes the composition of civil offenses, the relationship between penalty and guilt, guilt and its forms. Particular emphasis was placed on improving the institution of civil liability, including ensuring a fair procedure for compensation. In addition, proposals were made to improve the application of penalties for non-performance or inadequate performance of contractual obligations by business entities, as well as to ensure the fulfillment of obligations.*

**KEYWORDS:** *Contract, Obligation, Creditor, Debtor, Liability, Guilt, Damage, Liquidated Damages, Fine, Money, Property, Payment For Breaking The Promise*

### INTRODUCTION

The civil legislation of the Republic of Uzbekistan stipulates penalty as the amount of money established by the legislation or the contract, which the debtor is obliged to pay to the creditor in case of non-performance or improper performance of the obligation.

Penalty is a way to ensure the fulfillment of obligations and a form of civil liability.

Civil liability has the features of prevention and compensation, in contrast to the types of liability that are only of preventive nature (prevention, warning).

In order to increase the effectiveness of the application of measures related to the property interests of the offender, the liability must be inevitable and assigned to specific individuals who have affected the condition of the objects.

The basis of liability consists of such components as illegal action, damage caused, the causal link between them and the subjective factor - the guilt. [1]

Civil liability arises when the conditions specified in the law exist. These conditions constitute the content of the offense and serve as a basis for prosecution. These are: 1) the presence of damage; 2) unlawful conduct; 3) the causal link between unlawful behavior and harm; 4) the presence of guilt.

Entrepreneurs (citizens, legal entities) are interested in the conscious and voluntary fulfillment of their obligations. This is because entrepreneurs seek to make a profit under the risk they take and their property liability[2].

However, some business entities do not fulfill the terms of the contract, allowing the breach of obligations without due diligence.

This means that civil liability is the main tool in ensuring the fulfillment of contractual obligations[3].

The Civil Code of the Republic of Uzbekistan (Part 1 of Article 333)(hereinafter - the RFRC) states that "The debtor is shall be liable (if s/he is guilty) for non-performance or improper performance of the obligation, unless otherwise provided by the legislation or the contract"[4].

The presence of guilt is one of the grounds for the application of civil liability.

In civil law, the principle of guilt is cited as the basis for liability for unlawful acts. This principle is the basis of contractual and civil-legal liability (under guilt).

Measures of civil liability are aimed at preventing civil offenses, while ensuring the realization of the property interests of the parties.

Liability sanctions can intimidate, endanger, and impede the initiative required for entrepreneurial activity by individuals who are not fully aware of the regulations.

To do this, there must be a firm belief that it is not possible to impose liability on those who carry out business activities, even in unavoidable circumstances. In this regard, Article 333, Part 2 of the Code of Criminal Procedure of the Republic of Uzbekistan stipulates that "if the debtor proves that he has taken all necessary measures to properly perform the obligation, he shall be found not guilty"[5].

The principle of guilt determines the basis of civil liability arising from contractual and non-contractual relations. After all, guilt is the mental attitude of the perpetrator of a civil offense in the form of a malicious intent or negligence towards his illegal actions and their harmful consequences[6].

Regarding the concept of guilt, some scholars argue that "the malicious intent or negligence of a person who has committed an unlawful act and harmed another by his actions cannot be called a guilt in civil law, ... guilt is a certain attitude of a person towards his own illegal morality" [7].

There is also the existence of innocent liability in cases provided for by law or contract [8].

If the party who caused damage to a person or property outside the contract can prove that the damage was not caused by his own fault, then he is released from the obligation to pay damages.

Historically, many states, based on the traditions of Roman law, have recognized the possibility of recovering the difference between the actual damage and the prescribed penalty, if the amount of the penalty is less than the amount of damage[9].

In case of non-performance or improper performance of contractual obligations, the creditor requires the debtor to pay the penalties provided for in the contract or the law, or to compensate for the damage caused by non-performance of the contract.

If the debtor fails to prove his guilt in the breach of obligations, he shall be liable in the manner and to the extent provided for in the contract or law.

The scientific literature has shown that if the breach of contract by the debtor is caused by gross negligence, the damage can be fully compensated[10].

This means that the debtor is given the right to deny guilt and the debtor is liable only if there is guilt for his actions.

Regardless of the form of guilt (intentional or negligent), there is liability: the prescribed penalty is recovered, the damage is compensated.

But in some cases, the law exempts the debtor from liability if there is a non-serious negligence in his actions.

For example, Article 889 of the RFRC, which deals with the liability of the depositor, states that “If the stored thing is not taken back by the depositor after the expiration of the storage period provided for by the contract, or the period during which the depositor was obliged to take the thing back at the request of the custodian, then the custodian will only be liable for the loss, shortage or damage of this thing if s/he did it with intent or gross negligence”[11].

This means that the depositor is released from liability if s/he proves that s/he did not act intentionally or did not commit gross negligence due to the fact that the item was missing or damaged, that is, he was not guilty of causing the item to fall into such a state.

It is important for the practice that the task of proving innocence is assigned to the debtor. However, according to Article 414 of the Civil Code of Uzbekistan of 1963, the creditor was obliged to prove the guilt of the debtor[12].

The transport charters provide for the consignee or consignor to prove the guilt of the carrier for the loss, shortage and damage of the cargo. According to Article 721 of the RFCC, the burden of proving innocence rests with the carrier (the debtor). This rule is aimed at increasing the responsibility of the transport organization for the carriage of goods, to ensure the strict implementation of its obligations.

As a general rule, if the obligation is not performed due to the event of force majeure, the debtor is not required to prove his innocence, but there are exceptions to the general rule of liability under the law and the contract, taking into account the characteristics of certain types of obligations.

For example, Article 333, paragraph 3, of the RFRC stipulates that “unless otherwise provided by law or contract, a person who fails to perform or improperly performs an obligation in the course of entrepreneurial activity fails to prove that it was not possible due to emergency (unavoidable circumstances, force majeure), s/he shall be subject to liability.

In accordance with Article 241 of the RFRC, the performance of the obligation may be entrusted to a third party. The party to the contract shall be liable for the non-performance of the obligation, unless the legislation or the contract provides for the liability of a third party. Article 334 of the RFRC also provides for the liability of a contract party (debtor) for the actions of a third party, ie the fault for non-performance of an obligation. In accordance with the principles of general civil liability established by Articles 333, 334 of this Code, in order to release the debtor from liability, the debtor must prove his innocence, as well as the third party who imposed the obligation.

The guilt of the creditor in the non-performance of the obligation shall definitely be taken into account. According to Article 335 of the RFRC, the debtor may be released from some part of the liability if the creditor is also at fault for non-performance of the obligation. To do this, the court must compare the guilt of the debtor and the creditor in accordance with Article 326 of the RFCC and may reduce the amount or penalty required to compensate the damage caused by the debtor. It does not matter what form the creditor's guilt takes to minimize the debtor's liability.

If damage may be caused to the creditor due to non-performance of the obligation, the creditor shall take all measures aimed at preventing this damage and taking all necessary measures to reduce it. If the creditor does not take such measures or does not try to reduce it, neglects the matter and as a result of the damage, it is considered his fault in the occurrence of such consequences and the debtor may be released from the appropriate amount of fees paid to the creditor. If the creditor has intentionally allowed an increase in damages, he will also be deprived of the right to claim damages from the debtor.

The concept of guilt has the same meaning for individuals and legal entities. The guilt of a legal entity is manifested through the attitude of employees towards the performance of their duties and the criminal actions committed by them. This is because the actions of the employees of the enterprise are considered to be the actions of the legal entity. For example, the production of substandard goods through the fault of the employees of a legal entity is the fault of that legal entity. The fault of a commercial organization that did not deliver the goods on time due to lack of manpower or equipment is considered to be the fault of the manager who failed to prevent the timely elimination of these defects.

In the past, the state was interested in compensating for the damage caused, whether or not the parties to the obligation were at fault, and was compelled to do so by law. Because the enterprises that were the parties to the obligation belonged to the state. For this reason, the following idea (said in the literature) was expedient in the interests of the state, "it was recognized as an obligation to pay damages regardless of the presence or absence of guilt. Business entities face the same consequences (in terms of quantity) for non-fulfillment of obligations, as well as in the absence of fault, compensation was recognized as an obligation, whether or not there was a fault" [13].

In a market economy and with the formation of private property rights, such ideas have lost their relevance. Now, guilt has found its place in the legislation as an important principle of civil liability.

As noted in the Decree of the President of the Republic of Uzbekistan No F-5464 "On measures to improve the civil legislation of the Republic of Uzbekistan" (dated April 5, 2019), "the Civil Code of the Republic of Uzbekistan adopted in 1995-1996 has played an important role in

regulation of ‘wide range of changes in related social relations’ and created a solid legal basis for the development of a market economy in the country” [14].

But today, when the quality is constantly changing, the primary task is to fully ensure the rights and legitimate interests of entrepreneurs and private owners, potential foreign investors. In this sense, this Decree was a serious step towards the modernization of civil legislation in accordance with the principles of a market economy and international standards, further deepening economic reforms in the country and creating a modern civil law framework for the development of a market economy: development and adoption of a new edition of the Civil Code.

The new code should serve to reduce the state’s participation in the economy, define what property is, who owns it, its title rights, methods and means of protecting private property, improve the business environment and investment climate in the country, and ultimately increase the country’s position in international rankings. Importantly, emphasis is placed on improving the institution of civil liability, including ensuring a fair procedure for damages.

This can also be seen from the fact that the penalty approach in English law was first formed within the framework of the law of justice[15].

Over the years, the RFCA was adopted on December 21, 1995 (first part), August 29, 1996 (second part), aimed at the formation of market relations based on different forms of ownership, and both parts entered into force simultaneously - from March 1, 1997.

The Code consisted of 2 parts, 6 sections, 71 chapters, the number of articles was originally 1199 articles. At present it has 1191 articles.

To date (as of June 1, 2020), a total of about 200 amendments and additions have been made to the Civil Code, which has been in force for more than 23 years.

Based on the abovementioned, we will focus on some aspects that need to be improved in the code and in the field of concerned relations.

In the application of civil liability for an offense, it serves as the basis for the offender’s guilt, regardless of whether it arises from a contractual relationship or a tort relationship. However, civil law, unlike criminal law, does not define the concept of guilt. Although the scientific literature states that guilt exists in civil law in the form of intent, negligence, and gross negligence[16], they have not been thoroughly substantiated. In this case, it would be appropriate to define guilt and its forms in the first part of the RFCC, in the subsection “Basic provisions”.

This requires a special approach to negligence, even if the form of “intent” is determined by the Criminal Code of the Republic of Uzbekistan. Negligence can be defined as an act (action or omission) that results in socially dangerous consequences due to negligence, negligence or unreasonable attitude of the subjects of civil law to their obligations, observance of the legitimate rights and interests of others. If we take into account that environmental offenses are usually committed by negligence, then strengthening the concept of negligence in law will serve to properly assess such offenses and apply fair liability measures.

**Based on scientific research and international experience, the following suggestions for improving civil legislation can be made. In particular,**

The penalty is a monetary obligation; besides it also can be unclaimed items (property). For example, in English law, a pre-assessed loss can be expressed both as money and property [17]; it is not the duty of the court to reduce the amount of the penalty, it is necessary to clearly define the proportionality and the minimum limit of losses on commercial obligations and the penalty; in accordance with the technique of national legislation and the spirit of contracts concluded in today's market economy, it is expedient to replace the word "penalty" in Articles 260, 261, 262 and 326 of the RFCC with the word "payment for breaking the promise" and the word "fine" with "payment for guilt";

- the accountable, alternative and absolute penalty, by its very nature, serves to cover damages and can not be considered as a separate measure of property liability;
- since it is not always possible to accurately determine the extent of property liability of participants in commercial contracts, the ratio of penalties and losses should be clearly defined by law;
- It should be specified in the RFCC that the limitation of action (suit, claim) on the recovery of penalty begins from the moment of non-performance or improper performance or damage of the contract, the limitation of action (suit, claim) on the recovery of penalty can not be suspended or extended, except in cases of force majeure;
- Article 262 (related to the form of the agreement on penalty) of the RFCC should be supplemented with parts 2 and part 3, as follows:

"The origin of the penalty liability, the form of the penalty recovery and the procedure for calculating it can be determined in the Penalty Agreement itself or by reference to a specific normative document.

Failure to comply with the written form of the Penalty Agreement will invalidate the agreement". In addition, the spread of coronavirus infection around the world, the collapse of the dam "Sardoba Reservoir" in Sardoba district show that there are many gaps in our legislation to compensate for the damage caused by mentioned disasters for the farmers and cooperatives.

Therefore, it is necessary to include a separate article in paragraph 5 of the Civil Code entitled "liability for the grower of agricultural products", which states that "the producer of agricultural products is liable in case of non-performance or improper performance of economic obligations".

