One of the priority areas of our state is caring for the younger generation. Programs have been developed to increase attention to the upbringing of a physically healthy, spiritually mature and harmoniously developed generation and, for this purpose, to strengthen the mechanism of practical interaction of the institution of the family with educational and upbringing institutions, to ensure their effective cooperation.

Among the children who require special attention are children with speech disorders. Speech disorders are of varying degrees of complexity. One of these complex speech disorders is dysarthria. This speech disorder requires long-term corrective work, which includes medical, psychological and pedagogical components of the assistance provided.

Arkhipova E.F., Belyakova L.I., Vinarskaya E.N., Gurovets G.V., Ippolitova M.V., Karelina I.B., Lopatina L.V., Mayevskaya S.I., Mastjukova E.M., Martynova R.I., Sobotovich E.F. Serebryakova E.H., Chernopolskaya A.F. and others.

Currently, the problem of childhood dysarthria is being intensively developed in the clinical, neurolinguistic, psychological and pedagogical directions. Dysarthria has been studied in most detail in children with cerebral palsy (M. B. Eydinova, E. N. Pravdina-Vinarskaya; K. A. Semenova; E. M. Mastjukova; I. I. Panchenko; L. A. Danilova, 1, etc.). In foreign literature, it is represented by the works of G. Bohme, 1966; M. Climent, T. E. Twitchell, 1959; R. D. Neilson, N. O. Dwer, 1984.

In preschool children with dysarthria, there are manifestations that indicate a systemic impairment of speech activity. One of the main features is a later onset of speech, speech is agrammatical and is characterized by fuzzy pronunciation, poorly understood by others. The child understands the speech of others well, but utters words completely indistinctly and inexpressively. Insufficient speech activity is observed, which drops sharply with age without special training. However, children are quite critical of their defect, they are ashamed of speech defects, do not come into contact.

The problems of dysarthria were studied from various angles: speech characteristics of children with dysarthria, motor activity, mental processes. One of the important processes is the memory process, which is essential for the development of cognitive activity.

Memory in childhood is one of the central, basic mental functions. All other functions are formed depending on the state of mnemonic processes. From the point of view of mental development: not thinking, and in particular not abstract thinking, stands at the beginning of development, but the defining moment at the beginning of development is the child's memory. With well-organized psychological and pedagogical work, junior schoolchildren master concepts, acquire the ability to reason, generalize and develop speech.

A huge contribution to the study and development of this problem was made by: P. P. Blonsky, L. M. Vekker, L. S. Vygotsky, R. M. Granovskaya, T.B. Nikitina, S. L. Rubinstein, A. N. Leontiev, L. V. Zankov and other psychologists.

The importance of the normal development of memory is very great. For full-fledged communication, it is necessary that the child's speech is correct, the ability to clearly pronounce all the sounds of the native language, construct grammatically correct sentences, and have a coherent speech. Inadequate speech activity leaves an imprint on the formation of sensory, intellectual and affective-volitional spheres in children. With a relatively preserved semantic, logical memory in children with dysarthria, verbal memory is reduced: the productivity of memorization suffers; they forget complex instructions, elements and sequence of tasks, which complicates communication and teaching of children with speech pathology. Not only the degree of development of speech depends on the level of development of the child's memory, but also the level of development of memory depends on the formation of speech. This problem was dealt with by domestic and foreign scientists in the field of pedagogy and psychology, such as: Vygotsky L.S., Zeigarnik B.V., Leontiev A.N., Lindrey P., Miller J., Rubinstein S.Ya., Norman D and others. In particular, B.V. Zeigarnik noted that defective speech activity leaves an imprint on all cognitive processes of this category of children. The connection between speech disorders and other aspects of mental development determines the specific features of memory. With a

relatively preserved semantic, logical memory in children with dysarthria, verbal memory is reduced, the productivity of memorization suffers, they forget complex instructions, a sequence of tasks.

It is extremely important to study memory processes in children with dysarthria for a more effective correction process.

With dysarthria, there are features of memory: a narrowing of its volume, a rapid fading of the resulting traces, limited retention of verbal stimuli, etc. Verbal memory is especially affected - voluntary, mediated, including memory for words, phrases, complete texts. Verbal memory is a specific human memory, in contrast to motor, figurative, emotional. With visual reinforcement, children memorize material more easily, and speech memory is more developed. Difficulties in choosing words, forgetting words, difficulties in reproducing their structure sharply limit the child's ability to freely express. It is noted:

- Decrease in active orientation in the process of recalling a storyline, a sequence of events;
- Insufficient activity of observation;

The results of a study of auditory memory in children with speech impairments demonstrate: weak retention of speech signals and the accuracy of their reproduction, high inhibition of auditory-speech traces, a low level of development of randomness and control of auditory memory, impaired recognition of words presented by ear, poor training on speech stimuli, slow orientation in the conditions of the problem, etc. (I.T. Vlasenko, G. S. Gumennaya, O. R. Danilenkova, E. M. Mastjukova, E. E. L. Figueredo, T. A. Fotekova, etc.).

EAT. Mastjukova, studying groups of children with speech impairments, notes that they have a decrease in verbal memory, while indicating the existing relationship between the severity of memory impairments and the severity of the organic syndrome. EAT. Mastjukova emphasizes the dependence of verbal memory on the degree and nature of speech underdevelopment.

In our work, our goal was to identify the features of memory processes in preschool children with pseudo-bulbar dysarthria.

Objectives: 1. To study the processes of memory in children of the fifth or sixth year of life.

2. Determine the level of performance of tasks for the diagnosis of memory in children of preschool age with pseudo-bulbar dysarthria. The control group consisted of preschoolers with normal speech development.

Twenty children took part in the study. The control group consisted of children with normal speech development (10) and the experimental group - children with pseudo-bulbar dysarthria. (ten).

The base was a special preschool educational institution No. 475 of the Chilonzar region. Tashkent city. (control group) and the Republican Psychoneurological Hospital for Children with Musculoskeletal Disorders. U.K. Kurbanova (experimental group).

In the experimental part of our work, we used the following methods to identify memory processes in preschoolers. 1) .Method "Memory for numbers».

The researcher sequentially reads to each child from top to bottom a series of numbers shown in the figure, with an interval of 1 second between numbers. After listening to each row, the child

had to repeat it after the researcher. This continues until the child makes a mistake: he cannot reproduce a sequential series of numbers. In the experimental part of our work, our goal was to identify the features of memory processes in preschool children. 2) .Method "Memory for words"

Material: two rows of words written on separate cards.

1. Airplane, lamp, apple, pencil, thunderstorm, duck, bag, table, parrot, leaf.

2. Pictures depicting objects: airplane, kettle, butterfly, log, candle, dog, table, mushroom, boots, car.

3). "Remember the pictures" technique.

This technique is designed to determine the volume of short-term memory. Children receive the pictures below as incentives. They are given the following instruction:

"There are nine different figures in this painting. Try to remember them and then recognize them in another picture, which I will now show you. On it, in addition to the nine previously shown images, there are six more such that you have not yet seen. Try to recognize and show in the second picture only those images that you saw in the first of the pictures. "

The exposure time of the stimulus picture is 30 sec. After that, this picture is removed from the child's field of vision and instead of it he is shown a second picture. The experiment continues until the child recognizes all the images, but no longer than 1.5 min.

4). "Learn words" technique

With the help of this technique, the dynamics of the learning process is determined. The child receives a task: for several attempts to memorize and accurately reproduce a series of 12 words: tree, doll, fork, flower, phone, glass, bird, coat, light bulb, picture, person, book.

Memorizing a row is done as follows: After each next listening to words, the child tries to reproduce the entire row. The experimenter notes the number of words that the child remembered and named correctly during this attempt, and I read the same row again. And so six times in a row, until the results of reproducing a series of words in six attempts are obtained.

5). Method "Memory for images"

Purpose: examination of figurative memory.

Instruction: You will be provided with a table with pictures. Your task is to make 20 seconds. memorize as many images as possible. After 20 sec. I will remove the table, and you will have to verbally express those images that you remember.

6). "Toys" method. Instruction: Look at the toys on the shelves, remember their neighbors to the right and left. First look at the toys on the bottom shelf, then on the middle, and only then on the top.

Then place the toys on the shelves of this cabinet as they stood when you examined them.

The results of the experiment are presented in a summary table.

Method name		High-level	Middle level	Low-level
Memory for numbers	theex.	—	6	4

	counter.	3	7	–
Memory for words (auditory perception)	theex.	–	–	10
	counter.	2	7	1
Memory for words (visual perception)	theex.	–	3	7
	counter.	4	6	–
Memorizethe drawings	theex.	–	10	–
	counter.	3	7	–
Learn the words	theex.	–	–	10
	counter.	1	9	–
Memory for images	theex.	–	6	4
	counter.	2	8	–
Toys	theex.	–	5	5
	counter.	2	6	2

Analyzing the results of the study of memory development, we came to the following conclusion: children with dysarthria have impaired auditory and verbal memory in comparison with the memory of children without speech impairments. There were no significant differences in the level of development of visual memory during the experiment.

The connection between speech disorders and other aspects of mental development determines the specific features of thinking. Having in general full-fledged prerequisites for mastering mental operations, accessible to their age, children lag behind in the development of verbal-logical thinking, without special training they hardly master analysis and synthesis, comparison and generalization.

Along with general somatic weakness, preschoolers suffering from dysarthria are characterized by some lag in the development of the motor sphere, which is characterized by poor coordination of movements, decreased speed and dexterity of performance. The greatest difficulties are revealed when performing movements according to verbal instructions.

Children lag behind normally developing peers in reproducing a motor task in terms of spatio-temporal parameters, violate the sequence of action elements, and omit its component parts. Insufficient coordination of fingers, underdevelopment of fine motor skills is noted. Slowness is detected, stuck in one position. With a relatively intact semantic, logical memory in children, verbal memory is reduced, and the productivity of memorization suffers. They forget complex instructions, elements and sequence of tasks.

ABSTRACT

This article examines the demographic trends of Uzbekistan that have formed over the past 10 years. The issues of their influence on the labor market are discussed. The questions of the structure of the population by sex and age are considered. The comparison of fertility and mortality rates by regions shows that a low birth rate and a high death rate in the city of Tashkent will soon cause tension in the labor market in terms of labor supply, if not internal migration.

KEYWORDS: *Labor Market, Demographic Situation, Population Size, Dependency Ratio, Potential Replacement Rate, Digital Economy.*

INTRODUCTION

Labor market is a set of economic, demographic and legal issues, in this connection, the analysis of the demographic situation in the country is an important part of its research.

The population of the country is both buyers of goods and services, and sellers and buyers of labor to produce goods and services. The economically active population of the country participates in the process of creating the gross national product, national income. In this regard, the study of the characteristic features and trends of demographic situation in the country, the

number and composition of the economically active population, its share in the total population of the country and other indicators is of scientific and practical interest.

The demographic situation characterizes the general trends in the demographic and reproductive behavior of the population at the national level. The leading elements in the concept of demographic trends are the reproductive behavior of the population, as a factor influencing changes in the demographic processes of the country, which determines its analysis in the study of the demographic situation.

The qualitative approach to the study allows us to determine the correspondence between the available labor resources and the needs for labor in the labor market and the impact of demographic changes on the growth of the country's economy, the development of entrepreneurship and vocational training.

RESEARCH METHODOLOGY

The methodological basis of the study was the official statistical material, legislative and regulatory documents related to the labor market in Uzbekistan. Methods of deduction and induction, observation, analysis and synthesis are used.

Analysis and results

Demographic trends in population growth rates, territorial distribution, and population structure are interrelated with socio-economic factors. The decline in the number of young people entering the labor force, the aging of the economically active population, and others inevitably affect the state's employment policy. Under the influence of the pace and nature of technological innovations, changes in production management methods within enterprises, transformation and change in the significance of the concept of "labor force, labor service", the behavior of workers in the labor market is changing.

The dynamics of the population of Uzbekistan is characterized by the following indicators (table1.)

TABLE1 DYNAMICS OF THE POPULATION OF UZBEKISTAN FOR THE PERIOD FROM 2010 TO 2020 (AT THE BEGINNING OF THE YEAR)

Name of indicators	2010 y.	2015 y.	2017 y.	2018 y.	2019 y.	2020 y.
Population (in thousands)	28001,4	31022,5	32120,4	32656,7	33255,5	33905,2
Annual growth (in thousands)	468,0	529,7	545,1	536,2	598,9	649,7
Growth rates, in % to the base period	100	110,8	114,7	116,6	118,8	121,1

At the beginning of 2020, the population of Uzbekistan was 33905.2 people. The country has a stable trend of increasing the population. The annual population growth averaged more than

579.2 thousand people. If in 2010 the population growth was 468.0 people, then in 2019 – 649.7 people. The growth rate of the population of Uzbekistan during the study period was 121.1%.

According to the definition of UN experts, the published report on the demographic situation on the planet says: "In Central Asia, there are two opposite trends: relatively stable in any scenario, Kyrgyzstan, Kazakhstan and Turkmenistan, and more dynamically growing Uzbekistan and Tajikistan".¹

The increase in the population in Uzbekistan occurs under the influence of a number of reasons: historical, socio-economic and, especially characteristic of the republic, demographic factors that are directly related to each other.

According to the UN forecast, at the turn of 2057-2058 about 50 million people will live in Uzbekistan, and by 2100 the population may reach 65 million. From the perspective of the labor market, this causes a lot of stress associated with the task of creating jobs and ensuring employment for the population.

In the course of analyzing demographic processes, we studied the structure of the population according to one or another attribute (gender, age, place of residence, etc.)

TABLE2 AGE COMPOSITION OF THE POPULATION OF UZBEKISTAN (AS A PERCENTAGE OF THE TOTAL POPULATION)²

Population	Years					
	2010	2015	2017	2018	2019	2020
Under working age	29,9	28,2	28,5	28,6	28,9	29,1
In the working age	64,3	65,2	64,3	64,0	63,3	62,7
Overworking age	5,8	6,6	7,2	7,4	7,8	8,2

More than a quarter of the population of Uzbekistan is children under 14 years of age. Although, compared to 2010, this indicator decreased from 29.9 % to 29.1 % in 2019. The share of the working-age population (from 16 to 54 years of women and up to 60 years of men, respectively) is continuously decreasing. The downward trend in the indicator is such that if in 2010 its value was 64.3%, then at the beginning of 2020 it was 62.7%. The aging of the economically active population leads to a surplus of unskilled labor over the age of 50 due to age-related inability to new functions in the context of the digitalization of the economy.

A clearly opposite trend is observed in the dynamics of population growth over the working age. The share of the population of Uzbekistan over the working age is certainly increasing. In 2010, the indicator was 5.8 % and, constantly increasing, reached 8.1 % by the beginning of 2020. This is primarily due to the increase in life expectancy in Uzbekistan.

One of the characteristics of the age composition of the population is the demographic load, which is the ratio of the population of disabled age to the population of working age.

Diagram 1

The growth of the demographic ratio directly increases financial spending on social policy in the state (construction of educational institutions, social protection, health care, pension payments, etc.)

The potential replacement rate (child load) reflects the ratio of the population below the working age to the working age population. The potential replacement rate for Uzbekistan in 2019 was 38.7%.

The reproductive behavior of the population varies by region of Uzbekistan. This is a leading element that forms changes in the demographic processes of the country, and therefore its analysis is a key point in the study of the demographic situation.

Diagram 2

Analyzing the territories by the birth rate, we can say that the highest birth rate is in Surkhandarya region (28.0), the lowest-in the city of Tashkent. The average birth rate in Uzbekistan in 2019 was 24.3.

The death rate in Uzbekistan at the beginning of 2020 was 4.6 ppm and, compared to the same period in 2019, decreased by 0.1 ppm.

Diagram 3

The mortality rate varies across the regions of Uzbekistan and ranges from 3.9 in the Jizzakh region to 6.1 in the city of Tashkent. The comparison of fertility and mortality rates by regions shows that a low birth rate and a high death rate in the city of Tashkent will soon cause tension in the labor market in terms of labor supply, if not internal migration. In the Surkhandarya region, on the contrary, there is a high birth rate and a relatively low mortality rate, which implies a surplus of labor in this region. These comparative characteristics are necessary for the development of employment programs for the regions of Uzbekistan.

The distribution of the population of the republic across the territory is uneven, and in terms of the average population density, Uzbekistan is ahead of a number of CIS countries. Due to the rapid growth of the population, its density per square kilometer of territory at the beginning of 2020 averages 71.5 people per square kilometer.³

Average life expectancy in Uzbekistan is 72.5 years, which is higher than the average life expectancy in the world, which is about 71 years (according to the Population Division of the UN Department of Economic and Social Affairs).

To study the impact of demographic trends on the labor market, it is necessary to study the indicators of population distribution by sex (Diagram 4.).

Diagram 4

Taking into account the national characteristics of Uzbekistan, it should be known that the female half of the population is mainly engaged in the reproductive function and the upbringing of children. Therefore, the development of the labor market is mainly focused on the employment of men.

The gender factor affects the change in the structure of the labor force, mainly on its active part. Currently, the position of women in the labor market is undergoing fundamental changes. The feminization of society changes the role of women in society, the value and role of the institution of the family, which is acutely manifested in the migration of women to international labor markets.

Uzbekistan systematically and consistently ensures the observance, promotion and protection of the rights of women and girls, taking into account the generally recognized principles and norms of international law, as well as the national interests, mentality and traditions of our people⁴. A separate article on equality between women and men is enshrined in the Constitution of the Republic of Uzbekistan, which provides women with equal opportunities for education, vocational training, employment and career advancement.

The Government pays great attention to strengthening the role and protection of women's rights. Laws on gender equality and protection of women from violence have been adopted, the proportion of women in parliament has increased (up to 32%), and they are being promoted to leadership positions at all levels of state and local government. In 2019, the Parliament adopted two important laws to protect women's rights: the Law «On guarantees with respect to equal rights and opportunities for women and men» and the Law «On protection of women from harassment and abuse», the purpose of which is to prevent harassment and violence in everyday life, at workplaces and in educational institutions, as well as to increase responsibility for the

commission of such acts. It is important to prevent violence against women and domestic violence, and to combat outdated customs and practices, including against minors.

Targeting by 2030 to ensure universal access to sexual and reproductive health services, including family planning and raising the age of marriage for girls under eighteen, and mainstreaming reproductive health into national policies and programs⁵.

Thus, we found that modern demographic trends are expressed in accelerated population growth, differences in the level and quality of life of the population between developed and developing countries, and an increased outflow of immigrants to developed countries. The territorial differentiation of the country in terms of the level of development of demographic processes creates the need to create models for the development of the labor market in the regions, the implementation of new approaches in management and the formation of an effective socio-economic policy for managing the factors of regional development.

SKILLS IN THE GERMAN LANGUAGE: AUDITORY SKILLS – LISTENING AND SPEAKING.

Kakhorova Zabarjad*

*Student,
Karshi State University,
UZBEKISTAN

ABSTRACT

In this article we can see to what extent the role of Language skills is in German. Listening comprehension and speaking Are an integral part of the article. Also focuses on the special role of language skills in Language learning, with the focus on the role of Language skills in German and their imparting to learners. The importance of grammar has a traditional background. Before the opening-up policy in the 1980s, oral communication with Germans was hardly necessary in China. Back then, people were more concerned with written texts. The grammar was the focus of the reaching. Poor Performance can be due to the learners if, for example they lack motivation or the correct Learning technique when learning German. In my opinion it is due to three Misjudgments.

KEYWORDS: *Language Competence, Wernicke Area, Language Reception, Envelopment Process, Differentiation, Complexity, Research Areas, Sub-Areas, Broca Area, Language Production.*

INTRODUCTION

Linguistic competence represents a complex theoretical construct. The discussion about what constitutes language competence and How this complexity is to be represented has therefore occupied Various research areas for a long time. The Language skills include “comprehension (listening and Reading), the visible and audible productive language performance (reading and writing) and knowledge (reading and writing) and knowledge in terms of vocabulary and grammar“. The Mentioned services prove the language competence of German learners. In teaching, however, it is often observed that after a year, many German learners are still hardly able to form correct sentences or fully understand a text with an everyday Topic. This lack of Language skills makes us think. Poor Performance can be due to the learners if, for example they

lack motivation or the correct Learning technique when learning German. In my opinion it is due to three Misjudgments.

RESULT AND DISCUSSION

Auditory skills – listening and speaking – listening comprehension as Receptive and oral language production as a productive Area of competence together form the auditory language Competencies and must be differentiated from the written language areas. This makes it possible to acquire communicative skills in Speaking and listening comprehension in a language without being able to read or write it, which is often the case with the non- institutional second language verb. The relationship between listening comprehension and speaking is based not least on a neurobiological Prerequisite for the neural connection between the Broca Area, which controls the oral language production and the Wernicke area, understand the word takes place. Both areas are involved in the process of Understanding spoken words. During listening comprehension, the signals are passed on from the primary auditory cortex to the Wernicke area. In principle a functioning speech reception can be seen as an indispensable basis for oral speech production. Grammar If we take a look at the time distribution of teaching, the following Makes sense: In the lessons at many universities, grammar is still the Focus, and thus the so-called grammar-oriented foreign language Teaching. The teaching materials, e.g. reading texts, serve primarily as an aid for learning grammar. Most grammatical rules are explained thoroughly, no matter how often they are used in everyday life. It is clear, however, that the placement takes a lot of time and that the correct application must be checked. The importance of grammar has a traditional background. Before the opening-up policy in the 1980s, oral communication with Germans was hardly necessary in China. Back then, people were more concerned with written texts. The grammar was the focus of the reaching. Nowadays the situation has changed, verbal Communication is part of everyday life and is used more. The problem is that the weighting of the GFL teaching has remained unchanged – the grammar is still in the foreground .ahListening and speaking are neglected in both teaching and testing. Missing training In the entire GFL teaching, the German language is primarily imparted as pure knowledge, instead of intensively trained. The learners have few opportunities to practice in class. You have to rely on the German languages.

CONCLUSION

Finally, I believe that every foreign language learned has its own rules and abilities. This is particularly reflected in the German language. The above-mentioned services demonstrate the language skills of the German learners. It is surprising that learners can barely communicate despite good knowledge of German and cannot educate the expected success. For this, the students practice more, hear a lot, read aloud and memorize texts is particularly important. Only then can the learner see the expected result. That will be all I want to write.

ABSTRACT

The paper primary measurement and modification elements, their structural principles, research algorithms and software, as well as a wide range of functional capabilities of information and measurement tools, depending on the parameters of high functionality, high sensitivity, accuracy and reliable operation of control and management systems and devices in high quality power supply special attention is paid to the creation and application.

KEYWORDS: *Single And Three Phase Currents, Control And Management, Elements, Devices.*

INTRODUCTION

Targeted measures aimed at the development and implementation of elements, devices, tools and systems of control and management of single and three-phase currents of renewable energy sources in the power supply system of the Republic are being widely implemented. The Action Strategy for the further development of the Republic of Uzbekistan for 2017-2021, including "... introduction of information and communication technologies in the economy, social sphere, management system, ... reduction of energy and resource consumption in the economy, ... expansion of energy-saving technologies in production implementation "tasks. One of the important tasks is the creation of new sets of elements and tools of the control and management process, the development and implementation of primary information-measuring elements that change the control and management signals.

The results of the analysis showed that the complex application of modern techniques and technologies in the control and management of single, two, three and more phase current and voltage renewable energy sources of the power supply system, modeling and algorithmicization of signal generation processes required for management and monitoring, The issues of structural

and parametric design of variables that allow evaluation, the development and implementation of a wide range of their functional capabilities have not been sufficiently studied [1,2].

Renewable energy sources are the subject of research from the study and application of electromagnetic current converters with enhanced functional capabilities for the control and management of single and three-phase currents [3,4].

Renewable energy sources include the study of the structural principles and application of electromagnetic converters of control and management of single and three-phase currents, the development of models, algorithms and research software, the creation and application of physical and technical effects models and research algorithms.

A renewable energy source power supply system is generated from reactive power sources that are installed near consumers, the main part of the reactive power generating a magnetic field and magnetic flux in electrical devices [4].

Renewable energy source power supply system S - full power transmitted from the power transmission device or network is determined as follows [3-5].

$$S = \sqrt{P^2 + Q^2}, \quad (1)$$

and the three-phase current is equal to:

$$I = \frac{\sqrt{P^2 + Q^2}}{\sqrt{3} \cdot U}, \quad (2)$$

There is P the active power (W, kW, MW),

Q - reactive power (VAr, kVAr, MVAr),

U - voltage (V, Kv).

In formulas (1) and (2), it is assumed that the active power is obtained entirely from the source at the beginning of the network [4-7].

When the reactive power supply with power Q_k is installed near the consumers, ie at the end of the network, the total power and current are as follows [2-4]:

$$S' = \sqrt{P^2 + (Q - Q_k)^2}, \quad (3)$$

and current

$$I^B = \frac{\sqrt{P^2 + (Q - Q_k)^2}}{\sqrt{3} \cdot U}, \quad (4)$$

There is Q_k is the reactive power of the energy source used as the compensating device.

As the current ratio is $\Gamma < I$, the cross-sectional area of the cable of the power transmission line of the renewable energy source decreases, ie the capacity of the network increases, the additional active and reactive energy and power losses in the network significantly decrease [7- 10].

The characteristics of electromagnetic converters are important in the control and management of single and three-phase currents in renewable energy supply systems [4, 7, 9].

Renewable energy supply systems are single- and three-phase currents controlled and controlled by the same or different natural variables $K [\Phi_{\mu g}(x), U_{e2}]$ single natural change source and $W [\Phi_{\mu}(0), \Phi_{\mu g}]$ different natural magnitude change source. The static description of the parameter and the transformation of the transmission function to normal physical quantities is expressed in the following form:

$$U_{e2} = 2 \cdot \pi \cdot f \cdot I_{e1} \cdot w_{ov} \cdot w_{SE} \cdot \int_0^{l_{x.o}} \Phi_{\mu g}(x) \cdot dx \quad (5)$$

There is f -the primary current frequency; I_{e1} -primary input current value;

w_{SE} - number of packages of the sensing element; w_{ov} is the number of packages of the primary element; $l_{x.o}$ is the height of the air gap; $\Phi_{\mu g}(x)$ -magnetic current.

The static characteristics of the variable of the control and management system obtained on the basis of computational and experimental studies are given in Figures 1-4.

Figure 1. Static description of the dependence of the input current on the output voltage $U_{eoutput}$ at different values of the air gap balance.

Figure 2. Static description of the dependence of the variable $l_{x.air}$ interval height on the output voltage $U_{eoutput}$.

Figure 3. Sensitive element of the transducer w_{SE} Static description of the number of windings depending on the voltage $U_{eoutput}$ output signal.

Figure 4. Voltage $U_{eoutput}$ of the cross-sectional surface of the sensitive element S_{SE} of the converter.

Static description of the dependence on the output signal in the open view.

It can be concluded from the results that when the value of the air gap of the converter $l_{x.o}$ increases, the value of the output signal in the voltage $U_{eoutput}$ view decreases sharply, the increase in the number of windings of the sensitive elements fluctuates the change in the value of the output signal. When the number of windings of the sensing element is equal to the number of windings $w_{SE} = 15-16$, the output signal has a rational value when the height of the air gap is 0.002 - 0.003 m.

CONCLUSION

1. The principles of reliable control and management, models, information measuring instruments and power supply monitoring module of developed and advanced renewable energy supply systems provide stable energy supply.

2. The application of the created model of reliable control and management of electromagnetic converters of single and three-phase currents of renewable energy supply systems allows to increase the accuracy of calculation of the control signal by 0.68-1.55%.
3. As a result of the model-based study, equalizing the value of the air gap between the sensing element by 0.002-0.003 m and the number of its windings by 2-4 allows to provide the normative value of the output signal.
4. The single- and three-phase currents of the electromagnetic converter model allowed the formation of a steady state of the output signal after 0.03–0.04 seconds relative to the input signal (according to the standard requirement, the formation time of the steady state should not exceed 0.1 seconds). The total cumulative error of the converter was $\Delta = 0.49$ percent.

ABSTRACT

Over a period of time Medical tourism, which is alternatively called health tourism or wellness tourism, has gained lot of momentum. India's emergence of one of the world's fastest growing economy, coupled with Government policies for promoting overall economic growth, medical tourism has grown in to leaps and bounds in India. It is a silent revolution that has been sweeping the healthcare landscape of India for almost a decade by making significant contribution to Indian economy. The tourism industry of India is economically important and growing rapidly. Indian health care sector is considered one of the largest in terms of both revenue and workforce employment. Indian medical tourism industry is expected to reach \$6 billion by 2018, with number of people arriving in the country for medical treatment set to double over next four year. A large and growing population, a booming economy, rapid urbanisation which has expanded the middle class, rising diseases and increased awareness level has enabled the sector to grow at much higher rate. This research paper makes an effort to understand reasons for the growth of medical tourism in India, stake holders & their role in promoting Medical tourism, future prospect of the medical tourism of India.

KEYWORDS: Medical tourism, Indian Economy, Stakeholder of Medical tourism, Growth enablers. Future prospect, road map for potential growth

INTRODUCTION

The healthcare system consists of multiple stakeholders including the government, service (health care) providers, payers, pharmaceutical and medical devices firms. Each plays a vital role in the health care system in India. However, interactions between various stakeholders have remained limited. Healthcare in India has assumed a more dynamic form over the last few years – offering exciting opportunities for new reforms and improving stagnant indicators addressing concerns of access, affordability and quality across different population groups.

An ecosystem of innovations for world-class healthcare delivery, driven by private providers, is developing in India. Country is establishing new global standards for cost, quality and delivery, through its breakthrough innovations in healthcare. The other end of the spectrum is witnessing a number of innovations to increase access and improve quality of health services for the poor and unreached at affordable costs. The last couple of years have seen a rapid increase of private equity and venture capital funds available for entrepreneurs in healthcare, which has enabled scale up of some of these new interesting models of providing healthcare.

To leverage the healthcare growth story, the industry is now reshaping and redefining the very concept of “healthcare”. It has moved far beyond curative clinical practice (focused on episodic care), to embrace prevention, wellness and the concept of the “holistic care” through the pervasive health continuum.

OBJECTIVES OF THE STUDY:

This study tries to get an overview of the medical tourism in India. This study explains why India has emerged as destination for medical tourism. It also explores challenges and competitive advantages and future outlook of medical tourism in India. This is exploratory work which is based on past literature review, including published research, web sites, newspapers, and the travel and tourism magazines that carry medical tourism related information. This study also tries to understand why developing country like India is more successful in promoting medical tourism than others

CONTRIBUTION OF MEDICAL TOURISM TO THE INDIAN ECONOMY:

Many hospitals in India are accredited by international institutions and are offering world-class treatment at that cost which is comparatively 40-50% less than that of any European country can offer. Acknowledging the significance of medical tourism in India, Government is trying to persuade the international tourist traffic by offering medical visa. Generally a medical visa is valid for one year, or the period of treatment whichever is less. The period of medical visa can further be extended for one year with the permission of state government. India not only offers the medical treatment but also other rejuvenative services such as yoga, meditation, herbal therapies and other skin treatments which could uplift the mood and enhance health of medical tourists. As a result India is receiving a huge number of international tourists who are coming to gain the rejuvenative benefits. In 2012¹, India has received a total of 180,000 foreign health tourist. It is estimated that it will grow at a Compound Annual Growth Rate of over 19% and will reach up to 1.8 million by 2015. Tourism in India is also one of the fast revenue generating industry and contributing around 5.92% to the National GDP², and providing employment to over 9.24% of the total country's workforce. To promote tourism in India government is introducing various kinds of tax deductions and exemptions to attract foreign investors to invest

in tourism sector and also providing various kinds of incentives to persuade them. In its Union-Budget 2010-2011, Government of India has introduced a scheme of tax deduction for the establishment of new, especially 2-Star category hotels in country. Medical Tourism in India is playing a vital role in improving the economic and social status of the society. According to a study by McKinsey & Company and the confederation of Indian Industry, India will receive \$1 billion business by 2012, from medical tourism, which is 1% of the total world-wide revenue generated by medical tourism. The total revenue generated from medical tourism in the year 2004, worldwide was \$40 billion which has increased upto \$60 billion in the year 2006. McKinsey & Company³ estimates that it will raise to \$160 billion by the end of the year 2016

KEY FEATURES OF MEDICAL TOURISM IN INDIA:

The following are the top 5 factors the strength of Indian medical tourism which makes it to emerge as a pioneer in the global industry.

- Top quality healthcare services at low cost
- Expert team of professional doctors
- High end medical & health care facilities
- 100% Trustworthy
- 100% success rate

As per market research report “Booming Medical Tourism in India”⁴, India’s share in the global medical tourism industry will reach around 5% by the end of 2014. Moreover, medical tourism is expected to generate revenue worth US\$ 5 Billion by 2014, growing at a CAGR of around 26% during 2011–2013. The number of medical tourists is anticipated to grow at a CAGR of over 19% during the forecast period to reach 1.8 Million by 2014. It is also found that, India represents the most potential medical tourism market in the world. In addition to the existence of modern medicine, indigenous or traditional medical practitioners are providing their services across the country. There are over 3,371 hospitals and around 7,54,985 registered practitioners catering to the needs of traditional Indian healthcare. Indian hotels are also entering the wellness services market by collaborating with professional organizations in a range of wellness fields and offering spas and ayurvedic massages.

ROLE OF GOVERNMENT IN PROMOTING MEDICAL TOURISM:

Ministry of Health and Family Welfare and the Ministry of Tourism have jointly formed a Task Force with a view to promoting India as a Health Destination for persons across the globe so as to enable them to gainfully utilize the health care expertise and infrastructure available in the country. The aim is to expand the range of the tourism products in India, both for domestic and international market. For this, streamlining of immigration process for medical visitors is necessary. In this connection, the Government of India has introduced a new category of Medical Visa (M-Visa) which can be given for specific period to foreign tourists coming to India for medical treatment. Added advantage is provided by the uplifting government policies in India. The government led initiatives and campaigns such as Incredible India!, Colors of India⁵, Atithi Devo Bhavah and the Wellness Campaign for promoting the Indian tourism and hospitality industry adds to the creation of appeal amongst the foreign tourists. The Ministry of Tourism India (MoT) is planning to extend its Market Development Assistance (MDA) scheme to cover

Joint Commission International (JCI) and National Accreditation Board of Hospitals (NABH) certified hospitals. JCI stands for Joint Commission International and is a nongovernmental organization that provides hospitals worldwide with accreditation

PRIVATE SECTOR PARTICIPATION:

Private sector should work in tandem with the government on PPP initiatives to educate the later for developing more sustainable delivery models:

1. Provide Hub and Spoke models for both treatment and diagnostic care delivery
2. Take on the responsibility of Medical Education which includes medical professionals, nursing, and paramedical staff
3. To form a common healthcare forum / platform to corroborate all efforts which require policy decision changes which would giving more lobbying power
4. Encourage and extend CSR interventions in cross functional formats for capacity building of the public sector personnel. This can be done through exchange programs, CME's, short stay certifications in areas like hospital administration, quality controls, specialised nursing care like intensive care, operation theatre, high end diagnostics techniques and reporting for laboratory medicine and radiology CT / MRI scans, interventional radiology etc.
5. Encourage provision locum medical staff for short durations or on specific programs
6. Work with the government to encourage better penetration and utilisation of health insurance schemes
7. Within their own set ups – encourage accreditation, make it mandatory for credentialing of Medical Professionals while recruiting/ appointing to help ensure quality standards.

Enablers of Medical Tourism in India:

1. Medicine insurance coverage

In recent years, there has been a liberalization of the Indian healthcare sector to allow for a much-needed private insurance market to emerge. According to a study by the New Delhi-based PHD Chamber of Commerce and Industry, the healthcare insurance is projected to grow up to USD 5.75 billion in next few years. Moreover, the Insurance Regulatory and Development Authority (IRDA)⁹ eliminated tariffs on general insurance as of January 1, 2007. Removal of tariffs will result in wider acceptance of individual health coverage making healthcare more affordable to larger segments of the populace. Another challenge is that the foreign insurance companies are not willing to extend their coverage for treatments in low cost countries such as India due to concerns about the quality of health services offered. The insurers are also concerned with the absence of malpractice law in a foreign jurisdiction in which case the patient will have no recourse to his/her healthcare expenses. Indian policy makers need to find ways to improve upon the existing situation in the health sector and to make equitable, affordable and quality health care accessible to the medical tourists.

2. Research in medicine and pharmaceutical sciences

Horowitz and Rosensweig (2007)⁶ identified India as one of the preferred medical tourism destinations. The growth in foreign patient arrivals to India has usually been pegged at twenty-

five percent annually. Therefore, the medical tourism providers seek to develop clinical practice guidelines and foster effective interventions to improve the quality of care for the medical tourists. Research in medicine also measures complex aspects of the healthcare delivery system and patient perceptions of quality of care (Eccles et al., 2003), one of the critical issues in medical tourism

3. Medical tourism market

According to George and Nedelea (2009)⁷, countries like India, Mexico, Singapore, Brazil, Philippines etc. are actively promoting medical tourism. Generally, medical tourists are the resident of developed industrialized countries and they contribute towards major revenue earnings for many of the countries providing medical tourism. India provides world-class healthcare at substantially less cost. Based on 2002 data, an inpatient knee surgery would cost of USD 10,000 in the USA and only USD 1500 at hospitals in India (Matto and Rathindran, 2006). The low-cost solutions alone may not be enough to bring in international tourists for undergoing healthcare treatments in India. The negative perceptions about Indian medical tourism market with regard to hygiene standards, prevalence of contagious diseases in India, quality of healthcare services provided, and waste management practices counter the positive vibes created by the cost competitiveness of Indian healthcare system. Other infrastructure associated problems such as shortage of air linkages, power, water, and traffic congestions also affect the flow of healthcare tourists towards India.

4 . Healthcare infrastructure facilities

Healthcare infrastructure indicators of India vis-à-vis developed countries highlight the disparity and areas for improvement. Bhargava et al. (2005)⁸ have pointed out that healthcare infrastructure facilities and quality of services depend on economic development in the region. This would require sizeable investments for strengthening, upgrading and expanding the medical tourism health infrastructure in India. India needs to upgrade the healthcare infrastructure facilities with regard to improving sanitation standards, health awareness, availability of safe drinking water and nutrition. The government's role in improving the national health indicators should be reiterated through increase in government's budget for medical tourism. Today, there has been a rapid rise in private providers of healthcare (Peters et al., 2002)⁹. The Health Ministry must encourage the private player's active participation through benevolent tax structure and fiscal incentives. The concept of telemedicine should be promoted in an attractive manner in order to make more number of players to participate.

5 .International healthcare collaboration

The International healthcare collaboration normally gears towards improving health care access and quality of care across racially and ethnically diverse populations. International healthcare collaboration helps the medical tourism providers in improving their overall efficiency and management of healthcare services. According to Sarin and Lodge (2007)¹⁰ international collaboration such as Cochrane Collaboration help people make well informed decisions about health care by facilitating, maintaining and promising access to systemic reviews of the effects.

6. Global competition

Global competition is emerging in the medical tourism industry. The patients of developed countries want to avail health care facilities overseas on competitive basis and combine

recreational facility during their stay. In 2005, an estimated 500,000 Americans traveled abroad for treatment. 400,000 international patients travelled to Bumrungrad International Hospital in Bangkok, Thailand out of which 55,000 were Americans (Cohen, 2010)¹¹. In 2004, 1.2 million patients traveled India for healthcare (Schult, 2006)¹². India has also seen the growth in number of Spas in the last few years. The growth in Spas in India is also luring the medical tourists to visit some less-visited corners of India. This has also led to growth of Indian traditional healthcare systems in the domestic as well as in the international scenario.

7. Transplantation law

Organ transplantation is a revolution in the medical tourism as it has helped in saving the lives of those who would have died otherwise. Kidney, liver, heart, lung, pancreas, and small bowel are some of the organs that can be donated for an organ transplant (Acharya, 1994)¹³. The Human Organs Transplant Act (1994) has laid down various regulations that have to be followed while conducting the organ transplantation in India. According to the Act, any unrelated donor has to file an affidavit in the court stating that the organ is being donated out of affection. The Act does not permit medical tourist to India availing organs from a local donor. According to a survey by World Health Organization, Transplantation tourism is emerging in the world scenario with increasing number of patients moving to other destinations like Singapore where the transplantation laws are less rigid.

8. Top management commitment

According to Bergman and Klefsjo (2007)¹⁴, quality management calls for top management commitment. From the management's perspective, the medical tourism field would benefit from expanding its current interpretation of structure to include broader perspectives on organizational capabilities. Effective organizational capabilities such as leadership, human capital, information management systems and group dynamics are essential structural elements of quality improvement in a health-care organization (Glickma et al., 2007)¹⁵. The quality management has become a priority for senior executives and chief medical officers for successful medical tourism services. These leaders produce ideas, convey new ideologies, and propagate them throughout their organization.

9. National healthcare policy

Government of India has announced a national health policy and a national tourism policy in 2002²⁰. Some references have been made in the national tourism policy with regard to India's potential to tap the tourism market using its healthcare skills including the traditional wellness systems. The realistic formulation of health policies and programs requires a better understanding of health care seeking behaviour in terms of utilization of different sources of care (Bhatia and Cleland, 2001)¹⁶. Therefore, there is a need of specific policy focusing on promotion of healthcare tourism with clearly identifying the roles of various segments of players. This would require coordination between the two major government departments viz., Tourism and health. Consultations may also be necessary with other departments/agencies/organizations such as Ministry of External Affairs, immigration department, tourism promotion organizations, state governments, Indian healthcare federation, association of travel agents, tour operators and hotels. The real change in the pharmaceutical science arrived in the mid-1990s when India signed the World Trade Organization (WTO) TRIPS agreement (Trade-Related Aspects of Intellectual

Property Rights). As a result of signing this agreement, India began its own serious innovative research in Pharmaceutical Science.

10. Competent medical and para-medical staff

India has over 600,000 physicians with a density of 0.60 physicians per 1000¹⁷ population. However, there is a shortage of qualified specialist nurses and paramedical professionals and so qualified hospital administrators. Number of nurses per doctor in India is estimated to be 1.33 as compared to 5.27 in UK and 4.67 in Canada. Thailand, another developing country competing in the world healthcare tourism market has 7.64 nurses per doctor. One of the main reasons for low ratio of nurses to doctors in India is cross-border movement of nursing professionals from India.

CHALLENGES OF MEDICAL TOURISM IN INDIA

Most of the foreigners treated in India, come from other developing countries in Asia, Africa or the Middle East, where top-quality hospitals and health professionals are often hard to find. Patients from the United States and Europe still are relatively rare -- not only because of the distance they must travel but also, hospital executives acknowledge, because India continues to suffer from an image of poverty and poor hygiene that discourages many patients. India's health care system is hardly a model, with barely four doctors for every 10,000 people, compared with 27 in the United States, according to the World Bank. Health care accounts for just 5.1 percent of India's gross domestic product, against 14 percent in the United States. The following are some of challenges of fast pacing medical industry in India-

1. Lack of proper infrastructure, amenities and, access and connectivity:

Infrastructure needs for the travel and tourism industry range from physical infrastructure such as ports of entry to modes of transport to urban infrastructure such as access roads, electricity, water supply, sewerage and telecommunication. The sectors related to the travel and tourism industry include airlines, surface transport, accommodation (hotels), and infrastructure and facilitation systems, among others. However, infrastructure facilities such as air, rail, road connectivity, and hospitality services at these destinations and the connecting cities are inadequate. This remains a major hurdle for development of tourism. Amenities include basic amenities such as drinking water, well maintained and clean waiting rooms and toilets, first aid and wayside amenities (to meet the requirement of the tourists travelling to tourist destinations) such as lounge, cafeteria, and parking facilities, among others needs to be improved. India scores poorly in terms of availability of these infrastructure facilities. Inadequate infrastructure facilities affect inbound tourism and also could lead to an increase in the outflow of domestic tourists from India to other competitive neighbouring countries. Hence, for the industry to register healthy growth, issues concerning all the related sectors need to be addressed.

2. Service level:

In addition to hospital staff, the degree of service offered by these various stakeholders has a significant impact on determining the tourist's overall experience of India as a tourist destination. The government has taken initiatives to promote responsible tourism by sensitizing key stakeholders of the tourism industry through training and orientation, to develop a sense of responsibility towards tourists and inspire confidence of foreign tourists in India as a preferred destination.

3. Marketing and promotion:

Marketing and promotion of India as a major medical tourism destination is critical for the industry to achieve its potential. Lack of adequate budgetary support for promotion and marketing, compared with competing tourist destinations, is a major reason for India lagging behind its competitors. Marketing under the “Incredible India” campaign helped place India as a good tourist destination on the global tourism map. India needs to change its traditional marketing approach to a more competitive and modern approach. There is a need to develop a unique market position and the brand positioning statement should capture the essence of the country’s tourism products: i.e., they should be able to convey an image of the product to a potential customer.

4. Security:

Security has been a major problem as well for growth of tourism for a number of years. Terrorist attacks or political unrest in different parts of the country have adversely affected sentiments of foreign tourists. Terror attacks at Mumbai in November 2008 dealt a strong blow to tourism in the country. The terror attacks raised concerns of safety. In addition, insurgency in different parts of the country also mars India’s image as a safe destination.

5. Regulatory issues:

For inbound international tourists, visa procedures are seen as a hindrance. A number of countries competing with India for tourists provide visa on arrival. India should provide visa on arrival for more countries or for certain categories of tourists for a specific duration. There is a greater need for speedier clearances and approvals for all projects related to the industry.

FUTURE PROSPECTS OF INDUSTRY:

The travel and tourism demand is expected to reach US\$ 266.1 bn (₹ 14,601.7 bn) by 2019. During 2004–2009 travel and tourism demand in India increased at a compound annual growth rate (CAGR) of 16.4% to US\$ 91.7 bn (₹ 4,412.7 bn) and foreign exchange earnings from tourism increased ~13% to US\$ 11.39 bn¹⁸

KEY ISSUES IN ADDRESSING SERVICE QUALITY IN HEALTH CARE INDUSTRY:

Five dimensions of service quality developed by Parasuraman, Zeithaml and Berry can be applied to health care industry to serve patients better:

- **Reliability:** Ability to perform the promised service dependably and accurately (example – doctor keeps the appointment on schedule, diagnosis prove to be accurate).
- **Responsiveness:** Willingness to help customers and provide prompt service (example – no waiting, doctor’s willingness to listen).
- **Assurance:** Employees’ knowledge and courtesy and their ability to inspire trust and confidence (Example – reputation, credentials and skills).
- **Empathy:** Caring individualized attention given to customers (Example – acknowledging patient as a person, remembers previous problems, patience).
- **Tangibles:** Appearance of physical facilities, equipment, personnel and written materials (Example – waiting room, examination room, equipment, report cards). Zeithaml and Bitner

suggest that since health care services involve some amount of uncertainty/high risk, assurance dimension would be of great importance to the consumers. In the early stages of relationship, the consumer may use tangible evidence to assess the assurance dimensions. Visible evidence of degree, honours and awards and special certifications may give new customer confidence in a professional service provider.

TWELVE SUGGESTIVE NOBLE WAYS TO GET MORE PATIENTS:

1. Put yourself in your patient's shoes: It is a basic and commonsensical concept. Sometime should be spent every day thinking from the patient's point of view. It may be difficult but it will mean more sales of hospital services.

- Listen to the patients
- Ask questions from them
- Do something extra for each patient
- Admit mistakes to the patients gracefully.

2. Patient Satisfaction: A patient can take away his business to a hospital wherever he gets better value for his money and better service. He does not have to give reasons for his action. It is his money and he can spend it where he likes or the way he likes. Technicians and assistants in the hospitals are people and if they are not satisfied, one can never have satisfied patients. This is simple but often ignored fact. Many hospitals have succeeded without proper medical facilities, none without proper technicians. Employees with average intelligence and initiative, when treated with respect and dignity as individuals, given training and motivation will turn out to be good technicians.

3. Continuous communication with the patients: Communication with the prospects and the patients is the core of good marketing. How to achieve it? There is no magic wand in the world that will help achieve it; only patience and persistence pays. Each employee should be trained to be good listener to the patients when they come into the hospital or when they write to the hospital. This includes encouraging the patients to open up and express themselves clearly. In our country with so many festivals for *Devis* and *Devtaas*, a health provider has several 'excuses' to send a postcard to his patients. The postcards can contain simple messages to help the patients. And when a patient comes in, he should really be helped, otherwise it will result in stinking publicity. A promotional mailer can be so fine tuned that it can reach the individual on his birthday, on his anniversary and so on.

4. Patient oriented hospital: It is not a simple task, but can be done by following the patient by patient approach. When does a hospital becomes patient oriented? As soon as the facility starts rendering, through thoughts and actions, the best possible service to each of its patients. This way a hospital becomes great for its patients. Patients do not like to come to a big hospital where they get lost, but they love coming to a great hospital where they will be given the best possible attention. Also a big hospital does not necessarily make more profits than a great hospital.

5. Patient oriented policies and procedures: A hospital exists so long as the patients keep on coming. Hospital policies and procedures, even if they have been given by the best business management professor, are suicidal if they inconvenience the patients.

6. Patients must be given the best possible services: Patients should be given “USA” - Unique Service Advantage – and once they get it, they will become repeat patients and bring more patients. It simply means some extra and individual care to show that the business of patients matters a lot for the hospital. Maybe the best equipment can be installed, hospital be opened for longer hours for the convenience of patients, and so on. It also involves studying the competitors and to start serving the patients better.

7. Patients want answers to their problems; they are not impressed by the 3 Cs: A hospital where the patients get answers to their problems is a better “mousetrap” than a hospital where the patient’s problems don’t get solved. Patients are not impressed by the carpets, chrome and chandeliers (3Cs) in the hospital. Patients will flock to that hospital which follows a more helpful attitude. The 3Cs won’t help if they are shown the rules and regulations whenever they come with problems. A health provider should not only work harder to satisfy his patients but must also appear to be doing so. Patients with complaints must immediately get the feeling that they are still welcome – rather more welcome- than when they had come in the first place. A bit of additional consideration is all that is required to convince the patients that they are wanted at the hospital.

8. Listen, listen , listen to your patients: The patients should be given a proper hearing. Very often, their complaints are like burning embers and if ignored, may become huge fires, or on the other hand can be turned into ashes by merely dropping a few drops of cold water in the form of an instant helpful attitude. If properly attended to, complaints can be turned into opportunities. A health facility that wants to earn a good reputation in the long run also ensures that the patients are encouraged to lodge complaints and each complaint is fully investigated.

9. Each of the employees should visit patients: In a health facility , every employee does something – directly or indirectly for the patients. Otherwise, he does not have a right to be on the payroll of hospital. If so, how is it that some of employees never see the faces of their patients, at least, not away from the hospital. In the hospital, a selling atmosphere should be created wherein every employee gets an opportunity to market the services.

10. Checking with patients about employee’s attitude: Why customers (patients) quit?

- ☐ 1% Die
- ☐ 3% Move away
- ☐ 5% Form other friendships
- ☐ 9% For competitive reasons
- ☐ 14% Because of product dissatisfaction
- ☐ 68% Quit because of attitude of indifference towards customer by some employees

Notice the last line carefully. A continuous follow up , therefore, should be done with the patients to find out how they feel about the hospital employees and how they are treated by them.

11. Solve the small problems of patients today: A hospital is not a bed of roses. Of course, most of us feel that it is a bed of roses when we see it from a distance. It is only when we touch the bush to pluck the roses that we get pricked by the thorns too. And every hospital must learn how to handle difficult patients with extra care. A difficult patient is like a dark cloud with a

silver lining. He presents an opportunity in disguise to test the hospital's orientation to him. Fortunately, patients are people and the rule of 80:20 applies to them too, i.e. 80 percent of patients are reasonable and they forgive very quickly while it is only 20 per cent who carry their grievances on and on.

12. Dissatisfied patients are best teacher: One can never please 100 percent of patients, 100 percent of the times and 100 per cent of the days. If one can do so it is either a sellers market or he is a genius or he is not taking takeable risks. Generally for an average hospital one-third of patients are very satisfied, another one-third are reasonably satisfied and the balance one third are not fully satisfied and, in fact may be 10 percent are fully dissatisfied. These dissatisfied patients should be searched for and once they are located, one- third of the problems are solved. Close attention should be paid to every word they say and it should be noted down. This conveys that personal interest is being taken in the matter. The objective is not to win the argument but to come to an agreement that satisfies a dissatisfied patient.

CONCLUSION:

World-class treatment & highly advanced healthcare infrastructure have contributed tremendously to the growth of medical tourism in India. Booming software industry in India has facilitated technological revolution in healthcare. In fact, after software, healthcare industry is the next big thing in India & contributes majorly to India's fast growing economy. India's medical force boasts of a high intellectual resource pooled in by highly skilled & qualified professionals. Fast growing economy has led to privatization & corporatization in the field of healthcare, thereby leading to the setting up of world class hospitals that provide highly advanced treatment facilities through high end technology & world class doctors. Low operating costs, high resources & highly qualified English-speaking manpower have made India the hub for Research & Development as well as clinical trials, thereby contributing primarily to the healthcare infrastructure. Stake holders of Medical tourism industry have to synchronise their activities to reap maximum benefits in terms of achieving higher profits and greater market share.

THEORETICAL STUDY OF THE MOVEMENT PROCESS OF COTTON SEEDS TRANSPORTED ON A SCREW CONVEYOR

Rejabboev S*; Karimov A**; Muradov R***

UZBEKISTAN

ABSTRACT

In this scientific article, the movement of cotton seeds on a screw conveyor and the forces resisting this movement are studied. Based on the constructed mathematical model, the mechanism of seed mass compaction is formed, the moving force caused by the screw conveyor blades, the seed mass, the force of gravity and the frictional force generated along the entire length of the screw are calculated. As the mass of the cotton seeds increases, the angular dependence of the frictional force generating them with the inner surface of the screw conveyor increases, and vice versa, the angular dependence of the screw surface reaction decreases. This in turn leads to a decrease in the compaction coefficient of the seed mass within the conveyor. As a result, a decrease in congestion inside the conveyor of cotton seeds was observed.

KEYWORDS: Conveyor, Cotton, Seed, Mathematical Model, Mass, Screw, Weight, Force, Density, Reaction, Coefficient Of Friction, Speed, Acceleration.

INTRODUCTION

Despite the widespread use of screw conveyors in the cotton industry, not enough attention has been paid to the theoretical study of the transportation of materials using screw conveyors. This is because indicators such as the coefficient of friction of the transported material and the rotational speed of the conveyor shaft have a great influence on the process. In a screw conveyor, the forces that resist the movement of the material consist of the resistance of the seed coat to the surface of the screw shaft and the bearings. In addition, when the value of filling the screw conveyor with seeds is large, in addition, the bending force of the shaft is also affected. The mechanism of seed mass compaction is the resistance caused by the driving force generated by the screw conveyor blades, the seed mass, the gravitational force, and the frictional force generated along the entire length of the screw [1-4]. The coefficient of compaction of the seed mass depends in many respects on the specific load on which it is transported along the screw conveyor shell. When coagulating cotton seeds, the coefficient of resistance changes, which

leads to an increase in mass density and the formation of, clogs [5-11]. From this point of view, it is important to study the movement of the seed mass on the screw conveyor.

THE MAIN FINDINGS AND RESULTS

Mathematical modeling

The axial velocity V_1 of the cotton seed in the screw conveyor shell is determined by the following formula (Figure 1.1 a):

$$V_1 = \frac{Q}{900\pi(D^2 - d^2)\psi\gamma C_0}, \text{ m/sec} \quad (1.1)$$

where Q -conveyor working productivity, t / s; Outer diameter of D -conveyor, m; d is the diameter of the inner edge of the conveyor, m; ψ -coefficient of filling the space between the wings; γ - volumetric weight of the transported cargo, t / m³; $S_0 = 0.9 \div 1$ load shedding coefficient.

The coefficient of filling of the space between the blades should not exceed the coefficient of load capacity of the conveyor:

$$\psi = \psi_1 \cdot \psi_2 \quad (1.2)$$

where: ψ_1 – is the coefficient of load capacity dependence on the number of conveyor revolutions; ψ_2 is the coefficient of load capacity dependence of the conveyor on the angle of inclination, for a horizontal conveyor $\psi_2 = 1$.

The seed is in the screw conveyor shell V_a it is expedient to determine the angle of rise of the moving screw lines so that the seeds touching the shell due to the screw movement at speed. The seed velocity is the geometric sum of the axial velocity V_1 and the rotational velocity V_a .

It is assumed that the motion of the seed layer is uniform and that the material obeys the laws of point motion. So let's look at the material point of cotton seed.

This can be allowed if the internal friction of the seed is greater than the external friction; at the same time the equilibrium of the material point is considered, and an equation is developed to determine the angle of elevation of the moving screw line of the material point touching the shell.

In the platform, we separate the material point A (Fig. 1.1 b) and it shifts to the position A' as the screw conveyor rotates. In case A , the equilibrium equation for this particle is:

$$F_k \cos(\theta + \alpha) = mg \sin \beta \sin \alpha - mg \cos \beta \sin \phi' \cos \alpha + F_n;$$

$$P = F_k \sin(\theta + \alpha) + mg \sin \beta \cos \alpha + mg \cos \beta \sin \phi' \sin \alpha;$$

$$F_k = f_1 P; f_1 = tg \rho_1, \quad (1.3)$$

where F_k is the force of friction of the load particle on the inner surface of the screw conveyor shell, which is opposite to the velocity vector;

a

b

Figure 1.1. a-velocity triangle; b is the equilibrium scheme of the material point moving from the lowest state A to the state A'

θ - is the angle of elevation of the material point moving screw line;

α - the angle of rise of the screw line along the outer edge; mg - gravitational force of the load particle; g - free fall acceleration; β is the angle of inclination of the conveyor to the horizon; φ' - angle of rotation of the load particle to the side of the screw rotation; F_n - particle friction force on the screw surface; P - screw surface reaction; $f_1 = \tan \rho_1$ coefficient of friction of the load particle on the surface of the screw conveyor; ρ is the angle of friction of the load particle on the conveyor surface.

Putting F_n and f_1 in the equilibrium equation and subtracting P forces from it, and taking into account the fact that ginners use mainly horizontal screw conveyors, we give the formula as follows:

$$F_k = \frac{mg \sin \phi' \cos(\alpha + \rho_1)}{\cos(\theta + \alpha + \rho_1)}; \quad (1.4)$$

The centrifugal force P_c can be expressed as follows:

$$P_c = \frac{2mv_2^2}{D} = \frac{2mv_1^2 \tan \theta}{D}; \quad (1.6)$$

where f_2 is the coefficient of friction of the load on the inner surface of the conveyor shell in motion; D is the diameter of the shell to be taken to be equal to the diameter of the screw.

By aligning the right parts of the equations representing F_k and setting the value to P_c , we obtain:

$$\frac{mg \sin \varphi' + \cos(\alpha + \rho_1)}{\cos(\theta + \alpha + \rho_1)} = f_1 \left(\frac{2mv_1^2}{D} \operatorname{ctg} \theta + mg \cos \varphi' \right);$$

$$\frac{2f_2 v_1^2 \operatorname{ctg}^2 \theta}{Dg} = \frac{\sin \varphi' \cos(\alpha + \rho_1)}{\cos(\theta + \alpha + \rho_1)} + f_1 \cos \varphi'; \quad (1.7)$$

$$v_1^2 \operatorname{ctg}^2 \theta = \frac{Dg}{2} \left[\frac{\cos(\alpha + \rho_1) \sin \varphi'}{f_1 \cos(\theta + \alpha + \rho_1)} + \cos \varphi' \right]$$

From this we determine the velocity of the load axis:

$$v_1 = \operatorname{tg} \theta \sqrt{\frac{Dg}{2} \left[\frac{\cos(\alpha + \rho_1) \sin \varphi' + \cos \varphi'}{f_1 \cos(\theta + \alpha + \rho_1)} \right]} \quad (1.8)$$

where $\alpha = \operatorname{arctg} \frac{S}{\pi D}$ is the angle of rotation of the load on the outer edge of the screw conveyor and φ' is the angle of rotation of the load to the side of the conveyor loop, 13 is the screw pitch.

The relationship between speeds V_a , V_1 and V_2 is as follows:

$$V_2 = V_1 \cdot \operatorname{ctg} \theta \text{ м/сек}; \quad (1.9)$$

$$V_a = \frac{V_1}{\sin \theta} \text{ м/сек}. \quad (1.10)$$

The rotation speed of the outer edge is determined from the velocity triangle (Figure 1.1

a):

$$V_2 = V_1 (\operatorname{ctg} \alpha + \operatorname{ctg} \theta); \quad (1.11)$$

Results obtained and their analysis.

a)

b)

Figure 1.2. a) The change in the angular dependence of the friction force on the inner surface of the screw conveyor F_k . b) P - change in the reaction of the screw surface depending on the angle θ .

Figures 1,2,3 in Figure 1.2 a show a θ -angle dependence of the frictional force of the F_k -load particle on the inner surface of the screw conveyor when the mass of the cotton seed is m 0.002 kg, 0.004 kg, 0.006 kg, respectively.

Graphs 1,2,3 in Figure 1.2 b show the θ -angle dependence of the R-screw surface reaction when the mass of the cotton seed is m 0.002 kg, 0.004 kg, 0.006 kg, respectively.

Figure 1.3. Dependence of seed movement speed on angle θ

As the mass of the cotton seeds increases, we can observe that the frictional force generating them with the inner surface of the screw conveyor increases by a value of θ angles. Conversely, we can observe that the screw surface reaction decreases with a value of θ angle dependence.

This in turn leads to a decrease in the compaction coefficient of the seed mass within the conveyor. As a result, cotton seeds reduce congestion inside the conveyor.

In Equation (1.8) the angle θ is of unknown size and is easy to determine by the method of series approximation, and the results of such work are shown graphically in Figure 1.3. As can be seen from the graph, there is uneven and intermittent movement leading to short-term stagnation.

In practice, the diameter of the conveyor screw is 350 mm, the number of revolutions of 225 mm is 80 min^{-1} , the coefficient of friction between the seeds of the conveyor shell is 0.15, using the formula 1.8 - the speed of the seed mass at the bottom of the screw blade it can be calculated that the velocity at the tip is 0.38 m/s . Such a difference in velocities leads to different densities of the mass of seeds transported on the conveyor, and as a result increases the probability of congestion.

CONCLUSION

A mathematical model of the movement of cotton seeds on a screw conveyor was constructed. On the basis of the formed mathematical model F_k - graphs of friction force of cotton seeds on the inner surface of the screw conveyor shell, R - the laws of change of the reaction of the screw surface θ angular dependence are obtained.

As the mass of the cotton seeds increases, we can observe that the frictional force generating them with the inner surface of the screw conveyor increases by a value of θ angles. Conversely, we can observe that the screw surface reaction decreases with a value of θ angle dependence. This in turn leads to a decrease in the compaction coefficient of the seed mass within the conveyor. As a result, the congestion of cotton seeds inside the conveyor is reduced.

ON THE DEFINITION OF THE TERMS "VARIOLGY", "VARIATION", "VARIABILITY"

Sevara Sultanova*

*Lecturer,
Department of Russian Philology,
Ferghana State University,
UZBEKISTAN

ABSTRACT

The article discusses the terms "variology", "variation" and "variance", which have attracted close attention of linguists for a long time. In order to understand the principles of the development of diachrony and synchrony of the functioning of the language, it is necessary to understand the deep and comprehensive study of variance. In the last decade, the subject of interest of most linguists has been the problem of variance and variability, and in theoretical terms it has not yet been studied.

KEYWORDS: *Variology, The Term Variability, Variance Problems, Invariant, Variant-Invariant Language Devices, Variation Of Language Units.*

INTRODUCTION

The term variability competes in linguistics with the concept of variance. Which one should be preferred. Which one should be preferred and for what purpose. Preference should be given to the concept of variability, and here's why. The term variance emphasizes the presence in the language of variants that imply the location of the invariant. However, a large number of linguists seem to be predisposed to negatively answer the question of whether an invariant of speech variants can always be distinguished in a language. Invariants, as a rule, are relatively easy to distinguish when it comes to the pre-sign levels of the language system. A classic example is the establishment of the inventory of phonemes of a language as invariants, to which variants-allophones, which, in turn, are invariants for variants-backgrounds (or instances-backgrounds), are derived. The relative simplicity of identifying the repertoire of invariants at the phonological level is easily explained - here we are dealing with the so-called figures, that is, one-sided units that do not have a sign nature. However, as soon as we reach the sign levels of

the language, the selection of an invariant becomes a much more difficult task, and attempts at any cost to find an invariant for really existing variants are, as a rule, solutions that are artificial, speculative and ultimately violent over the language. The term variability, it seems, does not impose on us the obligation to search for an invariant, it is caused by the presence of variability in the language as a phenomenon and is completely neutral in terms of the methodology of its research [3, p. 166-167].

Finally, the qualities of variability and change are inherent in the Russian language, which is known to everyone who is at least a little familiar with the history of the language. Every modern language can be traced in its development, and the form of manifestation of its development is nothing more than a gradual change in all its subsystems. The reasons for the variability of the language are also obvious - they lie already in the fact that the native speakers of the language are people who are a part of living nature, a biological species.

DISSCUSSION

Variation (variance) is one of the most general concepts in linguistics, which makes it possible to study the language system and use certain variant units. In this regard, N.M. Solntsev states: "In linguistics, the concept of variability (variance) is used in two ways. First, as a characteristic of any linguistic variability, modification that can be the result of evolution, the use of different means of language to denote similar or the same phenomena, or the result of other causes. With this understanding, there is no need for the division of variance-invariance. Secondly, the concept of variability is used as a characteristic of the way of existence and functioning of language units in synchrony, acting against the background of the concept of invariance" [4, p. 32]. This difference has led to the fact that in modern linguistics there is an opinion about the need to distinguish between the terms "variability" and "variance". So, G.M. Vishnevskaya, these terms are used differentially. In this case, two types of variation are considered: 1) variation of the language system, denoted by the term "variability"; 2) variation of language units, denoted by the term "variance". This allows us to consider variability, as opposed to variance, as dynamics, as a process of development and change of language, and variance as a result of these dynamic changes, which is reflected in the language system itself and manifests itself in the existence of variants. This aspect is absolutely justified, since the very presence of two concepts of variability allows its two-fold terminological labeling.

The main purpose of variology is to determine the value properties of variant formations and their description as facts related to linguistic contacts, linguistic norms, and speech culture. However, the linguistic problematics of variology proper are much broader. As far as can be judged from the literature, the problem of variability is actualized in linguistics in the following cases: 1) when classifying the phenomena of linguistic variance and determining the limits of variation of linguistic units; 2) if necessary, explain the different appearance of identical units or their forms (eg: fox-fox, skird-skird, tractor-tractors) as well as when clarifying the nature of various kinds of alternations - eg: | g - f | - run - run, | k - h | - bake - bake; 3) in the sociolinguistic study of the variation of the norm and the use of different manifestations of the same units for stylistic, expressive and norm-forming purposes; 4) in the study of such intralingual factors of change and development of language as the transformation of options into new entities; 5) when studying the variant-invariant structure of the language; 6) when studying the processes of transition from language to speech.

Linguistic variance is a consequence of linguistic evolution, an indicator of linguistic redundancy, but redundancy, which gives impetus to movement and development. Decrease of variants is a constant process, as well as the emergence of new variants. The disappearance of variants occurs by replacing them with a stronger, more expedient variant, for various reasons, recognized as literary. Variants can diverge semantically and give an impetus for the formation of independent words, in addition, variants can serve as a stylistic enrichment of the language if they contribute to the redistribution of stylistic assessments (book - colloquial, common - professional, etc.).

During the functioning of the language and the transition from language to speech, the problem of variance arises, and also, if necessary, to explain the different meanings of the same variant units in linguistics.

Variation (variance) is one of the most general concepts in linguistics, thereby providing an opportunity to study it both in terms of studying the language system, and in terms of using specific variant units [7, p. 19-21].

According to the above, variability does not function in all its aspects, only when there is a need for attention to the term variability, but it is considered the most relevant and frequently used.

When studying literary texts, we concluded that variance in colloquial speech is considered in all aspects. Using the example of a phrase in a definitive meaning, they can carry a multifaceted variance, if they are adjacent to various forms of variance. One verb is capable of carrying out different means distributed among different verbs. From our point of view, we can consider formal variation in three forms. At the first stage of formal variation, words can take the form of words without a preposition and with a pretext (to work for a year - for a year, sleep in the evenings - in the evenings, perform a second time - a second time, arrange auspiciousness - as a consequence of favorable forms with pretexts (walking near the river - by the river, chatting on a couple - during a couple, running near the house - near the house) and at the third stage a reliable form and infinitive (come to dinner - for dinner - for dinner, run to save - to save, get tired of cooking - from cooking).

In terms of the culture of speech, variability can be considered as normative and non-normative, when studying the history of a language it is necessary to pay attention to the evolutionary development of language units, and functional stylistics is characterized by the implementation of synchronous means of expression in differential social spheres. For example: variability manifests itself in the information field of the younger generation in the need to shorten words due to rapidly changing means of communication, for example: (thank you, ok, please, pzh!, message-sms). The leading place in the social networks of young people is occupied by the use of neolexics. Stable phrases and special words were the result of the functioning and their use when communicating in the virtual world [1, p. 114].

CONCLUSION

In conclusion, variability and variance are continuously evolving phenomena and require constant attention from linguists to maintain and develop the freshness of the language. Thus, variance is a continuous process of dynamic changes in a language, reflected in the language system and manifested in the presence of certain variants of the language, and the concept of variability usually shows the presence of the ability to change the type of units, and linguistic

expression is most fully manifested in linguistic activity. We should add the opinion of Vishnevskaya, who gives the definition "Variation is already fixed in the language, but variability has a potential driving force that constantly lives and causes certain linguistic changes."

Thus, an indication of the preservation of identity by linguistic units is important in defining linguistic variability, i.e. a certain constancy, immutability: "The development of language proceeds as a struggle between two opposite tendencies - for the preservation and stabilization of the existing language system, on the one hand, and for its adaptation, transformation, improvement, on the other. The objective existence of these two opposite tendencies is clearly reflected in such a phenomenon as variation. "Nevertheless, the problem of the identity of linguistic units is rarely an independent subject of research and is considered, as a rule, in the context of the study of the phenomenon of variability. Along with the term "identity" in science, the term "constancy" is widely used [2, p. 76].

FROM THE HISTORY OF KHIVA-RUSSIAN RELATIONS (LATE XIX- EARLY XX CENTURIES)

Shavkat Jumabaevich Saidov*

*Associate Professor,
Candidate of Historical Sciences,
Tashkent State University of Oriental Studies,
UZBEKISTAN

ABSTRACT

This article is devoted to the history of relations between the Khiva Khanate and the Russian Empire in the late 19th and early 20th centuries. It covers the activities of state bodies and historical figures responsible and authorized to maintain diplomatic relations between the two countries.

KEYWORDS: *Khiva Khanate, Russian Empire, Turkestan, Amudarya Branch, Consulate, Diplomatic Representative, Petro-Alexandrovsk, "Diplomatic Official".*

INTRODUCTION

After Russia invaded the Khiva Khanate in 1873, an agreement defining bilateral relations was signed on August 12, 1873 in the Gandumiyon Park near Khiva by Khiva Khan Muhammad Rahimkhan (1864-1910) and Governor-General of Turkestan von Kaufmann [1, 330; 2, 118; 3, 347-351]. That is why this agreement goes down in history as the Gandumiyon Treaty.

According to the agreement, the lands on the right bank of the Amudarya will be separated from the Khiva Khanate and the Amudarya branch will be established within the Syrdarya region under the Governor-General of Turkestan [4, 2]. In accordance with the "Regulations on the management of the Turkestan region", the head of the Amudarya branch is entrusted with the full control of the life of the Khiva Khanate, as well as acting as the Representative (Ambassador) of the Russian Empire in the Khiva Khanate¹. The powers of the head of the department were much broader, and any relations with the Khiva Khanate were carried out under his direct supervision. This is because the head of the Amudarya department was directly subordinate to the Governor-General of Turkestan, contrary to the procedures established in the Empire². However, in accordance with the "Regulations on the administration of the Turkestan region" approved by

Emperor Alexander III (1881-1894) in 1886, the Amudarya branch was part of the Syrdarya region, and its head was subordinated to the regional military governor. Due to the fact that the relations with the Khiva khanate are treated with special attention and responsibility by the Russian authorities, it is possible to conclude that such a situation satisfied them.

The administrative center of the Amudarya branch was the city of Petro-Alexandrovsk (now Turtkul). Colonel M. Galkin, one of the active participants in the invasion of Turkestan and Khiva, was appointed the first chief of the Amudarya branch [6, 59]. Due to the fact that the department covers a large area of land, as well as the large number of financial and economic responsibilities of the head of the department, a special position of the second assistant head of the Amudarya department was introduced, responsible for relations with Khiva khanate, control, official correspondence³. At the disposal of the assistant was a separate court office, in which diplomatic staff, translators worked. The staff of this court, in response to the text, content and quality of official correspondence with the Khiva khanate, controlled the movement of all documents issued through the head of the department. All official documents related to the Khiva Khanate were kept under the supervision and guidance of a special official who served as a "Diplomatic Officer" in the Cabinet of the Governor-General of Turkestan. This official was responsible for the proper conduct of relations with the Khiva Khanate and the Emirate of Bukhara⁴. The incumbent also reports to the Russian Foreign Ministry⁵. At the same time, due to the steady growth of bilateral economic and trade relations, the Consulate General of the Russian Empire in Khiva operated in the city of Yangi-Urgench, the largest center of trade, industry and banking capital of the Khiva Khanate⁶.

In addition, the post of Consul of the Khiva Khanate, ie diplomatic representative, was established in Petro-Aleksandrovsk to quickly resolve various problems and issues arising in bilateral relations, to provide practical assistance in the development of economic and trade relations⁷. The Consul of the Khiva Khanate lived permanently in Petro-Alexandrovsk and for many years successfully fulfilled this task, Nurmuhammadboy Aminiddinbaev, who was considered one of the Khan's trusted aides⁸. Correspondence has so far been conducted in the official languages of both countries, ie all letters and official documents issued in Khiva have been written in Uzbek and delivered to the Amudarya branch through the Khiva Consulate. The necessary translations were made by the staff of the department and, after approval by the head of the Amudarya department, were sent to Tashkent, to the "Diplomatic Officer" serving in the court of the Governor-General of Turkestan. However, in 1896, at the suggestion of the head of the Amudarya branch of the Khiva khanate to finish the correspondence in Russian, Ahmadjon Agaev, a Tatar of Russian descent, was of Muslim descent, who was fluent in the local Uzbek language and had translation experience, was invited to Khiva⁹. His main task was to help translate official diplomatic letters and documents from Uzbek to Russian through the Khiva Khanate via Petro-Alexandrovsk, under the supervision of the head of the Amudarya branch, to various Russian officials, as well as to train Russian to some Khiva government officials.

During this period, there were no diplomatic relations, between the Khiva Khanate and Russia, established in Russia in accordance with the norms of international law. Any problems and disagreements were resolved at the level of the head of the Amudarya department, or through a "diplomatic official" in the court of the Governor-General of Turkestan. During the reign of Khiva khan Muhammad Rahimkhan-II (1864-1910) he did not personally visit Russia. According to some reports, as Ambassador, mainly Prime Minister Islam Hodja has visited

Russia several times. The businessman and minister was one of the leaders of the ongoing reforms in Khiva. As a result of his visits, he was able to open a modern post office in Khiva, build a European hospital and schools, and bring technical innovations.

It is known that many citizens of Khiva regularly visited Russia and Turkestan for commercial or civil purposes. Some citizens have permanently resided in cities where they can live comfortably. Therefore, on the initiative of the Khan of Khiva Muhammad Rahimkhan, the post of Special Representative of the Khiva Government, the Elder was established in various cities of Turkestan. The order of approval of the Khiva representatives for this position was carried out in accordance with the order of the Governor-General of Turkestan, approved on April 28, 1899¹⁰. On this basis, on the recommendation of the Khiva khan, a citizen of Khiva, Dustman MahkamKuliev, was appointed Elder of the Khiva people living in and around Ashgabat, the capital of the Caspian region¹¹. In the same order, on the recommendation of the Khiva khan, with a special letter from the Khiva government, OtajonAvazniyozov was appointed the Elder of the Khiva people living in the city and district of Merv, then Muhammadshirin Muhammad Yakubov, the Elder of the Khiva people in the city and district of Chorjoi, first VaisovKhudaybergan, then MuhammadaminboyAvazmuhammedov were appointed¹².

In order to develop the economic resources of the Khiva khanate and earn more money, Russian citizens, traders and businessmen began to flock to the country. By the beginning of the twentieth century, more than 30 companies and campaigns belonging to Russia's largest business circles, operating in many countries around the world, and hundreds of small entrepreneurs were operating in the Khiva Khanate. In general, by the beginning of the XX century, the Khiva khanate was inhabited by more than 1.5 thousand Russian citizens. In addition, hundreds of Russian citizens come to Khiva from Russia every year for commercial and other purposes. On the instructions of the Russian emperor, the senator, who came to inspect the social and economic situation in the country, ensured the introduction of the post of Russian Arbitration Court, City Police Officer in the Khiva Khanate, based on the demands and requests of Russian citizens living in Khiva¹³. As a result, the decisions and judgments of the Russian judiciary are enforced in the territory of the Khiva khanate, as they are in the whole territory of Turkestan, and even in the territory of the Khiva khanate they are strictly enforced by the citizens of Khiva¹⁴. For this purpose, it is planned to organize mobile sessions of the Samarkand District Court in the cities of New Urgench and Petro-Alexandrovsk, and permanent posts of court investigators will be established in these cities¹⁵. Not limited to this, Russian officials achieved the adoption of Law No. 28 "On the Application of Russian Jurisdiction in the Khiva Khanate", approved on June 1, 1912 in the highest circles of the Russian Empire. According to this, from January 1, 1913, the post of independent arbitrator will be established to operate in the territory of the Khiva khanate¹⁶. The court's decisions applied equally to Russian and Khiva citizens.

Thus, the analysis of the documents defining the bilateral relations shows that the Russian Empire based its military-political power and potential on the system of subjugation of small peoples, violation of their rights, disregard for the great statehood. The documents prove that he established relations with the Khiva khanate in a similar way, in which the Khiva khans cooperated with the ruling circles, and the Khiva people were completely deprived of the right to determine their own destiny.

GENDER INEQUALITY IN IT TECHNOLOGY: CAUSES AND PROSPECTS

F. Akhmedshina*

*Professor,
Doctor of Historical Sciences,
Jizzakh State Pedagogical Institute Jizzak, UZBEKISTAN

ABSTRACT

The article discusses the impact of the growth of information technology on a sharp increase in the need for IT specialists. More often than not, tech corporations use a policy of attracting women to tech jobs to meet this challenge. In order to bridge the gender gap in technology, to encourage girls and young women to choose professions in the field of information and communication technologies, international organizations are pursuing policies aimed at attracting them to the field of IT technologies.

KEYWORDS: *IT Technologies, IT Specialists, Gender Gap, Technology Corporations, International Organizations, Training Centers, Competitions.*

INTRODUCTION

Every year, the information and communication technology (ICT) sector is developing rapidly, technological progress continues to transform the nature of production, employment, interaction and people's lives. The COVID-19 pandemic has spawned a "new normal" when the shift to teleworking and changes in consumer behavior have become trends that accelerate the digitalization of the world with all the opportunities it opens up [1]. It gave a powerful impetus to the digital transformation of many aspects of modern life, making possible not only remote work, delivery of goods, but also virtual events and the use of cloud technologies. The demand for the use of programs such as Microsoft Teams, Skype, Cisco's Webex and Zoom has increased [2].

Since the beginning of the COVID-19 pandemic, digital technologies have also been successfully applied in the field of health (screening the population, tracing infection, prioritizing the use and allocation of resources, developing targeted responses). In Chinese hospitals, robotic assistants delivered medicines to patients, collected garbage, bed linen, moved independently in crowded places, recognized faces, remotely measured the temperature, simultaneously tracking

up to 32 people. Scientists in Singapore have invented a cleaning robot that can be remotely controlled using a laptop or tablet, which can wash and disinfect hard-to-reach surfaces - under tables and beds. To eliminate the risk of transmission from infected patients to healthcare workers, Stanley College Hospital in Tamil Nadu, India, used robots to dispense food and medicine. In the Chinese provinces, drones with loudspeakers and thermal imaging drones were used to determine the temperature of a person's body, even on his balcony, and report the data to a medical facility [3].

ANALYSIS AND RESULTS OF THE STUDY

Information technology, having become the most promising industry in the modern world, is sharply increasing the need for IT specialists. More often than not, tech corporations use a policy of attracting women to tech jobs to meet this challenge. This opens up new perspectives for women with high levels of technical expertise.

In Uzbekistan, as well as throughout the world, the demand for experienced programmers is steadily increasing. However, as noted in the first Voluntary National Review (VNR) of Uzbekistan (2020), “despite numerous reforms and the results achieved in the education system, there is still a shortage of staff for programmers in the labor market. The demand for experienced programmers is still high, and there are very few candidates with relevant qualifications in the market. There is an urgent need for personnel who have a fundamental education in the field of IT and applied experience” [4]. In order to develop the digital economy, widely introduce modern information and communication technologies in all sectors and spheres, first of all, in public administration, education, health care and agriculture, to meet the labor market needs for qualified IT specialists, a decree of the President of the Republic of Uzbekistan “On approval strategy “digital Uzbekistan - 2030” and measures for its effective implementation” dated 5 October 2020 and the President's decree “On measures to further improve the education system in the field of information technology, development and integration of scientific research with the IT industry” dated 6 October 2020 ... Priority tasks for the further development of the ICT sphere in 2021 are also defined in the President's Address to the Parliament and the people of Uzbekistan dated December 29, 2020. All these important legal documents create a solid foundation for ensuring the development of the digital economy, increasing the efficiency of the training system for IT technologies.

According to the analysis, in Uzbekistan in 2017, the total number of women employed in the ICT field was about 30%, including in universities and colleges, the average number of girls who chose the IT field was about 15% and 27%, respectively [5].

By the beginning of 2020, the proportion of the population with information and communication technology skills, compared to 2017, improved in all indicators by an average of 0.9 PP. To meet the demand for experienced personnel, new directions and specialties have opened in the universities of the Republic [4]. Statistical data show that over the past 4 years, the trend in enrollment among female students at IT faculties was at the level of 15–25% [5].

In the republic, much attention is paid to increasing the interest and participation of women and girls in professional activities at enterprises in the ICT sector. With the support of the Ministry for the Development of Information Technologies and Communications, various IT contests and competitions among young people are organized and held, such as the Best Soft Challenge, the national Internet competition MIT (Milliy Internet Tanlovi), Technovation Challenge, etc.

Challenge for girls aged 15-18 as part of an international educational program for the development of IT and entrepreneurial skills in the field of information technology in 78 countries. The aim of the competition is to develop girls' skills in critical thinking, entrepreneurship in innovation spheres and programming, to increase the interest of girls in technical professions, as well as to attract the attention of the general public to the gender issue in technological spheres of the economy [5].

At the same time, there is a growing interest in coding bootcamps. These courses have won international recognition. Programming courses emerged in 2011 in the United States in response to two emerging trends: an increase in demand for software developers in all sectors of the economy and, to a certain extent, insufficient development of computer science curricula in formal educational institutions. In recent years, the number of courses has grown exponentially, with about 40 percent women. According to experts, the model of training courses can contribute to both reducing the skills gap and bridging the gender gap in the high-tech industry. Such rapid skill acquisition courses are beginning to emerge in different regions of the world [6].

In 2020, 14 specialized schools with in-depth study of computer science and information technologies were created in the republic (by 2023, it is planned to increase to 205). In each region, through the organization of Digital Technologies Training Centers, work has been established to educate the population, especially youth, the basics of programming, to create websites and mobile applications; IT Park branches have been opened in Andijan, Fergana, Syrdarya, Jizzakh and Samarkand regions, where more than 400 enterprises that have developed over 900 software. In 2020, 107 Digital Technology Training Centers were organized and over 200 jobs were created. In order to further develop IT education, it is planned to open a branch of the Tashkent University of Information Technologies in the Tashkent region, and technical schools for training personnel in the field of information technologies will be created in the regions. By the end of 2021, it is planned to open 100 Digital Technology Training Centers in all districts and cities of the republic [7].

In order to support women entrepreneurs in IT and girls who choose this profession, popularize the work of women in the high-tech industry, on the initiative of the MirzoUlugbek Innovation Center, the IT Women'sGap forum was convened (April 2019). The forum emphasized the need to change social stereotypes, to take special measures to integrate women in IT spheres [8].

The megaproject "One Million Uzbek Coders", implemented in cooperation with the Dubai Future Foundation (UAE), the IT Academy at IT-Park, Inha University in Tashkent and the Muhammad al- Khorazmiy, which covered over 120 thousand listeners in a short time [9]. The project is aimed at remote free education of the general population in relevant IT specialties through a specialized online portal (uzbekcoders.uz) [10].

According to hh.uz, if the increase in vacancies in the IT field in January-February 2019 compared to the same period in 2018 amounted to 65% [11], then in January-November 2020 compared to the same period in 2019 it amounted to 76.3%, which indicates an increase in demand for specialists in this field. In the course of the study, the company found that: 69% of job seekers are men [12].

In 2021, the implementation of the TechBika project for girls aged 12 to 30 began with the aim of training specialists for IT-Park residents and establishing a training system in eight areas in the field of information and communication technologies [13].

CONCLUSION

Undoubtedly, the further development of IT technologies will lead to the emergence of new production processes for the effective functioning of which will require mixed teams of specialists, both men and women. The active participation of women in this process serves as the basis for the optimization of economic, political, social and cultural processes. This will actualize the issues of correcting the existing gender gap, gender inequality in the field of IT technologies. Around the world, new perspectives are opening up for highly skilled women in technical fields. To solve the problem of greater involvement of girls and young women in the field of IT technologies, it is necessary to understand the cultural and social roots of the problem and create de facto conditions for equality of rights and opportunities. According to the authors of the Education at a Glance 2016 study, the causes of gender inequality in the IT sphere should be sought already at the stage of education. Since, due to social prerequisites, gender stereotypes everywhere, technical specialties are chosen mainly by boys. Therefore, there are so many IT specialists among men. For example, according to research in 2019, more than 91% of IT professionals in the world were men. In all countries of the world there is a stereotype that information technology is a “non-feminine occupation” [11].

Thus, the emerging modern technogenic civilization based on the rapid development of fundamentally new technologies is becoming a decisive factor in the cardinal transformation of all forms of social development. New information and communication technologies increasingly make it possible to model and predict the development of complex global processes and systems (ecological, economic, political, social and others), which contributes to the rationalization of these systems and increasing their degree of sustainability. According to analysts in the field of information technology, further digitalization of the world economy will lead to bridging the gender gap by attracting a large number of women to IT technology [10].

ABSTRACT

This article is devoted to the development of a method for monitoring and monitoring the condition of mountain layers in mountainous and foothill areas on the basis of integrated sensors of optical fiber communication.

KEYWORDS: *Railway, Optical Fiber, Technological Process, Optical Fiber Sensor.*

INTRODUCTION

Ensuring the implementation of plans for the transport of goods and passengers by rail, management of trains, organization of loading and commercial operations, operation and maintenance of technical means of railway transport, organization of safety of cargo and passengers and their timely arrival at their destinations, The development of the railway industry through the introduction of new technical innovations, increasing the profitability and productivity of railway work are among the key issues and tasks. [1].

- 1) Ensuring safety in the transportation of goods and passengers is of particular importance in railway transport. Because the process of movement in mountainous and foothill areas is complex and requires extreme caution. Mountainous areas are the most vulnerable areas to natural influences as we know them. Earthquakes, floods and other natural disasters, in particular, have a significant impact on train traffic. The following are real examples of these situations:

As a result of the earthquake that occurred on
January 23, 2017 in Kamchik Pass

1-picture.

2-picture.

According to media reports, the landslide damaged the freight train and suspended the Andijan-Tashkent-Andijan train indefinitely (Figure 1.2). [2]

On the night of June 30, 2008, a 6-car passenger train No. 1322 traveling from Guangzhou to Chongqing in China overturned as a result of a strong mountain landslide, injuring several people (Figure 3).

3- picture

A 2013 mountainous landslide in Wyoming, United States, caused a moving freight train to crash (Figure 4).

4-picture

The main cause of the above cases is a dangerous geological phenomenon - a mountain landslide caused by an earthquake. In order to prevent the recurrence of the above adverse events, it is important to monitor and control the condition of the soil layer in mountainous and foothill areas, which causes landslides. As an innovative solution, it is advisable to use a radiomonitoring system based on optical fiber sensors.

The small weight and volume of the optical fiber, the absence of fire hazard, high resistance to abrasion, low cost and the risk of explosion make it possible to use optical fibers as sensitive elements for the measurement system.

