ACADEMICIA

An International Multidisciplinary Research Journal

ISSN (online) : 2249 –7137

Editor-in-Chief : Dr. B.S. Rai

Impact Factor : SJIF 2021 = 7.492

Frequency : Monthly

Country : India

Language : English

Start Year : 2011

Indexed/ Abstracted : Scientific Journal Impact Factor (SJIF2020 - 7.13), Google Scholar, CNKI Scholar, EBSCO Discovery, Summon (ProQuest), Primo and Primo Central, I2OR, ESJI, IJIF, DRJI, Indian Science and ISRA-JIF and Global Impact Factor 2019 - 0.682

E-mail id: saarjournal@gmail.com

VISION

The vision of the journals is to provide an academic platform to scholars all over the world to publish their novel, original, empirical and high quality research work. It propose to encourage research relating to latest trends and practices in international business, finance, banking, service marketing, human resource management, corporate governance, social responsibility and emerging paradigms in allied areas of management including social sciences , education and information & technology. It intends to reach the researcher's with plethora of knowledge to generate a pool of research content and propose problem solving models to address the current and emerging issues at the national and international level. Further, it aims to share and disseminate the empirical research findings with academia, industry, policy makers, and consultants with an approach to incorporate the research recommendations for the benefit of one and all.

ACADEMICIA

An International Multidisciplinary Research Journal

(Double Blind Refereed & Peer Reviewed International Journal)

SR. NO.	PARTICULAR	PAGE NO.	DOI NUMBER
1.	THE EFFECTS OF GLOBALIZATION ON NIGERIA'S UNDERDEVELOPMENT Abubakar, S. Yushau Alfakoro	1-11	10.5958/2249-7137.2021.00631.5
2.	PERFORMANCE OF FIBER OUTPUT AND FIBER LENGTH IN INTER VARIETY HYBRID FAMILIES OF MIDDLE FIBER COTTON Ergashev Jakhongir Abduganievich, Akhmedov Djabbarxan Djamalxonovich, Sidikjonova Muazzamkhon Sadulla kizi	12-18	10.5958/2249-7137.2021.00583.8
3.	THE HARMONY OF THE NEW RENAISSANCE PEDAGOGY AND THE PEDAGOGICAL VIEWS OF MAHMUDKHUJA BEHBUDI Akbarov A.T, Tojimatova Z.A	19-24	10.5958/2249-7137.2021.00584.X
4.	HISTORICAL BACKGROUND ON THE SYSTEMATIZATION OF THE VOCABULARY OF ETHICS Shukurova Madina Askarovna	25-29	10.5958/2249-7137.2021.00585.1
5.	THE STYLISTIC FUNCTIONS AND TYPES OF ZEUGMA Jurayev Ziyodbek Nurmatovich, Karimova Nodiraxon Abdurashidovna	30-35	10.5958/2249-7137.2021.00586.3
6.	THE STYLISTIC ESSENCE AND THE FUNCTION OF PERIPHRAISIS IN ENGLISH AND UZBEK LANGUAGES Abdulazizova Sevara Ganiyevna, Yoldasheva Oyistaxon Toxirovna	36-40	10.5958/2249-7137.2021.00587.5
7.	ESSENTIAL DRAWBACKS OF USING MULTIMEDIA AFFECTING BOTH STUDENTS AND TEACHERS IN LANGUAGE TEACHING CLASSES Rafieva Bunafsha Rustamovna	41-43	10.5958/2249-7137.2021.00588.7
8.	THE GENESIS AND EVOLUTION OF THE CONCEPT OF COMBATING SPIRITUAL THREATS Eshovkhurshid khurramovich	44-49	10.5958/2249-7137.2021.00589.9
9.	PREDICTION OF THE COST OF THE ASSORTMENT OF SEWING AND KNITTED PRODUCTS Zolotseva Lyubov Viktorovna, Bazarbaeva Guzal Gulimovna, Aminjanova Nargiza Siddikjon kizi	50-53	10.5958/2249-7137.2021.00590.5
10.	STUDYING THE INFLUENCE OF SOWING DATES ON THE GROWTH, DEVELOPMENT, YIELD AND QUALITY INDICATORS OF PEANUT VARIETIES IN THE IRRIGATED CONDITION OF TASHKENT REGION Khudaykulov Jonibek Bozarovich, Buriev Iskandar Astanovich, Irnazarov Shuxrat Ismatullayevich, Shavkatova Zarnigor Shavkatkizi	54-62	10.5958/2249-7137.2021.00591.7

11.	EFFECT OF SULFUR AND MANGANESE MICRO NUTRIENTS ON GRAIN QUALITY OF SOYBEAN VARIETIES Khayrullayev Sardor Shamsiddinugli	63-68	10.5958/2249-7137.2021.00582.6
12.	THE GEO-POLITICS OF NORTH INDIAN OCEAN: INDIA'S POSSIBLE RETALIATIONS TO CHINESE AGGRESSION Dr. Pranab Kr. Das	69-78	10.5958/2249-7137.2021.00622.4
13.	THE ASPECT OF REALIAS IN DIFFERENT CULTURES Bafoyeva Nilufarsalimqizi, Xalilova Muxtarama Inayatullayevna	79-82	10.5958/2249-7137.2021.00578.4
14.	PROSPECTIVE METHODS OF USING ENTOMOPHAGES IN THE PROTECTION OF VEGETABLE CROPS FROM APHIDS IN KARAKALPAKSTAN Utepbergenov Adilbay Reymbaevich, Satbaeva Rimma Sarsenbaevna, Joldasbaev Edilbay Markhabaevich	83-86	10.5958/2249-7137.2021.00579.6
15.	BRONCHOO STRUCTIVE SYNDROME IN CHILDREN: PREVALENCE AND DIFFICULTIES OF DIFFERENTIAL DIAGNOSTICS Sh.M. Ibatova, F.Kh. Mamatkulova, N.Y.Ruzikulov, Yu.A.Rakhmonov	87-92	10.5958/2249-7137.2021.00580.2
16.	INFLUENCE OF TECHNOLOGICAL PARAMETERS OF THE DRAFTING SYSTEMS OF THE RING SPINNING MACHINE ON YARN QUALITY Bobojanov Husankhon Tokhirovich, Yusupov Alijan Abdujabbar ugli, Muhiddinov Abdurahmon Abdusamad ugli	93-102	10.5958/2249-7137.2021.00596.6
17.	THE USE OF SOCIAL FORMS TO INCREASE LESSON EFFECTIVENESS Juraeva Mastura Tojihakim qizi	103-109	10.5958/2249-7137.2021.00597.8
18.	INFLUENCE OF PLATINUM CLUSTER SIZE ON REACTIVITY IN THE PROCESS OF OBTAINING ETHANE FROM METHANE Kobilov Nodirbek Sobirovich, Rakhmatov Xudoyor Boboniyozovich, Shukurov Abror Sharipovich, Sulaymonov Ikromjon, Khushnazarov Shohboz, Boynazarov Ruziboy Abdulaziz ogli	110-116	10.5958/2249-7137.2021.00598.X
19.	ANALYSIS OF CHANGES IN THE PHYSICAL AND MECHANICAL PROPERTIES OF TWISTED YARNS AS A RESULT OF FINISHING Yusupov Alijan Abdujabbar ugli, Bobojanov Husankhon Tokhirovich, Yuldashev Jamshid Qambaraliyevich	117-122	10.5958/2249-7137.2021.00600.5
20.	ON THE SCIENTIFIC BASIS OF FORMING STUDENTS' LOGICAL COMPETENCE Komiljon Raximovich Kodirov, Azizbek Solijonovich Nishonbaev	123-128	10.5958/2249-7137.2021.00595.4
21.	THE INFLUENCE OF TECHNOLOGICAL CHARACTERISTICS IN THE STORAGE OF MELON FRUIT GROWN IN THE CONDITIONS OF KARAKALPAKSTAN Sultanov Jetkerbay Dauletbaevich, Buriev Hasan Chutboevich	129-134	10.5958/2249-7137.2021.00619.4
22.	GROWTH, DEVELOPMENT AND PRODUCTIVITY IN VARIOUS VARIETIES OF ARTICHOKE (CYNARA SCOLYMUS L) IN THE CONDITIONS OF THE TASHKENT REGION Turakulov Alimardon Abdusalomovich	135-139	10.5958/2249-7137.2021.00628.5
23.	INDIA'S ADVANCEMENT TOWARDS E-GOVERNMENT TO E-GOVERNANCE MOVING FORWARD TO M-GOVERNANCE Sandeep Kumar Singh, Prof. Sanjay Medhavi	140-152	10.5958/2249-7137.2021.00624.8

24.	THE ANALYSIS OF "NARROW SPACES" OF THE ENTERPRISE OF THE SHURTAN GAS-CHEMICAL COMPLEX AND WAYS OF THEIR ELIMINATION Kobilov Nodirbek, Rakhmatov Xudoyor, Shukurov Abror, Suyarov Matniyoz, Kodirov Sarvar, Abdurakhmanova Nasiba, Khalimov Adhambek	153-158	10.5958/2249-7137.2021.00599.1
25.	DETERMINATION OF PRESSURE IN THE PLUNGER DURING THE OPERATION OF OIL WELLS BY SUBMERSIBLE PUMPS Yuldoshova Zarnigor Sayfullo qizi	159-163	10.5958/2249-7137.2021.00601.7
26.	RESEARCH INTO THE EFFECT OF STRETCHING COUPLES ON THE QUALITY OF THREAD IN A RING SPINNING MACHINE Yusupov Alijan Abdujabbar ugli, Bobojanov Husankhon Tokhirovich, Yusupov Sabirjon Abdujabborovich	164-171	10.5958/2249-7137.2021.00602.9
27.	TYPES OF SERVICES TO THE POPULATION Yu. B. Rakhmatov, M.T. Mustafoeva, Sh.T. Bafoeva, O.A. Umarova	172-176	10.5958/2249-7137.2021.00581.4
28.	RESEARCH METHODS OF LOCAL LORE Urinov.B.S	177-179	10.5958/2249-7137.2021.00633.9
29.	APPLICATION OF AUTOMATIC CONTROL AND ELECTRICITY MEASUREMENT SYSTEM IN TRACTION POWER SUPPLY SYSTEM A.B.Abubakirov, R.J.Tanatarov, T.U.Kurbaniyazov, Sh.B.Kuatova	180-186	10.5958/2249-7137.2021.00603.0
30.	PECULIARITIES OF EXPRESSING THE CATEGORY OF EMOTIVENESS IN DISCOURSE Muhammadieva Nigina Mahmudovna	187-191	10.5958/2249-7137.2021.00592.9
31.	THE PERIOD OF RECONSTRUCTION AND RISE OF THE HISTORY OF OUR PEOPLE IN THE YEARS OF INDEPENDENCE Jabborov M, Rahmatov M.G	192-194	10.5958/2249-7137.2021.00593.0
32.	PROBLEMS OF WATER DEPLETION AND POLLUTION AND THEIR CONSEQUENCES Abdumutalipova Kh.T, Botirov A.A, Mamazhonova N.A, Zhanzakova D. Zh	195-199	10.5958/2249-7137.2021.00594.2
33.	E. ALL WORTH: THE MATIC OF UZBEK LITERATURE Madaliyeva Zuhraon Odiljonkizi	200-205	10.5958/2249-7137.2021.00604.2
34.	MICROFINANCE AS A TOOL FOR ALLEVIATING POVERTY: THE JLG APPROACH Mr Chandan Swain, Dr Pallabi Mishra, Dr Shree Kanungo	206-211	10.5958/2249-7137.2021.00625.X
35.	FEATURES OF SUITABILITY FOR PLANTING MELON VARIETIES SUITABLE FOR PROCESSING IN SALTED AREAS Sultanov Jetkerbay Dauletbaevich	212-215	10.5958/2249-7137.2021.00620.0
36.	FEATURES OF STORAGE OF PUMPKIN FRUITS IN DIFFERENT TERMS AND METHODS Umidov Shavkat Ergashevich, Mamasaidov Olimjon Imurodugli	216-221	10.5958/2249-7137.2021.00621.2
37.	POLYMORPHISM OF GENES IS FACTOR EFFICIENCY ANTI ULCER PHARMACOTHERAPY Klichova F.K	222-228	10.5958/2249-7137.2021.00605.4

38.	IMAM AL-BUKHARI – A BRIGHT SPARK IN ISLAMIC WORLD Murtazaev Ulkar	229-234	10.5958/2249-7137.2021.00606.6
39.	PROBLEMS IN THE UZBEK INTERNET SUBCULTURE Urinbayeva Dilbar Bazarovna, Eshquvvatova Gulmira Norjigitovna	235-241	10.5958/2249-7137.2021.00607.8
40.	THE EFFECTIVE USE OF TOURIST POTENTIAL OF DESTINATIONS (IN CASE OF NURABAD DISTRICT, SAMARKAND REGION) Rakhmonov Shukhrat Shavkatovich, Rakhimov Abror Zafarovich	242-249	10.5958/2249-7137.2021.00608.X
41.	CHARACTERISTICS OF INFLOW AND SUBSIDENCE TURBIDITY IN WATER INTAKE CHANNELS Zhamolov Farkhod Norkulovich, Tursunov Ikram Numonugli, Ekubov Talabboy Abrorugli, Ibodov Islom Nizomiyugli	250-252	10.5958/2249-7137.2021.00609.1
42.	SCUTELLARIA COMOSA JUZ LATENT PERIOD IN ONTO GENESIS Zhamolov Akbarova Mukhayyo Xusanovna, Yusupova Zokhidakhon Abdumalikovna, Juraev Zukhuridin Najmidin oglu	253-259	10.5958/2249-7137.2021.00610.8
43.	COMPETENCE DEVELOPMENT TECHNOLOGIES Kutlymuradov Karamaddin Allabaevich	260-263	10.5958/2249-7137.2021.00611.X

Sokoto NIGERIA

Email id: alfakoros@gmail.com

ABSTRACT

Since time immemorial some societies across the globe have been dominating others directly or indirectly to say politically or economically. There is indeed no doubt that Globalization has been a process of international integration and cooperation among countries of the world and also a means of promoting economic and political development but, the reverse is the case in Nigeria and most third world countries. One of the problems facing most underdeveloped countries including Nigeria today is globalization, this to a large extent affect development. This paper x – rayed the devastating effect of globalization which includes unemployment, increased dependency ratio, poverty, and environmental degradation etc. secondary materials were collected through a comprehensive review of relevant literature on the subject matter under study; this paper concludes that important strategic measures and good leadership are part of the remedies that can tackle the problem of globalization, If Nigerians desire to attain economic growth and development.

KEYWORDS: *Globalization, Political, Economic, Integration, International. Development, Underdevelopment*

INTRODUCTION

Globalization is a complex issue; it is one of the greatest challenges facing most third world nations, this to a large extent affects the development of Nigeria. In Nigeria for example, this problem has become so and alarming such that the whole society and all sectors are been affected by the effect of globalization. Globalization is a global phenomenon, that cut across national boundaries and frontiers and encompasses all sphere of life be it health, education, trade, transportation etc so it is a universal phenomena. Globalization is conceive as a multi

dimensional concept it taken to mean a process where all countries of the world collaborate together to become a global village where the problem affecting one nation will be seen as a problem affecting all, it is also taken to mean a converted form of colonialism(Neo-Imperialism) this exploitative arrangement called globalization has many negative impact on Nigerians which includes environmental degradation, unemployment, poverty, indebtedness and economic liberalization which has lead to underdevelopment of Nigeria. Globalization as a new dimension of modernization theory can best be describe as a process of techno-capitalism, which involved a fundamental and systematic, restructuring, reorganization and integration of not only culture and politics but also the economy all with the view to either predominate developing countries by the other developed ones or their local and international economics of the world by the so- called “super powers” of the world (izibili, Enegho and Okiri, 2003). Globalization has affected many sectors of the economy for instance Nigeria represent a typical example of a country in African which development has been undermined and retarded by the menace of globalization.

In view of the above, this paper critically examines the synergy between globalization and underdevelopment. Specifically, the study seek to interrogate the state of globalization on underdevelopment in Nigeria , the challenges to development, the prospect of efficient and effective policies on globalization. Since the rationale behind any formal research is by its contributions to the existing body of knowledge or theory in the field of the study, this paper will not be any different the fact that every research work is geared towards identifying issues and problem with a corresponding possible solutions. This paper advance knowledge on the issues of globalization on underdevelopment. The study will intend to enable the economic analyst and policy makers on the possible effect of globalization and how to efficiently address them.

The manners in which Nigeria adopt foreign policies from the developed countries is detrimental to our development because the fails to incorporate with are political, economic, and cultural background, and also the preconditioned giving to Nigerian by the Briton hood institution like world- bank and IMF, before granting loans and other economic advice are also not at our favor. Secondly Nigerian home based industries are not able to compete with their foreign counterparts in terms of price and quality which as lead to unemployment and close down of many factories in Nigeria, also, the free trade policy has also constitute to the problem because there is no restriction and quota on importation, many obsolete and expired goods have been imported which also have a negative impact on the health’s of Nigerians.

Thirdly the activities of minerals exploration has also lead to problem of environmental pollution but air and land the farm land are no more fertile and arable for agricultural production in these minerals exploring communities leaving many rural dwellers jobless. Fourthly the rate of insecurity and issue of kidnapping in the country is rising due to globalization as the result of technological advancement and desire by young people to make fast money as the hear or watch from these foreign medias, lastly the rate of corruption is so alarming because political and bureaucratic office holders want to live expensive life’s style as been seen in media or visits to developed countries, these developed countries take advantage of our flamboyant life style and justifies that by producing commodities solely meant for Africa’s consumption, example of such commodities are expensive cars, beverages and houses; not to talk about monies being stanchd in these developed countries.

Related Literatures

Concept of Globalization

Although there is no unilateral definitions of globalization, to some people globalization is the best thing that has happened to the world while others have pointed accusing fingers on globalization as the rationale responsible for their underdevelopment. However some of the definitions are reviewed below.

Held et al (2004) have emphasized that globalization as we tried to prove is neither unique nor a linear process. Moreover, it is best presented as an extremely differentiated phenomenon that includes different spheres of activity and cooperation such as political, military, economic, and culture area and spheres of labor migration movement and economy. To some scholars globalization is synonymous to either universal civilization or westernization, which is also described as the product of modernization, Mohammed (2004). these definitions appears curious because many people are of the opinion that globalization implies positive implication to every nation concerned but however from the concept above it can be positive and negative result, Taiwo Makinde (2013). For example free transfer of funds and trade liberalizations.

According to Brittan (1998:2) globalization is viewed “as a whirlwind of relentless and disruptive change which leaves governments helpless and leaves a trail of economic, social cultural and environmental problems in its wake.” Arifalo and Ogen (2002) in their view describe as an “all embracing and culturally pervasive concept with economic, political, environmental and technological dimension”. Nkurayiya (2011) sees globalization as a convergence of economic, political, and cultural system such convergence may not be necessarily brings positive result. Also Hirst and Thompson (1996) are amongst those who consider globalization as the “westernization of the world”, especially as it encourage the promotion of capitalism in the global arena. Ogbu (2004) observe that the developed capitalist countries constitute the driving force of the phenomenon of globalization as it offers them with an avenue to further advance their economic and imperialist penetration of the less develop countries. He adds that globalization provides the multinational corporations an opportunity to intensity their exploitative economic activity in the developing countries that are technologically and ill-equipped and ill-prepared to match with the challenges of the globalization crusade thereby not only subjecting the latter to unhealthy competition but also sharpening the dichotomy and unequal exchange between the two polarized worlds (developed and undeveloped). Larson (2001) which equates globalization with the process of world shrinkage of distance getting shorter and things closer meaning the world has turned to a global villages. Almani Mazuri (2001) define globalization as the process by which different regions of the world are pulled together through and expanding network of exchange of people, idea and cultures as well as good and services. Sheidu (2001) regards the process as not just integrating the economies but also cultures, technologies and governance. It is in this wider context that Ibrahim (2003) describes globalization as the intensification of the domination of economic, political, security, military and socio-cultural affairs of the world by industrials capitalism, facilitated by the electronic and telecommunications, institutional agents such as International Monetary Fund (IMF), World Trade Organization (WTO) and World Bank revolution under the hegemony of the United States of America (USA) and its allies in the European Union and Japan.

However from the above definitions it is obvious that globalization is another clever means of further exploiting the underdeveloped countries by the so called developed countries, through science and technology etc.

Underdevelopment

Underdevelopment is been usually measured through three factors; unemployment, poverty and inequality (Todaro,1977) a country with high rate of aforementioned factors is simply termed as underdeveloped country, unemployment is very vast in underdeveloped country in which majority of people are employed in primary occupation such as; agriculture, fisheries and mining. Poverty is another measure and it may be taken to mean absence of three basic human needs food, clothing and shelter and majority of the population leaves in abject poverty. Note food does not mean eating anything but food that contains all six classes of foods, clothe mean covering the body with not any type of clothes but cloth to be worn will be determined by the nature of the weather. Shelter is the ability to protect oneself from weather, predators and other harmful living creatures.

Underdevelopment can also to be taken to mean lack of educational facilities, health facilities and housing and total dependant on foreign country through loan from international agencies, aids and grants. One of the most important indicators of underdeveloped country is high infant mortality rate and low life expectance rate. Daniel (1980) underdevelopment refers to the state of an economy or an economy of a satellite economy characterize by low real income per capita. In comparison with those of North America and west Europe, such economy, Daniel said characterize by illiteracy, poverty, overpopulation and disease.

Under development in this contest can be defined as a “process in which a country has not sufficient development” underdevelopment scholars urge that the status of insufficient development and underemployment of human and material resources was acquired through historical circumstances such as slavery, colonialism and neo-colonialism.

The colonial regime has already molded an indigenous political class and turns them towards metropolis, which was cut off from a social base, Gelinas (1998). Scholars in Nigeria have not done much in terms of giving relevant policy advice to their leaders even though there are evidence that in some instances there advices are not welcomed or at last discarded however in most cases one finds scholars in the country out of sycophancy supporting the implementation of western induce policy that have little or no bearing on the life of the citizenry. Gelinas (1998) observed that the export sector of underdeveloped economies like Nigeria is forced to adapt to products, technology and management of foreign conditions. He also points out that banking institutions in those countries are not only oriented to external financial flows but also deprived of adequate mechanism to attract domestic savings and channel it in to productive investment.

Under- pinning theory

There are many theory of globalization like modernization theory, World System theory and dependency theory, dependency theory is considered as the most fitting theory for this paper because many scholars are of the view that Nigerian was under colonial rule for a long period, further more dependency theory is the motion that resources flow from a “periphery” of poor and underdeveloped states to a “core” of wealthy states, enriching the latter at the expense of the former. It is central contention of dependency theory that poor state are impoverished and rich ones enriched by the way poor states are integrated into the “world system”. To Osvaldo (1969) Dependency theory can be defined as an explanation of economic development of a state in terms of the external influences; political, economic and cultural on national development of the nations. To the school of thought they believe the third world nations remain economically

backward not because of internal factors but because they are been exploited, in the sense that there is unequal exchange by paying less for raw-materials produce by the third world nations. Dependency theory arose as a reaction to modernization theory, an early theory of development which held that all societies progress through similar stages of development, that today's underdeveloped areas are thus in a similar situation to that of today's developed areas at sometime in the past, and that, therefore, the task of helping the underdeveloped areas out of poverty is to accelerate them along this supposed common path of development, by various means such as investment, technology transfer, and closer integration into the world market. Dependency theory rejected this view, arguing that underdeveloped countries are not merely primitive versions of developed countries but have unique futures and structures of their own and importantly, are in situation of being the weaker members in a world market economy.

Globalization as said early has lead to underdevelopment of Nigeria because of it devastating effect on Nigeria's economy, because globalization make it possible for the countries of the world to get in touch with others between minutes, hours through enhanced communications technologies like video call, E-mail, Fax etc, and also easy means of transportation across the length and breadth of the world. Nigeria has adopted policies which are not favorable or conducive to its citizens as a result of globalization like the policy on privatization which is been adopted from countries practicing capitalist system of government by so doing all Nigeria public assets have been transfer to private individual, the fact that these individuals are government officials, chances are that the monies used in acquiring these assets could be stolen monies which will eventually hamper the main aim of privatization of public enterprise, not to talk of foreign loans that comes with stringent conditionality. E.g. IMF, Swiss Bank and World Bank etc.

Many Nigerian indigenous companies has melt and close down because they were not able to compete with the foreign investors because of price and quality of the products for example, the Nigerian steel company, Nigerian Airways, Nitle communication etc. There has been increase in unemployment rate because many people want to make quick and easy money so it makes them to move from rural areas to urban centers and the agricultural sector was abandon. At the time of independence, 90% of Nigerians population engaged in agriculture, it a pity that Nigeria at the early 60s and late 70s can feed Africa but when oil was discovered and its exploration started it was not able to feed itself.

Nigerian which is been rated as one of the 25th richest countries in the world now become one of the poorest countries. The rate of insecurity has worsen and the quest for quick and easy money as lead to a lot of international cyber internet crimes like Yahoo, fake advertisement, false scholarship, all these are possible today in Nigeria owing to globalization. Corruption in but public and private sectors has become ramped as the result of globalization where by our public office holders tend to patronize everything foreign that comes their way at the detriment of our local manufactures and products which eventually lead to dumping.

It is now vividly clear that all these afore mentioned problems are external problems or to say have external influence from foreign countries or developed countries through the process of globalization at the center stage; the center countries controlled the technology and the systems for generating technology. Foreign capital could not solve the problem, since it only lead to limited transmission of technology, but not the process of innovation itself, which lives the skilled workers in the center; unskilled in the periphery as far as dependency theory is concerned.

Issues

Some of the indicators used in concluding that globalization has lead to the underdevelopment of Nigeria are buttress in the point below

Economic liberalization (economic nomadism) : The country has been economically invaded by the so called industrialized countries of the world there by dictating the pace and other arrangement by bringing down African countries to becoming exporters of raw materials and later importers of finished goods which translate to low per capital income. Wikipedia (2013) refers to it more as economic liberalization which is associated with classical liberalization, thus liberalization, in short refers to removal of control to encourage economic development liberalization include partial or full privatization of government institution and asset, greater labor market, flexibility, lower tax rates for businesses well as less restriction on both domestic and foreign capital open market among others.

Environmental degradation in which the environment is been polluted and made infertile :- Many oil exporting company that are operating in the Niger Delta- region like Shell, Chevrans and Total are all owned by foreign operating within the Niger- delta regions there by polluting the atmosphere and also contaminating there rivers without appropriate corporate social responsibility and adequate compensation, which leads to their underdevelopment and increase their dependence ratio on others for survival.(Jike, 2003 Ogbu, 2004). The multinational corporations as agent of globalization are not environmental friendly and socially responsible firms largely because they are profit seeking entities and they face little or no competition from the host country.

Rendering of services by eroding the functions of indigenous company's by foreign investors :- the myths of these foreign companies has muscled our indigenous companies rendering them more or less useful, a critical example of this is the heavy presence of MTN which is owned by South Africa have dominated the indigenous networks like Globacom and Zain networks and also in the construction company, the so called Julius Beggar has been in existence since independence which has led to the collapse or lack of patronizing of our own indigenous construction companies.

Unemployment- has become a natural problem in Nigeria despite the fact that 70% of Nigerians are into agriculture, globalization has also led to unemployment in Nigeria. The international system has been skewed and tilted in a manner that most Nigerians relied on foreign goods and services, another imperative point worthy of notice here is that Nigeria is more or less a mono-economy with 90% of its revenue coming from crude oil, which has over time rendered our teeming youth jobless, the conundrum here is that is oil actually a blessing or curse to Nigeria? The rate of unemployment was 12% in March 2005, it rose to 19.7% in March 2009 while the rate of underemployment covered around 19% in 1998 (Adebayo and ogunrinola, 2006, NBS 2010). Coming up to 2017, the rate of unemployment rose to 18.00 %, (trading economic.com)

High rate of insecurity and criminal activities - that make people to think of not seeing the next hour; the high rate of insecurity is so alarming that people don't sleep with their two eyes close, the advent of technology has triggered a lot of rural – urban migration just so that people will earn a living through any means possible legal or illegal so long as monies keeps coming in, all these shenanigans wouldn't have been possible without the advent of technology. (Alanana, 2004). Similarly, most spending on global media such as internet service has been focused

mainly on promoting false and evil values such as sex, crime and disasters to the extent that contemporary Nigeria is losing the sense of sin rapidly. These technology facilities have made unhealthy information accessible to teenagers thereby distorting their sense of morality all in the name of globalization.

Free transfer of funds at any place and time (money laundry): It makes it possible for free transfer of funds outside the country without any government regulation. Many politicians and public servants have siphoned Nigerian money which are meant for development projects into foreign reserve accounts of the so-called world financial institutions like the World Bank, International Monetary Fund etc. because of the cumbersome process in which these international financial institutions operate, it makes it difficult for all these monies to be returned safely to Nigeria. All the money is not returned to Nigeria which eventually brings about low infrastructural deficit and underdevelopment of Nigeria. Deming and Levine (2008) in a review of the various analytical methods used in finance literature, found strong evidence that financial development is important for growth. To them, it is crucial to motivate policymakers to prioritize financial sectors policies and devote attention to policy determinants as mechanisms for promoting growth.

Privatization of government property: as we all know, privatization is one of the accompanying processes of globalization, in as much as privatization is a force to reckon with as far as an economy of a country is concerned, chances are that some greedy individuals would want to use these as a yardstick or opportunity to appropriate government-owned assets to themselves further more crippling the economy. There are public enterprises that are saddled with the responsibility of providing essential services to the people at subsidized rates, when such enterprises eventually become a private property whose sole aim is profit making, the citizens might not be able to benefit from such basic services and amenities due to corresponding high rates of charges. However, the motives behind these public enterprises will end up being eroded.

Corruption: it is no longer news that Nigeria is a corrupt country that lacks accountability and transparency in its financial dealings, the fact that corruption is systemic in Nigeria, the leaders find it easier to use the advent of globalization to wire monies across the globe, part of these monies are saved in these expatriate banks abroad, build companies overseas, buy expensive cars from the developed countries, carry their families for summer overseas and send their children and relatives to study abroad, at the detriment of our public-owned institutions all as a result of interconnectedness called globalization. The irony here is that these monies are referred to as "capital flight". The federal government of Nigeria like most, if not all African governments have lost control of the policy making process, and are under pressure to accept dictation from creditor nations and financial institutions. (Joda, 2011) corruption is anti-social it confers unmerited benefit contrary to accepted rules. Corruption as one of the banes, if not the main problem with Nigeria is incompatible with development; Nigeria cannot expect to develop in the face of political and economic instability.

CONCLUSION

However, from the above reviewed literatures it is not a denying fact that globalization is a strategy of creating a gap between the haves and the have-nots in the country, which has left a growing mass poverty plus living with less than a dollar a day points to the failure of globalization to reduce poverty and ensure stability. A large chunk of our wealth goes to the rich moguls of the

western world and the political class and wealthy big business men of Nigeria, due to our over-dependence on these foreign economies, we will be severally affected if any economic crisis occurs in those countries. Although globalization cannot be totally discarded countries should not take it as a do or die affairs or the soul part to development, even though globalization cannot be totally discarded because people have shared knowledge, ideas and leads to technological transfer in the world. From these point listed above, it has shown the negative effects of globalization on Nigerian state, so it now left for Nigerian leaders to put this problem into place. All these attempt, rather than develop Nigeria further our underdevelopment and dependent on the foreign economies.

RECOMMENDATIONS

- (1) Nigeria government should formulate and enact more stringent financial policies regarding capital transfer, so as to check and tackle the menace of money laundries.
- (2) Accurate measures should be taken regarding the importation of luxuries products and if found necessary Quota should been given on the quantities to be imported into the country to reduce duping of local products.
- (3) Government should device another means of improving efficiency and effectiveness in the public sector either by reorienting workers, motivating them through increase in their remuneration, or conditions of service , not the privatization of public goods and services because these leads to increase in prices and monopoly of essential goods and services.
- (4) The educational sector in Nigeria needs a serious attention, so has to provide adequate and standard knowledge and skills for its citizens that will in turn foster a technological driven society, reduce unemployment and increases their standard of living; because no nation can develop more than it level of education.
- (5) Measures should be taking to prevent and tackle environmental degradations be it air, water, and land pollution, any company that is found wanted should be prosecuted and make to pay for damages.

ABSTRACT

Purposefulness of using the performed families O-445, O-580, O-455 in the genetic and breeding researches for improving of fiber output and the families of O-580, O-455, O-520 to improve the fiber length on the dependence of their genotypes has been presented in this paper. In general, similarity of a high dominance of varieties in the positive indexes on the fiber output and fiber length in combination of various soil-climatic zones was noted.

KEYWORDS: *Cotton Plant, Genotype, Hybrid, Inter Variety, Family, Fiber Output, Fiber Length.*

INTRODUCTION

Today, 90 percent of the world's produced cotton fiber belong to domesticated species of *G.hirsutum* L. Annually 20-22 million tonnes of fiber is harvested and exported in 86 cotton growing countries of the world. Development of high productive, high output and fine quality of

fiber, short season varieties and use widely them in the production is considered as the one of important problems in cotton breeding. Getting of high and quality crop in the correspondence of various soil-climatic zones without broadening of agricultural plantations in the countries of the world in reason of increasing of population over the world and decreasing of watering land plantations has become an actual question.

Global climatic change in the world, emerging of new disease causing races and increasing damage by the pest insects have shown the necessity of creation of resistant new cotton varieties to adverse factors. This problem can be decided by the attraction of new donors possessing unique traits.

Widely covering measurements on the development of competitive new cotton varieties with fiber output to meet world's market requirements are being implemented in our republic. Today, the creation of cotton varieties resilient to various soil-climatic zones, fiber output is not less than 40% is a topical question in our country and should be conducted a range of researches.

The aim of the research is to create the strains (lines) enriched with genetic valuable properties of various high fiber output varieties on the base of analysis the formation of fiber output in combination with other economic desirable traits in the materials developed by the inter variety hybridization of cotton.

G.hirsutum L. cotton varieties of Bukhara-102, An-Bayout-2, Bukhara-8, Sultan, Mekhnat, Dustlik-2, Beshqakhramon, Andijan-36, Chimbay-5018 introduced into production in different regions of our republic and cotton families and strains taken by their participation were used as the **research source**.

Study of valuable recombinants enriched by genetic features on traits and properties which were developed through application of the method of inter variety crossings, study of inheritance of fiber output, variation, formation and correlative relations within some of economic traits, determination of a trait transgression in the materials taken on the base of inter variety crossing method are considered as the **subject of research**.

MATERIALS AND METHODS

The scientific research have been conducted according to the method of "Methods on the carrying out of field experiments" [1] accepted in the UzPITI. The methods of inter variety crossing, phonologic observations, defining of wilt resistance, selection works, carrying out of sample pickings, mathematic, variation and correlation analyzes were used. Quality indexes of the fiber by contemporary HVI system and digital results taken from the experiments have been analyzed by the method of B.A.Dospekhov [2].

LITERATURE REVIEW

Cotton plant is mainly cultivated for its fiber and introduction of varieties with high fiber output has a great importance. That is why, a special attention is paid on the fiber output at the evaluation of initial material, at its selection or development.

Fiber output is a complicated polygene trait and it varies under the influence of different stresses and contains of 25-40% in the varieties and accessions. A special attention by many scientists [3; 101-6., 4; 34-39-6., 5; 214-6., 6; 349-6.]. 3; 101-6., 4; 34-39-6., 5; 214-6., 6; 349-6.] was focused on crossings of remote species in the studies of fiber output inheritance.

N.Z.Innes [7; 46-48-6.] has developed varieties with a very high fiber output through crossing of hybrids (G.hirsutum x G.arboreum) x G.raimondi and G.hirsutum x G.anomalum to other local varieties of Uganda.

B.I.Mamarakhimov, M.Khalikov and others [8; 67-71-6.] studied inheritance of fiber output in inter species hybrids and noted that the dominance of high fiber output and intermediate inheritance in the accession at the F₁ generation are presented when the varieties have been participated in hybrids as maternal forms.

RESULTS AND DISCUSSION

Cotton plant is a technical crop and the fiber taken from is considered as a valuable raw source for cotton industry. More than 100 different industrial commodities are reproduced from cotton fiber. Cotton fiber is extensively used in the textile, paper, chemical, furniture, machine construction industries. The fiber output depends on weight of seed, absolute weight of fiber on the seed, the number of fiber on the seed, quality of fiber and its index.

It is known that cotton plant is mainly grown for its fiber. That is why, the great attention at the breeding process is paid to the fiber output of initial accessions participating in the crossings.

Due to efficiency of researches on the trait conducted by the scientists of our republic, the most varieties in the production are considered as the varieties of a high fiber output (35-38%). But, fiber output of many varieties is on account of small seed and the scientists were charged with the task to develop varieties of high fiber output. For this reason, a special attention has been paid on fiber output of hybrid-families participated in our researches.

In our experiments, fiber output analysis shown that fiber output of parental varieties had been ranged from 36% (Sultan) to 42,1% (Beshqakhramon) and the fiber output of separated families made of from 35,4% (O-230) up to 39,7 % (F₄ (AN-Bayavut-2 x Bukhara-8) (have a look at table 1).

Positive recombinant plants over this trait can be found through carrying out of large size selection works.

TABLE 2 THE INDEXES ON THE FIBER OUTPUT OF SEPARATED FAMILIES, IN 2017.

AN-Bayavut-2	55		1	11	14	15	14		38,3±0,6	2,3	6,1
Bukhara-6	58		2	12	12	19	9	4	38,1±0,3	2,5	6,6
Sultan	50		4	15	16	12	3		36,4±0,1	3,1	8,7
Mekhnat	56		7	6	13	19	11		37,6±0,6	3,6	9,6
Andijan-36	50		10	16	15	7	2		36,0±0,6	3,0	8,0
Beshqakhramon	56		7	15	14	11	9		37,5±0,7	3,5	9,4
O-230	52		4	12	16	15	3	2	37,5±0,7	3,2	8,7
O-125	57			12	18	19	5	3	38,9±0,43	2,2	5,7
O-445	56		8	12	12	12	10	2	38,6±0,91	3,6	9,4
O-580	53		1	20	15	15	2		36,7±0,46	2,2	6,0
O-455	51			8	19	14	4	6	38,4±0,53	2,9	7,7
O-622	59		2	4	10	20	15	8	39,2±0,32	2,4	6,3
O-520	50			8	13	15	10	4	38,0±0,53	2,0	6,7
C-6524 (St)	57		2	12	17	14	12		37,2±0,56	2,3	6,2

So, to employ the family 0-445 in genetic-breeding processes is considered purposeful. This is perfectly approved by the dependence of inheritance and formation with parents genotypes of this family, in which the fiber of Beshqakhramon was higher and Andijan-36 also has relatively positive.

At this, it is necessary to say that if we pay attention to an average arithmetic inclination (σ), it was from 1,37 (O-622) to 6,9 (O-580) and the variation amplitude in the separated families was reported as 3,7 % (O-622) to 5 % (O-520).

Fiber length is considered as the one of fiber quality parameters. One of the topical objects standing in front of our scientists is to develop cotton varieties of fiber quality meeting the world standards. We carried out analysis on the fiber length in the inter variety hybrids. According to the results, the families were equal to the standard C-6524 and also to the varieties, participating as the parental varieties or presented a little higher results. The most high index (36,6 mm) belong to the family of O-580 and at this the fiber output either was higher (39,4%). The index of the fiber length was from 33,7 mm (O-125) to 36,6 mm (O-580) which presents the superiority of all separated families on the trait than standard variety C-6524 (33,0 mm).

Mean arithmetic inclination (σ) of families was from 0,8 (O-455) to 2 (O-230) and the variation amplitude (V, %) from 2,4 (O-455, O-520) to 6,2 (O-230, O-622) and these permit the possibility to do conclusion about their stability.

TABLE 3 FIBER LENGTH INDEXES OF SEPARATED FAMILIES, IN 2017

Classes											
Families	n	26,1-28,0	28,1-30,0	30,1-32,0	32,1-34,0	34,1-36,0	36,1-38,0	38,1-40,0	M±m	σ	V, %
Varieties and families											
Bukhara-102	58	2	8	25	16	4	3		33,7±0,28	2,1	2,8
Chimbay-5018	23	2	6	7	5	2	1		33,1±0,53	2,5	2,1
Bukhara-8	36	3	12	11	8	2			33,1±0,35	2,1	2,8
Dustlik	27	4	6	7	6	4			33,0±0,50	2,6	2,3
An-Bayavut-2	31	1	9	14	2	2	2	1	34,3±0,49	2,7	2,7
Bukhara-6	51			12	11	17	9	2	34,1±0,32	2,3	3,7
Sultan	15		1	3	6	4	1		34,1±0,53	2,0	3,2
Mekhnat	17			5	7	2	2		33,5±0,59	1,8	3,0
Andijan-36	30	1	8	12	3	3	3		34,0±0,40	1,7	3,7
Beshqakhramon	51			12	11	17	9	2	34,3±0,32	2,3	6,7
O-230	20		2	9	6	3			32,0±0,40	1,7	5,5
O-125	14			1	2	7	2	2	35,3±0,58	2,2	6,2
O-445	17		1	2	5	6	2	1	34,0±0,59	2,4	7,2
O-580	22	1	3	4	8	4	2		32,5±0,55	2,6	8,0
O-455	16		4	6	4	1	1		32,6±0,57	2,2	7,2
O-622	16			5	7	2	2		33,1±0,49	1,9	6,0
C-6524	17		4	4	6	3			31,9±0,52	2,1	6,7

According to the data of the table 2, the outcomes of our experiments conducted in the following years shown that the fiber output of the varieties, took participation in the experiments has ranged from 35,1% (Bukhara-8, Dustlik) to 38,3% (AN-Bayavut-2). The index on this trait in the separated families was from 36,7 % (O-580) to 39,2 % (O-622) and reported the superiority of all separated families than standard variety (37,2%).

We note as the inference that the families O-125, O-622, O-445 might be employed to increase the trait in breeding processes.

Results of analysis on the fiber length of separated families in 2017 (table 3) exhibited that the fiber length of varieties participated as parental varieties had from 33 mm (Dustlik) to 34,3 mm (Beshqakhramon) and the separated families' fiber length had ranged from 32 mm (O-230) to 35,3 (O-125). At that time, the standard variety S-6524 had made of 31,9 mm. Some plants with the fiber length of 38,1-40 mm occurred in the varieties of AN-Bayavut-2, Bukhara-6 and families of O-125, O-445. Except of the family O-230, plants with fiber length of 36,1-38 mm occurred in all separated families.

So, according the results of this year, using of the families O-125 and O-445 in the breeding process to improve the trait is purposeful.

According to the consequences of continues researches as shown in the table 3, the fiber output of the separated families in 2018 was higher than 38,1 mm.

This evidences about the separation of families and lines which have at least 1,2% higher fiber output than check variety S-6524. The highest fiber output in families made of 39,5 (O-580) and in the lines it accounts for 41,6 (L-33-35/18) percentage. The highest fiber output than 38% in all families remarks the existed high fiber outputs in the created lines L-33-35/18 (41,6 %), L-25-27/18 (41 %).

TABLE 4 FIBER OUTPUT AND FIBER LENGTH INDEXES, IN 2018

Varieties and hybrids	Fiber output				Fiber length		
	M±m	Σ	V,%		M±m	σ	V,%
S-6524	36.9±1.21	1.2	3.34		33.5±0.50	1.75	2,22
O-230	38.6±1.28	1.56	4.62		31.6±0.53	1.07	3.38
O-125	39.1±0.88	1.53	3.91		34.5±0.89	1.78	5.17
O-445	38.6±0.93	1.61	4.18		32.1±0.83	1.44	4.50
O-580	39.5±0.89	1.54	3.90		34.8±0.70	1.70	4.10
O-455	38.1±0.98	1.96	5.14		34.9±1.30	1.84	5.26
O-622	39.8±0.94	1.58	3.98		34.9±0.75	1.80	4.12
L-33-35/18	41.6±0.71	1.59	3.82		34.1±0.98	1.41	3.50
L-25-27/18	41.0±0.91	1.83	4.47		33.8±0.29	0.50	1.48
L-54-56/18	37.4±1.92	1.34	4.91		35.0±0.67	1.17	3.54
LSD ₀₅	1,8				2,0		

So, the varieties participated in the crosses have a great importance and it was obvious that the development of families and lines takes place in the dependence of parental genotypes. Because, the fiber output of all crossed varieties was high.

Inconsiderably low indexes of fiber lengths were noted only in the families of O-230 and O-445 correspondingly 31,6 and 32,1 mms and in the rest lines the fiber output were 34,8 (O-580)-34,9 (O-455, O-622) mms. But, in the lines, according to this year data, the fiber lengths from 33,8 mm (L-25-27/18) to 35 mm (L-54-58/18) were determined.

CONCLUSIONS

It is necessary to underline that the analysis of fiber output and fiber length formation in the cotton families exhibit the possibility to find positive recombinant plants on the trait through

broaden the size of population and to take a large size selection works to determine positive transgression. Efficiency of using families 0-622, 0-125, 0-580 and lines L-33-35\18, L-25-27\18 to increase fiber output and on the fiber length 0-125, 0-445, 0-580 and L-54-56\18 was presented. The inheritance of these families in comparison of their parental genotype found its evidence and it proves its superiority on the trait. In general, it was obvious that the positive results of superiority on the fiber output and fiber length in integration with suitability of varieties to different soil-climatic region were noted.

ABSTRACT

In this article, the author focuses on a comparative analysis of the harmony between the pedagogical views of the new Renaissance pedagogy and the modern educator Mahmudhoja Behbudi, a modern educator. Mahmudkhuj Behbudi's views and the harmony of modern education are revealed on the basis of a unique approach. In The Springs of Wisdom, Ibn Sina, using the achievements of the natural sciences and philosophy of his predecessors and contemporaries, created a pedagogical doctrine that rose to the pinnacle of theoretical knowledge in the Middle East.

KEYWORDS: *New Renaissance Pedagogy, Education, Pedagogical Vision, Morality, Spiritual And Moral Education.*

INTRODUCTION

The three important things that forms the national identity - the past, present and future - has always been the focus of the intellectuals of the time, the devotees who care about the future of the people. Even today, the issue of deeper understanding of this fact, the effective use of rich national experience at a new stage of development is of great importance at the state level. President of the Republic of Uzbekistan Sh.M.Mirziyoev said: "In particular, the understanding of our national identity, the study of the ancient and rich history of our Motherland, we need to strengthen research in this area, to fully support the activities of scientists in the humanities. To inculcate in the minds of young people the invaluable heritage of our great scholars and writers, our saints, the courage of our invincible commander and leader, we need to pay special attention to strengthening their sense of national pride".

First, let's take a brief look at the history of Renaissance pedagogy.

The first Renaissance pedagogy in the territory of Uzbekistan, covering the IX-XI centuries, during this period, such scholars as Muhammad al-Khwarizmi, Abu Nasr al-Farabi, Abu Ali ibn Sina, Abu Rayhan al-Beruni, who made a great contribution to the development of pedagogical thought not only in the East but also in the West. The humanistic pedagogy that emerged in Europe and America in the 1950s was in fact the very essence and foundation of early Renaissance pedagogy.

For example, Farabi is extremely progressive and humane in his social ideas. He sees man as a social phenomenon and believes that humane relations between people arise on the basis of their interests, desires, and mutual union. According to Farabi, the destiny of a person is not predetermined, each person acts according to his own will, creates his own happiness, decides his own destiny. Human beings are the same in creation, but under the influence of upbringing and environment, they change. The scientist attaches great importance to education here. The twelve qualities of the perfect man classified by Farabi are still of special importance today as universal values.

Ibn Sina was a humanist sage who believed in human potential, who encouraged the development of the intellect in all its aspects and the knowledge of truth. He believed that the purpose of education and upbringing is to form a person who cares not only for himself but also for others, who has qualities such as humanity, true friendship, moderation, strong will, honesty and diligence.

In The Springs of Wisdom, Ibn Sina, using the achievements of the natural sciences and philosophy of his predecessors and contemporaries, created a pedagogical doctrine that rose to the pinnacle of theoretical knowledge in the Middle East. The scientist describes the goals and objectives of pedagogy as follows: "This science has to train people who don't just live for themselves, but should strive to live for the benefit of others and the community as well. Love of work, good morals and honesty must always prevail in a person".

Abu Rayhan Beruni's contribution to the development of humanistic pedagogy is invaluable. A scientist who considers man to be a social being by nature defines morality and diligence as the main criteria of human dignity in the individual.

Beruni's legacy is a unique set of scientific theories that contain the content of education and upbringing, the most valuable ideas in science. Among them, the main emphasis is placed on the practical application of the acquired knowledge, motivation and the need to know, the idea that a person strives to grow his worldview.

The emergence and development of the second Renaissance pedagogy is associated with Amir Timur and the Timurid kingdom. The activities and scientific and pedagogical views of Mirzo Ulugbek, Alisher Navoi, Zahiriddin Muhammad Babur, who lived and worked during this period, are highly commendable.

In his time, Mirzo Ulugbek built three madrassas (in Bukhara, Samarkand, Gijduvan) and radically reformed the higher education system. Education in Mirzo Ulugbek madrassas was an example of a truly higher education institution, which included three stages (anda, aust, alo) and perfectly taught religious and secular knowledge.

It should be noted that today Mirzo Ulugbek is the first in the world to implement a brilliant example of the stages of training in higher education (bachelor, master, doctorate).

Alisher Navoi's works such as "Hayrat ul-abror", "Mahbub ul-qulub", "Nazm-ul javohir" are truly pedagogical works. His patronage of the construction of schools and madrassas in his time is, in today's parlance, a shining example of public-private partnership in the field of education.

It is a well-known fact that in the works of Alisher Navoi the works devoted to the spiritual maturity and enlightenment of the younger generation play an important role. In the beginning of "Бадойеъ ул-бидоя" he said, "Девоне топилайким, анда маърифатомуз бир ғазал топиламай. Ва ғазале бўлайким, анда мавъизатангиз бир байт бўламай. Мундоқ девон битилса, худ асру беҳуда заҳмат ва зоъе машаққат тортилғон бўлай", – the confession also confirms that the great poet attached great importance to educational issues.

During this period, a number of pedagogical works were created by Zahiriddin Muhammad Babur that, all of the are specialized for some purposes, for example, "Boburnoma" is devoted to nature, "Khatti Boburiy" to literacy, "Mubayyin" to fiqh, "Harb ishi" to military education.

Achieving the Third Renaissance, in turn, required the creation of a new Renaissance pedagogy. This requires an in-depth study of the scientific and pedagogical, literary heritage of prominent representatives of the national Renaissance pedagogy, taking into account the succession between innovation and historical experience. One of the founders of the National Renaissance pedagogy is Mahmudhoja Behbudi.

It is known that the main goal of the Jadids was the idea that "only science and enlightenment can save Turkestan from socio-cultural, political and economic crisis". That is why they opened new methods of teaching in their mother tongue, wrote textbooks for schools, published newspapers and magazines, and organized theater troupes in order to spread their ideas among the people.

In short, they have been active in introducing innovations in the field of education. Mahmudhoja Behbudi, Munavvar qori Abdurashidkhonov and Abdulla Avloni to raise the level of modern enlightenment to a higher level, the focus on issues such as the enrichment of scientific pedagogy with national educational laws and principles, the popularization and popularization of education is in line with the priorities of the new Renaissance pedagogy.

One of the founders of the Jadid movement in Turkestan, the only world-famous Uzbek geographer, famous public figure, great Islamic scholar, great educator and ethicist, high-minded journalist, Mahmudhoja Behbudi was born on March 10, 1874 in the village of Bakhshitepa in Samarkand.

In times of national liberation, struggle for social change, the fathers of the people come to the fore. Although the concept of "Father of the nation" is not very scientific, but we encounter this notion in the history of all nations that have experienced the national independence movement.

In fact, although it is a paternalistic concept and to a certain extent it is international, through which he led his people to great socio-political, cultural and enlightenment changes, and led these changes, at the head of them are the figures with deep democratic views.

In this sense, Mahmudhoja Behbudi, along with his multifaceted activities, was awarded the great title of the father of the nation.

His most gifted and loyal comrade, his contemporaries, in his writings in his honor after his tragic death, directly called him father and described him as the father of the nation.

A voice trembling on the throne of the oppressor shouted:

"Where did you hide my father's grave?"

(Fitrat.) Dear father, of the flowers in my hand

You don't know that mourning is a flower...

(Chulpon.)

Sadriddin Ayni praised him as "The genius of Turan" and "The great master". Munavvar Kori Abdurashidkhonov, a contemporary of Mahmudkhuja Behbudi, was awarded such a great title. Abdurauf Fitrat, Abdulla Kodiri, Abdulhamid Chulpon, Abdulla Avloni, Sadriddin Ayni, Hamza Hakimzoda, Sufizoda and others were considered and respected by the people as the fathers of the great socio-cultural movement.

We understand it a little differently when we see it as a father. It can be seen in the place of the father... But the first and foremost condition for this is that the person considered in the place of the father must first of all be the conscience of the people, the nation.

Mahmudkhuja Behbudi and his comrades, colleagues, as well as his fate can be called the conscience of the nation, the people with full and all-round meaning.

Bekhbudi is the conscience of a prosperous nation. The faith of Turkestan.

Conscience and faith resound in every word he writes and every action he takes in history, in every deed he does, in his attitude to the Motherland, to the people, to man, to life, to the destiny of his people. He was also the conscience of two centuries.

Everyone has the right to call him father because he is the embodiment of conscience. If you read the horrible memoirs of Munavvar Kori written during his arrest and imprisonment, his articles and poems full of sorrow, great enlightenment, if you read Mahmudkhuja Behbudi's "Travel Memories" and his articles that burn like fire, you will, of course, fully understand and know what the father of the nation, the embodiment of the nation's conscience.

We also call Mahmudkhuja Behbudi and Munavvar Kori great teachers. Like many great teachers, he founded the first theater in the life of the nation, founded the first journal, founded the first societies, and took an active part in their activities. He sought to awaken the consciousness of the oppressed people with his fiery social speeches and to lay the foundations for a new cultural life.

What kind of person were Mahmudkhuja Behbudi or Munavvar Kori? What human characteristics predominate or lead in the aspects of their personalities? - we still cannot answer the questions to the extent and on a scale that satisfies ourselves and our contemporaries. The memories of his contemporaries are few, few, and they contain only important words that are more general.

Is it possible to know the personality of Mahmudkhujja Behbudi, his well-known features as a human being from his inherited works? Do they find such information that would answer our question?

In this regard, his work “Memories of Travel”, written in 1914 and published stage by stage in the magazine “Oyna” is very large and immortal.

We want to talk about some of the subtleties of Mahmudkhujja Behbudi’s personality. We find them in his works, and especially in his “Travel Memories”, just like gold particles scattered everywhere. Most of the time, we don't pay much attention to them. Because gold particles mix with the soil of life. He only gets it when he catches it.

Sometimes a person is such a creature that even if you live with him for a hundred years, you will not know him. Or you may not know. It takes centuries to get to know some of the hills. We still do not know Navoi, Sakkoki, Atoi, Mashrab.

As Behbudi saw the world and gained experience in struggles, he came to the conclusion that only human devotion and knowledge could change the world for the better. At one point in Travel Memories, he exclaims that people are trying to reconstruct their history:

«Бу бўлмаса ва мундоқ фидокорлик қилинмаса миллият ва динлар маҳв бўлуб кетар...»

Look again and again at Behbudi’s “Tasks for Writing Letters” in “Kitobul Atfol” and you will see how much culture, inner manners, and respect for human beings are highly valued by Behbudi and the Jadids. Such an unchanging culture, inner strength, and decency prevail in his attitude to all criticisms and all debates, even the most difficult, confusing issues.

Mahmudkhujja loves brotherhood more than he loves man.

Turkmen, Tajik, Russian, Kazakh, Uzbek, Arabic, Jewish, Greek, French, English - all are brothers in humanity for him.

No matter how much he hurts for Turkestan Uzbeks or Osmanli Turks, for others it hurts, it burns, and for them it misses the path of enlightenment and progress. But it is strange and incomprehensible that we are not yet accustomed to writing letters and correspondence, which Mahmudkhujja Behbudi taught with so much love, pleasure, knowledge, and offered beautiful examples. Thoughts, attitudes, habits are so conservative that it is hard to believe.

It is known that through the elimination of indifference and indifference to the events taking place in society, as well as the formation of a healthy spiritual need, citizens are able to think freely, to have a sense of belonging.

The question of the development of sanogen, that is, common sense, characteristic of Renaissance pedagogy, has not escaped the attention of the scientist. Mahmudkhujja Behbudi's views on science, enlightenment and ethics require very in-depth analysis and interpretation. Scholars, educators, literary critics and journalists will refer to Behbudi’s scientific legacy many times in the future and study its positive aspects.

HISTORICAL BACKGROUND ON THE SYSTEMATIZATION OF THE VOCABULARY OF ETHICS

Shukurova Madina Askarovna*

Researcher,

Teacher at the Department of English Linguistics,
Bukhara State University, UZBEKISTAN

Email id: sh.madina_84@mail.ru

ABSTRACT

This article is devoted to the comparative study of the historical background on the systematization of the vocabulary of ethics of the XVI-XVII centuries, which is considered to be very actual for investigation. The views expressed in this article about the systematization history serve as a scientific source when highlighting various aspects of the terms of ethics of the Renaissance period.

KEYWORDS: *Period, Development, Fragment, Culture, Experience, Determinate, Determination, Interpretation, Semantic, Research, Linguistic Changes, Semantics, Method, Effect, Literature, Principles*

INTRODUCTION

In the historical development of the English language, the epoch we are studying seems to be especially important, since during this period the existence of the linguistic norm becomes undoubted¹.

The steady development of production and social consciousness in the Middle Ages, certain achievements of science and technology led to the fact that the cultivated ideological postulates began to restrain the further progress of mankind. Providing the relative freedom of the human person, and hence a certain flourishing of his creative activity, feudalism could not, however, create the necessary conditions for the all-round connections of the individual with nature and society and, thereby, the material prerequisites for the all-round development of human being. And as you know, social progress is successfully carried out only when social relations provide unlimited scope for the creative initiative of the individual. The historical mission of the bourgeoisie consisted precisely in the destruction of local and estate feudal privileges and

fragmented forms of handicraft labor, as well as in the creation of social prerequisites for the rapid development of personal initiative in accordance with the requirements of production, which was quickly universalized under the influence of scientific and technological achievements of modern times².

It took “a kind of reorientation towards the restoration of the bodily-material ideal of being in antiquity, accompanied by a gradual rejection of the ascetic-quietist ideals of the Middle Ages, which is reflected in the self-name of the upcoming early bourgeois era - the Renaissance.” This was also facilitated by a number of critical natural science discoveries that radically changed the picture of the world. Thanks to the great discoveries of N.Copernicus, G.Bruno, G.Galileo and others, a new experimental natural science appeared, new branches of science were rapidly developing. Under the influence of great geographical and scientific discoveries, religious and mythical ideas about the world collapse and the principles of a scientific-realistic worldview are gradually formed, which, accordingly, leads to changes in ethical and aesthetic canons. As a result, the results become unexpected, impudent assumptions and guesses, which naturally lead to an urgent need for a critical analysis of the knowledge gained.

Cognition becomes the central problem, and its relation to the material subjects being studied becomes the core of new social and ethical programs. Due to the interest of artists of the word to the inner world of a person, a tendency towards psychologization and individualization of the depicted or described becomes quite noticeable. Themes of personal suffering and intimate experiences of a person increasingly penetrate into literature. All this leads to a gradual departure from medieval symbolism in art and its growth in realistic principles of reflecting reality, since harmonious proportionality in literary creativity should be the messenger of the soul, because for an artist, the main thing, according to Leonardo da Vinci, is not just a person, but an idea of his soul.³

At the same time, interest in the idea of unlimited freedom as the basis of social progress and a person as an active, creative individual is shifting towards society, society. The key issue is about the place and role of a person in society, about his rights, attitude to power, about his place in the state system. This is how two cores, two centers are formed, around which the interests of the artists of the word are grouped: society and cognition. Having put forward this idea, the thinkers of the epoch defend in their work a new life-affirming worldview, in which the ideal still prevails over the real one for granted and therefore cannot be expressed in the forms of life itself. Thus, art as a whole becomes the main form of objectification of the universalized abilities of a new person, and such objectification is still possible on the basis of a symbolic artistic language⁴.

Thus, the successes of experimental sciences testified to the fruitfulness of new methods of accumulating observations and their rational processing. Scientific work, at the same time, of the period of research, by its nature, acts as a universal labor. Taking into account the organizing and orienting functions of science in relation to all types of practice and cognition, we can say that the sphere of production and functioning of philosophical knowledge is a certain axis of the cross section of the entire culture⁵.

The formation of a new worldview was given impetus by the great socio-economic and technical shifts associated with the names of J. Hilbert, D. Napier, W. Harvey and others. A new powerful rise of realism in literature is associated with the formation of bourgeois nations and the national

consciousness of the English people, which is expressed in a specific national culture and becomes generally accessible and democratic in nature⁶.

Expansion and enrichment of the practice of the peoples of Europe and England, in particular, gave rise to the need for a corresponding restructuring of theoretical concepts, revision of the methods and tasks of cognition⁷.

Already Shakespeare's dramaturgy "acquires the character of a clearly expressed national certainty in the living reproduction of historical processes and topical social conflicts, remaining renaissance in terms of the breadth of human life and the height of the sound of humanistic ideals"⁸.

As far as England is concerned, here already from the end of the 15th century and especially in the 16th century, a breakdown of the old worldview of the era of feudalism begins and this formation is replaced by a new socio-economic formation, characterized by the rapid development of science and technology, an unprecedented flourishing of literature and art, the invention of printing (William Caxton - 15th century) - the largest event in the field of cultural development not only in England, but throughout Europe. The first book in English "The Recuyell of the Historyes of Troe" ("Collection of stories about the Troe") W. Caxton wrote in 1475.

Scientific works are already being created in English, translated literature is undergoing significant development, the scientific and philosophical movement is widely deployed, the crown of which is the materialist philosophical system of Francis Bacon - the founder of all experimental science and which completes the philosophy of the Renaissance and opens a new stage in the development of European scientific philosophical thought of the New Time.

The establishment of the English language as the language of scientific and philosophical literature took a more difficult path. There were no significant changes in the language of science of this period, since "the Latin language in the linguistic life of England in the 16th-17th centuries and even in the 18th century was the center around which the search for the norm of the English literary language was carried out." However, in 1531 Thomas Eliot wrote *The Governor* / in English. This was the first attempt to create a scholarly work in the native - English - language. T. Eliot made it quite deliberately in order to prove that serious works can be written in English, although the English language of that time did not yet have its own specialized industry terminology.

Some scholars, for example, Ralph Lever (16th century), tried to adapt the national language for the expression of scientific concepts, tracing Latin terms by means of the English language, although the English language of that era was already heavily oversaturated with Latin borrowings. Unnecessary, at first glance, Latinisms provoked the protest of the champions of good style - the purists, who strongly opposed the contamination of the English language with foreign words (John Chick, Thomas Wilson). However, as V.N.Yartseva, despite all the enthusiasm, attempts to create a terminology of philosophy on the basis of primordial English morphemes turned out to be in vain, 16 since the grammatical scheme proposed by the English rationalist grammarians was nothing more than a logical and rational rethinking of Latin grammar, mechanically transferred on the basis of the English language of the studied era⁹.

Formation of ethical and philosophical vocabulary in the XVI-XVII centuries in England took place on the one hand, under the influence of the national specifics of socio-economic and cultural development, and on the other, it reflected the main tendencies of general linguistic evolution. Despite the presence of two contradictory and opposite directions - purism, on the one hand, and the widespread use of Latinisms to create missing terms, on the other. Both the first and second directions are indicated by the conscious nature of the struggle for one or another language policy.

In England of the XVI-XVII centuries, supporters of the universal use of the language (Thomas Nash, George Puttenham, Edmund Spencer, Thomas Eliot, etc.) sharply raised the question of replenishing its vocabulary and, above all, the creation of English scientific terminology. A review of the genre-diverse literature of this period shows that the most of terminological vocabulary is created by rethinking the semantics of words and phrases of the general literary language. Moreover, its characteristic feature is imagery and connotation, that is, an expansive interpretation of a word-concept. This imagery is characteristic of the initial stage of term creation - when a new concept is introduced for the national linguistic consciousness and which, for clarity and clarity, is figuratively compared with already known concepts. It is with this phenomenon that we are faced when we analyze the terminology that reflects the worldview of a particular writer or thinker. This is especially clearly manifested in the works of a deep, vivid philosophical and ethical orientation, where the author strives for the most objective, in his opinion, reflection of the phenomena of social reality of his era¹⁰.

It is important to note that the choice of means of linguistic expression of scientific concepts is influenced by both the style traditionally adopted in this genre and the individual linguistic approach of the thinker. This explains, in our opinion, the fact of sometimes extraordinary means of expression in the field of socio-philosophical and fictional literature, when, as S. Ullmann notes, the positive (from the speaker's point of view) properties of an object are highlighted, or the speaker's goal is to highlight it from other objects¹¹.

Simultaneously with them, lexicographers also developed their activities, striving to fix the vocabulary of the language. If the first such dictionaries were bilingual Latin-English dictionaries of new words, then at the beginning of the 16th century dictionaries of the so-called "difficult" words appeared (Robert Cawdrey). Bilingual dictionaries reached their apogee in the 16th century. These are the dictionaries of Thomas Eliot, Richard Huloet, Thomas Cooper, John Barrett, John Ryder, etc. All this leads to the fact that the nature and position of the original and translated literature is changing: it is becoming highly demanded. The conquest of the English language the right to use in all genres of scientific and literary creativity was the most important issue of the time. At the same time, it is especially necessary to emphasize the interaction of the scientific and artistic literary language with the spoken language, for the language in which Shakespeare spoke was the language in which he wrote.¹²

CONCLUSION

Based on the above mentioned information, it can be argued that the tasks of language here went far beyond pure linguistics - it was a struggle for a new humanistic thinking, for a genuine cultural flourishing, which required adequate forms of its linguistic explication, expressed in a vivid form also in the process of term creation in the field of philosophical vocabulary in general

and vocabulary of ethics in particular. The creation of scientific terminology on a national-English basis by significantly filling the vocabulary was on the agenda.

The emergence of new concepts, and therefore new words, depended on the socio-historical conditions, capabilities and interests of the nation. Bright revolutionary ideas associated with the era of deep national transformations and revolutionary storms also led to an explosion of term creation in the areas of special demand, such as ethics and morality in that era, and, as a result, the emergence of new lexical units, including the vocabulary of philosophical - ethical order.

THE STYLISTIC FUNCTIONS AND TYPES OF ZEUGMA

Jurayev Ziyodbek Nurmamatovich*; **Karimova Nodiraxon Abdurashidovna****

ABSTRACT

This article is devoted to the stylistic functions and types of zeugma. Zeugma is a fun rhetorical device, an important figure of speech, wherein a single word is used to denote two or more words in a sentence and is fraught with literal and metaphorical undertones. Like most other figures of speech, even this rhetoric device draws its name from the Greek word 'zeugma', meaning 'yoking' or 'bonding.' Zeugma is the use of a word in the same grammatical, but different semantic relations to two adjacent words in the context, the semantic relations being on the one hand literal and on the other, transferred. Dora was plunging at once into privileged intimacy and into the middle of the room. This stylistic device is particularly favored in English emotive prose and in poetry. The revival of the original meanings of words must be regarded as an essential quality of any work in the belles-lettres style. A good writer always keeps the chief meanings of words from fading away, provided the meanings are worth being kept fresh and vigorous.

KEYWORDS: *Zeugma, Stylistic Functions, Primary, Secondary, Connected, Independent, Original meaning, Derivative, Pun, Syllepsis, figurative, Pictorial, Hypozeugma.*

INTRODUCTION

Zeugma is the use of a word in the same grammatical, but different semantic relations to two adjacent words in the context, the semantic relations being on the one hand literal and on the other, transferred. Dora was plunging at once into privileged intimacy and into the middle of the room.

There are special stylistic devices which use a word in two dictionary meanings primary and secondary, connected and independent. They are zeugma and pun. Zeugma is the use of a word

in the same grammatical but different semantic relations to the words in the context. *She lost her purse, head and reputation.*

The main structural models of Zeugma is V + 2N

So Juan, following honour and his nose,

Rushed where the thickets fire announced most foes;

There are other structures of Zeugma too: Adj. + 2N

Clara was not a narrow woman either in mind or body.

“Sally”, said Mr. Bently in a voice almost low as his Intentions, “Let’s go out to the kitchen”

The same can be said of the use of the verbs 'stain' and 'lose' in the following lines from Pope's "The Rape of the Lock":

"...Whether the Nymph

Shall stain her Honour or her new Brocade

Or lose her Heart or necklace at a Ball."

This stylistic device is particularly favoured in English emotive prose and in poetry. The revival of the original meanings of words must be regarded as an essential quality of any work in the belles-lettres style. A good writer always keeps the chief meanings of words from fading away, provided the meanings are worth being kept fresh and vigorous.

Zeugma is a strong and effective device to maintain the purity of the primary meaning when the two meanings clash. By making the two meanings conspicuous in this particular way, each of them stands out clearly. The structure of zeugma may present variations from the patterns given above. Thus in the sentence: "...And May's mother *always stood on her gentility*; and Dot's mother *never stood on anything but her active little feet*"

The word 'stood' is used twice. This structural variant of zeugma, though producing some slight difference in meaning, does not violate the principle of the stylistic device. It still makes the reader realize that the two meanings of the word 'stand' are simultaneously expressed, one primary and the other derivative.

One unique thing about zeugma is that it taps on several nuances of a verb, and the result is often a big surprise. Functioning as a verb, zeugma serves as a grammatical cord, trussing together the parts of a sentence. This part of figurative language helps in making the literary works and conversation more efficacious. Besides, it serves to embellish and emphasize a sentence, thereby escalating its beauty to greater heights. It also makes the sentence unique and delivers the actual idea in a very pictorial and impressive style.

The frequent use of zeugma can be well perceived in the literary works of the 17th century. The writers and poets exploited this rhetorical device to add simplicity or vividness to a long passage, to build up the plot in a precise manner or to indicate connections between the elements used in the plot. Scroll down this write-up to explore the examples of zeugma.

There are some other kinds of 'transference' that are more 'regular'. Thus many adjectives may be used either literally for the quality referred to or with the

transferred meaning of being the source of the quality. Thus a person may be *sad* and a book may be *sad*, while a coat may be *warm* in the two senses (either that it is of a certain degree of temperature or that it keeps one warm). The language recognizes the difference of meaning in that we cannot say *John is as sad as the book he was reading*.

This is similar to the traditional grammarian's concept of ZEUGMA (*She was wearing a white dress and a smile on her face*), for in each case one word co-occurs with two other words and these two each require the first to have a different meaning, and this the language does not allow. Similarly, many nouns have a concrete and an abstract sense. Thus we may compare *the score, of the symphony is on the table* and *The score of the symphony is difficult to follow*. Notice once again that we cannot say *the score is on the table and difficult to follow*. Similar contrasts hold for *thesis, book, bible, etc.*

The word zeugma is pronounced as /zjugmə/ from Ancient Greek means from literature "a yoking together" and syllepsis from Ancient Greek means "a taking together" are related figures of speech in which two or more parts of a sentence are joined together grammatically or semantically by a single word other than a conjunction.

There are multiple and somewhat conflicting definitions for "zeugma" in current use: In ancient Greek and Latin rhetoric, a zeugma was where a single word is used in relation to two other parts of a sentence although that word grammatically or logically applies to only one.

In modern English rhetoric, a zeugma is typically where a single word is used with two other parts of a sentence although it must be understood differently in relation to each. This definition depends on ellipsis of repeated uses of the term. If the word is simply repeated with a different meanings each time as in "Time flies like an arrow; fruit flies like a banana", it is an example of antanaclasis rather than zeugma. Likewise, a single word being used in two meanings at the same time is a pun or double entendre rather than a zeugma.

This article follows the Oxford Dictionary of Literary Terms in using the loosest possible definition, describing a zeugma as any case of parallelism and ellipsis working together so that a single word governs two or more other parts of a sentence. The opposite of this would be hypozeuxis, where each clause is independent, or anaphora, where common words are repeated across clauses.

In classical Greek, it was the *last* of these three definitions which was known as syllepsis. However, the Latin rhetors applied the first definition instead. English originally used "syllepsis" to refer to employing authorial intent in understanding otherwise misleading grammar, but Modern English follows the Latin use or employs "syllepsis" to cover both the first and second definitions.

Henry Peacham praised the "delight of the ear" in the use of zeugma but stressed that "too many clauses" should be avoided.

Zeugma is a rhetorical term for the use of a word to modify or govern two or more words although its use may be grammatically or logically correct with only one. Adjective: zeugmatic. Rhetorician Edward P.J. Corbett offers this distinction between zeugma and syllepsis: in zeugma, unlike syllepsis, the single word does not fit grammatically or idiomatically

with one member of the pair. Thus, in Corbett's view, the first example below would be syllepsis, the second zeugma:

"You are free to execute your laws, and your citizens, as you see fit."

"Kill the boys and the luggage!"

As Bernard Dupriez points out in *A Dictionary of Literary Devices* (1991), "There is little agreement among rhetoricians on the difference between syllepsis and zeugma," and Brian Vickers notes that even the Oxford English Dictionary "confuses syllepsis and zeugma"

So, zeugma is a fun rhetorical device that can be used to connote several meaning in one single line. For example, "He hid his feelings and the ball." In the following sentence 'hid' is used to describe about the feelings as well as the ball. In this article, we have attempted to present a list of best zeugma examples that might help you to understand this figure of speech better.

There are two types of Zeugma.

Zeugma, based on interaction of independent and connected meanings of the word; *He took his hat and his leave.*

He fell into a chair and jaunting fit simultaneously.

Zeugma based on interaction of primary and secondary meanings of the word.

O men with sister dear

O men with mothers and wives!

It is not linen you are wearing out,

But human creatures lives!

Zeugmas may be categorized according to the location and part of speech of the governing word. They are:

1. Prozeugma
2. Mesozeugma
3. Hypozeugma
4. Diazeugma
5. Syllepsis
6. Grammatical syllepsis
7. Semantic syllepsis

A prozeugma, *synezeugmenon*, or *praeiunctio* is a zeugma where the common term occurs at the beginning of the sentence. "Lust conquered shame; audacity, fear; madness, reason".

A mesozeugma is a zeugma where the common term occurs in the middle of the sentence and governs clauses on either side. The form of mesozeugma where the common term is a verb is called "conjunction" (*coniunctio*) in the Roman Rhetorica ad Herennium. "What a shame is this, that neither hope of reward, nor feare of reproch could anything moves him, neither the persuasion of his friends, nor the love of his country."

A hypozeugma is a zeugma where the common word occurs at the end of the sentence. This may occur naturally in certain languages (particularly German) or may be used to create suspense. Following a hypozeugma with a prozeugma is one form of chiasmus. Hypozeugma is typical of periodic sentences. "Does nothing of the nightly watch of the Palatine, nothing of the city guard, nothing of the fear of the people, nothing of this union of all good men, nothing of their holding of the senate in this most defensible place, nothing of their faces and expressions move you?"

"The foundation of freedome, the fountaine of equitie, the safegard of wealth, and custodie of life, is preserved by lawes".

Both prozeugmas and hypozeugmas are called "adjunctions" (*adiunctio*) in the *Rhetorica ad Herennium*.

A diazeugma is a zeugma where a single subject governs multiple verbs. A diazeugma where a single subject begins the sentence and controls a series of verbs was called a "disjunction" (*disiunctio*) in the *Rhetorica ad Herennium*.

As mentioned above, the meaning of syllepsis varies. Here, it is used for the kind of zeugma where a single word is used in relation to multiple other parts of a sentence despite (a) grammatically or logically applying only to one of them or (b) having to change its meaning in relation to each.

The first kind of syllepsis by definition will most often be grammatically "incorrect" according to prescriptivist rules. However, such solecisms are not errors but intentional constructions in which the rules of grammar are bent by necessity or for stylistic effect. For example: "He works his work, I mine".

The second kind of syllepsis is not wrong at all but creates its effect by appearing to be, by exploiting homophones or multiple meanings of a single word or phrase. The confusion produced by the rapid use of different senses of the word can be used to comical effect, similar to double entendres and puns.

The other was able to lend not only his achievements, but also his support and ears.

"Here Thou, great Anna! Whom three Realms obey, 'Dost sometimes Counsel take – and sometimes Tea."

"[She] went straight home in a flood of tears, and a sedan chair."

"Where the washing is not put out, nor the fire, nor the mistress";

"[They] covered themselves with dust and glory."

"Oh, flowers are as common here, Miss Fairfax, as people are in London."

"You can leave in a minute and a huff."

"You are free to execute your laws and your citizens as you see fit."

"The word 'Arms' would have two different meanings at once: 'weapons' (as the object of 'keep') and (as the object of 'bear') one-half of an idiom. It would be rather like saying 'He filled and kicked the bucket' to mean 'He filled the bucket and died.' Grotesque"

Usually a verb is associated with two subjects, objects or adverbial modifier:

- 1) There comes a period every man's life but she's just a semicolon in his.
- 2) Mr. Stigginge... took his hat and his leave. A young girl who had a yellow smock and cold in her head;
- 3) When they departed, she had taken a deep breath and her telephone receiver.

In conclusion we can say that zeugma is a strong and effective device to maintain the purity of the primary meaning when two meanings clash.

THE STYLISTIC ESSENCE AND THE FUNCTION OF PERIPHRAISIS IN ENGLISH AND UZBEK LANGUAGES

ABSTRACT

This article is devoted to the stylistic essence and the functions of periphrasis in two languages. Periphrasis is the use of a longer phrase instead of a possible shorter one. Periphrasis is always a word combination and it is used instead of a generally accepted word. In order to understand the linguistic nature of the stylistic devices of this group it is necessary to clear up some problems, so far untouched, of definition as a philosophical category. Any definition can point out only one or two properties of a phenomenon. Therefore in building up a definition the definer tries to single out the most essential features of the object. These are pinned down by the definer through a long period of observation of the object, its functioning, its growth and its changes. Periphrasis is a device which, according to Webster's dictionary, denotes the use of a longer phrasing in place of a possible shorter and plainer form of expression. It is also called circumlocution due to the round- about or indirect way used to name a familiar object or phenomenon. Viewed from the angle of its linguistic nature, periphrasis represents the renaming of an object and as such may be considered along with a more general group of word designations replacing the direct names of their denotata.

INTRODUCTION

In order to understand the linguistic nature of the stylistic devices of this group it is necessary to clear up some problems, so far untouched, of definition as a philosophical category. Any definition can point out only one or two properties of a phenomenon. Therefore in building up a definition the definer tries to single out the most essential features of the object. These are pinned

down by the definer through a long period of observation of the object, its functioning, its growth and its changes.

While in lexical stylistic device the stylistic effect is achieved through the interaction of lexical meanings of words and in syntactical stylistic devices through the syntactical arrangement of elements, the third group of stylistic device is based on the both syntactical structure and interaction of lexical meanings.

However, no definition can comprise all the inner qualities of the object and new combinations of it with other objects as well; a deeper penetration into the ontology of the object will always reveal some hitherto unknown qualities and features.

In the third group of stylistic devices, which we now come to, we find that one of the qualities of the object in question is made to sound essential. This is an entirely different principle from that on which the second group is based, that of interaction between two lexical meanings simultaneously materialized in the context. In this third group the quality picked out may be seemingly unimportant, and it is frequently transitory but for a special reason it is elevated to the greatest importance and made into a telling feature.

Sometimes for a special reason one of the features of the thing is made the most essential, it is elevated to greatest importance. Such stylistic devices as simile, periphrasis, euphemisms are included into this group.