As a general rule, civil liability arises for contractual and non-contractual obligations, but in some cases provided by law, liability for damages to a citizen or legal entity occurs throughout the entire system of civil law. These include: general disaster, requisition, damage caused by the seizure of land for the needs of the state and society, compensation for damage in case of absolute necessity. They must be distinguished from illegal behavior.

The conclusion is that in the renewed Uzbekistan, civil legislation continues to develop, taking into account the norms of international law and national features.

UZBEKISTAN

### ABSTRACT

*The article describes the scientific study of the artistic language in Turkology, in particular, Uzbek linguistics, as well as the lexicon of the Uzbek folk epos and ideas about what aspects of the language they are aimed at. In the section on statistics, the evidence shows which groups more than 470 names belong to according to the nature of their meaning, how many names correspond to each epic contribution and in which epics each name is repeated. The author conducted his scientific observations on the basis of six epics of Jumanbulbul's son. It provides interesting information about some of the compound words used in these epics, mainly double and repeated words, and some grammatical forms that are not currently used.*

### INTRODUCTION

The issue of learning the language of fiction has long been controversial. Some researchers note the need to study the artistic language as a methodological field of literature and linguistics [1].

The essence of studying the language tools used in a fiction depends on the nature of the purpose for which this study is intended. The researcher can conduct his research in different directions in accordance with his purpose and desire. For instance, a linguist can focus linguistic facts on the historical aspect of language, a stylist can use them to determine the stylistic features of the artistic discourse of that period, and it is quite natural for someone to subordinate linguistic means in a specific work to clarify which dialect of a literary language. From this it should be concluded that the language tools used in a fiction may serve a different purpose.

## MATERIALS AND METHODS

In Uzbek linguistics, there are a number of scientific studies on the lexicon of Uzbek folk epics, which can be divided into certain groups in terms of what aspects of the language they are aimed at:

### **The study of the relationship of lexical material with a dialect and a literary language**

One of the linguists, H. Doniyorov, in his large monograph "Dictionary of Kypchak dialects", not claiming superiority, took the region of Kypchak dialects, the city of Samarkand, as a focal point and divided it into five groups: eastern, western Ferghana, southern and northern Khorezm. According to H. Doniyorov, the fifth group of people is characterized by the presence of Oguz elements in their speech[2]. In this paper, the question was developed about the relation of the language of epics to the Kypchak dialects. The bakhshis from Khorezm, as H. Doniyorov points out, "... continue to create in the common or inter-dialectal oral form of the language, they create oral literary works[3]." Khorezm bakhshi sings an epic for a certain period of time at night. This requires great skills and abilities from a bakhshi.

Khorezm epics reflected not only inter-ethnic literary relations, but also inter-linguistic relations. Accordingly, the epics in their lexical structure also to some extent reflect the peculiarities of the local languages of the region.

In Uzbek linguistics there are observations directly devoted to the lexicon of epics, including A. Ishaev's short article entitled "Some Features of the Lexics of Epics". In it, the author urges to pay special attention to an important point in the study of the language of epics: "... when studying the language of epics, indeed, it is necessary to take into account where and by whom they were written, the literary skill and linguistic talent of the bakhshi, and how the work was prepared for publication[4]." The author conducted his scientific observations on the basis of six epics of Jumanbulbul's son. It provides interesting information about some of the compound words used in these epics, mainly double and repeated words, and some grammatical forms that are not currently used.

### **Research with a complex approach to lexical material analysis**

Among the scientific observations on the lexicon of epics, D. Abdurahmanov and H. Bektemirov's article "Onomastics of Uzbek folk epics" is noteworthy in that it covers a wide range of issues related to the onomastics of epics[5]. The authors did this on the example of twelve epics. A certain part of the work is devoted to the statistics of the proper names used in the epics, and to the repeated names in them. In the section on statistics, the evidence shows which groups more than 470 names belong to according to the nature of their meaning, how many names correspond to each epic contribution and in which epics each name is repeated. Part of the work is devoted to aspects related to parallel names, nicknames, ethnonyms, proper names, naming rituals. In the last part of the work, the authors discuss the lexical-semantic features of the onomastics of epics. They noted that it is not enough to interpret the language of epics on the basis of a single dialect material: "Uzbek folk epics contain not only very old information on history, ethnography and geography, but also ancient traditional linguistic facts, which cannot be interpreted on the basis of modern Uzbek dialects and Uzbek language [6]."

Among the works that have taken place in recent years, it is worth noting the observations of S. Tursunov. The author has published a number of articles, such as "On the study of the lexicon of

the epic Alpomish"[7], "Anthroponyms in the language of Alpomish"[8], "On the study of lexical and phraseological features of the epic" Alpomish"[9], "Synonyms in the epic "Alpomish"[10]. As a generalization of these observations, S. Tursunov defended his dissertation on the topic "Lexical Features of the Alpomish Epic", in the third chapter, which describes the functional and methodological features of the vocabulary of the Alpomish epic, there are three parts and each of them has its own name: a) literary-poetic lexicon, b) folk-poetic lexicon, c) folk poetic aphorisms[11].

Although the examples in this chapter emphasize that the events in the epic are related to the past of individuals, such connections have not been thoroughly analyzed with clear evidence. The examples included in the thematic groups consisted only of registration of facts. Another work related to our topic belongs to Z.T. Kholmanova[12]. In the first chapter of the work, as well as in works devoted to the language of folklore, words are genetically described that are divided into groups according to the number of uses, high, medium and low lexemes. The second chapter is devoted to thematic groups of epic lexicons that describe anthroponyms, toponyms, ethnonyms, astronomy, military terms, words related to everyday life, words related to the profession.

The third chapter of the dissertation is devoted to the analysis of the relationship between the form and content of epic vocabulary. It examines the ambiguous, synonymous, antonymic, homonymous words found in the text of the epic. In addition, the study makes extensive use of statistics. This dissertation is valuable in terms of showing the connection of the vocabulary of the epic with the language of the literary language, dialects, written historical memoirs.

In our opinion, since the author of the study did not set the goal of functional analysis of the lexicon of epics, it does not cover the nominative-descriptive and artistic-methodological function of lexical units.

### **Research on the poetics of epics**

Most of the research on the language of epics belongs to Sh. Shoabdurahmanov[13], of which are mainly of an article nature. They are distinguished by their originality, richness in the analysis of factual materials. In this regard, the author's observations on the language of the epic "Ravshan" are particularly noteworthy. The research begins with observations on the structure of the syllables of the epic and provides extensive information the system of rhymes, the peculiarities of the use of figurative words, adjectives, analogies, metaphors, metonymy, irony, rhetoric, syntactic imagery, phonetic imagery. At the end of the work, both the lexical and some grammatical features of the epic are briefly discussed[14]. This work is one of the perfect studies of the poetics of folk epics done to date.

### **RESULT AND DISCUSSION**

In this regard, it is worth mentioning the work on the language of epics in the linguistics of fraternal peoples. In Kazakh linguistics, J. Bayzakov's work can be mentioned among the works devoted to the linguistic features of the epic [15]. In the introductory part of this work, the author dwells on the issue of magic. The genesis of the concept of the "seven perfect saint" gives an idea of the need to go through the "chilla" "period seven times - forty days - in order to master the art of magic. Then it is reported that the epic "Alpomish" is widespread among the population of South Kazakhstan, and the Uzbek language has influence on its language, but the question of the

influence of the Uzbek language is not supported by evidence. The study consists of three chapters, the first of which focuses on the artistic features of the epic "Alpomish" on the example of lexical units, which focuses on the use of epithets, analogies, metaphors, metonymy, phrases, repetitions, pairs of words, syntactic parallels, and synonyms.

The second chapter of the work discusses the analysis of historical words and dialectisms found in the lexicon of the epic. Here a broader understanding of the shortening properties of words is given. The third chapter analyzes the borrowed words from Arabic, Persian, Mongolian, in part, Uzbek, Uyghur, Karakalpak languages in the epic. One of the works in Turkmen linguistics devoted to the linguistic features of the epic is E. Chorieva's work on "Language features of the epic" Gul Sanobar "[16]. The author has a complex approach to revealing the linguistic features of the epic. It analyzes the lexical, phonetic, morphological and syntactic features of this epic. The first chapter of the work is devoted to the lexical features of the epic. This section describes the spiritual differences of lexical units used in the epic from the units of modern Turkmen, synonymous, homonymous relations of lexical units, as well as the artistic means of the epic, such as analogy, metaphor. Indeed, a comprehensive approach to the linguistic features of the epic did not allow for a full and perfect coverage of the lexical features.

In addition, there are studies on the language of folklore of a small genre, in which the work of F. Khayitova is one of the first researches[17]. First chapter of the study, which studies the role of words in the language of wedding songs, the role of dialectal lexicon, the use of artistic means in the realization of certain semantic motives, the methodological features of repetitive words in the language of songs are directly related to our work.

Another work on the lexicon of folk songs belongs to M. Djumaniyazova, the first chapter analyzes the lexical layers of songs[18]. The second chapter of the dissertation discusses the specific lexical and spiritual features of the language of songs. In this work, mainly the regional-stylistic peculiarities of the songs created in the South Khorezm region, their relation to the past and the local dialect, the literary language are identified.

Thus, some research has been conducted in Turkology, including Uzbek linguistics, on the study of the lexicon of epics, which is an independent genre of folklore. Some of the works only mention the lexical means of epics, and some of them were completely devoted to the vocabulary of epics. Based on the above analysis, it can be said that a certain amount of experience has been accumulated in the study of the lexicon of epics. However, the main part of the work done in them is not devoted to the whole problem, but to some aspects of the lexicon of epics.

Much of this work is in the nature of articles, and there has not yet been a fundamental study of the complex approach to the language of folklore. Even if the work on a single epic lexicon is carried out, there is still no reason to say that it fully reflects all aspects, stylistic and poetic features of the lexicon of many Uzbek folk epics. This is because if the features identified on the basis of observations made on the scale of one epic are not compared with the same issues in other epics, the specific style and general aspects of the epic performer with other performers will not be revealed. According to this, it is still necessary to continue the study of the lexical features of the epics belonging to the repertoire of epic performers belonging to different schools of epic poetry.

We hope that our scientific research on the lexicon of the epics "Khirmondali" and "Forty Thousands", which are included in the repertoire of the poets of North Khorezm, also made a

modest contribution to the development of large monographs on the lexicon of many other Uzbek folk epics.

There are certain shortcomings in the lexical-semantic, and functional-methodological aspects of epic lexicon: when words are analyzed in thematic, genetic groups, often these analyzes are not related to the subject of the epic, their image-making service, the past of the epic heroes, events in the epic. Such analyzes are no different from pure linguistic research, as if they had nothing to do with epic events, with the behavior of individuals. However, the epic is an oral form of artistic discourse. The lexical means used in it are directly and indirectly related to its imagery, art.

## CONCLUSION

From the above notes, it can be seen that the research on the lexicon of epics in Uzbek linguistics has been devoted to describing the stable state of the lexical structure of epics, with the exception of the work of Sh. Shoabdurahmanov. According to this, in our research we aimed to show the lexicon in action - dynamics, and accordingly tried to show them in the nominative-descriptive and artistic-methodological function.

## INTRODUCTION

Recent data from the World Health Organization shows that cardiovascular diseases have increased dramatically among female patients and have increased by 0.1-1% in recent years at ages 45-54 and 10-15% at ages 65-74.

It is believed that depressive manifestations are detected more frequently in women than in men against the background of stress. It is believed that women are more likely to be depressed. The authors attribute it to neuroendocrine features in women.

Data from various studies show that the incidence of depression in older age groups is between 9 and 30% (1, P.21-23; 3, P.61-68; 4, P.41-43). In particular, depression is more prevalent among patients with coronary heart disease (CHD) than in the population, with different data showing 18-65% depression [5, P.278; 6, P.209; 10, P. 192-203]. Different studies highlight several important risk factors for mood disorders in somatic diseases. One of the important risk factors for anxiety-depressive disorder is immune inflammation, as recent studies have shown, does not rule out the role of immune inflammation in the emergence and progression of affective disorders of the anxiety-depressive spectrum in CHD. The association of ILI with anxiety disorders has been increasing in recent years and increases the mortality rate of such patients by a factor of 2-4. This phenomenon is clearly illustrated by the development of the so-called "cytokine" hypothesis of depression [2, P. 19; 8; 9, P.136-138], which states the effect of pro-inflammatory cytokines on the formation of depressive disorders. According to this model, immune action in the periphery causes the synthesis or appearance of cytokines and their receptors in brain parenchyma, which may lead to chronic, localized inflammatory processes in brain regions responsible for depressive symptoms.