Optical fiber cables designed for data transmission can also be used as sensitive elements in determining temperature, pressure, vibration, and magnitudes that have a physical effect. The main advantages of such systems are the ability of power grids to serve you, the absence of the effects of electromagnetic interference, high sensitivity and small size. In addition, the use of standard optical fiber cables and elements used in telecommunications shows that the cost of such sensors is not expensive.

An optical fiber sensor (OTD) is a measuring instrument consisting of a measuring transducer (OO) that is transmitted from an optical fiber, connected to an optical signal processing and conversion device via an optical fiber communication line, and measures the physical size of any optical fiber signal. designed to present the measured data signals in the form of applications by varying the size.

The advantages of using optical fiber measuring sensors in the monitoring system of various objects and processes are:

- no impact on the measuring device;
- no problems with the heater;
- no problems such as arcing and sparks;
- high resistance to adverse environmental conditions
- possibility to carry out measurements in potentially explosive atmospheres;

- the impossibility of the fiber to chemically react with the measuring medium;
- high mechanical strength and simplicity of the system structure;
- resistance to temperature rise.

Another major advantage is the ability to perform remote measurements when electronic sensors cannot be used or are not recommended for use.

Based on the advantages and capabilities of the optical fiber sensors listed above, it allows for continuous monitoring of mountain layers and mountain migration processes in mountainous and foothill areas.

The continuous monitoring process (Figure 4) is performed by the data processing center.

Figure 4. The principle of organizing a radio monitoring system.

The center will be located at the nearest station on the mountain and in the foothills where the train is moving, the data will be processed, and if the area is concluded to be dangerous, the train driver will be notified by train radio. The train driver will take all necessary measures to ensure safety.

Similar innovative methods of railway transport aimed at ensuring the safety of trains running in mountainous and foothill areas, first of all, increase confidence in railway transport and bring great benefits to the economy of the republic.

ABSTRACT

We study one incoming, two outgoing and triangle graphs for the equation of linear KdV. Using the theory of potentials, we reduce the problem to systems of linear integral equations and show that they are uniquely solvable under conditions of the uniqueness theorem.

KEYWORDS: *Third Order PDE, Boundary Value Problem, Method Of Energy Integrals, Method Of Potentials, Initial Condition, Boundary Condition, Integral Equation.*

INTRODUCTION

In this paper, we address the linearized KdV equation on a star graph Γ with one bounded bond and two semi-infinite bonds connected at one point, called the vertex.

The bonds are denoted by B_j , $j = \overline{1,6}$ the coordinate x_1 on B_1 is defined from $-L_1$ to 0, and coordinates x_2 and x_3 and x_4 from links B_2 and B_3 and B_4 from 0 to L ,

and coordinates x_5 and x_6 on the bonds B_5 and B_6 are defined from 0 to such that on each bond the vertex corresponds to 0. On each bond we consider the linear equation:

$$\left(\frac{\partial}{\partial t} - \frac{\partial^3}{\partial x_j^3} \right) u_j(x_j, t) = f_j(x, t), \quad t > 0, x_j \in B_j, j = \overline{1,6}. \quad (1)$$

Below, we will also use the notation x instead of x_j , $j = \overline{1,6}$. We treat a boundary value problem and using the method of potentials, reduce it to a system of integral equations. The solvability of the obtained system of integral equations is proven.

1. Formulation of the problems

To solve the linear KdV equation on an interval, one needs to impose three boundary conditions (BC): two on the left end of the x -interval and one on the right end, (see, e.g., [5-6] and references therein). For the above star graph, we need to impose 5 BCs at the vertex point, which should provide also connection between the bonds and 2 BCs at the left side of B_1 . In detail, we require

$$\begin{cases} u_1(0,t) = u_2(0,t) = u_3(0,t), & u_{1x}(0,t) = \frac{1}{b_2}u_{2x}(0,t) = \frac{1}{b_3}u_{3x}(0,t), \\ u_{1xx}(0,t) = u_{2xx}(0,t) + u_{3xx}(0,t), & u_1(-L_1;t) = \phi_1(t), \end{cases} \quad (2)$$

$$\begin{cases} u_2(L_2,t) = u_4(0,t) = u_5(0,t), & u_{2x}(L_2,t) = \frac{1}{b_4}u_{4x}(0,t) = \frac{1}{b_5}u_{5x}(0,t), \\ u_{2xx}(L_2,t) = u_{4xx}(0,t) + u_{5xx}(0,t), \end{cases} \quad (3)$$

$$\begin{cases} u_3(L_3,t) = u_4(L_4,t) = u_6(0,t), & u_{3x}(L_3,t) = \frac{1}{b_4}u_{4x}(L_4,t) + \frac{1}{b_6}u_{6x}(0,t), \\ u_{3xx}(L_3,t) = u_{4xx}(L_4,t) + u_{6xx}(0,t), \end{cases} \quad (4)$$

for $0 < t < T$, $T = \text{const}$. Furthermore, we assume that the functions $f_j(x,t)$, $j = \overline{1,6}$ are smooth enough and bounded. The initial conditions are given by:

$$u_j(x,0) = u_{0,j}(x), \quad x \in \overline{B_j}, \quad j = \overline{1,6}. \quad (5)$$

It should be noted that the above vertex conditions are not the only possible ones. The main motivation for our choice is caused by the fact that they guarantee uniqueness of the solution and, if the solutions decay (to zero) at infinity, the norm (energy) conservation.

2. Existence and uniqueness of solutions

Lemma 1. Let $b_2^2 + b_3^2 \leq 1$, $b_4^2 + b_5^2 \leq 1$, $b_4^2 + b_6^2 \leq 1$. Then the (1)-(5) has at most one solution.

Proof of Lemma 1. Using the equation (1) one can easily get:

$$\frac{\partial}{\partial t} \int_a^b u_j^2(x,t) dx = \left(2u_j u_{jxx} - u_{jx}^2 \right) \Big|_{x=a}^{x=b} + 2 \int_a^b f_j(x,t) u_j(x,t) dx$$

for appropriate values of constants a and b on each bond. The, the above equalities and vertex conditions (2)-(5) yield:

$$\frac{\partial}{\partial t} \left(e^{-\varepsilon t} \|u\|^2 \right) \leq e^{-\varepsilon t} \left(\frac{1}{\varepsilon^2} \|f\|^2 + \phi_1^2(t) \right),$$

$$\|u\|^2 \leq \|u_0\|^2 + \int_0^t e^{-\varepsilon(t-\tau)} \left(\frac{1}{\varepsilon^2} \|f(\cdot, \tau)\|^2 + \phi_1^2(\tau) \right) d\tau, \quad (6)$$

Where

$$(u, v) = \int_{-L_1}^0 u_1 v_1 dx_1 + \int_0^{L_2} u_2 v_2 dx_2 + \int_0^{L_3} u_3 v_3 dx_3 + \int_0^{L_4} u_4 v_4 dx_4 + \int_0^{+\infty} u_5 v_5 dx_5 + \int_0^{+\infty} u_6 v_6 dx_6, \quad ,$$

$\|u\| = \sqrt{(u, u)}$ are L_2 scalar product and norm defined on graph, ε - is an arbitrary positive number.

Uniqueness of the solution follows from (6).

Lemma 2. a) Let $\omega \in [a; b]$. Then $u(x, t)$ satisfies $u_t - u_{xxx} = 0$ for $t > 0$ and:

$$\lim_{(x, y) \rightarrow (x_0, 0)} u(x, t) = \begin{cases} \pi \omega(x_0), & \text{if } x_0 \in (a, b); \\ 0, & \text{if } x_0 \notin (a, b). \end{cases}$$

b) Let $f \in L^2((a, b) \times (0, T))$. Then, $v(x, t)$ satisfies $u_t - u_{xxx} = \pi f(x, t)$ in $(a, b) \times (0, T]$, $T > 0$ and initial condition $u(x, 0) = u_0(x)$, $x \in (a, b)$.

c) If $\varphi_k \in H^1(0, T)$, then

$$\lim_{x \rightarrow a+0} \omega^{(1)}(x, t) = \frac{2\pi}{3} \varphi(y), \quad \lim_{x \rightarrow a-0} \omega^{(1)}(x, t) = -\frac{\pi}{3} \varphi(y), \quad \lim_{x \rightarrow a+0} \omega^{(2)}(x, t) = 0$$

Now, we are ready to construct exact solutions for the considered problems. We assume that initial data and source terms in each bond are sufficiently smooth and bounded functions.[16]

Main results

Theorem 1. Let $\det A \neq 0$, $\varphi_k \in C^1[0, T]$

Then the problem (1)-(5) has a unique solution in $u_{0,j}(x) \in C^3[0, T]$

$(C^1([0, T], C^3(\Gamma)))$

Proof of Theorem 1. To prove the theorem, we use the following functions are called fundamental solutions of the equation $u_t - u_{xxx} = 0$. (see [1, 3, 5, 12, 16]):

$$U(x, t; \xi, \eta) = \begin{cases} \frac{1}{(t-\eta)^{\frac{1}{3}}} f\left(\frac{x-\xi}{(t-\eta)^{\frac{1}{3}}}\right), & t > \eta, \\ 0 & t \leq \eta \end{cases}$$

$$V(x, t; \xi, \eta) = \begin{cases} \frac{1}{(t-\eta)^{\frac{1}{3}}} \varphi\left(\frac{x-\xi}{(t-\eta)^{\frac{1}{3}}}\right), & t > \eta, \\ 0 & t \leq \eta \end{cases}$$

where $f(x) = \frac{\pi}{\sqrt[3]{3}} Ai\left(-\frac{x}{\sqrt[3]{3}}\right)$, $\varphi(x) = \frac{\pi}{\sqrt[3]{3}} Bi\left(-\frac{x}{\sqrt[3]{3}}\right)$ for $x \geq 0$, $\varphi(x) = 0$ for $x < 0$ and $Ai(x)$ and $Bi(x)$ are the Airy functions. The functions $f(x)$ and $\varphi(x)$ are integrable and $\int_{-\infty}^0 f(x)dx = \frac{\pi}{3}$, $\int_0^{+\infty} f(x)dx = \frac{2\pi}{3}$, $\int_0^{+\infty} \varphi(x)dx = 0$.

We summarize some properties of potentials for (1) from [3,5]. Forgiven ω , f and φ let:

$$u(x, t) = \int_a^b U(x, t; \xi, 0) \omega(\xi) d\xi, \quad v(x, t) = \int_0^t \int_a^b U(x, t; \xi, \tau) f(\xi, \tau) d\xi d\tau,$$

$$\omega^{(1)}(x, t) = \int_0^t U_{x\xi}(x, \eta; a, t) \varphi(\eta) d\eta, \quad \omega^{(2)}(x, t) = \int_0^t V_{x\xi}(x, \eta; a, t) \varphi(\eta) d\eta.$$

Below, we also use fractional integrals [8]

$$J_{(0,t)}^\alpha f(t) := \frac{1}{\Gamma(\alpha)} \int_0^t (t-\tau)^{\alpha-1} f(\tau) d\tau, \quad 0 < \alpha < 1$$

and the inverse of this operator, i.e. the Riemann-Liouville fractional derivatives [8, 9] defined

$$\text{by: } D_{(0,t)}^\alpha f(t) := \frac{1}{\Gamma(1-\alpha)} \frac{d}{dt} \int_0^t (t-\tau)^{-\alpha} f(\tau) d\tau, \quad 0 < \alpha < 1.$$

We look for solution in the form:

$$u_1(x, t) = \int_0^t U(x, t; 0, \eta) \varphi_1(\eta) d\eta + \int_0^t U(x, t; -L_1, \eta) \alpha_1(\eta) d\eta + F_1(x, t)$$

$$u_k(x, t) = \int_0^t U(x, t; 0, \eta) \varphi_k(\eta) d\eta + \int_0^t V(x, t; 0, \eta) \alpha_k(\eta) d\eta + \\ + \int_0^t U(x, t; L_k, \eta) \beta_k(\eta) d\eta + F_k(x, t), \quad k = 2, 3, 4.$$

$$u_5(x, t) = \int_0^t U(x, t; 0, \eta) \varphi_5(\eta) d\eta + \int_0^t V(x, t; 0, \eta) \psi_5(\eta) d\eta + F_5(x, t), \\ u_6(x, t) = \int_0^t U(x, t; 0, \eta) \varphi_6(\eta) d\eta + \int_0^t V(x, t; 0, \eta) \psi_6(\eta) d\eta + F_6(x, t),$$

Where

$$F_k(x, t) = \frac{1}{\pi} \int_0^t \int_{B_k} U(x, t; \xi, \eta) f_k(\xi, \eta) d\xi d\eta, \quad k = \overline{1, 6} \quad (7)$$

Satisfying the conditions (2) we have:

$$a) \quad u_1(0, t) = u_2(0, t) = u_3(0, t),$$

$$f(0) \varphi_1(t) - f(0) \varphi_2(t) - \varphi(0) \alpha_2(t) + \\ + \frac{1}{\Gamma\left(\frac{1}{3}\right)} D_{(0,t)}^{\frac{2}{3}} \int_0^t \frac{1}{(t-\eta)^{\frac{1}{3}}} f\left(\frac{L_1}{(t-\eta)^{\frac{1}{3}}}\right) \alpha_1(\eta) d\eta - \\ - \frac{1}{\Gamma\left(\frac{1}{3}\right)} D_{(0,t)}^{\frac{2}{3}} \int_0^t \frac{1}{(t-\eta)^{\frac{1}{3}}} f\left(\frac{-L_2}{(t-\eta)^{\frac{1}{3}}}\right) \beta_2(\eta) d\eta = \\ = \frac{1}{\Gamma\left(\frac{1}{3}\right)} D_{(0,t)}^{\frac{2}{3}} [F_2(0, t) - F_1(0, t)] \quad (8)$$

(8*) can be derived from (8)

$$f(0) \varphi_1(t) - f(0) \varphi_2(t) - \varphi(0) \alpha_2(t) + \\ + \frac{1}{\Gamma\left(\frac{1}{3}\right)} \int_0^t K_1 \alpha_1(\eta) d\eta - \frac{1}{\Gamma\left(\frac{1}{3}\right)} \int_0^t K_2 \beta_2(\eta) d\eta = \\ = \frac{1}{\Gamma\left(\frac{1}{3}\right)} D_{(0,t)}^{\frac{2}{3}} [F_2(0, t) - F_1(0, t)] \quad (8^*)$$

\end{aligned}$$

We obtained the system of integral equations (8) – (22) with respect to unknowns

$$\Phi(t) = (\varphi_k(t), \psi_n(t), \alpha_i(t), \beta_i(t))^T. \quad k = \overline{1, 7}; n = 1, 2; i = 2, 3, 4$$

$$\text{matrix } A = \begin{pmatrix} A_1 & 0 & 0 \\ 0 & A_2 & 0 \\ 0 & 0 & A_3 \end{pmatrix}$$

$$\text{I-Bondmatrix : } A_1 = \begin{pmatrix} f(0) & -f(0) & 0 & -\varphi(0) & 0 & 0 \\ f(0) & 0 & -f(0) & 0 & -\varphi(0) & 0 \\ f'(0) & -\frac{1}{b_2}f'(0) & 0 & -\frac{1}{b_2}\varphi'(0) & 0 & 0 \\ f'(0) & 0 & -\frac{1}{b_3}f'(0) & 0 & -\frac{1}{b_2}\varphi'(0) & 0 \\ -\frac{\pi}{3} & -\frac{2\pi}{3} & -\frac{2\pi}{3} & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & f(0) \end{pmatrix}$$

$$\det A_1 \neq 0$$

$$\text{II-Bondmatrix : } A_2 = \begin{pmatrix} f(0) & 0 & -\varphi(0) & f(0) & 0 \\ 0 & -f(0) & 0 & f(0) & -\varphi(0) \\ -\frac{1}{b_4}f'(0) & 0 & -\frac{1}{b_4}\varphi'(0) & f'(0) & 0 \\ 0 & -\frac{1}{b_5}f'(0) & 0 & f'(0) & -\frac{1}{b_5}\varphi'(0) \\ -\frac{2\pi}{3} & -\frac{2\pi}{3} & 0 & -\frac{\pi}{3} & 0 \end{pmatrix}$$

$$\det A_2 \neq 0$$

$$\text{III-Bondmatrix: } A_3 = \begin{pmatrix} 0 & f(0) & -f(0) & 0 \\ -f(0) & f(0) & 0 & -\varphi(0) \\ -\frac{1}{b_6}f'(0) & f'(0) & -\frac{1}{b_4}f'(0) & -\frac{1}{b_6}\varphi'(0) \\ -\frac{2\pi}{3} & -\frac{\pi}{3} & -\frac{2\pi}{3} & 0 \end{pmatrix}$$

$$\det A_3 \neq 0$$

$$\det A \neq 0$$

According to the asymptotes of Airy functions the kernels of the integral operators are integrals (see [14, 15]). Hence, it follows from the uniqueness theorem and Fredholm alternatives that the system of equations has a unique solution. Thus the solvability of the problem is proved.

ABSTRACT

The article highlights the essence of student's research competence, the features of project-based learning in its development, as well as the possibility of using project-based learning technology in the process of theoretical training and qualification practice.

KEYWORDS: *Scientific Research Competence, Project Training Technology, Theoretical Training, Qualification Practice.*

INTRODUCTION

In the current context of globalization, one of the main tasks of higher education institutions is to train cadres which possess up-to-date knowledge and are independent-minded, scientifically and pedagogically competitive, as a solution for this, increasing the effectiveness of research work in higher education, the targeted orientation of students to conduct research remains an urgent pedagogical issue.

In this regard, a number of decrees and resolutions have been signed by President Sh.M.Mirziyoyev. In particular, the Decree PF No.5847 on October 8, 2019 on the "Concept of development of the higher education system of the Republic of Uzbekistan until 2030" pays special attention to increasing the efficiency of research in higher education, attracting young people to scientific activities, the formation of innovative science infrastructure [1, 3].

Scientific research is the process of developing new knowledge, one of the types of cognitive activities. It is characterized by objectivity, reliability, accuracy. Scientific research, when repeated under all conditions, must always give the same result, proving the point in question. Scientific research consists of two interrelated parts - experiment and theory. The main components of scientific research: definition of the topic, pre-analysis of existing information, conditions and methods in the field of research, scientific hypotheses, experiments, analysis and generalization of results, verification of hypotheses based on evidence, expression of new facts and laws, scientific prediction. It is common to divide scientific research into fundamental and applied, quantitative and qualitative, unique and complex research. The methods and practices of scientific research are widely used not only in science itself, but also in solving many economic and social problems [2, 121].

Scientific research consists of a set of goal-oriented creative actions of human mental activity. The purpose of this activity is to study and discover new scientific knowledge about an event or process, to improve it and to apply it in social life [3, 22].

Scientific research activities provide practical assistance to self-awareness, self-evaluation, that is, if a person wants to be a real scientist, he must manage his passions and aspirations, make rational, effective and optimal decisions, engage in heuristic activities that serve goodness. The result of such activity is manifestation as discovery, creativity. This situation opens up new possibilities in the analysis, understanding and evaluation of scientific and creative activity. In this context, a more in-depth study of the approaches to the research process will help to find its specific features [4, 4].

Students' research activities are one of their individual forms of work. This is the most important part of the training process for future professionals. Individuality ensures the activation of the intellectual activity of the student, the independent acquisition of knowledge, the development of creative abilities, the formation of professional skills, the formation of professional skills of the future specialist [5, 194].

Through the content of education, students should be equipped with knowledge, skills and competencies about the essence of research, algorithms, methods and tools of the research process. In shaping the competence of students to conduct research, we first tried to study the pedagogical potential of the educational content (qualification requirements, curriculum, science programs). It should be noted that the classification of professional competencies specified in the qualification requirements does not include research activities, only the subject of "General Pedagogy" taught at the undergraduate level is limited to one topic of research in the standard subject program.

Organizing the learning process through active and interactive learning, being able to see and solve problems, work on educational projects, perform tasks of a heuristic and creative nature is an important condition for the formation of research competence in students. Independent forms of education in most disciplines do not reflect the research nature, which leads to difficulties in the implementation of course work and graduate project work.

As part of our research, a survey was conducted among students of 1-4 courses of Fergana State University in the areas of "Pedagogy and Psychology" and "Primary education and sports education" to determine their readiness for research work (112), in which the following questions were asked:

1. What research did you do at school? What results did you achieve? Give examples?
2. Do you want or are you doing research in scientific circles at the university?
3. Describe “research activities”.
4. Describe “Project Activities”.
5. What is the difference between research and project activities?
6. What topics of research and project work do you think are the most relevant and interesting today?
7. Please finish the sentence: "If research and project work with students will be successful."
8. Do you want to do project and research work (or study for a doctorate) after graduating from university?
9. How many points would you rate your readiness to conduct personal research from 1 to 5 points?
10. How many points would you rate your competence to conduct personal research from 1 to 5 points?

Only 37% of students surveyed answered “yes” to the first question of the survey, and only 19% published articles in newspapers before entering university. Only 30% of students want to study science (or do research in academic circles), 20% answered “no” and 50% found it difficult to answer. Only 30% of students (when asked for definitions of “Research Activity” and “Project Activity”) were able to give an acceptable definition of the concepts of research and project activity (no one gave a clear definition). This is definitely a very low figure.

The results show that the competence of students of higher education institutions to conduct research is not sufficiently formed. One of the main reasons for this is that students do not have enough understanding and skills about scientific research. This creates a need to improve the system of formation of competence in conducting research among students of higher education institutions.

As a result of many studies, we have been convinced that project-based learning technology is one of the technologies to effectively develop students' research competence.

Project education opportunities for students in the development of the main components of research competence (value-based approach, project-creative, subjective-transformational, control-correctional) are wide, integrating professional, research and educational activities of future professionals, developing a project attitude to their personal lives teaches. This method involves the use of a set of methods such as research, heuristic, problem-solving, group work, as well as the integration of reflexive, productive, exploratory, creative and other modern methods. Project training is effective in the following cases:

- in systematic, one-time or long-term observations of certain psychological and pedagogical processes and events that require the collection of initial data to solve the problem;
- research or comparative study of a particular pedagogical phenomenon, process, fact, in making pedagogical decisions or making recommendations;

- in a comparative study of the effectiveness of solving the same or different problems to determine the most effective solution;
- in the joint development of an idea (practical or creative);
- when presenting a future project or its results.

As a result of our research, a model of continuous, step-by-step formation of research competence in higher education has been developed. Based on three levels of personality activity, developed by AM Novikov, we have divided the formation of research competence into three stages (situational activity, situational activity, creative activity). In addition, we envisage that project technology will implement projects at three levels:

- ✓ small (mini) projects (e.g. solving traditional learning problems) are suitable for first-level situational activity;
- ✓ large, medium-sized secondary projects (midi projects) corresponding to a strong situation, personal activity (for example: preparation of abstracts, reporting, game situation design, etc.);
- ✓ Large tertiary educational projects (maxi projects), relevant creative activity of the individual (for example, course and diploma work)[6,17].

Our analysis showed that there are specific features of the implementation of project-based learning technology, which depend on the type of training (theoretical, practical). In the process of theoretical education, through project activities, students perform small projects, ie learning tasks and tasks in the form of traditional education.

The research shows that in the process of passing theoretical lessons from course to course, it is necessary to develop students' independent work in project activities, strengthen interdisciplinary interdependence, strengthen ties with real life and professional practice.

The role of project education in the pedagogical practice of students is invaluable. The research showed that the main task of passive practice is to study in depth the research activities and experiences of school teachers, to implement projects such as "Methods and programs for studying the research activities of school teachers" by students. At the pre-internship conference it is expedient to make the study of methods and methodology of innovative pedagogical experience as a didactic requirement in the formation of research competence in students. For this purpose, we proposed to include in the composition of elective courses the course "Methods and methodology of scientific pedagogical research.

During the period of active pedagogical practice of research work, the main issue is large-scale projects of medium level (m: designing and conducting a problem lesson, preparation and organization of scientific-practical conferences among students, etc.) preparation and implementation of high-level (course work, preparation and defense of graduate work).

In-depth study of the course "Methods and methodology of scientific pedagogical research" before the internship leads to an increase in research competence of students during the internship.

The considerations given above show that the use of project-based teaching technology in higher education influences the effective development of students' research competence. At the same time, the development of an organizational and pedagogical mechanism for the integration of

teaching technologies as a condition for optimizing the competence of research leads to an increase in the quality of professional training of graduates.

UZBEKISTAN

ABSTRACT

The article shows that insufficient attention is paid to the issues of heat storage and earthquake resistance in the individual, individual construction of buildings, the heat-retaining materials used in these buildings have a porous structure, and therefore the relative strength is much lower than dense structures. In the construction of these buildings, it is recommended to build the main load-bearing structures from high-strength materials, such as steel, reinforced concrete, wood and composite materials, and to restore the retaining walls and roof structures from porous materials.

KEYWORDS: *Steel. Reinforced Concrete. Current Development Of Housing Construction. Currently Heating Buildings And Structures*

INTRODUCTION

One of the main problems in the current development of housing construction is to reduce the consumption of fuel and energy resources, in this regard, saving energy used not only in the production of building materials, but also in the operation of buildings and structures to heat them.

Currently, about 35% of the total energy resources are used to heat buildings and structures. Compared to European countries, CIS countries consume 2-3 times more energy per single dwelling area. Similarly, in Russia, the heat consumption in multi-storey residential buildings is 350-550 KWh / (m²yl), while in cottage-type detached houses this figure is 600-800. In Germany, for example, an average of 250 kWh / m² per year in courtyard-type buildings, -135

kWh / m² per year in Sweden, 90-120 kWh / m² per year in the highest quality foreign residential buildings / 2/.

It was found that the specific heat loss of the conditionally obtained accommodation is as follows: through the wall - 36%, through the window - 24%, from the window openings with infiltrated air space between them - 37%. On other values: through the wall - 45%, windows and doors - 33%, between the roof and partitions - 22%. In order to reduce heat loss according to these values, first of all, it is necessary to equip the walls and partitions of houses with heat-insulating layers.

Great importance is attached to increasing the thermal resistance of barrier structures around the world and in the CIS countries. For example, the decision of the State Construction Committee of Russia of March 25, 1994 prohibits the use of single-layer panels made of material with a density of more than 900 kg / m³ in the construction of prefabricated reinforced concrete residential and public buildings in order to save fuel and energy resources. It is recommended to replace the panels. From September 1, 1995, paragraph 3 of SNiP II-3-79 "Building heat engineering" construction norms and rules was amended, which provides for a gradual increase in the thermal and technical characteristics of barrier structures.

In the first stage, by increasing the coefficient of resistance of walls to heat transfer from 1.16 m² S / W to 2.2 m² S / W, the heat consumption in modern buildings is reduced by 17%. The requirements of this stage are met by thermo coupled three-layer expanded clay-concrete panels made of expanded polystyrene concrete slabs.

For three-layer panels it is effective to use concrete with a heat-retaining medium layer density of 300-500 kg / m³, compressive strength of 0.5..2.5 MPa, and their thermal conductivity is 2.5 compared to the single-layer lightweight concrete used. It is required to be 4 times lower. In these cases, the traditional fillers (perlite, expanded clay and its types), amorphous (porous) layered structural fillers (penosteklogranulyant, azerite, barotelite, diolite and steclosite) can be used, the thermal conductivity of which is obtained from crystalline structures, wood and agricultural wastes. The concentration is 25-30% lower than that of foamed polymer granules.

The thermal storage properties of three-layer panels in the middle layer of concrete can be increased by 20-30% by using active additives such as low-energy clinker-free or low-clinker binders obtained on the basis of industrial waste or mountain-volcanic effluents (tuff, pumice, volcanic slag, etc.) instead of portland cement.

Factors arising from the application of three-layer barrier structures to increase their resistance to thermal conductivity by 2-2.5 times, reduce material consumption, in terms of operational requirements, even if the thickness of the walls and roof (2-3 times) is reduced due to the thermal resistance of the thermal insulation layer. That is, a given climate is achieved by stabilizing the heat-humidity regime in the rooms, which is crucial.

The technical advantage of using three-layer structures in construction is characterized by the ability to reduce the weight of barrier structures (4-5 times on average), expand the range of supporting structures and facilitate free planning in residential, public and industrial buildings, increase earthquake resistance due to reduced inertial mass.

The use of three-layer construction will increase the quality of construction - improve the thermal insulation properties of buildings; increase the soundproofing properties of structures;

serves to give a modern look to buildings and structures on the basis of the requirements for decorative and artistic quality.

For the wide application of three-layer barrier construction, the technology of processing and preparation of cold-waterproof layer composition in the middle layer is also necessary to expand the production of ultra-light filler. It is necessary to conduct a comprehensive study of the physical and mechanical properties of such concretes, the formation of cracks in the outer layer of structural concrete and three-layer structure under different forces, to develop a method for calculating hardness and strength.

However, the above considerations remain relevant, mainly for buildings being built in public partnership. Insufficient attention is paid to the issues of heat conservation and earthquake resistance in the personal, individual thinking of citizens. Solving the problem in a complex is a difficult task. Most heat-retaining materials have a porous structure, so their relative strength indexes are much lower than those of dense structures.

CONCLUSION

Based on the above, we recommend that the main load-bearing structures in the construction of local residential buildings be constructed of high-strength materials, such as steel, reinforced concrete, wood and composite materials, and the retaining walls and roof structures from multilayer structures made of porous materials. In this way, while maintaining the cost of the building, we will ensure the compatibility of its performance, such as durability, spatial viability, earthquake resistance and heat retention.

PSYCHODIAGNOSTICS OF CHILDREN WITH ATTENTION DEFICIENCY SYNDROME AND HYPERACTIVITY

Askarova Nargiza Abdivalievna*

*Senior Lecturer,
Tashkent Medical Academy,
UZBEKISTAN

ABSTRACT

The article analyzes the issue of psychodiagnostics and selection of diagnostic methods for attention deficit and hyperactivity syndrome in children, as well as the results of research in this area. The high results on the attention deficit scale indicate a low level of attention compared to the control group of the main group of subjects. Therefore, DESG means that children have problems with compliance with social norms of behavior, reading, mastering the learning material. Such symptoms, i.e., emotional instability and psychomotor restlessness, are also observed in children with neurosis. According to IP Brezgunov and EV Kasatkina, dyslexia, dysgraphia and dyscalculia are secondary symptoms in DESG.

KEYWORDS: *Psychodiagnostics, Hyperactivity, Emotional-Volitional Sphere, Cognitive Processes, Fine Motor Skills, Behavior.*

INTRODUCTION

The problem of attention deficit syndrome and hyperactivity is not only in the urgency of child health, but it is a psychological problem of the civilized world. Evidence of this can be seen in the following: first, children with this syndrome are poorly integrated into the school curriculum; secondly, they do not obey generally accepted rules and often fall into the path of crime. 80% of the criminal group consists of people with DESG, thirdly, they have three times more accidents, they have 7 times more car accidents; fourth, these children are 5 to 6 times more likely to be drugged or alcoholic than normal children; fifth, 5% to 30% of children with this syndrome. The ability of a person to enter into interpersonal relationships, to find his place in society and to develop his emotional and volitional management skills in a normal way is important for the successful implementation of the process of personality formation.

The main function of emotion in a person is to ensure that these people can understand each other unconditionally, engage in joint activities and communication. In order to carry out this process more successfully, a person must be able to control his emotional state, his emotions with the power of his will. Poor development of emotional and volitional management skills in children causes serious problems in the education system, interpersonal relationships in groups and families, the organization and management of educational activities.

Fighting, aggression, stubbornness, anger, impatience, high levels of rudeness, and inability to consciously control behavior in students in this group often lead to conflicts between peers and family members. Therefore, they are more reprimanded and punished than others. As a result, they lose self-confidence, self-esteem, and a sense of accomplishment. Misunderstanding and punishment of such children by teachers and parents leads to school maladaptation, the formation of delinquent behavior. Delinquent - an offender who does not fulfill his obligations. Therefore, it is important to be able to diagnose and eliminate this syndrome in a timely manner.

There can be a number of difficulties in diagnosing a child with Attention Deficit Hyperactivity Disorder (DESG). In his research, NN Zavadenko emphasizes that DESG should not be confused with autism, schizophrenia, manic-depressive syndrome and mild olegophrenia. Such symptoms, i.e., emotional instability and psychomotor restlessness, are also observed in children with neurosis. According to IP Brezgunov and EV Kasatkina, dyslexia, dysgraphia and dyscalculia are secondary symptoms in DESG. Thus, the psychological study of children who are presumed to have DESG should cover several areas: the level of attention and memory development; the specificity of the child's emotional sphere; to study the child's perception of the family environment; Specificity of a child's behavior at home and at school (kindergarten) One of the most effective methods in diagnosing DESG is standardized observation, to which criteria have been developed by American psychiatrists.

Such major behavioral disorders are accompanied by other serious disorders, including low mastery and difficulties in communicating with others in the first place. Low mastery is typical for hyperactive children. This is explained by the specificity of their behavior, their behavior does not meet the age norm and seriously hinders the child's full participation in learning activities. The methodology used in our research is the "scale that determines the emotional state of the child."

This questionnaire was developed by Russian psychologists A.P.Golovey and E.F.Ribalko and is used to determine the degree of manifestation of emotional states in a child, to what extent they are expressed. According to the results of the J. Swanson survey used in our research work, high scores were obtained on the four scales in the main group. In the control group, the opposite was observed. Scale I - attention deficit was 22.6 in the main group, this indicator was 4.7 in the control group, Scale II - 22.4 in the main group on impulsivity / hyperactivity, 3.6 in the control group, Scale III - group abnormalities averaged 32.3 in the main group and 5.4 in the control group, while the IV scale - attention without hyperactivity was found to be 27.2 in the main group of subjects and 4.06 in the control group.

The high results on the attention deficit scale indicate a low level of attention compared to the control group of the main group of subjects. Therefore, DESG means that children have problems with compliance with social norms of behavior, reading, mastering the learning material. Also on this scale it is possible to assess the completion and direction of the child's

mental activity, thinking about the institutions, the process of development of the individual in specific conditions. Statistical processing of the results showed high levels of attention deficit in children with DESG.

This condition leads to neglect, easy involuntary distraction, superficial assimilation of new material, and reflex activity is noted in people with sluggishness. A correlation was also found between anxiety, impatience, agitation, and high levels of aggression. This communication showed a high level of anxiety in children with attention deficit disorder. In addition to anxiety, there is impatience and irritability. High levels of agitation and impatience often lead to conflict situations where children with DESG cannot get out independently.

The fact that such children are not accepted by their peers is reflected in insults and intimidation. According to our observations, in children with this syndrome, the tone of voice changes, they use elements of verbal and nonverbal aggression, beating. The predominance of play motives over reading motives, inadequate conditions for teaching problem children, lead to behavioral disorders, anxiety, and school maladaptation.

The indicators on the scales of the survey "Assessment of the emotional state of the child" were as follows. The highest scores on the survey scales, i.e., "sensitivity" 0.37, "impatience" 0.34, "stubbornness", "masculinity-impulsivity" 0.32, were higher than J. The relevance of the Swanson questionnaire to the 'group disorder' scale indicator does not contradict the data in the literature and confirms the validity of the results obtained in the J. Swanson questionnaire, the DESG showed emotional psychological instability in children.

Low scores on the sympathy scale indicate emotional alienation (coldness), mild, superficial character, and inability to express one's feelings, which is typical of children with DESG. These figures averaged 0.5 in the main group and 2.6 in the control group. On the "jealousy" scale, the average was 2.9 in the main group and 0.9 in the control group. This means that DESG in children is egocentrism, anxiety, insecurity.

Also, high scores on the scale of group disorders "anger" 3.5, "aggression" 3.6, "anger" 3.8 indicate emotional disorders in such children. The main group's score on the "cheerfulness" scale is 0.96, and in the control group - 2.9, which indicates that their mood is unstable, they do not understand the jokes of their peers and others, and always respond to them rudely.

Such high scores on the scales "Susceptibility" 3.4, "masculinity" 3.23 "group disorders" - 0.36 mean that they are easily offended by even the smallest things, as men they always think of their own interests, try to be the center of attention. as a result, they find it difficult to enter into interpersonal relationships in the group and become isolated.

On the scale of "gentleness" in the main group was recorded 0.43, in the control group - 2.1 result observed. This is manifested in the lack of communication skills in children with this syndrome, ignorance or inability to use verbal and nonverbal means of communication, frequent use of harsh words, insults, constant shouting when communicating with others.

In particular, on the scales of "fear" and "suspicion" were recorded 3.06 and 3.33, respectively, while in the control group these indicators were 1.1 and 1.06. These results indicate that DESG children are afraid of their own situation and the consequences of misbehavior, of seeing others as enemies, of constant anxiety.

In conclusion, the methodologies selected for the study of individual characteristics of children DESG cover the entire measuring spectrum of children's characteristics: conditions of development and development, level and quality of attention, behavioral specificity and personality traits, development of cognitive processes, capillaries the degree of development of motor skills. If mutual understanding, patience, and a warm attitude toward such children are maintained, all behavioral and cognitive impairments will disappear after DESG psychocorrection. Otherwise, character flaws will persist and can lead to more serious consequences.

ABSTRACT

This article shows the possibilities of increasing the resistance of the silkworm to various diseases, the amount of silkworm production using an air aeration device when growing the silkworm. High humidity and strong gas heat in the wormhole have a negative impact on the life of the worms. It causes additional diseases. Therefore, depending on the outside air temperature every two hours, it is necessary to open the doors and windows and ventilate for 15-30 minutes.

KEYWORDS: *Ionic; Aerotonizer; Silkworm; Electric Field; Electron; Corona Discharge; Air Ion.*

INTRODUCTION

In order to further develop the silk industry of the country, the Resolution of the President of the Republic of Uzbekistan ShavkatMirziyoyev dated March 29, 2017 No 2856 "On measures to organize the Uzbek cotton industry" sets out the main measures to reform the silk industry. In this historic resolution, special attention is paid to the provision of breeds and hybrids suitable for the climatic conditions of the country, as well as increasing the volume and quality of cocoon raw materials grown [1].

Silkworm rearing and silkworm rearing in Uzbekistan is one of the leading sectors of agriculture and industrial production in the country.

Now, in the conditions of transition to a market economy, the capacity and forms of privatization of agricultural and industrial enterprises of the silk and silk industry of Uzbekistan have changed. It is known that Uzbekistan ranks 4-5 in the world in the production of silkworm cocoons and raw silk [2].

Improving the efficiency of production in the agricultural sector, the development of its material and technical base has become one of the main factors of scientific and technological progress. It is difficult to imagine the technical aspects of the management of the agricultural system today, without electricity, which is the most convenient, yet unique type of energy, and in turn without the improvement of production processes.

Fresh air and light regime play an important role in the growth and development of silkworms. In the process of respiration, worms release a lot of "carbon dioxide" gas and moisture. Especially at the age of IV-V, worms breathe strongly. High humidity and strong gas heat in the wormhole have a negative impact on the life of the worms. It causes additional diseases. Therefore, depending on the outside air temperature every two hours, it is necessary to open the doors and windows and ventilate for 15-30 minutes. If the air is cool, the ventilation time can be reduced to 10-15 minutes, which naturally leads to excessive energy wastage and constant labor to reheat the room [3]. In this regard, in order to eliminate these inconveniences and increase the efficiency of silkworm breeding, the article considers the application of electro technological methods in the process of feeding silkworms.

It is known that today foreign and domestic scientists believe that light negative ions in the atmosphere have a positive effect on humans and livestock in certain doses, light and heavy ions with a positive signal do not have such an effect. gas exchange in the lungs and enzyme activity have been found to increase protective function.

In fact, how is air aeration done? The air around us contains neutral atoms, molecules and ions of its constituent gases. Ions or aeroions are formed when neutral atoms and molecules of gases in the air donate their electrons or add foreign electrons. As a result of this process, negative or positive charge ions are formed in the air [4].

Negative aeroions have been shown to stimulate biological processes and have a beneficial effect on living organisms. Natural ionization of air occurs under the influence of radioactive substances in the soil and air, as well as cosmic rays. There are 700... 1000 air per 1 cm³ outside and less than 100 aeroions in the rooms.

In rooms where living organisms live, such as livestock farms, the small amount of negative aeroions is explained by the high humidity and dustiness of the air, which causes gas ions to combine with very fine liquid or solid particles to form heavy ions. There are also heavy ions in the air that respiratory organisms emit, with more positively charged ones in them. This adversely affects the physiological state of the organism. Therefore, it is necessary to maintain a certain concentration of negative aeroions at all times by artificially ionizing neutral particles of air in the rooms [4,5].

Needle electrodes or small-diameter wire are used as crowns in the discharge gaps used to aerate the air in silkworm rearing rooms, which are given a negative potential of 10... 80 kV from a

high-voltage source. The second electrode is the barrier of the chambers, mainly the floor with a galvanic contact through the ground with the positive pole of the source [6].

Equipment used for aeroionization should fill the air of silkworm rooms with the required amount of light negative ions and not adversely affect them and the service personnel. Electrical aerators using a crown discharge meet these requirements.

Corona discharge is one of the characteristic discharge forms for strong non-homogeneous electric fields. To form such a discharge, at least one of the electrodes of the discharge gap must have a radius of curvature not large. When a certain voltage is applied to the discharge gap, the voltage near the electrode with a small radius of curvature reaches 15 kV/cm and above. Intensive shock ionization of gas atoms around it begins, forming positively and negatively charged ions moving towards the corresponding polar electrodes. With the ionization of air, there is a process of recombination of positive ions and electrons, which combine to release large amounts of photons when the atoms return to a neutral state, resulting in the formation of a specific oil. This was called the radiating area corona layer, or inner zone, or crown sheath, around the electrode with a small radius of curvature, and the electrode was not corona. In the remaining part of the air gap, called the outer zone of the crown, no conductive channel is formed and the inter-electrode space does not completely lose its insulating properties. The voltage between the electrodes must be increased again for the gap to be completely perforated.

Negative ions and electrons formed in the corona layer move through the electric field lines of force, creating a stream of charged particles in the outer zone of the corona discharge. In this case, the free electrons are added to the neutral molecules of the gas, forming new negative aeroions, primarily to oxygen, and, they, too, move towards the grounded positive electrode.

The needle discharge device consists of a metal mesh with a square or triangular grid, the nodes of which have steel needles with a length of 20... 40 mm and a tip with a radius of curvature of 0.1... 0.3 mm. The wire mesh is pulled from the metal tube to the prepared frame. The frame is hung on the ceiling surface on one or more high-voltage insulators like a chandelier. The tips of the needles point towards the area.

Needle discharge equipment ensures even distribution of aeroions in small rooms. They are used for local ionization of air in rooms or in the area where living organisms live.

Wire coated electrodes ensure a sufficiently even distribution of ions in large volume rooms. In this case, the crown electrodes are mounted using high-voltage insulators attached to the ceiling or walls of the room.

The maximum concentration of negative aeroions on the surface perpendicular to the electrode axis is formed under the wire and decreases as it moves away from its axis. Under the conditions of mechanical strength, the wire diameter is assumed to be the minimum allowable (up to 0.1 mm).

The voltage at which an electric field is generated by a crown discharge is called critical. It is found in the empirical expression of Pickney:

$$E_0 = 30,3p(1 + \frac{0,298}{\sqrt{\rho R r_0}})10^5,$$

here: E_0 -critical intensity of the crown discharge, B/m; ρ -relative density of air, кг/м^3 , (density of air under normal conditions $\rho_0=1,29 \text{ кг/м}^3$ -in relation to); r_0 -radius of the crown electrode, m.

The initial discharge voltage of the crown discharge for wire surface type electrodes:

$$U_0 = E_0 r_0 \ln \frac{2h}{r_0},$$

h -the distance from the crown electrode to the surface, m.

When the source voltage is multiplied by a value above the critical value, the current, A/m, which corresponds to the unit length of the corona wire electrode, increases in a quadratic relationship.:

$$I = \frac{\varepsilon_0 \pi^2 k U (U - U_0)}{h^2 \ln(2h/r_0)},$$

here: ε_0 -electrical constant, $\Phi/\text{м}$ ($\varepsilon_0=8,85 \cdot 10^{-12} \Phi/\text{м}$); k -the mobility of negative aeroions, $\text{м}^2/(\text{В} \cdot \text{с})$ [$k \cdot 1,8 \cdot 10^4 \text{ м}^2/(\text{В} \cdot \text{с})$]; U - voltage between electrodes, B.

The number of aeroions, obtained from the unit of length of the coiled wire electrode:

$$n_1 = I/e = \frac{\varepsilon_0 \pi^2 k (U - U_0)}{h^2 \ln(2h/r_0) e},$$

e -aeroion charge, Cl ($e=1,6 \cdot 10^{19} \text{ Cl}$).

In rooms where silkworms are kept, including rooms where other living organisms live, coronary aeroionizers should operate in a mode that prevents the formation of ozone and its oxides, as they contribute to the formation of electric discharges at large currents. Limiting resistors with a resistance of 108 108 1010 Ohm are connected in series with the crown electrodes to stabilize the discharge current.

Electric corona air ionizers consume less electricity even in the relative size of the rooms of silkworm rearing rooms. The reason for this is that the average lifespan of aeroions is 10 s. A discharge current equal to one-tenth of a milliamperere is required to produce the desired concentration.

The required discharge current to the crown, A:

$$I = enV/\tau,$$

here: n -the desired concentration of aeroions, ион/см^3 ; V -the ionizing volume of the rooms, см^3 ; τ - The average duration of the "life" of aeroions, c.

The effect of aeroions on biological objects depends on the concentration of ions, the operating mode of the equipment during the day, the duration of the cycles and the breaks between them.

In any case, the concentration of aeroions should not exceed the cut-off value - 106 ion- см^3 . The operation of the aeroionizers is controlled by programmed equipment and is automatically maintained by changing the daily measures during a given cycle.

In addition to the beneficial physiological effects on living organisms, artificial aeration of the air reduces the number of dust and microorganisms and consequently reduces disease, increases silkworm productivity.

Observations have shown that the ionic composition of the room differs from the ionic composition of the outside air due to the fact that silkworms are kept indoors. Some of the light ions coming through the air settle on the elements of the ventilation system, while the light ions left inside the building disappear into heavy ions. As a result, silkworm disease and malnutrition are observed. Theoretical and scientific experiments are being carried out to study the effects of artificial electrical ionization on the environment of the silkworm breeding room. At the same time, the incidence of silkworm disease in ionized air is expected to decrease by 5-10%, feeding by 12%, and silkworm productivity by 3-6%. Ionized air was given in combination with aeration 3 to 6 times a day, depending on the age of the silkworms.

ABSTRACT

The article examines the device for protection against short circuits, fires and explosions caused by overcrowding of high-power transformer substations used in power transmission systems. The device that starts the electric motor in the event of an emergency of the transformer consists of an electrical contact device connected via a thermorelay, which is attached to the body of the transformer. Let's look at the operation of a transformer fire and explosion protection device.

KEYWORDS: *Thermal Relay; Thermo-Sensor; Cooling Radiator; Radiator Freonrunning Pipes; Freon Storage Volume (Barrel); Dielectric Oil Storage Barrel.*

INTRODUCTION

In recent years, our country has undergone radical changes aimed at developing the economy and improving the living standards of the population. At present, it is impossible to imagine all sectors of the economy and our life without electricity. Such rapid growth rates in all sectors of society and the economy is leading to an increase in the demand for electricity in the first place.

Particular attention is paid to the development of energy in the country, the stable supply of electricity to consumers. It is known that in power distribution networks, high-voltage energy

(550 kW; 110 kW; 10 kW; 6 kW) is converted to a voltage of 0.4 kW through step-down transformer substations [1].

In these processes, many failures are observed as a result of overloading of step-down transformer substations. Depending on the failure status of the transformers, overloading can cause the transformer oil to overheat and cause a short circuit. As a result of the inability of existing automated protection devices and systems to fully and reliably protect expensive high-voltage transformers, there are interruptions in the uninterrupted power supply to consumers. In this regard, it is necessary to use methods and devices based on new technologies that protect high-voltage transformers from short circuits in emergencies. It is known that one of the most pressing problems of current uninterruptible power transmission is to ensure the uninterrupted operation of the transformer, as well as its long operation at high power, by continuously controlling and preventing the overheating of the dielectric cooling oil of high-voltage transformers. Analyzing the research and engineering work carried out in this area, for example, a method and device for preventing the explosion of a transformer, developed by Indian scientists, and then preventing fire, have been proposed. The device consists of a housing filled with coolant and pressure sensors placed inside it, which activate the valves and emit inert gases inside the vacuole. The pressure rise as well as the pressure generating agent are not shown here [2,3]. A device that protects the automatic connection network from transformer explosion and high-pressure ignition is also known, which includes a gas relay, a sensitive electrical relay, a special relay, a dielectric cooling tank, a control unit, and a generated nitrogen gas leak. Dielectric oil emits nitrogen gas during cooling of the boiler, with the release of nitrogen gas, the gas relay and the sensitive electric relay are activated and send a signal to the control unit [4,5,6]. The method and tool used in this device cannot fully meet the current need. Also, this device does not have a system for automatic disconnection and reconnection of the transformer in the event of a short circuit in the high and low voltage lines. The protection of these proposed devices does not meet current requirements. As the demand for power supply increases, the protection devices of transformer devices have not changed significantly. Given the shortcomings of the above devices, it is necessary to introduce means to ensure continuous, high power and long-term operation of the transformer by continuously monitoring the temperature of the dielectric coolant and preventing overheating to increase the efficiency and uninterrupted operation of transformer devices. To achieve this task, we present the block diagram of the device that protects and ensures the uninterrupted operation of the following transformer devices, as well as the device that protects the transformer from fire and explosion (Figure 1). The proposed transformer fire and explosion protection device includes a radiator, thermo relays and sensors made of coolant-filled tubes housed inside its housing, as well as a pump for circulating the coolant in the radiator and a ventilator for additional cooling of the radiator from the outside of the transformer housing.

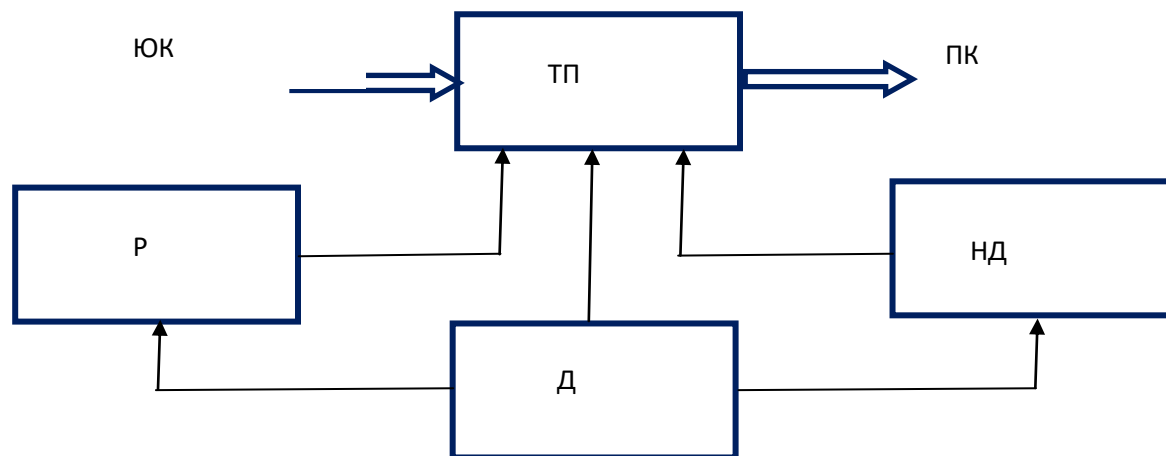

Figure 1. Block diagram of the transformer fire and explosion protection device.

This means that the fire and explosion protection device of the transformer consists mainly of four parts, namely, T-transformer, D-sensor, N-pump, which carries out the circulation of cooling oil; R- radiator and fan. The design of the proposed transformer fire and explosion protection device is connected to the data sensor and fastened to the housing by means of a switch. The cooling radiator is also attached to the housing by means of a tube that measures the transformer housing. The electric motor of the freon propulsion pump is attached to the Freon storage barrel through a tube. The high voltage and low voltage insulators of the transformer and the neutral wire of the transformer is connected to the ground from the housing. The device that starts the electric motor in the event of an emergency of the transformer consists of an electrical contact device connected via a thermorelay, which is attached to the body of the transformer. Let's look at the operation of a transformer fire and explosion protection device. It is known that when a transformer substation is operated at full power for a long time, the primary and secondary windings start to heat up, respectively. At the same time, the dielectric oils inside the transformer housing also begin to heat up. The heating of the dielectric oil often reaches the level of the combustion temperature, and this process can lead to an explosion. In the proposed device, a temperature control device is placed inside the transformer housing. The control device-sensor transmits the message to the thermocouple when the temperature of the oil reaches 80°C. Thermorele 1 will start 2 electric motors 12 and 15, respectively. The first electric motor 15 turns the main blade 8 and the radiator 15 starts to cool the freon. The second electric motor 12 starts the gear pump 11. The gear pump creates a large pressure and forces the freon 6 in barrel 13 to circulate inside the transformer housing and provides circulation through the freon tubes and the cooling device inside the transformer 19 starts to cool the transformer coil 20 and the dielectric oil. The sensor, immersed in transformer oil, extends the chain of the cooling system 24 through a thermorelay with dielectric oil, primary and secondary coil temperatures of 60°C. At the same time, the operation of the transformer is prolonged and will last for many years. The wiring diagram of the transformer fire and explosion protection device is shown in Figure 2 and its structural design is shown in Figure 3. This protection device was used in the transformer 63/10, which supplies electricity to the small processing company "Nur", which operates in the town of Yazyovan, Yazyovan district, Fergana region. The transformer fire and explosion protection device used a pump of model MDW-07 (or MDW-15MDW-15S with a

capacity of 1.1 kW) with a power of 0.5 kW and a speed of 2760 rpm, as well as a device RJ-6511 as a cooling system. This device has a motor that rotates the blade of the radiator and the fan attached to it. By extending the service life of transformers in the power transmission system, it is possible to reduce economic costs by up to 60%, prevent interruptions in the system and ensure uninterrupted power supply to consumers.

ABSTRACT

The article describes the linguopragmatic approach of tourism, analyzes its main components, reflecting the relationship between linguopragmatics and the theory of speech acts. The article substantiates the structure and content of professional intercultural competence, which are formed within the framework of the linguopragmatic approach to teaching professional communication in a foreign language.

KEYWORDS: *Tourism, Lingvoculture, Communication, Classification, Lingvopragmatics.*

INTRODUCTION

The communicative-pragmatic turn in linguistics marked a shift in the interest of researchers from studying the internal properties of the language system to analyzing the functions of language in the complex structure of human communication, and also drew the attention of scientists to the very term "pragmatics", which was practically not used in linguistics until the middle of the twentieth century. The rapid development of linguistic pragmatics has led to, that the field of study of this new science began to include everything that goes beyond traditional system linguistics, which rapidly expanded the scope of its object and made its boundaries very vague. To this day, the question of the relationship between pragmatics and linguistics remains controversial.

Tourism is an intensively developing industry in the context of globalized economic relations, influencing the strengthening of interpersonal and intercultural interaction, expanding the boundaries of knowledge. Along with the traditional types of tourism: business, educational,

cultural, sightseeing, historical, commercial, pilgrimage, etc., there are new ones: gastronomic, extreme, festival, ecological, rural, etc., which is associated with new tourist goals that lead to the emergence of innovative routes.

Linguistic research in the field of tourism discourse has been actively conducted over the past decade, since the tourism industry, which is rapidly developing around the world, has its own language. However, scientists still face many issues that require detailed study. Moreover, one of such questions is the typological status of the tourist discourse. This problem was dealt with by O. R. Bondarenko, who investigated the dominant properties of English-language discourse in the field of tourism; V. A. Maslova, who considered the advertising nature of tourist discourse; E. E. Menshikova, who studied tourist discourse in media texts; N. V. Filatova, who studied the genre space of tourist discourse. It is also worth noting that the tourist discourse is a popular object of modern dissertation research: for example, M. G. Vokhrysheva in her work studied the communicative strategies of dialogic influence in the tourist discourse; N. A. Tyuleneva described linguocognitive strategies for positioning and promoting tourist services; S. A. Pogodaeva studied linguistic means of argumentation in tourist discourse.

Tourist discourse is a relatively new area of linguistic research. His research is carried out by R. Bondarenko, M. G. Vokhrysheva, V. A. Maslova, E. E. Menshikova, S. A. Pogodaeva, N. A. Tyuleneva, N. V. Filatova.

There are several points of view about the typological status of tourist discourse: whether it is an independent type of discourse or acts as a subtype of advertising. Thus, O. V. Goncharova, V. A. Maslova, E. E. Menshikova, S. A. Pogodaeva and N. V. Filatova believe that tourist discourse is an independent linguistic phenomenon, and advertising is a part of it. In turn, N. A. Tyuleneva argues that the tourist discourse is part of the advertising discourse. In her dissertation research, Tyuleneva notes that "tourism discourse is a special subspecies of advertising discourse that combines various types of tourism advertising and is aimed at positioning and promoting tourist services through argumentation strategies that have a linguocognitive character".

T. M. Zavgorodnaya distinguishes three types of addressee in the spheres of functioning of tourist discourse: mass, collective and individual addressee. Individual means a tourist, collective - all kinds of organizations engaged in the tourist business, mass-representatives of various societies. However, it should be noted here that if tourists act primarily as an addressee, then organizations and individuals representing the tourist business can act both as an addressee and as an addressee. It seems that when identifying the characteristic features of the tourist discourse and its varieties, it is necessary to take into account, first, the specifics of communication with tourists (both potential and actual tourists) and, secondly, the specifics of professional communication of organizations and individual employees engaged in the tourism industry.

The specific features of the sphere of functioning of tourism discourse discussed above give grounds to define its typological status as follows: (a) tourism discourse is undoubtedly an institutional category, since it is used primarily in communication situations in which at least one of the parties represents a social and / or economic institution that operates within the tourism business (management, marketing, financial flows, personnel policy, public relations, media resources, institutes of culture and art of different countries, state, legal, social, environmental organizations); (b) entering the space of institutional discourse, tourist discourse can be classified as a variety of business discourse, since its attributive features clearly show formality

(participants of communication are in official relations with each other, when both or one of the parties performs specific professional functions), status (relations provide for social distance), the presence of a business problem, certainty in time and place, normativity of communicative behavior, etiquette, tonality, varying depending on the type of addressee: in the case of communication between representatives of organizations — formality, neutrality, etiquette; in the case of communication with tourists-emotionality, evaluativeness, trust, deliberate transition to friendly relations, psychological impact, etc.

The tourist discourse is also characterized by a special language that is colorful in creating images and describing tourist places. M. Francesconi argues that the following basic language features are characteristic of the tourist discourse: terminological accuracy and pragmatically deterministic selection of language means used by the sender of the message.

In public tourist discourse, the goal is to form a positive attitude of the potential tourist to the proposed tourist product and further implementation of this product, therefore, in this subspecies of tourist discourse, manipulative strategies are mainly used, which involve influencing the addressee in order to encourage him to carry out post-communicative actions desired for the other side of communication. Undoubtedly, such goals require the use of psychological factors (emotional, ethical, aesthetic impact on the addressee). As an example of the psychological (emotional) impact on a potential tourist, we give several texts of advertising travel companies: **"You will have something to remember!"; "Paris is city of lovers!"; "So the Gods rested!"; "Great journeys - fascinating places!"; "Unforgettable journeys!"; "Have a good journeys!"**.

Thus, in the tourist discourse, the choice of topics, images and language means is determined by pragmatics, i.e. the emphasis is placed on those means and topics that will most effectively influence the consciousness of customers, motivate them to make a purchase and go on a trip. It is important to note that advertising messages are often based on the values and categories that are important in this particular society. Next, taking into account all of the above, we will consider the specifics of the Spanish tourist.

Concluding the discourse consideration of the specifics of tourist discourse, we emphasize the following:

- being a kind of institutional business discourse, tourist discourse has such attributive features as formality, status, normativity, etiquette, business tonality;
- in its linguistic and pragmatic characteristics, the tourist discourse is not homogeneous - in accordance with the specifics of the communicative situations, the goals of functioning and the type of addressee, it can be divided into three subspecies: professional, academic and public tourist discourse;
- argumentative strategies prevail in professional and academic tourist discourse, while manipulative strategies come to the fore in public discourse, but this does not exclude the presence of some common characteristics, such as intellectual, rational, and psychological arguments, which are inherent to different degrees in each of the subspecies of tourist discourse;
- the differences in the tourist discourse used depending on the specifics of the communicative situations are clearly shown in the lexical composition of the texts functioning in this type of

institutional business discourse: in professional and academic tourist discourse, the frequency is marked by terms and special vocabulary, in public - the vocabulary with evaluative and emotive connotations prevails.

The above facts and arguments can serve as a basis for the conclusion that pragma linguistics should rather be understood as an area parallel" to syntax, while syntax is considered as a system discipline (the area of Langue), and pragma linguistics as a communicative discipline (the area of Parole). However, in order for communication to take place, it is necessary to have the same "code" in the minds of the interlocutors - language competence, they must speak the same language. In contrast to speech acts, the system of language is something general and permanent. Language is the basis of the infinite number specific speech acts. On the other hand, the existence of a language is justified only in so far as it is realized in these particular speech acts. Thus, speech and language are inextricably linked, assume each other. However, in their essence, these are fundamentally different things, so they should be considered and studied independently of each other

ABSTRACT

The article discusses methods for solving problems and exercises using tables and diagrams in the study of atomic composition. In the tabular form of the problem, the reader must enter the number of protons, neutrons, electrons, the charge of the nucleus and nucleons of the unknown element. In the diagrammatic method, based on the given data, it is necessary to determine the element or determine the number of elementary particles in the element and their percentage. Such methods require the student to have a basic knowledge of atomic structure. To do this, the student must first thoroughly study the theoretical part of the topic. Therefore, first of all, the student is given an atomic model. Depending on this model, the student shows the location of each particle in the atom, the symbol and the charge of the elementary particles.

KEYWORDS: Atom, Proton, Neutron, Electron, Nucleon, Atomic Charge, Element Serial Number, Relative Atomic Mass.

INTRODUCTION

An atom is the smallest unit of common substance that makes up a chemical element. Every solid, liquid, gas, and plasma is composed of neutral or ionized atoms. Atoms are extremely small, usually about 100 picometers across. They are so small that, due to quantum effects, it is impossible to accurately predict their behavior using classical physics [1-3].

Each atom consists of a nucleus and one or more electrons associated with the nucleus. The nucleus consists of one or more protons and several neutrons. Only the most common type of hydrogen has no neutrons. More than 99.94% of the mass of an atom is in the nucleus. Protons have a positive electrical charge, electrons have a negative electrical charge, and neutrons have no electrical charge. If the number of protons and electrons is equal, then the atom is electrically neutral. If an atom has more or less electrons than protons, then it has a common negative or positive charge, respectively - such atoms are called ions [4].

The electrons of an atom are attracted to the protons in the atomic nucleus by electromagnetic force. Protons and neutrons in the nucleus are attracted to each other by nuclear force. This force is usually stronger than the electromagnetic force, which pushes positively charged protons away from each other. Under certain circumstances, the repulsive electromagnetic force becomes stronger than the nuclear one. In this case, the core splits and leaves behind a different elements and particles. This is a form of nuclear fission.

The number of protons in the nucleus is the atomic number, and it determines which chemical element the atom belongs to. For example, any atom containing 29 protons is copper. The number of neutrons determines the isotope of the element. Atoms can attach to one or more other atoms by chemical bonds to form chemical compounds such as molecules or crystals. The ability of atoms to combine and dissociate is responsible for most of the physical changes seen in nature. Chemistry is the discipline that studies these changes.

To give an initial idea of the atomic structure of an unknown element, students are given a drawing that describes a graphical model of the atomic structure of this element (Fig. 2). According to the picture, the student must find out which particle is included in the structure of the atom and write the name of the elementary particles and their symbols

Fig. 2 . Atomic structure of an unknown element

Answers to Figure 3

Fig. 3. Student's answer to the atomic structure of an unknown element

Tabular method.

The tabular method is a very convenient method for studying the composition of an atom. Thanks to this method, the reader quickly understands the composition of the nucleus of an element, the equality of the atomic number to the charge of the nucleus, and develops his knowledge on this basis. Below is an example that requires filling in the blanks.

Atom	Number of protons	Number of electrons	Nuclear charge (Z)	Number of neutrons	Number of nucleons
one	one	?	?	?	?

Step 1. Based on the data provided, the student determines the atomic mass of an element from the periodic table of elements and, on this basis, determines the number of neutrons. The next time the reader fills out the spreadsheet, the student automatically switches to determining relative atomic mass and quickly guesses if the number of protons is equal to the number of electrons, or vice versa.

Atom	Number of protons	Number of electrons	Nuclear charge (Z)	Number of neutrons	Number of nucleons
one	one	one	+1	0	one

Step 2. The next line will fill in another cell of the element.

Atom	Number of protons	Number of electrons	Nuclear charge (Z)	Number of neutrons	Number of nucleons
one	one	one	+1	0	one
2	?	6	?	?	12
3	?	?	+12	12	?
four	?	80	?	120	?
five	15	?	?	?	31

Step 3. The reader now quickly realizes that the number of nucleons is the relative mass of the atom, that electrons do not take into account the relative mass, or that the charge of the nucleus is equal to the number of protons.

Atom	Number of protons	Number of electrons	Nuclear charge (Z)	Number of neutrons	Number of nucleons
one	one	one	+1	0	one
2	6	6	+6	6	12
3	12	12	+12	12	24
four	80	80	+80	120	200
five	15	15	+15	16	31

Step 4. In this table, you can also add the element symbol or the serial number of the element instead of the main charge.

Element symbol	Number of protons	Number of electrons	Element ordinal number	Number of neutrons	Number of nucleons
N	?	?	?	?	14
P	?	?	?	?	31
O	?	?	?	?	16
Na	?	?	?	?	23

Answers:

Element symbol	Number of protons	Number of electrons	Element ordinal number	Number of neutrons	Number of nucleons
N	7	7	7	7	14
P	15	15	15	16	31
O	8	8	8	8	16
Na	eleven	eleven	eleven	12	23

Or you can enter the name of the item.

Element name	Number of protons	Number of electrons	Element ordinal number	Number of neutrons	Number of nucleons
Nitrogen	?	?	?	?	15
Phosphorus	?	?	?	?	32

answers:

Element name	Number of protons	Number of electrons	Element ordinal number	Number of neutrons	Number of nucleons
Nitrogen	7	7	7	8	15
Phosphorus	15	15	15	17	32

Chart Method

The charting method is very useful when studying atomic composition. Such questions allow the reader to see what the atom as a whole is made of. Below is the composition of the isotope of element 14 - nitrogen (Fig. 4) .

Fig. 4. Nitrogen isotope

Answers to fig. 4

The student must find protons, electrons and neutrons according to the diagram. Another example is the use of diagrams to identify hydrogen isotopes.

Fig. 5. Isotopes of hydrogen

By looking at the diagram, the reader can guess about each isotope of hydrogen. Depending on the scheme, the student learns the composition of the isotopes of protium 1p, 1e, 0 n, deuterium 1p, 1e, 1n, tritium 1p, 1e, 2n.

The diagram below shows four oxygen isotopes. The student must figure out which oxygen isotope is shown in Fig .

Fig. 6. Oxygen isotopes

According to the diagram, the students calculate that it is given from the isotopes Oxygen-15, Oxygen-16, Oxygen-17, Oxygen-18.

Alternatively, the composition of the isotope can be predicted. The student should write down the percentage of a given isotopic composition based on the data provided [5].

For example, argon contains 18p, 18 e-, 22 n.

Fig. 7 . Isotope argon-40

Answers Fig. 8. Isotope argon-40

CONCLUSION

The tabular method for solving logical problems was proposed by the Hungarian logicians D. Bizam and J. Herzog. According to this method, tables (matrices) of all possible combinations of terms appearing in the reasoning are built, so that then, on the basis of the information contained in the conditions of the problem, delete impossible combinations. The remaining cells are the final conclusion. Such a tabular form is in a sense a continuation and generalization of Carroll diagrams. In fact, we are talking about Carroll diagrams using exclusively general negative judgments.

REAL-TIME ANALYZING OF CHATBOT DATA WITH DISTRIBUTED SYSTEMS

Boltayev B. R*; Xujamov D. J**

^{1,2}Master,

Tashkent University of Information Technology,
Named after Muhammad Al-Khorezmi of Urgench Branch,
UZBEKISTAN

ABSTRACT

Chatbots are one of the most widely used technologies to implement virtual assistance. Presently, chatbot based virtual assistants are being used by many web administrators to mediate access to data and to carry out generic conversations with the users. Such virtual assistants are getting a lot of attention from the business organizations, as it can help in improving customer care support; reduce the costs in customer service centers and can handle multiple clients at a time. Big data analytics is the process of collecting, organizing and analysing large data sets to discover patterns and unknown correlations hidden in the data, such as usage statistics and customer preferences, which can serve as valuable business information. This paper describes the implementation of a chatbot framework with an interface to big data. This implementation would provide mass knowledge analysis capability to chatbots from distributed environments, which can further the spectrum of usage of such intelligent agents.

KEYWORDS: Chatbot, Play Framework, Akka, Cassandra, PostgreSQL, Elasticsearch.

1.INTRODUCTION

Many companies have recognized chatbots as “the next big thing” in terms of customer relationships. In today's digital age these relationships are shaped by an empowerment of customers due to increased information availability, digital communication channels and more diverse possibilities for reaching customers. Regarding the usefulness of chatbots from the customers' point of view, a chatbot enables 24-hour customer service, personalized interaction and no waiting time. For companies, chatbots entail time and cost savings as many processes can be automated and employees can be appointed to more complex tasks. [1]

One of the familiar technologies to implement virtual assistance is chatbot. Chatbots, also known as conversational agents, are software frameworks that can respond to natural language inputs and attempts to hold a conversation in a way that imitates a real person. Chatbots communicate with their human partners through various frameworks ranging from a simple text interface to speech recognition features. [2]

II. THE USE OF CHATBOTS

Definition The word “chatbot” consists of the terms “chat” and “robot”. Originally, the term chatbot was used for a computer program, which simulates human language with the aid of a text-based dialogue system. Chatbots contain a text input and output mask, which allows mobile users to communicate with the software behind them, giving them the feeling of chatting with a real person. [3]

Generally, chatbots have quite similar technologies and architectures. Figure 1 shows the technical process of a chatbot, when a user makes a request until the appropriate answer is sent by the chatbot. And responsible users like managers request report or statistics to control behavior of chatbot.

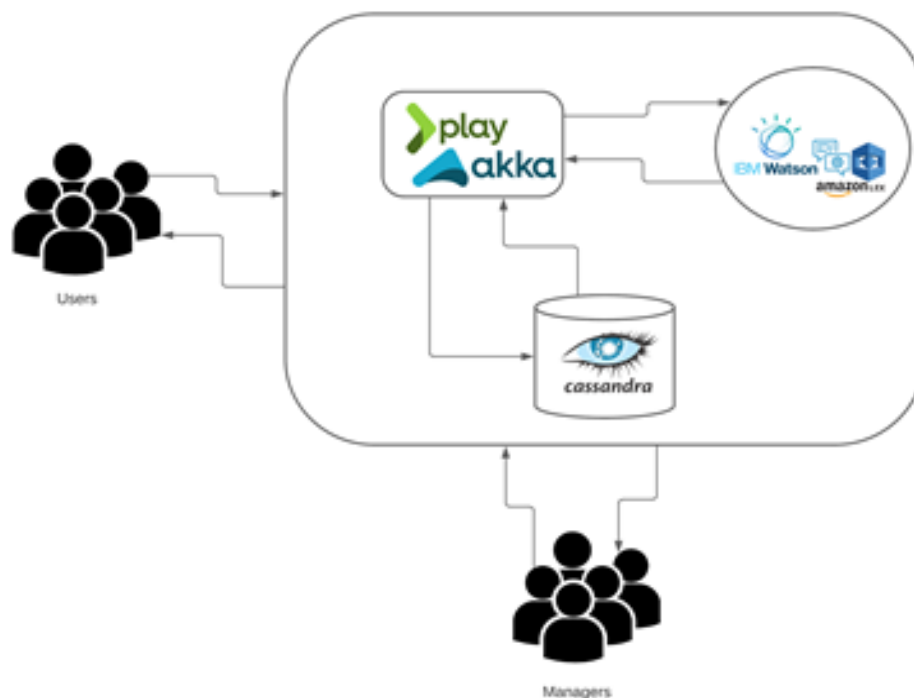

Fig.1 General Model of building chatbots

The process starts with a users' request using messengers or widgets in the web pages or via SMS. The users' request is processed by mini-program, which can handle concurrently many requests. In this section is used technologies Play framework [4] and Akka[5], which is the construction of concurrent and distributed applications. Next one is described API of IBM Watson [6] or Amazon Lex [7], which is recorded by NLP and is translated into the programming language of the conversation engine, then it analyses the question and redirects to

back-end Play/Akka construction. Each process will be saved to NoSQL Database Cassandra [8] to support chats in real-time after amount of time and it will store data for reporting and statistics.

Benefits of Structure:

- Quick response.
- Continue conversation after any amount of time.

Challenges of structure:

- High consumption of RAM.
- By increasing conversations recovery becomes slow (after restart server while deployment).
- Elastic requests of report and statistics become not effective.

To solve the problem of reporting need to add another database which has good adaptation for query requests.

Fig.2 Chatbot model with NoSQL and SQL databases.

PostgreSQL – it's database, which has good adaptation with query request. Now not all data will be stored in Cassandra, all data will be transferred to PostgreSQL. Data of last several days will be stored on Cassandra to provide continue conversation in real-time without delays. For reports and statistics will start working PostgreSQL.

Benefits of structure:

- Quick response.
- Continue conversation after several days.
- Elastic requests of report and statistics become not effective.
- Old data will be stored in ROM last, new data will be stored in the RAM.

Challenges of Structure:

- Search texts or phrases inside of bot or user inputs becomes difficult

To improve search from input text need to integrate with search tool by effective indexes.

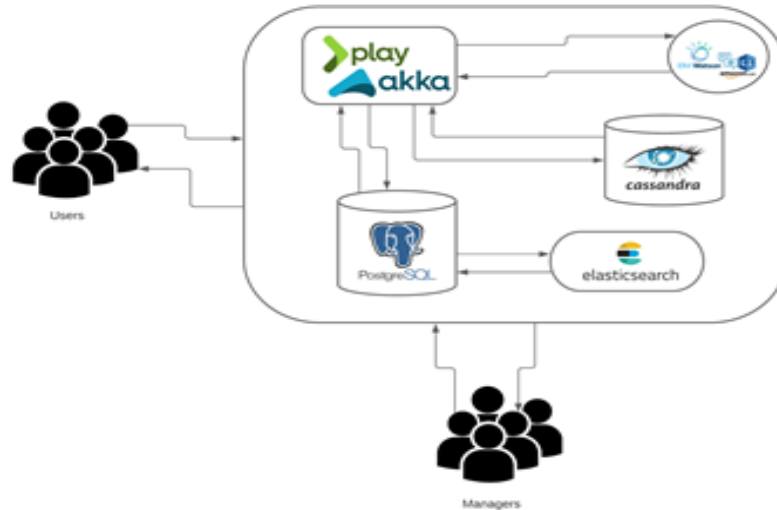

Fig.3 Structure with search engine as Elastic search

With help of Elastic search [9] searching texts or phrases inside of bot or user inputs becomes easy and fast. It works with synchronization with Postgre SQL. For main reports Postgre SQL will be used, but for detailed searching Elastic search will be used

III. RESULTS AND DISCUSSION

Fig.4 Comparing of Figure 1,2,3

In the Fig.4 can be seen first model (Fig.1) fully works with RAM, but not effective for reporting and input search. The second model (Fig.2) good for reporting, but still not for input search. The third model (Fig.3) shows, that any search, reporting problems are solved.

IV. CONCLUSION AND FUTURE WORK

The use of new technologies provides many opportunities for improvement and optimization of the existing system. Since with the accumulation of data, their processing will require the use of other technologies these structures can be further optimized using big data technologies like Spark, Hadoop, Storm, and Kafka.

THE ROLE OF INNOVATIVE LECTURES IN THE IMPROVEMENT OF STUDENTS ' PROFESSIONAL THINKING

Kurbanova Gulnoz Negmatovna*

*Associate Professor,
Head of the Department of Pedagogy,
Psychology and Languages,
Bukhara State Medical Institute,
Bukhara city, Republic of UZBEKISTAN

ABSTRACT

The article gives account of the findings of the research on the efficient lecturing techniques and the methods of enhancing students' cognitive activity at lectures. The results of a survey at the university show that in the process of mastering the material, students are ranked fourth in terms of the effectiveness of lectures - training and production practice, workshops and laboratory classes, as well as independent study. In their view, e-manuals on a particular course prevent unnecessary summarizing of lecture materials and allow more time to be spent on the internship process.

KEYWORDS: *Student, Thinking, Development, Lecture, Method, Reception, Activation.*

INTRODUCTION

The relevance of the topic is a number of researches and developments of domestic and foreign scientists in this field (OR Rozikov, KZ Zaripov, BR Adizov, N. Saidakhmedov, O. Tolipov, I. O. Zagashyev, S. I. . Zair-Bek, L. F. Krasinskaya, L. I. Savva, T. G. Galaktionova, A. A. Verbitsky, Ya. R. Yakupova, Dillon JT, Halpern D, and b) and the existence of teachers in many higher education institutions. is marked by a special interest in the subject of our study.

In the educational process we call traditional, lecture sessions have been recognized as the primary form of teaching students. But lately, we are witnessing a drastic change in attitudes towards the report. Due to the widespread use of modern media, opportunities for direct reading and study of electronic copies of e-learning materials, including textbooks, manuals and guidelines, as well as their reproduction are expanding [1, 2, 12, 15, 33, 43].

The results of a survey at the university show that in the process of mastering the material, students are ranked fourth in terms of the effectiveness of lectures - training and production practice, workshops and laboratory classes, as well as independent study. In their view, e-manuals on a particular course prevent unnecessary summarizing of lecture materials and allow more time to be spent on the internship process. It is unfortunate that most of the lecture sessions organized in educational institutions are organized on the basis of some inconsistencies, which inevitably have a negative impact on the effectiveness of the sessions. In the mentioned lectures, the teaching materials are presented verbally, with very little use of visual materials, and the saddest thing is that they are organized in the form of low intellectual activity of students. It is known that fundamental knowledge is not generated adaptively, that is, simply by adding new information to existing information [3,10,11,20,25,44,50].

Acquisition of fundamental knowledge requires intensive thinking activities aimed primarily at understanding, processing and systematizing the learning material. Many students are left at the stage of intellectual development at the level of mastering unanalyzed knowledge, it is difficult to express their views on the problem, comparative analysis of alternative ideas, generalization of concepts in the content of materials, draw conclusions [4,5,13,14,21,22,41, 42,51].

A natural question arises. Is it possible to ensure the effectiveness of lectures through the use of pedagogical methods aimed at activating students' thinking? or is it possible to develop students' professional thinking based on modern teaching methods and pedagogical methods while ensuring the effectiveness of lecture sessions?

The purpose of our study was to study the methods aimed at activating the memory and thinking of students in the course of lectures developed by researchers, and to assess their use in the educational process of students of medical pedagogical education.

Lecture is one of the main organizational forms of teaching that continuously manages the learning activities of students.

The term *maurza*, derived from the Latin word *lection* (reading), first appeared in ancient Greece and began to be recognized as the main form of teaching in ancient Rome. Lectures in higher education institutions are the main link in the didactic cycle in the educational process, the purpose of which is to form a solid scientific and theoretical basis for students to master the next parts of the educational material.

The report performs the following functions:

- Information (provides the necessary information);
- Stimulant (arouses interest in the topic);
- Educator, developer (evaluates events, develops thinking);
- Reference;
- Explanatory (for example, the main scientific categories);
- Convincing or proving.

It also affects the personal maturity of the student, contributes to the development of general culture and erudition in him [6,7,8,9,10,16,17,53].

As mentioned above, in addition to the "supporters" of the lectures, there are also "rivals" who give the following arguments about the disadvantages of presenting the training material in the form of lectures:

- The lecture prevents students from developing independent thinking by teaching them to passively accept the opinions of others.
- The lecture extinguishes the interest in independent training;
- Lectures are needed only in the absence of textbooks;
- Not all students have time to master the material during the lecture;

However, it should be noted that the abandonment of the lecture reduces the level of scientific preparation of students and has a negative impact on the systematic and smooth conduct of educational activities during the semester. Therefore, the lecture deserves attention as the most basic form of teaching in higher education. The above shortcomings can be overcome by describing the training material on the basis of an improved methodology. The opportunities for the development of independent thinking, as well as the implementation of thinking operations such as analysis, synthesis, comparison, generalization in the lectures are invaluable. Therefore, the report has a wide range of untapped opportunities and internal resources for the implementation of pedagogical tasks.

The effective technology of organizing lectures was developed by American experts D. V. Johnson, R. T. Johnson and K. A. Smiths suggested that they distinguish three stages in the organization of lectures:

- 1) preparation, in which the teacher activates the existing knowledge of students, fully draws their attention to the problem under study and arouses interest in the study of this problem;
- 2) the stage of implementation and understanding. At this stage, the new learning material is described and a system of pre-thought-out and prepared assignments is presented for the purpose of critical processing and analysis;
- 3) reflection phase. At this stage, students master the process of understanding new knowledge while analyzing the content of the study material.

The technology of organization of lectures, in turn, requires the use of methods to activate the learning activities of students during the lectures.

Based on the study of methods developed and used in practice, we recommend the method of problem pedagogy for students of medical education: the method of problem situations, the method of activating questions, the method of dialogue, the method of visualization, and other methods of developing professional thinking [18,19, 23, 24, 40].

The problem-solving method is based on the teacher's creation of problem-solving situations and the learners' active cognitive activities during the lecture session. It consists of analyzing, evaluating, and making a subsequent decision on a specific situation. The lecture focuses on developing students' professional thinking skills in analyzing the causes and consequences of problematic situations and finding solutions to them.

The complexity of the problem chosen for the "problem situation" method should be appropriate to the learners' level of knowledge. They need to be able to find a solution to the problem posed,

otherwise when they fail to find a solution, the learners lose interest and lose their self-confidence. When using the "problem situation" method, students learn to think independently, analyze the causes and consequences of the problem, find a solution.

Developing a problem task requires great effort and pedagogical skills. As a rule, the task is divided into having to create a successful option in the study group after several experiments. Nevertheless, such tasks allow the theory to be linked to the real situation. This allows students to activate teaching in their minds, helping them to understand the practical benefits of the material being studied for the development of their professional thinking [26, 27, 28, 29, 30].

Activating Questions Method

In order to stimulate students' thinking and attract their attention, the speaker asks activating and rhetorical questions to the audience. After a while, the teacher engages any student to answer the activating question. The teacher must explain the answer given, and if the answer is incorrect, he must answer it himself.

Dialog method. The dialogue during the lecture provides an opportunity for the teacher and the student to express and reinforce the learning information at a particular stage of the lecture through interaction, creating an exchange of ideas. The dialogue is organized in response to three questions:

- Which and what information did we receive?
- What do we strive for in our activities, is the received information enough to achieve the goal?
- How do we use the acquired knowledge to achieve the goal?

In organizing the **dialogue**, it is necessary to create an atmosphere of complete trust between the teacher and the student. The student should be able to express his / her opinion boldly even in case of mistakes. Because the main purpose of the dialogue is to arouse students' interest in the problem and thus to activate its thinking mechanism. Achieving this, the smart teacher quickly and easily eliminates the student's mistakes through short comments, completing the answers if necessary [31, 32, 34, 44, 45].

Visualization Method

This method implements the principle of demonstration in education. It is known that the exhibition not only allows to remember and accept the educational material, but also to activate the mental activity of the student, to deepen the understanding and comprehension of the content of the studied situations. It is possible to speak at length to describe any information, but it is certain that everything will be clear by showing a picture, diagram, diagram, histogram, or table substantiating that information. The study of the laws of visual thinking shows that it is related to the creative nature of decision-making. The visualization method ensures the formation of a thinking process by systematizing, focusing, and separating the most important aspects of the data being analyzed. Visual information is displayed by the teacher on a board or projector in the form of a model, picture, graphic, photography, film, cartoon [35, 36, 46, 47, 52].

Such organized lectures not only develop students' professional thinking, but also stimulate the teacher's self-study and creative activity. Current teaching materials developed by experienced teachers using many animation programs such as LearningApps, Hot Potatoes, 3ds Max,

Blender, AutoQ3D, Bryce (DAZ Productions), DX Studio, Sculptris also help students to listen to lectures, understand the essence of the material and develop thinking skills. serves [37, 38, 39, 48, 49].

CONCLUSION

Thus, the management and improvement of students' learning activities in lectures is one of the most important didactic tasks for the teacher. This problem involves the process of stimulating students' professional and cognitive interests, their active participation in lectures, the organization of independent work on lecture materials.

All these tasks are solved through the use of an integrated set of methodological methods.

In turn, it is advisable to use all methods that activate the cognitive activity of students, depending on the content of the educational material, the composition and preparation of the audience.

CORPORATE CULTURE IN THE MODERNIZATION OF THE HIGHER EDUCATION SYSTEM

Baxranova Zubayda Saidovna*

*Vice Rector,
Youth Affairs in Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

The article discusses the role of corporate culture in the management of educational institutions in the context of modernization of the higher education system. The analysis of the level of formation of corporate culture in universities of the republic, the problems of the formation and development of corporate culture of the university. Higher education institutions with broad rights and relative economic independence are the subjects of competition in the market of educational services, defending their "private" interests. At a time when society is building its structures on the principle of corporate interests, it is, of course, impossible to disagree with the idea that it is unthinkable that educational institutions should be left out of the sphere of civil relations.

INTRODUCTION

State Program of the President of the Republic of Uzbekistan dated March 2, 2020 "On the implementation of the Action Strategy on the five priority areas of development of the Republic of Uzbekistan for 2017-2021 in the "Year of Science, Enlightenment and Digital Economy" In accordance with the tasks set by the Decree of the President of the Republic of Uzbekistan, in the near future to ensure the quality of the educational process, increase the professionalism and responsibility of teachers, rationalize infrastructure, strengthen staffing and resources, retraining and advanced training of teachers mechanisms are required. Ultimately, educational institutions need to be fully staffed with highly qualified pedagogical and managerial staff capable of ensuring the highest quality of education [1].

In Higher Education Institution, corporate culture can be seen as a system of management and pedagogical, behavioral and communication programs aimed at implementing the Higher Education Institution Development Strategy in accordance with the modern level of development of society. Corporate culture is one of the most powerful sources of organizational efficiency. However, the analysis of pedagogical research and management practices in our country shows that the accumulated resources or limitations in the characteristics of the culture of the organization are still not fully understood. A highly effective corporate culture is able to transform a social organization into a self-organizing competitive system in which all parameters of the organization are consistent in decision-making, distribution of power, and employee behavior. One of the main functions of corporate culture is to bring the organization to a level where the lack of managerial influence does not reduce its effectiveness.

As for the sources of the concept of corporate culture, it is worth noting that it was developed in the United States in the 70-80s of the twentieth century. It was in the late 1970s that the problems of strategic management of organizations related to the need for new approaches of small and medium-sized businesses to bring them out of the theoretical crisis of labor efficiency served as factors in the development of the concept of corporate culture [5].

The reform of the education system has gradually highlighted the need to develop a corporate culture in educational institutions. Today, success in the market of educational services is guaranteed only for Higher Education Institutions that have a clear strategy of socio-economic development, aimed at ensuring a high quality of training, as well as creating a positive image of both Higher Education Institutions and graduates. In this case, the market sets its own conditions: the quality of professional training should meet not only the requirements of state educational standards, but also the needs of real sectors of the economy. The new economic and social relations that are developing in the educational environment imply the use of such descriptions as "corporation" and "corporate culture" in relation to the Higher Education Institution [3].

Implementation of the concept of development of the higher education system of the Republic of Uzbekistan until 2030 provides for the gradual transition of higher education institutions to a system of self-financing and ensuring their financial stability [2].

Higher education institutions with broad rights and relative economic independence are the subjects of competition in the market of educational services, defending their "private" interests. At a time when society is building its structures on the principle of corporate interests, it is, of course, impossible to disagree with the idea that it is unthinkable that educational institutions should be left out of the sphere of civil relations.

Let's look at the conceptual characteristics and features of corporate culture in relation to its higher education institution. Typically, corporate culture is recognized as a universal phenomenon by various disciplines and manifests itself as a set of values, rules, systems of norms or suggestions of human culture in the organization, social experience, original organizational origin, a mechanism for re-creating a single economic and social space. 'ladi. Professional communities, whose development depends more on individuals than on individuals, associate the future existence of the world community with the practical use of its potential, which depends on the selection of teams, the organization of their coordinated and purposeful behavior.