Periphrasis is the use of a longer phrase instead of a possible shorter one. Periphrasis is always a word combination and it is used instead of a generally accepted word. "*Gargantuan soldier* names Dahoud picked Ploy by the head and scrutinized this convulsion of dungarees and despair whose feet thrashed a yard above the deck."

"His face was red, the back of his neck overflowed his collar and there had recently been published a second edition of his chin."

"His huge leather chairs were kind to the femurs."

"O my dear pen-shaker, if the ignorant people of Bukhara are insulting the scholars like you, then there is Qahhorzuljalolegasib, who will punish them as well";

"Then the sign was given, and the honorable teacher handed me the spectacles and said, 'Look at this, look at the past of your people.'"

"It simply came to our notice then. Steel birds pollute the air. "

In the first example qalamtebratuvchiazizqadrdonim is used as a periphrasis and muhtaramustodis used instead of author and po'latqushlaris used instead of air-plane.

Every periphrasis indicates a new feature of a phenomenon which occurred to the writer. For this reason periphrasis is used to convey a purely individual perception of a given phenomenon. "If you are so successful in cribbing your way through the nursery games known here as examination, I prophesy for you great and shining future."

"Quyoshdaymehribon

Vataning – onang.

Zamindayvazminu,

Mehnatkash, mushfiq

Istagannarsangnitayyorlaguvchi

Xalqbor – otangbor”:

In this example the words onangand otang are used as periphrasis, because the words mother and father are very close and respectful to a person that's why we can use these words when we compare to native land.

Periphrasis is a device which, according to Webster's dictionary, denotes the use of a longer phrasing in place of a possible shorter and plainer form of expression. It is also called circumlocution due to the round- about or indirect way used to name a familiar object or phenomenon. Viewed from the angle of its linguistic nature, periphrasis represents the renaming of an object and as such may be considered along with a more general group of word designations replacing the direct names of their denotata.

One and the same object may be identified in different ways and accordingly acquire different appellations. Thus, in different situations a certain person can be denoted, for instance, as either “his benefactor”, or “this bore”, or “the narrator”, or “the wretched witness”, and others. These names will be his only in a short fragment of the discourse, the criterion of their choice being furnished by the context. Such naming units may be called secondary, textual-confined designations and are generally composed of a word-combination. “I took my obedient feet away from him.”

“I got away on my hot adolescent feet as quickly as I could.”

“I am thinking an unmentionable thing about your mother.”

Jamiyattarihidayangibosqich, tarihcharhpalagi, mag'zinichaqmoq, bahtichopti, hayolbog'i, chakagiochiq, ishhurjun, simqoqmoq and others;

So, periphrasis is a word – combination, which is used instead of the word designating an object. “A child had appeared among the palms, about a hundred yards along the beach. He was a boy of perhaps six years, sturdy and fair, his clothes torn, his face covered with a sticky mess of fruit. His trousers had been lowered for an obvious purpose and had only been pulled back half-way.”

“When I saw him again, there were silver dollars weighting down his eyes.”

She was still fat after childbirth; the destroyer of her figure sat at the head of the table.”

"Negayoldanurmasekan. The guy knows exactly what he knows.

In this example, word combinations “otasoqoliko'kragigatushgan” is used as periphrasis, instead of old people who worked very hard.

As we mentioned above, periphrasis is the nomination of an object or action through exhibiting certain features of this object or action. Such periphrasis is based on one of the original features of the object: The sun was beginning to yawn and edge towards his bed, behind the far mountains, the sun was setting. She wondered a little to and fro, perhaps clumsily, but still with marked success, maintaining her balance on those two tiny supports, standing on her little feet.

Biroqqizitushmagurningxushimi, shirinso'zlarimi, xarqalayG'iyosiddinningtil-jag'inibog'lab, qulog'nikar, ko'ziniko'rqilibqo'yganedi;

The main stylistic function of all these types is to convey the author's subjective perception, thus illuminating the described entity with the new, added light and understanding.

Periphrasis has different stylistic functions:

- The function of creating elevated, high – flown speech.
- The function of additional characteristics of an object and phenomena.
- The function of creating humorous or satiric effect.

Then hate me when thou with, if ever, now:

Now while the world is bent my deeds to cross,

Join with the spite of fortune, make me bow

And do not drop in for and after – loss,

Ah do not, when my heart hath scraped thi sorrow,

Come in the reward – conquered woe;

Give not a windy night a rainy morrow.

The idea of this text is expressed through the following periphrasis; a windy night which stands for storms of life means all the misfortunes that have befallen the writer. A rainy morrow means a prolongation of despair though perhaps not in a violent form.

The structure of periphrasis is modeled with difficulty, for it is exceedingly variable. Very generally and not quite precisely it can be defined as a phrase or sentence, substituting a one-word denomination of an object or phenomenon.

As a stylistic device, periphrasis aims at pointing to one of the seemingly insignificant or barely noticeable features or properties of the given object, and intensifies this property by naming the object by the property. instruments of destruction means pistols, the most pardonable of human weakness means love, issiqqozonichidaqaynamoq means to have much difficulties in life, machiningengulug 'placemeans mehrob and poisonoushaorat means chayon that people can see.

Periphrasis makes the reader perceive the new appellation against the background of the one existing in the language code and the twofold simultaneous perception secures the stylistic effect. At the same time periphrasis, has a certain cognitive function inasmuch as it depends our knowledge of the phenomenon described “Jean nodded without turning and slid between two vermilions colored buses so that two drivers simultaneously used the same qualitative word.”

“During the previous winter I had become rather seriously ill with one of those carefully named difficulties which are whispers of approaching age.”

“Naritur – beriturqilib, besh-oltikishiotgabosiriqbo'lgannio'rtadanolibchiqdilar.”

The essence of the device is that it is decipherable only in context. If a periphrastic locution is understandable outside the context, it is not a stylistic device but merely a synonymous expression. Such easily decipherable periphrases are also called traditional, dictionary or language periphrasis. The others are speech periphrasis. Here are some examples of well-known dictionary periphrasis, they are periphrastic synonyms. For example: the cap and gown it means

student body; a gentleman of the long robe means a lawyer, samoochini is used instead of Gagarin, dalamalikasi means makkajo'horland others.

The main function of periphrases is to convey a purely individual perception of the described object. To achieve it the generally accepted nomination of the object is replaced by the description of one of its features or qualities, which seems to the author most important for the characteristic of the object, and which thus becomes for grounded.

“Naturally, I jumped out of the tub, and before I had thought twice, ran out into the living room in my birthday suit.”

“For a single instant, Birch was helpless, his blood curdling in his veins at the imminence of the danger, and his legs refusing their natural and necessary office.”

“Quyoshningtagidaterlagantanlarniko'ylaklari'padi”;

“Bulutchodiriniyirtibmo'ralab, chiqsaquyosh, ko'kkabo'lamanmaftun”;

As we mentioned above, one of the stylistic functions of periphrasis is to produce a satirical or humorous effect, sarcastic description. For example:

“Come on”, said Miss Hardforth, “has the cat got your tongue?” it means can you speak? ; To be snatched up to the skies means to die. In Uzbek there are also many examples, which produce a satirical or humorous effect, sarcastic description. For example: tentaksuv, yopiqeshiklarkaliti, obi zam – zammeans aroq, madaniyatbo'yintirig'imeans a tie.

So, periphrasis is the nomination of an object or action through exhibiting certain features of this object or action. Such periphrasis is based on one of the original features of the object.

The sun was beginning to yawn and edge towards his bed, behind the far mountains, the sun was setting. She wondered a little to and fro, perhaps clumsily, but still with marked success, maintaining her balance on those two tiny supports, standing on her little feet.

Biroqqizitushmagurningxusnimi, shirinso'zlarimi, xarqalayG'iyossiddinningtil-jag'inibog'lab, qulog'nikar, ko'ziniko'rqilibqo'yanedi.

In conclusion we can say that one of the stylistic functions of periphrasis is to produce a satirical or humorous effect sarcastic description. In “Come on”, said Miss Hand forth, “has the cat got your tongue?” (Can you speak?).

ESSENTIAL DRAWBACKS OF USING MULTIMEDIA AFFECTING BOTH STUDENTS AND TEACHERS IN LANGUAGE TEACHING CLASSES

Rafieva Bunafsha Rustamovna*

*Senior Teacher,
Samarkand Branch of Tashkent State University of Economics,
UZBEKISTAN

ABSTRACT

Nowadays foreign language teachers are using technology in the classroom more often than ever before. Learners who use a high volume of technology perform as well as expected on the lessons, however technology can potentially have negative effects for students if used inappropriately. When training with the use of technology teachers should be aware of potential obstacles that technology can make to the educational process. Some of the negative effects of modern technology in the classroom lies in the fact that they can take away essential study time, they can be abused, and they can transform the educational experience for students in the game, which can miss the main point of the lesson. To fully understand creative education and the use of multimedia, it is necessary to realize that technology applications serve as an aid to effective teaching and learning, not a goal, and should under no circumstances dominate the classroom. In today's classrooms, teachers are forced to count every minute. If the teacher and students are inexperienced with technology in the classroom, precious time is often wasted on technical issues. In addition, the teacher faces difficulties associated with the presence in the class of students of different levels of training. In many schools, most students will have a computer and Internet access, but schools located in poor areas may have a large proportion of students with little or no computer experience.

KEYWORDS: *Technology in the classroom, Multimedia, Drawbacks, Learning effects.*

INTRODUCTION

There are many benefits to using multimedia technology. However, it should not be forgotten that practical teaching and implementation of interactions can also cause some disadvantages. Listed below are the biggest challenges you may face when presenting and delivering multimedia materials.

One problem that many classroom teachers face is that students often use computers primarily for games. Because of this, many students associate computers and technology with games. While some teachers may use this to their advantage, if this problem is not addressed, some students can easily become distracted and distracted from the assignment. Because students associate computers with the game, they can try their hand at hacking without worrying about the consequences. Searching the internet for students only can lead them to find sites that are not age appropriate.

There is a danger of multimedia dominating the classroom. Multimedia should be a supportive tool to achieve the desired learning effect. However, it turns out that sometimes teachers are too dependent on multimedia devices, which makes them more their slaves than playing a leading role in teaching. According to Patel, many teachers have a proven track record of teaching using multimedia, but lack the skills to handle it with confidence. Teachers become passive and stand in front of the computer, while the student's attention is drawn to the screen, so there is no eye contact between students and teachers. To fully understand creative education and the use of multimedia, it is necessary to realize that technology applications serve as an aid to effective teaching and learning, not a goal, and should under no circumstances dominate the classroom. In today's classrooms, teachers are forced to count every minute. If the teacher and students are inexperienced with technology in the classroom, precious time is often wasted on technical issues. In addition, the teacher faces difficulties associated with the presence in the class of students of different levels of training. In many schools, most students will have a computer and Internet access, but schools located in poor areas may have a large proportion of students with little or no computer experience. While teaching these kids about technology is important, it needs to happen at a pace that meets the individual needs of each person, or more study time will be wasted. In some classes, technology is overused. This can lead to many problems. Many students learn best by physically and mentally interacting with what they are learning. Computers cannot replace practical lessons with art supplies, scientific equipment, or musical instruments. If most of the teaching is done using computer generated images or PowerPoint lectures, students' needs are not being met. Technology should be used to complement the classroom curriculum, but not as the only source of learning. In addition, students may be overly impressed by the complexity of new technologies and ignore the information conveyed with vivid visuals and sound effects.

In conclusion, the utilization of multimedia technology can fully improve the students' thinking and practical language skills. This will ensure and fulfill an effective result of English language teaching. Despite some drawbacks of using multimedia technology in teaching, multimedia technology can be used effectively in the English language teaching classrooms.

THE GENESIS AND EVOLUTION OF THE CONCEPT OF COMBATING SPIRITUAL THREATS

Eshovkhurshid khurramovich*

*Researcher,
Department of "Civil Society,
Faculty of Social Sciences, and Jurisprudence",
National University of UZBEKISTAN
Email id: x.eshov@edu.uz

ABSTRACT

Nowadays the notion of "spirituality", "spiritual threat", "a mechanisms for preventing the spiritual threats", "spiritual ascent" and the views about its meaning, necessity and difference are clearly formed in our mind. When and where the notion of fight against the spiritual threats originated and what changes have done during its existence? You can find the comprehensive answers to such issues in this article. It is clear that the concepts of "spirituality" and "spiritual threat" serve conflicting purposes. There are two kinds of influence on development, if "spirituality" serves the rise of progress, and a "spiritual threat" can lead to a decline in progress through man. Hence, the concepts of "spirituality" and "spiritual threat" are incompatible in essence and content. But there is a difference in the level of understanding of it by people. It is also possible to understand the reason for this correctly. It is important to take this into account in spirituality as well. In some cases, spiritual propaganda still does not openly respond to the problems of keeping pace with the times.

KEYWORDS: *Prevention, Intensification, Spirituality, Conscience, Spiritual Threat.*

INTRODUCTION

The situation in the history of mankind at the end of the XX century and the beginning of the XXI century is characterized by the deepening of relations between states and peoples as a result of globalization, characterized by the information revolution, the high development of science and technology. At the same time, the growing ideological threats aimed at capturing the human mind and heart in the modern world, it is also evident that selfish goals are being pursued by

various currents and forces. In this regard, the President of the Republic of Uzbekistan Shavkat Mirziyoyev in his speech, which at the opening ceremony of the 43rd session of the Council of Foreign Ministers of the Organization of Islamic Cooperation on October 18, 2016 in Tashkent, "Today we are witnessing the development of humanity, so to speak, we are living in a historical stage in which dramatic twists are taking place. In recent years, there have been dramatic geopolitical changes on Earth, the system of security and stability on the international stage is failing. The intensification of globalization not only expands the possibilities of humanity, but also leads to the escalation of conflicts and the widening gap between developed and backward countries".¹

In today's consciousness and thinking, the concepts of "spirituality", "spiritual threat", "mechanisms of prevention of spiritual threat", spiritual growth, clear-cut assumptions about the meaning, necessity and difference of its meaning are formed.

It is inextricably linked to man and human development. To understand spirituality, one must first understand man. The spiritual upliftment of man is an essential condition of progress. When a person changes, society changes.² In particular, in the development of man and society to know the difference in the meaning of the concepts of "spirituality", "spiritual threat" and its achievements, opportunities, the acquisition of objective knowledge on the basis of a comparative study of its limited aspects and dangerous aspects is of current scientific and practical importance. In this context, it is important to pay attention and highlight the interpretation of the concepts of "spirituality" and "spiritual threat". It can be said that in recent years a clear scientific approach to the concept of spirituality has been formed.

The idea that "spirituality is an incomparable force that purifies a person, encourages him to grow in heart, strengthens his inner world, strengthens his will, unites his faith, awakens his conscience, is the criterion of all his views" is the basis for a clear expression of the essence of spirituality.³ The "Spiritual threat" is the one who encourages a person to weaken spiritually and mentally, weakens his inner world, weakens his will, weakens his faith. It is a set of ideas and views that have the power to influence the conscience to indifference and indifference. In this regard, "Spiritual threat is primarily directed against the fact that everyone, regardless of language, religion, creed, lives as a truly free person, it is precisely the ideological, ideological and informational attacks that aim to destroy his spiritual world".⁴

It is clear that the concepts of "spirituality" and "spiritual threat" serve conflicting purposes. There are two kinds of influence on development, if "spirituality" serves the rise of progress, and a "spiritual threat" can lead to a decline in progress through man. Hence, the concepts of "spirituality" and "spiritual threat" are incompatible in essence and content. But there is a difference in the level of understanding of it by people. It is also possible to understand the reason for this correctly. The reason is that the spiritual potential of people is different, which is inextricably linked with the different levels of consciousness, thinking and worldview, goals and interests. At the same time, the interpretation of the concept of "spiritual threat" does not mean that there is a general situation and understanding.

There are two different situations. First, it has to do with accepting the concept of spirituality and understanding and interpreting it correctly.

Secondly, it should be noted that there is a situation of not accepting the concept of spirituality, not joining it. The rationale is, can there be a "spiritual threat"? How to understand the view of

spiritual threat if it is related to spirituality itself. This view is common among some experts in the field. Such views can be observed in conversations and opinions. How well-founded is the concept of "Spiritual threat" to be understood and interpreted? It should be borne in mind that the problem is more in understanding and interpreting it. We think it is possible to agree with the first interpretation of the concept of "spirituality". There are different bases and manifestations of the threat. It is very different. At the same time, what kind of threat can be assessed against the attempts to change man, his consciousness, thinking, heart, to manipulate him, which is against spirituality, that is, against national and universal spirituality? "Spiritual threat" refers to spirituality, which is aimed at weakening the spirituality of man, his heart, weakening his faith, isn't it a form of threat against him? In this context, we need to think more about "mechanisms to prevent spiritual threats". Because it is constantly being updated and changed. Man-made and human-influenced motive technologies are being used in an attractive way. The technology of showing "spiritual threat" attracts others with its attractiveness.

Psychological psychology makes extensive use of methods and characteristics of interest. It is important to be responsive to a person's needs, wants, and concerns.

It is important to take this into account in spirituality as well. In some cases, spiritual propaganda still does not openly respond to the problems of keeping pace with the times. Proponents of the "spiritual threat" are fed up with this. In addition, the common goals that lead to it also unite some political forces.

That's why: First, related to common geopolitical goals, which has become an important geopolitical goal; Secondly, some shortcomings and disadvantages in the development of a democratic society are observed, for example, in cases of governance related to disobedience to the law, one-sided consideration of interests, lack of understanding of national interests; Thirdly, the shortcomings in cases where different interests are related to the moral mutual interest, human freedom, and the priority of interests in practice; Fourthly, deficiencies in practice also serve as a source of nourishment for the "spiritual threat"; Fifth, there may be some shortcomings in the moral image of the behavior of those responsible for activities in the field of education and spiritual enlightenment.

At the same time, if a person's qualities related to me also serve spirituality, his shortcomings and shortcomings will be food for the "spiritual threat". Therefore, the need to reform me, to feel the need for it, the responsibility to be kind, the rise of culture is an important mechanism for preventing the "spiritual threat".

In the process of globalization, with its complex nature, creates a process of new thinking in the minds of people and on this basis the formation of a new way of life. In the modern era of civilization, the process of globalization is of particular importance, including the inclusion of modern means of production, high-quality information and communication and other technologies.

In this regard, the study envisages the development of technologies to ensure spiritual security in society based on the analysis of ideological processes at the national, regional and global levels, based on the experience of cultural development of independent Uzbekistan.

First of all, given that the concept of security is a multi-faceted concept and has been studied in many areas, let us consider its narrow meaning.

According to political scientist T. Alimardonov, the perception of the culture of spiritual security by the members of society as one of the important elements of the security system is one of the factors strengthening the integrity of the state, sovereign independence, realization of socio-economic potential and sustainable development.

The system of spiritual security is a set of ideas and values about the culture, history, foundations of the Uzbek statehood, expressing the spirit, potential and will of the nation.

The issue of spiritual security is one of the tasks that determine the existence of a nation. It expresses the activities of integrated social systems aimed at preserving society and its culture through moral values⁵.

In our opinion, spiritual security is the main basis of the national security system, and as an integral part of it, it is necessary to understand the system of protection against internal and external threats, including cultural, ideological, informational, scientific and religious security.

The existence of a "spiritual threat" has given rise to a field of moral security in security theory. An analysis of research on national security issues has shown that spiritual security is now becoming an integral part of national security as one of the key areas.

The inclusion of many social issues as threats in the identification of spiritual threats leads to the expansion of the object of spiritual threats and the erosion of its boundaries. This, in turn, reduces the effectiveness of monitoring spiritual threats, identifying threat levels, and combating them.

Different approaches of foreign scholars to the concept of "spiritual threat"

The following approaches can be observed in the definitions of spiritual threats given by the scientists of the Russian Federation on spiritual threats N.A. Fedoryak, E.A. Boksha, P.I. Chizhik, A.A. Vozmitel and A.I. Khvilya-Olinter.

Sociologist N.A. Fedoryak listed the following as the main threats to Russia's spiritual security today:

- socio-cultural fragmentation and crisis of relations between generations;
- the ideological vacuum that emerged after the failed communist ideology;
- demographic crisis;
- criminalization of consciousness and behavior;
- The rise of "popular culture" and its westernization;
- social stratification and growth of social stratification;
- Decline in the social status of the population, etc.⁶.

One of the peculiarities of this approach is that problems in social issues, including the division of the population into social strata and the growth of social stratification, the decline of social status and demographic crises, are also considered as spiritual threats. Researchers A.A. Vozmitel and A.I. Khvilya-Olinter also analyzed demographic problems as spiritual threats along with factors influencing religious beliefs⁷. This shows that the concept of "spirituality" in

Russian differs in content from the concept of "spirituality" in Uzbek, as well as the differences between the concepts of spiritual threat in Uzbek and Russian.

The philosopher E.A. Boxha focused on the factors that are destructive in nature, leading to spiritual contradictions, directed at the lifestyle of families as spiritual threats⁸.

In particular, he assessed the following as moral threats to the lives of Russian families:

- The ideology of radical feminism;
- The spread of the idea of gay culture;
- Propaganda of lust (eroticism);
- Increased selfishness in the family;
- The negative impact of market ideals on moral foundations.

According to the philosopher P.I. Chizhik, spiritual threat is an internal and external processes, events and conditions that have destructive properties in a social being. They have a negative impact on the morale of society and its subjects, forcing citizens to work harder to adapt to the changing conditions of social life⁹.

In general, Russian researchers have approached the identification of spiritual threats taking into account the existing problems in their country, including socio-cultural fragmentation, demographic crisis, and the growth of social stratification of the population.

From the above analysis, it can be seen that the spiritual threats are comprehensive and there are different approaches to it. The complex nature of this concept, according to researchers, corresponds to the thesis that "the world is one, but the realities are different".¹⁰

First, the risk is the possibility of a certain damage, that is, the reduction of its durability and competitiveness potential by changing the structure or other characteristics of the security object¹¹.

In addition, risk may be the capacity of any policy entity, but it is a situation in which it is not yet ready to use force or intimidate in the pursuit of its goals. Threat, on the other hand, differs from risk in the degree of readiness to do harm.

Threat is the readiness of one subject to use force against another specific object to achieve its goals, the last stage (period) of the escalation of the conflict, the situation directly before the conflict.

Second, the threat is always manifested by the fact that it is directed to a specific address, the presence of its subject (source of threat) and object, the subject's activities are directed to the object. A threat cannot be distinguished from a threat by its approximate nature and its subject and object cannot be clearly indicated (expressed).

There is a need to develop and adopt the Concept of Spiritual Security of the Republic of Uzbekistan, which will be the basis for the effective organization of spiritual security, including the improvement of legislation in this area.

It is also necessary to use the term "moral threat" in the legislation aimed at ensuring spiritual security and in the development of regulations and government programs in this area, based on

their content. This is because, unlike scientific sources, these concepts have not yet been specifically addressed in official sources.

The concept of national security of the Republic of Uzbekistan, which is being prepared in the new edition, also identifies the main threats and challenges to the spiritual sphere.

In conclusion, we can say that, first of all, the concept of "spirituality" has its own meaning and significance. There are enough grounds to use it; Second, the interpretation of the concept of "spiritual threat" in the form of an attempt to manipulate spirituality is a social, morally negative situation; Third, spirituality is related to the essence of man.

Any threat aimed at dehumanizing man as a spiritual being is a specific manifestation of the "spiritual threat"; Fourth, spiritual advancement prevents the appearance of a "spiritual threat".

Only it needs to fit the essence and it is strategically important that it never turns into a mask. Then, the causes and factors that lead to a spiritual threat will decrease. It protects humanity from some perverted ideological and spiritual threats.

ABSTRACT

This article presents a systematic analysis of the material costs of garments and knitwear. Information data on the main and additional materials are the basis for the development of mechanisms for predicting material consumption at the stage of sketching a new model. In conditions of unstable assortment, the life cycle of products, especially knitwear, is constantly decreasing. Manufacturers have to adapt to the frequent change of assortment. In these situations, it becomes necessary to minimize the cost of its development. The task of predicting the economic efficiency at the stage of the preliminary design of a new product becomes urgent, which will save the cost of manufacturing a prototype.

KEYWORDS: *Product Life Cycle, Assortment Changeability, Forecasting, Draft Design, Material Consumption, Prime Cost.*

INTRODUCTION

In conditions of unstable assortment, the life cycle of products, especially knitwear, is constantly decreasing. Manufacturers have to adapt to the frequent change of assortment. In these situations, it becomes necessary to minimize the cost of its development. The task of predicting the economic efficiency at the stage of the preliminary design of a new product becomes urgent, which will save the cost of manufacturing a prototype.

In modern sewing and knitwear, much attention is paid to finishing materials and accessories, especially in products of a high value category. [1,2]. For a comprehensive forecast of material consumption, it is necessary to identify what share of the cost of a product is the cost of basic, applied, finishing materials, sewing threads and packaging. Therefore, it is necessary to conduct an appropriate analysis of the structure of the material consumption of garments and knitwear. The structure of the material consumption of garments and knitwear includes an assortment of basic and auxiliary materials (Photo 1).

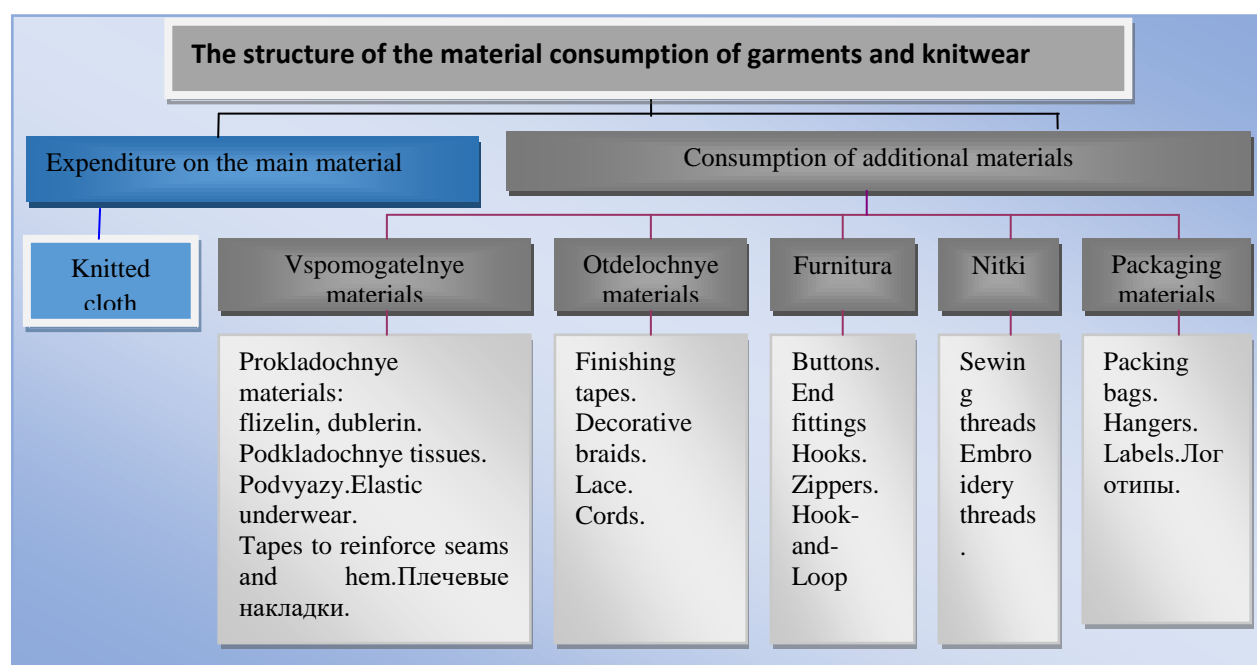

Photo1. The structure of material costs of garments and knitwear.

In order to study the structure of the material consumption of garments and knitwear, an analysis of the manufactured models of industrial enterprises has been carried out. The results of the analysis made it possible to conditionally divide the types of garments and knitwear into 3 main groups, where the I-group is the assortment of upper products; jackets, trousers, skirts in which up to 84% is achieved by the consumption of the main material, i.e. knitted fabric, 4% auxiliary materials, 1% finishing materials, 5% accessories and up to 6% sewing threads.

Group II consists of products of the upper assortment; blouses, shirts, cardigans, pools, dresses, sundresses, skirts, skirt-trousers. These products are distinguished by a high level of consumption of both the base material up to 54% and finishing materials up to 24%. T-shirts, sleeveless tops, tops, T-shirts make up Group III products, in which auxiliary materials and accessories are practically not used, where the consumption of the main material reaches

89%, finishing materials - 4%, sewing threads - 7% in the total material consumption of products.

The results of the analysis of the cost ratio of the main and auxiliary materials are given on the example of individual models of each of the assortment groups of knitwear. All materials used for the manufacture of the product are divided into 4 groups:

1. Main material;
2. Applied and finishing materials;
3. Fittings.
4. Auxiliary materials and packaging.

In OOO "Art Print and Textile" an analysis of the ratio of material costs to the cost of sewing and knitwear has been carried out. It was revealed that the main share of material costs is occupied by knitted fabric. (Photo 2)

Photo 2. Diagram of the ratio of material and labor costs in the total cost of the finished product (in %).

The analysis showed that in the structure of the material consumption of garments and knitwear, the consumption of the main material for some types of products reaches up to 80 ÷ 90%. Therefore, when predicting the cost of a product, first of all, it is necessary to pay special attention to the characteristics of the main material from which the product will be made. With the optimal choice of the type of knitted fabric, as well as the appropriate accessories and applied materials, you can get a rational ratio of the price and quality of the product.

THE GEO-POLITICS OF NORTH INDIAN OCEAN: INDIA'S POSSIBLE RETALIATIONS TO CHINESE AGGRESSION

Dr. Pranab Kr. Das*

*Assistant Professor,
Department of Geography, Sree Chaitanya College,
Habra, West Bengal, INDIA
Email id: pranabtaki@gmail.com

ABSTRACT

Over the last two decades, China and India have shown significant economic and political growth in the Indo-Pacific region. Despite the source of Covid-19, China has successfully recovered and boosting its production. Where India, USA and European countries are experiencing negative growth, China still have 3.6% growth rate. It is the best time for China to show it's hegemony in the Indo-Pacific region. It is reviving its export through the North Indian Ocean Maritime Route. During this Covid-19 pandemic, the boundary dispute between India and China has become worst after 1962. To establish itself as global superpower, China is creating geopolitical pressure on India. India can retaliate this Chinese aggression, obstructing North Indian Ocean Maritime Route. China's geostrategic interest in this region is mainly to protect its ship-liners. Sri Lanka's enticing geostrategic position is favourable for maritime surveillance and security. All most every Chinese ship has to pass the southern coastline of Sri Lanka during the course between Strait of Hormuz and Malacca. Thus, China has invested a lot to establish its strategic posts in Sri Lanka which directly strike Indian dominance in North Indian Ocean. This paper suggests a few counter mechanisms which India could adopt in responses to this Chinese aggression in the North Indian Ocean and Sri Lanka.

KEYWORDS: China, Geopolitics, India, North Indian Maritime Route, Sri Lankan Ports.

INTRODUCTION:

Oceans have great importance as the sources of resources, means of transport and strategic command. They provide the security and prosperity; even in the 21st century, with the emergence of an increasingly globalised world trading system (Geoffrey, 2013). Sea control is a strategic concept, where the main objective of a nation is to ensure the avenue of resources and global exposures. Actually, sea power is the ability to influence people's behaviour in support of national interests (Giok, 2014). Sea power has two objectives, the naval dimension and the maritime or commercial aspect seafaring (Mahan, 1918). Sea power provides enormous strategic grip where global economic integration accelerates (Tangredi, 2002). Like sea control, the complexity in foreign policy is translated to a single strategic concept; forward presence or deployment (Rexrode, 2004). The success of a forward strategy depends on the maritime capability and experiences to keep open the sea communications. Thus, the major sea powers are interested to control the strategic seaports in their proximity and across the prime maritime routes. In this context, interactive foreign policy and geopolitics play the key role.

The rise of the China and India and their competition has shifted the maritime pivot of the world towards the Asia-Pacific region. China is clearly a giant economic force and thus a national power on the world scene (Black, 2006). China is not only spreading its influence in the Asia Pacific region but also across the world. A stable, peaceful China in the Asia-Pacific is very essential for India. But China's faster economic growth has given it a voracious thirst for resources and markets to sell its goods across the world. This thirst is challenging the Indian dominance in the North Indian Ocean. Like other global powers, India is worried about China's huge defence spending and aggressive maritime policy. China's aggressive actions in north Indian Ocean is due to its economic and geo-political needs. China is experiencing the fastest growths in energy demand in the last two decades (Xu, 2007). In 2016, China has imported 51% of its crude oil from Arab peninsula and 19% from East African countries (U.S. Energy Information Administration, 2017) through the Strait of Malacca. Moreover, China is the major investor in East Africa (Pilling, 2017). Thus China is very much interested to enhance its presence across the North Indian Ocean. Over the last twenty years, it has aggressively increased its activities in this region which includes diplomatic and economic engagements with the South Asian countries (Khurana, 2016). China is interested to control naval movement across the North Indian Ocean that is a matter of concern for global powers including India. India is the major player here. Recent Chinese aggression is a directly hit to Indian authority over this region. The Chinese 'String of Pearl Policy' also acts against India's interest. As a part of this policy, China is developing port facilities in Hambantota and Colombo in Sri Lanka (Srinivasan, 2017). India's apprehensions about the growing Chinese presence in the island country are well known. This paper is about the recent geopolitical conditions over North Indian Ocean and Sri Lanka in context of China's aggressive move and India's possible retaliation.

OBJECTIVES:

This paper deals with the following objectives:

- i. To study Chinese geopolitical interests on North Indian Ocean and Sri Lanka.
- ii. To study India's concern and retaliation to Chinese aggression in North Indian Ocean and Sri Lanka.

MATERIALS AND METHOD:

The most important research question of the present studies is how India responds on Chinese aggression in North Indian Ocean Region. Previous researchers have emphasised only in geopolitical tension between India and China in this region. But no clear indication has been noticed about India's possible retaliation to China. This paper is a serious attempt which specifically discusses about India's counter mechanism to Chinese geopolitical aggression in North Indian Ocean, specifically in Sri Lanka. This paper is based on secondary data sources. Intensive library work has been conducted in different libraries, news paper archives in this regard. Secondary data, information were collected from different research papers, news paper articles, edited volumes and blogs. Several books, newspaper reports, articles, research papers, government reports (discussed in introduction/literature review) were also collected and consulted. Collected data were analyzed with specific statistical and graphical methods. For the preparation of maps Google Earth Pro software was used.

DISCUSSIONS:

CHINA'S GEO-POLITICAL INTERESTS ON NORTH INDIAN OCEAN AND SRI LANKA:

China is one of biggest economies in the world and in last two decades it has shown significant growth. Present day, China's economy is mostly depended on export across the world. Despite the strike of Covid-19, China has successfully recovered and boosting its production. Where India, USA and European Union are experiencing negative growth, China still have 3.6% growth rate (Davidson and Kuo, 2020). It is the ideal time for the 'Red Giant' to show its supremacy in Indo-Pacific region. China's military power depends on its economy, more precisely its export. In post Covid-19 situation, it will expand its export to secure more investment in defense sector. South Asia, Arab peninsula and East Africa are the main markets for Chinese goods. China's geopolitical imperatives in the Indian Ocean are mostly related with economy which supports its political thirst. In recent years China is doing huge trade through Indian Ocean Maritime Route (Fig: 1). It has presence in South Asia, East Africa and Arab peninsula as the major trading partner. China is the key investor in East Africa. In recent times, Chinese companies invested a lot in East African states to access the hydrocarbon and other precious minerals (Pilling, 2017). Gradually, Africa is becoming China's constant source of raw materials and dumping ground of finished goods. So, free maritime movement in North Indian Ocean is essential for China.

Fig 1: China's Trade through Indian Ocean Region (2002-2018)

Source: World Trade Statistical Review, 2019

China is not self-reliance in hydrocarbon production. China is the largest consumer and importer of crude oil. It imported 7.59 million barrels of crude oil/day in 2016, an increase of 13.6 percent over the previous year. It is predicted that China's consumption of crude oil will be 12 million barrels / day by in 2020, and in 2030 near about 80 percent of China's crude oil supply will be imported (U.S. Energy Information Administration, 2017). In 2016, it produced only 199.7 million ton crude oil and consumed 578.7 million ton (BP Statistical Review of World Energy, 2017). This clearly indicates that China has imported 65.49% of crude oil from abroad. In 2016, it has imported 51% of its crude oil from Arab peninsula and 19% from East African countries (U.S. Energy Information Administration, 2017) through the Strait of Malacca.

In this context, Indian Ocean is very important for China to access the Arab peninsula and African nations. In 2014, 'The Blue Book on Indian Ocean Region', the annual report on the Indian Ocean Region was published which mentioned that China's interest in this region is only commercial (Lin, 2015). However, the 'Maritime Silk Road' and 'String Pearl policy' are the serious representation of aggressive foreign policy of China. It is geo-strategic compulsion of China due to poor coast/area ratio and long distance of south and western part of it from major hydrocarbon sources (the Arab peninsula and Africa) region. The capital of Xinjiang province, Kashgarh is 4000 km away from Chinese port Guangzhou but Gwadar of Pakistan is only 2000 km away to access the Arabian Sea (Das, 2014). On the other side, the southern part of Tibet is near about 600 km away from the coastline of the Bay of Bengal where Chinese Pacific coast is more than 2000 km away (Khurana, 2016). The coast/area ratio of China is 1.55, very low (Table: 1) in consideration to other big players in global politics and well below of world average i.e. 7.80.

TABLE 1: COAST/AREA RATIO OF GLOBAL POWERS

Country	Length of Coast (Km)	Land Area (Km ²)	Coast/area Ratio (m/km ²) in TWF method
United Kingdom	12429	241,930	51.40
India	7516	2,973,193	2.29
China	14,500	9,326,410	1.55
South Korea	2413	100,210	24.1
France	4853	640427	7.58
Russia	37653	16,377,742	2.30
Australia	25,760	7,682,300	3.35
U.S.A	19,924	9,147,593	2.17
Japan	29,751	364,485	81.60

Source: CIA, World Fact Book, 2016

According to 'Defense White Paper, 2014' of China, port facilities are very urgent in Sri Lanka to ensure the strategic sea-liner communication in the north Indian Ocean (China's Military Strategy, 2014). So for the secure transportation of crude oil and goods, Chinese control over north Indian Ocean is very vital, overcoming the India-U.S.A nexus. Considering these facts and aiming to encircle India (String Pearl policy), China has been developing a series of port facilities across the Northern Indian Ocean region such as Gwadar in Pakistan, Kyaukpyu in Myanmar, Chittagong in Bangladesh and Hambantota in Sri Lanka. Sri Lanka is located at the northern fringe of Indian Ocean, favourable for maritime surveillance and security. All most every

Chinese ship-liner has to pass the southern coastline of Sri Lanka during its journey between Strait of Hormuz and Malacca. In this regard, Sri Lanka could play a vital role in favour of the 'Red Giant'. Hambantota (6° 7' 10" N, 81° 6' 29" E) is located in the southern tip of Sri Lanka, blessed with natural harbour with deep sea facilities. Recently a deep sea port has been developed with the collaboration of China in 2016 and the port was handed over to China for next 99 years lease (Chazan, 2017). The total cost of the first phase of the project was 1.4 billion U.S Dollar and 85% of the funding was issued by Chinese Government (Chazan, 2017). The Chinese agencies have also shown interest in development of highway network and industrial zone in and around Hambantota. Not only that, China is modernizing the Colombo port. Under this agreement, China will get 88 hectares on a 99-year lease and another 20 hectares on a freehold in Colombo Port City Projects (Tortajada and Biswas, 2015). The activities of Colombo port are very much related to India. So, this project can directly hit the Indian interest. In addition to this, China proposed the Lankan authority to deploy a submarine and naval ship in Colombo port (Tortajada and Biswas, 2015). This was a massive tension in between India and Sri Lanka.

INDIA'S CONCERN ON CHINESE PRESENCE IN NORTH INDIAN OCEAN REGION AND SRI LANKA:

Historically India is the key player in North Indian Ocean Region due to its' proximity, vast coastline and political hegemony. But recent Chinese aggression is a direct hit to the Indian supremacy and interests over this region. Strategically it is very important for India to tighten up the maritime and naval security in this region for regional balance of power. The geopolitical environment of North Indian Ocean Region is becoming very dynamic and volatile due to Chinese presence. China's 'String of Pearl Policy' and 'One Belt One Road Initiative' are encircling India very fast. The Chinese investments and ongoing port development projects across South Asia is a part of the same mission which creates a geo-strategic challenge to India. Chinese presence in the coastline of Bangladesh, Pakistan or Myanmar is not so worried but its' aggressive presence in Sri Lankan territory is a great threat for India. The movement of Indian navy and commercial ship-liners would be under the strict surveillance of China. Even the maritime movement in between two coasts of India could be threatening as the large vessels cannot pass through the strait of Palk. Moreover, the supply of hydrocarbons from the Arab peninsula to the eastern coast of India could be cut-off during war situation. Majority of the merchant ships and oil tankers of Indian Ocean pass through the channel in between Maldives and Sri Lanka. China has also concretized its presence in the Maldives, replacing India for the same interest. For the past fifteen years, Beijing has strategically invested in the Maldives to enhance its presence in North Indian Ocean and accelerating the 'One Belt One Road Initiative'. China has purchased the unpopulated island, Feydhoo Finolhu, just 75 nautical miles away from India's Exclusive Economic Zone (EEZ), to install radar facility (Ranade, 2018). Entire western and southern coast of India shall be under the surveillance of this Chinese radar.

The economy also enforces India to participate in port politics in North Indian Ocean Region including Sri Lanka. India was the major exporter to Sri Lanka, presently replaced by China. In 2016, Sri Lanka imported 4273.58 million US dollar from China against 3827.50 US dollar from India (International Trade Statistics of Sri Lanka, 2016). Before 2016, consistently India was the prime exporter. Still Sri Lanka largely depends on India for refined petroleum, cement, automobiles, machinery, garments and steel. India is still the third largest destination of Lankan goods (551.21 million US dollar) where China received only 199.15 million US dollar of Lankan

goods in 2016 (International Trade Statistics of Sri Lanka, 2016). So, overall India still is the major trading partner of Sri Lanka. So, Chinese presence in Sri Lankan port is making the condition more complex for Indian companies doing business in this island country.

INDIA'S RETALIATION TO CHINESE INITIATIVES IN NORTH INDIAN OCEAN REGION AND SRI LANKA:

Due to apprehensions about the Chinese presence in Sri Lanka, India has stepped up its strategic presence in Sri Lanka and other parts of Indian Ocean Region. India has great strategic advantages in this Ocean due to proximity and presence of military establishments in Andaman and Nicobar Island, close to Strait of Malacca. This strategic presence allows strong surveillance of maritime movements around this strait. India is also developing the port Chabahar in Iran, 375 km away from Strait of Hormuz (Das, 2014) for the same purpose. It is also developing strategic outpost in the south-western part of Indian Ocean, across the maritime route that carries oil from Africa to East Asia. In 2015, Indian Foreign Ministry had finalised the agreement with Seychelles and Mauritius to establish strategic presence respectively in Assumption Island and Agalega Island (Brewster, 2017). In these islands, India has deployed radar and airstrip for enhancing maritime surveillance.

In continuation to this, India is strengthening its presence in Sri Lanka. Since 2011, India has a presence in Kankesanthurai (9°49' 0" N, 80°2' 0" E), a northern Lankan port, very close to the southern tip of India. Indian government is also interested in controlling the Trincomalee (8°34' 38.8" N, 81°13' 42.5" E) port of eastern coast of Sri Lanka. This port has significant strategic importance. It is the key transit point of Indian sea-liners from the Indian Ocean towards its eastern coast. In April 2017, during the visit of the Lankan prime minister, India has declared that it would operate an oil storage facility and LNG plant in Trincomalee and modernize the port of Trincomalee with a joint partnership of Japan (Pararajasingham, 2017). Another big opportunity has arrived, when Sri Lanka indicated that it could hand over the Chinese built Rajapaksa International airport at Mattala, 40 km away from Hambantota, to India. The airport was built at a cost of 209 million US Dollar of which 190 million US Dollar loan came from Exim Bank of China (Shepard, 2017). Presently this airport is unable to generate any business due to the remote location. In August of 2017, India offered Lankan government to purchase 70% of stake hold of the said airport for 40 years lease. This attempt of India could be an answer to Chinese presence at Hambantota as it could monitor the Chinese activities at the southern coast of Sri Lanka.

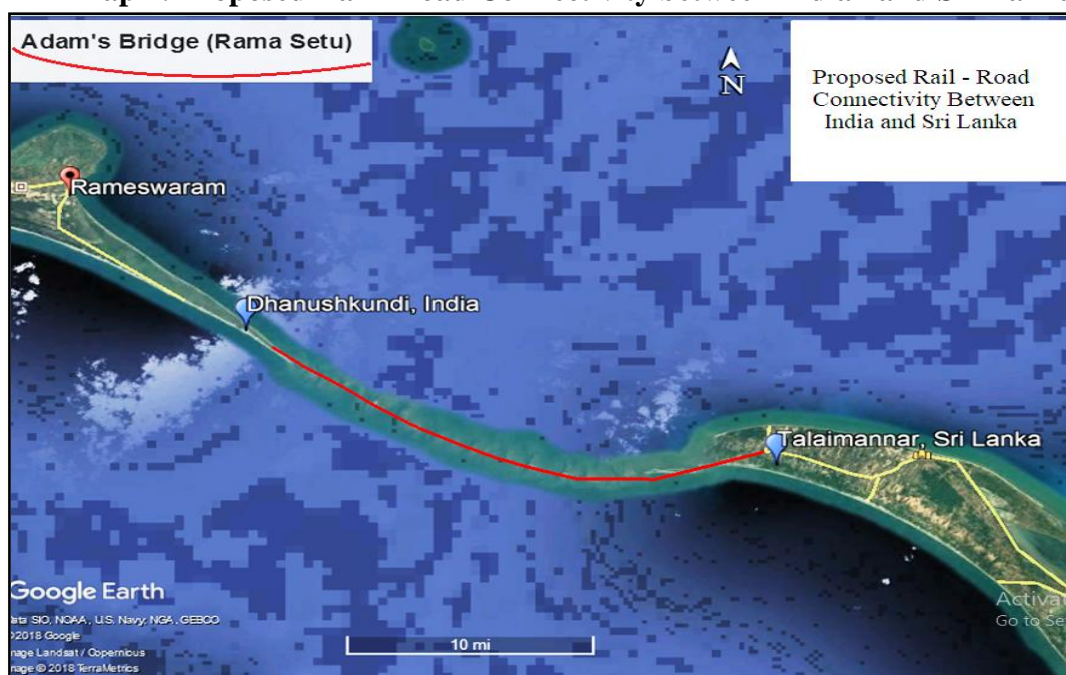

RECENT DEVELOPMENTS:

This geopolitical tug of war between two Asian Giants has created enormous opportunity for Sri Lanka to emerge as a promising economic centre with better sea and air connectivity. Its strategic location on maritime routes of Indian Ocean, allows it for a graceful deal with China and India. In the post-civil war situation, Sri Lanka has inclined towards China for its own interests and passively challenged the Indian hegemony in South Asia. During the rule of Mahindra Rajapaksa, Sri Lankan foreign policy was pro-Chinese. Both countries served each other interests over a decade. During the tenure of Ranil Wickremesinghe, the situation changed due to different facts. The high interest rate of Chinese loan has created a negative impact on Lankan people. For the Hambantota port project, Sri Lanka took 301 million US Dollar loan from China with an interest rate of 6.3%, while the interest rates on soft loans from the World Bank and Asian Development Bank are only 0.25-3% (Roy Chaudhury, 2018). Whereas, India provides loan to its neighbouring

countries as low as 1% interest rate or even less in special cases. Estimated national debt of Sri Lanka is 64.9 billion US Dollar of which 8 billion dollar to China as the debt trap (Roy Chaudhury, 2018). The local people are opposing the adjoining 15,000 acre Chinese Industrial zone near Hambantota and in January 2017, protesters clashed with the police at the proposed site (Aneez, 2017). The management of Hambantota port is under the direct control of China and Colombo port is gradually occupied in the same way. This is becoming the question of sovereignty of Sri Lanka. On the other hand, certain Sinhalese groups have apathy on India due to Tamil issue. They are not in favour to hand over the port Trincomalee to India. At present, Sri Lanka's attempt to balance India and China by playing against each other has proven effective. Sri Lanka is showing significant economic growth in the South Asian region despite Covid-19 pandemic and becoming a place of common interest for China and India.

CONCLUSION:

In post Covid-19 situation, India has to be more flexible and lenient in bilateral relationship with Sri Lanka. India and Sri Lanka both have century-old ethnic and cultural bondage. But this was hampered in last two and half decades due to India's support to Tamil community. The 26 years long civil war was ended in 2009. In post civil war situation, most of the western countries restricted bilateral relation and investments with Sri Lanka due to the violation of human rights. Even, India halted bilateral relations due to Tamil sentiment in domestic politics. In this critical stage, China stepped up the post-war reconstruction in Sri Lanka. From that time China is replacing India strategically and politically from Lankan soil. Sri Lanka is one of the major members and destinations of Chinese 'One Belt One Road Initiative'. Actually, China wants to transform Sri Lanka as a 'Satellite State' in its favour to challenge India's hegemony in north Indian Ocean Region. On the other hand, in spite of long civil war against Tamils, India continued assistance in infrastructural development and social amenities in Sri Lanka. But these attempts were not satisfactory from Sri Lankan point of view. So, after initial recompense India has started counter mechanism. Now, New Delhi's key focus is to resume the strategic and economic relationship with Sri Lanka. Both these country are the member of SAARC, BIMSTEC and signatories of the South Asian Free Trade Agreement (SAFTA). India is keen to use these platforms to enhance political and economic relations with Sri Lanka. Due to proximity and traditional linkage, India has opportunity to replace China from the island nation and regain its strategic supremacy in north Indian Ocean. This Ocean is the interior lines of India and exterior limit for China. India has some natural advantages; shorter distance from its own base and major hydrocarbon source (Arab peninsula) of the world, strong military establishments in Andaman Nicobar Island near the Strait of Malacca etc. In addition to this, the Government of India started a feasibility study of rail-road connectivity between India and Sri Lanka. This rail-road linkage will connect Rameswaram in India and Talaimannar of Sri Lanka through Adam's Bridge (Rama Setu) in the Palk Strait. The distance between Dhanushkundi in Rameswaram and Sri Lankan territory is only 23 km which could be joined through a bridge as most of the sandbanks are either dry or shallow. India is also engaged in modernisation of railway connectivity in Sri Lanka. This rail-road connectivity will allow India to reach Lankan soil much faster and it can strengthen its strategic presence there. On the other hand, Sri Lanka could use this land connectivity to join the South Asian transport network.

Map 1: Proposed Rail –Road Connectivity between Indian and Sri Lanka

Courtesy: Google Earth

Another advantage of India is that the human rights violation in Sri Lanka is becoming less in number and now Govt. of India has less pressure in domestic politics regarding Tamil issues. So, there is a good opportunity for India to get back its lost position in Sri Lanka. North Indian Ocean is one of the politically unstable regions of the world with the presence of fragile states, except India. China is utilizing this to anchor its strategic presence over this region. In this context, India must play an important role to maintain peace and stabilities in north Indian Ocean Region as a responsible regional power with the quad of U.S.A, Japan and Australia. This quad is also effective to overcome Chinese threat across Indian Ocean and maritime security.

THE ASPECT OF REALIAS IN DIFFERENT CULTURES

Bafoyeva Nilufarsalimqizi*; Xalilova Muxtarama Inayatullayevna**

^{1,2}Master Degree,
Navai state pedagogical, UZBEKISTAN

ABSTRACT

This article examines the specificity of translation of realias – linguistic units reflecting national life, which are generally studied in linguoculturology. Realias are a stumbling block in translation, since the translator should recreate the text for the reader preserving not only the ideological content of realia, but also the national and historical colouring. Thus, the following paper reveals both the origin and usage of realia in the context, identifies the most possible methods of rendering realia and leads to better translation. By the way, it helps to identify the origin meaning of culture block words in different cultures. As well as, this article deals with how to translate realias in three ways: transliteration, neologisms, collocations. Each culture has its own denominations of national and historical elements, objects, phenomena, which are defined by the term “realia”. Realias, elements of a foreign culture, with ethnic, historical or local colouring, are frequently used in foreign language as a means of helping students to develop functional knowledge of the target language in terms of vocabulary and culture. “Realias are a stumbling block in translation, since the translator should recreate the text for the reader preserving not only the ideological content of realia, but also the national and historical colouring. Thus, the following paper reveals the originate of realias, their items in different cultures, as well as, the origin and usage of realia in the context”¹.

KEYWORDS: *Linguoculturology, Realias, Customs, Traditions, National Language, Culture, Linguistic Picture Of The World, Originality, Transliteration, Neologisms, Colocation.*

INTRODUCTION

The linguistic picture of the world is different for different nations. In the process of activity, a subjective reflection of the existing world appears in the human mind. “A person learns the language in the same way as the surrounding reality; at the same time, along with the logical, conceptual picture of the world, a linguistic picture arises, which does not contradict the logical

picture, but does not coincide with it”.¹ Thus realias can color these picture by their meanings to understand and feel any culturesirems more and more openly. So, what is realia itself?

Formation Origin: Stem Prefix Result Singular "res"(matter, thing) + -alis (sgpr) = reālisPlural "res" + -a (plpr) = realia.

“The semantic and connotative content of realia is rather confusing. Notwithstanding linguistic differences, care should be taken not to confuse the field of realia with the field of terms and proper names. Terms are the basis of scientific lexicon, their scope is specialized and they are used with a definite aim.”²

Realia represent elements of local and historical phenomenon, which are usually met not only in artistic, but also in scientific literature. As for realia and proper names, they are so closely connected that V. V. Vinogradov etc. include proper names in the category of realia, while S. I. Vlahov, S. Florin consider realia to be included in the class of in equivalent vocabulary. Imagine a culture to be a clock face - realia, terms and proper names form the clock system. The resonant frequency of clock speed equals to the beat pattern of culture pulse. Each group does its work, each one cooperates with another and each realizes the importance of being on the clock face; “The best result comes from everyone in the group doing what is best for himself and the group”. Consequently, without mutual understanding, culture clock cannot work properly and therefore culture cannot exist.

Realia as an Object of Translation

Realia really reveals reality, such as English derby, Greek monocle, Spanish moustache, British four-in-hand, gauntlets, footed cup or Dutch brandy flask (pic. 1), that depict abstract cultural nuances creating a sense of déjà vu. Each flask of culture gleams the scenery of a unique room.

In every language, there are words that, without distinguishing themselves in the original text, are not easily transmissible into another language; among these words are met denominations of everyday life, history, culture etc. (traditional clothes, musical instruments, newspapers, such as “The Times”), that do not have an exact match in another language and require a special approach in translation, e.g. kimono – кимоно.

In translation studies these words have received the name of realia. The word "realia" originates from Latin word “reālis” meaning "real-life thing or material”

Classification of Linguistic Realia according to S. I. Vlahov and S. Florin

According to S. I. Vlahov and S. Florin there are different classifications of linguistic realia according to time, semantic, local or other features:

1. Geographic realia, e.g. steppe – степь, ěĭ»å, Strait of Magellan – Магел-ланов пролив, etc.; name endemics, e.g. sequoia - секвойя, iguana – игуана, etc.
2. Ethnographic realia, e.g. Cossack - казак, Goth – гот, transfer of realia pound - фунт, Frank – франк, etc.
3. Socio-political realia, e.g. Tory – тори, ĩăñÇ, ataman – атаман, дума – дума, the Knesset – кнессет, etc.

4. Historical realia, e.g. samurai – самурай, Oppenheimer- Оппенгеймер, trilby- трилби (мягкая фетровая шляпа), Yeoman of the Guard - лейб-гвардейцы (дворцовая стража в Англии), etc.

The ways how to translate realias

1. Transcription and transliteration are distinguished from methods of realia translation as the first fundamental division. ‘Transcription is the transmission of sounds of a foreign language using the alphabet of the receiving culture, e.g., London – Лондон, while transliteration is the transmission of letters. Mostly, transcription and transliteration are used in publicistic style and quite often in literature, depending on the nature of the text granting the text certain exotics. “Transcription and transliteration are interrelated with each other; a paragon is Utah, which is translated into Russian as Утах being the result of transcription, instead of Юта – the result of both. It is what happens with the German Walküre, actualized in other languages as Valkyrie (English), валькирия (Russian), (Armenian).”⁴ Thus, transcription is the phonetic tool with which transliteration fulfills the act of translation.

2. ‘Neologism is a method of translation, which preserves the semantic content and colour of realia by coining a word or phrase used in a new sense. Calque, a method of neologism, usually means loan translation of a simple or composed word or word combination by literally transforming the elements of the expression in the source culture, e.g. skyscraper- небоскрёб, колхоз (коллективное хозяйство) - collective farm, the House of Commons - палата общин, the First Lady - Первая Леди. Then there is half-calque, in which just a part of a composed expression is preserved, e.g. the translation of the German expression Dritte Reich into Third Reich in English, Третий Рейх in Russian, Armenian. It should be noted that calque or half-calque could take widespread rank in the language, but in the end remain as an exoticism for its denotation is alien in the culture.

3. During contextual translation, realia are substituted with words that in the original context explain the sense of such a collocation. It is a word or word combination, created by the translator, in order to permit the rendition of the semantic content of realia, e.g.

Сколько стоит путевка на советский курорт?

How much are accommodations at a Soviet spa?

In the following example, the sense of кypoptis lost being a sort of official certificate given to someone going on vacation that in Soviet times could have been free or cost a symbolic sum. Evidently, this word has no analogue outside Soviet Russia.

Regarding these above, it is challenging action to translate realias one language to another, however learning and using these could assist as a magical key to learner to be and to feel this culture during in the conversion.

ABSTRACT

The article presents the types of aphids that develop in and damage vegetable and melon crops in Karakalpakstan, the type of crop that each species develops in, the period of coming to the field, the damage and the criteria for economic damage. The biological efficacy was determined after application of natural predators, vermins, and laboratory-bred golden eyed entomophagous in the control of aphids, and the technology of application of this predator was studied.

KEYWORDS: *Sucker, Pest, Entomophagous, Predator, Vermin, Biolaboratory, Biological Efficiency, Economic Damage Criterion, Migration.*

INTRODUCTION

The importance of vegetables and melons grown by our farmers in providing the population with vegetable and melon products is very high.

At present, food security and ecologically clean production remain a pressing issue in the world. Therefore, we must pay attention to the modernization and diversification of our economy, including the agricultural sector, especially the cultivation of food crops. Over the next four years, 300,000 hectares of low-yielding cotton and grain fields will be replaced by fruit and vegetable and other food crops, including 32,000 hectares of intensive orchards, 15,000 hectares of vineyards, 2,000 hectares of modern greenhouses, and 114,000 hectares of vegetables and potatoes, legumes and oilseeds on 72,000 hectares, and other crops on 52,000 hectares.

At present, farms of the Republic plant vegetables and melons on 15-20 thousand hectares, of which 30-40 centners are harvested. This is 2.5-3 times less than expected.

According to medical data, for the normal development of the human body during the year, the population of the Republic is recommended to receive 113.0 kg of vegetables and 50.4 kg of melons, an average of 81.7 kg. This equates to an average of 44.4 kg per person today. One of the main reasons for this is the low level of reclamation of arable lands, the increase in soil salinity, as well as the damage of pests, pathogens and weeds that develop in agricultural crops. Therefore, increasing the productivity of agricultural vegetables and melons requires improvement of soil reclamation, soil salinization and the development of promising methods to control plant pests.

According to the scientific data of the well-known scientist of Uzbekistan entomologist Sh.T.Khojaev [3] melon aphid (*Aphis gossypii* Glov.) highly damages melons, cucumbers, tomatoes; cabbage aphid (*Brevicoryne brassicae* L.) damages cabbage plant. According to the results of scientific research conducted by scientists of the Republic, 30-40% of vegetable and melon crops become unusable every year, despite the use of high agro-techniques in agricultural crops and measures to control plant pests [1; 2].

In solving the above problems, filling the population's table with ecologically clean vegetables and melons without destroying the crop, taking into account the specific environmental factors of the region and the peculiarities of bioecological development of pests, the types of methods of pest control, their application technology are fully studied, and the method is required to ensure a biological efficiency of more than 98%.

In order to identify the types of aphids that grow in vegetable and melon crops in Karakalpakstan in 2018-2020, in the fields of Chimbay, Kegeyli and Nukus districts controlling works were carried out every 10 days at the stations of melon, cucumber, tomato and cabbage crops. As a result of control works, the development of melon and acacia aphid in melons and cucumbers, large cotton aphid in tomatoes and cabbage aphid in cabbage was determined. The average density of aphid of melon (*Aphis gossypii* Glov.) and acacia (*Aphis craccivora* Koch.) was found to be 22 to 185 pieces per 1 damaged plant, and 85 to 345 pieces of cabbage aphid (*Brevicoryne brassicae* L.) per 1 plant. But the number of large cotton aphid (*Acyrtosiphon gossypii* Mordv.) in tomatoes was very few. That is, the number in 1 plant did not exceed 4-5.

In our experiment, the species of natural predators and vermins found in the group of vermins were identified and their density in the field was studied. As a result, in all species of aphids were found 2, 7 and 14-point species of beetle ladybird, larvae of the sirfid fly, golden eyed larvae, the number of which averaged 0.5-2.5 per 1 damaged plant.

Parasitic aphidids were found in large colonies of acacia aphid in the licorice plant on the edges of vegetable and melon crops. They were seen biting adult individuals of aphids, laying their eggs on them and infecting aphids.

In our experiment, the dynamics of the development of aphids in cucumbers and cabbage was studied. That is, in entomological small gardens, 2 pieces per 1 plant in the 1st variant; in the 2nd variant, 6 aphids and in the 3rd variant, 10 aphids were distributed, covered with a cloth entomological material, and the development and reproduction of aphids were monitored for 20 days. Due to the absence of natural entomophagous in entomological small gardens, the number of aphids increased very rapidly, and after 20 days the number of aphids increased to 40 in variant 1, 65 in variant 2, and 114 in variant 3.

During our experiment, the economic damage caused by aphid in the developmental stages of the cucumber plant was studied. In entomological small gardens, 10 melon aphids were distributed to 1 plant in small gardens during the 3–4 leaf period of the plant, growing, flowering and fruiting periods. As a result, no crop was harvested from the 3-4 leaf period. 4.2 kg of cucumbers were taken under control. The yield was 2.2 kg during the growing period, 3.1 kg during the flowering period and 4.1 kg during the fruiting period.

This means that when the pest falls during the young germination period of the plant, 100 percent of the crop is lost. 50% was not harvested during the growing period, 25% during the flowering period and 4% during the fruiting period.

In order to reduce the damage of melon aphid in the cucumber crop, an additional golden eyed predator was applied to natural entomophagous and its biological effectiveness was determined (Table 1).

TABLE 1 BIOLOGICAL EFFICACY OF GOLDEN EYED PREDATOR AGAINST MELON APHID IN CUCUMBER (IN ENTOMOLOGICAL SMALL GARDEN)

№	Variants	Average number of pests per 1 damaged plant, piece				Biological efficiency, %, in days		
		Numbers till using golden eyed	Numbers after using golden eyed					
			3	7	14	3	7	14
1	Control	162	184	260	380	-	-	-
2	5:1	205	106	84	30	31,8	59,1	83,4
3	10:1	212	152	106	58	38,4	50,0	72,7
4	15:1	186	152	140	85	38,3	46,8	64,4
5	20:1	198	168	152	106	35,2	42,6	53,5

As can be seen from the table, in the unused variant of golden eyed, the number of aphids increased from 184 to 380, and the plant was not harvested. When applied in the 2nd variant at a score of 5: 1 (5 aphids: 1 entomophagous), the biological efficiency was achieved after 14 days by 83.4%, and in subsequent variants by 72.7, 64.4 and 53.5%.

CONCLUSION

1. Melon and acacia aphid develops in vegetable and melon crops, causing great damage to the plant.

2. The average number of melon aphid is 192.6 pieces in average 1 damaged cucumber plant during the vegetation period.
3. In plants with melon aphid, from natural entomophagous ladybird beetles, sirfid fly larvae, golden eyed larvae and parasitic aphidids are found. Their average number in 1 damaged plant was 0.5-2.5 pieces.
4. In entomological small gardens, when 2, 4 and 6 pieces of aphid were distributed to 1 plant, after 20 days their number increased to 40, 65 and 114 pieces according to the variants.
5. In entomological small gardens on the developmental stages of the plant, when 10 aphids were sent to 1 plant, no crop was harvested from the 3-4 leaf period. 4.2 kg of cucumbers were taken under control. The yield was 2.2 kg during the growing period, 3.1 kg during the flowering period and 4.1 kg during the fruiting period.
6. The use of golden eyed larvae in a 5: 1 ratio against aphids in cucumber crops reduced aphids damage and achieved a biological efficiency of 83.4%.

BRONCHOO STRUCTIVE SYNDROME IN CHILDREN: PREVALENCE AND DIFFICULTIES OF DIFFERENTIAL DIAGNOSTICS

Sh.M. Ibatova*; **F.Kh. Mamatkulova****; **N.Y.Ruzikulov*****; **Yu.A.Rakhmonov******

^{1,4}Samarkand State Medical Institute,
Republic of Uzbekistan, Samarkand

ABSTRACT

Broncho-obstructive syndrome in children is clinically manifested by paroxysmal cough, expiratory dyspnea, asthma attacks and is associated with impaired bronchial patency, develops acutely, but can be persistent. The first symptoms: shortness of breath and wheezing syndrome often appear in children at an early age. Differential diagnosis of biofeedback in young children is difficult due to the impossibility of using methods for assessing the function of external respiration, difficulties in obtaining sputum for cytological and bacteriological studies in order to verify the diagnosis. Early diagnosis, which determines the tactics of treatment, largely determines the prognosis of the disease and the choice of preventive measures.

KEYWORDS: *Broncho-obstructive syndrome, children, cough, shortness of breath, diagnosis, differential diagnosis, treatment, prognosis.*

INTRODUCTION

Diseases of the respiratory system are leading in the structure of morbidity in childhood [1, 3, 4, and 10]. It is important to note the high annual rate of increase in the prevalence of bronchial asthma (BA) in children, which reaches 20%. At the same time, in recent years, BA has been increasingly recorded in children in the first years of life [2, 7]. In young children, 5-50% of cases of acute respiratory infections are often complicated by broncho-obstructive syndrome, the main cause of which is acute obstructive bronchitis (AOB) [3, 5, 6, and 17].

Broncho-obstructive syndrome (BOS) is a symptom complex that is clinically manifested by paroxysmal cough, expiratory dyspnea, asthma attacks and is associated with impaired bronchial patency of functional or organic origin [9,10,11]. By itself, Broncho-obstructive syndrome has a characteristic clinical picture, so there are no difficulties with its diagnosis and especially clinically evident in children of the first years of life, which is due to the anatomical and

physiological characteristics of the respiratory system: the narrowness of the airways, insufficient elasticity of the lungs, the softness of the cartilage of the bronchial tree, insufficient rigidity of the chest, a tendency to develop edema, hypersecretion of viscous mucus, poor development of smooth muscles of the bronchi [12].

When faced with broncho-obstructive syndrome in infants in practice, the doctor, as a rule, makes a diagnosis of obstructive bronchitis or bronchiolitis, occurring with symptoms of respiratory failure, developing more often against the background of acute respiratory infection (ARI) [19,21]. With broncho-obstructive syndrome, many diseases of the bronchopulmonary system occur: acute obstructive bronchitis (AOB), BA, bronchopulmonary dysplasia (BPD), congenital malformations (CM) of the bronchopulmonary system (tracheobronchomalacia, tracheobronchomegaly, pulmonary malformations), as foreign body, etc. [5, 6, 8]. The uniformity of the clinical symptoms of bronchial obstruction in these diseases complicates early diagnosis and treatment tactics, which can lead to a protracted and recurrent course of some of them.

Broncho-obstructive syndrome can also be a consequence of allergic inflammation of the tracheobronchial tree, obstructive obstruction or hemodynamic disorders, congenital malformations of the upper respiratory tract. The widespread prevalence of biofeedback in children, as well as the heterogeneity of its course, development and outcome, has been an urgent object of study for many years for scientists and medical practitioners, since difficulties arise in the differential diagnosis of this condition [21].

Acute respiratory infections occupy a leading place in the structure of human infectious pathology. The airborne route of transmission of the pathogen, the high susceptibility of the population to almost all viruses, pathogens determine their main epidemiological feature - the speed and breadth of their spread. They are practically unlimited and significantly increase during periods of seasonal immunodeficiency that occurs in the winter and winter-spring periods.

Clinical manifestations of broncho-obstructive syndrome consist of the elongation of exhalation, the appearance of expiratory noise (wheezing, noisy breathing), asthma attacks, and the participation of auxiliary muscles in the act of breathing; an unproductive cough often develops. This clinical symptom complex is called "wheezing" - "wheezing syndrome", since whistling sounds (distant or heard during auscultation) are the main clinical manifestation of biofeedback [17, 21]. The genesis of wheezing is associated with both turbulent air movement against an obstacle in the airways (trachea, bronchi) and with rapid oscillations of the lumen of the lobar and segmental bronchi. In this case, there is an increase in intrathoracic pressure, fluctuations in the air flow rate during expiration, compression of the bronchi and their vibration, and the end result is the appearance of wheezing rales [22].

Bronchial obstruction against the background of respiratory diseases in children, as a rule, occurs more often in the form of acute obstructive bronchitis. Biofeedback mainly develops acutely, but it can be persistent. Differential diagnosis of BOS in young children is difficult due to the impossibility of using methods for assessing the function of external respiration, difficulties in obtaining sputum for cytological and bacteriological studies in order to verify the diagnosis [18, 22]. The persistent recurrent course of biofeedback, resistant to traditional conservative therapy, may require an endoscopic examination of the bronchial tree, which makes it possible to

visualize changes in the bronchi, as well as laboratory study of biological fluids and tissues obtained during bronchoscopy [12, 19, and 20].

The first symptoms: shortness of breath and wheezing syndrome often appear in children at an early age [13, 15, 23]. Previous bronchial obstruction also increases the risk of viral lower respiratory tract infection [17, 19]. A study conducted in 2008 by L. B. Bacharier et al. Showed that 60% of infants hospitalized with bronchiolitis had more frequent respiratory infections and episodes of bronchopulmonary obstruction within 2 years of follow-up compared with controls [18,24]. Biofeedback of both infectious and allergic inflammatory origin is always more severe in children with bronchial hyperreactivity and manifestations of atopy [22]. It is also known that AD develops in 30–50% of children who had recurrent biofeedback of viral origin in infancy [21]. The viral infection acts synergistically with allergic sensitization and decreased lung function during infancy, leading to the development of AD later. Atopy is a risk factor for the development of AD after virus-induced biofeedback.

Children who underwent BOS in the early years of life and have such signs of atopy as allergic sensitization, atopic dermatitis, allergen-specific immunoglobulin E, have the highest risk of developing AD [20]. In a study by R.F. Lemanske et al. Found that children of the group with a high genetic risk of developing allergic respiratory diseases at the age of 3 years more often develop biofeedback in the presence of the following risk factors in infancy: passive smoking, allergic sensitization to food at the age of 1 year, any respiratory disease without biofeedback moderate and severe, at least one episode of BFB associated with infection with respiratory syncytial (RS) virus, rhinovirus or other pathogens in infancy [23]. In children who often suffer from respiratory infections, biofeedback is recorded more often [7, 20]; according to some data, bronchial obstruction in infants with ARI reaches 50% or more [18].

The frequency of BOS, which developed against the background of infectious diseases of the lower respiratory tract, ranges from 5 to 40% [18]. Soroka Yu.A. et al. argue that in every second child ARI is accompanied by bronchial obstruction of varying severity [12, 23], and recurrent episodes of respiratory infection occur with recurrent BFB [11, 22], which often progress to severe exacerbations requiring hospitalization of children. Timely and correct identification of infants at increased risk for persistent asthma can help predict long-term outcomes and improve prevention and treatment [15, 21,27]. Over the past two decades, many scientific advances have improved the understanding of AD and the physician's ability to effectively control it [2, 7, and 22].

Early diagnosis, which determines the timely start and tactics of treatment, and also largely determines the prognosis of the disease and the choice of preventive measures [1, 6] The basis for determining the prognosis of biofeedback, as well as early diagnosis of AD, was the study of biofeedback phenotypes depending on age, genesis and characteristics of the course of the disease [12, 23]. The non-atopic phenotype of biofeedback is the most difficult to diagnose and understand. It is known that severe adenovirus infection can lead to prolonged bronchial obstruction in a previously healthy child. Respiratory viruses, including rhinovirus, RSV, metapneumovirus, influenza, affect the respiratory epithelium of the lower respiratory tract and provoke a local immunological response, as well as a protective antiviral response with the production of interferons, chemotaxis and activation of NK cells. Respiratory viruses damage the ciliated epithelium of the mucous membrane of the respiratory tract; increase its permeability to allergens, toxic substances and the sensitivity of the receptors of the submucous layer of the

bronchi, which causes an increase in bronchial hyperreactivity and the occurrence of BOS in children [14, 26].

Thus, the differential diagnosis of clinically heterogeneous phenotypes of children with symptoms of bronchial obstruction, concealing many diseases and conditions that are of the same type in their clinical manifestation, will help in determining the prognosis of biofeedback in young children, in choosing treatment tactics and preventive measures [25,28].

ABSTRACT

In this article, its friction resistance is tested in determining the quality index of the tissues. The properties of friction resistance, length, linear stiffness, torsion and strength, deformation properties of the fibre in its composition were studied. In this paper, the friction resistance of tissue is tested in determining its quality index. The properties of friction resistance, length, linear stiffness, torsion and strength, deformation properties of the fibre in its composition were studied. It has also been studied that fibres are formed based on a spinning system and that their deformation properties increase or decrease when the fabric is resistant to abrasion. Also in the research work was prepared yarn (Compact melange yarn (RoCos)) with high deformation properties. The study found that rubber tissue has a 10% higher abrasion resistance than tissue made from ordinary melange yarn. Experiments have shown that the tensile strength of compact

(RoCos) melange yarn made of ordinary melange yarn is 19.2N higher than the length of the fabric made of ordinary melange yarn.

KEYWORDS: Yarn, Spinning Machine, Deformation, Quality, Compact Yarn, Spun, Unevenness, Elongation, Melange.

INTRODUCTION

The yarns produced at the enterprises must meet certain requirements, depending on what purpose they are used for, that is, they must be in a certain consistency, to a certain extent, clean and smooth [1,2].

The threads with the highest quality are produced in the spinning machines with rings. The ring spinning style has been improving for more than two hundred years [3]. The advantage of the ring-spinning machine is that the yarn obtained from it satisfies the requirements of the world market in terms of quality. The ring spinning machines installed in the enterprises of Uzbekistan are mainly operational, high-performance equipment of leading foreign firms. The most common among them is the ring-spinning machine of the firms “Rieter” and “Zinser”. The frequency of rotation of the female of these machines is now reached up to 25000 thousand⁻¹. With the introduction of advanced technologies in the textile industry, product quality management, based on the study of factors affecting the structure and properties of yarn obtained in serum spinning machines, is important in improving spinning efficiency [4,5]. Leading companies are conducting several important studies to improve the efficiency of spinning machines and machine design. Examples of such innovations include increasing the number of loops in machines, the introduction of compact spinning machines, continuous spinning and waste-free spinning [6]. Updates of this type are still in use on spinning machines. At the same time, the properties and traditional loop spinning yarns have become very popular in spinning technology under the name of the compact yarn, increasing the quality indicators based on completely new technologies. The geometry of the compact yarn has changed compared to traditional loop yarns. In the process of forming compact yarns, the baking triangle is almost non-existent [7].

Figure 1. The basic principle of compact and simple yarns. (I) yarn spun in a simple ring method. (II) yarn spun in a compact manner

In the zone of yarn formation, the fibres become tense at the edges of ordinary yarns. ROTORCRAFT scientists explain that the fibres in the middle part are less involved in the twist.

In ordinary yarns, the tension of the cross-sectional fibres is greater, and the tension of the fibres decreases towards the centre. Because the fibres have different stresses, the structure of the yarn is uneven and has low resistance to tensile forces [8, 9]. In compact yarns, we can see that the fibres are evenly distributed in the cross-section of the yarn. This arrangement of the fibres also affects the next stage of the process. In ordinary yarns, the tension of the cross-sectional fibres is greater, and the tension of the fibres decreases towards the centre. Due to the fact that the fibres have different stresses, the structure of the yarn is uneven and has low resistance to tensile forces. In compact yarns, we can see that the fibres are evenly distributed in the cross-section of the yarn. This arrangement of the fibers also affects the next stage of the process [10].

Ordinary yarns have low tensile strength and high hair strength. These problems have been eliminated in compact yarns. The larger the baking triangle, the worse the texture of the yarn. This means that the loss of the baking triangle in compact yarns has led to an increase in yarn properties. The compact and simple yarns look longitudinal as follows.

Figure 2 Placement of fibers in simple compact yarns

THE MAIN ISSUE

Several companies have also proposed their own inventions for compact yarns. Suessen (Elite spinning) Zinzer Air-Com-Tex 700 invention, Marzoli's Mas 3000 compact spinning machine, Rieter (Comforspin) engineers' compact spinning device, RoCoS device in the production of compact spinning devices by Rotorkraft have managed to improve the quality of yarn. Among the recommended devices, Rotorkraft's RoCoS compact yarn is simple and does not require additional energy. From the words Rotorkraft, Compact, Spinning - the term RoCoS, which is a device for mechanical compaction of fibres involved in the formation of yarn. Specifically, in the manufacture of compact yarns, the fibres passing between the elongated rollers of the ring-spinning machine are compacted using a device before the winding process [11, 12].

Figure 3. Rotorkraft's RoCoS compact yarn production method.

The RoCoS device is tested at a melange spinning mill. The experiments used a Zinser-350 ring spinning machine. Instead of a machine output roller, a RoCoS device was installed and compact mélangé yarn samples (spinning frequency 17,000 and ripening at 750 b/m, 20-text sample yarn) were compared and compared with ordinary factory yarn.

Figure 4 Comparison of RoCoS compact spinning system with the simple spinning system.

TABLE 1 CHARACTERISTICS OF SIMPLE AND COMPACT YARNS

№	Name of the parameters and unit measure	Simple yarn	Compact yarn
1.	Frequency of spindle rotation x103, min-1	17	17
2.	Relative breaking strength (Rkm) R, sN/teks	12,59	15,71
3.	Number of feathers 50 m long, more than 3 mm long, pcs	187	65
4.	Practical ripening, Ka, b / m	671	703
5.	Coun or line unevenness, C2 {T} %	16,34	15,54
6.	Force of the breaking, unevenness C2 {R} %	11,04	8,57

It was found that the quality of compact melange yarn obtained using a compact device has improved in all respects compared to ordinary melange yarn. Experiments have also shown that compact yarns have higher deformation properties than ordinary yarns.

Figure 5. Deformation of normal and compact melange yarns by loading and unloading for 2 seconds. 1-simple melange yarn, 2-compact melange yarn

An optical instrument was used to measure the deformation properties of the threads. It is known that the threads are subjected to a force for a very short period of time [13,14]. With this in mind, their deformation resistance was determined over a short period of time, and the results were plotted and analyzed [15,17].

The single-cycle deformation properties of the sample yarns were studied over a period of 2 s (Figure 5). It was found that when compact (1) and ordinary melange yarns (2) are under load, the compact yarn has a 13% greater resistance to ordinary yarn. During the unloading process, it was found that the compact melange yarn returned to its original state by 21%.