In the framework of the above, it can be assumed that the prognosis of cardiovascular diseases in comorbidity with anxiety-depressive syndrome and on molecular-genetic level is also unfavorable. It is assumed that in such cases, carriers of variations in inflammatory marker gene structure associated with changes in secretion or expression of corresponding protein products may have a higher risk of depression. But to date, the association between genes that participate in the inflammatory process in CHD in comorbidity with anxiety-depressive disorder (ADD) has been poorly studied.

**Objective of the study:** to study the association of polymorphism of the IL-10 C/T 819 gene in women with anxiety disorders in the destabilization of angina.

## MATERIALS AND METHODS

The study was carried out in the Samarkand branch of the Republican Scientific Center for Emergency Medical Care, in emergency therapy departments 1 and 2. The study included 307 patients diagnosed with unstable angina. The average age of patients was  $69.4 \pm 8.9$  years. The women were conditionally divided into 2 groups: The 1st group was made up of women under 60 (187), the 2nd group was made up of women over 60 (120) (Fig.1).

Figure 1. Distribution of women by age.

All patients during the study were carried out the following laboratory and instrumental methods: ECG, EchoCG, X-ray, determination of lipid spectrum (OX, HDL, LDL), determination of the level of uric acid (UA) in the blood, biochemical blood tests (ALT, AST, creatinine, urea, residual nitrogen). The concentration of the following molecules was assessed: IL-1 $\beta$ , IL-4, IL-10, TNF- $\alpha$ . The DNA gene was studied by isolation of peripheral blood lymphocytes by perchlorate extraction with ethanol deposition. The variants of the gene carrying point replacements of nucleotides - IL-10 C/T 819, and also determined the level of anxiety thanks to the Spielberger-Hanina scale and the hospital scale HADS, which passed a full cycle of language adaptation and was modified when calculating the components. Statistical data processing was performed using the STATISTICA software package (version 6.0). The reliability of the indicators was assessed using the Student-Fisher criterion, the significance level was 0.05 ( $p < 0.05$ ).

## RESULTS

211 cases of psychosomatic disorders were identified during the study using the HADS scale, of which 146 patients had clinically significant anxiety and 65 patients had subclinical anxiety. In addition, 97 cases of clinically significant anxiety and 38 cases of subclinically significant anxiety were above the age of 60. Blood levels of MK, LDL, OX and LDL were then determined by a unified method for all patients including those with anxiety disorders. The results of the study showed that among patients with anxiety disorder the level of MC is high and averaged 483.2  $\mu\text{mol/l}$ . In the course of the study it was found that cytokine balance is more frequently disturbed among patients with increased MC level in blood (Table 1).

**TABLE 1. INDICATORS OF CYTOKINE STATUS AND URIC ACID IN PATIENTS WITH NS (IN PG/ML) DEPENDING ON GROUPS**

Indicator	NA + anxiety disorders (n = 211)	NS without anxiety disorder (n = 96)
IL-1 $\beta$ , pg/ml	103,5 $\pm$ 0,12	92,37 $\pm$ 0,03
IL-4, pg/ml	20,36 $\pm$ 0,14	24,3 $\pm$ 0,09
IL-10, pg/ml	10,2 $\pm$ 0,62	14,51 $\pm$ 0,10
TNF $\alpha$ , pg/ml	79,97 $\pm$ 0,23	68,29 $\pm$ 0,54
MK, $\mu$ mol/l	458,5	360,0

And the lipid spectrum indicators were statistically indistinguishable in both groups (Fig. 2).

### Indexes of lipid metabolism in patients with NS

**Figure 2: Lipid metabolic rate in women with NS.**

Further our interest was aroused by the results of the study of polymorphism of the IL-10 C/T 819 gene. Thus, women with anxiety disorders were mostly older than 60 years, and those without anxiety disorders were mostly women under 60 years. Cases of IL-10 C/T 819 polymorphism were more common among women over 60 years of age, perhaps our study confirms the results of a study by the Japanese scientist Bing-Jian Wang and his co-authors, who linked the presence of polymorphism in the gene.

gene IL-10 C/T 819 with old age and atherosclerotic lesions [7, P. 17842-17855]. Thus, among patients with unstable angina and anxiety disorder cases with 135 C/T alleles and homozygous alleles of TT 106, patients with clinically expressed anxiety disorders of TT polymorphic allele in 43 patients and homozygous polymorphic allele in 97 patients, among patients without comorbid pathology 39 cases with unchanged SS alleles, 57 cases with heterozygous ST alleles of IL-10 C/T 819 gene, more than one case with homozygous TT alleles (Fig. 2).3 ).

**Figure 3. Frequency of occurrence of polymorphism of gene IL-10 819 C/T.**

In this figure we can see that among patients with homozygous variant of T/T there is quite often, clinically and subclinically expressed anxiety, which can explain the severe clinical course of unstable angina with comorbid condition.

Further, we decided to study the mean value of pro- and anti-inflammatory cytokines depending on the polymorphism of the IL-10 819 T/C gene (rs1800871) in two early study groups.

**TABLE 2. CYTOKINE CONCENTRATION LEVEL AS A FUNCTION OF C/T POLYMORPHISM OF THE GENE IL - 10 819 (RS1800871) IN PATIENTS WITH UNSTABLE ANGINA ABOVE 60 YEARS OF AGE**

Indicators cytokineconcentrations	GenotypeIL – 10 C/T 819		
	C/C	C/T	T/T
IL-1 $\beta$ , pg/ml	98,2 $\pm$ 0,11	98,4 $\pm$ 0,13	101,5 $\pm$ 0,56
IL-4, pg/ml	21,4 $\pm$ 0,07	23,2 $\pm$ 0,23	22,03 $\pm$ 0,09
IL-10, pg/ml	13,4 $\pm$ 0,09	13,1 $\pm$ 0,11	12,7 $\pm$ 0,33
TNF $\alpha$ , pg/ml	66,48 $\pm$ 0,56	66,56 $\pm$ 0,03	68,95 $\pm$ 0,12

**TABLE 3 CYTOKINE CONCENTRATION LEVEL AS A FUNCTION OF C/T POLYMORPHISM OF THE GENE IL - 10 819 (RS1800871) IN PATIENTS WITH UNSTABLE ANGINA UNDER 60 YEARS OF AGE**

Indicators cytokineconcentrations	GenotypeIL - 10 819 C/T		
	C/C	C/T	T/T
IL-1 $\beta$ , pg/ml	84,9 $\pm$ 0,45	85,3 $\pm$ 0,52	92,7 $\pm$ 0,22

IL-4, pg/ml	29,1±0,11	30,0±0,11	26,56±0,34
IL-10, pg/ml	22,0± 0,21	23,9± 0,15	23,7± 0,76
TNFα, pg/ml	54,03±0,06	55,22±0,76	57,57±0,78

So, in the taboo. 2 and 3 shows the difference between pro- and anti-inflammatory cytokines in two groups of women. Women over 60 years of age are more adept at exacerbating the inflammatory process and endothelial dysfunction in cases of destabilization of angina due to cytokine balance disorder and clinically pronounced anxiety disorder, which may be associated with age-related cognitive disorders.

## CONCLUSION

Thus, women with anxiety disorders are susceptible to frequent angionistic attacks, which are not always bought by nitrates, and the duration of treatment of these patients requires a longer correction. Patients with anxiety disorder have frequent cases of cytokine balance disorder and cases of IL-10 819 C/T polymorphism. This may be due to age-related metabolic changes, which require an individual approach to treatment for each patient and further study, which will help to reduce the mortality of this group of patients and improve the prognosis of cardiovascular disease.

### ABSTRACT

*This study uses the structural equation model in Nepali stock market, chooses investor sentiment, monetary and macroeconomic factors as latent variables, and selects a few observed variables which can explain the latent variables to study the influence on stock prices. Based on existing empirical research conclusion, influence path diagram is designed and gets its path coefficient and causal path diagram using maximum likelihood estimation. The statistical significance of the results indicated that the causal relationships of Nepal's stock market as follows can be accepted; firstly, investor sentiment, macroeconomic indicators, and monetary factors have certain influence on stock prices, the investor sentiment has a positive correlation. Secondly, the investor sentiment has the biggest impact on stock prices; when investor sentiment is more stable and optimistic, stock prices will relatively be better. This research also provides a certain reference for investors to make rational investment decisions.*

**KEYWORDS:** *Structural Equation, Stock Prices, Investor Sentiment*

### INTRODUCTION

The pricing implication of common stocks has drawn considerable attention since the publication of seminal work of Markowitz (1952) - the mean-variance portfolio theory. Since then there is an ongoing debate on whether the market risk factors explain better or there are some other anomalies influencing common stock prices. There are many studies about the affecting factors on the stock prices. Some studies showed that there is in fact a relationship between stock prices and certain macroeconomic indicators, those studies were mostly conducted in developed economies.

The price volatility of the stock is the foundation of the stock market. Officer (1973) correlated the changes in stock prices to the volatility of macroeconomic variables. Fama and Schwert (1977), Fama (1981), and many others, documented a strong positive correlation between common stock returns and real economic variables like capital expenditures, industrial production, real GNP, money supply, lagged inflation and interest rates and found a negative relationship between stock prices and inflation in the US Market. But, what about less developed economies? Some studies showed no relationship between the economies and the financial markets of less developed countries like Asian markets. Fung and Lie (1990) explained that macroeconomic factors can't be reliable indicators for price movements in the Asian markets because of the inability of stock markets to fully capture information about the change in macroeconomic fundamentals. Similarly, many others attempted to relate changes in stock prices and economic variables, including Fama (1981), Thorbecke (1997), Maghayreh (2003), Kandir (2008), and Alagidede and Panagiotidis (2010).

The studies on the effects of investor sentiment reveal that many general investors are puzzled about the stock prices in the market. The investor's main dilemma is whether or not to invest in the particular asset/assets, so that they can get better sustainable and fair return of their investment with bearing minimum/zero risk. Mackay (1841) assembled a book of readings about Tulip-mania and some equally famous market "bubbles" which had a self-explanatory title: Extraordinary Popular Delusions and the Madness of Crowds. In contrast to Mackey's astonishing stories, Bachelier (1900) set a forth formal model in which security prices were random outcomes that had probabilities attached to them. Baker(2006) analyzed the impact of investor's sentiment on stock price mechanism in theory. He used the measure indexes of investor sentiment by selecting six principal components including; turnover rate, closed-end fund discount rate, IPO quantity, the yield of the first day, bonuses premium rate, and equity distribution ratio and built composite investor sentiment indexes to measure the mood. The study found the statistical significance of the construct variable mood and its strong influence on individual stocks. Zhang and Wang (2013) applied EGARCH model for the empirical analysis on their study and found that investor sentiment index could explain better on stock returns.

The relevance of the studies conducted in developed and big capital markets is yet to be seen in the context of smaller, developing and under-developed capital markets. Nepal has guided towards a change in the financial architecture of the economy since the adoption of economic liberalization policy in the beginning of 1980s. In the contemporary scenario, the activities in the financial markets and their relationships with the real sector have assumed significant importance. Correspondingly, researches are also being conducted to understand the current working of the economic and the financial system in the new scenario of Nepal. A study of the effect of dividends on common stock prices in Nepalese context (Pradhan, 2003) showed the strong dividend effect, and a very weak retained earning effect, indicating attractiveness of dividend among Nepalese investors. Basnet (2007) reported that market price per share (MPS) is well explained by dividend and returns in Nepalese stock market. Baskota (2007) found that there is no persistence of volatility in Nepalese stock market and the stock price movements are not explained by the macroeconomic variables. Bhattarai and Joshi (2009) documented both short-run and long-run interdependence among stock index and some macroeconomic variables.

The review of early research papers reveal that there are several factors in determining stock prices. Based on the literature, this study constructs three latent variables namely; investor sentiment, monetary factors and macroeconomic indexes that affect stock prices. The important observed variables which can measure the latent variables, as suggested by the literature, are included in the model to make the structural equation model. The explained variable is the Nepse/Market index (MI) which is the proxy of stock prices. Then, it uses structural equation model to analyze the affecting factors on stock prices. This study on Nepali stock market from the perspective of macroeconomic and investors' sentiment has very important theoretical and practical significance. From theoretical perspective it has importance on deepening our understanding of the field and from practical perspective it can improve the performance of our investment with the rational allocation of resources.

### **Theoretical Analyses and the Variables Selection**

#### **THEORY ANALYSIS**

The economists Wright first put forward the concept of "path analysis" in 1921. Karl Joreskog, the Swedish statistician and psychologist, put forward the Structural Equation Model (SEM for short) in 1973 (Hendry, 1986). Since then, path analysis was gradually shifted to LISREL, AMOS and SEM software, which is called the path analysis oriented in the SEM.