Features of the corporate culture of the Higher Education Institution, first of all, to meet the needs of the individual for intellectual, cultural and spiritual development; providing conditions for scientific and pedagogical staff and students 'creative activity; formation of students' civic position, their ability to work effectively and competitively; preservation and development of spiritual, cultural and scientific values; it is manifested in a socially-oriented focus on the dissemination of knowledge among the population in order to raise its educational and cultural level. The corporate culture of higher education is characterized by a dual nature, which is primarily to achieve its interests in the market of educational services; and second, the preservation and enrichment of human values. This culture can also be described as a form of organizational culture that is functionally focused on the integration and integration of scientific and pedagogical content, the differentiation and presentation of the Higher Education Institution in a competitive environment. Structurally, corporate culture differs from organizational culture only in the functional-meaningful load - the internal or external environment of the organization, the priority of modality and intensity.

The analysis of the state of corporate culture in higher education institutions of the Republic showed that the majority (87%) of professors and other categories of employees are familiar with the concept of "corporate culture". At the same time, knowledge of corporate culture is based on more observable behavioral reactions than the officially declared principles of the structure of the university, which are usually formalized in the form of statements and / or appeals. More than 70% of students know the symbols and traditions of the Higher Education Institution. Students are well aware of the history of the Higher Education Institution, but acquaintance with it is usually done at the request of others rather than on the students' own initiative (for two-thirds of students, this is the result of the group's stories, historical literature).

The majority of respondents support the traditions of the Higher Education Institution. Students find the following centralized traditions more and more useful: coaching hours, graduation evenings, student dedications. Events that require individual initiative: group birthdays, cultural events in the dormitory, group celebrations are not very popular. The mission of the Higher Education Institution is understandable for a large proportion of students (66%) and students (63%) accept it. The mission, in their view, is to provide the economy with highly qualified personnel and increase the efficiency of the Higher Education Institution to a level that will allow it to compete with the leading Higher Education Institutions in our country and abroad. Scientific activity is not so interesting for students: 42% of them participated in scientific conferences or seminars organized on the basis of their own Higher Education Institution, while only 3% of students regularly participated in mobile events. A similar situation is observed in the implementation of research projects and grants.

The results of the study show that one of the important tasks of the corporate culture of the Higher Education Institution is to "determine" the normative behavior of professors and other categories of employees. As a motivator for such behavior, it shows a sense of responsibility. In Higher Education Institutions, students differ on the need for Internal Procedures and the Code of Ethics for Students: 55% are in favor, 45% are against or do not have a clear opinion.

Apparently, this can be explained by the fact that the approved norms, on the one hand, make life easier for students, and on the other hand, require certain conditions to be met. The corporate environment of the Higher Education Institution is characterized by a relatively high level of ease of social relations. The vast majority of faculty and staff are satisfied with their relationships

with their colleagues, which they see as partners. Most students are able to communicate with classmates, group coaches, teachers, and the dean's office. The attitude of students to the administration of the Higher Education Institution is "polar". At the same time, the number of students who described their attitude to the administration as positive was two-thirds higher than that of their opponents. Professors and staff point out significant changes in the socio-psychological environment of the Higher Education Institution. Most of them work with full mobilization, do their job well because they enjoy their profession, and they feel good when they come to work and when they leave.

Most of the faculty and staff are aware of the strategic plans and priorities for the development of the Higher Education Institution. However, only 3% of respondents are fully aware of the plans, and almost half are generally aware of the Higher Education Institution's immediate strategic plans. More than 20% of respondents are constantly unaware of the promising measures being taken at the Higher Education Institution. Only a third of faculty and staff receive information from the Higher Education Institution's official website or telegram channel, which actively uses personal e-mail, which is effective in implementing the information policy pursued by the Higher Education Institution administration by the majority. evaluated as an element of organizational work. Awareness of the life of the Higher Education Institution decreases as it moves "down" in the chain "Higher Education Institution - Faculty - Department".

Understanding the presented results allows to note the following problems related to the formation and development of the corporate culture of the Higher Education Institution:

- 1) the fact that a certain part of the faculty and students are not familiar with the values and ideas that form the core of corporate culture;
- 2) formal traditions are not attractive enough and traditions that are informal, neutral or contrary to the values of the Higher Education Institution are preferred;
- 3) priority of traditional channels of information interaction;
- 4) insufficient use of modern information and communication technologies.

The influence of the corporate culture of the Higher Education Institution is relatively stable and effective at the highest level of management, and its influence on the level of real behavior of faculty, staff and students is the achievement of the team's goals and objectives. not enough to sell. Most of the faculty, staff and students are not interested in the work of the Higher Education Institution, are not interested in it, do not want to understand the essence of its problems and are not ready to participate in solving them.

In order to rationalize the process of formation and development of corporate culture of higher education, in our opinion, it is necessary to improve the organizational structure and management mechanisms on the basis of corporate culture, as well as a number of auxiliary technologies: corporate traditions, positive image, social adaptation and psychological environment.

INTRODUCTION

In the context of global changes in the economy effective organize of various forms of cooperation in agriculture is an important issue. At the moment, experience of cooperative action is deserves careful study and practical use in all respects, because cooperation is an international phenomenon of human activity. The practical significance of studying cooperative activity is that it is an international point of view to enable better implementation of mutually beneficial cooperation.

Based on the study of foreign experience, it can be concluded that the cooperative in these countries all sectors of the economy on the basis of the use of various effective areas of cooperation has been used as one of the important mechanisms.

We have also drawn attention to the fact that in the study of cooperative relations, its manifestations take different forms in different countries. The world cooperative movement is theoretically and practically studied by many scientists and experts. As you explore the cooperative relations, new dimensions are revealed. We also drew attention to the fact that its manifestations take different forms in different countries during our study of relations with cooperation.

In the United States, cooperatives operate in the following areas. Depending on the size of the market, they divide cooperatives into local, interregional and national cooperatives, and international cooperatives. The form of ownership is divided into centralized, federal, hybrid, other business structures and new generation cooperatives [1].

1. Centralized cooperatives serve their members directly. Many cooperatives in the United States are such cooperatives.
2. Federal cooperatives. Cooperatives are created on the basis of ownership and are controlled by cooperatives.
3. Hybrid cooperatives. A number of large cooperatives will be created in both directions. That is, from a mixture of centralized and federal cooperatives. Such cooperatives can be called hybrid.
4. Other business content or structures. This includes joint ventures, holding companies, and information exchange organizations.
5. Cooperatives of a new generation (NGK). The new generation of cooperatives is called “new wave and value added cooperatives”. They have 2 characteristics that set them apart from other types of centralized agricultural cooperatives. First, the “right to supply” in the NGK equates to the right to membership. Members buy shares, that is, they transfer the rights and obligations to the cooperative to sell the current amount of the product. For example, a shareholder must supply 1,000 bushels of wheat to the cooperative annually. In the event of a supply failure, the cooperative has the right to assess and collect a membership fee (fee) to cover the increased costs. In the second type, membership is limited or closed. The right of delivery limits the number of members of the cooperative through sale and the number of products that must be obtained from members. The initial cost of membership is determined by the distribution of the total amount equal to the required capital from the members according to the number of units of the product.

There are also workers' cooperatives in the United States. These cooperatives are organized on the basis of workers' ownership. Most often, these cooperatives operate in the manufacturing and service industries. Such cooperatives were created by workers to protect jobs, improve working conditions, wages and productivity, and create a democratic environment for themselves. There are currently over 300 such cooperatives in the United States.

With regard to the legal status of cooperatives, we cite the experience of three EU countries, namely the Netherlands, France and Romania.

a) In the Netherlands, agricultural cooperatives and cooperatives are defined as “economic organizations in which farmers or gardeners operate on a permanent basis and partly participate in a joint economic activity (usually a commercial function) that accepts and distributes risks. Maintenance is also an enterprise that retains its self-sufficient character.” In fact, they are supported not only by simple structures that facilitate and regulate the relationship, but also by an organizational structure, which usually has a share of the capital provided by the contractor or participants.

b) Used in France as a co-operative society, this category of “society” is different from civil society and companies that play the role of co-producer in the economic sphere.

c) In Romania, it is managed by cooperatives in accordance with the law and other forms of their association at the regional and national levels. Agricultural cooperatives are understood as “associations of persons jointly used for the joint improvement of agricultural land owned by members of the cooperative, the use of a common mechanism and the cultivation and exploitation of agricultural products”.

Based on the above, cooperatives are required to join forces to reduce costs in order to provide the necessary investments to ensure competitiveness in the market [2].

The monograph of Professor Sh. Ergashkhodzhaeva "Marketing strategy for the development of cooperation in rural areas" [3] studies in detail the activities of cooperatives in foreign countries.

- "net cooperatives" - enterprises in which the management and distribution of profits are equal;

- "joint-stock cooperatives" - enterprises in which elements of a joint-stock company prevail, are distributed in the form of dividends in proportion to the number of shares, ensuring equality of rights in management, and are usually limited to an upper limit. But such enterprises rarely have advantages over other types of enterprises - and are almost indistinguishable from private companies;

- Enterprises that occupy an intermediate position between “pure cooperatives” and “joint stock cooperatives”.

Professor O. Olimdzhanov in his book "Legal and financial foundations of agriculture"[4] scientifically substantiated the division of cooperatives into three: production, consumer and service.

According to our observations of the scientific work of Russian scientists and specialists, cooperatives are studied in two directions, that is, consumer and production cooperatives. These types of cooperatives differ from each other in their purpose.

The globalization of the market environment, increased competitive pressure, consumer demand, changes in agricultural production and processing technologies and other factors are forcing manufacturers to look for new models and modern strategies in order to gain a solid market position.

THE IMPORTANCE OF ASSESSMENT IN TEACHING PROCESS AND ITS TYPES

Kattaboeva Dilrabo*

*Senior Teacher,
Uzbek State World Languages University,
UZBEKISTAN

ABSTRACT

This article focuses on the study of types of assessment and their importance in teaching process. Assessment is the process of documenting in measurable terms, knowledge, skills, attitudes and beliefs. The term assessment is generally used to refer to all activities of the learners. Moreover this article deals with the results of pre and post-testing results of language learning classes. Well-designed assessment has numerous benefits aside from the obvious one of providing a measure of students' progress as it can be a means to engage students with their learning. Ideally then, you should aim to support active learning rather than assessment of learning to ensure that the assessment process is an integral part of students' education.

KEYWORDS: *Assessment, Education, Process, Learning, Learner, Formative, Summative, Strategy, Implement, Purpose, Feedback, System, Level, Provide.*

INTRODUCTION

Assessment for learning focuses on the opportunities to develop students' ability to evaluate themselves, to make judgments about their own performance and improve upon it. It makes use of authentic assessment methods and offers lots of opportunities for students to develop their skills through formative assessment using summative assessment sparingly.

This investigation explores the interplay between teachers' beliefs and practices in understanding and implementing assessment and feedback to enhance student learning. Particularly, it explores teachers' conceptions of effective formative feedback strategies, and the role they should play in their classroom practice.

It is not a secret that every person spends most time of his priceless life for not only studying, but also for gaining valuable knowledge that could give an opportunity to be the best on his/her field

in the future. Furthermore, it is important to assess and to give feedback in order to identify whether a proper study was effective or not.

The main purpose of the article is finding out the most effective ways of giving feedback for assessing the learners, detecting mistakes and lacks of the learners, to establish the right time and duration of feedback in language learning class (Alderson, J. C. 1986. 162).

The goal of the article is to prove that giving feedback raises the effectiveness of learning language. There are many reasons why we assess language learners and many ways that we can assess them. Too often, however, we focus on assessment "of learning," on how much our learners have achieved, using traditional, formal tests. We tend to forget the important role of assessment "for learning," using alternative or informal assessments that monitor students' progress and help us to identify students who need extra support or things that we need to spend more time on in the classroom to improve student learning.

Much of the research literature around assessment points to the importance of feedback to students as part of the learning process. Abdrabou, A argues that formative assessment is "specifically intended to provide feedback on performance to improve and accelerate learning." Proving a student with a grade or mark in response to a piece of assessable work is not, except in the broadest sense, giving feedback. Similarly, making comments on student work is not, of itself, providing feedback. Feedback is a term that requires careful definition for it to represent a useful contribution to learning. (Abdrabou, A. 1984. 29-36)

Another factor that may influence the effectiveness of feedback is whether it is provided continuously or differentially. When continuous feedback is employed, students receive feedback each time they perform a given task, whereas differential feedback is only provided when a student performs better on the task. One advantage that differential feedback offers over continuous feedback is that it emphasizes improvement rather than a student's absolute level of achievement. Hence, all students have a near equal chance of obtaining recognition. When feedback is geared to the absolute level of performance, recognition is only given to the best students. Therefore, it is generally good to give students feedback when they show improvement.

Woodford, P. Is the first scholar who tried to differentiate formative and summative assessment in context of program? Woodford, P. Mentioned that summative evaluation helps to judge overall value of educational program, while formative evaluation mainly focused on continuously program improvement. (Woodford, P. 1982. 152)

On the other hand, educators and researches claimed that formative assessment is process, but not a test. Applebaum S agreed with this opinion and mentioned that in this view, the process produces not so much scores as a qualitative insight into student understanding (Applebaum S. 1988. 207-223). He claimed that 'Formative assessment is a process used by teachers and students during instruction that provides feedback to adjust ongoing teaching and learning to improve students' achievement of intended instructional outcomes'. A common simplification of this position is that as long as the results are used to change instruction, any instrument may be used formatively, regardless of its original intended purpose.

Anastasi, A pointed out the following features of formative assessment:

- It can be used in order to check students' progress;
- It helpful in guiding the next steps in instruction and effective in considering the further additional learning opportunities needed to ensure success;

Moreover, the following types of formative assessment are found as effective ones by Anastasi, A:

- Projects and performances;
- Writing assignments;
- Tests and quizzes;
- Asking questions;

There are some features of summative assessment as well:

- Summative assessment provides both a teacher and students with information about attainment of knowledge;
- Often result in a grade which means they have a high point value (ie, they "count a lot");
- The goal is to evaluate student learning at the end of an instructional unit by comparing it against some sort of standard or benchmark;

According to Anastasi, A, there following types of summative assessment that can be used during the process of teaching (Anastasi, A. 1966. 88-95):

- A senior recital;
- A final project;
- A midterm paper;
- A midterm exam;
- A paper;

As above mentioned this article carried out the results of assessment and feedbacks given while teaching. Among sources of data, experimenting target classes was found most productive and effective. The process of acquiring helpful information started before beginning the sessions. Two classes were observed in order to get the full image of the groups. We could gain necessary information about students' level, physical and social environment in the classes and students' attitude towards the language learning classes.

We decided to make a survey for clarifying learners' attitudes toward the giving feedbacks. 20 students participated in this questionnaire. In order to identify their experience in terms of assessing them by the teachers and taking tests, students were asked to mark their best answer.

Here you can see results from questionnaire.

Actually, grading students' knowledge and providing them with feedback differ from each other. According to the results, 70 % of students prefer to be provided with feedback, while 25% of them stated that it is better to mark. Just one student said that it is not necessary to assess him, because he can identify himself whether he answered/performed well or not.

The second issue (question) was dedicated to the problem of frequency of assessment. 65% of students claimed that they want to be assessed in each class. Other 35% of learners argued that there is no need to assess their performance in each lesson and it is quite enough to take mid-term and final works. On the one hand, students think that it is important to know about their mistakes in every single lesson. On the other hand, it was considered as wasting the time as they can find out their errors themselves.

In addition, students shared with their opinions about the techniques used by the teacher during the sessions. Students mostly want to work in groups (80%), however, some students prefer to work in pairs (10%) and do self-study (10%). To cope with the heterogeneous class the students found it preferably to use group works.

Most students (75%) argued that teachers criticize and give only negative feedback, while others (25%) claim that their teachers have never criticized them. It is also suggested by the scholars to give corrective feedback, not negative one in order not to lose learner's enthusiasm towards your classes.

Right Time to Give Feedback and Duration

One the major questions were dedicated to the duration and right time to give feedback. Respondents tried to identify the right time for receiving feedback and duration of it. From their own experience a large number of learners (90%) claimed that it is better to give feedback as immediately before each completed task as possible and it should not take so much time (100%) so that learner become to lose attention and interest from receiving feedback. Eventually, time would be wasted with no profit for both teacher and student. Others affirmed that feedback should be given at the end of the class (10%). The reason was that student could become upset from received feedback and be out of class ultimately.

Moreover we did additional survey with teachers in order to collect their thoughts toward the giving feedback to the learners.

Providing Students' Performance with Feedback

A minor number of teachers (12%) claimed that it is one of the effective ways to assess students' knowledge and make the students to feel and correct their mistakes themselves. Others (88%) stated that in terms of objectivity of the assessment feedback could be omitted and marking the students' knowledge can fully show their progress or regress. However, the researcher beliefs that giving feedback should be omitted with multi-level student class and could rise up the proficiency of the students as they become to recognize their own and peers' errors. Furthermore, they try to correct themselves and outline the mistakes of their classmates.

Problems with Giving Feedback

As it was mentioned above, the rest of teachers do not provide students' performance with feedback. They considered that students will not follow their instructions (60%), they have many documentations and this is an extra work for them (30%), they believe that giving feedback would not help to rise up the proficiency of the learners'(10%). To make it short, the teachers found out that providing the students' performance with feedback is useless and wasting of time. Nevertheless, the researcher totally disagree the above-mentioned opinions and has proved that feedback must be given and students will follow the instructions certainly.

The Most Effective Strategy for Classes

The most number of teachers suggested grouping strategy as the best one (80%). Other teachers mentioned that it depends on activities (10%) chosen by the teacher for the target class, while some of them claimed that it is challenging to teach such kind of class and it is better to hold classes according to the lesson/course plan (10% and students with below-level need an extra lessons). However, the last group of teachers does not take into consideration above-level student, which can be bored and disappointed from the lesson.

At the beginning, the hypothesis was proving that conducting assessment and giving feedback to the students' performance are helpful for learners. At the end of course, we discovered that his hypothesis was right.

The results of the learners' questionnaire showed that teacher should choose right time to give a feedback. As we mentioned before there are two types of assessment- formative and summative. Formative assessment is mostly used to improve weak points of the learners' and summative assessment is used for assessing the knowledge of the learners. Mostly teachers use feedback for formative assessment during the lessons. In this research we tried to find out teachers who conduct formative assessment and give feedback to students. To make it short, the teachers found out that providing the students' performance with feedback is useless and wasting of time. Nevertheless, the researcher totally disagree the above-mentioned opinions and has proved that feedback must be given and students will follow the instructions certainly.

According to the learners' opinion, feedback should be given at the end of their presentation. Because, giving feedback as an assessment during the presentation may confuse the learners. Moreover they mentioned that, they would like to receive feedback at the end of each lesson for working and improving their weak points.

Overall, we gathered valuable data to deal with class in terms of creating a well-managed environment, assessing students' knowledge and implementing formative assessment.

WORK OF THE DIRECTOR WITH AN ARTIST

Shamsiddin Usmonov*; **Azizjon Talaboyev****

^{1,2}Fergana Regional Branch of Uzbekistan State Institute of Arts and Culture,
UZBEKISTAN

ABSTRACT

This article tells the reader about the director's work with an artist. The high level of effectiveness of theatrical performances depends on its creator, the manager, the leader who unites the creative team. And the leader is the director. For many years, there was a need in the art of directing. Director is a French word and means a manager, a leader, as a caravan leader in our own language. With the advent of live cinema, the image is sealed and begins to find its expression, especially the art of "small screen", the miracle of the twentieth century, the need for this caravan leader has increased. Major works of art, whether in theater, cinema or television, could not be imagined without a director.

KEYWORDS: Theater, Performance, Abstractionism, Impressionism, Surrealism, Naturalism, Cubism, Dress.

INTRODUCTION

The role and place of the director in the presentation of examples of classic drama, novels, short stories, adaptations of short stories, talk shows, entertainment programs, major celebrations and events has become incomparable. That is why it is necessary for a person who has mastered this profession to have mastered its secrets, rules, and school. Not everyone has the ability to manage, this ability should be nurtured, guided, directed. The basics of directing help students who specialize in this field. The art of directing is an artistic reflection of the depiction of life through the means of expression in the art of theater, cinema, television. What is the difference between science and art? In fact, science studies, proves, and logically analyzes the laws of life. Art, on the other hand, shows and convinces those laws through artistic images. The main goal of both art and science is a simple life, human perception, his way of life. The only difference between art and science is that it studies man, deals with man's feelings, experiences, his psyche. Science studies the biological characteristics of man, his physical aspects, his mental state. Art shows all this on one scale, the image of a being, its place in life.

Working with an artist in directing is one of the most important periods. We know that the art of painting has a centuries-old history, a very rich cultural and spiritual heritage. Each period finds its own style, its own way of expression. There are Renaissance, Baroque, Rococo, Classicism, Gothic and many other trends in art.

As we walked the streets of Budapest, the guide introduced us to the city, saying, "This building was built during the Renaissance, this is typical of the Rococo period. These are buildings of the period of practicism. Beautiful apart, unnecessarily stretched out in front of architectural masterpieces the newly built buildings, which have nothing to do with the extravagantly decorated building in front of it and stands like a matchbox, has shown us that it is the art architecture of the Khrushchev period. While visiting the Louvre in Paris, the Dresden in Germany, the Hermitage in Russia, and the Tretyakov Gallery, we see that our artists have inherited great works of art over the centuries. An exhibition of the artist Kandinsky was taking place in one of the museums in Munich. An interesting incident took place in front of a play. Theatrical scholar Sechin stopped in front of this picture and began to watch it for a long time. In it, the other limbs were arranged in pieces around the human eye, and some other line, as if those eyes were peering between shapes, was an incomprehensible work to me. I began to observe the scientist. He looked up and frowned. Then he took a step or two away and stared. He looked around again, his face turning pale before my eyes. "Sure, it's weird," he said in surprise. Or take the "Black Square" that Molevich created over the years. So you have to understand the artist's lines. Unfortunately, we did not go through this school. In short, children need to learn about fine art, its types, a number of trends, such as abstractionism, impressionism, surrealism, naturalism, cubism. Whatever the type of art, from architectural art to watercolors, drawing, graphics and other types must find a consistent expression. When working with an artist, the director must study in depth the peculiarities of each period, its weapons, costumes, customs, social life, and pay attention to them in every scene and screenplay he creates. The artistic decoration of the artist should be distinguished by its external expression and internal depth. In theatrical art, famous theater artists have left wonderful examples of collaboration with the director. The combination of the director's plan and the artist's idea leads to good results. Great directors KS Stanislavsky, V. Meyerhold, A. Tairov, N. Akimov, G. Tovstonogov, V. Lyubimov paid great attention to the artist's work. Theater artists such as H. Ikramov, M. Musaev, S. Milenin, A. Riftin have created wonderful plays with directors such as M. Uygur, T. Khojaev, A. Ginzburg. The best example of such cooperation is the work of director Bahodir Yuldashev and artist Georgy Brim. The plays created by them are distinguished by their true style and direction. The performances are distinguished by their composition, color and decorative harmony, professionalism. A number of plays, such as "Bride's Revolt", "Old woman Mamura", "Alexander", "Black Belt", "The Case of Maysara" are embodied as beautiful examples of theatrical work with their plasticity, style of performance, figurative expression and interpretation. It's as if the play is like a flight of two wings of a bird.

Artistic style is one of the priorities of the director's plan. When working with an artist, the director must find a single figurative expression that lies at the heart of the work, and look for the external figurative expression in the nature of the work. It is important to remember that expressive scales, placing the actors up, in, in front of the stage mirror, the implementation of the director's plan depends on the artist. For the player, the more action points, the more

playgrounds, the more the possibilities of expression expand. When and where the events take place depends on the interpretation of the director and the artist.

Due to fate, I had to stage Shakespeare's tragedy "Richard III" at the Syrdarya Regional Theater named after Olim Khodjaev, translated by Askad Mukhtor. We invited artist Anatoly Slugin, who has worked in the theater for many years. Due to the lack of a building, the play was staged in the assembly hall of the regional administration. The events take place in England during the reign of King Edward IV: sometimes in the Tower, sometimes on the street, sometimes in the palace, sometimes in the Palace of the Bears, and so on. The work is complex and the scene is limited. It was hard to find a stage expression. In the play, the disability, imperfection struggles with perfection. For me, the murders that took place around Gloster, the tragic events that took place, the internal conflicts in the palace, the depth, the intensity of the events were significant and important. The artist found the only way out of the situation. All the events took place around a device - a construction performed by four people on a background of black rough fabrics. The device turns into a royal throne when it is raised, and into a tree when it is lowered, it would become a hangover, and the executioner. This device could have been put in a different position. Throne and executioner, side by side, disgrace is here, justice is here. The theatrical figurative expression found with the artist was a great help in the opening of the events of the work. A play that could be played on a small stage was born.

Of course, in the process of working with the artist, the social background of the participants of the work, who they are, what class they belong to, the expression of clothes also play a big role.

The role, lifestyle, relationships, and customs of the participants are important in determining their stage expression. Which color, expresses the solution of the architectural style and the form of the play? It is these problems that develop between the director and the artist's relationship. Museums, libraries, photo exhibitions, newsreels, press, magazines, newspapers, photographs help artists to create artistic decoration. This is called the study of iconographic materials. The figurative expression, character, style, course of events, space and time cooperation of the play are the result of serious research.

"Algeria is my homeland" based on Muhammad Dib's novel "House", staged by Alexander Ginzburg at the National Academic Drama Theater, "Daughter of the Ganges" based on Robindranath Tagore's novel "Destruction", "Blessed Blood" based on Oybek's novel "Sacred Blood" Chingiz Aitmatov's performances "Sarvqomat dilbarim" are the best stage productions created in collaboration with the artist.

Often, an artist-director collaboration begins with sketches and layouts. The next play is a mock-up and sketch discussion around the table, with thought-out scales, costume looks, lighting, color expression of the scene, and the speed of the performance depending on the location of the paintings. The placement of equipment and items should facilitate the actor's performance. In general, all the conditions on stage should allow the actor to create an image. From makeup, clothing, artificial equipment to real, everything should be focused on the realization of the director's plan, the performance of the actor. All the research of the artist should be aimed at expressing the essence of the work in the image, finding a solution. The famous director Peter Brook notes that the "stage space" is full of miracles. Nemirovich-Danchenko says that "it is possible to perform a show even on a little rug." The possibilities for a miraculous scene are

vast. The collaboration of a director and an artist is the creation of works of art with the effective use of these opportunities.

HOMIL YAKUBOV'S VIEWS ON OYBEK LYRICS

Munajatxon Askarova*

*Fergana Regional Branch of Uzbekistan State Institute of Arts and Culture,
UZBEKISTAN

Email id: asqarova.munajatxon19@gmail.com

ABSTRACT

Oybek is an artist who has enriched Uzbek literature with works of various genres. As a creator, he wrote everything from poetry, prose, short stories and essays to novels, and as a literary critic, he created journalistic and literary-critical articles. Oybek's work has been warmly welcomed by readers at different times, studied and appreciated by literary scholars and critics. Among the researches on the life and work of Oybek in literary criticism, the scientific works of H.Yakubov have a special place. In the research of the scientist, Oybek's activity as a poet, prose writer, literary critic is studied in connection with his personality. This article describes H.Yakubov's research on Oybek's poetry.

KEYWORDS: Critic, Prose, Poetry, Literary Criticism, Review, Literary theory, Press.

INTRODUCTION

Well-known literary scholar Homil Yakubov has made a worthy contribution to the development of science, literature and literary criticism in our country. Literary critic Laziz Qayumov, who appreciated H.Yakubov's fruitful and fruitful work, wrote in his article "Literary Scholar" that "he had made a great contribution to the formation and development of the new Uzbek literary criticism as an independent science." - He wrote.

At the beginning of the twentieth century, a variety of types and genres appeared in Uzbek literature, and innovations began to appear in art. This required literary critics to do new research. Literary critic Homil Yakubov also took an active part in this process. He has written articles and reviews on a variety of topics since the 1920s, making a worthy contribution to the formation of new literary criticism and literary criticism. At the same time, the critic himself wrote more and more important scientific works every year. He has been a scientific creator for almost half a century. Over the past period he has created many articles and reviews, scientific

essays, monographs, textbooks and manuals, programs and brochures. "Creative way of Hamid Olimjon" (1936), "Short stories of Abdulla Qahhor" (1946), "Uzbek literature in the five years before the war" (1953), "Life and work of Ghafur Ghulam" (1959) "Selection" (two - 101 - vol., 1983) are among them. These scientific works discuss the achievements of the new Uzbek literature, and important ideas are presented in accordance with the requirements of the time. Each scholar seeks to reveal the peculiarities of the works of writers and poets, their place in the history of Uzbek literature, the educational and aesthetic significance of their works.

Oybek is an artist who has enriched Uzbek literature with works of various genres. Oybek's work has been warmly welcomed by readers at different times, his works have been studied and appreciated by literary scholars and critics.

The research work on Oybek in the creative heritage of Homil Yakubov stands out. The leading features of the writer's work are studied in detail in his monographs "Oybek" (1959), "Ideology and skill" (1963) and "The skill of the writer" (1966). These studies, with their richness of evidence, perfection of ideological and artistic analysis and deep scientific conclusions, play an important role not only in their time, but also in our literature today. (Homil Yakubov's doctoral dissertation on "Ideology and skill in Oybek's work", defended in 1967, is also based on these books).

The author closely connects Oybek's multifaceted and fruitful work with the stages of development and current issues of the new Uzbek literature. In the example of Oybek's work, he expressed his views on modernity and history, tradition and innovation, form and content, plot and composition, realism and artistic texture, lyrical conflict and character, commonalities and differences between epic and lyro-epic imagery.

A number of works have been done in our literature on the study of Oybek's work. He has written articles, scientific-critical works, and dissertations covering the works of the artist in various directions. His prose works in particular have been studied in detail. In particular, M.Kushjanov's scientific-critical works, such as "The skill of portraying characters in Oybek's novels", "The plot and character in Oybek's novels" included in the collection "Life and skill" cover the prose works of the artist. However, Oybek's activity as a poet was not sufficiently studied in Uzbek literature and criticism until 1963. "His poetic work is also touched upon only in connection with certain issues or in connection with certain periods of development of Uzbek poetry" [Yakubov H. Ideology and skill in Oybek's lyrics. 1963: 4 b], we can see that in this process, too, certain poems and verses of the artist are analyzed.

Munaqqid pays special attention to the artistic level of Oybek's poetic works. It is known that "art, which is associated with the representation and knowledge of reality in figurative form, is determined by issues such as the poet's worldview, the social significance of the ideal, the lyrical character in the typical context, the ideological, popular, socio-educational impact of the work." [Yoqubov H. Ideology and skill in Oybek's lyrics. 1963: 4 b] The critic believes that as a result of his research and study, the poet's mastery in achieving a high level of ideology and art, that is, the unity of artistic form and content, is achieved.

Homil Yakubov got acquainted with Oybek's poetry and summarized his observations and studies in the monograph "Ideology and skill in Oybek's lyrics". Munaqqid examines Oybek's lyrics from the point of view of the period, linking them with the changes taking place in our country, socio-political life and the development of Uzbek literature. From the monograph

"Research in lyrics", "Realism in Oybek's lyrics", "Life of a poet in lyrics", "Image of revolutionary changes", "Nature landscape and images of love", "Paphos of victory", "Songs of peace and Pakistan", "Lyrical style colors" "And so on.

In this monograph, H.Yakubov talks about the peculiarities of Oybek's work. The reaction emphasizes that understanding them based on their own views has tried to incorporate their own feelings into their own colors. "Oybek approaches the lyrical work as an expression of the human" spirit ", his" I ", but often the sphere of" feelings "is the only reality and does not cover the content of the surrounding events, the objective truth" [Yakubov H. Ideology and skill in Oybek's lyrics. 1963: 4 b].

The essence of Munaqqid Oybek's poetry is that the poet speaks of me as an Ottoman-Turkish symbolist who created in 10-20 years - Khalid Fakhri, Orkhon Sayfi, Yusuf Ziya, Umar Sayfiddin and their follower Cholpon. Has an effect.

The same can be said about Oybek's poem "Nay kuylari" from the collection "Tuygular". The poem "Nay kuylari" is dedicated to Cholpon, and in the play the critic sees the image of "hijranli poet" Cholpon in the image of "Savdoli shepherd". "Oybek expresses his fascination with Cholpon's melodies in" Hijranli poet "in the form of a" merchant shepherd "with a symbolic veil." [Yoqubov H. Ideology and skill in Oybek's lyrics. 1963: 11 b]

The critic notes that the pure emotions and feelings in the poet's work are depicted in isolation from the realities of social life, and as a result, the dominance of a depressed mood is observed in the play.

"It is characteristic that this depressive mood in Oybek's first work was temporary. Motives of confidence in the future are intertwined in the image of the poet's sad, depressing poems. [Yoqubov H. Ideology and skill in Oybek's lyrics. 1963: 14 b] In the eyes of the critic, the poet grows in the literary process, and his works rise artistically. In the poems from the collection "Emotions", the facts and perceptions of the critic are described in a slightly different way. In this collection of more than forty, ie 43 poems, he sees the motive of a man striving for change in socio-political life in such poems as "Whose Land", "Word of the Poor", "To the Worker", "Waves of Change", "Awakening". H. Yakubov connects such contradictions in Oybek's first work with the period. "After all, the reality of Uzbekistan at that time was still controversial." [Yoqubov H. Ideology and skill in Oybek's lyrics. 1963: 19 b]

Homil Yakubov notes that from the earliest days of Oybek's work, Uzbek literature tried to introduce certain innovations into the poetic system. "Oybek tries to form some components of the lyric genre in Uzbek poetry during this apprenticeship. It's not just about reworking the lightest and most playful types of finger weights, melodic rhythmic methods and rhyme systems, but also about adding the poet's own imagination, his "own" colors, to poetry, even if it's not yet pure. " [Yoqubov H. Ideology and skill in Oybek's lyrics. 1963: 15 b]

Commenting on Oybek's lyricism and poetry of the period, Munaqqid noted that the "indescribable" sensations in the language of thought, which were lacking in the didactic and rhetorical poetry of the 1920s, reflected in the poet's work the moods and situations that were not fully understood. He emphasizes the subjective, exciting aspects of the image, emphasizes the "melody", "resonance of sounds", "words", tried to create a "musical image" of the poem,

"juicy", "charming" juice, It is no coincidence that he called the first of his first collections of poetry "Emotions" and the second "The Pipes of the Heart."

While studying Oybek's character, Munaqqid praises the poet's fruitful work. The originality of the emotions in his poems pays special attention to the fact that the spirit of the time and epoch is reflected in the artistic creation. He observes the processes from Oybek's first work to his formation as a mature poet and expresses certain conclusions.

CULTURE OF SILENCE: A CASE STUDY OF BARRIERS TO TWO-WAY COMMUNICATION

Dr. Dhyan Singh*

*Asst. Professor,
Govt. Degree College Dharamshala (Himachal Pradesh),
INDIA

ABSTRACT

Feedback is substantial in communication process. Consequently, due to absence of two-way communication in classroom, teaching and learning are not productive and prolific in most of Indian institutions. Secondly, talk or interaction is a significant medium of students' assessment and by listening to what they have to say teachers support their learning. Several studies conclude that classroom discussions are often dominated by a small number of students while others remain silent and quiet. The study was precisely conducted to find out the factors or barriers contributing to students' reluctance to communicate in the classrooms. The case study method was employed and total 35-student was interviewed. The study concludes that dialogue or communication between teachers and students is a vital part of the education process and those students who do not speak in the classrooms are disadvantaged. The study found that psychological, emotional, practical, social attitude and previous school education barriers was the salient that responsible to students communication behavior in the classrooms. These barriers must be removed to ensure the participation of quiet students to make active role in education.

KEYWORDS: *Communication, Barriers, classroom, students, teachers etc.*

INTRODUCTION

It is well established fact that feedback or two-way communication is substantial element in communication process. Without two way communication conversation or discussion is not meaningful and consequential. For that reason, our classrooms are seemed boring and unexciting due to the deficiency of appropriate feedback of students. It is well known that through talk teachers significantly assess the prospective approach and potential of a student and by listening

to what he says teachers support his learning. Therefore, due to lack of two-way communication in classroom, teaching and learning are not so much productive and prolific. Several studies conducted on Indian higher education system state that most of the students do not interact with teachers and class discussions are often dominated by a small number of students while others remain silent and quiet.

Several studies have confirmed that when interaction occurs in the classroom, both student and the teacher are benefitted. Two-way communication makes learning more easy, assist students to achieve their goals and also strengthens the bond between students and teacher. Consistent evidence suggests that to improve students' academic achievement and social skill development, we need to focus on the nature and quality of teacher-student interactions.

The study carried out by Jones, Vernon F., and Louise Jones (1981) reveal that only a few students in a classroom grasp and learn promptly, but at the same time other students have to repeat the same things with using different techniques. And then, teaching becomes difficult and hard, particularly if there is no two-communication. Communication between the teacher and the student serves as a connection between the two, which provides a better atmosphere for teaching and learning. Of course a teacher is not enough able to understand every problem of every students in the classroom, but by two-way communication he or she could obtain adequate information. They also indicate that student's academic achievement, attitude and behavior are mostly influenced by the quality of communication happen between teacher and students. The more the teacher communicates with their students, the more expected they will be capable to facilitate students' learning at a high level and achieve quickly.

Linda Haggarty & Keith Postlethwaite (2002) identified that some students felt problems in communicating with their teachers. But some students who were labeled quiet by their teachers communicated more than they thought. The researchers also observed that negative non-verbal communication by the teachers had a prevailing influence on the students who prompt it. Their results emphasized on improving the communication process between teachers and students about better learning in the class.

Da Luz, Fredson Soares dos Reis (2015) emphasized on the caring and supportive relationship between teachers and students. Teachers can engage actively the students in the learning instead of being them passive learners. Researchers further concluded that a good environment in the classroom is important factor because a social-emotional temperament establishes with students provide opportunities to see themselves as capable, worthy and confident members and make them feel part of the learning process.

Weheba, Dina Mostafa and Abd El Kader, Maher (2006) examine that teaching is an exciting adventure in which both the teacher and the students participate. Communication in the teaching process help students attach concepts to their own lives, as students will apply what they learn in class to the world around them. While Dorothy Spiller (2009) report that feedback or two-way communication is an important ingredient of the learning cycle, but both students and teachers most of the time express their disappointment and frustration in feedback process. Generally students take interest in marks rather than concerned with feedback comments. When discussion around appraisal and feedback is extended and the students ensure their active participations in the whole process, then feedback is possibly to be most valuable to students learning.

J Hattie and Timperely (2007) explain that whether feedback is positive or negative but it influences the learning and achievement process effectively. Further, they also argued that evidence shows that feedback can be used in several ways to enhance the effectiveness in classrooms. Feedback has the potential to have a significant effect on student learning achievement

Hypotheses

On the basis of several studies and literature, the following three hypotheses can be formulated:

1. The students do not interact adequately and satisfactorily with their teachers while discussing a subject matter in the classroom.
2. Only a group of students who have studied in private schools and speak English communicate frequently with their teachers.
3. One way communication in classrooms influences quality of education and discourage teachers.

Objectives of the study

There were four prime research questions:

1. To what level, teachers and students communicate and interact with one another?
2. To find out the factors which contribute to silence in classrooms among college students?
3. The students who communicate mostly what is their educational and social backgrounds?
4. How do teachers and students distinguish this interaction?

Research designing

This study was conducted at Govt. College Dharamshala in Himachal Pradesh. Participants included 36 students from science and arts disciplines. There were three sessions of Forum Focus Group Discussion conducted in three zones and discussed for at least 45 minutes each. To obtain qualitative information on silence in class and why students do not use two-way communication in classroom, they were asked open-ended questions. Whereas, 20 teachers from different disciplines were chosen to discuss about their interaction with students in the classrooms.

Results and interpretations

It is found that a large number of the students do not communicate with teachers when teachers ask questions in classroom and on any other significant occasion. Therefore, our first hypothesis is true. Almost 92% students accept that they do not interact in the class with teachers although in which 33% students sometimes know the answers. On the other hand teachers also revealed that only less than ten percent students dominant the class in discussion.

Social environmental and educational barriers

80% students acknowledged that they were not trained and educated to indulge in two way-communications in their previous classes. Unfortunately, only a few students had been exposed to these types of effective interactions in the early classes or grades. Therefore, now they feel it is peculiar and eccentric to respond in the classroom. Interviews and talks with quiet students state that they feel anxious about being asked to speak in class. This anxiety frequently prevent

them participating in conversation. Sometimes this feeling is aroused among the students due to the detachment with teacher and lack of confidence.

Psychological aspects of silence

Most of the students accepted that even though they knew the answer but replied it slowly and when teachers asked to repeat it again loudly they forgot the content. This happens because of their low self esteem and confidence. Without exercising and practice it cannot be built. That is a feeble aspect of our subordinate education standard in the schools. Secondly, 94% sample revealed that they frequently wanted to talk with teachers on various issues but could not find the appropriate words. This is a lot occurs due to the fewer knowledge of spoken language. The educations we are obtaining are not mostly used in everyday life style. If students reply wrong answer in the class then their classmates will make fun of him. Mostly, this thought keeps them away from participation.

Majority of students (93%) also acknowledged that they passively listened to the instructors and jotted down notes. This habit has been evolved since their primary education. This traditional pedagogy practice has been used since decades. But by emphasizing the learners to change their attitude and behavior can play an active role in constructing knowledge.

Interaction as a life line of learning: Teachers' opinion

Most of the teachers (91%) accept that there is a significant correlation between two-way communication and academic performance of the students. Silence inside classrooms is a big problem and it reduces socialization and skill temperament. It is not easy to bring them out to talk about their view points and attitude. Some of the teachers have poor opinion about the education imparting in the schools. They thought students were still in memorizing stage their understanding and reflection mode were switched off. McCroskey & Wheelless, (1976) observed that between 50 and 90 percent of all interpersonal communication occurs primarily because of the participants' motivation to seek affinity with one another. Most of the teachers were not satisfied with the quality education imparting on the secondary and high school levels.

That is why; the factors influencing interaction in the classroom should be eliminated. Affective factors in improving communication among professors and students are essential for improving the educational process (Khosravi, 2011). Effective teaching depends on successful communication. When teachers and students interact with one another, an explicit communication occurred that is good for learning and teaching environment (Miller, 1988).

David Andrade (2015) assessed that Communication is supreme in education and learning. Whether it is used by teacher to student, student to teacher, teacher to teacher, teacher to parent, teacher to admin or admin to parent, or vice versa, communication is needed to make sure our students are successful. But on the other hand, Nurzali Ismail and Khairu'l Najmi Idris (2009) found no correlation between effective classroom communication and students' performance. Two-way communication in the classroom was just essential in assuring that effective teaching and learning could take place. Sometimes students feel inferior and remain passive in the classroom. And sometimes **students seem more intent on writing down what teacher says than on listening and understanding. Most students, seemingly unconcerned with content, laboriously and uncritically write down whatever teachers say.**

In practice, that is not the case.

DISCUSSION AND CONCLUSION

Indeed, if appropriately, effective two-way communication is established between teachers and students the chances of success will be equally high. Importance of two-way communication should be widely recognized to make students confident, well behavioral, self-esteemed and psychological strong. Providing sufficient opportunities of speaking or answering to the students in the class would increase their confidence level. The result oriented productivity in classroom comes from an effective interaction and cooperation between the student and teacher. Good relationships between the two are imperative for motivation and academic achievement of the students (Spilt, Koomen and Thijs, 2011). This will also make reciprocal relationship between duos.

Mary P. Clynes and Sara E.C. Raftery (2008) define that the importance of feedback has already been acknowledged though this element is inconsistently absent in students' communication process. Whereas, feedback increases self-esteem and confidence in students, also motivate them to achieve their goals. They identify that inadequate supervision, training and education, unfavorable learning environment and insufficient time spent with students are some of the barriers to the two-way communication. Nakane, I (2007) in his study discovered that the students who belonged to the minority ethnic group were silent in the classrooms in comparison with their majority peers. Some students' silence in the classrooms is consequence of conflicts based on cultural and caste differences. This silence or silencing of the minority students in the classroom can be seen as a sign of discrimination and control and also the tension which exists in negotiating power relationships between the teacher and students.

As it is pointed above,

Thus, even though these statements are unsupporte

PEDAGOGICAL POSSIBILITY OF PHYSICAL QUALITIES EDUCATION IN PRESCHOOL CHILDREN

Sohiba Khamidovna Achilova*

*Teacher,
Kokand State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

The article shows the role of physical exercises in the development and strengthening of the musculoskeletal system of children and pedagogical possibility of physical qualities education in preschool children. Physical exercises have an educational value. Children develop attention and observation, develop strong-willed qualities, and develop character. Examples of exercises for preschool children are given.

KEYWORDS: *Preschool Educational Institution, Physical Education, Physical Exercises, Attention And Observation, Child Development, Movement, Games.*

INTRODUCTION

Ensuring the implementation of the Decree of the President of the Republic of Uzbekistan dated September 30, 2017 No PF-5198 "On measures to radically improve the management of preschool education" and the establishment of state and non-state networks of preschool education further expansion, creation of conditions for the formation of a healthy competitive environment between public and private preschools, the introduction of new forms of preschool education in the context of public-private partnership, as well as In order to ensure the effective organization of the Ministry of Preschool Education of the Republic of Uzbekistan, the Ministry of Preschool Education was established. The document says the number of public preschools in the country has shrunk by more than 45 percent over the past 20 years, while enrollment in preschools has risen by about 30 percent. [1],[8]

The physical development of preschool children is particularly important for the proper development of motor skills.

In the State curriculum of a preschool educational institution "The first step" contains the competencies of the field "Physical development and formation of a healthy lifestyle". At the end

of the educational activity in the field of "Physical development and formation of a healthy lifestyle", a child aged 6-7 years:

- * shows physical activity according to their capabilities and age norms of physical development;
- * is able to perform various types of motor activity in a coordinated manner and with the goal of;
- * uses fine motor skills in a variety of life and learning situations;
- * regulates your movements with the help of your senses;
- * applies personal hygiene skills;
- * knows the basics of a healthy lifestyle and nutrition;
- * follows the rules of the basics of safe life. Children of early preschool age need outdoor games, outdoor exercises.

In addition, you need tasks aimed at developing psychological qualities. Such tasks are applied in a strict sequence, are included in different forms of motor activity. Also, tasks are included in the independent motor activity of the child on a walk.

Outdoor games originate from the depths of folk pedagogy. Starting from an early age, the child is brought up on bright toys, jokes, nursery rhymes, games and fun associated with the initial movements of the baby. There were folk games with motor content, including enticing game beginnings, songs, and counting games for children. All this still represents the artistic charm, educational value and is the most valuable, unique game folklore. According to Ushinsky, a special educational role is played by collective games, which develop children's communication skills, and establish "the first associations of social relations". [3]

Main part

The physical qualities of children are innate, they need to be developed and improved. At a younger age, the most rapid growth and development of the main body systems and their functions takes place, and the foundation for the multi-faceted development of physical and spiritual qualities is built. The greater the number of different movements a child masters, the wider the opportunities for the development of sensation, perception and other mental processes, the more fully its development is carried out. If you conduct the education of physical qualities while developing motor skills, then this has an impact on their improvement, improvement of the whole body, increasing the emotional and positive state of the psyche; children show more and more confidence in performing movements, learn new things faster, strive for greater achievements, show creative independence.

The development of physical qualities is observed in certain actions, especially when walking, jogging, running, long jumping, high jumping, climbing a rope, climbing stairs, playing on playgrounds, slides, throwing a ball, competitions and competitions, sports. When children perform each exercise, all physical qualities are shown in all movements, but each type of movement or exercise is aimed at developing certain muscles of the body, certain physical qualities. For example, when running short distances-speed; when running a long distance — endurance, and when jumping long and high with a run — up-strength combined with speed. For example, the ability to move quickly allows you to run quickly, swim, ride a bicycle. And short-term power stresses are necessary in jumping, climbing, and throwing objects.

The game is a means of forming the child's personality. Emotions that arise in the game are a health component. Joy is one of the mandatory conditions of play activity, without which the game loses its meaning for children.

Outdoor play is one of the most important means of comprehensive education of preschool children. Its characteristic feature is the impact on the body and on all aspects of the child's personality; in the game, physical, mental, aesthetic and labor education is simultaneously carried out.

In outdoor games, the child has to decide for himself how to act in order to achieve the goal, contributing to the development of independence, initiative, creativity, and ingenuity.[5]

Outdoor games are a means of active recreation after strenuous mental work. Playing activity strengthens the main muscle groups and thus contributes to better health. The movements included in outdoor games are very simple in their form, natural, understandable and accessible to perception and execution.

Game activity is always associated with solving certain tasks, performing certain duties, overcoming difficulties and obstacles, strengthening willpower, cultivating self-control, determination, achieving goals, and self-confidence.

From all of the above, we can conclude that a high level of development of physical qualities helps in various life situations. The higher the level of development of physical qualities, the more successful the child's motor activity, the higher his ability to master new forms of movement, the higher the ability to use them expediently in life, the higher self-esteem, confidence in movements.

Physical education is an essential part of physical education. All physical qualities are innate, i.e. they are given to a person in the form of natural inclinations that need to be developed and improved. It is in preschool age that the most intensive growth and development of the most important body systems and their functions is carried out, and the basis for the comprehensive development of physical and spiritual abilities is laid. The greater the number of different movements a child masters, the wider the opportunities for the development of sensation, perception and other mental processes, the more fully its development is carried out. The education of physical qualities in unity with the training of children in motor skills has an impact on their improvement, improving the whole body, increasing the emotional-positive state of the psyche; children show more and more confidence in performing movements, learn new things faster, strive for greater achievements, and show creative independence.

The development of physical qualities is manifested in specific actions, basic movements: walking, running, jumping, climbing, throwing, playing and sports activities. When performing any exercise, the main type of movement, all physical qualities are manifested to some extent, but any one of them takes precedence. For example, when running short distances — speed; when running long distances-endurance, and when jumping long and high with a run-up-strength combined with speed. For example, the ability to move quickly allows you to run quickly, swim, ride a bicycle. And short-term power stresses are necessary in jumping, climbing, and throwing objects. I propose to consider the development of physical qualities in preschoolers.

Dexterity is a complex quality characterized by good coordination and high accuracy of movements. Dexterity develops in the main types of movements (climbing, in general

development exercises with objects, with equipment, in outdoor games, in sports games. The development of dexterity is facilitated by performing exercises in changing conditions. So, in mobile, sports games, children have to continuously switch from one movement to another, not conditioned in advance; quickly, without any delay, solve complex motor tasks, in accordance with the actions of their peers. Dexterity develops when performing exercises conducted in complicated conditions that require a sudden change in movement technique (skiing up and down a hill, etc.). When conducting relay games (running between objects, climbing into a hoop, etc.). To determine dexterity, a shuttle run is performed for a time.

Age	Average score boys	Average score girls
5 years old	12,7 +/- 1,5	13,0 +/- 1,5
6 years old	11,5 +/- 1,1	12,1 +/- 1,0
7yearsold	10,5 +/- 1,1	11,0 +/- 1,0

Speed - the ability of a person to perform movements in the shortest possible time.

Speed develops in dance movements, in exercises performed with acceleration (walking, running with gradually increasing speed, at speed (to reach the finish line as quickly as possible, with a change of pace (slow, medium, fast and very fast, as well as in outdoor games, when children are forced to perform exercises with the highest speed (to run away from the driver). The development of speed is promoted by speed-strength exercises performed in the course of organized educational activities, in free motor activity, on a walk: jumping, throwing (the push when jumping in length and in height with a run-up, the throw when throwing is made at high speed). For the development of speed, it is advisable to use well-mastered exercises, while it is necessary to use an individually differentiated approach, take into account the physical fitness of children, as well as their state of health. To determine the speed, children run 30 meters for a time.

Age	boys	girls
4yearsold	8,5	9,4
5 years old	8,1	8,5
6 years old	7,3	7,8
7yearsold	6,5	7,0

Flexibility - the ability to achieve the greatest magnitude of the range (amplitude) of movements of individual parts of the body in a certain direction. Flexibility depends on the condition of the spine, joints, ligaments, as well as the elasticity of the muscles.[8]

Flexibility develops when performing physical exercises with a large amplitude, in general developing exercises in the morning, in class, wake-up calls after sleep. In preschool children, the musculoskeletal system has great flexibility. You should strive to maintain this natural flexibility, without abusing stretching exercises that can lead to irreversible deformities of individual joints (for example, the knee). Flexibility exercises should first be performed with an incomplete swing, for example, do 2-3 half-bends, and then a full tilt, 2-3 half-squats, then a deep squat. To determine flexibility, the child performs a downward tilt, standing on a bench, or sitting on the floor, moves the cube away from him.

Age	boys	girls
4yearsold	8 – 10	9 – 12

5 years old	5 – 8	8 – 12
6 years old	7 - 9	6 – 11

Balance - the ability of a person to maintain a stable position while performing a variety of movements and poses on a reduced and raised area of support above the ground (floor). This quality is necessary for a person to move around in the room and on the street, without touching objects, each other, to successfully cope with the duties necessary for different jobs (top climber, etc.).

The balance depends on the state of the vestibular apparatus, all systems of the body, as well as on the location of the general center of gravity of the body (GCG). In preschoolers, the total center of gravity of the body is located high, so it is more difficult for them to keep their balance. When performing exercises, changing positions, the center of gravity of the body shifts and the balance is disturbed. You need to make an effort to restore the desired position of the body. For preschoolers, this is quite difficult.

Balance develops in such types of movements as walking, running on a bench, in exercises performed on a reduced and raised support area (skating, cycling, also in exercises that require significant effort to maintain a stable body position (throwing at a distance, long jump from a place and from a run, etc.). To assess the balance function, a stand is performed on one leg, the other bent at a 90-degree angle and set aside.

Endurance - the ability of a person to perform physical exercises of acceptable intensity for as long as possible.

RESULTS AND DISCUSSIONS

The development of endurance requires a large number of repetitions of the same exercise. The monotonous load leads to fatigue, and children lose interest in this exercise. Therefore, it is best to use a variety of dynamic exercises, especially in the fresh air: walking, running, skiing, skating, sledding, cycling, swimming, etc. Outdoor games are also useful, which cause positive emotions and reduce the feeling of fatigue. Walking (walking, skiing, during which exercise alternates with rest) is also recommended. The dosage of exercises and the duration of classes increase from group to group. And it also contributes to the development of endurance. To determine endurance, a step test is performed. The heart rate and the ability to restore the pulse are monitored.[7]

When planning the main types of movements in the class, I note for myself what physical quality I will develop today. What qualities can be developed in the main types of movements?

Walking- Endurance, speed, balance

Running-Speed, endurance, agility, balance

Jumping- Strength, agility, speed, balance

Throwing- Agility, strength, speed, balance

Climbing- Agility, flexibility

To track the effectiveness of our activities, we monitor the development of physical qualities at the beginning of the school year and at the end. We use the diagnostics proposed by N. V.

Poltavtseva, E. N. Vavilova, and A. B. Lagutin. Based on the results of the autumn monitoring, I plan my work with children.[6],[7]

Work on the development of physical qualities is impossible without the cooperation of a physical education instructor, narrow specialists, and teachers. During classes, on a walk, in independent games, I draw the attention of teachers to those children who have difficulties with any movement, I ask them to conduct individual work during a walk, free activity, taking into account the individual characteristics of the child, his capabilities, paying attention to how he tolerates the load.

CONCLUSION

Having considered physical qualities and studied the patterns of their development in preschool children, we can conclude that physical qualities are important for the comprehensive physical development of children. For training physical qualities as a means of forming physical development in preschool children, the universality of outdoor games is important. During the game, only one of the child's qualities does not develop. There is a General training of the body with a great emphasis on one of the types of qualities studied. The development of physical qualities is measured by certain indicators, such as speed, flexibility of the body, endurance, coordination of movements. This is necessary for the proper development and full life of a person.

In the course of the work done, the goal was achieved and the tasks were solved. We must remember that it is a huge mistake to encourage children at preschool age not to move and be silent. During this period, children learn the world. And the development of physical qualities provides a solid Foundation for a comprehensive study. It can be concluded that as a result of the use of outdoor games in preschool children, the level of physical fitness increases. In addition, a physically developed child does not lag behind in his mental development. It is easier for him to establish friendly relations with other children during the game. From here we get a healthy person on all levels: physical, mental and social.

This work can be used by teachers and physical education instructors in kindergartens.

ABSTRACT

This article is devoted to the concept of "discourse", its scientific definition from the point of view of Russian and foreign linguists' research. The article presents the main characteristics of the discourse features depending on the scientific field of its research and application

KEYWORDS: *Discourse; Basic Characteristics; Discourse Features and Peculiarities.*

INTRODUCTION

Many terms used in the field of research are characterized in many ways and are contradictory. They certainly include such a concept as discourse. Many disciplines are related to the study of discourse, for example, pedagogy, sociology, pragmalinguistics, speech linguistics, cultural studies, psycholinguistics, law, etc. Each science and scientific direction approaches the study of discourse depending on the specifics of the subject.

Discours (French) (from Lat. discursus-movement, conversation, conversation) is translated as "discourse" (less often-speech, type of speech, text, type of text). It is considered one of the complex concepts for the definition. But, despite this, it is often an applicable and functionally convenient term.

Initially, the word "discourse" in French linguistics meant speech in general or text. As it is supposed, the theory of discourse takes its origins from the concept of E. Benveniste, who defines discourse "as speech assigned to the speaker". He drew a line between the plan of the narrative (récit) and the plan of the language appropriated by the speaker (discours). An identical

distinction was also observed in L. V. Shcherba : language as a system and as an ability, speech activity and language material, texts.

Studying discourse as a subject of text linguistics, and discursive analysis

- one of his methods, T. M. Nikolaeva considers discourse as "a polysemantic term of text linguistics, used by a number of authors in meanings that are almost homonymous"[11] and identifies the main ones :

- 1) Dialog;
- 2) oral-colloquial form of the text;
- 3) a group of statements related to each other in meaning;
- 4) coherent text;
- 5) a speech work as a given, oral or written.

In the future, the definition of "discourse" as a term of text linguistics was not limited to the text and "began to include an enumeration of the conditions in which this text is updated" [10]. In this case, it will be relevant to recall the definition of discourse proposed by T. A. van Dijk , who in modern linguistics holds the first place in the description of this phenomenon, "as a speech flow, language in its constant movement, absorbing the diversity of the historical era, individual and social characteristics of both the communicant and the communicative situation

, in which the communication takes place .The discourse reflects the mentality and culture both national, universal, and individual, private. "[4]. Therefore, "... discourse is a complex communicative phenomenon that includes , in addition to the text, also extralinguistic factors (knowledge about the world ,opinions, attitudes, goals of the addressee) necessary for understanding the text" [8] It should be noted that this definition is the basis for numerous linguistic studies of the text of the modern period.

V. Z. Demyankov, relying on the works on foreign linguistics, offers a more in-depth definition of discourse, which ,according to Yu. S. Stepanov, is the most complete in the modern theory of linguistics :

"Discours – a discourse, an arbitrary fragment of text consisting of more than one sentence or an independent part of a sentence. Often, but not always revolves around some reference concept; creates a shared context of describing the characters, objects, circumstances, times, actions, etc., being determined not so much a sequence of sentences, as those common to create discourse and interpreter of the world that is "built" for code deployment of the discourse, is a point of view "Ethnography of speech"... [5]

It should be noted that in this definition, discourse consists of features and features characteristic of various disciplines-from semiotics to sociology, communication theory, modal logic, etc.

P. Serio believes that the concept of "discourse" can not be combined with either empirical speech produced by the subject, or with the text .This definition has many definitions: 1) the equivalent of the concept of "speech" (according to F. Saussure), i.e. any specific utterance; 2) a unit that exceeds the phrase in size; 3) the impact of the utterance on its recipient, taking into account the situation of the utterance ; 4) conversation, as the main type of utterance ; 5) speech from the standpoint of the speaker, as opposed to the narrative, which does not take into account

such a position (according to E. Benveniste); 6) the use of language units , their speech actualization: language and speech are contrasted (langue/ discourse);

7) A socially or ideologically limited type of utterance, for example, feminist discourse ; 8) a theoretical construct designed to study the conditions of text production [12]

Focusing on the interaction between the study of language formations and the analysis of the conditions of the social context, M. Stubbs distinguishes three basic characteristics of discourse: 1) in formal terms, it is a unit of language that exceeds the volume of a sentence, 2) in informative terms, the discourse is associated with the use of language in a social context, 3) in its form, the discourse is interactive, i.e., dialogical. («It refers to attempts to study the organization of language above the sentence or above the clause, and therefore to study larger linguistic units , such as conversational exchanges or written texts . It follows that discourse analysis is also concerned with language use in social contexts , and in particular with interaction or dialogues between speakers».[14].

The above statements make it possible to assert that discourse is likened not only to text (oral and written) and dialogue, but also to language and speech.

Discourse is a means of updating language in speech. On the one hand, it is characterized as speech embedded in a communicative situation and, in this regard, as a category with a pronounced social content in comparison with human speech activity : discourse is speech "immersed in life" [2; 7], the minimum component of which is a statement (a replica in a dialogue) – "characterized by a change of subjects of speech , completeness, genre design, connection with other statements of the dialogue and integrity. The statement, first of all, is connected with the response statement of another communicant, the interlocutor" [9]. As a result, interaction, transaction, or dialogic unity is distinguished

– a unit of the next level of discourse analysis. Examples of dialogic unity are the QUESTION/ANSWER, REQUEST/RESPONSE, etc. pairs [1]. On the other hand, the actual practice of modern (since the mid-1970s) discursive analysis is associated with the study of flow patterns information within the framework of a communication situation, and performed primarily through the exchange of replicas. Thus, the structure of dialogical interaction, which was initiated by Z, is actually described. By Harris .

Discourse is a key phenomenon in human life "in language", what B. M. Gasparov calls linguistic existence: "Every act of using language-whether it is a work of high value or a fleeting remark in a dialogue-is a part of the continuously moving flow of human experience. In this capacity, it captures and reflects the unique set of circumstances under which and for which it was created." These circumstances include :

- 1) The author's communicative intentions;
- 2) The relationship between the author and the addressees;
- 3) All sorts of "circumstances", significant and random ;
- 4) The general ideological features and stylistic climate of the era as a whole and of the specific environment and specific personalities to whom the message is directly or indirectly addressed;

5) Genre and style features of both the message itself and the communicative situation in which it is included;

6) A lot of associations with previous experience that somehow fell into the orbit of this language action [3]

In the work of A. A. Kibrik, another definition of discourse is given, which also reflects the diversity of its features: "Discourse should be considered as the interaction and intersection of four structures:

1) The structure of the ideas expressed in the text;

2) Structures of the speaker's thought processes;

3) The language structures used by the speaker;

4) The structure of the speech situation (the relationship between the speaker and the listener)" [6].

The above allows us to conclude that the basis of discourse is the cognitive processes of the writer or speaker, namely, the processes of understanding, interpretation and generation of discourse.

Along with the two main concepts of discourse (the identification of discourse and text and discourse and speech), there is another one, according to which discourse is characterized as a discursive practice (this understanding belongs to M.Foucault [13]) , representing the field of practical use of language in political science, social semiotics, and sociology . In this case, the following components of the discourse are studied: the specifics of the topic, language distinctions, stylistic features, discussion of a certain discourse that characterizes an individual or a group of subjects.

So, based on the above, it should be noted that the whole set of scientific ideas about discourse, interacting with each other and being inseparable parts of one concept, indicates the frequent use of this term in modern science, but at the same time emphasizes the lack of transparent boundaries and a finite number of structural components of this concept.

ABSTRACT

Every year, students and interns come to Tashkent State University of Oriental Studies from different countries who have studied Russian at universities for some time. However, their knowledge of the Russian language is rather passive, since, having a certain vocabulary, they cannot use it sufficiently. The article describes the introduction of innovative approaches in the teaching methodology of RFL into the educational process. The content, methods and techniques of teaching are determined not only by the ultimate goals, but also by the degree of preparedness of the students. The effectiveness of training depends on how successfully it is possible to use the existing speech skills and the language stock of students to form new skills, how quickly the disadvantages of foreign language skills are overcome. When setting to activate passive language proficiency, the main attention is directed directly to the formation of speech ability. In order for the tasks of activation to be solved in a short time, all the essential signs of verbal communication should be reflected in the educational material, and the listeners should have mastered.

Keywords: *Teaching The Russian Language, Teaching Features, Educational Process, Teaching Efficiency.*

INTRODUCTION

The types of assignments, the forms of communication between the teacher and the audience, the nature of the students' speech actions should be such that some common features of speech contacts are constantly assimilated. The article shows the dependence of the content, style and tone of communication on the situation, the relationship of the interlocutors, the targeting of speech, the desire to influence the interlocutor, the choice of one's own speech behavior depending on the expected reaction of the interlocutor, etc. The language material of such a course, according to the authors of the article, can be divided into three parts: the actual minimum of activated lexical and grammatical structures, lexical and grammatical means introduced as new material and, finally, linguistic means, the flow of which is regulated by the actual communication needs.

Educational communication should be divided into three stages: 1. training of typical language means familiar to students, 2. introduction of means of speech contact that are missing for more complex forms of speech activity, 3. providing students with the greatest opportunities to define and implement their own speech behavior program. Thus, as a result of the transition from passive to active language proficiency, a transition is made from controlled linguistic situations to fluent language proficiency.

THE MAIN FINDINGS AND RESULTS

The methodology of teaching Russian as a foreign language (RFL) assumes constant updating of the content of education based on the analysis of existing scientific theories. The content of education is constantly updated by searching for appropriate pedagogical technologies. Innovative approaches in teaching RFL are based on the provision that teaching and learning any foreign language is part of the process of language education, which includes value, process, result and system. In the modern multilingual world, the openness of borders and the realization of the individual's abilities in the global cultural space guarantee the student not only a pragmatic knowledge of the Russian language, but also entry into the socio-cultural space [1].

A significant part of foreign students entering the Tashkent State University of Oriental Studies, to one degree or another, speaks Russian, therefore, in our university, the direction of RFL for foreign students and trainees functions mainly as a form of improving speech skills in a certain area, corresponding to the needs of a specific contingent of students.

The content, methods and techniques of teaching are determined not only by the ultimate goals, but also by the degree of preparedness of the students. The effectiveness of training largely depends on how successfully it is possible to use the existing speech skills and the language stock of students to form new skills, how quickly the disadvantages of foreign language skills are overcome. Often our colleagues express the opinion that, for example, the Japanese audience is in some sense difficult for the teacher's work: firstly, the external lack of emotion of students, unwillingness to ask questions and somehow demonstrate whether the material is understood, and secondly, there is a big difference in language systems (such as the presence of declension and conjugation in Russian and the immutability of the Japanese language); thirdly, there are a lot of mistakes in speech made under the influence of interlingual and intralingual interference.

This article is devoted to the peculiarities of working with foreign students and trainees who passively speak the language. This type of incomplete language proficiency, in which receptive

skills clearly outweigh productive ones, is one of the most common when learning a language outside the linguistic environment, therefore, it is noted among many foreigners who have previously studied Russian at home. It occurs as a result of the lack of contact with native speakers or when they are limited and irregular. The main source of linguistic information for passive language proficiency, as a rule, is the Internet and books. Therefore, the lag in listening and speaking skills in comparison with reading is quite understandable. Probably, the methodology of teaching the Russian language, which until recently did not provide a sufficiently communicative orientation of education, does not allow to overcome all the difficulties of mastering a foreign language as a new means of communication and predetermines a passive type of language proficiency. The aforesaid made us turn to the problem of choosing the methods of teaching with the attitude towards activation of the learned passively.

What exactly is passive language proficiency manifested in?

Experience has shown that with a relatively large volume of linguistic material studied by foreigners, its assimilation is not functional enough: in the field of grammatical structures, various elements are usually known, but difficulties are noted when combining them in speech and when producing integral utterances; in the field of vocabulary, the compatibility of words, the sound image of words and the scope of use of individual lexical units are not sufficiently mastered; speech means do not always correlate correctly with communication situations; along with a significant stock of linguistic means, there is a lack of knowledge of the most necessary means of speech contact, that is, the composition of the linguistic stock is also insufficiently functional. Speech behavior is characterized by attempts to apply analysis both in perception and in the production of speech, as well as inability to manage communication with the studied means. The consequence of all these features is the lack of readiness to participate in speech communication. Usually, when meeting students, we ask them to tell or write about themselves. As a rule, this request causes great difficulty and what is expressed or written is limited to two or three phrases such as: "My name is ... I am from ... I am a student." At the same time, knowing the language passively, students often demonstrate a significant supply of language means, they can already operate with rather complex grammatical and lexical material. The problem of memorization, which, according to many methodologists, is central in the acquisition of a foreign language, with the activation of passive proficiency in the language loses its acuteness to a certain extent, the main thing becomes not so much memorization as "remembering" what has already been met, recognizing known material in new contextual conditions and using it for solving communication problems [1].

Taking into account the noted features of passive language proficiency, some parameters of teaching foreign students can be distinguished:

Since the main disadvantage of passive language proficiency is the inability to use the acquired linguistic material in communication, it seems appropriate to direct training towards mastering the communicative aspect itself, operating mainly with language structures and forms known to students, which makes it possible to immediately involve a significant number of linguistic means into communication without undue complication training.

Establishing ways to activate passive language proficiency, we proceed from the assumption that the mastery of verbal communication in a foreign language occurs not only through the sequential assimilation of the means of expressing individual speech intentions. It is impossible

to exhaust all the basic situations, to provide for all the speech needs of students (even within the set goals and for a certain contingent), just as it is impossible to cover all permissible language combinations. Identification of typical communication needs of students is necessary for a methodologically grounded organization of the course, increasing the motivation of students, and ensuring the purposefulness of training. However, learning by intentions tends to go beyond specific communication tasks and specific situations, just as learning by thematic principle turns out to be productive only in those cases when it goes beyond the boundaries of certain topics. This means that on the basis of certain topics, situations, intentions, the norms of speech behavior are mastered. Not only the linguistic aspect of the speech production is mastered, but also the social-role and national-cultural ones. The student masters the tactics of verbal communication [2, pp. 478-480], the level of his "communicative competence", the ability to navigate in the circumstances of communication and to resolve the emerging communicative collisions increases.

When setting to activate passive language proficiency, the main attention is directed directly to the formation of speech ability. Since in the case of passive language proficiency this aspect was missed, it has to be introduced additionally, and it is he as such that becomes the subject of instruction. It is known that in many countries there is traditionally a large number of students in groups and in the classroom, reading and grammar are mainly studied. The knowledge assessment system often involves the form of written tests, as a result of which foreign students are often focused on passive perception of lectures in order to prepare for the test.

In order for the tasks of activation to be solved in a short time, the educational material should be reflected, and the listeners should have mastered the main signs of verbal communication.

The types of tasks, the forms of communication between the teacher and the audience, the nature of the students' speech actions should be such that some common features of speech contacts are constantly assimilated, at the same time their uniformity and diversity.

Some typologization of situations outlined in the educational and methodological literature [3, pp. 248-252; 5] allows the teacher to select only those types of work that really respond to the attitude towards mastering the patterns of speech behavior: they show the dependence of the content, style and tone of communication on the environment of communication and the relationship of interlocutors, the targeting of speech, the desire to influence the interlocutor, the choice of one's own speech behavior depending on the expected reaction of the interlocutor, etc. The regional content of the main situations that meet the communicative needs of listeners is mastered. Along with the development of specific situations and conversational topics, a set of fairly universal speech reactions is distinguished, with the help of which the student can still carry out spontaneous communication. Speech practice is organized in such a way that students are constantly faced with the need to navigate in the conditions of communication offered to them or established by them.

This orientation of teaching neutralizes the inhibitory effect of receptive language acquisition, forms a new language experience for students, thanks to which the transition from book language proficiency to living and natural language is the least painful and rather quick.

The mastery of speech behavior in situations typical for the country of the target language and for contacts of representatives of different countries is recognized by persons who have already studied the Russian language as a new, unknown side of the functioning of the language, due to

which the entire course, despite the fact that it is based on language material familiar to students is assessed as a new step in language learning, and not as repetition and training of the known, which is important in itself, as it increases interest and enhances the motivation for learning.

Although the linguistic content of communication is not singled out as a separate aspect [6], in our opinion, it is still regulated in the preparation of programs and teaching aids, which makes it possible to activate the language means most typical for the communication tasks of the course in the speech of listeners and to solve some correction problems. Consequently, selection and special training do not apply to all lexical and grammatical means introduced into the activating course. The language material of such a course can be divided into three parts.

The first part is actually a minimum of activated lexical and grammatical constructions, usually familiar to the listeners and introduced with a focus on the accuracy of word usage. This minimum includes constructions that make up the "core" of the linguistic support of topics and situations. Being mostly familiar, this language material is easily included in the speech of listeners and is assimilated in the process of educational communication in the combinations necessary for speech, being at the same time the basis for the development of the skill of combining language units. The formation of this skill is facilitated by the fact that communication exercises - participation in a dialogue, reaction to certain circumstances set in educational communication, constantly require students to reorganize (regroup, replace, etc.) linguistic units. This ensures a fairly quick functional assimilation of the basic minimum of language means that students can use in different communication conditions.

The second part of lexical and grammatical means is introduced as new material. These are, first of all, typed means of speech contact. As testing shows, they are usually not learned by mastering the language in a receptive way. Currently, they are usually given in connection with the rules of speech etiquette, however, they can be presented much more broadly, for example, as a means of entering into a conversation, avoiding a conversation, expressing the desired reaction with a greater or lesser degree of certainty, etc. (A you know ..., I heard ..., how can I tell you ..., by the way,).

And, finally, the third part of the lexical and grammatical composition (large) is made up of linguistic means, the receipt of which is regulated by the actual communicative needs, and the main criterion for the success of the course is the ability to resolve various communication problems with acceptable grammatical and lexical incorrectness of speech within certain limits, the ability communication tasks language means known to students from previous experience.

The very construction of an activating course differs from the training itself: we usually begin the lesson with a question-and-answer conversation at the household level: questions are asked concerning the daily life of foreigners: What day is it today? What time did you wake up? What did you do last night? etc. These are exercises in communication, but on relatively simple material, obviously familiar to students, the use of which has already been brought to certain speech automatisms. Then its rapid expansion is ensured, accompanied by verification and reminder of the most important speech means for the situations involved.

The construction of a separate lesson and the entire course is determined by the complication of educational speech activity, the transition to forms that require students to independent speech behavior.

The first stage of educational communication provides speech activity, controlled according to different parameters: target, situational, according to the characteristics of the participants in communication, according to the set language programs. It correlates with the regulated lexical and grammatical content and includes the training of typical linguistic means, familiar to the listeners, but in need of activation. Simple forms of speech behavior are mastered - a reaction to a situation, micro-dialogue, a detailed replica, etc.

The second stage provides the introduction of the means of speech contact that are missing for more complex forms of speech activity. Whole programs of speech behavior are assimilated, their language predestination decreases, the mobility of the components of controlled situations increases.

The third stage provides students with the greatest opportunities to define and implement their own speech behavior program. The transition from controlled situations to free behavior is carried out. This stage ensures the handling of a large lexical stock, contributing to the extraction of words from the passive and the assimilation of a certain number of new linguistic means. The latter are assimilated against the background of familiar material partly as a combination of it, partly as a missing link for expressing meaning. The rapid mastery of new linguistic means in the mainstream of speech activity is supported by associations with familiar linguistic material and is facilitated by the fact that at this stage speech skills reach an already known level of dynamism. For example, in Japan, in the classroom, students read Russian folk tales "Kolobok", "Turnip", "Geese-Swans", etc. In the classroom, we suggest watching cartoons based on these tales. Students watch with interest, retell the cartoon, and then, already at home, watch other Russian films and cartoons on their own and retell their content in the classroom, answering questions about what they have seen.

The main source of the intensification of learning in the conditions of one-year education is the "tension of the speech need" (A. N. Leont'ev) among students, resulting from their interest in the content of the lesson, under the influence of the communicative atmosphere in the group, corresponding to the teacher's strategy, the teaching materials used, problem situations, etc. This principle, which is important in general when teaching speech, is especially relevant when setting on activation.

It is known that a tendency to analyze is one of the characteristics of an adult, including a student, audience. When working with a book in a foreign language, this feature often manifests itself in the desire to analyze the linguistic phenomena of another language, in the desire to comprehend linguistic forms. Therefore, the activating courses especially emphasize the role of oral forms of work [7, 8], setting a pace that requires immediate reactions from students, that is, the form of presentation of educational material takes students away from its analysis. This explains the preference for listening to reading in homework.

It is even more important, however, to emphasize the role of the problematic nature of teaching and the use of assignments that encourage listeners to produce independent speech acts. It is important that the propensity for the analysis of adult learners is aimed at solving substantive rather than formal language problems, so that the teacher's statements and teaching materials put students in front of the need to reflect. In this case, they often manage to overcome the constraint that comes from passive language skills themselves, and their participation in educational communication becomes natural; the listener finds himself in a role familiar to him when using

his native language, which facilitates the transfer of the relevant skills of his native language to a foreign one.

The desire to express his thought most convincingly makes a person in his native language look for means of its expression. The desire to understand the interlocutor, to learn from him what seems interesting, to object to him or support him creates a state that stimulates the search for the necessary language means, develops verbal resourcefulness. Passion for the learning process, emotional and intellectual stress (and their relationship is beyond doubt) contribute to the activation of the learned passively.

Thus, the tension of speech needs, the problematic nature of tasks, the use of internal motivation of students are absolutely necessary to increase the efficiency of activation processes.

In the context of group learning, such recollection becomes collective. It often happens that at first the listener does not seem to be able to express his thought, he obviously lacks the means for this, but as soon as the subject of the conversation becomes common, he, having listened to others for some time, enters into the conversation quite freely.

Such observations force us to devote a significant place to conversations in which the whole group participates, and it seems preferable that the listeners engage in the conversation on their own initiative, and not in response to a direct question from the teacher (a question-problem is posed to the entire group). Let us refer to the following example: vocabulary tasks were performed by each student in the group in writing, then the same exercises were done orally; at the same time, significantly more words were named than there were in all written works.

It seems that special types of exercises (especially vocabulary) can also be developed that would contribute to remembering what was previously encountered, that is, along with involuntary, voluntary "remembering" is stimulated. In this regard, the role of reminding the main means of expression in the form of a story or a teacher's address, vocabulary work, preliminary reading of a text on a similar topic, the role of visual supports - drawings, photographs, etc. should be assessed.

CONCLUSION

It is important to include in the course a sufficiently wide and varied speech material that can evoke numerous associations among students. This idea is suggested by the hypothesis developed, for example, in the work of A. Jacykiewicz, about the existence in the memory of those studying a foreign language of a complex system of intra-verbal associations, separate from the system of intra-verbal associations of the native language [11].

Thus, the course of teaching the Russian language, aimed at activating passive language proficiency, has a number of differences from the teaching itself, although, of course, it is conducted within the framework of those general principles that determine the effectiveness of teaching a non-native language as a means of communication according to the data of modern psychology and methodology. After reviewing some of the characteristics of this course, we wanted to highlight the idea that all language learning is specifically targeted. Moreover, the more concretely it is oriented, the more successful its results are.

ABSTRACT

In this article the basic attention are concentrated on the study of control system of Chach's oasis, reforms that were carried out by Khakans in control system of oasis that were analyzed by foreign researchers in a scientific way. As well, the appearance of Turkish dynasties in control system of oasis including the representatives of main dynasty of Tegens and their deputies of Tuduns and were studied their careers and titles. In this article foreign researchers as E. Shavan, F. Gren, Э. De Vassier, American J.K. Skef, German researcher Z. Stik, Hungarian orientalist K.I. Bekvis, Turkish orientalists and historians Z. V. Tugon, E. Esin and E. Ekrem had scientifically analyzed the expressed opinions regarding to the management of oasis.

KEYWORDS: Tegin, Tudun, Chach, hierarchy, Chabish, Kay-Yuan, Suy-shu, Bey-shi, Tan-shu, tibetan, khakan, turkish(tyurk), management, vassal (foundation), system, reform, Chach's sovereign(ruler), Khun.

INTRODUCTION

In the 6th-8th centuries, the socio-political and ethno-industrial processes in Central Asia attracted not only our local researchers, but also foreign orientalists and scientists, historians. In particular, while Western researchers are studying this period in Central Asia, they still pay attention to the Amu Darya and Sirdarya gap and the adjacent territories of Sagda, Ferghana, Ustrushon, Bukhara, Tukharistan, Khorezm, and one of the Chach's oasis governments.

In the early Middle Ages, the view of the leadership of the Chach government and the origin of the government of the oasis dynasties were expressed in a number of foreign publications, between them are mainly separated by the research of Shawan, F. Gren, E. De Vasier, the

American J. K. Skeff, the German researcher Z. Stik, Hungarian orientalist K. I. Bekvis, Turkish orientalists and historians Z. V. Tugon, E. Esin, and E. Ekrema.

Scientists conducted scientific research based on written sources, especially information from Chinese chronicles. And also, they were able to clarify the history of the oasis mainly in the field of coverage of the Turk khanate and achieved coverage of many problems that could not be identified until today. Among them, one of the first who study the history of Central Asia based on Chinese sources was the scholar E. Shawann, and in the early twentieth century in his monograph "Documents on the History of the Western Turks" during the translation of Chinese datum, which reflected the political history of the Chach's oasis in the early Middle Ages, compared Arabic and Persian information and expressed his opinions on the activities of the titular lords of Tudun who were sent as representatives from the Khakans to Chach.

RESULTS AND DISCUSSION

The countrymen of E. Shawan F, Grene and E de la Vassier relatively in the coming years carried out their research, especially during the analysis of the Sagdian documents of the Mug Mountain, in the 720s, an ambassador Fatufar was sent by the Sagdian ruler Devashtich and documents were translated into French, a letter under the cipher A-14 which was addressed to their ruler, especially focused on the political processes in the Oasis for the same period. These researchers analyzed the phrases "Ruler of Chach", "Tudun of Chach", "hun" that are found in this document, the latter two were associated with Turkic Khakanism. The American researcher J. K. Skeff mainly based on the information of the Chinese chronicles, focused on the reforms in the administration of its most recent Turkic rulers (khakanstvo) governance, tried mainly to cover the issue well in the example of the Chach government. According to him, the leadership of the governance was very well formed, and the special representative who was sent as representative of Khakans-tuduns was recognized as a Turk by origin.

The German historian Z. Stark, based on the resources of various languages and archaeological materials, highlighted the history of the ancient Turks, the rulers who were originally related to the Ashin tribes from the Chach oasis. According to him, the Turki administration ruled Chach, Ferghana and Tukhoristan, as well as probably Bukhara directly by appointing representatives from their descendants. Some foreign researchers, especially J. K. Skaff, de la Vaissiere, Grenet F, Stark S, Z. although they expressed their important new opinions about the political management of the Chach oasis, it is also noted that during the reign of the dynasty, some unified approaches were made. Especially, if Stark defines the Turkic titles under the rule of vassal rulers not by a specific system and is evaluated as just a coincidence or belonging to the time. On the other hand, J. K. Skaff, stressed that the titles of the Chach Tudun dynasty were in the Turkic language, and the names were non-Turkic. However, the opinion of both researchers was not studied in depth, unfounded, not scientifically analyzed, expressed without comparing the data that are given in different languages and did not pay serious attention to numismatic materials, and it was also noted and explained to several researchers that several issues such as "specific era system non-Turkic names" were used in that period.

Especially, as G. Boboyorov notes, during the Turkic governance (Khakanstvo), the use of the Turkic titles of khakans, and their use was observed in vassals. If, as they wrote, they were evaluated according to the specific systems of the era, then the rulers who wished to optional order those titles related to them Khakans, that is, despite their levels could choose at will,

would be used in a mixed way. Including this the researcher drew attention to non-Turkic names and reached evidence on the basis of different sources that according to the Chinese chronicles the origin of the names of 3 -Tuduns was pure Turkic.

As we mentioned above Chawannes E. He is one of the first researchers who during the translation into French the information of the first Middle Ages according to the Chinese chronicles relating to the political history of the Chach oasis "Bei Shi", "Sui Shu" and "Tang Shu", was one of the first Western researchers who paid attention to the data from Arabic sources

During the translation, it is noticeable how this researcher successfully analyzed the information from the chronicles. In spite of this, F. Grenet and E Le de Vasseur made several mistakes even if they were informed by the research of Chavannes from these chronicles. In particular, when they analyzed the Sagd document A-14, the Chinese data translated from Shawann's side the full phrase-Shi-Guo Wang- "Deputy ruler of Chacha Tudon" Shi-Guo Wang T'ele, that is, in the sentence "Ruler of Chacha Tegin" missed the word "Tegin" gives in the form of Shi-Guo Wang "Ruler of Chacha" and this in turn becomes the cause of confusion of several historical events. That is, according to Chinese sources, despite the fact that it was the ruler of Chacha who was Tegin, it caused confusion that as a result of the omission of this title, because of these researchers, they did not determine the owner of which title is the head of the Chach dynasty, and which ones are vice versa.

As a result, not finding a solution to this issue was overlooked. In the following, the researcher G Boboyarov, who at one time drew attention to this question, noted that F.Grene and E de la Vasier made a mistake, in fact, that during the reign of Chacha, the head of the dynasty was the Tegin, and the secondary dynasties were the Tudun, which were given not only according to Chinese sources(Shi-Guo Wang- "Deputy ruler of Chacha Tudun" Shi-Guo Wang T'ele " Ruler of Chacha Tegin») that is, he accepted that the titles of the hierarchy are military administrative rule (khakanstvo) as the status of "tegin"-(prince), and "tudun" - (representative).

For a more detailed coverage of this period, the Tibetan source was the distinguished specialist K. I. Bekvis, who explored topics that were insufficiently studied related to the history of the Chach Oasis rule. Especially according to the researcher on the Chinese chronicles, it was the rulers of Chach Tegin and Tudun who were Turkic names, in fact, they were mentioned in the form of Inal Tudun Kulug. And also, According to the Chinese chronicles, the name in the form of Cha-bi-shi is restored in the form of the name of the Chach ruler Chabish, and in fact it was not a name, in Turkic chabish (chovush) referred to military titles. According to the researcher, this ruler was a minor ruler of Chach, was the son of Inal Inai Tudun Kulug, was noted as an ally of the Turgash Khakanstvo and as a manager of the Turgash Khakanstvo who opposed China. Later, in 751, his allies Hakan Turgasha and together with the Tibetan military leaders Byd were detained by the Chinese commander Gao Xiangzhi, and was carried to the capital Chang'an and there, by order of the emperor, was executed near the "Gate of Kai Yuan" of the capital. After this incident, the son of the late ruler of Chacha Chabish asks for help from the head of the Arab garrison in Samarkand, Zied ibn Solih al Khuzain, against the Chinese, and as a result, coming in 751, the Great War of Talas will happen. Apparently, the defeated Arab armies took under their care those whom they helped during this war and the rulers of the oasis, including Chacha, were undoubtedly able to turn them into a subordinate government. Because after this war comes the end of khakanstvo (rule) and as a result, khakanstvo faces a crisis.

Although there is no special research about the history of the early Middle Ages of the Chacha oasis, however, it is possible to mention some foreign scientists who have studied some questions about the history of the oasis. Especially among them, Turkish researchers occupy a special place. In particular, in the 60-70 years of the last century, the orientalist and historian Z. V. Tugon, the learned art historian E Esin, during the definition of the history of the Turkic people, drew attention to the Chach oasis, the opinion expressed by them occupies a special place in history. And also when Z. V. Tugon E. Esin highlighted the historical side of the widespread depiction of animals in the visual art of the Turks before the Islamic period, in the territories of Ettisuv and Sirdarya, and also paid special attention to the widespread depiction of a lion and a leopard. The researcher links and interprets the depiction of lions on metal and ceramic objects, as well as on numismatic materials found on traditional Turkic reigns with the beginning of the spread of Buddhism. According to him, the image of animals like (tunga) tiger, leopard, and snow leopard was considered as a symbol of courage during the reign of the Turkic Khakanstvo and the names of these animals were used as the names of rulers or titles. And e.Esin believes that the appearance of the image of the tiger in the art of Central Asia and the Far East, can be associated with the culture of the peoples of the oasis of Sind and Hind. According to him, since the tiger was not found in Central Asia, China and the Far East, in ancient eras, the tiger motif is very rare among the arts of this continent. However, in these territories, with the spread of Buddhism, the image of a lion as a totem (ongon) began to spread) the family is related to the Buddha. As a proof to his opinions, the researcher recalled as an example that the discovery of lion sculptures from the districts of Shivet-Ulan (Mugulistan), are very similar and close to the shape of the image of lions from the Sind region. As the researcher emphasizes, in appearance they are very close to the model of Buddhist culture on the image of a lion found on the pillars of the Sarnat monument. It is very true that the finds from the Tashkent oasis with images of a lion on metal objects are related to the Turkic Khakanism, and it should be noted that it is very similar to the images of a lion on the stone monuments of Shiven-Ulan.