The deformation properties of the yarns can also affect the quality of the fabric in the next stage. To determine this, a simple and compact melange yarn sample was obtained from a rubber knit fabric. The quality of the fabric was studied in the laboratory, in accordance with the requirements of standard norms. The results obtained are summarized in the table 2.

TABLE 2. INFLUENCE OF PHYSICAL AND MECHANICAL PROPERTIES OF FABRICS ON YARN QUALITY

№	Names	Friction resistance and number of rotations in friction	Breaking force N		Elongation, %		Shrinkage, U %		Air permeability	Surface density M, gr/m ³
			Length	Eni bo'yicha	Length	Width	Length	Width		
1	Made from the Simple	28,8	816	331,9	66,7	231	10	-5	106,7	474,1

	melanj yarn Lastik tissue									
2	Made from the Compact (RoCos) melanj yarn tissue	32	835,2	348,5	67,05	263,7	8,50	-3	108,5	505,9
3	Simple melanj yarn and made from the Spantex Lastik tissue	30,5	841,2	363,7	120,9	351,7	7	-2	40,9	635,8
4	Compact (RoCos) melanj yarn and made from the Spantex Lastik tissue	34,1	868,3	408,8	112,3	310,9	7	-1	35,4	626

RESULTS ANALYSIS

In determining the quality of a fabric, its abrasion resistance is tested. The properties of abrasion resistance depend on the length of the fiber, its linear density, torsion and strength, deformation properties. This is formed on the basis of the fiber spinning system. In analyzing these, we did this through several experiments below. Their deformation properties also play a role in increasing or decreasing the abrasion resistance of tissues. Rubber fabric made of yarn with high deformation properties (Compact (RoCos) melange yarn) has a 10% higher abrasion resistance than ordinary melange yarn.

Figure 6. Friction resistance of materials

A certain amount of Lycra yarn is used to preserve the shape of knitted fabrics. The study also examined the abrasion resistance of Lycra mixed rubber tires.

Based on the results of the research, the quality of rubber fabric made from a mixture of ordinary melange yarn and Lycra yarn, as well as the quality of rubber fabric made from a mixture of Kompact (RoCos) melange yarn and lycra yarn were analyzed. According to the analysis, we can see that the rubber fabric woven from Kompact (RoCos) melange yarn has an abrasion resistance of 11% higher than the rubber fabric woven from melange yarn. as well as a mixture of ordinary melange yarn and Lycra yarn, Rubber Tissue Friction Resistance It was found that woven rubber fabric obtained from a mixture of compact (RoCos) melange yarn and lycra was 11.8% higher than the friction strength.

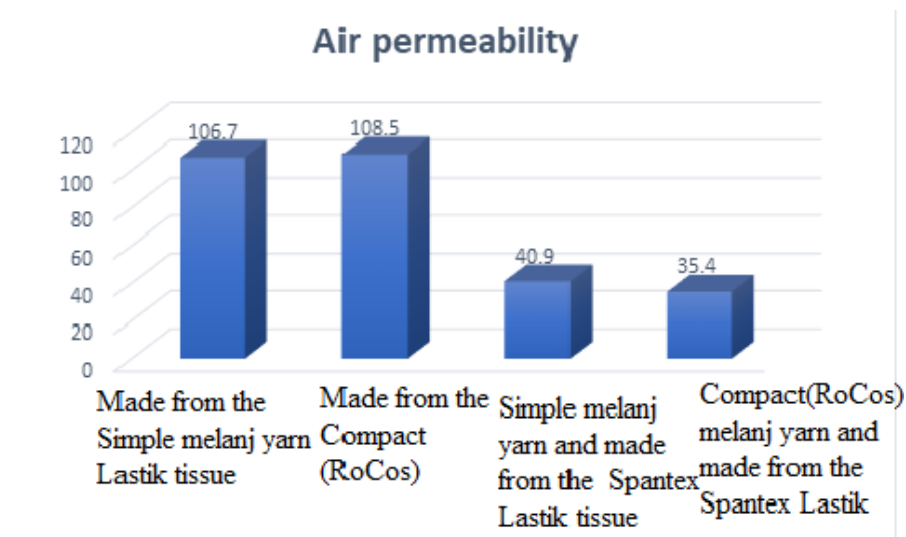

Figure 7. Air permeability

We know that the air permeability of the material depends on the type of yarn from which the fabric is made. We see on the basis of experiments that the prepared tire differs from the texture.

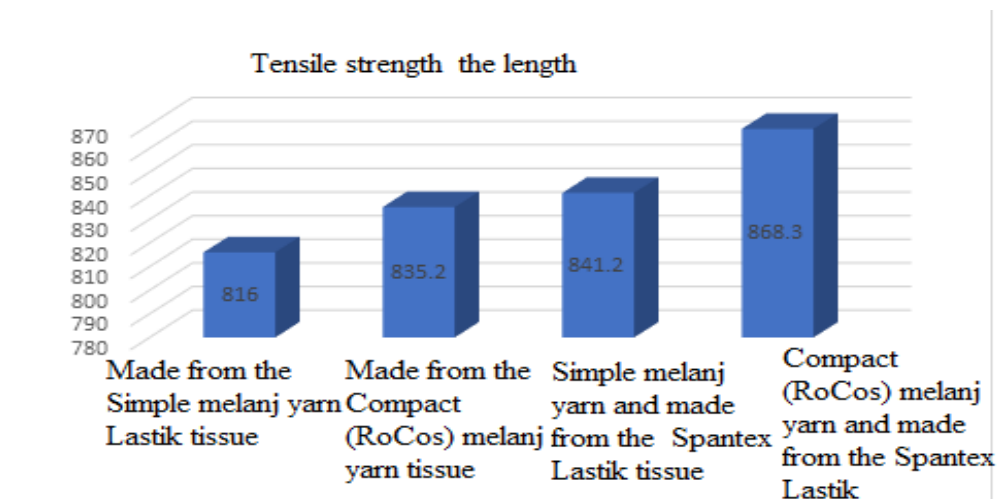

Figure 8. Tensile strength the length

Based on experiments, Normal Melange Yarn Compact Tire (RoCos) Melange Yarn Tissue Tensile Strength 19.2N, Normal Melange Yarn Tire Tissue Compact (RoCos) Melange Yarn and Lycra Tire to We can see that the tensile strength is less than 27.1 N

CONCLUSION

1. Studies have shown that compact melange yarns have higher physical and mechanical properties than ordinary yarns.
2. The melange yarn obtained in the RoCos compact spinning machine was found to have strength of 19.2N from factory ordinary melange yarn.
3. The compact yarn obtained in Rieter's K44 compact spinning machine has a strength of 27.1N compared to ordinary melange factory yarn. Normal Melange Yarn Tissue Compact (RoCos) is 1.8% different from Melange Yarn and Normal Melange Yarn Compact (RoCos) Melange Yarn is 5.5% air-tight compared to Lycra Tire. Permeability was determined experimentally

ABSTRACT

The Internet time powers every one of us to manage a regularly baffling and constant arrangement of innovation incited changes. At the point when a foundation of incredible computational and specialized apparatuses is coordinated with a pervasive correspondence organization, the stage is set for quick advancement. A portion of these advancements are maintaining and assist us with conveying, play, and learn all the more adequately utilizing recognizable thoughts and practices. Different advancements are problematic constraining clients to go external the monetary and social limits set by past innovations and instructional methods to utilize them successfully. Learning, be that as it may, is widespread, and consequently people develop means and applications to utilize both problematic and supporting advancements to upgrade their lives and those of others in the world.

KEYWORDS: *Social forms, dominant, Behavior, Social entity, Collectives, Model, Method, Internet, Individuals, Groups, Networks, Presentation, Pdvancements, Financial, Personal, Ethical, and social constraints.*

INTRODUCTION

In determining the dominant social forms, the distinctions we have made are:

- Sets are social structures where individuals may have no information on others in the set however are bunched by shared traits between them. This may prompt solid ID and trust now and again, yet not ordinarily.

- Groups are social forms where people intentionally go along with others with shared objectives and relate to a mass standards and practices.
- Nets are social forms where the associations among people and now and then bunches of people are what tie them together.
- While in some cases it tends to be difficult to distinguish whether one assortment of individuals is a gathering, net, or set, there are general guidelines to follow. To sum things up:
- If the social element continues regardless of whether there are no members, likely it is a gathering.
- If there is little result to realizing who is included and the subject is the main perspective, it is probably going to be a set.
- If recognizable individuals are perceived by each other, it is most likely a net.

The three social forms for picking up, addressing the way that there is a continuum between the structures, each obscuring into the following. These social forms are limited by basic ascribes of sharing and correspondence that can add to the learning of others. Collectives, a specific type of aggregate knowledge, can rise out of any or these social structures and are described by algorithmic conglomeration, sifting, information mining, grouping, and example coordinating. These algorithmic processes may be internal to crowd members (e.g., responding to others in a crowd) and/or externally imposed, typically by computers (e.g., recommender systems) but sometimes by individuals (e.g., people who count votes in an election) [1-4].

Figure 1. **Social forms for learning: Sets, nets, and groups**

Our model is gotten from our perceptions about assortments of students and how they profit by each other's information and activities. While these social forms can and do exist in settings other than learning, it isn't our expectation to give a total model of human culture, or to propose that the model would be helpful taking all things together different settings. This model is valuable in light of the fact that, as we will show in the following parts, it assists with sorting out

not just how friendly learning happens in conventional instructive settings yet additionally how the various ways that we can interface utilizing the internet innovations may add to our learning directions in casual and individual settings [5-9]. These social structures can and do exist as a rule past learning, and we will now and again give instances of their utilization in different settings to help outline what we mean, however it isn't our goal to step beyond a learning setting in applying this model.

Much of the time, it is workable for each of the three to be valid. It is useful to picture the typology as a Venn diagram of covering sets, the cover demonstrating not just that we decide to see a specific social structure inside an assortment of individuals and this doesn't avoid us from having different viewpoints all gatherings are the two sets and nets, for example yet in addition that there are frequently covers and fluffy boundaries between them. Figure 1.2 shows the typology for certain instances of the sorts of social substances pertinent to learning found inside them. On the other hand, you could consider it to be a continuum.

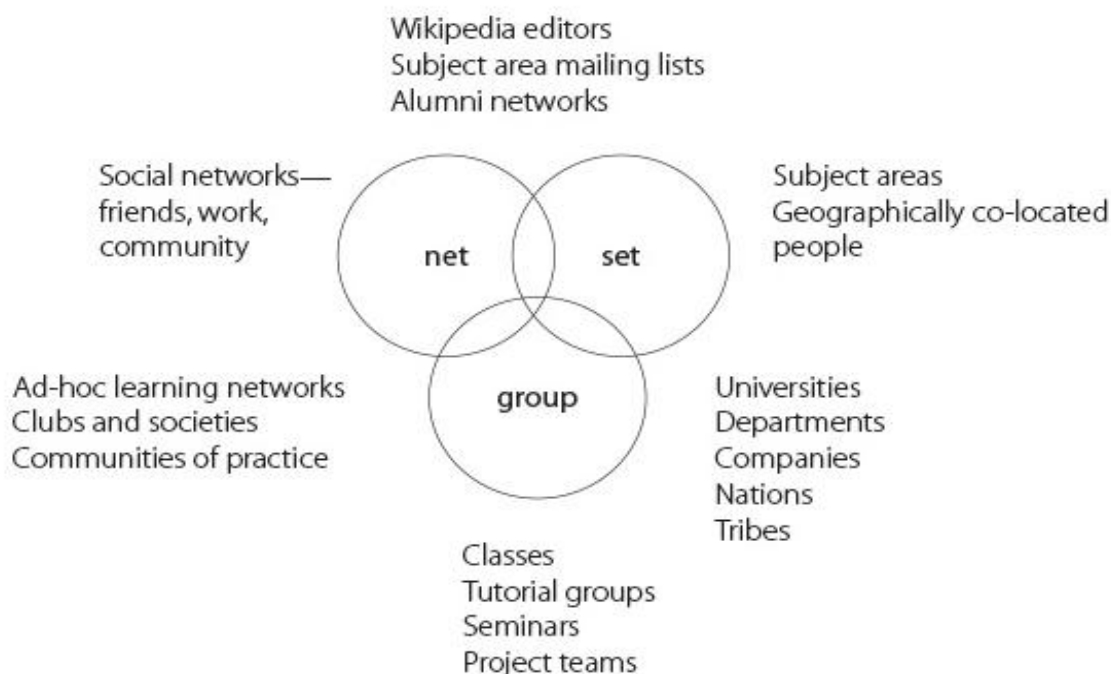

Figure 1.2 Venn diagram view of the typology.

Every social form mixes into the following. For instance, numerous ancestral structures, for example, fondness bunches like hockey fans, Goths, or entertainer network scholars, are nearer to sets than gatherings; others, similar to colleges, countries, and worldwide meetings are more gathering like. Networks of training exist some place on the continuum among gatherings and nets, frequently with restricted or non-existent force structures yet showing more prominent deliberate cohesiveness than a straightforward organization. The idea of mixing is valuable as it proposes a similarity to colors: a boundless wide range of shades and tints can be made by joining the three essential tones.

INDIVIDUALS

Before we move into the domain of genuinely social forms that include various members, see that much learning includes just the most questionable connections between individuals. At the point when we as people read a book, paper, page, or news source, value-based distance is amazingly high. Notwithstanding, in any event, for the most single of students, others are essentially engaged with the learning exchange as creators and makers of substance [7-11]. In many cases, this involves a form of guided didactic conversation (Holmberg, 1986) in which the learner engages in internalized dialogue with the very distant tutor. Indeed, even where this isn't the situation, the creator's voice might be clear and there is a solid sense that pretty much every learning cycle includes, at least one stages eliminated, another individual. At a limited scale, all text based correspondence and numerous that utilization voice, video, or symbols incorporate a cycle of turn-taking in which we read/retain and, possibly, react. The distinction for the individual student is that the chance of a progressing trade isn't accessible.

COLLECTIVES

Having characterized the three social forms, we presently direct our concentration toward collectives, which are maybe the most charming of elements empowered by friendly programming. Collectives, as we utilize the term, cause the group to carry on as a solitary entertainer [11-13]. They are not friendly structures like gatherings, nets, and sets, but rather are the machine-as well as human-accumulated aftereffects of the exercises of an assortment of people. Collectives accomplish an incentive by removing data from the individual, gathering, set, and organization exercises of individuals, and afterward utilizing that data to play out some activity. Commonly in the internet, these exercises are totaled by programming and the outcomes introduced through PC interfaces, however people can purposefully play out the conglomeration job as well. Be that as it may, there need be no outer specialist required for a group to frame: the people who structure the group may themselves play out the accumulation, prompting new practices of the group.

Preceding the approach of the Internet, deliberate cooperatives were utilized in, for example, casting a ballot in decisions or displays of support in a study hall, however inadvertent assemblages happen in a more far and wide way, like the arrangement of unmistakable trails in woods, the social affair of groups around a road performer, and the developments of the financial exchange.

On the Internet, there are perhaps millions of applications that create value through aggregation, analysis, processing, and re-presentation of crowd activities, collecting user actions such as links placed on web pages (e.g., Google PageRank), photo and video tags, annotations and downloads (e.g., Flickr, YouTube, Instagram), article or solution evaluations (e.g., Digg, Mixx, Slashdot, StackOverflow), recommendations (e.g., Amazon, ratemyteacher.ca), and those that employ individuals' reputations for some other purpose (e.g., eBay). Crowd behaviour can be mined from certain decisions or commitments made at the individual, gathering, or organization levels, from unequivocal practices like rating or labeling, or by blends of each approach. Collectives for the most part improve in an incentive as the size of the group's/network's/set's tested activities develops [8-12]. At the point when enormous quantities of assets are arranged, explained, and appraised by many, for instance, the resultant asset posting can acquire impressive aggregate worth contrasted with a rundown evaluated by a solitary obscure person.

Collectives act as dynamic specialists inside a framework in manners that are closely resembling the office of people: in genuinely unsurprising ways they settle on decisions, esteem proclamations, articulations of conviction, and act to achieve changes in the conduct of others. This is critical with regards to learning in organizations and sets in light of the fact that, without a proper educating or psychological presence, cooperatives frequently assume that part. Collectives may here and there go about as reflections of the gathering psyche, or parts of organization awareness that framework planners or individuals from the group have picked as huge. Since they address picked parts of gathering, set, or organization movement, the impression of the aggregate brain is constantly appeared through a contorting mirror that might be accumulating, refining, concentrating, choosing, separating, averaging or in any case preparing parts of group conduct.

Commonly, yet not solely, aggregates influence their own individuals in an iterative and self-coordinating cycle. For example, in friendly route, signs are regularly underscored or de-accentuated because of people inside a gathering or organization moving around a framework, which thusly influences the later route of that equivalent gathering or organization. Nonetheless, this doesn't need to be the situation. For instance, the aftereffects of deciding in favor of an applicant by one gathering may impact the democratic conduct of another, or the labeling of photographs inside a framework, for example, Flickr may impact the conduct of outcasts and guests to that framework's assets.

The Values of Different Social Forms and Collectives

When designing a social system to support learning, it is important to bear in mind what kinds of activities and what goals are intended, and to choose approaches and social forms that best serve the needs identified. To summarize the main strengths and weaknesses of each form:

- Groups offer the best worth when the object of knowing is known and the way toward knowing is mind boggling. They are particularly useful when a supported exertion is required. Gatherings are incredible sparks, misusing our intrinsic requirement for having a place and the manners in which that we have grown up and additionally advanced to live in chains of command. In any case, bunches require responsibility and accompany an enormous overhead of plan and the board; they are additionally costly. Devices worked to help gatherings ought to typically offer help for jobs, cycles, and strategies.
- Networks are implanted practically speaking, stretch out past the specifiable, and permit us to profit by variety and information that rises above limits and handily indicated targets. Organizations are incredible for effective, in the nick of time learning, and open us to good fortune and change. Organizations, similar to gatherings, misuse social capital for both commitment and inspiration. Nonetheless, networks require exertion to be misused for learning. Without construction and direction, we need to settle on choices for ourselves. As a rule, network devices should help oversee and support connections, make and break associations, and manage the association of subsets of the organization, with optional access and protection controls.
- Sets are most helpful when the information we look for can't be handily found in our gatherings and organizations, when we need to realize something however don't have the foggiest idea who to inquire. They are additionally a significant methods for acquiring

different experiences and information about a subject. In any case, similar to networks, they request exertion from us to choose what to realize in any case and afterward to settle on choices about dependability, significance, and honesty. Sets need devices for association and, all in all, advantage most from the accessibility of assemblages to help them.

- Collectives give the way to us to sort out, specifically, sets, less significantly nets, and at times, gatherings. Like educators, assemblages instruct us, who to trust, what is intriguing, and how to move toward a subject. In any case, assemblages are just pretty much as savvy as the group, the methods by which the group is chosen, characterized by the calculations and introductions that play out the work. The adapting needs, as opposed to just the inclinations, of their clients ought to be upheld.
- The form or forms that an individual learner may make use of in his or her learning journey will always depend upon context and needs, but these will be codetermined by external structures like the need for assessment and accreditation, the formal and informal rules of behavior in a given context, as well as other financial, personal, ethical, and social constraints.

ABSTRACT

The paper shows the influence of platinum cluster size on reactivity in the process of obtaining ethane from methane. The enthalpy of activation and geometric parameters of intermediates and transition state for the stage of methane activation on an Al_6O_9 substrate, As well as geometric parameters of clusters used in calculations of the mechanism of ethane formation from methane have been presented. The alumina was chosen as the substrate material since experimental data indicate that it stabilizes platinum nano clusters. Our calculations confirm this. Upon the adsorption of 3Pt_4 and $3Pt_6$ clusters on the Al_6O_9 substrate, the energy of the system decreases by 242.5 and 421.7 kJ / mol, respectively, which is higher than the energies with which we will operate in the future, this is an indicator that the clusters formed on the $Pt_4Al_6O_9$ and $Pt_6Al_6O_9$ substrate are stable.

KEYWORDS: Methane, Ethane, Platinum, Alumina, Cluster, Size, Influence, Substrate.

INTRODUCTION

Until now, no quantum-chemical study of the theoretically and practically important mechanism of the process of obtaining ethane from methane has been carried out.

Figure 1 shows four of the six clusters in which we studied the mechanism of ethane formation from methane.

The tetrahedral cluster ${}^3\text{Pt}_4$ and the octahedral cluster ${}^3\text{Pt}_{14}$ (A) reveal the activity of platinum atoms located at the vertices and edges of the crystal, and the planar clusters ${}^3\text{Pt}_6$ and ${}^1\text{Pt}_{14}$ (B) (face-centred cubic lattice) simulate the planar face of the crystal [1-3].

MATERIALS AND METHODS

The main criteria for choosing a substrate were a small deformation of platinum clusters during adsorption onto the substrate and small deformation of the substrate itself during this adsorption and subsequent reactions. These criteria are met by the Al_6O_9 substrate (Fig. 1).

Figure: 1. Geometric parameters of clusters used in calculations of the mechanism of ethane formation from methane (bond lengths in pm).

The alumina was chosen as the substrate material since experimental data indicate that it stabilizes platinum nanoclusters. Our calculations confirm this. Upon the adsorption of ${}^3\text{Pt}_4$ and 3Pt_6 clusters on the Al_6O_9 substrate, the energy of the system decreases by 242.5 and 421.7 kJ / mol, respectively, which is higher than the energies with which we will operate in the future, this is an indicator that the clusters formed on the $\text{Pt}_4\text{Al}_6\text{O}_9$ and $\text{Pt}_6\text{Al}_6\text{O}_9$ substrate are stable [5-9].

Another reason the alumina support was chosen is that platinum catalysts are susceptible to sulfur poisoning. However, there are experimental data that small clusters of platinum on an alumina substrate show high catalytic activity in the presence of poisons.

Figure: 2. Enthalpy of activation and geometric parameters of intermediates and transition state for the stage of methane activation on an Al_6O_9 substrate (multiplicity 1, bond lengths in pm).

To confirm the low activity of the selected Al_6O_9 substrate during the activation of the methane molecule, we considered the corresponding reaction (Fig. 2). To break the CH bond in the methane molecule, an activation enthalpy of 92.4 kJ/mol is required, and the TS1-2 transition state is 57.3 kJ/mol higher than the sum of the enthalpies of the reactants, while for $^3\text{Pt}_4$ TS1-2 it is 35.9 kJ/mol lower than the sum of enthalpies reagents. Therefore, this process is energetically disadvantageous.

In the process of ethane formation from methane on platinum clusters of various sizes and structures, three limiting stages were identified [10-17]. This is the migration of the methyl group to the bridging position between two platinum (I) atoms; transfer of a methyl group to a platinum atom to which another methyl group (II) is already attached; the process of formation of the C-C bond (III).

The analysis of the results obtained for the tetrahedral cluster $^3\text{Pt}_4$ with and without an Al_6O_9 substrate showed (Fig. 3) that the formation of ethane from two methane molecules is exothermic ($\Delta\Delta H_{298K} (^3\text{Pt}_4) = -95.8$ kJ/mol, $\Delta\Delta H_{298K} (^3\text{Pt}_4\text{Al}_6\text{O}_9) = -40.8$ kJ/mol), but thermodynamically favourable only for $^3\text{Pt}_4$ ($\Delta\Delta G_{298K} (^3\text{Pt}_4) = -48.1$ kJ/mol, $\Delta\Delta G_{298K} (^3\text{Pt}_4\text{Al}_6\text{O}_9) = 8.2$ kJ/mol). For the $^3\text{Pt}_4$ cluster, the limiting process is the formation of the C - C (III) bond (stage 10 \rightarrow 11, the activation enthalpy 104.4 kJ/mol), and for the $^3\text{Pt}_4\text{Al}_6\text{O}_9$ cluster, process (II) (stage 7 \rightarrow 8, the activation enthalpy 170.2 kJ/mol). In this case, the use of support reduces the catalytic activity of the $^3\text{Pt}_4$ cluster.

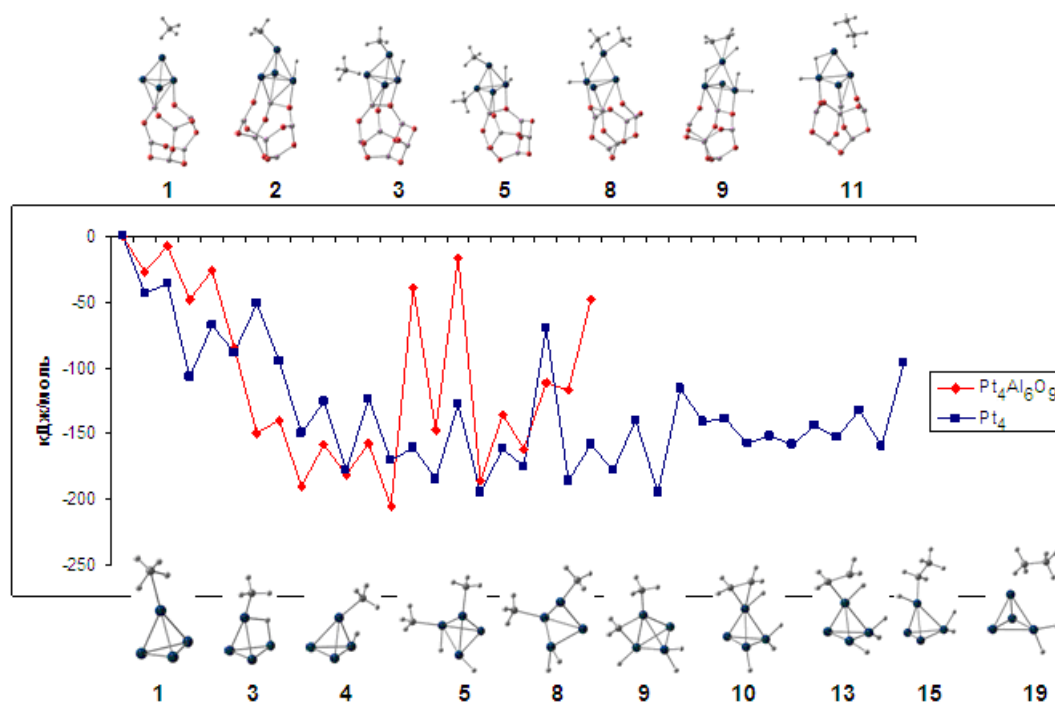

Figure: 3. Energy diagram of the reaction of ethane formation from methane on a $^3\text{Pt}_4$ cluster with and without an Al_6O_9 substrate. The sum of the formation enthalpies of isolated reagents is taken as zero.

As an alternative mechanism, using the example of the $^3\text{Pt}_4$ cluster, we considered the process of ethylene formation (Fig. 4). Initially, the formation of ethylene is more energetically favorable

than the formation of ethane [18-23]. Thus, when a hydrogen atom migrates from a carbon atom to a platinum atom, the enthalpy of the system decreases with the formation of structure 14a with the lowest relative enthalpy (-243.6 kJ/mol). However, the process of detachment of a carbon atom from a platinum atom (stage 14a \rightarrow 15a) occurs with a barrier of 114.2 kJ/mol, which is higher than the barrier of the limiting stage of the formation of a carbon-carbon bond (stage 10 \rightarrow 11, activation enthalpy 104.4 kJ/mol).

The process of further carbonization of platinum is energetically unfavourable, which is confirmed by structure 19a, the relative enthalpy of which is 170 kJ/mol higher than the sum of the enthalpies of the reactants [21-26]

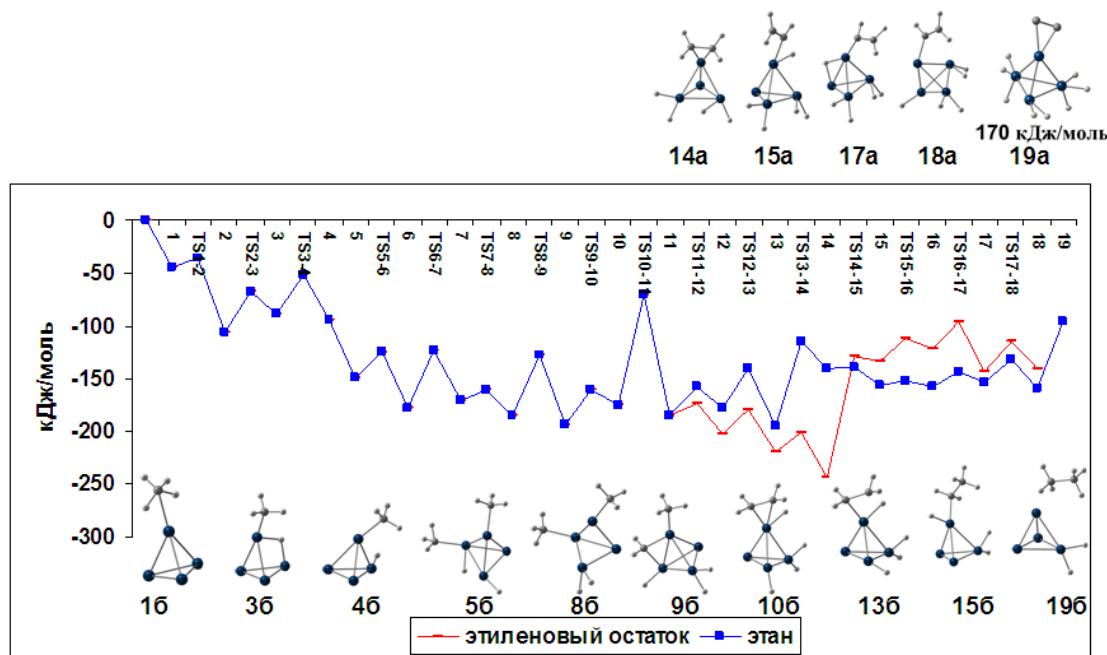

Figure: 4. Energy diagram of the reaction of ethane and ethylene formation from methane on the $^3\text{Pt}_4$ cluster. The sum of the formation enthalpies of isolated reagents is taken as zero.

RESULT AND DISCUSSION

The analysis of the results obtained in the study of the conversion of methane to ethane on platinum clusters of various sizes deposited on a substrate (and without it) made it possible to reveal some important regularity in the course of this process. It was found, that the values of the activation barriers for the main stages with respect to the sum of the enthalpies of isolated reagents for $^3\text{Pt}_4$, $^3\text{Pt}_{14}$ (A) and $^3\text{Pt}_6$, $^1\text{Pt}_{14}$ (B), respectively, are quite close.

It follows from this that the results for small clusters can be used, to simulate methane conversion processes on clusters of much larger size.

Thus, the order of relative stability for neutral, cationic, and anionic platinum clusters has been determined. The most stable isomers of neutral Pt_n clusters up to $n = 6$ have a planar structure. It is shown that the adsorption of a hydrogen molecule on small platinum clusters occurs without activation. The resulting $\text{Pt}_{4-9}\text{H}_2$ hydrides are elongated to 306.3 pm. Pt-Pt bonds and a different

order of relative stability than the initial Pt₄₋₉ clusters. For Pt₄H₂, the tetrahedral arrangement of platinum atoms becomes the most favorable. The limiting stages of the methane dehydrogenation reaction on neutral, cationic and anionic platinum clusters have been identified.

ACKNOWLEDGEMENT

The authors acknowledge the immense help received from the scholars whose articles are cited and included in references to this manuscript. The authors are also grateful to authors/editors/publishers of all those articles, journals and books from where the literature for this article has been reviewed and discussed.

ABSTRACT

The article examines the effect of the finishing process on the physical and mechanical properties of twisted yarns based on practical research. The results of the applied research were analyzed, and graphs of correlation coefficients of variability in terms of unevenness, tensile strength and tensile strength of the obtained samples were constructed and analyzed. Based on the analysis, alternative options were recommended. The defining properties of yarn and threads in the standards include linearity, toughness, toughness, elongation, and flatness. The linear density of yarn yarns is determined by the text value, such as fibres. The thickness of the yarn is determined by the mass in grams of 1000 m yarn in the text system. The higher the numerical value of the text, the thicker the yarn.

KEYWORDS: *Spinning yarn, Annular spinning, Twisted, toughness, Unevenness, Tensile strength, Product quality, Spindle, Carda, linear density, Relative elongation, Relative elongation, Consistency.*

INTRODUCTION

One of the important tasks in the implementation of the program of measures for the further development of the textile industry is to increase the production capacity of finished products by spinning yarn. The finishing of spun yarns has a direct impact on their quality. This requires scientific research on them. The quality and durability of dyed and twisted yarns are inextricably linked with the mechanical, physical and chemical properties of the fibers that make them up, and their listed parameters must be proportional to each other. In turn, technical equipment is needed to measure, evaluate or test the performance of the product and the performance of the yarn [1-5]. The more reliable and perfect the tool, the clearer the results of the experiment. Measuring or testing instruments without the involvement of the subject, that is, striving to minimize externalities is an important aspect of development.

MATERIALS AND METHODS

The defining properties of yarn and threads in the standards include linearity, toughness, toughness, elongation, and flatness. The linear density of yarn yarns is determined by the text value, such as fibres. The thickness of the yarn is determined by the mass in grams of 1000 m yarn in the text system. The higher the numerical value of the text, the thicker the yarn. In studies, the process of dyeing yarn has been evaluated based on mechanical tests. To study the effect of the dyeing process on the yarn quality parameters, a two-and-a-half-pound bale wrapped in 25x2 tex yarns was selected for the sample and divided into four equal samples. Option 1 was painted black, Option 2 was painted pink, Option 3 was bleached, and Option 4 was taken as raw yarn [6-9]. The physical and mechanical properties of each sample were then studied. The properties of all yarns in the variant obtained for the experiment were checked against the standard requirements and the results were summarized in Table 1. The mechanical properties of the yarn change as a result of the finishing of the yarn.

TABLE 1. THE PROCESS OF FINISHING YARN AND MECHANICAL TESTING OF SUBSTANCES

№	T- The properties of the yarn	Untreated (raw) thread	Bleached thread	Yarn painted in black	Yarn painted in pink
1	Linear density of yarn, (tex)	25x2	25x2	25x2	25x2
2	Uster rope unevenness, Um (%)	8,57	9,27	8,6	9,25
3	Breaking force, sN	683,5	718,5	635	715
4	Coefficient of variation, (St)	10,82	11,7	10,87	11,65
5	Relative tensile	13,67	14,37	12,7	14,3

	strength, sN / tex				
6	Coefficient of variation in relative tensile strength, CV%	5,52	6,58	4,55	7,04
7	Relative elongation at break, %	5,5	5,1	4,6	4,62
8	Coefficient of variation of relative elongation at break, CV%	6,09	6,03	4,81	6,59

The spinning industry consists of a complex of continuous technological processes, in which uncontrolled external and internal changes, in which there are several interrelated and conditional factors, directly affect the quality of the products being processed. As a result of the individual or joint influence of these factors, disturbances occur in the stability of the technological process, which leads to a sharp change in the quality indicators of the finished and finished products, that is, the appearance of unevenness. By making the unevenness simpler, it can be called the repetition of the creamy and thin areas along the length of the product. If the entire length of the spinning thread is analyzed by determining the linear density, the number of fibres, the ripeness and the number of twists in different incisions, transverse forties, it is possible to observe that these indicators are not the same in length. So it turns out that when these indicators go from one-fortieth to another, they change, depending on the structure of the thread and lead to unevenness. So, the concept of unevenness theoretically expresses how much the product properties (linear density, tensile strength, number of bends) differ from the average in quantity [7-10]. The spinning industry consists of a complex of continuous technological processes, in which uncontrolled external and internal changes, in which there are several interrelated and conditional factors, directly affect the quality of the products being processed.

As a result of the individual or joint influence of these factors, disturbances occur in the stability of the technological process, which leads to a sharp change in the quality indicators of the finished and finished products, that is, the appearance of unevenness. Twisting -consists of twisting the individual threads, forming a single plane of threads, to increase their ripeness and strengthen the twisting of the hem thread. Before twisting, the threads are plastered so that the surface turns out much smoother. In the preparation of the bobbin thread by adding three single threads, after the twine, the threads are twisted in reverse to the twine of the hem thread. When the bobbin thread is made of 6 single threads, it is first twisted by adding two threads, and then by adding three pairs of twisted threads, the hem is turned upside down to the twine of the thread. Then the twist of the bobbin thread will not loosen. Well, twisted and strengthened threads form rings when sewing (the machine throws thread) and often break off. The reel takes in itself the processes of finishing yarn, boiling, bleaching, dyeing, appretizing and glueing. To determine the unevenness of 25x2 woven yarns, we used four types (processed yarn, black yarn,

pink yarn, raw yarn) relative to each other. The roughness graph of the rope was compared. Raw yarn roughness is 8.57%, bleached yarn is 9.27%, black yarn is 8.6%, pink yarn is 9.25%.

Figure 1. Unevenness graph of threads

The relative elongation at break of the 25x2 textured yarn obtained in the experiment after four different methods were also tested according to the Uster standard. The experiment found that the tensile strength of untreated yarn was 5.5%, bleached yarn 5.1%, black yarn 4.6%, and pink yarn 4.62%. The elongation at break was known to be superior to the rest of the quality of the untreated yarn. Black and pink dyes have a relatively low elongation at break. It was found that the elongation at break was 10% different from black and pink yarns. Experiments have shown that the relative elongation of untreated yarn is 16% higher than that of black and pink. This means that experiments have shown that dyeing yarns with chemicals reduce their elongation at relative elongation. The experimental yarns were treated in 4 different ways and their properties were compared. The properties of yarns processed by different dyeing methods of the same linear density (untreated yarn, bleached yarn, black dyed yarn, pink dyed yarn) differed from each other. According to the Uster standard, bleached yarn showed the best results in terms of relative toughness, although it was uneven. Experiments have shown that black yarn has a lower quality than pink yarn. It is advisable to take into account the different properties of yarns based on the time of exposure to chemicals in dyeing them. Because the black yarn is in the dye liquid for a long time, it was found that the quality indicators decreased compared to the remaining samples. Figure 2. Relative elongation at break. Figure 3. Breakdown power results diagram.

Figure 2. Relative tensile strength of yarns.

1 unprocessed raw yarn. 2 bleached yarn, 3- black thread, 4 pink coloured yarn

Figure 2. Relative tensile strength of yarns

1 unprocessed raw yarn. 2 bleached yarn, 3- black thread, 4 pink coloured yarn

It is also advisable to dye the fibres of different grades and their products with separate dyes for dyeing. The temperature and time of dyeing the fibres and yarns should be optimal. Theoretical and practical conclusions based on the research analyze the trends in the development of techniques and technologies of yarn production, enrichment of the domestic and foreign markets with competitive products by expanding the range of textile enterprises in Uzbekistan using local raw materials.

CONCLUSION

Based on the results of the experiments, the tensile strength, which is one of the main quality indicators of the yarn, is set at 683.5 sN for the raw (raw) yarn. As a result of bleaching these raw yarns, it was found that its tensile strength increased by 718.5 sN or 5%, its tensile strength

decreased by 635 sN or 7% when given a black colour, and increased by 715 sN or 4.5% when given a pink colour. These results show that different dyes have different effects on the strength of the yarn during the dyeing process.

ABSTRACT

This article is devoted to the study of the scientific foundations of the formation of logical competence of students in mathematics lessons, which describe traditional and mathematical logic, the relationship between them. He was one of the first to develop a scientific understanding of the basic categories of logic, such as concept, judgment, and conclusion. It has also been proved by Aristotle that there are 19 types of correct conclusions in a special form. The constructed mathematical-logical model allows to study the forms of thinking, that is, the forms of thinking are reflected in the formulas in the logic of reasoning and predicate logic. That is, the same logical form can have different meanings. Just the study of form, the disregard for content, the study of the connections between these forms, is the view of logic as a science.

KEYWORDS: *Logical Competence, Intellectual, Mathematics, Traditional Logic, Mathematical Logic.*

INTRODUCTION

The process of teaching all subjects, especially mathematics, should be shaped on the basis of logical competencies, logical knowledge and logical skills. The school mathematics course has a great potential in the development of students' thinking skills, the formation of logical competence. However, research and observations on this topic show that this potential is not fully used. For example, N.Kh. Rozov [1], speaking about the science of logic in mathematics

education, notes that the school mathematics course does not cover the whole course of logic, but focuses on the study of elements of mathematical logic, which is a special part of it. The author argues that the contribution of mathematics in the development of logical skills in students is that mathematics is inseparable from the mathematical foundations of logic, but that it is never emphasized, explained, developed.

Resolution of the Cabinet of Ministers No. 187 of April 6, 2017 approved the State Education Standard for General Secondary Education and the curriculum of subjects taught in grades 10-11, in particular, the curriculum of mathematics [2]. The program took into account the education of mathematics in developed countries and its development trends, and included in the content of mathematics education one of the new topics on the science of logic "Collections and logic." It is planned to study concepts such as collection, actions on collections; filler kit; feedback; denial, conjunction, and disjunction; logical equality; logical laws; implication, conversion, inversion, and counterpoint; predicates and quantifiers; laws of reasoning; paradoxes and sophisms in these topics and 19 hours are devoted to this. The above-mentioned state education standard, a textbook created in accordance with the program of mathematics [3], fully describes the content planned in the program, explains the newly introduced concepts, actions with the examples. However, it should be noted that the issues related to the development and consolidation of the acquired knowledge and skills on logic are not given in the following topics. This has a negative impact on the systematic formation of students' logical competencies. Therefore, there is a need to develop effective ways to develop logical competencies in schoolchildren, in particular, to develop a methodological framework for teaching them to use the knowledge and skills of logic specifically learned in the mathematics course in the study of mathematics and other sciences. To solve this problem, it is important to study the scientific basis for the formation of logical competencies in students.

The Main Findings and Results

This article is devoted to the study of the scientific basis for the formation of students' logical competence in mathematics lessons, which describes the traditional and mathematical logic, the relationship between them.

Logic as a science began with the work of Aristotle (384-322 BC), a student of Plato. Aristotle almost built a mathematical model of the human thought process. This model of his has served the development of European scientific civilization for more than 2,000 years. He was one of the first to develop a scientific understanding of the basic categories of logic, such as concept, judgment, and conclusion. It has also been proved by Aristotle that there are 19 types of correct conclusions in a special form. They are called Aristotle syllogisms. During 2000 years, logic developed on the basis of ideas and methods created by Aristotle. These ideas and methods are not only of historical significance in the present period, but are still in use today.

Even in ancient times, logic entered mathematics and turned it into a science of logic. From the time of the ancient Greeks, the term "mathematics" was synonymous with "proof" [4, p. 23].

Mathematics and logic have evolved over the centuries on the basis of close interactions. Moreover, their interaction has led to crises in these areas of knowledge, and through these interactions, these crises have been overcome, resulting in the effective and progressive development of these disciplines. These crises are due to the fact that the mathematical results accumulated during this period cannot be explained within the existing methods of reasoning. In

order to solve the resulting delays, it was necessary to radically reconsider the general foundations and methodology of almost all mathematical theories and, of course, to analyze the logical methods of proof, the logical foundations of mathematical science. The development of mathematical science put forward more and more criteria for the solidity of mathematical proofs, which in turn led to the development of logic. At the same time, evolving logic has helped mathematicians find ways to get out of the deadlock that arises in logical reasoning.

The development of science and technology in European countries in the XVIII century, especially the development of mechanics and mathematics in connection with practice, paved the way for the emergence of a new direction - mathematical logic on the basis of traditional logic.

The German philosopher and mathematician G. Leibniz (1646-1716) developed a method of mathematical calculation, and applied it to logic. He was able to identify ways to reason logically by applying symbols to forms of thinking (perception, judgment, inference).

By the middle of the XIX century, mathematical logic was fully formed as an independent science, to which the English mathematician, logician J.Bul (1815-1864) and the German philosopher, mathematician G.Frege (1848-1925) made a significant contribution. In their works, the logical model of the thought process created by Aristotle was supplemented with mathematical content. On the one hand, logic applied mathematical methods in the study of the general structure of correct thinking, and at the same time was formed as a branch of mathematics. Logic entered the ranks of the mathematical sciences, and mathematical logic emerged. On the other hand, the subject of its study was the process of proving mathematical theorems, mathematical theories. Thus, logic became one of the real parts of mathematics, mathematical logic. In the twentieth century, conclusions were reached on the methods of thinking of mathematical logic that could not be proved using traditional logic. This applies to the axiomatic method, which is one of the most important, basic methods of mathematics, and the limits of its application. These scientific results were discovered by K. Godel, A. Turing, A. Tarsky, A. Church, and they are among the greatest discoveries in the field of mathematics in the twentieth century.

In the second half of the twentieth century, unusually effective applications of mathematical logic were discovered. Mathematical logic, recognized as purely theoretical and abstract, had a strong influence on computers, their creation and operation. On the one hand, the methods of mathematical logic were used as a mathematical apparatus for computer practice, that is, for the creation of computers, for the construction of connection schemes. On the other hand, it became necessary to create software (applications) for computers.

The great practical importance of mathematical logic is that students are introduced to their understanding of the basics of mathematical logic in high school computer science and mathematics courses. In this case, logic is given by mathematical expressions. But its science of thinking, of reasoning, and of proof is not manifested. Hence, traditional logic should be used in shaping the logical competence of school students. However, logic cannot be imagined without its mathematical component.

The fundamental basis of traditional Aristotle logic is the famous Aristotle trinity, i.e., concept, judgment, conclusion. These trinities constitute the stages of the thinking process and they serve as the methodological basis for building a mathematical model of the thinking process. To

interpret these categories in terms of mathematical logic, the two main sections of mathematical logic: the logic of reasoning and the logic of predicates are used.

The mathematics of logic begins with the passage of the subject of "concept" and continues with the subject of "judgment," and achieves great results in the passage of the subject of "conclusion."

The process of thinking begins with naming the things and events that surround us. These names (terms) refer to concepts, which in turn represent some class of objects of known character. Aristotle developed ideas on how to introduce concepts and how to classify them. It gives the scope of the concept, how to define the content of the concept, how to find them, how to identify them. From the point of view of mathematical logic, characters are one-place predicates: the set of characters representing its content is the resultant predicate, i.e., it is a conjunction of predicates. Finally, the concept size is the set of truth values of the resulting predicate. From this point on, modern set theory is involved in describing traditional logic using mathematical logic. Thus, concepts generalize knowledge about individual objects and events in the world around us.

The second stage of the thinking process is to study the connections among events, processes, and objects in the world around us, to express these connections in the form of judgments. A judgment is a statement that gives a certain judgment about an object or event. This fact can be used to determine whether a statement is true or false. The validity of an opinion in a commentary represents an important characteristic feature of that subject or event. Thus, any opinion will be either true or false, there can be no other case. 1 character is added to each true comment and 0 character is added to the false comment. Thus, in the 1st stage of the thinking process, we move away from the content of the judgment and leave for each judgment one characteristic of it - true or false. In this case we create a set of two elements $\{0; 1\}$.

Aristotle divides judgments into quantitative (general, specific, unit) and qualitative (affirmative, negative) classes. He also divides judgments into simple and complex judgments. A simple judgment is a judgment in which no related part of it is a judgment. A complex judgment can consist of several simple judgments. Thus the relationships between concepts are expressed in judgments.

From the point of view of mathematical logic, complex judgments will be more complex than the simple judgments made by Aristotle. This difference is seen in drawing conclusions from complex and simple judgments. Complex judgments are modeled through the logic of reasoning, the first part of mathematical logic, while simple reasoning is modeled through the logic of predicates.

Logically complex reasoning is formed from simple reasoning using conjunctions such as "but (not)", "and", "or", "if", "if", "then", "only and only", "in this case".

The next stage of the thinking process focuses on the essence of such conjunctions "but" is called negation of the action in which the conjunction participates and is denoted as \neg , "and" the action represented by the conjunction is called conjunction, it is defined as \wedge , or the disjunction is matched to the conjunction and is defined as \vee , the implication operation corresponds to the conjunction "if", "if", "then" and is defined as \rightarrow . In this case, only and only in this case the equivalent of the connector corresponds, it is defined as \leftrightarrow .

These actions are called logical actions, and a truth table is created for each of them. As a result, we come to the following algebraic construction: a set of two elements and one unar given in it, and four binary algebraic operations $\neg, \wedge, \vee, \rightarrow, \Leftrightarrow$. We define this construction as

$$B = \langle \{0,1\}, \neg, \wedge, \vee, \rightarrow, \Leftrightarrow \rangle$$

And we call it the algebra of considerations (Bul algebra).

Aristotle distinguishes between a set of simple judgments about the properties of things - categorical (or attributive) judgments. He divides them into those that belong to a particular thing (unit) and those that belong to a class of things (general), as well as those that affirm and deny them, respectively. The mathematical logic apparatus that models such judgments is called predicate logic.

Thus, in the first two stages of the thought process - the stage of forming concepts and judgments - human actions move from the material world to the realm of consciousness.

The third step in the thinking process is to draw conclusions. In general, drawing conclusions is an intellectual process expressed in judgments, in which a person acquires new knowledge. This knowledge is also expressed in the form of judgment. The initial judgments are called the conclusion condition, and the resulting judgments are called the conclusion result or outcome. Thus, with the help of conclusions, we grow our knowledge without directly referring to the things and phenomena of being, being able to discover the connections and relationships of that cannot be seen with the naked eye.

Aristotle was the first to draw attention not only to the content of the judgments, but also to the fact that they bring to new conclusions through the connections between them. Inference theory or proofs are taken as the culmination of traditional logic reasoning.

CONCLUSION

Thus deductive reasoning is the culmination of classical logic, in which a sequence of judgments is given. The constructed mathematical-logical model allows to study the forms of thinking, that is, the forms of thinking are reflected in the formulas in the logic of reasoning and predicate logic. That is, the same logical form can have different meanings. Just the study of form, the disregard for content, the study of the connections between these forms, is the view of logic as a science. Thus, in the formation of students' logical competence, we must rely on the achievements of traditional logic and mathematical logic, and use them.

ABSTRACT

In this article, the information on research on scientific justification of reproduction of products prepared on the basis of technology of processing of melon fruit in the conditions of the Republic of Karakalpakstan was taken as the basis. At the same time, the influence of technological properties and chemical composition of zucchini on the properties of preservatives has been studied.

KEYWORDS: *Melon, Sugar Content, Consistency, Chemical Composition, Cutlet, Hemicellulose, Starch, Pectin Substances, Organic Acids.*

INTRODUCTION

In the tropical, subtropical and temperate climatic regions of the planet earth, melon crops are grown on 6.2 million hectares. In the same area 142.4 million tons are grown melon crops. In order to obtain melon seeds in seed farms in the Republic of Uzbekistan, an average of 15-20 thousand tons of products are spent every year. As a result of such a large amount of melon processing, more than 10 thousand tons of melon can be distinguished. The chemical composition of melon meat includes sugar (sucrose, fructose, glucose), cutlet, hemicellulose, starch, pectin substances, organic acids (lemon, oxalate, Apple acids), various vitamins: C, carotene, B6, B15, B1, E, macro-and micronutrients: magnesium, phosphorus, sulfur, chlorine, manganese, iron, copper, fluorine, zinc.

Purpose of the study: scientific justification of reproduction of products prepared on the basis of technology of processing of melon fruit in the conditions of the Republic of Karakalpakstan.

Research objectives: to investigate the cultivation and ripening periods of melon varieties suitable for storage and processing of crops in zone conditions; to determine the consistency and biochemical composition of the fruit flesh of local melon varieties; improvement of methods of storage and drying of fruits;

The following are the **scientific novelty** of the researches: for the first time, samples of varieties suitable for storage and processing were allocated from the melon collection; the density and biochemical composition of the fruit flesh of local melon varieties were determined; -the methods used in the preparation of beeswax from melon fruits have been improved; the economic efficiency of processed ishlangan products was determined; -the types of technology for processing melon fruits are improved and introduced into farmer farms.

Researchs on the determination of the specificity of melon varieties. Seeds of melons, which gave low figures in 2018 year, were not sown in 2018 year, and newly brought seeds were sown. The yield of the melon varieties under study was observed to be different in terms of varieties. In melon varieties such as OltinVodiy and Qora gulobi, Mestnaya (212), Saxovat, higher yield in 2017 year compared to other varieties, and in 2018 Qora gulobi, OltinVodiy, Saxovat varieties gave good indicators on productivity (Table 1).

In the experiments, it was studied that the fruit weight of melon varieties varies over time, the amount in the blood, the soluble dry matter and long-term storage. These signs are of great importance in the cultivation of melon intended for export.

Among melon varieties, sugar content in the Kara asani variety was 12,5%, the amount of soluble dry matter was 15,5%, the weight lost on 52 day was 630 Gramm. It turned out that the indicators of the economic indicators of the Oldinvodiy, Zargulobi, AFX-36068 and Saxovat varieties are higher than those of other varieties.

From the varieties studied during the experiments, 5 pieces of melon were selected to be sent to the laboratory for the purpose of studying the density, appearance, color, shape and biochemical composition of the fruits. Of the studied varieties, Ak novot variety with a high weight was distinguished (4.2 kg.). The minimum weight was included in the fruits of the following varieties: when the sample K-212 was equal to 1.4 kg, the honey Ohm variety was equal to 1.6 kg. The following varieties with respect to the meat Fortress had high indicators: Qorapuchok - 4-5,5 cm, Ak novat 5,0 CM, Zargulobi 4,5 CM.

TABLE 3 INDICATIONS FOR INDUSTRIAL AND BIOCHEMICAL CHARACTERIZATION OF MELON VARIETIES

№	Name of the variety	Fruit weight, kg.			Amount of soluble dry matter, %	The amount of sugar, %	Thickness of meat, CM	Months of storage

19.	Qoragulobi	3,180	2640	540	7,5	6,0	4,0	Stored

The weight, shape, sugar content and soluble dry matter of the varieties of melon crops are of great importance in their salinity properties. Especially important is its soundness in overseas exports. All tested varieties of melons are kept in special conditions in the varieties collection of Karakalpakstan Agricultural Research Institute.

In our experiments, varieties of melons, of which high figures were obtained, were grown under the farmer's Farm Act and poured into storage in special rooms for delivery to peasant farms.

CONCLUSIONS

According to the results of laboratory analysis, the sugar content in the Kizil asani variety of melon was 12,5%, the amount of soluble dry matter was 15,5%, the weight lost on 52 day was 630 Gramm. It turned out that the indicators of the economic indicators of the OltinVodiy, Zargulobi, AFX-36068 and Saxovat varieties are higher than those of other varieties. The yield of melon varieties has changed from 17,1 to 37,3 tons per hectare. The highest (from 26.9-36.8 t/ha and quality (dry matter in the composition from 14.0%, confectionery more than 12.0%) commodity harvest melon summer Toshloqli – 862, Novotkalla, L-152, blue tinni – 1087, transverse lace, white-baker, Samarkand obi novvoti, Lazzatli, OltinVodiy, Saxovat, Tuyona, Ich-kizil, Dilkhush, Ok kovun – 557, Kukcha – 588 varieties were obtained. The thickness of the bark of melons is of great importance in transportation and storage in remote areas. Among the melon varieties, the thickness of the bark was black birch, K-199, 4-5 cm in the varieties of OltinVodiy and Zargulobi.

GROWTH, DEVELOPMENT AND PRODUCTIVITY IN VARIOUS VARIETIES OF ARTICHOKE (*CYNARA SCOLYMUS* L) IN THE CONDITIONS OF THE TASHKENT REGION

Turakulov Alimardon Abdusalomovich*

*Termez branch of the Tashkent State Agrarian University,
UZBEKISTAN

ABSTRACT

*The article presents the results of research on the cultivation of artichoke prickly (*Cynara Scolymus* L.) in the conditions of the Tashkent region. It is established that morphobiological and economically valuable characteristics largely depend on the variety and method of sowing. As shown, in studies in the conditions of the Tashkent region, a reduction in the growing season, an increase in the height of plants and the number of stems, an increase in the average weight and number of inflorescences and yield occurs in the second year of plant life. It was revealed that the potential productivity of artichoke prickly plants in the conditions of the Tashkent region is high. The yield of the Overseas delicacy variety in the second year of life is 38.0 t / ha, in the Maikop 41 variety-41.0 t / ha.*

KEYWORDS: *Signs, Inflorescences, Vegetation Period, Plant Height, Prickly Artichoke, Cynarin, Phenolic Acid.*

INTRODUCTION

The birthplace of the artichoke seed, or prickly, is the Mediterranean, where its ancestor grows - cardon, or Spanish artichoke (*C. cardunculus*). Both species are cultivated as a vegetable, mainly in Southern Europe.

The thickened bases of scales and fleshy florets of young inflorescences are used for food. The juicy bases of the outer leaves of the wrapper, as well as the bottom of the head, contain a lot of carbohydrates and special aromatic substances that give the product a pleasant taste. The fleshy bloom of a young artichoke, when raw, resembles a fresh, unripe walnut.

The healing properties of artichoke have been known since ancient times. Ancient healers used artichoke leaf juice as a diuretic and digestive aid. [4]

Artichoke leaves contain cinarin, phenolic acids (chlorogenic, coffee, etc.), flavonoids, polysaccharides, proteins, trace elements, vitamins; in inflorescences, carbohydrates in the form of polymers with a low molecular weight, called fructooligosaccharides. The inflorescences of artichokes of the annual crop contain: dry matter 15-27%, sugar up to 15, proteins-2.5, ascorbic acid-2-3, 8%, carotene 0.2 mg%. In addition, inulin and the glycoside dinarin can be found in them [2].

Artichokes contain the chemical cynarin, which in most people disrupts the taste sensation, increasing the sensitivity of the papillae of the tongue to sweetness. In addition, it spoils the taste of the wine. Therefore, it is better to drink cold water with artichoke, which at the same time acquires a pleasant sweet taste.

The artichoke flower contains: 2.5-3% protein, 7-15% carbohydrates, 3-11 mg % vitamin C, 0.4 mg% carotene, vitamins A, B 1 and B 2, PP, 86-88% water. Its seeds contain about 30% fat and are used for poultry feed.

The flower also contains: 2.5% nitrogenous substances, 1% sugars, 2% dextrin, 1.3% fiber, polysaccharide, inulin, carotene, vegetable fats, mineral salts (especially a lot of potassium and iron). Moreover, potassium and sodium salts have a significant alkaline property, which makes artichoke useful for people suffering from high acidity of gastric juice. In the fleshy (lower) parts of the scales, the sugar content is higher (2.2%).

Artichoke is used as a forage (for green food and for silage) and an ornamental plant. It can be used as a source of electricity when burning its bio-raw materials.

It is also used for diabetes, liver and kidney diseases. It is useful for the elderly, as it has a complex of medicinal properties. The energy value of artichoke is quite significant – 290 kJ per 100 g of the raw mass of the plant. It is practically free of lead and mercury, even if it grows in soil with a high content of them.

On the basis of artichoke prickly in many countries, a number of medicinal preparations of raw materials have been obtained.

It is also used for diabetes, liver and kidney diseases. It is useful for the elderly, as it has a complex of medicinal properties. The energy value of artichoke is quite significant – 290 kJ per 100 g of the raw mass of the plant. It is practically free of lead and mercury, even if it grows in soil with a high content of them. On the basis of artichoke prickly in many countries, a number of medicines have been obtained [4].

According to the researchers [1] according to the FAO [6] for 2013, the cultivated area of artichoke in the world amounted to 0.131 million hectares, the average yield – 13.72 t / ha, and the volume of gross production reached 1.793 million tons. Major artichoke producers: Italy-0.548 million tons, Egypt-0.391 million tons, Spain-0.200 million tons, Peru-0.113 million tons, Argentina-0.106 million tons [3]. The highest yield was recorded in Argentina (24.93 t / ha), Egypt (24.10 t/ha), Cyprus (20.60 t/ha), Kazakhstan (20.0 t/ha), Peru (19.30 t/ha). The main producer of artichoke in the United States is the state of California.

Material and methods of research. In 2017-2018, in the experimental section of the Tashkent State Agrarian University (Uzbekistan).

The object of research was the varieties Overseas delicacy and Maikop 41. The seeds were sown in February 2017 and 2018 in the open ground. Seedlings were planted in the phase of 5-6 real leaves in the first decade of February. The landing scheme is 100x80 cm. During the growing season, phenological observations, morphological description of plants, and crop accounting were carried out according to the methods [3, 5].

Results and discussion. We found that the natural and climatic conditions of the Tashkent region are the closest to the conditions for growing various varieties of artichoke prickly. Literature data have shown that for the successful development of artichoke prickly requires fertile soils with a predominance of carbonates of alkaline and alkaline earth metals, air temperature in the range of 20-26 °C abundant watering. These conditions favor a high yield of the plant [2].

Phenological observations were made for annual plants in the vegetative phase of growth, two plants in the generative phase. The terms and duration of the phenophases for the generative shoots of the first and second year of the plant's life are given in Table 1.

Despite the different calendar dates of sowing and planting seedlings, later dates of sowing in the open ground, vegetating individuals of the first year of life were compared in development by the end of the growing season. In subsequent years, the method of sowing did not significantly affect the biology of plant development.

Despite the lower germination rate and greater dependence on the meteorological conditions of young plants, when sown in the ground, their greater viability was observed, in comparison with seedlings grown in a greenhouse. There was a significant loss of seedlings when transferred to the open ground - up to 35-42 % in different years. In the first year of life, the plants formed one shortened vegetative shoot in the form of a basal rosette.

TABLE 1 GROWTH AND DEVELOPMENT OF PRICKLY ARTICHOKE IN THE CONDITIONS OF THE TASHKENT REGION (2017-2018)

Variety	Plant height, cm	Number of branches, pcs	Number of inflorescences (baskets), pcs	Weight of the inflorescence (basket) in technical ripeness, g	Plant productivity, kg / plant
First year of life					
Zamorskiydelikates	116	2-2,5	12-30	96-100	1,96-1,98
Maykopskiy 41	119	2,5-3,0	13-28	98-110	1,98-2,05
Second year of life					
Zamorskiydelikates	219	2,5-5,0	38-70	125-128	3,10-3,80

Maykopskiy 41	221	2,6-3,2	20-40	215-218	3,50-4,10
----------------------	-----	---------	-------	---------	-----------

In the second year of life, at the end of March, the sprinkled plants were loosened, and the same agro technical work was carried out that had previously been carried out with seedlings.

In the second year of life, with the beginning of the growing season, the plants resumed the rosette of leaves, and the stem began to grow in height (the stem phase). This phase began from the second half of April to the first decade of May. The active growth of the stem in height continued until the beginning of flowering of the baskets of the first order, after which their height practically did not change. The stemming phase was quickly followed by the budding phase, during which the stem continued to grow.

Mass flowering of artichoke plants of the Overseas Delicacy variety in the first year of life occurs on June 29, and in the second-on May 22. In the second year of life, the onset of this phase occurs 40 days earlier, compared to the first year.

Mass flowering of artichoke plants of the Maikop 41 variety in the first year of life occurs on July 8, and in the second-on May 26. In the second year of life, the onset of this phase occurs 48 days earlier, compared to the first year.

The period from mass germination to the beginning of biological ripeness, depending on the variety, in the first year of life is 238-242 days, and in the second year – 148-157 – is reduced by 94-100 days.

The most significant differences were also in the number of inflorescences (baskets). So, plants of the Overseas Delicacy variety form from 12 to 30 inflorescences in the first year of life, and from 38 to 70 in the second. The number of inflorescences on the plant in the Maikopsky 41 variety is significantly less than in the Overseas Delicacy variety. In the Maikopsky 41 variety, in the first year of life, the plants formed 13-28 inflorescences, and in the second – 20-40. The most important indicator that ultimately determines the yield is the average mass of inflorescences. So, in the variety Overseas delicacy in the first year of life, the average mass of inflorescences in the phase of technical ripeness was 96-100 g, and in the second-125-128 g. These indicators for the Maikopsky 41 variety were 215 and 218 g, respectively. In the second year of life, the plants formed larger inflorescences. Depending on the age of the plants, the yield of artichoke was different. Thus, the productivity of plants of the Overseas Delicacy variety in the first year of life was 1.96-1.98 kg, which in terms of an ideal hectare is 19.6-19.6 t/ha. The same indicators in the second year of life were 3.10-3.80 kg/ha and 31.0-38.0 t/ha, respectively. The productivity of plants of the Maikopsky 41 variety in the first year of life was 2.05 kg, which in terms of an ideal hectare is 20.5 t/ha. In the second year of life, the same indicators were 4.10 kg / rast. and 41.0 t / ha.

CONCLUSIONS

It is established that it is advisable to sow unstratified seeds in the ground in the first half of the ferval. The largest raw material mass (leaves) of the prickly artichoke is in the first and second year of cultivation. After the first year of vegetation, it is necessary to cover the rosettes for the winter period.

It was found that the main part of the biomass of artichoke prickly is made up of basal leaves. The collection of leaves in the autumn period after the fruiting of the baskets for plants of the second year of life provides a yield of up to 410 c / ha.

Recommended dates for collecting artichoke prickly leaves: from plants of the first year of life in the fall; plants of the second life also in the fall, after fruiting the bulk of the baskets.

ABSTRACT

Information and Communication Technology (ICT) is one of India's fastest growing sectors. The Government of India and the State Governments are using ICT to better serve citizens and the industry. The government interacts with citizens and other stake holders through ICT-based services called the e-Governance Portals. E-governance facilities are primarily used in urban areas, and are less popular in rural areas due to lack of proper infrastructure, training, and awareness. With the revelation of mobile technology, smart phones are also reaching remote and rural areas. Governments are trying to effectively implement government services for businesses and citizens by combining mobile and Internet technologies. Highly saturated mobile devices, high-speed broadband technologies such as UMTS (Universal Mobile Telecommunications System) and wireless networks etc. provide various opportunities to government administration to better serve citizens. E-Governance is already improving the speed of utility services, but with 24/7 reach and availability of mobile services are directly facilitating to all stakeholders, this can be termed as mobile governance (m-governance). This will allow the government to convert more and more e-governance facilities into m-governance facilities. M-governance has also become a tool for servicing to the last person of society and paying attention to his voice. In this paper, we will elaborate on India's progress towards e-government to e-governance and the move forwards m-governance.

KEYWORDS: *E-Government, E-Governance, M-Governance, G2c, G2b*

INTRODUCTION

The main goal of good governance is to provide more meaningful, timely, reliable and transparent government services. Due to the rapid growth of internet usage in today's era, the government is also changing its way of working from manual to computerization and providing its online service to citizens. Electronic governance refers to the application of information technology (IT) which improves the services provided by the government sector for the benefit of the citizen & businesses. IT is changing rapidly and it is almost essential that the government use IT services efficiently to provide hassle free services to the citizens & businesses. Information and communication technology (ICT) is a versatile tool for the government to bring the public closure to it and it includes all the possible needs of citizens to provide them with the best possible services (Sigdel, 2007). ICT is the best solution for fixing the delays of citizens in obtaining information from the government and is an important tool that helps in giving good governance by the government. E-governance has the ability to govern with transparency and accountability, and to help them reduce the cost of government business operations (Harris, 2000). With the rise in popularity of the Internet, citizens want to access information through government websites. To achieve the goal of e-governance, online services provided by the government to the citizens should be used effectively. The main challenges of e-governance are lack of infrastructure, speed of internet, electricity, low income level, illiteracy etc.

The government can provide e-governance services through mobile devices to alleviate these problems such as lack of infrastructure, internet speed, electricity, low income level, illiteracy. Mobile penetration has increased significantly in recent years in developing countries such as India, and the mobile device offers a variety of features such as Internet access, financial transactions etc. A mobile device is considered a personal device that makes mobile governance (m-governance) more user-friendly and easier to use. The two main factors that impede the implementation of e-governance are the rate of literacy and poor penetration of internet in India. Mobile penetration has increased among rural and urban populations, and the government can redirect the direction of these services. The government may offer government services through computer peripherals or mobile devices. The citizen can use any of these services as per their convenience. India ranks second in worldwide mobile penetration (Wikipedia) and according to a report by the Telecom Regulatory Authority of India (TRAI, 2020), India has total 1173.75 million wireless subscribers at the end of September, 2019. The Government of India can use mobile penetration with the ability to reach more people in urban and rural areas that provide government services through mobile applications. M-governance is an alternative way to provide a variety of services to citizens as well as businesses.

The Government of India is developing more mobile applications on various mobile operating systems to make the service available to all citizens. Mobile devices, small portable devices, and wireless networks provide a platform for providing government services to citizens, called m-governance. This can be considered as the use of all types of wireless and mobile technologies, services, applications, and devices to better serve citizens, businesses, and all government agencies. Governments can use mobile devices as tools to provide citizens with a variety of government services. Governments can provide services on the streets, people's homes, or other convenient locations, rather than citizens visiting government offices or logging in to e-

government portals to access these services. The main success factors for m-governance are convenience, availability, and an easy-to-use interface. Convenience means that citizens can benefit from all government services 24 hours a day, 7 days without having to line up in front of government offices. Clients do not need to purchase technology or devices to use government services. He has access to all services on his mobile device. Mobile devices are considered personal devices and do not require any special skills or training to use mobile governance. Implementing mobile governance does not require additional costs to purchase technologies, devices, or infrastructure such as e-governance. Citizens can benefit from these services via mobile devices.

To implement mobile governance, the government must create an easy-to-use application that a citizen can use to receive government services on their mobile phone. He does not need to acquire any special skills or knowledge to use these services. The mobile control can also be viewed as an alternative channel for electronic control. To bring government closer to its citizens, government agencies can use e-governance and m-governance at the same time. For the fast and efficient provision of public services to the rural population, mobile devices are a better channel than computers, as the mobile penetration rate is very high even in the rural population. E-governance has already improved to speed up the delivery of utilities, but mobile services, with their 24/7 functionality, can facilitate the mobile government's direct contact with citizens as well as businesses.

LITERATURE REVIEW

ICT are an essential part of development strategies in both developing and developed countries. It has great potential to bring about the desired social change by increasing access to people, services, information and other technologies (Dutton et al., 2004). The use of ICT in management processes can be divided into two categories, namely improving government processes and, secondly, building up interaction with and within civil society. Examples of the first category are the diffusion of grievance mechanisms for public information, utility bills and billing services (Mitra and Gupta, 2003). With the further development of ICT, e-government contributes to solving the everyday problems of citizens effectively and efficiently and to reducing costs, time and skills considerably.

Cao and Che (2007) discussed that ICT has been recognized as one of the major torrent products for the telecommunications industry and is used in many fields, such as government, automotive, health and some others. After analysis, they will give some suggestions to the government and telecom operators. Kalsi et al. (2009), this article examines the need for a revolution from traditional governance to electronic governance. Furthermore, it tries to identify the right path for governance. They also focused on the use of e-governance for citizens and the benefits that accrue from it. The result is that the developing country and governance require a joint union between the various major players in the society.

Ghosh (2011) this research presents a brief review of inventive ICT projects for rural development and to what extent they have contributed. The second objective is to deliberate on the achievements and failures of ICT in demonstrating sustainable development. Sharma et al. (2011) in this paper, they study the desirability of e-governance for government enterprises and Indian citizens. They also say that today is the era of electronic communication. Governments around the world are using electronic communications, namely, e-governance, which is used to

control public and private activities in which India is one of them. They explored the areas that benefited from the e-governance approach and who is not benefiting from it at all and what are the reasons behind it that point out the challenges facing e-governance that reduce its usefulness. Padmapriya (2013) focuses on the initiatives taken by India, methods of preparation and delivery of electronic government services, inter-sector cooperation and service delivery and key factors necessary for the successful implementation and ensuring of e-governance. Studied for Study of Mittal and Kaur (2013) the emergence of Information and Communication Technology (ICT) has provided faster and better communication, data retrieval and information usage for its customers. E-Governance primarily applied ICT to provide government services to citizens through the Internet. They highlight the major challenges facing the implementation of e-governance in India.

Srivastava (2015) this paper addresses the challenges facing the implementation of e-governance in rural India, the various e-governance projects undertaken by the government and the government for the successful implementation of e-governance in rural India. Dhillon and Laxmi (2015) say that the author has helped governments and people in the field of ICT. People are able to use the services provided by governments without any difficulty.

E-GOVERNMENT

Using information technology and new business processes to transform government interaction with citizens and businesses - that's e-government. This refers to the use by government agencies of information technology (such as wide area networks, the internet and mobile computing), which have the potential to transform relationships with citizens, businesses and other governments, as World Bank defines. E-government is expected to reduce corruption, increase transparency, improve convenience, increase revenues and reduce costs. The prerequisites for e-government are (a) good functioning of government, (b) functionality of governance processes, (c) availability of infrastructure & resources, (d) consensus on the driving forces of e-government, and (e) strong political will, support and leadership. Government stakeholders include citizens, businesses, government officials, ministries, departments and agencies, labour leaders, community leaders, politicians and foreign investors etc. Governments are the social superstructure of policies formation, implementations of policies and programs. The components of e-government are:

i) Electronic delivery of services

Governments can request, inform and interact with the public through electronic networks. Since people started to use the Internet for leisure and business, governments have gradually shifted their services to electronic platforms. Despite its cost-effectiveness, the problem with this solution was the 'digital divide'. The expectations were as follows:

- Access of the all personal data of those persons that stored in public databases. For now, this is limited by security, privacy and confidentiality reasons.
- Anyone has access to all official documents of all kinds. Storage and retrieval costs are currently prohibited, and there are security, privacy and confidentiality concerns also.
- Information architecture that allows one-stop shopping for all information from all governments in a simple thematic directory. There is also a lack of cost to integrate, index

and search this information, and there is no known technique.

ii) Electronic workflows

There are some user-friendly templates that are currently designed and deployed throughout the government intranet. There should be a standard set for all types of transactions in every government department and agency. Like "business rules", there is the ability to develop "administrative rules" that will regulate information processing and decision making. The key issues in this area are security, privacy and confidentiality. Effective policy analysis and program design using comparative data should be based on evidence. Most additional improvements in policy analysis, program design, and service deployment will come from automated data processing and integrated data repositories.

iii) Electronic voting

Electronic voting machine (EVM) system is working very well in India. In developed countries, security, privacy and confidentiality concerns may be this is more difficult than in other electronic interactions. An elected official in the United States was once unaware of claiming that he knew that every member of his constituency voted, and to prove that his name is on the street after the results! Whether genuine or simply high-profile, this is a fundamental fear of many voters, the reason being that the official went on to explain that he spared no effort to reward his supporters and punish those who did not vote. If candidates are suspected of being able to access the electronic voting record, it is unlikely that voters will trust the process enough to agree to use it. The challenge of any proposal to increase electronic voting is to create sufficient public confidence in the security of the results record.

iv) Electronic productivity

The foundation of e-government is better operations at lower cost, that is, productivity. Despite the predictions of Marxists and anarchists, there seems to be no prospect of the "state withering away" in the foreseeable future. The social need to guarantee public health and safety, national security and the fight against crime, economic prosperity and environmental sustainability, will guarantee the presence of governments and their active participation in our lives, either visibly or "behind the scenes". Spending efficiency should be the goal.

E- GOVERNANCE

Electronic governance refers to the use of information and communication technologies to transform and support the processes and structures of a governance system. It is the use of information technology by government agencies to improve and transform relationships with citizens, businesses, and other departments of government. E-governance involves making and implementing decisions, providing appropriate leadership, making organizational arrangements, securing resources and funding, establishing accountability, and measuring success. Infrastructure needs include telecommunications networks, internal agency systems, intergovernmental systems, service delivery networks: access points, Internet access, and trained personnel. The expected results are better delivery of government services to citizens, better interaction with business and industry, empowerment of citizens through access to information, and more effective government management. The overall benefits are greater transparency,

greater convenience, less corruption, higher revenue and lower running costs. Scope of e-Governance is as follows...

- **Electronic Delivery of Service (G2C):** Delivering information and services and transacting electronically to citizens.
- **Government to Business Transactions (G2B):** Delivering information, services and transacting electronically with businesses including government procurement and infrastructure projects.
- **Government to Government Administration (G2G):** Improving the efficiency, effectiveness and transparency of departmental and inter-departmental interactions within government, with state governments and with government employees.
- **Foreign Trade (G2X):** Allow electronic transactions in foreign trade that include exchange of capital, goods, and services across international borders or territories.

Governance is the societal synthesis of development, changes in politics, implementation of policies, and programs. The components are as follows,

i) Possibilities of electronic participation

The potential for people to participate in the policy process through electronic networks ranges from sending e-mails to elected officials to creating a separate conferencing facility (mail store, document repository, chat rooms, etc.) for each major policy initiative (new policy, or change to existing policy). There are a few examples of globally understood, inclusive, and a mix of each of these elements that you can imagine, although full electronic communications are still not very common. It will outline more effective methods that can be used to shape future efforts. The Organization for Economic Cooperation and Development (OECD) has made a similar proposal. The five stages of OECD policy-making paradigm will guided to policy-makers that are- agenda setting, analysis, formulation, implementation and monitoring.

i) Electronic consultation

This refers to the interaction between public servants and citizens and interest groups, liaison between public service and interest groups. But recent developments have combined to create something extraordinary: (1) Ordinary citizens now have the ability to participate in regulation. And (2) E-consultation in medical field brought revolution. These are some good examples of e-consultation, but there is no clear guidance on how to make better use of electronic media in general government negotiations & services. As a solution, the government is trying to propose an e-consultation toolkit and mandatory guidance for central government departments.

iii) Electronic control

There are two aspects to successful control, which are optimized and integrated to achieve all the benefits, hardware configuration and software customization. For the comptroller to be effective, all the information and telematics hardware must be interconnectable in a single system. The capacity must also be certified. The employee's email mailbox must have the same storage space; All Internet connections must have the same baud rate, and attachments must have the same byte limit in all sizes. Electronic technologies are playing an important role in shaping the mindset of citizens and they want that mindset to be reflected in social governance. Governance software

must also be standardized. Another aspect of software design that requires standardization to complete controls is the use of Extensible Markup Language (XML) for file formats and document layouts. It is used on the Internet and can be included in any software application.

iv) Social networking guidance

The foremost & important question of political analysis is who watches the watchers, who govern the governors. Part of answering this question is the concept of devolution between government branches and jurisdictions within the country. Those who compete for power look to each other to keep everyone honest or to expose rivals' illegal practices. With the rise of mass media, all the news has travelled from mouth to mouth to more quickly and thoroughly informs people's opinions about such violations. Recently, the Internet has become the fastest vehicle for such revelations.

HISTORY OF E-GOVERNANCE IN INDIA

The history of e-governance in India dates back to 1970. In 1970, given the growing importance of electronics, the Government of India established the Department of Electronics. Establishment of the National Informatics Centre (NIC) in 1977 was the subsequent & first important step towards starting of e-governance in India as it focused on "information" and its communication. However, the primary emphasis for e-governance was initiated in 1987 by the NICNET-National Informatics Centre NETwork – NIC network. This was consequent by the starting of the District Information System of the National Informatics Centre (DISNIC) to connect all the district offices in the country through computer network, for which the state governments were offered free hardware and software. By 1990, NICNET was extended to all district headquarters through state capitals. These steps by the Government of India helped to revolutionize e-governance in India. The results of these initiatives can be seen nowadays when we can sit in our living room and register for any government scheme or program. We are a push button for any benefit provided by government schemes or programs. Due to the mobile-friendly nature of the websites, people living in remote areas can also access these services. This is a turning point in governance. Not only services and benefits, but also information is provided. This makes it important and legitimate. We can make up our minds about the government by searching the information provided on government websites and if there is a problem with the content they use, we can easily report it. These days, great care is taken in the feedback of the customer or client. There is still room for improvement. This is now also possible through e-governance, where anyone can provide feedback to the government through online portals, as the government communicates with them.

The Akshay Project was Kerala's first as well as India's first mass e-governance program. This was a district-by-district electronic literacy program aimed at "empowering Kerala." The project involves setting up of nearly 5000 multipurpose community technology centres in Kerala under the name of called Akshaya e-Kendra's. Run by private business people, each center set up at a distance of 2-3 km. The project emphasizes the role of private players in e-governance in India. This helps to make the work of the government transparent and accountable for its work.