Structural equation modeling (SEM) is a statistical methodology that takes a confirmatory (i.e., hypothesis-testing) approach for simultaneous estimation of a structural theory bearing on some phenomenon. Typically, this theory represents causal processes that generate observations on multiple variables (Bentler, 1988). It's aim is mostly to confirm a research study design and is expressed by the casual model or path graph. In this model, the estimators are biased and inconsistent and estimated coefficients become meaningless if feedback is not considered. Formulation of SEM requires specification of equations in the model based on theory and it doesn't guarantee rightly estimated coefficients.

The analysis on the SEM begins with model identification first. The model is said to be identified if it meets the conditions for identification: Order and Rank conditions. For, order condition, if  $g$  = no. of endogenous variables in system &  $m$  = no. of variables (endogenous & exogenous) missing from equation under review then,  $m = g - 1$  (exactly identified);  $m > g - 1$  (overidentified);  $m < g - 1$  (not identified). For rank condition, If rank of the coefficient matrix of all variables excluded from a particular equation (excluding coefficients of concerned equation) is  $g-1$ , then identified. Order condition is necessary but not sufficient, whereas rank is sufficient. If model is identified or over identified then model is identified.

Simultaneous estimation method i.e. maximum likelihood estimation is used for the analysis of this recursive structural regression (SR) model. The impact levels of affecting factors, as well as correlations among latent factors and stock prices are presented and analyzed by using structural equation modeling.

#### **DESIGN VARIABLES**

The influence of selected factors on stock prices is analyzed using structural equation model where stock prices represented by market index (MI) is the endogenous variable, and investor sentiment, monetary factors and macroeconomic indexes are the exogenous variables. Market/NEPSE Index (MI) is a market value weighted index composed of the shares of listed

companies from different sectors in the Nepalese stock exchange. It gives the investor a general idea about the direction and performance of the market. While measuring the impact of macroeconomic and other affecting variables on stock prices, Market Index was used as the proxy of stock prices in several prior studies like; Mukherjee and Naka (1995), Osamwoyi and Osagie (2012), among others.

The selected observed variables that can explain the latent variables are; Market capitalization (MC), Volume (V), Narrow money supply (M1), Broad money supply (M2), Gross domestic product (GDP), Inflation (INF) and Interest rate (IR). Market capitalization (MC) reflects the changes of total price of the listed securities in a time, if MC rises stable then investor sentiment is optimistic. Volume (V) is the sum amount of transactions happens in a particular period. It represents the market liquidity, it reflects the investor's participation, if investor sentiment is optimistic, volume will be large.

GDP is used as a proxy of real aggregate economic activity in an economy. In this study nominal GDP has been considered for analysis. Higher GDP represents economic prosperity of the country and stock returns are expected to influence positively. Inflation (INF) has puzzle relationship with stock returns. As the worth of rupees gets reduced due to high inflation, it is expected that the stock prices would be high in the time of Inflation ( Ibrahim & Aziz, 2003). But, higher inflation reflects higher discount rate leading to the lower value of equities. The interest rate (IR) is another important economic factor affecting the value of common stocks. The reduction in interest rates reduces the cost of borrowing and thus serves as an incentive for expansion. This will have a positive effect on future expected returns for the firm, so as stock prices. The IR used in this study is the weighted average 91 days T-bills rate, annualized % as of yearend. Narrow money supply (M1) consists of currency held by public (C) and demand deposits (DD) held at the banking sectors. Symbolically,  $M1 = C + DD$ . Broad money supply (M2) consists of narrow money supply and time deposit (TD) held at commercial banks. Symbolically,  $M2 = M1 + TD$ . Both the monetary factors reflect the liquidity status in the market and hence expected to have positive relationship with stock prices as well as investor sentiment. To smoothen the data natural logarithms has been taken for the variables; MC, V, GDP, M1, and M2. The specific variable design is as given in the table 1.

**TABLE 1. VARIABLE DESIGNING**

<b>Variables</b>		<b>Observed Variables</b>
<b><i>Latent Variables</i></b>		
Investor Sentiment (Inv.Senti.)		Market Capitalization (MC), Volume (V)
Monetary Factors (MF)		Narrow Money Supply (M1), Broad Money Supply (M2)
Macroeconomic Indicators (MEI)		GDP, Inflation (INF), Interest Rate (IR)
<b><i>Endogenous variables</i></b>		
Stock Market Prices		Market Index (MI)

Upon completion of indicator design based on the theory and former research conclusion, this study uses AMOS17.0 software to construct the initial structural equation that shows a path model as given in fig. 1

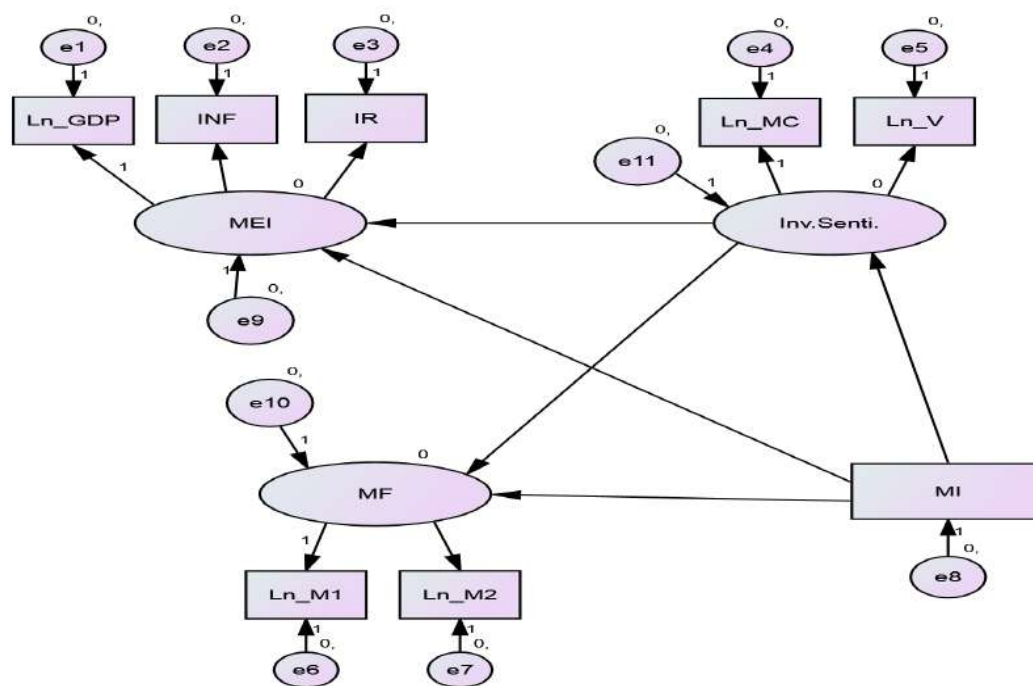

Fig. 1 Preliminary Design of SEM Path Diagram

Where,  $e_i$  are residuals of all observed and unobserved variables.

### Parameter Estimation and Analyses

#### MODEL CONSTRUCT

This study uses macroeconomic, monetary and stock data for the period of 1994 to 2016 covering 23 years to study the influence factors of stock prices. The secondary data were retrieved from various sources like; Government of Nepal-Ministry of finance (MoF), Nepal Rastra Bank (NRB) and Nepal Stock Exchange Ltd. (NEPSE), then uses Amos17.0 software to carry on the fitting test.

Latent variables are scaled and errors, like latent variables, are also scaled for identification. For this, we assign loading for direct effect on any one of its indicators to 1 that is known as reference variable as GDP for factor MEI. Disturbances ( $e$ ) in structural regression (SR) are assigned a scale equal to 1. Total no of parameters that can be estimated is limited by number of observations. With 'P' observed variables, no. of observations equal  $P(P+1)/2$ , for our model that has 7 observed variables, have 28  $[7(7+1)/2]$  no. of observations.  $Dfm = p - q$  is termed as the model's degree of freedom. Our model contains 56 parameters, 28 free parameters, 44 sample moments leading to 16 degrees of freedom (Dfm). When the model box is (OK: Default model), it means that it can display parameter estimates, and that there is no problem in theory model defining. With that standard, the model is fitted and the result is as follows:

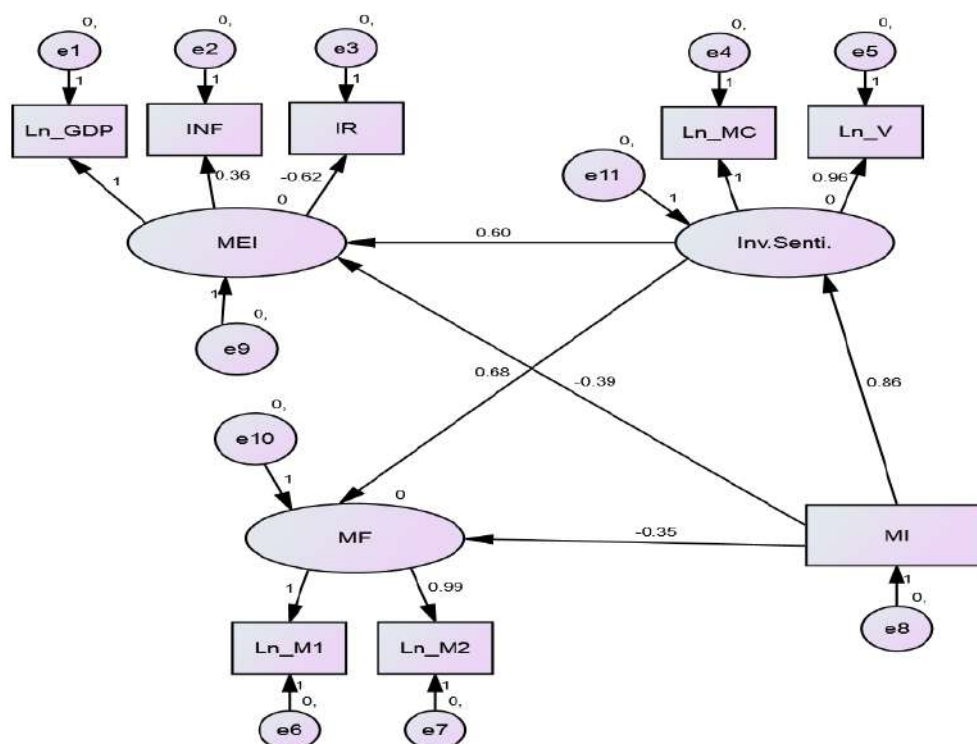

Fig. 2 Standardized Path Diagram and Path Coefficients (ML Estimation)

## MODEL FIT

The aim here is to determine the degree to which sample variance data fit the SEM; commonly used criteria are: Chi-square ( $\chi^2$ ), the goodness-of-fit index (GFI), comparative fit index (CFI) and the root-mean-square residual (RMR). Asberg, Bowers, Renk and McKinney (2008, p. 491) suggest that the model is satisfactory with comparative fit index (CFI) greater than or equal to .90, the parsimonious fit index (PFI) greater than or equal to .60, and the squared error of approximation (RMSEA) less than or equal to .10. Schreiber et al. (2006, p.330) indicate a full set of criteria for an accepted SEM, which is mentioned in the following table:

TABLE 2. CRITERIA FOR AN ACCEPTED SEM

Indexes	Shorthand	General rule for acceptable fit
<b>Absolute/predictive fit</b>		
Chi-Square	$\chi^2$	Ratio of $\chi^2$ to df $\leq 2$ or 3
Akaike information criterion	AIC	Smaller the better
Browne-Cudeck criterion	BCC	Smaller the better
Bayes information criterion	BIC	Smaller the better
Consistent AIC	CAIC	Smaller the better
Expected cross-validation index	ECVI	Smaller the better
<b>Comparative fit</b>		
Normed fit index	NFI	$\geq 0.95$ for acceptance
Incremental fit index	IFI	$\geq 0.95$ for acceptance

Tucker-Lewis index	TLI	$\geq 0.95$ for acceptance
Comparative fit index	CFI	$\geq 0.95$ for acceptance
Relative noncentrality fit index	RNI	$\geq 0.95$ similar to CFI
<b>Parsimonious fit</b>		
Parsimony-adjusted NFI	PNFI	Very sensitive to model size
Parsimony-adjusted CFI	PCFI	Sensitive to model size
Parsimony-adjusted GFI	PGFI	Closer to 1 the better
<b>Other</b>		
Goodness-of-fit index Adjusted GFI	GFI/AGFI	$\geq 0.95$
Root mean square residual	RMR	Smaller, the better
Standardized residual	SRMR	$\leq 0.08$
Weighted root mean residual	WRMR	$< 0.90$
Root mean square error of approximation	RMSEA	$< 0.06$ to $0.08$ or below ( $0.1$ )

The criteria for an accepted SEM, presented in the Table 2, are used to assess the model fit for used data.