Among the Turkish researchers mentioned above are Z. V.Tugon, E. Esin, E. Ekrem can pay attention to the study and how they relatively studied more about the political and ethno-cultural processes that took place in the Chach oasis during the Turkic rule. Some in the form of exceptions among these scholars in their research, referring directly to Chinese, Arabic, Persian sources conducted research and from local sources especially, due to the fact that they are not well informed with documents in the Sagdian language and numismatic materials, used the data that are associated with the Turkic dynasties under the control of the Chach oasis, the source is limited only to information. It should be mentioned, in contrast to other researchers among them, E. Esin was one of the first to pay attention to numismatic materials, especially relying on Chach coins, and it is worth noting the research conducted by O. and Smirnov, as well as the remarkable notification of Turkish researchers about scientific news.

In the coming years, Uzbek researchers, especially from historians and numismatic scholars, as a result of the dehumidification of a number of scientific publications in Turkey, dozens of Turkish historians and Turkologists have expressed interest in the history of the Turkic peoples of the Chacha oasis, should be noted as they express their opinions on this issue. In particular, if we are pleased with the publication of scientific articles by archaeologists, numismatists, and historical scientists in 2002 from Uzbek researchers like L Baratova, A. Malikov, G. Boboyarov in Ankara, and in 2007 we are proud that in Ankara the study of G. Baratova was published. Boboyarov

mainly consisted of Chacha coins, a huge study called "Catalog of coins of the Turkic Khakanstvo". And also, as a result of the publication of a dozen articles by this researcher about the ancient Turkic coins of Chacha in the Turkish scientific conference, the appearance of the interest of applicants about the history of the Chacha oasis is noticed.

At the same time, although more information is found in written sources, with the exception of a number of Uzbek historians, it should be noted that Turkish and researchers from other countries do not pay enough attention to questions concerning the place of the Chach oasis in the history of the Turkic Khakanstvo, especially related to Khakanstvo with the history of the Turkic dynasty during the reign of the oasis. It should also be noted that the location of Zhabgukat in Chacha is the center of the government of one of the Western Turkic khakanstv, the minting of Khakan coins is in the Chacha oasis, it should be emphasized that not enough attention is paid to such issues as the system of government of the Chacha oasis, and many other issues that have remained without solutions and are still waiting for solutions.

CONCLUSION

In short, as a result of the research of some foreign researchers in the early Middle Ages, the political and social history of the Chacha oasis came to the conclusion:

Foreign researchers, especially among them, French, German, Hungarian, American researchers, who made a significant contribution to the history of the Chacha oasis

Their research was mainly based on various written sources and partly on archaeological materials, which significantly covered the history of the oasis.

There are scientific achievements and news in the work of foreign researchers, along with the fact that the ideas are quite reasonable, there is an opinion that is expressed one-sided.

CONCLUSION

In general, in the early Middle Ages, in the Chacha oasis among the Amu Darya-Sirdariya as it existed in other historical and geographical regions (in fact, oasis), it represented a typical form of oasis government, that is, there were several small governments at the same time, and as they all obeyed in a large kingdom. However, these processes were not an obstacle to the economic and cultural development of the oasis. As a result, the existence of separate engravings for minting coins in the OASIS, as well as the fact that representatives of the Turkic dynasty, who were under the control of the Chocha, sent an ambassador to a foreign country (China), indicates that his position is incredibly great.

ABSTRACT

This article develops ways to attract investment in the Republic of Uzbekistan, in particular, in Namangan region, to attract investment in accordance with the capabilities of each region, and at the same time prepares specific scientific developments, proposals and recommendations to identify existing problems in the field.

KEYWORDS: *World Economy, Investment, Economic Growth, Engineering, Technology, Reconstruction, Competitiveness, Diversification, Free Zones.*

INTRODUCTION

Representatives of all sectors are deeply aware that the rapid development of the world economy is largely due to the inflow of investment into the country. It consists of developing ways to attract more investment to the economy of the republic, as well as foreign investment. All businesses feel the need for investment to start, expand and renew their operations. Investment is one of the main factors in the development of enterprises, ensuring economic growth in the country.

Therefore, given that almost every specialist and business entity understands that the future development of the Uzbek economy depends mainly on investment, today the wider attraction of investments into the economy of the republic, in particular foreign investment, is an important basis for their effective implementation of economic reforms. It is expedient to understand that. Attracting foreign investment to boost the country's economy, build new enterprises equipped

with modern machinery and technology or reconstruct existing ones will, first of all, solve the most important social problems such as economic development, employment, increase in wages and incomes.

Main part.

The logic of achieving the long-term strategic goal of economic development of our country requires the continuation of the policy of accelerated development of modern industries and industries based on structural changes and high technologies aimed at increasing the competitiveness and strengthening of Uzbekistan's position in the world market. It is the creation and rapid development of promising innovative sectors of the economy that will ensure the production of high-tech products with high added value on the basis of diversification of industries and rational use of available resources rich in raw materials and resources in the country.

To implement the above issues, a number of practical measures have been taken to attract large-scale investments in the country's economy and develop ways to use them effectively. In 2020, 114 billion soums will be spent in the Republic of Uzbekistan. USD investment projects have been implemented, in the 3rd quarter of 2020 1.8 bln. It is planned to implement investment projects in US dollars, of which 23% fell to the Russian Federation, 12% to the People's Republic of China, 2% to India, 9% to the US, 4% to Germany and the remaining 50% to other countries. If we analyze the breakdown of direct investments in the 3rd quarter of 2020 by sector, 48% to the energy industry, 6% to the chemical industry, 18% to the light industry, 14% to the automotive industry, 2% to the education sector, 12% corresponding to other areas. In the third quarter of 2020, investment projects worth 4.8 billion US dollars were implemented. To implement the above issues, a number of practical measures have been taken to attract large-scale investments in the country's economy and develop ways to use them effectively. In 2020, 114 billion soums will be spent in the Republic of Uzbekistan. USD investment projects have been implemented, in the 3rd quarter of 2020 1.8 bln. It is planned to implement investment projects in US dollars, of which 23% fell to the Russian Federation, 12% to the People's Republic of China, 2% to India, 9% to the US, 4% to Germany and the remaining 50% to other countries. If we analyze the breakdown of direct investments in the 3rd quarter of 2020 by sector, 48% to the energy industry, 6% to the chemical industry, 18% to the light industry, 14% to the automotive industry, 2% to the education sector, 12% corresponding to other areas. In the third quarter of 2020, investment projects worth 4.8 billion US dollars were implemented.

Figure 1. Dynamics of direct investment flows in the Republic of Uzbekistan (Number of implemented projects)

As can be seen from the picture above, the total amount of investments in the period from 2016 to 2020 increased from 95 to 3,000. Accordingly, 95 projects were implemented in 2016, 111 projects in 2017, 449 projects in 2018, 871 projects in 2019, and 3,000 projects in 2020 in the country's economy. At that time, foreign direct investment amounted to 1917 million US dollars in 2016, 3349 million US dollars in 2017, 2848 million US dollars in 2018, 4200 million US dollars in 2019, and 6700 million US dollars in 2020. Compared to the previous period, it increased by 4783 million US dollars. These projects include the organization of production of synthetic liquid fuels, construction of new, modern gas-chemical complexes for the production of polyethylene and polypropylene products, liquefied and compressed natural gas, production of mineral fertilizers and new types of chemicals based on modern energy-saving technologies, obsolete equipment. such areas as the rapid development of the energy sector through the replacement of modern steam and gas appliances. Modernization of production, technical and technological re-equipment, rapid renewal of the leading sectors of the economy will certainly be consistently pursued as the most important priority of economic growth.

RESULTS AND DISCUSSION

The main factor in this is the creation of a favorable investment climate in the country for the gradual implementation of structural changes. In order for the country's economy, especially industrial production, to develop and achieve economic growth, it is necessary to use investment funds wisely. During the COVID-19 pandemic in the world economy, the decline in economic growth in 2020 was around 5.2-8%, and economic activity in developed countries fell to 7% [15].

In this situation, the Republic of Uzbekistan has developed a set of measures to prevent crises during the pandemic and reduce its impact. According to the International Finance Institute

(Asian Development Bank, ADB), economic growth in Uzbekistan will continue to slow and have a positive result, and according to the European Bank for Reconstruction and Development, economic growth will be +0.2% in 2020 and 4.5% in 2021. is predicted to be. According to the World Bank Group, economic growth in Uzbekistan is expected to be around 0.4% and 0.8%. The measures taken during the pandemic of the country's economy were as follows. 1.0 billion by the anti-crisis fund. The government provided direct assistance to 500,000 companies and 8 million people. In addition, \$ 230 million was provided to the economy. To further increase these economic indicators, the most important goal and the main priority of socio-economic development is to continue reforms, to modernize the production sector, to ensure high and stable rates of economic development, efficiency and macroeconomic balance.

One of the typical sectors of the economy of Namangan region is sewing. Namangan is known for its tailors and is known for its investment attractiveness in the region's textile and textile industry. It can be seen that world-famous foreign companies have invested in Namangan region. These include: plum companies such as HUGO BOSS, ZARA, ZOLLA, FUN DA, INDITEX, Louis Vuitton, working in partnership with leading companies in the region. Also ART SOFT, UZTEX., AISHA, IDIAL D.MARETTI, IMIR, VAKKONI, for example, allow enterprises in the region to have their own well-known brands. Today, 59.5 thousand tons of yarn, 3 mln. pairs of socks, 57.7 thousand tons of knitted fabrics, 19.6 million sq.m. of fabric, 6.6 mln. has a production capacity of more than one piece of ready-made garments. As a result of the new projects, it is planned to produce and dye fabrics and fabrics, knitted fabrics, as well as ready-made export textiles and garments. Two cluster chains have been developed, covering a total of 11 projects worth 2.5 trillion soums, with an annual capacity of 1.4 trillion soums. soums. As a result, the budget receives 129.9 billion soums a year. soums, 12.7 mln. USD exports, 71 mln. USD worth of import-substituting products and creation of 3,920 new jobs.

In order to further expand the production of textiles and garments in Namangan region, it is planned to establish a free economic zone "Namangan Textile". A total of 323.7 hectares of land were selected from 5 regions of the region. In particular, 12.8 hectares of land were selected from the Ijodkor massif in Namangan, 10.0 hectares from the Ibrat massif and 100.0 hectares from the Yuksalish massif, 100.2 hectares from the Zabardast Gairat massif of Turakurgan district and 100.7 hectares from the Baland Adir massif of Chartak district. It should be noted that a targeted program is being formed to place import-substituting and export-oriented textile and knitwear, textile fittings and accessories, dyes and chemicals, process equipment and their parts and other products in the free economic zone. . It is also planned to implement 77 projects worth \$ 250.0 million in the Turakurgan and Chartak districts of the Namangan Textile Free Economic Zone, create 12,300 new jobs and generate an additional 50.0 billion soums to the budget. It is expected that more than 23.0 thousand jobs will be created, the export potential will be increased by \$ 200.0 million and the budget will receive an additional 120.0 billion soums.

CONCLUSIONS

Significant structural changes in the world economy in recent years, in turn, have played an invaluable role in the development of each country. Investing in innovations in foreign countries is one of the most pressing issues today. Based on the experience of the above foreign countries, the state in the Republic of Uzbekistan also supports the use of investments, their orientation to the industry.

At the same time, the country is required to perform a number of tasks related to the use of investments. These include:

1. It is necessary to create scientific technopolises in the country, dealing with the investment opportunities and attractiveness of each region, and they should include science parks, technology parks, research centers, innovation and investment centers;
2. Development of innovation-investment integration based on the chain of links between "Production - University - Investment";
4. Development of the Investment Development Strategy of the Republic of Uzbekistan for 2021-2030, including the development of systems to encourage investment in the country's potential, the development of incentives to direct the private funds of the population, the creation of national brands based on high technology. "Accelerate development and promotion.

THE ROLE OF WOMEN IN SOCIETY AND STATE AFFAIRS

Solieva Havasxon Omonovna*

*Fergana Regional Branch of Uzbekistan State Institute of Arts and Culture,
UZBEKISTAN

ABSTRACT

In case of the society is enlightened, personal qualities of the citizens are valued, state encourages the prosperity of the people, human capital is formed, the quality of education is improved, and women can easily hold high leadership positions in such a country. In conclusion, it can be said that a woman is like a pearl of the heart. There is a woman, the world is enlightened. Mother is a symbol of kindness! Doing well to her is one of the reasons for happiness in this world and happiness in the Hereafter. So let us all look at our mother's radiant faces with a smile and live a life based on kindness and family love.

KEYWORDS: *State affairs, Women, Family life, Society.*

INTRODUCTION

Today, about 50% of the population of our country are women. Given their fruitful work in all spheres, the upbringing of children, their great contribution to family life, their place in society, their valuable contribution to the success of independent Uzbekistan cannot be measured and evaluated by anything. Realization of dreams and aspirations of women of Uzbekistan - In his speech at the solemn event dedicated to the International Women's Day on March 7, 2018, President of Uzbekistan Sh. Mirziyoyev identified this task as a priority for the state and society. This was a good reason to look back and take a look at the path that has been traversed. What has been done in the country in recent years to ensure decent quality of life and conditions for women, what has not been achieved? Ensuring the rights and interests of women in Uzbekistan, increasing their economic, social and political activity has been identified as an important direction of public policy. Today, about 1,400 of our sisters hold senior positions in the system of state and public organizations.

The share of women is more than 82% in healthcare and social services, 72% in science, education, culture and arts, more than 45% in agriculture and 38% in industry. In 2018, the Presidential Decree "On measures to radically improve the activities in the field of support of

women and strengthening the institution of the family" was adopted. Ensuring equal rights and opportunities for women and men in the social, economic and political spheres is one of the key factors in maintaining peace and economic stability in our society. With this in mind, the draft "Strategy for Gender Equality in the Republic of Uzbekistan in 2020-2030" is being prepared and agreed with governmental and non-governmental organizations. It is noteworthy that all the directions in this strategy are developed in accordance with the UN Sustainable Development Goals until 2030. Equality between men and women plays an important role in the well-being of the people, social peace and economic stability. In this regard, the issue of employment of women and the expansion of opportunities for them to fully realize their aspirations and abilities is in the constant focus of our state. Today, the flexibility, kindness, ingenuity and intelligence of women in our society are increasing because of the number of women ministers and deputy ministers, as well as women governors. In particular, in order to increase the participation of women in public administration, a staff reserve of more than 6,000 active women has been formed. At present, systematic training courses are being organized to prepare them for various leadership positions. 514 doctors of sciences, 6 academicians, 15 heroes of Uzbekistan, 16 women leaders of the Ministry of Internal Affairs, 6 women governors and 1 ambassador have been appointed out of women. In addition, about 1,500 women hold leadership positions at various levels. According to the results of elections to the Oliy Majlis and Local Councils in December 2019, the number of women deputies accounted for 32% of the total number of deputies in the Legislative Chamber, women senators for 25% of Senate members, and women in Local Councils for 25.64 out of 6 parliaments.

The society should conduct a comprehensive analysis of the problems of women and measure the level of development. Today, government agencies need to be more effective in helping women in need, combating domestic violence, and supporting women entrepreneurs. As the number of female leaders' increases, society becomes more compassionate, humane, and enlightened. Because when a woman is empowered, she tries to support most of the social sector, directing the treasury money to building more schools and hospitals.

In particular, our holy religion, Islam, addresses everyone equally and treats men and women equally. No one is superior to another in rights. Also, Islamic law generally aims to achieve a specific goal, which is called "protection." Protection comes in different forms, on different fronts. In particular, the dignity of women and everything that concerns them is protected on the basis of Islam. For this reason, the rights and subtle definitions of women in the Qur'an and the Sunnah of the Prophet are given special attention, and are explained with justice, grace and kindness. With this in mind, there are verses and hadiths that envisage the life of a woman as a daughter, wife and mother, and her respect and protection at all stages of her life.

According to the Decree of the President of the Republic of Uzbekistan "On measures to radically improve the activities in the field of support of women and strengthening the institution of the family", now in our country to increase social and political activity of women, ensuring unconditional observance of their rights and legitimate interests. Extensive work is being done to support children in every possible way, to create conditions for them to realize their abilities and potential in various fields, as well as to strengthen the institution of the Family. The updated structures of the Women's Committee of Uzbekistan and its territorial divisions have been approved.

Under the regional branches of the Women's Committee, public associations "Women Lawyers", "Science and Women", "Creative Women", "Women Entrepreneurs", "Women and Health", "Honorary Women" were established. "Woman of the Year", "Exemplary Family" competitions are being held. A club of non-governmental non-profit organizations has been established under the Women's Committee of Uzbekistan. The main goal of the club is to create a platform for cooperation of non-governmental organizations working in the field of women, to promote positive experiences, as well as to coordinate social services, increase the role of NGOs on issues facing women and children. Currently, there are 9,700 non-governmental non-profit organizations in Uzbekistan, 378 of which work in the field of women. In order to conduct fundamental, applied and innovative research in the field of family values and traditions, a separate scientific-practical research center "Family" under the Cabinet of Ministers and its regional branches were established on the basis of the Republican Family Research Center. Reproductive health and democratic development of the family, setting the criteria for a modern exemplary family, the conceptual idea of "Healthy family - healthy society" and the constitutional principle "Family under the protection of society and the state" were among the main tasks of the Family Center. Indeed, our society, when the time comes, is harsh and ruthless towards women. There are unwritten but strictly enforced rules in this regard. In order for a woman to find her place in this or that front, she must be married and have children. The family, so to speak, gives it legitimacy. It is rare for a woman who is not married and has no children to be recognized as a qualified professional, to achieve a high rank, and to gain the affection of the people. Whether we like it or not, Eastern society is so structured and we have to reckon with this order. Involving women in higher education will alleviate the social burden of the state. Because an educated woman does not look at social payments, she works independently for the growth of her children.

As society develops, the country becomes richer, and girls are given a decent education, discrimination against girls in the family and women in society will end. Maybe we should also study the working conditions of today's leaders? An irregular working day, heavy loads, mental stress ... Anyway, a man will have a wife at home who will keep a bowl of soup and wash her children. And a female leader has to pull a double wagon ... Also, today, government agencies seem to be working more effectively to help women in need, to combat domestic violence, to support women entrepreneurs. There are not many shelters in our country that help women in need. Support facilities opened in Bukhara and Samarkand in the 1990s are still operating, but they are few. The first condition of shelters is anonymity. That is, from the point of view of security, these institutions should not disclose their location to anyone, and at the same time, the identity of the applicants should be kept confidential. If the state organizes shelters, it becomes impossible to maintain anonymity.

Why are we so passionate about women? Because behind a woman is the fate of dozens of people, her children, her husband, her parents. That is why in developed countries, social workers study and support the problem of not only one woman, but the whole family.

This means that if the society is enlightened, if the personal qualities of the citizens are valued, if the state encourages the growth of the people, if human capital is formed, if the quality of education improves, women can easily hold high leadership positions in such a country.

In fact, in an enlightened society, who governs the state is not so important. Let me explain my point with a real-life example: imagine two roads that are regulated by a certain sign, indicator,

and traffic light, and no sign is set, no rules are enforced. On the first road, drivers move without interfering with each other. No matter how much the second type of road is widened, car accidents continue to occur unless the rules are set and followed.

FORMATION OF UZBEK TAX AND CUSTOMS TERMS IN THE POST-ISLAMIC PERIOD

Ikromjon Toshpolat ogli Habibjonov*

*Fergana Regional Branch of Uzbekistan State Institute of Art and Culture,
UZBEKISTAN

ABSTRACT

This article briefly discusses the development of Uzbek tax and customs terms after the introduction of Islam. There are also comments on the role of industry terminology in the economic life of society. The term dahi du refers to the tax and customs concept of paying twelve percent of the crop from the land, while the term dahi nim refers to the payment of half a tenth of the crop as a rent tax. Both terms are combined in an isophytic way, which also manifested itself in the terminological sense of the language, because this is precisely the manifestation of the rental tax.

KEYWORDS: Terminology, Tax, Payment, Customs, Term.

INTRODUCTION

After the conversion of the people of Movarounnahr and Khorasan to Islam, the existing tax policy and customs activities began to be adapted to Islamic rules - the rules of Sharia, new forms of taxation or customs were introduced. During the years of the Arab Caliphate, new types of taxes were levied on the population. The term zakat originated in this regard. For example, "the population paid taxes like maran and zakat to the state for grazing their cattle on pastures belonging to khans and beks. Over time, this levy became a mandatory property tax, and special officials were appointed by the state to collect it.

Such people were called amils or omils." The main collector of zakat was called zakat kalon, that is, the highest collector of zakat who lived in the ark, that is, in the capital. Zakat (zakat savoyim) was levied in cash or in kind from territories engaged in stock raising. A kind of zakat, also known as retail, was a non-Sharia tax imposed on local rulers, governors, kings and ministers.

The term hiraj was also one of the first tax and customs terms and was used in the ancient Turkic language. According to the historian A. Juvonmardiev, hiraj was one of the main taxes, and

sometimes it was called the commodity tax. The hiraj tax was a tax levied on the land, imposed by the ruler, and the peasant paid a certain portion of the harvest as a tribute. Hiraj was taken in the form of one-third (suls), one-fourth (ruble), one-fifth (khums), depending on the level of fertility of the land.

According to the lexicographical information in the Explanatory Dictionary of the Uzbek Language, the term khiraj is an Arabic word and means "issue" and "land tax" in Arabic. Land tax collected by the state in the Middle Ages and the New Age in the countries of the Near and Middle East, including Central Asia. (Introduced by the Arabs in the 7th century). According to the National Encyclopedia of Uzbekistan, Khiva khan Muhammad Rahim I was the first who introduced the collection of hiraj. From the above explanations, it is clear that the Arabic term hiraj originally meant a tax paid on a product grown without money, and later as a tax paid with money. It should be noted that this term has been used in the Turkic language since ancient times to express the terminological concept.

At different stages of development of the Uzbek language it was used only as an expression of terminological meaning, in other words, this linguistic unit had the status of a term from the time of its appearance in the Uzbek language and remained so.

From the literature on history, we have found that the hiraj tax is referred to in specific terms in each region. According to I. Azizov, in the Emirate of Bukhara, the collection of hiraj was carried out twice a year. The first was in the middle of summer, and it was called safedbari. The term Safedbari literally means "white harvest." Safedbari symbolized the collection of tribute for the harvest of barley and wheat, which ripened in late spring and early summer. The term safedbari is derived mainly from crops grown on dry land. The second was a tax levied in the fall, referred to by the term kabudbari. The term kabudbari meant "blue harvest" and often referred to the tax collected from the harvest of autumn crops such as rice and corn.

In connection with the concept of hiraj, various tax or customs terms have appeared in the Turkic languages. For example, they are terms that refer to quantitative expressions of rent. In this sense, sul, ruble, khums are quantitative forms of rent and are tax and customs terms. We inquired about the history of the formation of these terms and highlighted the following:

Suls is an Arabic word meaning "one-third", although the Arabic form of calligraphy is also called sul. The etymology in the Explanatory Dictionary of the Uzbek Language also confirms that the word appeared in the Uzbek texts in a terminological sense. Only the lexicographic commentary in the annotated dictionary shows that the word entered as a term for the art of calligraphy. But the meaning of the word sul in Arabic, "one-third," is precisely what the word relates to the concept of taxation, since after the Arabs introduced rent as a land tax, of course, the installment plan method of paying the annual tax must also be applied. If we take into account that the Arabs from the earliest days of their rule formed the tax system on the basis of Islamic rules, the term sul has been used in Central Asian languages, including Turkic, since ancient times as a term to describe the quantitative appearance of the tax.

A. Akhmadzhanov and A. Kasimov wrote about the term khums: "There are 5 types of taxes in Islamic law: khums, zakat, hiraj, ushr, jizya. These types of taxes are levied in accordance with the established norms. We will talk about this in more detail, using the original source (here we mean the book "Kitab al-Kharaj"). Khums (Arabic - one-fifth) is one-fifth of the booty captured by Muslim armies in the Islamic tradition. It was first allocated to the will of Muhammad (s.a.v),

then to the treasury of the caliphs, and the rest was distributed by the military leaders themselves and the armies. While the word khums refers to the concept of taxation in Arabic, it also appeared as a term related to taxation in Turkic languages. In other words, it has been mastered in the Turkic languages as a tax-customs term. The use of this term is also the same as the term suls.

It is noted that the ruble in ancient Russian meant "grain, per day", "plug" and "currency". In Russian dictionaries compiled by S.I. Ojegov, A.P. Evgeneva, D.N. Ushakov, the word ruble is also interpreted as a pure Russian word in the sense of currency. So, since when did the ruble begin to be used in Uzbek as a tax and customs term? We assume that this term should have been used in Uzbek texts in later periods of history, that is, after the establishment of trade relations between Tsarist Russia and the khanates and emirates. It is possible to say that it was during this period that the term was used to denote a quarter of the annual rent. Thus, the terms that describe the quantitative manifestations of the rent tax have emerged and have been used at various stages of the development of our language due to social, political, economic factors. In general, the term rent, together with other terms that refer to the tax on rent, was formed in the ancient period of the Uzbek language in the gender relationship. Although the terms denoting hiraj and its quantitative forms appeared in the Uzbek language long ago, in accordance with historical conditions, the amount of tax they mean - the terminological concept has been changing. In the Uzbek language, the Tajik words dakhi du, nimni, dakhi nim, which denote other forms of hiraj, also have a gender status in relation to the term hiraj from a linguistic point of view. The use of these terms in Turkic-language sources is also due to the fact that Turkic peoples, including Uzbeks, lived side by side with the Tajik people in the same historical context.

In particular, let us study the Tajik terms dakhi du, dakhi nim.

The term dahi du refers to the tax and customs concept of paying twelve percent of the crop from the land, while the term dahi nim refers to the payment of half a tenth of the crop as a rent tax.

Both terms are combined in an isophytic way, which also manifested itself in the terminological sense of the language, because this is precisely the manifestation of the rental tax.

Another form of hiraj is the Arabic word ushr, meaning "one-tenth." Ushr is one-tenth of the income. The term ushr is related to the entry of the Arab Caliphate into Central Asia and the spread of Islam there, as there is a jurisprudential fatwa on the collection of tithes in the Sharia. Conclusions on the introduction of the tithe tax and the formation of the term ushr, which represents this tax, can be found in the following opinion of I. Azizov: "We know from jurisprudential sources that after the obligatory zakat, the amount of tushr to be paid from agricultural products is determined in accordance with the sunnah. Thus, some lands received the status of ushr and some lands received the status of hiraj. If the ushr land is irrigated from ditches, 1/10 tithe is taken from the products taken from it according to the Sharia. Similar lands existed in the Bukhara Emirate. Like all Islamic countries, the head of state was responsible for giving ushrs to those whom Allah has commanded. The head of state also allocated tithes from the collected expenses. Even if landlords voluntarily gave tithes to whoever they wanted, the head of state had the right to demand it back according to the law. Thus, the formation of the term ushr as a tax-customs term was directly related to the period when "Sharia Mustafa" had been in force. The same tax was applied in the territory of the Bukhara Emirate in the Persian-Tajik term dahyak, which also means "one-tenth". Some Muslim countries still have a ushr tax.

Until the beginning of the twentieth century, tithing was preserved in Central Asia: Therefore, giving zakat is subject to ushr and hiraj. [Burhoniddin Marghinoni, 2001, p. 341]

If we conclude that the terms ushr and dahyak were formed as tax terms in Turkic, including Old Turkic, we can say that the term ushr appeared before the term dahyak as an expression of the concept of tax and began to be used in the language of Turkic peoples. The term Dahyak was later used as a linguistic expression of the ushr tax introduced by the Arabs in the language of the people of the Bukhara Emirate. This is explained by the fact that the people of the region (it should not be forgotten that the emirate was inhabited by Tajiks and Iranians, and still exist) prefer to call it dahyak in their native language.

According to the historical literature, in the state of Amir Temur there were also taxes or levies called molu-jihot, khiraj, sovarin (peshkash), konalga and shilon money.

For example, "Temur's Statutes" (I also ruled that the emirs and commanders should not demand excessive sovari, konalga and shilon from the citizens when collecting molu jihot) and Giyasullugat, which states that molu jihot was a tax paid in cash and in kind, which arose in the history of the Uzbek language in connection with the naming of a type of tax levied on people's property.

According to A. Juvonmardiev, the word jihad in this term, which consists of Arabic words, means "side, part", "cause, excuse" and "salary" in Arabic; jihad is the object of taxation. The term is also used in the works of Alisher Navoi: Solis erur farz adoni zakat, Haq neki bermish sanga molu jihot (Hayratul abror). A structural analysis of this Arabic term reveals that the term molu jihot is equivalent to the term income tax today.

In the middle Ages, taxes were expressed by the term olik-solik, which is a local Turkic term. Olik-solik are money and other things that were collected and levied as taxes from the country and the population. Or: Besides this tax, they should not be required to pay any taxes (Temur's Statutes, 1991, p. 99).

According to historians, during the reign of Amir Temur there were the following tax and customs terms:

Bois - 1. A special tax paid by one state to another or collected from one country to another, and in times of intensification of internal strife, from one province to another. 2. Special fee charged from traders in urban and rural markets. Tax collection in Central Asia has been going on since the middle Ages. The recipient of the bois is called the tusguul.

Bakiya - (Arabic) tax, payment. The part of the debt etc. that is not paid on time; in the rest, the remnant: Aning birla bu mojaru surguli, Bakoyani devonga kelturgali. [Explanatory Dictionary of the Language of Alisher Navoi's Works, Vol. 1, 1983, p. 236].

Mol is a type of tax. Tribute, tax, income collected from 1/3 or 1/5 of the harvest: Biri ulkim, viloyat molin mashvaratsiz olib turursiz va bu mahud emas erdi. [Alisher Navoi's Explanatory Dictionary of the Language of Works, Volume 2, 1983, p. 315].

The term "duty" is used in "Temur's Statutes" in the following meaning: 1) taxes, tribute, payment; 2) the tax on goods transported across the border; 3) the Minister, who manages the property belonging to the homeless, the dead and the fugitives, the zakat and duties levied on the

property of the arriving (merchants), the livestock of the country, their pastures, and the income collected from all this as a deposit.

Another term that refers to a type of tax is tanobona. According to the National Encyclopedia of Uzbekistan and the structural analysis of the word tanobona, the tanob part is in Arabic and the

-One part is in Persian-Tajik.

The glossary of the Uzbek language does not give this term. The term occurs in the decrees of Muhammadalikhan in 1245 AH (1829-30), Sayyid Muhammad Khudoikulikhan in 1282 AH (1865-66), Khudoyorkhan in 1285 AH (1868-69) and Nasriddinbek in 1292 AH (1875). According to the decrees, "tanobona", "bogot and bedazori vajidan ...", in the XIX century, this tax was levied on gardens and barren lands. According to P.P. Ivanov, during the reign of Abdullah (in the XVI century) in Bukhara there was also a tax on gardens.

In the study of I. Azizov "Tax system in the last quarter of the XIX - early XX century in the Bukhara Emirate" it is also written that the tanobona tax was applied in the Bukhara Emirate in the last quarter of the XIX - early XX century. In the XX century it was used as a type of rent (the term rent is used in the thesis) and "The sum of expenditures in the Emirate is 3 botmons of 10 botmons of wheat, 18 coins from each stem of the garden, and 6 coins from each stem of lucerne. "Therefore, the term tanobona meant the type of tax levied depending on the size of the tanoba of the land - the garden.

Another tax or customs tax levied on the harvest is called bogot. The term has an Arabic-Persian content and is applied to the tax levied on gardens.

For example, one source writes about bogot: In the testimonies of Abdulmuhammadkhan to Sayyid Zahid in 1011 AH (1602-03) and Sayyid Muhammad Khudoyquli Bahodir in 1282 AH (1865-66), Khudoyorkhan in 1285 AH (1868-69) and Nasriddinbek in 1292 AH (1875). As you can see, this term is an Arabic-Persian suffix, and its lexical meaning is "tax on gardens". Such Persian and Arabic terms were widely used during the Kokand Khanate.

Boburnoma also uses old Uzbek tax and customs terms. For example, there are such tax and customs terms as shakdar (tax collector), barot (tax exemption), doruga, tarhan and ushra. For example, when we were here, we heard that Sultan Ibrahim, who was standing on this side of Delhi, had left and was moving forward, and that Hamidkhani, the shakdar of Gissar Feruza, was coming from Gissari Feruza with his army 10-15 kurohs before him. Or: From here on the eighteenth of the month, Monday night, we sent Tahir to Ogra. He took away barot spent on hospitality from Kabul." The term barot is a polysemantic term that means "tax exemption" as well as "a separate tax document issued by the rulers." The Central Asian khanates sometimes collected several taxes at once.

The document that gives such a right is also called barot. The term barot is polysemantic, meaning "a letter of release from a tax or fine issued by a king or khan" and "a special certificate or certificate issued to acquire property or position under certain conditions, to collect taxes from the people, or to receive money, grain, or fodder", and a person who has such a certificate is called a barotdor.

Also in the context of the "Boburnoma" in the mention of the term mirohor is defined as "the official in charge of rent and other income." However, as O. Akhmedov said, the term tiyul

cannot be considered a tax and customs term, since the semantics of the word does not relate to the concept of tax or customs. The term appears in the Boburnoma in the following place:

At night he stayed in the tiyul of Kutlug-Khoja, and the next day he was scolded for allowing himself too much, repented and returned. O. Tursunova defines the term as "property given for life for service"

The term konalga is also a variation of the tax and penalty established on the basis of the duty to provide ambassadors and couriers, as well as to provide shelter for the royal people during the hunt, food for the couriers and fodder for horses. In the Emirate of Bukhara, this concept of tax was called konalga, and this tax also served for the supply of military units. It is understood that the term was purely Turkic, based on the semantic development of the word konalga, derived from the word konmaq. The reason we say this is that the word "konalga" originally meant "a place of temporary landing, stopping." Later, the term was used to refer to overnight fees and food for the khan's people and their horses while hunting. Namely, there was a metonymic transfer of meaning.

In the history of the Uzbek language, along with the names of taxes and duties, there were also terms denoting various levies. For example, historical sources say that during the military campaigns, grain was collected from the population for the needs of the army, traveling from village to village.

This collection was called takor / tagor. Or they collected enough money from the population on the occasion of the arrival of the khan in a province or city, and this collection was called sovarin / sovari / prize. Sharafiddin Ali Yazdi explains this as follows:

It should be noted that in the post-Islamic period, tax and customs terms were not only derived from Arabic, but also in Turkic and Old Uzbek. Such terms include konalga, oshlig (nomadic Uzbeks had a food tax), taqor / taghor, double money, ulog, tamga (stamp - "mark, seal"; "customs duty", a trade duty paid for a permit to engage in trade in the XIII-XV centuries; used in the sense of "spot") and other terms.

Thus, in the period after the adoption of Islam, a large part of the tax and customs terms in the old Uzbek language was formed. The tax and customs concepts represented by these terms were introduced primarily on the basis of Islamic rules.

Therefore, most of them are Arabic terms. In addition, the existence of Persian-Tajik tax and customs terms in the old Uzbek language is due to the fact that the Uzbek people lived side by side with the Tajik people and a large part of the Persian-speaking population lived in the territory of the Bukhara Emirate. Representatives of this region named many Arabic or Turkic tax-customs terms with alternatives in their own languages.

ABSTRACT

This article examines the influence of the great thinker Alisher Navoi on the work of Gafur Gulam. Navoi's literary influence on Ghafur Ghulam's work is extensive, and the article discusses some aspects of this issue. It examines the uniqueness of Gafur Ghulam's artistic skills on the basis of an analysis of the poet's poems and ghazals dedicated to Navoi.

KEYWORDS: Tradition, artistic skill, originality, lyrical hero, commonality, ghazal, byte, emotion, experience. Commonality, presumption.

INTRODUCTION

Academician Gafur Ghulam's creative legacy, like that of many classical artists, has a special place in the creative heritage of Navoi. Well-known Navoi scholar A. Hayitmetov noted that in his conversations with various gatherings, conferences, writers, hundreds of verses of poets such as Navoi and Muqimi found their scientific interpretation: "... in his articles there is a pleasant length of these conversations" [Hayitmetov A., 1997: 55 p.], - writes. In Ghafur Ghulam's work, the problems that need to be studied in connection with Navoi are very serious. This issue can be conditionally grouped as follows:

1. Preparation of a prose statement of Navoi's works. Ghafur Ghulam Navoi prepared the prose narration of the second epic of "Khamsa" "Farhod and Shirin". This epic is in the 8th volume of Ghafur Ghulam's Collection of Perfect Works.
2. Translation of some examples from the lyrical works of Alisher Navoi in Persian. The poet skillfully translated some of Navoi's ghazals from Devoni Foni into Uzbek. These translations are still loved by readers today.
3. Writing articles based on in-depth scientific research on the personality and work of Alisher Navoi and speaking at conferences. Ghafur Ghulam's lectures "Let's learn from folklore" (939)

"Navoi and our time" (1948), "The great poet and thinker of the East Abdurahman ibn Ahmad Jami" (1964), "The great teacher" (1966) and in his articles the issues of the originality of Navoi's work, the vitality of his works were studied on a scientific basis.

4. Completion of poems and ghazals dedicated to the poet. Ghafur Ghulam not only wrote poems dedicated to Navoi and created an immortal image of him in art, but in some of his poems he used the image of heroes in the works of Navoi and the poet as a means of confirmation. The poet has skillfully continued the creative traditions of some of Navoi's poems.

Ghafur Ghulam's poems "Alisher" and "Alisher on the tomb of Alisher" are directly dedicated to the interpretation of the image of Navoi. In his poems dedicated to Navoi, Ghafur Ghulam puts forward his views on the greatness of literature, art and the art of speech. In his poem "Alisher" his respect for Navoi, the eternity of the poet's work, the fact that for centuries his creative heritage has been a spiritual treasure, the pride of the people are sung with pride.

Yuksak tog'oralab o'kirgan sherning

Na'rasiga tengdir aksi sadosi.

Besh yuz yil yangradi tog'day vatanda

Buyuk Alisherning asriy nidosi [Ghafur Ghulam.T.2, 1984: 143 p.]

It is no coincidence that the poem begins with these verses. Indeed, the echoes of the great poet's works are likened to a lion roaring through a high mountain, and the greatness of Navoi and the infinity of the poet's work are exaggerated. It is an artistic expression of the poet's masterpieces echoing in thousands of hearts and the immortality of Navoi's works.

Ghafur Ghulam, who describes Navoi and his unique work from different angles, gives unique metaphors and expressions. In the poem, "When Alisher Mushtari shines in the Uzbek sky like a star", "Flood, alone in the wells, proud as a monolith, a granite statue", "Like a hateful eye in a golden cane" The poet's unique image is embodied in the uplifting verses, such as 'Idi karachug'. Navoi was alone in the "storm" and "hurricane". The pride of his struggles and the steadfastness of his aspirations are also due to the fact that his work is indestructible and respected like the apple of his eye. To shake the pen for a thousand years, to be proud of the ancestral teacher who was lucky enough to shine in the Uzbek sky like a Customer Star, is also to strive for the air of this lofty place. It is this aspiration that has made Ghafur Ghulam's work last forever.

When Ghafur Ghulam was in Afghanistan in 1964, he wrote a series of poems called Herat. The poet did not choose to visit this place in vain. At the heart of this is the poet's sense of kinship, boundless respect for his teacher, inscriptions inspired by the poetry of Alisher Navoi.

There is a desire to weigh the sultan on the artistic and aesthetic scales of the sultan of ghazal property. Ghafur Ghulam finished his ghazal "On the tomb of Alisher Navoi" to the tune of Navoi's poem "Aylab":

Dilim ravshanligin hissim yo'lida oftob aylab,

Mazoring boshida ta'zim ila turmakdudurmen sarhisob aylab,

Qulog'ing so'z eshitmas bo'lsa ham qalbdan xitob aylab,

Vatandoshlar salomin necha jildli bir kitob aylab

Navoiy deb Musalloga kelibmen intixob aylab.

[Ghafur Ghulam.T.3, 1984: 323 p.]

Apparently, after the rhymes at the end of the verses, such as "sun", "summary", "address", "book", "choice", the word "moon" is repeated, and the position of the radius is reached. It reinforces the rhythm of thought and emotion, and provides an inextricable link between each verse.

This poem reveals the important reasons for the poet's visit to this sacred place.

First of all, this is Ghafur Ghulam's heartfelt message to the poet Navoi. Secondly, it is a feeling of indebtedness to the blessed soul of the genius Uzbek poet. Thirdly, it is our responsibility to convey the blessed greetings of our compatriots who have been enlightened by Navoi's enlightenment for centuries.

Ghafur Ghulam's attitude to Navoi's work is even more evident in his hymns to his poems.

It is well-known that it is a very responsible job to connect a poem with a poem, and a poet must be able to deepen the meaning of the poem, adapt it to life and time, while deeply feeling the content of the poem. As the literary critic R. Majidi noted, "Muhammad's connection served to expand the poet's creative sphere, to increase interest in the works of advanced poets of the past, to capture their creative traditions and to convey their progressive ideas to the people." [Majidiy R., 1963: 89 p.]. We can see the confirmation of these ideas in the example of Ghafur Ghulam's connection to Navoi's radiant ghazal "Tun bila tong".

Night and Morning is the 363rd ghazal in Navoi's Badoe 'ul-vasat.

Ghafur Ghulam Navoi composes 21 lines of poetry, adding three lines to each byte of this 7-byte romantic ghazal. Approximately all the bytes of the poem are unchanged. The poet logically continues Navoi's views in the poem and expresses thoughts and feelings in a unique way.

Mening qarog'imu oning jamoli tun bila tong,

Mening zavolim u oning kamoli tun bila tong.

Mening kuyuk mahim, oning hiloli tun bila tong,

Mening firoqimu aning visoli tun bila tong,

Bu nav' dahrda yo'q ehtimole tun bila tong.

In this poem, the pain, condition and experiences of the lover due to the separation are described through the symbols of night and morning. The night represents separation, and the morning represents the vision. All the symbols, expressions and metaphors in the poem are aimed at poetically expressing these experiences. The inner content of the verses is full of mystical views. As the literary critic N.Kamilov noted: "According to the philosophy of mysticism, man consists of two opposite bases - matter and spirit. Therefore, it combines the features of these two principles ... Man, who is made up of spirit and body, is called the boundary between the divine world and the physical world, and is likened to the dawn. Because morning is also the boundary between night and day. Just as the darkness disappears in the morning and the sun shines, so the human soul must gradually leave the darkness of the body - the darkness, and move to the world of pure spirit, the world of light "[Kamilov N. 2009: 25 p.]. The views expressed are directly

relevant to this assumption. In the first verse of this proverb, the lyrical protagonist is the mirror of the soul, and the beauty of the eyes is inseparable from the eternal unity, the hopeful Islam at the foot of the Creator, as well as the state of the slave who feels "decline" and "perfection". the devotion of the lover to the lover is inseparable. Therefore, no matter how far the distance between the two is, the attention and respect for the quality of the person is drawn in proportion to his level of spiritual height, regardless of the lover's state of mind or body. It ensures that the poet's thoughts depend on Navoi's thoughts and feelings. By repeating the word "mine" at the beginning of the band, the anaphora is used as a means of artistic expression, further enhancing the melody of the verses.

The poet tries to convey to the people of his time the endless suffering in his awake heart:

Nechuk tushuntira oldim buni gumon eliga,
Hamisha ishqni qilguvchi imtihon eliga,
Ki birni ikki deyib bo'lmag'ay zamon eliga
G'arib zulfu yuz ermasmukim, jahon eliga
Ko'runmamish bu ikining misoli tun bilan tong.

[Ghafur Ghulam.T.3, 1984: 343 p.]

Apparently, Ghafur Ghulam, who is trying to express his language, does not intend to admit some mistakes. The color of trade that clings to the heart of the poet, who has not the slightest doubt that the place of darkness is replaced by light:

"The pupil of the eye," sometimes the "pupil of the eye," sometimes the "moon [sometimes the blood]," and in some places the "nightingale." All this gives an idea of the scale of the grief in the heart of the lyrical protagonist. Interestingly, the poet concludes that the lyrical "I": the way to face the dawn is to shake off the world:

Kimki qayg'u qo'lidan yaqoni qutqordi,
Jahon ishiini etak silkimak-la bitkordi,
Qarong'u kecha yurib subhidam tomon bordi.
Biravki, tongu tunin boda birla o'tkargay,
Yaqinki, bo'lmag'ay aning maloli tun bila tong.

[Ghafur Ghulam.T.3, 1984: 343 p.]

If we look at the last paragraph of the hymn, it is clear that this is not the only solution. After all, as Navoi said, "Desperation is a remedy for pain," the remedy of great love is to see despair as a remedy.

Qilolmadim qaro tun, nurli tong zavolin kashf,
Nafas-nafas o'tayotgan umrning uvolin kashf,
Siyoh haqqi bu Mirzo, qog'oz jamolin kashf,
Navoiy etmadi zulfu yuzing visolin kashf,

Valek erur g‘aminging ittisoli tun bila tong.

[Ghafur Ghulam.T.3, 1984: 343 p.]

In our opinion, it is no coincidence that the hearts of Navoi and Murid Ghafur Ghulam are connected with the symbols of night and morning. After all, a bright morning is a product of a ruined night. On the contrary, night is a being that begins at the point of dawn. In the face of this eternity, life is short and fleeting. However, the value of the momentary life given to a person is measured by the degree of reward and reward achieved through action. Therefore, the human being should spend every breath in the path of good deeds and keep his heart as pure as white paper from the dust of the material world.

It is clear that Ghafur Ghulam, who measures the value of life with the value of the moment, does not regret the loss of the lyrical hero's life. But after this decline, a bright morning begins.

Our observations show that Ghafur Ghulam was a leading scholar of classical literary heritage, especially Navoi's work. His literary-critical articles, lectures, and masterpieces based on in-depth analysis treated Navoi's traditions with respect. In his poetry, the poet dedicated poems to Hazrat Navoi and created his image. The great poet continued the Navoi tradition creatively, tying takhmis to his poems. The study of Ghafur Ghulam and Navoi will undoubtedly help to identify the sources of the poet's work, to understand the peculiarities and artistic features of his works.

CHRONOTOPE IN UZBEK NOVELS OF THE PERIOD OF INDEPENDENCE

Islomjon Yakubov*

*Professor,
Doctor of Philology, TDPU named after Nizami,
Republic of UZBEKISTAN

ABSTRACT

The article examines the problem of creative development of national-literary traditions, in particular the literary and artistic heritage of Navoi, which significantly expanded the space-time boundaries of national novels of the period of independence. The boundaries of space and time of the national novels of the independence period are expanding. There is no doubt that the same phenomenon observed in the literary process is a positive sign for the national novel.

KEYWORDS: *Literary text, National thinking, Space and time, Lalonism, Continuity, Metaphor, Association, Poetics, Form and content, Literary montage method, Compositional center.*

INTRODUCTION

The boundaries of space and time of the national novels of the independence period are expanding. There is no doubt that the same phenomenon observed in the literary process is a positive sign for the national novel. Explaining this situation with national-literary factors, in particular the category of inheritance and genetic basis, reflects only one aspect of the problem. In later years, the novel's poetic expression was enriched by a sudden, difficult-to-grasp connection between reality, fantasy, dreams, and memory. The artwork includes comparisons, comparisons, comparisons, unexpected transitions, and mergers. The metaphorical level of the work has increased dramatically.

All the legitimate concerns about the declining level of reading today are linked to this point. Because what connection did the author rely on between events? It takes a student to be creative in order to find answers to questions like, "Will they be put together in a single chain?" It is not enough for the student to equate, contrast, or subordinate words and expressions with the words with which they interact. To do this, one must feel the ocean behind the drop, that is, the deep

connection between the concepts used in the poetic word used. The same thing does not happen where the height of imagination, the breadth of imagination, the depth of thought.

In this case, there is no cross-linking from the bridge created by the associations to the chains to which they belong. As long as the concepts are not interconnected, the literary text will not be beautiful. The reader does not understand or feel the author's own poetic point of view, his artistic philosophy.

In general, in the poetics of today's national novels, the desire for a metaphorical understanding of man and the world is growing. In our opinion, the original renewal is the result of the national novelist's artistic intent, aesthetic ideal and the needs of the period of independence. The novel is in the process of moving towards poetry. That is why national novels are introducing new forms and content, narrative methods that help to reveal and interpret the essence.

As the national novelist works in harmony with the global world, his emotional perception, poetic thinking and expression will expand. It is important to note that since the 1930s, Uzbek novelism has been far removed from the idea of drawing a broad line on the achievements of the Soviet era and has been defined as universal, and the devotion of the Soviet people to the communist faith has been reflected in many novels. The Uzbek novel, in a sense, has become a "small model" of all-Soviet novels. In the literary criticism and poetic works of the independence period, the concept of inheritance is perceived on a national basis, on a universal, universal scale. The Uzbek novel, in a sense, has become a "small model" of all-Soviet novels. In the literary criticism and poetic works of the independence period, the concept of inheritance is perceived on a national basis, on a universal, universal scale. Of course, it's hard to say that all writers have "rebuilt" themselves. But advanced novelists have come to realize that the position of man to exploit Mother Nature for his own economic benefit, the attitude of consumption, is absolutely wrong.

Contemporary novelists, regardless of the time and place in which all the existing philosophical-aesthetic, enlightenment-moral, socio-political views were created, expressed their creative glory, poetic beauty, universality, all of them creatively re-created. There is a need for adjustment. At the same time, the expansion and globalization of the theoretical basis is nourished by our national-literary traditions. For example, in the philosophical epic "Lison ut-tayr" Navoi speaks of beating "javlon in Lomakon square" and making it a "wonderful square". As the poet flies in his imagination, he is delighted to see the harmonious movement of the elements of the universe as he travels.. He is happy to be free from the chains of the material world. In the Badoye ul-Bidoya divan, Muhammad Mustafa's (saas) journey in Lomakon refers to a materialized fantasy in the form of a Burak horse. He says that if a believer remembers the qualities of a prophet, he will learn a great lesson from him and get rid of his neglect. [Navoi, Badoye 'ul-bidoya. 1987: 195-; 240 p.] In Badoye ul-Wasat, the poet emphasizes that the lyrical protagonist has attained greatness, and that the angels, especially Gabriel, cannot be mahrams in Lomakon.[Navoi, Badoye 'ul-vasat.1990: .275 p.] In the epic "Farhod and Shirin" it is said that Rakhsh took the horse to Lomakon. [Navoi, Farhod and Shirin. 1991: 14 p.] In Favoyid ul Kibar:

O'zin o'zluksinu kavnayn mulkidin qilib xorij,

Qayu kavnayn mulki, lomakondin ham topib ixroj.

Navoi, Favoyid ul kibar. 1990: 19 p.] verses occur. Apparently, in Navoi's works, the idea of "I" is driven not only by identity and being (space), but also by lomakon. According to the poet, the "I" is completely exiled in Lomakon. In other words, it is absorbed into being and absolute unity is formed. In the "G'aroyib us-sig'ar " department, the lomakon is compared to the vast sea. It is such a sea that every drop of water gives life to the soul. Because attaining lomako is the attainment of a priceless divine blessing. After all, the treasure trove of meaning is in the realm of non-existence. [Navoi. G'aroyib us-sig'ar. 1987: 9 p.] In Mahbub ul-Qulub, the poet shows kindness to the people of the time and is saddened by his infidelity and arrogance. That is why fidelity and life pass through the borders of a world full of sorrow and dust. [Navoi, Mahbub ul-qulub. 1990. p. 46] For Navoi, Lomakon forgets the material world and becomes a consolation, that is, a hope of liberation from all suffering and suffering. His hunting of spacelessness, on the one hand, carries a socio-moral, educational content, and, on the other hand, a longing for divine harmony at the height of poetic understanding. In "Navodir un-nihoya" the soul finds peace in the harmony of the universe. Because his real wish was to have this high place, a place where the spirit horse could ride and feel free. This is also the case with the "Navodir ush-shabob", "Sab'ai sayyor", and "Saddi Iskandariy".

Therefore, the expansion of the intellectual scale of the scope of innovations is essentially a return to national thinking, through which the understanding of time and contemporaries. Undoubtedly, the category of nationality dominates in our poetic thinking. Human experience recognizes that the way literature preserves its national image is Eastern thinking and a corresponding way of life. Consequently, the protagonist is absolutely Uzbek, both in order to express his unique identity in the global world, and to face his national beliefs, thoughts, attitudes and death, as well as his spiritual life in the world of non-existence, even when portrayed in lomakon. It must be distinguished by its uniqueness. Indeed, our novels are valued for their nationality to readers around the world.

Contemporary Uzbek writers see a miracle in every plant, imagine a man in their image, and shake their pens in honor. They are creating a novel world with a deep artistic understanding of the eternal harmony of the sublime being. At the same time, modern Uzbek novels, which have a deep understanding of the integrity of the universe - the community, the plants, the interplanetary connection, are truly national. The main sign of the strength of the national soil of creative intellect is the poetic expression (Isajon Sultan, "Ozod" novel) of the whole unity of the landscape, from lakes, mountains, rivers and winds to poplars, redstarts, savas, kakku, pukas, crows, owls. As noted above, Uzbek novels, such as Oriental-Muslim philosophy, art criticism, and literary criticism, are not satisfied with an artistic reality based solely on social reality. So, it is a matter of re-perceiving our literary and philosophical heritage on the basis of inheritance. These works have no interpretation other than the simplicity of folklore, the Navoi spirit, the Roman philosophy.

The image of an old man wandering through novels such as "Rang va mehvar", "Zarradagi olam", "Boqiy darbadar", "Ozod" suits the artistic taste of each reader: an experienced farmer, Rumi, Navoi, Khayyam, Mashrab, even Oybek and Mirtemir are thought of as disturbed spirits. A.Dilmurod and I.Sultan rely on the living spirit of the genius of the nation. It is loaded on him, his destiny strives to understand the philosophy of eternity and eternity.

Interestingly, writers even look at the treasure trove of meanings hidden in the elegant words of contemporary poets. In the novel "Yo'l" U.Hamdani tells the story of a young man who reached

the age of maturity, rediscovering the heritage of spiritual perfection, the purposeful and surfing long life of a human being, which lasted for thousands of years from the beginning to the end. inspection, observation of religious and divine sources, and finally the submission to Rumi and Navoi. In the novel "Zarradagi olam", A.Dilmurod, in the course of millennial intellectual observation, feels a wisdom in every particle, an eternal truth understood in every great wisdom. In the novel "Ozod" I.Sultan refers to the namatak on the rock (Oybek), the old man (Mirtemir) sitting under the willow. Undoubtedly, such cases are born of the fate of teachers, the enjoyment of their literary and spiritual heritage, the deep sense of indebtedness to their eternal souls, the responsibility to the inherited pen.

It is clear that in the observed examples, the path of formation of the protagonist takes place entirely on national soil. This is confirmed by the mythology in the structural layer of the novels, the fairy-tale adventure, the epic romance. After all, it is the writer's creative intention to dynamically grow the young man and turn him into Eran. Therefore, all structural-semantic fragments are united in a single compositional center in the method of literary montage on the basis of the main purpose. Motives such as the journey, the trial, the sponsor in the novels "Ozod" and "Yo'l" also confirm that these works are nourished by the national soil. For example, the purpose of the trip in the novel "Ozod" is not to look for a lover, but to find the legendary mountain tulip and give it to his future wife (Oydin). Ozod's companion is not imagined as a real person, as in the epics of Shopur (Navoi, "Farhod va Shirin") or Navfal (Navoi, "Layli vaMajnun"). Because his closest companion was the wind.

It should be noted that the wind appears in a hierarchical sequence, such as a wise man, an intelligent narrator, and finally a gospel of divine grace, guiding in proportion to the perfection of the Free. He interprets and interprets the heroic events of the event - the unexpected events, symbols and symbols he observed at the test sites. The thoughts, feelings, desires and insights of Ozod, who knows the wind as a teacher, are deepening. This path of depth and spiritual uplift is in the form of a rush from the outward appearances around him to the inner essence.

Since the goal (destination) of the free is clear, the aspirations are based on faith and trust, all the secrets are revealed throughout the image, and the world begins to be reflected in the mirror of his heart and soul. Looking at the inner layer of meaning from the wisdom (external window) to the subtle word leads to the end (address). This means that as long as the goal is clear and the belief is convincing (the "path" is chosen correctly), then the miracles will flash in the subconscious and bring it to reality.

UZBEKISTAN

ABSTRACT

In this article there is given innovative recommendations about supporting agriculture by the government, improving the life quality of the population, development of the national economy and its integration with the world, strategic directions of government economic policy in agriculture.

KEYWORDS: *Life quality, National economy, Stabile development, Modernization, Agricultural reforms, Economic growth, Competition.*

INTRODUCTION

Increasing the effectiveness of socio-economic reforms in agriculture is an important issue for improving the standard of living in Uzbekistan, ensuring sustainable development of the national economy and promoting its integration into the world community.

The acceleration of agricultural reform cannot be achieved without addressing existing problems. For this reason, it is important to identify a number of existing problems that are a serious obstacle to the development of agriculture, study their causes and develop solutions. Regardless of what problems they solve, they will have a significant impact on the overall development of the sector's economy, improving living standards in rural areas and in the agricultural sector.

Therefore, in the context of modernization and diversification of the modern economy, special attention is paid to state support for agricultural producers. Large-scale work is being carried out to deepen agrarian reforms, strengthen the material and technical base of the industry, and most

importantly, improve the efficiency of agriculture, which is becoming an increasingly decisive force for the growth of the agricultural economy.

MAIN PART

As the President of the Republic of Uzbekistan Sh.M. Mirziyev noted, “6 million 124 thousand tons of grain, 2.3 million tons of cotton, 8 million 661 thousand tons of vegetables, 2 million 411 thousand tons of potatoes, 1 million 607 thousand tons of vegetables, 2 million tons melons”, It is worth noting that you have produced about 100 million tons of fruits, 1 million 314 thousand tons of grapes, 18 thousand tons of cocoon, 1 million 789 tons of meat and 7 million 830 thousand tons of milk. The total volume of agricultural production in the amount of 58 trillion 181 billion soums is the result of your hard work throughout the year. ”

To date, in accordance with the developed programs for supporting and determining priority areas of agriculture, a number of decrees of the President of the Republic of Uzbekistan and government decrees have been implemented. "This year, farmers are given 1 trillion 33 billion soums, or 142% more than last year, and 5 trillion 138 billion soums to farmers, or 2.4 times more than last year." In particular, the seasonal nature of agricultural production and related costs during the year and its results at the end of the year can lead to a long turnover of agricultural enterprises and, objectively, to a temporary shortage of working capital. Taking into account the fact that the government provides financial support to the sector in the course of agricultural reforms, Bank credit is gradually being introduced into the issue, and the credit system is being improved. At the current stage of the ongoing reforms, an appropriate legal and regulatory framework for this process has been created and implemented.

The strategic directions of the state economic policy in the agricultural sector should be aimed at achieving the following long-term goals:

- ⌘ Ensuring sustainable economic growth and scientific and technological progress;
- ⌘ Increases the competitiveness of the product in the domestic and foreign markets;
- ⌘ Ensuring effective integration into world economic relations;

Many of the problems considered to be serious in agriculture are interrelated, and addressing one of them can have a significant impact on others. However, there is a common feature of the problem that all these problems require investment. Limited investment opportunities force us to seek solutions to other problems in agriculture by solving one problem.

In the current conditions of accelerated agrarian reform and economic development, the most important and effective way to solve agricultural problems is to move the industry to large areas and invest it on a large-scale and effective basis.

The transfer of industry to rural areas will have a positive impact on the further development of the agricultural sector and will contribute to the growth of production and incomes in various sectors through the intensification of inter-sectoral capital flows. It is necessary to create the necessary conditions for the creation of various industrial enterprises in rural areas.

To do this, it is necessary to create a system of incentives for the growth and development of agricultural processing enterprises in rural areas and provide tax incentives to industrial

enterprises operating there. At the same time, tax incentives should be used for small industrial enterprises established in remote rural areas, that is, far from regional centers.

CONCLUSION

As a result of a positive solution to these issues:

⌘ Industrial enterprises and agricultural enterprises will be merged;

⌘ Today, agriculture will be able to solve the problem of unemployment in the number of the able-bodied labor force;

⌘ In accordance with the legislation, the use of free funds by farmers for processing their own or other agricultural products can bring additional income and, in some cases, stabilize the financial balance in case of loss of agricultural products;

⌘ Further development of trade and reproduction in the country by increasing incomes and raising the standard of living, increasing the solvency of the population;

⌘ Development of a wide range of high quality and low-cost industrial products for domestic and foreign markets through on-site processing based on the effective use of some deadly agricultural products;

⌘ Agricultural enterprises will follow the principle of rational distribution of income based on excessive savings in time, labor and costs, as well as their desire to increase the quantity and quality of products, which is an important factor in the development of free competition and the skills to adapt to a free market.

UZBEKISTAN

²Bukhara Engineering Technological Institute,
UZBEKISTAN

ABSTRACT

In industry, in most cases, high grinding steppes are required. The automatic control of solid particulate material crushing is a prerequisite for maximizing equipment productivity. A more voluminous task, which must be solved in the automation of crushers, is related to the optimization of the entire process of multi-stage crushing, the effect of using separate units taking into account the requirements of automatic control, rather than by increasing the number of controlled parameters, allowing, as is often the case in practice, not only receive comprehensive information about the process, but also insure against possible malfunctions in the operation of unreliable devices. An automatic crusher performance control system control circuit has been developed. The following tasks are solved: construction and description of functional diagram of automatic crusher performance control system; defined mathematical and computer models of the automatic control system; optimal control scheme is defined.

KEYWORDS: *Crushing; Performance; A control circuit; Automatic control system; Process; electric motor power consumption.*

INTRODUCTION

In industry, in most cases, high grinding steppes are required. Sometimes the sizes of the pieces of starting material reach 1500 mm, while in technological processes, a material is sometimes used, the particle sizes of which are fractions of microns. Such steps of grinding are achieved by grinding in several stages, since in one take-up (on one machine) it is not possible to obtain a product of a given final size. According to their purpose, grinding machines are conditionally divided into crushers of large, medium and small crushing and mills of fine and ultra-fine crushing. [1, 2, 3-5]

The main machines are divided into the following [1,2]: cheek, cone, hammer crushers, roller and ball mills, wipers. All crushing machines have general requirements: a minimum of dust generation, continuous and automatic unloading, the ability to control the degree of crushing, the uniformity of the size of the ground material, and a small energy consumption per unit of production. The difficulty of controlling the degree [6] of grinding consists in determining the degree of grinding, concentration and dispersion of the ground product. Each crushing machine design at maximum capacity corresponds to an optimal degree of crushing. When a large degree of grinding is required, crushing is carried out in several stages that is, a number of crushing machines, different in design and technical characteristics [1, 3], are sequentially installed.

The main object of direct optimal control is a crusher - a grinding apparatus. If at the first stage of multistage system analysis [7] the installation, then the grinding apparatus is divided into a number of quasi-devices. This is the crusher body, crushing elements and solid material. In turn, the solid material consists of particles of the first, second, third, etc. sizes of the milled end product.

Input parameters of object for modeling of target product cone grinder object are: consumption of solid material G_0 , concentration of ground target product at inlet C_0 , particle sizes δ_i , energy consumption N . Output parameters: material consumption G_m , concentration of tested components at the output C .

Material with certain concentration of particles and dispersion of ground product is fed into crusher. The material balance equation for the selected component (for example, for particles in grinder a_i) is compiled:

One of the main indicators of crushing machines is the degree of grinding, which depends on the design of the crushing machine, the physical and mechanical properties of the processed stone rock and the absolute size of the pieces. With an increase in the degree of grinding, the productivity of crushing machines decreases, and the energy consumption increases. Each design of the crushing machine at maximum productivity corresponds to an optimal degree of crushing: for example, for cheek and cone crushers of large crushing $i=3-5$. When a large degree of grinding is required, crushing is carried out in several stages, i.e., a number of crushing machines, different in design and technical characteristics, are sequentially installed. At the same time, they gradually move from large to medium and then fine crushing so that the crushing efficiency in subsequent stages is higher, and the energy consumption is less.

The crushing process is characterized by high energy consumption and rapid wear of machine parts in contact with the crushed material. Such parts are mostly made of expensive alloyed steels. Before crushing, fractions of the finished product should be removed from the starting material, since, distributing among larger pieces, they increase the elasticity of the ground mass. When processing non-solid construction materials, machines can work in open and closed cycles.

When crushing in an open cycle, the material passes through the crushing machine only once, while the pieces of the final product are obtained in different sizes.

When crushing in a closed cycle, large fractions of the remaining material on the screen after sorting are returned for repeated crushing. Since the material repeatedly passes through the crushing machine, the load (circulation) on it increases, however, the machine operates at a higher capacity than with an open cycle and produces a more uniform product. With a closed

crushing cycle, the material is not re-ground and energy consumption is reduced, as well as wear and tear of the machine working elements. The disadvantage of a closed cycle of crushing is that as the number of machines and transporting mechanisms increases, the height of buildings and capital costs increase. Single-stage, two-stage, three-stage and less often four-stage crushing schemes are used. When determining the number of crushing stages, the capacity of the plant, the size of the pieces of the initial and final product, as well as the design of the crushers should be taken into account. The number of crushing stages is the main indicator that determines the scheme of the crushing and sorting plant.

The most important means of electrification, mechanization and automation, the basis for increasing the productivity of machine equipment is an automated electric drive, which accounts for more than 65% of the country's public electricity consumption.

Extensive theoretical and experimental material has been accumulated on the mathematical description of the crushing complex, and crusher, in particular. At the same time at automation several mathematical models of crushers are proposed, depending on different channels of passage of input impact [8].

A more voluminous task, which must be solved in the automation of crushers, is related to the optimization of the entire process of multi-stage crushing, the effect of using separate units taking into account the requirements of automatic control, rather than by increasing the number of controlled parameters, allowing, as is often the case in practice, not only receive comprehensive information about the process, but also insure against possible malfunctions in the operation of unreliable devices.

The Purpose of the Study is: Development of control circuit of automatic crusher performance control system.

RESEARCH OBJECTIVES

1. Construction and description of functional diagram of automatic control system (ACS) of crusher capacity.
2. Definition of mathematical-computer model of ACS.
3. Determine the optimal control.

Prior to the development of the Automatic Crusher Performance Control System (PCS) control device, it is appropriate to consider a simplified crusher arrangement, in particular a coarse crusher cone crusher.

Fig. 1. Cone Crusher Diagram

1-whole-cast bottom part of crusher; 2-eccentric shaft; 3-vertical shaft; 4-crossbeam; 5-cap; 6-suspension; 7-movable cone; 8-stitching; 9-crushing plates; 10-middle part of the housing; 11-shift armor; 12-cement pouring; 13-seal; 14-cup eccentric shaft; 15-drive shaft; 16-cone wheel

The capacity of a large crusher cone crusher is determined by the volume of crushed stone V_0 leaving the machine in one run-in of the inner cone, and the number of runs-in per calculated time, that is:

$$P = V_0 \cdot n$$

The volume of crushed stone falling out of the crusher during one rolling of the cone will be equal to the volume of the ABCD ring (see Fig. 2).

Fig. 2. Stone crushing scheme in cone crusher

The volume of crushed stone V_0 exiting the machine in one run-in of the inner cone is determined by:

$$V_0 = PD_{av} \frac{2l + S_1 + S_2}{2} h$$

Where D_{av} - average diameter of crushed stone ring, m.

Knowing that:

$$S_1 + S_2 = 2r, \quad h = \frac{2r}{tg\alpha_1 + tg\alpha_2}$$

we get:

$$P = 3600 \frac{nD_{av}2r(l+r)}{tg\alpha_1 + tg\alpha_2} n\mu$$

where n -number of inner cone rolls, sec; μ -coefficient of loosening of a ready-made product (0.35-0.6); the l -size of an unloading crack of the crusher at rapprochement of cones; r -eccentricity of swing of a cone, m; h -distance from upper unloaded pieces to lower edge of crusher slot, m.

Before proceeding with the development of the functional diagram, it will be appropriate to consider the simplified crushing process diagram (Fig. 3).

Fig. 3. Simplified Crushing Process Diagram

The main controlled parameters are the moments of resistance on the shaft of the crusher motor and the output conveyor (1), the control parameter is the angular speed of rotation of the input feeder motor shaft or the feeder capacity. Two control circuits including level (3) and output (4) regulators through intermediate unit (5) act on bias current of single-phase power magnetic amplifiers (6). Rectified voltage is supplied to the feeder motor armature winding. If the adjustable values exceed the limits set for them, then a signal is transmitted to the unit (5) and the feeder (2), which acts as an actuator, will reduce its performance until the signal disappears.

In this case, we need to ensure that the crusher capacity is displayed and that the crusher capacity can be changed.

The performance control window contains a functional process diagram as a substrate, as well as two forms such as dynamic text, to display performance. These forms are intended for displaying and entering information. This property can be used to allow the operator to specify the desired mill capacity.

In general, the ACS scheme has the form:

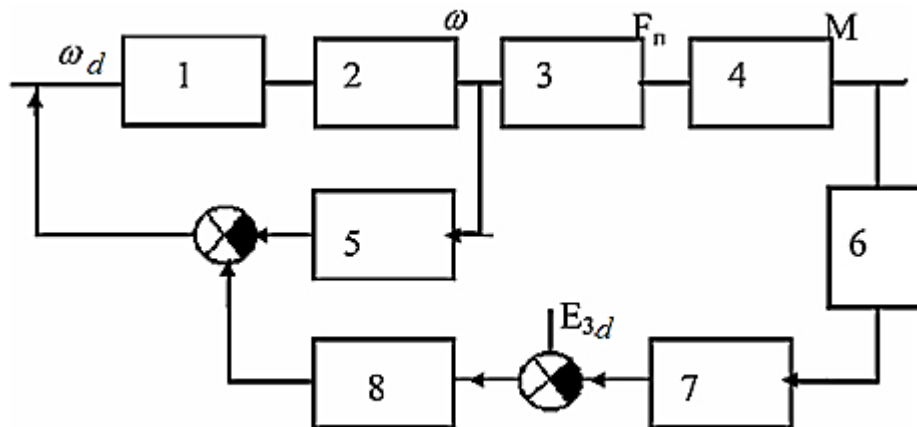

Fig. 4. General view of ACS diagram

Elements included in the control device (Fig.4): 1-electronic control device in the motor shaft speed ACS; 2-Feeder motor; 3-Feeder; 4-Crusher receiving chamber; 5- Speed sensor, $\frac{1}{4}$ d-maximum speed of shaft rotation; 5-Speed sensor, M-maximum shaft rotation speed; 6-Electric motor converting the mass of material at the moment of resistance, and then at the moment on the engine shaft; 7-Sensor converting M1 into an electric signal; 8-electronic control device to the crusher motor load ACS.

The complex should be considered as an in-line transport complex. This complex should include an automatic start-up system, with the first to include a receiving conveyor, then a crusher and only then a feeder.

Based on the above diagram of the complex control system, a computer model is developed, which consists in cascading control of the crusher performance and dependency graphics (Fig. 5, a, b, c).

The first part of the control is to control the supply of material to the crusher. Such a control part is to control the power of the electric motor. The control problem is that if the crusher is overloaded, it will be loaded with a large amount of materials, and the load on the electric motor will increase. The power consumed by the electric motor will increase, and it can change to the limit power. Therefore, such a scheme is created - a kind of cascade scheme for controlling the operation of the crusher. To do this, in both cases we used proportional adjustment - the curves show changes in the transient characteristics of such a system. In both cases of proportional regulators, changing the proportionality coefficient, we will try to obtain a more acceptable characteristic of the object. As you can see from the number of selected options, the system with a coefficient of 0.1 is most suitable for the case of material supply. The object is an integral system, and for power control the gain is 0.5. In the future, we can draw up such a scheme and further create a computer control of PCS material crushing. At coefficient 1, for the first system and 1 for the second system, as can be seen from the graph, the system has a larger oscillation coefficient. And for case 0.1 and the second coefficient 2, the fluctuations are also relatively large. Therefore, we have chosen the best case of optimal work configuration.

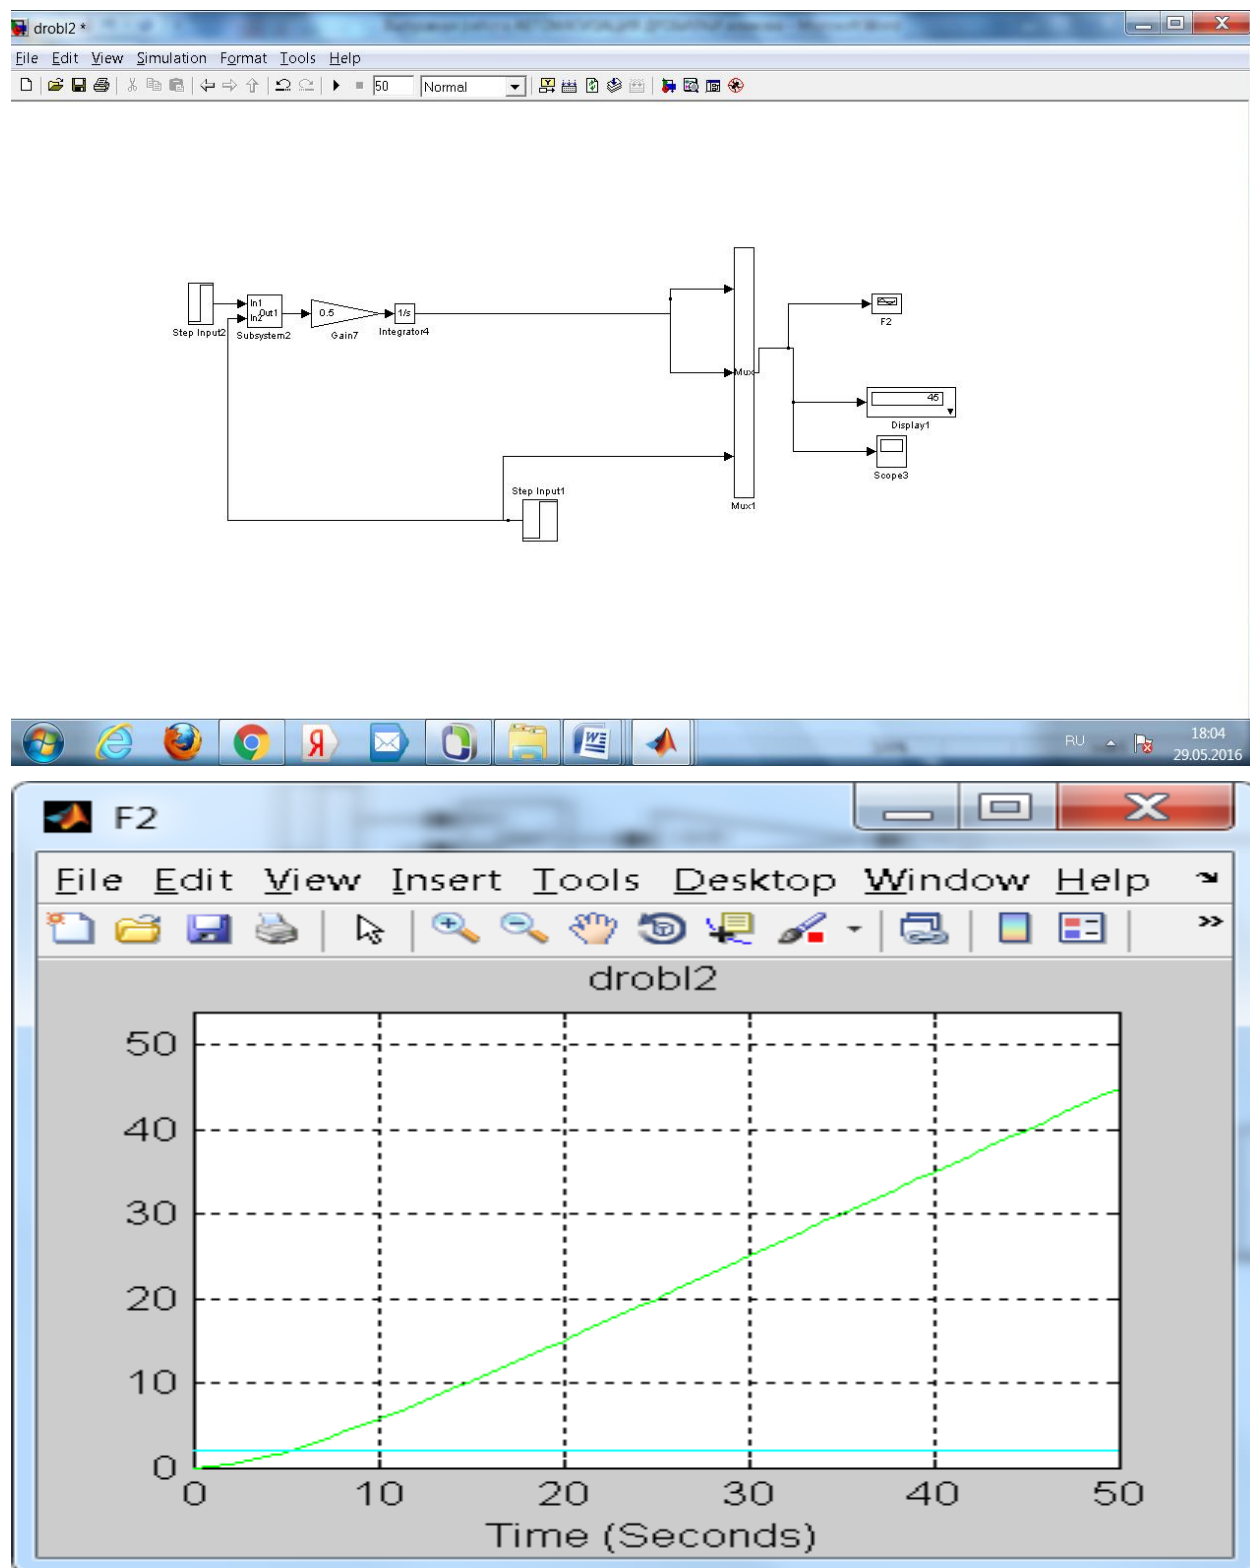

Fig. 5, a.

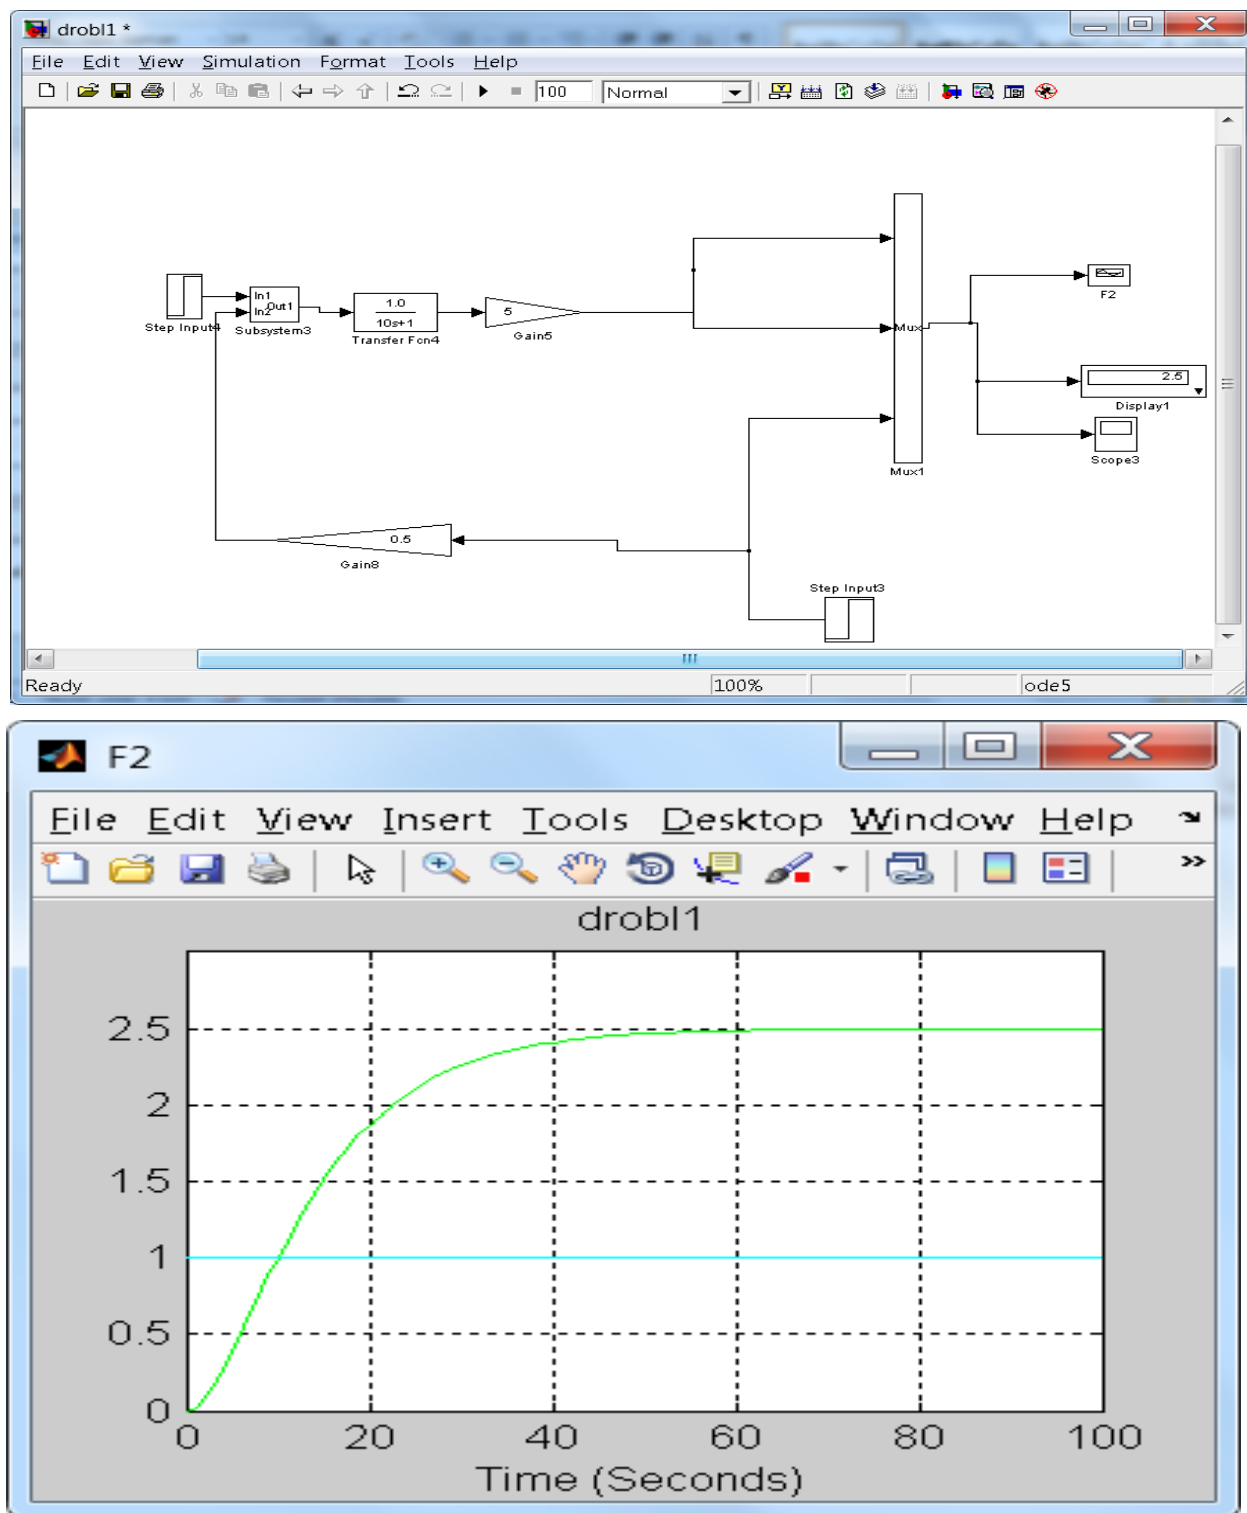

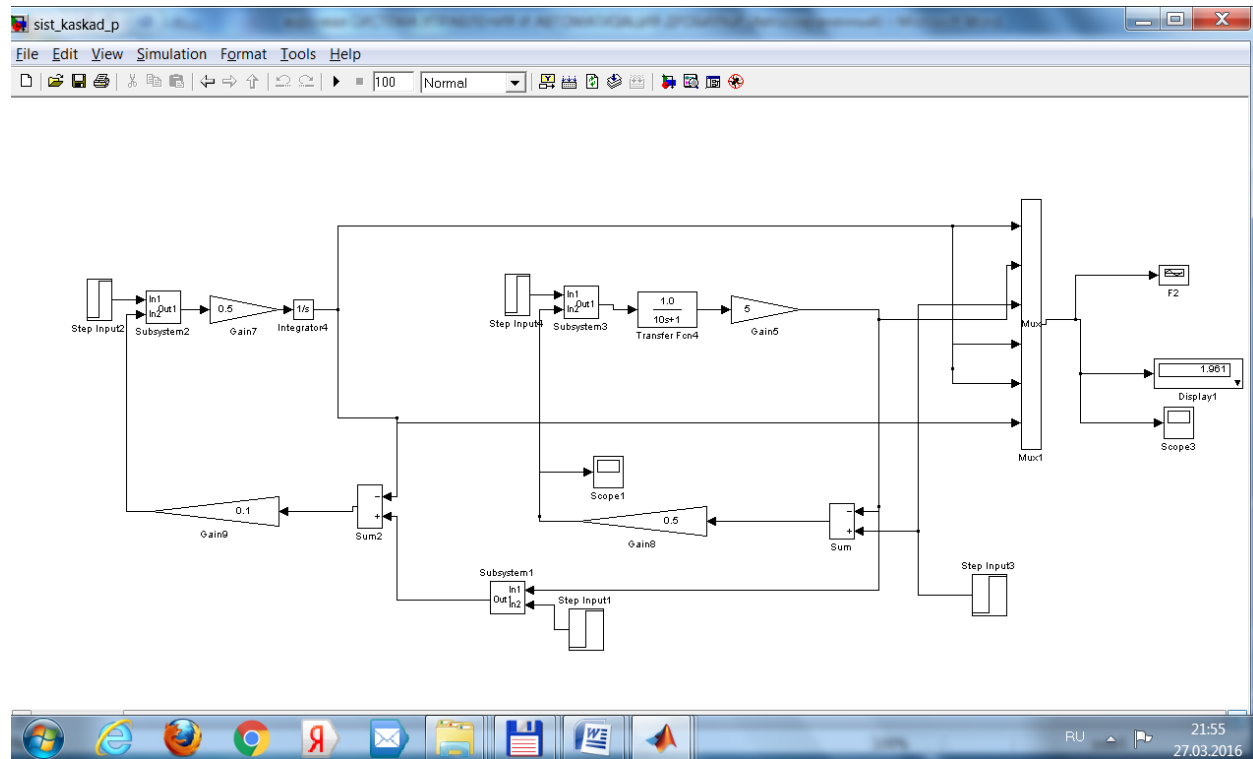

Fig. 5, b.

$$K1=1 \quad \kappa2=1$$

$K_1=0.1; \kappa_2=2$

$K_1=0.1; \kappa_2=0.5$

Fig. 5, c.

Fig. 5. Computer model consisting in cascade control of crusher performance and dependency graphics

Select a control device. Structural diagram of automated process control system (APCS) of crushing is given in Fig. 6.

The crushing process control system is provided as hierarchical in a three-level design. The lower level is implemented by instruments and hardware in place and on local boards. It includes regulation, parameter monitoring and alarm. The second level is organized in operator stations with access to the common network via the interface. The principle of APCS construction is adopted locally, for each building and department with transmission of information to the common information network. At the APCS software control level, the controller's task is to generate control actions on actuators by mathematical processing of information on the process progress, logical processing of signals on the position of controls and the state of actuators, as well as displaying the operating state of the control system on the screen. From the software control layer controller, all Ethernet information is transferred to the upper layer of the management system. At the upper level of APCS of crushing, data processing, visualization of main process parameters at terminals, generation of schedules and reporting process documentation for process control and monitoring are performed. A GENESIS-32 system is used to manage and visualize, diagnose and track the process at a centralized control point that provides quick access to all data and allows for global settings. GENESIS-32 is a software package designed to develop, configure and start real-time process control systems. The software complex includes an ACS development mode and a run-time mode. The entire ideology of GENESIS-32 construction is based on the OPC standard - OLETM *forProcessControl* (a mechanism for linking and implementing objects for data collection and control in industrial automation systems), which is the most common way to organize interaction between various data sources and receivers, such as devices, databases and systems for visualizing information about a controlled automation object.

Fig. 6. Structural Diagram of Automated Crushing Process Control System

CONCLUSION: The task of describing the control device of the automatic crusher performance control system was performed at a sufficient level.

A more comprehensive task, which should be solved in the automation of crushers, is related to the modeling and optimization of the entire crushing ACS process. It has been more acceptable to control the level of material supply by controlling the load on the electric motor of the equipment.