E-GOVERNANCE INITIATIVES IN INDIA

Now India has taken a big step towards e-governance program. We have this service in almost all industries. India has shown the world that there is a difference of opinion against it. There are

many programs and programs that are entirely Internet-based and have pioneered the advancement of e-governance, such as:

- Aadhar Enable Payable System (AEPS)
- Digital Cloud For Every Indian
- Digital India Programme
- E-Biz
- E-Courts
- E-Kranti Scheme
- Mobile Seva
- My Governance
- MyGov Citizen Portal

All these programs and initiatives have improved the pace of government. Technology makes it easy and fast, saves lots of time and money. This not only improves transparency, but also accountability, convenience, improved customer service and improved access to information.

E-Government Development Index (EGDI)

The UN E-Government Survey which includes E-Government Development Index (EGDI) reflects the state of e-government development of UN member states. In addition to assessing a country's website development patterns, the e-Government Development Index includes access characteristics such as infrastructure and educational levels, to reflect how a country uses information technologies to facilitate access and integration of its population. EGDI is a global initiative that encompasses three pillars of governance, namely online service delivery, telecommunications connectivity and human capacity.

The survey also highlighted the fact that countries with a population of more than 100 million have made tremendous progress and recorded their efforts to provide e-governance services to their people despite the various challenges they face. Regarding the latest growth in e-government services shown in **Table-1**, India has recorded a decrease of 04 points from the year (Rank 96) 2018 to (Rank 100) 2020. The government and citizens must share the 04 point retrogression fall in the index tally. India has emerged to show its potential in e-governance with increased potential in ICT. The government has taken positive steps to provide valuable and objective information through ICT. Information technology (IT) is the greatest strength of India. While we have highly disciplined wizards in the ICT fields, the purpose and goals of providing simple, effective and accurate services to the public but it hampered due to lack of adequate infrastructure, lack of literacy, poverty, political instability, and high level of corruption, etc. With all these setbacks, India has made undeniable progress in socio-economic context and this further encourages India to do all things through ICT which called impossible.

TABLE 1: E-GOVERNMENT DEVELOPMENT IN LARGEST POPULATION COUNTRIES

Country	E-Government development Index		World E-Government development ranking		Population (in millions)
	2020	2018	2020	2018	
United States of America	0.9297	0.8769	9	11	329
Russian Federation	0.8244	0.7969	36	32	141
China	0.7948	0.6811	45	65	1,394
Brazil	0.7677	0.7327	54	44	211
Mexico	0.7291	0.6818	61	64	128

M-GOVERNANCE

Kushchu and Kuscu (2004) who define m-government as “strategy and its implementation involving the utilization of all kinds of wireless and mobile technology, services, applications and devices for improving benefits to the parties involved in e-government including citizens, businesses and all government units”. Mobile interfaces can be used to bridge the gap between e-governance processes and the government sector. Mobile communications allow governments to operate especially in rural areas with guaranteed results and also helps to reach citizens faster (Hellstrom, 2009). With M-governance services, the government needs to provide services universally to all mobile users but should not force to the citizen to upgrade for new mobile devices to avail m-governance services (Rannu, 2004).

Kaur (2010) advocates that MANETS has potential of continuous connectivity and high transmission quality so that the implementation of MANETS along with 4G in parallel with m-governance projects in India will more useful. Hellström(2011) studied mobile governance initiatives in East Africa and proposed a course of actions to the success of M-governance. The important point is that M-governance services need to provide direct value to end users, and they need to be well marketed and promoted so that everyone can recognize them, and these services are more It needs to be transparent and accountable and build trust in the public. Poblet(2011) says that M-governance could open new avenues for public participation and political debate. Although he focuses on new challenges such as technical options, target population, ease of use, project scalability, implementation costs, and privacy issues. Kumar (2016) critically analyzed the mobile services project initiated by the Department of Electronic Information Technology (DeitY) of India. It is a cloud-based platform for all government sectors and institutions in the country through various channels. Success factors include a national policy framework for m-governance, implementation team accountability, departmental implementation ease, portal effectiveness, performance reliability, transparency, and participatory design. The challenges

identified are lack of technical knowledge and qualified resources within the government departments, infrastructure support, lack of understanding of the project, lack of understanding of the departments, and face-to-face interactions.

M-governance can be defined as a strategy for implementing e-governance initiatives & services, which includes the use of all types of wireless and mobile technologies, services, applications, and devices. This will improve the interests of people involved in e-governance, including citizens, businesses and all government agencies. For example, the following table shows m-Governance applications in different areas for providing multiple services.

M-Governance Initiatives in India

The Department of Electronic Information Technology (DeitY) of India has developed the M-App Store for the deployment and provision of public services via mobile phones. Indian states are developing several mobile apps for m-governance. **Table-2** summarizes these details.

TABLE 2: STATEWISE MOBILE APPLICATIONS

S No.	Service Type (Central/State/UT)	Total No. of Applications	Total No. of Downloads
1	Central Government Service	474	79153218
2	General Application	248	235533
3	Others	48	150726
4	Andhra Pradesh	15	130738
5	Arunachal Pradesh	3	5131
6	Bihar	5	25313
7	Chandigarh	3	10004
8	Chhattisgarh	2	18979
9	Delhi	2	6540
10	Gujarat	2	10480
11	Haryana	5	18350
12	Himachal Pradesh	15	27763
13	Jharkhand	5	162360
14	Karnataka	3	38368
15	Kerala	4	9295
16	Madhya Pradesh	7	40364
17	Maharashtra	22	108243
18	Manipur	6	8722
19	Meghalaya	5	6286
20	Nagaland	1	2248
21	Odisha	5	7374
22	Punjab	18	125657
23	Rajasthan	14	105850
24	Sikkim	13	19920
25	Uttar Pradesh	3	183859
26	West Bengal	14	26662
Grand Total		942	80637983

Source: <https://www.mgov.gov.in/> (Access date 25-11-2020)

As shown in the above table at present total 942 various mobile applications are available for citizens as well as for businesses. The total number of downloads clearly shows the popularity of these mobile applications among the stakeholders.

CONCLUSION

Socio-economic factors such as income, education, age, gender, language differences, lack of infrastructure, and lack of public awareness are major obstructs for successful e-governance implementation. Governments take different directions to implement government services, from e-Forms to mobile apps. Mobile device “always-on” technology enables mobile devices to receive, send, and access a variety of information and services in real time. Governments are using mobile devices as tools to provide services to citizens with a variety of government services. Governments are providing more and more services through m-governance on the streets, people's homes, or other convenient locations, rather than citizens visiting government offices or logging in to e-government portals to access these services. Due to the accessibility of mobile devices, m-governance is more useful and important than e-governance. Mobile penetration is so high even among rural people that mobile devices are better channel than computers to provide government services to rural population in a fast and efficient way. M-governance also be seems as an alternative channel for e-governance. To create a more citizen-friendly government, government authorities are using e-governance and m-governance at the same time.

ABSTRACT

In the work given the analysis of "narrow spaces" of the enterprise of the Shurtan Gas-Chemical Complex and ways of their elimination. As well as process, the technology of obtaining polymer granules at the LLC "Shurtan gas-chemical complex" have been presented. The gas chemical industry is important in the southern region of Uzbekistan. The main products, such as Polyethylene granules, produced by LLC "Shurtan gas-chemical complex" are exported and also used within the republic for the production of various types of products. The wide applicability, as well as the purposefulness of the products of Shurtan Gas-Chemical Complex LLC, ensures the sustainable and effective development of various sectors of the economy of Uzbekistan. Serves as a kind of catalyst for the introduction of completely new types of products and technologies.

KEYWORDS: Gas, chemicals, Polyethene, granule, Pressure, Polypropylene, Polymerization, Dimethyl sulfoxide.

INTRODUCTION

The gas chemical industry is important in the southern region of Uzbekistan. The main products, such as Polyethylene granules, produced by LLC “Shurtan gas-chemical complex” are exported and also used within the republic for the production of various types of products.

The wide applicability, as well as the purposefulness of the products of Shurtan Gas-Chemical Complex LLC, ensures the sustainable and effective development of various sectors of the economy of Uzbekistan. Serves as a kind of catalyst for the introduction of completely new types of products and technologies [1-9] It makes it possible to actively develop small and medium-sized businesses, as well as increase export suitability in the republic.

MATERIALS AND METHODS

In industry, high-pressure polyethene is obtained by free-radical polymerization of ethylene at a temperature of 200-280 °C and a pressure of 150-300 MPa. The resulting polyethene has the lowest density of 918 - 930 kg / m³. Getting LDPE is a large-scale production. Polyethene is used for the manufacture of technical products, films, products for agriculture, as well as the manufacture of pipes for cold water [1-4].

The operating LDPE unit produces high-pressure polyethene grade 15303-003. The maximum ethylene conversion is 20.7%. To improve the existing installation, it is proposed to reconstruct the reactor unit, as well as to use additional initiators of the reaction. The operating industrial reactor is a tubular tube-in-tube reactor of piston action, divided into 2 zones, with a single additional input of a cold stream of a mixture of initial reagents. Oxygen is used as the initiator of the reaction on the analogue. A schematic diagram of the flows of an operating reactor is shown in Fig. 1.

Figure: 1 - Schematic flow diagram of an operating reactor

The construction of additional production facilities will ensure the economic development of the region. An analysis of the bottlenecks of the Shurtan Gas Chemical Complex (SHGHK) was carried out. The focus is on four key units: CHFU, AOP, pyrolysis and polymerization. The main drawback in the CHFU unit was revealed that the required amount of reflux is not created in the ethane column, as a result of which a very fuzzy separation of ethane from the ethane-propane fraction occurs. This, in turn, leads to large losses of ethane with the gas leaving the reflux tank. For greater efficiency of the column, we propose to provide additionally cooled reflux to irrigate the top of the column during the deethanization process. As the reflux temperature for reflux and the top temperature decrease, the ethane content in the liquid on the trays in the reinforcing part

of the deethanizer column gradually increases, and the propane content in the deethanization gases gradually decreases [2-11]. With a decrease in the reflux temperature and the top temperature, the amount of additionally cooled reflux for refluxing the top also decreases, due to which the amount of vapour and liquid in the column also decreases, which makes it possible to increase the feed performance [12-19].

RESULT AND DISCUSSION

When analyzing the AOP plant, the main risk factor was represented by the large flow of raw materials. The installation requires high energy consumption for the process of regeneration of the water-methanol mixture due to a large amount of water and the need for deep regeneration to low residual methanol content in the water.

The solution to the problem is to supply the unit with a mixer for water injection, which will allow organizing the extraction of methanol from the propane fraction stream. The connection of the mixture supply line with the mixer will allow, in the case of a high concentration of methanol in the initial mixture, to reduce it before feeding it to the separation column. Thanks to this, a deep purification of propane from methanol and a decrease in specific energy costs are achieved. To increase the turnaround time, we propose to install a degasser to purify propane from impurities that accumulate and can lead to disruption of the technological process. To increase the driving force of the process, reduced pressure is required, which is created by a throttle installed in front of the degasser.

The pyrolysis unit undergoes frequent decoking processes, which negatively affects the condition of the furnace equipment and the quenching evaporator. Coke deposits significantly impede heat transfer and increase the pressure drop in the pyro tubes. Reduces the reaction zone, thereby reducing product yield. Also, diffusion of carbon atoms from the coke into the wall leads to embrittlement of the metal and the subsequent formation of cracks in the coils. The resulting coke deposits have to be removed periodically. Usually, they are burned out with a steam-air mixture passed through a heated coil; however, damage to the coils is possible due to local overheating due to the high heat of combustion of coke in oxygen. Frequent decoking processes result in reduced productivity, reduced service life and increased operating costs. To increase the turnaround time and ensure an uninterrupted supply of raw materials, we propose the addition of an inhibitor, namely dimethyl sulfoxide (DMSO) [3-7]. It reduces coke formation by 75% and increases the yield of ethylene. DMSO is a by-product of the pulp and paper industry, its involvement as an inhibitor increases the total economic efficiency of production [3-5].

The solution to the problem is to supply the unit with a mixer for water injection, which will allow organizing the extraction of methanol from the propane fraction stream. The connection of the mixture supply line with the mixer will allow, in the case of a high concentration of methanol in the initial mixture, to reduce it before feeding it to the separation column. Thanks to this, a deep purification of propane from methanol and a decrease in specific energy costs are achieved. To increase the turnaround time, we propose to install a degasser to purify propane from impurities that accumulate and can lead to disruption of the technological process. To increase the driving force of the process, reduced pressure is required, which is created by a throttle installed in front of the degasser [19-24].

The pyrolysis unit undergoes frequent decoking processes, which negatively affects the condition of the furnace equipment and the quenching evaporator. Coke deposits significantly impede heat

transfer and increase the pressure drop in the pyro tubes. Reduces the reaction zone, thereby reducing product yield, In addition, diffusion of carbon atoms from the coke into the wall leads to embrittlement of the metal and the subsequent formation of cracks in the coils. The resulting coke deposits have to be removed periodically. Usually, they are burned out with a steam-air mixture passed through a heated coil; however, damage to the coils is possible due to local overheating due to the high heat of combustion of coke in oxygen.

Frequent decoking processes result in reduced productivity, reduced service life and increased operating costs. To increase the turnaround time and ensure an uninterrupted supply of raw materials, we propose the addition of an inhibitor, namely dimethyl sulfoxide (DMSO) [3]. It reduces coke formation by 75% and increases the yield of ethylene. DMSO is a by-product of the pulp and paper industry, its involvement as an inhibitor increases the total economic efficiency of production [3].

In polymerization units, it is proposed to increase their efficiency and turnaround time. The Ziegler catalyst has a low performance and is highly corrosive to equipment due to its active chlorine content. As a result, it was decided to replace the second or third generation Ziegler-Natta catalyst with a modern fourth-generation titanium-magnesium catalyst (TMK), use trimethylaluminum as a cocatalyst, and methylcyclohexyldimethoxysilane as a stereoregularity additive.

This replacement leads to an improvement in technical and economic indicators. This will allow improving consumer properties and expanding the branded range of products, improving environmental performance. When using TMC from propylene, up to 40 kilograms of polypropylene per gram of catalyst is obtained, while when using traditional catalysts, no more than 4–5 kg.

CONCLUSION

The problem of creating domestic technologies in the field of gas chemistry is urgent. The demand for petrochemical products will grow every year. Petrochemical clusters are important strategic targets for the development of the country's economy. The modernization of the existing production leads to an increase in the production capacity of Uzbekistan.

ACKNOWLEDGEMENT

Authors acknowledge the immense help received from the scholars whose articles are cited and included in references to this manuscript. The authors are also grateful to authors/editors/publishers of all those articles, journals and books from where the literature for this article has been reviewed and discussed.

ABSTRACT

The article discusses the definition of pressure on the plunger during the operation of oil wells with deep pumps. The resulting formulas are of interest, both for calculated purposes and to substantiate the methods of experimental research. Determination of the pressure on the plunger is of interest both for design purposes for the design and operation of oil wells and for substantiating the experimental research methodology. In the mathematical modelling of the process, generally accepted assumptions are used regarding the fluid and its motion.

KEYWORDS: *Pre-image and Laplace transform, Oil wells, Pressure on a plunger, Velocity liquid.*

INTRODUCTION

During the operation of oil wells with downhole pumps with a hydraulic seal, due to the variability of the plunger speed, the movement of fluid in the gap between the plunger and the cylinder of the downhole pump is unsteady, which is reflected in the total pressure on the plunger and on the fluid leakage through the gap.

Relevance and Problem Statement Determination of the pressure on the plunger is of interest both for design purposes for the design and operation of oil wells and for substantiating the experimental research methodology. In the mathematical modelling of the process, generally accepted assumptions are used regarding the fluid and its motion [1,2,3]. During pumping, the change in pressure on the plunger is due to the inertia of the liquid and the total pressure on the plunger will be:

$$p(t) = \Delta p(t) + (L - h)\gamma + p_0, \quad (1)$$

Where $\Delta p(t)$ – pressure loss during unsteady movement of a viscous fluid in an annular riser pipe; p_0 – wellhead pressure; L – the height of the liquid column being lifted; h – immersion depth of the deep-well pump; γ – the specific gravity of the liquid. In the practice of operating oil wells with deep pumps $\alpha = r_2 / R > 0.2$ [1, 2] for such a case, the radial gap between the pipe and the rod column can be considered as a flat pipe [3]. In a non-stationary laminar flow of a viscous fluid in a lifting tube, the velocity of the fluid can be determined from the equation

$$\rho \frac{\partial v}{\partial t} = \mu \frac{\partial^2 v}{\partial y^2} + \frac{\Delta p}{L}, \quad (0 < y < l), \quad (2)$$

$$\begin{aligned} v(y, 0) &= 0, \quad (0 \leq y \leq l); \\ v(0, t) &= v_0(t), \quad v(l, t) = 0, \quad (0 \leq t \leq T), \end{aligned} \quad (3)$$

Where ρ, μ – density and dynamic viscosity of the liquid; T – the period of one cycle of plunger movement; r_2 – radius of the rod; R – lifting tube radius; $l = R - r_2$. Equation is used to define $\Delta p(t)$

$$Q = \pi(r_1^2 - r_2^2)v_0(t) = 2\pi \int_0^l (y + r_2)v(y, t)dt, \quad (4)$$

Where r_1 – plunger radius, Q – fluid consumption Relations (2) - (4) expresses the mathematical model of the process under study;

METHODS

We introduce the following new dimensionless quantities

$$\bar{t} = \frac{t}{t_x}, \quad x = \frac{y}{l}, \quad \bar{v}(\bar{t}) = \frac{v(t)}{v_c}, \quad \bar{v}_0(\bar{t}) = \frac{v_0(t)}{v_c}, \quad \bar{q}(\bar{t}) = \frac{l^2}{\mu v_c} \frac{\Delta p}{L},$$

$$\bar{T} = \frac{T}{t_x}, \quad v_c - \text{the average speed of the suspension point of the rods, } t_x = \rho l^2 / \mu.$$

Then, in dimensionless variables, we have the equation

$$\frac{\partial \bar{v}}{\partial \bar{t}} = \frac{\partial^2 \bar{v}}{\partial x^2} + \bar{q}(\bar{t}), \quad (0 < x < 1) \quad (5)$$

Boundary conditions (3) and balance ratio (4) take the form:

$$\begin{aligned} \bar{v}(x, 0) &= 0, \quad (0 \leq x \leq 1); \\ \bar{v}(0, \bar{t}) &= \bar{v}_0(\bar{t}), \quad \bar{v}(1, \bar{t}) = 0, \quad (\bar{t} > 0). \end{aligned} \quad (6)$$

$$\frac{r_1^2 - r_2^2}{2l^2} \bar{v}_0(\bar{t}) = \int_0^1 \left(x + \frac{r_2}{l}\right) \bar{v}(x, \bar{t}) dx. \quad (7)$$

To solve the problem, applying the integral Laplace transform

$$\tilde{v}(x, s) = \int_0^{+\infty} e^{-st} \bar{v}(x, \bar{t}) d\bar{t}, \quad \tilde{v}_0(s) = \int_0^{+\infty} e^{-st} \bar{v}_0(\bar{t}) d\bar{t}, \quad \tilde{q}(s) = \int_0^{+\infty} e^{-st} \bar{q}(\bar{t}) d\bar{t},$$

$$\text{We get } \tilde{v}(x, s) = \tilde{v}_0(s) \frac{shw(1-x)}{shw} + \frac{\tilde{q}(s)}{s} \cdot \left(1 - \frac{shw(1-x)}{shw} - \frac{shwx}{shw}\right), \quad \text{where } w = \sqrt{s}.$$

Substituting the expression for $\tilde{v}(x, s)$ in the image of the relation (7) we get

$$\tilde{q}(s) = \frac{l}{l+2r_2} \cdot s \tilde{v}_0(s) \cdot f(w), \quad (8)$$

Where

$$f(w) = \frac{\varphi(w)}{\psi(w)}, \quad \varphi(w) = 1 - \frac{shw}{w} + \frac{r_2}{l}(1 - chw) + \frac{r_1^2 - r_2^2}{2l^2} wshw, \quad \psi(w) = 1 - chw + \frac{w}{2} shw.$$

Using the methods of the theory of functions of a complex variable we decompose the function $f(w)$ into a series:

$$f(w) = \frac{4f_0}{w^2} + 4 \sum_{k=1}^{\infty} \left[\frac{1}{w^2 + a_k^2} + \frac{w_k \varphi_k}{\psi_k (w^2 + w_k^2)} \right] = \frac{4f_0}{s} + 4 \sum_{k=1}^{\infty} \left[\frac{1}{s + a_k^2} + \frac{w_k \varphi_k}{\psi_k (s + w_k^2)} \right].$$

Here $w = w_k$ the roots of the equation $\psi(w) = 0$:

- 1) $w = w_k = \pm ia_k = \pm 2k\pi i$, $a_k = 2k\pi$, $k = 1, 2, \dots$;
 - 2) $w = w_k = \pm 2z_k$, $k = 1, 2, \dots$, z_k – Positive roots of the equation $tgz = z$.
- $$f_0 = \frac{3}{l^2} (r_1^2 - r_2^2 - r_2 l) - 1, \quad \psi_k = w_k \cos w_k - \sin w_k,$$

$$\phi_k = 1 - \frac{\sin w_k}{w_k} + \frac{r_2}{l} (1 - \cos w_k) + \frac{r_1^2 - r_2^2}{2l^2} w_k \sin w_k.$$

The original $\Phi(\bar{t})$ corresponding to the $f(w)$ has the form

$$\Phi(\bar{t}) = 4f_0 + 4 \sum_{k=1}^{\infty} \left(e^{-a_k^2 \bar{t}} + \frac{w_k \phi_k}{\psi_k} e^{-w_k^2 \bar{t}} \right). \quad (9)$$

From (8) and (9), using the composition theorem of the operational calculus, we find the formula for: $\bar{q}(\bar{t})$:

$$\bar{q}(\bar{t}) = \frac{l}{l+2r} \cdot \int_0^{\bar{t}} \bar{v}_0'(\tau) \Phi(\tau) d\tau \quad (10)$$

RESULTS AND DISCUSSION

Formula (10) allows you to determine the pressure drop at a given speed of the plunger. Following [1], the speed of movement of the plunger $v_0(t)$ during one cycle of its movement $0 \leq t \leq T$ can be taken as:

$$v_0(t) = \frac{48v_c}{\pi^3} \sum_{n=1}^{\infty} \frac{1}{(2n-1)^3} \sin \frac{2\pi(2n-1)t}{T} \quad (11)$$

The pressure loss in the riser is determined by substituting (10) into the formula $\Delta p(t) = \mu v_c L \bar{q}(\bar{t}) / l^2$, the total pressure is found by the formula (1).

Using the obtained formulas, numerical experiments were performed using the following initial data:

$L - h = 1000 \text{ m}$; $v_c = 0,60 \text{ m/c}$; $T = 20 \text{ c}$, $R = 0,030 \text{ m}$, $r_1 = 0,028 \text{ m}$, $r_2 = 0,010 \text{ m}$, $p_0 = 10^5 \text{ Pa}$. Fig. 1 shows the graphs of the total pressure on the plunger versus time for three types of oil: 1) $\mu = 0.04 \text{ Pa} \cdot \text{c}$, $\rho = 750 \text{ kg/m}^3$; 2) $\mu = 0.07 \text{ Pa} \cdot \text{c}$, $\rho = 800 \text{ kg/m}^3$; 3) $\mu = 0.10 \text{ Pa} \cdot \text{c}$, $\rho = 900 \text{ kg/m}^3$. It can be seen from the graphs that the profiles of the total pressure differ significantly in the initial period and the period of the end of the descent acceleration, as well as at the moment of stopping the plunger.

CONCLUSION

The resulting formulas can be used in the design and operation of oil wells with deep pumps with hydraulic shutters. They allow you to explore the effect of viscosity and oil density for full pressure on the plunger.

ABSTRACT

In the present study, compact melange yarn samples were obtained using a mechanical compact device. The study obtained samples of 800 b / m winding in the combing and snow-spinning systems, with a spinning rate of 14,000 min⁻¹, and a linear density $T = 20$ ($N_e = 30$). The physical and mechanical properties of the obtained yarn samples were compared to those of standard yarn and standard indicators. Comparison of the strength, elasticity and inequality of the compact melange yarn samples obtained in this study was analyzed. The study found that high-quality characteristics of melange yarn obtained by machine-made compact device and melange yarn obtained by re-combing can have the same high quality.

INTRODUCTION

Demand for textile products has always been high in the domestic and global market. There is always a high demand for products that meet the requirements of consumers, have high hygienic, aesthetic and operational properties. The yarns used to make these products should be of high quality. In order to obtain yarns with high-quality performance, several important types of research are being carried out by leading firms to improve the productivity of spinning machines, machine design and yarn quality. Examples of these innovations are the increase in the number of loops on ring spinning machines, the introduction of compact spinning machines and equipment into production, continuous and wasteless spinning. Changes in this appearance are still ongoing in ring spinning machines. In order to further improve the quality of yarn, the designers of spinning machines have recently been actively working on the creation of compact devices that spin the fibre and reduce the hairs on the surface of the yarn.

MATERIALS AND METHODS

Compared to traditional loop yarns, the geometry of the compact yarn has been changed. During the formation of compact yarns, the baking triangle is almost not formed [1, 2]. We can see that the B-width varies in simple and compact ways. In the case of yarn formation in size b , we can see the formation of a baking triangle in ordinary yarns. In compact yarns, the baking triangle is almost lost, as mentioned earlier, and we can see that all the fibres are involved in yarn formation (Fig. 1). In the zone of yarn formation, the fibres become tense at the edges of ordinary yarns. Experts from ROTORCRAFT explained that the fibres in the middle part are less involved in the twist. In ordinary yarns, the tension of the cross-sectional fibres is greater, and the tension of the fibres decreases as they move towards the centre. Given this, because the fibres are of different stresses, the yarn structure is also uneven, with a low resistance to tensile forces. In compact yarns, however, we can see that the fibres are evenly distributed in the cross-section of the yarn. This arrangement of fibres also has a major impact on subsequent stage processes. Normal yarns have low tensile strength and high fluff. These problems have been eliminated in compact yarns.

Figure 1 The basic principle of compact and simple yarns. (I) yarn spun in a simple ring method. (II) yarn spun in a compact manner

Some firms use air-sucking devices when making compact yarns, while some firms recommend mechanical compact yarns. The production of melange yarns also plays an important role in expanding the range and producing competitive products. However, during the dyeing and drying processes of cotton fibre, the curl of the fibres increases. It was noted that after dyeing, the strength of yarns decreased by 1.5-4, elongation by 7.5-11, elasticity by 20-40% compared to undyed yarns [3, 4]. In order to study the possibility of improving the quality of yarn as a result of obtaining melange yarns by compact method, compact devices were analysed and Rotorcraft's RoCoS compact yarn spinning device was selected for the experiment. It has been taken into account that this device has a high convenience with no need for additional power, air duct, electric motor, fan, perforated surface plate or drums. This device is placed on the front cylinder of the ring-spinning machine stretching tool. Its feature is that it has two loading rollers on the front cylinder and a seal that seals the width of the outgoing wool. Note that the sealant touches the cylinder because it is on a fixed magnetic plate. As the two loading rollers cover the front cylinder, the height of the cooking triangle also decreases, resulting in changes in yarn formation [5]. In the experiment, three different melange yarn samples were analyzed. The first example is a traditional melange yarn obtained by the snow method. The second sample is a compact melange yarn obtained using a RoCoS device in the snow method. The third sample is a melange yarn obtained in a re-spinning system. In this experiment, using the same selection cotton variety, Zinser 350 ring spinning machine with linear density $T = 20$ (Ne 30), yarn rotation speed 15000, maturity 800 b/m was obtained. The spinning plan is given in Table 1.

TABLE 1. SPINNING PLAN

№	Machine name Shaving machine DK-903	Linear density, tex		Stretching, E	Number of add	Twisting		Speeds

Uster TESTER4, Zweigle D 314 PRs of physicomachanical properties of the samples were determined and the results were summarized in Table 2. The strength of the thread break is one of the important quality indicators of the thread. Taking into account this, from the results of the experiment obtained, the strength of the thread break was analyzed (Figure 2).

TABLE-2 PHYSICAL-MECHANICAL INDICATORS OF TEKS YARN SAMPLES OF LINEAR DENSITY T= 20 (NE 30), OBTAINED BY THE METHODS OF CARDA TRADITIONAL, CARDA COMPACT AND RE-COMBING.

№	Spinning method	Frequency of rotations $\times 10^3, \text{min}^{-1}$	Practical durability, $K_a, \text{b/m}$	Relative tensile strength of the yarn, (Rkm)	Elongation at break, $\epsilon, (\%)$	Hairy, H, (%)	Inequality in breaking strength, CV, (%)
1	Karda melange	15000	800	14,98	4,12	6,05	10,7
2	Mechanical compact melange in the snow	15000	800	17,84	4,22	4,7	7,8
3	Shaving melange	15000	800	17,41	4,25	5,31	8,2
4	Uster statistics 2013	15000	800	5%- 17,1			5%- 7,1
				50%-14,7			50%-8,8
				95%-12,7			95%-10,9

The elongation strength of the samples taken for the experimental test was examined for compliance with the standard requirements. It was found that the tensile strength of the yarn obtained by the re-spinning method (Fig. 2, 3) was 14% stronger than that of ordinary yarn. Experiments have shown that the tensile strength of the compact melange yarn obtained by the snow method (Fig. 2, 2) is 16% higher than the tensile strength of ordinary factory yarn. It can be seen that the strength of the yarn obtained by the simple snow method (Fig. 2, 1) is the lowest. In determining these indicators, quality indicators were identified and analyzed in the USTER TESTER4 device installed at OSBORN Textile.

Picture-2 Carda melange, Carda mechanical compact melange, the relative tensile strength of re-comb melange threads., (Rkm)

One of the important indicators of yarn quality is fluffiness. With this in mind, the fluff performance of the yarn samples was analyzed (Fig. 3).

Picture-3 The frequency of rotation of the bitch is 15000 m-1, ripeness 800 b/m, the linear density of the thread is 20 (Ne 30) indicators of the fluidity of the Tex threads (%).

1-Garda melange rope; 2-Carda compact melange rope; 3-Re-combed melange thread.

It became known that the compact melange yarn (Figure 3, 2) obtained by the Carda method is 22% thinner than the ordinary melange yarn (Figure 3, 1), and the combed melange yarn (Figure 3, 3) is 12% less tolerant. In the process of spinning, there will be irregularities in the products of each appearance (Holst, pilta, Wick, thread). It can be said that by the length of the product by making the unevenness simpler, the creamy and thin areas can be repeated. In other words, if we take the desired cross-section of the product, the number of fibres in it will be different. If a deeper analysis of the unevenness of the product is made, it can be seen that it is a complex event. Theoretically, when taken, the unevenness of the product is due to the fact that the fibres have the main properties: they are not uniform in length, ripeness, moisture, creamy, friable, curly, and these basic properties deviate from the average arithmetic value. If the resulting thread is uneven, then the gauze from it also turns out uneven. Therefore, it is best to try to take a straight thread first. At the same time, unevenness is formed in the processes of weaving and finishing.

Therefore, it is necessary to try to reduce the unevenness of the product from the first stage to the last stage of processes in the textile enterprise [6,7]. The samples obtained in the experiment were analyzed in the laboratory and a histogram was constructed using computer software to determine the results obtained on the non-precision index. As can be seen in the histogram, it was found that the unevenness of the Carda melange thread (Figure 4, 1) is higher than that of compact melange and re-combed melange threads. The top of the unevenness indicator indicates that the quality of the thread is poor. Here it became known that the uneven index of compact melange yarn (Figure 4, 2) is less than the remaining yarn [8-17]. The uneven indicator of the

melange thread (Figure 4, 3), obtained by the method of re-combing, is close to the indicator of the compact melange thread.

Picture-4 The frequency of rotation of the bitch is 15000 m-1, ripeness is 800 b/m, the density of the Strip is 20 (Ne 30) uneven of textured threads, CV, (%).

1-Carda melange thread; 2 - Carda compact melange thread; 3-Re-combed melange thread.

The properties of the compact, re-combed, and snow melange yarns analyzed in this analysis are important in improving product quality. The product is subjected to repeated bending, bending, stretching, friction during operation. In such processes, the re-spun yarn retains its shape relative to ordinary yarn. Due to the parallel and gypsum arrangement of the fibres in the re-spinning yarn, all the fibres in it are equally involved in the twist, which leads to an improvement in the structure of the yarn. As a result, the elongation resistance of the yarn increases, and in ordinary yarns many fibers are not fully involved in the twist. Therefore, the tensile strength of ordinary yarn is low, and the fluff is higher than that of re-shearing and compact yarns.

CONCLUSION

In conclusion, it was found that the strength of melange yarn obtained in a mechanical compact device is 16% higher than that of factory yarn, compared with the tensile strength of melange yarns obtained by the simple snow method.

The results of the study showed that the strength of traditional melange yarns obtained by the method of re-combing with melange yarn using a mechanical compact device using the simple snow method is equal.

In the experiment, when the roughness values were compared, it was found that the roughness of the yarn obtained in a mechanical compact spinning machine was less than that of ordinary and re-spun yarns. Experiments have shown that melange yarns obtained in a mechanical compact device have a high potential for the production of competitive products in terms of physical and mechanical performance, good shape, consumer satisfaction and competitiveness.

ABSTRACT

The article analyzes the types of services provided to the population. The article examines the directions and types of services to the population, as well as directions in various spheres of public life in the study of geography. A population is an association of conscious beings who live in a certain area and are fully involved in all spheres of activity. The population participates in production and is a consumer of manufactured products. Therefore, special attention should be paid to public services. It is important to study the structure of their networks. The geography of public services is part of all manufacturing and non-manufacturing sectors. This will improve the state of services and expand their network. Areas of services in the literature are divided into tangible and intangible. All this is aimed at meeting the needs of the population. Improving the social status of the population, such as the formation of medical culture, increasing demand for life expectancy, increasing family income, increasing demand for a better life, the development of recreation, tourism and other cultural consciousness as a product of human needs formed. The services sector, which is the third sector of the economy, includes sectors that are not part of the material production sector. They are divided into areas as follows. These include financial services, insurance, stock exchange, business and professional services, wholesale and retail trade, catering, hotel business, housing and communal services, cultural institutions and public services, etc. lim, health, recreation services.

KEYWORDS: *Geodemography, Geography of material services, Trade, housing and communal services, Transport and communications, Services, consumer services.*

INTRODUCTION

A population is an association of conscious beings who live in a certain area and are fully involved in all spheres of activity. The population participates in production and is a consumer of manufactured products. Therefore, special attention should be paid to public services. It is important to study the structure of their networks.

THE MAIN PART

The geography of public services is part of all manufacturing and non-manufacturing sectors. This will improve the state of services and expand their network. Areas of services in the literature are divided into tangible and intangible. All this is aimed at meeting the needs of the population. Improving the social status of the population, such as the formation of medical culture, increasing demand for life expectancy, increasing family income, increasing demand for a better life, the development of recreation, tourism and other cultural consciousness as a product of human needs formed.

Areas of public services are divided into economic and social groups. If the services in the economic, ie industrial spheres are focused on technical devices and their management, social services will be focused on the needs of the population. In the process of social production, the service sector is of particular importance, as well as the satisfaction of human needs is the most important task and is directly changing in terms of quality and quantity. Consequently, the service sector covers a number of areas. Their territorial organization is characterized primarily by the location of the population, its socio-demographic characteristics. Local authorities are directly responsible for the fact that the service sector is located in a convenient area of the population. This is due to the fact that it is expedient to solve each service area and its problems not in the center, but in the region, which will contribute to the further development of the industry and the convenience of the population. However, today everyone can create a personal service area in their home. For example, it can accommodate hairdressers, beauty salons, markets and other areas.

The issue of territorial organization of public services aroused interest in the field in the 30s and 40s of the twentieth century. In particular, the famous "Central Places" theory was developed by German scientists Walter Kristaller (1893-1969) and August Losch (1906-1945). According to him, the territorial organization of services is determined on the basis of supply and demand, and services are organized in a hierarchical manner. The role of service centers is very important, because the main link for any industry is the center. They, in turn, are divided into network (medical, commercial, etc.) and complex services.

Beginning in the 1970s, the social sphere, especially the service sector, began to be studied geographically. Thus, the development of this industry began to take shape in the 90s of the twentieth century. The first advanced concepts in this field The role of the first meeting of the Geographical Society of the former Soviet Union, held in Moscow in 1974 on the geography of public services, is invaluable. First of all, at the meeting, the results were determined by direct contact with the representatives of various fields, that is, according to the classification of disciplines, it was noted that the geographical responsibility for the regional characteristics and regional organization of the service sector.

The geography of public services began to develop after the 60s of the twentieth century. The contribution of VV Pokshishevsky and SA Kovalev to the formation of this industry is invaluable. This field appeared in the 70's, and its role in the system of sciences and the subject has contributed to the views of several scientists. According to AIAlekseyev, the geography of public services is a unique branch of socio-economic geography, where the needs for services and regional differences in the level of their satisfaction, as well as the natural social, economic, studies issues such as demographic and territorial organization in different forms of population distribution. The essence of the concept of territorial organization of services was first revealed by VV Pokshishevsky, SA Kovalev, YG Saushkin. The territorial organization of YG Saushkin service areas, first of all, their "points" in relation to each other and to the settlements, the location of people in accordance with the direction of daily routine, etc., is the sum of these "points" studied in the sense of fully meeting the needs of the population. At the same time in the scientific study of the social sphere and in particular the sphere of services Abramov MA, Alekseyev AI, Tkachenko AA, Merkusheva L.A., Belenikiy VR, Manak B.A. and other studies.

In Uzbekistan, the study of this field began with the scientific school of A. Soliev. For the first time MI Nazarov conducted a scientific study on the provision of medical services to the population. Later it can be observed in researches of Z.N.Tajiyeva, N.K.Kamilova.

World and Uzbek scientists working in the field of public services: although less work has been done by Uzbek scientists in this field, A. Soliev and M. Nazarov, Z. Tojjeva . M. Bo`rieva, R. Maxamadaliyev, M. Atajonov, L.A. Merkusheva, M.A.Abramov, E.A. Ahmedov, O.A. Saydaminova, R.B. There is research conducted by Kodirov.

According to M. Nazarov and Z. Tojjeva, the service sector is divided into two major sectors. These are: material and spiritual services. At the same time, these services have their own structure.

The structure of public services varies, and the material and spiritual network covers a wide range of areas.

Material services: The system of material services includes financial services (finance, credit, insurance), trade (wholesale, retail), housing and communal services, education, culture, tourism, sports, trade, catering, etc. . . .

Trade (grocery stores, supermarkets, industrial and construction goods stores, various markets), catering (kitchens, cafes, bars, restaurants). Household services (tailoring shoes; shoe repair; tailoring and repair of leather, fur, sewing and hats; tailoring and sewing of knitwear; Repair and maintenance of televisions, radios, tape recorders and radios; repair of refrigerators, vacuum cleaners, washing machines and sewing machines; repair of watches; production and repair of metal products; repair and maintenance of vehicles belonging to citizens; service; repair and maintenance of cars; furniture making and repair; dry cleaning and painting; laundry service; performance of housing and other construction works on the order of the population, etc. construction of houses and repair of houses; construction of general and individual garages; construction works on a contract basis at the expense of citizens; ati; barber shops; photography and film laboratory services; rental accommodation service; gasification, filling, delivery and repair of gas cylinders; transportation of population cargo; delivery of tickets home; cargo storage services; conducting wedding ceremonies; agricultural processing services; ritual services).

Housing and Communal Services: This includes the provision of electricity, natural gas, drinking water and sewerage, which are the most important needs of the population, at the level of everyday life. Medical care is provided to the population in preventive and practical polyclinics.

Transport and communication: communication services include the following services (mail, telegraph, envelope, remittances, money transfer, telegram); telephone service (international and long-distance calls, telephone service in hotels and apartments, telephone exchanges); Transport services include the following services (urban electric transport; road transport; paid transport services to the population), etc.

The services sector, which is the third sector of the economy, includes sectors that are not part of the material production sector. They are divided into areas as follows. These include financial services, insurance, stock exchange, business and professional services, wholesale and retail trade, catering, hotel business, housing and communal services, cultural institutions and public services, etc. lim, health, recreation services. It is also studied in the field of services in accordance with the principles of territoriality and periodicity. The service sector differs from other industries by its geography.

Service is the activity of meeting the needs of customers. The geography of public services is a unique branch of economic and social geography, which differs from the needs for services and regional differences in the level of their satisfaction, as well as the natural social, economic, demographic and studies the issues of territorial organization in different forms of population distribution (Table 1).

THE SHARE OF THE SERVICES SECTOR IN GDP TABLE-1

No	Years	GDP (in bln soums)	Total services, (in bln soums)	To GDP In %	Change tendencies than previous years
1	2011	78764.2	40951.5	51.9	125.0
2	2012	97929.3	51121.1	52.2	124.8

Service area is the area affected by a particular type of service, the condition of which depends on the quality of service.

Tasks of service geography;

- Identify differences between security and usability;
- Regulation, planning the deployment of new service facilities to meet their needs.

The current tasks are to assess the level of development of the service sector in the regions and cities;

- Analysis of consumer behavior and development of a network of market services;
- Optimization of the network of institutions providing budget services at the local level.
- grouping of public services

Based on the above considerations, we can say that the placement of services to the population is primarily influenced by demographic factors. However, the role of natural, socio-economic factors is important. Also, the characteristics of natural conditions are important for recreation, recreation, development of farms. Historical sites are the most important for tourism. However, in the regional location of public services, the transport factor is in the center of attention.

RESEARCH METHODS OF LOCAL LORE

Urinov.B.S*

*NDPI Senior Teacher,
UZBEKISTAN

ABSTRACT

A small area is an administrative district, a collective farm, a small urban area, or a rural area. From the point of view of local lore, events and processes in small areas, accurate data are systematically studied and collected. One of the main features of local lore is that the result of research is not only the state of a place at a certain time, but also the state of its properties and characteristics over many years, as well as the criteria for predicting. Small areas are convenient for observation and inspection, as well as for travel and collection of any information. Whether it is a community or a farm, or a small town or a rural settlement, their properties and characteristics, natural socio-economic conditions, customs and traditions of the population are often associated with the local conditions of the place will be.

KEYWORDS: *Systematically, Socio-Economic, Inspection*

INTRODUCTION

Local lore is a complex of knowledge about one's place of birth and residence, which has existed for a very long time.

Primitive people also knew the nature of their habitats very well, they wrote their simplest knowledge on stones. Much of such paintings have survived to the present day.

With the development of human society, information about the region began to be collected. As a result, written monuments and sources began to emerge. In ancient times and the middle Ages, there were works dedicated to the nature, economy, history and culture of different countries. Information about our country is given in Al-Khwarizmi's book "Kitab-Surat-al Arz"; Our great compatriot Abu Rayhan Al-Beruni in the XI century "India"; "Monuments of ancient peoples"; Zakhridin Muhammad Babur's work "Boburnoma" is a great contribution to local lore.

With the development of science and technology, the scope of local lore became narrower and deeper. By the twentieth century, local lore began to be understood as a place of residence, economy, history and culture. As a result, there are works of local lore dedicated to individual regions, districts and cities. For example, "Khanabad", "Andijan region", "Samarkand region", "Geography of Khorezm" and so on.

Natural and economic maps of each region of Uzbekistan were published. Currently, projects are being developed to create geographical and local history atlases of each region.

The object of local lore is nature, population, economy, history, art and culture. These objects are studied by various disciplines. But the subject of study of all sciences is the same, that is, the region. "Region" is a conditional concept, the scope of which depends on who studies it and for what purpose. For example, for a school, academic lyceum or professional college, the school area can be a neighborhood, village, district, city.

There are the following branches of local lore: natural or geographical local lore, economic local lore, and historical, ethnographic local lore, cultural and artistic local lore.

Natural or geographical local lore is the study of the nature of a region, ie the geological structure, minerals, relief, climate, inland waters, soil, flora and fauna and landscapes of the region.

According to S.V. Kolesnik, local lore is a comprehensive study of a small area. Local lore uses the data of geology, socio-economic, historical and ethnographic sciences in its research.

A small area is an administrative district, a collective farm, a small urban area, or a rural area. From the point of view of local lore, events and processes in small areas, accurate data are systematically studied and collected.

Small areas are convenient for observation and inspection, as well as for travel and collection of any information. Whether it is a community or a farm, or a small town or a rural settlement, their properties and characteristics, natural socio-economic conditions, customs and traditions of the population are often associated with the local conditions of the place. will be. The properties and characteristics of large geographical areas are related to the generality of the properties and characteristics of local areas.

One of the main features of local lore is that the result of research is not only the state of a place at a certain time, but also the state of its properties and characteristics over many years, as well as the criteria for predicting. In this case, the interrelationships and interactions of the components of natural or cultural landscapes in the study area are revealed. As a result, it will be possible to assess the natural, economic, cultural aspects of the place and predict its prospects. It is no coincidence that education and upbringing, love for the motherland begins at the threshold, at home.

The information collected by local historians not only improves the secular outlook of people (schoolchildren), but also greatly contributes to the organization, development and effective placement of socio-economic, cultural, administrative, economic activities. gives (significant).

According to the famous geographer VA Anuchin, in solving any scientific and practical problems, in the creation of specialization in certain territorial units, it is important to take into account local natural and economic conditions from the point of view of local lore.

When studying the country in detail, it is necessary to pay attention to the following;

Interdependence, interdependence, interaction of nature and all its elements (geology, relief, minerals, climate, water, soil, flora, fauna, etc.); the impact of human activities on the development of nature, the occurrence of natural processes, natural phenomena (karst phenomenon, landslides, the growth of river valleys, changes in the riverbed, the growth of cliffs, soil erosion, etc.).

Urban and rural ethnography, toponymy, history of their formation, development;

Interdependence of the natural environment and the economy, economic processes, economic life processes; cultural and spiritual, educational and creative activities of the population (folk art, folklore, architecture, etc.) should be studied from the point of view of local lore.

APPLICATION OF AUTOMATIC CONTROL AND ELECTRICITY MEASUREMENT SYSTEM IN TRACTION POWER SUPPLY SYSTEM

A.B.Abubakirov*; **R.J.Tanatarov****; **T.U.Kurbaniyazov*****; **Sh.B.Kuatova******

^{1,4}Department of Electrical Engineering and Metrology,
Karakalpak State University, UZBEKISTAN
E-mail: aziz1306@mail.ru

ABSTRACT

In that work the methods of organization an automatic control and metering system for electricity (ACMSE) in the traction power supply system of electrified railway transport are presented. We consider the installation of electricity metering devices on an electric rolling stock, similar in their metrological characteristics (accuracy class, minimum interval of reading, etc.). The definition of the level of consumption, specific consumption and unbalance of electricity for the traction of trains is given. Also, consumption of active and reactive electricity, power losses in the traction network, and the magnitude and duration of the regeneration regimes in AC sections are determined. The estimation of the level of power loss in the traction network under various schemes of connection of traction substations (circuits for connecting two-way and one-way power supply of the contact network) is considered.

KEYWORDS: Control, accounting, Traction network, Reactive energy, Alternating current, Block diagram, Functional diagram, Synchronization, Measuring unit.

INTRODUCTION

Today, railway transport is one of the most energy-intensive sectors of the economy of Uzbekistan. Therefore, the cost of energy savings is very high, given the constant growth of the electrified line landfill and the rise in electricity prices.

In this regard, the issue of introducing new technologies comes to the fore:

Firstly, these are technologies for improving electric traction systems, which make it possible to provide both the required load density, and high-speed traffic, and a decrease in energy consumption in operation;

Secondly, it is the implementation of controlled energy consumption, which is directly related to the creation of automated commercial accounting systems and energy-optimal transportation process.

The modes of operation of electric traction systems and external power supply, power flows and power quality, optimization of the power range of traction substations play a significant role in the automatic system for monitoring and metering electricity.

An effective means of reducing electricity bills is a high-tech commercial metering of electricity based on modern high-precision electronic meters, as well as servers and converting modems. This will create a modern 4-level automatic electricity metering system [1].

In general, the commercial metering system allows you to see the real consumption of electric energy in all areas of the railway transport.

Thus, by controlling this process, it is possible not only to significantly reduce the cost of purchased electricity, but also to ensure a decrease in consumption both in operational activities and in traction power supply [2].

To solve the issue of on-line monitoring of the distribution of electricity in the traction power supply system, it is required to carry out technical accounting together with the commercial metering of electricity, namely, to control the consumption of the overhead line feeders (OLF). Such an automated electricity metering system at the overhead line feeders (AEMSOLF) will allow not only to determine the amount of losses and the amount of imbalance, but also to identify power flows between substations that cause additional losses.

MAIN PART

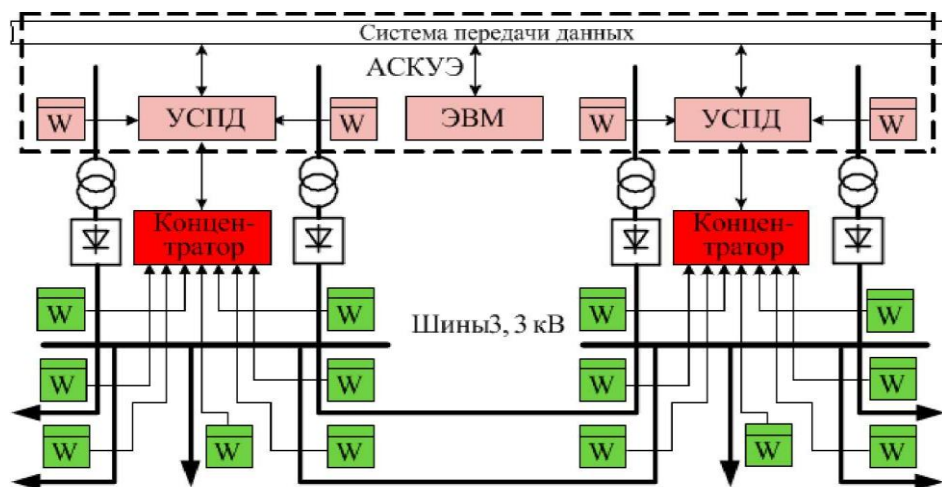

Currently, when analyzing the operating modes of traction power supply systems, analytical and probabilistic-statistical approaches are used. Methodology, theoretical content and information and technological support for the functioning of automated control systems for electricity consumption in terms of traction power consumption are built only on the basis of information received from ACMSE [3].

The development of electricity metering systems at the overhead contact network feeders will make it possible to quickly analyze the operating modes of the traction power supply system as a whole, to compare the current indicators at adjacent substations, which will make it possible to analyze the electrical parameters of the networks.

The network of multifunctional electricity meters, synchronized with each other, located in various nodes of the power system, will provide real-time information about the current state of both individual objects and the entire power system as a whole. The proposed technique can be used both for determining the parameters of electrical modes and for the parameters of equivalent circuits of the traction network [4].

The task of obtaining synchronized measurements, which arises for distributed objects of the electric power industry, can be solved using the standard synchronization system existing in the data transmission system of “АО «ЎТЙ»”. This system provides synchronization accuracy up to 0.1 s. Global systems GLONASS and GPS make it possible to increase the synchronization accuracy by several orders of magnitude.

To implement the electricity metering system, the concentrators are connected to data collection and transmission devices (DCTD), to which AC meters of the ACMSE system are already connected. The use of ACMSE subsystems will allow to synchronously determine the consumption of electricity, both received from the external power supply system and supplied to the load. This approach makes it possible to determine the unbalance of electricity for each substation and to correct the level of unbalance in the contact network.

The block diagram of the electricity metering system on the overhead line feeders (OLF) is shown in Figure.

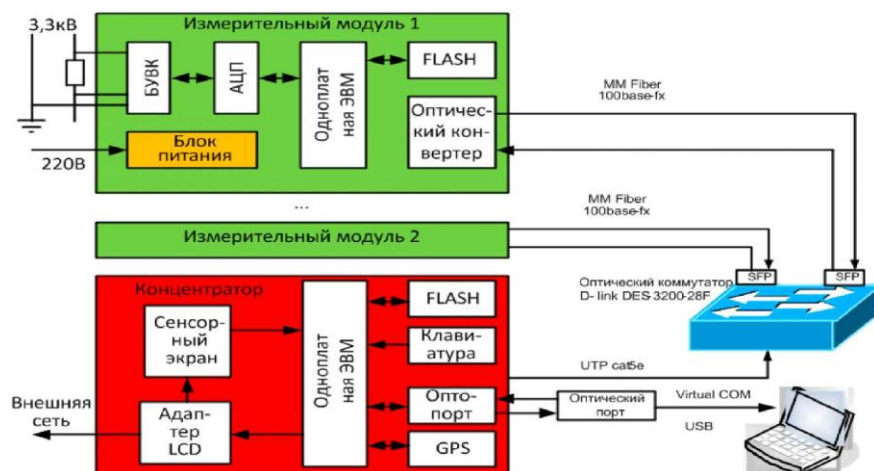

Figure 2 Block diagram of the electricity metering system on overhead line feeders.

The block diagram is built on the principle of a distributed computing system, which is determined by two independent conditions. The first condition is the galvanic isolation of the analog signal input circuits from the digital output circuits of the processed data with high requirements for the breakdown voltage. The second condition is that as the data is processed, the methods of this processing change, i.e. when analog signals are input, a continuous stream of data converted to digital form with uniform sampling is formed, however, after receiving the main calculated values, the task of archiving, managing data transfer protocols and managing the entire system as a whole appears. Therefore, the electricity metering system is divided into two parts.

The measuring unit consists of three parts: an analog-to-digital converter (ADC), a processing unit and an optical interface. The ADC converts signals proportional to voltage and current into digital readings. It provides temperature compensation for the error, as well as periodic correction of the additive error. The ADC is connected to the processing unit via the SPI interface. The measuring unit measures current and voltage signals, calculates active power based on instantaneous values of current and voltage signals, calculates effective values of current and voltage, load graphs. The data output period is 5 s, which facilitates the further calculation of the consumed energy.

The processing unit is implemented on a single-board computer "Tion-pro-28", which provides maximum processing, efficient distribution, archiving of data, and control of the device as a whole and support of exchange protocols via digital interfaces. This microcomputer is a highly integrated device and contains almost all the necessary ports to implement communication interfaces.

Data transmission to the hub is carried out using a fiber-optic communication line. The fiber-optic interface is based on the Net link HTB-1100 optical transceiver and the D-link DES-3200-28F optical switch. Information transfer is carried out using the Ethernet interface, which ensures high data transfer rate. The optical switch allows connecting up to 24 measuring units to the hub.

The concentrator is designed for collecting data from measuring units, archiving, building consumption graphs, and additional information processing, and calculating electricity consumption throughout the substation. Display of current values and local control is carried out using a touch screen. The optical port is a technological one and is intended for loading, debugging and configuring the program in the microcontroller.

The AEMSOLF communication via the existing DCTD with the upper-level subsystem is carried out via the RS-485 interface using the Modbus RTU protocol. The top-level software required for the operation of the system is installed on the same servers that are used in the ACMSE. The structure of the AEMSOLF hardware is given in the work published in the journal "Ecological Systems" [6].

Installation of electricity metering devices on electric rolling stock, similar in their metrological characteristics (accuracy class, minimum interval for taking readings, etc.) to measuring devices installed on the overhead line feeders, as well as providing the possibility of real-time monitoring of the location of electric rolling stock, will allow:

- 1) Determine the level of consumption, specific consumption and imbalance of electricity for traction of trains:

- Within the boundaries of inter-substation zones;
- Within the boundaries of service areas for locomotive crews;
- On the sections of the races of locomotive crews of adjacent railways;
- within the boundaries of tariff zones.

The availability of a database on electricity consumption at these sections, together with information on restrictions on the speed of train traffic, the provision of "windows", areas for the use of regenerative braking and other factors affecting the organization of train traffic will allow the development of targeted measures to improve the main indicators of the efficiency of using electric rolling stock and reduce the specific consumption of electricity for traction of trains according to the meters of traction substations, which in turn will lead to a decrease in the cost of the transportation process.

2) Determine the consumption of active and reactive electricity, electricity losses in the traction network, the magnitude and duration of the recuperation modes in the alternating current sections, which in turn will allow:

- To ensure quality control of the train running by the locomotive crew by monitoring the consumed and recovered electricity at the sections alternating current;
- To determine the standards for electricity consumption for running a train along a route with a complex track profile.

To estimate the level of electricity losses in the traction network for different schemes of connecting traction substations (schemes for connecting two-sided and one-sided power supply of the contact network), which in turn will make it possible to single out the values of equalizing currents (inequality of voltages on substation buses, power transit through the contact network) at different schemes for connecting traction substations and thereby determine the directions of combating them.

3) Obtaining the specified data will make it possible to promptly make decisions on the need to repair sections of the traction network, strengthen the elements of the contact network and develop instructions for locomotive drivers aimed at increasing the efficiency of using electricity for traction of trains.

4) The purpose of organizing electricity metering at the feeders of the catenary traction substations is to accumulate a database on electricity consumption for traction of trains for the development of organizational and technical measures to reduce the specific consumption of electricity for traction of trains, as well as to clarify the structure and reduce the level of unbalance of electricity for traction of trains, adopted by the meters traction substations and consumed by electric rolling stock counters.

FINDINGS

It has been established that the excess of the value of the unbalance of electricity for traction of trains over technological losses is spent on traction of trains uncontrollably, and, therefore, irrationally, ensuring control of this consumption of electricity will reduce the consumption of electricity for traction of trains according to the meters of traction substations.

It is shown that the simultaneous implementation of the AMSE OLF and AMSE EPS projects will make it possible to determine and further exclude from the structure of the unbalance of electricity for train traction the share of the commercial component of electricity losses caused by the error in metering, receiving and distributing electricity on 27.5 kV buses.

PECULIARITIES OF EXPRESSING THE CATEGORY OF EMOTIVENESS IN DISCOURSE

Muhammadiyeva Nigina Mahmudovna*

*Teacher of the English linguistics Department,
Bukhara State University
UZBEKISATN

ABSTRACT

The article deals with the emotive means of the language. Based on the works of foreign linguists, the author of the article defines the categorical status of emotiveness and correlates the concept of "emotiveness" with the adjacent category of "expressiveness". It also determines the categorical status of emotiveness, an analytical review of the literature on a given topic is carried out, and an attempt is made to correlate emotiveness with an adjacent category of expressiveness. Proponents of the linguistic stylistic approach consider expressiveness at the level of utterance, exploring ways giving the speech originality and expressiveness. The main question is the choice of means of successful transmission of the speaker's intention. Expressiveness is studied as a functional category that manifests itself in a communicative act and increases the expressive capabilities of discourse.

KEYWORDS: *The category of emotiveness, Communicativeness and expressiveness, discourse.*

INTRODUCTION

In the course of the successive reforms carried out in our country to improve the education system, great attention is paid to strengthening the material and technical base of educational institutions at all levels. The introduction of innovative technologies and advanced educational standards into the educational process ensures a steady increase in the quality of theoretical and practical knowledge and skills of student youth [9, 1289].

Now that the work programs have been drawn up, the time has come to think about what lies behind this concept and what is the difference between training, which aims at the formation of competencies, from the traditional one [8, 91].

The theory of the speech genre dates back to ancient times and still remains one of the key questions of pragmatics. Genres as relatively stable types of utterance are characterized by a variety of forms, being a kind of linguistic reflection of human activity. In the era of the development of mass communication, the concept of a genre has become an object of more detailed study; it became possible to talk about interstyle genres. In this regard, the most urgent is the problem of determining the key characteristics of the genre as a whole, as well as individual genres.

In this article it is planned to show what language means can be used to verbalize a critical attitude to a message. In order to determine the categorical status of emotiveness, an analytical review of the literature on a given topic is carried out; an attempt is made to correlate emotiveness with an adjacent category of expressiveness. Within the framework of the activity paradigm that came to linguistics from psychology, genetic and functional dependence has been established communication from human activities. The study of the text as a product of speech activity is inextricably linked with the concept of a communicative situation, a personality factor and the solution of communicative tasks. In the process of communication, any text acts as a unity of content-semantic and pragmatic principles, being both a product and a result of communication. In the text as an object of research from the standpoint of the activity approach, two aspects are inextricably linked with each other: a set of linguistic means (this includes categories such as coherence, integrity, completeness, communicativeness and expressiveness) and extra linguistic characteristics (the motive and purpose of communication, the character of the author and audience).

ANALYSIS

Proponents of the linguistic stylistic approach consider expressiveness at the level of utterance, exploring ways giving the speech originality and expressiveness. The main question is the choice of means of successful transmission of the speaker's intention. Expressiveness is studied as a functional category that manifests itself in a communicative act and increases the expressive capabilities of discourse.

The emotional state of a person is a very complex phenomenon. Some scientists argue that human emotions can be divided into universal (basic or primary) and non-basic emotions (A. Vezhbitskaya); others reduce all emotions to primary and secondary (cultured) [6,142].

Emotional processes acquire a positive or negative character, depending on whether the action that a person produces and the impact to which he is exposed, in a positive or negative relation to his needs, interests, attitudes. The emotional states that a person experiences are very diverse. It is customary to single out the following as the main emotional experiences:

- Mood - the general emotional state of a person, determined by the meaning of an event for a person in the context of his life plans, interests, expectations and expressed in the system of all its manifestations;
- Emotion - a personal attitude to emerging or possible situations, to their activities and their manifestations in them. Emotions can be triggered by both real and imaginary situations.
- Feeling - the most stable experience of a person of his attitude to objects and phenomena of reality, the result of the generalization of emotions, associated with the idea or idea of the immediate object. The feelings that accompany this or that behavioral act are not even always

realized. A person's emotional experience is usually much broader than the experience of his and individual experiences. Human feelings, on the other hand, are usually very noticeable outwardly.

- Affect - a strong and relatively short-term emotional state associated with a sharp change in life circumstances important for the subject and accompanied by pronounced motor manifestations and changes in the functions of internal organs. Sometimes in a state of passion, anger, fear, joy, etc., a person seems to lose self-control, loses power over himself, all is given to experience. Unlike emotions and feelings, affects proceed violently, quickly, accompanied by pronounced organic changes and motor reactions. Passion is a strong, persistent, long-lasting feeling that captures a person, directs all his thoughts of personality. Passion is the strongest and most vivid emotional state of a person, which for his satisfaction is caused by the desire for vigorous activity.

It can be concluded that the classifications of emotional states (emotions) can be built on various grounds, among which the following are generally accepted:

- 1) According to the sign of emotions - they distinguish positive and negative emotions. VC. Willunas also distinguishes ambivalent, i.e. not belonging to either type. K. Izard clarifies the terms "positive" and "negative" emotion, which are defined depending on the degree of desirability or undesirability of the consequences it causes;
- 2) In terms of such qualitative characteristics as the degree of awareness, duration, intensity, etc. see: emotions, feelings, passions, affects;
- 3) Based on the principle of primacy, basic and derived emotions are distinguished. At the same time, the list of emotions referred to as basic varies depending on the author. It is not only the quantity and quality of basic emotions that causes disagreement, but also the essence of derived emotions, which are distinguished by a mixed character, for example, the emotion of "pride" is a mixture of joy and love or joy and anger;
- 4) The most common ground is based on the type of emotions, for example, love, hate, joy, etc. Such classifications contain more than 150 types of emotions.

The idea of two-way conditioning of emotions (from the side of motives and from the side of objective influences, situations) allows us to consider emotions in two directions: as an object of reflection and as a way of reflecting reality.

The peculiarity of emotions as an object of reflection is associated with their role in the cognitive-reflective process. The object of cognitive attitude and reflection is not only the objective world, but also the subjective reality of a person. A number of specific qualities of emotions as an object of reflection are distinguished. One of the main features of emotions is their dynamic nature: emotional states and experiences are changeable, continuous, fleeting. Another feature is that emotional experiences are among the objects inaccessible to direct observation, objects of the invisible world.

It is not possible for us to draw a clear line between studies of expressiveness in language and speech: expressiveness has a linguistic nature, represented through the means of language, but manifested in speech. Speech expressiveness is broader than the expressiveness of language, since it manifests itself as a result of the use of linguistic means. The expressiveness of the

language is of paramount importance, since it determines the speech expressiveness, which is consciously formed by the author with the help of expressive means of expressiveness and stylistic devices.

DISCUSSION

Representatives of the Prague Linguistic Circle also pointed out the presence of expressiveness both at the language level and in speech, highlighting two types of expressiveness: own, or inherent (embedded in the language unit itself, its form and existing outside the context), and contextual, or adherent (acquired linguistic unit in a certain environment when used figuratively). Definitions of expressiveness in linguistic dictionaries emphasize the presence of expressiveness both at the language level and in speech.

The Linguistic Encyclopedic Dictionary gives the following definition of expressiveness: "The set of semantic and stylistic features of a language unit, which ensure its ability to act in a communicative act as a means of subjective expression of attitude speaker to the content or addressee of speech" [3, 591]. It follows from the definition that expressiveness arises with such a combination of features originally embedded in a language unit, which in a certain way affects our perception of what is said.

In a number of works by foreign authors (B. Charleston, S. Bally, R. Jakobson) these phenomena are identified. R. Jakobson uses them as synonyms to denote one of the six functions of the language allocated to him. Identifying the emotive function with the expressive one, he gives the following definition: "The so-called emotive or expressive function, focused on the addressee, has as its goal a direct expression of the speaker's attitude to what he is talking about. It is associated with the desire to give the impression of the presence of certain emotions, genuine or feigned [7, 198]. S. Bally combines expression and emotions under the general concept of "the affective value of the elements of the language system." On the subject of the study of stylistics, he writes: "Stylistics studies emotional expression elements of the language system, as well as the interaction of speech facts that contribute to the formation of a system of expressive means of one or another language" [1, 17]. Among the tasks of stylistics, he mentions the definition of the emotional nature of a speech fact and the study of the expressive system of speech facts [1, 33].

Some Russian linguists (A. A. Reformatsky, V. A. Zvegintsev, K. A. Levkovskaya) also do not share the concept of expressiveness and emotionality. For example, V. A. Zvegintsev believes: "The word has not only subject-logical content, it is used not only for the transmission of thought - it is also endowed with an emotional or expressive element, through it a person expresses his emotions" [10, 167], and "the expressive-emotional elements associated with the word are not included in its meaning" [10, 175].

The emotional state and emotional attitude can be represented in the language by various means - both direct nomination (fear, love, anger), and direct expression (interjections, invective vocabulary, etc.) and description (posture, speech and voice features, look, movements, etc.). Among the emotive vocabulary, there are words that name emotions and feelings, and words, the emotionality of which depends on associations, reactions to a connection with a denotation. If, when determining emotiveness, we rely on the concept of a situation representing the emotional state of the subject (which is inevitable with an activity approach to communication), we have to admit that there are various means of representing the emotional state and attitude in different communication conditions and depending on the speaker's intentions. Thus, among the means of

achieving emotiveness can be both language means, characterized by a certain degree of expressiveness, and neutral (out of context) linguistic elements.

CONCLUSION

Summing up the review of linguistic literature, let's say that expressiveness acts as a global property of the text, its general expressiveness, realized at different levels through phonetic, lexical and syntactic means. It exists at the pragmatic, semantic and stylistic levels of the text and is created due to the emotive and subject-logical conceptual content of the text. Emotiveness is a component of expressiveness and reflects the impact of the text on the emotional, non-intellectual sphere of the human psyche.

ABSTRACT

The world is wide, there are many countries in the world, but in this world, our unique homeland, Uzbekistan, is unique. The uniqueness of the country called Uzbekistan is reflected in its unique nature, rich history, hardworking people, as well as the fact that people of different nationalities and ethnic groups live on this land as children of one family. Such harmony, friendship and cooperation have deep historical roots and foundations. When a just national policy is pursued, multiethnicity helps to understand the unity of our goals, the unity of our destiny, the need for solidarity, the priority of universal ideas, and the correct understanding of personal interests. On the contrary, a lack of vigilance and sensitivity in national relations and even a slight disregard for national principles can have a negative impact on peace and stability.

INTRODUCTION

The uniqueness of the country called Uzbekistan is reflected in its unique nature, rich history, hardworking people, as well as the fact that people of different nationalities and ethnic groups live on this land as children of one family. Such harmony, friendship and cooperation have deep historical roots and foundations. When a just national policy is pursued, multiethnicity helps to understand the unity of our goals, the unity of our destiny, the need for solidarity, the priority of universal ideas, and the correct understanding of personal interests. On the contrary, a lack of

vigilance and sensitivity in national relations and even a slight disregard for national principles can have a negative impact on peace and stability.

MAIN PART

All of today's reforms serve to further strengthen our independence. Because so many great and honorable people were born in this heavenly country; if we take the example of Imam Al-Bukhari as a great hadith scholar, the hadiths he collected as a great scholar are loved and revered in many countries. Achieving Independence in the Republic of Uzbekistan was of great importance. During this period, the adoption of the Law on the State Language under the leadership of the First President was the first step towards independence. The first focus was on the State Language, and after the adoption, the main goal was to understand national identity and restore statehood. Gave. On March 24, 1990, the post of President of Uzbekistan was established. Now the main task was the adoption of the Declaration on the State Sovereignty of the Republic of Uzbekistan, a document of great importance in the historical destiny of the country and the people, because this declaration was the main criterion for creating freedom and freedom of our people. The next declaration took into account the centuries-old historical experience and traditions of the Uzbek people. The Declaration of Independence, adopted at the 2nd session of the Supreme Soviet of the Uzbek SSR on June 20, 1990, included some clauses related to the formation of the National Army. This declaration consists of 12 articles. From that day, the issues of economic and political life of the republic began to be resolved independently. It was during this period that the first new book on independence was published. The first book by President Islam Karimov, published in 1991, was published in Uzbekistan. "We are doing our best to ensure that our people are no less than anyone else in the world, and that our children are stronger, more educated, wiser and, of course, happier than we are." In this regard, the issue of spiritual education is undoubtedly of paramount importance. If we lose our vigilance and sensitivity, our determination and our responsibility, and leave this very important thing to its own devices, we may lose our historical memory of our spiritual values, which are nourished and nourished by our sacred values. The VI Extraordinary Session of the Supreme Council of the Republic of Uzbekistan of the XII convocation, convened on August 31, 2012, played an important role in the proclamation of Uzbekistan as an Independent State. Because it was the eternal dream of our people;

First of all, do you approve the State Independence of the Republic of Uzbekistan on December 29, 1991? The results of the referendum on the subject are a clear example. The referendum was attended by 94.1% or 9,898,707 registered voters. 9 million 718 thousand 555 people or 98.2% of those who took part in the referendum voted for the state independence of the Republic of Uzbekistan. This event helped the people of Uzbekistan to determine their own destiny and create a political system in society. From the first days of our independence, great attention was paid to the National Idea. As the First President said, I think that if we imagine the best aspirations and hopes of any nation, we will be able to express the essence of such a broad concept. Today, the attention to the national idea has increased more than ever. This is because the teaching of science as a new subject has begun at the Higher Education Institution. This has helped to raise the attitudes of students to the national idea. We have the strength to fulfill the great tasks set before us by President Mirziyoyev in his Address to Parliament. - a national hero who will be a source of power The need for our development has been highlighted. In particular, we need to understand the national identity, study the ancient and rich history of our country,

strengthen research in this area, and fully support the work of scientists in the humanities. The assessment of the past must be objective and, most importantly, free from differences of opinion. "There are people who think of the old Soviet ideology as a national idea," he said. This is also true, but if ideology is human, if it serves to glorify human rights and freedoms, why should we be afraid? The basis of all our actions is to please our people, and this is the basis of everything we do in terms of humanity. In this regard, I would like to emphasize that the ideology of the New Uzbekistan we are creating will be the idea of goodness, humanity and humanism"2.

CONCLUSION

In conclusion, national tolerance is achieved through respect for the language, religion, way of life, customs and traditions, national cultural heritage of people of different nationalities, respect for their honor, dignity and dignity. Represents a specific spiritual breadth (tolerance) National tolerance is not achieved at the expense of the contrary, to the detriment of the national interest. It will be strengthened on the basis of a balanced view of the interests of different nations.

ABSTRACT

This article discusses issues related to the causes of pollution and depletion of water resources, their environmental and socio - economic consequences for society, as well as measures aimed at solving such environmental problems. The article deals with issues related to the causes of pollution and depletion of water resources, their environmental and socio-economic consequences for society, as well as the feasibility of solving such environmental problems.

KEYWORDS: Water, Hydrosphere, Pollution, Depletion, Ecology, Industry, Aral Sea.

INTRODUCTION

As you know, water covers more than half of the globe: its role in nature is invaluable. Also, for the economy, water resources are of extreme necessity and require a rational approach to their use. In the context of the global development of industry and STP (scientific and technological progress), intensive use of water leads to its depletion's particular, in such industries as metallurgy, heat and power engineering, and the petrochemical industry, the use of a huge amount of water is required, which certainly affects the volume of water reserves. And there are very few fresh water resources suitable for consumption on Earth – 2% of the entire hydrosphere. In addition, active human activity negatively affects the quality of water, polluting it. Water resources are one of the components of the economic potential of any country. For full-fledged farming, meeting the needs of the population, it is necessary to have a sufficient amount of water reserves. In some countries, water scarcity is considered a major social and economic problem. And the most pressing problems related to water today are its pollution and depletion.

The main “suppliers” of fresh water are rivers, lakes, underground water and glaciers. The total water reserves are shown in the figure. (1)

Figure: 1 Water Rapas of the Earth

Earth's Hydrosphere

- ☐ Underground (except for soil water)
- ☐ Ice and snow (mountain– glacial areas)
- ☐ Land surface water (lakes, reservoirs, rivers)

- ☐ Atmospheric water
- ☐ Water contained in living organisms

Every day, as a result of human influence, a large volume of fresh water becomes completely unusable. The sharp deterioration of water quality is caused by its contamination with chemicals, radioactive substances, synthetic fertilizers and toxic chemicals, and sewage. And pollution of the hydrosphere-causing irreparable damage to the environment! Industrial emissions of large plants, especially metallurgical and automobile plants, into fresh water change its composition with various heavy metals – xenobiotics, such as lead, cadmium, mercury, and others. Of course, further consumption of such water by people is fraught with dangerous consequences. The situation is even worse when water bodies are contaminated with radioactive substances, since when the result of the decay of isotopes – particles-enters the body, they cause serious cancer. The flow of water into reservoirs from sewage drains poses a threat to living beings due to the presence of a mass of pollutants in them: food residues, household waste.

In addition to pollution, humanity is also facing the depletion of water resources. The first reason for the decrease in the amount of usable water resources is the increase in their consumption per capita. With an increase in the population, the number of consumers is also growing, which means that the world's water reserves will remain less and less. The improvement of the technology of industrial and agricultural production leads to a significant depletion. The development of mineral deposits leads to large losses of fresh water. The process of urbanization, which covers more and more territories and is expressed by the construction of many structures and buildings-the construction drainage of urban areas leads to water losses in huge quantities.

All the above-mentioned problems have extremely sad consequences not only of an environmental, but also of a socio – economic nature. Special attention should be paid to the World Ocean, because it is known that it plays a primary role in the functioning of the entire biosphere and 70% of the oxygen on Earth is produced as a result of photosynthesis of plankton living in the ocean. The pollution of the World Ocean caused by the release of household and industrial garbage and the localization of large urban agglomerations leads to the fact that various representatives of flora and fauna die out, the water temperature in the ocean rises, some global climate phenomena change their direction and garbage islands appear. In particular, one of these largest plastic islands is the garbage plastic island in the North Pacific Ocean, which arose due to ocean currents collecting plastic waste in one place. Another example is the Aral Sea crisis, which is an urgent problem not only in Central Asia, but also in the whole world. Extreme salinization and a decrease in the area of the sea has created many environmental problems.

What causes pollution and depletion of water resources? First of all, the incidence of diseases among the population increases due to the consumption of polluted water; as a result, life expectancy is reduced, labor productivity and the percentage of able-bodied people of working age fall. The lack of clean water will lead to the dissatisfaction of people's needs. Due to the fact that it is not possible to use highly polluted water, people will resort to further intensive use of the remaining clean water resources. From an economic point of view, the shortage of water forces some countries to import it to ensure the efficient functioning of the economy, that is, there is an increase in water prices. If there is a large shortage of water, individual resource-

intensive factories and factories will cease to exist, and this phenomenon can subsequently lead to a decline in some industries and cause unemployment and a shortage of goods. If it is necessary to purify contaminated water, it may be necessary to implement expensive technologies to achieve the desired result. The costs of restoring natural resources, preventing possible consequences of pollution, recycling and disposal of waste will increase. Such economic consequences can undermine the country's macroeconomic indicators, reduce the level of development of the economy and infrastructure, and reduce the human resources potential.

To overcome the problems associated with water supply, water scarcity and rational use, a number of programs have been implemented and are being implemented, international conferences have been held, and UN resolutions on water law have been adopted. [2]

In particular, special attention is being paid to the problem of the Aral Sea at the present time. Together with the UN, the Program "Strengthening the Resilience of the population affected by the Aral Sea Crisis through the creation of a multi-partner fund for human security in the Aral Sea Region" was developed. On February 10, 2017, an official ceremony was held in Tashkent to launch this Program. In addition, great efforts are being made at the regional level: IFAS (the International Fund for Saving the Aral Sea), whose founders are Kazakhstan, Uzbekistan, Tajikistan, Kyrgyzstan and Turkmenistan. In addition, on January 18, 2017, the Decree of the President of the Republic of Uzbekistan approved the State Program for the Development of the Aral Sea region for 2017-2021, aimed at improving the conditions and quality of life of the population of the region, providing for the implementation of projects with a total cost of 8,422 trillion soums. [3]

Can it restore the former size of the Aral Sea?

Everything is possible. An example is the United States. They are systematically dismantling the dams. They return the rivers to their natural position. They live in harmony with the environment, and we all build reservoirs. To make such decisions, I repeat, you need to save water. And here there is a contradiction: the state has distributed land to the peasants, who need to be provided with water. But many of them irrigate the land the old-fashioned way, and this is a problem. It is necessary to change the approach: you need to first invest in the development of water management and only then give the land in trust management. The Aral Sea is originally a huge body of water. The sea had a significant climate-forming effect on the environment.

Previously, cyclones did not pass through the territory of the Aral Sea. Today, when the sea is almost gone, they repel the hot air. This has become a continental-scale problem. There are similar problems in Iran and Africa. The drying up of large bodies of water changes the planet. This will eventually lead to its desertification. Therefore, the drying up of the Aral Sea is a global problem. It must be resolved before it is too late.

Solving problems related to water resources requires joint efforts. Coordinated action by all countries of the world to save and expand water resources and ensure rational use will certainly restore the natural balance on the planet.

E. ALL WORTH: THE MATIC OF UZBEK LITERATURE

Madaliyeva Zuhrahon Odiljonkizi*

*Doctoral Student,
Andijan State University
UZBEKISTAN

ABSTRACT

The article provides a comparative analysis of the views of the American Uzbek scholar Edward Allworth on the subject of Uzbek literature, as well as the views of Uzbek literary critics. The scientific basis of these ideas will be explored. The literary process of the last century is analyzed. The views of E. Allworth and Uzbek literary critics on this issue, their similarities and differences, and their reasons are analyzed on a scientific basis. The article argues that the "debates over Uzbek literature during the Cold War" served ideology more than literature.

KEYWORDS: *Uzbek literature, atheistic propaganda, E. Allworth, Uzbek scholar, social system, image, theme, literary policy, Cold War, Cholchayon.*

INTRODUCTION

American literary scholar Edward Allworth's book "Uzbek literary politics" has a separate chapter on the theme and content of the Uzbek literature of the last century ("THEMES AND CONTENT").¹ Allworth tried to study Uzbek literature extensively, but in our opinion it seems to be trying to give a more political character to this issue. According to him, the theme of Uzbek literature after the first five-year plans (1927 / 1928-1932 / 1933) is expressed as follows:

1. Social industrialization;
2. Construction of collective farms;
3. The Cultural Revolution;
4. Women's freedom;
5. The heroic past of Uzbekistan.