Table 3 illustrates the test statistics estimated for whole model to identify the fit measures.

TABLE 3. MODEL FIT SUMMARY

CMIN					
Model	NPAR	CMIN	DF	P	CMIN/DF
Default model	28	27.157	16	.040	1.697
Saturated model	44	.000	0		
Independence model	8	427.609	36	.000	11.878
Baseline Comparisons					
Model	NFI Delta1	RFI rho1	IFI Delta2	TLI rho2	CFI
Default model	.936	.857	.973	.936	.972
Saturated model	1.000		1.000		1.000
Independence model	.000	.000	.000	.000	.000
NCP					
Model	NCP	LO 90	HI 90		
Default model	11.157	.527	29.628		
Saturated model	.000	.000	.000		
Independence model	391.609	328.710	461.957		
RMSEA					
Model	RMSEA	LO 90	HI 90	PCLOSE	
Default model	.174	.038	.284	.058	
Independence model	.688	.630	.747	.000	
AIC					
Model	AIC	BCC	BIC	CAIC	
Default model	83.157	119.157			
Saturated model	88.000	144.571			

Independence model	443.609	453.894		
ECVI				
<b>Model</b>	<b>ECVI</b>	<b>LO 90</b>	<b>HI 90</b>	<b>MECVI</b>
Default model	3.616	3.153	4.419	5.181
Saturated model	3.826	3.826	3.826	6.286
Independence model	19.287	16.553	22.346	19.735

Among many fit measures, it is worth pointing out that the interpretation of many (but not all) fit measures depends on CMIN having a chi square ( $\chi^2$ ) distribution for correctly specified models. Many fit measures depend on the ratio CMIN/DF, which should be close to 1 ( $\leq 2$ ) for a correct model. In maximum likelihood estimation, calculating the likelihood ratio  $\chi^2$  statistic requires fitting the saturated model. Whether or not Amos fits the saturated model is the evidence for the correct specification of the model.

The structural model fit is very good with chi square ( $\chi^2$ ) distribution; CMIN/df = 1.697, and p-value = 0.04; IFI (Incremental Index of Fit) = 0.973; CFI (Comparative Fit Index) = 0.972; Noncentrality parameter (NCP) estimate is framed within the bounds of confidence interval as suggested by Steiger (1990). Our hypothesized model yielded a noncentrality parameter of 11.157. This value represents the  $\chi^2$  value minus its Dfm (27.157-16). The confidence interval indicates that we can be 90% confident that the population value of noncentrality parameter ( $\lambda$ ) lies between 0.527 to 29.628. However,

RMSEA (Root Mean Square Error of Approximation) = 0.174 PCLOSE(0.058) indicate the model doesn't fit very well as the value below 0.10 is preferred. This may be due to the reason of small sample size and large number of estimated parameters in the model. When sample size is small the RMSEA tends to overreject true population model (Bentler, 1999). Thus, the cutpoints for RMSEA should be interpreted with caution in this model. GFI is not reported as means are explicit model parameters. Because the published GFI/AGFI formulae ignore the residuals of the mean vector, using these GFI fit indices with means-level models is not logically appropriate.

Akaike's (1987) Information Criterion (AIC) and Bozdogan's (1987) consistent version of AIC (CAIC) both criterion address the issue of parsimony in the assessment of model fit. The Browne-Cudeck Criterion (BCC; Browne & Cudeck, 1989) and the Bayes Information Criterion (BIC) operate in the same manner as AIC and CAIC but they impose grater penalties than either AIC or CAIC for model complexity. Our results for all four of these fit indices pass the test and showed that the fit statistics for the hypothesized model are substantially smaller than they are for either the independence or the saturated models.

The Expected Cross-Validation Index (ECVI) is estimated as a means of assessing the likelihood that the model cross-validates across similar-sized samples from the same population (Browne & Cudeck, 1989). It assumes a comparison of models; the model having the smallest ECVI value exhibits the greatest potential for replication. In assessing our fit statistics, the lower ECVI value (3.616) for the hypothesized model, compared with both the independence and saturated models, represents the best fit to the data.

These indexes indicate a strong predictive validity of the model for the used data.

## MODEL TEST

The study uses the recursive model. According to the model study, we estimated the path coefficients using the method of ML and got the path diagram Fig.2. In general, the parameter estimates should exhibit the correct sign and size, and be consistent with the underlying theory. Table 4 is the test result of parameter hypothesis.

**TABLE 4. STANDARDIZED REGRESSION COEFFICIENTS AND THE STATISTICAL TEST (ML ESTIMATION)**

			Standardized Estimate	Non-Standardized Estimate	S.E.	C.R.	P
Inv. Sentiment	<---	Market Index	.857	.004	.000	7.447	***
Macroeconomy.	<---	Market Index	-.390	-.001	.000	-4.878	***
Monetary Factor	<---	Market Index	-.345	.001	.000	-4.168	***
Macroeconomy	<---	Inv.Sentiment	1.319	.600	.038	15.842	***
Monetary Factor	<---	Inv.Sentiment	1.278	.677	.047	14.452	***
Ln_GDP	<---	Macroeconomy	.995	1.000			
INF	<---	Macroeconomy	.361	1.408	.767	1.836	.066
IR	<---	Macroeconomy	-.619	-2.454	.662	-3.710	***
Ln_MC	<---	Inv.Sentiment	.986	1.000			
Ln_V	<---	Inv.Sentiment	.956	1.124	.084	13.358	***
Ln_M1	<---	Monetary Factor	.996	1.000			
Ln_M2	<---	Monetary Factor	.999	1.233	.025	49.525	***

Note. ← means the influence path of variables.

Among them, Estimate represents the estimated value of the influence coefficient, S.E. the standard error and C.R. is the Critical Ratio test statistic which represents the parameter estimate divided by its standard error, as such, it operates as a z-statistic in testing that the estimate is statistically different from zero. Based on the probability level of 0.5, the test statistic needs to be  $>\pm 1.96$  before the hypothesis can be rejected. Obviously, three latent variables; Investor sentiment, Macroeconomic indicator, Monetary factors, along with seven observed variables are all passed the test and reach the significance level. It also means that C.R.  $> 1.96$ . However, the estimate of INF to Macroeconomic indicator has passed the test at 10% level of significance.

## RESULTS AND DISCUSSION

After analysis, the causal relationships as followed can be accepted:

- 1) Investor sentiment, Macroeconomic indicator and Monetary factor have a certain influence on stock prices, and the biggest impact on stock prices is investor sentiment, it reaches 0.857, and then followed by macroeconomic indicator and monetary factors.

- 2) Investor sentiment has positive correlation with stock returns. It indicates that increase in investor confidence leads to the increase in stock prices. The result is consistent with the findings of Hua, Shiting, and Qiubai (2013). The relationships of macroeconomic indicators and the monetary factors to market index are negative. In the case of macroeconomic indicators, the literature review on observed variables Interest rate (IR) and Inflation (INF) documented the evidence of negative relationship with stock prices. The negative relation of interest rate implies that investors tend to invest less in stocks when interest rates go up causing stock price to fall (Kandir, 2008). The negative effects of inflation on stock prices is explained by three dominant hypotheses, namely, tax effect, proxy effect, and the reverse causality hypotheses, explaining the negative effects of inflation on stock returns (Fama, 1981). The justification for the negative relation of monetary factors on stock prices could be made as the increase in money supply M1 & M2 rises the level of inflation which brings higher discount rates and hence the lower value of equities. The above causes are justifiable to have the negative effects of latent variables; macroeconomic indicators and monetary factors and positive effect of investor sentiment with stock prices.
- 3) In the investor sentiment factors, the trading volume (V) has estimated coefficient 0.96 that shows a significant influence on stock prices, the higher is the volume, higher the stock prices.
- 4) The impact of macroeconomic indicators on stock prices is only after investor sentiment, it reaches -0.39. Assigning loadings 1 to GDP, the market interest has the better explaining capacity (-0.62) to stock prices. The higher the interest rate, lower is the stock prices. The monetary factor also has a certain influence on stock prices.
- 5) There also have a certain relationship between the investor sentiment, Macroeconomy and Monetary factors. While looking in un-standardized estimate, the monetary factor has positive effects on investor sentiment; the influence coefficient is 0.68. This shows that higher the money supply in the market, the higher will be the investor confident on rising stock prices. The macroeconomic indicators also have positive effects on investor sentiment; the influence coefficient is 0.60, the better the macroeconomic indices, the investor sentiment will be more optimistic.

## CONCLUSIONS

Now stock investment activity has become a new hot spot of human financial activities, and an empirical analysis of the influence factors on stock prices can provide certain reference for investors and stakeholders. This paper uses the structural equation model, chooses stock prices as explained variable, and investor sentiment, macroeconomic indicators and monetary factors as latent variables, then selects observed variables which can explain latent variables to do empirical analysis, finally finds that investor sentiment has the biggest influence on stock prices followed by macroeconomic indicators and monetary factors. Knowing the positive relationship of investor sentiment and negative relations of macro-economy and monetary factors to the stock prices, investors can make scientific decisions and invest rationally. In addition, it provides some suggestions for improving the efficiency of investment from three angles that is the investors, listed companies and securities institutions to ensure the healthy and stable development of the Nepali capital market.

## COMPARATIVE ANALYSIS OF PHRASEOLOGY IN ENGLISH AND UZBEK LANGUAGES

**Khudaynazarova Uglonoy Allamurodovna\***

\*Teacher,  
Termez State University,  
UZBEKISTAN

### ABSTRACT

*This article describes the research of using phrases in sentences, the method of translating them, the phrases with mythos components, the phrases with original and figurative meaning and others. Investigating phrases has been always important section in linguistics and the learners and students who wants to adopt the language accurately should be informed with them. Phrases are also the main part of the language, that's why most scientists always put interests in investigating them. There are no any language in the world which doesn't own the phrases. Using phrases in the sentences make the speech meaningful and colorful. And they are always interesting for the speaker and the listener.*

**KEYWORDS:** *Phraseologism, Comparative Study, Research Work, Mythos Components, Theomorphism.*

### INTRODUCTION

Today there are lots of research works connected with phraseologisms and these investigations done by the several scientist living different sides of the world. And with this we can see learning phraseologism is one of the important stages of linguistics. Most people say that the first investigator of the theory of phrases was Charles Bally, the French scientist. After deeply learning the phrases he placed a paragraph named "French stylistics". He could differ the unbelievable, figurative and original features of phrases. (1)

Ferdinand de Saussure said following words in his work "General Linguistics course": "There are some kind of ready made word units which we can use them without preparation"

## LITERATURE REVIEW

In Russian literature A.B.Kunin, L. Kuliyeva, K. Musaev, I.S. Stepanova, E.P. Artsenteva and in Uzbek linguistics Sh. Rakhmatullaev, Sh. Makhmaraimova, A. E. Mamatov made some researches which revealed the aspects of phrases which are unknown to everybody.

No matter there are plenty of research works connecting with phrases still we come across the problems which exposes the unexplored sides of them. One thing which I want to say that phraseologisms attract the learners with including the word units expressing all fields of life. And while translating them from one language into another the translator should use his poetic ability. And phrases do not always own their first original meaning and second, portable meaning.

### Main part

For example: the Uzbek phrases- Boshiga ko`tarmoq, tarvuzi qo`ltig`idan tushmoq, kosasi oqarmoq, do`ppisini osmonga otmoq, yuzi qora bo`lmoq, boshi egilmoq, o`z yog`iga qovurilmoq and etc.

1. Boshiga ko`tarmoq- raise somebody on the shoulders (especially it is used for the little children in a happy situation).

O`sha kuni u o`zini baxtli his qildi va o`g`lini boshiga ko`tardi.

That day he felt himself so happy and raised his son on his shoulder.

2. Boshiga ko`tarmoq- pamper, cosher somebody/ to do all wishes of any person, appreciate smb.

Karim turmush o`rtog`ini boshida ko`tarar edi.

Karim always did all the wishes of his wife.

The phrase “Yuzi qora bo`lmoq” has also 2 meanings.

Blackened face during painting.

U uy poydevorini bo`yayotganda yuzi qora bo`ldi.

His face got black while he was painting the foundation of the house.

Get ashamed with unpleasant situation.

Noto`g`ri xatti harakatlari tufayli uning yuzi qora bo`ldi.

He got ashamed due to the wrong line movements.

We can see some phrases owning the same meanings. They are followings: Boshi egilmoq- yuzi qora bo`lmoq

Do`ppisini osmonga otmoq- og`zi qulog`id abo`lmoq and etc.

To my mind there is even a little connection between the original and portable meaning of the phrases. This phrase can be a good example to this idea.