Tashkent Medical Academy,
Tashkent, UZBEKISTAN

ABSTRACT

The main purpose of this work was to substantiate the feasibility and possible directions of the influence of means of pharmacological correction of endothelial dysfunction for the prevention of pathological conditions associated with a new coronavirus infection. The analysis of the available literature on the functions of the endothelium was carried out, the study of foreign and domestic experience on the possible directions of pharmacological correction of endothelial dysfunction was carried out. A review of the available literature data on endothelial dysfunction with substantiation of the role of vascular endothelial damage as one of the central links in the pathogenesis of acute respiratory distress syndrome is presented. The phases of the formation of stages of endothelial dysfunction are shown, the mechanisms of endothelial damage in a new coronavirus infection are determined. Possible directions for the pharmacological correction of endothelial dysfunction are proposed, which will prevent the risk of complications from a new coronavirus infection, including through the development of pathogenetically grounded directions of pharmacotherapy.

KEYWORDS: *Ankylosing spondylitis, Asymmetric dimethylarginine, homocysteine, endothelial dysfunction, cardiovascular pathology, COVID-19.*

INTRODUCTION

Endothelial dysfunction is defined as a pathological condition characterized by progressive damage of endothelial cells and accompanied by a violation of its functions. Endothelial dysfunction is an important pathogenetic link in a wide range of diseases, which determines the high practical significance of the development of methods for its diagnosis.

Among the reasons that can initiate endothelial dysfunction, it is necessary to highlight systemic inflammation and activation of lipid peroxidation processes. According to researchers, inflammatory mediators can cause activation and damage to the endothelium, leading to impairment of its function, which has been convincingly proven in particular pathology, in particular, in osteoarthritis [8].

Analysis of the literature data showed that the main causes of ED are the association of inflammatory markers (asymmetric dimethylarginine, homocysteine, endothelin 1-21, type 1 vascular endothelial adhesion molecule, type 1 intercellular adhesion molecule, reactive hyperemia index), impaired adsorption-rheological properties of blood, as well as persistence, contributing to the development of endothelial dysfunction, is asymmetric dimethylarginine (ADMA), which inhibits nitric oxide synthase. The main functions of nitric oxide in the cardiovascular system are associated with its vasodilatory effect, inhibition of smooth muscle cell proliferation, as well as platelet aggregation and adhesion [10]. That is why, with an increase of ADMA in the blood plasma, insufficient vasodilation of blood vessels occurs, the function of the endothelium worsens, which contributes to the development of cardiac pathology.

Ogawa T. et al. have investigated the pathways of metabolism of ADMA [11]. After intravenous administration of labeled ADMA to rats, 2% of the molecules were excreted with exhaled carbon dioxide, 14% was excreted in the urine, and 86% was accumulated in the liver, pancreas and kidneys in the form of citrulline. In subsequent works of these authors, two enzymes were isolated that participate in the hydrolysis of ADMA. These enzymes were found to be dimethylargininedimethylaminohydrolase (DDAG) [12] and alanine glyoxylate aminotransferase 2 (AGAT2) [13]. DDAG is the main enzyme that hydrolyzes about 80% of ADMA to form dimethylamine and citrulline. DDAG is divided into two main isoforms: DDAG1 and DDAG2 [14]. DDAG1 is synthesized in the digestive, respiratory, excretory systems, the central nervous system and the male reproductive system. DDAG2 is synthesized in the bone marrow, digestive system, excretory system, and the female reproductive system [15].

In rheumatological patients, a change in endothelial function is a unique "crossroads" of pathogenetic pathways, on the one hand, determining the progression of the immune-inflammatory process (traffic of immunocompetent cells to target organs, antigen-presenting function and cytokine production by activated endothelial cells), on the other hand, leading to accelerated progression atherosclerosis and an increase in the risk of its complications (decrease in the antithrombogenic potential of the endothelial lining, subendothelial accumulation of oxidative low density lipoproteins, foam cells, inflammatory cells) [9].

A.L. Maslyansky et al., 2015, assessed the functional state of the endothelium in patients with rheumatological diseases [9]. Researchers studied the effect of various markers of inflammation on ED, as well as the increase in the level of markers of ED, depending on the nosological form. Based on the examination of 286 patients with rheumatological diseases, the researchers came to the conclusion that in patients with ankylosing spondylitis, the levels of such markers as type 1 intercellular adhesion molecule, type 1 vascular endothelial adhesion molecule were increased, in addition, in ankylosing spondylitis, the greatest increase in the level of homocysteine was observed. Compared with other groups of rheumatological patients. At the same time, with ankylosing spondylitis, the level of ADMA was lower than in patients with systemic scleroderma, rheumatoid arthritis, systemic lupus erythematosus, but higher than in the control

group. There is also evidence that the well-known association of increased homocysteine levels with the development of cardiovascular disease is mediated by mechanisms involving ADMA.

The research results of E.D. Egudina et al., proved that in addition to markers of inflammation, there are also other factors that contribute to the development of ED in patients with ankylosing spondylitis. According to the authors, ED develops in 53% of patients with ankylosing spondylitis and in the presence of vascular pathology is accompanied by an increase in the blood concentration of cGMP and a decrease in the content of prostacyclin [29].

In the work on the role of systemic inflammation and endothelial dysfunction in patients with ankylosing spondylitis, D.A. Poddubny et al. provided evidence that patients with ankylosing spondylitis have significantly increased levels of circulating endothelial cells, which are a marker of endothelial damage, as well as increased levels of von Willebrand factor. Endothelium-dependent vasodilation is reduced in 47% of patients [30]. The study shows the relationship between systemic inflammation and endothelial dysfunction.

The presence of ACE2 on the endothelium and smooth muscle cells of blood vessels is the reason for the involvement of the cardiovascular system in systemic damage, which is observed in almost all patients with COVID-19.

The endothelium is one of the tissues involved in the defeat of the SARS-CoV-2 virus, and therefore in some works even use the term "endothelitis" [20]. In this case, there is a pronounced endothelial dysfunction associated with the introduction of the virus into cells. This is accompanied by endothelial damage, endothelial dysfunction, and perivascular inflammation, which exacerbates endothelial damage [21].

Despite the high density of expression of ACE2 on endothelial cells, there is evidence of organ features of the distribution of the ACE2 protein on the endothelium. Currently, there is the only work in which clinical material obtained from a biopsy or autopsy was investigated. In total, the distribution of ACE2 in the tissues of 15 organs from 93 patients with various diagnoses was investigated [9]. The authors noted that ACE2 is present on the endothelium of both arterial and venous vessels of almost all organs. Moreover, smooth muscle cells of arterial vessels showed ACE2-positive staining. ACE2 was found even on the endothelium and smooth muscle cells of the cerebral vessels, while it was not found in other brain cells. However, ACE2 is not expressed on the endothelium of the sinusoidal capillaries of the liver. Thus, the presence of a receptor on the vascular endothelium for the introduction of the virus makes it one of the most important targets for SARSCoV2. In addition to endothelium and smooth muscle cells, ACE2 is expressed in significant amounts on the pericyte membrane, which also contributes to the development of vascular disorders [10].

The introduction of the SARS-CoV-2 virus into endothelial cells has been proven by numerous studies. Microscopic examination of tissues of patients with COVID-19 in several studies revealed damage to the endothelium of various organs. So, in a patient with COVID-19, pneumonia, when examining the pulmonary arteries of medium diameter, endothelial damage with vacuolization of the cytoplasm, signs of desquamation of endothelial cells was found [22]. The SARS-CoV-2 virus was also detected in the endothelium and extracellular space of lung capillaries [23]. In a patient with COVID-19, complicated by mesenteric ischemia followed by resection of a section of the intestine, histological examination of the resected area revealed pronounced "endotheliitis" of the vessels of the submucosal layer with signs of direct lesion of

endotheliocytes by the virus, phenomena of apoptosis, perivascular inflammation, and mononuclear infiltration [20]. The authors suggest that COVID-19-induced endothelial damage may explain the systemic impairment of microcirculatory function in various organs in patients with COVID-19 [20].

CONCLUSION

Thus, the presented analytical review on the influence of the functional state of the endothelium on the course of ankylosing spondylitis and the formation of pathological processes initiated by exposure to the body of the coronavirus from the SARS-CoV-2 family makes it possible to single out endothelial damage as one of the central links in the pathogenesis of the development of cardiovascular complications. Due to AS and other severe complications of COVID-19. Timely differentiated prescription of drugs for the pharmacological correction of endothelial dysfunction will most likely improve the prognosis of a new coronavirus infection, especially against the background of concomitant chronic diseases complicating the course of COVID-19. The study and understanding of the causes of endothelial dysfunction in rheumatic diseases seems promising, since it will reveal the mechanisms of the rapidly progressive atherosclerotic process and high cardiovascular mortality.

ABSTRACT

Early diagnosis and treatment of background and precancerous diseases of the cervix is one of the important problems of gynecology, the ultimate goal of which is to reduce the incidence of cervical cancer. To date, many scientific papers have been devoted to the problem of treating cervical pathology and various methods of treating background and precancerous diseases of the cervix have been introduced. The most common methods are those based on the use of electro coagulation, cry destruction, and laser vaporization methods as a therapeutic effect. According to domestic and foreign authors, the therapeutic effect of the above-mentioned methods of treatment is 67-98. 7% [1, 2, 5]. However, each of these methods has its own indications, contraindications and a number of complications: exacerbation of chronic salpingoophoritis, bleeding, the occurrence of endometriosis, scarring of the cervix, cervical canal stenosis, violation of reproductive function [2, 4, 6, and 9]. In order to prevent cervical cancer, the treatment of background and precancerous diseases should be radical, but at the same time careful, while preserving the anatomical and functional fullness of the cervix, which largely determines the state of the reproductive system. In this regard, treatment methods are currently being developed that combine the optimal therapeutic effect in the absence of undesirable complications. One of the newest approaches to the treatment of cervical pathology is laser photodynamic therapy (LFTT). This method causes selective death of pathological cells, which is provided by the selectivity of the accumulation of the drug in the pathological tissue and local light supply. According to foreign sources, there are isolated cases of successful treatment of dysplasia and cervical cancer with the use of hematoporphyrin derivatives as a photosensitizer. In the sources available to us, no information was found about the use of LFTD in the treatment of background and precancerous diseases of the cervix, and the effectiveness of

the drug "0.05% solution of mytilene blue belonging to the group of phenothiazines (cationic azines)" in the use of LFTD in gynecology was not evaluated, which determined the purpose of our study.

INTRODUCTION

PURPOSE OF THE STUDY

Improve the effectiveness of treatment of background and precancerous diseases of the cervix by innovative laser photodynamic therapy.

RESEARCH MATERIALS AND METHODS

In accordance with the purpose and objectives of our study, 112 women with background and precancerous diseases of the cervix, who were in the gynecological departments of the regional perinatal center of the Bukhara region, were examined and treated for the period 2017 to 2020. The age of the examined women ranged from 21 to 65 years (mean age 43.2 ± 0.3 years). The maximum number of patients (67%) was between the ages of 21 and 35 (mean age 32.2 ± 0.3 years). The following pathology of the cervix was revealed: ectopia - in 52 patients (46.4%), eroded ectropion - in 14 (15.5%), leukoplakia - in 21 (18.7 %), dysplasia of the I-II st. - in 7 (6.3%), endometriosis - in 12 (10.7%). The diagnosis of the disease was made in accordance with the International Statistical Classification of Diseases and Health Problems, 10-revision (ICD-10), adopted by WHO in 1995. To obtain a true understanding of the nature of the pathological process of the cervix, we conducted a comprehensive clinical, microbiological, colposcopic, cytological, and histological study. The clinical examination included a thorough analysis of the premorbid background, the study of complaints, transferred and concomitant extragenital and gynecological diseases, features of menstrual, sexual, and generative function. The state of the cardiovascular, respiratory, endocrine, urinary and digestive systems, and mammary glands was assessed. In the course of the work, a standard range of laboratory tests was used: a general blood test, a general urine test, blood for RW, HBs, HCv, and HIV. The gynecological status was determined on the basis of examination of the external genitalia, examination of the vagina and uterus with mirrors, and bimanual vaginal examination. Colposcopic examination was carried out with a colposcope "Som 52/42 KALTLICHT"(manufacturer Germany) with a resolution of 70 times magnification. Using colposcopic examination, we determined the size and shape of the cervix and external pharynx, the color and relief of the mucosa, the features of the vascular pattern, the boundaries of the flat and cylindrical epithelium, revealed the true area of ectocervix lesion, as well as signs of atypical transformation. Microbiological examination was carried out using bacterioscopic and bacteriological methods. Bacterioscopic examination made it possible to determine the affiliation of microorganisms to obligate-anaerobic species, lactobacilli, to assess the invasiveness of fungal flora, and to evaluate both the qualitative and quantitative composition of bacterial flora. The determination of specific pathogens in the mucus of the cervical canal was carried out by polymerase chain reaction (PCR). Cytological examination of smears-prints from the surface of the cervix and the cervical canal is one of the main methods for diagnosing precancerous and malignant diseases of the cervix. Cytological examination revealed the morphological features of the cells, the relationship of individual cell groups, and the location of cell elements in the

preparation. Much attention was paid to the detection of the nuclear-cytoplasmic index, the distribution of chromatin in cells, the increase in nucleoli, and the detection of mitotic division patterns. The results of the cytological examination were described according to the classification of Papanicolaou. Histological examination of cervical biopsies and scrapings of the cervical canal mucosa made it possible to make a final diagnosis. We interpreted the histological patterns in accordance with the classification of Ya. V. Bokhman (1989).

Preoperative preparation was carried out for all women with a detected infection of the genital tract and included etiotropic, immunomodulatory therapy followed by the appointment of eubiotics to normalize the vaginal microbiocenosis. The treatment was carried out in the first phase of the menstrual cycle. Performing PDT did not require anesthesia. The PDT session was performed 2 hours after applying the Photoditazin 0.5% gel to the pathological area of the ectocervix.

As a source of laser radiation, a semiconductor laser device "ALT-Vostok-03" corresponding to the technical specifications TSh 64-15302652-002:2010 was used. Manufacturer "NAF " LLC (Republic of Uzbekistan) with the following technical characteristics: supply voltage-110-220 V, 50 Hz, 10 W; radiation range-660-670 nm; average total radiation power in the output; plane of the emitting terminal-1.0 W; area of the output hole of the emitting terminal-4 cm²; pulse frequency-24±10% Hz; modulation frequency-1.2±10% Hz. The output wavelength was 662 nm in continuous mode for 10 to 20 minutes (depending on the affected area), the output power was -1 W, and the energy density was 80 to 250 J/cm². Evaluating the process of cervical epithelization, we took into account the presence of complications during manipulation, the nature of the scab, the period of its rejection, the timing of regeneration, the dynamics of the results of cytological and bacteriological studies, as well as the presence of complications in the early (4-12 weeks) and late (6-12 months) treatment periods.

RESEARCH RESULTS AND DISCUSSION

Analysis of anamnesis, clinical picture of cervical pathology, effectiveness of diagnostic methods, immediate and long-term results of treatment performed in 135 patients with background and precancerous diseases of the cervix, allowed us to obtain data on the causes and features of the course of background and precancerous diseases of the cervix, the nature of reparative processes after PDT in comparison with diathermosurgical treatment, to develop methods and indications for PDT.

The analysis of anamnestic data revealed extra-genital, behavioral and genital risk factors for the development of cervical pathology, which create not only a background for the development of background and precancerous diseases of the cervix, but also cause the development of background and precancerous diseases of the cervix.

Our laboratory and instrumental examination allowed us to obtain data on the causes of background and precancerous diseases of the cervix, the features of their course, to identify the true size and study the structure of the pathological process. Colposcopic examination of the majority of patients (71.3%) revealed the presence of areas of cylindrical epithelium on the surface of the ectocervix.

Cylindrical epithelial cells were found in smears-prints from the surface of the cervix. Cytological studies conducted by us have shown low information content in the detection of leukoplakia.

Important colposcopic signs of precancerous diseases of the cervix are certain markers, which can be used to judge the high probability of dysplasia of the multilayer squamous epithelium. As a rule, their appearance is associated with an increase in the concentration of DNA in cells (acetobellum epithelium) or the formation of atypical vascularization. The atypical transformation zone was detected in 31.5% of patients and was mainly associated with the presence of inflammatory changes in the cervix, leukoplakia, and dysplasia. The results of our study confirmed the high informative value of colposcopy in the diagnosis of background and precancerous diseases of the cervix. Many researchers have proven the role of infectious agents in the development of background and precancerous diseases of the cervix [1, 3, 6, 7]. In this regard, we pay great attention to the identification of infectious agents by bacterioscopic, bacteriological examination and diagnosis by PCR. Bacterioscopic examination revealed the 2nd and 3rd degrees of vaginal purity in the majority of patients (46.9 % and 37.8%, respectively), and the 1st and IV degrees of vaginal purity were less common (5.8% and 6.9%, respectively).

Thus, among 21 patients with colposcopic signs of leukoplakia, 8 did not have cytological signs characteristic of leukoplakia. The cytogram of inflammation was noted in 39.9% of patients. Cytological signs of dysplasia against the background of ectopia, leukoplakia and concomitant inflammation were detected in 18.2% of patients. After a course of anti-inflammatory and antibacterial therapy, these patients underwent a cervical biopsy followed by histological examination, which confirmed the presence of dysplasia in 9.2% of patients with colposcopic ectopia and leukoplakia in combination with an atypical transformation zone.

Dysplasia of the I-II degree was detected in 7 patients, of which 1 - against the background of chronic cervicitis and ectopia, 4-against the background of ectopia in combination with viral lesions, 1-in combination with leukoplakia and viral lesions of the squamous epithelium, 1-with leukoplakia and concomitant chronic inflammation of the cervix.

Histological examination was performed in 25 patients with abnormal colposcopic pattern and cytological confirmed dysplasia, which allowed to make a final diagnosis.

Signs of leukoplakia in the form of acanthosis, hyperkeratosis, parakeratosis, without atypia were found in 16 patients. Of these, chronic cervicitis was detected in 7 patients. The presence of ectopia on the background of chronic cervicitis was revealed in 9 patients. Of these, 3 had a viral lesion of the squamous epithelium.

To conduct an objective comparative study, depending on the treatment methods used, the patients were divided into two groups, group I included 82 patients with background and precancerous diseases of the cervix at the age of 21 to 55 years (average age 36.32 ± 0.3 years), who underwent PDT.

The comparison group (group II) consisted of 30 patients with background cervical diseases aged 21 to 65 (mean age 44.2 ± 0.3 years), who were treated with diathermosurgical (DH) treatment. Depending on the method of DH treatment, this group was randomly divided into two subgroups: group 1 included 15 patients who underwent diathermocoagulation, group II consisted of 15 patients who underwent diathermoconization. In both groups, the duration of

epithelization after various methods of exposure was evaluated, the beginning, end, and total duration of epithelization were evaluated. As can be seen from the data presented in Figure 1, the epithelization time was significantly shorter in the group of patients who underwent PDT (26.5 ± 2.7 days), whereas after DH treatment, the average time for completion of epithelization was 41.5 ± 0.9 days ($p < 0.001$).

Chart 1. Dynamics of the process of epithelialization of the cervical mucosa in various types of treatment (1-FTD, 2-DH (conization and coagulation)).

It was found that the duration of epithelization of the cervical mucosa in the main group was almost 15 days shorter than in women after DH (26.5 ± 2.7 and 41.3 ± 0.9 days, respectively).

We have shown that PDT is characterized by shorter epithelialization times compared to the DH method. At the same time, when comparing the two methods of DH treatment, it can be seen that the beginning and end of epithelization occur significantly later in conization than in coagulation ($p < 0.05$), and the total duration of the epithelization process was almost the same ($p > 0.1$).

The analysis of the immediate results of treatment showed that the frequency of complications significantly depends on the type of treatment used: Thus, in 4.1% of patients of the main group, postoperative complications were presented in the form of incomplete epithelization. At the same time, patients after DH treatment had a significantly high rate of postoperative complications: 88.8% of patients were concerned about pain in the lower abdomen ($p < 0.01$), 5.1%-bleeding ($p < 0.05$), 8.2%-exacerbation of chronic salpingitis ($p < 0.5$), 28.2%-colpitis ($p < 0.001$), 22.3%-incomplete epithelialization ($p < 0.001$). A comparison of both methods of DH treatment showed that the frequency of such postoperative complications as exacerbation of chronic salpingoophoritis ($p < 0.1$), pain ($p < 0.001$), bleeding ($p < 0.1$) after diathermoconization was significantly higher than after diathermocoagulation.

It is known that after DH intervention, a deep necrosis zone is formed on the cervix, accompanied by pronounced leukocyte infiltration in the wound surface [2,3,5,7,8]. In this regard, along with clinical observations, we conducted bacterioscopic and cytological studies in dynamics 12 and 30 days after treatment.

We found that in patients after PDT, the cytogram of inflammation after 12 and 30 days was detected in 7.1% and 1.2% of patients, respectively, while the cytogram of inflammation after

DH treatment after 12 days was detected in 55% of cases, and after 30 days it was preserved in 25% of patients ($p < 0.001$).

Similar results were found when analyzing the results of bacterioscopy taken 12 and 30 days after PDT and DH treatment ($p < 0.001$).

Thus, the results of our observation showed the inexpediency of using diathermocoagulation in the treatment of extensive, long-existing pathology of the cervix, especially in nulliparous women due to the high percentage of side effects that violate the reproductive function.

ABSTRACT

This article analyzes the natural, scientific, neurophysiological, psychological and pedagogical approaches to the nature of interdisciplinary connections in special education. Interdisciplinary links ensure the establishment of a unified system of teaching, education and work in a special school, which significantly affects the level of generalization, robustness, completeness and differentiation of the formed concepts. This has a positive effect on the acquisition of the concepts that make up the content of the subject. The positive effects of developing knowledge, skills and competencies based on interdisciplinary connections are highlighted.

INTRODUCTION

The study of the nature of interdisciplinary links and the search for ways to implement them as a condition that significantly affects the effectiveness and practical significance of the educational process has long been in the focus of researchers and remains relevant today. the emergence of the concept of making interdisciplinary connections in the process of giving is related to the understanding in the minds of students of the obligation to reflect the world around them in a single and holistic way.

Attempts to explain the need to create a learning process based on the study of connections between objects and events, as well as to determine the role of interdisciplinary links in ensuring the successful development of children's mental development Ya.A. Komensky, IG Pestalotsy, Russian thinkers and educators AI Gersen, N.G. Chernyshevskiy, K.D. Ushinskiy, pedagogues-

experimenters V.Ya. The result of the methodological development of the theory of interdisciplinary communication, carried out by Stoyunin, NFBunakov, VIVodovozov and others, is that the unity of emotional, practical and logical aspects of learning is the interaction of emotion, perception and thinking, attention and memory. It is necessary to form an integral system of knowledge at the same time with the development of mental abilities. Long-term study of the nature and role of interdisciplinary links in the educational process Natural scientific (neurophysiological), psychological and pedagogical formed approaches. Modern interdisciplinary theory of relations is based on materialist epistemology, the doctrine of the general relationship of events and processes in nature and society, the transitions of forms of action, and the interrelationships of branches of science. From a philosophical point of view, interdisciplinary connections are seen as a didactic form of the general principle of coherence. This principle is one of the methodological principles that form the basis of knowledge in science. It requires the illumination of any object under study as a whole, which has different types of connections between the object and the objective reality within the object. An important task of the educational process based on this principle is to integrate the diversity of connections to a single abstract image.

Interdisciplinary connections are designed to create a single methodological basis for the subject organization of education in the modern school. The ability to provide a natural-scientific basis for the physiological nature of the relationship between the various features of the subject or phenomenon. It arose as a result of the development of Pavlov's theory of the reflexive nature of spiritual activity. A series of brain reflexes, combined with connections that occur under certain conditions, form a "whole association." This is the result of the reflection of the nervous system on the objective relationships of the properties and characteristics of the object. The more often and in many ways objects are viewed, the more complete and sufficient the resulting associations will be [3,p.45].

IP Pavlov reveals the neurodynamic basis of the process of formation of associations and distinguishes systematics as its characteristic feature. The reflection of the interrelationships of objectively existing objects and events in the brain leads to the emergence of a complex system of permanent and temporary connections that ensure the consistency of knowledge about the world. The systemic principle of brain activity is manifested not only in the specific stimulus, but also in the ability to interact, to form an integral association for the complex of stimuli. The strength of the nervous system's influence on the perceived object depends not only on its character, but also on the readiness of the actions of previous stimuli [2, p. 78].

This fact underlies the process of transferring previously developed associations to new drivers if these associations are in the same relationship with each other as with the generated drivers. . This is the essence of the process of transferring previously acquired knowledge about the object obtained in the study of various disciplines to a new situation in the review of other subjects [2, p. 25].

As for the problem of interdisciplinary communication, this rule can be illustrated as follows: the acquisition of existing knowledge about this object obtained in the study of other sciences in the acquaintance with new materials is related to the activity of acquiring new knowledge is an "additional stimulus" that has a positive effect on the functional state of the shell parts. By combining knowledge of the properties of the object in the process of making connections, the teacher seeks to form a high level of associative communication. The properties of reality-related

objects are similarly reinforced in the imagination. Therefore, the implementation of interdisciplinary connections in the learning process is based on the existing functional mechanisms of the cerebral cortex.

The neuropsychological substantiation of interdisciplinary communication mechanisms has been the basis for explaining psychological processes in the study on this basis.

From a psychological point of view, association is the connection between all forms of reflection of objective reality, which is based on emotions.

Psychological and pedagogical substantiation of the conditionality of the implementation of interdisciplinary connections in the learning process with the objective laws of higher nervous activity was proposed by LS Vygotsky. He experimentally determined that the activity of thinking, as a basic stage in the formation of previously emerging concepts, enters the new activity of thought by generalizing it. At the same time, he concludes that there is a clear sequence in the formation of such a generalization: the new stage of generalization appears only on the basis of the previous ones [5, p. 55]

Therefore, the highest form of generalization of knowledge about an object - concepts, should be formed by combining the previous stages - the concepts derived from different disciplines about the properties of the object.

LSVygotsky's concepts, along with a natural-scientific understanding of the nature of high nervous activity, were applied to DNBogoyavlensky, Y.N. Kabanova-Meller, A.Alyublinskaya, NAMenchinskaya, KKPlatonov, Yu.A. Samarin, AASmirnov, DBElkonin and other researchers. When the data were combined with previously learned knowledge and previous work experience in different areas, it was concluded that all the lessons play a role in the formation of new connections, associations.

Research shows that connections in the learning process are the most important means of fulfilling the functions of education, upbringing and development.

The basis for studying the mental activity that occurs when using interdisciplinary connections is associative connections. In separate lessons in the primary grades, the initial perceptions of objects and events ("local associations") that children acquire when they become acquainted with them are integrated and interdependent in the learning process, making them more complete and diverse. reflection is the next stage of generalization leading to "partial system connections". The use of interdisciplinary links to unite local associations provides the level of generalization needed to further shape concepts based on them.

One of the consequences of these rules is the requirement to combine this knowledge with its application. Learning and applying knowledge are two sides of the same coin. Applying knowledge to solve real-world problems requires children to make analytical choices from a range of disciplines.

The concepts included in each subject include knowledge of a number of disciplines. They are the source of interdisciplinary connections. The teacher has a special role to play in the implementation of this concept, because his correct explanation of the interrelationships of the disciplines helps to form the most complete, accurate picture. According to BG Ananov and

Yu.A. Samarin, interdisciplinary connections are a necessary condition for the formation of integral systemic knowledge [6, p. 56]

One of the important tasks in solving the problem of establishing interdisciplinary links is to develop the ability to transfer existing knowledge to different conditions of activity. Implementing them, according to P.G. Kulagin, will create opportunities for the development of advanced reflection. The developed skills of knowledge transfer allow to predict some features of a new object in the mind. To successfully solve practical problems of life, taking into account the real connections of science and events, it is necessary to use interconnected knowledge in a comprehensive manner. The implementation of interdisciplinary teaching of academic disciplines is the basis for the organization of efforts to solve new problems due to the expectation of their results in the transfer of knowledge and the formation of the ability to implement them in accordance with the purpose. the transfer of knowledge contributes to the growth of their generalization. Research by LS Vygotsky, VV Davydov, AN Leontev shows that mastering the methods of movement with the material studied by children helps to understand and strengthen knowledge[5,b.76].

Special application of knowledge on a topic previously acquired by children in different lessons will not only help them to better understand and comprehend the new material, but also to better remember and systematize it. According to AA Smirnov, the spiritual grouping of educational material, the separation of general concepts in it and the establishment of connections between new knowledge and acquired knowledge help to strengthen memorization, the stability of formed concepts and their clarity. This, in turn, helps to make the images more differentiated. Mastering the ways of transferring knowledge and skills from one subject to another leads to a more goal-oriented movement in the analytical-synthetic activity of students, increases activity and independence, life-practical helps to master the methods and logic of effective problem solving.

The purpose of reasoning is to identify important connections between science and events through synthesis and analysis. The fact that analysis goes beyond a single subject deepens and expands it to a higher level. As S.L. Rubinstein points out, making connections within a material is a specific method of mental activity that is a system of synthesis and generalization in solving knowledge problems.

Recognition of the associative-reflex nature of thinking and its systemic nature defined the understanding of the process of knowledge acquisition as the formation of a complex system of associations that reflects the relationship between science and events. Interdisciplinary links ensure the establishment of a unified system of teaching, education and work, which significantly affects the generalization, robustness, completeness and degree of differentiation of the formed concepts. This has a positive effect on the understanding of the concepts that make up the content of the subject.

In a study conducted by a number of scientists led by BG Ananov, interdisciplinary connections and their use in the learning process are considered as one of the ways to increase the activity and organization of students' learning, taking into account the psychological laws of formation of concepts and notions. The attraction of knowledge from different fields of science ensures the completeness and accuracy of the concepts on the subject under study, a holistic reflection of its properties and objective connections in accordance with the principle of consistency.

The pedagogical understanding of the nature and functions of interdisciplinary connections is based on the understanding of the natural-scientific basis and the psychological mechanisms of their functioning. It should be noted that there is still no single position in defining the essence of interdisciplinary links as a pedagogical category.

Interdisciplinary connections affect the nature of teacher-student interactions in the pedagogical process. It is determined by the logic of the sciences and the connections between them.

The purpose of interdisciplinary links is to meet the following requirements for the learning process: 1) to eliminate duplication in the study of educational material; 2) the possibility of time to study specific issues; 3) consistency and originality in the definitions and characteristics of scientific concepts; 4) to combine the efforts of teachers of different disciplines in the formation of scientific concepts and notions of students, to instill in them practical skills and competencies; 5) use by teachers of scientific and technical information received by students in various subjects in the educational process; 6) the solution of other pedagogical problems connected with peculiarities of educational disciplines and the relations between them.

The results of the research have become a system of teaching disciplines in which interdisciplinary connections are made based on the integration and coordination of complementary knowledge.

Interdisciplinary coordination requires a special structure and content of the lesson, the main features of which should be: 1) the spiritual interdependence of the content of teaching several disciplines; 2) unity of forms and methods of teaching; 3) integrated use of knowledge and skills in solving practical problems. At the same time, it is necessary to identify the main directions of systematization of teaching materials in different disciplines, reflecting the interrelationships between programs and textbooks.

Coordination of knowledge is achieved through the coordination of curricula of related disciplines in terms of a general interpretation of the concepts, processes, events and time of their study. It's about understanding science in a narrow sense. Coordination helps to combine knowledge, that is, to combine elements of different disciplines in a single integrated synthetic course.

Interdependence should apply not only to knowledge in different disciplines, but also to the operational aspects of teaching different disciplines (a system of actions aimed at solving educational or other practical problems). Particular attention should be paid to the operational aspects of student activities. Solving practical problems requires combining knowledge and transferring it to a new situation. At the same time, the logic of creating such combinations of knowledge differs significantly from the logic of presenting and mastering their components in the linear study of individual disciplines.

GVVorobev believes that a system of interconnected knowledge capable of dynamic change should ensure their success in their application in practice. Establishing the right relationships in the teaching of various disciplines is interdisciplinary (speech, measurement, calculation) is necessary to master the types of activities that can be included in the type. The role of generalized directed action in the formation of activities such as solving spatial-projection problems specific to the lessons of geometry, drawing, geography was identified. According to VM Kosataya, the impact of interdisciplinary links on the education and overall development of

students is achieved through the reconstruction and improvement of the internal logical structure of teaching methods.

Based on the study of the possibilities of interdisciplinary connections in the learning process, conclusions were drawn about their impact on the learning process of students.

At each stage of the acquisition of knowledge, the implementation of interdisciplinary links has a certain impact on its progress. Thus, in the early stages, as they prepare to become acquainted with new material, they help children to actively understand unfamiliar things, to communicate, and to move from what is known to what is unknown. This will allow you to determine the purpose of the lesson. All of this is due to the fact that interdisciplinary connections contribute to the formation of reflection. At this stage, they are often carried out by students through the use of questions and assignments based on interdisciplinary material, methodical acceptance of recall and recall based on intra-topic and inter-topic connections.

When reviewing new material, it is compared with data from different disciplines, analyzed, improved, enriched. In this way, the introduction of new material into the knowledge system is ensured. In the next stage of knowledge acquisition - the process of understanding and consolidation, interdisciplinary links continue to play an activating role. They are made, according to GISHukina, temporary connections - due to the involvement of past experience, which contributes to the formation and strengthening of traces. 'allows you to increase flexibility. Thus, the generalized profession (formed as a result of mastering the connections between the methods of learning activities used in different disciplines). Interdisciplinary coordination in the educational process helps to develop and intensify the learning activities of schoolchildren, to optimize the learning process.

ABSTRACT

This article covers the relations of Muhammad Shaibanikhan and the rulers and princes of Bukhara Shaybani with the people of science and art, the support of scientists and poets, the provision of financial assistance to them, scientific considerations based on historical sources and research results.

KEYWORDS: Bukhara, Samarkand, Shaybanis, Ruler, Prince, Muhammad Shaybanikhan, Kochkunchikhan, Ubaydullah, Abdullah II, Abu Said, Kokaldosh, Ulama, Poetry, Scholars, Qasida, Madrasa, Mudarris.

INTRODUCTION

The period of cultural upheaval in history is associated with the formation of centralized and powerful states. At the same time, factors such as the reforms of the rulers in these countries in the field of science, personal aspirations, patronage of representatives of science and culture also contributed to cultural development. Although the political history of Muhammad Shaibanikhan and his descendants, the first representative of the Shaybanid dynasty that ruled in the history of Uzbek statehood for a century, has been sufficiently studied, the scientific and literary activities of this dynasty, its relations with science and creativity unexplored.

The enlightenment of the representatives of this dynasty and their high devotion to science, art and poetry played an important role in the development of science, culture and poetry during the Shaybanid period. They sponsored the development of science, the free activity of poets and artists, and supported them materially and spiritually. For example, Muhammad Shaibanikhan (1451-1510), Kochkunchikhan (1452-1529), Abu Saidkhan (1481-1533), Ubaydullah (1487-1540), Abdulazizkhan (d. 1551), Abdullah II (1534-1598), Abdumo Representatives of the

Shaybanid dynasty, such as Minkhan (1567-1598), Abdol Sultan (d. 1578), Abulkhair Sultan (d. 1578), Muzaffar Sultan (d. 1578), Dostum Sultan (d. 1583), were honored poets and scholars. they put their respect in place, treated them warmly, invited them to their palaces, and enjoyed their creations. Also, during the Shaybani period, this group of people had more privileges than others.

MAIN PART

First of all, the founder of the dynasty, Muhammad Shaibanikhan, was a wise, educated, enterprising and creative man of his time. He was "aware of the virtues of science and, more precisely, a person who fully possessed them, and had a great deal of faith in the field of poetry and poets." [1] Herman Vamberi writes that Shaybanikhan had great respect for the clergy of the time, even as a child, and carried with him a small beautiful library on all his travels, and, like Timur, took part in religious debates with the scholars of Damascus and Aleppo. Judge Ikhtiyar and Muhammad Yusuf, the leading commentators on Herat, were challenged about some verses of the Qur'an. ... After the death of Sultan Hussein Mirza, many scholars who needed a handful of grain took refuge in Shaybanikhan. He recruited scribes and gave them worthy assignments. He was also surrounded by a number of scholars during the military campaigns, who treated him with respect and devotion. [2]

Muhammad Shaibanikhan attracted many scholars and poets to his palace. Kamoliddin Bina'i, Muhammad Salih, Mullo Shadi, Fazlullah ibn Rozbehan and others took refuge in his palace and finished their works.

In addition, Muhammad Shaibanikhan held discussions on various issues on the agenda. They were attended by the great scholars of Movarounnahr and expressed their views. At one such meeting in Konigil, near Samarkand, a decision was made to use the lands that had become neglected as a result of wars and disputes. Also, during his reign, the role of the Uzbek language in historical and literary literature increased. By order of the khan, works written in Persian and Mongolian were translated into Turkish.

After the death of Shaibanikhan, Kochkunchikhan, who was transferred to the khanate throne due to his age, was close to culture and art in terms of military-political sphere. According to Ziyodulla Mukimov, a Shaybani scholar of statehood and law, he was a Sharia lawmaker, a hermit, and a defender of scholars and scholars. During his reign and reign, he undertook the task of blessing and bowing down to scholars and nobles. [5]

Mutribi Samarkandi (1558-1632), a Tazkiranavist writer of the Shaybanid period, also narrates a story about the khan's remoteness, simplicity and humility. According to him, from the first days of his accession to the throne, the khan often visited madrassas in Samarkand, talked to students and gave them gifts. Seeing the level of knowledge of the students, he said with satisfaction that "all the learned people of the world are gathered only in Samarkand" [6].

RESULTS

Ubaydullah, another enlightened ruler of the Shaybani dynasty, was educated by the leading scholars of his time (Amir Abdullah Yamani, Khoja Muhammad Sadr, Khoja Mullo Isfahani, Mawlana Mahmud Azizon, Mawlana Yormuhammadqori and others). Reads Arabic and Persian diligently. Mirza Muhammad Haydar (1501-1556), a statesman and cultural figure of the 16th century, described the khan's scientific achievements in his famous work "Tarihi Rashidi": "He

was adorned with all the virtues from his youth." [7] . For example, he studied hadith from the leader of modern muhaddiths, Khoja Mawlana Isfahani, jurisprudence from the leader of faqihs, Mawlana Mahmud Azizon, and recitation of the Qur'an from the famous hafiz Yormuhammad. Ubaydullah's faith and respect for the Emir Abdullah Yemeni, also known as Mir Arab, was high. It was his mentor, Mir Arab, who not only provided him with spiritual guidance, but also gave him close advice on public affairs and military matters.

Ubaydullah invited various poets and scholars and held literary talks. According to Zayniddin Wasifi (1486-1566), in February 1514, when Wasifi and his friends were sitting in the Ulugbek madrasa, a khan's official came in and said, "The khan is asking for Mawlana Wasifi." Then, when Zayniddin Wasifi went to Ubaydullah, the khan asked him for a problem and told him not to say his name. Then two problems are read in the name of the khan, and Ubaydullah considers both problems to be nameless. Then another 79 problems are written, 65 of which are considered anonymous by the enlightened ruler. This shows Ubaydullah's quick wit and ingenuity, his mastery of problem solving, and his ability to debate with poets.

He was a great statesman, a skilful politician, a creative ruler, a king and poet Abdullah II, who wrote poems in Uzbek and Persian under the pseudonym "Khan". This Shaybani ruler, like his ancestors, had a warm relationship with poets, representatives of culture and art, and did not withhold his generosity and generosity from them. In his time, scholars and poets had more privileges than anyone else. Many artists have also written poems, poems, works of art, music treatises, and melodies dedicated to Abdullah II.

One day, the poet and literary critic Mutribi Samarkandi will have the honor of meeting Abdullah II at the Khoja Guzor Fauna and Flora Preservation Center in the Aliabad district of Samarkand. The khan then asks him 3 questions in the field of poetry. Mutribi Samarkandi answers all the questions correctly and clearly. Abdullah II was pleased with the poet's knowledge and ingenuity, praised him and rewarded him with a mawut chakman and gold coins.

It should be noted that Abdullah II also had great respect for the people of the sect. He considered Sufis such as Khoja Islam Joybari, Qasim Sheikh Karminagi and Khoja Kalonkhoja as his piri. He listened to their advice in governing the country. He attracted famous scholars of his time, such as Mirzajon Sherozi [12], Poyanda Muhammad Akhsavi, Sadriddin Muhammad Bukhari, to the field of education, that is, to active social life. He appoints them as teachers at a large military madrasa he has built. It sets a sufficient salary for them to live without excessive worries [13].

Historian A.Zamonov in his article "The Price of a Poem" also cites the fact that one of the Shaybani princes was a martyr of poetry and Qasida, which shows that the representatives of the Shaybani dynasty had a positive attitude to science and creativity. [14]. According to this article, the winter of 1512 in Movarounnahr was very severe, which led to a famine. This famine, like that of the entire population of Samarkand, aggravated the plight of madrasa students.

Mawlana Abdulali Balkhi and Zayniddin Wasifi, the students of the madrasah, who are not indifferent to the state of science, are thinking of a way to bring the scholars out of the winter famine: their praise of poetry, qasida, and medieval rulers. He wrote a poem dedicated to the prince of the Shaybanis, Abu Said Sultan (the eldest son of Kochkunchikhan, who was the khan of Movarounnahr at that time. Abu Said sultan was the khan of Movarounnahr in 1530-1533)

and was awarded the prize. a spending plan will be drawn up to support the madrassa students [16].

The two writers wrote a poem dedicated to Sultan Abu Said overnight and brought it to the attention of the sultan, who was currently wintering in Konigil, outside Samarkand. The qasida was written in Persian, but Abu Said, the sultan, did not know Persian well, so his munshi (Imam Khatifi) translated the meaning of the qasida. Satisfied with this, the prince, realizing the real purpose of the mourners, gave them ten fat sheep, twenty man flour (different units of measurement in different periods, one man in Samarkand - about 20-25 kg), a hundred the khan ordered a silver (silver coin) money and four trees for firewood. Thus, the people of the madrasah, which had this supply, spent the winter of 1512 to 1513 as they wished and reached the spring. It is true that this incident means that the prince is not indifferent to the verse, although he praises the praise given to him here, and shows a certain indifference, focusing only on the praisers. It is obvious that not only the rulers, but also the princes supported the scholars, the people of creation, and did not withhold their material and spiritual support from them if they knew they needed help.

DISCUSSION

At the same time, not only the rulers and princes, but also their subordinates supported the people of science and creativity. For example, during the reign of Abdullah II, the servant Kokaldosh highly valued and guided the people of science and literature. He listened to their wishes and delivered them to the khan, helping them to ease their difficulties. From time to time he gathered poets and held poetry readings in the palace. The winners were awarded. [18]

Mirzajon Sherozi, the mentor of the famous philosopher and scholar Yusuf Karabaghi, came to Bukhara with his blessing and kindness. Hafiz Tanish Bukhari writes: "He first came to Balkh province by Sheroz and met with His Holiness through the mediation of Kulbobo Kokaldosh. At that meeting, His Majesty sent him to Bukhara with honors and pleased him with the news that he would become a teacher at his high school. "[19]

According to the scholars, Abdullah ordered Kulbobo Kokaldosh to discuss Surat al-Fath in the presence of this scholar in the palace. This event will be completed as planned. In other words, there will be a very interesting debate between Mirzajan Sherozi and the scholar Sadriddin Muhammad Bukhari on Surat al-Fath. The scholars enjoyed this discussion and felt a sense of satisfaction, and as mentioned above, Mirzajan Sherozi became a teacher at the Abdullah Madrasa. [20]

CONCLUSION

In short, Muhammad Shaybanikhan and the Shaybanid dynasty always supported the scholars, artists and poets, treated them well, and raised their status in society above other categories. He never withheld material support from the people of science and creativity when he realized that their situation was difficult. In this way, they sought to develop science and literature in their country to a certain extent. Nevertheless, science and literature did not flourish during the Shaybanid period as they did during the Timurid period.

PLACEMENT OF PRISONERS OF WAR INTURKESTAN MILITARY CAMPS

Jakhongir Tojiboev*

*Doctoral student,
Namangan State University
UZBEKISTAN

ABSTRACT

This article gives information about the prisoners of war in Turkestan and how the military camps were established to disperse the captives in the region. It also highlights data concerning POWs' living conditions in Turkestan. Most of them were sent to Tashkent. Initially, it was not difficult to place them in military camps. The barracks of the Turkestan Military District (TurkVO) were given to the captives. The Slavs were sent near the border with Kazakhstan, not far from Omsk in south-central Russia. The Hungarians and Germans became prisoners of war in the Siberian camps. The location of the camps also played an important role in the difficult lives of political prisoners.

KEYWORDS: Barracks, Prisoners, Established

INTRODUCTION

In 1914, Austro-Hungarians, Germans, Slavs, and Romanians captured in Russia, by order of the General Staff, began to be resettled in the Urals, Siberia, Turkestan, and the Far East [3]. More than 400 military camps were set up in Russia during World War I [5]. Russia had planned to place prisoners of war only in remote areas far from major cities. They were mainly sent to the areas where the railway lines reached. Because they knew that rail transport would be a great help in placing prisoners of war in military camps. But suddenly, the Russians' plans to relocate the prisoners changed. This, in turn, is due to the growing number of prisoners of war in Russia.

Prisoners of war, initially housed in military camps in Kiev, Penza, Kazan, and Turkestan, were later dispersed to different regions according to their ethnic origin. The Slavs were sent near the border with Kazakhstan, not far from Omsk in south-central Russia. The Hungarians and Germans became prisoners of war in the Siberian camps. The location of the camps also played

an important role in the difficult lives of political prisoners. For example, in Murmansk, in the far northwest of Russia, the situation of soldiers forced to serve in captivity was much worse and sadder than in the southern parts of the empire.

METHODS AND MATERIALS

According to the plan, the territory of Turkestan was not pre-designated for prisoners of war, but, as noted above, the increase in the number of prisoners led to their relocation to the territory of Turkestan. In the telegram No. 6158 of August 30, 1914 of the Chief of the General Staff to the Chief of the General Staff of the Turkestan District, it was announced that Turkestan was designated as a permanent place of detention of prisoners of war [11]. First, as early as September 1914, a stream of prisoners of war was placed in the urban areas of Turkestan.

Initially, it was planned to place about 10,000 prisoners of war in Turkestan. However, by the end of 1914, the number of prisoners of war planned to be placed in Turkestan had grown significantly. As of July 21, 1915, there were about 150,000 people in the Turkestan military district. Prisoners of war from Austria-Hungary and Germany began arriving in Tashkent in September 1914.

More than 50,000 prisoners of war of various nationalities have been relocated to Turkestan since the start of hostilities. Most of them were sent to Tashkent. Initially, it was not difficult to place them in military camps. The barracks of the Turkestan Military District (TurkVO) were given to the captives. Prisoners of war were sometimes forced to move from one camp to another. For example, a prisoner of war named Ferdinand Effenberg was brought to Peremishl on March 22, 1915, and then with other prisoners of war was sent first to Kiev, then to Moscow, in April to Tashkent, in July to Samarkand, and finally to Siberia [13].

By June 1915, the number of prisoners of war in Turkestan exceeded 148,000 [7]. They were placed in 37 specially built military camps, barracks and other places at the disposal of the Turkestan Military District. There was a shortage of space for prisoners of war in camps in the Turkestan military district. The reason was that the number of prisoners of war was increasing day by day. For example, the special zones in Kattakurgan were intended to house only 600 prisoners of war, but in practice doubled the number to 1,200. In Samarkand, the figures were 1,000 instead of 500. Under these circumstances, to solve this problem, two bunk beds were brought and installed in military camps. This event was the only way to accommodate the capacity of the captives mentioned above. About 600 prisoners of war to be housed in the camp at Charjoi were sent to barges in the Amudaryaflotilla. In the Syrdarya region, a university building in Kazalinsk was donated to 100 prisoners of war. Similar cases were reported in Perovsk [6].

According to Sterling, the head of the U.S. mission, in 1915 there were 82,425 Austro-Hungarian and 3,812 German prisoners of war in Turkestan [14]. By March 1916, the number of prisoners of war in the country had reached 200,000 [8]. They outnumbered the population of the cities where they lived. Even the Turkestan government was concerned about the areas where these prisoners of war were being held, because in the event of various riots, of course, the prisoners of war and the local population were a great force together.

In addition to prisoners of war, Austrian-Hungarian and German "civilian prisoners" - Germans, Poles, and other centuries-old tsarist troops - were brought to Turkestan. Refugees evacuated

from the western regions began to appear in Central Asia in June 1915, and by the end of the year there were about 70,000 people. Among them were about 8,000-10,000 Poles and Jews, 1,500 Baltic, and about 4,000 Germans from the Volyn and Kiev regions. Due to the influx of refugees, the Turkestan administration requested their expulsion. Beginning in May 1916, refugees began to be expelled, mainly from the Samara and Saratov regions. The remaining 8,000-10,000 people joined the ranks of Europeans in Turkestan.

Most of the refugees were from Poland, the Baltics and other parts of the empire [8]. It should be noted that in late 1915, the military governor of the Sirdarya region, Lieutenant General A. Galkin, appealed to the Catholic priest Justin Pranaytis to provide asylum for refugees from the church. Pranaytis immediately agreed, and in 1916 he granted them asylum. Initially, 63 refugees took refuge in Kostel's dormitory. They were provided with food, clothing, and other necessities. The refugees were funded by a Roman Catholic charity. Medicines and foodstuffs were also sent by Poland as humanitarian aid. In particular, in the spring of 1916, a special central committee of the Kingdom of Poland sent a group of health and food supplies to help sick refugees in Turkestan[9]. It is clear that the Polish government has not spared any assistance to its citizens, no matter where they are.

According to the Refugee Assistance Committee, as of May 1, 1916, there were 59,400 prisoners of war in Turkestan, up from June 1, 1916. ra 15,900. After the evacuation, which began in late April 1916, there were about 7,000 to 8,000 refugees left in the country [1]. The growing focus on the issue of prisoners of war and refugees in Turkestan, in turn, has worsened the financial situation of the local population, and the process has led to an economic crisis over food and livelihoods.

The reasons for the resettlement of many prisoners of war and refugees in Turkestan include:

- It is too far from the location and as a result there is no possibility of escape;
- The availability and cheapness of food in this country.

All military camps in the Russian Empire are subordinated to the Ministry of Defense under the General Staff (GUGSh). The issue of prisoners of war was initially dealt with by the 7th Division of the Evacuation Department of the GUGSh. By the fall of 1916, the GUGSh had set up a separate evacuation unit for prisoners of war. At the same time, in all military districts, units for the issue of prisoners of war, accountable to the GUGSh, began to be established [2].

The captured military officers, doctors, priests and officials were placed in Tashkent, Perovsk, Kazalinsk, Turkestan, Namangan, Kokand, Samarkand, New Bukhara (Kogon), Jizzakh and Khojand.

The military camps in the Russian Empire differed in function, as in all the countries of the First World War. Prisoners of war were sent to collective, transport, filtration, and labor camps for a period of time. Concentration camps were not set up to carry out fascist extremist activities, as in World War II, but were organized to constantly monitor the movement of prisoners of war. The decision to establish the first concentration camp was made in April 1915 by TurkVO. They planned to house 50,000 prisoners of war in this camp. Initially, two such camps were set up in Troitsk, near Tashkent, for 6,500 prisoners of war and in Samarkand for 3,500 prisoners of war [6].

The tsarist government realized that captives were a valuable resource for the wartime economy. As a result, many prisoners were forced to work on farms and mines, to participate in the construction of canals, and 70,000 were involved in the construction of railways. Many prisoners were killed during the construction of the Murmansk railway. Captives also died of malaria, vitamin C deficiency due to malnutrition and fruit and food malnutrition. The death toll totaled about 25,000. Due to the appeals and pressures of the German and Habsburg governments on the use of the labor of prisoners of war, their forced labor was much more limited.

There was a "class stratification" of prisoners in the Habib camps. Captive military officers were required by Article 190, Chapter II, Section 17 of the 1907 Hague Convention [15], to receive the same salary as soldiers received during their service in their home country during captivity. As a result, military officers received a salary of 50 to 75 rubles a month [12]. However, the remaining 1,500,000 non-commissioned officers were not paid a single salary. However, after the events of February 1917, prisoners of war were officially recruited and paid a monthly salary.

In the spring of 1915, the TurkVO command began building new camps using the labor of prisoners of war. These camps were set up along the railway line in major cities such as Kazalinsk, Perovsk, Turkestan, Chernyaev, Avliya-Ota, Khojand, Kattakurgan, Namangan, and Kokand. As construction continued, the prisoners lived in camps. The total capacity of all barracks (old and new camps) was eventually increased to 200,000 [8].

In mid-1915, prisoners of war from Turkestan were sent to work in Russia's European territory. A total of 68,000 people were evacuated, eliminating the issue of overcrowding. It should be noted that in Turkestan, as well as in the neighboring Emirate of Bukhara, the labor of prisoners of war was actively used. Thus, 138 people worked in private individuals, in the Zemstvo and municipal institutions - 551, in the military unit (on the territory of TurkVO) - 765; in the Ministry of Railways (within TurkVO) - 288; in trade enterprises - 272; in the institutions of the Ministry of Agriculture and Land Management - 209 people worked [8].

In the process of registering prisoners, Russian military officials first registered them based on which of their hostile armies and religions they belonged to. Therefore, it was very difficult to create a clear national composition of prisoners in Turkestan. For example, the national composition of the prisoners of war of the Habsburg monarchy was as diverse as the empire itself. According to the data, during the First World War, 25% of the Austrian-Hungarian armed forces were Austrians and Germans, 23% - Hungarians, 13% - Czechs, 4% - Slovaks, 9% - Serbs and Croats, 2% - Slovenians, 3% - Ukrainians, 7% - Romanians and 1% - Italians who served in the military and participated in World War I [4].

The principle of national and civilian placement of prisoners was established at the beginning of the war and was of great national importance. From 1914 to 1915, the camps in Turkestan were "mixed", meaning that they had different nationalities. Researchers have reported that since 1916, there has been a practice of division in national camps. Thus, while the camps in Tashkent were predominantly Slavic (Croatians, Slovenians, Czechs, etc.), the Germans, Austrians, and Hungarians settled in Skobelev and Fergana. If the camps were of a mixed type, the Slavs were appointed to senior positions in the internal administration of the prisoners [13].

Many citizens of the Habsburg monarchy were taken prisoner of war in 1914 (at the Battle of Galicia) or in 1916 (Brusilovsky's victory). Some were arrested while injured, others surrendered voluntarily. Each prisoner's biography is unique. In particular, these are autobiographies of

subgroups (mostly Slavs) called "friendly nations." Attitudes toward the Slavs were friendly until the Russian Revolution of 1917. Not surprisingly, they were closer to the Russians than the captured officers. In addition, the captives of the lower classes of the Slavs had more opportunities to establish human relations with the common people.

In 1915, a branch of the Union of Czech and Slovak Societies of Russian Societies was opened in Tashkent. It was soon transformed into a representative office of the Czech-Slovak National Council and operated for several years. As of January 15, 1917, there were 10,489 registered soldiers and 617 officers of West Slavic descent in Turkestan.

CONCLUSION

Thus, the issue of prisoners of war during the First World War was a process that lasted for 8 years on the Eastern Front, from August 1914 to the summer of 1922 until the release of the last group of prisoners of war from Vladivostok. Many prisoners of war spent 3-4 years of their lives in captivity in various parts of Russia from 1918-1919 until their release. Of the estimated 8.5 million prisoners of war, about 750,000 were reported to have died in military camps. About 430,000 Austro-Hungarian, German, and Turkish prisoners of war were resettled in Siberia and Turkestan during the Civil War [12], and were forced to link their lives with these countries until their return to their homeland in 1921-1922.

UZBEKISTAN

ABSTRACT

This article has focused on the importance of communicative tasks for young learners in teaching grammar indirectly through grammar tasks, activities and games as well as on recommendations on how to design these tasks. Teaching grammar and designing communicative tasks or activities play an important role in language teaching process for young learners. Thus this paper also pointed out beneficial results of children's attitudes and motivation toward communicative tasks for teaching grammar in language learning.

KEYWORDS: *Communication, Activity, Design, Young Learners, Grammar, Children's Capacity, Task, Creative*

INTRODUCTION

Learning a language is something that should be done naturally. Children learn to use their first language to communicate with people around them. They do not need any stationery to learn the language. But when they learn other or foreign language, they have such a kind of difficulty like: many things needed as learning media. This means that the process of learning a particular language should be as natural as possible to achieve the purpose: to communicate receptively. As well as adults, children even spend more than 45% of communication to listen. This can be a starting consideration for teachers that the beginning activities should make the children listen and become interested in the English. Naturally, they will try to recognize

the meaning and also the pattern. In recognizing the pattern, there will be an automatic process of grammar realization related to form and meaning of some particular expressions stated by the teacher. Children's language learning stages consist the things in which they should experience based on their psychological development. Playful stage is one of the characteristics of their life activities that cannot be ignored, especially in foreign language learning.

The communicative grammar tasks or activities designed for the present research work were created as production tasks. As the designers, we exercised a certain control over the language to be used, in order to make the targeted grammatical structures, if not essential, at least useful. In addition, they were designed as communicative tasks, so that there is place for negotiation and provision of feedback.

MATERIALS AND METHODS

Grammar is helpful for effective language learning. It can be taught through different methods of second language teaching. Although the principles are different from one another, there is always a focus on grammar, whether explicit or implicit. [9:p.12-88]

In 1622 a certain Joseph Webbe, schoolmaster and textbook writer, wrote:

'No man can run speedily to the mark of language that is shackled... with grammar precepts.' He maintained that grammar could be picked up through simply communicating: 'by exercise of reading, writing, and speaking ... all things belonging to Grammar, will without labor, and whether we will or no, thrust themselves upon us.'

The important grammar purpose is to make a meaningful communication. When the students communicate meaningfully, it means that they already use correct and appropriate grammar. The performance of forming children's good communication can include the combinations of their social skill, skill of thinking critically, physical activities, and creativity. This valuable combination can make a complete set of learning activities in which the purpose is to make the students "busy" of doing their "games", however they are learning something out of their consciousness.

These activities can be adapted and modified according to the language level, the number and the needs of the students. The suggested activities and procedures can be carried out with different topics or grammar items as well. The presented activities exploit the children's capacity for interaction and talk; they build on their capacity and need for movement and play.

•Animal description

The teacher draws the following chart on the board.

Animal	Size	Colour	Touch
frog	small	green	cool
elephant	long	black	wet
fish	big	brown	hard
snake	short	grey, gold, blue	smooth

Children choose an animal from the given list and they are asked to describe the selected animal by combining the characteristic features in the above chart. The teacher demonstrates the activity by providing an example.

E.g. The frog. It is small. It is green and smooth.

After children have written their definitions, they read it to the rest of the class and the others have to find out which animal they are reading about.

The above list can be extended by several other animals and also by abilities of animals e.g. what the animal can do (e.g. jump, run fast, climb trees, etc.)

•Animal movements

Each student chooses an animal and an activity or movement that the animal can do. E.g. I am a fish and I can swim. I am a monkey and I can climb trees. I am a lion and I can run fast. I am a dog and I can bark. I am a cat and I can catch mice. I am a bear and I can eat a lot of honey. etc. The teacher helps learners choose animals and form correct sentences. As soon as everyone has it correct, learners stand in a circle and the first student says or reads his or her sentence aloud. The student next to him repeats, e.g. You are a fish and you can swim. I am a monkey and I can climb trees. The third student repeats the previous two sentences and adds his or her own. In large classes, students should be divided into two circles. An alternative of the activity can be that instead of saying You are a fish and you can swim, children say: He is a fish and he can swim. In this case children have to pay attention to using the right personal pronoun he/she.

Fruit salad

Children are sitting in a circle with no spare chairs. The teacher stands in the middle of the circle and assigns a fruit to each child going round the circle, e.g. apple, strawberry, banana, peach. Children are asked to remember their fruit. Then the teacher says one fruit, e.g. banana, all the children assigned the name banana have to stand up and change chairs immediately.

When the teacher says Fruit salad!, everyone should change chairs. The teacher plays a few rounds until the children get familiar with the game, and then sits down on one chair while the children are changing chairs so that one child remains in the middle of the circle and takes over as the leader and the game starts again.

This game can be used for practicing specific vocabulary and does not necessarily need to be limited to fruit names only. Any lexical set e.g. animals, food, vehicles, etc. can be used as an alternative. In case the teacher uses another lexical set, an alternative instruction to Fruit salad should be used, e.g. if the game is based on wild animals, the teacher can say Safari, if the game is based on food, the instruction could be Dinner time.

Grab the word and run

Students work in groups of three or four, each group occupying one corner or part of the classroom. In the middle of the class, there are different words placed on a desk or a chair, each written on a piece of paper. Every group gets a particular category of words and must get those words that fit into the category, certain words fit into more categories, so the group that is the most skilful gets them. Each student can go to the desk and grab only one word. Then, another

student takes over. The activity involves word distribution and can be used for both revising and introducing new parts of speech.

The categories can be: adverbs (e.g. cloudy, sunny, windy, foggy, hot, warm, etc.), adjectives (e.g. hot, warm, fat, slim, tall, short, tired, happy, sad, etc.), ing forms s (e.g. swimming, windsurfing, playing football, running, playing golf, etc.) or nouns p(e.g. head, hair, season, weather arm, leg, neck, hand, eyes, etc.).

Listening

Children get the text of the song **Twinkle, Twinkle Little Star!** (prepared and printed in advance)

Learners listen to the song and answer the following questions:

1. What is a Karakalpak for Little Star?
2. What is twinkling referred to?
3. What about the song?
4. Let's sing a song together

Sentence scramble

Children work in pairs or groups of three. Each pair/group receives a numbered envelope containing word cards. Children work with their partners and arrange the cards from the envelope on their desk to make a sentence. Each group receives a different set of words.

Possible sentences:

If it rains tomorrow, I will stay at home.

I went to play football with my friends yesterday afternoon.

Look at those clouds, it is going to rain.

We were having dinner when the taxi arrived.

I usually go to school by bus at 7 o'clock.

Toys

Students work in pairs, where one of them gets worksheet A and the other worksheet B. For this activity, the structure of 'has got' and 'have got' must be pre-taught. Students take turns and ask questions from their partner in order to complete the chart, e.g. Student A: Has Anvar got a ball? Student B: Yes, he has. Student A: Has Barno got a balloon? Student B: No, she hasn't.

In order to gather quantitative data, we developed a questionnaire with a total of 10 questions. The questionnaire consisted of 2 sections. The first section of the questionnaire included five motivation related questions with multichoice format. The main aim was to measure learners likes, dislikes toward communicative grammar tasks, and their reason to learn English. In the third section, the remaining ten attitude-related questions made use of a four point Likert style. The items in this section aimed to measure young learners' views regarding their English class communicative grammar tasks teaching inductively, their English book, their English teacher, their parents' views about kids' learning English, and learning English in general. This Likert-type range was specifically designed for this age

group including 'yes', 'a little', 'no', and 'I don't know'. The format of the paper was made suitable for the age group as well supported by several different colorful pictures. In order to attract young learners' attention, rather than just marking, they were required to paint the boxes or smiles suitable for them. Students' classroom teachers and their English teachers were consulted during the questionnaire development process as well. All the questions were written in Karakalpak. The questions used in the personal interviews were similar to the items in the questionnaire. However, compared to the questionnaire data, it was possible to elaborate the answers to get deeper understandings of the young participants.

The quantitative data were gathered with the help of two different teachers responsible for teaching English in participants' classes. Kids were instructed to color smiles for their answers.. Quantitative data were analyzed using descriptive statistics . Three flows of activities were followed for the analysis of the qualitative data: data reduction, data display, and conclusion drawing/verification¹ .

RESULTS AND DISCUSSION

TABLE 1 DESCRIPTIVE STATISTICS OF YOUNG LEARNERS' ATTITUDES TOWARD LEARNING ENGLISH BY COMMUNICATIVE TASKS

Expressions	Yes		A little		No		I don't know	
	%	F	%	F	%	f	%	F
1. I would like to continue learning English.	87.5	35	8.9	3	3.6	2	0	0
2. It is fun to learn English by communicative tasks such as games and singing songs	84.4	33	12.0	4	2.6	2	1.0	1
3. My parents say that learning English is important.	82.4	33	10.9	3	2.6	2	2.6	2
4. I like my English teacher	82.0	32	6.3	2	9.9	3	9.5	3
5. Our English book is fun.	80.2		13.5		3.6		1.0	
6. My parents are happy that I learn English.	79.7		11.5		4.7		4.2	
7. I like English.	79.6		16.2		3.7		5	
8. I'm looking forward to English classes.	73.4		15.1		9.9		1.6	
9. I am good at English.	56.8		35.9		6.3		1	
10. English is easy to learn.	42.9		47.6		9.4		0	0

Firstly, it was obvious that young learners had quite positive attitudes toward learning English by communicative tasks such as games and singing songs. Over 85% of these learners wanted to continue learning it and they found it fun to learn English by communicative tasks in a friendly

atmosphere. Concerning the wish to continue learning English, F8 stated that: 'yes, I want to continue learning English, because I want to be an English teacher.' It was also obvious that learners' parents supported them in having positive attitudes because they were both pleased that their kids learned English and they explicitly stated that learning English was important for young learners. Except for 10% of the participants, all young learners liked their English teachers and for most of them their English book was fun. Regarding young learners' perceptions of English language learning and instruction, they had various ideas. To start with, when this research was conducted, learners could sing the song of alphabet, introduce themselves, meet someone, and say colors and numbers with their current English knowledge.

CONCLUSION

Teaching a foreign language to young learners is one of the most demanding, yet at the same time most challenging and rewarding tasks. The teacher needs to be a highly skilled professional who has to combine theoretical assumptions and background with practical experiences and the practical needs and circumstances of the foreign language classroom. The main aim of this work was designing communicative tasks or activities and to introduce and discuss theoretical assumptions and key issues that directly relate to foreign language teaching to young learners and to provide several strategies, techniques and concrete applicable activities for the practice of teaching young learners based on this theoretical background. Wherever possible, we have included concrete practical examples, tips and guidelines to illustrate and support our point.

IMPROVING THE METHODOLOGICAL TRAINING OF FUTURE PRIMARY SCHOOL TEACHERS USING THE EXAMPLE OF GEOMETRY

Azamova Muxtarovna Barno*

*Teacher of Namangan state university,
UZBEKISTAN

ABSTRACT

The modernization of education in Uzbekistan actualizes the problem of training a teacher who knows the methodology of an integral pedagogical process, its laws and contradictions. This presupposes the development of a teacher, in particular of an elementary school teacher, of a methodological culture (MC) in the process of geometric preparation for professional activity.

KEYWORDS: *Methodological Culture, Geometric Transformation, Geometric Information, Polyhedral, Geometric Content, Visual Geometric*

INTRODUCTION

In the conducted theoretical and experimental research, an effective technology of geometric training of a future primary school teacher, focused on the development of his MC, was revealed and tested. The conceptual basis of this technology consists in disclosing the methods used to study the geometric properties of figures, highlighting the affine, metric and topological properties of figures, disclosing the main elements, creating conditions for the development of MC in a future elementary school mathematics teacher.

The methodological basis of the technology is formed by the systemic, integrative, personal and functional-activity approaches.

The content of the technology includes an educational and professional program in geometry. The program includes the following sections: movements, similarities and affine transformations of space and plane; polyhedra; convex polyhedra and their properties; regular, semi-regular and star-shaped polyhedra, modeling of polyhedra; symmetry of polyhedra; crystals are natural polyhedrons.

The fixing manifestations of MC components in relation to geometric transformations (GT) in future teachers are: the ability to operate with a generalized approach to studying specific types of movements, similarities, affine transformations; possession of generalized techniques for solving geometric problems by the GT method; possession of the technology of teaching elementary school students to the practical use of GT; understanding of the methodology for constructing technologies for teaching students to solve problems of practical content using GT.

The peculiarity of the program is that the GT planes are studied in connection with the GT space.

The pedagogical experiment showed that the developed technology is focused on the development of MC in the subjects of the educational process.

Geometric preparation of students should be aimed at mastering geometric material in such a way that the acquired knowledge is effective and personally significant. The first is connected with the possibilities of their use in various, including educational, situations, the second - with their meaningfulness.

The means of such assimilation of knowledge is the work of understanding. The essence of understanding lies in the cognitive interaction of the system of our knowledge, experience and incoming information, the assessment of its significance for the subject.

This interaction can be carried out in the process of solving geometric problems by students. In this case, the tasks should perform the following functions:

- be a means of assimilation of different levels of activity - practical and theoretical - at the stages of analysis of the condition, search for a solution, justification, research;
- be a means of forming the ability to translate from one language describing reality to another (in the process of working on a task, texts describing geometric figures are reformulated or converted into texts describing real objects, and vice versa; translation into different "languages", the role of which is played by methods - analytical, vector, etc.);
- be a means of realizing the relationship of subject and methodological training (work on the task includes consideration of objects and situations described in the task from the point of view of their use in teaching younger students, in particular, reformulation or transformation of the conditions of tasks with the aim of using them in elementary course in mathematics).

The implementation of the named functions of geometric problems in the process of teaching students is aimed at creating an understanding of geometric objects by students, and therefore can improve the quality of professional training of future primary school teachers [7].

The emergence of a unified geometry course based on set theory in the mathematical specialties of pedagogical universities in the early 1970s was undoubtedly a progressive phenomenon. Substantial generalizations on a set-theoretical basis and the formalization of expressive means caused by them made it possible to create a new generation of university geometry textbooks. One of the distinguishing characteristics of these textbooks is the combination of geometric content that is largely traditional for pedagogical universities and new forms of its presentation. The past thirty years have convincingly shown which of the methodological findings and acquisitions really turned out to be valuable, which look dubious. The time has long come for rethinking and reassessing values, universities have long been waiting for the next generation of textbooks. I would like to hope that in them we will meet with the "denial of negation"[8].

As the practice of organizing independent work of students with educational literature shows, one of the dubious acquisitions is the abundance of analytical definitions found in it. We will give only one example - the presentation of the theory of curves in the textbook by L.S. Atanasyan and V.T. Bazyleva. The fundamental concepts of the theory “curvature” and “torsion” are defined as follows. “The vector $n = d\tau / ds$ is called the curvature vector of the line γ at the point M, and its length $|n| = k$ is the curvature of the line γ at this point”. The number v in the formula $d\beta / ds = -vv$ is called the torsion of the line γ at point M “. Despite the fact that in the future the geometric meaning of the introduced concepts is revealed, this does not give the effect that the use of genetic definitions of the named concepts gives. There is no description in the textbook of where the names of the coordinate planes of the Freinet frame came from. The fact that such an approach makes it possible to significantly “squeeze” the presentation cannot be a serious justification. We must not forget that genetic definitions clearly indicate the way of formation (or the way of origin) of the concept being defined, and this is undoubtedly more valuable for a future teacher. With this approach, geometry breaks away from its visual geometric fundamental principle[9].

At the same time, the experience of teaching a unified geometry course convincingly shows that the new level of formalization can be perfectly combined with the original content depth of the material being studied[10].

For a long time, geometry was considered synonymous with mathematics. Recently, geometry in school teaching has been losing ground. It is more and more difficult for the teacher to introduce students to geometry, to arouse interest in it, to teach them to perceive the space in which the student lives, to explore it[11].

In order for students to form clear geometric ideas, it is necessary to begin the study of geometry as early as possible. In elementary grades, students get an idea of some geometric objects (point, segment, line, polygon, etc.). Gradually clarifying and expanding ideas about them, improving the skills and abilities of working with geometric material, during the first four years, students receive a stock of geometric representations, which allows them to start studying a systematic geometry course from the 5th grade[12].

Geometers and methodologists of the Department of Algebra and Geometry of the Kolomna Pedagogical Institute, with the active participation of teachers from some schools in the city, have created a geometry program for grades 5-6. The unifying principle here is the formation of the initial and at the same time fundamental ideas about geometric transformations. The figure is represented as a set of points, although this is not explicitly stated. In the learning process, geometric abstractions are developed, and students receive geometric knowledge based on logical conclusions, and not only through specific observations.

Geometric information is repeated from class to class with some changes, meaningful enrichment occurs, an increase in the volume of geometric information. This gives the teaching of geometry an educational character. The formation of skills and abilities in operating with geometric objects depends on the content of the material provided for assimilation and the tools that students should use.

One of the main goals of modern education is the formation of a comprehensively developed personality. Geometry, connecting logical and imaginative thinking, plays an important role in this. However, for example, the reduction of hours for subjects in the physics and mathematics

cycle is the reason for insufficient attention to geometry in the mathematics course for 5-6 grades. Teaching individual courses in planimetry and stereometric sometimes causes problems in the formation of spatial representations among students. One of the possible ways to correct these shortcomings is to use the opportunities of additional education.

For example, to organize a mathematical circle for the study of geometric material in grades 5-6. In the classroom of such a circle, students: get acquainted with the basic geometric shapes, including stereometric ones; solve geometric problems "for cutting" and folding; learn to use geometric instruments (ruler, protractor, compass), perform constructions with their help. Tasks and theoretical material should be entertaining, contribute to the development of certain qualities of thinking. This age is very favorable for the development of "smart hands". The development of not only individual thought processes, but also the entire intellect of a developing personality depends on the characteristics of manual labor. The use of modeling in circle classes contributes to the formation and development of abilities: to perform logical operations of analysis and synthesis, predict the result, make its assessment and check its correctness.

Thus, in the circle classes, solid knowledge of the simplest geometric shapes, some of their properties (for example, symmetry), visual and graphic skills, methods of constructive activity are formed; develop: spatial imagination, geometric intuition and creativity.

ABSTRACT

The fairy tale, which is the leading genre of Korean folklore, is the most valuable monument of the spiritual and poetic culture of the Korean people and is of great educational value. The fairy tale has long been loved by the people. In the recent past, it was a fairy tale that nourished the spiritual culture of ordinary Koreans.

KEYWORDS: *Fairy Tales, Tales, Fables, Once Upon A Time, Storyteller, Devil, Hero, Enmal, Eniyagi, Laborer – Mosymkun, Commoner – Chongmin.*

INTRODUCTION

Located at the very edge of East Asia, Korea is renowned for its amazing beauty and diversity of nature. It is no coincidence that its inhabitants called their country so poetically: Choson - the land of morning fresh. A talented and hardworking people live here. Working for thousands of years on the land mastered by the Chosong ancestors, the Korean people have created a rich, distinctive culture. An integral part of this culture is oral folk art: fairy tales, traditions, legends, myths, proverbs, sayings and songs marked with the seal of wisdom.

On summer sultry evenings, old storytellers - Iyagikuns told fairy tales to children. More than one generation of Korean children listened with delight about miracles and wizards, about the cunning tricks of devils - tokkebi, about the spirits of deceased ancestors and relatives. In the rare hours of rest, adults also listened to iyagikunu, sitting in a shabby shack on a reed mat laid over a warm cana-ondori, on a blizzard winter night, when a cold, piercing wind raged behind a paper-covered window, or on a hot afternoon, perched in the shade of weeping willows in the rice field. Adults, like children, believed in the almighty hero - zhangsu, who is able to save them from the earthly hardships and oppression of the yangbans. They believed in a "happy" grave, for which they were looking for and could not find a single place on the "only" happy mountain. As a

reward for the search, they expected happiness and blessings from their grateful ancestors, who had long gone to chosin - another world. They also believed in prophetic dreams, in which the hero appears as a seer in the guise of a gray-bearded old man-hermit, a Taoist giving wise advice, or in the guise of a heavenly fairy - a dream that tells how to find happiness. But in real life, everything was completely different: the desired happiness did not come, life took revenge on naive people for their gullibility, mercilessly crushing ghostly hopes.

Fairy tale has always been a favorite form of oral creativity among Koreans. Some call it "enmal" - a word about antiquity, others - "enniyagi" - a story about antiquity. The roots of the Korean fairy tale go back to the hoary antiquity, and it originated somewhere at the dawn of the emergence of Korean culture. It is as difficult to determine the exact time of its appearance as it is impossible to imagine when it was: "in ancient times ...", "when the tiger was still smoking a pipe, and the buffalo spoke in human language ..." the imprint of the earliest era in the history of the emergence of Korean society. In a peculiar form, inherent only in fairy tales, they reflected the way of thinking of primitive people, their naive and sometimes distorted ideas about the world around them, the origins of customs and beliefs. It is here that the roots of many elements of fairytale fiction are hidden, images and plots widely known in Korean folklore originate from here. Korean fairy tales are an invaluable source for studying the way of life, customs, traditions and customs of the country, "for the fairy tales of any nation bear the imprint of the spirit of the people" [1]. Like the folklore of other peoples, Korean fairy tales are organically linked to real life. To a greater extent, fairy tales embody the realities of the subsequent stages of development of the feudal world with its characteristic social attributes and collisions. Thus, in the artistic form, the fairy tales reflected the characteristic features of the Korean people at different stages of its history.

Over the centuries, a natural selection of folklore material took place: subjects and style were polished. The memory of the people retained only what the soul of the people lived with, its aspirations. This is how the Russian writer and the first collector of Korean folklore N. Garin-Mikhailovsky wrote about the intrinsic value of Korean fairy tales: not only nature, but also the life-loving Koreans themselves, are fabulous, according to N. Garin- Mikhailovsky. The poetry of a fairy tale has so merged with life itself that both the fairy tale and the life of the Korean are inseparable.

"You become infected with their mood: life for them is the same fairy tale, and everything here is fabulous, and poetic, and terribly fabulous. And nature is the same" [*]. Shocked by the impression that one Korean storyteller made on him, the writer notes: "It seems ... some kind of dream, charm, in which we all were suddenly transported into the unknown depths of the rushed millennia" [2].

This collection presents the main genres of Korean oral prose. They are arranged in the traditional order of myths and legends, fairy tales, everyday tales, animal tales, folk anecdotes about the cunning and clever Kim Son Dal,

The legends, legends and myths included in the book are widespread in Korea both in the oral performance of storytellers and in the records of historical works "SamgukSagi" ("Historical Records of Three States", 1145) by Kim Busik, later chronicles of "Kore sa" ("History of Korea", 1454).

Korean legends and myths have a close connection with fairy tales; sometimes it is even difficult to determine where the legend ends and the fairy tale begins. And the fabulous plot is difficult to separate from the real history of the country. That is why there are many stories in Korean folklore about the ancestors, the founders of the ancient Korean states of Joseon, Kogur, Silla ("The Li Dynasty", "The Second Legend of the Dynasty Reigning in Korea", "The Legend of Tang Gong," which is the founder of Ancient Joseon). The mythical characters are presented as semi-historical-semi-legendary rulers or heroes of Korea.

The traditional hero of Korean fairy tales is often the sage magician Henin in the form of a gray-bearded old man. This image is probably inspired by the patriarchal-Confucian veneration of old age.

There are many tales where the character is a monk. The Korean monk bears little resemblance to his Russian counterpart. He is not attached to the temple, but walks through the villages, collecting alms, doing good, punishing evil ("Temple on Mount Baekjoksan", "How Seoul Became the Capital").

The age-old dream of the Korean people was embodied in the image of a hero - zhangsu, capable of performing miracles, making people happy ("Bloody Tears of a Hero", "Lake of a Bogatyr").

Among Koreans, as well as other peoples of the world, tales about a stepdaughter and an evil stepmother are very popular ("How Yonnie Escaped From Her Stepmother", "Rose and Lotus"). "The story of the virtuous Khonchi and the wicked stepmother and her daughter Phatchi" is notable for its realism: the heroine, Khonchi, loses not a gold, but a cloth shoe, fording a river, and marries not a prince, but a provincial governor[14].

And here is another, also very common story about two brothers: the elder and the younger, rich and poor, evil and good ("The Tale of the Soothsayer and His Three Sons"). The most famous is the tale of the malevolent elder brother Nolbu and younger brother Hinbu[15]. In Korea, where strict Confucian ethical norms have prevailed for a long time, requiring unquestioning respect for the elder in the family, the conflict between the younger and the elder acquires particular acuteness. In fairy tales of this kind, the younger brother is humiliated by the elder in every possible way, deprives him of the inheritance, or even kicks him out of the house[16]. The younger brother is in poverty, but suddenly a miracle happens - the diligence, honesty, meekness of the younger brother are rewarded. The stories of such fairy tales are very popular among Koreans. And therefore, at the mere mention of the name of the heroes of the tale, visible images appear in the mind of a Korean. Any Korean understands the meaning of the phrase, an allegory like: "Neighbor Kim is true Nolbu, and Pak is Heungbu." These and similar names have become common nouns[17].

The favorite hero of Koreans is a fisherman, in whose image the generosity of the soul of a simple Korean is embodied. He usually releases the fish caught by him to the wild, which in reality turns out to be the son of the king of the sea[18]. A young fisherman finds himself in the underwater kingdom and is rewarded for his kindness. Another hero of fairy tales is a poor lumberjack ("The Lumberjack and His Son"), who makes his living by collecting brushwood and selling it to the rich. The woodcutter goes to the mountains for brushwood, and miraculous events take place there, which form the basis of a whole cycle of fairy tales ("Fairies from the Diamond Mountains", "The Legend of the Cheonnyu Rock", "How the young man Moon Hyesong got the root of life")[19].

The hero of fairy tales is often a simple youth without any specific name. The action in these tales takes place not in the ghostly "thirtieth kingdom of the thirtieth state", but in some province, district of Korea, and the scene of the action is described very accurately, which aims to give the tale as much authenticity as possible[20].

The richest idea about life and aspirations, about the joys and sorrows of the Korean people, about their way of life and traditions are given by everyday tales. The heroes of everyday fairy tales are, as a rule, ordinary people[21]. They achieve success not with the help of sages or heavenly fairies, but thanks to hard work, intelligence, ingenuity, dexterity. Most often these are peasants or farm laborers - mosymkun or commoners - chongmin. The tales of this cycle sparkle with humor, they ridicule such human vices as stupidity, greed and envy. The plot is usually built on a disagreement between the hero and his ill-wishers. The poor man who is downtrodden and oppressed in life is completely transformed in a fairy tale and emerges victorious in a kind of duel ("A grain of millet", "The son of a butcher", "A tale about a dog, a miracle tree and a hunting horn")[22].

The hero of many everyday fairy tales is the noble Yangban ("Yangban full of coins", "How the Yangban saved a girl with friends"). But it is necessary to emphasize the originality of the Korean yangban. If in European fairy tales the "poorest" landowner had land, an estate, a servant, then the yangban in old Korea was often naked like a falcon[23]. Many representatives of the Yangban estate vegetated in want and even beggarly. The Yangbans often fed off their wealthy relatives while living in their home. Chasing the yangban was not allowed by strict kinship laws. In Korea, such impoverished yangbans were called mungeks, or hangers-on. In a number of tales, the arrogance and arrogance of the Mungek-Yanban are caustically ridiculed[24].

In old Korea, scholarship inaccessible to the common people was highly revered. A person who learned a thousand or two hieroglyphs and read several Confucian books was considered an educated scientist. The Confucian scientist in Korean fairy tales is a peculiar figure. Confucian teaching, which came from China, was elevated in Korea to the rank of state ethical and religious norm. Knowledge of Confucian dogmas was necessary to pass exams and enter an official position[25]. All the education of such "scientists" was reduced to the canonical books memorized by heart in the ancient Chinese language. Usually these "scientists" were poorly versed in the simplest life questions. It is not for nothing that the people said about them: "A Confucian scientist, but he cannot draw up a receipt for the payment of tax on a bull." Koreans have put together many tales about such would-be scholars, where their ignorance and complete ignorance of real life is ridiculed ("The cunning farm laborer Tolsve", "How the sunbi deceived a monk", "How a young man outwitted the minister")[26].

A curious feature of Korean groom tales is that the hero wants to marry not a young girl, but a young widow. Confucian morality preached the wife's reckless loyalty to the memory of her deceased husband ("The Widow's Fortress in Sunchkhan County", "To Mi and His Wife"). Even the bride was not supposed to marry another if the groom chosen by her parents died. And so the fairytale hero, in spite of the Confucian prohibitions, takes care of the widow ("Profitable Turnover"). This probably expressed a kind of protest against the disenfranchised position of women in old Korea[28].

Korean animal tales have a lot in common with other peoples' tales. Only the animals are acting in them. So, the place of the wolf in Korean fairy tales is taken by the tiger. In the eyes of

Koreans, the tiger not only symbolized strength and power, but was also the object of superstitious worship. It is no coincidence that in the old days his image was adorned with military banners and banners ("White-Eared Tiger", "Monk-Tiger", "Tiger Hunters"). But at the same time, the tiger is a sorcerer and wizard ("The Tiger and the Pipe", "The Beautiful Tigress") [29].

The deer is invariably present in animal tales. Folk fantasy associates him with heavenly fairies ("The Deer and the Snake", "How the Girl Saved the Deer"). The deer often helps the heroes as a token of gratitude for saving them from imminent death. The motive of gratitude is especially common in Korean fairy tales. The role of grateful animals is also played by a dog ("How a puppy saved the owner"), a pheasant ("A grateful pheasant") and a toad ("How a toad overpowered a cruel snake") [30].

An important influence on the formation of the image of an animal - a character in Korean fairy tales, apparently, was exerted by the existence of a belief among Koreans that if an animal lives for a hundred years, it changes the color of its fur and becomes white, and after living for a thousand years, it becomes black. Such long-lived animals are considered werewolves, capable of assuming human form. That is why Koreans have so many tales of centennial tigers, millennial werewolf foxes [31].

In the folklore of the peoples of the East, there are many fairy tales united by a single hero - the defender of ordinary people [32]. For some it is Khoja Nasreddin, for others it is Aldar Kose. For Koreans, such a hero is Kim Sung Dal. A defender of the disadvantaged, a merry fellow, a master at clever tricks, sharp-tongued, Kim Son Dal is inexhaustible on fantasies and tricks in order to teach a lesson to a swaggering, arrogant and stupid rich or stingy man. The collection presents a cycle of stories "How Kim Sung Dal sold the Taedong River".

THEORETICAL AND METHODOLOGICAL BASIS OF ATTRACTING FOREIGN INVESTMENT TO THE NATIONAL ECONOMY

Gulchehra Narzullayeva*

*Lecturer,
Bukhara State University, Bukhara,
UZBEKISTAN

ABSTRACT

The article highlights the objective role of foreign investment in ensuring economic development in modern conditions. The types of foreign investments and the peculiarities of their attraction are described. The article also outlines the priorities for economic development by attracting foreign investment.

KEYWORDS: *National Economy, Development, Investment, Foreign Investment, Capital, Competitiveness, Investment Policy, Investment Climate.*

INTRODUCTION

Reliable legal protection and guarantees are provided for foreign investors for attraction of foreign direct investment in the implementation of programs to further improve the investment climate in the country, modernization, technical re-equipment and reconstruction of production, creation of new jobs in the regions of the country with surplus labor force. In addition, investments are used as a regulatory tool to ensure the priorities and strategic objectives of sustainable development of certain sectors and regions of the economy.

An important factor in the development of the country's economy is the investment in it and its effectiveness, which is mentioned in a number of textbooks and sources published by domestic and foreign economists. It should be noted that today investment is one of the most talked issues. This is because investment, especially the inflow of foreign investment into the country's economy and thus the development of sectors of the economy, is becoming one of the most pressing issues today. It is noteworthy that the direction in which investments are directed, determines its development, as well as the timely elimination of a number of problems that hinder the development of the country. Investment (Latin: investio-wrapping) is a long-term investment in various sectors, socio-economic programs, innovations, business projects in the

country or abroad for the development of the economy. Traditionally, an investment is the implementation of specific economic projects in order to generate future income. Such an approach to describing the nature of investment is the primary focus of national as well as foreign economic literature. It should be noted that many economists have conducted research on the content of foreign investment. Theoretical view of local economist, D. Gozibekov about foreign investment is the following: "Foreign investment is the binding of the capital of one economic entity to another economy for a certain period of time, differing from domestic investment in the breadth of risks, characterized by changes in the legal environment, the investment climate, resulting in capital movements across countries and regions". From these considerations, it can be concluded that foreign investment is capital that moves from one country's economy to another's economy, which differs from domestic investment in the breadth of its risks. He added that "while foreign investment is a necessary and important source of external financing for countries, it also includes a lot of tangible and intangible assets, various technological, information, financial flows, management skills, work in world markets, experiences and more. They are characterized by cross-border movement, ie migration, change of legal conditions of operation, confrontation with additional risks and specific goals". N. Kuzieva, Uzbek economist in her scientific works states that: "Foreign countries exporting capital for the purpose of future profit, legal entities and individuals to the countries receiving capital in various forms of wealth (migration, real estate, intellectual property, etc.) and income from them (profits, interest, dividends, license and commission fees, royalties, maintenance and other rewards) are called foreign investments. 10 She thoughts, the classification of foreign investments on the basis of various characteristics further clarifies their economic nature.

One of the economists, K. Khoshimov, in his research work described foreign investment as: "Foreign investment - all that foreign owners mobilize a certain amount of capital from one economy to another for a certain period of time in order to achieve a relatively high level of efficiency, taking into account the obvious and uncertain risks to various sectors of the economy of another country that are not prohibited by law? property, financial, intellectual wealth" 11.