The same themes prevailed in many works created during this period.

For a quarter of a century, from early 1928 to 1956, Allworth reflected dozens of special themes in Uzbek literature, including atheism, "interethnic friendship," "Soviet peace," anti-Americanism, respect for Russia, and respect for Stalin. Emphasizes. According to the scholar, the universal ideas of Islam, which influenced the Uzbek and Chigatay literature, significantly decreased after 1924. He noted that religious themes in Soviet-Uzbek literature had diminished under the anti-religious propaganda of Russian communists, and that **"atheist propaganda in modern Uzbek literature had deliberately discredited religion and portrayed Muslim mullahs, eshans, and imams as ruthless looters"**² writes the Uzbek scholar. As an example, Allworth cites an excerpt from Parda Tursun's novel the "Teacher", published in the 1950s (we cite the Uzbek version of the passage): "His eyes were on the white turbans lined up on the porch looking for someone. Here, just like that! The grass of confidence shines in his heart. That's exactly what he's looking for. I have heard a lot about people with such white turbans. One of them is "suf", a cure for death, a word written on a piece of double-sided paper is a tumor that protects a person from any misfortune. He saw "eye tumors", "water tumors" on the shoulders of children, on the necks of women, on the armpits of men. He saw fifty letters written by them being crushed by people. It is called a duo. Here they are! He found what he was looking for now. If one of these turbans goes and says "suf" once, his mother will be resurrected..."³In this passage, Allworth approaches the writer from the perspective that there is irony, criticism, and condemnation of the "people in white turbans." Through this passage, the researcher tries to prove the above idea, that is, he says that such works appeared as a result of atheistic propaganda. In fact, as in this passage, the azimkhan, bakhshi, and kushnoch are not religious officials, but the result of the beliefs of the common people over time. Allworth considered the Azimkhans, the Athenians, to be among the mullahs, eshons, and imams. When the time comes, we will not be able to think correctly, because we are a generation that has grown up under the influence of these beliefs. "The girl drank a handful of tea with the teacher's "sharp breath", blood on a handkerchief, a thin white dress worn on the head (this also touched the "breath" of the teacher!) And a piece of paper with black, dark ink and vice versa, with some letters written on it and a "crusher" that puts "immortal love" in the hearts of both parties, wrapped it in a handkerchief and put it in a certain place so that it would not be forgotten tomorrow."⁴

"After he left, the three of them gathered and discussed the situation of their son-in-law. After much deliberation, it was decided to send Khadijahan to the lame azayimkhan tomorrow morning..."⁵

There are many such examples. Like Cholpon and Oybek, in PardaTursun, the above-mentioned cases show the centuries-old beliefs of the people, not the discrediting of religion and the condemnation of religious leaders. "When Karakhan saw his only child, he tore his collar, brought a neighbor, fed him, brought him a mullah, brought him a mullah, taught him, brought him a donkey and gave him a ring."⁶

Allworth attributed these circumstances to Soviet propaganda, which in fact existed before, during, and now before the Soviets.

Rano in Abdulla Qodiri's novel "Mehrobdanchayon" and Lalikhan in Oybek's epic "O'ch" sometimes deviate from the themes firmly defined in Soviet literature (freedom of women, the inclusion of men in the working class, etc.). tries to explain through. In other words, the portraits of Rano and Lalikhan in the novel "Mehrobdanchayon" show the full portrait of Rano, emphasizing that the symbols of Rano and Lalikhan are depicted as a real charm, graceful

beauty, in general, a delicate creature. Oybek also says that in a number of his works he avoided the proletarian character:⁷

Yoshi o`nsakkizda, ismiLa`lixon.

Qoshdemaganunda: ingichka, asl...

Lablarinaqpishgangilos-qip-qizil.

Oqtiniqyuzlarikulimsarhar on.

Ko`zlariyirik, sho`x, kipriklarquyuq⁸

In English:...eighteen year-old Lala-khan: "...her dark brows deserve praise / her lips like scarlet cherries/ ... hair to her waist and tall/..."⁹

Continuing to talk about the themes of Uzbek literature, Allworth says that the theme of the beautiful Fergana Valley will be repeated in the works of Uzbek poets and writers. Cholpon and Gayrati used this theme in the national proletarian literature. Here we remember that Cholpon's poem "Buzilgano`lkaga" was re-created by Gayrati under the name "Tuzalgano`lkaga" Allworth says that GhayratyCholpon's poems "Fergana" and "Kechkirish" have the same attitude. The author's words at this point seem to be neutral towards Cholpon, but he seems to be sarcastically emphasizing Gayrati's poem "Tuzalgano`lkaga":

"... Ghayraty "answered" a poem by Cholpan titled Buzulghano`lkaga, 1923, with one he named Tuzalgano`lkaga, 1927. Ghayraty's method was to cite passages from the poem attacked, and to add lines giving a new direction to its development or else supplying a parody "¹⁰. Literary critic LazizKayumov's article "G`oyaviykurashmaydoni" shows the opposite: Cholpon, a bourgeois nationalist, called one of the most shameful poems about Fergana during the revolutionary years "Buzilgano`lkaga". In those years, the poet Gayrati struck a blow to Cholpon, writing a poem "To the Healed Land", which sang the happiness of the peoples who broke the chains of slavery in Uzbekistan.¹¹ We see that the approach of both researchers is different. For Allworth, Cholpon is a tool to prove his point. For LazizKayumov, he is a bourgeois nationalist (of course, from the point of view of the time). He called on the national independence fighters to liberate the country through his poem "Buzilgano`lkaga", but because their heads were stuck in a dead end, the poet reconciled with the Soviets and hoped for salvation?!(Blood race to the torn tongues, soul race to the empty needles, thorny gardens to the flower show, The path of truth is, of course, a crossing).In any case, along with many such poems of the fiery poet, the poem "Buzilgano`lkaga" has been an obstacle to his "justification" for years.

The English researcher cites works on the subject of Fergana: Hamza's "Fergana", Botu's "Fergana's Youth", Elbek's "Fergana's Evening", Zavkiy's "Fergana", Mirmukhsin's "Fergana's Spring" and many others.

The English researcher cites works on the theme of Fergana: Hamza's "Fergana tragedy", Botu's "To the youth of Fergana", Elbek's "Fergana evening", Zavkiy's "Fergana", Mirmukhsin's "Fergana spring" "And many other works depict the Fergana Valley and its people.

The researcher says that such an example as Gulkhani's "Scorpion with a Turtle" in "Zarbulmasal" can be found in Hamza HakimzodaNiyazi, as well as the image of a scorpion in

the works of the Persian poet Abdurahman Jami. The author also cites a riddle about this insect to prove that the image of a scorpion already existed among Uzbeks:

“Birotimborajabgina

Dumlariborgajakkina

Hali kelsako`rarsiz;

Kula-kulao`larsiz” (Chayon)

All worth says that scorpions have a negative attitude in Uzbek literature. Here he remembers A. Kadyri's work “Mehrobdanchayon” In 1918 and 1919, there were also Uzbek newspapers Chayon and Cholchayon. It is known that these publications were published in Tatar in Tashkent in the years mentioned by Allworth, edited by KhalifTulakov and Ibrahim Tahiri. “In Uzbek literature the scorpion has played the role of a sinister villain, a crafty fellow , a resistance symbol, a hero, and in some cases the terrible poisonous arachnid which it really is in parts of Central Asia”¹². Translation: In Uzbek literature, the image of the ugly, the negative, the cunning, the symbol of resistance, the hero and, in some cases, the dangerous danger, as in some parts of Central Asia, is interpreted.

For some reason, the author makes an unexpected statement about the "Scorpion": It is not surprising that scorpions appear in Uzbek writings, but it is striking to find that a country so distant and formerly unimportant to Uzbeks as The United States of America comes up in Uzbek literature from time to time. Anti-Americanism has been a Russian propaganda line for many years, of course, and some Uzbek poets emulate the Russians on this theme. In the thirties Hamid Alimjan wrote ‘What we care about America?’. Poems, stories, and prose essays in this vein by well-known Russian writers have been translated into Uzbek: for example, Gorky's ‘On America’, and ‘City of the Yellow Devil’, and Mayakovsky's ‘The America which I discovered’. In 1955, Zulfiya's poem, ‘Saadat's Answer to the American Woman’ was printed in a book of poems. Many Uzbek writers have included in their works stock propaganda phrases like ‘American imperialists’, ‘American warmongers’, particularly in the seasons of active anti Western policy in the USSR. **Translation:** It is not surprising that there is a world image in Uzbek literature, but for Uzbeks it is surprising that the topic of the United States of America, which is far away and insignificant, appears. Anti-Americanism has been the focus of Russian propaganda for many years, and of course, some Uzbek poets are imitating the Russians. In the thirties, Hamid Olimjon asked, "Why America?" he wrote. Poems, short stories and essays by famous Russian writers have been translated into Uzbek, for example: Gorky's "About America", "Yellow City", Mayakovsky's "America I Discover". In 1955, Zulfiya's "Saodat's Answer to the American Lady" was published. During the USSR's anti-Western policy, many Uzbek writers included in their works such works as "American imperialists" and "American warriors."¹³

The author seems to be upset that Uzbek writers are not friendly to the American people. LazizKayumov said that there are poems written with a sincere attitude to the American people, and at this point he wants to see a poem by GafurGhulam dedicated to "Pol Robson". We also found it necessary to quote from this poem:

Qo`ldaborfursatlarning hukmiga bo`yinegib,

Qondagijo`shqinlar-la yozarekanmankitob,

Qalbimningcho`qqisigaumidbayrog`intikib,
 TasavvurgakeladiAmerikadainqilob...
 Harxalqningo`zxohishi, irodasi, huquqi,
 Tuzumivato`zimio`z-o`ziningishidir.
 Qo`shnilardevoridanmo`ralab sir axtargan,
 Xuddishuqo`shnisigadushmanbo`lgankishidur.¹⁴

Hamid Olimjon's "Nima bizga Amerika!" when thinking about his poetry, the poet does not express any negative opinion against the American people and its citizens. We are talking about two social systems, a five-year plan. The poet is very happy with the changes taking place around him. Confidence in the future grows in his heart.

...

Amerika,
 Nimabizga
 Uningsur`ati
 Uningtezlikligi,
 Kuchi,
 Quvvati.
 Mana biz,
 O`zimiz
 Safargaturib,
 Undano`tibketamiz –
 Yaratib
 Zavodlar,
 Mashinalarni¹⁵

Of course, the socialist system seems to be correct for the poet, and the capitalist system is correct for the American, just as everyone bends to the spring from which he drinks water. In the poem, Hamid Olimjon tries to compare the growth and development of the Soviet state. Edward Allworth may consider this example of Uzbek literature as a poem against American imperialism, but logically, Hamid Olimjon, living in a socialist state, can not sing the capitalist state! This does not occur to any of the representatives of this system, because for each of them the ideas of their society are true. In particular, Oybek says the following about these isms: Capitalism has shown the essence of hunger, slavery, unemployment, decay, decline, decline, resistance to culture, and so on. Socialism is the complete opposite.¹⁶ There are works in the same direction in Zulfiya's work. Not to mention the dozens of poems written by the poet in the 50's under the influence and repression of politics, ideology (for example, "Saodat's response to a foreign lady", "The voice of the Uzbek girl", "Party"). (except for his poems "I greet you", "I am

a communist"), many of his works are true examples of lyricism.¹⁷ We cannot say that there is no example in American literature in which the capitalist system has not been praised and praised as better than other systems. Such views are found in representatives of both systems. From the above, we can conclude that literature and ideology are like magnetic poles. When you move away, it pulls closer, and when you move closer, it pulls away.

ABSTRACT

Micro finance is relatively a recent approach to financial services but it is the need of the time in many developing countries. Since greater than one fourth of the rural inhabitants of India are beneath the poverty line, they need financial support to run their livelihood and prosper at the same time. But no banks can stand a support as they are unable to provide any collateral facilities. So NABARD has started with the SHG and JLG to provide assistance to these poor and not to be surprised many farmers and micro business from across the globe especially in developing countries. These schemes have benefitted countries like India, Bangladesh to a great extent. This paper makes a humble attempt to review many papers in this context.

KEYWORDS: Joint Liability Group, Micro Finance, SHG, Rural Development

INTRODUCTION

Micro finance is relatively a recent approach to financial services but it is the need of the time in many developing countries. Bangladesh has seen a remarkable rise in the microcredit system and India is no exception. Majority of the rural population in India is beneath the poverty line. From

the total population living in the rural parts of 35 states and Union Territories of India, 25.7 per cent of them are in the beneath poverty line category, according to RBI. Whereas in urban and semiurban areas, the situation is slightly improved with 13.7 per cent of the population living beneath the poverty line. In total, around 22 percent of the Indian population livelihood is under the poverty line. The idea is very simple yet effective. The major objective of microfinance is providing a very small loan to someone who is living below poverty line and it could help them in expanding their small business. The number of people who live in poverty is quite higher in comparison to the affluent people. They cannot avail financial assistance by giving expensive collaterals or cannot do complicated paperwork but their financial growth has a significant impact on the economy.

Government of India has taken various steps for reducing poverty. But it was later realized that efforts on individual level are not adequate. So it started creating groups through which the poor people could get benefit by collective decision making. Such groups are known as Self help group. However the most important limitation of SHG is that the loan amount is attached with the saving of its member which restricted the size of the loan. It is also found that there is another segment of people who are above poverty line but in direct need of credit due to low income level. Hence based on same principles of SHG, NABARD has developed another credit model based on the mechanism of “Joint Liability Group” for all these segment of society.

The lower part of the society are being provided with loans in the form of group or joint liability schemes for developmental activities. This scheme provides loans individuals on basis of confirmation from the other collateral group members. Many of the NGOs and government organizations in Odisha are heavily dependent on the joint liability to serve the lower part of the society.

DISCUSSION

Brickell et al (2020) have found that when microfinance was at its peak, with an estimation of 139 million microfinance customers globally, the COVID-19 pandemic has engulfed us. The microfinance sector in Cambodia is a fastest growing sector and, similar to others in the Global South, has changed from providing entrepreneurial resources to liquidity and relief from on a daily basis. At this point of view, however, it was argued that it should be a matter of concern and not comfort, to encourage microfinance as a market-oriented relief and recovery from this pandemic. Second, credit-taking is supposed to increase further in terms of the number of borrowers and amount of loan as a consequence of the health and economic impacts associated with COVID-19. The dependency on MFIs would leave households undernourished and therefore more vulnerable to their disciplinary and extractive impulses. It was further suggested that the intertwining between over-indebtedness, hunger pre-existing problems and the COVID-19 global health crisis is a chief challenge to gender equity and sustainable growth. For debt relief to be provided, cooperation between the Cambodian government, foreign investors, lenders of microfinance and developmental partners is crucial. In addition, progressive socio-economic policies and programs related to public welfare need to be prioritized to reverse the dependency of too many beneficiaries on the industry of microfinance for survival.

Iqbal et al (2019) have found that strong corporate governance for microfinance institutions (MFIs) has been considered a building slab of success as it is believed to assist them in achieving their financial and social objectives. The paper analyses the relationship between corporate

governance and financial results for MFIs in Asia. For the period 2007-2011, a panel dataset was used which included 173 MFIs in 18 Asian countries. Based on seven metrics relating to composition and board size, CEO characteristics, and form of ownership, a corporate governance index was created. The both-way relationship between this index and each of the five different indices of financial performance was then calculated. A dual-stage least-squares estimation approach with instrumental variables to resolve the potential simultaneity between financial efficiency and corporate governance was performed. The endogenous essence of financial performance and corporate governance was confirmed by the findings. The study concluded that with good governance practices, the profitability and sustainability of MFIs are improved and that more sustainable and efficient MFIs have better governance systems.

Quidt et al, 2018 have said that several authors point to a decrease in microcredit for joint liability and an increase in individual lending for liability. Yet there is a lack of empirical proof, and there has been no systematic study of potential causes. By using the MIX market dataset it was shown that there was a decline. Then it was theoretically demonstrated that marketing pushes business intermediaries to reduce the use of joint liability loan contracts, with increasing competition and a transformation from non-profit to for-profit lending. Further the main predictions of the model were tested and the data supported it.

Sharma and Mani (2016) have shown that JLGs support is a successful business proposal. Simplified documentation, group dynamics, timely repayment culture and credit enhancement prospects for quality customers are required. Taking into account the needs and findings of the studies, NABARD has issued detailed JLG guidelines to banks targeting small and marginal farmers, oral leaseholders, tenant farmers involved in the agricultural sector and other non-farm clients. For the initial three years, NABARD will assist banks in nurturing and funding JLGs.

S. Priya, S. Debabrata (November 2015) made an attempt to study the impact of JLG intervention on sustainable livelihood support and promotion of social capital in the context of East Champaran district of Bihar, one of the poorest states in India. It is found that JLG has significant impact on improvement in land holding under cultivation, improving livestock and inputs for agricultural activities. Credit has also played role in empowering these poor people in decision making process. The study recommends possible solutions that can further aid in long term sustainability of livelihood and use the synergy from social capital in a more productive way.

Vasantrao et al (2014) explained the importance and contribution of microfinance for uplifting rural India. It has come up in India in late 80's to accomplish the need of poor families who are not able to avail Bank loans due to inadequate security/mortgage. Even today more than 60% of the population resides in Rural India and are dependent upon agriculture to satisfy their requirements. From these more than 75% of the farmers are in economically backward condition. So Micro Finance has been introduced by social activists & economics & agriculture experts in order to assist them in developing their condition. Joint Liability Groups (JLG) are formed to meet the financial need of the small farmers. The focus of the study was on the role and performance of Joint Liability Groups of Micro Finance in upliftment of rural India.

Pareek Prashant (2015) tried to point out the success rate of the initiative pilot project started by NABARD in the form of joint liability group in 2004-05 in 8 states of India. Since India is an agrobased economy, there are lakhs of marginally small and tenant farmers, share croppers and

oral lessees, as also as entrepreneurs engaged in various farm and non-farm activities and the biggest problem they face is availing loan as they are not in a position to provide collateral for availing bank loan.

MalgosiaMadajewicz (2004) explained that the importance of joint versus individual liability scheme depends on the strength of society development. The society below poverty is not eligible for the loan scheme for individuals due to the deficiency of the credit rating and therefore would be able to access only throughout the group credit. The joint liability is undertaken in the group credit as the collateral for the loan provision. Whereas in the developed society, every individual can access the higher loan amounts only through individual liability scheme as group credit would not cater to the requirements like progressive increment in the amount of loan.

Hermes & Lensink (2007) described the basic model used to provide loans to the group members once or in parts. However, in case of default by one or more members of the group the critical criteria general laid was nonprovision of further loans to all the members of the group.

Besley & Coate (1991) explained that the local information in the joint liability scheme leads to advantage of lower costs acquired in monitoring of the groups by the lending organization. The members of groups are involved in selection and formation of the groups. These group members also monitor and take responsibility of the group due to availability of local information. During the same time, the members' activities would lead to the downsizing of the costs to the lending organization as informed by Ghatak (2000).

Ahlin & Townsend (2007) explained that shared responsibility works best when the members of the party are extremely familiar and willing to prosecute the member by default. Not every community, however will have the same phenomenon and thus the shared responsibility group credit would only work in societies that will be involved in punishing rather than looking at the individual choice. The joint liability scheme also fails when the group members learn that, irrespective of supervision the other members are defaulting. Then the majority of the members will also default because, because regardless of current results, the additional loan would be refused. At the same time, the presence of insurance for the loan portfolio will also allow consumers to invest in the higher portfolio in the high risk projects and become less bothered towards loan repayment as described by Karlan (2005).

Zeller (1998) stated that it is important to inculcate group forming and the monitoring skills between the microfinance and this requires an investment. As this training program forms the main part of investment at the possibility of moving members to alternative fund providers may put away the private lending organizations in accepting the first timers.

Ahlin & Townsend (2007) Informs that models similar to the Besley and Coate social sanctions model and the Ghatak peer monitoring model were found in an increase in repayments by individuals in the group credit scheme at that time.

Different numbers of models by different authors aim to describe the mutual liability phenomenon. By using these subjects which are titled as moral hazard, adverse selection and peer pressure, the main models can be summarized in the categories as described by Ghatak & Guinnane (1999).

Franklin Simtowe and Manfred Zeller (2006) studied that joint liable community lending is active in Malawi for almost four decades. The major reason of default was solely the inability to repay back loans. They analysed the magnitude of moral hazards taking place and examined the determinants of occurrence among Malawian joint liability loan schemes by using data from group-level of 99 farm and non-farm credit categories. Results revealed that peer selection, control, pressure, dynamic incentives and variables capturing the degree of matching issues explain most of the difference between credit classes in the occurrence of moral hazard. The result showed that lending institutions with shared responsibility would continue to rely upon social stability and dynamic rewards to enhance their performance. This further had a direct impact on the outreach, impact and sustainability of the groups.

CONCLUSION

Sustainable livelihood support to the poor is provided by different provisions of microfinance. It is observed that credit played a significant role in improving land holding under cultivation, live stock improvement and improvement in agricultural inputs. It also helped in enhancing the power of decision making. Mostly small, marginal and tenant farmers were benefitted by the micro credit system. Though different studies reveal that micro credit through Joint liability group has improved the condition of the poor, further studies may be taken up to find out whether it has a impact in the economic and social development of it's members.

FEATURES OF SUITABILITY FOR PLANTING MELON VARIETIES SUITABLE FOR PROCESSING IN SALTED AREAS

Sultanov Jetkerbay Dauletbaevich*

*Nukus branch of Tashkent State Agrarian University,
Nukus city, UZBEKISTAN

ABSTRACT

This article describes the results of tolerant experiments on the cultivation of melon varieties in laboratory conditions and saline field conditions. Data on melon varieties suitable for planting in the conditions of the Republic of Karakalpakstan are presented on a scientific basis.

KEYWORDS: *Melon, Evening Varieties, Duragay, Fluidity, Laboratory Conditions, Millet, Salinity.*

INTRODUCTION

Currently, the sphere of storage and processing of agricultural products is one of the most urgent. In ensuring food security, this network includes the most important areas. In recent years, special attention has been paid to a radical increase in the volume of food production, their assortment and export potential in our country.

Objectives and objectives of the researches: Scientific justification consists in the reproduction of products prepared on the basis of technology of processing of melon fruit in the conditions of the Republic of Karakalpakstan. Also to examine the cultivation and ripening periods of melon varieties suitable for storage and processing of crops in zone conditions. To achieve this goal, the following tasks are required: to determine the consistency and biochemical composition of the meat of fruits of local melon varieties; to improve the methods of storing and drying fruits; to determine the economic efficiency of processed ishlangan products.

The research was carried out on the fields of farming "Arshan" in Chimbay District of the Republic of Karakalpakstan.

It is known that the fertility of varieties in laboratory and field conditions is one of the important factors in the study and evaluation of varieties in different soil-climatic conditions.

Figure 1. Solubility of melon seeds in laboratory conditions

The yield of the imported melons was studied in laboratory and field conditions. Among the melon varieties studied, the highest indicator in local conditions was revealed in the varieties of rag nomer K-199, Kizil asani, Zargulabi, Suyunchi-2, OltinVodiy and Dilkhush, and in 2018 in the varieties of Shakar palak, Suyunchi-2, Kora gulobi, Bargi K-578, Zargulobi and OltinVodiy. In these varieties, the yield was on average 97-98 % (Table 1.). In all the studied varieties of melon, the yield gained almost excellent indicators.

Figure2. Fertility of melon seeds in field conditions

From experience it turned out that the melon varieties studied can be divided into three groups depending on the degree of fertility in the field conditions.

To the first group: the degree of fertility is higher than 70-80%, varieties. (Kizil ani, Mestnaya (783), Shakar-palak (582), Saxovat-1, Oltinvodiy, Dilkhush).

To the second group: melon varieties with a fertility rate higher than 60% (Kora gulobi, Mestnaya (212), Shirin puchok (433), Ak-navat (390), Suyunchi-2)

To the third group: melon varieties (Bargi (50), Kari kiz, Zargulabi, Oltin tepa), whose fertility rate is higher than 57%, were introduced.

It should be noted that in the field conditions of these varieties, we can see that the fertility rate was significantly lower in 2019 year. In our opinion, this circumstance is indicative of the fact that the fields are strongly engaged and the plants are not watered on time.

TABLE 1.FERTILITY OF MELON VARIETIES IN LABORATORY AND FIELD CONDITIONS, %

№	Names of varieties	In laboratory conditions		In field condition	
		2018 y.	2019 y.	2018 y.	2019 y.
1.	BeznomerK-199	95,3	93,3	70	70
2.	Kizilasani	92,4	91,4	80	72
3.	Koragulobi	98,1	97,5	60	58
4.	Mestnaya (212)	91,3	97,2	60	59
5.	Mestnaya (783)	97,3	-	80	-
6.	Bargi (578)	76,2	97,4	50	48
7.	Shakar-palak (582)	96,4	98,6	80	71
8.	Shirin- puchok (433)	90,2	95,6	60	57
9.	Taluk-aktila (826)	83,1	94,2	70	65
10.	Korakukcha	92,1	94,2	70	67
11.	Karikiz	94,1	-	40	-
12.	Ak-navat (390)	87,2	82,3	70	66
13.	Saxovat-1	94,2	94,2	80	73
14.	Suyunchi-2	96,4	98,8	60	57
15.	Oltinvodiy	98,3	94,5	80	74
16.	Zargulabi	97,2	97,2	50	58
17.	Oltintepa	85,2	-	52	-
18.	Dilxush	98,3	96,3	70	68
19.	AFX-36068	-	93,7	-	60
20.	Korapuchok	-	91,3	-	60
21.	Honey Ohm	-	93,7	-	70
22.	DottexF ₁	-	93,5	-	70

23	KukchaK-18	-	94,2		67
----	------------	---	------	--	----

Especially important is its soundness in overseas exports. All tested varieties of melons are kept in special conditions in the varieties collection of Karakalpakstan Agricultural Research Institute.

In our experiments, varieties of melons, of which high figures were obtained, were grown under the farmer's Farm Act and poured into storage in special rooms for delivery to peasant farms.

CONCLUSIONS

Among the tested melon varieties, a high indicator of fertility in laboratory conditions was manifested in Karakulobi, Zargulobi, Oltinvodi, Shakar – palak, Mestnaya (783) and Soyunchi - 2 varieties. The highest (from 26.9-36.8 t/ha and quality (dry matter in the composition from 14.0%, confectionery more than 12.0%) commodity harvest melon summer Toshloqli – 862, Novotkalla, L-152, blue tinni – 1087, transverse lace, white-baker, Samarkand obi novvoti, Lazzatli, OltinVodiy, Saxovat, Tuyona, Ich-kizil, Dilkhush, Ok kovun – 557, Kukcha – 588 varieties were obtained. In the cultivation of melon fruit in Saline lands, the most important factor is to take into account its varietal characteristics. In this regard, it is desirable to plant Kara gulabi, Zargulabi, OltinVodiy, Bargi K-578, Saxovat and Dilkhush varieties in the territory of the Republic of Karakalpakstan.

ABSTARCT

In this article, the results of the research on the conservation of varieties of pumpkin belonging to three cultural species are described. Experiments are based on quality control by organoleptic evaluation of changes in their composition when storing pumpkin fruit in two different ways. As a result of the research, scientifically based conclusions were formed

KEYWORDS: *Pumpkin, Temperature, Storage Mode, Relative Humidity, Slices, Storage Period, Gas Environment*

INTRODUCTION

Storage is a relatively complex and long stage of the technological cycle. Since agricultural crops are seasonal, this area is considered relevant. According to the records of many researchers, zucchini can be stored from 6 months to a year, depending on the variety in controlled conditions (when the temperature of 6-8°C and the relative grade of air is 75-80%). However, there is not enough literature on the analysis of retention in an unmanaged environment and truncated state.

Storage in an unmanaged environment. During the studies, experiments were conducted on the storage of pumpkin fruits, characteristic of different species and varieties, in an unmanaged environment (with a temperature of 14-22°C and a relative humidity of no more than 75%).

When storing pumpkin fruits in an unmanageable environment in the whole state, it became known that their biochemical composition and Consumption Value did not disappear until 180-240 days. Pumpkin fruits are generally considered products that are suitable for long-term

storage. During the experiments, this again found its confirmation. The composition of important components in the composition of pumpkin fruits has also been preserved for a long time. When storing pumpkin fruits in an unmanaged environment, the amount of dry matter contained in fruits of all varieties was constantly reduced. For storage, the fruits of Ispanskaya 73, Volzhskaya Seraya 92, Medovaya varieties, bread kadi, Kustovaya Oranjevaya varieties, 268 and Kashgarskaya 1644 varieties belonging to the cultural type of Muscat pumpkin were selected, belonging to the cultural type of large-fruited pumpkin.

During storage, the biochemical composition of pumpkin fruits was regularly studied. There were also trends in the reduction in the amount of carbohydrates, organic acids and vitamins. The amount of starch sharply decreased over time, by the later periods of storage, and in all other varieties of starch from the 92 variety of Volzhskaya Seraya did not remain at all.

During storage, the qualitative characteristics of the composition were more pronounced than varieties belonging to the cultural type with a hard coat. Especially the fruits of bread kadi varieties were well preserved compared to other varieties.

The composition of pumpkin fruits of this variety initially contained 18,84% of the dry matter, after 60 days it was 17,9%, after 120 days it was 15,88%, after 180 days it was 15,16%, after 240 days it was 14,48%. This means that its composition is relatively stable. In other varieties, there was a decrease in the amount of dry matter more sharply than in the Non-kadi variety.

In turn, the decrease in the amount of sugar also repeated this trend. Only on 240 – th day of storage it became known that there was no starch left in the composition. However, the amount of monosaccharides, sucrose, organic acids and other components did not decrease sharply.

The lowest shelf life characteristics during storage were observed in the Medovaya variety of the yirikmevali pumpkin cultural variety and Kashgarskaya 1644 variety of the Muscat pumpkin cultural variety.

Keeping pumpkin fruits in slices cool. On sale, often there is a high need for realization in the form of slices in the case of zucchini cut - 0,5-1,5 kg mass. This is due to the fact that one fruit of zucchini is usually plural for one use at home. In this regard, it is desirable to put them on sale as a semi-finished product. For this reason, experiments were conducted on the storage of pumpkin fruits as a semi-finished product, cut into slices in a cooled state. The main purpose of this study was to study the optimal period of storage of pumpkin fruits in the state of slices.

TABLE 1. ORGANOLEPTIC INDICATORS SCALE FOR SENSORY ANALYSIS OF SLICES OF PUMPKIN FRUITS

№	Pumpkin slice quality indicator	Important coefficient	Ball	Ball rating description
1.	Appearance	3,0	5	like a fresh pumpkin
			4	Characteristic of a fresh pumpkin, in which there is a change without sensation
			3	Characteristic of the a fresh pumpkin, in which there is a significant change
			2	Not fresh pumpkin

2.	Color	3,0	5	Consistent and uniform, typical a fresh pumpkin
			4	Little has changed
			3	Significantly changed
			2	Is not peculiara fresh pumpkin
3.	Taste	6,0	5	Very sweet, a pleasant taste of melon comes
			4	Sweet
			3	Less sweet
			2	Not sweet, not unpleasant taste
4.	Aroma	4,0	5	Pleasant, bright, melon-like
			4	Pleasant
			3	Lessnoticeable
			2	unknown, odorless
5.	Consistency	4,0	5	Veryfastidious, soft, dense
			4	Sersuv, densityisaverage
			3	Low-water, loose
			2	Numerous

According to the results of the study, it was found that pumpkin fruits cut into slices at home should be stored 3-5 days. But in some cases more time is required for storage. During the storage of pumpkin fruits in the cut state, changes in its biochemical composition, organoleptic properties and other indicators, data on which are not presented in the literature. We also carried out these studies in our experiments.

In order to investigate the variation in the consumption values of pumpkin fruits, we prepared to cut and store no more than 500 Gramm of the varieties under study. Cut pumpkin slices +2 in the cooling chamber...It was stored at a temperature of +4°C and in conditions with a relative humidity of 80-90% of the air. Analysis on the determination of organoleptic and microbiological indicators was carried out 5,10, and 15 days, experiments on the determination of biochemical indicators were carried out between 3,6,9,12,15 days.

The study of organoleptic properties of the fruit slices of the pumpkin varieties under study was carried out on the basis of the following indicators: appearance, color, consistency of the flesh, its taste and aroma. The evaluated indicators were formulated in accordance with the specific characteristics of the research object and consumer demand. These indicators are widely used in organoleptic evaluation of fruit and vegetable products.

In order to ensure the difference levels of score scales, we have developed indicators that allow us to accurately determine the harb one-point rating level due to the characteristics of the fruit tilim. In generalizing the conclusion of experts on each indicator, it is purposefully evaluated at 4 levels, taking into account the coefficient of significance on individual signs. At the end of the evaluation process, the degustation sheets filled out by the expert commission, consisting of 7 people, are summarized.

In this way, we developed a 100-point scale to determine the quality indicators of pumpkin fruits

of the varieties in which the experiment is conducted organoleptic. In this case, on the basis of the coefficient of significance, an assessment of the quality by 4 degree is provided (see Table 1).

The data obtained as a result of organoleptic analysis were summarized and expressed in Table 2.

In this experiment, the standard deviation on each indicator did not exceed 0,5 and was in the range of 0,0-0,45. For this reason, the overall price remained the same. When organoleptic analysis of pumpkin slices, which were cut into slices, significant changes were noted when storing 10 and 15 days in all varieties.

In the first period of storage (5 days), the quality of pumpkin seeds decreased imperceptibly, and this decrease was on average 7,28-8,28 points. The best preserved pumpkin in the form of slices is Kustovaya Oranjevaya (S. pepo L.) observed in varieties. When analyzing the changes in all organoleptic indicators, it was observed that the aroma and taste of fruit meat in all experimental varieties were on average 0,43-0,57 and 0,42-0,71 points respectively. In our opinion, these changes occur due to biochemical changes in the composition of the product during storage.

In general, during the first period of storage, the overall score in the main varieties was 80,29 - 88,57 points and was considered good in itself.

Only in the medovaya variety, which was rated 84,71 points before being put on storage, the total score was 71,14 points and was considered satisfactory. In the second period of storage (10 days), the quality significantly decreased. During storage, the taste and aroma indicators of the samples decreased sharply (0,85-1,14 and 0,71-1,14), which in itself significantly affected the overall price and decreased by 13,86-18,71 points. As a result, the total score of pumpkin seeds was 70,83-78,00 points and was considered satisfactory.

TABLE 2. CHANGES IN ORGANOLEPTIC INDICATORS IN THE STORAGE OF SLICES OF PUMPKIN FRUITS (2016-2018 YY)

At the end of the storage, there was a sharp decline in quality, especially in all research varieties, 13-15 days, and the total price was in the range of 40-48 points.

The consistency, aroma and taste of all the samples were unsatisfactory, and the appearance and color were satisfactory evaluated. This means that the product is unsuitable for consumption.

The main cause of many losses was the cause of Phytopathological diseases during storage.

As a result of organoleptic evaluation of stored pumpkin slices can be concluded as follows:

- cut pumpkin slices +2....When stored at a temperature of +4°C and in conditions with a relative humidity of 80-90% of the air, the limited storage period is 10 days.

- Slices of fruit of Ispanskaya 73 and Volzhskaya Seraya 92 varieties can be stored up to 10 days qualitatively, slices of fruit of other varieties are recommended to be stored 5 days

- it turned out that the fruits of the Medovaya variety, which belong to the type of large-fruited pumpkin, are completely unsuitable for storage in the conditions under research in the form of slices.

ABSTRACT

Peptic ulcer disease is one of the variants of the typological response of the body when exogenous factors of the internal environment interact (type of the nervous system, endocrine system, psycho emotional characteristics, metabolism, biochemical reactions, and cytokine profile) with external exogenous factors. This pathology is one of the most common diseases of internal organs, and among the adult population it occurs in 7-12% of cases [1; 2; 3]. Type II stomach ulcers (Johnson H. D., 1965) or combined stomach and duodenal ulcers account for about 25% of the structure of gastric ulcers [7] According to modern research data, up to 10% of residents of Europe, the USA and Russia suffer from this disease (Ivashkin V.T., Minushkin O.N., 2015). In Uzbekistan, about 14% of people develop stomach ulcers; this disease is most common in men. (Https. // nuz.uz Jun 5, 2018) This review article also contains information on the significant effects of gene polymorphisms encoding biotransformation enzymes of drugs on the efficacy and safety of antiulcer pharmacotherapy. Determination of the polymorphism of the CYP3A5 gene makes it possible to initially determine the tactics of treatment with proton pump inhibitors in patients with peptic ulcer disease.

KEYWORDS: *Peptic ulcer disease, the prevalence of Helicobacter pylori disease, Gene polymorphisms pharmacogenetics, Pharmacotherapy.*

INTRODUCTION

Peptic ulcer and duodenal ulcer continue to be one of the most important medical and socio-economic problems of our society. According to WHO, more than 7 million people around the world are registered with diseases of the digestive tract every year and more than one hundred thousand people die from complications of such diseases [4, 5, 6, and 37] In Uzbekistan in 2017,

13.4% of the population had diseases of the gastrointestinal tract, which ranked second among all diseases of the population [10, 11, 12, 35, and 36].

A peptic ulcer is a disease in which an ulcerative defect in the mucous membrane is formed. The disease is observed when the balance between the factors of aggression and protection of the mucous membrane is disturbed. As a result, under the influence of provoking factors, the submucosal and muscle layers are affected.

Common causes of peptic ulcer disease are *Helicobacter pylori* bacteria. In addition, in a large percentage of cases, this disease is caused by non-infectious factors, among which the administration of drugs is leading: non-steroidal anti-inflammatory drugs, antibiotics, glucocorticoids. Also, etiological factors are a person's lifestyle, nervous overstrain, unbalanced diet with insufficient vitamins and excessive consumption of rough, hot, salty and sweet foods, alcohol abuse, smoking and hereditary predisposition. These factors play an important role in the pharmacotherapy of peptic ulcer disease [7, 8, 9, 13, 14, 34, and 35].

Despite the achievements of medical science and the introduction of a huge number of new drugs, the problems of effective and safe pharmacotherapy remain relevant at the present time. Modern pharmacotherapy in most cases includes numerous drugs of synthetic and natural origin [15, 16, 21, 22, 32, and 33]. From the literature it is known that after the introduction of drugs into the body, the place and role of genetic factors is of particular importance in shaping the response of the human body to these drugs: effectiveness, ineffectiveness, and development of adverse side reactions [17, 18, 23, 24, 30, and 31]. The patterns revealed by pharmacogenetics allow the doctor to individually approach the choice of both the drugs themselves and their doses for each individual patient, providing the most effective and safe pharmacotherapy.

As you know, genetic factors or genetic characteristics of a patient are polymorphic regions of genes, the products of which, in one way or another, are involved in the implementation of various pharmacokinetic and pharmacodynamic processes.

The authors argue that the pharmacokinetic process involves genes encoding biotransformation enzymes and transporters that carry out the absorption, distribution and excretion of drugs from the body. Currently, the role of genes that control the synthesis and work of enzymes of biotransformation of drugs, in particular isoenzymes of cytochrome P-450 (CYP2D6, CYP2C9, CYP2C19, CYP3A5, etc.), enzymes of phase II biotransformation (N-acetyltransferase, glutathione S-transferase) and drug transporters (P-glycoprotein, transporters of organic anions and cations) [19,20,25,26].

Accordingly, the main task of the pharmacodynamic process is performed by genes encoding target molecules of drugs or proteins (receptors, enzymes, ion channels) functionally linked to these structures. Also included are genes whose products are involved in various pathological processes (blood coagulation factors, apolipoproteins, genes of the HLA system, etc.), against which the corresponding pharmacotherapy is directed [27, 28, and 29].

The main task of modern doctors is to develop and apply in practice the safest and most effective method of treating peptic ulcer disease. However, the selection of quality therapy is still an important problem due to the increased resistance of *H. pylori* to antibiotic therapy, the widespread use of non-steroidal anti-inflammatory drugs, and other factors [1, 33, and 34].

With the development of pharmacogenetics, it became clear that the potential reasons for the low effectiveness of pharmacotherapy for peptic ulcer disease should be considered in terms of the genetic characteristics of the organism (Makushina A.A. et al., 2017). Pharmacogenetic studies allow predicting the effect of a drug in each patient and selecting an individual effective and safe dose of the drug.

Previous studies have shown that most proton pump inhibitors (proton pump inhibitors) are metabolized by cytochrome CYP2C19, CYP3A4, CYP3A5 enzymes, which are encoded by genes with polymorphism, which determines the pharmacokinetics, pharmacodynamics and drug efficacy [2]. The enzyme CYP2C19 has the greatest effect on the concentration of proton pump inhibitors in plasma [3]. Based on the combinations of CYP2C19 polymorphisms, several phenotypes are distinguished: normal, intermediate, fast and slow metabolizers of proton pump inhibitors [2].

The results of the study revealed a relationship between the genotype of patients according to CYP2C19, the phenotype and the effectiveness of therapy for peptic ulcer disease, which made it possible to develop recommendations for the dosage of drugs [4]. Proton pump inhibitors are also substrates for the P-glycoprotein (P-gp) encoded by the ABCB1 gene. Since P-gp affects the absorption and metabolism of drugs, the ABCB1 gene polymorphism can also affect the success of proton pump inhibitor therapy in patients with peptic ulcer disease. It was found that the carriage of the C3435T polymorphism in the homozygous variant affects the effectiveness of antiulcer and anti-Helicobacter pylori therapy [1, 5].

The CYP3A5 gene encodes the CYP3A5 isoenzyme of cytochrome P450. The isoenzyme CYP3A5 plays a role in the metabolism of proton pump inhibitors [1]. Studies have shown that the allelic variant of CYP3A5 * 3 (A6986G, rs776746) of the CYP3A5 gene affects the metabolic rate of proton pump inhibitors and, therefore, their pharmacological action [2]. The study of the effect of the carriage of the polymorphic marker CYP3A5 * 3 in patients with peptic ulcer on the effectiveness of proton pump inhibitors may be of clinical importance, since proton pump inhibitors are the first-line drugs of choice in the treatment of peptic ulcer disease [30,31,32,34,35].

Proton pump inhibitors are also substrates for the P-glycoprotein (P-gp) encoded by the ABCB1 gene. Since P-gp affects the absorption and metabolism of drugs, the ABCB1 gene polymorphism can also affect the success of proton pump inhibitor therapy in patients with peptic ulcer disease. It was found that the carriage of polymorphism C3435T in the homozygous variant affects the effectiveness of antiulcer and anti-Helicobacter pylori therapy

It is known to science that polymorphism of the CYP2C19 gene in different ethnic groups for everyone - in Europeans if it is 2-5%, and in Asians these indicators are different: in Koreans, 12%, in the population of the Southwest Pacific, 70%. If the metabolism of inhibitors in the G / G genotype for the CYP2C19 gene is enhanced, and in the G / A genotype, drug metabolism is weaker and this is of particular importance for the effective and safe use of drugs.

Science knows that polymorphism of the CYP2S19 gene is different for different ethnic groups - in Europeans 2-5%, in Asians it is different, for example, in Koreans 12%, in the peoples of the Southwest Pacific 70% []. While the metabolism of inhibitors the proton pump in the G / G genotype according to CYP2S19 is accelerated, the metabolism of drugs in the G / A genotype is reduced, which is important for the effective and safe use of drugs.

According to the literature, in patients with chronic gastritis in the Bukhara region, the G / G genotype for this gene is 79%, which indicates an accelerated metabolism of proton pump inhibitors, which should be taken into account when dosing drugs. A high frequency of CYP2C19 * 17, CYP3A5 * polymorphisms was found. 3, as well as rs1045642 and rs4148738 ABCB1 among patients with gastric ulcer and duodenal ulcer. Further studies of the effect of these polymorphisms on the effectiveness of therapy with proton pump inhibitors in patients with gastric ulcer and duodenal ulcer are required.

A high prevalence of CYP3A5 * 3 polymorphism was found among patients with gastric ulcer and duodenal ulcer. Further study of the role of this polymorphism in the metabolism of proton pump inhibitors is required.

CONCLUSION

It is quite possible that in the near future the knowledge that each patient who is a carrier of a certain genotype and allele of pepsinogen, pepsin, hydrochloric acid, hormones, gastrin, components-factors of immune inflammation, pro- and anti-inflammatory cytokines and others, which, when studied on large samples of patients will show the impact on the development of peptic ulcer disease, as well as the widespread creation of a genetic passport for the entire population will allow us to predict the development of the disease with a certain degree of probability in each individual.

IMAM AL-BUKHARI – A BRIGHT SPARK IN ISLAMIC WORLD

Murtazaev Ulkar*

*Lecturer,
Department of Social Disciplines,
Samarkand Institute of Economics and Service,
UZBEKISTAN

ABSTRACT

This scientific article describes the characteristics and significance of the religion of Islam. The ideology of Islam is set out in the Holy books of Muslims, the Koran and the Sunnah. The Sunnah according to the creed is a collection of sayings of Muhammad and stories about his life. Imam al-Bukhari, this name is one of the most revered in the Muslim world. His name has been celebrated in the Muslim world for more than 12 centuries and the book "al-Jomi-as-Sahih" is considered the most reliable Muslim book after the Koran. "As-Sahih al-Bukhari" will consist of more than four dozen books, different in volume and number of hadiths covered. For his deep knowledge of hadith, the scholars of the ulama gave him the title "Imam al-Muhaddisin" (Lord of the world according to Hadith).

KEYWORDS: Religion, Religion Islam, Quran, Imam al-Bukhari, Hadith, Sunnah, prophet Muhammad, Mecca, Medina, Basra, Kufa, Egypt, "al-Jomi al-Sahih", Imam al-Muhaddisin, Samarkand region, Payaryk district, Imam Bukhari international research center.

INTRODUCTION

Religion, being an integral part of the world culture and history of any nation, has influenced the minds and way of life of people for centuries. It is a tribute to religion that many ethical and universal values, humanistic ideas, moral traditions and customs have survived to our time. The entire centuries -antique history of mankind has immeasurably developed within the framework of national religions over the globe. This applies to morality, customs, rituals, and various types of art: literature, music, architecture, fine and applied arts.

In the religious image of today's world, Islam [4] (translated from Arabic "obedience", "surrender to God") is one of the most widespread religions among the nations. The adherents of Islam are called "Muslims" (from Arabic "Muslim"-"faithful"). A Muslim is a person who

believes in Allah, arranges his life as to the reason given to him by Allah, recognizing all the prophets, messengers of Allah, guided by Muhammad.

MAIN PART

Islam is one of the most widespread religions on the planet. Islam is professed by over a billion people (according to some estimates, up to 1 billion 300 million)[5]. In fact, Muslims, whose communities exist in over 120 countries, constitute the majority of the population in 35 states. In addition to this, in 28 countries, such as Egypt, Saudi Arabia, Morocco, Kuwait, Iran, Pakistan and others, Islam is declared as a state belief. The vast majority of Muslims live in West, South and Southeast Asia, and North Africa. On top of that Islam is the religion of the peoples living in the territory of the Central Asian region: Uzbekistan, Tajikistan, Turkmenistan, Kyrgyzstan, Azerbaijan, and Kazakhstan. The remarkable impact of Islam in Russia is seen in the territory of the Volga and Ural regions with Tatar and Bashkir populations, the North Caucasus, and a number of regions of Siberia. Islam spread to the territory of Uzbekistan at the end of the 7th and early 8th century as a result of the Arab conquests. On the basis of Islamic ideology, Central Asia has become one of the centers of Muslim civilization. Islam, having absorbed most of the local Zoroastrian ideas and values, became the core of the culture and spirituality of the peoples inhabiting in the territory of Uzbekistan. For many centuries, the ancient land of Uzbekistan remained a hearth of education and science, one of the centers of world civilization. In the 9th-12th centuries, immigrants from Central Asia became representatives of the intellectual elite of the Muslim world.

The ideology of Islam is set out in the holy scriptures of Muslims: the Koran and Sunnah [6]. The Koran is handed out by Muslim theologians as the "word of Allah", and the Sunnah is the second source after the Koran. Muslims read the Sunnah, considering it as divine as the Koran.

Sunnah, according to creed, is a collection of sayings of Muhammad and stories about his life. Both the integral semantic sayings of Muhammad and the stories about his life are called hadiths (hadith from Arabic means "story"). Therefore, the Sunnah is also called the collection of hadiths. Muhammad himself is considered the author of the sayings. The authors of the stories about his life are reckoned to be the contemporaries of Muhammad. The Sunnah deeds as a Muslim "sacred endowment". On the basis of the Koran and Sunnah, theologians have developed a set of legal norms of Muslim behavior. These set of rules are called "Shariah" (translated from Arabic, "a clear path") and prescriptions enshrined in the Koran and Sunnah, by which believers should be guided in all life situations in order to achieve moral perfection and peaceful well-being. In the Sunni environment, it was recognized that the six thematic collections contain reliable material and can be considered as the main sources of the Sunnah, which soon acquired the meaning of sacred books. Of the six such collections of the Sunnah, the most authoritative is still recognized as "Al-Jomi-as-Sahih") - (Reliable collection) al-Bukhari.

In the speech of the President of the Republic of Uzbekistan Shavkat Mirziyoyev on September 19, 2017 at the 72nd session of the General Assembly of the United Nations [2], it was noted: "We consider the most important task to bring to the broad world community the truly humanistic essence of Islam. We honor our sacred religion as the center of primordial values. We strongly condemn and will never reconcile with those who place our great faith on a par with violence and bloodshed. Islam calls us to goodness and peace, the preservation of a truly human principle. I would like to especially note the invaluable contribution to the development of

Islamic and world civilization of a whole galaxy of outstanding representatives of the Central Asian Renaissance. One of them, Imam Bukhari, is recognized all over the world as the author of the second most important book in Islam, after the Koran, "Sahih al Bukhari".

"Imam al-Bukhari", this name is one of the most well-known names in the Muslim world. The greatest hadith scholar managed to put together all the stories related to the Prophet Muhammad, and managed to leave the descendants of valuable knowledge of Islamic studies. His name has been glorified in the Muslim world for more than 12 centuries, and the book "Al-Jomi-as-Sahih" written by him is considered the most reliable Muslim book after the Koran [9].

Abu Abdullah Muhammad ibn Ismail al-Bukhari, known as Imam al-Bukhari, was born on July 19, 810 in Bukhara [7]. Muhammad was shrewd beyond his years, quick-witted, had an extraordinary memory. Already at the age of seven, he studied the holy book of the Koran, and at the age of 10 he knew by heart several thousand Hadith. For ten years he studied the collection of Malik "Al-Muwatto" of 70 thousand hadiths. At the end of the madrasah, sixteen-year-old Abu Abdullah, together with his mother and brother Ahmad, performs the hajj to Mecca. After completing all the rites of the pilgrimage, he went his separate ways from his family and remained in Arabia. Later, he notes in his books that "I set myself a great goal - to collect truly authentic hadith about the Prophet Muhammad". It is not secret that this was important during the period of widespread Islamic religion as the words, deeds and covenants of the Messenger of Allah after his death were spread orally by the companions. In Mecca, Ismail al-Bukhari studied with the great scholars and he visited all the centers of Islamic sciences known at that time. In Baghdad, Ismail al-Bukhari met several times with the hadith scholar Ahmad ibn Hanbal, went to Basra, and repeatedly visited the city of Balkh (which is located on the territory of modern Afghanistan) and Egypt. In Damascus, the future leading thinker studied with Abu Mushir, then studied hadiths with the famous Hafiz Yahya ibn Munhari in Nishapur. He noted that he wrote down and accepted hadiths from 1,800 teachers. During a sixteen-year stay in Medina in the Prophet Muhammad's mosque, he read a collection of hadiths about the actions and words of the Prophet Muhammad and his associates. Famous writings of al-Bukhari include such books as Al-Asma wa al-kuni, At-Tarikh al-kabir, as Sunan fi-l-fiqh, Khalq afal al-ibad, and Al-Qira and Khalfa l-Imam. "But his main creation, on which he worked for 16 years, and collected materials for it during his life, is "Al-Jami al-sahih". The title of this book, in a reliable translation, means "A collection of authentic hadiths with a connected chain on issues related to the Messenger of Allah."

The main reason that prompted al-Bukhari to compile "Al-Jami al-sahih", which included only authentic hadiths, was the fact that the collections compiled by his contemporaries included "weak" hadiths along with the authentic ones. This did not please Imam al-Bukhari as he followed the path of Sheikh Ishaq bin Rahavayhi, who dreamed of collecting only reliable hadiths, which he encouraged his disciples to do. Imam al-Bukhari did a colossal work on this path. Studies show that from the mouths of the ulemas of Mecca, Medina, Taifi, Jiddi, and then Basra, Kufa, Sham (Syria) of Egypt, Khorasan and Nishapur [8], he wrote down and checked six hundred thousand legends and sayings of the prophet. Working on the collection for many years, Imam al-Bukhari put the methods of collecting materials on a scientific basis. Isnad (the aggregate of reference to narrators in the hadith collections of the prophet) became his main methods. Additionally, he was engaged in establishing the chain of transmitters of a certain Hadith by the method from the latter to the original source. He also rewrote the persons who

wrote the Hadith and passed it on. He determined to be reliable only those whose primary sources were people who directly witnessed the actions of the Prophet Muhammad. In fact, the scholar paid much attention to the moral character of the people who transmitted hadiths. If the legend came from a person who was associated with unseemly deeds, then it was excluded from the number of reliable hadiths of al-Bukhari. So he developed methods that created a reliable barrier for the Sunnah of the Prophet Muhammad. Imam al-Bukhari is one of the founders of the typology of dividing hadiths into rejected and acceptable, and also developed a system of reasons why certain hadiths were rejected. "As-Sahih al-Bukhari entered the history of Islam also by the fact that the principle of "musannaf" was used for the first time in compiling the collection: based on it, the hadiths in this collection were classified according to their subjects. The truly titanic work done by Imam al-Bukhari in criticizing and selecting them led to brilliant results.

Al-Bukhari, included only about one percent of the authentic ones out of the the six hundred thousand hadiths that were known to , that is, seven thousand two hundred seventy-five, but these hadiths came from sources that actually entered into a dialogue with the Prophet Muhammad personally.

As- Sahih al-Bukhari consists of more than four dozen books, varying in length and number of hadiths covered. The main part of the collections is devoted to explaining the doctrine, cult prescriptions, and rules of ritual purity. This is evidenced by the titles of the books: "The Book of Faith", "The Book of the Description of Heaven and Hell", "The Book of Divine Providence", "The Book of the Repentance of Apostates", "The Book of Monotheism", "The Book of Prayer", "The Book of Friday", "The Book of Two Holidays", "The Book of Fasting", "The Book of Hajj".

The collection of hadiths "Al-Jami as-sahih" put its author in the highest place among scholars, and also became the most important phenomenon for the entire religion of Islam. Great scholars and theologians of the Islamic world have recognized it as the most outstanding book after the Koran. The book of al-Bukhari, after careful critical study by famous Muslim ulema-theologians, did not undergo any changes and was unanimously recognized by all muhaddiths as the best book on hadith. For his deep knowledge of hadiths, scholars awarded him the title "Imam al-Muhaddisin" (Lord of the world hadith)

Upon his return to his homeland, Al-Bukhari began teaching. In the ancient city of Bukhara, he began teaching at a madrasah. But enemies and envious people, seeing that al-Bukhari's popularity among the people is growing every day, slandered him before the emir of Bukhara Khalid ibn Ahmed al-Zukhali, after which the scientist was forced to leave Bukhara and move to the village of Khartang near the city of Samarkand. After living here for a short time with relatives, he fell seriously ill. On September 1, 870, Al-Bukhari died and was buried in this village.

In 1998, the 1225th anniversary of Al-Bukhari [3] was widely celebrated in Uzbekistan. In the village of Khartang, on the initiative of the First President of Uzbekistan I.A. Karimov, a majestic memorial complex was built, including a mausoleum, a mosque, a library and a madrasah.

On October 18, 2016 [1], at the opening ceremony of the 43rd session of the Council of Foreign Ministers of the Organization of Islamic Cooperation, the President of the Republic of Uzbekistan Shavkat Mirziyoyev put forward an initiative: "In order to study the multifaceted

religious and spiritual heritage of our great ancestors who made an immeasurable contribution not only to Islamic culture, but and in the development of all human civilization "- to create the International Research Center named after Imam Bukhari and the school of hadith studies in the Payarik district of the Samarkand region. The choice of the location for the Imam Bukhari International Research Center under the Cabinet of Ministers and the school of hadith studies nearby is motivated by the role of Samarkand as one of the pearls of Muslim culture, as well as by the special spiritual and moral atmosphere of the village of Chelek, where the resting place of the great thinker of the Muslim world, Imam al- Bukhari. The infrastructure of the center includes an administrative and research building, study rooms, an information resource center, a depository for storing manuscripts, a restoration laboratory, an exhibition hall, a large auditorium for conferences, symposia, including international ones, as well as online videoconferences. In the concept of the Imam Bukhari International Research Center, the main activity is the implementation of a wide range of scientific and educational projects.

In-depth study of the religious and spiritual heritage – “tafsira” (Islamic exegesis) of hadith studies, “kalama” (theology), “fiqh” (law), as well as the exact sciences - mathematics, astronomy, medicine, mineralogy, geography, as well as publish a scientific bulletin in Uzbek, English -Arabic-Russian religious journal of the collection “Imam al-Bukhari saboklari” (Lessons of Imam al-Bukhariy) thematic almanacs.

In the organizational structure - the center of the Board of Trustees from among the authoritative domestic and foreign ulema, public figures, patrons of the arts.

The creation of the International Research Center named after Imam al-Bukhari shows how significant in scale and content the work has been done in recent years in the Republic of Uzbekistan in accordance with the principle of "Enlightenment against ignorance". Particular attention is paid to protecting the consciousness and thinking of young people from destructive ideologies. At the same time, the ideas of the genuine peaceful, tolerant, creative and humanistic essence of Islam are widely used in educational and upbringing processes.

CONCLUSION

Summing up, it can be noted that religion helps in creating ethical framework and also a regulator for values in day to day life and religious heritage of great ancestors as Al-Bukhari has positive impact on people to deeply realize of the principles of morality like justice, honesty, equality, tolerance and others.

ABSTRACT

Rituals and ceremonies by materialistic people can adversely impact on the minds and spirituality of youngsters. A subculture is an anti-traditional culture that affects the level of the knowledge of young people. If we compare main discrepancy between culture and subculture, we should take into consideration the subculture of internet because internet is a rich collection of materials which gives opportunity to people to express opinions in a global information space. And it services as a vehicle for the rapid spread of subcultures.

KEYWORDS: *Subculture, culture, Mishel Mafessoli, Sub, Viktor Dolnik, musical culture, internet subculturei, Uznet, SMS*

INTRODUCTION

The word “culture” comes from the Latin “cultivation” and was used in this sense (“agricultural art”) until the early 18th century. After that it began to be used for humanity who had elegant manners, knowledge, and musicality and so on. Culture is not “common”, each culture unites a particular community, a specific way of doing things in the social practice of people. For instance, although uzbek culture has a long history, it has not become a central Asian culture. [1] Traditional culture communicates with other traditional cultures and aspects of national culture that have overlooked can be appeared. Culture reveals many spheres of our life. For example, culture of clothing, conversation and writing. Unfortunately, some people think that their attitudes towards the life and way of living are right. People consider that customs which are familiar to them are universal and understandable for all and they try to pass them on to others.

And it is still called the culture in quotes. Culture includes not only developing the ability to follow existing norms and cultures, but also encouraging the desire to follow them [2].

MAIN PART

A kind of culture within quotes is subculture. One of the main things is that we will have some questions in terms of subculture including What is subculture itself? What is its originality? What does it mean? The word “sub” is derived from Latin and means “below”, “near”, “beside” [3,619]. The word culture is defined in annotated dictionaries as follows: Culture [a.civilization]1.A set of achievements in the industrial, social, spiritual and educational life of society. *Alifbo- The greatest creation of human life and perfection. World culture, all science, endless artistic, philosophical, moral riches are based on these letters*(K.Yashin, Hamza).2.Degree to which a social group, class or nation has achieved in a given period of time. *Culture of music, culture of speech. The film forum is a major event in the culture of cinema which is held in every two years. (from the newspaper). The names of dignitaries who have made a significant contribution to the development of Islamic culture are known all over the world.* (K.Yashin, Hamza).3.Education, upbringing, enlightenment. Staying without knowledge of the culture. Achieving culture. Behavior, culture of the humans towards the wealth especially bread is measured. *(from the newspaper). Educator must have a culture of verbal communication.* («Fan va turmush»).4. Condition that meets the requirements of a cultured person. Workers are satisfied with the work of the deputy to improve the welfare of the humans, the culture of life. *(from the newspaper).*5.*(the types of plants or crops) delivery, planting, cultivation. In particular, they have advanced in the field of agricultural culture.* (N.Hayitqulov, Yer tafti).[4.604].Thus, subculture is culture against the culture. Let's take a look to the history of subculture. In the 18th and 19th century traditions and cultures began to play the role of “center of norms and customs. Began to be discussed with local subcultures (the culture of Afro-Americans in the United States, the culture of some German lands, the culture of youth and women, as well as the culture of the “third[old]century”). In the 1950s, the American sociologist David Riesman used the term subculture in his research to refer to a group of people who deliberately chose a style or value that was preferred by minority.[5].British sociologist and media scholar Dick Haddidge provides a more in-depth analysis of the phenomenon and concept of subculture in his book “Subculture: The meaning of style”. He considered that subcultures draw people's attention with similar interests and worldviews who are dissatisfied with generally accepted standards and values .[6]. The French sociologist Michel Mafessoli applied the concept of “urban tribes” to youth subcultures in his works. Subcultures are mostly closed and try to separate themselves from the national culture.[7]. Subculture is characterized by aggression and contradiction from the norms of traditional culture. We can say them that they culture against culture. The literature defines subculture as a special form of organizing youth activities, defining norms, values, institutions and the lifestyle and thinking of its bearer within the prevailing cultural traditions in a society that is relatively autonomous and holistic.

There are the following types of subcultures:

1. subculture of music
2. Artistic subculture
3. Internet subculture

Subculture of Music- Actions of youth associated certain genres of music. The image of musical subcultures is mainly formed by imitating the stage image of famous performers in this subculture.

Artistic subculture- It comes from certain type of art or activities.

Internet Subculture-It is the culture of presenting information, the culture of how users interact and write on it. Internet subculture emerged as a global phenomenon because of the internet and has the characteristics of separate social phenomenon within human civilization.

Internet fills with valuable of news, information and it gives opportunity to ones to share their opinions freely. Specialized Internet communities are formed on the basis of different internet cultures, which can be very diverse. For instance, the following table compares Uzbek and Russian internet users with the examples of subcultures.

№	In Russian	In Uzbek
1.	Рунет	Uznet
2.	Майл.ру	editory.uz
3.	ВКонтакте.ру	ziyonet.uz
4.	Авито.ру	edu.uz
5.	Мигрант.ру	zarnews.uz
6.	Яндекс.ру	natlib.uz

Thus, the formation of the Internet in a very short period of time has made the subculture a global phenomenon that reflects life, including youth. But besides that it has own peculiarities, forms, customs. They evolve, change, reach new “stage” over the time. Sms messages is a kind of appeal of internet subculture. Nowadays we are using chats in order to write letters and information. It is significant to remember that these correspondences also have their own culture. For example, on September 2, 1993, the law “on the introduction of a new Uzbek alphabet based on the Latin script” was adopted. On May 15, 2018, an “Plan for the widespread introduction and further improvement of the new Uzbek alphabet based on the Latin script” was developed. It is clear that we should use Uzbek alphabet for writing news or information and promote it. Unfortunately, some messages are written in Cyrillic alphabet.

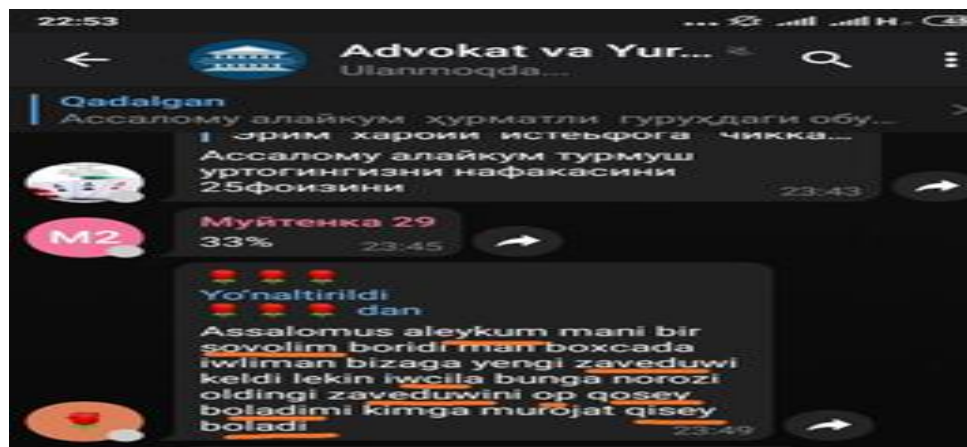

We come across some mistakes in the process of analyzing internet texts.

- 1. Phonetic Errors:** We often come across some mistakes that young people write numbers instead of writing abbreviations and letters in the sms messages. For example, writing number of **6** instead of the letter **o'** , **4** instead of the letter **ch**, **w** instead of the letter **sh** is being common. *Qalesan – qandaysan*. In this example the result of exchanging the pronoun *qanday* to the number suffix to the second person singular-number suffix [-y] and the sound [n consonant to l, vowel a to o]was occurred.

[group of sinfdoshlarimni sog'indim by Zayniddinov Z.]

In the word *aleykum* exchanging sound was occurred because of using *e* instead of *a*. There are two mistakes in the word *boxcada*, here *x* is used instead of *g*'. It is considered a phenomenon of sound inclination. The second mistake is connected with the letter *c* which is used instead of *ch*. *Op qosey - olib qolsak* this compound word is written according to the phonetic spelling rule although it must be written instead with in the morphological spelling rule. Moreover, it is being common that usage of the vowel letter *o*' without " ". For example, in this text diacritical mark is omitted. Following example that taken from the telegram channel, is not suitable for any literary standards. There are spelling, morphological, syntactic, punctuation and methodological errors.

[From the group of the advice of advocate and lawyer]

1. **Lexical Errors-** There are equivalents in the Uzbek language and there are words that are considered barbarism. For example, in Uzbek the word “dekret” has the equivalent of maternity leave.

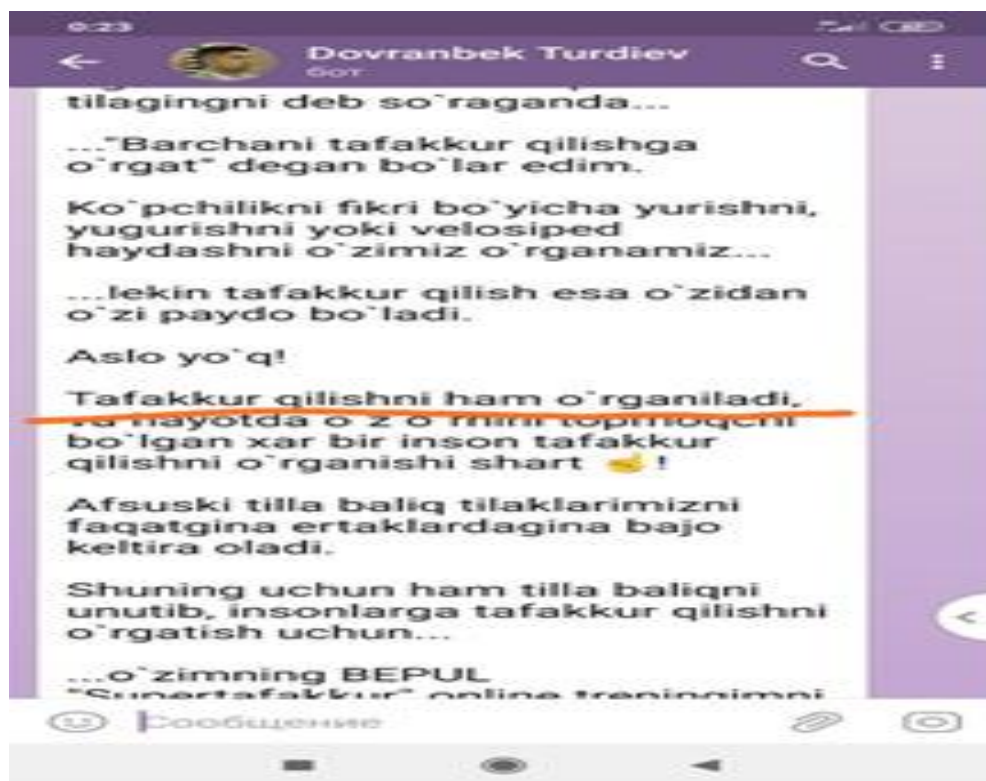

[From the group of the advice of advocate and lawyer]

Morphological Errors- Morphological errors are caused by incorrect word formation. The same errors can be occurred in internet texts. For example, *o'zgarishlarda-o'zgarishlarga*

(Group of the advice for young mothers)

Excessive use of suffixes of case causes morphological mistake. For example, *Tafakkur qilishni ham o'rganiladi* – *Tafakkur qilish ham o'rganiladi*. In this sentence suffix of objective is used in a wrong way.

[Davronbek Turdiev]

CONCLUSION

In my conclusion I can say that in order to prevent spread of culture against the culture which is being common among the youngsters, we should take into consideration of culture of global internet and its elimination. We cannot imagine our life without mass media, so it is no coincidence that third of the five initiatives launched by our President is dedicated to the organization of effective use of computer technology and the internet among the population and the youth. The so-called “World wild web” must be used appropriately and the culture of use must be observed every time. In XXI century we cannot imagine our life without internet. Because of that the President of the Republic of Uzbekistan SH.M. Mirziyoyev paid attention to the decree of “on measures to radically increase the prestige and status of the Uzbek language as the state language” and we should not do any morphological, phonetic, syntactic, orphographic, punctuation mistakes while dealing with papers. Furthermore, we should use Latin alphabet instead of Cyrillic. It is clear to all that young people are being lazy because of internet texts. It is no exaggeration to say that we have partially proved this by analyzing the texts of the telegram throughout our article.

ABSTRACT

This article analyzes tourism potential of Nurabad district that is located in the western site of Samarkand region. The SWOT analyses are used to determine and identify tourism potential of the destination. Moreover, the economic situation of the district and its tourism resources has been analyzed and golden opportunities to develop tourism industry with the base of tourism resources have been studied. Furthermore, article highlights that except cultural, historical and ecological tourism, the district has potential to develop other niche tourism market and attract various tourist segments.

KEYWORDS: *Tourist destination, Tourism potential, SWOT analyses, Samarkand region, Nurabad district, Tourism opportunities.*

INTRODUCTION

Samarkand is one of the most popular tourist destinations of the world, which was the main point at the crossroads of the Great Silk Road in history. The government of the Republic of Uzbekistan is paying a great attention to the development of tourism and hospitality industry in Samarkand region and adopting gradual decrees to improve tourism industry and to promote tourism attractiveness of the region. On June 30, 2017 The Cabinet of the Ministers of the Republic of Uzbekistan adopted the decree “About measures for accelerated development of tourism potential of Samarkand city and Samarkand region in 2017-2019”, where government focused on effective use of tourism resources of the region and to improve tourist facilities and infrastructure in the region [1]. Moreover, on September 30, 2019 the decree “About additional

measures for the effective use and development of tourism potential of Samarkand region” was adopted by The Cabinet of the Ministers of the Republic of Uzbekistan. In this decree the main focus was on the creation of modern tourism infrastructure and analyzing socio-economic situation and tourism potential of the region. Furthermore, approaches and action plans directed to effective use of tourism potential of the region were highlighted in the decree [2].

LITERATURE REVIEW

Tourist destinations may be defined in a variety of ways. According to the Dictionary of Travel, Tourism and Hospitality destination is a “geographic location to which a person is travelling” [3, p.165]. Dickman (1999) states that in the travel industry, a tourist destination refers to the five “A” main components: “attractions, access, accommodation, amenities, and activities” [4, p.118]. Morachat (2003) pluses some extra information to the definition of destination given by Dickman (1999) and says that a tourist destination must have all of these elements to some degree, although they need not be equally balanced on of the same quality and consistency for each potential destination [5, p.42].

It is obvious that destinations must have tourist attractions and resources which signify the tourism potential of the region. Tourism potential can be defined as the natural, man-made, cultural, historical, economic, and social components which show the potential tourist supply of a given area [6, pp. 50-54]. These factors, together with technical facilities and basic and tourism infrastructure, constitute the foundation of a tourist attraction for a given territory and help to deem the destination as either suitable or unsuitable for visiting and receiving visitors [7, pp. 183-186].

“Samarkand region is rich in tourism resources which create endless opportunities to develop cultural, sport, adventure, educational and eco-tourism” [8, p.22]. According to the statistics, in Samarkand located 1105 archeological, 670 architectural, 37 attractive, 18 monumental, 21 memorial, total 1851 tangible-cultural heritage objects [9, p.95].

Study Area

We chose Nurabad district of Samarkand region as a study area for our research which is located 55 km to the western side of the Samarkand city with total area 4 860 sq. km. The center of the district is Nurabad city. The total population is 147 256 people [10, p.5].

Figure 1 Geographic map of Nurabad district

The district was established in 1975 and there are 8 sub-districts (villages) in the area including: Nurdum, Djam, Djarkuduk, Norbulak, Tim, Sazogon, Ulus and Tutli.

METHODS AND METHODOLOGY

For better analyzing and understanding the tourism potential of the destination SWOT analyses is used in order to know the strong, weak points and to take into consideration further opportunities and threats. Usually, SWOT analyses are used in enterprises and companies to determine their power and weaknesses and future prospects. According to Stăncioiu (2009), SWOT analyses may be used also for a tourism destination as well, in order to take into consideration destination's tourism potential [11].

SWOT ANALYSIS OF THE DESTINATION

STRENGTHS	WEAKNESSES
<ul style="list-style-type: none"> ✓ An appropriate geographical location (along the Great Silk Road); ✓ Rich in architectural and cultural tourist attractions (Arab ata mausoleum is in the list of World Heritage Sites); ✓ Growing economy; ✓ Far from urbanism; ✓ Pleasurable weather and climate; ✓ Untouched natural resources; ✓ Regional and governmental support and cooperation. 	<ul style="list-style-type: none"> ✓ Poor infrastructure and tourism facilities; ✓ Lack of tourist accommodation; ✓ Lack of identity (website, image); ✓ Language barrier; ✓ Lack of marketing and promotion activities.

OPPORTUNITIES	THREATS
<ul style="list-style-type: none"> ✓ Investment opportunities; ✓ Collaboration with regional tourism stakeholders; ✓ Great opportunities to develop tourism industry; ✓ Opportunities to develop niche tourism markets (agritourism, star-gazing tourism services, rural tourism); ✓ Organizing various events in the open field. 	<ul style="list-style-type: none"> ✓ Environmental impacts of tourism; ✓ Socio-cultural impacts of tourism; ✓ Competition amongst other districts; ✓ Lack of funds for investing in further development of tourism industry.

The Pivotal Strength of the Destination

One of the vital strong points of the Nurabad district is its economic development. The economic situation of the district is stable and it is showing increasing results. Limited Liability Companies are dominating in the district amongst enterprises with total number 228, that is followed by private enterprises accounting for 228. It has to be mentioned that nominal average salary in the district is \$156, 3. The main business entitles of the district are agriculture and trade, that made up 27 % and 25 % respectively in 2019 (Figure 2).

Figure 2 Economic overview of Nurabad district [12, p.7]

Another strong point of the district is there are 50 archeological and 5 architectural and religious tourist attractions, overall 55 cultural heritages cites that are main resources of cultural, historical and architectural tourism [13, p.11]. The most significant architectural tourist site of the district is mausoleum of Arab ata which is able to attract both international and local Muslim visitors.

Arab ata mausoleum which is in the World Heritage list located in the south-eastern part of the district, in the village called Tim. This mausoleum is one square room that occupies 5,60 x 5,60 m. External sides of the mausoleum is 8,0 x 8,70 m. It is analyzed that proportional mechanism was used in the construction of mausoleum which can be clearly seen in façade of the building. The building style and construction is really the same with the mausoleum of Samanids that is located in Bukhara. Arab ata mausoleum keeps its uniqueness and represents type of portal-dome tomb and powerfully entered into the list of the foremost creations of the East. Indeed, the mausoleum is located on the route of the Great Silk Road [14].

Nature-based tourism resources	Cultural, historical and architectural tourism resources
1000 years old fir tree 	 Arab ata mausoleum (XI century)
Picturesque mountains 	Oq masjid (XII century) 
Small rivers (water streams) 	Hazrati Davud ((XVII-XIX centuries)) 

Figure 3 the main tourism resources of Nurabad district

The Golden Opportunities of the Destination

Except the cultural, historical and architectural tourism resources, there are golden opportunities to develop eco-tourism and agritourism in the district. There are all necessary natural and geographical prerequisites, including pleasurable climate, picturesque mountains, small rivers, 1000 years old fir tree, fruit and vegetable production fields that are basics of eco- and

agritourism. According to the statistics, agricultural sector has a great importance in the Nurabad district, accounting for 2,3 % of the region's gross yield of agricultural products [15, page 7].

Moreover, there is also an opportunity to develop recreational and health tourism on the base of available mineral sources (radon water) in the city of Nurbulak, which is widely used in the treatment of arthritis, sciatica, polyneuritis, chronic inflammation of the small intestine, chronic spondylarthrosis (inflammation of the spine).

Furthermore, various types of tourism activities can be organized in the district. For instance, most European tourists are eager to hiking and trekking and they prefer to spend their time in the heart of nature. It is possible to create special hiking trails and to promote it in order to attract tourists who love physical activities.

Indeed, the district is a wonderful and ideal place to organize star-gazing services that is becoming popular in recent years. As a result of urbanization and high rate of air pollution in major cities, contemplating the stars in a pitch-black sky is fast becoming a rarity that tour operators are banking on as a new selling-point. Well-known astronomer and director of the Stars without Borders workshop Harald Bardenhagen stated that "many Europeans have never seen accurately the Milky Way" [16]. Today, most tourist destinations have already organized the proper facilities for this service (Oman, Iceland, Namibia, Norway, Chile, the Canaries, Jordan, Scotland, Swiss Alps, Southampton) [17] and seeing it as a perspective direction in tourism. We also can organize and offer this service for tourists, since we have a clear "open sky" without smokes and harmful gases.

The Main Weaknesses

Region has weaknesses that are main obstacles to the development of the tourism industry in the district. The most crucial problem that should be tackled is bad infrastructure and tourism facilities. Another important one is unfamiliarity of the district for tourism because of less efforts and actions in destination branding. Moreover, language barrier is also an issue which is lowering the development of the district as a tourism destination.

Threats

Environmental degradation and adverse socio-cultural impacts of tourism development, increased competition between other districts of the region and less attention and regional support are the threats to the further development of the tourism industry in the region.

CONCLUSIONS

Taking into consideration all aforementioned thoughts, it can be said that Nurabad district is one of the most appropriate destinations of Samarkand region to develop tourism. The district carries golden opportunities to develop cultural and historical tourism. Indeed, niche tourism market can be developed through establishing infrastructure and tourism facilities in the district. Government has to pay attention to reconstruct tourism attractions of the destination and should allocate the fund to increase socio-economic living standard of areas where tourism resources are located. Moreover, regional tour operators have to think about creating new tour products and travel trails which leads tourists to the district. Forming tourism cluster based on available resources can be one of the important factors of economic development in the Nurabad district

and will contribute to raising the income level of the rural population, providing employment, and developing social and engineering infrastructure in rural areas.