A black sheep- is considered both a word unit and a phrase. If we understand it as a simple word unit it means the sheep in black color, but if it comes as a phrase it means – a shame/ something which went wrong. The little connection is can be seen with the word black.

Because we know that the black color is always understood as a sadness, bad sides of the thing and also the uncomfortable situation of the person.

Ann: What is the party like?

Bill: A black sheep.

If we apply for other phrases in English and in Uzbek languages there are plenty of phrases with the word evil /devil and hell.

1. Shayton yo`ldan urmasdan.

2. Shaytonga hay bermoq.

3. Shaytonga dars beradigan.

In English linguistics:

1. The devil`s advocate- Iblis malayi

2. Lead apes in hell- Qari qiz bo`lib qolmoq. If we translate it word by word it is translated like–do`xaz maymunlarini boshqarmoq.

But sometimes the word evil-shayton is also used for pampering a little child. Such as: Ha, sen shoshmay tur, shayton qizcha.(2)

In this sentence the word shayton is used for the naughty child.

Phraseologism is also used in the works of poets and writers to intensify the meaning of the sentences and for being pleasant to the readers. And while reading their works you are always eager to know the next parts of the events. In phrases they use some literacy devices called: mubolog`a, tashbih, tazod and others.

The famous writer A.Navoiy many phrases which is here presented some of them.

1. Jahon ganjiga shoh erur ajdaho

2. Yaxshilik qilib suvga tashla; Xalq bilar, xalq bilmasa baliq bilar,  
Baliq bilmasa Holiq bilar.(3)

Geoffrey Choser also used several mythos componentated phrases in his literacy works like that:

1. He must have a long spoon that soups with the devil- Shayton bilan bog`langan bo`lsang o`zingdan o`pkala.

2. Murder will out- Kasalini yashirsang isitmasi oshkor qiladi.

The mythos componentated phrases consists of the words belonging religion: God, angel, evil, devil, hell and heaven.

In Modern Uzbek linguistics Sh. Rakhmatullaev, Berdiyev Kh , Rasulov R and Sh. Makhmaraimova investigated mythos words in their research works.

Sh. Makhmaraimova prove the different usage of the words: anqo and ka`ba and she conderes that it is not true using them in every place as we are the Moslim. To her mind the famous people who possess a religious philosophical benevolent appeareances-Omar Hayyom, Ibn Arabiy, F.Attar also used these words carefully.

---

## CONCLUSION

It can be concluded that today there are lots of types phrases which have never been applied and which have used little. And we are faced with a number of tasks, such as related to phraseology.

## LEXICO – STYLISTIC MEANS IN THE FORMATION OF PROVERBS.

**Eshmuratova Dildor Urolovna\***

\*Teacher,

Termez State University, UZBKISTAN

### ABSTRACT

*One of the essential properties of a truly individual style is its permanence. It has great powers of endurance. It is easily recognized and never loses its aesthetic value. The form into which the ideas are wrought assumes a greater significance and therefore arrests our attention. The language of a truly individual style becomes de-automated. It may be said that the form, i.e. the language means themselves, generates meaning. This will be shown later when we come to analyzed the nature and functions of stylistic devices.*

**KEYWORDS:** Repetitions, Juxtaposition, Rhymed Assonance, Alliteration, Assonance.

### INTRODUCTION

*The main lexical depictive means as repetitions and comparisons.*

#### Repetitions

Repetitions fulfill the function intensification repeating. Lexemes don't usually stand side by side. There are different kinds of repetitions.

1) Repetition of the lexeme, standing at the first place. There can be repeated both principle and subordinate lexemes.

*First come, first served.*

(Kim oldin kelsa, hizmat birinchi.)

*Handsome is as handsome does.*

(Kim yahshi ishlasa, o'sha yahshi hisoblanadi.)

*Love me, love my dog.*

(Meni sevsang, meni narsalarimni ham sev.)

*Such carpenters, such chips.*

(Ko'z qo'rqq, qo'l botir.)

**Proverbs with circular repetition are to be found rarely.**

To obready reminded by us proverbs like begins like you like cures diamond.

(Hattoki toshdan ayb topar.)

2) Recurrence of the lexeme standing at the second place:

He laughs best, who laughs last.

*Let bygones, be bygones.*

(Nima bo'lgan bo'lsa kechiriladi.)

One mans meat is another mans poison.

3) Repetition of the lexeme standing at the third place. In this sort of repetition also subordinate lexemes recur.

**It is rarely to be met he that serve god, for money, will serve the devil for better wages.**

(Kim ko'p to'lasa o'shanga hizmat qilishar.)

*What is sauce for the goose is sauce for the gender.*

(Banda bor joyda hammasi teng..)

It is possible, then repetition of analytical form.

He that will steal an egg, will steal an ox.

4. Repetition of the lexeme, standing at the 4<sup>th</sup> place. This kind of repetitions is very rare:

*If two man ride on a horse, one must ride behind.*

(Ikkitadan bittasi orqada qolar.)

5. Repetition of two lexemes. Besides repetitions of lexemes in the midst of proverbs, the repetition of 2 and 3 lexemes are also to be found. This sort of recurrence is also very rare:

*So many men, so many minds .*

(Har bir kallada har hil fikr.)

The repetition of two first subordinate lexemes: Out of sight, out of the mind. In the proverb in a penny, in for a pound. There subordinate lexemes are repeated.

6. Iterative repetition. This kind of repetition is very rare and has a joking character. Such kind of repetition is to be found, e.g. in the proverb

Don't trouble until trouble troubles you.

(Aytmasang qimiydi.)

Joking character of the proverb is intensified by an unusual kind of repetition, by the recurrence of lexemes standing side by side.

**Juxtaposition**

**Juxtaposition may be divided into two group.**

1) Antonymous comparison i.e. comparison of lexemes which are antonymous out of this proverb.

*A black hen lays a white egg.*

Oqni qora deb bo'lmas, qorani oq deb bo'lmas.

*God sends meat and the devil sends cooks.*

*A good horse cannot be of a bad colour.*

Yahshi otga bir qamchi, yomon otga ming qamchi.

*He that spares the bad injures the good.*

Yomonlikni unitib, yahshilikni bil.

*Antonymous juxtaposition is widely applicable in comparative proverbs.*

A living dog is better than a dead lion.

Uzoqdagi quyruqdan, yaqindagi yog' yahshi.

*Better reign in hell than serve in heaven.*

In the last proverb antonymous combination of lexemes are used reign in hell and serve in heaven. The combination of recurrence with antonymous juxtaposition is possible in proverbs.

*He that never climbed never fell.*

Yiqilgan kurashga to'ymas.

2) Confrontation of combinations of lexemes that are not antonymous out of this proverb.

A bird in the hand worth two in the bush.

What is got, over the devils back is spent under his belly a man others.

**Euphonious means**

Euphonious means, to which ascribed rhymed consonance, alliteration and assonance are the most significant expressive means promoting stability and sassiness to be memorized and crampedly in interacting with their meanings. Rhyme, assonance of ending, shows paramount magnitude of musical sensitivity of people, its instinctive aspiration for completeness and beautifulness of the sound. The rhyme gives the final form to the proverb, completes the building, makes the proverb (certainly, relatively) immobile and alongside with this easy to remember.

**Rhymed assonance**

Rhymed assonances are widespread in English proverbs. Different types of rhymes are met in proverbs.

**Complete male rhyme**

In complete male rhyme the repetition is created by lexeme in coincidence of the vowel of rhyming lexeme with all the going after it sound. This type of rhyme prevails in English rhymes proverbs. The following proverbs can serve as examples:

A little pot is soon hot.

A straw shows which way the wind blows as you sow, you shall now.

Velvet paws hide sharp claws.

O'zi yuvosh bo'lsa ham, o'ziga puhta.

When the cat's away, the mice will play.

Exact a identical male rhyme. This type of rhyme differs from the one by that consonants, vowel all the other sounds coincide. In English rhymed proverbs repeating sounds are the parts of the complex of another lexeme, e.g.

There's many a slip twixt the cup and the lip words cut more than swords.

**Mixed rhyme**

Such rhymes in proverbs are very rare. When Adam delved a Eve span who was then a gentleman? Sound repetition is composed by lexeme.

**Complete female lexeme**

Female rhyme in proverbs is to be found less seldom than male one, but some examples may be met. In complete female rhyme one stressed syllable and one unstressed syllable recur in coincidence of vowel of the stressed syllable and all the going after this sounds. e.g.

Birds of a feather flock together he that mischief hatches, mischief hatches, mischief catches – Burovga chog' qazisang o'zing tushasan.

**In complete female rhyme**

This kind of rhyme is to be found very seldom. As an example may serve the proverb still waters have deep bottoms. Besides stated rhymes are to be met in proverbs compound rhyme, i.e. rhyming of one lexemes.

Too much of one thing is good for nothing.

Har sohadan bir shingil.

Tall to logical rhyme – the proof of the pudding is in eating .

**Alliteration.**

One can come across different types of alliteration in English proverbs.

Repetition of two sounds. This type of alliteration is the most widespread. In compositional approach it is possible to distinguish the following subtypes:

1) The repetition of a consonant in first and the last words.

Look before you leap barking dogs seldom bite let sleeping dogs lie stolen kisses are sweet.

2) Repetition of the consonant in the second and the last words.

A beggar's purse is bottomless.

Ochni to'ydirib bo'lmas.

A cat may look at a king. Every bullet has its billet.

Пуля виновного найдёт.

Every dog has his day.

Har narsaning vaqti soati bor.

One swallow doesn't make a summer.

3) Alongside with the two distinguished subtypes there exist some alliterated proverbs in which 2 or 3 consonants in different lexemes recur:

A creaking door hangs long in its hinges dumb dogs are dangerous –

Бойся молчащей собаки.

Saint heart never won fair lady.

Mag'urning biri ikki bo'lmas.

It is a long lane that has no turning.

Repetition of two sounds.

The repetition of two sounds is very rare in proverbs, e.g. plenty is no plague.

Combination of alliteration with rhyme.

Beauty lies in lovers eyes.

Не по – хорошему мил, а по – милу хорош.

A stitch in time saves nine.

Один стежок, сделанный вовремя, стоит девяти.

Many a little makes a mickle.

Toma-toma ko'l bo'lur.

### Assonance

Assonance, i.e. the recurrence of vowels is very rare in English proverbs.

Little pitchers have long ears.

Small rain lays great dust.

The nearer the bone the sweeter the flesh.

Supra qoqdi shirin bo'lur.

Combination of alliteration with assonance.

All roads lead to Rome.

Все дороги ведут в Рим.

Death pays all debts.

O'lganda hamma sedan kechar.

Time and tide wait for no man.

Vaqt kutib turmaydi.

### **Lexical – Euphonious means of formation of proverbs.**

In formation of proverbs lexical a euphonious expressive means may interact. To them attributed repetition with alliteration, repetition with rhyme and juxtaposition of antonymous, and rhyme.

Repetitions with alliterations is typical of extremely laconic elliptical proverbs like: in a for penny, in for a pound.

Other examples are – like prist, like people: no Gross, crown; no song, no supper.

Ishlamagan tishlamaydi.

In long proverbs the repetition with alliteration are to met less. e.g. take care of pence and the pounds will take care of themselves.

As to combination of repetitions with rhyme, they are met both in extremely laconic proverbs like:

Fast bind, fast find; no pains, no gains;

A penny saved is a penny gained, a in long proverbs, e.g. in time of adversity not one among twenty – Qatoringda noring bo'lsa yoking erda qolmaydi.

Money spent on the brain is never spent.

Kerakli narsaga sarflangan pul zoe ketmas.

In some proverbs we can see the combination of juxtaposition of antonymous with rhymes, e.g.:

A light purse is a heavy curse.

Do'sti yoqni puli yoq.

Little strokes fell great oaks-

Kichkina.demang bizni ko'tarib uramiz sizni

Proverbs with comparison of not antonymous a combination of lexemes may also be rhymes:

East or west, home is best.

O'z uying,o'lan to'y.

Better the food slip than the tongue trip.

Лучше оступится, чем оговориться.

Although among widespread English proverbs there are some long proverbs like; a bird in the hand is worth two in the bush , he should have a long spoon that sups with the devil.

And others, but majority of proverbs are short, laconic utterances. As above stated examples have shown ellipse prevail among proverbs more than in other types of idiomatic expressions. Long proverbs, i.e. proverbs consisting more than ten lexemes, tend to become obsolete. The majority of long proverbs registered in Oxford dictionary of proverbs are obsolete. Long proverbs are often ousted by shorter proverbs both close in image and possessing totally another imagery. So, the long proverb measure thy cloth ten times, thou canst cut it but once is ousted by the close in image measure twice a cut once -

Семь раз отмерь, один раз отрежь.