In our view, foreign investment means the outflow of capital from one economy to another, with the goal of placing wealth on more favorable terms and ensuring the flow of capital over a relatively long period of time until the investment returns to the foreign owner. They are characterized by cross-border migration, in which foreign investment essentially replaces their national investment climate. In addition to security, profitability, capitalization and liquidity, foreign investment is an important feature of a specific goal. The economy, which attracts their attention, is also trying to achieve its goals. These goals can be as efficiency, productivity growth and market penetration. Therefore, mutual interests, trusting relationships, taking into account the conditions of entry are the basis for the transfer of investment from one country to another. Foreign investment, unlike domestic investment, is subject to additional risks, such as country, currency, nationalization, requisition. This means that their range of risks is much wider.

It is advisable to classify foreign investments into private, public, foreign and mixed investments according to the form of ownership. Depending on the object of direction, foreign investment can be divided into financial and real investments. In developed countries, the main place in the structure of financial investments is occupied by private property owners. The structure of foreign investment can be grouped as follows (Figure 1.1).

Foreign direct investment in the structure of foreign investment is important for the development of sectors of the economy, they accumulate more capital than the level of domestic savings, support the balance of payments and can have a positive impact on economic development by expanding import opportunities.

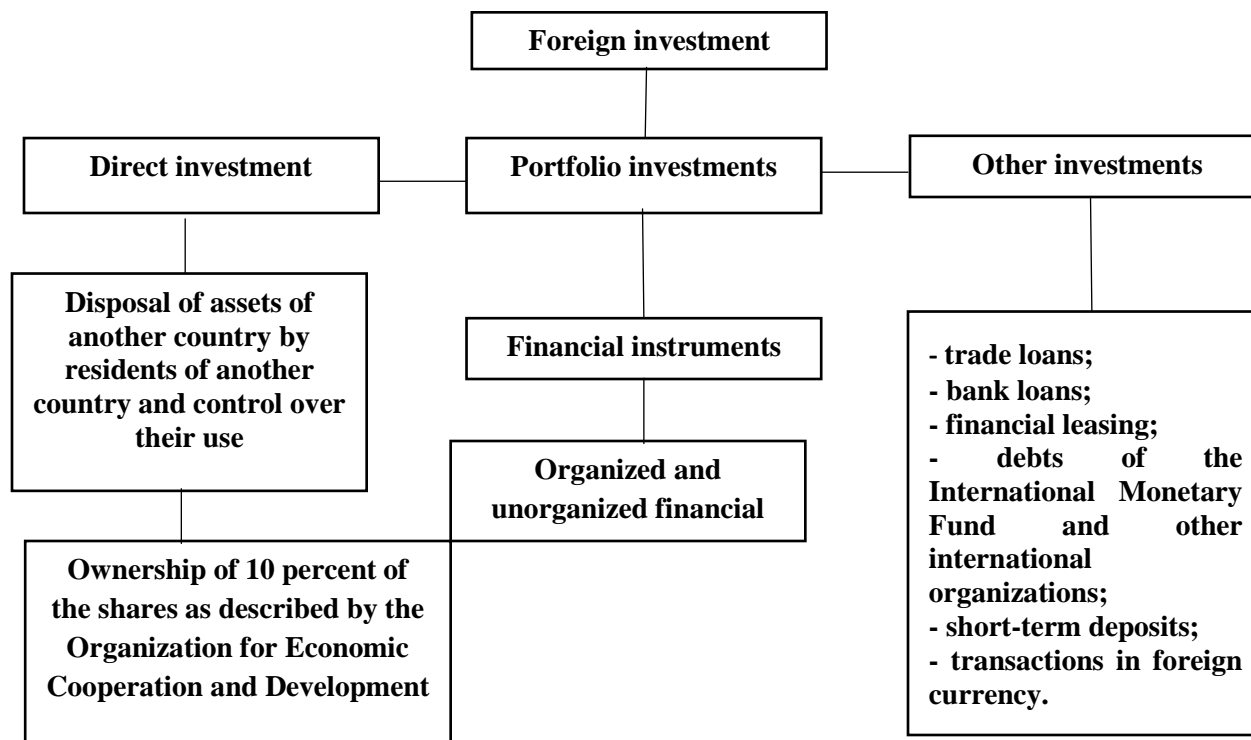

Figure 1.1. Classification of foreign investments

Foreign direct investment plays an important role in improving the operations, production and capital efficiency of individual enterprises, the introduction of new technologies and the improvement of the management system. These processes help to develop the internal market, increase the skills and practical experience of workers by indirectly influencing suppliers, customers and competitors of products and services. The above types of foreign investment have their own characteristics.

1.1-TABLE DISTINCTIVE FEATURES OF FOREIGN INVESTMENT

Signs	Foreign direct investment	Portfolio investments
The main purpose of entry	Control of a foreign firm	High profitability
Ways to achieve the goal	Organization and conduct of production abroad	Buying foreign securities
Methods to achieve the goal	<ul style="list-style-type: none"> – full ownership of a foreign company; – acquisition of a controlling stake (from 25% of the company's share capital as recommended by the 	Acquisition of at least 25% of the share capital of a foreign company (in the USA, Japan and Germany - 10%)

	International Monetary Fund) should not be less);	
Forms of income	Entrepreneurial profits, dividends	Dividends, interest

Particular attention is paid to the work on attracting investment for the implementation of projects on restructuring the economy, modernization of industries, technical and technological renewal. Investment opportunities and real volumes are closely linked to the situation in domestic and foreign markets. Despite the negative changes in foreign markets as a result of the financial crisis, the domestic market of our country continues to grow steadily. This is the most important condition for strengthening the investment climate. It is known that the policy of stimulating the domestic market has been implemented in recent years. The steady increase in the number of jobs and wages, the rapid expansion of income from entrepreneurship through the development of small business are the factors that ensure the stability of demand in the domestic market. The way to expand the benefits and preferences for large-scale, far-sighted free enterprise, which will continue in 2018, is to increase the volume of investments, especially foreign investment, and to ensure the sustainable growth of our economy and its macroeconomic balance. This has had a positive effect on mining.

Large-scale liberalization and stabilization factors play an important role in improving the economic situation in all countries in transition. Liberalization requires free pricing, the abolition of state control over trade, and the creation of new companies without hindrance. Stabilization means reducing inflation, eliminating imbalances in the economy and foreign economic spheres.

These two factors, which are closely linked to reform, can be addressed in the early stages of the transition. Foreign investment plays an important role in international economic relations and is an important source of capital for many countries. In the context of modernization of the economy, it is possible to increase the competitiveness of products only on the basis of investment, renewal of fixed capital and on this basis to reduce production costs and improve quality. Therefore, the President of the Republic of Uzbekistan Shavkat Mirziyoyev said that ensuring the growth of investments from year to year, the launch of new modern enterprises producing high value-added, deeply processed products - to ensure sustainable economic growth, first of all, is one of the most important factors in further improving the living standards and welfare of the population.

Investment policy is a set of targeted measures aimed at revitalizing investment activities, boosting the economy, increasing production efficiency and creating favorable economic conditions for economic entities in order to solve social problems. The state's foreign investment policy is a system of measures to regulate foreign investment flows by the state. Investment policy is one of the most important permanent means of goal-oriented activity of the state in terms of socio-economic development. Such a policy is the core of the entire political sphere of the state, or in other words, it is the basis of the political activity of the whole state. The growth of the country's production capacity, economic growth, increase in the volume and quality of production of material and spiritual goods, the development of the overall infrastructure will largely depend on investment and investment policy.

Investment policy is a function of the state to mobilize investment funds to organize the reproduction of material goods in society. From the organizational and legal point of view, this area of public policy consists of the activities of its relevant bodies to define the goals and objectives of such a policy, to seek funding for its implementation. The development of prudent investment policy plays a leading role in economic growth. For the effective implementation of investment policy, it is necessary to establish a number of institutions that will serve to create a favorable investment climate. The model that works effectively in the world economy relies on a market system and takes full advantage of the national economy. We have every reason to say that Uzbekistan has created a unique investment climate, a system of privileges and preferences for investors.

This is evidenced by the fact that the volume of foreign investment in our economy is growing from year to year. The role of foreign investment, especially direct investment, in the further deepening of structural changes in the economy, the acceleration of investment activity of enterprises, modernization of production, technical and technological re-equipment is invaluable. This will create opportunities for the introduction of advanced technologies, the creation of new jobs and, on this basis, to ensure the sustainable and balanced development of the country's economy. The experience of developed countries shows that the attraction of foreign investment has been one of the decisive factors in the high level of development of these countries. Further deepening of structural reforms in the economy, further revitalization of investment activity of enterprises, wide attraction and effective use of foreign investment, especially foreign direct investment, modernization of production, technical and technological in order to re-equip, create new jobs and on this basis to ensure the sustainable and rapid development of our national economy, a large amount of funds is allocated from the national budget. At the current stage of modernization of the Uzbek economy further improvement of investment activities is required.

DIDACTIC GAMES IN TEACHING MATHEMATICS

Jumaniyozov Kudrat Sapoyevich*

*(PhD), Associate Professor,

Candidate of Pedagogical Sciences

Head of the Department "Methods of exact and natural sciences",

Tashkent regional center of training and in-service of public education stuff,

UZBEKISTAN

ABSTRACT

This article focuses on the usage of didactic games in teaching of mathematics in schools. Entertaining elements of mathematics lessons favor increasing interest to the subject as well as the development of logical thinking. A lesson containing elements of the game is a form of interaction between the teacher and the students. Through the system of game actions, educational opportunities are realized inherent in the content of educational material. Play is creativity, play is labor.

KEYWORDS: *Didactics, Technology, Crosswords, Screen Tools, Entertaining Texts, Oral Methods, Math Quizzes, Thinking.*

INTRODUCTION

The school course of mathematics is acquiring an increasingly important role in the system of general education of students. The math teacher has to solve problems every day how to make the most productive use of every minute of the lesson. It is necessary to look for effective ways to solve this problem. At each lesson, the teacher faces a number of tasks: how to bring all the necessary information to the consciousness of each student, how to achieve the assimilation of theoretical and practical material, how to form and maintain students' interest in the study of mathematics. This task is one of the most difficult. After all, mathematics is a science that requires a lot of mental stress, the development of logical thinking and creative abilities. Therefore, to arouse students' interest in mathematics, to keep them active throughout the lesson, it is useful for the teacher not to miss an opportunity to make the lesson more entertaining. The elements of entertainment are also conducive to the development of students' creativity. The

growth of interest in knowledge, the activity of students in the classroom, the formation of positive motives for learning, an increase in the effectiveness of the learning process is facilitated by the use of didactic games, fairy tales, crosswords, mathematical quizzes, tests, elements of historicism, tables, posters, as well as the use of tasks - drawings, mathematical dictations, on-screen teaching aids, handouts, signal cards, various types of frontal polling, etc. etc. Computer technologies can play a special role the formation of positive motives for learning, an increase in the effectiveness of the learning process is facilitated by the use of didactic games, fairy tales, crosswords, mathematical quizzes, tests, elements of historicism, tables, posters, as well as the use of tasks - drawings, mathematical dictations, on-screen teaching aids, handouts, signal cards, various types of frontal survey, etc. etc. Computer technologies can play a special role the formation of positive motives for learning, an increase in the effectiveness of the learning process is facilitated by the use of didactic games, fairy tales, crosswords, mathematical quizzes, tests, elements of historicism, tables, posters, as well as the use of tasks - drawings, mathematical dictations, on-screen teaching aids, handouts, signal cards, various types of frontal survey, etc. etc. Computer technologies can play a special role...

In order for teaching to be effective, it is necessary to use in a complex all the variety of techniques and teaching methods, which we tried to do when developing lessons on the topic "Quadrangles".

About didactic games. An important role is given by us to didactic games in mathematics lessons - a modern and recognized method of teaching and upbringing...

We use the following considerations. A lesson containing elements of the game is a form of interaction between the teacher and the students. Through the system of game actions, educational opportunities are realized inherent in the content of educational material. Play is creativity, play is labor. During the game, students develop attention, a desire for knowledge. Carried away, children do not notice that they are learning: they learn, remember new things, orient themselves in unusual situations, replenish their stock of ideas, concepts, and develop imagination. Even the most passive students are included in the game, making every effort not to let down their playmates. Children tend to be alert, focused and disciplined during play.

We have developed games "The third extra", "Who - who lives in the little house", "Silence".

The game "The third extra" is convenient to use when consolidating the studied material. Students are offered three figures (quadrangles), two of which have common properties (at least one), and the third figure does not have this property, therefore it turns out to be "superfluous". The student's task is to determine the "extra" figure. The use of such a game does not lead to simple memorization of the textbook material, but to the development of students' ability to analyze facts and think logically. This game can be used to study other topics in geometry and other subjects.

Information about the quality of assimilation of theoretical material can be obtained by using the game "Who - who lives in the little house". And to quickly receive feedback from all classes - the game "Silence" using signal cards (red, yellow, green), it helps the teacher to save time in the lesson, discipline students and at the same time receive information about the assimilation of the material by all students in the class. For example, when questioning, if a student at a desk agrees with the answer of the responding student, then he raises a green card, and if not, a red one. Thus, each student has the opportunity to "speak out". (Let's agree that the green card

corresponds to the statements "yes", "true"; red - "no", "not true"; yellow - "there is an addition"). This game can be used not only for interviewing students, but also for oral exercises.

Crosswords... The use of crosswords helps not only to arouse students' interest in mathematics, but also contributes to the development of their creative abilities, develops ingenuity. It is often difficult for a teacher to achieve this, so that students thoughtfully repeat this or that material and, especially, their active participation during the participation of repetition in the lesson. And here crosswords can help the teacher. In order to compose or solve a crossword puzzle, a student must work with a textbook, learn to highlight the main thing in definitions, concepts, theorems.

Screen tools. The mathematics teacher has at his disposal a lot of teaching methods and means, including on-screen ones. Along with tables, handout cards can be considered the most promising slides - specially prepared separate frames for demonstration using a computer.

Entertaining texts. Sometimes, to enhance the impression on an important topic, you can tell or invite students to write a fairy tale. This is exactly the case presented to us in the first lesson, where the definition of a quadrangle is introduced. We decided to introduce students to the classification of quadrangles using a fairy tale.

Elements of historicism. The use of elements of historicism in teaching mathematics is also a very effective and efficient tool. The history of mathematics shows that mathematics by its origin is not the product of "pure reason", but originated from the practical needs of man and was formed as a result of the mental and practical activities of people for many centuries. It is necessary to reveal to students that mathematical concepts change and develop on the basis of practice, i.e. to reveal the dialectical path of development of mathematics. Therefore, we decided to include a historical minute in the lessons, during which we acquaint students with the history of the origin of the concept in question.

Testing... One of the modern methods of testing students' knowledge is testing. We directly use tests in the development of lessons and therefore the control work on the topic was carried out using tests.

Oral methods. Oral work in the lesson also has great educational value, developing the mental activity of students, it brings revitalizing variety to the course of the lesson. The use of oral exercises in the lesson allows you to productively and economically put the work on deepening and consolidating knowledge. We included in the lessons oral work with a table - an assignment, oral work on ready-made drawings in the form of a frontal survey, a mathematical quiz.

An ordinary survey does not arouse proper interest among students, therefore, during the frontal survey, we also use special exercises that require students to be able to apply definitions, theorems in various situations, and the ability to quickly navigate in the conditions of a problem.

The task table allows you to quickly and efficiently carry out work to consolidate the material under study, organize a repetition of the passed. The work carried out using this table, activates the attention of students, is at the same time a change in the types of activities in the lesson¹...

Also, ready-made drawings, figures drawn in bright colors on a poster and used during oral work are good at concentrating the attention of students. They help to highlight equal, proportional elements (the teacher and students agree to indicate equal elements in one color with a smooth line, and proportional elements with a dotted line). In addition, such exercises educate students

aesthetically, which arouses interest in the subject. Psychologists noted that when depicting diagrams, drawings, figures and their elements in different colors, it is best to use no more than three colors at the same time. Usually, the main elements are depicted in red, and minor ones, for example, in green and blue.

Math quizzes... Attention, observation, intelligence of students also develop math quizzes. Conducting quizzes enriches and enlivens the lesson. We conduct a math quiz in one of the lessons, where we use practical tasks on the topic "Quadrangles". Solving these problems, students analyze facts, see the relationship between science and practice. The proposed tasks are brought to the students by clearly reading the text of the exercise once or twice. The participants of the quiz are warned that a personal-team championship is being played. To identify the winner of the quiz, a certain number of points is assigned for solving each problem, determined by the degree of difficulty of the proposed problem. The winning team is determined by the total of the points scored.

About tasks... We also paid much attention to solving problems. Problem solving is used to solve educational goals: to form motivation and interest in the educational activities of students, to illustrate and concretize the material studied, to develop special skills and abilities in students, to monitor and evaluate the results of their educational work, etc. Repetition is also carried out through a system of tasks - the systematic and purposeful formation of those operations that make up the solution process. Geometric calculation problems are characterized by the following operations: identification of the relationship (relationship) between the elements of a certain figure; direct search for the sought-after from relations containing one unknown; the selection of an auxiliary task (subtask), which consists in finding some unknown; drawing up an equation or systems of equations.

One example that contributes to the development of students' thinking is the method of auxiliary tasks. Its essence is as follows: a given task, if it encounters difficulties for a student, is initially replaced by an auxiliary task (tasks) prepared in advance by the teacher, which in some elements of the solution is similar to the main task, or is part of the main task, or the solution to one of them follows from solutions are different. An auxiliary problem is offered to students before solving a complex problem or in the middle of a solution, but the students are not told that it is an auxiliary problem. Then the main task is solved. Using the example of one lesson on the topic "rectangle", we will try to show the use of dialectical games in teaching mathematics.

The purpose of the lesson: repeat the concept of "rectangle" with the students, familiarize with the new definition and study its properties.

Equipment: computer, projector.

The lesson uses a didactic game.

During the classes:

1. Conducting a lesson in the form of a didactic game.

Teacher: Today in the lesson, guys, we will play. The game will consist of several stages, which I will introduce you to during the lesson. Let's break up into three teams (each row is a team). Each of the teams will earn points for themselves at each stage.

Stage I - updating basic knowledge.

Now we will choose the captains of the teams as follows: you must reproduce in notebooks for

Fig. 1

Fig2

independent work the reference notes based on the material of the previous lesson on the topic: "The rhombus and its properties." Writing key notes will take 4-5 minutes. The captain of each team will be the one who plays the keynote first. If the team does not have time to complete the work in 5 minutes, then it loses 2 points for every extra minute; if she completes the task in less than 5 minutes, she will receive 2 points for each saved minute. I'll keep an eye on this. Those who need advice can raise their hand and the captain will advise him. But each consultation deprives the team of 2 points. The number of consultations in all teams and the scores will be written on the board. (Notebooks of teams are reviewed by the teacher during consultations and independent work of students,

Stage II - consultation.

Guys, now each team should hold a consultation on the issues written on the board. It is allowed to use the textbook during the consultation. The consultation takes

5-6 minutes.

Questions:

1. What quadrangle is called a parallelogram?
2. What is a rhombus?
3. Formulate the properties and attributes of a parallelogram.
4. Formulate the properties of the rhombus.
5. Which straight lines are called perpendicular?
6. Formulate a criterion for parallelism of straight lines and a consequence of it.
7. Formulate the property of the angles formed at the intersection of parallel secant lines and the consequences from it.
8. Formulate a criterion for equality of right-angled triangles.
9. Stage III - learning new material.

The following pictures and questions are projected onto the screen using an overhead scope.

1. Select rectangles from among the quadrangles proposed in Fig. 1.
2. Can it be argued that a rectangle is a parallelogram?
3. What can you say about the degree of each corner of the rectangle?

4. Give the definition of a rectangle.
5. Prove that rectangle $A_2B_2C_2D_2$ has sides C_2D_2 and A_2B_2 ; A_2D_2 and B_2C_2 are parallel.
6. In fig. 2 name all right-angled triangles.
7. Find Equal Rectangular triangles and justify their equality.
8. What conclusion can be drawn about the diagonals of the rectangle?
9. Formulate properties that apply to both the parallelogram and rectangle and rectangle-only properties.

Teacher: Now, one by one, the team captains will call their rivals to answer the questions presented to you on the screen. Each team will answer three questions, 9 questions in total. 10-12 minutes are allotted for the study of new material.

Stage II - drawing up a reference outline.

So, guys, you and I considered a rectangle as a particular type of a parallelogram, got acquainted with its properties. Now you read the tutorial material we've covered. (Students read the "Rectangle"). Now close the textbooks and write a pivotal synopsis in your workbooks. At this stage of the lesson, we will take up to 8 minutes. Again, as in the first stage, the team will receive points for a job well done. When drawing up a synopsis, you can use this drawing.

Stage V - problem solving.

Each team must solve a problem.

The tasks for the three teams are written on the board.

1. Prove that if a parallelogram has all angles, then it is a rectangle.
2. Prove that if a parallelogram has equal diagonals, then it is a rectangle.
5. Prove that if the parallelogram has at least one corner of a straight line, then it is a rectangle.

Weak students are called in to answer these tasks. Each team gets points for solving the problem.

Stage VI - summing up the results of the game.

Today in the lesson during the game, we guys got acquainted with a new type of quadrangle - a rectangle, as a particular type of parallelogram, which has all its properties. In addition, we have expanded the property that applies only to the rectangle: the diagonals of the rectangle are equal. When solving problems, we got acquainted with the features of a rectangle, i.e. those of its properties that make it possible to establish that the parallelogram is a rectangle:

If in a parallelogram: 1) the diagonals are equal; or 2) all angles are equal; or 5) at least one corner of a straight line.

Here the winning team is named, individual students are given a grade in the magazine.

The usage of didactic games in mathematics lessons will allow students to show interest in the subject under study, and also contribute to the development of logical thinking and increase the activity of students in general education schools.

FORMATION OF THE CONTENT OF THE EDUCATIONAL-METHODOLOGICAL COMPLEX "INFORMATION AND COMMUNICATION TECHNOLOGIES IN EDUCATION" IN THE SYSTEM OF PROFESSIONAL DEVELOPMENT

Jumanazarov Sirojiddin Salaydinovich*

*PhD, Tashkent Regional Center of retraining and in-service,
Personnel of public Education,
Tashkent, UZBEKISTAN

Abstract

The article deals with the formation of the content of the educational and methodological complex in the direction of innovative activities in the process of professional development of public educators. The content of practical training in the organization of the educational process in accordance with the working curriculum, the principles of "simple to complex, practical application of theoretical knowledge" were followed.

KEYWORDS: Educational-Methodical Complex, Educational Program, Interactive Educational Methods, Innovation, Theoretical And Practical Training

INTRODUCTION

The widespread introduction of advanced pedagogical and information and communication technologies in the educational process, as well as innovations in the education system are one of the main criteria for increasing the effectiveness of education. This makes it necessary to update the educational and methodological complexes used in the system of self-training, as well as to form them in accordance with modern requirements.

Educational-methodical complexes mean a concept that represents a set of didactic tools used in the educational process [1].

What is the content of teaching training modules in the field of information technology in the system of professional development today, what are the pedagogical problems in the creation of educational and methodological complexes in this area. The following issues are analyzed from a scientific and pedagogical point of view.

Main part:Currently, the regional centers for retraining and advanced training of public educators are working effectively to create educational and methodological complexes aimed at the formation of innovative pedagogical activities of listeners, combining the latest achievements of information and communication technologies. In particular, educational and methodological complexes, which are important in improving the quality of education and the formation of innovative pedagogical activity of listeners, are created in accordance with the requirements of the time based on the needs of listeners [2-5].

These educational-methodical complexes were formed as a result of the study of the needs of listeners in the process of professional development on the basis of surveys, educational-practical seminars in basic schools and cooperation with mentors in the field of science.

Here we consider the content of the educational-methodical complex "Information and communication technologies in education."

The working curriculum is based on the basic curriculum of the in-service training course for public educators and teachers, which describes the goals, objectives and requirements for the knowledge, skills, competencies and competencies of the trainees in the module. The curriculum takes into account the organic sequence of topics and the existing knowledge of the audience on information technology in the creation of educational and methodological complex. Therefore, the program is given not only basic concepts about information technology, but also provides for a complete acquaintance with its technical tools and the formation of skills for working in them.

Interactive learning techniques used in teaching the module. One of the main criteria for directing listeners to innovative pedagogical activity in the teaching of this educational module is the appropriate and effective use of interactive educational methods in the teaching of training. The educational-methodical complex includes the proposed interactive teaching methods and their descriptions in the teaching of the educational module.

Useful interactive teaching methods in teaching the module. One of the main criteria for directing listeners to innovative pedagogical activities in the teaching of this training module is the ability to use interactive teaching methods in the classroom. The educational-methodical complex contains the recommended interactive teaching methods and their descriptions in teaching the module.

Theoretical training materials (2 hours). The educational-methodical complex is created in a methodologically coherent sequence, ie the content of the theoretical material is presented in a logical sequence and the essence of the topic is revealed through the basic concepts and theses.

It fully covers the knowledge and skills that need to be conveyed to the audience on the topic. The topic of the training module is "Modern information and communication technologies in education" for 2 hours.

Practical training materials (6 hours). The practical training of this educational module consists in the development of competencies of the listener to effectively use information and communication technologies in their professional work and the preparation of electronic and didactic materials in innovative pedagogical job. The content of practical training In the organization of the educational process in accordance with the working curriculum, the principles of "simple to complex, practical application of theoretical knowledge" were followed. It is advisable to perform tasks based on the direction and characteristics of the profession in the

conduct of practical training. Therefore, the main focus is on the formation of practical skills. The following is the content of the practical training: In the educational-methodical complex the theme "Creation of educational materials with the help of practical programs" is designed for 2 hours, the main purpose of which is to develop the skills and abilities of listeners to create educational materials using practical programs. The theme "Use of multimedia technologies in education" is also designed for 2 hours, and the purpose of the lesson is to develop listeners' skills and abilities to use multimedia technologies. In addition to developing the knowledge of multimedia tools needed in their professional activities in the process of professional development of personnel of public education, it is also necessary to develop students' skills and abilities to use the Internet, its capabilities and Internet educational resources in the educational process. The theme of the Internet and its services is to develop students' skills and abilities to use Internet resources and their services.

Bank of Cases. In the course of the practical training, the tasks of the listeners to study the situation, analyze it and solve the problem using the case study method are presented in tabular form.

Independent study topics. Topics of independent study are presented in order to further develop the knowledge of listeners on the training module, the independent use of Internet resources in their professional work and the formation of qualification paper, as well as the preparation of presentations. These independent learning topics almost covered the materials in the training module.

Glossary. In the materials of the training module there are Uzbek and English explanations of terms, which are used a lot and come as a base phrase.

The list of used literature contains a list of used and recommended literature and electronic resources for this module.

CONCLUSION

In ensuring the quality of the educational-methodological complex, it is recommended to take into account the relevance of the topics, their compliance with the requirements of the state and the needs of the educational system, the ongoing socio-political and democratic changes in the country, priority issues of reforms in the areas of economic, legal and other spheres, as well as the latest achievements. This determines the position of the educational module in education to acquaint the audience with information and Communication Technology in education, its application in practice and thereby ensure the effectiveness of Education.

The following recommendations on the organization and conduct of training on the basis of the educational-methodological complex "Information and Communication technologies in education" in the process of qualification development of regional centers are referred to:

- carrying out in education in the form of theoretical and practical training of modern information and communication technologies module;
- to give information about modern information and communication technologies;
- to teach the use of technical tools and practical applications.

The following recommendations on the organization and conduct of training on the basis of the educational-methodical complex "Information and Communication Technologies in Education" in the process of professional development of regional centers are presented:

- Conducting modules of modern information and communication technologies in education in the form of theoretical and practical training;
- Providing information about modern information and communication technologies in education in theoretical training;
- To teach the use of technical means and practical programs in practical training.

It is recommended to use the following forms of teaching in this educational-methodical complex:

- lectures, practical classes (understanding of information and technology, developing intellectual curiosity, strengthening theoretical knowledge);
- round tables (to increase the ability to make proposals on the solutions of the tasks under consideration, to hear, to perceive and to draw logical conclusions);
- discussions and discussions (provide evidence and substantive arguments on assignment solutions, develop the ability to hear and find solutions to problems).

The content of the educational-methodical complex is inextricably linked with the curriculum modules "Educational technologies and pedagogical skills", "Specialized disciplines" and "Pedagogical software in education" to increase the level of formation of innovative training of listeners in the training process.

STUDY OF FREQUENCY INDICATORS OF COMORBID STATES AT DIFFERENT FUNCTIONAL CLASSES OF HEART FAILURE

Tosheva Khakima Bekmurodovna*; **Zokirov Aziz Chorievich****

^{1,2}Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

In order to study comorbid conditions in patients with chronic heart failure (CHF) living in regions with a hot climate, 323 patients were examined, including 150 men (46.43%), 173 women (53.56%) aged up to and older 60 years. Analyzes showed in groups of patients with low hemoglobin albuminuria was detected in 35.6% of cases, in the absence of anemia 24.3% ($p < 0.05$). Blood creatinine indices in patients under 60 years old was 74.9 ± 17.7 and in 60 years old and older $98 \pm 21.9 \mu\text{mol} / \text{l}$, an increase in the indicator was noted depending on the FC of CHF, amounted to I-FC- 83.2 ± 2 , II-FC 101 ± 3.8 , III-FC 128 ± 5.4 , IV-FC $138.9 \pm 9.1 \mu\text{mol} / \text{L}$ ($p < 0.05$). Thus, in patients with CHF, the incidence of comorbidity increases in proportion to the age and functional class of chronic heart failure.

KEYWORDS: Comorbidity, Chronic Heart Failure, Ischemic Heart Disease, Chronic Kidney Disease, Functional Class, Fibrosis Markers, Anemia, Creatinine, Albuminuria.

INTRODUCTION

Experts from the World Health Organization consider the increase in the prevalence of chronic diseases as a global epidemic of the 21st century [6,15]. Among them, a special place is occupied by ischemic heart disease (IHD) and arterial hypertension (AH), as the causes most often leading to chronic heart failure (CHF). It is well known that due to the introduction of new modern therapeutic and prophylactic methods, as well as an increase in the proportion of elderly and older patients, the number of CHF patients is increasing [1,6,7,14,15]. It should be noted that with an improvement in the quality of life and its duration, the proportion of ischemic heart disease and hypertension and associated CHF will certainly increase. According to the American Heart Association (AHA), CHF was named the leading cause of death in 283,000 people in 2008 and represents a new epidemic of cardiovascular disease (CVD), affecting more than 23 million

citizens worldwide, and the economic costs associated with CHF are estimated at billions of dollars per year [5,9,18].

A characteristic feature of the modern diagnostic and treatment process for chronic diseases, which include CHF, is the presence of a combination of several pathological conditions in the patient, i.e. comorbidity, which has received special attention in recent years, while most often we are talking about comorbidity in a patient, and not with any disease [2, 8]. According to European studies, the risk of developing CHF is especially high in the presence of both coronary heart disease (CHD) and diabetes mellitus (DM) [5,18]. According to various researchers, the presence of high comorbidity leads to an increase in mortality in patients with chronic disease, a decrease in the quality of life and social maladjustment [6,11,13]

Initially, the term "comorbidity" (Latin co - "together" and morbus "disease") was proposed by Feinstein A.R. This concept characterizes the presence of an additional clinical picture that already exists or has appeared independently, in addition to the current disease and is always different from it [3,12,16].

The prevalence of comorbidity varies significantly and significantly depends on the parameters of the sample (patients, doctors and clinics, sex of patients, age, adherence of researchers to different classifications of diseases), but in general there is an increase in the frequency of comorbidity with age, mostly in women [1,9,17 ,20]. According to M. Fortin's data, based on the analysis of 980 case histories taken from the daily practice of a family doctor, the prevalence of comorbidity ranges from 69% in young patients (18-44 years old) to 93% among middle-aged people (45-64 years old) and up to 98% - in patients of the older age group (over 65 years old). Moreover, the number of chronic diseases in one patient varies from 2.8 in young patients to 6.4 in older people [4, 15].

The most significant (92%) proportion of patients with comorbidity is found among patients with CHF, and the most common combinations of diseases include diabetes mellitus, ischemic heart disease, anemia, as well as hypertension, obesity and hyperlipidemia. At the same time, comorbidity cannot be described using several simple combinations of diseases, which also do not reflect differences in the severity of the condition, the effect on the level of physiological and mental functions, and disability [10, 14].

The aim of the study. To study comorbid conditions in patients with CHF living in regions with a hot climate.

MATERIAL AND METHODS

We examined 323 patients who were inpatient treatment in the cardiology department of a multidisciplinary hospital in Bukhara. Among the examined patients there were 150 men (46.43%), 173 women (53.56%). All patients had CHF and were divided by age into 2 groups up to 59 years old - 161 people and the second group - 162 people over 60 years old. The average age in group 1 was 52.55 ± 6.42 years, in group 2 - 67.56 ± 6.7 years ($p < 0.01$). CHF was diagnosed and assessed in accordance with the recommendation of the Heart Society of New York. All patients underwent general clinical and laboratory examinations, ECG and the results were processed according to the standard method. In addition, patients were interviewed using the Minnesota Questionnaire.

RESEARCH RESULTS AND DISCUSSION

According to the functional class (FC), the patients were distributed: I FC-26.93%; II FC-50.51%; III FC-22.29%; IV-0.26%. Body mass index on average in the first group under 60 years old was 29.4 ± 4.9 , in the second group over 60 years old - 28.1 ± 4.5 .

All patients had comorbid conditions. Thus, there were 43 patients with one concomitant diagnosis - this amounted to 13.31% of patients, with two concomitant diagnoses - 214 patients, which amounted to 66.25%. With three comorbidities - 56 patients, which amounted to 17.33% of patients. In 9 patients, there were 4 or more concomitant pathologies, accounting for 2.78%. On average, the general comorbidity averaged 2.1 ± 0.67 , in the group under 60 years old 1.9 ± 0.53 , over 60 years old - 2.2 ± 0.75 ($p < 0.01$).

When evaluating comorbidity by functional classes, it was found that in patients with 1 FC among 87 people, the comorbidity was 1.74 ± 0.61 , in patients with 2 FC in 164 patients it was 2.1 ± 0.57 in patients with 3 FC among 72 patients comorbidity was 2.54 ± 0.65 . The analysis showed that with age and an increase in CHF FC, the frequency of comorbid conditions increases in parallel and is most often diagnosed in older age groups with III-FC CHF.

The patients were divided into two groups depending on the parameters of blood hemoglobin. In the first group, hemoglobin indices were 112.4 ± 10.2 , in the second group, hemoglobin was 134.9 ± 8.9 ($p < 0.05$). The average age of patients with anemia was 64 ± 10.1 years, and those with normal hemoglobin values were 57.9 ± 9.1 years ($p < 0.05$). The study of hemoglobin indices depending on the FC of CHF showed the following: with I-FC - 139.9 ± 16.8 , with II-FC - 118.5 ± 19.7 , with III-FC - 112.2 ± 14.5 , with IV-FC - 102.5 ± 10.2 ($p < 0.05$). The analysis showed that anemia is often diagnosed in older patients with CHF and the frequency increases depending on the FC of the disease.

Therefore, in order to study renal dysfunction in patients with CHF, we analyzed the number of patients with albuminuria and blood creatinine levels. We studied the incidence of albuminuria in the examined patients with CHF, depending on age, FC, the presence of anemia.

If albuminuria was detected in 24.8% of patients under the age of 60, then in older age categories it occurs in 35.1% of patients ($p < 0.01$). This confirms that renal dysfunction in patients with CHF increases with age. In 323 patients with CHF, the incidence of albuminuria was studied based on FC and age. It was revealed that the age of patients with I-FC 54.8 ± 9.3 , II-FC 54.4 ± 10.3 and III-FC 64.5 ± 9.9 years.

Analyses showed the presence of albuminuria in patients with I-FC 12.3% of cases, II-FC 18.5% of cases, III-FC 29.1% of cases.

In patients with CHF, with an increase in FC, the number of patients with albuminuria increases in parallel, which corresponds to the literature data.

Also, in the observed group of patients, the incidence of albuminuria was studied depending on the hemoglobin parameters. Analysis of data in groups of patients with low hemoglobin albuminuria in 35.6% of cases, in the absence of anemia 24.3% ($p < 0.05$). The blood creatinine indices in patients under 60 years old were 74.9 ± 17.7 and in 60 years old and older - 98 ± 21.9 $\mu\text{mol} / \text{l}$ ($p < 0.05$).

A comparative analysis of this biochemical indicator, depending on the presence of anemia, revealed the following: with hemoglobin 112.43 ± 12.0 g / l, creatinine was 119.64 ± 13.7 μ mol / l and with hemoglobin 134 ± 9 g / l, this indicator was 89.6 ± 8.5 μ mol / l ($p < 0.01$).

Based on the FC, when comparing the creatinine indices, it was in patients with FC I- 83.2 ± 2.8 , FC II- 101 ± 3.8 , FC III- 128 ± 5.4 , FC-IV 138.9 ± 9 , 1 μ mol / L.

Analyzes of patients with CHF showed that with increasing age and FC, creatinine levels in the blood increase, the process is aggravated in the presence of comorbid pathology, which confirms the presence of impaired renal function in a certain number of patients we observed.

CONCLUSION

CHF often occurs with comorbid conditions, among which anemia, dysfunction with an increase in chronic kidney disease are most often diagnosed.

The presence of renal dysfunction is confirmed by a large number of patients with proteinuria and high blood creatinine levels.

The incidence of comorbidity increases in proportion to the age and functional class of chronic heart failure.

MORPHOFUNCTIONAL CHARACTERISTICS OF THYMUS UNDER EXPOSURE TO VARIOUS ENVIRONMENTAL FACTORS

Sabohat Bahodurovna Azimova*

*Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

In the presented article, devoted to the features of the structure and function, morph metric parameters of the main structures of the thymus {thymus}, the patterns of development of this organ at the stages of postnatal ontogenesis are revealed. An increase in the number of luminescent granular cells of the cortico-medullary and subcapsular zones is revealed after 1 and 14 days. After 14 days, the cells of both the cortico-medullary and subcapsular zones become larger and more densely filled with granules.

KEYWORDS: Morphology, Organs Of The Immune System, Thymus, Action Of Environmental Factors

INTRODUCTION

The immune system of humans and animals is one of the most reactive systems of the body, reacting quickly to the effects of damaging factors at the earliest stages. The immune system is formed by a complex of organs and tissues that create protection against foreign endo- and exogenous influences.

It arose in the early stages of evolution and its activity is based on the recognition of foreign antigens, their destruction and removal, which is absolutely necessary for the survival of the organism. {1}

At present, convincing data have been accumulated indicating that the immune system largely determines the body's resistance to the effects of chemical factors. The central organs of immunogenesis in mammals are the thymus, where the formation and reproduction of T-lymphocytes takes place, as well as the red bone marrow, where B-lymphocytes are formed and multiply. Peripheral lymphoid organs are lymph nodes, spleen, tonsils, intestinal lymphoid follicles. The immune system of humans and animals is one of the most reactive systems of the

body, reacting quickly to the effects of damaging factors at the earliest stages. The immune system is formed by a complex of organs and tissues that create protection against foreign endo- and exogenous influences.

It arose in the early stages of evolution and its activity is based on the recognition of foreign antigens, their destruction and removal, which is absolutely necessary for the survival of the organism. {1}

Also immobilization stress induces adrenal hypertrophy, thymic involution and the appearance of destructive lesions in the gastric mucosa of white rats, correlating in terms of potency with the duration of stress exposure. Pathomorphological changes in the adrenal glands were characterized by hypertrophy, predominantly of the fascicular zone of the cortex. Also, under immobilization stress, there was a massive death of T-lymphocytes and their release into the cardiac bed, which was accompanied by involution of the thymus. {10}

During a stress reaction, T-lymphocytes are released into the blood and massive death of lymphocytes in the organ itself, especially in the cortex. Thus, with a 6-hour stress exposure, a 1.3-fold decrease in the thickness of the thymus cortex of white rats compared with that in animals of the intact group, the value of this indicator was 260 μm , with a range of fluctuations from 200 to 290 μm . On the contrary, the area of the medulla in the thymus of rats after stress exposure increased by 1.2 times (Fig. 2) and amounted to 940 μm , the oscillation range varied from 840 to 1020 μm . {11,12}

Lymphoid tissue, being the main site for the development of specific immunological reactions, contains numerous cell populations involved in ensuring the genetic constancy of the internal environment of the body. {2}

The thymus is considered as an immune organ in which acquired and natural immunity is formed with the help of biologically active peptides through the production of thymic hormones and the formation of progenitor cells of T-lymphocytes.

In the structure of the immune system, the thymus provides the maturation and differentiation of T-lymphocytes, including in the peripheral immune organs, stimulates the integration of various populations of T-lymphocytes and macrophages for the implementation of immune responses.

Until the end of the 20th century, the theory of involution of the thymus of humans and animals was considered indisputable. According to the theory of thymus involution in adolescents 14–15 years old and animals aged 8–9 months. upon reaching the period of puberty, the organ under study undergoes complete involution in the body and loses its functional purpose. The founders of this development and age-related changes in the organ before the onset of biological death. In a 4-week-old embryo, the reticuloepithelial complex and its cellular elements are formed. The thymus reaches its maximum functional development in newborns. However, there are substantiations for the morphofunctional significance of this gland in northern animals throughout all periods of the individual Thymus is a combination of epithelial and mesenchymal reticules and, together with the capillary network, form a reticulo-epithelial complex.

Epithelioreticulocytes differentiate and various cellular immunities appear in the body and form thymus-dependent zones (in the spleen, lymph nodes, etc.). The epithelial islets of the thymus of young adult animals secrete into the blood a secret that contains hormones of the thymosin family. These hormones regulate humoral immunity in the body of animals and humans. {3}

The development of T-lymphocytes is the result of the interaction of progenitor cells and immature thymocytes with components of the thymic stroma, which contains several types of cells that create a supporting framework and form a microenvironment for developing thymocytes. {4}

Autopsy studies of the thymus of people of different age groups made it possible to verify the expression of serotonin in human thymus cells at all stages of ontogenesis. A significant increase in the number of cells containing serotonin in humans has been established.

living age and the preservation of this hormone in people of old age and long-livers at the same level as at the initial stages of ontogenesis. The intensity of serotonin synthesis does not change during ontogenesis. The data obtained convincingly indicate the preservation of the endocrine function of the gland during aging {5}.

A comprehensive assessment of the immunoarchitectonics of the thymus revealed some important trends regarding the development of stress-induced immunomodulation in the growing organism of experimental animals. under the action of various types of stressors (physical and psychoemotional). According to quantitative immunohistochemistry data

According to the analysis, among the mechanisms of thymus involution under chronic stress in a growing organism, excessive apoptosis of double positive T-lymphocytes of the cortical substance and inhibition of the proliferation of cortical thymocytes are of great importance {8}.

It has been shown that under chronic stress there is a decrease in the number of T-lymphocyte precursors in the red bone marrow and a decrease in the level of their chemoattractants in the thymus, which contributes to organ hypoplasia {9}.

MATERIAL AND METHODS

The regenerative potential of the thymus of adults (54 people) who underwent chemotherapy for 12 months for lymphoma was investigated. The dynamics of thymic activity was analyzed by assessing structural changes in the thymus using sequential computed tomography, correlating them with the results of studying the thymus by simultaneous analysis of T-cell receptor excision circles (sjTREC) and CD31 (+) recently emigrated from the thymus (recent thymic emigrants - RTE) in peripheral blood. In addition, the regeneration processes in the thymus were assessed based on the recovery of peripheral CD4 (+) T cells after chemotherapy. An enlargement of the studied organ after chemotherapy compared with the baseline level, called recurrent thymic hyperplasia, was detected in 20 patients aged 18–53 years (average 33 years).

Using general linear models of mathematical analysis, it was found that patients with hyperplasia had a faster recovery of TREC and CD31 (+) RTE levels after chemotherapy than patients of the same age, sex, diagnosis, stage of disease, and thymic function at baseline. but without hyperplasia.

These data suggest that the adult thymus retains its ability to regenerate after chemotherapy, especially in young adults. The presence of hyperplasia may promote the renewal of thymopoiesis and replenishment of the peripheral CD4 (+) T-cell pool after chemotherapy in adults {6}. The role of cytokines produced in the thymus is mainly to maintain the main processes in the thymus, that is, T-lymphopoiesis. Cytokines also coordinate cell-cell relationships.

In an experiment on white outbred male rats who were injected intramuscularly with cyclophosphamide, imunofan and their combinations, it was found that the course administration of imunofan leads to changes in the morphology of the thymus and the functioning of its bioamine-containing structures. Imunofan significantly increases the width of the cortical, diameter and area of the medulla of the thymus with a corresponding increase in the mass of the organ 7 and 14 days after the end of the course of injections. An increase in the number of luminescent granular cells of the cortico-medullary and subcapsular zones is revealed after 1 and 14 days. After 14 days, the cells of both the cortico-medullary and subcapsular zones become larger and more densely filled with granules. It has been shown that the use of Imunofan against the background of the administration of cyclophosphamide promotes an increase in the mass of the thymus, the size of the cortex and medulla of the lobules, and the acceleration of the restoration of the cytoarchitectonics of the thymus. Recovery processes occur within 1 day after the combined course. After 7 days, the weight of the thymus and the size of the cortex and medulla in rats with isolated administration of cyclophosphamide and in the group with combined administration of cyclophosphamide and imunofan differ little, but there is a tendency towards normalization of the thymus structure. After the combined administration of imunofan and cyclophosphamide, the thymus structure and bioamine supply of cells differ significantly from those with the isolated administration of both drugs. It was found that an increase in the size of the cortical and medullary substance of the lobules with the introduction of imunofan occurs due to the activation of proliferation and differentiation of thymocytes, which can be mediated by the inclusion of the production of factors that control the growth and development of lymphocytes. Imunofan reduces the destruction of lymphocytes, because it has the ability to protect their DNA from damage caused by cyclophosphamide. {7}

Increased migration of thymocytes from the thymus to the blood and peripheral immune organs is believed to be the cause of accidental involution.

CONCLUSION

Morphological studies of the thymus {thymus gland} make it possible to assess age-related changes in the functioning of the immune system in response to the action of factors of various nature. Modern immunohistochemical research methods create opportunities for elucidating stromal relationships in the thymus. Further study of the morphofunctional organization of the organ will make it possible to identify and analyze the patterns of its structural and functional changes under the action of factors of various origins on the body.

EFFICIENCY OF PDT IN SEVERE CERVICAL DYSPLASIA

Akhmatova Gulrukh Rakhmatovna*

*Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

One of the most promising and high-tech methods of treating severe dysplasia and cervical cancer today is photodynamic therapy (PDT), based on the principle of selective destruction of pathologically altered cells. This is achieved due to the effect of photo-radiation on cells, in which a special chemical substance accumulates. The essence of the method lies in the application or introduction of a certain chemical compound into the affected area and further exposure, for example, with a laser. Selectivity or selectivity is a necessary property of all drugs and substances, methods of exposure used to treat cancer and precancer. Selectivity assumes that the introduced substance or effect aimed at destroying cancer cells will not act on healthy tissues, otherwise all destructive methods of treatment will be harmful or fatal to the whole organism. Cervical cancer has the same signs of living tissue, therefore, the main difficulty in creating a selective effect is to study the properties and differences of malignant structures from normal ones. Initially, PDT in gynecology was used to treat early forms of malignant neoplasms, or was used in the complex treatment of severe widespread processes. At present, the technique, due to the achievement of high selectivity, can be prescribed for the treatment of background and precancerous diseases of the cervix, including severe dysplasias. To date, the experience of treating women with cervical pathology using the method of photodynamic therapy shows its high therapeutic activity, a minimum number of complications and side effects.

KEYWORDS: *PDT, Dysplasia, Cancer, Cervix, Precancer.*

INTRODUCTION

Photodynamic therapy (PDT) and diagnostics (PDD) have become recognized therapy and diagnostic tools for cancer treatment. This method requires at least three agents to coexist. A photosensitizer (PS), at the correct energy density and wavelength, converts chemical compounds (such as molecular oxygen O₂) into free radicals that directly cause local toxicity.

Nevertheless, the effectiveness of the treatment procedure is a complex dependence of the energy density of the activating light, the initial concentration of the photosensitizer, and the PS filling factor. Porphyrin derivatives and some other sensitizers require an appropriate oxygen concentration. In addition, these amounts and conditions may change during treatment due to photobleaching of the sensitizer, oxygen consumption, changes in PS concentration, and other factors. Effectiveness can also vary by patient and drug. In gynecological PDT, the menstrual cycle influences fluorescence spectroscopy as a monitoring tool for dosimetry and diagnostics¹ There are several aspects to consider when calculating the dose of excitation light. Higher illumination can cause thermal effects in the tissue, as well as rapid oxygen consumption, leading to photobleaching and phototransformation of the photosensitizer.^{2,3} This can reduce the effective concentration of the sensitizer, so a higher treatment efficacy is needed. either by increasing the treatment time (decreasing illumination) or by excitation with a fractionated light source.^{4,5} Photochemical modification PS and oxygen consumption should also be taken into account during prolonged exposure to light.

There is also a need for the development of sensitizers that absorb longer wavelengths due to deeper penetration of light into tissues that are not affected by hemoglobin uptake.

Moreover, the radiation dose absorbed by photosensitizers is highly dependent on the illumination configuration and the uniformity of light emitted directly from the source⁶ or from the light applicator ^{7,8}, as well as on the structure and morphology of the surface. As we show, the complex shape of the organ can also seriously affect the efficiency of light penetration into the tissue, affecting all successive stages of the treatment procedure due to the inhomogeneous delivery of the light dose. There have been few attempts to consider the effect of organ shape on PDT performance.^{9,10}

The aim of this work is to develop an approach to PDT in patients with early stages of malignant neoplasms and severe dysplasia.

The following research tasks :

1. Influence of the shape of the cervix on the effectiveness of photodynamic therapy
2. To determine the advantages of PDT over other methods.
3. Determine which drugs are most effective in PDT patients.

Methods

1. The effectiveness of PDT in different positions in manipulating patients with severe dysplasia and cervical cancer will be studied.
2. The effectiveness of all methods of treatment will be studied and the advantages of PDT will be determined.
3. Individually acting drugs that will be used in PDT treatment will be studied.

RESEARCH RESULTS AND DISCUSSION

We will be able to find a more effective treatment for PDT by changing the position of the cervix.

Studying the effectiveness of all methods in the treatment of severe dysplasia or early stage cervical cancer, selectively change the tactics of PDT treatment.

We will be able to find out what drugs will help with this method of PDT treatment in combination therapy.

Conclusion. PDT of patients will allow to solve problems with many complications that arise with other methods in the treatment of severe dysplasia of the cervix and cervical cancer. Higher rates of eradication of oncogenic HPV types in comparison with therapeutic, surgical and physical methods of influencing HPV and the absence of reinfection over a long period of observation, most likely indicate sanitation of the basal layer of the scaly integument, where the virus replicates, and also indicate cell destruction with an integrated form of HPV, when antiviral drugs become ineffective. PDT improves the prognostic factors of the clinical picture of precancerous diseases and early cervical cancer. The obtained results of antiviral efficacy demonstrate the effect of PDT, the purpose of which is to prevent the recurrence of the disease. Preservation of menstrual and reproductive functions gives a woman the opportunity for full reproductive function. Summing up, we can say that PDT is an alternative regimen of organ-preserving treatment, which affects not only the pathological epithelium, but also the etiological factors of cervical cancer carcinogenesis, which allows not only to cure the patient, but also leads to the complete medical and social realization of the woman.

ABSTRACT

The examined women were divided into somatotypes as follows: 35 (23,5%) pregnant women had asthenic somatotype, 71 (47,7 %) - normosthenic somatotype and 43 (28,8%) - picnical somatotype. To correctly assess the indicators of ultrasound data and reduce diagnostic errors, it is necessary to use the standards of fetometric indicators developed for a specific region. The average age of the examined women was $25,2 \pm 0,3$ years. All pregnant women had a single pregnancy and were in the age group from 21 to 35 years, weighing from 65 kg to 95 kg and height from 151 to 182 cm. Thus, a direct correlation was established between a woman's somatotype and the following complications of pregnancy: the threat of termination of pregnancy, anemia, preeclampsia, intrauterine infection, fetoplacental insufficiency.

KEYWORDS: *Somatotypes, Examined, Gynecological*

INTRODUCTION

The most important task of the obstetric and gynecological service is to improve the quality and efficiency of prenatal diagnostics of fetal growth and development. A modern component of this process is screening ultrasound fetometry []. To correctly assess the indicators of ultrasound data and reduce diagnostic errors, it is necessary to use the standards of fetometric indicators developed for a specific region. The development of personalized medicine, the formation of individual approaches to the assessment of the physical condition of the mother and fetus and their adaptive potential [], forces us to pay attention to the constitutional features of mothers, which undoubtedly have an impact on the process of fetal development. Populations of different somatotypes have different anatomical and physiological characteristics of the body and its components, but the same reactivity within their group []. Separate studies []. clearly indicate the features of intrauterine development and functional state of fetuses in women with different

somatotypes. Mishchenko N. A. et al. (2006), L. I. Kondakova, A. I. Krayushkin (2009) provide data on the features of the placenta morphology in women of different physiques []. However, there are no systematic studies in the available literature to identify the relationship between the anthropometric parameters of pregnant women and the fetometric parameters of the developing fetus.

The purpose of the study: to establish the features of fetometric parameters in pregnant fetuses of different height and build at the stages of ultrasound screening examinations.

RESEARCH MATERIALS AND METHODS

To solve the tasks set in the work, 149 pregnant women were examined, belonging to the dispensary groups of healthy or practically healthy, who first applied to a women's consultation and registered for pregnancy at a period of 8-10 weeks. The examination was carried out once upon admission to the obstetric hospital during pregnancy at 38-40 weeks. The average age of the examined women was $25,2 \pm 0,3$ years. All pregnant women had a single pregnancy and were in the age group from 21 to 35 years, weighing from 65 kg to 95 kg and height from 151 to 182 cm. All women were expected to give birth for the first time (pregnant women with a history of dysmenorrhea, with antenatal fetal death, with developmental abnormalities, and with intrauterine development delay were excluded).

In addition to grading by somatotype, all women were also divided into growth groups: short – from 151 to 160 cm, medium – sized – 161-170 cm and tall-171 cm and above. The selection of growth groups is due to the fact that the anthropometric indices are calculated without taking into account the body length of the subjects and they will be different in different growth groups [].

Ultrasound examinations were performed in all women Three times in the dynamics of pregnancy (in the first trimester at 10-14 weeks, in the second trimester at 20-24 weeks, in the third trimester at 30-34 weeks). In the first trimester of pregnancy, the exact period of pregnancy was determined by the size of the coccygeal-parietal size (CTD) of the fetus .In the second trimester of pregnancy, extended fetometry of the fetus was performed. At the same stage, visible fetal malformations were detected, placentography was performed, and the amount of amniotic fluid was evaluated.

The analysis of the data of the anthropometric examination of women conducted at the time of 38-40 weeks gestation showed that the average values of the length and body weight of the examined women were $159,2 \pm 4,8$ cm and $65,5 \pm 8,5$ kg, respectively. The somatotype was determined by the index in Rees, Eyshenck. The index assessment according to Rees, Eyshenck provides for the allocation, taking into account anthropometric indicators and the component composition of the body, of three somatotypes: asthenic, normosthenic and picnic.

The examined women were divided into somatotypes as follows: 35 (23,5%) pregnant women had asthenic somatotype, 71 (47,7 %)-normosthenic somatotype and 43 (28,8%)-picnic somatotype. According to our data, the course of the present pregnancy in 131 (87,9%) of the examined women was complicated. Iron deficiency anemia was the most common complication of pregnancy (78,5%).The frequency of iron deficiency anemia in the first half of pregnancy was higher in women of the asthenic somatotype, compared with women of the normosthenic and picnic somatotype.

At the same time, we found a positive correlation between the prevalence of iron deficiency anemia and the frequency of preeclampsia ($r=0,96$, $p<0,01$). It should be noted that the severity of iron deficiency anemia significantly correlated with the severity of preeclampsia ($p<0,01$, $g=0,94$).

The frequency of the threat of termination of pregnancy in women of the picnical somatotype remained high throughout the entire gestation period (41,5 %, $p<0,01$)

It was found that the frequency of infectious diseases (ARI, influenza) in women of the asthenic somatotype, registered in the first and second half of pregnancy, was 2 or more times higher than in women of the normosthenic and picnic somatotype.

Also noteworthy is the fact that in pregnant women of the asthenic somatotype, the rate of inflammatory diseases of the urogenital sphere was significantly higher than in women of the normosthenic and picnic somatotype both in the first half of pregnancy and in the second half of pregnancy. In 11,2% of women with asthenic somatotype, the gestational process was complicated by acute pyelonephritis.

A violation of adaptation in a normal pregnancy is the cause of many complications of the gestational process, the leading of which is preeclampsia. frequency of this complication was the highest in women of the picnic somatotype, compared with women of the asthenic and normosthenic somatotype. At the same time, as a consequence of the high frequency of preeclampsia in women of the picnic somatotype, chronic fetoplacental insufficiency was diagnosed in 82,9% of cases, which is significantly more frequent than in women of the asthenic and normosthenic somatotype (9,4% and 9,6%, respectively, $p<0,001$). In women of asthenic and normosthenic somatotypes, preeclampsia had a short-term monosymptomatic course in the form of edema that occurred at the gestational age of 37-38 weeks.

Thus, a direct correlation was established between a woman's somatotype and the following complications of pregnancy: the threat of termination of pregnancy, anemia, preeclampsia, intrauterine infection, fetoplacental insufficiency.

POSITIVE EFFECTS OF FORMATION OF KNOWLEDGE, SKILLS AND SKILLS ON THE BASIS OF INTERDISCIPLINARY RELATIONS

Nazokat Abidova*

*Teacher,
Tashkent State Pedagogical University,
Tashkent, UZBEKISTAN

ABSTRACT

This article analyzes the natural, scientific, neurophysiological, psychological and pedagogical approaches to the nature of interdisciplinary connections in special education. Interdisciplinary links ensure the establishment of a unified system of teaching, education and work in a special school, which significantly affects the level of generalization, robustness, completeness and differentiation of the formed concepts. This has a positive effect on the acquisition of the concepts that make up the content of the subject. The positive effects of developing knowledge, skills and competencies based on interdisciplinary connections are highlighted.

KEYWORDS: *Interdisciplinary connection, Based on the formation of knowledge, Skills, special Education, Process, Interdisciplinary communication, Natural, Scientific, Neurophysiological, Psychological, Pedagogical approaches, Labor activity, Integration, Psychological and Pedagogical bases.*

INTRODUCTION

The study of the nature of interdisciplinary links and the search for ways to implement them as a condition that significantly affects the effectiveness and practical significance of the educational process has long been in the focus of researchers and remains relevant today. the emergence of the concept of making interdisciplinary connections in the process of giving is related to the understanding in the minds of students of the obligation to reflect the world around them in a single and holistic way.

Attempts to explain the need to create a learning process based on the study of connections between objects and events, as well as to determine the role of interdisciplinary links in ensuring the successful development of children's mental development Ya.A. Komensky, IG Pestalotsy, Russian thinkers and educators AI Gersen, N.G. Chernyshevskiy, K.D. Ushinskiy, pedagogues-

experimenters V.Ya. The result of the methodological development of the theory of interdisciplinary communication, carried out by Stoyunin, NFBunakov, VIVodovozov and others, is that the unity of emotional, practical and logical aspects of learning is the interaction of emotion, perception and thinking, attention and memory. It is necessary to form an integral system of knowledge at the same time with the development of mental abilities. Long-term study of the nature and role of interdisciplinary links in the educational process Natural scientific (neurophysiological), psychological and pedagogical formed approaches. Modern interdisciplinary theory of relations is based on materialist epistemology, the doctrine of the general relationship of events and processes in nature and society, the transitions of forms of action, and the interrelationships of branches of science. From a philosophical point of view, interdisciplinary connections are seen as a didactic form of the general principle of coherence. This principle is one of the methodological principles that form the basis of knowledge in science. It requires the illumination of any object under study as a whole, which has different types of connections between the object and the objective reality within the object. An important task of the educational process based on this principle is to integrate the diversity of connections to a single abstract image.

Interdisciplinary connections are designed to create a single methodological basis for the subject organization of education in the modern school. The ability to provide a natural-scientific basis for the physiological nature of the relationship between the various features of the subject or phenomenon. It arose as a result of the development of Pavlov's theory of the reflexive nature of spiritual activity. A series of brain reflexes, combined with connections that occur under certain conditions, form a "whole association." This is the result of the reflection of the nervous system on the objective relationships of the properties and characteristics of the object. The more often and in many ways objects are viewed, the more complete and sufficient the resulting associations will be [3,p.45].

IP Pavlov reveals the neurodynamic basis of the process of formation of associations and distinguishes systematics as its characteristic feature. The reflection of the interrelationships of objectively existing objects and events in the brain leads to the emergence of a complex system of permanent and temporary connections that ensure the consistency of knowledge about the world. The systemic principle of brain activity is manifested not only in the specific stimulus, but also in the ability to interact, to form an integral association for the complex of stimuli. The strength of the nervous system's influence on the perceived object depends not only on its character, but also on the readiness of the actions of previous stimuli [2, p. 78].

This fact underlies the process of transferring previously developed associations to new drivers if these associations are in the same relationship with each other as with the generated drivers. . This is the essence of the process of transferring previously acquired knowledge about the object obtained in the study of various disciplines to a new situation in the review of other subjects [2, p. 25].

As for the problem of interdisciplinary communication, this rule can be illustrated as follows: the acquisition of existing knowledge about this object obtained in the study of other sciences in the acquaintance with new materials is related to the activity of acquiring new knowledge is an "additional stimulus" that has a positive effect on the functional state of the shell parts. By combining knowledge of the properties of the object in the process of making connections, the teacher seeks to form a high level of associative communication. The properties of reality-related

objects are similarly reinforced in the imagination. Therefore, the implementation of interdisciplinary connections in the learning process is based on the existing functional mechanisms of the cerebral cortex.

The neuropsychological substantiation of interdisciplinary communication mechanisms has been the basis for explaining psychological processes in the study on this basis.

From a psychological point of view, association is the connection between all forms of reflection of objective reality, which is based on emotions.

Psychological and pedagogical substantiation of the conditionality of the implementation of interdisciplinary connections in the learning process with the objective laws of higher nervous activity was proposed by LS Vygovsky. He experimentally determined that the activity of thinking, as a basic stage in the formation of previously emerging concepts, enters the new activity of thought by generalizing it. At the same time, he concludes that there is a clear sequence in the formation of such a generalization: the new stage of generalization appears only on the basis of the previous ones [5, p. 55]

Therefore, the highest form of generalization of knowledge about an object - concepts, should be formed by combining the previous stages - the concepts derived from different disciplines about the properties of the object.

LSVygotsky's concepts, along with a natural-scientific understanding of the nature of high nervous activity, were applied to DNBogoyavlensky, Y.N. Kabanova-Meller, A.Alyublinskaya, NAMenchinskaya, KKPlatonov, Yu.A. Samarin, AASmirnov, DBElkonin and other researchers. When the data were combined with previously learned knowledge and previous work experience in different areas, it was concluded that all the lessons play a role in the formation of new connections, associations.

Research shows that connections in the learning process are the most important means of fulfilling the functions of education, upbringing and development.

The basis for studying the mental activity that occurs when using interdisciplinary connections is associative connections. In separate lessons in the primary grades, the initial perceptions of objects and events ("local associations") that children acquire when they become acquainted with them are integrated and interdependent in the learning process, making them more complete and diverse. reflection is the next stage of generalization leading to "partial system connections". The use of interdisciplinary links to unite local associations provides the level of generalization needed to further shape concepts based on them.

One of the consequences of these rules is the requirement to combine this knowledge with its application. Learning and applying knowledge are two sides of the same coin. Applying knowledge to solve real-world problems requires children to make analytical choices from a range of disciplines.

The concepts included in each subject include knowledge of a number of disciplines. They are the source of interdisciplinary connections. The teacher has a special role to play in the implementation of this concept, because his correct explanation of the interrelationships of the disciplines helps to form the most complete, accurate picture. According to BG Ananov and

Yu.A. Samarin, interdisciplinary connections are a necessary condition for the formation of integral systemic knowledge [6, p. 56]]

One of the important tasks in solving the problem of establishing interdisciplinary links is to develop the ability to transfer existing knowledge to different conditions of activity. Implementing them, according to P.G. Kulagin, will create opportunities for the development of advanced reflection. The developed skills of knowledge transfer allow to predict some features of a new object in the mind. To successfully solve practical problems of life, taking into account the real connections of science and events, it is necessary to use interconnected knowledge in a comprehensive manner. The implementation of interdisciplinary teaching of academic disciplines is the basis for the organization of efforts to solve new problems due to the expectation of their results in the transfer of knowledge and the formation of the ability to implement them in accordance with the purpose. the transfer of knowledge contributes to the growth of their generalization. Research by LS Vygotsky, VV Davydov, AN Leontev shows that mastering the methods of movement with the material studied by children helps to understand and strengthen knowledge[5,b.76].

Special application of knowledge on a topic previously acquired by children in different lessons will not only help them to better understand and comprehend the new material, but also to better remember and systematize it. According to AA Smirnov, the spiritual grouping of educational material, the separation of general concepts in it and the establishment of connections between new knowledge and acquired knowledge help to strengthen memorization, the stability of formed concepts and their clarity. This, in turn, helps to make the images more differentiated. Mastering the ways of transferring knowledge and skills from one subject to another leads to a more goal-oriented movement in the analytical-synthetic activity of students, increases activity and independence, life-practical helps to master the methods and logic of effective problem solving.

The purpose of reasoning is to identify important connections between science and events through synthesis and analysis. The fact that analysis goes beyond a single subject deepens and expands it to a higher level. As S.L. Rubinstein points out, making connections within a material is a specific method of mental activity that is a system of synthesis and generalization in solving knowledge problems.

Recognition of the associative-reflex nature of thinking and its systemic nature defined the understanding of the process of knowledge acquisition as the formation of a complex system of associations that reflects the relationship between science and events. Interdisciplinary links ensure the establishment of a unified system of teaching, education and work, which significantly affects the generalization, robustness, completeness and degree of differentiation of the formed concepts. This has a positive effect on the understanding of the concepts that make up the content of the subject.

In a study conducted by a number of scientists led by BG Ananov, interdisciplinary connections and their use in the learning process are considered as one of the ways to increase the activity and organization of students' learning, taking into account the psychological laws of formation of concepts and notions. The attraction of knowledge from different fields of science ensures the completeness and accuracy of the concepts on the subject under study, a holistic reflection of its properties and objective connections in accordance with the principle of consistency.

The pedagogical understanding of the nature and functions of interdisciplinary connections is based on the understanding of the natural-scientific basis and the psychological mechanisms of their functioning. It should be noted that there is still no single position in defining the essence of interdisciplinary links as a pedagogical category.

Interdisciplinary connections affect the nature of teacher-student interactions in the pedagogical process. It is determined by the logic of the sciences and the connections between them.

The purpose of interdisciplinary links is to meet the following requirements for the learning process: 1) to eliminate duplication in the study of educational material; 2) the possibility of time to study specific issues; 3) consistency and originality in the definitions and characteristics of scientific concepts; 4) to combine the efforts of teachers of different disciplines in the formation of scientific concepts and notions of students, to instill in them practical skills and competencies; 5) use by teachers of scientific and technical information received by students in various subjects in the educational process; 6) the solution of other pedagogical problems connected with peculiarities of educational disciplines and the relations between them.

The results of the research have become a system of teaching disciplines in which interdisciplinary connections are made based on the integration and coordination of complementary knowledge.

Interdisciplinary coordination requires a special structure and content of the lesson, the main features of which should be: 1) the spiritual interdependence of the content of teaching several disciplines; 2) unity of forms and methods of teaching; 3) integrated use of knowledge and skills in solving practical problems. At the same time, it is necessary to identify the main directions of systematization of teaching materials in different disciplines, reflecting the interrelationships between programs and textbooks.

Coordination of knowledge is achieved through the coordination of curricula of related disciplines in terms of a general interpretation of the concepts, processes, events and time of their study. It's about understanding science in a narrow sense. Coordination helps to combine knowledge, that is, to combine elements of different disciplines in a single integrated synthetic course.

Interdependence should apply not only to knowledge in different disciplines, but also to the operational aspects of teaching different disciplines (a system of actions aimed at solving educational or other practical problems). Particular attention should be paid to the operational aspects of student activities. Solving practical problems requires combining knowledge and transferring it to a new situation. At the same time, the logic of creating such combinations of knowledge differs significantly from the logic of presenting and mastering their components in the linear study of individual disciplines.

GVVorobev believes that a system of interconnected knowledge capable of dynamic change should ensure their success in their application in practice. Establishing the right relationships in the teaching of various disciplines is interdisciplinary (speech, measurement, calculation) is necessary to master the types of activities that can be included in the type. The role of generalized directed action in the formation of activities such as solving spatial-projection problems specific to the lessons of geometry, drawing, geography was identified. According to VM Kosataya, the impact of interdisciplinary links on the education and overall development of

students is achieved through the reconstruction and improvement of the internal logical structure of teaching methods.

Based on the study of the possibilities of interdisciplinary connections in the learning process, conclusions were drawn about their impact on the learning process of students.

At each stage of the acquisition of knowledge, the implementation of interdisciplinary links has a certain impact on its progress. Thus, in the early stages, as they prepare to become acquainted with new material, they help children to actively understand unfamiliar things, to communicate, and to move from what is known to what is unknown. This will allow you to determine the purpose of the lesson. All of this is due to the fact that interdisciplinary connections contribute to the formation of reflection. At this stage, they are often carried out by students through the use of questions and assignments based on interdisciplinary material, methodical acceptance of recall and recall based on intra-topic and inter-topic connections.

When reviewing new material, it is compared with data from different disciplines, analyzed, improved, enriched. In this way, the introduction of new material into the knowledge system is ensured. In the next stage of knowledge acquisition - the process of understanding and consolidation, interdisciplinary links continue to play an activating role. They are made, according to GISHukina, temporary connections - due to the involvement of past experience, which contributes to the formation and strengthening of traces. 'allows you to increase flexibility. Thus, the generalized profession (formed as a result of mastering the connections between the methods of learning activities used in different disciplines). Interdisciplinary coordination in the educational process helps to develop and intensify the learning activities of schoolchildren, to optimize the learning process.

ABSTRACT

This article covers the relations of Muhammad Shaibanikhan and the rulers and princes of Bukhara Shaybani with the people of science and art, the support of scientists and poets, the provision of financial assistance to them, scientific considerations based on historical sources and research results.

KEYWORDS: *Bukhara, Samarkand, Shaybanis, Ruler, Prince, Muhammad Shaybanikhan, Kochkunchikhan, Ubaydullah, Abdullah II, Abu Said, Kokaldosh, Ulama, Poetry, Scholars, Qasida, Madrasa, Mudarris.*

INTRODUCTION

The period of cultural upheaval in history is associated with the formation of centralized and powerful states. At the same time, factors such as the reforms of the rulers in these countries in the field of science, personal aspirations, patronage of representatives of science and culture also contributed to cultural development. Although the political history of Muhammad Shaibanikhan and his descendants, the first representative of the Shaybanid dynasty that ruled in the history of Uzbek statehood for a century, has been sufficiently studied, the scientific and literary activities of this dynasty, its relations with science and creativity unexplored.

The enlightenment of the representatives of this dynasty and their high devotion to science, art and poetry played an important role in the development of science, culture and poetry during the Shaybanid period. They sponsored the development of science, the free activity of poets and artists, and supported them materially and spiritually. For example, Muhammad Shaibanikhan (1451-1510), Kochkunchikhan (1452-1529), Abu Saidkhan (1481-1533), Ubaydullah (1487-1540), Abdulazizkhan (d. 1551), Abdullah II (1534-1598), Abdumo Representatives of the

Shaybanid dynasty, such as Minkhan (1567-1598), Abdol Sultan (d. 1578), Abulkhair Sultan (d. 1578), Muzaffar Sultan (d. 1578), Dostum Sultan (d. 1583), were honored poets and scholars. they put their respect in place, treated them warmly, invited them to their palaces, and enjoyed their creations. Also, during the Shaybani period, this group of people had more privileges than others.

MAIN PART

First of all, the founder of the dynasty, Muhammad Shaibanikhan, was a wise, educated, enterprising and creative man of his time. He was "aware of the virtues of science and, more precisely, a person who fully possessed them, and had a great deal of faith in the field of poetry and poets." [1] Herman Vamberi writes that Shaybanikhan had great respect for the clergy of the time, even as a child, and carried with him a small beautiful library on all his travels, and, like Timur, took part in religious debates with the scholars of Damascus and Aleppo. Judge Ikhtiyar and Muhammad Yusuf, the leading commentators on Herat, were challenged about some verses of the Qur'an. ... After the death of Sultan Hussein Mirza, many scholars who needed a handful of grain took refuge in Shaybanikhan. He recruited scribes and gave them worthy assignments. He was also surrounded by a number of scholars during the military campaigns, who treated him with respect and devotion. [2]

Muhammad Shaibanikhan attracted many scholars and poets to his palace. Kamoliddin Bina'i, Muhammad Salih, Mullo Shadi, Fazlullah ibn Rozbehan and others took refuge in his palace and finished their works.

In addition, Muhammad Shaibanikhan held discussions on various issues on the agenda. They were attended by the great scholars of Movarounnahr and expressed their views. At one such meeting in Konigil, near Samarkand, a decision was made to use the lands that had become neglected as a result of wars and disputes. Also, during his reign, the role of the Uzbek language in historical and literary literature increased. By order of the khan, works written in Persian and Mongolian were translated into Turkish.

After the death of Shaibanikhan, Kochkunchikhan, who was transferred to the khanate throne due to his age, was close to culture and art in terms of military-political sphere. According to Ziyodulla Mukimov, a Shaybani scholar of statehood and law, he was a Sharia lawmaker, a hermit, and a defender of scholars and scholars. During his reign and reign, he undertook the task of blessing and bowing down to scholars and nobles. [5]

Mutribi Samarkandi (1558-1632), a Tazkiranavist writer of the Shaybanid period, also narrates a story about the khan's remoteness, simplicity and humility. According to him, from the first days of his accession to the throne, the khan often visited madrassas in Samarkand, talked to students and gave them gifts. Seeing the level of knowledge of the students, he said with satisfaction that "all the learned people of the world are gathered only in Samarkand" [6].

RESULTS

Ubaydullah, another enlightened ruler of the Shaybani dynasty, was educated by the leading scholars of his time (Amir Abdullah Yamani, Khoja Muhammad Sadr, Khoja Mullo Isfahani, Mawlana Mahmud Azizon, Mawlana Yormuhammadqori and others). Reads Arabic and Persian diligently. Mirza Muhammad Haydar (1501-1556), a statesman and cultural figure of the 16th century, described the khan's scientific achievements in his famous work "Tarihi Rashidi": "He

was adorned with all the virtues from his youth." [7] . For example, he studied hadith from the leader of modern muhaddiths, Khoja Mawlana Isfahani, jurisprudence from the leader of faqihs, Mawlana Mahmud Azizon, and recitation of the Qur'an from the famous hafiz Yormuhammad. Ubaydullah's faith and respect for the Emir Abdullah Yemeni, also known as Mir Arab, was high. It was his mentor, Mir Arab, who not only provided him with spiritual guidance, but also gave him close advice on public affairs and military matters.

Ubaydullah invited various poets and scholars and held literary talks. According to Zayniddin Wasifi (1486-1566), in February 1514, when Wasifi and his friends were sitting in the Ulugbek madrasa, a khan's official came in and said, "The khan is asking for Mawlana Wasifi." Then, when Zayniddin Wasifi went to Ubaydullah, the khan asked him for a problem and told him not to say his name. Then two problems are read in the name of the khan, and Ubaydullah considers both problems to be nameless. Then another 79 problems are written, 65 of which are considered anonymous by the enlightened ruler. This shows Ubaydullah's quick wit and ingenuity, his mastery of problem solving, and his ability to debate with poets.

He was a great statesman, a skilful politician, a creative ruler, a king and poet Abdullah II, who wrote poems in Uzbek and Persian under the pseudonym "Khan". This Shaybani ruler, like his ancestors, had a warm relationship with poets, representatives of culture and art, and did not withhold his generosity and generosity from them. In his time, scholars and poets had more privileges than anyone else. Many artists have also written poems, poems, works of art, music treatises, and melodies dedicated to Abdullah II.

One day, the poet and literary critic Mutribi Samarkandi will have the honor of meeting Abdullah II at the Khoja Guzor Fauna and Flora Preservation Center in the Aliabad district of Samarkand. The khan then asks him 3 questions in the field of poetry. Mutribi Samarkandi answers all the questions correctly and clearly. Abdullah II was pleased with the poet's knowledge and ingenuity, praised him and rewarded him with a mawut chakman and gold coins.

It should be noted that Abdullah II also had great respect for the people of the sect. He considered Sufis such as Khoja Islam Joybari, Qasim Sheikh Karminagi and Khoja Kalonkhoja as his piri. He listened to their advice in governing the country. He attracted famous scholars of his time, such as Mirzajon Sherozi [12], Poyanda Muhammad Akhsavi, Sadriddin Muhammad Bukhari, to the field of education, that is, to active social life. He appoints them as teachers at a large military madrasa he has built. It sets a sufficient salary for them to live without excessive worries [13].

Historian A.Zamonov in his article "The Price of a Poem" also cites the fact that one of the Shaybani princes was a martyr of poetry and Qasida, which shows that the representatives of the Shaybani dynasty had a positive attitude to science and creativity. [14]. According to this article, the winter of 1512 in Movarounnahr was very severe, which led to a famine. This famine, like that of the entire population of Samarkand, aggravated the plight of madrasa students.

Mawlana Abdulali Balkhi and Zayniddin Wasifi, the students of the madrasah, who are not indifferent to the state of science, are thinking of a way to bring the scholars out of the winter famine: their praise of poetry, qasida, and medieval rulers. He wrote a poem dedicated to the prince of the Shaybanis, Abu Said Sultan (the eldest son of Kochkunchikhan, who was the khan of Movarounnahr at that time. Abu Said sultan was the khan of Movarounnahr in 1530-1533)

and was awarded the prize. a spending plan will be drawn up to support the madrassa students [16].

The two writers wrote a poem dedicated to Sultan Abu Said overnight and brought it to the attention of the sultan, who was currently wintering in Konigil, outside Samarkand. The qasida was written in Persian, but Abu Said, the sultan, did not know Persian well, so his munshi (Imam Khatifi) translated the meaning of the qasida. Satisfied with this, the prince, realizing the real purpose of the mourners, gave them ten fat sheep, twenty man flour (different units of measurement in different periods, one man in Samarkand - about 20-25 kg), a hundred the khan ordered a silver (silver coin) money and four trees for firewood. Thus, the people of the madrasah, which had this supply, spent the winter of 1512 to 1513 as they wished and reached the spring. It is true that this incident means that the prince is not indifferent to the verse, although he praises the praise given to him here, and shows a certain indifference, focusing only on the praisers. It is obvious that not only the rulers, but also the princes supported the scholars, the people of creation, and did not withhold their material and spiritual support from them if they knew they needed help.

DISCUSSION

At the same time, not only the rulers and princes, but also their subordinates supported the people of science and creativity. For example, during the reign of Abdullah II, the servant Kokaldosh highly valued and guided the people of science and literature. He listened to their wishes and delivered them to the khan, helping them to ease their difficulties. From time to time he gathered poets and held poetry readings in the palace. The winners were awarded. [18]

Mirzajon Sherozi, the mentor of the famous philosopher and scholar Yusuf Karabaghi, came to Bukhara with his blessing and kindness. Hafiz Tanish Bukhari writes: "He first came to Balkh province by Sheroz and met with His Holiness through the mediation of Kulbobo Kokaldosh. At that meeting, His Majesty sent him to Bukhara with honors and pleased him with the news that he would become a teacher at his high school. "[19]

According to the scholars, Abdullah ordered Kulbobo Kokaldosh to discuss Surat al-Fath in the presence of this scholar in the palace. This event will be completed as planned. In other words, there will be a very interesting debate between Mirzajan Sherozi and the scholar Sadriddin Muhammad Bukhari on Surat al-Fath. The scholars enjoyed this discussion and felt a sense of satisfaction, and as mentioned above, Mirzajan Sherozi became a teacher at the Abdullah Madrasa. [20]

CONCLUSION

In short, Muhammad Shaybanikhan and the Shaybanid dynasty always supported the scholars, artists and poets, treated them well, and raised their status in society above other categories. He never withheld material support from the people of science and creativity when he realized that their situation was difficult. In this way, they sought to develop science and literature in their country to a certain extent. Nevertheless, science and literature did not flourish during the Shaybanid period as they did during the Timurid period.

PLACEMENT OF PRISONERS OF WAR INTURKESTAN MILITARY CAMPS

Jakhongir Tojiboev*

*Doctoral student,
Namangan State University
UZBEKISTAN

ABSTRACT

This article gives information about the prisoners of war in Turkestan and how the military camps were established to disperse the captives in the region. It also highlights data concerning POWs' living conditions in Turkestan. Most of them were sent to Tashkent. Initially, it was not difficult to place them in military camps. The barracks of the Turkestan Military District (TurkVO) were given to the captives. The Slavs were sent near the border with Kazakhstan, not far from Omsk in south-central Russia. The Hungarians and Germans became prisoners of war in the Siberian camps. The location of the camps also played an important role in the difficult lives of political prisoners.

KEYWORDS: Barracks, Prisoners, Established

INTRODUCTION

In 1914, Austro-Hungarians, Germans, Slavs, and Romanians captured in Russia, by order of the General Staff, began to be resettled in the Urals, Siberia, Turkestan, and the Far East [3]. More than 400 military camps were set up in Russia during World War I [5]. Russia had planned to place prisoners of war only in remote areas far from major cities. They were mainly sent to the areas where the railway lines reached. Because they knew that rail transport would be a great help in placing prisoners of war in military camps. But suddenly, the Russians' plans to relocate the prisoners changed. This, in turn, is due to the growing number of prisoners of war in Russia.

Prisoners of war, initially housed in military camps in Kiev, Penza, Kazan, and Turkestan, were later dispersed to different regions according to their ethnic origin. The Slavs were sent near the border with Kazakhstan, not far from Omsk in south-central Russia. The Hungarians and Germans became prisoners of war in the Siberian camps. The location of the camps also played

an important role in the difficult lives of political prisoners. For example, in Murmansk, in the far northwest of Russia, the situation of soldiers forced to serve in captivity was much worse and sadder than in the southern parts of the empire.

METHODS AND MATERIALS

According to the plan, the territory of Turkestan was not pre-designated for prisoners of war, but, as noted above, the increase in the number of prisoners led to their relocation to the territory of Turkestan. In the telegram No. 6158 of August 30, 1914 of the Chief of the General Staff to the Chief of the General Staff of the Turkestan District, it was announced that Turkestan was designated as a permanent place of detention of prisoners of war [11]. First, as early as September 1914, a stream of prisoners of war was placed in the urban areas of Turkestan.

Initially, it was planned to place about 10,000 prisoners of war in Turkestan. However, by the end of 1914, the number of prisoners of war planned to be placed in Turkestan had grown significantly. As of July 21, 1915, there were about 150,000 people in the Turkestan military district. Prisoners of war from Austria-Hungary and Germany began arriving in Tashkent in September 1914.

More than 50,000 prisoners of war of various nationalities have been relocated to Turkestan since the start of hostilities. Most of them were sent to Tashkent. Initially, it was not difficult to place them in military camps. The barracks of the Turkestan Military District (TurkVO) were given to the captives. Prisoners of war were sometimes forced to move from one camp to another. For example, a prisoner of war named Ferdinand Effenberg was brought to Peremishl on March 22, 1915, and then with other prisoners of war was sent first to Kiev, then to Moscow, in April to Tashkent, in July to Samarkand, and finally to Siberia [13].

By June 1915, the number of prisoners of war in Turkestan exceeded 148,000 [7]. They were placed in 37 specially built military camps, barracks and other places at the disposal of the Turkestan Military District. There was a shortage of space for prisoners of war in camps in the Turkestan military district. The reason was that the number of prisoners of war was increasing day by day. For example, the special zones in Kattakurgan were intended to house only 600 prisoners of war, but in practice doubled the number to 1,200. In Samarkand, the figures were 1,000 instead of 500. Under these circumstances, to solve this problem, two bunk beds were brought and installed in military camps. This event was the only way to accommodate the capacity of the captives mentioned above. About 600 prisoners of war to be housed in the camp at Charjoi were sent to barges in the Amudaryafлотilla. In the Syrdarya region, a university building in Kazalinsk was donated to 100 prisoners of war. Similar cases were reported in Perovsk [6].

According to Sterling, the head of the U.S. mission, in 1915 there were 82,425 Austro-Hungarian and 3,812 German prisoners of war in Turkestan [14]. By March 1916, the number of prisoners of war in the country had reached 200,000 [8]. They outnumbered the population of the cities where they lived. Even the Turkestan government was concerned about the areas where these prisoners of war were being held, because in the event of various riots, of course, the prisoners of war and the local population were a great force together.

In addition to prisoners of war, Austrian-Hungarian and German "civilian prisoners" - Germans, Poles, and other centuries-old tsarist troops - were brought to Turkestan. Refugees evacuated

from the western regions began to appear in Central Asia in June 1915, and by the end of the year there were about 70,000 people. Among them were about 8,000-10,000 Poles and Jews, 1,500 Baltic, and about 4,000 Germans from the Volyn and Kiev regions. Due to the influx of refugees, the Turkestan administration requested their expulsion. Beginning in May 1916, refugees began to be expelled, mainly from the Samara and Saratov regions. The remaining 8,000-10,000 people joined the ranks of Europeans in Turkestan.

Most of the refugees were from Poland, the Baltics and other parts of the empire [8]. It should be noted that in late 1915, the military governor of the Sirdarya region, Lieutenant General A. Galkin, appealed to the Catholic priest Justin Pranaytis to provide asylum for refugees from the church. Pranaytis immediately agreed, and in 1916 he granted them asylum. Initially, 63 refugees took refuge in Kostel's dormitory. They were provided with food, clothing, and other necessities. The refugees were funded by a Roman Catholic charity. Medicines and foodstuffs were also sent by Poland as humanitarian aid. In particular, in the spring of 1916, a special central committee of the Kingdom of Poland sent a group of health and food supplies to help sick refugees in Turkestan[9]. It is clear that the Polish government has not spared any assistance to its citizens, no matter where they are.

According to the Refugee Assistance Committee, as of May 1, 1916, there were 59,400 prisoners of war in Turkestan, up from June 1, 1916. ra 15,900. After the evacuation, which began in late April 1916, there were about 7,000 to 8,000 refugees left in the country [1]. The growing focus on the issue of prisoners of war and refugees in Turkestan, in turn, has worsened the financial situation of the local population, and the process has led to an economic crisis over food and livelihoods.

The reasons for the resettlement of many prisoners of war and refugees in Turkestan include:

- It is too far from the location and as a result there is no possibility of escape;
- The availability and cheapness of food in this country.

All military camps in the Russian Empire are subordinated to the Ministry of Defense under the General Staff (GUGSh). The issue of prisoners of war was initially dealt with by the 7th Division of the Evacuation Department of the GUGSh. By the fall of 1916, the GUGSh had set up a separate evacuation unit for prisoners of war. At the same time, in all military districts, units for the issue of prisoners of war, accountable to the GUGSh, began to be established [2].

The captured military officers, doctors, priests and officials were placed in Tashkent, Perovsk, Kazalinsk, Turkestan, Namangan, Kokand, Samarkand, New Bukhara (Kogon), Jizzakh and Khojand.

The military camps in the Russian Empire differed in function, as in all the countries of the First World War. Prisoners of war were sent to collective, transport, filtration, and labor camps for a period of time. Concentration camps were not set up to carry out fascist extremist activities, as in World War II, but were organized to constantly monitor the movement of prisoners of war. The decision to establish the first concentration camp was made in April 1915 by TurkVO. They planned to house 50,000 prisoners of war in this camp. Initially, two such camps were set up in Troitsk, near Tashkent, for 6,500 prisoners of war and in Samarkand for 3,500 prisoners of war [6].

The tsarist government realized that captives were a valuable resource for the wartime economy. As a result, many prisoners were forced to work on farms and mines, to participate in the construction of canals, and 70,000 were involved in the construction of railways. Many prisoners were killed during the construction of the Murmansk railway. Captives also died of malaria, vitamin C deficiency due to malnutrition and fruit and food malnutrition. The death toll totaled about 25,000. Due to the appeals and pressures of the German and Habsburg governments on the use of the labor of prisoners of war, their forced labor was much more limited.

There was a "class stratification" of prisoners in the Habib camps. Captive military officers were required by Article 190, Chapter II, Section 17 of the 1907 Hague Convention [15], to receive the same salary as soldiers received during their service in their home country during captivity. As a result, military officers received a salary of 50 to 75 rubles a month [12]. However, the remaining 1,500,000 non-commissioned officers were not paid a single salary. However, after the events of February 1917, prisoners of war were officially recruited and paid a monthly salary.