ABSTRACT

The article deals with the processes of turbidity, infiltration and sedimentation of mud, the annual volume of turbidity in the water intake without a dam from the Amu Darya to the Amu-Bukhara Canal. It is established that the decrease in water consumption, turbidity and transparency of the flow along the length of the intake channels is mainly due to the level of water consumption, turbidity of the river and the amount of water flowing through the main ABMC facility. As a result of the reconstruction of the main structure and the ABMC canal with the widespread use of hydro-mechanization devices, it became possible to carry out such water consumption. As the volume of water intake increased, so did the amount of turbidity that came

with the water. A large amount of floating and attracting silt coming from the river will sink into the channel bed, reducing the living cross-section and carrying capacity of the channel.

KEYWORDS: *Amu Darya, channel, river, muddy, water, flow, level, flow, structure, water velocity, muddy subsidence. The Amu-Bukhara machine canal is the main source of irrigation in the Bukhara and Navoi regions of the Republic of Uzbekistan and the Farob district of the Lebap region of Turkmenistan. Over the years of operation, the water flow through the channel has increased several times and now reaches 400 m³ / s.*

INTRODUCTION

As a result of the reconstruction of the main structure and the ABMC canal with the widespread use of hydro-mechanization devices, it became possible to carry out such water consumption. As the volume of water intake increased, so did the amount of turbidity that came with the water. A large amount of floating and attracting silt coming from the river will sink into the channel bed, reducing the living cross-section and carrying capacity of the channel. To maintain the necessary culvert capacity of the channel, the service service has to hire a large number of different tanks and various dredgers for timely cleaning and self-leveling work from the entrance along the length of the water intake channels to the ABMC. the main object. The length of the intake channels varies significantly throughout the year and from year to year, depending on the water content of the year and the location of the river fairway. Sometimes the length of water intake channels in winter increases from one hundred meters to several kilometers. Continuous cleaning of the Amu-Bukhara canal

Fig. 1-Dredger in the ABK-1 channel

Based on the research materials, the analysis of seepage and subsidence of silt in the water intake channel 1 of the ABMC was carried out. The measurement data show that a sharp decrease in turbidity and a decrease in the degree of sedimentation of the flow is observed in the area from the entrance to the water intake channel No. 1 to the main sediment. There is also a decrease in the flow rate with a sharper decrease in the initial sections of the channel. The reduction of water consumption, turbidity and transparency of the flow along the length of the intake channels mainly depends on the level of water consumption, turbidity of the river and the amount of water flowing through the main ABMC facility. The amount of floating silt along the length of the

ABMC water intake channel No. 1 is shown in Table 1. As can be seen from this table, the reduction in water turbidity and the transparency of the flow depend mainly on the amount of water extracted. The water flow rate also depends on the length of the intake channel.

1. Months	2. January	3. February	4. March	5. April	6. May	7. June	8. July	9. August	10. September	11. October	12. November	13. December
14. Amount of 15. turbidity m3	16. 7134	17. 11161	18. 23085	19. 32950	20. 31124	21. 55897	22. 91971	23. 51260	24. 16040	25. 7087	26. 5098	27. 6057

Clay particles of floating drilling mud <0.005 mm increase from 15% to 36% from the entrance to the main ABMC facility. $D = 0.05$ dust particles of floating drilling mud also increase from 38% to 66% from the entrance to the main ABMC object. In contrast, sand particles with $d = 0.05-0.25$ mm decreased from 3% to 71%, while turbidity particles $d > 0.25$ mm decreased from 1.3% to 0.15%. No. 1 the accumulation of a large amount of muddy sediments along the water intake channel led to the forced departure of the fairway of the river to the left. Thus, as a result of the increase in water intake from the Amu Darya to the ABMC, large channel deformations occurred in the catchment area. An analysis of the results of monitoring the volumes of water intake, solid runoff and treatment in 2017 at the ABMK main site showed that the maximum of these indicators, according to Table 1, falls on May, June, July and August.

ABSTRACT

This article provides information on the stages of the ontogenetic period of the medicinal plant Scutellaria comosa Juz. In the course of laboratory observations, the features of the latent period of the plant were studied. Such features include the formation or loss of individual organs, the growth of the branch, the nature of branching, the degree of development of the surface mass, the number of vegetative and generative branches, the proportions between the height and diameter of the plant.

KEYWORDS: *Ontogeny, Vegetation, Latent, Virgynyl, Juvenile, Generative, Subsenile, Ecological, Coenotic, Ontogenetic.*

INTRODUCTION

Due to the sharp increase in demand for natural medicinal plant products, their reserves in nature are decreasing. Therefore, it is an important urgent task to study the biological foundations of the process of their restoration in nature, the use of their reserves on a scientific basis. An important indicator is the study of the formation of the place of plant cover, especially in populations scattered in their various ecological environments. Because the main indicator that determines

the position of the plant in the plant cover is their senopopulation state, that is, the property of pressing the periods and stages of ontogenetic development. Therefore, without analyzing the plant species from a senopopulatory point of view, it is impossible to draw a fully scientifically based conclusion about its role in the plant cover, the state of recovery and the use of their reserve.

Natural resources are declining due to a sharp increase in demand for natural medicine products. To do this, it is possible to study the biological basis of regeneration in nature, the scientific basis for the use of their sources. Special conditions have been created to implement the accelerated operation of populations living in different ecological environments. Because the main indicators of the role of operations in the vegetation were the state of senopopulation, the transition to the main ontogenetic treatment processes and processes. On this basis, without analyzing the types of work in terms of senopopulation, it is impossible to draw complete scientific conclusions about its role in the overall movement, the state of recovery and the use of their reserves.

OBJECTS AND METHODS OF RESEARCH

One such plant is *Scutellaria* L., a source of new drugs. Propagation is the reproduction of a plant from seed. Seed propagation techniques are widely used in world practice to propagate perennials and restore their natural aging. The biology of seed germination includes many factors, the main components of which are exogenous (temperature, humidity, light, storage conditions) and endogenous (structure of the seed coat, physiological state during germination). Based on these components, exogenous, endogenous, and mixed sleep patterns are distinguished in seeds.

From this point of view, the study of the biomorphological properties of *Scutellaria comosa* in nature has an important scientific and practical significance.

Scutellaria comosa Juz.- *Scutellaria* is a small shrub of the Lamiaceae family and is a promising medicinal plant. Valuable medicinal flavonoids, glycosides were isolated from species belonging to the genus *Scutellaria* L. (3: 110). In Uzbekistan, a number of scientific studies have been conducted to study the biomorphological properties of perennial grasses, shrubs and shrubs living in nature and in cultivated conditions [4,7]. However, research on *Scutellaria comosa* is insufficient [8].

Ontogenetic groups were identified taking into account the additions of A.A. Uranov (1975) and his students (Plant senopopulation, 1976, 1988). The type of ontogeny has been established based on the classification approaches of ontogeny of perennial plants (Zhukova, 1987, 1995). Ontogeny has been described in a variety of ecological and cenotic conditions. More than 1000 herbarium specimens were analyzed and 100 plants were obtained for quantitative description of ontogenetic conditions.

The data were processed statistically: arithmetic mean, its error, minimum and maximum values of functions, calculated using a computer program. When comparing the values of biometric parameters of plants in different habitats, values with significant differences on the Student's t-test (95% significance level) were used (Zaysev, 1984). A standard table (for $n \leq 0.05$) was used to calculate the critical values of the student t-test (Milnikov, 2007).

In determining the ontogenetic structure of plant senopopulations, the criteria of their periods and stages, O.B. Smirnova et al (1993), L.A. Zhukova (1987, 1995) methods were used.

RESULTS AND DISCUSSION

According to the study of the stages and stages of ontogeny of plants, the duration of the juvenile phase is 35-40 days, and the immature phase is 45-50 days. The total duration of the virginil period is 1-2 years and the generative period is 10-16 years.

(TABLE 1). THE DURATION OF THE ONTOGENETIC STAGES OF SCUTELLARIA COMOSA

Plant ages and stages	Duration per year (days)	Year duration
Latent period		
Virginil period	146 - 165	1 - 2
Lawn stage	16 - 20	
juvenile stage	35 - 40	
immatur stage	45 - 50	
virginil stage	50 - 55	
Generative period	58 - 75	10-16
Subsenyl period	20 - 28	3 - 6

Observations of the stages of *Scutellaria comosa* ontogeny (n = 100 in several plants) resulted in the termination of vegetation during the virginil period in the first year, and in the second year, 10–12% of plants entered the generative period. In the third year of development, the transition of the tubers to the young generative stage is 85-95%. The major life cycle of *S.comosa* ontogeny lasts 14–24 years.

The ontogenesis of the species has been studied in a group of evergreen-stone-wormwood plants found in the stony-gravel soils of the hills of Damkol village, Fergana district, Fergana region. The morphological features of the plant, which change with age, allow us to study different age conditions. Such features include the formation or loss of individual organs, the growth of the branch, the nature of branching, the degree of development of the surface mass, the number of vegetative and generative branches, the proportions between the height and diameter of the plant. According to the classification of S.V. Yuzepchuk (1954), *Scutellaria* species are perennial, orthotropic, anisotropic polycarp, chamefite plants [3].

Based on generally accepted classifications in the study of the major life cycle of *S. comosa*, we will consider the following periods and stages:

In the ontogenesis of *S. comosa*, 4 age periods were distinguished: latent (seeds), virginil (r - grass, j - juvenile, im - immature, v - virginil), generative (g1 - young generative, g2 - medium generative, g3 - old generative), subsenil (ss- senil).

Figure 1. Scheme of ontogenetic cycles of *Scutellaria comosa*

Latent period

One of the main factors determining the regeneration of a plant in the vegetation is the biological properties of its seed state. In order to study the biomorphological characteristics of the seeds of *Scutellaria comosa*, the seeds of medium generative stage growing in the hills around the village of Damkol, Fergana district, Fergana region were used. [7]. The soil of these hills is gray soil, the annual rainfall is 240-250 mm.

It is known that seed yield depends on a combination of internal and external factors. Internal factors include, first of all, the number of sperm in the node, hormonal balance, transport of certain elements, and external factors - the genotype that determines the weather conditions of a particular season and agrophone (Levina, 1980). Potential and actual seed productivity, as well as fertility, reflect the suitability of biological characteristics and living conditions of the population. [5].

Weather conditions during the growing season are important for the productivity of *Scutellaria comosa* seeds. Seed yields increase in favorable weather conditions and decrease in adverse weather conditions. The following indicators were recorded for the growth period in 2018-2019: the average number of seeds in a walnut is 2.7 ± 0.005 , the average number of generative branches in a single plant is 6.73 ± 0.03 formed. [4].

One of the main indicators of the suitability of growing conditions for the biological needs of a species is the presence of seeds. Seed productivity is a quantitative and seed germination is a qualitative feature of a seed. Seed germination is the process by which a seed emerges from a dormant state and sprouts from a vegetative growth sprout. Seed quality is determined by seed size, 1000 seed weight and germination [2].

The seeds of *Scutellaria comosa* are flattened, ovate, 1-1.5 mm long, elliptical in cross section. The color is gray, slightly darker. In order to determine the absolute weight of the seeds, 20 plants of almost the same age of middle generative age were selected and harvested in late September 2018. After the seeds were separated from the fruit, they were counted 5 times out of 1000, and the average weight when weighed was 1.1 g.

Fertility of *Scutellaria comosa* seeds in the laboratory was determined on the basis of the method of MK Firsova at temperatures of $+20^{\circ}$, $+25^{\circ}$, $+30^{\circ}$ [8].

Experiment 100 seeds were placed on Petri dishes and 3 experiments were performed on each temperature indicator. According to the experiment, the maximum forgetfulness of *Scutellaria comosa* was 65.5% at $+25^{\circ}$.

TABLE 2 SEED GERMINATION OF SCUTELLARIA COMOSA IN LABORATORY CONDITIONS (N-100)

T ⁰ C	Days										%
	1	2	3	4	5	6	7	8	9	10	
	1.09.	4.09.	6.09.	8.09.	10.09.	12.09.	17.09	20.09.	25.09.	30.09	
20 ⁰ C	0	2	6	18	32	52	52	55	57	58	58
25 ⁰ C	0	4	10	22	38	56	60	63	64	65	65
30 ⁰ C	0	3	8	19	35	55	59	60	61	61	61

Seed germination capacity was 20⁰-30⁰ 14%. The dormancy period of *Scutellaria comosa* seeds was short, the germination of seeds obtained at the end of September 2018 was 65%, after one year of storage it decreased sharply to 17.6%, and two years later to 2.4%. Therefore, it is recommended to use freshly harvested seeds in the organization of artificial plantations of *S. comosa* [6].

Figure 2. Germination of *Scutellaria comosa* seeds

In order to determine the germination rate of *Scutellaria comosa* seeds in the field, the seeds collected in late September 2018 were sown in a specially prepared experimental field in October, November and March and April 2019. To do this, the soil was loosened and leveled to a depth of 30 cm, and furrows 40 cm wide were taken and 100 seeds per 2 meters were sown 3 times at a depth of 0.5-1 cm. The yield of *S. comosa* in the field was 40.5% in October, 37.8% in November and 43.8% at the end of March next year. Therefore, it is advisable to sow the seeds of *Scutellaria comosa* in the spring in March-April.

In order to determine the role of the latent period in the natural regeneration of *Scutellaria comosa* in the vegetation, the seeds of the plant were found in the soils of Damkol village of Fergana district and Gozalobod village of Turakurgan district of Namangan region. stock was analyzed. For this purpose, in November 2018 and April 2019, an area of 1 m² was identified around the plants belonging to the middle-aged generative stage, and seed reserves were studied in 5 cm thick soil. For this purpose, the soil sample was washed through a special sieve and divided into fractions. It was found that soil samples with a diameter of 0.5-1 mm sieve contained an average of 60-65 seeds per 1m² in November, and 20-25 seeds in the sample taken in April.

From the data obtained, it can be concluded that the germination of *Scutellaria comosa* seeds lasts from 1 to 5-6 months, after which they germinate. This means that the seeds of *Scutellaria*

comosa spend the dormant period in two different environments, that is, the seeds that ripen during September and survive in the construction of the shed and the generative stem, live in February-March next year.

Analysis of the plant's seed stock in the soil showed that the degree of natural regeneration in the vegetation cover, perennial shrubs that dominate the vegetation cover: *Kochia prostrata* (L.) Schrad., *Artemisia sogdiana* Bunge, *Perovskia angustifolia* Kudrjasch., *Convolvulus hamadae* (Vved.) Petrov, *Lagochilus platycalyx* Schrenk, perennial grasses: *Haplophyllum pedicellatum* Bunge, *Ferula lipskyi* Korovin, *Capparis spinosa* L., *Poa bulbosa* L. and annual grasses: *Delphinium rugulosum* Boiss., *Glaucium fimbriigerum* Boiss., *Erodium cicutarium* (L.) L'Her., *Avena fatua* L., *Ziziphora tenuior* L. were found to be lower than larvae [1].

CONCLUSIONS

Therefore, the organization of the *Scutellaria comosa* reserve is carried out in two directions, firstly, the creation of a protection zone in its natural growing areas, and secondly, special planting and reproduction in forestry.

From the results it can be concluded that *Scutellaria comosa* is a promising medicinal plant, the scientific study of its ontogenetic periods and stages is necessary for its natural regeneration and organization in artificial plantations.

ABSTRACT

Methods of using innovations and technologies of competent development in the development of modern pedagogical skill; Acquaintance with the content of theoretical sources showed that there are a number of contradictions in the development of professional competence of teachers in the education system, in particular: among the traditional and innovative methods used in the process of developing the professional competence of the pedagogical specialist; between the mechanism and the laws of development of the process of professional development of the pedagogical specialist with the activity of educational institutions aimed at pedagogical support in the development of the teacher's personality and his professional competence.

KEYWORDS: "Innovation", "Pedagogical process", "case study", "competence".

INTRODUCTION

Our society needs professionals with deep knowledge, skills, ability to make quick and constructive decisions. Therefore, the person-centered interaction between teacher and student has become an important aspect of the educational process, in which the improvement of educational technologies plays an important role. The use of innovative technologies in the educational process helps to improve the quality of training and enhance the role of independent work of students. The introduction of innovative teaching methods in the development of professional competencies of the future specialist will lay the foundation for his future competitiveness in the labor market. Innovation or renewal is inherent in any professional activity of a person. Innovations do not appear little by little, they are among the results of scientific research, advanced pedagogical experience.

The concept of "innovation" means "renewal, innovation, change" in Latin Innovation in the pedagogical process means the introduction of innovations in the goals, content, methods and forms of education, the organization of joint activities of teacher and student. Today, it is

innovation in pedagogy that is becoming the most effective means of increasing the effectiveness of education. Problem-based learning technology, which is gaining popularity today, involves the independent performance of cognitive, creative tasks by increasing knowledge and skills, encourages students to form a certain system of actions, and creates a creative environment in communication. Problem-based learning technology can be implemented in the following stages:

1. Identify the problem that occurred in a given situation (situation).
2. Situation analysis, problem statement.
3. Find a solution to the problem.
4. Determine if the solution is right or wrong

Teaching and student participation in problem-based learning technology is reflected at the following levels:

1. The teacher identifies the problem with the students, finds a solution and discusses it.
2. The student finds little solution to the problem posed by the teacher, and the teacher only gives him direction.
3. The student finds the problem independently; the teacher helps him to find the solution.
4. The student is less likely to identify the problem and find a solution to it independently.

This level is called the "case-study" method of problem-based learning. The use of research methods in problem-based learning technology also develops students' independent thinking. In it, the student expands his knowledge a little, organizes and applies scientific methods, searches for information, sorts it, plans it.

In order to ensure the implementation of the Decree of the President of the Republic of Uzbekistan dated November 6, 2020 No PF-6108 "On measures to develop education and science in the new period of development of Uzbekistan" (hereinafter the Decree):

1. Ministry of Preschool Education:

- a) together with the Ministry of Public Education and the State Inspectorate for Quality Control in Education to take measures to ensure free one-year compulsory primary education for children by August 1, 2021 and to ensure the coherence of primary education curricula;
- b) Together with the Ministry of Information Technologies and Communications Development, the State Inspectorate for Education Quality Control and other relevant ministries and agencies to introduce modern forms of teaching, new pedagogical and information technologies in the preschool education system by January 1, 2022, including: on the basis of international standards and requirements to develop criteria and indicators for assessing the development of children of preschool age; to launch the information management system "Kindergarten" on monitoring of growth of children and coverage of preschool education and to provide transparency of the data entered in it; to introduce electronic payment systems for preschool education services; integrate the information management system in the field of preschool education with the information systems of other ministries and departments.

Acquaintance with the content of theoretical sources showed that there are a number of contradictions in the development of professional competence of teachers in the education

system, in particular: among the traditional and innovative methods used in the process of developing the professional competence of the pedagogical specialist; between the mechanism and the laws of development of the process of professional development of the pedagogical specialist with the activity of educational institutions aimed at pedagogical support in the development of the teacher's personality and his professional competence; in the midst of insufficient use of opportunities for integration of teachers of pedagogical disciplines with general and specialized disciplines in the development of personal and professional competence; scientific and technological progress, the growing demands of a renewed society for a skilled educator, and the unwillingness of teachers to operate in the context of the gradual development of a major part of their professional competence development.

One way to overcome such contradictions is to develop the professional competencies of future professionals. Development of professional competence of specialists, creation of pedagogical conditions necessary for ensuring their professional and personal development in the system of advanced training, retraining and advanced training of specialists.

Concept of development of teaching technology in preschool, general secondary, vocational and higher education systems of the Republic of Uzbekistan Concept of Development Strategy of the Republic of Uzbekistan until 2035, PF-5712 of April 29, 2019 and September 6, 2019 on approval of the Concept of development of public education of the Republic of Uzbekistan until 2030 PF-5812 on additional measures to further improve the system of vocational education and the Concept of Industrial Development of Uzbekistan until 2025 and the implementation of the tasks set out in the Address of the President of the Republic of Uzbekistan to the Oliy Majlis on January 24, 2020.

Defines the main goal of developing the competence of the specialist by modernizing the content and structure of education, determining the psychological and pedagogical conditions and developing a mechanism for monitoring and evaluating its quality. Development of professional competence of specialists, creation of necessary pedagogical conditions for their professional and personal development in educational institutions, modernization of the content and structure of retraining, definition of pedagogical-psychological conditions and development of a mechanism for quality control and evaluation defines the main purpose. If we look at the origins of the concepts of "competence" and "competence", we can understand that they did not arise by chance. In the explanatory dictionary of the Uzbek language "Competence" (lat. Sompetere worthy, worthy):

1. The scope of powers of a particular body or official, defined in official documents; authority.
2. A person's awareness of a field means the level of knowledge of that field. For example, the concept of "competence" is defined in the Kazakh dictionary as follows: "generally the ability to perform a certain task or to do something."

One way to overcome such contradictions is to develop the professional competencies of future professionals. The conditions for the development of professional competence of specialists, the creation of the necessary pedagogical conditions for their professional and personal development in the system of advanced training, retraining and advanced training of specialists are being created.

ABSTRACT

Researchers concerned with the digitalization of the K-12 school have contributed insights and understanding of what an increased uptake and use of digital technology in school has meant in terms of possibilities and challenges for school leaders, teachers and students (Olofsson et al. 2015; Nordén, Mannila, and Pears ; Willermark). In this article, the focus is on a central aspect of the digitalisation of the K-12 school – digital competence – and specifically teachers’ digital competence (Krumsvik et al. 2016). In Sweden, the question of digital competence has been put in the spotlight due to the national strategy for the digitalization of the K-12 school system launched by the Swedish Government in 2017 (Government decision I:1, supplement). The strategy consists of three focus areas: (1) digital competence for all in the school system, (2) equal access and use of digital technology and (3) research on and follow-up of the possibilities of digitalization. In the strategy, adequate digital competence is used in relation to children and students and is said to be a concern for everyone in the school system, i.e. children, students, teachers, school leaders and other members of staff. The strategy has led to changes in the curriculum for the compulsory school, preschool class, school-age educare and upper secondary school. According to the Swedish National Agency for Education , digital competence can be divided into four areas: (a) to understand the impact of digitalization on society, (b) to be able to use and understand digital tools and media, (c) to develop a critical and responsible approach and, finally, (d) to be able to solve problems and translate ideas into action. In the national strategy, children’s and students’ digital competence is discussed in terms of “adequate digital competence”. It may therefore be reasonable to expect teachers’ and school leaders’ digital

competence to be discussed in the same terms, although this is not the case in the strategy. However, in earlier preparatory work, the notion of “adequate digital competence” is discussed in relation to children and students and teachers and school leaders (The Swedish National Agency for Education. Here, we argue that it is reasonable to expect that teachers and school leaders will also need to have some kind of “adequate digital competence” in order to be able to support children’s and students’ development at their “level” of “adequate digital competence”.

KEYWORDS: *Children’s and students’ digital competence, Information and data literacy, (b) Communication and collaboration, (c) Digital content creation.*

INTRODUCTION

In a recent study, Fransson, Lindberg, and Olofsson (2018) analyzed the Swedish national strategy for the digitalisation of the K-12 school system with the aim of teasing out the possible meanings of adequate digital competence at a conceptual level. The authors mean that in the strategy the notion “adequate” appears to be both vague and wide, that it can be understood in relation to most aspects of education and thereby be difficult for stakeholders in school to contest or even neglect. The authors conclude that the notion of “adequate” needs further interpretation and discussion, with empirical resonance from school and different representations of how teachers’ adequate digital competence is displayed in practice. Therefore, in this article, the focus is on teachers’ adequate digital competence – in policy and practice – with an aim to explore how enacted digital competence in three Swedish upper secondary schools appears, and thereby provide an empirical account of what “adequate” might mean in practice.

With this approach, this study also contributes to an understanding of how policy is interpreted, transformed and enacted (Ball, Maguire and Braun 2012). In such policy-formation processes, opportunities for different actors to be involved and display agency are important. As agency reflects “the capacity of actors to critically shape their own responsiveness to problematic situations” (Emirbayer and Mische 1998, 971) it should be viewed as something that is achieved rather than given; Agency is achieved in relation to structural conditions, local circumstances, values, personal efforts and resources. Personal resources can be experiences, skills, knowledge about context and how policy operates, or how to perform micro-political negotiations (Kelchtermans 2007). In this article, the resources mainly refer to digital infrastructure and teachers’ competencies, values and experiences related to digital technologies. Hence, teachers’ resources for displaying agency in certain contexts can help to explain what adequate digital competence might mean and consist of and to understand how the notion of “adequate” is used in policy and practice.

The empirical data utilized in this article consists of four narrative sub-case descriptions based on observational data and interviews with 25 upper secondary school teachers in Sweden concerning aspects related to equal access to and use of digital technologies. The sub-case descriptions explore what adequate digital competence in three upper secondary schools in Sweden might mean and how it is enacted. The reason for only addressing this second area is due to the many alignments between its content and suggestions and upper secondary teachers’ everyday lives in school, where digital technology is used for teaching, learning and administration. Hence, with the intention of creating a framework for the narrative case

descriptions that appear later in the article, we first present possible ways of describing teachers' digital competence, including how it is developed and enacted in school.

Teachers' digital competence

"Digital competence" is a concept that seems to be elusive, in that the preconditions, opportunities and challenges, as well as the contextual and societal circumstances, change. The concept can be used differently in different contexts and by different actors. It also seems to depend on what someone wants to highlight, or whether it is conceptualised in a narrow or wider sense. However, efforts have been made to describe what it could mean. For instance, in the DigComp project, five areas of digital competence are identified: (a) information and data literacy, (b) communication and collaboration, (c) digital content creation, (d) safety and (e) problem solving (Carretero, Vuorikari, and Punie 2017). The authors discuss these areas in relation to eight levels of proficiency in order to discern how digital competence could be played out with various levels of proficiency by various actors in different contexts. In the educational context, the DigCompEdu framework for educators (Redecker 2017) is proposed as a "framework for the development of educators' digital competence in Europe" (7) The framework focuses on six areas: (a) professional engagement, (b) digital resources, (c) assessment, (d) teaching and learning, (e) empowering learners and (f) facilitating learners' digital competence, and relates to six levels of proficiency, from newcomer to pioneer. The DigCompEdu framework draws on competences claimed to be of importance for teachers. This can be illustrated by the area of "digital resources", which highlights competences such as identifying, assessing and selecting digital resources, creating, modifying and managing digital resources, safety, protecting resources and information and sharing digital resources safely, correctly and in accordance with copyright rules.

Further, based on a literature review of 76 educational research articles concerning digital competence, Ilomäki et al. (2016) describe digital competence as the skills and knowledge that citizens need to take part in and contribute to a digitalised knowledge society. However, they also contend that despite their current definition, digital competence is a concept that still needs to be more clearly defined (cf. Pagani et al. 2016). This is interesting, especially considering the vague description of adequate digital competence reported on in this article (see Fransson, Lindberg, and Olofsson 2018). In another literature review, Pettersson (2017) describes that teachers' digital competence is not only something for the individual teacher to take responsibility for, but should be seen as part of a school's digitalisation process (cf. Fransson et al. 2019; Pettersson et al. 2019). Pettersson's (2017) conclusion finds resonance in From's (2017) work and his argumentation for "pedagogical digital competence" (PDC) in educational contexts and activities. According to From (2017), PDC comprises three interrelated levels – a micro-level (interaction level, pedagogical interaction with students), a meso-level (course level, design and implementation of courses as well as the infra-structure of education) and a macro-level (organisational level, educational management and the development of the organisation). The importance of the school organisational level for teachers' development of digital competence is also highlighted in the Norwegian "SMIL study", which focuses on the use of ICT in upper secondary schools in Norway and involved 2477 teachers. In this study, Krumsvik et al. (2016) conclude that education authorities need to "... implement strategies that support vulnerable teacher groups in order to increase their individual digital competence (e.g. through continuing ICT education)" (160).

According to Krumsvik (2008), Krumsvik (2014), the why, what and how questions in teaching are generally related to the concept of digital competence and specifically to teachers' pedagogical use of digital technologies. Krumsvik (2008) describes teachers' digital competence as "the teacher/TEs' [teacher educators'] proficiency in using ICT in a professional context with good pedagogic-didactic judgement and his or her awareness of its implications for learning strategies and the digital Bildung of pupils and students" (283). However, matching the description offered by Krumsvik (2008) seems challenging for teachers – both with regard to their own level of digital competence (Olofsson, Lindberg, and Fransson 2017; Sipilä 2014) and when organising learning activities for students' own development of digital competence (Lindberg, Olofsson, and Fransson 2017; Voogt et al. 2013). For example, in a Nordic action research project on the development of teaching in and for a digitalized school, Willermark (2018) shows that teachers are required by school leaders to develop the digitalized classroom, but at the same time are often left wondering what should be developed and how this should be done. Based on the results of a study of Swedish teachers' use of thematic Face book groups, Lantz-Andersson et al. (2017) suggest that answers to such "didactic questions" in a digitalized school context can be sought through social media and that participation in self-organized online learning communities with other teachers can be a rewarding way of continuous professional development (CPD) activity. However, in a Swedish study in an upper secondary school context, Lindberg, Olofsson, and Fransson (2017) argue that teachers often find it difficult to keep pace with the rapid development of digital technology and that the time allowed for CPD to deepen their digital competence, including the practical use of digital technology, is limited. In another Swedish study, teachers' self-efficacy related to the Dig Comp project's five areas of digital competence were researched and the results showed that there was a large spread in the 530 participating teachers' self-efficacy (Mannila, Nordén, and Pears 2018). Higher self-efficacy was related to information and data literacy, while they seemed less confident with competencies relating to copyright, licences and programming. Drawing on the results of a Australian study on the use of digital technology in secondary schools, Bulfin et al. (2016) maintain that it is important for teachers to develop digital capacity and be " ... active in seeking to assume an expert role where appropriate, and to take a lead in positively shaping students' exposure to digital technology" (250).

To sum up, research on teachers' digital competence shows that there are challenges related to (a) defining digital competence in educational policy and practice, (b) teachers' current levels of digital competence and the time and contexts for CPD and (c) the degree of readiness at an organizational level for the digitalized school. In short, although the challenges are different in character, there is a common need for additional research-based knowledge. The intention with this article is to contribute knowledge gleaned from the everyday lives of teachers in three upper secondary schools in Sweden. However, before giving an account of the empirical data, the Swedish policy document relating to adequate digital competence in K-12 schools that was launched in October 2017 is presented.

The question of digital competence has recently been moved higher up on the Swedish political educational agenda, mainly due to the national strategy for the digitalisation of the K-12 school system launched by the Swedish Government. The strategy consists of 14 condensed pages divided into three focus areas: (1) digital competence for all in the school system, (2) equal access and use and (3) research and follow-up of the possibilities of digitalization. In the

strategy, digital competence is often formulated as adequate digital competence that is said to frame the future work in school. On page 7 of the strategy, the reason given is that “... adequate digital competence is also used to indicate that it is impossible to specify an absolute level of digital competence when it successively needs to be developed in relation to society’s requirements and children’s and students’ prerequisites” (Government decision I:1, supplement, 2017).

This article explores the possible meanings of the notion of “adequate” in the strategy by expanding the discussion in the above mentioned article by Fransson, Lindberg, and Olofsson (2018). This is done by using our research-based understanding on the preconditions and activities in three schools in which the teachers display and enact digital competence. We apply this understanding in a reflective reasoning on how the teachers and their students develop digital competence and what the notion “adequate” could mean in the context of the strategy’s second focus area of equal access and use. This is done by using observational data and interviews with 25 teachers giving account for the existing local educational practices in three upper secondary schools in Sweden as preconditions for the possible integration and enactment of adequate digital competence in the respective schools. The teachers’ views have been read in relation to the goal stated in the strategy’s second focus area, which is that: “Children, students and staff should have good and equal access to digital tools and resources in order to improve the education and make it more effective” (Government decision I:1, supplement 10, 2017). This goal is further divided into the following sub-goals: (1) children, students and staff who work with children and students should have access to digital tools based on their needs and prerequisites, (2) appropriate infrastructures and technological and pedagogical support should be in place, (3) the digital learning resources that are used in the teaching should be appropriate and result in the technology being used effectively and (4) digitalisation should be used to simplify the staff’s work situation in relation to teaching and administration issues. Within the scope of this article it is not possible to describe the four sub-goals in detail or even to provide a URL link, since the strategy is only available in Swedish. However, three quotations relating to each sub-goal have been translated into English in order to illuminate the characteristic rhetoric in the strategy’s second focus area (6–13).

Sub-goal 1- Children, students and staff who work with children and students should have access to digital tools based on their needs and prerequisites: (a) “Considering the demands placed on staff in the educational system who work with children and students to use digital technology in teaching and administration, it is important that these staff have a good access to digital tools”, (b) “... the general access to digital tools and the use of them amongst children and young people differs according to socioeconomic background and other demographical variables. This underlines the importance of the educational system giving all children and students equal opportunities to use digital tools and to develop their digital competence”, and (c) “In order for digitalisation to have any effect it is important that the responsible authority is active in the development and for example formulates local strategies that connect to national strategies and goals”.

Sub-goal 2 – Appropriate infrastructures and technological and pedagogical support should be in place: (a) “The technology should not constitute an obstacle for a good education. Support functions must be available in order to guarantee interruption-free connexions and that digital tools and other IT equipment works so that the teaching can be pursued without technology-

related disturbances”, (b) “It is important for the responsible authority to guarantee that in addition to access to digital tools there is an appropriate and functional infrastructure for the use of digital learning resources as well as school administrative system solutions” and (c) “It is important at the local level to ensure that an appropriate infrastructure is in place with regard to access to a wireless network, sufficient broadband capacity and access to other relevant equipment, as well as access to educational support”.

Sub-goal 3 – The digital learning resources that are used in the teaching should be appropriate and result in the technology being used effectively: (a) “Not only is access to digital tools required in the teaching, but also competence to choose the correct tools and knowing how to use them”, (b) “Digital learning resources and their use in the teaching can develop the teaching and contribute to children’s and students’ knowledge acquisition” and (c) “It is therefore it is important that there is a development and supply of digital learning resources of a high pedagogical, interactive, visual and scientific quality and that fulfil the stated availability requirements”.

Sub-goal 4 – Digitalisation should be used to simplify the staff’s work situation in relation to teaching and administration issues: (a) “Through digitalisation tools and methods can be developed that facilitate the staff’s administration, planning, implementation, follow-up, and evaluation of the teaching. In this respect, the potential of digitalisation must be realised”, (b) “Working environments with for example badly functioning digital tools, system solutions or internet connexions risk leading to an increased administrative burden for preschool teachers, teachers and other staff as well as for preschool school managers and principals” and (c) “The digital solutions that are introduced should be user friendly and make the work more effective. Content and methods should be developed for and adapted to work in a digital environment. Another important component is the access to suitable digital tools in order to follow children’s and students’ development and to analyse the teaching with a view to improving it”.

The next section describes how the content in the second focus area of the Swedish national strategy can be related to the observational and interview data in order to arrive at an understanding of what adequate digital competence in three Swedish upper secondary school practices might be and how it is enacted.

Method and analysis

The article draws on data collected from 2015–2016 in a 4 year Swedish research project carried out by the authors. The project explores how digital technology is used in three Swedish one-to-one upper secondary schools, which means that all the teachers and students have access to an individual laptop and a wireless internet connexion. These three schools are “known” for their advanced use of digital technology for teaching and learning. However, the narratives of advanced use have been projected on all three schools due to certain limited contextual circumstances at the schools or in the municipalities, rather than any widespread advanced use (cf. Olofsson, Lindberg, and Fransson 2017). In School A, this refers to the reputation of the municipality regarding the uptake and use of digital technology in its K-12 schools, in School B to a specific Centre of Technology within the school and in School C to the school’s reputation for its remote teaching and mixture of educational on-site and distance practices. The empirical data used in this article is illustrated in the form of four narrative case descriptions (Eggen and Stobart 2015). These have been constructed from observational data in the classroom and

interviews with 25 upper secondary school teachers in the three schools mentioned above (A, B and C). In Sweden, the upper secondary school is organised into twelve national vocational programmes, six national higher education preparatory programmes and one introductory programme in preparation for one of the national programmes. The teachers who were observed and interviewed were from the Technology Programme (TP), the Natural Science Programme (NP) and the Electricity and Energy Programme (EEP). Most of the teachers taught in one of the three mentioned programmes, but some also taught in two or three of them and some in other programmes. The 25 interviews were semi-structured and focused on issues such as access to digital technologies, the current opportunities for and challenges of using such technologies in teaching, learning and administration, the teachers' professional development, support and infrastructure, as well as the future use of digital technology in school. All these issues are included in the Swedish 2017 national strategy for the digitalisation of the K-12 school system. The teachers were interviewed individually, with either one or two of the three researchers in the project present during the interview. The interviews lasted between 38 and 110 minutes, with an average of 60 minutes. All 25 interviews were recorded digitally, transcribed verbatim and then coded and thematically analysed (Creswell and Plano 2007) with the aid of NVivo11® software. In the first step of the analysis, the following 10 themes reflecting the teachers' views of their current digitised local school practices were constructed: (a) the infrastructure of and access to digital technologies at the school, (b) collegial learning and examples in the teaching teams of the good use of digital technologies, (c) examples of own use of digital technologies in teaching and learning, (d) continuous and professional development with regard to the use of digital technologies in teaching and learning, (e) the level of ICT support at the school, (f) possibilities with digital technologies in teaching and learning, (g) challenges with digital technologies in teaching and learning, (h) the use of digital technologies in administration and communication, (i) the future of digital technologies in school and (j) the most important things for students to learn in school and the role of digital technologies in that learning. The teaching practices of all 25 teachers were also observed. At School A, 21 lessons were observed for a total of 24 hours. At School B, 18 lessons were observed for a total of 21 hours and in School C 8 lessons were observed for a total of 12 hours. The observations focused on the everyday practices and activities in the classroom, with extra attention paid to issues related to digital technology, such as the infrastructure and the teachers' and students' use of the technology. The observations were documented as field notes. In a second step, the interview- and observational data from each school was analysed and used to construct a narrative case description (Boyatzis 1998). This main case description was then thematically organised into four sub-cases reflecting each one of the four sub-goals in the second focus area in the Swedish 2017 national strategy for the digitalisation of the K-12 school system accounted for above. In step four, these case descriptions were then analysed in relation to adequate digital competence as described on page 7 in the national strategy. More specifically, the case descriptions represent our understanding of the contextual preconditions and circumstances in which the teachers are expected to display and enact their digital competence as well as they can. Thus, in the fifth step of the analysis we applied this understanding to a reflective reasoning of what adequate digital competence might mean and how it is enacted, based on the contextual circumstances emerging in the four narrative sub-case descriptions.

Discussion

In recent years the question of teachers' digital competence has been in focus in research, policy and practice. From the above, at least three different themes of teachers' digital competence can be identified in former research conducted in this field. These themes display challenges related to (a) defining digital competence in educational policy and practice.

In this article, four empirical sub-narrative case descriptions have been constructed, all of which are strongly aligned to teachers' enacted digital competence as described in the strategy's second focus area of equal access and use. When elaborating on what the term "adequate" might mean in practice, it is clear that teachers are expected to show and enact adequate digital competence in relation to at least (a) technological challenges, (b) technological-pedagogical challenges, (c) CPD and challenges related to time, identifying needs and networks and (d) technology-mediated communication and administration. The insights gained in the four descriptions are below assimilated into one possible understanding of what an adequate digitally competent teacher in the Swedish upper secondary school context accounted for in this article might be.

The empirical findings show that teachers with adequate digital competence can use a laptop and various digital learning resources in a good way. They are at ease with the functionality of different educational software and digital tools and know what kind of value digital technology will add to students' learning. They will also have the competence to anticipate possible challenges in students' use of digital technology and be able to negotiate established rules and routines with the students that reduce a non-educational use of the digital technology. As a consequence of limited economic resources, they will know which digital technology the school should buy and why, and how to search for free digital learning resources and programmes on the internet. Due to a centralised IT-support, they will have developed the competence to solve minor technological problems in the classroom and, if the problems cannot be solved, or if the internet is down, will be able to rapidly turn a digital mediated teaching plan into an analogue plan. In these Swedish school contexts teachers can also combine and enact technological and pedagogical competences in order to plan and organise subject-specific teaching- and learning activities. This includes the democratic aspect of organising learning activities that provide students with a rich use of digital technology as a preparation for their future lives as Swedish citizens. Even though the time in school for continuous professional development (CPD) is limited, the teachers can formulate their own needs for CPD, have solid networks and the competence to engage in informal collegial learning activities with teachers both within and outside their own school with the aim of learning how best to integrate digital technology in teaching and learning. Furthermore, they are creative in their administrative and communicative manoeuvres within and perhaps also beyond an LMS with several downsides with regard to functionality. They have the necessary competence to use the LMS for educational purposes, mostly as a digital repository for assignments. In addition, they can deal with the additional work of documentation and administration that digitalisation brings with it. Not least, they have the competence to balance aspects such as GDPR issues and ethical practices in the wake of an increased transparency and parents requesting digital access to school-related material in a way that has not happened before. Finally, due to the shortage of local policy documents with strategies relating to the digitalisation of the school, they have the competence to navigate in an educational context without clear local guidelines and to contribute locally to the development of such policy documents and routines.

As this possible understanding of “adequate” in terms of digitally competent teachers covers a number of aspects it will be a real challenge for any one teacher to live up to them all with the excellence that is expected by policymakers and other stakeholders. In that sense, the above description may be more about an ideal teacher than a general teacher. Further, the designated competences are also expected to be displayed at different levels, depending on the level of competence that is needed in the local school context at any one time. Notably, it is in relation to the local contexts that the meaning of the term “adequate” becomes clear and operative.

Conclusion

Adequate digital competence in the Swedish upper secondary schools reported on in this article seems to be flexible in meaning, is determined by the local contextual conditions and is enacted in various activities, understandings and decisions based on the teachers’ own framework of values. If it is thought that a high level of adequate digital competence in school requires an exemplary digital school practice, it can be concluded that such a practice can at least be characterised by good technological infrastructure, teachers with a high level of technological-pedagogical knowledge, ongoing teacher CPD and a well-functioning technology-mediated communication and administration. However, at the same time, it can also be concluded that the elaborated understanding of “adequate” in this study does not always seem to clarify the formulations used in the national strategy for the digitalisation of the K-12 school system in Sweden. This also leads to the conclusion that different conditions in the schools, potential variations in meaning, agency and the enactment of adequate digital competence – in line with the our areas of digital competence as well as the new formulations in the revised Swedish curriculum for the upper-secondary school – can create unequal possibilities for students to develop an active citizenship in the (hyper) digitalised Swedish society of today and tomorrow that the policy seems to expect.

A variety of concepts are used to describe digitization in terms of investment, adoption, and use of newer technology in educational practices and educational research. These concepts include digital technology, information technology (IT), information and communication technology (ICT), and educational technology, to name a few. In general, these concepts are used interchangeably, as a clear distinction between them does not exist. As newer and more modern technologies are central to the scope and aim of this research, this section aims to provide an overview of a number of the variations of the concepts used by previous studies and authoritative reports Swedish authorities, i.e., the National Agency for Education, the School Inspectorate, publish a number of yearly reports addressing the status of digitalization in Swedish schools and national education. The concepts and acronyms used in these reports on digitalization varies between Information Technology, IT, and Information and Communication Technologies, ICT. In reports and websites published in Swedish, the word IT is often used. However, in one report, the distinction between the concepts can be clearly identified. The last digital agenda for Sweden distinguished the use of IT for the Swedish version (Näringsdepartementet, 2011a) and ICT for the English version (Näringsdepartementet, 2011b). As for the Swedish authorities’ websites, they use the concept of IT in Swedish while for the English webpage Introduction 8 the concept of ICT is used. This can be seen in the webpages for, e.g., the Swedish National Agency for Education^{10, 11}, as well as the Swedish Digital Commission^{12,13}, which are responsible for analyzing progress in meeting the objectives of the Swedish IT policy. However, in a Swedish report published by the Swedish Digital Commission addressing the digital transformation of the

society (Digitaliseringskommissionen, 2015), the concept of technology is used rather than the concept of IT. The use of IT and ICT interchangeably can be identified in scholarly work as well. For example, Grönlund (2014) uses IT and technology interchangeably in his report published in Swedish. Other scholars (e.g., Fleisher, 2013; Tallvid, 2014; Tallvid, 2015) used IT in Sweden, and ICT in English. In addition, the concept of digitalization and digital tools used to a large extent in Swedish published work, both authorities' reports and other publications, and scholarly works and publications (e.g. Digitaliseringskommissionen, 2015; Grönlund, 2014; Tallvid, 2015). In English publications by scholars outside Sweden, the acronyms and associated concepts used varies. In general, based on a limited number of publications, the most common concepts used are ICT (e.g., BESA14, 2015) and technology (e.g., Mishra & Koehler, 2006; Ertmer&Ottensbreit-Leftwich, 2010; Bates, 2015). ICT is defined as the utilization of IT and technology. However, in addition to IT and ICT concepts such as educational technology (Bates, 2015) are also used. Mishra and Koehler (2008) further make a distinction between advanced and standard technologies, referring to standard technologies as books, chalkboards, and blackboards, and advanced technologies as the Internet, digital video, operating systems, standard software, web browsers, email programs, and word processing programs. In agreement with Bates (2015), this research considers digitization to include all tools used to support teaching and learning considered to be, and referred to as technology, regardless of whether they are in the form of computers, software programs, or printed books. For this dissertation, the concept digital technologies will be used to refer to newer technologies used in the digitalization of the schools and into school teachers' everyday practices.

ABSTRACT

The emergence of oil exploration in commercial quantity in the Niger Delta region in 1956 came with great excitement and huge hopes for rapid development and accelerated civilization in communities, in the region. Although most multinational oil companies (MNOCs) have found the Niger Delta a fertile ground for business, the region remains backwards, poor and underdeveloped. The host communities in the region represent a sordid tale of its squalor and underdevelopment in centre of its tremendous wealth, which include deforestation, noise pollution and other ecological damages, which has presented serious humanitarian challenges with implications for security, development, human right, social justice and poverty. To address these issues, the MNOCs have engaged in some programmes intended to benefit the oil bearing communities in the area of corporate social responsibility (CSR). This paper is focused on the role of the federal government in regulating the activities of the MNOCs with regards to CSR in the development of communities in the region and its contributions to conflict resolution.

KEYWORDS: *Community, Corporate Social Responsibility, Conflict and Conflict Resolution.*

INTRODUCTION

Recurrent oil conflict has affected the Niger Delta region since the past five decades since the commercialisation oil exploration from the Niger Delta in 1958. The region's conflicts are blamed on the negative effects of oil exploration activities, which have impacted negatively on the relations amongst MNOCs (Shell, Chevron and Agip), the Nigerian State, and oil producing

communities. The problem in the Niger Delta stems from the alleged neglect; oppression, marginalization and environmental dilapidation occasioned by oil exploration and production activities (Ifedi, 2011). After a long period of frustration over the appalling conditions created by the economic activities of the MNOCs, the communities of the region, according to Ibeanu (2000) in Nwankwo (2018), took up arms against petrol-business and its political allies in order to draw attention to their situation. The resulting conflict, which has degenerated and defied several measures aimed at its resolution, could inherently be related to the failure of the MNOCs CSR projects and policies in the Niger Delta in general.

The contradiction that generates conflict in the Niger Delta could be traceable to the haphazard nature and failure of the various multinationals' corporate social responsibility projects and policies (Ako, 2013). In spite of the attempt by the trans-nationals and government at various levels to mediate the crisis through interventionist strategies and programmes as measures towards managing or addressing the issues, conflict in the region has remained unabated. The tension in the Niger Delta continues to pose serious challenges for good governance and livelihood for the people in the region. That the militarisation of the region has not helped in restoring the much-desired stability in this regard raises a question of the government's conflict management style. Key socio-economic indicators reveal that there will be further devastating consequences if the crisis is not managed through inclusive policies derived from democratic and participatory processes. Without doubt, restoring peace in the region would require political will (Epelle, 2010) and determined effort to bring about the physical development of the region. The formulation and implementation of CSR policies and the establishment of a new and positive culture of social, economic and democracy can support this. In this regard, a multi-stakeholder joint problem solving approach is required for timely implementation of CSR.

In spite of the interventionist measures adopted, the aggrieved communities seem not to be appeased by the Nigerian oil industry. On the other hand, the MNOCs in a bid to rebrand their image with the international community spent millions of dollars investing in the Niger Delta as part of CSR. Thus, according to Okodudu (2008), Shell's annual expenditure increased from \$25m in 1994 to \$60m in 2000. Despite these concerted efforts, Shell has continued to be blamed by the host communities with consequences including insecurity and public safety breaches.

The dependency mentality within the host communities has been fostered by the failure of most CSR programmes, which does not involve the local people in the initiation, planning and implementation process. Since, the construction of buildings and other development projects do not genuinely involve the local people, these social initiatives are seen, as gifts from outsiders and the local people do not claim ownership of the projects. Schemes introduced in this way cannot remain functional without the continued support of the owners/users, and this contravenes a basic principle of development. Thus, as stated earlier, while the MNOCs claim to be actively engaged in CSR and to have invested extensively (huge amount of money) towards the development of the oil producing communities, the latter contend that the MNOCs have not done enough. In this regards, this study is focused on evaluating the reasons why increases in CSR funding by the MNOCs, correspondingly produces intensive communal resistance.

Conceptual Clarification

The Concept of Community

The term community has various meanings from different scholars. There are communities such as rural, urban, religious, racial or ethnic, economic, organized labour, industrial, academic etc. One could only grasp the concepts of these different communities with a better understanding of their dynamics. However, the basic ideology which is found in all communities is the shared interest. Hence, Egenti (2012) identified a community as a group of people living within a legally established area, communicate together and living in a given geographical environment, have common needs and problems, such as the family, village, town or clan, tribe, state or nation. A community, therefore, is a social group, occupying a more or less defined geographical area and based on the feeling that people have for one another.

In a similar view, Umezulike (2003), observed that a community involves a conscious organization of individuals within a geographical area with definite legal boundaries who support some basis of primary institutions, use some common facilities within this geographical area, and have a common legal as well as political identity. Hence a community can be described as constituting those residing in a given locality who shares certain interest, common backgrounds or goals. The common feeling of a community recognizes attributes and common sentiment which make the people believe in one destiny and have a strong bond holding the people together (Abiona, 2009).

Community creates a feeling of brotherhood, in all members to the extent that what affects a member of the community or an event that concerns a group attracts a common feeling in the community. Moreso, community has the ability to share a recognized way of life. This can be manifested on culture, dressing, language, education, politics etc. for example, the pre-colonial communities of the Igbos, Yoruba's, Hausa's, Ijaw's, Ibibio's etc. The modern Nigeria is also a community because of their share political, economic and social interest. The way of life is peculiar to a given community and such people attract certain values to the system. A breach in the social order is frowned at and a social sanction is enforced in order to curb the occurrence of such acts.

Corporate Social Responsibility (CSR)

The business of social responsibility has gained attention in recent years, especially since the 1990s thereby demonstrating a nexus between businesses and society (Idemudia, 2010). At the heart of every CSR programme is the need to satisfy the aspirations of the people in the community where the business is located (Alfred, 2013). Obi (2010) asserts that CSR is effective when corporate behaviour is aligned to the needs and expectations of not only the organizations, but also the communities where the company is situated. By implication, the social and environmental welfare of the people must be considered as are responsibility of the company, even while making a profit (Obi, 2010). The foregoing means that the companies are obliged to plan towards enhancing the human and environmental conditions of the communities where they carry out their businesses as friends of the people and not their foes. Such obligations are identified by Jones, Hillier and Comfort (2009) as protection, improvement and consideration of the welfare of all the stakeholders in the communities.

There are different views on CSR. One of which is the classical perspective, which focuses on the economic benefits of business. Another one is the stakeholder view, which, in line with the stakeholder theory, states that corporations must live up to the expectations of being socially

responsible to the people and the entire environment (Lantos, 2001). In line with the “constrained profit-making view,” Manuel Castelo Branco, Lucia Lima Rodrigues (2007) in Nwankwo (2018), averred that the profit making goal of companies overshadows some of their basic obligations owing to the fact that the ethics of business does not receive the desired attention. Also, Friedman (1998) maintains that the high level of honesty in their dealings with the people would enhance corporate image while generating and maximizing profit.

Concept of Conflict in Niger Delta Region, Nigeria

Conflict conveys many meanings and carries many connotations. Accordingly, Heraclites, an ancient Greek philosopher, describe conflict as the defining property of human community. To function properly, the social order, as a necessity becomes a conglomerate of cleavages. It is from such disagreements that the society derives its own vibrancy. It is a circle that runs forever (Orluwene, 2008), conflict can also be defined as actions that contending parties take toward each other due to the incompatible objectives in what they are attempting to achieve. The Niger Delta conflicts that lead to organized violence emerges from a combination of several factors directly related to their grievances, demand and struggle aimed at redressing their disadvantages and deprivations. Otite (2001) sees conflict from the pursuits of divergent interests, goals and aspiration by individuals and, or groups in a defined social and physical environment, he further notes that conflict generally entails struggle, competition, rivalry for objects to which individuals and groups attach value. From this definition, conflict does not necessarily have to be violent. But when conflict turns violent, it becomes detrimental to the growth and stability of the system.

From the foregoing, it may be drawn that conflict is a natural consequence in any situation where the parties involved do not see the same issue from the same point of view. Otite (2000) argues that conflicts are conscious processes of interaction. Stedman (1991) cited in Peterside (2014), explains further that conflicts result from incompatible human interactions where the ability to satisfy one's needs depends on the choices, decisions and behaviour of others. The behaviour exhibited by the others may not be what the other complaining party or parties want, and indeed, may escalate the conflict. Hocker and Wilmot (1998) agree with Stedman on the incompatible factor, but add that there must be at least two interdependent parties who perceive that the other party is interfering with the achievement of their own goals. Hence, conflict is the violent manifestation of incompatibility.

Basically, four major conflict situations have been identified by Ugbomeh (2008) in the Niger Delta Region these include:

i) Community/Oil Companies Conflict: This conflict situation can be caused by several factors such as incursion into community land; a threat or perceived threat to the continual existence of a community, ineffective communication between communities and oil companies; nonpayment of compensation for occupied land, nonpayment or inadequate payment or unduly delayed payment of compensation for polluted land and water resources, abject poverty due to displacement and loss of livelihood arising from pollution of farmlands or fishing waters. This disputes between communities and oil companies are therefore often of long standing nature and difficult to resolve.

ii) Community/Government-Federal, State or Local Government

Conflict: The causes of community and government conflict are many. Some of which include:

- a. Low level and quality of development in the region.
- b. Perceived low level of government presence in the region.
- c. Non-chalant attitude of government towards the plight of the people of the Niger Delta.
- d. Marginalization by government.
- e. Creation of local government by the federal and state government.
- f. Boundary adjustment by federal government.
- g. Use of force in conflict management by the police and military force.

iii) Inter-Community Conflict: This conflict situation is a result of long disputes between two or more communities, unsettled boundary problems, disputes over oil-bearing land or incursions into community land.

iv) Intra-Community Conflict: This conflict situation may be due to long standing disputes between individuals within a community, political marginalization by a ruling class, ethnic groups or class, an unacceptable traditional ruler or embezzlement (real or imagined) of compensation by community leaders.

Pursuant to the above, it has been observed that generally, conflicts in the Niger Delta region are becoming increasingly frequent and intensely violent leading to incessant loss of lives and properties. Furthermore recent management and resolution strategies such as the Oil Mineral Producing Area Development Commission (OMPADEC) and the Niger Delta Development Commission (NDDC), the creation of local government Areas/councils, the provision of social amenities and payment of compensation for land, have failed to arrest conflicts in the Niger Delta. If anything, the violent conflicts have taken a new turn for the worse. Thus, there is a need to re-examine the resolution strategies in relations within and between communities and oil companies and communities and government, with a view to instituting conflict management procedures that would lead to peace and sustainable development in the Niger Delta Region.

Sources of Conflict in Niger Delta Region

It is not difficult to fathom the proximate, causes of the conflicts in the Niger Delta region. The origin and fundamental causes of the present Niger Delta Crisis were laid in the colonial period within the context of the inability of then government to address the issue of the minorities. The region lost its power to control their destinies with the amalgamation of the southern and Northern protectorates by Lord Lugard and every successive federal constitution was reluctant to address the fears of the minorities in the region. The minorities fear was centred on political and socio-economic rather than cultural or linguistic in nature. The fear of the minorities was confirmed by the Willincks Panel Report of 1958, (Peterside, 2014). The apparition of violence in the Niger Delta is attributable but not limited to the following.

1. The Distorted Structure of the Nigeria Federation

Historically, conflict in the Niger Delta region can be traced down to federal system of government that is being practiced since independence which from the very beginning was at

variance with the expectations of many minorities in the nation. It has been argued that the federal constitution that was drafted suffered from two fundamental and destabilizing setbacks. The first, was the classification of the country into unequal regions. The second is the political and demographic domination of the Northern, Western and Eastern regions, being the majority ethnic groups and the marginalization of the minority ethnic groups. The Niger Delta people are the largest group amongst the minority groups spread over the South-South geopolitical zone (Akporaro, 2008).

The skewed structure of the Nigeria State has precipitated fiscal centralization in favour of the Federal Government and ethnic majority. The overbearing domination by the federal government has made it difficult for the oil-bearing communities to gain equitable access to wealth derived from their resources. Thus, the people of the Niger Delta have led a wave of agitation for greater control of their resources. Such agitation has more often than not, assumed violent dimensions. Therefore, it can be said that resource disparity in access, control and wealth distribution has been the bases of the conflicts between the oil companies and the Nigerian government and communities and the various ethnic groups in the Niger Delta for decades.

ii. Activities of the Oil and Gas Companies

From all indication, oil exploration and exploitation have unleashed far-reaching consequences on the environment. Oil-related activities have done much damage to the fragile Niger Delta environment as well as the health of the people (CASS, 2005 in Peterside, 2014). Notable impact of oil extraction, have been the loss of biodiversity; ecological devastation/degradation and destruction of mangrove forests. The popular perception in the region has been that the operations of the oil companies have led to the gradual destruction of the region's ecosystem. And whenever the oil companies fail to take responsibility for the damage done to the environment, the stage is invariably set for conflict between the people of the community and the oil companies.

Also, the trend of violence and compulsive appropriation by communities, groups and youths was as a result of decades of reckless environmental degradation, barefaced economic exploitation, arrogance, insensitivity and mistreatment of the communities by multinational oil companies. According to Ikelegbe (2005), communities and community groups and militants have had to threaten or actually destroy and disrupt multinational oil companies operations before any benefits are extended to them. Also potential benefits from the oil economy and revenue to community leaderships and grouping whether solicited or compelled are quite enormous and a major element in the struggle for the benefits and control of the oil revenue including the ownership of land and water in which oil fields are located. According to Ikelegbe (2005) this has fuelled inter family, group, communal and ethnic contestations of indigeneity and ownership of oil rich land and water which has tended to involve ferocious, highly destructive and vicious fighting. Apart from issues of ownership of land and water, there have been conflicts between and within communities over the distribution and control of payouts and compensations by both the multinational oil companies and the Nigerian State for appropriated and polluted land and water and related benefits.

iii. Militarization and Proliferation of Small Arms and Light Weapons

The militarization and proliferation of small arms and light weapons in the Niger Delta have been one of the causes of conflicts in the Niger Delta region. Successive governments have

sought to contain the impasse in the oil-producing region through troops and weapons deployment. The aggrieved communities have in turn, taken up arms against the security forces to dislodge what they have long regarded as an unwarranted siege on their communities. The militarization of the region by the government finds expression in the several cases of military invasion of restive oil producing area (Akoraro, 2008).

iv. Retention of Legislations Widely Perceived as Obnoxious

It is widely held that the people of the Niger Delta have been disempowered and disinherited of their land through the instrumentality of legislations such as the land use Act, the petroleum Act, lands Act and some sections of the petroleum Act. These legislations vest ownership and control of lands, waters, and the resources found there in the hands of federal or state government. Environmental activists in the region argue that these legislations stifle local initiatives at protecting the environment and the reluctance of the government to accede to such requests have all intensified the activism for resource control, protests, brigandage and violence (Akoraro, 2008).

Conflict Resolution Strategies

There are different strategies adopted to resolve conflicts. While some people adopt a non-adversarial approach, others adopt confrontational strategies or even the total avoidance of the conflict. This section will discuss alternative dispute resolution, confrontation and arbitration as conflict resolution strategies that are adoptable in the Niger Delta.

Alternative Dispute Resolution (ADR)

Miller (2005) argues that alternative dispute resolution (ADR) aims to address conflicts in such a way that the outcome would be mutually acceptable to the parties involved. ADR does not involve litigation (which lasts longer and seems to be a more complex method of conflict resolution). The nonviolent approaches or ADR approaches have been discussed by Hadi (2010) in Nwankwo (2018), to include negotiation, mediation, reconciliation and arbitration. Otite (2001) adds that the joint-problem solving approach, which involves constructive listening by both parties in a conflict, so as to comprehend the elements in the conflict with the aim of addressing them.

Otite (2001) asserts that it takes two parties that are willing to actualize a win-win outcome for the joint problem solving approach to be successful. In addition, Albert (2010) gives an example of joint-problem solving, with the argument that the best way to deal with the herdsmen and farmers conflict is by assisting both parties to appreciate the opportunities offered by joint problem solving. However, joint problem solving entails that parties collaborate to address their problems (Onyima and Iwuoha, 2015).

Confrontation

Confrontation could be a direct expression of a group or a person's view, thoughts or feelings regarding a conflict situation. Confrontation could be an invitation to actors in conflicts to express their views on a particular conflict. Confrontation as a conflict resolution strategy is basically concerned with exploring and clarifying issues of conflict, but it can be aggressive.

When it becomes aggressive, those involved in the conflict attack each other, either physically or emotionally, sometimes in verbal form (Otite, 2001). An example of confrontation

is the Federal Government of Nigeria's approach to resolving the Niger Delta conflict. The Nigerian state adopted the option of the military intervention principle (Etekpe, 2007). This intervention strategy was utilised by the Obasanjo administration between 1999 and 2007. It deployed Nigerian soldiers to contain the restiveness of youth and criminal gangs that sought to hinder oil production and distribution without taking into consideration the reasons for their grievances (Etekpe, 2007). Before the establishment of the Joint Task Force in 2003, the Federal Government had adopted the principle in Ogoni, in 1990; Umuechem, in 1990; and Odi, in 1999. The confrontation strategy caused the Federal Government to spend billions of naira to sustain the presence of security forces in most Niger Delta communities to protect oil installations and oil workers (Okolie-Osemene and Tor, 2012).

Arbitration

Arbitration is a form of alternative dispute resolution that requires third-party intervention in conflict situations. This requires disputants to appoint arbitrators to hear evidence and take a decision on the issue (Hadi, 2010 in Nwankwo 2018). An arbitrator is a third party that seeks to address the source of the prevailing conflict. According to Zartman (1991), "third party decision-making methods occur when third parties acting on behalf of the larger society such as a court of law, pronounce mandatory judgments to resolve the conflict." The impact of arbitration is felt when the decision of an arbitration tribunal is enforced, like the judgment of a court, and such an award is usually binding on all the parties involved (Hadi, 2010 in Nwankwo 2018).

Linking Multinational National Oil Companies Corporate Social Responsibility and Conflict Responsibility

Many studies have linked CSR with conflict (Idemudia, 2010). The environmental unfriendly activities of MNOCs are contributory to conflicts, whereas their genuine CSR involvement can prevent and quell conflicts. He observed that conflict-sensitive organisations and their managements symbolize a necessary part of a combined effort to achieve a more peaceful world. In other words, the CSR commitment of businesses would definitely influence changes or the outcome of conflicts within the local communities and society, at large. However, businesses cannot stay neutral in conflict situations, as the advocates of CSR suggest that organisations seem to have focused on the enhancement of a peaceful business environment in their host communities (Idemudia, 2010).

Paradoxically, it is still disputable that CSR and conflict have a close nexus, especially in the context of conflict de-escalation. Allen, (2014) argues that there is no adequate empirical evidence to decide whether or not the involvement of businesses in CSR could prevent or reduce conflict. However, recent studies have been directed towards this direction (Idemudia, 2010). The scientific community is hesitant in establishing the scope of sincere corporate citizenship on security and its contributions in either triggering or quelling intra-state conflict in particular. It is, therefore, possible to conclude that given the expected growing role of businesses in conflict mitigation, there appears to be a necessity to examine the situation and scope to which these roles can be fulfilled, hence businesses are perceived as effectual vehicles for conflict mitigation (Idemudia, 2010).

Concrete CSR reduces the negative impact of business activities on the environment; society reserves the right to a healthy and clean environment irrespective of corporate practices. The theory of the right to a liveable environment was established in Blackstone (1988), who notes

that the right to a clean, safe environment is a human right. Therefore, MNOCs are expected to act responsibly to protect this human right. This is, particularly, important nowadays owing to the danger of the lack of a liveable ecosystem essential for human existence. Aghalino & Okolie-mene, (2014) have also demonstrated the importance of this theory by arguing that it is not possible for humans to flourish in an environment that is chemically toxic while at the time experiencing freedom or being content with the quality of the air they breathe. Most importantly, the right to a liveable environment is enshrined in the constitutions of most countries; therefore, this is an inalienable right. In other words, a distortion of this right is capable of causing conflict.

In the Niger Delta region, for example, when building a pipeline, the MNOCs would engage the communities with another project, which ends as soon the pipeline is completed. This implies that projects in the realm of CSR in the region are only peace projects, because the oil companies have realized there would be conflict otherwise. On the problems with CSR projects in the Niger Delta, Idemudia (2010) argues that the failure of MNOCs in CSR involvement was the major triggering factor for the Ken Saro-Wiwa-led protest that resulted in massive human rights violations in Nigeria in the 1990s. Frynas (2005) alleged that, most businesses get involved in CSR for selfish reasons; such as that of maintaining a stable working environment. Apparently MNOCs involvement in CSR with the Niger Delta has not been carried out as obligation but haphazardly. Put differently, as a measure of managing the regions conflict.

Federal Government Role in the CSR Related Conflict and the Success of the Strategies

The government's involvement in oil exploration and exploitation makes it necessary for it to be actively involved in the resolution and management of oil related conflicts between different stakeholders. To this end, the Federal Government of Nigeria has played a number of roles in both the resolution and management of oil related conflicts in the Niger Delta. It has achieved these by strengthening the legal framework needed to regulate the activities of the MNOCs, through third party intervention, the establishment of committees and the creation of commissions to accelerate the development of the area.

Specifically, several meetings have been held between government officials and representatives of militant groups and sometimes directly with the militants themselves. A case in point is the series of meetings held with the militants (sometimes referred to as 'the boys in the creeks' meeting with stakeholders) in July and August 2007. The meeting was attended by the then Vice President, Good luck Jonathan, Senator David Brigidi, key actors in the Warri creeks, and some representatives of the oil states' Peace and Rehabilitation Committees (Watts, 2009). The meetings offered the opportunity for them to discuss possible ways of brokering peace, the demilitarization of the Niger Delta and as a corollary, a truce between the Joint Task Force and the militants. The National Assembly's (Nigeria's central legislature) House Committee on Environment also provides a platform for mediating between stakeholders in the Nigerian oil industry. This can be achieved by organizing public hearings on oil and environmental related matters.

Other efforts by the government to resolve conflicts between the host communities and the MNOCs include the establishment of the National Oil Spill Contingency Plan (NOSCP) and the National Oil Spill Detection and Response Agency (NOSDRA) in 2004. The Federal Ministry of Environment in compliance with the International Convention on Oil Pollution Preparedness Response and Cooperation (OPPRC) initiated NOSDRA (Ugochukwu & Ertel, 2008). This

intervention by the Federal Government, which has enormous legislative significance, is intended to help in regulating the activities of the international oil companies in the country. 18 NOSDRA evaluates and determines the causes of spills and respond appropriately; it also allows NGOs, CBOs and communities to send representatives to ensure transparency during oil spill investigations.

From the above, it is clear that there are legal mechanisms in place to regulate the relationship between MNOCs and the host communities. However, the implementation of the laws is the problem. For instance, in the investigation of the incidents of oil spills of the MNOCs, it is interesting to point out that the Nigerian government largely depends on MNOCs such as Shell to provide the technical expertise and/or to authenticate issues of spills (IDI, Environmental Rights Action, 2013). How then do you enforce sanctions on a company that provides you with the requisite technical expertise to investigate an oil spill? This 19 Senior officer in the Environmental Impact Assessment Department of the FME, 2014 demonstrates a conflict of interest and it is a limitation on the part of government to effectively represent the interests of the host communities (Epelle, 2004).

The effectiveness of the federal Government's intervention strategies in the oil industry would have been strengthened within the framework of the Petroleum Industry Bill (PIB) (now Petroleum Industry Bill Governance (PIBG)) if it had been passed into law as the Petroleum Industry Act (PIA). The PIB aims to increase local content in the oil sector; introduce a participatory approach of the people in the industry and; give indigenous people more sense of belonging. The PIB, which is about 223 pages long, has as one of its objectives to develop indigenous manpower and encourage the use of local resources and services, thus contributing to economic empowerment. It would also address what Evoh (2009) calls 'unsustainable patterns of resource exploitation and community relations that contributed to the destruction of the foundations of traditional economy in the Niger-Delta, as well as end decades of lethal ecological war'.

Most peace-building workers in NGOs believe that the Federal Government has indirectly fuelled the conflict by not attending to the people's immediate needs. Such needs include the passage of the PIB, which they believe would have helped to economically empower the indigenous people, and hence reduce the problem of unemployment. For them, the non- passage of this bill explains why there is a high rate of anti-social activities in most oil producing communities.

Hence, it is no surprise that joblessness has heightened the host communities' frustration especially amongst graduates. The majority of able bodied young men are seen all over the Niger Delta cities riding 'keke napep' (a tricycle transport vehicle) in order to raise money needed to meet some of their basic human needs. This trend further discourages most youths from acquiring higher education. The crisis in the Niger Delta is worsened by the failure of the Federal Government to directly empower the people. Most youths in the region hold an opposite view. They believe that government officials do not get to the grassroots to identify the basic needs of the people. They also believe there is corruption and impunity in the NDDC and the duplication of the NDDC roles by the Ministry of Niger Delta reduces each agency's responsibility, and therefore should be able to undertake the needs of the region.²⁰ From the interviews conducted, it was observed that employment generation and everything that gives priority to empowerment of the youths and women are the main basic needs that should never be downplayed by the

government and MNOCs. The implication of this finding validates the third hypothesis that if MNOCs and government embark on programmes and projects that stimulate the local economy (like employment generation and youth empowerment), then incidences of social conflicts in oil bearing communities will lessen (Nwankwo, 2018).

Summary

This paper reviewed the relevant literatures on the subject matter of the study. It began with the concepts of CSR; conflict and its dimensions, causes and strategies for its resolution; oil conflicts in the Niger Delta and the role of MNOCs managing the conflicts. In the next chapter, This study has critically investigated whether or not the current CSR strategies of the MNOCs operating in the Niger Delta have contributed to the perennial conflicts in the region. The background information on the perceived exploitation of the Niger Delta people from the pre-colonial palm oil period to the current era of oil exploration as well as the attendant resistance by militants in the region. The conflict in the region became aggravated in the 1990s when the host communities, became more conscious of the wealth accruable from the oil beneath their land, and felt deprived of their resources largely due to the previous colonial laws and ordinances. The inability of the MNOCs, operating in the Niger Delta region, to stick to MoUs signed with host communities, and the government's inability to discipline the MNOCs on their environmental abuses, contributed to the escalation of the conflicts. All these factors are underlined by the Government's failure to reinvest the tax paid by the MNOCs into the region: together they exacerbate the host communities' current impoverishment and underdevelopment. The paper also examined the relevant literatures relating to oil conflict and the MNOCs' CSR approach in the region. It also conceptualised the term "conflict" by analysing its different connotations, management, and resolution as well as arguments for and against it. The conflictual relationship between the communities, the MNOCs and the Government, was examined to establish the major causes of the conflict. The relationship between ineffective CSR and conflicts in the Niger Delta region and the role of Federal Government was examined.

Recommendations

The paper offers the following recommendations:

- I.** MNOCs should be sensitized with regards to the importance of adhering to the signed General Memorandum of Understandings (GMOUs) with host communities since deviation from this is normally what triggers most of the CSR conflicts in the Niger Delta region. They must also ensure that their CSR projects are timely, relevant and aimed at meeting the genuine socio-economic needs of the local people.
- II.** MNOCs should embark on environmentally friendly processes of oil exploration and maintenance as well as replacement of antiquated oil pipelines, some of which have not been changed since oil was discovered in commercial quantity in 1958. They should as a matter of obligation guard against staff negligence and equipment failures that result to oil spillage.
- III.** The host communities should be included in the joint venture agreement with the MNOCs rather than the existing 60/40 partnership between the government and the oil companies. A percentage should be set aside for the host communities. It is believed that the Petroleum Industry Bill (PIB) now Petroleum Industry Governance Bill (PIGB), which was not passed by the last National Assembly (2011-2015), would have

addressed this problem. The PIB was said to have reserved 10% share of the oil business for the host communities. If this is done however, the latter will now see themselves as stakeholders in the oil exploration and exploitation process and will play their part in protecting and preserving the mutually beneficial oil business. It will also help in reducing their demands for resource control.

- IV. Attempts should be made to identify the traditional economy of the oil producing communities and revive them; they should be arranged in clusters depending on what they produce. These cluster communities should then be provided with agro- allied cottage industries with funds and technical supports provided by the government and the oil companies whilst the communities themselves would manage its funds. The Government should, as a matter of urgency, review upwardly its revenue allocation formula from the present 13% to the 1963 (50%) derivation formula level.
- V. The Government and the MNOCs should employ a sustainable development model that will examine the local people's needs for not just electricity but constant electricity, the provision of accessible healthcare, the construction of good road networks and the availability of drinking water.

ABSTRACT

In this article, based on the work of researchers of romanticism and its representatives, an attempt is made to characterize Romanticism as an artistic direction. The characteristics of romanticism and the features of the romantic worldview, the features of new genres created by romantics, in particular romantic drama, as well as the originality of the romantic hero are considered. It is noted that the romantics paid great attention to the image of the inner world of the hero, turned to folklore as the primary source of art, synthesized in their works the best features of previous trends. The freedom-loving character of the hero, for whom freedom was above all else, was expressed through the monologue of the romantic hero. Romanticism emphasized the importance of the artist's personal subjective opinion on the surrounding reality, which was partially transmitted through the experiences of the romantic hero.

KEYWORDS: *Romanticism, Romantics, Romantic Drama, Romantic Hero, Conflict, Monologue, Synthesis, Twofold World, Freedom.*

INTRODUCTION

The XIX century occupies a special place in the history of world literature. At this time, a new direction in literature – Romanticism – was developing and flourishing. Romanticism, which has already been extensively studied, continues to be interesting at all times, since its branches grow in other, more intimate periods of literary development in the literatures of different peoples. Thus, the characteristic features of romanticism were embodied in the literature of the beginning of the first half of the twentieth century in the works of the Jadid writers. And the work of one of the most prominent representatives of Azerbaijani literature of this period – the poet and playwright Huseyn Javid – is characterized as progressive romanticism, and the poet himself is considered the founder of the genre of romantic drama in Azerbaijani literature. To clarify the

validity of these statements, it is necessary to analyse thoroughly the features of romanticism as an artistic direction. In this article, we aim at considering the characteristic features of romanticism based on the work of representatives and researchers of this direction. The focus of this article is on the definition of romanticism, the reasons that caused it, the characteristics of the direction, the originality of the romantic drama, the romantic hero and the author-creator of the romantic work.

MATERIALS AND METHODS

Review of the literature. Romanticism as an art direction attracted the attention of many scientists and researchers. Of the whole variety of scientific literature in the preparation of this article, we have focused on the works of a major representative of French romanticism, F. R. Chateaubriand "Experience about English literature and judgments about the spirit of people, epochs and revolutions" [1], which examines the history of English literature from the Middle Ages to the beginning of the XIX century and the largest theorist of German romanticism, F. R. Schlegel's "Fragments" [2], which most fully describes the theory of romanticism. Russian critic V. G. Belinsky's works have led us to the article "Karamzin and his Merits; the Karamzin period of Russian literature: Dmitriev, Krylov, Ozerov, Zhukovsky, and Batyushkov. - The meaning of Romanticism and its historical development" [3], which notes the persistence of romanticism, amenable to temporary changes. From the legacy of V. M. Zhirmunsky, we chose his work "The Poetry of Alexander Blok" [4], about the features of symbolism and romanticism in the works of the Russian poet. We also used the book "Romanticism in Germany" by the famous scientist, specialist in Western European and Russian literature N. Ya. Berkovsky [5], which is devoted to the history of the formation of this trend in this country. Especially interesting for us was "The Aesthetics" [6] Y. B. Breva, representing the wealth of material from the history of world art, book literary critic A. A. Anikst "Theory of drama in the West in the first half of the nineteenth century" [7], art historian of literature A. S. Yanushkevich "journey to the land of romanticism: new approaches to the study of Russian romanticism of the first third of the nineteenth century" [8] as well as textbooks and study guides, covering the problems of romanticism created by modern scholars such as A. N. Andreev [9], D. N. Katysheva [10], I. N. Chistyukhin [11], E. V. Isaeva [12].

The research methodology consists of the works of well-known and recognized scientists, literary critics, their opinions and statements about Romanticism and its features. When writing the article, the material from the works of Western European and Russian scientists-researchers was analysed and synthesized. The article uses a descriptive method, methods of analysis and synthesis.

Analysis and results. Romanticism as one of the leading trends in world art has always been in the centre of attention of researchers. A.V. Schlegel defined it as "a property of the New European Christian culture" [6, 175]. In accordance with this, V. G. Belinsky noted that "in its closest and most essential meaning, romanticism is nothing but the inner world of a person's soul, the innermost life of his heart" [3, 145]. The Russian critic argued that "the mysterious soil of the soul and heart, from which all vague aspirations for the better and higher arise, trying to find satisfaction in the ideals created by fantasy" is the sphere of romanticism [3, 146]. Thus, it can be argued that initially researchers paid attention to the spiritual side of romanticism. In the twentieth century, this situation began to change. Following the rules of formalism, V. M.

Zhirmunsky already considered Romanticism from the point of view of the history of style and equated it with the "poetics of metaphor" [13, 42].

When discussing the reasons for the emergence of this trend, researchers traditionally rely on religious, spiritual, and human parameters.

Thus I. N. Chistyukhin states that "in its purest form, Romanticism concentrated on the spiritual world of man. It was an expression of a certain aspiration to transcend the limitations of the physical world and the body (the finite), in search of the ideal truth (the infinite)" [11, 234]. It is interesting that the desire to overcome was so strong that Romanticism quickly penetrated into all spheres of art. As N. Ya. Berkovsky testifies, "Romanticism was formed as a whole culture, variously developed, and in this it was similar to its predecessors-the Renaissance, Classicism, Enlightenment. He appeared as ... a single "school", but in all the arts and at the same time in cultural affairs, leaving literature and penetrating into each of the arts, one after the other" [5, 19].

What were the features of this direction? And why did it develop so quickly and successfully? In this respect, the arguments of Yu. Borev, who writes that Romanticism "showed that the dysfunctional state of the world became a state of mind, he created powerful lyrical characters that contributed to the artistic study of a special state of mind ("world sorrow"), and realized that the state of the world, the essence of being, determines the immortality of evil and the eternity of the struggle against it. The starting point of criticism among Romantics is the idea of the unrealizable perfection of the world, which verifies the spiritual riches and moral qualities of the individual, and, on the other hand, the idea of the unrealizably perfect personality, which verifies the world" [6, 180]. Thus, it can be considered that the impetus for the emergence of romanticism was the "unfavourable state of the world" [6, 180], which contributed to the formation of the artistic features of Romanticism as an artistic direction.