The proverb – he that hath had to one of his family hanged may not say to his neighbor “Hang up this fish – is ousted by the proverb twice as short a totally another by image: people who live in glass houses should not throw stones”

The long proverb can not save even the rhyme. It is quite fair in attitude to long proverbs with archaic elements. e.g.

He that winketh with one eye, a looketh with the other. I will not trust him though he were my brother –

Observed by us expressive means promote more brightness of English proverbs (these clots of peoples wisdom) which are organic part of phraseological structure of the English language. Types of phraseological meaning integral communicative meaning. It is typical of entirely reconsidered proverbs with constant dependence of components. Comparative meaning of completely reconsidered proverbs with consonant dependence of components (like blood is thicker than water) are the varieties of integral communicative importance.

2) Separating- integral communicative meaning. It is characteristic for proverbs with consonant –variant dependence of components. Varieties of this importance are:

1. Comparative meaning of proverbs with consonant variant dependence of components words cut or hurt more than swords.

2. Partially figurative meaning of proverbs. This meaning is composed by the combination of literal meaning of components with metaphorical meaning of one or two of them like faults are thick when love is thin and other.

As a conclusion, Stylistics, sometimes called lingo-stylistics, is a branch of general linguistics, it has been more or less definitely outlined. It deals mainly with two independent tasks:

a) The investigation of the inventory of special language media which by their ontological features secure the desirable effect of the utterance.

b) Certain types of text (discourse) which due to the choice branch and arrangement of language means are distinguished by the pragmatic aspect of the communication. The two objective of stylistics are clearly discernable as separate fields of investigation.

UZBEKISTAN

### ABSTRACT

*This article shows how to form an ecological culture in the minds of students studying in higher education in extracurricular activities in biology. The teacher explains in detail about the flora and fauna, which are currently in danger of extinction. We must not forget that students should be informed about the "Red Book" of Uzbekistan, about the state protection of plants and animals included in it. It is important to explain to students how harmful environmental pollution is to humans. The most important thing for professors and teachers of higher education is to understand the education system as an educator, to learn the basics of biology, its specific forms, methods and techniques to guide the educational activities of students. Some vertebrates live in secret. Most of them live at night. Field inspections from zoology require the practitioner to be observant, alert, unfamiliar with sound and agility in movement.*

**KEYWORDS:** *Discuss The Information, Methodological, Popular Science, Literature, and Research.*

### INTRODUCTION

Orientation of students to the formation of ecological culture through the transfer of theoretical knowledge, independent thinking in biology classes requires great skill from the professor. In the

process of extracurricular activities, it is important for students to independently strengthen their environmental knowledge and apply it in practice. To do this, the teacher should properly organize the work of students with environmental literature, the collection of various Internet data, recommend and collect scientific and artistic literature on ecology in order to encourage them to read outside the classroom. It is advisable to study and discuss the information together with the group.

To do this, it is important to pay attention to the basic concepts and principles of environmental education, to determine the level of formation of their environmental culture, to develop thinking skills, talent development mechanisms, a set of scientific and methodological, popular science literature, to conduct research.

### **Main part**

Field practice in biology in the formation of ecological culture in students is a key component of the training of highly qualified teachers. The main purpose of the field practice is to strengthen and apply in practice the theoretical knowledge acquired by students in lectures and laboratory classes on biology. During the internship, students learn about different species of flora and fauna in the wild and make observations on them. Under the guidance of a teacher, practitioners will gain skills in collecting animals and plants, the rules of their storage, identification of species, collection.

Field practice in zoology and botany is a key component of training highly qualified biology teachers. During the internship, students learn about different species of animals and plants in the wild and make observations on them. Students will be able to collect and store animals and plants under the guidance of a professor attached to them, to identify their species, to prepare collections, to know the habitat of the collected plants and animals, their impact on the environment and qualify.

In addition, students learned how to conduct research on plants and animals in the field practice, working with scientific literature. During the internship, students are given independent work by teachers, and students prepare abstracts and reports on independent work. At the end of the internship, students prepare a collection of plants and animals and submit a written report on them. Final conferences on field practice will be organized and reports will be discussed. The collected materials are used in course and diploma works.

Field practice is carried out on the habitat of plants and animals, ie biotopes. During the operation, attention is paid to the topography, soil, flora and fauna of the study area. Areas of collected plants and animals, as well as pests and damage to nature are recorded in the diary. Rare species in nature are studied only on the basis of existing collections. Useful species are collected in limited quantities.

The formation of students' teaching skills in practical work requires regular independent work with them, experiments, observation in nature and on the land of the institute. This practical work helps to form ecological education and culture in students. This largely depends on which method the teacher uses in the practical training.

Biology field-practices are the main school in the requirements of Mother Nature, its flora and fauna, water and air, Mother Earth. During the field trip, the teacher must explain to the students the current problems of nature protection: protection of the environment, air and drinking water

from pollution, conservation of endangered flora and fauna are the current problems of our time. These problems are related to the fact that the young generation brought up by the teacher consists of the Motherland, its love for nature, love for it and care for it like the apple of an eye. The teacher explains in detail about the flora and fauna, which are currently in danger of extinction. We must not forget that students should be informed about the "Red Book" of Uzbekistan, about the state protection of plants and animals included in it. It is important to explain to students how harmful environmental pollution is to humans. If the pollution of air, water and soil causes various diseases in humans, the future teacher will not be indifferent to the protection of Mother Nature and will follow this in his future teaching activities. She instills love for her future students, Mother Earth, and educates her as a true conservationist.

Students of the second stage of Navoi State Pedagogical Institute will complete 4 semesters and carry out field practice in the process of studying the local flora and fauna in the Sarmishsay gorge. The practice includes the following steps.

1. *Introductory conversation;*
2. *Excursion to nature;*
3. *Laboratory classes;*
4. *Independent work with collected materials.*

In the introductory conversation, the specifics of the Sarmishsay fauna are analyzed, and in the laboratory, attention is paid to independent work with materials collected by students.

On the basis of the course of invertebrate zoology, students get acquainted with planaria from the class of ciliated worms, rain worm from the class of low-haired worms, neris from the class of multi-haired worms, medical zulu from the class of leeches. Representatives of the mollusk species are studied using the earthworm, which lives in the upper part of the earth. The class of crustaceans is studied with the help of shrimp, shrimp, and the class of arachnids is studied with the help of pastures, scorpions. Insect class materials are collected, collections are prepared, first to the category, and in the laboratory to the family and species. Students conduct phenological observations on some of the representatives of the insect class.

In the first days of the practice of vertebrate zoology, they get acquainted with the work of identifying species of vertebrates, which are specific to different mountainous regions, different landscapes. Species and numbers of vertebrates are relatively small, the nervous system is much improved, they are very sensitive to human approach, movement, noise, clothing color and even tobacco smoke. Usually the animals hide before the appearance of the tourist students. Some vertebrates live in secret. Most of them live at night. Field inspections from zoology require the practitioner to be observant, alert, unfamiliar with sound and agility in movement.

During the practical training, students get acquainted with the abiotic and biotic factors of each biocenosis, the composition of the plant world, methods for determining their quantity and density. The materials collected during the field practice are used as exhibits in the museum of the department, in practical classes and laboratory classes.

During the field practice, it is advisable to hold excursions in nature, evenings dedicated to the diversity of fauna and flora, their importance in nature. On the eve of the completion of the field practice, students complete the independent work under their supervision, collect the necessary

materials, write a report and pass a colloquium or test.

Field practice is one of the main factors not only in improving the knowledge of students, but also in their ecological education, that is, the formation of ecological culture in them. As a result of field practice, students develop sustainable development, environmental awareness, knowledge of global and local environmental problems, the ability to compare objects and phenomena in nature, intelligence in dealing with changes in the environment, the ability to think deeply about the environment. , patriotism, love for Mother Nature, personal responsibility, care for nature, knowledge of ecological values, aspiration to preserve ecological values, initiative in environmental protection, diligence, care for the environment, self-reliance The qualities of consciousness, responsibility and will, which define the ecological culture, such as protection, perseverance in nature protection, economy in the use of natural resources, cleanliness and cleanliness, are being developed.

Biological sciences play an important role in the formation of ecological culture of students of pedagogical higher educational institutions. The study of this subject enriches the personal experience of students, helps to gain knowledge about the events and processes occurring in animate and inanimate nature around us. Therefore, the teacher should be well acquainted with the scientific, theoretical and practical achievements of biological sciences. Good knowledge of biological sciences allows higher education teachers to properly organize the teaching of students. The most important thing for professors and teachers of higher education is to understand the education system as an educator, to learn the basics of biology, its specific forms, methods and techniques to guide the educational activities of students. At the same time, teachers should be familiar with the nature and agricultural features of their country and use them in working with students.

In biology classes, students receive theoretical knowledge, practical, teaching and skills under the guidance of a professor in accordance with the program. Explaining the topic to students in a clear way, using a variety of tools, the teacher gives the necessary insights, learns how to work with the book, to apply their knowledge in practice.

## CONCLUSION

The purpose and content of your lessons are different. However, the common goal of all of them is the general education of the student and the articulation of knowledge that is understandable to them. The teacher should organize the work of students in such a way that they understand that the ecological knowledge acquired in the classroom is connected with the previous topics, and consciously master the new topic. During the lesson, the teacher should try to create conditions for active work of students, to arouse their interest, and as a result to achieve the goal.

## PSYCHOLOGICAL FACTORS OF SOCIAL AND PERSONAL IDENTIFICATION IN ADOLESCENTS SELF-CONSCIOUSNESS

**Murodov Kamoliddin Fakhridinovich\***

\*Base Doctoral Student,  
Department of Psychology PhD,  
Samarkand State University, UZBEKISTAN

### ABSTRACT

*The article compares the theoretical views of European scholars on self-awareness, social and personal identification. Identification and self-awareness have been interpreted as psychological phenomena and have been argued to be related to several social psychological factors. The essence of the psychological interaction and influence of the phenomenon of identification and self-awareness is revealed. Scientific comments on the study of psychological and psychophysiological processes in adolescents. Suggestions and comments were made as a partial solution to the problem.*

**KEYWORDS:** Social Personality, Identification, Self-Awareness, Social Phenomenon, Psychological Factor, Experiment.

### INTRODUCTION

Nature, which is built on the interests of more human beings, created the world in which only human beings understand the world through self-awareness, thoroughly acquire secular, religious, social and political knowledge. Creates a comfortable environment for himself and has the experience of building a solid foundation for the future. However, no one denies that there are still psychological, socio-psychological negative events around the world, and there are no concrete proposals for the optimal solution to such problems. The fact that the science of psychology today has managed to cover all areas of life is certainly not new to all of us. So has the need for psychology increased in every field? This indicates that the scale of social and psychological problems in society is becoming more widespread. Including; increasing divorce rates among many young families; suicides are reported; Problems that need to be addressed, such as the emergence of conflict between organized groups and the unusual behavior that often occurs in the lives of young people, pose a huge challenge to the science of modern psychology.

---

**Main part**

The origin of the above-mentioned social psychological problems is in fact a holistic concept related to self-awareness, and self-awareness is often considered by researchers as an invisible phenomenon of a specific nature. will be left out. The phenomenon of self-awareness in the individual first developed on the basis of social identification in the early 50-60s, under the tremendous influence of an approach based on psychological knowledge. Self-awareness is often defined by the perfection of the ability to know oneself transparently. According to many theorists, this is an axiom that requires certain knowledge and skills. American psychologist George Herbert Mead says that in a child this ability is not only innate, but appears from 12 to 18 months. This ability implies a separate form of consciousness: "man develops as a coordinating system, on the basis of the history of social development, in order to realize that he is different from others."

Self-awareness, in addition to the ability to express oneself, is related to the execution processes necessary for self-management. In Western countries, in social psychology, self-awareness is often explained by theoretical psychologists Shelley Duval and Robert Wicklund, in connection with the theory of objective self-awareness.

The most important component of consciousness, one of its components, is self-awareness. Animals are incapable of comprehending the psyche built into them. By understanding the program of their lives, they do not analyze their actions and make a comparative assessment of them. Self-awareness is only the specific center of the human mind - it is the separation of a person from the outside world, the assessment of his abilities and capabilities, thoughts and feelings, actions, place in society, etc. in other words, to know oneself as a unique and united person. In Europe, however, social and personal identification is interpreted as the most important psychological factor or structure, especially in cognitive psychology. The basic view is that social knowledge in the world is formed on the basis of stereotypes, on the basis of identities, on the basis of identification, on the basis of consistent concepts, relationships that regulate social behavior. This process had long attracted the attention of European scientists.