In the spring of 1915, the TurkVO command began building new camps using the labor of prisoners of war. These camps were set up along the railway line in major cities such as Kazalinsk, Perovsk, Turkestan, Chernyaev, Avliya-Ota, Khojand, Kattakurgan, Namangan, and Kokand. As construction continued, the prisoners lived in camps. The total capacity of all barracks (old and new camps) was eventually increased to 200,000 [8].

In mid-1915, prisoners of war from Turkestan were sent to work in Russia's European territory. A total of 68,000 people were evacuated, eliminating the issue of overcrowding. It should be noted that in Turkestan, as well as in the neighboring Emirate of Bukhara, the labor of prisoners of war was actively used. Thus, 138 people worked in private individuals, in the Zemstvo and municipal institutions - 551, in the military unit (on the territory of TurkVO) - 765; in the Ministry of Railways (within TurkVO) - 288; in trade enterprises - 272; in the institutions of the Ministry of Agriculture and Land Management - 209 people worked [8].

In the process of registering prisoners, Russian military officials first registered them based on which of their hostile armies and religions they belonged to. Therefore, it was very difficult to create a clear national composition of prisoners in Turkestan. For example, the national composition of the prisoners of war of the Habsburg monarchy was as diverse as the empire itself. According to the data, during the First World War, 25% of the Austrian-Hungarian armed forces were Austrians and Germans, 23% - Hungarians, 13% - Czechs, 4% - Slovaks, 9% - Serbs and Croats, 2% - Slovenians, 3% - Ukrainians, 7% - Romanians and 1% - Italians who served in the military and participated in World War I [4].

The principle of national and civilian placement of prisoners was established at the beginning of the war and was of great national importance. From 1914 to 1915, the camps in Turkestan were "mixed", meaning that they had different nationalities. Researchers have reported that since 1916, there has been a practice of division in national camps. Thus, while the camps in Tashkent were predominantly Slavic (Croatians, Slovenians, Czechs, etc.), the Germans, Austrians, and Hungarians settled in Skobelev and Fergana. If the camps were of a mixed type, the Slavs were appointed to senior positions in the internal administration of the prisoners [13].

Many citizens of the Habsburg monarchy were taken prisoner of war in 1914 (at the Battle of Galicia) or in 1916 (Brusilovsky's victory). Some were arrested while injured, others surrendered voluntarily. Each prisoner's biography is unique. In particular, these are autobiographies of

subgroups (mostly Slavs) called "friendly nations." Attitudes toward the Slavs were friendly until the Russian Revolution of 1917. Not surprisingly, they were closer to the Russians than the captured officers. In addition, the captives of the lower classes of the Slavs had more opportunities to establish human relations with the common people.

In 1915, a branch of the Union of Czech and Slovak Societies of Russian Societies was opened in Tashkent. It was soon transformed into a representative office of the Czech-Slovak National Council and operated for several years. As of January 15, 1917, there were 10,489 registered soldiers and 617 officers of West Slavic descent in Turkestan.

CONCLUSION

Thus, the issue of prisoners of war during the First World War was a process that lasted for 8 years on the Eastern Front, from August 1914 to the summer of 1922 until the release of the last group of prisoners of war from Vladivostok. Many prisoners of war spent 3-4 years of their lives in captivity in various parts of Russia from 1918-1919 until their release. Of the estimated 8.5 million prisoners of war, about 750,000 were reported to have died in military camps. About 430,000 Austro-Hungarian, German, and Turkish prisoners of war were resettled in Siberia and Turkestan during the Civil War [12], and were forced to link their lives with these countries until their return to their homeland in 1921-1922.

ABSTRACT

This article has focused on the importance of communicative tasks for young learners in teaching grammar indirectly through grammar tasks, activities and games as well as on recommendations on how to design these tasks. Teaching grammar and designing communicative tasks or activities play an important role in language teaching process for young learners. Thus this paper also pointed out beneficial results of children's attitudes and motivation toward communicative tasks for teaching grammar in language learning.

KEYWORDS: *Communication, Activity, Design, Young Learners, Grammar, Children's Capacity, Task, Creative*

INTRODUCTION

Learning a language is something that should be done naturally. Children learn to use their first language to communicate with people around them. They do not need any stationery to learn the language. But when they learn other or foreign language, they have such a kind of difficulty like: many things needed as learning media. This means that the process of learning a particular language should be as natural as possible to achieve the purpose: to communicate receptively. As well as adults, children even spend more than 45% of communication to listen. This can be a starting consideration for teachers that the beginning activities should make the children listen and become interested in the English. Naturally, they will try to recognize

the meaning and also the pattern. In recognizing the pattern, there will be an automatic process of grammar realization related to form and meaning of some particular expressions stated by the teacher. Children's language learning stages consist the things in which they should experience based on their psychological development. Playful stage is one of the characteristics of their life activities that cannot be ignored, especially in foreign language learning.

The communicative grammar tasks or activities designed for the present research work were created as production tasks. As the designers, we exercised a certain control over the language to be used, in order to make the targeted grammatical structures, if not essential, at least useful. In addition, they were designed as communicative tasks, so that there is place for negotiation and provision of feedback.

MATERIALS AND METHODS

Grammar is helpful for effective language learning. It can be taught through different methods of second language teaching. Although the principles are different from one another, there is always a focus on grammar, whether explicit or implicit. [9:p.12-88]

In 1622 a certain Joseph Webbe, schoolmaster and textbook writer, wrote:

'No man can run speedily to the mark of language that is shackled... with grammar precepts.' He maintained that grammar could be picked up through simply communicating: 'by exercise of reading, writing, and speaking ... all things belonging to Grammar, will without labor, and whether we will or no, thrust themselves upon us.'

The important grammar purpose is to make a meaningful communication. When the students communicate meaningfully, it means that they already use correct and appropriate grammar. The performance of forming children's good communication can include the combinations of their social skill, skill of thinking critically, physical activities, and creativity. This valuable combination can make a complete set of learning activities in which the purpose is to make the students "busy" of doing their "games", however they are learning something out of their consciousness.

These activities can be adapted and modified according to the language level, the number and the needs of the students. The suggested activities and procedures can be carried out with different topics or grammar items as well. The presented activities exploit the children's capacity for interaction and talk; they build on their capacity and need for movement and play.

•Animal description

The teacher draws the following chart on the board.

Animal	Size	Colour	Touch
frog	small	green	cool
elephant	long	black	wet
fish	big	brown	hard
snake	short	grey, gold, blue	smooth

Children choose an animal from the given list and they are asked to describe the selected animal by combining the characteristic features in the above chart. The teacher demonstrates the activity by providing an example.

E.g. The frog. It is small. It is green and smooth.

After children have written their definitions, they read it to the rest of the class and the others have to find out which animal they are reading about.

The above list can be extended by several other animals and also by abilities of animals e.g. what the animal can do (e.g. jump, run fast, climb trees, etc.)

•Animal movements

Each student chooses an animal and an activity or movement that the animal can do. E.g. I am a fish and I can swim. I am a monkey and I can climb trees. I am a lion and I can run fast. I am a dog and I can bark. I am a cat and I can catch mice. I am a bear and I can eat a lot of honey. etc. The teacher helps learners choose animals and form correct sentences. As soon as everyone has it correct, learners stand in a circle and the first student says or reads his or her sentence aloud. The student next to him repeats, e.g. You are a fish and you can swim. I am a monkey and I can climb trees. The third student repeats the previous two sentences and adds his or her own. In large classes, students should be divided into two circles. An alternative of the activity can be that instead of saying You are a fish and you can swim, children say: He is a fish and he can swim. In this case children have to pay attention to using the right personal pronoun he/she.

Fruit salad

Children are sitting in a circle with no spare chairs. The teacher stands in the middle of the circle and assigns a fruit to each child going round the circle, e.g. apple, strawberry, banana, peach. Children are asked to remember their fruit. Then the teacher says one fruit, e.g. banana, all the children assigned the name banana have to stand up and change chairs immediately.

When the teacher says Fruit salad!, everyone should change chairs. The teacher plays a few rounds until the children get familiar with the game, and then sits down on one chair while the children are changing chairs so that one child remains in the middle of the circle and takes over as the leader and the game starts again.

This game can be used for practicing specific vocabulary and does not necessarily need to be limited to fruit names only. Any lexical set e.g. animals, food, vehicles, etc. can be used as an alternative. In case the teacher uses another lexical set, an alternative instruction to Fruit salad should be used, e.g. if the game is based on wild animals, the teacher can say Safari, if the game is based on food, the instruction could be Dinner time.

Grab the word and run

Students work in groups of three or four, each group occupying one corner or part of the classroom. In the middle of the class, there are different words placed on a desk or a chair, each written on a piece of paper. Every group gets a particular category of words and must get those words that fit into the category, certain words fit into more categories, so the group that is the most skilful gets them. Each student can go to the desk and grab only one word. Then, another

student takes over. The activity involves word distribution and can be used for both revising and introducing new parts of speech.

The categories can be: adverbs (e.g. cloudy, sunny, windy, foggy, hot, warm, etc.), adjectives (e.g. hot, warm, fat, slim, tall, short, tired, happy, sad, etc.), ing forms s (e.g. swimming, windsurfing, playing football, running, playing golf, etc.) or nouns p(e.g. head, hair, season, weather arm, leg, neck, hand, eyes, etc.).

Listening

Children get the text of the song **Twinkle, Twinkle Little Star!** (prepared and printed in advance)

Learners listen to the song and answer the following questions:

1. What is a Karakalpak for Little Star?
2. What is twinkling referred to?
3. What about the song?
4. Let's sing a song together

Sentence scramble

Children work in pairs or groups of three. Each pair/group receives a numbered envelope containing word cards. Children work with their partners and arrange the cards from the envelope on their desk to make a sentence. Each group receives a different set of words.

Possible sentences:

If it rains tomorrow, I will stay at home.

I went to play football with my friends yesterday afternoon.

Look at those clouds, it is going to rain.

We were having dinner when the taxi arrived.

I usually go to school by bus at 7 o'clock.

Toys

Students work in pairs, where one of them gets worksheet A and the other worksheet B. For this activity, the structure of 'has got' and 'have got' must be pre-taught. Students take turns and ask questions from their partner in order to complete the chart, e.g. Student A: Has Anvar got a ball? Student B: Yes, he has. Student A: Has Barno got a balloon? Student B: No, she hasn't.

In order to gather quantitative data, we developed a questionnaire with a total of 10 questions. The questionnaire consisted of 2 sections. The first section of the questionnaire included five motivation related questions with multiple choice format. The main aim was to measure learners' likes, dislikes toward communicative grammar tasks, and their reason to learn English. In the third section, the remaining ten attitude-related questions made use of a four point Likert style. The items in this section aimed to measure young learners' views regarding their English class communicative grammar tasks teaching inductively, their English book, their English teacher, their parents' views about kids' learning English, and learning English in general. This Likert-type range was specifically designed for this age

group including 'yes', 'a little', 'no', and 'I don't know'. The format of the paper was made suitable for the age group as well supported by several different colorful pictures. In order to attract young learners' attention, rather than just marking, they were required to paint the boxes or smiles suitable for them. Students' classroom teachers and their English teachers were consulted during the questionnaire development process as well. All the questions were written in Karakalpak. The questions used in the personal interviews were similar to the items in the questionnaire. However, compared to the questionnaire data, it was possible to elaborate the answers to get deeper understandings of the young participants.

The quantitative data were gathered with the help of two different teachers responsible for teaching English in participants' classes. Kids were instructed to color smiles for their answers.. Quantitative data were analyzed using descriptive statistics . Three flows of activities were followed for the analysis of the qualitative data: data reduction, data display, and conclusion drawing/verification¹ .

RESULTS AND DISCUSSION

TABLE 1 DESCRIPTIVE STATISTICS OF YOUNG LEARNERS' ATTITUDES TOWARD LEARNING ENGLISH BY COMMUNICATIVE TASKS

Expressions	Yes		A little		No		I don't know	
	%	F	%	F	%	f	%	F
1. I would like to continue learning English.	87.5	35	8.9	3	3.6	2	0	0
2. It is fun to learn English by communicative tasks such as games and singing songs	84.4	33	12.0	4	2.6	2	1.0	1
3. My parents say that learning English is important.	82.4	33	10.9	3	2.6	2	2.6	2
4. I like my English teacher	82.0	32	6.3	2	9.9	3	9.5	3
5. Our English book is fun.	80.2		13.5		3.6		1.0	
6. My parents are happy that I learn English.	79.7		11.5		4.7		4.2	
7. I like English.	79.6		16.2		3.7		5	
8. I'm looking forward to English classes.	73.4		15.1		9.9		1.6	
9. I am good at English.	56.8		35.9		6.3		1	
10. English is easy to learn.	42.9		47.6		9.4		0	0

Firstly, it was obvious that young learners had quite positive attitudes toward learning English by communicative tasks such as games and singing songs. Over 85% of these learners wanted to continue learning it and they found it fun to learn English by communicative tasks in a friendly

atmosphere. Concerning the wish to continue learning English, F8 stated that: 'yes, I want to continue learning English, because I want to be an English teacher.' It was also obvious that learners' parents supported them in having positive attitudes because they were both pleased that their kids learned English and they explicitly stated that learning English was important for young learners. Except for 10% of the participants, all young learners liked their English teachers and for most of them their English book was fun. Regarding young learners' perceptions of English language learning and instruction, they had various ideas. To start with, when this research was conducted, learners could sing the song of alphabet, introduce themselves, meet someone, and say colors and numbers with their current English knowledge.

CONCLUSION

Teaching a foreign language to young learners is one of the most demanding, yet at the same time most challenging and rewarding tasks. The teacher needs to be a highly skilled professional who has to combine theoretical assumptions and background with practical experiences and the practical needs and circumstances of the foreign language classroom. The main aim of this work was designing communicative tasks or activities and to introduce and discuss theoretical assumptions and key issues that directly relate to foreign language teaching to young learners and to provide several strategies, techniques and concrete applicable activities for the practice of teaching young learners based on this theoretical background. Wherever possible, we have included concrete practical examples, tips and guidelines to illustrate and support our point.

IMPROVING THE METHODOLOGICAL TRAINING OF FUTURE PRIMARY SCHOOL TEACHERS USING THE EXAMPLE OF GEOMETRY

Azamova Muxtarovna Barno*

*Teacher of Namangan state university,
UZBEKISTAN

ABSTRACT

The modernization of education in Uzbekistan actualizes the problem of training a teacher who knows the methodology of an integral pedagogical process, its laws and contradictions. This presupposes the development of a teacher, in particular of an elementary school teacher, of a methodological culture (MC) in the process of geometric preparation for professional activity.

KEYWORDS: *Methodological Culture, Geometric Transformation, Geometric Information, Polyhedral, Geometric Content, Visual Geometric*

INTRODUCTION

In the conducted theoretical and experimental research, an effective technology of geometric training of a future primary school teacher, focused on the development of his MC, was revealed and tested. The conceptual basis of this technology consists in disclosing the methods used to study the geometric properties of figures, highlighting the affine, metric and topological properties of figures, disclosing the main elements, creating conditions for the development of MC in a future elementary school mathematics teacher.

The methodological basis of the technology is formed by the systemic, integrative, personal and functional-activity approaches.

The content of the technology includes an educational and professional program in geometry. The program includes the following sections: movements, similarities and affine transformations of space and plane; polyhedra; convex polyhedra and their properties; regular, semi-regular and star-shaped polyhedra, modeling of polyhedra; symmetry of polyhedra; crystals are natural polyhedrons.

The fixing manifestations of MC components in relation to geometric transformations (GT) in future teachers are: the ability to operate with a generalized approach to studying specific types of movements, similarities, affine transformations; possession of generalized techniques for solving geometric problems by the GT method; possession of the technology of teaching elementary school students to the practical use of GT; understanding of the methodology for constructing technologies for teaching students to solve problems of practical content using GT.

The peculiarity of the program is that the GT planes are studied in connection with the GT space.

The pedagogical experiment showed that the developed technology is focused on the development of MC in the subjects of the educational process.

Geometric preparation of students should be aimed at mastering geometric material in such a way that the acquired knowledge is effective and personally significant. The first is connected with the possibilities of their use in various, including educational, situations, the second - with their meaningfulness.

The means of such assimilation of knowledge is the work of understanding. The essence of understanding lies in the cognitive interaction of the system of our knowledge, experience and incoming information, the assessment of its significance for the subject.

This interaction can be carried out in the process of solving geometric problems by students. In this case, the tasks should perform the following functions:

- be a means of assimilation of different levels of activity - practical and theoretical - at the stages of analysis of the condition, search for a solution, justification, research;
- be a means of forming the ability to translate from one language describing reality to another (in the process of working on a task, texts describing geometric figures are reformulated or converted into texts describing real objects, and vice versa; translation into different "languages", the role of which is played by methods - analytical, vector, etc.);
- be a means of realizing the relationship of subject and methodological training (work on the task includes consideration of objects and situations described in the task from the point of view of their use in teaching younger students, in particular, reformulation or transformation of the conditions of tasks with the aim of using them in elementary course in mathematics).

The implementation of the named functions of geometric problems in the process of teaching students is aimed at creating an understanding of geometric objects by students, and therefore can improve the quality of professional training of future primary school teachers [7].

The emergence of a unified geometry course based on set theory in the mathematical specialties of pedagogical universities in the early 1970s was undoubtedly a progressive phenomenon. Substantial generalizations on a set-theoretical basis and the formalization of expressive means caused by them made it possible to create a new generation of university geometry textbooks. One of the distinguishing characteristics of these textbooks is the combination of geometric content that is largely traditional for pedagogical universities and new forms of its presentation. The past thirty years have convincingly shown which of the methodological findings and acquisitions really turned out to be valuable, which look dubious. The time has long come for rethinking and reassessing values, universities have long been waiting for the next generation of textbooks. I would like to hope that in them we will meet with the "denial of negation"[8].

As the practice of organizing independent work of students with educational literature shows, one of the dubious acquisitions is the abundance of analytical definitions found in it. We will give only one example - the presentation of the theory of curves in the textbook by L.S. Atanasyan and V.T. Bazyleva. The fundamental concepts of the theory “curvature” and “torsion” are defined as follows. “The vector $n = d\tau / ds$ is called the curvature vector of the line γ at the point M, and its length $|n| = k$ is the curvature of the line γ at this point”. The number v in the formula $d\beta / ds = -vv$ is called the torsion of the line γ at point M “. Despite the fact that in the future the geometric meaning of the introduced concepts is revealed, this does not give the effect that the use of genetic definitions of the named concepts gives. There is no description in the textbook of where the names of the coordinate planes of the Freinet frame came from. The fact that such an approach makes it possible to significantly “squeeze” the presentation cannot be a serious justification. We must not forget that genetic definitions clearly indicate the way of formation (or the way of origin) of the concept being defined, and this is undoubtedly more valuable for a future teacher. With this approach, geometry breaks away from its visual geometric fundamental principle[9].

At the same time, the experience of teaching a unified geometry course convincingly shows that the new level of formalization can be perfectly combined with the original content depth of the material being studied[10].

For a long time, geometry was considered synonymous with mathematics. Recently, geometry in school teaching has been losing ground. It is more and more difficult for the teacher to introduce students to geometry, to arouse interest in it, to teach them to perceive the space in which the student lives, to explore it[11].

In order for students to form clear geometric ideas, it is necessary to begin the study of geometry as early as possible. In elementary grades, students get an idea of some geometric objects (point, segment, line, polygon, etc.). Gradually clarifying and expanding ideas about them, improving the skills and abilities of working with geometric material, during the first four years, students receive a stock of geometric representations, which allows them to start studying a systematic geometry course from the 5th grade[12].

Geometers and methodologists of the Department of Algebra and Geometry of the Kolomna Pedagogical Institute, with the active participation of teachers from some schools in the city, have created a geometry program for grades 5-6. The unifying principle here is the formation of the initial and at the same time fundamental ideas about geometric transformations. The figure is represented as a set of points, although this is not explicitly stated. In the learning process, geometric abstractions are developed, and students receive geometric knowledge based on logical conclusions, and not only through specific observations.

Geometric information is repeated from class to class with some changes, meaningful enrichment occurs, an increase in the volume of geometric information. This gives the teaching of geometry an educational character. The formation of skills and abilities in operating with geometric objects depends on the content of the material provided for assimilation and the tools that students should use.

One of the main goals of modern education is the formation of a comprehensively developed personality. Geometry, connecting logical and imaginative thinking, plays an important role in this. However, for example, the reduction of hours for subjects in the physics and mathematics

cycle is the reason for insufficient attention to geometry in the mathematics course for 5-6 grades. Teaching individual courses in planimetry and stereometric sometimes causes problems in the formation of spatial representations among students. One of the possible ways to correct these shortcomings is to use the opportunities of additional education.

For example, to organize a mathematical circle for the study of geometric material in grades 5-6. In the classroom of such a circle, students: get acquainted with the basic geometric shapes, including stereometric ones; solve geometric problems "for cutting" and folding; learn to use geometric instruments (ruler, protractor, compass), perform constructions with their help. Tasks and theoretical material should be entertaining, contribute to the development of certain qualities of thinking. This age is very favorable for the development of "smart hands". The development of not only individual thought processes, but also the entire intellect of a developing personality depends on the characteristics of manual labor. The use of modeling in circle classes contributes to the formation and development of abilities: to perform logical operations of analysis and synthesis, predict the result, make its assessment and check its correctness.

Thus, in the circle classes, solid knowledge of the simplest geometric shapes, some of their properties (for example, symmetry), visual and graphic skills, methods of constructive activity are formed; develop: spatial imagination, geometric intuition and creativity.

A FAIRY TALE AS A REFLECTION OF THE NATIONAL CULTURE OF THE PEOPLE

Madinabonu Yusufjonova*

*Trainee researcher of Namangan state university,
UZBEKISTAN

Email id: ymadinabonu@gmail.com

ABSTRACT

The fairy tale, which is the leading genre of Korean folklore, is the most valuable monument of the spiritual and poetic culture of the Korean people and is of great educational value. The fairy tale has long been loved by the people. In the recent past, it was a fairy tale that nourished the spiritual culture of ordinary Koreans.

KEYWORDS: *Fairy Tales, Tales, Fables, Once Upon A Time, Storyteller, Devil, Hero, Enmal, Eniyagi, Laborer – Mosymkun, Commoner – Chongmin.*

INTRODUCTION

Located at the very edge of East Asia, Korea is renowned for its amazing beauty and diversity of nature. It is no coincidence that its inhabitants called their country so poetically: Choson - the land of morning fresh. A talented and hardworking people live here. Working for thousands of years on the land mastered by the Chosong ancestors, the Korean people have created a rich, distinctive culture. An integral part of this culture is oral folk art: fairy tales, traditions, legends, myths, proverbs, sayings and songs marked with the seal of wisdom.

On summer sultry evenings, old storytellers - Iyagikuns told fairy tales to children. More than one generation of Korean children listened with delight about miracles and wizards, about the cunning tricks of devils - tokkebi, about the spirits of deceased ancestors and relatives. In the rare hours of rest, adults also listened to iyagikunu, sitting in a shabby shack on a reed mat laid over a warm cana-ondori, on a blizzard winter night, when a cold, piercing wind raged behind a paper-covered window, or on a hot afternoon, perched in the shade of weeping willows in the rice field. Adults, like children, believed in the almighty hero - zhangsu, who is able to save them from the earthly hardships and oppression of the yangbans. They believed in a "happy" grave, for which they were looking for and could not find a single place on the "only" happy mountain. As a

reward for the search, they expected happiness and blessings from their grateful ancestors, who had long gone to chosin - another world. They also believed in prophetic dreams, in which the hero appears as a seer in the guise of a gray-bearded old man-hermit, a Taoist giving wise advice, or in the guise of a heavenly fairy - a dream that tells how to find happiness. But in real life, everything was completely different: the desired happiness did not come, life took revenge on naive people for their gullibility, mercilessly crushing ghostly hopes.

Fairy tale has always been a favorite form of oral creativity among Koreans. Some call it "enmal" - a word about antiquity, others - "enniyagi" - a story about antiquity. The roots of the Korean fairy tale go back to the hoary antiquity, and it originated somewhere at the dawn of the emergence of Korean culture. It is as difficult to determine the exact time of its appearance as it is impossible to imagine when it was: "in ancient times ...", "when the tiger was still smoking a pipe, and the buffalo spoke in human language ..." the imprint of the earliest era in the history of the emergence of Korean society. In a peculiar form, inherent only in fairy tales, they reflected the way of thinking of primitive people, their naive and sometimes distorted ideas about the world around them, the origins of customs and beliefs. It is here that the roots of many elements of fairytale fiction are hidden, images and plots widely known in Korean folklore originate from here. Korean fairy tales are an invaluable source for studying the way of life, customs, traditions and customs of the country, "for the fairy tales of any nation bear the imprint of the spirit of the people" [1]. Like the folklore of other peoples, Korean fairy tales are organically linked to real life. To a greater extent, fairy tales embody the realities of the subsequent stages of development of the feudal world with its characteristic social attributes and collisions. Thus, in the artistic form, the fairy tales reflected the characteristic features of the Korean people at different stages of its history.

Over the centuries, a natural selection of folklore material took place: subjects and style were polished. The memory of the people retained only what the soul of the people lived with, its aspirations. This is how the Russian writer and the first collector of Korean folklore N. Garin-Mikhailovsky wrote about the intrinsic value of Korean fairy tales: not only nature, but also the life-loving Koreans themselves, are fabulous, according to N. Garin- Mikhailovsky. The poetry of a fairy tale has so merged with life itself that both the fairy tale and the life of the Korean are inseparable.

"You become infected with their mood: life for them is the same fairy tale, and everything here is fabulous, and poetic, and terribly fabulous. And nature is the same" [*]. Shocked by the impression that one Korean storyteller made on him, the writer notes: "It seems ... some kind of dream, charm, in which we all were suddenly transported into the unknown depths of the rushed millennia" [2].

This collection presents the main genres of Korean oral prose. They are arranged in the traditional order of myths and legends, fairy tales, everyday tales, animal tales, folk anecdotes about the cunning and clever Kim Son Dal,

The legends, legends and myths included in the book are widespread in Korea both in the oral performance of storytellers and in the records of historical works "SamgukSagi" ("Historical Records of Three States", 1145) by Kim Busik, later chronicles of "Kore sa" ("History of Korea", 1454).

Korean legends and myths have a close connection with fairy tales; sometimes it is even difficult to determine where the legend ends and the fairy tale begins. And the fabulous plot is difficult to separate from the real history of the country. That is why there are many stories in Korean folklore about the ancestors, the founders of the ancient Korean states of Joseon, Kogur, Silla ("The Li Dynasty", "The Second Legend of the Dynasty Reigning in Korea", "The Legend of Tang Gong," which is the founder of Ancient Joseon). The mythical characters are presented as semi-historical-semi-legendary rulers or heroes of Korea.

The traditional hero of Korean fairy tales is often the sage magician Henin in the form of a gray-bearded old man. This image is probably inspired by the patriarchal-Confucian veneration of old age.

There are many tales where the character is a monk. The Korean monk bears little resemblance to his Russian counterpart. He is not attached to the temple, but walks through the villages, collecting alms, doing good, punishing evil ("Temple on Mount Baekjoksan", "How Seoul Became the Capital").

The age-old dream of the Korean people was embodied in the image of a hero - zhangsu, capable of performing miracles, making people happy ("Bloody Tears of a Hero", "Lake of a Bogatyr").

Among Koreans, as well as other peoples of the world, tales about a stepdaughter and an evil stepmother are very popular ("How Yonnie Escaped From Her Stepmother", "Rose and Lotus"). "The story of the virtuous Khonchi and the wicked stepmother and her daughter Phatchi" is notable for its realism: the heroine, Khonchi, loses not a gold, but a cloth shoe, fording a river, and marries not a prince, but a provincial governor[14].

And here is another, also very common story about two brothers: the elder and the younger, rich and poor, evil and good ("The Tale of the Soothsayer and His Three Sons"). The most famous is the tale of the malevolent elder brother Nolbu and younger brother Hinbu[15]. In Korea, where strict Confucian ethical norms have prevailed for a long time, requiring unquestioning respect for the elder in the family, the conflict between the younger and the elder acquires particular acuteness. In fairy tales of this kind, the younger brother is humiliated by the elder in every possible way, deprives him of the inheritance, or even kicks him out of the house[16]. The younger brother is in poverty, but suddenly a miracle happens - the diligence, honesty, meekness of the younger brother are rewarded. The stories of such fairy tales are very popular among Koreans. And therefore, at the mere mention of the name of the heroes of the tale, visible images appear in the mind of a Korean. Any Korean understands the meaning of the phrase, an allegory like: "Neighbor Kim is true Nolbu, and Pak is Heungbu." These and similar names have become common nouns[17].

The favorite hero of Koreans is a fisherman, in whose image the generosity of the soul of a simple Korean is embodied. He usually releases the fish caught by him to the wild, which in reality turns out to be the son of the king of the sea[18]. A young fisherman finds himself in the underwater kingdom and is rewarded for his kindness. Another hero of fairy tales is a poor lumberjack ("The Lumberjack and His Son"), who makes his living by collecting brushwood and selling it to the rich. The woodcutter goes to the mountains for brushwood, and miraculous events take place there, which form the basis of a whole cycle of fairy tales ("Fairies from the Diamond Mountains", "The Legend of the Cheonnyu Rock", "How the young man Moon Hyesong got the root of life")[19].

The hero of fairy tales is often a simple youth without any specific name. The action in these tales takes place not in the ghostly "thirtieth kingdom of the thirtieth state", but in some province, district of Korea, and the scene of the action is described very accurately, which aims to give the tale as much authenticity as possible[20].

The richest idea about life and aspirations, about the joys and sorrows of the Korean people, about their way of life and traditions are given by everyday tales. The heroes of everyday fairy tales are, as a rule, ordinary people[21]. They achieve success not with the help of sages or heavenly fairies, but thanks to hard work, intelligence, ingenuity, dexterity. Most often these are peasants or farm laborers - mosymkun or commoners - chongmin. The tales of this cycle sparkle with humor, they ridicule such human vices as stupidity, greed and envy. The plot is usually built on a disagreement between the hero and his ill-wishers. The poor man who is downtrodden and oppressed in life is completely transformed in a fairy tale and emerges victorious in a kind of duel ("A grain of millet", "The son of a butcher", "A tale about a dog, a miracle tree and a hunting horn")[22].

The hero of many everyday fairy tales is the noble Yangban ("Yangban full of coins", "How the Yangban saved a girl with friends"). But it is necessary to emphasize the originality of the Korean yangban. If in European fairy tales the "poorest" landowner had land, an estate, a servant, then the yangban in old Korea was often naked like a falcon[23]. Many representatives of the Yangban estate vegetated in want and even beggarly. The Yangbans often fed off their wealthy relatives while living in their home. Chasing the yangban was not allowed by strict kinship laws. In Korea, such impoverished yangbans were called mungeks, or hangers-on. In a number of tales, the arrogance and arrogance of the Mungek-Yanban are caustically ridiculed[24].

In old Korea, scholarship inaccessible to the common people was highly revered. A person who learned a thousand or two hieroglyphs and read several Confucian books was considered an educated scientist. The Confucian scientist in Korean fairy tales is a peculiar figure. Confucian teaching, which came from China, was elevated in Korea to the rank of state ethical and religious norm. Knowledge of Confucian dogmas was necessary to pass exams and enter an official position[25]. All the education of such "scientists" was reduced to the canonical books memorized by heart in the ancient Chinese language. Usually these "scientists" were poorly versed in the simplest life questions. It is not for nothing that the people said about them: "A Confucian scientist, but he cannot draw up a receipt for the payment of tax on a bull." Koreans have put together many tales about such would-be scholars, where their ignorance and complete ignorance of real life is ridiculed ("The cunning farm laborer Tolsve", "How the sunbi deceived a monk", "How a young man outwitted the minister")[26].

A curious feature of Korean groom tales is that the hero wants to marry not a young girl, but a young widow. Confucian morality preached the wife's reckless loyalty to the memory of her deceased husband ("The Widow's Fortress in Sunchkhan County", "To Mi and His Wife"). Even the bride was not supposed to marry another if the groom chosen by her parents died. And so the fairytale hero, in spite of the Confucian prohibitions, takes care of the widow ("Profitable Turnover"). This probably expressed a kind of protest against the disenfranchised position of women in old Korea[28].

Korean animal tales have a lot in common with other peoples' tales. Only the animals are acting in them. So, the place of the wolf in Korean fairy tales is taken by the tiger. In the eyes of

Koreans, the tiger not only symbolized strength and power, but was also the object of superstitious worship. It is no coincidence that in the old days his image was adorned with military banners and banners ("White-Eared Tiger", "Monk-Tiger", "Tiger Hunters"). But at the same time, the tiger is a sorcerer and wizard ("The Tiger and the Pipe", "The Beautiful Tigress")[29].

The deer is invariably present in animal tales. Folk fantasy associates him with heavenly fairies ("The Deer and the Snake", "How the Girl Saved the Deer"). The deer often helps the heroes as a token of gratitude for saving them from imminent death. The motive of gratitude is especially common in Korean fairy tales. The role of grateful animals is also played by a dog ("How a puppy saved the owner"), a pheasant ("A grateful pheasant") and a toad ("How a toad overpowered a cruel snake")[30].

An important influence on the formation of the image of an animal - a character in Korean fairy tales, apparently, was exerted by the existence of a belief among Koreans that if an animal lives for a hundred years, it changes the color of its fur and becomes white, and after living for a thousand years, it becomes black. Such long-lived animals are considered werewolves, capable of assuming human form. That is why Koreans have so many tales of centennial tigers, millennial werewolf foxes[31].

In the folklore of the peoples of the East, there are many fairy tales united by a single hero - the defender of ordinary people[32]. For some it is Khoja Nasreddin, for others it is Aldar Kose. For Koreans, such a hero is Kim Sung Dal. A defender of the disadvantaged, a merry fellow, a master at clever tricks, sharp-tongued, Kim Son Dal is inexhaustible on fantasies and tricks in order to teach a lesson to a swaggering, arrogant and stupid rich or stingy man. The collection presents a cycle of stories "How Kim Sung Dal sold the Taedong River".

THEORETICAL AND METHODOLOGICAL BASIS OF ATTRACTING FOREIGN INVESTMENT TO THE NATIONAL ECONOMY

Gulchehra Narzullayeva*

*Lecturer,
Bukhara State University, Bukhara,
UZBEKISTAN

ABSTRACT

The article highlights the objective role of foreign investment in ensuring economic development in modern conditions. The types of foreign investments and the peculiarities of their attraction are described. The article also outlines the priorities for economic development by attracting foreign investment.

KEYWORDS: *National Economy, Development, Investment, Foreign Investment, Capital, Competitiveness, Investment Policy, Investment Climate.*

INTRODUCTION

Reliable legal protection and guarantees are provided for foreign investors for attraction of foreign direct investment in the implementation of programs to further improve the investment climate in the country, modernization, technical re-equipment and reconstruction of production, creation of new jobs in the regions of the country with surplus labor force. In addition, investments are used as a regulatory tool to ensure the priorities and strategic objectives of sustainable development of certain sectors and regions of the economy.

An important factor in the development of the country's economy is the investment in it and its effectiveness, which is mentioned in a number of textbooks and sources published by domestic and foreign economists. It should be noted that today investment is one of the most talked issues. This is because investment, especially the inflow of foreign investment into the country's

economy and thus the development of sectors of the economy, is becoming one of the most pressing issues today. It is noteworthy that the direction in which investments are directed, determines its development, as well as the timely elimination of a number of problems that hinder the development of the country. Investment (Latin: investio-wrapping) is a long-term investment in various sectors, socio-economic programs, innovations, business projects in the country or abroad for the development of the economy. Traditionally, an investment is the implementation of specific economic projects in order to generate future income. Such an approach to describing the nature of investment is the primary focus of national as well as foreign economic literature. It should be noted that many economists have conducted research on the content of foreign investment. Theoretical view of local economist, D. Gozibekov about foreign investment is the following: "Foreign investment is the binding of the capital of one economic entity to another economy for a certain period of time, differing from domestic investment in the breadth of risks, characterized by changes in the legal environment, the investment climate, resulting in capital movements across countries and regions". From these considerations, it can be concluded that foreign investment is capital that moves from one country's economy to another's economy, which differs from domestic investment in the breadth of its risks. He added that "while foreign investment is a necessary and important source of external financing for countries, it also includes a lot of tangible and intangible assets, various technological, information, financial flows, management skills, work in world markets, experiences and more. They are characterized by cross-border movement, ie migration, change of legal conditions of operation, confrontation with additional risks and specific goals". N. Kuzieva, Uzbek economist in her scientific works states that: "Foreign countries exporting capital for the purpose of future profit, legal entities and individuals to the countries receiving capital in various forms of wealth (migration, real estate, intellectual property, etc.) and income from them (profits, interest, dividends, license and commission fees, royalties, maintenance and other rewards) are called foreign investments. 10 She thoughts, the classification of foreign investments on the basis of various characteristics further clarifies their economic nature.

One of the economists, K. Khoshimov, in his research work described foreign investment as: "Foreign investment - all that foreign owners mobilize a certain amount of capital from one economy to another for a certain period of time in order to achieve a relatively high level of efficiency, taking into account the obvious and uncertain risks to various sectors of the economy of another country that are not prohibited by law? property, financial, intellectual wealth" 11.

In our view, foreign investment means the outflow of capital from one economy to another, with the goal of placing wealth on more favorable terms and ensuring the flow of capital over a relatively long period of time until the investment returns to the foreign owner. They are characterized by cross-border migration, in which foreign investment essentially replaces their national investment climate. In addition to security, profitability, capitalization and liquidity, foreign investment is an important feature of a specific goal. The economy, which attracts their attention, is also trying to achieve its goals. These goals can be as efficiency, productivity growth and market penetration. Therefore, mutual interests, trusting relationships, taking into account the conditions of entry are the basis for the transfer of investment from one country to another. Foreign investment, unlike domestic investment, is subject to additional risks, such as country, currency, nationalization, requisition. This means that their range of risks is much wider.

It is advisable to classify foreign investments into private, public, foreign and mixed investments according to the form of ownership. Depending on the object of direction, foreign investment can be divided into financial and real investments. In developed countries, the main place in the structure of financial investments is occupied by private property owners. The structure of foreign investment can be grouped as follows (Figure 1.1).

Foreign direct investment in the structure of foreign investment is important for the development of sectors of the economy, they accumulate more capital than the level of domestic savings, support the balance of payments and can have a positive impact on economic development by expanding import opportunities.

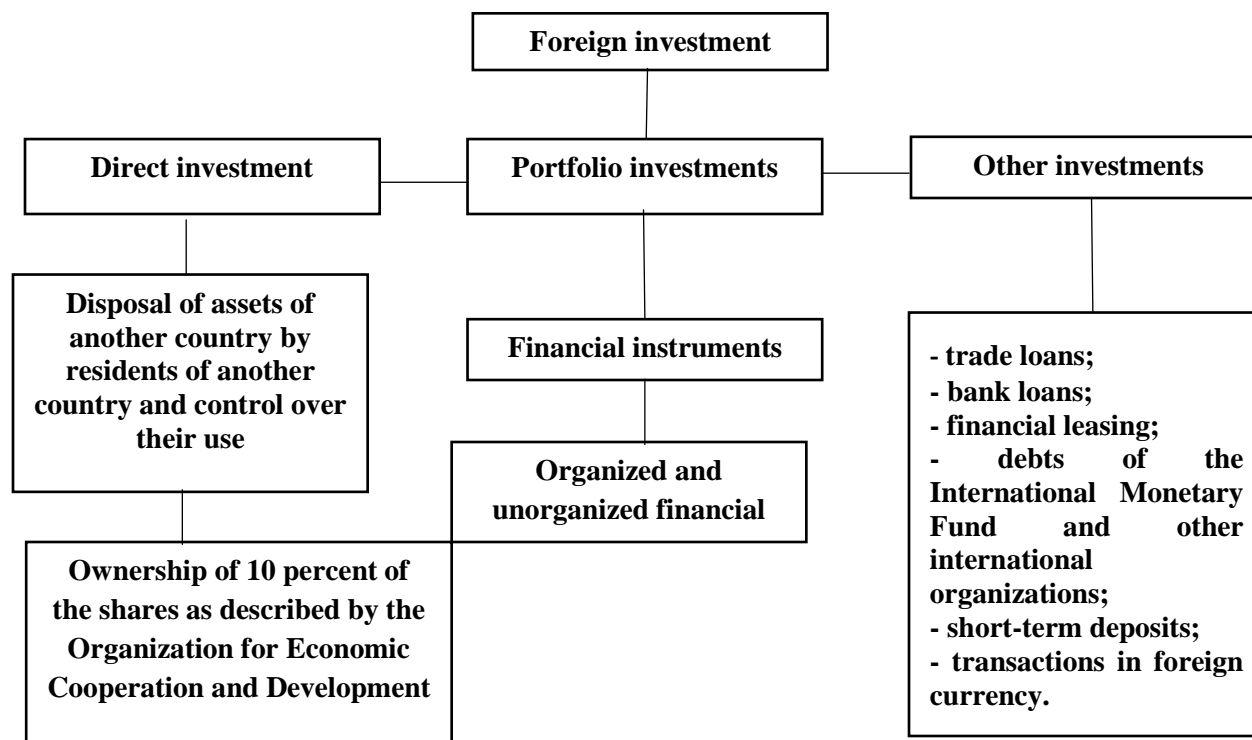

Figure 1.1. Classification of foreign investments

Foreign direct investment plays an important role in improving the operations, production and capital efficiency of individual enterprises, the introduction of new technologies and the improvement of the management system. These processes help to develop the internal market, increase the skills and practical experience of workers by indirectly influencing suppliers, customers and competitors of products and services. The above types of foreign investment have their own characteristics.

1.1-TABLE DISTINCTIVE FEATURES OF FOREIGN INVESTMENT

Signs	Foreign direct investment	Portfolio investments
The main purpose of entry	Control of a foreign firm	High profitability
Ways to achieve the goal	Organization and conduct of production abroad	Buying foreign securities
Methods to achieve the	– full ownership of a foreign	Acquisition of at least 25% of

goal	company; – acquisition of a controlling stake (from 25% of the company's share capital as recommended by the International Monetary Fund) should not be less);	the share capital of a foreign company (in the USA, Japan and Germany - 10%)
Forms of income	Entrepreneurial profits, dividends	Dividends, interest

Particular attention is paid to the work on attracting investment for the implementation of projects on restructuring the economy, modernization of industries, technical and technological renewal. Investment opportunities and real volumes are closely linked to the situation in domestic and foreign markets. Despite the negative changes in foreign markets as a result of the financial crisis, the domestic market of our country continues to grow steadily. This is the most important condition for strengthening the investment climate. It is known that the policy of stimulating the domestic market has been implemented in recent years. The steady increase in the number of jobs and wages, the rapid expansion of income from entrepreneurship through the development of small business are the factors that ensure the stability of demand in the domestic market. The way to expand the benefits and preferences for large-scale, far-sighted free enterprise, which will continue in 2018, is to increase the volume of investments, especially foreign investment, and to ensure the sustainable growth of our economy and its macroeconomic balance. This has had a positive effect on mining.

Large-scale liberalization and stabilization factors play an important role in improving the economic situation in all countries in transition. Liberalization requires free pricing, the abolition of state control over trade, and the creation of new companies without hindrance. Stabilization means reducing inflation, eliminating imbalances in the economy and foreign economic spheres.

These two factors, which are closely linked to reform, can be addressed in the early stages of the transition. Foreign investment plays an important role in international economic relations and is an important source of capital for many countries. In the context of modernization of the economy, it is possible to increase the competitiveness of products only on the basis of investment, renewal of fixed capital and on this basis to reduce production costs and improve quality. Therefore, the President of the Republic of Uzbekistan Shavkat Mirziyoyev said that ensuring the growth of investments from year to year, the launch of new modern enterprises producing high value-added, deeply processed products - to ensure sustainable economic growth, first of all, is one of the most important factors in further improving the living standards and welfare of the population.

Investment policy is a set of targeted measures aimed at revitalizing investment activities, boosting the economy, increasing production efficiency and creating favorable economic conditions for economic entities in order to solve social problems. The state's foreign investment policy is a system of measures to regulate foreign investment flows by the state. Investment policy is one of the most important permanent means of goal-oriented activity of the state in terms of socio-economic development. Such a policy is the core of the entire political sphere of

the state, or in other words, it is the basis of the political activity of the whole state. The growth of the country's production capacity, economic growth, increase in the volume and quality of production of material and spiritual goods, the development of the overall infrastructure will largely depend on investment and investment policy.

Investment policy is a function of the state to mobilize investment funds to organize the reproduction of material goods in society. From the organizational and legal point of view, this area of public policy consists of the activities of its relevant bodies to define the goals and objectives of such a policy, to seek funding for its implementation. The development of prudent investment policy plays a leading role in economic growth. For the effective implementation of investment policy, it is necessary to establish a number of institutions that will serve to create a favorable investment climate. The model that works effectively in the world economy relies on a market system and takes full advantage of the national economy. We have every reason to say that Uzbekistan has created a unique investment climate, a system of privileges and preferences for investors.

This is evidenced by the fact that the volume of foreign investment in our economy is growing from year to year. The role of foreign investment, especially direct investment, in the further deepening of structural changes in the economy, the acceleration of investment activity of enterprises, modernization of production, technical and technological re-equipment is invaluable. This will create opportunities for the introduction of advanced technologies, the creation of new jobs and, on this basis, to ensure the sustainable and balanced development of the country's economy. The experience of developed countries shows that the attraction of foreign investment has been one of the decisive factors in the high level of development of these countries. Further deepening of structural reforms in the economy, further revitalization of investment activity of enterprises, wide attraction and effective use of foreign investment, especially foreign direct investment, modernization of production, technical and technological in order to re-equip, create new jobs and on this basis to ensure the sustainable and rapid development of our national economy, a large amount of funds is allocated from the national budget. At the current stage of modernization of the Uzbek economy further improvement of investment activities is required.

DIDACTIC GAMES IN TEACHING MATHEMATICS

Jumaniyozov Kudrat Sapoyevich*

*(PhD), Associate Professor,
Candidate of Pedagogical Sciences
Head of the Department "Methods of exact and natural sciences",
Tashkent regional center of training and in-service of public education stuff,
UZBEKISTAN

ABSTRACT

This article focuses on the usage of didactic games in teaching of mathematics in schools. Entertaining elements of mathematics lessons favor increasing interest to the subject as well as the development of logical thinking. A lesson containing elements of the game is a form of interaction between the teacher and the students. Through the system of game actions, educational opportunities are realized inherent in the content of educational material. Play is creativity, play is labor.

KEYWORDS: *Didactics, Technology, Crosswords, Screen Tools, Entertaining Texts, Oral Methods, Math Quizzes, Thinking.*

INTRODUCTION

The school course of mathematics is acquiring an increasingly important role in the system of general education of students. The math teacher has to solve problems every day how to make the most productive use of every minute of the lesson. It is necessary to look for effective ways to solve this problem. At each lesson, the teacher faces a number of tasks: how to bring all the necessary information to the consciousness of each student, how to achieve the assimilation of theoretical and practical material, how to form and maintain students' interest in the study of mathematics. This task is one of the most difficult. After all, mathematics is a science that requires a lot of mental stress, the development of logical thinking and creative abilities. Therefore, to arouse students' interest in mathematics, to keep them active throughout the lesson, it is useful for the teacher not to miss an opportunity to make the lesson more entertaining. The elements of entertainment are also conducive to the development of students' creativity. The growth of interest in knowledge, the activity of students in the classroom, the formation of

positive motives for learning, an increase in the effectiveness of the learning process is facilitated by the use of didactic games, fairy tales, crosswords, mathematical quizzes, tests, elements of historicism, tables, posters, as well as the use of tasks - drawings, mathematical dictations, on-screen teaching aids, handouts, signal cards, various types of frontal polling, etc. etc. Computer technologies can play a special role the formation of positive motives for learning, an increase in the effectiveness of the learning process is facilitated by the use of didactic games, fairy tales, crosswords, mathematical quizzes, tests, elements of historicism, tables, posters, as well as the use of tasks - drawings, mathematical dictations, on-screen teaching aids, handouts, signal cards, various types of frontal survey, etc. etc. Computer technologies can play a special role the formation of positive motives for learning, an increase in the effectiveness of the learning process is facilitated by the use of didactic games, fairy tales, crosswords, mathematical quizzes, tests, elements of historicism, tables, posters, as well as the use of tasks - drawings, mathematical dictations, on-screen teaching aids, handouts, signal cards, various types of frontal survey, etc. etc. Computer technologies can play a special role...

In order for teaching to be effective, it is necessary to use in a complex all the variety of techniques and teaching methods, which we tried to do when developing lessons on the topic "Quadrangles".

About didactic games. An important role is given by us to didactic games in mathematics lessons - a modern and recognized method of teaching and upbringing...

We use the following considerations. A lesson containing elements of the game is a form of interaction between the teacher and the students. Through the system of game actions, educational opportunities are realized inherent in the content of educational material. Play is creativity, play is labor. During the game, students develop attention, a desire for knowledge. Carried away, children do not notice that they are learning: they learn, remember new things, orient themselves in unusual situations, replenish their stock of ideas, concepts, and develop imagination. Even the most passive students are included in the game, making every effort not to let down their playmates. Children tend to be alert, focused and disciplined during play.

We have developed games "The third extra", "Who - who lives in the little house", "Silence".

The game "The third extra" is convenient to use when consolidating the studied material. Students are offered three figures (quadrangles), two of which have common properties (at least one), and the third figure does not have this property, therefore it turns out to be "superfluous". The student's task is to determine the "extra" figure. The use of such a game does not lead to simple memorization of the textbook material, but to the development of students' ability to analyze facts and think logically. This game can be used to study other topics in geometry and other subjects.

Information about the quality of assimilation of theoretical material can be obtained by using the game "Who - who lives in the little house". And to quickly receive feedback from all classes - the game "Silence" using signal cards (red, yellow, green), it helps the teacher to save time in the lesson, discipline students and at the same time receive information about the assimilation of the material by all students in the class. For example, when questioning, if a student at a desk agrees with the answer of the responding student, then he raises a green card, and if not, a red one. Thus, each student has the opportunity to "speak out". (Let's agree that the green card corresponds to the statements "yes", "true"; red - "no", "not true"; yellow - "there is an

addition"). This game can be used not only for interviewing students, but also for oral exercises.

Crosswords... The use of crosswords helps not only to arouse students' interest in mathematics, but also contributes to the development of their creative abilities, develops ingenuity. It is often difficult for a teacher to achieve this, so that students thoughtfully repeat this or that material and, especially, their active participation during the participation of repetition in the lesson. And here crosswords can help the teacher. In order to compose or solve a crossword puzzle, a student must work with a textbook, learn to highlight the main thing in definitions, concepts, theorems.

Screen tools. The mathematics teacher has at his disposal a lot of teaching methods and means, including on-screen ones. Along with tables, handout cards can be considered the most promising slides - specially prepared separate frames for demonstration using a computer.

Entertaining texts. Sometimes, to enhance the impression on an important topic, you can tell or invite students to write a fairy tale. This is exactly the case presented to us in the first lesson, where the definition of a quadrangle is introduced. We decided to introduce students to the classification of quadrangles using a fairy tale.

Elements of historicism. The use of elements of historicism in teaching mathematics is also a very effective and efficient tool. The history of mathematics shows that mathematics by its origin is not the product of "pure reason", but originated from the practical needs of man and was formed as a result of the mental and practical activities of people for many centuries. It is necessary to reveal to students that mathematical concepts change and develop on the basis of practice, i.e. to reveal the dialectical path of development of mathematics. Therefore, we decided to include a historical minute in the lessons, during which we acquaint students with the history of the origin of the concept in question.

Testing... One of the modern methods of testing students' knowledge is testing. We directly use tests in the development of lessons and therefore the control work on the topic was carried out using tests.

Oral methods. Oral work in the lesson also has great educational value, developing the mental activity of students, it brings revitalizing variety to the course of the lesson. The use of oral exercises in the lesson allows you to productively and economically put the work on deepening and consolidating knowledge. We included in the lessons oral work with a table - an assignment, oral work on ready-made drawings in the form of a frontal survey, a mathematical quiz.

An ordinary survey does not arouse proper interest among students, therefore, during the frontal survey, we also use special exercises that require students to be able to apply definitions, theorems in various situations, and the ability to quickly navigate in the conditions of a problem.

The task table allows you to quickly and efficiently carry out work to consolidate the material under study, organize a repetition of the passed. The work carried out using this table, activates the attention of students, is at the same time a change in the types of activities in the lesson¹...

Also, ready-made drawings, figures drawn in bright colors on a poster and used during oral work are good at concentrating the attention of students. They help to highlight equal, proportional elements (the teacher and students agree to indicate equal elements in one color with a smooth line, and proportional elements with a dotted line). In addition, such exercises educate students aesthetically, which arouses interest in the subject. Psychologists noted that when depicting

diagrams, drawings, figures and their elements in different colors, it is best to use no more than three colors at the same time. Usually, the main elements are depicted in red, and minor ones, for example, in green and blue.

Math quizzes... Attention, observation, intelligence of students also develop math quizzes. Conducting quizzes enriches and enlivens the lesson. We conduct a math quiz in one of the lessons, where we use practical tasks on the topic "Quadrangles". Solving these problems, students analyze facts, see the relationship between science and practice. The proposed tasks are brought to the students by clearly reading the text of the exercise once or twice. The participants of the quiz are warned that a personal-team championship is being played. To identify the winner of the quiz, a certain number of points is assigned for solving each problem, determined by the degree of difficulty of the proposed problem. The winning team is determined by the total of the points scored.

About tasks... We also paid much attention to solving problems. Problem solving is used to solve educational goals: to form motivation and interest in the educational activities of students, to illustrate and concretize the material studied, to develop special skills and abilities in students, to monitor and evaluate the results of their educational work, etc. Repetition is also carried out through a system of tasks - the systematic and purposeful formation of those operations that make up the solution process. Geometric calculation problems are characterized by the following operations: identification of the relationship (relationship) between the elements of a certain figure; direct search for the sought-after from relations containing one unknown; the selection of an auxiliary task (subtask), which consists in finding some unknown; drawing up an equation or systems of equations.

One example that contributes to the development of students' thinking is the method of auxiliary tasks. Its essence is as follows: a given task, if it encounters difficulties for a student, is initially replaced by an auxiliary task (tasks) prepared in advance by the teacher, which in some elements of the solution is similar to the main task, or is part of the main task, or the solution to one of them follows from solutions are different. An auxiliary problem is offered to students before solving a complex problem or in the middle of a solution, but the students are not told that it is an auxiliary problem. Then the main task is solved. Using the example of one lesson on the topic "rectangle", we will try to show the use of dialectical games in teaching mathematics.

The purpose of the lesson: repeat the concept of "rectangle" with the students, familiarize with the new definition and study its properties.

Equipment: computer, projector.

The lesson uses a didactic game.

During the classes:

10. Conducting a lesson in the form of a didactic game.

Teacher: Today in the lesson, guys, we will play. The game will consist of several stages, which I will introduce you to during the lesson. Let's break up into three teams (each row is a team). Each of the teams will earn points for themselves at each stage.

Stage I - updating basic knowledge.

Now we will choose the captains of the teams as follows: you must reproduce in notebooks for

Fig. 1

Fig2

independent work the reference notes based on the material of the previous lesson on the topic: "The rhombus and its properties." Writing key notes will take 4-5 minutes. The captain of each team will be the one who plays the keynote first. If the team does not have time to complete the work in 5 minutes, then it loses 2 points for every extra minute; if she completes the task in less than 5 minutes, she will receive 2 points for each saved minute. I'll keep an eye on this. Those who need advice can raise their hand and the captain will advise him. But each consultation deprives the team of 2 points. The number of consultations in all teams and the scores will be written on the board. (Notebooks of teams are reviewed by the teacher during consultations and independent work of students,

Stage II - consultation.

Guys, now each team should hold a consultation on the issues written on the board. It is allowed to use the textbook during the consultation. The consultation takes

5-6 minutes.

Questions:

1. What quadrangle is called a parallelogram?
11. What is a rhombus?
12. Formulate the properties and attributes of a parallelogram.
13. Formulate the properties of the rhombus.
14. Which straight lines are called perpendicular?
15. Formulate a criterion for parallelism of straight lines and a consequence of it.
16. Formulate the property of the angles formed at the intersection of parallel secant lines and the consequences from it.
17. Formulate a criterion for equality of right-angled triangles.
18. Stage III - learning new material.

The following pictures and questions are projected onto the screen using an overhead scope.

1. Select rectangles from among the quadrangles proposed in Fig. 1.
2. Can it be argued that a rectangle is a parallelogram?
3. What can you say about the degree of each corner of the rectangle?

4. Give the definition of a rectangle.
5. Prove that rectangle $A_2B_2C_2D_2$ has sides C_2D_2 and A_2B_2 ; A_2D_2 and B_2C_2 are parallel.
6. In fig. 2 name all right-angled triangles.
7. Find Equal Rectangular triangles and justify their equality.
8. What conclusion can be drawn about the diagonals of the rectangle?
9. Formulate properties that apply to both the parallelogram and rectangle and rectangle-only properties.

Teacher: Now, one by one, the team captains will call their rivals to answer the questions presented to you on the screen. Each team will answer three questions, 9 questions in total. 10-12 minutes are allotted for the study of new material.

Stage II - drawing up a reference outline.

So, guys, you and I considered a rectangle as a particular type of a parallelogram, got acquainted with its properties. Now you read the tutorial material we've covered. (Students read the "Rectangle"). Now close the textbooks and write a pivotal synopsis in your workbooks. At this stage of the lesson, we will take up to 8 minutes. Again, as in the first stage, the team will receive points for a job well done. When drawing up a synopsis, you can use this drawing.

Stage V - problem solving.

Each team must solve a problem.

The tasks for the three teams are written on the board.

1. Prove that if a parallelogram has all angles, then it is a rectangle.
2. Prove that if a parallelogram has equal diagonals, then it is a rectangle.
5. Prove that if the parallelogram has at least one corner of a straight line, then it is a rectangle.

Weak students are called in to answer these tasks. Each team gets points for solving the problem.

Stage VI - summing up the results of the game.

Today in the lesson during the game, we guys got acquainted with a new type of quadrangle - a rectangle, as a particular type of parallelogram, which has all its properties. In addition, we have expanded the property that applies only to the rectangle: the diagonals of the rectangle are equal. When solving problems, we got acquainted with the features of a rectangle, i.e. those of its properties that make it possible to establish that the parallelogram is a rectangle:

If in a parallelogram: 1) the diagonals are equal; or 2) all angles are equal; or 5) at least one corner of a straight line.

Here the winning team is named, individual students are given a grade in the magazine.

The usage of didactic games in mathematics lessons will allow students to show interest in the subject under study, and also contribute to the development of logical thinking and increase the activity of students in general education schools.

FORMATION OF THE CONTENT OF THE EDUCATIONAL-METHODOLOGICAL COMPLEX "INFORMATION AND COMMUNICATION TECHNOLOGIES IN EDUCATION" IN THE SYSTEM OF PROFESSIONAL DEVELOPMENT

Jumanazarov Sirojiddin Salaydinovich*

*PhD, Tashkent Regional Center of retraining and in-service,
Personnel of public Education,
Tashkent, UZBEKISTAN

Abstract

The article deals with the formation of the content of the educational and methodological complex in the direction of innovative activities in the process of professional development of public educators. The content of practical training in the organization of the educational process in accordance with the working curriculum, the principles of "simple to complex, practical application of theoretical knowledge" were followed.

KEYWORDS: Educational-Methodical Complex, Educational Program, Interactive Educational Methods, Innovation, Theoretical And Practical Training

INTRODUCTION

The widespread introduction of advanced pedagogical and information and communication technologies in the educational process, as well as innovations in the education system are one of the main criteria for increasing the effectiveness of education. This makes it necessary to update the educational and methodological complexes used in the system of self-training, as well as to form them in accordance with modern requirements.

Educational-methodical complexes mean a concept that represents a set of didactic tools used in the educational process [1].

What is the content of teaching training modules in the field of information technology in the system of professional development today, what are the pedagogical problems in the creation of educational and methodological complexes in this area. The following issues are analyzed from a scientific and pedagogical point of view.

Main part:Currently, the regional centers for retraining and advanced training of public educators are working effectively to create educational and methodological complexes aimed at the formation of innovative pedagogical activities of listeners, combining the latest achievements of information and communication technologies. In particular, educational and methodological complexes, which are important in improving the quality of education and the formation of innovative pedagogical activity of listeners, are created in accordance with the requirements of the time based on the needs of listeners [2-5].

These educational-methodical complexes were formed as a result of the study of the needs of listeners in the process of professional development on the basis of surveys, educational-practical seminars in basic schools and cooperation with mentors in the field of science.

Here we consider the content of the educational-methodical complex "Information and communication technologies in education."

The working curriculum is based on the basic curriculum of the in-service training course for public educators and teachers, which describes the goals, objectives and requirements for the knowledge, skills, competencies and competencies of the trainees in the module. The curriculum takes into account the organic sequence of topics and the existing knowledge of the audience on information technology in the creation of educational and methodological complex. Therefore, the program is given not only basic concepts about information technology, but also provides for a complete acquaintance with its technical tools and the formation of skills for working in them.

Interactive learning techniques used in teaching the module. One of the main criteria for directing listeners to innovative pedagogical activity in the teaching of this educational module is the appropriate and effective use of interactive educational methods in the teaching of training. The educational-methodical complex includes the proposed interactive teaching methods and their descriptions in the teaching of the educational module.

Useful interactive teaching methods in teaching the module. One of the main criteria for directing listeners to innovative pedagogical activities in the teaching of this training module is the ability to use interactive teaching methods in the classroom. The educational-methodical complex contains the recommended interactive teaching methods and their descriptions in teaching the module.

Theoretical training materials (2 hours). The educational-methodical complex is created in a methodologically coherent sequence, ie the content of the theoretical material is presented in a logical sequence and the essence of the topic is revealed through the basic concepts and theses.

It fully covers the knowledge and skills that need to be conveyed to the audience on the topic. The topic of the training module is "Modern information and communication technologies in education" for 2 hours.

Practical training materials (6 hours). The practical training of this educational module consists in the development of competencies of the listener to effectively use information and communication technologies in their professional work and the preparation of electronic and didactic materials in innovative pedagogical job. The content of practical training In the organization of the educational process in accordance with the working curriculum, the principles of "simple to complex, practical application of theoretical knowledge" were followed. It is advisable to perform tasks based on the direction and characteristics of the profession in the

conduct of practical training. Therefore, the main focus is on the formation of practical skills. The following is the content of the practical training: In the educational-methodical complex the theme "Creation of educational materials with the help of practical programs" is designed for 2 hours, the main purpose of which is to develop the skills and abilities of listeners to create educational materials using practical programs. The theme "Use of multimedia technologies in education" is also designed for 2 hours, and the purpose of the lesson is to develop listeners' skills and abilities to use multimedia technologies. In addition to developing the knowledge of multimedia tools needed in their professional activities in the process of professional development of personnel of public education, it is also necessary to develop students' skills and abilities to use the Internet, its capabilities and Internet educational resources in the educational process. The theme of the Internet and its services is to develop students' skills and abilities to use Internet resources and their services.

Bank of Cases. In the course of the practical training, the tasks of the listeners to study the situation, analyze it and solve the problem using the case study method are presented in tabular form.

Independent study topics. Topics of independent study are presented in order to further develop the knowledge of listeners on the training module, the independent use of Internet resources in their professional work and the formation of qualification paper, as well as the preparation of presentations. These independent learning topics almost covered the materials in the training module.

Glossary. In the materials of the training module there are Uzbek and English explanations of terms, which are used a lot and come as a base phrase.

The list of used literature contains a list of used and recommended literature and electronic resources for this module.

CONCLUSION

In ensuring the quality of the educational-methodological complex, it is recommended to take into account the relevance of the topics, their compliance with the requirements of the state and the needs of the educational system, the ongoing socio-political and democratic changes in the country, priority issues of reforms in the areas of economic, legal and other spheres, as well as the latest achievements. This determines the position of the educational module in education to acquaint the audience with information and Communication Technology in education, its application in practice and thereby ensure the effectiveness of Education.

The following recommendations on the organization and conduct of training on the basis of the educational-methodological complex "Information and Communication technologies in education" in the process of qualification development of regional centers are referred to:

- carrying out in education in the form of theoretical and practical training of modern information and communication technologies module;
- to give information about modern information and communication technologies;
- to teach the use of technical tools and practical applications.

The following recommendations on the organization and conduct of training on the basis of the educational-methodical complex "Information and Communication Technologies in Education" in the process of professional development of regional centers are presented:

- Conducting modules of modern information and communication technologies in education in the form of theoretical and practical training;
- Providing information about modern information and communication technologies in education in theoretical training;
- To teach the use of technical means and practical programs in practical training.

It is recommended to use the following forms of teaching in this educational-methodical complex:

- lectures, practical classes (understanding of information and technology, developing intellectual curiosity, strengthening theoretical knowledge);
- round tables (to increase the ability to make proposals on the solutions of the tasks under consideration, to hear, to perceive and to draw logical conclusions);
- discussions and discussions (provide evidence and substantive arguments on assignment solutions, develop the ability to hear and find solutions to problems).

The content of the educational-methodical complex is inextricably linked with the curriculum modules "Educational technologies and pedagogical skills", "Specialized disciplines" and "Pedagogical software in education" to increase the level of formation of innovative training of listeners in the training process.

STUDY OF FREQUENCY INDICATORS OF COMORBID STATES AT DIFFERENT FUNCTIONAL CLASSES OF HEART FAILURE

Tosheva Khakima Bekmurodovna*; **Zokirov Aziz Chorievich****

^{1,2}Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

In order to study comorbid conditions in patients with chronic heart failure (CHF) living in regions with a hot climate, 323 patients were examined, including 150 men (46.43%), 173 women (53.56%) aged up to and older 60 years. Analyzes showed in groups of patients with low hemoglobin albuminuria was detected in 35.6% of cases, in the absence of anemia 24.3% ($p < 0.05$). Blood creatinine indices in patients under 60 years old was 74.9 ± 17.7 and in 60 years old and older $98 \pm 21.9 \mu\text{mol} / \text{l}$, an increase in the indicator was noted depending on the FC of CHF, amounted to I-FC- 83.2 ± 2 , 8, II-FC 101 ± 3.8 , III-FC 128 ± 5.4 , IV-FC $138.9 \pm 9.1 \mu\text{mol} / \text{L}$ ($p < 0.05$). Thus, in patients with CHF, the incidence of comorbidity increases in proportion to the age and functional class of chronic heart failure.

KEYWORDS: *Comorbidity, Chronic Heart Failure, Ischemic Heart Disease, Chronic Kidney Disease, Functional Class, Fibrosis Markers, Anemia, Creatinine, Albuminuria.*

INTRODUCTION

Experts from the World Health Organization consider the increase in the prevalence of chronic diseases as a global epidemic of the 21st century [6,15]. Among them, a special place is occupied by ischemic heart disease (IHD) and arterial hypertension (AH), as the causes most often leading to chronic heart failure (CHF). It is well known that due to the introduction of new modern therapeutic and prophylactic methods, as well as an increase in the proportion of elderly and older patients, the number of CHF patients is increasing [1,6,7,14,15]. It should be noted that with an improvement in the quality of life and its duration, the proportion of ischemic heart disease and hypertension and associated CHF will certainly increase. According to the American Heart Association (AHA), CHF was named the leading cause of death in 283,000 people in 2008 and represents a new epidemic of cardiovascular disease (CVD), affecting more than 23 million

citizens worldwide, and the economic costs associated with CHF are estimated at billions of dollars per year [5,9,18].

A characteristic feature of the modern diagnostic and treatment process for chronic diseases, which include CHF, is the presence of a combination of several pathological conditions in the patient, i.e. comorbidity, which has received special attention in recent years, while most often we are talking about comorbidity in a patient, and not with any disease [2, 8]. According to European studies, the risk of developing CHF is especially high in the presence of both coronary heart disease (CHD) and diabetes mellitus (DM) [5,18]. According to various researchers, the presence of high comorbidity leads to an increase in mortality in patients with chronic disease, a decrease in the quality of life and social maladjustment [6,11,13]

Initially, the term "comorbidity" (Latin co - "together" and morbus "disease") was proposed by Feinstein A.R. This concept characterizes the presence of an additional clinical picture that already exists or has appeared independently, in addition to the current disease and is always different from it [3,12,16].

The prevalence of comorbidity varies significantly and significantly depends on the parameters of the sample (patients, doctors and clinics, sex of patients, age, adherence of researchers to different classifications of diseases), but in general there is an increase in the frequency of comorbidity with age, mostly in women [1,9,17 ,20]. According to M. Fortin's data, based on the analysis of 980 case histories taken from the daily practice of a family doctor, the prevalence of comorbidity ranges from 69% in young patients (18-44 years old) to 93% among middle-aged people (45-64 years old) and up to 98% - in patients of the older age group (over 65 years old). Moreover, the number of chronic diseases in one patient varies from 2.8 in young patients to 6.4 in older people [4, 15].

The most significant (92%) proportion of patients with comorbidity is found among patients with CHF, and the most common combinations of diseases include diabetes mellitus, ischemic heart disease, anemia, as well as hypertension, obesity and hyperlipidemia. At the same time, comorbidity cannot be described using several simple combinations of diseases, which also do not reflect differences in the severity of the condition, the effect on the level of physiological and mental functions, and disability [10, 14].

The aim of the study. To study comorbid conditions in patients with CHF living in regions with a hot climate.

MATERIAL AND METHODS

We examined 323 patients who were inpatient treatment in the cardiology department of a multidisciplinary hospital in Bukhara. Among the examined patients there were 150 men (46.43%), 173 women (53.56%). All patients had CHF and were divided by age into 2 groups up to 59 years old - 161 people and the second group - 162 people over 60 years old. The average age in group 1 was 52.55 ± 6.42 years, in group 2 - 67.56 ± 6.7 years ($p < 0.01$). CHF was diagnosed and assessed in accordance with the recommendation of the Heart Society of New York. All patients underwent general clinical and laboratory examinations, ECG and the results were processed according to the standard method. In addition, patients were interviewed using the Minnesota Questionnaire.

RESEARCH RESULTS AND DISCUSSION

According to the functional class (FC), the patients were distributed: I FC-26.93%; II FC-50.51%; III FC-22.29%; IV-0.26%. Body mass index on average in the first group under 60 years old was 29.4 ± 4.9 , in the second group over 60 years old - 28.1 ± 4.5 .

All patients had comorbid conditions. Thus, there were 43 patients with one concomitant diagnosis - this amounted to 13.31% of patients, with two concomitant diagnoses - 214 patients, which amounted to 66.25%. With three comorbidities - 56 patients, which amounted to 17.33% of patients. In 9 patients, there were 4 or more concomitant pathologies, accounting for 2.78%. On average, the general comorbidity averaged 2.1 ± 0.67 , in the group under 60 years old 1.9 ± 0.53 , over 60 years old - 2.2 ± 0.75 ($p < 0.01$).

When evaluating comorbidity by functional classes, it was found that in patients with 1 FC among 87 people, the comorbidity was 1.74 ± 0.61 , in patients with 2 FC in 164 patients it was 2.1 ± 0.57 in patients with 3 FC among 72 patients comorbidity was 2.54 ± 0.65 . The analysis showed that with age and an increase in CHF FC, the frequency of comorbid conditions increases in parallel and is most often diagnosed in older age groups with III-FC CHF.

The patients were divided into two groups depending on the parameters of blood hemoglobin. In the first group, hemoglobin indices were 112.4 ± 10.2 , in the second group, hemoglobin was 134.9 ± 8.9 ($p < 0.05$). The average age of patients with anemia was 64 ± 10.1 years, and those with normal hemoglobin values were 57.9 ± 9.1 years ($p < 0.05$). The study of hemoglobin indices depending on the FC of CHF showed the following: with I-FC - 139.9 ± 16.8 , with II-FC - 118.5 ± 19.7 , with III-FC - 112.2 ± 14.5 , with IV-FC - 102.5 ± 10.2 ($p < 0.05$). The analysis showed that anemia is often diagnosed in older patients with CHF and the frequency increases depending on the FC of the disease.

Therefore, in order to study renal dysfunction in patients with CHF, we analyzed the number of patients with albuminuria and blood creatinine levels. We studied the incidence of albuminuria in the examined patients with CHF, depending on age, FC, the presence of anemia.

If albuminuria was detected in 24.8% of patients under the age of 60, then in older age categories it occurs in 35.1% of patients ($p < 0.01$). This confirms that renal dysfunction in patients with CHF increases with age. In 323 patients with CHF, the incidence of albuminuria was studied based on FC and age. It was revealed that the age of patients with I-FC 54.8 ± 9.3 , II-FC 54.4 ± 10.3 and III-FC 64.5 ± 9.9 years.

Analyses showed the presence of albuminuria in patients with I-FC 12.3% of cases, II-FC 18.5% of cases, III-FC 29.1% of cases.

In patients with CHF, with an increase in FC, the number of patients with albuminuria increases in parallel, which corresponds to the literature data.

Also, in the observed group of patients, the incidence of albuminuria was studied depending on the hemoglobin parameters. Analysis of data in groups of patients with low hemoglobin albuminuria in 35.6% of cases, in the absence of anemia 24.3% ($p < 0.05$). The blood creatinine indices in patients under 60 years old were 74.9 ± 17.7 and in 60 years old and older - 98 ± 21.9 $\mu\text{mol} / \text{l}$ ($p < 0.05$).

A comparative analysis of this biochemical indicator, depending on the presence of anemia, revealed the following: with hemoglobin 112.43 ± 12.0 g / l, creatinine was 119.64 ± 13.7 μ mol / l and with hemoglobin 134 ± 9 g / l, this indicator was 89.6 ± 8.5 μ mol / l ($p < 0.01$).

Based on the FC, when comparing the creatinine indices, it was in patients with FC I- 83.2 ± 2.8 , FC II- 101 ± 3.8 , FC III- 128 ± 5.4 , FC-IV 138.9 ± 9 , 1 μ mol / L.

Analyzes of patients with CHF showed that with increasing age and FC, creatinine levels in the blood increase, the process is aggravated in the presence of comorbid pathology, which confirms the presence of impaired renal function in a certain number of patients we observed.

CONCLUSION

CHF often occurs with comorbid conditions, among which anemia, dysfunction with an increase in chronic kidney disease are most often diagnosed.

The presence of renal dysfunction is confirmed by a large number of patients with proteinuria and high blood creatinine levels.

The incidence of comorbidity increases in proportion to the age and functional class of chronic heart failure.

MORPHOFUNCTIONAL CHARACTERISTICS OF THYMUS UNDER EXPOSURE TO VARIOUS ENVIRONMENTAL FACTORS

Sabohat Bahodurovna Azimova*

*Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

In the presented article, devoted to the features of the structure and function, morph metric parameters of the main structures of the thymus {thymus}, the patterns of development of this organ at the stages of postnatal ontogenesis are revealed. An increase in the number of luminescent granular cells of the cortico-medullary and subcapsular zones is revealed after 1 and 14 days. After 14 days, the cells of both the cortico-medullary and subcapsular zones become larger and more densely filled with granules.

KEYWORDS: Morphology, Organs Of The Immune System, Thymus, Action Of Environmental Factors

INTRODUCTION

The immune system of humans and animals is one of the most reactive systems of the body, reacting quickly to the effects of damaging factors at the earliest stages. The immune system is formed by a complex of organs and tissues that create protection against foreign endo- and exogenous influences.

It arose in the early stages of evolution and its activity is based on the recognition of foreign antigens, their destruction and removal, which is absolutely necessary for the survival of the organism. {1}

At present, convincing data have been accumulated indicating that the immune system largely determines the body's resistance to the effects of chemical factors. The central organs of immunogenesis in mammals are the thymus, where the formation and reproduction of T-lymphocytes takes place, as well as the red bone marrow, where B-lymphocytes are formed and multiply. Peripheral lymphoid organs are lymph nodes, spleen, tonsils, intestinal lymphoid follicles. The immune system of humans and animals is one of the most reactive systems of the

body, reacting quickly to the effects of damaging factors at the earliest stages. The immune system is formed by a complex of organs and tissues that create protection against foreign endo- and exogenous influences.

It arose in the early stages of evolution and its activity is based on the recognition of foreign antigens, their destruction and removal, which is absolutely necessary for the survival of the organism. {1}

Also immobilization stress induces adrenal hypertrophy, thymic involution and the appearance of destructive lesions in the gastric mucosa of white rats, correlating in terms of potency with the duration of stress exposure. Pathomorphological changes in the adrenal glands were characterized by hypertrophy, predominantly of the fascicular zone of the cortex. Also, under immobilization stress, there was a massive death of T-lymphocytes and their release into the cardiac bed, which was accompanied by involution of the thymus. {10}

During a stress reaction, T-lymphocytes are released into the blood and massive death of lymphocytes in the organ itself, especially in the cortex. Thus, with a 6-hour stress exposure, a 1.3-fold decrease in the thickness of the thymus cortex of white rats compared with that in animals of the intact group, the value of this indicator was 260 μm , with a range of fluctuations from 200 to 290 μm . On the contrary, the area of the medulla in the thymus of rats after stress exposure increased by 1.2 times (Fig. 2) and amounted to 940 μm , the oscillation range varied from 840 to 1020 μm . {11,12}

Lymphoid tissue, being the main site for the development of specific immunological reactions, contains numerous cell populations involved in ensuring the genetic constancy of the internal environment of the body. {2}

The thymus is considered as an immune organ in which acquired and natural immunity is formed with the help of biologically active peptides through the production of thymic hormones and the formation of progenitor cells of T-lymphocytes.

In the structure of the immune system, the thymus provides the maturation and differentiation of T-lymphocytes, including in the peripheral immune organs, stimulates the integration of various populations of T-lymphocytes and macrophages for the implementation of immune responses.

Until the end of the 20th century, the theory of involution of the thymus of humans and animals was considered indisputable. According to the theory of thymus involution in adolescents 14–15 years old and animals aged 8–9 months. upon reaching the period of puberty, the organ under study undergoes complete involution in the body and loses its functional purpose. The founders of this development and age-related changes in the organ before the onset of biological death. In a 4-week-old embryo, the reticuloepithelial complex and its cellular elements are formed. The thymus reaches its maximum functional development in newborns. However, there are substantiations for the morphofunctional significance of this gland in northern animals throughout all periods of the individual Thymus is a combination of epithelial and mesenchymal reticules and, together with the capillary network, form a reticulo-epithelial complex.

Epithelioreticulocytes differentiate and various cellular immunities appear in the body and form thymus-dependent zones (in the spleen, lymph nodes, etc.). The epithelial islets of the thymus of young adult animals secrete into the blood a secret that contains hormones of the thymosin family. These hormones regulate humoral immunity in the body of animals and humans. {3}

The development of T-lymphocytes is the result of the interaction of progenitor cells and immature thymocytes with components of the thymic stroma, which contains several types of cells that create a supporting framework and form a microenvironment for developing thymocytes. {4}

Autopsy studies of the thymus of people of different age groups made it possible to verify the expression of serotonin in human thymus cells at all stages of ontogenesis. A significant increase in the number of cells containing serotonin in humans has been established.

living age and the preservation of this hormone in people of old age and long-livers at the same level as at the initial stages of ontogenesis. The intensity of serotonin synthesis does not change during ontogenesis. The data obtained convincingly indicate the preservation of the endocrine function of the gland during aging {5}.

A comprehensive assessment of the immunoarchitectonics of the thymus revealed some important trends regarding the development of stress-induced immunomodulation in the growing organism of experimental animals. under the action of various types of stressors (physical and psychoemotional). According to quantitative immunohistochemistry data

According to the analysis, among the mechanisms of thymus involution under chronic stress in a growing organism, excessive apoptosis of double positive T-lymphocytes of the cortical substance and inhibition of the proliferation of cortical thymocytes are of great importance {8}.

It has been shown that under chronic stress there is a decrease in the number of T-lymphocyte precursors in the red bone marrow and a decrease in the level of their chemoattractants in the thymus, which contributes to organ hypoplasia {9}.

MATERIAL AND METHODS

The regenerative potential of the thymus of adults (54 people) who underwent chemotherapy for 12 months for lymphoma was investigated. The dynamics of thymic activity was analyzed by assessing structural changes in the thymus using sequential computed tomography, correlating them with the results of studying the thymus by simultaneous analysis of T-cell receptor excision circles (sjTREC) and CD31 (+) recently emigrated from the thymus (recent thymic emigrants - RTE) in peripheral blood. In addition, the regeneration processes in the thymus were assessed based on the recovery of peripheral CD4 (+) T cells after chemotherapy. An enlargement of the studied organ after chemotherapy compared with the baseline level, called recurrent thymic hyperplasia, was detected in 20 patients aged 18–53 years (average 33 years).

Using general linear models of mathematical analysis, it was found that patients with hyperplasia had a faster recovery of TREC and CD31 (+) RTE levels after chemotherapy than patients of the same age, sex, diagnosis, stage of disease, and thymic function at baseline. but without hyperplasia.

These data suggest that the adult thymus retains its ability to regenerate after chemotherapy, especially in young adults. The presence of hyperplasia may promote the renewal of thymopoiesis and replenishment of the peripheral CD4 (+) T-cell pool after chemotherapy in adults {6}. The role of cytokines produced in the thymus is mainly to maintain the main processes in the thymus, that is, T-lymphopoiesis. Cytokines also coordinate cell-cell relationships.

In an experiment on white outbred male rats who were injected intramuscularly with cyclophosphamide, imunofan and their combinations, it was found that the course administration of imunofan leads to changes in the morphology of the thymus and the functioning of its bioamine-containing structures. Imunofan significantly increases the width of the cortical, diameter and area of the medulla of the thymus with a corresponding increase in the mass of the organ 7 and 14 days after the end of the course of injections. An increase in the number of luminescent granular cells of the cortico-medullary and subcapsular zones is revealed after 1 and 14 days. After 14 days, the cells of both the cortico-medullary and subcapsular zones become larger and more densely filled with granules. It has been shown that the use of Imunofan against the background of the administration of cyclophosphamide promotes an increase in the mass of the thymus, the size of the cortex and medulla of the lobules, and the acceleration of the restoration of the cytoarchitectonics of the thymus. Recovery processes occur within 1 day after the combined course. After 7 days, the weight of the thymus and the size of the cortex and medulla in rats with isolated administration of cyclophosphamide and in the group with combined administration of cyclophosphamide and imunofan differ little, but there is a tendency towards normalization of the thymus structure. After the combined administration of imunofan and cyclophosphamide, the thymus structure and bioamine supply of cells differ significantly from those with the isolated administration of both drugs. It was found that an increase in the size of the cortical and medullary substance of the lobules with the introduction of imunofan occurs due to the activation of proliferation and differentiation of thymocytes, which can be mediated by the inclusion of the production of factors that control the growth and development of lymphocytes. Imunofan reduces the destruction of lymphocytes, because it has the ability to protect their DNA from damage caused by cyclophosphamide. {7}

Increased migration of thymocytes from the thymus to the blood and peripheral immune organs is believed to be the cause of accidental involution.

CONCLUSION

Morphological studies of the thymus {thymus gland} make it possible to assess age-related changes in the functioning of the immune system in response to the action of factors of various nature. Modern immunohistochemical research methods create opportunities for elucidating stromal relationships in the thymus. Further study of the morphofunctional organization of the organ will make it possible to identify and analyze the patterns of its structural and functional changes under the action of factors of various origins on the body.

EFFICIENCY OF PDT IN SEVERE CERVICAL DYSPLASIA

Akhmatova Gulrukh Rakhmatovna*

*Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

One of the most promising and high-tech methods of treating severe dysplasia and cervical cancer today is photodynamic therapy (PDT), based on the principle of selective destruction of pathologically altered cells. This is achieved due to the effect of photo-radiation on cells, in which a special chemical substance accumulates. The essence of the method lies in the application or introduction of a certain chemical compound into the affected area and further exposure, for example, with a laser. Selectivity or selectivity is a necessary property of all drugs and substances, methods of exposure used to treat cancer and precancer. Selectivity assumes that the introduced substance or effect aimed at destroying cancer cells will not act on healthy tissues, otherwise all destructive methods of treatment will be harmful or fatal to the whole organism. Cervical cancer has the same signs of living tissue, therefore, the main difficulty in creating a selective effect is to study the properties and differences of malignant structures from normal ones. Initially, PDT in gynecology was used to treat early forms of malignant neoplasms, or was used in the complex treatment of severe widespread processes. At present, the technique, due to the achievement of high selectivity, can be prescribed for the treatment of background and precancerous diseases of the cervix, including severe dysplasias. To date, the experience of treating women with cervical pathology using the method of photodynamic therapy shows its high therapeutic activity, a minimum number of complications and side effects.

KEYWORDS: *PDT, Dysplasia, Cancer, Cervix, Precancer.*

INTRODUCTION

Photodynamic therapy (PDT) and diagnostics (PDD) have become recognized therapy and diagnostic tools for cancer treatment. This method requires at least three agents to coexist. A photosensitizer (PS), at the correct energy density and wavelength, converts chemical compounds (such as molecular oxygen O₂) into free radicals that directly cause local toxicity.

Nevertheless, the effectiveness of the treatment procedure is a complex dependence of the energy density of the activating light, the initial concentration of the photosensitizer, and the PS filling factor. Porphyrin derivatives and some other sensitizers require an appropriate oxygen concentration. In addition, these amounts and conditions may change during treatment due to photobleaching of the sensitizer, oxygen consumption, changes in PS concentration, and other factors. Effectiveness can also vary by patient and drug. In gynecological PDT, the menstrual cycle influences fluorescence spectroscopy as a monitoring tool for dosimetry and diagnostics¹ There are several aspects to consider when calculating the dose of excitation light. Higher illumination can cause thermal effects in the tissue, as well as rapid oxygen consumption, leading to photobleaching and phototransformation of the photosensitizer.^{2,3} This can reduce the effective concentration of the sensitizer, so a higher treatment efficacy is needed. either by increasing the treatment time (decreasing illumination) or by excitation with a fractionated light source.^{4,5} Photochemical modification PS and oxygen consumption should also be taken into account during prolonged exposure to light.

There is also a need for the development of sensitizers that absorb longer wavelengths due to deeper penetration of light into tissues that are not affected by hemoglobin uptake.

Moreover, the radiation dose absorbed by photosensitizers is highly dependent on the illumination configuration and the uniformity of light emitted directly from the source⁶ or from the light applicator ^{7,8}, as well as on the structure and morphology of the surface. As we show, the complex shape of the organ can also seriously affect the efficiency of light penetration into the tissue, affecting all successive stages of the treatment procedure due to the inhomogeneous delivery of the light dose. There have been few attempts to consider the effect of organ shape on PDT performance.^{9,10}

The aim of this work is to develop an approach to PDT in patients with early stages of malignant neoplasms and severe dysplasia.

The following research tasks :

1. Influence of the shape of the cervix on the effectiveness of photodynamic therapy
2. To determine the advantages of PDT over other methods.
3. Determine which drugs are most effective in PDT patients.

Methods

1. The effectiveness of PDT in different positions in manipulating patients with severe dysplasia and cervical cancer will be studied.
2. The effectiveness of all methods of treatment will be studied and the advantages of PDT will be determined.
3. Individually acting drugs that will be used in PDT treatment will be studied.

RESEARCH RESULTS AND DISCUSSION

We will be able to find a more effective treatment for PDT by changing the position of the cervix.

Studying the effectiveness of all methods in the treatment of severe dysplasia or early stage cervical cancer, selectively change the tactics of PDT treatment.

We will be able to find out what drugs will help with this method of PDT treatment in combination therapy.

Conclusion. PDT of patients will allow to solve problems with many complications that arise with other methods in the treatment of severe dysplasia of the cervix and cervical cancer. Higher rates of eradication of oncogenic HPV types in comparison with therapeutic, surgical and physical methods of influencing HPV and the absence of reinfection over a long period of observation, most likely indicate sanitation of the basal layer of the scaly integument, where the virus replicates, and also indicate cell destruction with an integrated form of HPV, when antiviral drugs become ineffective. PDT improves the prognostic factors of the clinical picture of precancerous diseases and early cervical cancer. The obtained results of antiviral efficacy demonstrate the effect of PDT, the purpose of which is to prevent the recurrence of the disease. Preservation of menstrual and reproductive functions gives a woman the opportunity for full reproductive function. Summing up, we can say that PDT is an alternative regimen of organ-preserving treatment, which affects not only the pathological epithelium, but also the etiological factors of cervical cancer carcinogenesis, which allows not only to cure the patient, but also leads to the complete medical and social realization of the woman.