In the era of Romanticism, "an unprecedented wealth of theoretical thought arises, and the struggle of views is a characteristic feature" [11, 69] of this trend, which proclaimed "freedom of creativity and the search for new forms" [11, 69]. Thanks to the rapid activity of its representatives, Romanticism has made a kind of revolution in literature and in art in general. It is no accident that A. N. Andreev states in his lectures on the Theory of literature that "Romanticism was characterized not just by a change of style, but above all by colossal shifts in the field of pathos, in the development of new life strategies. In romanticism, with its specific cult of the irrational in the individual, irony – tragic, romantic, sarcastic-began to prevail as a result of disillusionment with man as a rational being" [9, 57].

Researchers have tried to characterize the features of romanticism and highlight its most characteristic features. So in his "Aesthetics" Yu. B. Borev identified six artistic and aesthetic features of romanticism: 1) an apology for feeling, heightened sensitivity; 2) an interest in geographically and historically distant cultures, in cultures that are not sophisticated and "naive"; orientation to the traditions of the Middle Ages; 3) a predilection for "natural", "picturesque" (in the language of the era, "romantic") landscapes; 4) rejection of strict norms and pedantic rules of classicism poetics; 5) strengthening of individualism and the personal-subjective principle in life and creativity; 6) the emergence of historicism and national identity in artistic thinking [6, 181].

An equally interesting list of the main features of romanticism was presented by E.V. Isayeva. Based on the goals of your tutorials it is limited to specific and concise list of the features of

romanticism, among which highlighted the following: 1. dynamic plot; 2. the poetics of secrets; 3. the special image of the world: past, fabulous, exotic; 4. bright unusual character, opposed to the world; 5. irresolvable conflict between the hero and society, world people; 6. tragic mood; 7. principle of contrast in composition, the plot, the imagery, language; 8. romantic landscape and romantic portrait; 9. The theme of freedom, which is the hero of the highest value; 10. romantic worlds – existence and equality of the two worlds: the real and the imagined (fantastic, fantastic) [12, 19-20].

As can be seen from the presented characteristics of romanticism, researchers most often pay attention to such characteristic features of romanticism as the ironic, tragic, unsolvable conflict between the hero and society and, as a result, the romantic duality. Close attention to the spiritual world and the world of human feelings, in particular, to the emotional perception of the surrounding reality, led to an increase in the role of fantasy in romanticism. I.N. Chistyukhin states that "romanticism, based and focused on emotion, as opposed to rationalism, did not describe objects of study of the real world, but rather a certain ideal and glorified the idea of the artist as a mad genius, not bound by any rules" [11, 234]. Continuing his thought, the researcher sums up: "romanticism caused a vast array of dramatic literature and productions in which the presentation of essential ideas was replaced by emotional manipulation. Romantics tried to contrast the prosaic everyday life of bourgeois modernity with the world of adventures, bright and bizarre images" [11, 234].

The originality of the content of the works of romanticism required a special form. Romantics defended the complete freedom of creativity, stood for the use of a wide variety of genres, modified the old and created new ones. They paid great attention to poetry. Drama was no less popular. So a special place in the world literature was occupied by the romantic drama.

The appearance of the romantic drama is attributed to the beginning of the XIX century. It replaced the classic tragedy and sentimentalist drama, synthesized and preserved some of the features of its predecessors: "entertaining and dynamic plot, increased emotionality, moralizing, long monologues explaining the inner experiences of the hero or his attitude to other actors, the primitiveness of the psychological characteristics of the characters" [14].

How do the researchers of romanticism characterize the features of the romantic drama? First of all, scientists have paid attention to the fact that the Romantics have stopped the primacy of "dogmatism in the theory of drama" [11, 69] characteristic of the classical era. Moreover, Romanticism, according to I.N. Chistyukhin, "put an end to the centuries-old domination of reason in art and brought a completely new type of conflict" [11, 68]. As a result, "the romantic movement led to a radical transformation of the concepts of drama... from now on, the understanding of the nature of drama is formed without relying on the poetics of Aristotle interpreted in one way or another, but on the study of the dramatic works themselves" [7, 6-7]. And if "in Greek tragedies the ideal consisted in the harmonious balance of all forces" [11, 68], then the system of views of the Romantics proceeded "from the contradiction between ideals and reality" [11, 68]. Schlegel also spoke about internal bifurcation, claiming that this bifurcation is "an unattainable ideal" [11, 68].

The next important feature of the romantic drama is that it is a poetic drama, most often written in verse, since romantics have always paid great attention to the lyrics in the drama [10, 90] and were engaged in the formation of the laws of the poetic drama. Among them are the principles of

organicity, naturalness, mainly in the image of the wonderful and incredible. Action is one of the main factors in justifying conditionality, while naturalness is associated with the "embodiment of the nature of feelings" [10, 94]. It is no accident that Schlegel singled out the concepts of "dramatic efficiency and theatricality", "poetry" [11, 69] as the nodal judgments of romantic art [11, 68]. Due to its peculiarities, the genre of romantic drama was strengthened and retained with minor amendments until the second half of the XIX century.

A close look into the soul of a person led romantics to the need to portray the feelings, thoughts (often

aloud) and inner experiences of the characters. It is no accident that the romantic playwright "puts the inner world of the hero, his feelings in the foreground, emphasizing their dominant importance in human behaviour" [11, 68]. Accordingly, another invention of romanticism was the romantic hero.

The originality of the romantic hero, as well as the direction itself, most clearly emerges when comparing them with classicism. As you know, the heroes of a classic tragedy could easily portray a few passions, but they were devoid of originality. In contrast to them, the heroes of romanticism are bright, exceptional, individual personalities. Romantic authors were interested in "a human personality endowed with a bright and passionate character" [6, 178]. Yu.B. Borev assures that "romanticism created a special type of character, which is based not on drama, but on lyricism, not on dramatic, but on lyrical tension" [6, 178]. D.N. Katysheva rightly notes that "the completeness of the character portrayed with all the weaknesses, inconsistency and variability as necessary properties of human nature, determines for romantics the vitality of literary heroes" [10, 91].

We should not also forget that Romanticism tends "to everything unusual" [11, 69] and denies "the prosaic nature of life" [11, 69]. And the discovery of unusual "characters that contradict the general rules leads to the creation of a character" [11, 69], revealing the "tragic duel of personality and fate" [11, 69]. In the depiction of the characters, romantics paid attention to "his spirit, his subjectivity" [6, 298], which led to the emergence of a new type of character – the rebel hero. The task of the formed hero is to confront the world around him, although by nature he is a lone hero, distinguished by "melancholy, bitter irony towards himself and his own impulses, hence the exaggeration of feelings" [15]. The identity of the romantic hero was also determined based on his opposition to the surrounding world and society. Important for romantic playwrights is spirituality (the lyrical principle), which "manifests itself not only through the character" [10, 91], but also through its external embodiment. Accordingly, the behaviour of the hero on the stage changed. In romanticism, the speech of the characters underwent changes, since here "melodic recitation was replaced by colloquial speech" [15].

"Rapid emotional gestures, rather than the measured but unnatural movements characteristic of classicism, have become widespread." Now "external beauty goes into the background, psychologism becomes important in the construction of the image" [15].

Romantic writers have approached the portrayal of a romantic hero in the world of his own spiritual life in different ways. For some – "it is primarily a titan hero, a mythological character, and a god-man." Others have "an exotic image, endowed with violent passions and a mysterious biography". Others have a creative personality (artist, musician, writer)" or "a hero-wanderer

(not only wandering, but also strange)" [8, 6]. However, the unifying link in the characterization of a character who does not accept an imperfect world was loneliness and suffering.

The originality of the image of the romantic hero was predetermined by the uniqueness of the author who created it. D.N. Katysheva notes that "for romantics, not only the personality of the hero, but also the author himself – the poet-playwright-is of particular importance," and "attention to the image of the author leads to a change in aesthetic views and artistic practice." Now "the author's active attitude to reality is taken as a basis, the ability of the spirit as the greatest creative force to assimilate what is happening around", "the evaluative moment" is an "expression", and "not an image – an important means of manifesting the personality of the creator in the work". The poet's view is a crystal of poetry that omits the facts of existence [10, 92].

Yu.B. Borev also admits that "romanticism put forward and first developed the concept of the author" and "the theory of romanticism recommended the writer to create a romantic image of the writer" [6, 175]. According to the scientist, "the problem of the author ...organically develops in romantic aesthetics into the problem of a genius who, according to romantics, creates in solitude in order to then present the results of his work to people", and as is well known, "a genius without restrictions and regulations creates artistic reality, which for a romantic is higher than reality". He "does not obey the norms, but prescribes them to the world" [6, 175]. The clash of both realities-real and created-in the author's mind explained the peculiarity of his attitude to the world. The romantic writer was dissatisfied with the surrounding reality, in his view it is grey, boring and uninteresting. Hence, according to the assumption of A.V. Pavlyuk, "there is a romantic twofold world-the simultaneous coexistence of two worlds: the real one, which does not satisfy the romantic, and the ideal one, which exists in his imagination" [16, 15].

RESULTS AND DISCUSSIONS

When defining romanticism, attention was paid to the spiritual essence of the direction, and only in the twentieth century did scientists begin to focus on the features of the style in terms of form. Romanticism emerged from literature and permeated all the arts, because it was an expression of a person's desire to overcome himself. The reason for the emergence of romanticism was the belief in the "dysfunctional state of the world" and disillusionment with the person. Researchers most often pay attention to such characteristic features of romanticism as the ironic, tragic, unsolvable conflict between the hero and society and, as a result, the romantic twofold world. Attention to the emotional life of a person has led to an increased role of fantasy in romanticism. Romanticism led to great genre transformations. Here appeared a peculiar form of poetic drama-romantic drama. Romantic drama brought a new kind of conflict, developed new principles of drama, such as the principles of organic nature, naturalness, mainly in the depiction of the miraculous and incredible. The romantic hero is distinguished by an unusual character, contrasted with the world around him. Changes are also made in the speech and gestures of the hero in romanticism. They become more human and emotional. No matter who the romantic hero is (a god-man, an exotic image, or an artist), he is always alone and tragically opposed to society. The originality of the romantic hero was determined by the author's peculiarities. Romanticism has advanced the concept of the author. The author, usually dissatisfied with the reality surrounding him, contrasted the ideal world created in his imagination with the dull reality. It is the romantic writer who is the bearer of the romantic duality, which is reflected in his romantic hero, and in general in all his work and creativity.

Named after Islom Karimov, UZBEKISTAN

ABSTRACT

Several designs of wide-range current transformers (TT) have been developed. The analysis of their work has established that the most complete requirements of control and control systems are met by TT, in which the wide range is implemented by the implementation of a spiral core in the form of an Archimedean spiral. This leads to an increase in the stability of the TT. The developed TT consists of a fixed hollow core 1 in the form of a spiral made of non-magnetic and non-conductive material, a primary winding 2 applied according to the required functional law to a fixed core 1, a movable ferromagnetic magnetic core 3 that can rotate around a common axis 4 with the help of a holder 5, a secondary winding 6 located in the inner cavity of a movable ferromagnetic core 3 and a ferromagnetic liquid 7 filling the parts of a spiral hollow tube covered by a movable ferromagnetic core 3 of 1.

KEYWORDS: *Wide range, Current transformers, Magnetic circuit, Magnetic resistance, Stability, Ferromagnetic liquid.*

INTRODUCTION

As you know [4, 5, 6, 7, 9, 10, 11, 19, 20], the current transformer in which the wide-range is carried out by smoothly regulating the number of turns of the windings, has low reliability due to the presence of a sliding contact. Therefore, in this article, a new design with non-contact adjustment of the conversion range is proposed [5, 15, 16, 17, 19, and 20]. Figure 1 shows the developed wide-range TT: Figure 1, a is general view of the TT, and Figure 1, b is a movable magnetic core with a measuring winding.

FIRST PROPOSAL

The developed TT consists of a fixed hollow core 1 in the form of a spiral made of non-magnetic and non-conductive material, a primary winding 2 applied according to the required functional law to a fixed core 1, a movable ferromagnetic magnetic core 3 that can rotate around a common axis 4 with the help of a holder 5, a secondary winding 6 located in the inner cavity of a movable ferromagnetic core 3 and a ferromagnetic liquid 7 filling the parts of a spiral hollow tube covered by a movable ferromagnetic core 3 of 1. The primary winding 2 is wound on the spiral core 1 so that the specific number of turns per unit of the angle of rotation of the moving part increases from the center of the core 1 to its ends. The described transformer belongs to the class of low-power laboratory TT with an air gap.

Figure1. Design scheme of a wide-range TT according to [15]

The wide-range TT works as follows. When an alternating current passes through the primary winding under the influence of a magnetic field, the ferromagnetic liquid is held in the part of the spiral tube covered by the movable magnetic core due to the electromagnetic force. When moving the movable magnetic core along the spiral tube, the ferromagnetic liquid also moves. The production of a spiral core in the form of a hollow tube significantly reduces the mass and reduces the material consumption of the TT magnetic core.

The total magnetic resistance in the path of the working magnetic flux is found as [9, 12]

$$R_{\mu\Sigma} = \frac{l_{\mu c}}{\mu_c \mu_o S_{\mu c}} + \frac{l_{\mu \omega c}}{\mu_{\omega c} \mu_o S_{\mu \omega c}} + \frac{l_{\mu \delta}}{\mu_o S_{\mu \delta}},$$

где $l_{\mu \delta} = 2(\delta + \delta_c)$ – total non-magnetic gap in the path of the working magnetic flux; δ is the gap between the movable magnetic core 3 and the spiral hollow core 1; δ_c is the thickness of the spiral hollow core 1; $\mu_o = 4\pi \cdot 10^{-7} \frac{\Gamma_H}{M}$ is a magnetic constant; μ_c , $\mu_{\omega c}$ – magnetic

permeabilities of steel and ferromagnetic liquid, respectively; $S_{\mu c}$, $S_{\mu \omega c}$, $S_{\mu \delta}$ – cross-sections in the path of the working magnetic flux of the mobile magnetic core, ferromagnetic liquid, and gap, respectively.

The primary current creates the MDS [12]:

$$U_{\mu 1} = I_1 w_2 = I_1 k \alpha ,$$

When $w_2 = k\alpha$ – the number of turns of the measuring winding per unit of the angle of rotation, α mobile magnetic circuit, k – the proportionality coefficient.

The described TT is designed to convert not very large currents. Wide-range (smooth adjustment towards the expansion of the lower limit of the conversion) is carried out by changing the number of turns of the primary winding by turning the movable magnetic circuit without breaking the primary circuit, which is very important when power outages in the system are undesirable [18].

At the same time, with a short-term sudden disconnection of the primary current, the ferromagnetic liquid flows out of the location of the mobile magnetic circuit with windings, and when the primary current is restored, the TT will work without the ferromagnetic liquid. This leads to a significant conversion error. Therefore, the task was set – to increase the stability of the TT.

SECOND PROPOSAL

The problem is solved by the fact that in a wide-range TT containing a spiral core made in the form of a hollow diamagnetic and non-conductive tube, on which the primary winding is applied according to the required functional law, and a movable magnetic core with a secondary winding covering a part of a spiral core with a ferromagnetic liquid, the core is made in the form of an Archimedean spiral and is located vertically with the possibility of rotation. The movable magnetic core is freely mounted on a vertically positioned guide with the possibility of movement.

Increasing the stability of the TT operation is achieved due to the fact that the spiral core is made in the form of a vertically installed Archimedean spiral with the possibility of rotation; while the movable magnetic core covers a part of the spiral core filled with a ferromagnetic liquid, and can only move vertically.

In the proposed TT, when the spiral core is rotated, the movable magnetic core with the secondary winding and the ferromagnetic liquid moves only along the vertical guide. Therefore, the ferromagnetic liquid is always held in the lower part of the Archimedean spiral core, which is covered by the movable magnetic core.

The implementation of the spiral core in the form of an Archimedean spiral and its vertical placement, as well as the free installation of the movable magnetic core on a vertically positioned guide with the possibility of movement, eliminates the leakage of ferromagnetic liquid from under the movable magnetic core with a secondary winding in the event of a short-term sudden shutdown of the power source and restoration of the power source, the TT continues to operate in the established mode, thereby maintaining the stability of operation.

Figure 2 shows the developed wide-range TT [1, 2, 3, 8, 13, 14]: in Fig. 2, a-front view, in Figure 2, b - side view in section, in Figure 2, c-view when the spiral core is rotated by 90°, in Figure 2, d-movable magnetic core with a secondary winding (in section).

Figure 2 Multi range TT by [3]

The proposed wide-range TT consists of a core 1 made in the form of a vertically arranged Archimedean spiral of a hollow diamagnetic and non-conductive tube, on which the primary winding 2 is applied according to the required functional law, and a movable magnetic core 3 with a secondary winding 4 covering a part of the spiral core 1 filled with ferromagnetic liquid 5.

The movable magnetic core 3 with winding 4 is mounted on a vertically located guide 6 with the possibility of moving in the vertical direction when turning the spiral core 1. The core is rotated by means of auxiliary gears 7 and 8.

The movable magnetic core 3 is used to create a magnetic flux. It is a hollow cylinder with a curved axis that coincides with the axis of the wire wound on the hollow core 1, and covers only a part of the core 1 with the winding 2. The principle of operation of this TT does not differ from the principle of operation of the previous TT.

The rotation of the spiral core 1 is carried out by means of an auxiliary gear. In this case, the ferromagnetic liquid 5 under the influence of the electromagnetic force created by the magnetic field is held in the lower part of the coils of the spiral core 1 covered by the movable magnetic core. The movement of the movable magnetic core 3 with the winding 4 when the spiral core 1 is rotated occurs only along the guide 6.

CONCLUSION

Thus, the positive effect is achieved by the fact that the execution of the spiral core in the form of an Archimedean spiral and its vertical placement with the possibility of rotation, as well as the free installation of the movable magnetic core with a winding on a vertical guide with the possibility of movement when the spiral core is rotated, does not allow the ferromagnetic liquid to flow out from under the movable magnetic core with a winding during a short-term sudden power outage and restoration of the power source, the TT continues to operate in the established mode. This leads to an increase in the stability of the TT.

UZBEKISTAN

ABSTRACT

The article reveals the President of the Republic of Uzbekistan President Shavkat Mirziyoyev in his speech at the ceremony dedicated to the twenty-ninth anniversary of independence of the Republic of Uzbekistan, important changes in speech and reforms carried out on the path of development of our country were noted, including the role and significance of the work carried out within the framework of the third renaissance in the Republic of Uzbekistan.

KEYWORDS: *Third Renaissance, Youth, Information Technologies, Higher Education, Independence, Youth – Our Future, Opportunities.*

INTRODUCTION

Today, when there is any mentioning of Uzbekistan in the world arena, the term “New Uzbekistan” is being used. It is recognition of the great achievements we have made in recent years, as we have entered a completely new stage of development. This is an honor of our great achievements, which in the following years we have moved to a completely new stage of development.

It would be true to say that a foundation for a new revival – for the Third Renaissance – is being laid in Uzbekistan. Because today's Uzbekistan is not the same with the one we knew some years back and neither are the people,”

The word "Renaissance" from French means "Rebirth", Italian - "Rinascimento" – to reappear, to be born again, to rise again, to wake up.

Speaking at a ceremony marking the 29th anniversary of Uzbekistan's independence, President Shavkat Mirziyoyev noted that Uzbekistan is on the threshold of a new era – the Third

Renaissance. He said: "At the present time, when the glorious power of our people is at the peak of its development, the foundation is being created in Uzbekistan for a new awakening – the third renaissance. Because today's Uzbekistan is not yesterday's Uzbekistan. Today's people are also not yesterday's,"

If we look at the centuries-old history of the people of Uzbekistan, we will see the difficult stages of conquering the peaks of development. At these stages, the formation of our statehood, the rise of science, art and culture in society, the achievements of great figures in their activities contribute to the development of world civilization. Our tough people were always ready for changes and difficulties. We know that society never stands still and is constantly striving for development and renewal. Because of this, values, customs and traditions are changing. Young people are the driving force behind this development and change. The fact that today there are a large number of young people who set an example for their peers and take an active part in the process of renewing society with innovative ideas and projects, of course, we use the conditions created by our state.

After gaining independence, the Independent Republic of Uzbekistan realized many of the dreams and expectations of our people, which they had been waiting for centuries. Today, we are the children of independent Uzbekistan, which is recognized by all influential foreign countries of the world and is a Member of the United Nations. Today, thanks to independence, great revolutionary changes are taking place in the economic and political activities, social life of Uzbekistan, in the consciousness, spirit, and spirituality of peoples and nations. A new era has begun in the development of universal, national and spiritual values that our people have preserved for centuries, so it is difficult to overestimate it.

The Republic of Uzbekistan is a wise country, clearly pursuing the interests of its state and people, not indifferent to the future of youth and the fate of its people, which year after year reaches high heights and develops.

Thanks to the unyielding will, selfless work and steadfastness of our people, the joint efforts of the population and state bodies, we courageously overcome all these trials.

From the speech of the President of the Republic of Uzbekistan Shavkat Mirziyoyev at the ceremony dedicated to the twenty-ninth anniversary of the independence of the Republic of Uzbekistan.

As you know, today Uzbekistan is rapidly entering a new stage of development. The changes taking place in the country in all directions are also recognized by the world community. Of course, these changes do not happen spontaneously. The Action Strategy and the State Program, adopted annually on its basis, today serve as an important basis for the renewal and transformation of our country, recognized in the world as a new Uzbekistan.

The first Revival in the history of Uzbekistan coincided with the period of the Samanids, when scientific and philosophical works and universal discoveries created by our great ancestors became the cornerstone of Islamic civilization. Such important processes as the comprehensive development of the social sphere, building relations in society on the basis of certain principles, economic and cultural development of cities and regions, centralization of science and education are the principles that determine the specifics of statehood in our country.

The Second Renaissance coincided with the reign of Amir Temur and the Timurids, and not only Movar annakhr, but the whole of Central Asia reached a new level of development. During this period, the foundations of statehood were improved, urban planning and architecture flourished, and international trade and diplomatic relations intensified. Also, during this period, the development of science, culture and art, as well as the growth of the sphere of thinking, will be reflected.

The Central Asian region, in particular the territory of modern Uzbekistan, historically existed as an ancient cradle of science, culture and art. The regions of Uzbekistan have historically been at the crossroads of the Great Silk Road and its branches. Therefore, people from different countries of the East and the world, wishing to receive a religious and secular education, have always aspired to such ancient cultural centers as Samarkand, Bukhara, Khorezm, Nasaf (Karshi), Kesh (Shakhrisabz), Tashkent, Fergana.

The first Eastern Renaissance is the "Muslim Renaissance" that took place in our region in the 9th-12th centuries.

During the period of the Eastern Renaissance, great scientists, encyclopedists and famous thinkers appeared. In the field of exact sciences Muhammad Khorezmi, Abu Bakr Razi, Abu RaikhanBeruni, Ahmad Fergani, Umar Khayyam, Mirzo Ulugbek, in the field of philosophy Abu Nasr Farabi, Ibn Rushd, Muhammad Ghazali, Aziziddin Abu Nasafi, in the field of medicine in Ali ibn Sino, Mahmud Zamakhshari, in the poetry of Abu AbdulloRudaki, AbulkasimFirdavsi, Hafiz Sherozi, NizamiGanjavi, Abdurahmon Jami, Alisher Navoi, KamoliddinBehzod in painting. Their world-class scientific and creative discoveries have made an unprecedented contribution to the development of mankind.

The second Eastern Renaissance is the second "Timurid Renaissance" of the XIV-XVI centuries. The role and significance of the great empire built by Amir Temur are incomparable.

The empire founded by our great ancestor Amir Temur, "the founder of Central Asian civilization, which still affects the world today", as well as a great statesman, a victorious commander, a skilled diplomat, a passionate patron of science, who left an indelible mark on history, occupies a special place ... "The great figure who determined the fate of the 15th century" - Sahibkiran and his successors ruled Turkestan, Khorasan, Persia, Azerbaijan and the Arab world for almost a century and a half, forming a centralized potential Turkic state.

"One of the mountains of Turkestan" - a civilization founded by Amir Temur "Golden Age" of the history of Turan in the XIV-XVI centuries - a special stage of the Renaissance "Muslim - Renaissance" is sealed. As the famous French scientist Lucien Keren put it, "European artists appreciate Amir Temur as the creator of the Eastern Renaissance."

In the 15th century, the glorious kingdom founded by our ancestor Amir Temur and continued by his worthy descendants marked the beginning of the second Renaissance in our country. During this period, unique scientists appeared, such as Kazizoda Rumi, Mirzo Ulugbek, Giyosiddin Kashi, Ali Kushchi, classical poets and thinkers such as Lutfi, Sakkoki, Hafiz Khorezmi, Abdurahmon Jami, Alisher Navoi, BoburMirzo. Historians such as Sharafiddin Ali Yazdi, artists such as Mahmud Muzahib, KamoliddinBehzod, many calligraphers and musicians, musicologists and architects are famous all over the world.

During this period, such areas as urban planning, architecture, fine and applied arts, painting, jewelry, metalworking, calligraphy, science and education, art, book art and librarianship, and musicology were highly developed. The consequences of the Revival of Turanzamin were felt in Khorasan and India, and even in European countries. The peoples of Europe deeply analyzed the Timurid Renaissance. Amir Temur created great opportunities for the development of science and culture; he paid special attention to religious figures, scientists, art critics, writers and poets. As a result of this high politics, the second phase of the Eastern Renaissance was founded. Many historians believe that the East, especially the Central Asian region, was the source of two powerful scientific and cultural upheavals in the 9th-12th and 14th-16th centuries, which positively influenced the Renaissance in other parts of the world. The Eastern Renaissance is rightfully recognized by the world scientific community as the Eastern Renaissance.

After Uzbekistan gained national independence in the early 1990s, favorable conditions were created for the third new stage of the Renaissance. At an international scientific conference held in Samarkand on May 14-15, 2014, it was noted that our country is on the verge of the third revival. Consequently, for almost 30 years, especially in the short period of the last three to four years, which is calculated for centuries, unique and complex creative work has been carried out.

Why the Third Renaissance? It is natural to ask why exactly at this stage of our development.

Our ancestors made discoveries in the middle Ages, made an invaluable contribution to the development of world science, founded two Renaissances, and our land was recognized as the cradle of civilization. The head of our state wants our country to be one of the cradles of civilizations and keep up with other countries in the field of science. In addition, today, along with all other areas, the advancement of science to a new level is required. Indeed, without science, it is difficult to solve the current problems facing society. The implementation of the Third Renaissance largely depends on the development of science, knowledge, worldview and intellectual potential of young people.

Despite the current economic crisis in many countries, the Republic of Uzbekistan is increasingly focusing on education and efforts to develop it. The world community is also shocked by such actions. In particular, at the beginning of this academic year, about 650 thousand first-graders received school supplies worth 72 billion UZS as a gift from the President. In addition, children from low-income families and children with disabilities were provided with winter clothing, school uniforms and school supplies worth \$ 426 billion UZS. At the same time, taking into account the current situation, 17 billion UZS were allocated from the Anti-Crisis Fund to provide schools with the necessary medical and antiseptic means to protect the health of students and teachers. We are aware that school education in our country has recently become a national movement and a new era in the development of the industry has begun. As a practical manifestation of this movement, 77 new schools worth 556 billion UZS have been built over the past two years. Reconstruction and repairs were carried out in 1930 schools. At the same time, a wide path opens up for the private education system. In this regard, the procedure for obtaining a license has been simplified. It is noteworthy that over the past three years, their number has increased 6 times to 140. Decisions were made on the development of mathematics and chemical and biological sciences. According to them, schools in these subjects will gradually open in each district and city. In the same year, 56 schools of mathematics and 27 schools of chemistry and biology were opened. It is no exaggeration to say that the implementation of such measures during a pandemic is a heroic act.

As for the Third Renaissance, it rises to the level of a national idea as a strategic task. Kindergarten educators, school teachers, professors, scientific and creative intelligentsia were recognized as the four pillars of the new Renaissance, said President Sh.M. Mirziyoyev. We can say that our attention to youth and education can be characterized as a focus on a brighter future.

Indeed, in recent years, the development of the education system in our country has become the main idea of state policy, ensuring that our children receive modern knowledge and skills in accordance with world standards, grow up physically and spiritually mature, realize their abilities and talents, intellectual potential, a lot of work is being done on fostering a sense of devotion and devotion to the Motherland.

In general, it should be noted that care for the younger generation has been at the center of reforms in our country in recent years. This, of course, is natural. After all, it is the young generation that is the driving force behind any upsurge and development, including the creation of the foundation of the New Renaissance.

The transformation of the third Renaissance into a national idea is necessary. A national idea is, in fact, a concept or slogan, a phrase that, in a few words or phrases, expresses the ultimate goal of a particular nation. It unites and mobilizes people on the way to this goal. With this, people coordinate all their efforts, aspirations, and creative activities. If necessary, it will deeply reform its economic and social relations, the legal, political and ideological foundations of the country, and the education system. One of the main tasks of the national idea is, first of all, to preserve and strengthen the unity and solidarity of the people, the territorial integrity of the country. Secondly, it defines the highest goal, the goals of development and the tasks of the nation as a whole. The national idea can be expressed in different ways. But regardless of the form of expression, it should show people the future, the social goal.

If we look at the centuries-old rich history of the people of Uzbekistan, we will see the difficult stages of conquering the peaks of development. At these stages, such proud processes as the formation of our statehood, the rise of science, art and culture in society, the achievements of great figures in their work, contribute to the development of world civilization.

It should be noted that the growth processes taking place in our rapidly developing life are manifested in all spheres. Therefore, in the first years of our independence, when we tried to understand our national identity, to grasp and realize the essence of our rich historical, spiritual and scientific heritage, now our people have united and started to implement the idea of "national revival - national rise". During this period, it is recognized that in our society there is a growing trend of social thinking, the integration of both national and universal values. Social thinking, which harmoniously combines the national spirit and universal values, becomes a criterion and a solid foundation for the sustainable development of our country.

In connection with the growth of the level of social thinking in our country, the culture and approach to work, the approach to industry, agriculture and other areas have changed. There is a profound meaning in the special attention given to this area of science. Science is thinking, which is one of the priority factors for ensuring stability in society. With the development of science, not only the economy develops, but also the socio-cultural sphere. Focusing on science serves to develop and expand human thinking. As the mentality of the society grows, the sphere of culture and art also grows in accordance with these requirements. The fact that the head of our state proclaimed the current period from national revival to national progress is based on firm

conviction and deep wisdom. After all, the next 10 years will inevitably be a period of real growth and development. The laws, decrees and resolutions adopted in recent years and, of course, the ongoing large-scale reforms will become the basis for new development horizons.

Building the foundations of the Third Renaissance, recognized by our President, we, the youth, will make every effort to use the opportunities created by our Government.

MODERN TECHNOLOGIES AND FOREIGN EXPERIENCE IN TEACHING FOREIGN LANGUAGES

Uzaqova Qansulov Yerejepbaevna*

*Assistant,
Nukus Branch of Navoi State Mining Institute,
Nukus, UZBEKISTAN

ABSTRACT

The article considers the examples of the use of innovative technologies in teaching a foreign language, based on the experience of foreign scientists. The article describes the detailed characteristics of innovative practices in English classes. Modern educational technologies used for the formation of a student's communicative competence when learning a foreign language are the most productive for creating an educational environment that provides a person-oriented interaction of all participants in the educational process. It is obvious that the use of any one teaching technology, no matter how perfect it may be, will not create the most effective conditions for the disclosure and development of students' abilities and the creativity of the teacher. Modern technologies of teaching foreign languages accumulate successful information about each of them, allow the teachers to adjust any technology in accordance with the structure, functions, content, goals and objectives of teaching in a particular group of students.

KEYWORDS: *Innovation, teaching, foreign language, distance learning, group learning, multimedia.*

INTRODUCTION

In recent years, the question of the use of new information technologies in the study of foreign languages has been increasingly raised. These are not only new technical means, but also new forms and methods of teaching, a new approach to the learning process. The main purpose of teaching foreign languages is the formation and development of the communicative culture of students, teaching practical mastery of a foreign language.

Modern educational technologies used for the formation of a student's communicative competence when learning a foreign language are the most productive for creating an

educational environment that provides a person-oriented interaction of all participants in the educational process. It is obvious that the use of any one teaching technology, no matter how perfect it may be, will not create the most effective conditions for the disclosure and development of students' abilities and the creativity of the teacher. Modern technologies of teaching foreign languages accumulate successful information about each of them, allow the teachers to adjust any technology in accordance with the structure, functions, content, goals and objectives of teaching in a particular group of students.

The purpose of this article is to emphasize the role of the use of modern technologies in teaching English as a second language. It discusses various approaches and techniques that can help English language students improve their learning skills through technology. These methods include online sites for learning English, online dictionaries, audio books, programs for video communication and messaging, educational video tutorials, and smart phone apps.

The introduction of information and communication technologies (ICTs) in education creates new learning paradigms. We live in a world of developing technologies, where gadgets have become our own and a breakthrough in technology is at the heart of pedagogical ideas. Therefore, there may be a need to rethink how to mitigate the limitations of second-language users through the use of modern technologies. The interaction between new technologies and pedagogical concepts has been found to meet the diverse needs of second language learners to some extent, and any global discovery aimed at minimizing student constraints is a welcome development in the rapidly changing world of technology.

Thus, this article is an overview presentation of how modern technologies can help both teachers and students studying foreign languages. The rapid growth of ICTs observed by the technologically advanced countries of the world has helped them to overcome some barriers in teaching and learning. The application of modern technologies in teaching and learning can enable teachers, students, and others to come together in communities of people far beyond their immediate environment to critically consider, analyze, contribute, critique, and organize issues logically and contextually, keeping in mind the professionalism and transformation of the entire society. Now new technologies, such as the described improvements in computers with new programs such as zoom, Skype, or educational portals like lingua.com, etc., make it much easier for teachers to conquer space and time, motivating this by eliminating restrictions and academic contradictions. Now we can bring learning to almost any place on earth at any time with the goal of achieving the desired learning outcomes.

In the past, teaching and education simply meant personal lectures, reading books or printed handouts, taking notes, and completing assignments, usually in the form of answering questions or writing essays. In short, education, learning, and teaching were considered impossible without a teacher, books, and blackboards. Today, education and training have acquired a completely new meaning. Computers are an integral part of every classroom, and teachers use VIDEO, audio, and video dictionaries to explain a new topic and material to students. Students can interact with the subjects using these web-based tools. Moreover, each student can progress at their own pace.

Technology enables distance learning: Perhaps the biggest impact of technology in the field of learning is its ability to help multiple people learn simultaneously from different locations. Students are not required to meet at a pre-determined time or place in order to learn and receive

instructions and information. all you need is a smart phone or computer connected to the Internet; these tools can literally deliver a "classroom" to people's homes and offices.

Technology allows group learning: There are skeptics who argue that distance learning of this kind cannot help students gain the support of traditional group learning. To prove this theory wrong, the technology has helped provide distance learning with online communities, live chats, and message boards. All of this allows students to collaborate and communicate, even if they are isolated in their own space.

The technology allows for personalized stimulation: Multimedia tools, online training, and training on a dedicated phone app have helped eliminate the need for instructor-based lesson plans. Students who grasp concepts faster are moving forward, not held back by those who need more time and help to learn. Such an individual pace is useful for everyone.

Technology helps to reduce learning costs and increase productivity: Another advantage of using technology to reach many students in a shorter time is to reduce learning costs. Corporate and academic institutions can reduce their costs of providing lessons to students on a case-by-case basis. In addition, the technology provides quantitative results and allows students to quickly and with better results apply this information in practice. Through the use of technology, students can significantly save time and increase their productivity. Both of these points justify the higher cost of advanced technology tools.

Roadblocks in the use of technology in teaching: Naturally, for educational technology to have a positive impact on students, it must be well developed and prepared. The tools used to disseminate information should be designed with the interests of the students in mind. There are also factors such as lack of computer / technology literacy that should be considered. Schools and businesses should keep in mind that educational technology is just a tool, and its success depends largely on the amount of planning that goes into it. The use of educational technologies may be the right choice if all these factors are taken into account.

With the development of technology and the boom of the digital revolution, foreign language teachers find it necessary to think about effective new ways to create a better environment for teaching and learning foreign languages, supported by multimedia technologies. As a result, innovative language teaching is becoming increasingly popular in the field of foreign language teaching.

In the United Kingdom, Australia, and the United States, there is an experience of teaching students according to individual plans, in accordance with an individual learning style. For a mass school, the experience of learning in collaboration is the most interesting as a general didactic conceptual approach, especially if we take into account the fact that these technologies quite organically fit into the classroom system, do not affect the content of learning, allow you to most effectively achieve the predicted learning outcomes and reveal the potential of each student. Taking into account the specifics of the subject "foreign language", these technologies can provide the necessary conditions for the activation of cognitive and speech activity of each student of the group, giving each of them the opportunity to realize, comprehend new language material, get enough oral practice to form the necessary skills and abilities. The ideology of learning in collaboration was developed in detail by three groups of American educators: R. Slaving from Johns Hopkins University; R. Johnson and D. Johnson from the University of Minnesota; and the group of E. P. Johnson. Aronson from California State University; the main

idea of this technology is to create conditions for active joint learning activities of students in different educational situations. Students are different: some quickly "grasp" all the explanations of the teacher, easily master the lexical material, communication skills; others need not only much more time to comprehend the material, but also additional examples and explanations. Such students are usually shy to ask questions in front of the whole class, and sometimes they simply do not realize what exactly they do not understand, cannot formulate the question correctly. If, in such cases, you combine the children in small groups (3-4 people) and give them one common task, specifying the role of each student of the group in the performance of this task, then there is a situation in which everyone is responsible not only for the result of their work (which often leaves the student indifferent), but, most importantly, for the result of the entire group. Therefore, weak students try to find out from the strong all the questions they do not understand, and strong students are interested in ensuring that all members of the group, primarily the weak student, thoroughly understand the material (at the same time, a strong student has the opportunity to test their own understanding of the question, to get to the very essence). In this way, joint efforts eliminate gaps. This is the general idea of learning in collaboration.

Practice shows that learning together is not only easier and more interesting, but also much more effective. At the same time, it is important that this effectiveness concerns not only academic success, but also their intellectual and moral development. Learning together, not just doing something together is the essence of this approach. The idea of learning in collaboration was developed by the efforts of many teachers in many countries of the world, because the idea itself is extremely humane in its essence, and therefore pedagogical, although it has noticeable differences in the options of different countries. In short, we can say that these methods and the introduction of new technologies not only help teachers to make the learning process interesting and easy, but also to teach languages to students on their own.

ABSTRACT

The article highlights the practical application of some methods and innovative technologies in teaching mathematics. Some problems are considered using the methods of analogy, generalization, concretization, classification, induction, deduction and others. In the lessons of mathematics (algebra, geometry, trigonometry, etc.), information and communication technologies are also used. They increase interest in the subject and give scope for independent creative work. Using an interactive whiteboard develops independence, interest in learning. All methods and technologies increase the efficiency and quality of the educational process.

KEYWORDS: *Mathematical education, methods of teaching mathematics, information and communication technologies, analogy, induction, deduction.*

INTRODUCTION

The introduction of innovative ideas into education in relation to the pedagogical process means the introduction of something new into the goals, content, methods and forms of teaching and upbringing, the organization of joint activities of the teacher and the student. In the mathematical

education of students, methods are used such as experiment and observation, comparison and comparison, analysis and synthesis, generalization, concretization, classification, abstraction, etc. The observation method, for example, can be applied in a geometry lesson, when several figures are given and among them you want to find figures with axial symmetry. In the study of geometry, the comparison method is also used when it is required to find similar and different sides of a quadrilateral and a hexagon. The generalization method is used when formulating mathematical rules, identifying patterns, etc. Depending on the content and goals of the lessons, the generalization process may include comparison, analysis or synthesis, other logical techniques and forms of thinking. Abstraction is a mental selection of those essential properties and attributes of an object or phenomena that are needed depending on the purpose of their study, while simultaneously abstracting from other properties and attributes. Conversely, concretization is a mental transition from the more general to the less general, from the general to the singular.

METHODOLOGY

The use of interactive methods, information and communication technologies give a good result for the development of new topics by students. When explaining new material, the teacher can make extensive use of presentations created in MS PowerPoint. The presentation in the lesson is a kind of supporting outline, and also replaces the blackboard. On the slides, you can place not only definitions, but also diagrams, illustrations for the lesson material, assignments for independent work, and questions for a frontal survey of students. In addition, the widespread use of electronic textbooks, multimedia encyclopedias, simulators increase the effectiveness of teaching. When implementing projects, creating presentations, students apply the acquired knowledge in practice, develop qualities such as initiative, independence, and composure. The use of an interactive whiteboard is also one of the most widespread and effective innovative technologies in teaching mathematics. When using an interactive whiteboard, the following are used: a screen for demonstrating presentations, electronic manuals, various software functions (for example, graphing functions). The use of various methods and information technologies in mathematics lessons allows you to improve the quality of perception of new material, automate knowledge control, diversify the forms of the lesson, motivate students to learn, develops their communication skills and creativity, increases information competence and the strength of the assimilation of knowledge and skills.

The software of mathematics as an academic discipline is very diverse: textbook programs, training programs, reference books, encyclopedias, video tutorials, libraries of electronic visual aids. However, the difficulty in using it lies in the fact that the teacher has to adapt the resources at his disposal to the teaching materials used for teaching, to the characteristics of students in his class. This becomes possible only if the teacher is confident enough in computer technology.

As noted in the materials of conferences at various levels devoted to the problems of introducing ICT into education, a lesson with the use of a computer will be more effective for a teacher who preserves human priorities in learning; has a kind, trusting attitude to the machine and its pedagogical capabilities; knows how to carefully and at the same time boldly handle a personal computer; intellectually developed, erudite, able to assess the pedagogical capabilities of computer programs; methodically flexible; disciplined, accurate, owns an ordered, logical thinking. Thus, mastering ICT requires professional and personal growth of a teacher.

The role of the computer is as follows:

- A high degree of motivation is formed, interest in the learning process increases;
- The intensity of training increases;
- Individualization of training is achieved;
- The objectivity of the evaluation of results is ensured;
- The proportion of independent work is increasing. When teaching mathematics in primary school, the following organization of educational activities using ICT tools is possible:
- Individual work with the training system;
- Creation and use of presentations in the lesson;
- Modeling: using ready-made models and developing new ones;
- Automatic testing systems;
- Project method of work;
- Game forms, contests, quizzes, participation in distance contests;
- Creation with the help of Microsoft Office and use of tools for organizing activities;
- Accounting of progress;
- Use of instrumental training programs;
- Use of web technologies.

Students can use ICT as a tool to perform calculations, draw graphs, and help solve problems. The most obvious example of using ICT in this way is when students use a calculator or the like to perform more complex calculations. However, spreadsheets, computer algebra systems, or graphing calculators can be used to solve problems with tests and improvement or search techniques. Mathematics students can use graphing calculators or plotters instead of algebra to graphically solve an equation. Students can seamlessly perform statistical analysis on the data they collect using the extensive statistical functions of the graphing calculator. Generating an image in a dynamic geometry package can help a student understand, solve, and then prove a geometric problem. When students use ICT as a tool to help them find things, solve problems, or understand what's going on, it often helps them develop their skills in using and applying math. ICTs can be a vast and effective tool, but students need to acquire the necessary technical skills in order to constructively and effectively capitalize on the opportunities presented to them.

CONCLUSION

This study shows the integration of ICT in mathematics. Several problems on the usefulness of ICT in mathematics have been derived from the literature. The integration of ICT into mathematics education has a positive impact on both the learning process and the learning process. The study was conducted to identify barriers to integrating ICTs into mathematics teaching and learning at teacher training colleges and at the secondary school level. There are some obstacles to integrating ICTs into the teaching and learning of mathematics in various areas of mathematics. In the future, we will expand my studies to a higher education level for

continuing education. It is thus emphatic from these deliberations that the reach of mathematics education in the present era is hugely dependent on the pace of creative innovations in IT, particularly, by all key stakeholders in the sub-sector.

UZBEKISTAN

Email id: utkireshaliyev70@gmail.com

ABSTRACT

The article sets out to analyze the professional competencies on the standard European e-Competence Framework. The survey of information technology teachers of Ukrainian universities concerning the necessity of forming and development of European e-Competence Framework competencies allowed defining the priority areas for training and forming the content component of a model of professional competencies development of information technology university teachers. The proposed model distinguishes stages, factors, and resources for training teachers. Teachers' attitude to motivation, time and money allocation for professional development was researched. The content component of the development of professional competences of teachers of information technologies is offered. Recommendations for training and advanced training of teachers of information technologies, assessment of the level of development of professional competence, were proposed.

KEYWORDS: *European E-Competence Framework, Professional Competencies Of Information Technology University Teachers, Development Of Professional Competencies.*

INTRODUCTION

The issue of transformation of education according to key challenges is being actively studied and discussed. Microsoft Corporation suggested a framework of higher education transformation comprising the following range of transformation processes: managing the life cycle of a student from admission to employment and maintaining contact after finishing the IT-oriented study; teaching, learning, and research based on the systems of educational content management, new teaching technologies, hybrid cloud-oriented educational environment and services for scientific

research and communication; combined campus that unites automatized management of administrative activity, the access policies on resources and services, educational laboratories, network communications and their management, automation of engineering systems etc [1,2].

The world is becoming increasingly technological. All the spheres of human activity are automatized, modern technologies are widely used even in professional activities pertaining to liberal arts. Ubiquitous technologization sets new challenges for higher education, being connected with such global issues as financing and state policy in the field of education, as well as with technological issues, namely use of ByoD/ByoIT/Cloud&Hibrid IT [3]. The approach to work in classroom using personal devices and IT requires a properly organized structure at the university, both network and server ones, while use of cloud and hybrid IT technologies – organization of access and administration of these technologies according to the concept of smart university [4]. The current state of the world IT industry, development of smart education technologies, and constant change of employers' requirements to training of IT specialists at universities force all the participant of educational process to search new models of development of professional competencies of university teachers who provide training of future IT specialists. In higher education, new technologies, based on principles of open education, are also used for organization of academic activities, in particular, for organization of educational process. Teachers should not only master the technologies of e-Educational content, but also the methodology of their use in teaching disciplines according to the technology of blended, adaptive, and project-based learning [5,6]. The constant change of the curriculum of computer science in secondary school, which is becoming more oriented at STEM Education, results in brand new competence in IT of the students entering the higher educational establishments. Data show that the set of core cognitive knowledge, skills, and abilities that are associated with a STEM education are in demand in nearly all job sectors [7,8]. It should also be considered in teaching professionally-oriented disciplines of IT majors. Undergraduate students should obtain basic knowledge in IT, which will be necessary during studying specialized professionally-oriented disciplines in the last years of education to the extent meeting the current requirements of employers. Thus, cooperation with IT business is a real objective for an IT teacher, and its achievement will solve a range of issues connected with the quality of practical training of students. An IT teacher should clearly understand what professional competencies are to be formed by a future IT specialist, as well as realize the importance of forming soft skills, self-education, research, and other competencies crucial for successful career in IT field. Problem statement: to study the components of professional competence of IT teachers and develop a model of professional competencies development (lifelong learning) of IT teachers at higher educational establishments. 2 Analysis of Publications Research by Ukrainian and foreign scientists indicate the significant attention to the issues of development of methods, forms, and means for forming and developing professional competencies of university teachers. Computer science is an educational field that will continue to need qualified teachers and professors to accommodate increased student populations and interest across the nation. Government initiatives, changing school policies, financial incentives to major in computer science, and an increased need to hire more computer science professionals (including educators) adds to the appeal of pursuing a teaching career in computer science [9]. Namely, Ji Hyun Yu, Yi Luo, Yan Sun, Johannes Strobel [10] studied a model of competencies for teachers of engineering disciplines, in which they distinguished 7 components: Engineering Concept Knowledge, Engineering Skills, Knowledge about Engineering Disciplines, Engineering Pedagogical Content

Knowledge, Attitudes toward Engineering, Attitudes toward Teaching Engineering, Integration of Engineering with Other Subjects. Such a model partially considers modern approaches to competencies of a university teacher in terms of their digital competence. The six areas of European Framework for the Digital Competence of Educators focus on different aspects of educators' professional activities [11]: Area 1: Professional engagement using digital technologies for communication, collaboration and professional development. Area 2: Digital resources sourcing, creating and sharing digital resources. Area 3: Teaching and learning managing and orchestrating the use of digital technologies in teaching and learning. Area 4: Assessment using digital technologies and strategies to enhance assessment. Area 5: Empowering learners using digital technologies to enhance inclusion, personalization and learners' active engagement. Area 6: Facilitating learners' digital competence enabling learners to creatively and responsibly use digital technologies for information, communication, content creation, wellbeing and problem-solving. The analysis of the level of digital competencies of students and teachers of Ukraine according to Dig Comp 2.1 methodology is given in [12]. It is determined that the level is sufficient, but there is a difference between teachers and students, which is the basis for organizing cooperation within the educational process. In our opinion, ISTE Standards for Computer Science Educators [13], Comprising 4 components: Knowledge of content, Effective teaching and learning strategies, Effective professional knowledge and skills, Effective learning environments, describes the elements of the Computer Science Educators competency in the most accurate manner, in the light of the issue considered. The model of competencies of a teacher includes pedagogical competencies that consist in mastering modern technologies of teaching, methods, and tools for development of educational content, analysis and assessment of e-Educational resources, conducting scientific research and processing their results using modern tools and services, including cloud ones. Both professional and pedagogical competencies of a teacher include the set of digital competencies and specific subject competencies. Professional competencies in information technology deal with the design, creation, management and maintenance of the varied components of the system, including software, hardware, networks, systems integration and multimedia. Broadly, information technology can be divided into four central pathways: network systems, information support and services, programming and software development, and Web and digital communication [14, 15].

For development of practical skills of teachers, it is necessary to constantly cooperate with IT companies and participate in development of IT solutions of various level of difficulty. Internships and involvement in project solutions at IT companies are one of the most efficient mechanisms of consistent improvement of professional competence in practical dimension. Cooperation with IT companies can be provided by means of: — Involvement of students and teachers in implementation of the projects ordered by IT companies. Hence, a teacher is managing a project and improving the level of practical skills of IT specialist: — Involvement of companies in teaching academic disciplines and practices. A teacher receives recommendations, practical cases, and assistance in their resolving; — Part of academic classes is transferred to a company and conducted under supervision of a company's tutor. Together with students, a teacher acts as an executive, improving the level of practical skills. Attending conferences, workshops, and seminars where teachers are able to obtain new knowledge and skills, is another efficient mechanism for their self-development. Every member of teaching staff of university should not only conduct educational activities, but also carry out research, scientific projects, and publish the results of research. Scientific achievements form a basis for their educational

activities, since they are of significant theoretic value and, thus, should be accessible for students.

Conclusions The proposed model, based on the analysis of modern standards of professional competencies of IT teachers, consists in a range of consecutive stages: defining the need for training, selection of courses for training, completing the courses, assessment of level of professional competence. The need for training is formed due to the following factors: emergence of new information technologies, new teaching technologies, requirements of IT companies to qualification of graduates majoring in IT, requests of students, and self-motivation. To define the need for professional competencies development, the existing standards (e-CF, ISTE) should be used, in accordance with the devised indicators for each set of competencies. The same indicators are to be used for assessment of professional competencies of teachers. Postgraduate courses can be used to substitute the advanced training courses. Additionally, it's possible to use training programs for teaching staffs of departments, which are based on MOOCs and form the necessary competencies.

ABSTRACT

This article discusses the ways and means to develop professional competence of teachers in refresher courses. The analysis of continuing education as a subsystem of continuing education, its main functions, goals, content, and ways to implement them. A description of the training module as means of organizing the activities of mathematics teachers in refresher courses by addressing decision educational problems; Professional development in the context of continuous education is considered not only as a type of additional vocational education, but also as a process of updating professional knowledge and skills of specialists in accordance with modern requirements for the level of their preparation. Considering professional development in the aspect of the process of updating professional knowledge and skills of specialists, Russian scientists give various characteristics (definition) the process of changing the qualities of a specialist, reflecting the main functions of professional development.

KEYWORDS: *Training, professional competence of the teacher, the content of teacher training, professional activity, efficiency of activity, professional development of an educator, methodical supplement for a qualification improvement system.*

I. INTRODUCTION

Professional development in the context of continuous education is considered not only as a type of additional vocational education, but also as a process of updating professional knowledge and skills of specialists in accordance with modern requirements for the level of their preparation.

Considering professional development in the aspect of the process of updating professional knowledge and skills of specialists, Russian scientists give various characteristics (definition) the process of changing the qualities of a specialist, reflecting the main functions of professional development.

V.V. Kraevsky, when defining advanced training, identifies the function of forming a new economic thinking corresponding to the modern stage social development: "... advanced training Is the acquisition of additional knowledge on the basic specialties and improvement of professional skills on the basis of understanding their own activities in the light of the knowledge gained "[2, p. 56].

B.S. Gershunsky in the definition of the concept of "advanced training" reflects the functions of continuous development intellectual and creative potential of specialists and advanced staffing of the latest achievements of scientific and technical progress: "Professional development and retraining of personnel ... includes a systematic update of knowledge, skills and abilities of workers, specialists and managers of industries, taking into account the latest achievements and the prospects for the development of science, technology, technology, economics and organization of production, both in our country and and abroad "[3, p. 77].

V.G. Onushkin, Yu.N. Kuliutkin, V.Yu. Krichevsky consider improving the qualifications of teaching staff as "... primarily and mainly the process of his progressive growth as a person and as a professional, a process that takes place throughout practical activity" [4, p. 28]. Thus, the authors emphasize the functions of satisfying a variety, continuously growing spiritual demands of workers; development of interest and improvement of skills and abilities of self-education, independent search for new knowledge.

A.Yu. Panasyuk, in characterizing the process of continuing education, describes such a function of it as improving vocational qualifications structure of society: "The process of professional development, of a specialist or leader is a change any parties, aspects of his professional activity, i.e. His professional attitudes" [5, p. 20]

E.M. Nikitin reflects both aspects of professional development: "Professional development is viewed as training in educational programs for growth professional competence, pedagogical and management skills, mastering new functional responsibilities (without obtaining a new specialty) by mastering modernized and expanded socio-cultural and professional programs "[6, p.225].

Professional development system created in Russia in the second half of the 60s of the last century, gradually integrated into the system of continuing education and is currently a subsystem of it. For the efficiency of the system of continuous education requires the implementation of the basic functions (professional and personal development of a person and his adaptation to a changing situation) by each of its subsystems. Within the framework of the subsystem of additional professional education, I.V. Ilyina, G.N. Podchalimova, T.I. Shamov allocate the corresponding social and pedagogical functions, reflecting the goals of the postgraduate education. Acmeological - the development of the human potential of specialists, their spiritual and moral qualities, subjectivity, creativity, individuality. Service - meeting the needs of the professional sphere in qualified personnel. Diagnostic - training based on the results of diagnostics of the level of professional competence, personal needs of students. Compensatory - Elimination of gaps in the basic professional training of specialists, making adjustments to their theoretical knowledge, skills and practical experience. Innovative - the destruction of the

prevailing negative stereotypes of professional activity of specialists, restructuring of thinking and activity, the formation of analytical skills, allowing to understand the essence of processes, phenomena, as well as preparing students for the implementation of various innovations that are significant for improving quality and efficiency of the specialist's work. Predictive - the development of the ability of students anticipate future problems of professional activity, develop anticipatory constructive models their permission, provide for the consequences of the professional solutions.

II. METHODS

The analysis of different psychological theories on the base of the systematic, personal-oriented active and complex acmological approach to the definition of the term "professional development of a teacher" is presented in this article. The problem of professional development of a teacher in the system of qualification improvement is raised. A suggestion of the necessity to work out and to support scientifically optimal conditions of teachers' professional development in the system of qualification improvement which lets to reveal new reserves of their professional activity effectiveness is put forward.

In connection with the deep and rapidly proceeding socio-economic changes taking place in our country, the democratization and humanization of society, training and advanced training institutions are faced with the task of resolving the contradiction between the requirements new practice and the consciousness of teachers saturated with traditional stereotypes.

Since the personality of a specialist acts as a means of professional activity, close attention is required to the peculiarities of the process of his professional development, to the conditions affecting influence him. For domestic and foreign psychology as a whole, the problem of professional development is not new. Selected questions and aspects of this problem in one or a different degree have already been investigated earlier by educators and psychologists, sociologists and philosophers. Analysis of domestic works on this subject indicates that research professional development is carried out within the framework of several approaches, among which should be highlighted: personality-activity; systemometractive (defineddivision of professionally important qualities a teacher as a subject of activity); activity (identifying patterns professional growth of the teacher thanks to the study of the effectiveness of its activities); holistic, complex, acmeological (interconnected study of the teacher's personal and professional growth).

Supporters of the first direction, relying on the analysis of activities from the point of view its structure and success; highlight the qualities of the teacher, which, in their opinion, can ensure the effectiveness of the process. Under such qualities imply the teacher's professional skills (F.N.Gonobolin, M.A. Danilov, V.A.Krutetsky, N.V. Kuzmina, etc.), pedagogical abilities (S.G. Vershlovsky, F.N.Gonobolin, V.N.Koziev, Yu.N. Kuliutkin, N.V. Kuzmina, V.A.Krutetsky and others); Later V.A. Krutetsky shares the concept of "pedagogical abilities" and "professionally significant personality traits", considering the first part of the second. The works of the named authors contributed to the creation of a professional portrait a teacher, which was the basis for the deployment of career guidance activities, professional selection and training of teachers.

III. RESULTS AND DISCUSSION

In the last decades of the XX century; in pedagogical science, a direction was defined that studies the problem of professional development on the basis of a systematic research-activity approach (O.S. Anisimov, A.A. Derkach, N.A. Masyukova, B.V. Palchevsky, P.G. Shchedrovitsky and others); Representatives of this direction are considering professional work of a teacher as a poly structural, poly disciplinary and poly functional dynamic system, which includes, in addition to purely pedagogical also research, methodological, design, management and other types activities. To characterize professional development, these scientists are most often use the concept of qualification, which is not understood as the sum of subject-professional knowledge, but organizational and activity competence - the ability not only fulfill, but also evaluate your activity. Methodological reliance on the theory of activity, on the one hand, allows you to leave from randomness in the selection of qualities, to cover all components and reasonably record the stages of professional growth, with the other - reduces the characteristics of the teacher to a subjective level, not taking into account his personal qualities. Increased interest in personality, characteristic of science at the end of the 20th century; In general, has led to an interest in research on professional development based on a personal approach (N.A. Astashova, G.G. Gorelova, O.P. Morozov, etc.). Their main feature is the concentration of attention on the individual teacher, his value orientations, semantic formations, individual style activities, etc. But commitment to the idea interiorization, social determination personal structures does not allow authors break out of the subject-object perception of the world. For example, some authors, considering the value sphere of the teacher an internal regulator that determines it attitude to the outside world and character professional activities, consider the process of forming value orientations as mastering pedagogical knowledge, social values, as the interiorization of specific patterns of behavior, social norms and rules...

The study of the personal and professional growth of a teacher on the basis of a holistic and integrated approach was carried out in the 1970s and 1980s. V.A. Slastenin, N.F. Talyzina and others; Later, these attempts found continuation in studies conducted on the basis of the acmeological approach (B.G. Ananiev, A.A. Derkach, N.V. Kuzmina, N.V. Kukharev and others); from an acmeological point of view, the professional maturity of a teacher is considered in the unity of individual-personal, procedural-technological and self-actualization components. The main, pivotal among them self-actualization acts; A holistic approach to the study of a person in professional activity is carried out in accordance with the theoretical model of a person proposed by B.G. Ananiev: individual, subject of activity, personality, individuality. All the studies discussed above have developed normative models the personality and activity of a specialist on the basis of the formation of professionally important qualities as a result of the interaction of the individual with society through the interiorization of the norms inherent in this society. The central category, reflecting the essence of the interaction between a person and a profession, is professional development, which in psychology is considered as a fundamental process of human change, as explanatory principle of the formation of professionalism and as the value of the professional community.

A similar understanding of this phenomenon raises the question of finding an adequate approach to study it. In psychological science, as we noted above, today there are various methods for analyzing the professional development of teachers. Each of them developed his own class of representations and corresponding concepts that are not derived from any one category common to them.

At the same time, they complement each other and therefore can be combined into the framework of a single personality development approach.

L.M. Mitina in her research notes the need to introduce a special concept of professional development teachers, not reducible to any procedural, nor to the performance characteristics. Thus, professional development understood as growth, formation, integration and implementation in pedagogical work professionally significant personal qualities and abilities, knowledge and skills, but

The main thing is as an active qualitative transformation by the teacher of his inner world, leading to his fundamentally new structure and way of life. Ideas integrity, unity, systemic organization of the teacher's labor made it possible to present this the most complex mental reality in the form multidimensional space consisting of three interrelated: the personality of the teacher, pedagogical activity and pedagogical communication. Each of them has its own coordinate system, its own central system-forming basis, uniting into a common multidimensional space by integral characteristics of the teacher's personality, which determine the optimal functioning and development of not individual aspects, but work of the teacher in general.

In psychological research of a personalistic nature, the emphasis is on not so much on the definition of the essence and components of pedagogical professionalism, but on the study of the mechanisms of its development. Improving teacher skills is studied in the context of personal development, during which changes structure and content of professional activities. Professional and personal development, according to scientists, is determined by internal conditions - consciousness and individual position. The fundamental condition for the development of mastery is raising the level of professional self-awareness, which is manifested in the transformation of their inner world. Personal-professional process teacher development is to achieve new semantic levels, it is determined the form of psychological regulation, the specificity of personal centralization ... Driving intrapersonal contradictions are called the force of professional development, but the latter can acquire destructive features and hinder this process. So, according to L.M Mitina, the integral characteristics of the teacher's personality are pedagogical orientation, competence, flexibility - determine the efficiency of labor and are the object of professional development.

A fundamental condition for the professional development of a teacher is the transition to a higher level of professional self-awareness. The constructive resolution of the teacher's intrapersonal contradictions acts as the driving forces of professional development. Professional improvement obeys principle of self-development; nevertheless, the teacher needs psychological help in raising the level of self-awareness, in the transition from the external determination of vital activity to the internal one. To this end, psychologists offer a variety of trainings, specially organized procedures that promote self-knowledge, self-esteem, self-stimulation for development, self-control, etc.

IV. CONCLUSION

Considering the problem of professional development, E.F. Zeer claims that it is changes in the psyche in the process of mastering and performing professional activities. The object of development is the subject activities. The factors that determine this process are the socio-economic situation and the leading activities,

First - educational and professional, then vocational education and finally vocational ... The growing demands of society for quality of education and pedagogical professionalism have determined the priority focus of the process of increasing qualifications to support the professional development of teachers.

Dynamism of modern public life, increasing requirements for the personal and professional development of the teacher identified the need to change priorities in professional development, their focus on supporting transformative pedagogical activity, carried out by the teacher himself, for personal and professional growth, for providing conditions for the independent solution of life and professional problems, which is becoming increasingly important in the development of content and technologies for advanced training.

Analysis of works devoted to the problems advanced training (I. Yu. Aleksashina, V. G. Vorontsova, I. D. Demakova, I. I. Zaretskaya, G. L. Ilyin, I. A. Kolesnikova, N. A. Masyukova, E. M. Nikitin, N.A. Perelomova, E.I. Rogov, A.P. Sitnik, R.Kh. Tilneeva, K.M. Ushakov, I. D. Chechel and others), call draws the conclusion that the system of professional development can, to varying degrees, affect the personal and professional teacher development: provide enough its rapid pace, to determine new directions, to stimulate the process of personal and professional development. Nevertheless, the modern organization of the professional development process does not sufficiently take into account the laws and patterns that lie in the basis of the personal and professional development of the teacher. It should be emphasized that the short duration of this process does not allow sufficiently harmonize external stimulation with the personal and professional development of the teacher; therefore there is a need to create psychological conditions for supporting the teacher as subject of personal and professional development. It is the knowledge of yourself, your personality, their professionally significant qualities will allow specialists to effectively plan and carry out their own professional activities. Insufficient knowledge of yourself, your strengths and weaknesses, lack of subtle differentiation of one's own emotional states - all this complicates professional and personal growth of teachers. Professional process the teacher's development is determined by constructive overcoming of difficulties that constantly and inevitably arise in pedagogical practice, which ensures the transition to a higher level of professional self-awareness. To ensure such development, it is necessary to determine the conditions: compliance of the teacher's personality with the requirements profession, optimization of the process of pedagogical activity of a specialist, change and improving the psychological components of professional development. One of the most effective forms of ensuring these conditions is the organization of courses in the conditions of the institution of improvement qualifications (M.E. Khvatsev, V.I.Seliverstov, R.Kh. Gilmeeva and others). This is confirmed used in the process of increasing qualifications of special psychological and pedagogical tools that allow the teacher to learn to identify the features professional development and thus optimize the professionalization process. However, the analysis of the existing system professional development of teachers showed that it needs to be expanded and refined with the purpose of further research on the psychological conditions of professional development and determining its methodological support.

ABSTRACT

The article examines the foreign and domestic analysis of the stages of development of information and communication technologies in education. The situation of the use of information and communication technologies (ICT) in education is also studied. The Internet has changed the way people use information and knowledge, the way they communicate. Technology is one of the fundamental general scientific concepts of the present time. The concept of pedagogical technology appeared in the twentieth century and is passing through various stages of development. Initially, this concept was used as "educational technology" from the 1940s to the mid - 50s, expressing the use of audiovisual techniques in the educational process. The concept of pedagogical technology originally began to be used in the US in the middle of the XX century. The terms " pedagogical technology "and" educational technology" were used in relation to teaching only with the help of technical means. Over time, as a result of the increase in the level of their application, the content also changed accordingly.

KEYWORDS: *Educational technologies, Mass open online courses (MOOCs), Distance education technologies, the impact of technologies, E-learning, Information and communication technologies (ICT).*

INTRODUCTION

The Internet has changed the way people use information and knowledge, the way they communicate. Technology is one of the fundamental general scientific concepts of the present

time. ICT is a technology that can be used remotely. The comparison of the dynamics of the development of educational technology in Russia and abroad made it possible to determine the following. The significant difference in the speed of use of pedagogical Technologies is discussed in more detail as follows.

As a result of the content, purpose and functions of education-training periods pass, its forms and methods are improving. Now, the main directions of human activity are turning from this activity into a holistic system, that is, Technologies, which give the opportunity to fully realize the intended goals. In a similar field of Education began to apply pedagogical technology in recent years. In the technology of production, the processing of various materials is carried out by masters of the respective profession. And the content of pedagogical technology is an expression by a teacher, educator from different ways of influencing the reader (educator) from a mental, spiritual, moral gist.

The concept of pedagogical technology appeared in the twentieth century and is passing through various stages of development. Initially, this concept was used as "educational technology" from the 1940s to the mid - 50s, expressing the use of audiovisual techniques in the educational process. The concept of pedagogical technology originally began to be used in the US in the middle of the XX century. The terms " pedagogical technology "and" educational technology" were used in relation to teaching only with the help of technical means. Over time, as a result of the increase in the level of their application, the content also changed accordingly.

So far, in order to establish a single definition based on modern science, the concept of pedagogical technology has been substantiated by several large scientists of different views and views. From the middle of the 50 - ies of the last century to the 60 - ies, the term "educational technology" was used, which meant programmed education. In the 70-ies, the term " pedagogical technology" was used, which represented a training process that was designed from the very beginning and guaranteed the achievement of clearly defined goals.

In 1979, the US Association of pedagogical communications and technology described pedagogical technology as follows: "pedagogical technology consists of a complex integrative process that includes the analysis and planning of the problem, assessing the solution of the problem and the methods by which it is managed, ideas, tools and activities that cover all aspects of the mastering of knowledge." www.ziyo.uz.com the library was told to create computerised and information technologies in education as pedagogical technology from the early 80s.

On the basis of the above points, the concept of pedagogical technology can be interpreted in two ways: firstly, it is implied that it expresses the subordination of the use of technical means in the educational process, and secondly, it can be concluded that this concept denotes the technology of self-construction of the educational process [1].

In the 60-ies of the last century, when the first steps were taken in the field of Information Technology, no one imagined how this could affect the progress of mankind. Information, information and Communication Technology (ICT) or media technology is now firmly established in every aspect of our lives. With the development of information and Communication Technologies, Technology has also changed.

(M. Eraut, R. Stakenas, R. Kaufman and other)

Programmed training was introduced. Attempts to introduce problematic education were activated.

The base of pedagogical Technologies has been established: the psychology of education, the theory of the management of the cognitive activity of teachers and students, the results of which are introduced new studies, has been scientifically established. The period is characterized by the introduction of a strict system.

Since 1989, the democratization of the educational sphere vocational education is aimed at production with the aim of satisfying the requests and interests of the individual.

Educational technology is understood as the emergence and development of interactive educational tools, attempts on the basis of a multifaceted approach. The essence of the modern pedagogical process is studied.

Computer auditoriums, distance learning centers are established abroad. The number and quality of programmable learning tools has increased and interactive systems have been widely used. In Russia, new educational technologies began to develop with the use of Remote Technologies, which were previously implemented through postal communication.

Information and technology: this period is characterized by a new trend of convergence of two directions.

Actively engaged in education from information and communication technologies (ICT), they sought opportunities for education. In 2008 - mass open online courses (OOOK) -electronic courses, with the help of which they created teaching methods. The use of ICT remains episodic (limitation), distance learning technologies are poorly developed.

Since 2014, it is planned to switch from the mass media system to continuous education, which is characteristic of the industrial economy, aimed at accelerating the pace of updating educational technologies, as well as education oriented to the individual.

DEVELOPMENT PERIODS	INFORMATION TECHNOLOGY IN THE USA AND WESTERN EUROPEAN COUNTRIES SPECIFIC FEATURES TO LEARN	SPECIFIC FEATURES OF EDUCATIONAL TECHNOLOGY IN EUROPEAN COUNTRIES
1-period 1940-1950 years	Educational technology - this period in the US and Western Europe, which is understood as the introduction of technologies into teaching, is characteristic. Audiovisual means in the educational process - tape recorder, television, radiolar, players, and cinema.	In the Soviet Union, this period is characterized by the following transformation of only traditional educational technologies; the tasks of information and education at the Institute of students have become topical.
2-period 1950-1960 years	Educational technology-understood as the implementation of a technological approach with a technical approach. Also improve its effectiveness in the organization of the educational process. (B. Skinner, S. Gibson, T. Sakamoto and others).	
	Audiovisual feedback tools were developed, programmed training sessions	Later, traditional educational technologies were used, and

	in schools, lingaphone rooms, training machines, simulators, tools for systematization of programs were introduced: programmed textbooks, didactic machines for control of knowledge, etc.	film proses, filmscopes, radio educational technical tools were introduced in part.
3-period 1970-90years	Educational technology is understood as the management of the educational process with clearly defined objectives, the solution of Information Technology and didactic problems (M. Eraut, R. Stakenas, R. Kaufman and other.)	
	Programmed training was introduced. Attempts to introduce problematic education were faollashdi. The base of pedagogical Technologies has been established: the psychology of education, the theory of the management of the cognitive activity of teachers and students, the results of which are introduced new studies, has been scientifically established.	The period is characterized by the introduction of a strict system. Since 1989, the democratization of the educational sphere vocational education is aimed at production with the aim of satisfying the requests and interests of the individual.
4-period In the mid-1990s - At the beginning of 2000 years	Educational technology is understood as the emergence and development of interactive educational tools, attempts on the basis of a multifaceted approach. The essence of the modern pedagogical process is studied.	
	Computer auditoriums, distance learning centers are established abroad. The number and quality of programmable learning tools has increased and interactive systems have been widely used.	In Russia, new educational technologies began to develop with the use of Remote Technologies, which were previously implemented through postal communication.
5-period From the year 2000 Until now	Information and technology: this period is characterized by a new trend of convergence of two directions.	
	Actively used information and communication technologies (ICT) in education, they sought opportunities for learning. In 2008 - mass open online courses (OOOK) -electronic courses, with the help of which they created teaching methods.	The use of ICT remains episodic (limited), distance learning technologies are underdeveloped. From 2014, the transition to the media system is planned. Continuing education, which is typical of the industrial economy, is aimed at person-centered education, as well as accelerating the pace of updating educational

		technologies.
--	--	---------------

The history of the development of pedagogical technology is inextricably linked with certain stages:

- * 1946 year. Audiovisual education is included in the University of Indiana in the United States (author -L. K. Larson).
- * 1954 year. The program is based on the training plan (author-professor B.F. Skinner).
- * 1962 year. The Department of educational technology was opened at the University of Southern California (head of department-D. D. Finn);
- * 1968 year. The LOGO programming language has been developed and applied to the educational institution. (Head of the Massachusetts Technological institute in the USA Peyper);
- * 1976 year. The first personal computer was created "Apple" (authors-Steve Jobs and Steve Wozniak);
- * 1981 year. In the display classes, special software tools were used for educational purposes.
- * 1990 years. Interactive technologies have been used in education.

In order to optimize the educational models, it is the system of creating, applying and identifying the process of mastering the entire teaching and knowledge, taking into account the human and technical resources and their interaction. (UNESCO)[1].

As can be seen from the analysis of the development of educational technologies, the main goal at each stage of its development was the introduction of pedagogical technologies into education. However, to do these at all levels, educational management will have to pay great attention to the following:

Ensuring the openness of education through the creation of competitive education electronic edition of educational programs, the use of Remote Technologies, video, audio, text, lectures;

- To train teachers and improve their computer literacy skills.

Introduction of methods of using ICT:

- Equip classes with computers, audio and video displays, etc.

-Full use of computer and internet as an educational tool in educational activities;

Educational technologies are of particular importance not only in the development of the educational sphere, but also in general lead to the radical development of the country. Therefore, the best pedagogical technologies, including the traditional ones, should be supplemented with the possibility of using ICT in the most competitive conditions.

At each stage of the process of training qualified personnel, it is necessary to carry out certain tasks in order to effectively organize the educational process, to wait for it to the higher stages, at the same time to bring it to the level of World Education. Indeed, at the first stage of this process (1997 — 2001 years)"... development and introduction of educational —methodical complexes and new generation of didactic and information supply in the educational process" in the second stage (2001 -2005 years)"... continuing to develop the material technical and information base of educational institutions, providing the educational process with high-quality educational

literature and advanced pedagogical technologies" and in the third stage (2005 and subsequent years)"... such urgent tasks as" further development of resources, personnel and information bases of educational institutions, complete provision of educational process with new educational-methodical complexes, advanced pedagogical technologies" are positively resolved.

Pedagogical technology (PT) is a sphere of knowledge, with the help of which in the 21st century in our state there will be radical deviations in the field of education, Teacher activity has been renewed, free thinking, thirst for knowledge in students - youth, humanism have been systematically formed. The main idea that lies on the basis of knowledge is also a humanitarian one, which understands the unity of nature and Man, which is patient, satisfactory, which refuses to give up the method of post-emptive and false thinking, which respects the idea of others, which is intended to form such personality qualities as national cultural and universal values. To what extent is the solution to this issue related to the technology of Education? The concept of technology came into science in 1972 year in connection with technical progress, and in Greek there are two words-Technos (technos) - art, profession and logos (logos) - science, which means the science of profession, formed from the words doctrine.

However, this expression cannot fully describe the modern technological process. The technological process always assumes the execution of actions in a certain sequence, using the necessary tools and conditions. More precisely, the technological process is the work of the worker on the creation of a product as a result of the gradual exposure to the objects of cocktails with these cocktail weapons. Namely: PT is the process of influencing the pupil (student) under certain circumstances with the help of the teaching (teaching) tools of the teacher (teacher) and intensive formation of the personality attributes defined before them as the product of this activity.

This approach to education in the pedagogical thinking of world is not a novelty. In the XVI century, Yan-Amos Komenskiy, the author of "great didactics", wanted to put the educational process into the form in which "in it each method and things had to be placed in such a way that the time was groundbreaking", "the whole pedagogical process should have gone unnoticed like a well-tuned clock." Teachers of the XXI century reached the dreams of the great pedagogical Komenskiy, taking the name of this social event pedagogical technology, serving as a guideline to teachers and educators of the whole world.

LINGVOCULTURAL ASPECTS OF BORROWINGS FROM ENGLISH TO UZBEK LANGUAGE

Mukhammadiyeva Ayubovna Nargiza*; **Nosirova Muborak Khaitbayevna****

*English Teacher,
Tashkent State University of Oriental Studies,
UZBEKISTAN

ABSTRACT

The present article is dedicated to the lingvo cultural analysis of borrowed words from English to Uzbek, which are frequently being used in the letters" daily life. It is understood that there is a system of unique signs or features render languages distinct from each other. Uzbek and English languages are no exceptions. We recognize variations in grammatical form under systemic discordance. Such thematic groups are based on hierarchical (hierarchical) relationships in the language. Creation of relations between nations and supremacy English as a market language triggers a great influx of words into Uzbek. Words, thereby enriching the word-stock It was untouched by the impact that English had on our language in all facts of life, educational, political and hardly any walk of life. In the following article a diverse range of types will be analyzed according to various spheres.

KEYWORDS: Borrowed Words, Loan Word, Translation, Adopting, Thematic Groups, Fixed Expressions, Native Words.

INTRODUCTION

Language plays an important role in developing a world image. Nevertheless, the diversity of language and symptom logy units also plays an important part. O. A. Kornilov said about function of communication as a national means of having a semantic perspective. And on the basis of each language, vocabulary occurs in special topics [O.A. Kornilov, 1999, p.75].

A further significant concern is because there is no vocabulary without new definitions or phrases in the world. Since, through the far-reaching progression of culture, various nations have made interrelationships that have contributed to new concepts and terms emerging in the language.

The opinion of V.V.Vinogradov about the role of new word formation in linguistics is exemplary. According to him, while the formation of terms is important in the science of linguistics, it is approached by lexicology - the science of the lexical structure of the language, and in turn by grammar - with the doctrine of form formation and word syntax. The number of supporters of this view is growing day by day. As we look at the formation of new words, we can see that the typological similarities of languages in this area are as obvious as their differences. This is confirmed by the results of research on five Slavic languages (V.A. Nikonov 1962, pp. 103-116) and three Germanic languages (V.V. Gurevich, 1970).

The Grammatical structures of the English and Uzbek languages are somewhat different. Aspects of type and genetics; if the English is part of the party of the Indo-European languages; Uzbek is part of the party of the Turkish languages [Rahimov, 2016, p. 100]. It says it's theirs. Grammar structures are completely opposite. English is an empirical language focused on the grammatical form. It means the English is rich with grammatical speech patterns and has a tight sequence of phrases. Uzbek is a language of agglutination. It is also rich in linguistic intonations, but each inflection can really only convey one type.

Modern linguistics emphasizes assimilation neologisms (the Greek word "neos" is new and the word "logos") as the main characters in the evolution of linguistics.

The new word means the enrichment of the vocabulary. All the processes in the formation of a new word are called neology. Assimilation neologisms are rapidly formed and developed in areas where news and information spread rapidly. As mentioned above, assimilation neologisms are also formed from existing words, abbreviations, acronyms, and by changing the sounds of a word.

The emergence and disappearance of assimilated neologisms in the language is reflected in its adoption in the language or in dictionaries. If assimilated neologisms are accepted and used by citizens of the society, these assimilated neologisms are also accepted in linguistics and lexicography. The emergence of assimilated neologisms plays an important role in the development and transformation of language.

The following types of neologisms are observed in the language:

- Variable is a neologism with a new meaning, used in a narrow sense only by representatives of culture.
- Widespread - assimilation neologisms used by society, but not yet linguistically accepted.
- Stable - all recognizable, used and continuous neologisms.