In the works of L. Festinger and J. Turner, the process of social and personal identification is explained in a different way, in the framework of the theory of social comparison. This approach focuses on the fact that social identification is a system of knowledge and understanding that plays a regulatory role in appropriate situations. [2]

Psychologists conducting psychological, socio-psychological research in Uzbekistan M.G.Davletshin,, E.G.Goziev, N.A.Soginov, V.M.Karimova, G.B.Shoumarov, B.M.Umarov, O.B.Shamsiyev. Although a number of research papers and scientific articles by Muhammedova and others focus on socio-psychological problems in family relationships, they are the ones who bypassed the problem of identification, self-awareness or considered it as a partially objective phenomenon. [1] In fact, the problem of self-awareness in the individual is both an objective and subjective psychological, psychophysiological phenomenon, which has the property of combining the constantly evolving, improving mechanism of mind and cognition of ontogenetic nature. It is a psychological process that is constantly changing and replenishing itself under the influence of the macro and macro environment, which depends not only on the individual. When

we say a self-aware person, we can imagine many images. Including; Not all students in the school have a thorough knowledge of the subject, some are excellent, some have an intermediate or lower level of knowledge, which means that they are well-versed. It is impossible to say that the students understood themselves, and those who could not master did not understand themselves. Or we can't admit that young families living in peace are self-aware, and vice versa, not all students studying in higher education institutions have high intellectual potential, some are lazy, some are active. If we consider an inquisitive student as a self-aware student, others will remain as self-aware students, because in the eyes of others, a student who successfully passes the university tests will also be considered as a self-aware student. We accept both a Nobel Prize-winning student and a regular student as a self-aware student, so we do not pay attention to the problem of self-awareness from an analytical point of view, so we still have a clear example of a fully developed personality. In fact, each age has its own level of self-awareness, which is specific to each ontogenetic period. The basis of our ideological ideas is that the phenomenon of self-awareness in a person, the phenomenon of social and personal identification, is likely to be in a state of continuous interaction and interaction with each other. Through this phase of influence, it is possible to apply measures of psychological, socio-psychological influence on the macro environment Z. Fred's book "Fundamentals of Psychoanalysis" states that a qualified psychologist can achieve a positive result through self-expression to the patient.

There are 4 psychological factors for the coordination of self-awareness. When a person is born, first of all, the mechanism of reflection of the surrounding shapes, colors and sounds is activated. At the same time, the mechanism is a leading factor in the formation of psychological functions in the understanding of the environment, being, the content of actions and the world of people in it, from the moment of birth of the individual. The peculiarity of the self-conscious person is that he reflects himself on the map of the whole world. Of course, it is natural that such a reflection event does not occur in the short term, which is the initial process of private reflection and is not large enough to cover the general reflection phase. Muddao is that it is possible to increase the activity of the dynamics of this stage on the school social platform. The difference is that through the general reflection, the individual classifies the skills that are formed in him, that is, filters, retains the relevant for himself. This creates a psychological basis for the child to develop the most optimal, subjective psychological reaction to any natural biological, psychological influences from the environment.

In the special reflection, a narrow range of psychological features of the individual is formed, which are associated only with the elimination of biological needs. The broad differences between general and specific reflection play an important role in determining the degree of alternativeness of the self-conscious person. There are several factors that direct the process of private reflection to general reflection.

1. The factor of understanding natural knowledge
2. The factor of understanding secular knowledge
3. The factor of understanding religious knowledge
4. The factor of understanding the being, the environment, the laws of the universe and all the organisms, details, objects, actions, laws, rules and norms in it.

Only when all of the above factors are met in a person can a person find an akmiological point at his level. There may be questions; What factors affect the completeness of these factors? Of course, the primary educational environment for a person begins with the family. Family relationships, close kinship, etc. Thus, the next stage in the sequence of education begins at school, when the person paints his psychological diversity. It is noteworthy that the process of self-awareness in a child before school age can take place in an undifferentiated way. In the school environment, skills are slowly developed, that is, a psychological environment is created for this, that is, a distracted, playful student before going to school, now has time to repeat the lessons done at school. Thus, the skills of repetitive approach to their work, themselves and tasks are improved. Thus, given that the initial reticular pharmacy of self-awareness is more active in the school environment, it is at this stage that the effectiveness of practical specific approaches to personality development can be recognized. It is true that there are enough textbooks, subjects, clubs for schools for the formation of the above factors for the student. To some extent, the child can fully master the textbooks and practical exercises in school, but there is no clear platform for a specific, psychological, pedagogical approach that encourages the harmonization of knowledge and impressions and regular adjustment. In order to clarify the above considerations, the results of experimental psychological research have shown that; The role of close kinship in the child's self-awareness was marked by significant differences from the special educational processes. This means that for children of any level of education who have mastered school textbooks, there must be a programmatic project as a differentiated textbook that further regulates their general knowledge experiences.

To further clarify the problem, it is useful to dwell on each of the four main factors listed above.

- The factor of understanding natural knowledge; Natural knowledge refers to organic, inorganic chemicals, ranging from liquefied gaseous substances in solid form to solid crystalline substances, which exist in natural conditions, in the state, under the influence of natural phenomena in motion. Perhaps the student can absorb the intended knowledge in the form, but the inability to reveal the essence of the character background can directly lead to a deviation from the real understanding of the nature of these details, ie the student's creation, creation, climate and nature, adaptation, shallow knowledge of self-adaptation, structural structure, natural phenomena of inevitable nature. In order to stabilize its dynamics, or more precisely its psychodynamics, it is necessary to form an autonomous psychomosa in a separate complex.

It is known that all countries, as a result of the historical evolution of living conditions, nature, have their own religion, customs, national values. It is important to note that when it comes to religion, the student is immersed in the abyss of knowledge acquired in any other natural or concrete sciences, unless he has a realistic idea of religious concepts. More precisely, it is natural for any object to lose the other side of the event as a rope tied to real details, which may negatively affect the progressiveness of the identification mechanism in self-awareness.

The factor of understanding the being, the environment, the laws of the universe and all the organisms, details, objects, actions, laws, norms in it.

As a set of knowledge listed above, the process of perceiving not only detailed knowledge but also the movement of the universe in a limited time frame, reflecting the real background of a distant galaxy, is for the reader, even some categories of adults. In order to activate the mechanism of self-awareness in a child who has to correctly assemble each part or element of a

device in order to activate it, a complex information system has been formed, which combines the above factors should be.

From birth, the child grows up under the influence of the external social and psychological environment, begins the first steps of verbal communication with others with questions. As you grow older, the questions become more complex and larger. The problem is whether the child will find the right and adequate answer to each question in time? Naturally, no expert or bureaucrat can give a definitive answer to this question. The article focuses on the development of self-awareness skills of school-age children, as the mental instability of children of this age can be compared to a "wild animal wandering in the woods." When a wild animal is in a sanctuary, it consumes what it is given for food, is forced to do so and adapts to this environment, while in the open forest, on the contrary, it lives instinctively and aggressively. If we do not have time to answer their questions in a timely manner, if we do not use the pedagogical, psychological means of spiritual nourishment in accordance with the requirements of the modern world, and if we do not use the appropriate psychological, socio-psychological environment for them.

## CONCLUSION

Surprisingly, not all children of different categories of children are fully formed as expected by society, if we do not form and promote the means provided. Therefore, no one can guarantee that we will not be able to achieve, at least in part, the conflict between some families in the society, the violence committed by a narrow group of organized groups, and the serious problems in maintaining the moral values built into society. The conclusion is that at the present time, when the flow of information around the world is sharp, it is necessary to properly educate and direct future successors in the era of negative material, which is contrary to human perfection, because the situation requires it. It is advisable to introduce a textbook project on the subject of "self-awareness" in the next list of school textbooks.

### ABSTRACT

*The article describes the methods of acclimatization of Hungarian carp breeds imported on the basis of imports in the hot and dry ecological climate of the Zarafshan oasis. There are in the article analyzed the breeds, age, delivery time and stocking of fish of natural ponds of new aquaculture objects and the indicator of fish resistance to oxygen deficiency hypoxia.*

**KEYWORDS:** *Acclimatization, Climate, Carp, Breed, Two-Year-Old, Aquaculture, Hypoxia, Stenophage, Benthos, Pond, Hybrid, Oxygen.*

### INTRODUCTION:

One of the main tasks of the fishing industry of our country today is to fully provide the population with quality, cheap, protein rich dietary fish meat, to significantly increase the volume of commercial fish products and maximizing fish productivity per hectare of water basin. One of the important ways to solve these problems is to meet the requirements of international

and European standards in terms of productivity and exterior in these reservoirs, low productivity, unknown origin of the local breed or mixed species (hybrids) of fish species and reduction of breeds, application of intensive aquaculture technologies, as well as acclimatization in hot and dry ecological climates of the Republic by importing new, productive, new commercial carp breeds. In the last five years, the fishing industry of Uzbekistan has been based mainly on its own resources, with special emphasis on the acclimatization of new aquaculture facilities. Farmers and entrepreneurs engaged in fisheries are importing high-yielding, fast-adapting fish species and breeds from abroad, which are being specially cared for and conditioned on farms.

Acclimatization of new imported fish species and breeds is an important biotechnological process in the fishing industry. The success of acclimatization largely depends on the biotechnology of the work done. Biotechnology of acclimatization processes is developed not only on the basis of advanced technical means, but also on the basis of in-depth knowledge of the biology, ecology of imported new fish species and biological laws of water bodies inhabited by aquaculture objects. In the acclimatization of fish, we focus on the study of the ability of new carp species imported from abroad to survive in the hot and dry ecological climate of the Zarafshan oasis, to maintain their morphological and productivity characteristics, as well as to pass these traits from generation to generation.

#### **MATERIAL AND METHODS:**

The research was conducted in 2019 at the fish farms of “Golden Lake Fish” Ltd, located in the Tudakul Reservoir in Kiziltepa district, Navoiy region, and “Oq Amur” Ltd in Samarkand district, Samarkand region. During the experiment, in the hot and dry climate of the Zarafshan oasis, in the climate of imported Hungarian carp fish, the timing of their import and pond fishing, the effective use of local natural nutrients (benthos, phytoplankton, zooplankton), oxygen deficiency in pond water (hypoxia) and its ability to withstand high and low temperatures was studied. The data collected were based on statistical analysis, ichthyology, and generally accepted methods in aquaculture.

#### **RESULTS AND DISCUSSION:**

Research on the acclimatization of newly introduced fish breeds in natural ponds was carried out in two parts. It was done in 2 different ways. In the first part of the experiment, the timing of the import of new carp species was studied.

For the normalization of the process of acclimatization of imported carp to natural water bodies, it is important to know such information as the timing of their import to the country, the timing of pond fishing, feeding of new species, as well as the age of new aquaculture facilities.

In 2019, the Golden Lake Fish fishery, located in the Tudakul reservoir in Kiziltepa district, Navoiy region, received a four-year-old (4) from Hungary with an average live weight of 4-6 kg. 399 adult fish of the Hungarian carp breeds (340 females and 59 males) were brought. In the experiment, the ability of imported pedigree fish to survive and adapt to the hot and dry ecological conditions of the farm was studied. The success of the acclimatization process depends on the seasonality of the year when the ponds are fished, and this relationship has been studied experimentally. The timing of fish imports and their survival rates are given in Table 1.

**TABLE 1. TIME OF ACCLIMATIZATION OF HUNGARIAN CARP BREEDS AND SURVIVAL RATE, %**

Pond №	Time of delivery, month	Number of fish piece	Survival rate, %	Survival fish	Fish loss	At the beginning of the experiment	At the end of the experiment
№ 1	March	224	97,3	218	6	10.03	26.09
№ 2	April	175	94,2	165	11	15.04	26.09

The first batch of fish was brought in early March, 224, the second batch in early April, 175 adult male and female fish were brought and placed in natural ponds with an area of 0.7 ha and 0.5 ha. The adaptive and physiological conditions of fish were studied in the same natural, nutritional and storage conditions of aquaculture objects brought in two different periods. Fish imported in March quickly adapted to the natural pool water, with a conservation rate of 97.3% and a survival rate of 3.1% higher than that of fish imported in April. The main reason for this is that in March in the Zarafshan oasis the air and pool water temperatures are not high, which allows European carp fish breeds to adapt more quickly to our hot and dry climate. From April, the air and pool water temperatures begin to rise sharply, making it difficult for fish to adapt to natural conditions.

In order for well-adapted new species and breeds of imported fish to the natural climatic conditions of the commercial water basin, it is advisable to use adult fish, as young fish (especially fish larvae) are stenophagous, ie in the natural pond. Many do not absorb well from natural (benthos, phytoplankton, zooplankton) and artificial foods. It is advisable to pay special attention to the fact that the fish themselves adapt as a result of natural selection, because in this case the balance between the ichthyofauna in the pond is not disturbed. From the above data it is clear that in order to maintain the high viability of fish, it is necessary to take into account the seasonal conditions of the year when fishing in ponds for a successful acclimatization process.