FEATURES OF THE COURSE OF PREGNANCY IN WOMEN OF DIFFERENT SOMATOTYPES

Khamdamova Mukhayokhon Tukhtasinovna*; Rabiev Sanjar Nasriddinovich**

^{1,2}Bukhara State Medical Institute named after Abu Ali Ibn Sina,
UZBEKISTAN

Email id: muhayo-1969@mail.ru

ABSTRACT

The examined women were divided into somatotypes as follows: 35 (23,5%) pregnant women had asthenic somatotype, 71 (47,7 %) - normosthenic somatotype and 43 (28,8%) - picnical somatotype. To correctly assess the indicators of ultrasound data and reduce diagnostic errors, it is necessary to use the standards of fetometric indicators developed for a specific region. The average age of the examined women was $25,2 \pm 0,3$ years. All pregnant women had a single pregnancy and were in the age group from 21 to 35 years, weighing from 65 kg to 95 kg and height from 151 to 182 cm. Thus, a direct correlation was established between a woman's somatotype and the following complications of pregnancy: the threat of termination of pregnancy, anemia, preeclampsia, intrauterine infection, fetoplacental insufficiency.

KEYWORDS: *Somatotypes, Examined, Gynecological*

INTRODUCTION

The most important task of the obstetric and gynecological service is to improve the quality and efficiency of prenatal diagnostics of fetal growth and development. A modern component of this process is screening ultrasound fetometry []. To correctly assess the indicators of ultrasound data and reduce diagnostic errors, it is necessary to use the standards of fetometric indicators developed for a specific region. The development of personalized medicine, the formation of individual approaches to the assessment of the physical condition of the mother and fetus and their adaptive potential [], forces us to pay attention to the constitutional features of mothers, which undoubtedly have an impact on the process of fetal development. Populations of different somatotypes have different anatomical and physiological characteristics of the body and its components, but the same reactivity within their group []. Separate studies []. clearly indicate the features of intrauterine development and functional state of fetuses in women with different

somatotypes. Mishchenko N. A. et al. (2006), L. I. Kondakova, A. I. Krayushkin (2009) provide data on the features of the placenta morphology in women of different physiques []. However, there are no systematic studies in the available literature to identify the relationship between the anthropometric parameters of pregnant women and the fetometric parameters of the developing fetus.

The purpose of the study: to establish the features of fetometric parameters in pregnant fetuses of different height and build at the stages of ultrasound screening examinations.

RESEARCH MATERIALS AND METHODS

To solve the tasks set in the work, 149 pregnant women were examined, belonging to the dispensary groups of healthy or practically healthy, who first applied to a women's consultation and registered for pregnancy at a period of 8-10 weeks. The examination was carried out once upon admission to the obstetric hospital during pregnancy at 38-40 weeks. The average age of the examined women was $25,2 \pm 0,3$ years. All pregnant women had a single pregnancy and were in the age group from 21 to 35 years, weighing from 65 kg to 95 kg and height from 151 to 182 cm. All women were expected to give birth for the first time (pregnant women with a history of dysmenorrhea, with antenatal fetal death, with developmental abnormalities, and with intrauterine development delay were excluded).

In addition to grading by somatotype, all women were also divided into growth groups: short – from 151 to 160 cm, medium – sized – 161-170 cm and tall-171 cm and above. The selection of growth groups is due to the fact that the anthropometric indices are calculated without taking into account the body length of the subjects and they will be different in different growth groups [].

Ultrasound examinations were performed in all women Three times in the dynamics of pregnancy (in the first trimester at 10-14 weeks, in the second trimester at 20-24 weeks, in the third trimester at 30-34 weeks). In the first trimester of pregnancy, the exact period of pregnancy was determined by the size of the coccygeal-parietal size (CTD) of the fetus .In the second trimester of pregnancy, extended fetometry of the fetus was performed. At the same stage, visible fetal malformations were detected, placentography was performed, and the amount of amniotic fluid was evaluated.

The analysis of the data of the anthropometric examination of women conducted at the time of 38-40 weeks gestation showed that the average values of the length and body weight of the examined women were $159,2 \pm 4,8$ cm and $65,5 \pm 8,5$ kg, respectively. The somatotype was determined by the index in Rees, Eyshenck. The index assessment according to Rees, Eyshenck provides for the allocation, taking into account anthropometric indicators and the component composition of the body, of three somatotypes: asthenic, normosthenic and picnic.

The examined women were divided into somatotypes as follows: 35 (23,5%) pregnant women had asthenic somatotype, 71 (47,7 %)-normosthenic somatotype and 43 (28,8%)-picnic somatotype. According to our data, the course of the present pregnancy in 131 (87,9%) of the examined women was complicated. Iron deficiency anemia was the most common complication of pregnancy (78,5%).The frequency of iron deficiency anemia in the first half of pregnancy was higher in women of the asthenic somatotype, compared with women of the normosthenic and picnic somatotype.

At the same time, we found a positive correlation between the prevalence of iron deficiency anemia and the frequency of preeclampsia ($r=0,96$, $p<0,01$). It should be noted that the severity of iron deficiency anemia significantly correlated with the severity of preeclampsia ($p<0,01$, $g=0,94$).

The frequency of the threat of termination of pregnancy in women of the picnical somatotype remained high throughout the entire gestation period (41,5 %, $p<0,01$)

It was found that the frequency of infectious diseases (ARI, influenza) in women of the asthenic somatotype, registered in the first and second half of pregnancy, was 2 or more times higher than in women of the normosthenic and picnic somatotype.

Also noteworthy is the fact that in pregnant women of the asthenic somatotype, the rate of inflammatory diseases of the urogenital sphere was significantly higher than in women of the normosthenic and picnic somatotype both in the first half of pregnancy and in the second half of pregnancy. In 11,2% of women with asthenic somatotype, the gestational process was complicated by acute pyelonephritis.

A violation of adaptation in a normal pregnancy is the cause of many complications of the gestational process, the leading of which is preeclampsia. frequency of this complication was the highest in women of the picnic somatotype, compared with women of the asthenic and normosthenic somatotype. At the same time, as a consequence of the high frequency of preeclampsia in women of the picnic somatotype, chronic fetoplacental insufficiency was diagnosed in 82,9% of cases, which is significantly more frequent than in women of the asthenic and normosthenic somatotype (9,4% and 9,6%, respectively, $p<0,001$). In women of asthenic and normosthenic somatotypes, preeclampsia had a short-term monosymptomatic course in the form of edema that occurred at the gestational age of 37-38 weeks.

Thus, a direct correlation was established between a woman's somatotype and the following complications of pregnancy: the threat of termination of pregnancy, anemia, preeclampsia, intrauterine infection, fetoplacental insufficiency.

ABSTRACT

The principle of scientificity in scientific restoration is the accessibility and provision of specialist restorers with reliable data and modern achievements in construction. The tasks of using new developments to restore the load capacity of building structures and the use of modern composite materials are becoming relevant. Innovative developments in the field of restoration are a specific form of management of the development of construction processes and technologies that make it possible to comprehensively change the structure, organization and content of the reconstruction process as a whole. The subject of the study is new technological developments in the field of the chemical and construction industry. The application of such developments allows you to solve the difficult problems of preventing destruction and giving historical uniqueness to architectural monuments of world importance.

KEYWORDS: *Restoration, Historical value, Artistic value, Technical state of the monument, scientific restoration, Modern achievements, New technologies, scientific data, Innovative developments, architectural monument.*

INTRODUCTION

The content of the concepts "architectural monument" and "restoration" has changed over time. These concepts emerged relatively late in the 18th century. They were interpreted in different ways depending on the philosophical, artistic and other ideas of each period. In various European countries, to designate what we call an architectural monument, the terms "monument", "historical monument", "architectural monument" are used. Nowadays, the concept of an architectural monument is included in the broader concept of "historical and cultural monument", and in the new Law of the Republic of Uzbekistan "On the protection and use of cultural heritage sites" adopted on August 30, 2001, this concept has become even broader - "cultural heritage site" ... These terms, first of all, reflect the twofold value of buildings that we classify as monuments - historical and artistic.

What is a Historic Landmark? This is the structure or building that bears witness to events that are either very remote or significant for the history and culture of a given area, country or humanity as a whole, which gives it a special meaning in the eyes of contemporaries. The historical value is manifested not only in terms of cognition but also emotionally. The "historical monuments" may include structures that have no architectural and artistic value. They are of interest only as a reminder of certain historical events or persons. But the value of historical monuments often extends to artistically valuable buildings that are architectural monuments [1-3]. In such cases, the building is considered a monument of history and culture.

Historical value or so-called the historicism of an architectural monument is expressed primarily in the fact. That he is a carrier of information about the past: the social structure of society; equal to engineering knowledge. Typological features of the surviving buildings of the past carry precious information about the everyday life of distant eras. Therefore, ancient structures are considered as monuments of material culture. Architectural monuments, of course, also have artistic value [4-7]. The works of architects of the past, whether they are buildings of the ancient, medieval period or modern times, are capable of evoking an acute aesthetic experience in a modern person. This may include the forms of an architectural monument, skilful carving or painting, unique decor of interiors and facades, sculptural decorations, etc.

However, without denying the artistic value of an architectural monument, its historical value is still brought to the fore, i.e. the significance of the monument as a document, since it carries, first of all, documentary information about the era of construction: the social life of society, the level of development of engineering knowledge, the level of production, artistic culture, etc. At the same time, the monument itself, with all the changes and additions accumulated during its centuries-old life, can be considered as the basis on which artistic elements of different times are combined. Restructuring, building and even loss do not always lead to the destruction of a monument as an artistic whole, sometimes modifying it, creating a new whole with new aesthetic qualities.

In such cases, there is a fusion of artistic elements of different centuries, eras, and in some parts and later times (examples: the Moscow Kremlin of the 15th-17th centuries, Rastrelli's Winter Palace with the later interiors of the era of classicism).

Parts of the structure of different times and styles enter into one or another relationship, ultimately determining the unique individuality of each monument. These so-called late layering should be assessed not only as having or not having artistic significance in and of themselves,

but also as elements that are part of the overall artistic system of the monument. Moreover, changes to the monument can be made not only by human hands but also by time [5-8]. So the ruins of an ancient building have a huge aesthetic expressiveness, different from that which this building had many centuries ago. Traces of the long existence of a monument in time, the so-called patina of time, not only obscure and distort information about a work of art of the distant past, but also carry their emotional information about the life of a monument in time, which is an important component of its today's aesthetic perception. There is one more distinctive feature for architectural monuments: it is its architectural and natural environment, i.e. its Wednesday.

The artistic perception of a monument also depends on its environment.

The older a monument is, the less, as a rule, the character of its modern environment corresponds to that which existed at the time of its creation, i.e. construction. This is especially evident in large cities involved in the urbanization process: the emergence of asphalt instead of stone paving, the introduction of urban vehicles, etc. The natural surroundings of the monuments are also unstable: trees grow, gradually die, other species are planted. The landscape is constantly changing. In addition to the compositional links between the later layers of the monument and the elements of its environment, there are also links of a stylistic order.

Both the alterations of the monument and the change in buildings around it are not always connected by an obvious compositional dependence. The main purpose of any work on an architectural monument is to extend its life as a structure of many-sided value. The work carried out on the monuments can be of a varied nature. There are four main types of work: repair, restoration, conservation and adaptation. In practice, they can be combined. The simplest type of work is repair - a set of works to maintain the technical condition of the monument.

Conservation is a set of measures aimed at protecting or strengthening a structure in its current form. Conservation is unanimously recognized as the main type of work to be carried out on monuments. An important condition for extending the life of a monument is its active inclusion in the life of modern society [6-9]. This goal is achieved in the following two ways: restoration of the emphasized identification of the artistic and historical value of the monument and adaptation - giving it a practical function for the modern needs of society. Restoration, literal translation means "restoration", in contrast to conservation, involves the introduction of certain changes in the structure, dictated by the awareness of its special significance as a monument.

Because of this, restoration is always a violation of the existing system of relationships. Therefore, it is customary to consider it as an exception, due to several restrictions. There are three requirements for the restoration of architectural monuments:

The first - is that an artistically valuable object that determines the direction of the restoration is not the creative intention of the ancient master, but the appearance of the monument existing in our time with its losses, late layers and established links with the architectural and spatial environment.

The purpose of the restoration is to maximize the artistic qualities of the surviving monument and its historically valuable features. Late layering: faceless annexes, apertures, late plasters covering ancient paintings, etc. - distort the original concept of the structure, something valuable that actually existed in the monument.

The second requirement for the restoration is the maximum preservation of authenticity. Only in extreme cases is the substitution of the original material allowed, which should be regarded as a necessary evil. New additions must not be falsified.

A fundamental solution to the problem was predicted by the theorist of archaeological restoration of the late 19th century - early 20th century: this is the use of the signalling method of a system of techniques for artificially isolating new inclusions (recall the restoration of the Arch of Titus by the architect Giuseppe Valadier: instead of marble, he used travertine stone, and gave new additions a simplified look) ... The disadvantage of this technique is that the use of such a technique leads to a violation of the integrity of the perception of the monument, therefore, signalling measures are far from a simple problem. It is necessary that in the monument the original prevails over the restoration, and not vice versa.

The third requirement is that the possibility of restoration additions should be limited by the condition of the reliability of the reconstruction, which should be based on a strict documentary basis. According to the Venice Charter, restoration should stop where the hypothesis begins! The documentary nature of the restoration has two sides.

First of all, this is proof of a principled order, confirming that this element of the monument really existed and existed in the form provided for by the restoration project. However, in many cases, this is only possible with varying degrees of approximation.

Secondly, the restoration includes elements of not only scientific analysis but also creativity. The main types of work on architectural monuments and their scope;

The Law of the Republic of Uzbekistan "On the Protection and Use of Cultural Heritage Sites", adopted in 2001, distinguishes four types of work that can be performed on monuments in order to preserve them: repair, conservation, restoration and adaptation for modern use. At the same time. This division is pretty rough. In practice, there are infinitely varied cases of combining these works. The assignment to one category or another is made according to the predominant nature of the work. For all types of work, the law sets out general requirements. They can be carried out only with the knowledge of the state authorities for the protection of monuments and under their control. In our republic, the state body for the protection of monuments is the Main Scientific and Production Department for the Protection of Monuments under the Ministry of Culture Affairs of the Republic of Uzbekistan. Abbreviated "GlavNPU of cultural monuments", which is located at st. Navoi-30. Carrying out certain types of work is impossible without a preliminary study of the monument. Research continues, as a rule, throughout the entire stage of work. For the above categories of work, a slightly different procedure for consideration and composition of project documentation has been adopted. The coordination of this documentation is carried out throughout the work. Production work must be carried out under the supervision of specialist restorers. Conservation and repair have a lot in common. In both cases, the main goal is to preserve the monument in the form that has come down to us, with late strata and the loss of some of the original parts.

REPAIR OF A MONUMENT is a periodically carried out work on its technical maintenance using conventional construction methods. The main structure of the monument is not affected in this case. The main types of repair work are changing and painting roofs, replenishing the loss of plaster, renewing the painting of walls, windows, doors, etc.

CONSERVATION is a complex of works carried out in order to preserve the monument in its present form and to prevent the deterioration of its technical condition. The need for it; Carrying out occurs when the monument for any reason is in an unsatisfactory condition.

RESTORATION is the most complex and complex type of work carried out on monuments. Its main goal is to extend the life of the monument. It usually includes elements of repair and conservation. An important part of the restoration is the change in the existing appearance of the monument that has come down to us in order to more fully reveal its artistic qualities, which makes it possible to more clearly emphasize its social value.

ADAPTATION OF A MONUMENT is a complex of works on partial reconstruction of a monument, but one that would take into accounts its significance and features as an architectural monument to the maximum extent. The adaptation should be carried out in such a way that not only does not violate the existing appearance of the monument but also maximally preserve the potential for revealing everything of value that the monument contains.

CONCLUSION

Thus, for almost two centuries in the history of the restoration of architectural monuments, the number of methods have been determined, which in this work. The principles of restoration and approaches in relation to the allocated methods are characterized. The fragmentary approach, which is rarely used in the domestic practice of restoring wooden monuments, has certain advantages since it allows us to fully reveal the history of the building and at the same time preserve its authentic later parts.

ABSTRACT

This article analyzes the essence of the concept of marginal spirituality, which negatively affects the national and spiritual development of society, and also describes its problems and solutions. In this sense, marginal spirituality is analyzed as a social phenomenon, which is a state of spiritual depravity, immorality, degradation, deviations in social relations that go beyond the spiritual life of a person. The main solution to this problem is to educate young people in a healthy spirit, which in turn contributes to the formation of a morally mature person, an ideal person, a harmoniously developed generation, to maintain the purity of the nation. A number of suggestions were made to accomplish this task.

KEYWORDS: *Marginal, Spirituality, Healthy psyche, Spirit, spiritual world, Immorality, lowliness, Perfect man.*

INTRODUCTION

It is known that any threat to spirituality in itself becomes one of the most serious problems of the country's security and its national interests, as well as for the future healthy generation, and will eventually lead to a social crisis. If the violent and aggressive forces of the world want to conquer or take possession of the wealth of any nation or country, first of all they seek to disarm it, that is, to deprive them of the national values, history and culture that are their greatest wealth. President of Uzbekistan Sh.M. Mirziyoyev specifically commented on the urgency of this threat: "We all know that today all over the world there is an intensification of fierce competition, confrontation and conflicts. Threats such as religious extremism, terrorism, drug trafficking, human trafficking, illegal migration and 'mass culture' are growing and degrading beliefs and family values that existed for many centuries. It is a fact that these and many other threats cause serious problems in the life of mankind and no one can deny it "[1]. And also how various

harmful vices affect the whole world, currents and their rapid penetration into our country, similarly has a negative impact on the culture and spiritual life of young people. As a result, they can become selfish people who do not think about their duties and responsibilities to their parents, family and society and the desire to live only daily life. Such factors in the social environment are called marginal spirituality, which is one of the main problems of spiritual culture. The essence of this concept, according to the explanatory dictionary of sociology, is that an individual, a social stratum or a group is the loss of some or all specific structures, sociocultural, political traditions, and the characteristics of a particular society [2]. (Marginal-lat. Extremely, A person who finds himself outside his social environment; degraded, outcast) This is due to the horizontal and vertical expansion of the migration opportunities of the population and individuals within society. The term "marginal" also applies to the person's personality in this situation.

MATERIALS AND METHODS

A marginal person is an individual who occupies an intermediate position between certain social groups, or an individual who does not belong to any class [3], a person who is not socially normal. Such a person occupies an intermediate position on the border between two or more people, is partially absorbed by each, alienated or excluded from various institutions of society. The behavior of the marginal carries social risk and negative character in the development of the nation. This term was first used by the American sociologist R. Park in the second half of the 1920s to refer to nations. In his opinion, such a person, in accordance with his position in society, has a certain character, namely, with anxiety, irritability, aggression, ambition, jealousy, shyness and selfishness [3]. Although marginalization is emphasized as a social phenomenon in more backward countries, it not only affects the economic and political stability of society, but also has a negative impact on its spiritual development. That is, its influence on the spiritual development of society to this day has not yet been sufficiently studied and socially-philosophically unanalysed. Therefore, its negative impact on the spiritual and cultural development of society, its consequences and prevention is an urgent problem.

Its relevance was studied by a number of scientists and explained from the point of view of "marginalization" with the following: "Marginalization is the disintegration of social groups, the violation of traditional relations between people, the loss of an individual goal that belongs to a particular social community, and the process of destruction of civil society, which manifests itself in the violation of aesthetic, moral, legal, physiological and other universal norms and values," explains the Russian scientist Yassenko N. E. - A person who is in spiritual and social distress, completely dependent on the unpredictable and uncontrolled actions of the authorities, demagogues and Adventists" [7].

From the idea put forward by the scientist, it is clear that marginality manifests itself in all social spheres.

Marginalization refers to concepts that, by their complexity, are familiar in many areas and at the same time, very vague, even speculative (notional) and often with negative comments on influence. The same aspect appears in various forms such as marginal art [8], marginal culture [9]. In this sense, under the spiritual type, marginal, that is, marginal spirituality refers to a state of spiritual depravity that goes beyond spiritual life, immorality, degradation, violation of social relations that go beyond the spiritual life of a person. Despite the increase in the number of

people, they support loneliness, do not want intense social interactions and reject socially accepted standards of life, or they have a strong passion and need (monism) for factors that are manifestations of spiritual depravity, such as individualism, oldism, censorship, homosexuality, lesbianism, who have the mood to live with a special pleasure in public life.

Today it is no secret that the forces striving for ideological hegemony carry out ideological attacks through information technology, communications, including the Internet.

The growing popularity of social networks on the Internet leads to an increase in the interest of young people, but at the same time, its negative aspects lead to their marginal spiritual life, to the destruction of their spiritual world. According to a special study carried out by specialists from accessible sites, about 12% were devoted to pornographic features, 44% to violence and anger, and 41.0% of an action movie based on various shootings and explosions. And also today the activity of "satanic" sects, propagandizing anti-human ideas, is intensifying [4]. Thus, the impact of some Internet sites on youth marginalization is reflected in the following:

1. Ideological attacks aimed at influencing the consciousness and thinking of members of society.
2. Spiritual attacks against our national traditions, attacks on our values, spiritual wealth, alienation from our national culture, ideas that form apathy.
3. Increased personal interest, pursuit of material wealth, selfishness.
4. Influence on the healthy spirit of youth and in the destruction of the inner spiritual world.
5. As all spheres of society become more global, it will certainly become one of the first in the field of cultures. One such feature is "popular culture", which promotes marginal spirituality.

In general, "mass culture" is one of the cultures that are completely incompatible with our national (Uzbek) values and it is a group of people who knows how to create wealth through moral violence, put their own interests higher than those of others. They effectively use the possibilities of modern information technologies, reflect on the preferences of themselves, and create various surface-cultural works, which under the pretext of entertainment in the sphere of material and spiritual life and the establishment of commercial consumption, in exchange for the loss of the culture of peoples based on their national values. It is a marginal spirituality that is driven by big profits. It has also influenced Uzbek national ceremonies, especially weddings, that is, the extravagance of weddings and we see that this is clearly reflected in the owner of the "Who is who" activity. In this regard, we need to educate and protect our children, who have not yet hardened, from the attack of evil forces, irrational life and spiritual depravity. After all, they are the future masters of our future, today's development. One of the important conditions for the fulfilment of this task and the formation of harmoniously developed people from young people is their upbringing in a healthy spirit. As I.A. Karimov: "To educate our children in the spirit of love for the Motherland, rich history, devotion to the sacred religion of our ancestors, we must, first of all, strengthen the ideological immunity in their hearts and minds. So that our youth can become individuals who deeply understand their national identity, as well as the world, and move forward with time; Then neither the "call" of ignorant fanatics, nor ideas that reject morality, completely alien to us, will not be able to influence them"[5-9].

To solve this problem, it is important to educate them in a healthy spirit. Only a nation brought up in a healthy spirit and having its own national spirituality and culture can survive as a nation. Therefore, it is necessary to educate our youth in a healthy spirit, to form the future generation, highly morally, spiritually mature, perfect and harmoniously developed people and to save the identity of the nation is an important task of state policy. This, in turn, requires a deeper understanding of the concept of healthy parenting.

CONCLUSION

In conclusion, we can assert that the concept of marginal spirituality is by its very nature an unhealthy state of mind (disturbance of mental states), formed upbringing, immoral behavior in the mind and spirit, distorted ideas, worldviews, conclusions and their manifestations in society, influenced by the environment ...

To solve this problem, it is necessary to pay special attention to the use of propaganda methods through the media, fiction, art and in all its forms, as well as the implementation of activities and the introduction of noble and progressive ideas, the introduction of spiritual education. When implementing it, it is advisable to take into account the following:

- 1). Development of skills among young people for the targeted use of information technology, the Internet (information culture);
- 2). Combine the history of the spiritual wealth of the nation with the spiritual culture;
- 3). Realization of creative intellectual potential (artistic and aesthetic creativity);
- 4). Formation of spiritual education in all secondary and higher education. Organize psychological training seminar among young people;
- 7). Conducting seminars of modern information technologies in harmony with spiritual education;
- 8). Create and develop national information resources, fiction, art that propagandizes the promotion of national ideology, expressing identity, strongly ideological, spiritual, educational, scientific and artistic, military-patriotic works, as well as sports and national games.

ABSTRACT

The article contains information on resettlement activities carried out by the People's Commissariat for Land and Water Resources for land development, resettlement of the population in Central Fergana, Yazyavan district. In addition, the benefits provided to the resettled population and issues of resettlement policy have been studied on the basis of scientific literature and archival materials.

KEYWORDS: *Population, relocation. Central Fergana, privileges, loans, People's Commissariat of Land and Water Affairs, Yazyovan, District Land Department.*

INTRODUCTION

In Uzbekistan, the Soviet resettlement policy was an integral part of the All-Union resettlement policy, implemented in the second quarter of the twentieth century. With the deportations of that period, in particular. During the process of collectivization and deafening, the forced evictions carried out by the NKVD - not to be confused at all with the deportees. The resettlement policy was conducted by the People's Commissariat for Land Affairs on a voluntary (in some cases "voluntary-compulsory") basis.

In Uzbekistan, since the 1930s, during the Soviet government's resettlement policy, internal resettlement has been carried out. The resettlement plan was developed by the People's Commissariat for Water Resources and approved by the Central Executive Committee of the USSR. The Central Executive Committee determined the approximate number of farms that could be relocated to resettlement areas (such areas were called resettlement funds) and at the same time assigned the task of organizing these farms to collective farms. The National

Encyclopedia of Uzbekistan on Population Migration states: "Population is migration due to change of residence. Population migration is one of the most important problems of the population, it is considered not as a simple mechanical movement of people, but as a complex social process that covers many aspects of socio-economic life. Population migration is related to the location of the population, the economic development of land, the development of productive forces, the emergence and intermingling of races, languages and peoples" [1].

THE MAIN PART

The policy of resettlement in Uzbekistan is primarily aimed at the development of new lands, ensuring the independence of the country's cotton. But other problems were also planned to be solved, the most important of which was to overcome the demographic problem. This was achieved through the mass relocation of the population from high-density areas to sparsely populated, undeveloped areas.

The Fergana Valley was one of the most densely populated areas with land shortages. There are many social problems of this kind, and it was difficult to solve them without easing demographic tensions, to achieve economic prosperity. Therefore, the population of the Fergana Valley was more involved in the resettlement policy. The population of the Fergana Valley had another special and important role in the resettlement policy, due to the fact that it had a great deal of experience in agriculture, including cotton, which was extremely necessary to ensure the independence of cotton. Thus, the inhabitants of the Fergana Valley, who had mastered the culture of farming, had to become teachers in this field for the indigenous people, most of whom lived on livestock.

The resettlement department under the People's Commissariat for Land Affairs relocates farms from areas with a shortage of land to areas with surplus land suitable for agriculture, to meet and accommodate relocated farms, to relocate farms from areas transferred to the state for construction of industrial facilities; to assist in the organization. Based on these tasks, the resettlement department had to develop annual and quarterly resettlement plans and submit them to the resettlement department under the governments of the USSR and Uzbekistan. The departments are also tasked with identifying surplus labor resources in the districts, identifying the contingent of the resettled population, finding suitable arable land, assisting in the establishment of nomadic settlements in nomadic areas, and allocating land to resettled people through local land and water authorities.

The Republican Relocation Department reports to the All-Union Relocation Committee. The head of the resettlement department was appointed by the head of this committee on the recommendation of the Council of People's Commissars of the UzSSR. The head and his deputy on the basis of decisions and orders of the All-Union Resettlement Committee and the People's Commissariat of Land Affairs of the USSR issue orders and instructions on their implementation and check their implementation, hiring, dismissal, management and control of local resettlement departments, resettlement engaged in the management of funds allocated to the resettlement department for.

The Relocation Department had a round seal and a triangular stamp with the words " Relocation Department under the Council of People's Commissars of the UzSSR ", provided at the expense of funds allocated from the budget of the Union in accordance with the main budget of the All-Union Transport Committee.

The relocation department consisted of a finance and planning group, a territorial and economic structure organization group, a construction group, an accounting group, and general groups.

The Finance and Planning Group was involved in the development of annual and quarterly plans for resettlement, resettlement of nomadic and semi-nomadic farms, budgeting for all activities related to resettlement and organization of resettlement. At the same time, the group was involved in identifying surplus labor resources, vacant land suitable for farming, identifying land reserves in undeveloped areas through local land and water authorities, and monitoring the proper use of loans and benefits.

The territorial structure and economic organization group was engaged in organizing road services for the resettled, meeting them and assisting in the organization of the farm, providing the relocation funds with equipment, vehicles, agricultural inventory, seeds, working animals.

The construction team carried out construction work in the resettled areas, providing construction materials, including local building materials, to the kolkhozes in the relocation funds.

The accounting team handled the financial and economic records and reports of the resettlement department, received and reviewed the quarterly reports of the resettlement departments. He compiled a consolidated report for the country, monitored the proper use of funds allocated for resettlement departments.

The conditions and procedures for resettlement in Uzbekistan are also set. Farms wishing to relocate to relocated plots have made a written commitment to follow the land and water use procedures established by the land authorities. Farms wishing to obtain information on lands in relocation funds performed this task by sending a representative.

The district executive committee and the district land department, on the basis of an instruction received from the People's Commissariat for Land and Water Affairs, compile a list of citizens to be immediately evacuated from the village councils. It is mainly the poor who become the object of relocation. Members of landless farms and their families will be relocated.

The relocation took place in Zelensky, Namangan, Andijan and Markhamat districts of Andijan region. Only farms outside the district were relocated to Zelensky and Namangan districts. In Andijan and Marxamat districts, internal resettlement was carried out simultaneously with the development of vacant land funds and the relocation of existing farms outside the district.

Resettlement activities in Andijan district began on January 15, 1930, and for a month since then, representatives of the relocation staff of the district land department have provided information on resettlement, including benefits and rights for the population [2].

However, the promised, documented benefits were not granted. For example, no payments were made for property in the area where they lived before moving, and loans for food were often not available. [3] The non-fulfillment of these promises has caused difficulties in the daily lives of the displaced population and aggravated labor activity. During the resettlement process, members of the executive committee visited the resettlement funds and established oversight.

The district branch of the People's Commissariat for Water Affairs was able to carry out the task of the party and the government in a timely manner, selecting and relocating the required number of contingents.

On April 22, 1930, the relocation of 1997 farms in Zelensky district began. Of these, 997 farms were sent to Surkhandarya, 705 farms to Samarkand. Although the resettlement policy was declared voluntary, in most cases the population was forcibly relocated. A number of problems arise during the work process. The work of the People's Commissariat of Water Affairs could not be considered satisfactory. For example, there was a lack of funds, there were problems with transportation, that is, trains, cars were not delivered on time.

The list of displaced persons compiled by the commission is final and final, and the replacement of the displaced person is made only by the decision of the commission. Collectivization work was carried out before relocation. The responsibility for the organization and implementation of collectivization measures rests with the cotton associations in the districts. One agronomist is assigned to each collective farm. Agronomists were directly involved in the selection and survey of the lands on which resettlement was planned.

It should also be noted that there are clear differences between intra-district resettlement and land and water reform. The main goal of land and water reform was the abolition of large private estates through nationalization, the transition to a collective form of management, ie the establishment of collective farms. As a result of the resettlement policy, as noted earlier, it was planned to develop new lands, develop cotton growing, and solve the demographic problem.

When sending the resettlers, the district land department had to provide the resettled farms with a resettlement certificate listing all the members and a certificate for preferential departure by rail, as well as money for travel expenses and food.

Although transfer funds are said to be conducted only on a voluntary basis, coercive methods have also been used. Because the norm of the population to be relocated is predetermined. Many promises have been made to keep the displaced. The government did not have a real opportunity to fully provide the planned assistance, nor did the scale of the resettlement policy. Clearly for the relocated - the benefits were their single agricultural tax, insurance payment, later exemption from meat tax, grain, potatoes, milk, wool, delivery obligation, as well as departure and transportation of goods by rail on preferential tariffs.

However, poor quality or unsuitability of land in relocation funds, lack of tools, working animals, machinery, seeds, insufficient and untimely provision of loans, unresolved housing and food problems have further aggravated the daily life of the relocated population. In fact, most of the displaced had moved in the hope of easing their economic and political situation.

The resettlement funds are mainly occupied by the part of the population that has no other choice, that is, those who have been politically persecuted in the central areas, and those who have lived even worse in their former residences. There were also those who were lucky enough to get relatively good plots of land, and those who received loans on time. [4] In this sense, the villages built in the desert as a result of the resettlement policy can be considered a product of human creativity, an example of selfless labor.

Resettlement activities continued even after World War II. During this period, the main focus was on the development of desert areas. For this purpose, measures have been taken to develop the Central Fergana Desert. In fact, the development of the Central Fergana region, in particular, the Yazyovan desert, began in the 1930s. At that time, a water network was dug from Shahrihansay to Yazyavan, later called Zelenskiy Arigi, and several small collective farms, such

as Cholgulistan, Pakhtachi, Mopr, and Ittifoq, were established in Yazyavan [5]. In April 1949, the Government of Uzbekistan issued a resolution on the development of desert areas in the Republic.

State figures such as Usmon Yusupov, Sharof Rashidov, Tursun Qambarov, Nuriddin Muhiddinov, Fahriddin Shamsuddinov, Buzrukhoja Usmonkhodjaev, Ahmadullo Rustamov, Gulomjon Fozilov, Hamdam Umarov, Gulomjon Pulatov made a significant contribution to the development of the Central Fergana Desert [6].

In 1953, Yazyovan district was formed. At the end of 1953, the Central Fergana Land Development Council was established to develop the Central Fergana Desert, and Sharof Rashidov became the chairman of the Central Fergana Land Development Council.

In 1953, a new Stalinabad collective farm was established in the village of Sariqsuv (also known as Sarijo, now the center of the Ulug Nor district), located in the heart of the Central Fergana Desert, and Ismailjon Sakkizbaev was elected chairman. After the establishment of the collective farm, another new collective farm called "White Gold" was established and I. Sakkizbaev was sent to it as chairman.[7]

In 1957, 27-year-old Hamidjon Kavlonov was elected the secretary general of Yazyovan district. Hamidjon Kavlonov recalls: "In those years, Sharof Rashidov, the chairman of the Presidium of the Supreme Soviet of Uzbekistan and the chairman of the Central Fergana Land Development Council, often came to us, rode horses to inaccessible places and visited our lands and farms. Thanks to that man, huge sums of money were allocated for the district. As a result, the scale of land development has expanded, construction has increased. Years of desert development Ormon Toshbaev, Kholmat Umarchaev, Juraboy Tadjibayev, Ibrahimjon Yusupov, Karimjon Badalov, Isroiljon Utanov, Muzaffar Hasanov, Abdulhamid Latipov, head of water economy Kholmoydin Isakov, from mirabs Abdurayim Polvon Mamajanov, Solomon Mamazanov, Boyada Mamadiev, brigadier Dadajon Mirzaev, Kibor Dadajonov, Ohunjon Dadajonov, Kuziboy Uzakov, Fozil Umrzakov, Ismoiljon Boborahimov, Maqsud Mahmudov, Karimjon Mamatov, Mirzali Rakhimov, Ismail Sakkizbaev, Jabborhon Mamadaliev, Ibrahimjon Halilov, Sotvoldikhon Valiev, Qodirjon Valiev, Gulomjon Nizamov, Jurahon Tillaev, Sodiqjon Shermatov, Shermat Kurbanov, Askarjon Mirzakarimov and others made great contributions to this work" [8-12].

It is noteworthy that representatives of different nationalities, including Tatars, Germans, Jews, Russians, Kyrgyz, Uzbeks, Ossetians, worked side by side in the development of the Central Fergana Desert [9].

CONCLUSION

In short, the resettlement policy in Uzbekistan has been going on for decades. The resettlement policy in Uzbekistan is mainly aimed at increasing the area under cotton and developing the desert. During the resettlement policy, the local population, the common people, suffered the most, because of the lack of necessary technical means in the development of the deserts, the lack of the most necessary conditions for the daily life of the population. And in this process, man and his labor were the decisive factor in the development of the lands.

The goals and objectives of the resettlement policy in Uzbekistan have been defined, the legal and regulatory framework and mechanism have been created, and the People's Commissariat of Affairs of the Uzbekistan SSR and the Department of Resettlement have been in charge of

resettlement. According to the terms and procedures of resettlement, first of all, the organized resettlement of the population from the high-density Fergana Valley began. There have been changes in its dynamics during the resettlement policy. In the first stage, the resettlement policy was implemented on a small scale, but in the later stages it rose to the highest points. In the end, the policy of resettlement gradually lost its relevance.

ABSTRACT

The study examines the problems that arose as a result of the socio-economic policy of the Soviet state in Uzbekistan in 1946-1990, as well as the shortcomings and contradictions in the policy of resettlement. The policy of relocation of Soviet power at that time was not to relocate our people to other allied republics but to relocate many factories and other strategic production facilities to the territory of Uzbekistan during the war, and as a result The relocation of children of different nationalities who were orphaned as a result of the war to Uzbekistan also took place.

KEYWORDS: *Population, relocation, Central Fergana, privileges, resettlement policy, collectivization.*

INTRODUCTION

One of the problems to be studied in the history of the Soviet period, important scientific conclusions, is the policy of Soviet resettlement in Uzbekistan in the second quarter of the twentieth century and its socio-political and economic consequences. The resettlement policy was aimed at developing new lands, expanding cotton fields, further strengthening the cotton monopoly inherited from tsarism, and "achieving cotton independence". At the same time, it was aimed at overcoming the existing demographic problem in the country, the collectivization of individual farms, and the settlement of the nomadic part of the Kyrgyz, Kazakh and Turkmen peoples in the country [1, 2].

MATERIALS AND METHODS

Party and Soviet organizations of the Uzbek SSR took urgent measures to strengthen the rear of the front, put the economy under military control, and master a large amount of military equipment, weapons and ammunition. Work in this direction was carried out on the basis of the Military-Economic Plan for the 4th quarter of 1941 and 1942, developed on behalf of the Central Committee of the All-Union Communist Party of Bolsheviks and the State Defense Committee and approved on August 16. The plan provided for the construction of new factories, mines and mines in the eastern regions of the country, including Uzbekistan, as well as the production of weapons and ammunition, especially a large number of tanks, aircraft, artillery and artillery [3-5]. The program also sets out the procedures for the reconstruction of transport, relocation and relocation of industrial enterprises, property of collective and state farms, scientific institutions eastward to areas under the threat of enemy occupation. The implementation of these measures was led by a special republican government commission headed by U. Yusupov, created on August 25, 1941. The economic and labour resources of Uzbekistan have been mobilized to the front. Throughout the USSR, including Uzbekistan, a new labour regime was introduced: working days were extended, holidays and vacations were cancelled. At the beginning of the war, about 20 thousand women from Tashkent went to work in industrial enterprises and construction, and about 1700 women from the republic went to work in coal mines. For example, in July 1941, 220 women worked tirelessly at the TashSelMash plant, replacing their fathers, brothers and husbands who had gone to the front. Measures have been taken to provide production with workers and specialists [6-11]. The activities of higher and secondary specialized educational institutions, vocational schools, factory schools of the republic were aimed at training personnel in accordance with the requirements of the war. Organized individual and team professional training; the population of the republic's villages stood up to provide the front and rear with food and raw materials. Every collective farmer and state farmer selflessly worked to fulfil two or three labour standards. The humane, noble and childlike qualities of the Uzbek people are reflected in the openness, compassion and care shown to people and children displaced from the western regions of the country during the war. In the early years of the war, the Uzbek people numbered over a million people, including over 200,000 orphans deported from Russia, Ukraine, Belarus, Moldova and the Baltic republics. At meetings of labour collectives, issues of admission, resettlement and creation of the necessary conditions for the resettled population were discussed, and practical assistance was provided. On December 3, 1941, the Central Committee of the Communist Party of Uzbekistan issued a special decree on the reception and placement of immigrants. The registration and placement of persons were carried out by a special republican commission under the Council of People's Commissars, created on July 10, 1941, and separate divisions under the executive committees of local Soviets. The evacuees were relocated to urban and rural areas. In a short time, 100 thousand people were accommodated in the Andijan region, 165 thousand - in the Samarkand region and 53.6 thousand - in the Namangan region. Immigrants found refuge and work in Uzbekistan [7-12]. The Uzbek people shared bread, clothes and shelter with migrants. By the spring of 1942, 716 thousand people resettled throughout Uzbekistan were hired, employed and provided with the necessary conditions. The Uzbeks took particular care of internally displaced orphans, taking on over 200,000 orphans. Thousands of wounded and sick soldiers and officers were sent to Uzbekistan. Particular attention was paid to their admission, hospitalization, rehabilitation, and they became one of the health resorts of the republic. By October 1, 1941, 47 hospitals with 14,950 beds were built and equipped in the system of the People's Commissariat of Health of Uzbekistan. To date,

48 hospitals with 15.9 thousand beds have been transferred, placed and put into operation from Moscow, Kalinin, Rostov and other regions. The construction of military hospitals continued in subsequent years. During the war years, 164,382 wounded and sick were hospitalized in Uzbekistan, 87% of whom received treatment for 143,101 people. The Soviet people began to rebuild cities and villages, factories, factories and other farms that had been liberated from the enemy during the difficult years of the war. All the republics and regions of the East, including Uzbekistan, took an active part in the restoration of the national economy of the liberated territories. Restoration work has become the business of the whole country. The movement to help the liberated towns and villages spread throughout Uzbekistan [13-16]. The issues of providing assistance to the provinces, cities and regions affected by the war were regularly discussed between the government of the republic, regional, city and district organizations and the population, and the necessary measures were taken. The Uzbek railways have played an important role in rebuilding the liberated regions. The railway workers of the Tashkent Freight Station collected 35 sets of lifting equipment, 350 units of metal structures and more than 2,000 spare parts and sent them to restore one of the stations in the West. On March 30, 1943, the Tashkent Railways dispatched a whole train with equipment to restore the Stalingrad railway network. It included a special mobile workshop, two steam locomotives, 33 equipped wagons and a platform, medicines and work clothes. The Uzbeks also took an active part in the relocation of displaced enterprises, scientific and cultural institutions, educational institutions, as well as in the restoration and relocation of buildings. Many Uzbek specialists and workers left to help their Russian, Ukrainian, Belarusian and Moldovan friends. More and more young people who graduated from factory schools and vocational schools of the republic are sent to the reconstruction of the western regions. From 1943 to 1945, 15 thousand students of the labour reserve schools of Uzbekistan were sent to work at enterprises, construction and railways of Donbas, Kyiv, Leningrad and the Urals. Even during the war years, Stalin and his entourage treated small peoples and ethnic groups unfairly. In the first year of the war, the German Autonomous Republic on the Volga was abolished. More than 300,000 of its residents were displaced and resettled to Siberia and Kazakhstan on suspicion that the occupiers could receive help. More than 175,000 Chechens, 157,000 Ingush, more than 150,000 Crimean Tatars, 4,500 Bulgarians, tens of thousands of Meskhetian Turks and Greeks were deported to Uzbekistan. The Uzbek people warmly welcomed them, provided them with housing and food. Local authorities provided them with loans for arable land, housing and agriculture. Gradually, the evacuees adapted to the new place with great difficulty. Problems have accumulated in all spheres of public life, and attempts to solve them using administrative-command methods have failed. Gradually, the growing mistrust and indifference of people began to appear. There have been unauthorized rallies, demonstrations and even incidents. In May-June 1989, tragic events took place in Fergana.

The Meskhetian Turks, expelled from their lands 45 years ago as a result of Stalin's atrocities, were received by the Uzbek people with kindness. Meskhetian Turks have been living in brotherhood with indigenous peoples for decades. However, on May 20, 1989, a fight broke out in Kuvasoi between indigenous peoples and groups of Meskhetian Turks.

The situation was aggravated by the inability of the political leadership of the republic to correctly assess the situation and take operational measures, which grew into an interethnic conflict that led to bloodshed. In the context of an emergency in the republic, a government

commission was created. On June 4, a curfew was imposed. The 13,000-strong unit of the USSR Interior Ministry's internal troops was urgently sent to Fergana.

The strike was repeated on June 7 and soon spread to the Kokand, Rishtan and Uzbek regions. On June 8, a peaceful demonstration in Kokand was shot by troops of the USSR Ministry of Internal Affairs, as a result of which more than 50 people were killed and more than 200 were injured. The riots killed 103 people. 1,011 people were injured and maimed. 137 servicemen of the internal troops of the USSR Ministry of Internal Affairs, 110 policemen were wounded, one of the policemen died. 757 houses, 27 government buildings, 275 cars were burned and looted. Due to the tragic nature of the events, the Soviets and authorities organized an emergency evacuation of the Meskhetian Turks to a camp at a military training ground in Fergana and to the village of Novgarzon in the Asht district of the Leninabad region of Tajikistan, guarded by armed soldiers. .. And medical assistance was provided [11-17]. Thousands of people could not stay in such camps for a long time. As a result, 16,282 people were evacuated from the Fergana region to the Smolensk, Orel, Kursk, Belgorod and Voronezh regions of Russia.

CONCLUSION

In short, the social composition of the displaced people varied, but the vast majority remained poor. In addition to Uzbeks, Tajiks, Kyrgyz, Kazakhs, Turkmens, Uighurs, Poles, Germans, Koreans and other ethnic minorities are involved in the resettlement policy. The problem of settling Jews on the earth and attracting them to agriculture was considered separately. The Red Army, Afghan political immigrants, Chinese, Dungs and Gypsies did not stay away from the resettlement process. In the resettlement campaign, people of all ages, genders, nationalities and social status have become a small part of the resettlement policy and have participated in the mobilization and implementation of huge government policies.

ACKNOWLEDGEMENT

The authors acknowledge the immense help received from the scholars whose articles are cited and included in references to this manuscript. The authors are also grateful to authors/editors/publishers of all those articles, journals and books from where the literature for this article has been reviewed and discussed.

KAZUO ISHIGURO AS AN INTERNATIONAL NOVELIST

Irsaliyeva Madina Anvarbek qizi*; Abrarova Sardora Najmiddin qizi**;
Xoliqova Nazokat Batirovna***

^{1,3}National University of UZBEKISTAN

ABSTRACT

The article is a creative portrait of the 2017 Nobel Prize in Literature Kazuo Ishiguro. The author reveals the peculiarities of the author's prose, his writing style, which makes the work of K. Ishiguro unique against the background of the existing variety of contemporary prose in Great Britain. The Nobel Committee's decision to award the 2017 Literature Prize to Kazuo Ishiguro, a Japanese-born British writer, has been welcomed by critics and admirers of his work, especially given the publicly controversial awards of previous years. The reasons for this unanimity are obvious. Firstly, Ishiguro's works are really popular and loved by various readers, both in the UK and far beyond its borders. Secondly, Ishiguro is a writer in the most direct, original sense of the word: he does not engage in politics, does not give interviews on sensitive issues of current international relations, but for several decades now, for several decades, he has published quite regularly, albeit at rather large intervals.

KEYWORDS: K. Ishiguro, Nobel Prize, Unreliable narrator, Englishness, Memory, History.

INTRODUCTION

The Nobel Committee's decision to award the 2017 Literature Prize to Kazuo Ishiguro, a Japanese-born British writer, has been welcomed by critics and admirers of his work, especially given the publicly controversial awards of previous years. The reasons for this unanimity are obvious. Firstly, Ishiguro's works are really popular and loved by various readers, both in the UK and far beyond its borders. Secondly, Ishiguro is a writer in the most direct, original sense of the word: he does not engage in politics, does not give interviews on sensitive issues of current international relations, but for several decades now, for several decades, he has published quite regularly, albeit at rather large intervals. Book light. He does not write columns in periodicals and is not a well-known literary critic like David Lodge, does not create a literary double and does not release under his name detective stories full of frank details, like Julian Barnes, does not

participate in political debate and does not write political journalism like Martin Amis. Unlike the works of other leading British writers, Ishiguro's prose does not contain explicit erotic episodes; his novels, as a rule, are small in volume and outwardly eventless. We also add that he was not among those writers to whom journalists and critics predicted the prize in 2017 for a number of reasons.

The reaction of the writer himself to the award of the prize is significant: when asked by the BBC correspondent, he said that the Nobel Committee had not informed him of anything in advance, so Ishiguro, having learned about the prize from the press, was not sure that this was not a joke. He later commented on the event as follows: "This award is a huge honor for me <...> it means that I am following in the footsteps of the greatest authors who have ever lived, so this is an amazing award" [1] [Ellis-Petersen, Flood 2017].

Ishiguro's external biography has developed smoothly and successfully. Japanese by nationality, he was born in Nagasaki in November 1954. The post-war Nagasaki, which survived a terrible nuclear explosion, will be described in his very first novel - moreover, it can be argued that he is part of the Ishiguro family history, since the writer's mother, who is still alive today, was among those who managed to survive the nuclear disaster. In 1960, when the future writer was five years old, the family moved to England, to Surrey. Ishiguro's father, an ocean scientist, at first did not plan to stay in England for a long time, but later the family stayed there permanently. According to the writer's recollections, in Surrey in the 1960s, any foreigner was a wonder, and there were simply no foreigners from Asia, except for the Ishiguro family. The future writer went to a local elementary school and even sang in the choir of a local church, that is, familiarization with British culture became a natural process for him. Let's clarify: K. Ishiguro's English is the language of the British intellectual, the language in which he creates his literary works and gives interviews even to Japanese journalists.

Repeatedly answering the question about his belonging to the Japanese culture and about knowledge of the Japanese language, Ishiguro states:

By their upbringing, my parents remain true Japanese, and when you are brought up in a family, you perceive the style of behavior adopted in it. I still communicate with my parents in Japanese. I start speaking Japanese as soon as I enter their house. But I am not very good at this language. My Japanese is a mixture of 5-year-old's Japanese speech with many English words, and I make grammar mistakes all the time ... [Mason 1989: 336]

In England, Ishiguro first received secondary and then higher education - at the University of Kent in Canterbury, where he majored in English and philosophy. Later, in 1979, Ishiguro entered the University of East Anglia in Norwich with a degree in writing and graduated with a master's degree. The creative workshop that Ishiguro taught and from which many famous writers have emerged was led by Malcolm Bradbury.

Ishiguro's first stories appeared in print in 1980. To date, he is the author of a number of short stories, several television scripts and seven novels, each of which (!) Was awarded prestigious literary prizes: "Where the Hills Are in the Haze" (1982), "Artist of a Shaky World" (1986), "The Rest of the Day" (1989), "Inconsolable" (1995), "When We Were Orphans" (2000), "Don't Let Me Go" (2005) and "Buried Giant" (2015). The writer's novels have been translated into many languages, based on the novel *The Remains of the Day*, director J. Ivory made a film of the same name in 1993 (the script was written by Harold Pinter), which brought together a stellar

cast that received wide audience success and a considerable number of prestigious awards (only for the "Oscar" he was nominated in eight nominations). In 2010, the novel "Don't Let Me Go" was also filmed.

The reception of Ishiguro's works by British critics has been more than benevolent from the very beginning of his writing career: twice, in 1983 and in 1993, his name was included in the list of the best British young writers of the decade according to the influential magazine *Grant*. It makes sense to note the remarkable literary flair of the critics: in 1993 their choice was understandable and obvious, but in 1983 Ishiguro, the youngest of all the writers on the list, was the author of only a few short stories and one short novel.

Today, the analysis of Ishiguro's works is included in all studies on the history of British literature, without exception, where the author's work is viewed from different points of view and in various contexts. For example, the influential critic F. Tew examines it in the chapter of his monograph on the image of modern British identity in literature, *Contemporary Britishness*, in the chapter *The Rise and Decline of the Middle Class*, where *The Remains of the Day* is clearly inscribed in the tradition of the English social novel, along with the novels of K. Amis, D. Barnes, M. Bradbury, J. Coe, D. Lodge and other writers of the late XX - early XXI century. Curiously, however, Ishiguro's works are not mentioned by Tew in the chapter "Diversity and Hybridity" [Tew 2007].

In the monograph by F. Tolan "New Directions Literature after 1990 Texts, Contexts, Relationships" There are several chapters devoted to Ishiguro's novels, including "Memory and Identity" and "Dystopia of the New Millennium" [Tolan 2010]. The collective monograph "Contemporary British Literature" states that the novels of K. Ishiguro, G. Swift, J. Barnes, J. McEwen and some other contemporary British writers "despite all their postmodernist strategies can be interpreted within the framework of the tradition of the psychological novel on the basis of that psychological and ethical significance <...> which they represent" [Contemporary... 2007: 41].

Along with several stories, the first two novels of Ishiguro can be called his Japanese works - their action is completely, as in the novel "The Artist of a Shaky World", or partially, as in the novel "Where the Hills are in the Haze," takes place in Japan, and almost all the characters these works are Japanese. In his Nobel Lecture, Ishiguro gratefully recalled that it was Bradbury who endorsed his Japanese works in an era when British multicultural literature had not yet formed as a direction of British literature.

After the publication of Ishiguro's first novels, critics and journalists repeatedly asked him about the literary tradition to which he considers himself. The answer - for several decades - has remained unchanged:

I believe I belong to the Western literary tradition. And I am very surprised that critics so often mention that I am Japanese, and try to remember two or three writers they heard about, comparing me to Mishima or someone else. It seems to me that this is inappropriate. I grew up on Western literature: Dostoevsky, Chekhov, Charlotte Brontë, Dickens [Mason 1989: 336].

The same thesis was voiced by the Secretary of the Swedish Academy Sarah Danius, who said: "Mix Jane Austen and Franz Kafka, and you, figuratively speaking, get Ishiguro. Although it may still need to add a little of Marcel Proust and mix gently" [Ellis-Petersen, Flood 2017]

It is interesting that Ishiguro, recalling in the Nobel lecture the period when the novel *The Artist of the Shaky World* was written, says that the novel was created under the influence of the prose of Proust, whom he was reading at that moment. Obviously, in the prose of multiculturalist writers, to whom Ishiguro belongs for objective reasons, complex relations between linguistic and cultural traditions arise, a synthesis of heterogeneous mental foundations of literature arises, as Bradbury wrote about back in 1987: "... we rank them> as British authors but, living in Britain and creating works in English, they belong to a culture that feels wider than we consider ours" [Bradbury 1987: 363].

COVERAGE OF MYSTICAL INTERPRETATIONS IN THE EPICS OF YUSUF AND ZULAYKHO

Jumaeva Dilnoza Tursunpulatovna*

*Ph.D,

Teacher of "Uzbek language and literature",
Department of Uzbek State Institute of Arts and Culture,

ABSTRACT

The appeal of Islam and the Qur'an in Uzbek literature has become a major literary event. Talented creators have further enriched the Qur'anic theme based on their skill. They created royal masterpieces. This great cultural heritage left by our ancestors is an unforgettable treasure of our spirituality. It should also be noted that "the penetration of Qur'anic themes into world and Uzbek literature in particular is not only from a religious point of view, but also clarifies for us the abstract aspects of Eastern literature, reveals the origins of various literary themes and connects modern Uzbek literature with Islamic literature. It has also helped to re-establish uninterrupted ties"

KEYWORDS: Uninterrupted, Penetration, Masterpieces, Reflects, Humanistic.

INTRODUCTION

When comparative study of the epics "Yusuf and Zulaykho" created in the Eastern literature, they are divided according to their ideological aspects into romantic-mystical and romantic-adventure epics. Abdurahmon Jami and Mirzo Olim Devona Samarkand epics are characterized by more romantic and mystical aspects. So far, this series of epics has not been included in the scope of scientific research on the same aspects. More often than not, they are traditionally divided into groups according to the theme of father and children as well as love. Literary scholar Abdulhamid Kurbanov comments on this in his article "Creative Interpretations of the Story of Yusuf and Zulaykho." According to him, since the 15th century, along with works that traditionally interpret the story of Joseph, many works have been created that describe him as a

purely romantic epic. With this in mind, the scholar divides the numerous poetic versions of Joseph's story into two groups according to the nature of the epic image:

Jusuf and Yaqub, i.e. works describing the relationship between father and son;

1. Works depicting Zulaykha's passionate love for Yusuf.

Accordingly, Firdavsi's "Yusuf and Zulayho", Ali's "Qissai Yusuf", Rabguzi's "Qissai Yusufi Siddiq alayhissalam", Avhadi Baloni (XVII century) "Yusuf and Yaqub" belong to the first group. Their interpretation and the interpretation of the story in the Qur'an have much in common. In the works of the second group, the main issue is Zulaykha's passionate love for Yusuf.

The epics created by Abdurahman Jami and Olim Devona, as mentioned above, belong to the second group of works. Because their main focus is on the relationship between two souls, a passionate love full of suffering. Another important reason why this epic has been loved and read for centuries is that it reflects a beautiful love story.

The epic poem "Yusuf and Zulaykho" by Jami is not a work that calls for the recognition of fate, as some literary critics say, but a lively work that encourages people to actively fight against any forces in the way of high emotions, glorifying the victory of pure love. Also, by referring to this plot, Jami skillfully depicts his great humanistic ideas about life and man, the role of man in life and the responsibilities assigned to him, in bright images, colorful episodes. As mentioned above, most of the stories about Yusuf and Zulayho focus on the father-son relationship. The main focus is on the image of Joseph. All events are related to Joseph. In Jami and Olim Devona, we see the exact opposite. In them, not Yusuf, but Zulayho rises to the forefront. In both epics we see that the hymn of pure divine love is given priority.

It is obvious from the very beginning that the theme of love is in the forefront in these epics. The main events in them begin with Zulaykho falling in love. From the moment she saw Yusuf in the dream of her lover Zulayho, her only goal in life was to achieve him. The fire of love in his heart is burning day by day. He finally falls to a level where he doesn't understand himself. The agony of Hijra throws Zulaykho into a thousand lakes and leads her to the steppe of madness:

Xush ul dilkim, oni ishq etsa manzil,

Qilur olam ishidin oni g'ofil...

Topilmas onda anduhi salomat,

Bo'lub bir kohcha ko'hi malomat.

Malomat chekkusi andoqki boda –

Ki, ondin bo'lg'usi ishqiy ziyoda.

Zulaykho, whose whole body is reduced to ashes by the fire of love, becomes an outsider. Her parents, who do not understand her condition, are worried about finding a cure for Zulaykha's illness. Zulaykha's pain is getting worse day by day.

It should be noted that Jami and Olim Devona were well-known as representatives of mystical literature. Therefore, in each episode of the works of these poets, mystical interpretations are felt. It is well known that in mysticism, the tax goes through the levels of authority one by one until it

is honored by God. Zulayho also goes through the painful path and stages of love until it reaches true love:

Uch yo'li ushshoq elining bor erur,
 Har birig'a o'zgacha raftor erur.
 Avvali bo'lsa talab dashti tabi,
 Shu'lag'a zanjir tomur birla labi...
 Telba bo'lub qilsa g'alat sayrdin,
 Bexud o'lub olsa xabar g'ayrdin...
 Keldi uchunchi yo'l anga ittihad,
 Munda erur asl mutobiq savod.
 Bir desa yuzdur nishon andoqki mo'l,
 Rangi dog'i bargdin andoqki gul...
 Qilsa muhabbat ani tamkin inon
 Kim, to'la paymonag'a bo'lmas fig'on.
 Bor esa mustag'raqi vahdat pisand,
 Ko'rsa ahd bo'lsa agar xudpisand.
 Bu yo'l aro chekti Zulayxo xurush,
 Urdi qaro qonkim behuda jo'sh...

It is well known that mysticism has a status. According to the description of Professor Najmiddin Kamilov: Having achieved the levels of authority one by one, he attains the status of a successful taxman and begins to observe the divine beauty in the imagination, and his heart is filled with joy. He ascends to a state where all his limbs seem to say Allah, and every breath he announces the existence of Almighty Allah. According to the scholar, a true Sufi is a person who has gone through selfishness and the mortal world and has regained his identity in the Garden of Truth. If we follow the course of events, similar processes take place in the psyche of Zulaykho. Now Joseph's love was forever sealed in his heart. Zulaykha's love acquires spiritual maturity. He sees the manifestation of Truth in the form of a companion. He finally finds himself in the Garden of Truth:

Kishi ishq ichra qo'ydi sidq ila gom,
 Chiqor ma'shuqliq birla onga nom...
 Tushekim ko'rmish erdi baxt ul yor,
 Ham onda bo'ldi Yusufga giriftor...

We think it is necessary to emphasize one thing here. In most studies, the epic of Abdurahman Jami is interpreted as a work dedicated to human love or worldly love. However, in the process of getting acquainted with the epic of Jami, we became convinced that it is impossible to agree with such considerations at all. Not one or two facts refuting this interpretation, but dozens of

examples can be cited from the work. The work is written in a completely mystical spirit, in which worldly love, along with real love, is glorified by divine love.

For example, during the events of the work, Jami introduces a short episode that is not found in other stories, and this small film and the image in it reveal the original purpose of the work. Through this episode, the author predicts the romantic experiences of Yusuf and Zulaykho. According to him, there will be a girl named Bozga from the tribe of Ad in Egypt. He was unequal in beauty and infinite in wealth.

Diyori Misr aro bor erdi bir qiz,

Jamolu, husniyu, xulqi adadsiz.

Latofat avji tobon axtari ul,

Jalish Od nasli sarvari ul...

He had dreamed of so many guys for her. The girl was indifferent to them. One day he hears the voice of Joseph, the slave whom Malik the merchant brought to Egypt. He falls in love with her in absentia and sets out with the state with a large fortune in order to meet and buy with her. When he sees Joseph, he sees that his incredible beauty, that there is no equal in this world equal to him, and he falls unconscious.

He is grateful to Yusuf for guiding him to the right path, awakening him from his slumber, and giving him a sign of the truth:

Dedi Yusufga: Chun vasfing eshitdim,

Jamoling shavqidin o'lmakka yetdim...

Yuzung ko'rgach bo'lub behud yiqildim,

Halokimni g'amingda jazm qildim.

Vale men deb kalomi mushfiqona,

Haqiqatdin manga berding nishona.

Jamoli haq sori ochding ko'zumni,

Ayurding mehri husnungdin yuzumni...

It is obvious that Jami Zulaykha's full activity during the work, his romantic experiences, that is, the gradual rise of figurative love in it to the level of real love, are shown in short images in the example of Bozga:

Yiqil'on hol aro tutding qo'lum sen.

Haqiqat sori ko'rguzdung yo'lum sen.

Chu emdi fikr ila andisha qildim,

Saning ishqing majoz erkanni bildim.

Haqiqatg'a ko'zum chun bo'ldi bino,

Majoziy ishq i tark etsam avlo.

Jazokallohki sen ochding ko'zumni,

Yeturgil yor vasliga o'zumni...

It should be noted that this small episodic image played a significant role in the epic. The author describes his original purpose, Sufi views, and one of the most important issues of mysticism through this short passage. In short, the image of the Egyptian girl reflects the main idea of the work, its essence.

The epics created by Abdurahman Jami and Mirzo Olim Devona are based on the principles of their creative thinking and, no matter how romantic and mystical they are, they are dominated by the ideas necessary for the secular spirit and human spiritual perfection.

ABSTRACT

For the assessment of water resources for sustainable development of the country and its regions need to have comprehensive and current data on the supply of quality water, the conditions of the formation of the hydrological regime of water bodies and their environmental condition, as well as a possible change in its inventory under the influence of natural and anthropogenic factors.

KEYWORDS: *Water, rivers, Water resources, Database, industry, Agriculture.*

INTRODUCTION

Intensive economic use of small rivers and other water bodies, increasing pollution and depletion of water resources urgently requires the development and preparation of schemes of rational use and protection of water resources at the regional level, the creation of a permanent system of accounting and water resources (water cadaster) for efficient water management. The use of this development of technology for storing and processing hydrological information is a very urgent problem, as it allows us to find optimal solutions for the use of water resources. Water resources are one of the most important components of the human environment. Intensive economic use of small rivers and other water bodies, increasing pollution and depletion of their water resources urgently requires the development and drawing up of schemes.

DISCUSSION

The current stage of information technology development is characterized by the wide application of mathematical methods for modelling, analyzing and evaluating the state of natural and economic complexes. [2] Since spatial aspects play a significant role in such systems, an effective solution to the problems of assessing the state is associated with the use of geoinformation technologies that integrate data about the territory and provide tools for processing and analyzing spatial information.

Intensive development of computer technology and information technology in recent years; As it is clear from the analysis of the current state of the problem, at present, the methods of electronic cartography are widely used both in our country and abroad [1].

In recent years, in the CIS countries and directly within the borders of Uzbekistan, a system of monitoring and control, assessment and forecast of changes in the state of the geological environment - the monitoring system has been created and successfully operates. A special place in the monitoring system is occupied by the tasks of managing the geological environment, which has a different scale - from studying individual objects to planetary tasks, from assessing the state of the geological environment in a narrow time slice up to many decades; from studying and forecasting a separate natural and technical complex to regional forecasts. Such a wide range of tasks related to changes in the geological environment requires the systematization and processing of large amounts of information [5].

The main deciphering signs in the determination of area and linear geological structures and the separation of the boundary of the KDK in terms of the composition of rocks are the pattern and structure of the colour gamut (spectral brightness) of the studied territory. The structure of the picture and the spectral brightness of the object, in this case, depends on the physical-mechanical, chemical properties, mineral composition, textural and structural features of the rocks, and also on the geological structure and geographical conditions of the territory (Figure 1).

Figure1: Area and linear structures based on drawings and color anomalies on RSD materials, Western Uzbekistan

Based on the recognition of various geological structures on the materials of space surveys, the preliminary distances are compiled according to the above-mentioned signs (Figure 2).

Figure 2: Results of interpretation (preliminary) RSD materials, Western Uzbekistan

The valley of the Chirchik River is the most developed in the republic. Industry and agriculture are booming here. There are more than 150 industrial, municipal and other enterprises in the Chirchik River Valley. [8] Agricultural crops are grown in almost all suitable areas of the lower terraces of the valleys. Large areas of the valleys are occupied by industrial and drinking water intakes. Their territories are partly used for growing vegetables and fruits. In the middle part of the valley is the Chirchik industrial complex, which includes the Uzbek plant of refractory and heat-resistant materials, a chemical plant. The main sources of industrial and municipal pollution, concentrated within the valley, can be divided into a point (industrial enterprises, public utilities, etc.), linear (surface watercourses) and areal (territories whose soil is polluted by industrial emissions into the atmosphere); according to the mode of operation – on a permanent basis [4].

The development of industry and agriculture depends on the availability of water resources. Despite their apparent significance in some areas, there is already a shortage of surface and underground water resources, which is due to seasonal variability in river flow, as well as uneven loads on the surface and underground water resources within settlements, agricultural and other objects, the development of irrigated agriculture, causes a significant change in the qualitative composition of surface and underground water. Their amplitude, the composition of anthropogenic-metamorphosed ingredients, as well as changes in physical properties are determined by the predominance of certain types of pollution. Due to the uneven distribution of pollution sources across the valley, the manifestation of pollution processes is uneven. The technical factor of changing the natural environment of the sections of the Chirchik River has become particularly evident since the 60s of our century. For several decades of intensive [7]. Among the technogenic factors, the main ones that affect the change in the chemical composition of natural waters are industrial and agricultural production. The chemical industry enterprises that pollute natural waters include the Chirchik Nitrogen Fertilizer Plant and the Electrochimprom. The Chirchik PO “Elektrokhimprom”, built according to the projects of the pre-war period, in which the issues of wastewater treatment were not resolved. Since the beginning of the 60s, the company has built more than 45 different facilities for the treatment of

harmful discharges. Water consumption by the Electrochimprom plant is 665 thousand m³/day, water disposal-588 thousand m³/day of these, 488 thousand m³/day is discharged into buffer ponds, 10 thousand m³/day into the slag storage tank, and the rest is drained into the city sewer. The waters of buffer ponds in high concentrations contain ammonium, nitrate, nitrite, petroleum products, phenols, copper and other components, some of which are systematically observed in the Chirchik River after the Yumalak reservoir flows into it. The enterprises of the metallurgical industry that pollute natural waters include the plant of refractory and heat-resistant metals with water consumption of 47.6 thousand m³/day and water disposal of 46.3 thousand m³/day. In recent years, the plant has carried out extensive work on the construction of new treatment facilities. Before the reconstruction of runoff production done in the slum, which is a pit, the bottom of which is the roof of pebbles, devoid of any grout curtain, resulting in polluting components was freely admitted into the groundwater. The plant's effluents contain large amounts of ammonium, nitrite, nitrate, molybdenum, iron, copper, tungsten, cobalt, chromium (ammonium-181.2, molybdenum – 16.4, copper – 0.8, iron – 29.0, tungsten -1.6, chromium – 0.004, cobalt – 1.3 mg/l). In November 1980, the company “Caprolactam ” was put into operation” BY “Elektrokhimprom”. Its water consumption is-22,32 thousand m³/day, water disposal – 20 thousand m³/day. Salvo discharges produced by Caprolactam, part of the production and” conditionally clean ” wastewater through the storm sewer network are discharged without any treatment into the Chirchik River. They contain (mg/l): ammonium ions-15.7, nitrates-23.1, and nitrites-1.4. Industrial waste causes pollution of natural waters in certain areas of the Chirchik River Valley with components specific to each production, which leads to a change in the chemical composition of the water. It is established that the largest production facility that discharges wastewater into the Chirchik River is the Chirchik Electrochemical Plant, located above all major cities and settlements of the Chirchik Valley on the II and III above-floodplain terraces. The main output products of the plant are nitrogen fertilizers [8-10].

CONCLUSION

In conclusion, thus the cover deposits in the irrigation fields of the Chirchik district serve as weak protection of groundwater from nitrogen contamination of fertilizers used in agricultural production. The intensity of the man-made agricultural factor as an indicator of natural water pollution depends not only on the number of fertilizers applied but also on the degree of "reactivity" of the system, i.e., on the dilution capacity of the aquifer and the intensity of water exchange processes. The results of the survey of wells and boreholes allowed us to conclude that the level of groundwater contamination in the floodplain territories from the I-th above-floodplain terrace of the Chirchik River in the agricultural development zones is significantly lower than in the II-th above-floodplain terrace, despite the weaker protection of the aquifer by cover deposits. Obviously, in this case, the prevailing purification factor is the intensity of water exchange. In general, the pollution of natural waters with nitrogen nitrate, as the main component of agricultural pollution, is widespread and is the result of the regional impact of this technogenic factor. Municipal wastewater from cities and settlements, including a mixture of conditionally clean and untreated wastewater from urban sewers and enterprises, is one of the most important technogenic factors of surface and underground water pollution. The impact of the municipal factor on water pollution is directly related to the size of settlements and the saturation of their industrial enterprises [6].

Thus, the growth of water use and pollution of water resources necessitate the search for the most effective methods to achieve the rational use and protection of water resources, focused not only on increasing the efficiency of the development of water-intensive industries but also to minimize the negative consequences of the functioning of the national economy and its individual sectors. The most important factor in achieving the parameters of sustainable water use, providing the population and economic activities with water resources, and improving their environmental condition should be a mechanism for rational water use, which allows regulating the volume and quality of water resources involved in economic turnover and ensuring the increase in the efficiency of their use [3].

Water resources are the determining factor of life and habitat, the most important resource that all sectors of the national economy are focused on. In the context of population growth, the scale of production and the aggravation of the shortage of irrigated water, the tasks of rational use of water resources, reduction of water loss during transportation, as well as optimization of the structure of agriculture in general and the irrigated sector in particular, taking into account the degradation of environmental components, primarily land and water resources, are of strategic importance. The solution to this problem largely depends on the degree of perfection of the water resources management system, taking into account the involvement of the country's water management complex in the sphere of market relations. Sustainable water use is an activity aimed at ensuring the economic use, protection and reproduction of water resources, taking into account the long-term interests of the country's economy (basin) and conservation.

FACTORS OF ORGANIZING PHYSICAL EXPERIMENTS BASED ON NON-TRADITIONAL TECHNOLOGIES

Sheraliev Sa'dullo Suyunboevich*

*Almaliq Branch of Tashkent State Technical University,
Uzbekistan

Email id: sadulla72@mail.ru

ABSTRACT

This article presents the factors of organizing physical experiments based on non-traditional technologies and algorithms for virtual organization and execution of individual experiments in the field of physics of electromagnetic oscillations using electronic resources. Assessing students' knowledge in non-traditional teaching technology is an important task. Since this technology is mainly focused on independent learning, it is advisable to take into account not only the results of the experiment but also the creative activity and independent working skills of students in the process of assessing students' knowledge.

KEYWORDS: *Experience, technology, Factors, Electromagnetic oscillations, Alternating current, oscillatory circuit, resonant frequency, voltage, originality.*

INTRODUCTION

Currently, one of the urgent tasks in the education system is to increase the interest of students in obtaining knowledge, as well as the development of creative abilities and the ability of students to apply the obtained theoretical knowledge in practice. In the development of the creative abilities of a schoolchild and a student, it is important to be able to properly organize, conduct physical experiments, and analyze the results [1,2]. This is a guarantee of production efficiency, including the introduction of the achievements of science and technology in various industries.

MATERIALS AND METHODS

An important place in the study of physics was occupied by the organization and conduct of experiments. Factors of organizing physical experiments based on non-traditional technologies:

- The level of physical knowledge will increase;

- The theoretical knowledge gained is strengthened;
- Achieves a deeper understanding and understanding of the basic concepts and laws of physics;
- Form the skills and abilities to solve experimental problems;
- Studies working with physical devices and instruments, measuring instruments;
- Learn to develop and analyze the results of observations and experiments;
- Learns to work on the measurement errors of physical quantities;

Non-traditional (virtual, with computer equipment).

Achievements: students' skills of working with computer equipment are being formed;

- Direct execution of processes and experiments that are impossible to see or difficult to observe in practice is achieved;
- Saves time when performing your experiments;
- The possibility of dynamic (animated) execution of experiments;
- Direct intervention of the student in it when performing the experiment (temporary stop and continue);
- Achieves repetition of the experience several times within a given time;
- Availability of automatic analysis (evaluation) of the results of the work performed;

Disadvantages: students' ignorance of the use of computer technology;

- The absence or incorrect structure of the method of performing the experiment;
- The illogical or incomprehensible sequence of the experiment execution;
- The student's work on computer equipment in excess of the established time;
- Incomplete understanding of measurement technology and computing apparatus;

As a result of the analysis mentioned above, the following can be recognized. The difference between non-traditional classes and traditional ones is that these classes create an atmosphere of freedom for students, allowing them to freely express their opinions [2-4]. With traditional methods of teaching the organization and conduct of physical experiments, the devices and devices of the experiment, with sufficient quality, give their effect in this particular case. Also, one of the advanced pedagogical technologies in further improving the effectiveness of training is teaching physical experiences using non-traditional learning technologies. With the above in mind, we present an algorithm for virtual execution of some experimental physics works on electromagnetic oscillations using computer-based learning technology.

1-experience. Method for determining the resonant frequency of the circuit

Purpose of the work: 1. Investigation of the phenomenon of resonance in an alternating current circuit composed of R, L, and K elements connected in series in an experiment.

2. To study the resonant frequency (ω_{rez}) of the oscillation circuit, the resonant voltage ($U_{m.rez}$) in the circuit and the determination of the originality and active resistance. Required equipment: an

electronic software tool designed to perform virtual laboratory work with auxiliary equipment [3-5]. Brief theoretical information: The phenomenon of a sharp increase in the amplitude of vibrations, when the frequency of harmonic vibrations in an electrical circuit becomes equal to the frequency of the circuit, is called resonance.

The resonance phenomenon in an electric circuit is achieved when the alternating current at a given voltage and at given values of R , L and C reaches its maximum value $R_L = R_C$,

When the oscillation contour with a very small active resistance is equal to the frequency of the alternating voltage outside its specific frequency, the amplitude of the forced oscillations of the current increases sharply and a resonance event occurs in the electric oscillation circuit.

The less energy is wasted in the circuit, i.e. the smaller the resistance R in it, the more pronounced the resonance phenomenon. When  the resonance value of the current increases infinitely:  is a schematic representation of it in Figure 1. The frequency dependence of the current amplitude when the resistances are different is shown in Figure 1

. As the current increases during resonance, the voltages in the capacitor and inductor also increase sharply. These voltages are equal in magnitude and several times higher than the external voltage.

As well as:

The external voltage is related to the resonant current as follows:

If it is

, it will be

During resonance, the shift between the external voltage phase and the current-carrying phase in the circuit tends to zero. Permission is obtained from the teacher to perform the measurements. The algorithm and methodology for performing the measurements are as follows: Step 1. The theme "Determination of the resonant frequency of the contour" is activated from the model in the dialogue box (Figure 1).

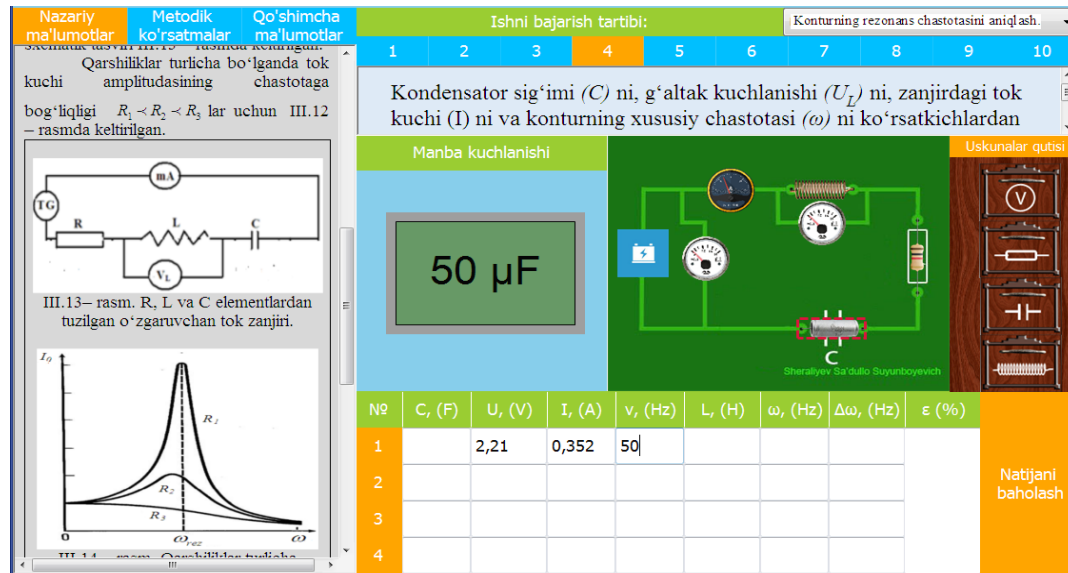

Figure 1: Model for determining the resonant frequency, the voltage of the circuit.

Step 1 A voltmeter, rheostat, capacitor, and coil are used to assemble the circuit in the electrical circuit from the toolbox.

1. Assemble the circuit diagram of the case shown in Figure 1.
2. The output voltage of the sound generator is set to a magnitude of 6B or close.
3. R = - the resistor is removed from the circuit.
4. Capacitor capacitance (C), coil voltage (U_L), circuit current (I) and circuit-specific frequency (ω) are plotted in the table in Figure 1.

5. The values of the coil inductance L are determined and entered in the table.

6. According to the measurement results, the resonant frequency is calculated and summed using the formula .

7. After the automatic calculations, the analysis and conclusions on the absolute and relative errors of the experiment are made.

2 - Experience. Methodology for determining the resonant voltage in the circuit;

Theoretical data on the determination of the resonant voltage in the circuit is studied. Permission is obtained from the teacher to perform the measurements. The algorithm and methodology for performing the measurements are as follows: Step 1. The theme "Determination of resonant voltage in the circuit" is activated from the model in the dialogue box (Figure 1).

Step 2 A voltmeter, rheostat, capacitor, and coil are used to assemble the circuit in the electrical circuit from the toolbox.

1. The electrical circuit of the work is assembled.

2. The output voltage of the sound generator is set to a magnitude of 8B or close.
3. R - resistor is not connected to the circuit.
4. The capacitance C, the winding voltage U_L , the current I in the circuit and the specific frequency ω of the circuit is entered in the corresponding table.
5. The coil inductance L from is determined and entered in the corresponding table.
6. According to the measurement results, the voltage at the resonance time is calculated and summed using the formula .
7. After the automatic calculations, the analysis and conclusions on the absolute and relative errors of the experiment are made. Computer-assisted learning technology is mainly implemented through e-learning resources and its features are:
 - It is aimed at developing the student's independent thinking and creative abilities;
 - The teacher participates in the educational process as a consultant;
 - Active integration of media and resources in the learning process is provided;
 - Training motivation is increased;
 - Increases the intensity and effectiveness of education;
 - The student's skills of independent work and research are formed.

CONCLUSION

Assessing students' knowledge in non-traditional teaching technology is an important task. Since this technology is mainly focused on independent learning, it is advisable to take into account not only the results of the experiment but also the creative activity and independent working skills of students in the process of assessing students' knowledge.

SOCIETY, STATE, LAW - MODERN DEVELOPMENT TRENDS AND PROSPECTS

Nurmatova Nodira Nabiyeвна*

*Senior Lecturer,
Department of Social-humanitarian subjects,
Andijan State Medical Institute,
UZBEKISTAN

ABSTRACT

The concept of state is known to us as the settlements inhabited by pre-Christian urban states. This is mainly the case between ancient Egypt and the states between Akkat and Shummer in Mesopotamia, which have a history of more than 3,000 years and functioned as a separate structure in governance. In short, the concept of State in the early days also meant the concept of the city. By our time, the State has acquired its essence as an improved perfect understanding of its function. State symbols are Flag, Territory, and Coat of Arms, Constitution, Army, Law Enforcement, Anthem and Currency. The concept of state performs its function depending on the socio-economic relations of society.

KEYWORDS: *Constitution, state, law, civil society, law and its observance.*

INTRODUCTION

Before independence, we looked at the state as a means of protection, as a guide. For example, we had the notion that if a problem arose, the State should take action. The problem of housing was that even the upbringing of children had to be carried out by the state. As we move toward building a democratic civil society based on a market economy, we will face several challenges on our own. First of all, we need to inculcate in the minds of our citizens the tendency to build a free civil society. We need to educate citizens who live with the idea that what the state has given us, what I have given to the state, what I have done for the welfare of society. In a market economy, it is natural for the population to be rich and poor. As the differences between these layers increase, it becomes necessary to prevent the elements from exploding. At this point, the state needs to fulfil its function.

MATERIALS AND METHODS

As the state implements social policy, it influences the distribution of income and the formation of social qualities between the strata. This is done as follows:

1. The state shall train a skilled workforce at its own expense and organize free general education for all. Everyone has the right to education. Free general education is guaranteed by the state. Schoolwork is under state control [1]. Preferential housing and medical services are guaranteed. Training of the population in new professions will be introduced at the expense of the state. Free medical care by the state is determined between social strata.
2. The state redistributes income through taxes and provides social protection to the poor at the expense of the rich. In this way, social harmony and reconciliation will be established, which will create favourable conditions for economic growth. Citizens' property is protected by the state. Everyone has the right to own property alone as well as in association with others. The secrecy of deposits in the bank and the right of inheritance are guaranteed by law [1].
3. The state shall take measures to provide employment and reduce unemployment. Unemployment benefits and employees are paid for by the state. The state allocates large sums of money to social programs. Takes social protection measures everyone has the right to work, to free choice of employment, to just and favourable conditions of work and to protection against unemployment. The harmonization of the ratios of market and field mechanisms has an impact on the lifestyle of the population and serves to ensure its well-being. But this ratio depends on the nature of each state, the level of development of the private sector in it, the economic problems facing the country.

The state is in contact with the world community and the norms of international law perform their functions in accordance with the normative documents. By function, the state is divided into 3 types: 1. Unitary; 2. Fiducive; 3. Confederate; According to their characteristics, government bodies are divided into 3 main groups:

1. General authority.
2. Special powers.
3. Network authority.

In our country, public administration is based on three powers. 1. Legislative power, 2. Executive power 3 Supervisory authorities; the media that can expand their sphere of influence to all three governments is called the 4th power. Its activities are based on transparency and democracy. As for the concept of law, the meaning of the law in its purely internal interpretation lies in the fact that it is a socially justified attribute or quality that determines whether each person acts in a certain way or not. If we pay attention to the lexical or philosophical meaning, then it is based on the words "Truth" and is a set of specific norms aimed at protecting a person. In our country, the law is reflected on the basis of all universal international law based on democratic principles. Public life in the Republic of Uzbekistan develops on the basis of a variety of political institutions, ideologies and opinions.

Democracy in the Republic of Uzbekistan is based on universal principles, according to which a person, his life, freedom, dignity and other inalienable rights are the highest values. Democratic rights and freedoms are protected by the Constitution and laws. One of the main factors in the

creation of the Constitution is that this document, which is a set of legal norms, is the basis for human development to have its place in the world community of any country.

If we focus on the constitutional system of developed countries;

We see that the U.S. Constitution, adopted in 1778, spanning several hundred years, is still in effect today. The Constitution is an important political and legal document that reflects the interaction of the socio-political, economic and spiritual order of society with the state. The republic was faced with the problem of choosing its own path of development. In June 1990, at the II session of the Supreme Council of the XII convocation, the Constitutional Commission was established under the chairmanship of the President. Until December 8, 1992, it was twice put up for public discussion. The constitutions of more than 30 countries were studied and several options were developed.

The president himself has made changes seven times.

Announcing the adoption of the Constitution, the President noted the following.

"We have advanced the idea that the greatest of all worldly blessings is man, and on this basis, we have sought to find a rational-legal solution to the relationship between 'civil society and the state.'" On this basis, you and our life and death are the encyclopaedias that give us the right to live as human beings. A set of 128 articles of the Constitution was formed.

The study of the Constitution reveals the role and importance of law in human life, helps to understand how the relationship of the citizen with the state should be formed and how important it is in human life.

The government of our country is doing a lot of positive work to study the Constitution and promote it among the general public, to increase the legal knowledge and skills of our people.

The purpose of the Decree of the President of the Republic of Uzbekistan No F-1322 of January 4, 2001, was to study the Constitution and increase the legal literacy of citizens. If we want a modern interpretation of the concepts of society, state, law, we should focus on the fact that the state delegates its functions to the members of society one by one, and on the legal actions taken to develop civil society. The process of liberalizing society creates "liberalism." What is liberalism? The term liberalism was used in the 1812 uprisings in Spain.

In the 1840s, the term spread throughout Europe. Hence, as the birthplace of liberalism, European Liberalism developed as a political movement, it largely supported the interests of the middle class. Liberal ideas existed even before they matured as a political movement and played a key role in the English revolutions of the 18th century, the American and French revolutions. The basis of liberalism is individualism. It should be seen as the Enlightenment that promotes the natural rights of man. Liberalism was described by Con-Look, one of the geniuses of the West, as "Life-freedom and property." If we study the process of liberalization scientifically, we will see that the interests of individuals appear to be high. This means that the society is united in a single goal as a result of entering into economic, social and political relations, which are independent individuals who embody personal interests. There seems to be an intrinsic connection between the concept of freedom and the concept of equality. However, it must be understood that freedom does not mean equality.

Our Constitution, which is our main encyclopaedia, says about freedom: Everyone has the right to liberty and security of person. No one may be arrested or detained without law. In addition to individuals, liberalism also has the characteristics of universality.

Liberal ideas promote equality before the law for all, regardless of gender, religion, race, or origin. Wealth based on equality of opportunity is considered to be the fruit of talent and hard work, and society is ruled by talented and lucky people. Liberals see pluralism as a natural state. They believe that truth emerges as a result of diversity and freedom of thought. Many countries have constitutions in a liberal spirit. Liberal ideas were also reflected in the 1787 US Constitution. In this regard, Tom Jefferson expressed the following views, based on the principle that "the best government is less government than others". "We have fought not only for a form of government based on the principles of freedom but also for the distribution and balance of governing power to several institutions so that none of them is limited by their legal powers. The people are the custodians of power and government. Everyone should influence the government". As our goal shifts from a strong state to a strong civil society, we have certainly made the main goal of radical renewal of society through self-government bodies in the liberalization of public administration.

CONCLUSION

While the state bodies delegate their functions to the self-governing bodies one by one, it should provide for control over the precise implementation of the measures that need to be carried out conveniently and quickly for the citizens.

We have as a basis the assembly of citizens of "Makhalla", which is its institution as a body of self-government in all places. Currently, the activities are carried out through this body. In the mahallas, various commissions are organized on a community basis, which expresses their attitude to the state bodies and thus participates in the management of the society. The interdependence of society, state, law, mistakes and shortcomings in the development of civil society are the main means for us to understand the negative consequences for human development. Human society recognizes the need for a strong state to prevent the violation of the rights and freedoms of the citizen by other individuals on all fronts. Freedom promotes only the idea of the law and the guarantee of its observance.

Review Process

Each research paper/article submitted to the journal is subject to the following reviewing process:

1. Each research paper/article will be initially evaluated by the editor to check the quality of the research article for the journal. The editor may make use of iThenticate/Viper software to examine the originality of research articles received.
2. The articles passed through screening at this level will be forwarded to two referees for blind peer review.
3. At this stage, two referees will carefully review the research article, each of whom will make a recommendation to publish the article in its present form/modify/reject.
4. The review process may take one/two months.
5. In case of acceptance of the article, journal reserves the right of making amendments in the final draft of the research paper to suit the journal's standard and requirement.