There are the following types of neologisms:

Scientific - a group of words created to classify a new term or rule created in science.

Technological - a set of words that came into use with the advent of new techniques and technologies.

Political is a term widely used to describe new terms and commands introduced into politics and economics. Wide spread, popular - spread through the media. In scientific and technical texts there are many neologisms of several components. This type of term is characterized by the

separation of their independent meanings. Assimilated neologisms in the terminological system express the concept of a certain field, they are concepts related to a particular group of objects, processes.

Each terminological group has a common element. For example, the word agro from the linguistic unit - agronomy, agro economics, agribusiness, and agro-industry - is a key element of the neologisms.

They are semantically translated words. We can see that the word from a foreign language corresponds to the Uzbek language in terms of meaning and form. For example, confort (home services) is represented in English as comforts. The rich stylistic and social status of the acquired words plays an important role. It serves to remember the society, culture, living conditions: the richness of the acquired words is reflected in the words leader, flirt, baby-sitter, and week-end. English words and phrases are sometimes short. It should be noted that some words that entered the Uzbek language have not been changed, including flirt, leader and other words. Uzbek phonetics and English man ship are well established among Uzbek speakers, as in the bar, film, sports (bar, film, sport), and others discussed above.

Similarly, in the field of economics, many English-language neologisms are used, and some of them are even becoming international. For example, if we consider the term "businessman", it is clear that the term "business + man" is composed of components in the form of "noun + noun". The term "businessman" translates to "entrepreneur." At the same time, it should be noted that this term is applied to a male entrepreneur, because the term "businesswoman" is applied to a female entrepreneur.

It is obvious that in the construction of this assimilation neologisms in English, special attention was paid to gender.

Also, many neologisms of economic assimilation through the addition of words are now actively used: For example: Agro business - "agrobizness" a business in agriculture. In a broad sense, this includes agricultural businesses. Agrofirma - (agrofirma) is an enterprise that grows certain types of agricultural products and processes them on an industrial basis. Hyperinflation - (giperinflyatsiya) is characterized by excessive inflation, a sharp rise in prices, a very rapid decline in the value of money, the reduction of the desire to earn money. Macroeconomy - (makroiqtisodiyot) is a national and world economy at the national level, which unites the material and intangible sectors of production throughout the country.

Microeconomy - (mikroiqtisodiyot) an economy of enterprises, firms, that is, the primary, primary link of the economy. It deals with concepts such as constraint, choice and alternative value, as well as production and consumption. So far, most of the textbooks, textbooks, manuals on economics for students of non-economic educational institutions, including higher education in the field of teacher training, cover the complexities of neologisms and concepts of economic development. Little attention is paid to the specifics of educational institutions.

Below, we classify the words of the thematic group in the field of soci-political, economic, cultural-educational and sports on the basis of internal divisions.

➤ Name of food: steak, hamburger, yogurt, cake, ketchup, jam, etc.

- Fabric names: belting, upright, reps, sheviot, nylon, cover, etc.
- Name of vehicles: trolleybus, express, tram, pickup, liner, trailer, tanker, etc.
- Scientific terminology:
- Fields of science, names of directions: logistics, ufology, management, etc.
- Economic sphere and trade: leasing, export, banknote, broker, warrant, voucher, grant, dumping, dealer, discount, import, importer, investor, barter, budget, marketing, manager, holding, clearing, consulting, bartender, businessman, business vs.

There are more than 20 language acquisitions that have had a significant impact on Uzbek lexicon. There are also a number of other language acquisitions that are not active in our language. After independence, the amount and development of meaning of English words is unique. Due to the novelty of the assimilation, there are cases when they are written differently in the sources. Even in the explanatory dictionary of the Uzbek language, the spelling of some lexemes, such as notebook, yogurt, player, blooming, canister, (noutbuk//notbuk, player//player, bluming//blyuming, kanistr//kanistra) has two different forms. Words like this are so common in our lexicon that we think their spelling should be kept as diverse as possible.

DIFFERENT APPROACHES TO TEACHING ENGLISH IN CONTEMPORARY TRENDS

Turdieva Komila Usmankulovna*

*Teacher,

Department of "Languages" of Tashkent State Agrarian University,
Tashkent, UZBEKISTAN

ABSTRACT

In this article analyzed the importance of the modern technologies and innovative methods of teaching English as a foreign language and carried out recommendations to improve the teaching methods. Contemporary trends it's important to use the innovative methods in educational institutions. Modern approaches in educational institutions has the potential not only to improve education, but also to empower people, strengthen governance and develop the internalization of the educational process. In the context of teaching English it's crucial to use the innovative methods. The use technology has become an important part of the learning process in and out of the class. Every language class usually uses the some forms of technology. This enables teachers to adapt classroom activities thus enhancing the language learning process.

KEYWORDS: *Traditional Teaching, Technology, Mobile Learning, Web-Based Learning, Social Media.*

INTRODUCTION

Nowadays, in contemporary trends it's important to use the innovative methods in educational institutions. Modern approaches in educational institutions has the potential not only to improve education, but also to empower people, strengthen governance and develop the internalization of the educational process. In the context of teaching English it's crucial to use the innovative methods. The use technology has become an important part of the learning process in and out of the class. Every language class usually uses the some forms of technology. This enables teachers to adapt classroom activities thus enhancing the language learning process.

It's important that in the lessons English language learners felt the beauty of a foreign language. This may be used by the use of different active forms and methods of work. In the process of

education and upbringing of the modern generation one of the main aspects in addition to emotional development is increase of the intellectual potential of students. Currently, English class students are given a very large amount of information, influencing the process of training. The using of international technologies in learning language is very effectively as the function of the technologies is wide. The introduction of informational technologies in the educational environment of English language lesson allows learners to enhance and to stimulate the interest of students activate their thinking, the effectiveness of learning, individualize instruction, increase speed of presentation. This, in its turn, enables assimilation of information and rapid adjustments knowledge. Technology-enhanced teaching environment is more effective than lecture-based class. Teachers should find methods of applying technology as a useful learning instrument for their learners although they have not learnt technology and are not able to use it like a computer expert. In traditional classrooms, teachers stand in front of learners and give lecture, explanation, and instruction through using blackboard or whiteboard. This method must be changed concerning the development of technology. The usage of multimedia texts in classroom assists learners in become familiar with vocabulary and language structures. The application of multimedia also makes use of print texts, film, and internet to enhance learners' linguistic knowledge. The use of print, film, and internet gives learners the chance to collect information and offers them different materials for the analysis and interpretation of both language and contexts¹. In this context, any scholars expressed their different point of views. For instance, Bennett, Culp, Honey, Tally, and Spielvogel (2000) asserted that the use of computer technology leads to the improvement of teachers' teaching and learners' learn in the classes. The use of computer technology helps teachers meet their learners' educational needs². The application of computer technology enables teachers and learners to make local and global societies that connect them with the people and expand opportunities for their learning. The positive effect of computer technology does not come automatically; it depends on how teachers use it in their language classrooms.

There are many kinds of technologies which can be used for teaching instruction:

Firstly, different forms of social media that allows individuals to share personal information or join groups with one another, maintain or make relationship with others. By the using of the social media students develop their communication network with other students, enhancing students' communicative competence, and enabling the teacher to acknowledge authentic chance to use English with technology;

Secondly, Web-based learning is another way to learn using web-based technologies or tools for learning or simply said it is a way to interact with teachers, other students, or learning material using computer and internet. the websites available seems not having high potential learning, but they can be attractive sources for English learners as they provide interesting ways to keep the learner learning via games or interesting activities.

Another way of the teaching English is mobile learning. Mobile learning has the positive effects for students in producing the quality of a text and also making the students more independent and being motivated in learning. Noriega (2016) conducted a study on the use of mobile learning, in this case Podcast to improve writing in English as Second Language in Columbia. Podcasting is a device to listen or watch an audio or video broadcast. The broadcast is published on the internet and downloaded to a desktop or laptop, and then it is copied o the device. The user can choose when, where, and how to watch or listen it. Noriega's study implies that mobile technology could

be an alternative source for teaching writing by incorporating it into traditional using genre approach³.

It can be concluded that nowadays it's important to attract learners by new methods. The computer technology is an integral part of the learning activity through which skills are transferred to learners. Language teachers should urge their learners to use technology in developing their language skills. Universities should regard technology as a significant part of teaching and learning programs. Technology experts should provide extra assistance for teachers who use it in teaching their English courses. Teachers should create technology-integrated lesson materials. These materials should concentrate on teaching and learning, not just on technology issues. As it was truly pointed out that "under the conditions of the requirements of new standards of teaching foreign languages in Uzbekistan, the teaching process should move to a fundamentally new stage; New development is necessary for the formation of a new type of linguistic personality. To achieve these goals, the learning process should be organized in such way that the child becomes the subject of the educational process, the person who is ready to learn lifelong. That is why a modern English lesson should be built in a completely new way. In this regard, the use of interactive methods in the teaching process has an undeniable advantage for both students and teachers⁴".

SCIENCE IN LITERATURE: USE OF CHEMISTRY IN THE DETECTIVE FICTIONS OF AGATHA CHRISTIE

Dr. Agnita Kundu*

*Assistant Professor,
Department of Chemistry, Shri Shikshayatan College,
West Bengal, INDIA
Email id: agnita.kundu@gmail.com

ABSTRACT

Literature reflects life and science unravels the mysteries of life. Yet, literature and science always have been in the two different ends of mindset. Apart from science fiction few authors have used science as a character in their creation. This article takes a look at the works of the celebrated detective fiction writer Agatha Christie as an example where this stereotype of opposition of these two themes has been broken effectively. She has used science as an important element in her novels and short stories. Agatha Christie was trained as a pharmacist and worked as one in the World War I. She used her knowledge as a pharmacist and uses and effects of different drugs in many of her detective novels. This article reviews the extensive use of scientific knowledge and specially that of all branches of Chemistry: organic, inorganic and biochemistry in her work in a quantitative and objective way. It shows that the use of chemistry by the author is more extensive than previously analyzed. She has used chemicals not only as poisons but has used them in more innovative manner, respecting their unique properties. Interestingly, the use of science has elevated her creation, rather than weighing it down as is evident from her ongoing popularity.

KEYWORDS: Agatha Christie, chemistry, literature, poison, science.

Science in Literature: Use of Chemistry in the Detective Fictions of Agatha Christie

INTRODUCTION

Agatha Christie has used science, specifically chemistry as a central pivot in many of her works. Agatha Christie is known as one of the best crime writers in the world with millions of her books being sold even today after 44 years of her death. She was famous for using poisons as one of her most preferred ways of creating a plot and weaving her novels around it (Klein, 1994: 58-59). She served as a pharmacist in the 1st world war and her training made her well conversant with the sources, pharmacology and toxicological effect of drugs (Christie, 1977). There have been studies related to the use of chemistry in her writings but they are qualitative and though credits her scientific knowledge but does not explore the extent of her use of that knowledge in her writings (Bargainnier, 1980: 167-189 ; Maida and Spornick, 1982: 68-84). Also all studies have looked at how she has used chemicals as poison but none has studied how she has used chemistry in its various forms throughout her writings (Harkup, 2015). This article takes a quantitative and objective look at how extensively and to what extent she has used her knowledge of all branches of Chemistry; inorganic, organic and biochemistry to make her stories interesting.

METHODOLOGY: The novels and short stories of Agatha Christie were first classified according to their method of committing the crime. Then the writings that use chemicals or other forms thereof were classified according to the chemical used. This article makes no distinction between how she has used the chemicals, be it killing the victim, drugging the victim and many other uses. The results were analysed with the software MS-EXCEL.

RESULTS AND DISCUSSION: Agatha Christie has written 67 detective novels and has 15 short story and play collections (McAllister and Riley, 1989: 352-354). She created many fictional detectives, amongst which the most famous are Hercule Poirot and Miss Marple. Figure 1 gives a pictorial presentation of the different methods of murder used by Agatha Christie in her novels and short stories. It is seen that poisons is the main method used by Agatha Christie. She has used as many as 31 different chemicals in her writings as poisons or otherwise with very accurate symptoms and effect and ways of procuring them, either from shops or from natural sources.

Figure 1. Various methods of committing murders employed by Agatha Christie in her novels and short stories (in percentage)

TABLE 1: CHEMICALS USED BY AGATHA CHRISTIE IN HER WORK

(ALPHABETICALLY ORDERED)

** Chemicals not used for Murder

Sl. No	Chemical used (Total number of times used)	Name of the Fiction
1	Arsenic(5)	The Cornish Mystery, The Tuesday Night Club, The Lernean Hydra, After the Funeral, 4.50 from Paddington
2	Acid (Corrosive) (1)	Murder in Mesopotamia
3	Boracic Acid** (1)	Hickory Dickory Dock
4	Chloral Hydrate(3)	Seven Dials Mystery, And Then There Were None, The Clocks**
5	Chloroform**(1)	The Plymouth Express
6	Cyanide (any form) (11)	The Adventure of the Egyptian Tomb , The Big Four, The Moving Finger, Wasp's Nest , The Blue Geranium , Yellow Iris , And Then There Were NoneX2, Sparkling Cyanide, A Pocket Full of Rye, The Mirror Cracked From Side To Side, Endless Night (KCN)X2
7	Ethyl Chloride**(1)	The Big Four
8	Iodine and Starch**(1)	Motive Vs. Opportunity
9	Litmus Papers**(1)	The Blue Geranium
10	Phosphorus (1)	Dumb Witne
11	Thallium(1)	The Pale Horse
12	Trinitrine (1)	The Chocolate Box
13	Veronal(3)	The Murder of Roger Ackroyd, Thirteen at Dinner , Hickory Dickory Dock
14	Biochemical Specimens	Cards On The TableX2 , Murder Is Easy , Death in The Air , The Flock of Geryon, The House of Lurking Death

She has used some chemicals which are of inorganic origin, some organic chemicals of non plant origin and some phytochemicals, of plant origin. The use of phytotoxins have been discussed in many articles. In this article we will concentrate on the chemicals other than the phytotoxins that she has used in her stories. A detailed list is given in table 1.

a. INORGANIC CHEMISTRY: Cyanide in its many form, Potassium Cyanide (KCN), Sodium Cyanide (NaCN), Hydrogen Cyanide(HCN) or Prussic Acid has been used by Christie either orally or as vapour. Cyanides are inhibitor of cellular respiration causing anaerobic metabolism. Hence, the tissues are not able to use the oxygen in the blood and eventual brain death occurs. The lethal dose for KCN is as less as 200 milligrams (Trestrail, 2000:27-44). All her deaths by cyanides are shown as instantaneous death, without any additional medical explanations. Its characteristic smell of bitter almond has been used by her to detect cyanide in her novels (*The Big Four, The Mirror Cracked from Side to Side*).

Though mentioned as Arsenic (As, Atomic Weight 33) in her novels, the compound of Arsenic that is present in weedkiller are either Arsenic trioxide (As_2O_3) or Sodium Arsenite (Na_2AsO_4) (Monteith et al., 1939:10-43). Arsenic is a very toxic element. Usual symptoms of Arsenic poisoning are vomiting, abdominal pain very similar to gastric problems. Hence, it was a convenient tool for murderers, especially for slow poisoning (Ratnaike, 2003:391-396) where the symptoms of poisoning could be camouflaged as gastric problems.

In *Murder in Mesopotamia*, one of the murder takes place by drinking “corrosive acid” unknowingly by the victim. The acids used in archeological digs are usually acetic acid (CH_3COOH) and Hydrochloric acid (HCl) (Ramadan et al., 2010:97-110; Hamed et al., 2013:153-160). As acetic acid has a distinct smell of its own, it cannot be substituted for water, hence though Agatha Christie does not mention which acid, it is safe to conclude that HCl was used.

Another acid she used is Boric Acid/Boracic Acid ($\text{B}(\text{OH})_3$, Molecular Weight, 61.8) The fact that it is a weak acid, white powder, dissolves in water and in dilute solution can be used as eye drops is mentioned in the novel, *Hickory Dickory Dock*. It is also mentioned that large doses can cause acute abdominal pain, which was used by the author as a diversion.

Iodine (I_2 , Molecular Weight 253.81), present as triiodide (I_3^{-1}) ion, when added to starch (a polysaccharide containing Amylose and Amylopectine) has been used as vanishing ink. The Amylose reacts with the Iodide, giving Iodine, that gives an ink blue colour and then upon exposure to air, aerial oxidation takes place and Iodine again goes back to Iodide and the colour disappears. This fact was used by her in the short story *Motive V Opportunity*, where a pen was filled with a starch solution with a few drops of Iodine, which she calls “evanescent ink”, which makes a deep blue black fluid and disappears entirely in four or five days. It was used to forge a will in the story.

Symptoms of Phosphorus (P, Atomic Weight 30) poisoning resembles liver damage and this fact was used in the novel *Dumb Witness*, where Phosphorus was mixed with the victim’s medicine for liver trouble because the death would mimic one due to liver problems. The author also mentions a glow that was coming from the victim’s mouth (aura) when she was alive. This claim seems farfetched and cannot be corroborated in medical literature (Reddy et al., 2017:238-242).

Thallium (Tl, Atomic Weight 81) and its compounds are toxic and is absorbed by skin. It was commercially obtained as a rat poison. It was used successfully in the novel, *The Third Girl*. Her description of Thallium poisoning by adsorption was so accurate that it helped others recognize the poisoning in real life and save people (Sanders and Len Lovallo, 1989: 314-315; Emsley, 2006:346-347).

b. BIOCHEMISTRY: There are a variety of uses of Biochemistry and Molecular Biology in her novels. Her search for unusual and rare poisons led her to this path. Boomslang poison, which is a poison from a large venomous tree snake found in South Africa was used in the novel, *Death In The Air* causing an instantaneous death. The poison is a combination of many proteins and it has been found that the main poison comes from a thermo labile glycoprotein (Kamiguti, 2000:163-170) and the recipient dies as a result of non coagulation of blood in external or internal bleeding.

In the novel, *Cards on the Table* the perpetrator uses bacterial strain of Anthrax and poisoned inoculation to murder her victim as also in the novel *Murder is Easy*. In the short story *The House of Lurking Death*, Ricin, which is a lectin obtained from castor oil causes four deaths. The lethal dose is 1mg/kg of body weight for humans. It is a heterodimeric protein that inhibits protein synthesis (Aplin and Eliseo, 1997: 260-261). In the short story *The Flock of Geryon*, the molecular biology of preparing culture of various bacilli was explained in simple terms and it was used to make cultures of various diseases to kill unsuspecting victims, the perpetrator happened to be a bacteriologist/chemist. This was at a time when molecular biology was not as popular as it is today and she did a great job in incorporating the essentials without confusing her readers.

C. ORGANIC CHEMISTRY: Six organic compounds, which are not plant based has been used by Agatha Christie. Chloral Hydrate, often used as a sedative, was used successfully in many novels, to drug or to kill. Overdose is characterised by nausea, vomiting, cardiac arrhythmia, coma and subsequent death. She has used it to cause death while sleeping in two cases and in one she has used it to drug the victim.

Veronal, a barbiturate, whose chemical name is diethyl barbituric acid was used as a sleeping aid till the 1950s. It has a slight bitter taste and overdose of it results in death. The therapeutic dose is 1 gm. (Finlay, 1919: 115). The deaths by overdose of Veronal have also been shown by Agatha Christie as sleeping deaths (*Thirteen at Dinner*, *Taken at the Flood*).

Chloroform (CHCl_3) is widely used as a local anaesthetic. She has used chloroform to drug the victim in *The Plymouth Express*. Though it has been argued that it does not produce instant incapacitation (Payne, 1998:685-690). Ethyl Chloride was used in *The Big Four* to produce instant and short lived sedation.

Litmus, a mixture of different water soluble dyes is absorbed on a filter paper to prepare the litmus paper, which is used as an indicator, to test the acidity or alkalinity of the sample. It turns pink in acid and blue in alkaline solution and it is purple in neutral. This property of Litmus paper was used in a unique way to frighten the victim in the short story, *The Blue Geranium*. Red litmus paper was pasted over red flowers and it turned blue by the fumes of the smelling salt (which contains Ammonium Carbonate, $(\text{NH}_4)_2\text{CO}_3$ that spontaneously decomposes to Ammonia, which is a base). Hence apart from litmus she also uses the chemical nature of Ammonium Carbonate.

Trinitrine or Trinitro Glycerine is used as a vasodilator, to treat heart conditions. In the short story, *The Chocolate Box* it is mentioned that “it lowers the blood pressure “and is used to treat heart conditions like angina pectoris and relieves the arterial tension”. Overdose results in methemoglobinemia which causes death. Trinitrine was used as a medicine by a member of the household and multiple tablets of the same was used inside chocolate, as a poison (Kaplan, 1985: 181-183) and the victim died due to cardiac arrest.

CONCLUSION: The study of Agatha Christie's novels has shown that she has used poison as her preferred mode of crime in her novels. It was also observed that she has used chemistry not only as poison but also has used interesting features of many chemicals. She was aware of the latest use of drugs and diseases and being a pharmacist she was knowledgeable of the current medical advances, inoculations etc. Use of molecular biology, protein chemistry etc. in her work suggests that she was conversant with advances in science made at that time. She has used the

poisons, depending on their ease of procurement and technique for its camouflage. Though there is no doubt she was aware of the effects and physical manifestations of each of the drug she used but only in 5% of her work, she has used the exact details and chemical properties of the drugs. May be the reason being that she did not want to confuse or burden the general readers by the jargons of chemistry, biochemistry. This article shows how science and literature has come together in the creations of Agatha Christie.

SOCIOLINGUISTIC FEATURES OF TRANSLATION IN DIFFERENT CONTEXT

Absamatova Gulkhayo Bakhodirovna*

*Samarkand State Architectural and Civil Engineering Institute,
UZBEKISATAN

ABSTRACT

The article deals with the sociolinguistic features of translation and its linguistic categories, such as context, semantics, lexical units, pragmatics, rhetoric, as well as the problems of intercultural communication, which suggests the intercourse between representatives of different languages and cultures. The process of translation, which arose during the formation of different languages and has a thousand-year history, is marked by constant efforts aimed at overcoming the language barrier in various spheres of human communication - economic, political, social, etc. Without the intermediary function of translation, it is impossible to transfer information in the field of philosophy, science, literature, religion, sports. The study of translation as a subject and as a separate branch of science sometimes leads to different and sometimes incompatible understanding of certain areas and theories of translation.

KEYWORDS: Translation, Category, Language, Culture, Intercultural Communication, Formation of different languages, Semantics, Vocabulary, Pragmatics, Rhetoric.

INTRODUCTION

The process of translation, which arose during the formation of different languages and has a thousand-year history, is marked by constant efforts aimed at overcoming the language barrier in various spheres of human communication - economic, political, social, etc. Without the intermediary function of translation, it is impossible to transfer information in the field of philosophy, science, literature, religion, sports. The study of translation as a subject and as a separate branch of science sometimes leads to different and sometimes incompatible understanding of certain areas and theories of translation.

The goal is to consider the sociolinguistic features of translation and its linguistic categories - context, semantics, vocabulary, pragmatics, rhetoric - as well as the problems of intercultural communication, involving communication between speakers of different languages and cultures.

RELEVANCE

Analysis of recent studies of the phenomenon and the process of translation [2; 6; 7] testifies that this issue has far from exhausted its range of problems, since even in the definitions of the process of his research, such expressions as: Eng. theory of translation, translation theory, translation science, translation studies, translatology, etc.

It is known that the quality of literary translation is not always perfect [5].

This is explained not only by the lack of theoretical knowledge and intercultural competence of the translator, but also by external (extralinguistic) circumstances, which are not influenced by him. These include, in particular, the often manifested lack of time and the "pressure" of the customer, who has a certain prejudice regarding the original text, the departure from which does not always allow defending the principles of translation and taking into account the point of view of the translator.

Considering translation as a process and as a result, let us point out some problems:

- 1) Problems associated with the specifics of the source text (taking into account the peculiarities of the individual style and expressive means of the language);
- 2) Pragmatic problems of translation arising on the basis of the contrast of extra-textual factors of both languages;
- 3) Culturally specific issues translation;
- 4) Contrastive linguistic problems associated with the structural features of the output and target texts.

The main provision of the translation process, taking into account its mental and psychological factor and lexical and semantic features, can be the understanding of the text as a certain creative action aimed at the source text to be translated, and the target text to which the translation is carried out. At the same time, the translation process is always perceived to be functionally and thematically outlined; it happens consciously, in a planned way, realizing its main purpose: providing the necessary information and establishing communication between representatives of different languages and cultures.

Translated texts represent super-summarized, multidimensional unity that must first be understood, and only then proceed to translation.

Under these conditions, translation options can be based on separate translation categories. From the point of view of hermeneutics, understanding the text is a process in which the already existing knowledge is mobilized and replenished, because only on the basis of the already mastered line of "ours" and "aliens" become more and more blurred and increasingly uniting the translator and the text. In this regard, we share the opinion of a number of linguists [4; 7], considering hermeneutics as a fundamental dimension of translation. In this case, the text is understood as a whole and the translation should be just as integral

However, there are no absolute criteria for the equivalence of a text and its translation. The translator strives only for optimal semantic unity both texts, where the unit of measurement is the content accuracy of the text, on the one hand, and the targeted, addressee-oriented adequacy of the translation, on the other. In addition, the translation should be done idiomatically correctly and easily perceived by the addressee.

The translation process requires the performer to choose certain language decisions, which cannot be absolute and final, but which should lead to an optimal preliminary result. In linguistics, especially in the linguistics of the text and semantics, separate approaches to research have been developed, which are decisive in the translation process. These include linguistic categories: context, semantics, vocabulary - for the receptive aspect of understanding and pragmatics, rhetoric - for the productive aspect of formulation.

The criterion for assessing the quality of the translation is its adequacy, one of the prerequisites for achieving which is a holistic approach to the text, i.e. the concept of the integrity of the text, both in relation to the original and to the translation. Integrity means some coherent formation, the individual constituents of which are subordinated to the meaning of the whole. Coherent text obeys the laws of grammar and syntax, forming a structured linguistic unity. Relevant for the understanding of a text is, however, not only its syntactic structure, but also textual factors, that is, the context. The texts are only a part against the background of a huge whole of extra-linguistic reality. The context includes the initial situation on which the text is built, its (the text) whole setting, as well as the extra-linguistic field, which includes factors that are known to the speaker. This includes culturally specific stereotypes and sociocultural environments that are expressed in natural, historical, cultural, religious, social, economic, political, technical, individual and occasional factors.

Each text is distinguished by a special thematic structure and is constituted from beginning to end by the relations between its lexemes.

However, since not syntax, but vocabulary is the central component of the language, then these relations are not grammatical, but semantic. At the same time, thematically oriented lexemes refer to certain groups of words, united by a common conceptual feature. Thus, semantic selection occurs, which determines the meaningful lexical solidarity / compatibility of text units (English compatibility).

In the process of translation, the determining factor is not only the potential of the meanings of words, but also their sociolectical and special functioning.

Thus, the question of professional vocabulary arises, where it is not only about terminology, but which is a tool of cognition and serves to record and transmit observations, hypotheses and theories that develop as research methods and the science of language itself improve.

Particularly important in the translation process is the pragmatic aspect, which determines for whom and for what purpose the translation is carried out [5; 8]. In this case, the purpose of the text can also change. The customer may, for example, require a generalized assessment of the text, which implies a deep understanding and explication of the main points. Along with this, for a linguist, the philological adequacy of the translation may seem more important. However, advertising texts undergo the greatest changes, the structure of which changes to the extent that it is required to optimize the obtained effect.

An essential prerequisite for the correctness of translation is knowledge in the field of rhetoric or the art of speaking and the translator's knowledge of rhetorical figures, which are types of planned syntagmatic deviations from the normal sequence of linguistic elements [1]. Such variations can affect all units of the linguistic system and are explicated in such linguistic phenomena as repetition (s) - alliteration, polyptoton, parallelism, poronomasia; expansion / distribution - paranthesis, pleonasm; contraction / contraction - apocop, ellipse, zoigma; permutation / permutation - palindrome, anastrophe, hyperbaton. This also includes substitution / substitution - tropes, rhetorical questions, proleps, etc.

The named linguistic categories play a decisive role in translation. In different texts, their application is completely different, at the same time they are closely related to each other. Explication of the culturally specific features of the source and target texts also plays a significant role. The task of the translator is to ensure that the information laid down by the sender is easily understood by the addressee, and this process becomes more complicated as linguistic differences increase due to historical, geographical, cultural, economic and other reasons. The translator becomes, in fact, a mediator not only between languages, but also between cultures, in which differences are both a cause and a consequence of the differences in the mentality of the respective nations. Often, a translator who is not sufficiently familiar with the specifics of the national culture, which is immanently manifested in the text of the source language, performs a descriptive translation, while the author's illocution does not correspond to the text.

As the conclusion we point that the problems of understanding the text are often problems of understanding the culture, and a true translator can only be one who, along with a deep knowledge of the language, feels confident in both cultures.

This constitutes the quintessence of "intercultural communication" as a separate branch of science closely related to translation theory, sociology, philosophy, psychology, history, religion, literature, ethnology, the degree of knowledge of which determines the level of intercultural competence of the translator. In practical terms, this means building a bridge between the message or idea of the original text and communication with representatives of other peoples and cultural strata, other social systems and languages with different grammatical systems [3].

In the linguistic space of each language, a large number of speech turns, idioms, catchphrases, which have no correspondences in other languages, are represented; translation and interpretation of such phenomena requires the translator to have a wide linguistic erudition and deep knowledge in various socio-cultural spheres. Great linguistic and local linguistic knowledge, awareness of cultural differences are required from the Russian recipient by such English expressions as, for example: blue beard, blue stocking, pillars of society, Hobson's choice, time is on our side, time is money, happiness takes no note of time, what will Mrs. Grundy say, something is rotten in the state of Denmark, much ado about nothing, to be or not to be, civil disobedience, Uncle Sam, the lost generation, kidnapping, my home is my castle. Similar phenomena take place in the Russian-speaking space. These and other questions await their solution, and the problem of cultural differentiation cannot be completely exhausted.

A CREATIVE APPROACH TO TEACHING RUSSIAN IN SECONDARY SCHOOLS

Akhmedov Numon*

*Teacher of the Uzbek Language and Literature,
Department of the Shahrizabz Branch,
Tashkent State Pedagogical University
UZBEKISTAN

ABSTRACT

Recently, in connection with the development of market relations and the radical changes taking place in the country in socio-political life, there has been a general tendency towards a decrease in interest in learning the Russian language at school. This grave mistake is bearing fruit in school education. So that our article is devoted to the problems of learning the Russian language today and their solutions; there are also ideas about the role of innovative technologies in language learning and their using. Less and less often, Russian is heard at breaks and on the sports ground, at class meetings, during conversations at the morning ruler and, to be honest, sometimes at lessons. This phenomenon is harmful for schools in Uzbekistan, where more than a hundred ethnic groups live together and where one of the languages that bind them together is Russian.

KEYWORDS: *Education, Foreign language teaching, internal motivation, foreign language teaching methods, innovative technologies.*

INTRODUCTION

Less and less often, Russian is heard at breaks and on the sports ground, at class meetings, during conversations at the morning ruler and, to be honest, sometimes at lessons. This phenomenon is harmful for schools in Uzbekistan, where more than a hundred ethnic groups live together and where one of the languages that bind them together is Russian.

A dangerous tendency is outlined: our students, especially in rural areas, have begun not to study Russian in a qualified manner, and, therefore, to speak and read in Russian. This is, of course, due to the lack of qualified personnel. During the visit of President Shavkat Mirziyoyev to the

Kashkadarya region, the President stressed the need to cover the need for teaching staff in educational institutions of the region in the coming years, using internal resources. To eliminate these shortcomings in our region, the Shakhrisabz branch of the Tashkent State Pedagogical University named after Nizami was created, where the department of the Russian language functions. The branch promotes the training of highly qualified teachers for the Kashkadarya region and adjacent regions. It should be noted here that loving your people and your language does not mean striving for isolation and isolation, indulging in thoughts about your exclusivity. The task of each nation is to expand and deepen economic, cultural and political ties with other nations in every possible way. In this regard, the Russian language provides invaluable assistance to us, which serves as a rallying, consolidating, uniting factor in relations between the peoples of the CIS. Unlike other languages that could claim the role of a language of interethnic communication (for example, Arabic, Turkic, etc.), Russian today provides the need for communication not only between representatives of different nationalities in Uzbekistan, but also in the CIS.

Years of experience in teaching Russian at school tells us: the problem of fluency in Russian will not be solved without the practical orientation of teaching younger schoolchildren and until pupils in primary school acquire strong skills of conscious, correct, fluent and expressive reading.

Russian language lessons at school should ensure the unity of lexical and grammatical work, connecting all types of speech activity in the lesson, as well as Russian language and reading lessons.

The practical orientation of teaching children the Russian language is expressed in the following.

1. This is, first of all, the implementation in the educational process of the relationship between vocabulary, grammar, phonetics and spelling, graphics and spelling. The relationship between pronunciation and spelling is especially obvious at the initial stage. Competent and correct writing is impossible without the ability to hear and pronounce the sounds in a word correctly.

2. Another problem that a teacher of the Russian language and literature in a national school constantly has to work on is the development of coherent speech in a non-native language. Very important in the development of students' speech is the formation of the skills of a coherent presentation of thoughts in oral and written form. Sometimes a student who speaks fluent Russian finds it difficult or shy to offer him to convey his statements in writing - in the form of a small piece of reasoning or a letter to a friend. How can this be explained?

First of all, the fact that teachers of many schools do not follow the teaching principle: "To teach not just a language, but to communicate in a non-native (Russian) language."

Phonetics and orthoepy are closely related to grammar and vocabulary and play an important role in the entire system of the Russian language. Therefore, in the process of mastering the language, great attention should be paid to correct pronunciation. "It is necessary to engage in the setting of the correct pronunciation during the entire period of teaching the Russian language, since incorrect pronunciation not only complicates the oral speech of students, but also affects their spelling" [1, p. 66]. Good speech is the most important condition for the full-fledged development of a person. The richer the speech, the easier it is to express one's thoughts, the wider the possibility in cognition of the surrounding reality [2, p.9].

3. A special place in the work on the development of speech is occupied by lexico-phraseological work.

It is no secret that in Russian language lessons, many teachers lack purposeful and systematic work with vocabulary and phraseology. Insufficient work on the vocabulary minimum, despite the fact that most students have very poor speech, poor vocabulary [3, p. 35]

Successful vocabulary work is possible when performing a system of special exercises. In school lessons, as you know, various methods of interpreting new vocabulary are used: 1) translation into the native language; 2) explanation of the word using synonyms or antonyms; 3) using derivational analysis; 4) based on context; 5) a description of the meaning of the word using a dictionary. It is important for the teacher to determine when and how (which method to choose) to explain the new word.

We follow a reasonable rule: if the interpretation of new words and expressions is the first stage of working on vocabulary, the next step is to consolidate it in the oral and written speech of students. Correctly organized work on mistakes is a good way to improve speech spelling and punctuation literacy. First of all, mistakes in student work are classified very inaccurately. Usually, when correcting the written work of their students, teachers highlight spelling, punctuation and stylistic errors using the well-known markings in the margins: "ticks", "sticks" and a wavy line. It is these three types of errors that are taken into account when assessing the literacy of work, as stated in the "Norms for assessing the knowledge, skills and abilities of students in national schools in the Russian language."

4. A serious drawback inherent in the work of many language teachers is the lack of creative methods that stimulate the work of students. Teachers are accustomed to building a lesson according to a well-known scheme (questioning, explaining, reinforcing the material), neglecting the active involvement of students in the educational process in the classroom. We are talking about role-playing and business games, lessons-disputes and lessons-discussions. If the lessons-disputes are suitable for literature lessons, then business and role-playing games are acceptable for Russian lessons. The purpose of the latter is the development and formation of speech skills, which are necessary in various situations of communication [4, p.25].

It should be noted that the normal functioning of education, science, economics, in general, communication between people of different nationalities in the republic is virtually impossible without fluency in Russian. If this is so, then it is necessary with renewed energy and as soon as possible to take up the improvement of the educational process when teaching the Russian language in the Uzbek national school. Every teacher of the Russian language must realize this high mission. Weeks of the Russian language, school competitions, quizzes, contests, subject evenings and matinees, which are held in Russian, should also become traditional at school. They should have one goal: to teach schoolchildren practical knowledge of the Russian language, so that, after graduating from a secondary national school, they can fluently speak Russian in its oral and written forms. The Russian language in Uzbekistan retains its informational value and communicative comfort even in the new conditions, when the modern language policy in Uzbekistan highlights the Uzbek language as the state language, but Russian continues to remain the language of interethnic communication.

In our state, work is underway to improve the scientific level and effectiveness of teaching the Russian language to Uzbeks, programs, textbooks and methodological studies are being created,

which highlight the urgent problems of teaching Russian in an Uzbek school. However, despite a rather serious solution to many issues of teaching the Russian language, a number of aspects of this problem have not yet been sufficiently developed, which affects the results of teaching Russian to students in Uzbek schools. Therefore, among the measures aimed at raising the level of teaching the Russian language in accordance with modern requirements, is the need for a broad development of urgent problems of teaching the Russian language in secondary educational institutions of the Republic of Uzbekistan.

The President of our state Sh.M. Mirziyoyev noted: "The great Russian culture has always been and will be an integral part of the spiritual life of the Uzbek society." He also said that a 100-volume collection "Masterpieces of Russian Classics" in Uzbek will be published in Uzbekistan. Our country's plans also include intensive study and promotion of Russian-language books. We have agreed with the Russian side to encourage in every possible way scientific, educational, humanitarian programs and exchanges with the maximum use of the Russian language in the interests of the political, spiritual and economic consolidation of Uzbekistan and Russia.

In conclusion, modern language teaching is aimed at forming a more cultured individual who has the skills to self-analyze and systematize new knowledge. Innovative methods are an integral part of modernizing the entire system. With this in mind, teachers can become acquainted with the most advanced approaches and then combine them and use them in their work to achieve significant growth in the education system. Many organizations are moving to a new level, using multimedia capabilities to send and receive information. The use of computers and other devices determines the success of the whole educational process.

Adequate attention should be paid to the formation of speech skills and the development of social resilience in educational training. In addition, the success of any lesson in education depends in many ways on the proper organization of the lesson. The lesson should be based on the creative collaboration of teacher and student. Only then will students be able to think independently and develop their will.

It can be added that learning a new language is not an obligation, but a hobby or a hobby, making it easier to learn. How much you adapt to the process or create an interesting environment is often up to the learner. Discipline, responsibility and patience are the basis of any success. In conclusion, I recommend reading the book "Rus tilini o'rganishning eng samarali usullari (The most effective ways to learn Russian language)" by Alisher Absalomov for language learners. Quick and effective learning, methods and exercises for managing one's self, emotional state, and mistakes made in language learning.

PSYCHO LINGUISTIC FEATURES OF SIMULTANEOUS INTERPRETATION

Daminov Navruz Kudratovich*

*Samarkand State Institute of Foreign Language,
UZBEKISTAN

Email id: Navruzdaminov28@gmail.com

ABSTRACT

This article is devoted to the study of the psycholinguistic aspects of simultaneous translation activity. The purpose of the work is to present their own vision of this issue. The cognitive system of simultaneous interpretation is described with a brief description of each of its elements. The article contains the views of the authors on ways to increase the stress resistance of cognitive elements, which is being done for the first time in translation science in relation to simultaneous translation activity and is a certain novelty. The results obtained showed that the resistance to stress of cognitive mechanisms is achieved, among other things, by taking into account situations in which the state of linguistic consciousness will change. The psychological state of the interpreter must be ready for the simultaneous translation process. Translation activity is inextricably linked with the theory of speech activity [9], the constituent elements of which are motive, goal, development of an action plan and its implementation by means of a particular language

KEYWORDS: *Simultaneous interpreting; Process of interpreting; Cognitive system; Cognitive mechanism; Cognitive operation; Stress resistance; Stress factor; Transformation of linguistic consciousness.*

INTRODUCTION

In modern psycholinguistics, there are many approaches to the study of simultaneous interpretation. However, none of them pay due attention to the stress factor, which plays a key role in the professional reliability of a simultaneous interpreter. In this article, we attempt to trace how translators respond to stress, as well as identify possible ways to block the negative impact of stress or to quickly overcome it. Therefore, in this article we will focus on those

psycholinguistic aspects that underlie the achievement of stress resistance of specific cognitive mechanisms, which determines the relevance of our article.

The purpose of this publication is to present the psycholinguistic foundations of the simultaneous interpretation. To achieve this goal, we have set the following tasks:

- To present your own point of view on ensuring the resistance to stress of each of the cognitive mechanisms;
- To describe the cognitive system of simultaneous translation;
- To give a description of its individual elements;
- highlighting the psycholinguistic properties of the translation process.

The main research methods we chose were the analysis of available scientific works, generalization of the results reached by researchers who studied individual elements of the cognitive system of simultaneous translation, as well as their extrapolation, if possible, to the entire process of simultaneous translation. The research material is printed and online sources on the problems of cognitive mechanisms of simultaneous translation. The results of our research can be used both for further study of issues related to the functioning of the cognitive mechanisms of simultaneous translation, and for the training of simultaneous translation personnel.

Our research is based on the postulate that in the process of simultaneous interpretation there is a change in the state of linguistic consciousness of a simultaneous interpreter [1]. This is a consequence of the stressful load arising for a number of reasons, both objective and subjective reasons.

In order to assist future simultaneous interpreters in coping with stress, we considered it important to take into account the element of psychological preparedness in our article. It is designed to induce such frequency parameters of the biorhythms of the brain, which would help the individual to tune in to productive work.

Translation activity is inextricably linked with the theory of speech activity [9], the constituent elements of which are motive, goal, development of an action plan and its implementation by means of a particular language. The main goal of the translation process is to perform a communicative act between communicants through an intermediary translator. Depending on the type of translation, such communication can be spread out in time (in the case of written translation), carried out in real time with certain intervals for translation (consecutive, paragraph-phrasal, visual-oral translation) or take place without time intervals (simultaneous translation) [6].

Unlike all other types of translation, during simultaneous translation activities, the translator is deprived of the opportunity to think over his actions in detail. With an acute shortage of time, a simultaneous interpreter must make balanced translation decisions almost instantly [4]. To do this, he needs to have significant experience and stress resistance. Therefore, it is extremely important to study those cognitive mechanisms that are involved in a simultaneous interpreter and to identify ways to increase their stress resistance.

In the work devoted to cognitive mechanisms in simultaneous translation [3], a set of these elements of the cognitive system of simultaneous translation.

We define the cognitive mechanism as the main element of the cognitive system of this type of translation, ensuring its functioning and consisting of cognitive structures and cognitive operations.

Each cognitive mechanism of simultaneous interpretation is responsible for a segment of the simultaneous interpretation process, in which the translator needs to use mental processes in a certain way. They are influenced by internal and external factors. It is also important to note that the cognitive mechanisms of simultaneous translation function mainly simultaneously with each other due to the peculiarities of this type of speech activity.

Based on our own practical experience of simultaneous translation, as well as based on the work of other scientists [5; 7; eleven; 16], dealing with the issues of cognitive mechanisms of simultaneous translation, we believe that the main cognitive mechanisms that ensure the functioning of the cognitive system of simultaneous translation include the following: the mechanism of perception and understanding, the mechanism of processing incoming information, the mechanism of probabilistic forecasting, the mechanism of switching between languages, a mechanism for developing a translation variant, a synchronization mechanism.

Let us briefly consider the functioning of each cognitive mechanism and the possible options that provide stress resistance.

The mechanism of perception and understanding is activated by a simultaneous interpreter as the first of all cognitive mechanisms. Its functioning lays the foundation for the success of simultaneous translation activities.

We separate the processes of perception and understanding. In our opinion, the perception of a speech message is a psychological process of reflection of objects and phenomena of reality mediated by language, which is of a subjective nature and depends on motives, goals, moods, etc. subject. As a result of perception, information is deverbilized. Understanding a speech message is a mental process of isolating the meaning of an utterance and translating it into another form of consolidation, which occurs at the levels of words, sentences and text. The process of understanding depends on the degree of a person's linguistic competence [2]. This process takes place at all language levels and allows the translator to create an image of the information coming from the speaker.

To increase the resistance to stress of this cognitive mechanism, in our opinion, it is necessary to ensure that simultaneous interpreters are able to work with representatives of different ethnic groups who use English in their speeches. In addition, the translator should know the terminology and abbreviations used by the participants in the upcoming event. Therefore, constant training in listening to various pronunciation patterns of English speech inherent in certain speakers and the expansion of knowledge of special terminology will help to simplify the cognitive operations of perception and understanding of foreign language speech by the simultaneous interpreter and will allow him to more accurately interpret the incoming information.

The basis of the cognitive mechanism of synchronization, in our opinion, is the distribution of attention to driver between different mechanisms / operations. A simultaneous interpreter has to

perform several cognitive operations almost simultaneously. At the same time, information processing by people can only take place through one channel (listening or speaking). We are closer to the idea expressed by E. Kamide-Freihas [10] that the translator's attention in simultaneous translation should be mobile and that it is necessary to learn how to distribute it at the right time between the main cognitive mechanisms / operations.

In the context of simultaneous translation from a foreign language into a native language, the translator should pay main attention to the perception of foreign language speech, since speech production in the native language does not require much attention. However, when a translator has to translate from a native language into a foreign language, his or her attention will shift towards generating an utterance in a foreign language. Despite this, it is necessary to pay significant attention to the perception in the native language in order to avoid the loss of important information. For this, it is extremely important to train simultaneous translation in both directions at each lesson (both from a foreign to native language, and from a native to a foreign one).

In addition to the above factors affecting the functioning of cognitive mechanisms, we will separately dwell on two more aspects that are characteristic of the cognitive system of simultaneous interpretation as a whole. This is the lag between the translator and the speaker and psycho-emotional training.

The lag of the simultaneous interpreter from the speaker characterizes some time that is used by the interpreter to work out a particular solution. In other words, due to this lag, all cognitive mechanisms of simultaneous translation function. To train such a lag behind the speaker's speech, a simultaneous interpreter must be able to store a certain amount of information in short-term memory, constantly updating it - removing the worked-out information and loading new one.

As a conclusion of the study of the psycholinguistic foundations of simultaneous interpretation, the authors came to the following conclusions:

1. The professional reliability of a simultaneous interpreter depends on the resistance to stress of cognitive mechanisms. These include the mechanisms of perception and understanding, processing incoming information, switching between languages, choosing a translation option, probabilistic forecasting, and synchronization.

2. In the process of simultaneous translation, the functioning of cognitive mechanisms turns out to be

Stressful influence due to changes occurring in the situation of simultaneous interpretation As a result, the efficiency of the cognitive system decreases, which can lead to the loss of important information during its translation.

3. To neutralize the negative impact of stress on the professional reliability of a simultaneous interpreter, it is necessary to train future specialists in conditions of situations in which the state of the interpreter's linguistic consciousness may change.

4. Different methods should be used in developing the skills of simultaneous interpreters

To do this, it is necessary to take into account both the improvement of translation skills by expanding linguistic and extralinguistic knowledge, and psycho-emotional training, which can be carried out by hardware and non-hardware ways.

Samarkand State Institute of Foreign Language,
UZBEKISTAN

ABSTRACT

This article is dedicated to discuss the peculiarities of speaking skill as a special purpose and secondary purpose. Namely, it is about improving the speaking skill in English as a special, first language, as well as a foreign language. The article indicates the main views of the topic, and implements the outcomes of the research. Some recommendations are also mentioned in this article. Teaching and learning English, except for the native language, is thus crucial for communicative purposes to cope with the growing local, national and international demands for English skills. In Uzbekistan, English is considered as a foreign language, and is used for the purposes of academic advancement, career advancement, and traveling abroad. To cope with the growing local and international demand, a number of efforts from all parties involved have been made to the Uzbekistan educational system to help boost the learners' English performance.

KEYWORDS: *Speaking skill, Developing, ESL, EFL, Teaching, Context, English*

INTRODUCTION

In the world of globalization, English has increasingly become the medium in every domain of communication, both in local and global contexts. As a result, the demand for using English effectively is necessary in every country. Teaching and learning English, except for the native language, is thus crucial for communicative purposes to cope with the growing local, national and international demands for English skills. In Uzbekistan, English is considered as a foreign language, and is used for the purposes of academic advancement, career advancement, and traveling abroad. To cope with the growing local and international demand, a number of efforts from all parties involved have been made to the Uzbekistan educational system to help boost the learners' English performance. The process of learning English is slow and progressive and it

could be interpreted as a series of challenges to face. This process consists of the development of certain skills. According to the common framework, these are divided into productive and receptive. Receptive skills comprise reading and listening. They are important because they allow learners to understand contents, textbooks, works or documents. Productive skills are consist of speaking and writing and they are significant because they permit learners to perform in communicative aspects such as oral presentations, written studies and reports among others. Therefore, these skills need to be developed and learnt properly. According to the experiences of many teachers as well as learners of foreign languages, most difficulties are found in the process of learning and teaching productive skills. On the other hand different methods, approaches and techniques are invented to make the teaching and learning process of productive skills easier both for teachers and learners. Thus the main purpose of this study is to identify the techniques of teaching productive skills as practiced in the modern world as well as in our country. This study sought to answer few questions related to the implementation of those techniques in our country. Hopefully, answering those questions will help us to find a way to utilize modern and contemporary techniques in our country in an effective manner. Subsequently, the purpose of this study is to identify and suggest probable solution to effective teaching of productive skills. In communicative approach there are four basic skills of learning foreign language like English i.e. listening, speaking, reading and writing. When it comes to talking about using English at any level of education whether it is primary, secondary, intermediate or at the tertiary level, it requires teaching the four skills of the language giving equal importance on each of these skills. Each of these is important. In communication and especially in communicative English each skill demands equal importance. Ever growing needs for using English around the world is the consequence of the role of English as the world's international language have given priority to finding more effective ways to teach these crucial language skills. In Bangladesh Secondary education is one of the most important sectors in education. English is taught at this level but appropriate emphasis is not given on learner's speaking and writing skills. Though speaking and writing are the two common means of communication, education planners of primary, secondary and higher secondary levels give less emphasis on these skills. As a result, students could not apply English in their practical life successfully.

In this paper much attention will be paid mainly to one category of language skills and those are productive skills. There are two groups of skills that are known and studied in the context of educational process represented by teaching and learning. The category of receptive skills - also recognized as passive skills – is demonstrated by reading and listening. In many cases of foreign language learning they appear as the first skills to be understood and comprehended. Foreign language learners mostly start their way of mastering a new language by observing, reading and collecting language experience. Passive language skills do not force students to produce anything actively. They gain the knowledge in a passive manner and later they start producing their own monologues, dialogues and many other “spoken results” are created. The same process is done with writing which the same way as speaking belongs to the category of productive language skills, also described as active skills. More energy is needed to ‘produce’ any outcome of those types. Both types of language skills make an integral part of learning process at any stage of its development. At first the paper will describe different strategies how both speaking skills are taught and it will present examples of more and less successful activities when learning not only English as a second/foreign language, abbreviated ESL/EFL. As Littlewood explains “ a ‘second’ language has social functions within the community where it is learnt, whereas a

'foreign' language is learnt primarily for contact outside one's community" (Littlewood, 1991, p.2). The article itself will concentrate more on the process of learning than teaching. There are various factors that influence the final outcome and success in grasping a foreign/second language. We will look at potential users of a new language and try to answer why some of them are more successful than the others. One of the final paragraphs will deal with the basic characteristics of English as a foreign language. It will underline the authors' own experience with teaching this language of a small nation to a heterogeneous group of students. 2. Productive skills, their description and basic features When one starts learning a foreign language, he surely and subconsciously is exposed to both categories of language skill. As mentioned before, productive skills - also called active skills - mean the transmission of information that a language user produces in either spoken or written form. Productive skills would not exist without the support of receptive ones. Passive knowledge - such as listening and reading - symbolizes a springboard to active implementation of grammar structures, passive vocabulary lists, heard and repeated sounds of a foreign language. This theoretical background applies to any studied language. This should also prove that both types of skills are inseparable and one cannot exist without the other. When learning a foreign language, receptive skills usually come first and should be followed by practical application of productive ones. If a learning process lacks one of them, the final outcome will not be complete. As most active users of any foreign language know, speaking and writing are in reciprocal relationship. Undoubtedly, grammatical structures, words and their proper use, and certain extent of accuracy need to be respected. These are implemented in both types of active skills. As Riggensbach and Lazaraton point out, rather than implementing activities that concentrate attention strictly to accuracy, plenty of language instructors focus on promoting communicative competence in language students by applying "communicative activities" (Riggensbach & Lazaraton, 1991, p.125). The classroom environment and atmosphere definitely create necessary part of successful teaching and learning. These are highly valued by the learners. Creative teachers, who do not want to let their learners to get bored, work with a wide scope of speaking and writing activities. For the teaching purpose, not only lesson plan but also a term syllabus needs to be created beforehand. More experienced language instructors bear in mind that students' responses to needs analysis forms bring valuable pieces of information for setting up the core of the language course plan. The content of such a plan should include some general activities, but there also should be a set of tailor-made exercises that suit the specific group of learners and where particular objectives are set. This aspect of selected activities will be dealt with later in the paper. As Olshtain and Cohen state (Olshtain & Cohen, 1991, p.154),"if we wish to master another language we need to become more communicatively competent". Their observation proves the idea that language accuracy is necessary but not the most vital feature of speaking activities. To organize the lesson effectively a wide range of diverse activities should be involved in the lesson plan. Examples of speaking activities that are listed in the "speaking menu" are organized from least to most difficult ones. As mentioned above, some grammatical structures and vocabulary are incorporated in order to suit the content to less homogeneous group of course participants and guide them towards the same or similar outcome. The teaching experience and long-term observation bring us a long register of activities and exercises in order to practice productive skills effectively. Speaking proves to be one of the main goals when learning English or any other language as a foreign language. There are favourite activities that are considered to be suitable even for learners-beginners. To name a few and prove that speaking and writing are in mutual relationship we can

start with writing or enumerating a list of words linked with a certain topic, and/or writing and simultaneous using of everyday phrases in short face to face conversation exchanges, role-play telephone conversations and picture games in the ESL/EFL classrooms. At this early stage of learning some learners enjoy keeping their personal diaries, some Dita Golkova and Sarka Hubackova / *Procedia - Social and Behavioral Sciences* (2014) 477 – 481 labelling pictures or images with basic descriptions, or filling in word bubbles in comics with everyday phrases. During the latter stage of learning students get acquainted with more specialized vocabulary and previously mentioned activities can be replaced with more advanced levels of those and/or new types of tasks. With respect to certain factors that may influence the final outcome of the language teaching, the following activities can be used: more complex conversation role-plays with stress on proper grammar structures and extended vocabulary register of certain topics, description of real-life topics and more serious local and global issues in a form of writing tasks, and e.g. oral summary of a recently seen film, read book or heard story. There are numerous ways how to raise learners' awareness of adequate phraseology of any foreign language and grammar accuracy but one important and necessary part in the process of learning is teacher's evaluation and provided feedback. Traditionally, the teacher evaluates his learners either by giving grades or verbally. The teacher's feedback involves criteria such as focus on content, i.e. clarity, original idea, organization and delivery of the speech, and whether the goals of the activity were kept. A common tool to collect some information of this kind is to design the evaluation sheet. An interesting outcome is revealed when the instructor distributes self-evaluation sheets to his students and they evaluate themselves. The teacher may even discover originally unexpected assessment from his students when comparing his and the student's grading (Riggenbach and Lazaraton, 1991, p. 129). Besides those previously mentioned traditional activities supporting proficiency of productive skills there are new and modern trends that proved to become very popular with young and middle-aged learners. Not all of them are popular with everybody but some seem to be gaining their audience. With the expansion of the Internet services and applications, a number of innovative methods how to support productive skills became highly valued and frequently used; After designing, distributing and collecting a simple questionnaire in a heterogeneous group of students in a course English as a foreign language, or Czech for foreigners, at the Faculty of Informatics and Management, University of Hradec Kralove, the answers brought clear picture that the Internet provides students with possibilities such as different kinds of social networking, e.g. Face book, Twitter, LinkedIn, My space, to name a few most common ones. The aim of this paragraph is not to judge these options for their reliability, suitability and invasion into our private space but to underline their existence and certain meaning for practice of productive skills. What comes into questions is grammar adequacy, level of vocabulary correctness, less formal English that play their roles in this format of communication tools without any supervision. Students in their answers also supported the idea of joining discussion groups; various interest clubs, real-life conversations that deal with contemporary issues. 3. Productive skills when teaching/learning English and Czech as foreign languages a concise and abbreviated definition of big linguistic field such presented as language typology serves as a theoretical background to this paragraph. Language typology is a linguistic field which examines linguistic features of different languages. It studies structures of languages and their diversity and consists of several disciplines, e.g. qualitative, quantitative and theoretical typology [<http://www.princeton.edu/>]. Examples of languages that are members of Indo-European language group are Italian, Spanish, Latin, German, and sub-category called Slavic

languages is represented by Czech, Slovak, Polish, etc. Czech belongs to West Slavic languages that respect format of inflection which means that nouns, adjectives and verbs change their forms according to set of patterns. Linguistic typology as a field of linguistics presents a morphological category of a synthetic language which is based on high proportion of morphemes per word. This brief theoretical introduction brought evidence that English as a foreign language is not an easy language to master. As inflective language it has a set of noun, pronouns and adjective forms produced in declension and a set of verb forms produced within conjugation. This language feature brings about a chance of free word order in contrast to the English language which also belongs to the family of Indo-European languages, namely Germanic languages, but it historically developed into a category of analytic languages where word order is very important. As parts of speech do not take many different endings, the SVO formula for word order is rather strict and users of English as lingua franca find the feature of inflection with many parts of speech as very complex and difficult language property. The existence of three grammatical genders, i.e. masculine – with two further categories of animate and inanimate nouns, feminine and neuter makes this view of English for a non-native user even more complicated. The previous theory should not serve as discouraging means for potential learners of English as a foreign language. The description of such language properties should attract all language enthusiasts who are keen on experimenting with relatively flexible word order in English sentences. On the other hand, English phonological system has a limited set of vowels and consonants with a few diacritic signs that appear above some of 480 Dita Golkova and Sarka Hubackova / Procedia - Social and Behavioral Sciences (2014) 477 – 481 the letters and indicate e.g. length of the vowel, but not the word stress. Since the pronunciation rules are invariable and the number of pronunciation exceptions is limited, the learners' attitude towards speaking is mostly positive. As our foreign students of English claim, the beginning of language course seems to be encouraging because gradual progress is observed. Students who attend our language courses within the university create a heterogeneous group of learners in many aspects. To name a few, students come from diverse cultural environments, their mother tongues are of different origins, their period of stay ranges from one term to two years, etc. Littlewood also points out that personality trait are likely to influence second language learning (Littlewood, 1991, p.64). Of course, there are some facts that unite the learners in one class. These can be staying in one common academic space, living temporarily in the natural environment of the studied language, sharing similar interests and worries, and also the language goal of mastering a certain level of understanding in a completely strange place. Before a teacher starts teaching such a heterogeneous group he should be aware of some effective ways how to motivate and encourage his students in their study effort. He needs to find out what mother tongues his students have and if there is any convenient opportunity he should emphasise similarities or differences of a particular language. Students always appreciate it and this process could eliminate some further misunderstandings or language interferences. The teacher should be able to establish a natural and relaxed atmosphere and continuously stimulate students in their learning. With respect to students' adult age, the teacher will definitely be able to find a way to his students. To continue with the set up topic of productive skills, there should be maintained activities that awake interest in such a morphologically complex language. From the responses in students' questionnaires is obvious that university students are keen on getting overall knowledge of the language environment. On the whole, they are grateful for activities that provide communication with some grammar practice and teacher's feedback afterwards. The learners are prepared to "show

off” their little knowledge individually, in pair work monitored by the teacher, and in group discussions with bigger support from the lecturer, especially at an early stage of learning. Sabrina Peck states that adult learners might show more interest in team discussions if the themes are relevant to their objectives (Peck, 1991, p. 368-370). She also adds that other unique factors are level of education, emotional and social needs. The aspect of previous instruction in studied language is also important. Actually, foreigners become more language-skilled and independent in a culturally new environment when they start constructing their sentences with adequate grammar knowledge and general, everyday topics. Themes for pair conversation or group discussions range from those oriented at children, e.g. family matters, favourite pets, school, favourite meals, aimed at teenagers, e.g. hobbies, music, future plans, and also directed at adult, mature learners. Their popular themes are weather, academic life, job, pastime and weather to name a few. In terms of writing activities that support active skills, very effective and successful seem to be writing and replying to emails between students or students and a teacher, filling in basic forms in the new foreign language, writing a brief family history or keeping a diary at later stage of learning. There are more and less successful students in the area of productive skills, but the truth is that they should not be discouraged in any phase of learning process. Continuous chase for more effective activities in order to meet the learners’ needs and even more activate their productive skills should be one of the teacher’s main objectives and motivations.

In this paper, we have demonstrated that productive skills do not exist utterly independently from receptive skills. Passive skills represent an essential part of language skills and basics of some categories of productive skills. Both types of active skills, i.e. speaking and writing share some types of activities and some belong merely to one of them. Nowadays, at the age of the Internet there are more innovative and lively ways to practice active skills. However, some of them are accepted only by foreign language users and not by their language instructors. Foreign students in our courses claim that English as a foreign language is difficult to master in the area of proper noun and adjective endings, and concerning verbs the situation is even more complex with changes in prefixes and suffixes, too. However, once a learner overcomes a certain stage of slower progress, enthusiasm and involvement in further studies is even bigger. In most cases, a foreign learner is highly motivated by the surrounding cultural and natural language environment, and certainly by his teacher.

DOUBLE RELATIONS IN THE SYSTEM OF TERMINOLOGY

Irmatov Ikhtiyor Rizakulovich*

*Doctor of Philosophy in Philology,
Gulistan State University
UZBEKISTAN

ABSTRACT

The article discusses the relationship of non-contradictory lexical units in the system of terminology and their lexical-semantic media, the relationship of doublet terms, which has common lexical units (synonyms, graduonyms, doublets) with a denotative basis. Linguistic terms serve as illustrative material for the article. A non-contradictory group of inter-verbal linguistic relations is based on a disproportion of form and meaning. They have more structural units than the meaningful ones. Absolute synonyms are more than one word with the same lexical meaning. In the Uzbek language, the words in the absolute synonyms are almost a pair, the lexical meanings are equal to the perception, and they are mainly related to the terminological lexicon. The components must be unique in one language. Phonetic variants and semantic forms of the word do not constitute an absolute synonym. Synonyms do not belong to the same core.

KEYWORDS: *Language, word, term, doublet, denotation, synonym, absolute synonym, phoneme, lexical unit, alphabet, etc.*

INTRODUCTION

A non-contradictory group of inter-verbal linguistic relations is based on a disproportion of form and meaning. They have more structural units than the meaningful ones.

This group is divided into two subgroups according to the denotation of lexemes that form lexical-semantic media devices:

1) lexical units with a common denotative basis and their group; 2) different denotative bases, differentiated lexical units and their group.

The group of lexical units with a common denotative basis is divided into three subgroups: a) synonyms; b) graduonyms; c) doublets. Either synonyms, or graduonyms, or doublets belong to

the same or closely related type of denotative basis of lexical units that do not have opposite meanings. Through this article, we want to reflect on the phenomena of synonymy and duplication in terminology.

In language, the usual meaning differs from the occasional meaning in that it is part of the semantic structure of only one word. For example, the occasional meaning of “lovely child” can be expressed in words with a positive emotional component, such as “kuzichok”(lamb/kid), “butalok” (calf), “toychok” (foal/colt), “shunkor” (sharp kid), “dumbok” (chubby). Usual means one word, that is, it cannot be expressed in another word.

Synonyms are more than one word that is close in meaning. However, a number of synonymous words differ either in their expressive color or in their subtlety of meaning [1, 29]. Only the words in the doublets have the same meaning [2, 29]. But doublets do not last long in language: either one is not used, or one is changed in one way or another [3, 239]. In other words, the usual meaning is not repeated in another word with full meaning.

Synonyms based on the homogeneity of the meaning of more than one word are called absolute synonyms in linguistics [4, 45]. Some linguists call them doublets [5, 130]. In some cases, however, the meanings are limited to saying that the same synonyms exist: it is neither called an absolute synonym nor a doublet [6, 183]. In fact, the terms absolute synonym and doublet have the same meaning. The synonyms expressed under these terms mean that the semantic structure of more than one word is the same. For example, in the Uzbek literary language there are the words “cheg”i and “kadok”, which are absolutely synonymous with each other. Because both of these words have two lexical meanings: 1) the place of broken porcelain joined together with the help of an iron plate; 2) an iron plate that seals a broken vessel. These two lexical meanings form the semantic structure of both the word “chegi” and the word “kadok”. There is no other semantics in the semantic structure of these two words. That is, their semantic structure is the same. They are absolute synonyms. Consider the following examples: “to be broken from a fixed iron plate part / to be broken from a sealed/fixed part” and “to fall from a fixed iron plate part / a fall from a sealed/fixed part”. These words are grammatically categorized, that is, they are the same in terms of class.

In the Uzbek language there are such pairs of words as “lingvist / tilshunos” (linguist), “qarsak / chapak” (clap), “shoti / Narvon” (ladder), “sinchalak / chittak” (tit), “ukituvchi / muallim” (teacher), “askar / soldat” (soldier), “sivizga / ney” (flute), they do not differ from each other in terms of meaning. They are synonyms with the same lexical meaning [4, 191]. They are indeed absolutely synonymous. Because they are mainly characterized by the fact that they are a term; although the terms are expressed verbally, there is no lexical adaptation to any style of speech, no emotionally-expressive color.

Absolute synonyms are more than one word with the same lexical meaning. In the Uzbek language, the words in the absolute synonyms are almost a pair, the lexical meanings are equal to the perception, and they are mainly related to the terminological lexicon. The components must be unique in one language. Phonetic variants and semantic forms of the word do not constitute an absolute synonym. Synonyms do not belong to the same core [4, 196].

Based on the above, the differences between the terms of synonymous, absolute synonym and double language status are determined by their specific function in the content plan. The difference between synonymous and doublet terms is, first of all, the following:

- a) Synonyms have a series of synonyms, doublets usually consist of two words;
- b) In the lexical sense of synonymous words, adherence to a certain style of speech is an emotionally-expressive color, which is not observed in doublets;
- c) The meaning of synonyms differs from the signifier, and in doublets it does not differ;
- d) Words are marked in synonyms, without markers in double words;
- e) Synonyms express the meaning of words, while doublets express only one concept;
- e) There is a synonymous paradigm in synonymous words, doublets do not form a paradigm;
- f) Doublet words are in pairs, not more than that, and in synonyms, on the contrary, synonyms consist of two or more words;
- g) One of the double words, of course, is "transient", there are no "transient" words among the synonyms, but they are passive;
- h) In doublet words the meaning of the word does not differ, because they mean the same concept, synonyms have a subtlety of meaning, the meaning differs;
- i) In doublets having many similar meanings is "a burden", but, in synonyms it is their characteristic feature;
- j) Synonyms become doublets through absolute synonyms, doublets usually do not become synonymous;
- k) Doublets consist of only two words; synonyms consist of the meaning of two or more words;
- l) One of the synonymous words is dominant; the meaning in the doublets remains the same.

Differences in the line of double words and synonyms do not end there. We can conclude from the above. There is not a synonym between the terms, but a doublet phenomenon. Therefore, the term cannot be used indifferently with synonyms and doublets towards term words.

If lexical units have the same value in the level of lexical meaning, stylistic color, in all functional styles of speech, they are distinguished as absolute synonyms [7, 17]. For example, "tilshunoslik and lingvistika" (linguistics), "asos and uzak" (basis/root), "lugatshunoslik and leksikografiya" (lexicography), "shakl and forma" (shape/form), "atama and termin" (term), "mavzu and tema" (theme/topic), "avtor and muallif" (author), "terminologiya and atamashunoslik" (terminology), "mimema and taklidsuz" (mime/imitation word), "pauza and tukhtam" (pause), "affiks and kushimcha" (affix), "fe'lnisbatlari and fe'ldarajalari" (verb ratio/verb degrees), "morfemika and suztarkibi" (morphemes and word structure), "ibora and frazeologizm" (phrases and phraseology), and more.

This type of synonym is called a double in terminology. Such a synonymous series, which unites the absolute synonyms, usually consists of two members. Doublet (synonymous), i.e. absolutely semantic lexical units: "prefix" and "old kushimcha" (prefix), "suffiks" and "ort kushimcha" (suffix), "nisbat" and "daraja" (degree), "gap" and "jumla" (sentence), "suz" and "leksema" (word/lexeme), "unlilar" and "vokalizmlar" (vowels/vocalisms), "undoshlar" and "konsonantizm" (consonants/consonantism).

Terminology differs from other levels of language as a separate system of specialized semantic units. A special function of the word, which is visible as a term, is to name [8, 6]. In fact, other units in a language, such as synonyms or compound terms, are also integral parts of a lexicon. However, in terms of clear, strict delineation of concepts, the presence of synonyms, variants or duplications is not acceptable. However, there are still problems with synonymy and duplication in the terminological system. These problems arise as a result of the gradual adoption of new terms or the nationalization of the term on the basis of the internal capabilities of the language.

Absolute semantics consists of the same lexical units that do not differ in semantic and functional scope. In the paradigm of absolute meaning, one of the unifying opposing members is actively used in speech, hindering and restricting the consumption of the other. Limited use and negation of the lexical unit take place in the inactive layer of the language lexicon. As a result, over time, the paradigmatic series of such lexical units is forgotten and disappears. A periodic study of linguistic terms in the Uzbek language shows that the synonymy between the terms dates back to two periods.

For example, the term “affix” is used as a letter, traces of the pronoun, “sticky pronouns”, working, signs of classification, signs of “supot”, “supotlama”, “o’khshatkich”, completeness, “fe’llama”, “durkumturlamalari”, “odot” in the diachronic state of the language, later as prefixes, affixes, suffixes. To date, it has been standardized mainly in the form of suffixes and affixes [9, 144], while the rest have been excluded from the language vocabulary content. Also, the suffix formed with the participation of these lexical units such as “suffiks” – “kushimcha” (suffix), “fonema” – “tovush” (phoneme/sound), “logicurgu” – “suzurgusi” (logical stress/word stress), “uzak” – “asos” (root/basis), “negiz – asosdosh” (core/basis), “turlovchisuffikslar” – “suzuzgartiruvchikushimchalar” (classifying suffixes/suffixes that can change words), “egalikkelishigi – karatkichkelishigi” (possessive case/objective case), “infinitive” – “fe’lningshakhssizshakli” (infinitive/non-finite forms of the verb), “tochka” – “nukta” (point/dot), “alfavit” – “alifbe” (alphabet), “apostrof” – “tutukbelgisi” (apostrophe), “ulush son” – “taksim son” (rational number), singular functional-content micro-groups (paradigms) are also far from the list of lexical-content media.

Which member’s consumption in the series of absolute meanings takes on a mass character, and which one becomes passive and forgotten, is connected with the socio-political system of a language-dependent society and its ideology. For example, in the 40s of the Soviet era in Uzbek language “skobka” (brackets), “kavichka” (quotation mark), “kup tochka” (Ellipsis marks), “tochka vergul” (semi-colon) [10, 196], “tochka” (Full stop/period), “suffiks” (suffix), “fonema” (phoneme), “alfavit” (alphabet) [11, 256] and similar lexical units were actively used, the consumption of alternatives such as “kavs” (brackets/parentheses), “kushtirnok” (quotation marks), “kupnukta” (Ellipsis marks colon), “nuktalivergul” (semi-colon), “nukta” (Full stop/period), “kushimcha” (suffix), “tovush” (sound), “alifbe” (alphabet) [12, 38] was limited.

Later, on the contrary, the consumption of alternatives such as parentheses, quotation marks, colon, semicolon, period, suffix, sound, alphabet became more active and popular, limiting the consumption of their alternatives, which were active in the 40s of last century. As in lexical units, absolute semantics and its paradigm in terms are included in the transient phenomena of language.

Based on the above, it can be said that terms of an absolute synonym and the terms which has adoulet character are considered one of the manifestations of the lexical system in the description of lexical-semantic media structures. There is no consistency in the expression and content of terms with such a feature.

These belong to the so-called paradigmatic type of asymmetry of form and content. The disproportion of form and content in these phenomena is based on the fact that the number of formal units is greater than the number of spiritual units.

ABSTRACT

The article examines the use of interactive teaching methods in the development of students' communicative competence. The author clarifies the concepts of "interactive teaching methods", "communicative competence", "development of communicative competence", gives a classification of interactive teaching methods, among which are game, discussion, creative, design, information and computer, as well as their general characteristics, features and didactic the possibility of using in training sessions. The necessity of using interactive teaching methods for the development of the communicative competence of students is substantiated. In the modern conditions of the development of education in Uzbekistan, the requirements for graduates of a non-linguistic university in the field of the level of proficiency in Russian are increasing. A modern specialist must be prepared and capable of effective oral and written communication in Russian.

INTRODUCTION

The teacher is the main profession on earth. If it were not for him, there would be no physicists or lyricists. There would be no one to build houses, ships, fly planes and solve the most complex problems of modern politics ... I am sincerely grateful to the teacher - the discoverer of the human soul, the pioneer who plows the way into the future. Aibek Musa Tashmukhamedov.

Mastering the Russian language should be based on methodological principles that take into account the concept of lifelong education in the republic, which is based on democratization, humanization, differentiation and individualization of the learning process, reliance on national and cultural traditions and universal values. It is rightly said that those who do not know their native language do not know their ancestry, their roots. This person has no future. Without knowing the language of a person, you will never know his soul. The native language is an inexhaustible treasury of the entire spiritual being of man. Mastering a language is a versatile activity, but its core should be a grammar course with a practical focus.

New educational technologies offer innovative models of building the educational process, where the interconnected activity of the teacher and the student is brought to the fore, aimed at solving both educational and practically significant tasks. Modern requirements for the Russian language lesson pose many new tasks for the teacher, one of which is to teach students to independently acquire knowledge. Russian language lessons are distinguished by a variety of methods, as well as innovative techniques, obeying general requirements: Innovative technologies allow developing the following approaches in teaching Russian in modern methods: $\frac{3}{4}$ questionnaires; $\frac{3}{4}$ testing; $\frac{3}{4}$ discussion of problematic issues; $\frac{3}{4}$ creative tasks; $\frac{3}{4}$ educational games; $\frac{3}{4}$ extracurricular teaching methods. Lessons closely related to life, bearing elements of moral education, are quickly assimilated by students and turn into their moral credo. The lesson is the main form of organizing the educational process in the Russian language. in higher educational institutions. The educational process is a joint activity of a teacher and students to transfer and assimilate new knowledge and master skills over a period of time.

In the modern conditions of the development of education in Uzbekistan, the requirements for graduates of a non-linguistic university in the field of the level of proficiency in Russian are increasing. A modern specialist must be prepared and capable of effective oral and written communication in Russian. The foregoing actualizes one of the problems of modern language vocational education - creating conditions for the development of communicative foreign language competence among future specialists in various fields of production. An analysis of theoretical research and pedagogical practice has shown that the process of teaching the Russian language at a university, and interactive te Speech is a type of human communication, a historically established form of communication between people. Speech is the most universal means of communication, since the meaning of communication is least lost in the transmission of information using speech.

Communication (lat. Communication - message, connection)

1. Communication or transmission by means of language of the content of the statement.
2. The specific form of interaction between people in the process of their cognitive and labor activity [1; from. 2000].

Communication is the foundation of human life. Successful social, emotional and intellectual development is impossible without free communication. The student should be able to express their thoughts, feelings and desires easily, quickly and clearly.

The main goal of the communicative aspect of language teaching is the formation of the skills of speech activity in its main forms and types. The mechanisms for solving communication

problems determine the content side of the academic subject, which includes the speech and language components in their relationship and interaction.

Communication is a complex process that requires many skills. Speech is just one of the many ways we communicate our messages. Since ancient times, human society has used additional means of communication and information transfer, many of which still exist. A separate speech action (a piece of communication) is called a communicative act.

The simplest scheme of a separate communicative act in the process of speech communication looks in a certain way.

Within the framework of a communicative act, the sender of information (for example, a speaker), having a motive for the utterance, builds it in internal speech, and when translated into external speech, encodes it into sounds. The receiver, perceiving the incoming signal, decodes it and recognizes the meaning of the statement. He also has a motive for the statement, an exchange of remarks takes place, i.e. feedback is provided. In other words, the sender and the recipient are reversed, but the scheme of the communication act remains the same. Thus, verbal communication is the communication of people, understood in the broad sense of the word not only as a conversation or conversation, but as any interaction with the aim of exchanging information (reading, writing, etc.). In accordance with this, communication is carried out in the process of a person's speech activity using verbal (verbal) and non-verbal means.

Verbal Communication -Communication by means of words or verbal communication. Its peculiarity lies in the fact that, in form and in content, it is directed at another person involved in the communicative process, it is a fact of communication. Verbal communication can be directed at an individual person, a certain group (or even not have a specific addressee), but in any case it has a dialogical character and is a constant communicative act [2; from. 126].

The act of verbal communication is a dialogue that consists of speaking and listening. Speaking has been a longstanding subject of research. There is a special science - rhetoric, a special discipline is laid out - oratory. In the modern literature on communication, great attention is paid to listening skills. Research shows that few people have sufficient listening skills. I. Atwater points out that listening is very difficult. We are primarily busy with our own broadcasting. In addition, if a person fell silent during the dialogue, it does not mean that he is listening. Hearing is an active process that requires attention. But, clarifying, evaluating or analyzing information during a dialogue, a person pays more attention to his deeds than to what he is told. This is especially true in situations of conflict communication [3; from. 417].

In dialogue, we are more often interested in whether the other understood us than that, whether we understood him. This distorts the communication process. The best method to avoid this is non-reflective listening. Its essence lies in non-interference in the language of the interlocutor (conditionally passive listening).

Depending on the situation, during a non-reflective hearing, support, approval, understanding can be provided with minimal answers that help prolong the conversation. Such neutral words help support the conversation, relieve tension. Researchers identify three main functions of speech: communicative, regulatory and programming.

1. The communicative function provides communication between people using language.

Language is a system of verbal signs, a means by which communication between people is carried out. Speech is the process of using language to communicate with people. People lived and live in society. Social life and work of people make it necessary to constantly communicate, establish contacts with each other, and influence each other.

2. The regulating function of speech realizes itself in higher mental functions - conscious forms of mental activity.

It is assumed that speech plays an important role in the development of voluntary, volitional behavior. Initially, the highest mental function is, as it were, divided between two people. One person regulates the behavior of another with the help of special stimuli ("signs"), among which speech plays the greatest role. Learning to apply to one's own behavior the stimuli that were originally used to regulate the behavior of other people, a person comes to master his own behavior. As a result of the process of interiorization - the transformation of external speech activity into internal speech - the latter becomes the mechanism by which a person masters his own voluntary actions

3. The programming function of speech is expressed in the construction of semantic schemes of a speech utterance, grammatical structures of sentences, in the transition from a concept to an external expanded utterance. At the heart of this process is internal programming, carried out using internal speech. It is necessary not only for speech utterance, but also for the construction of a wide variety of movements and actions.

Thus, the child's speech is not an innate ability, but is formed under the influence of the speech of adults. There are several stages in the development of speech - preparatory (up to one year), preschool (up to 3 years), preschool (up to 7 years), school. Distinguish between external and internal speech. External speech is oral and written. In turn, oral speech is monologic and dialogical. Researchers distinguish three main functions of speech: communicative, regulating and programming.

These functions are essential for human communication. They provide communication between people using language, with their help a person masters his own behavior, as well as correctly builds his speech utterance, various movements and actions.

In school practice, retelling is understood as the free transfer of the text "in your own words" or the transfer of the narration or description created by the speaker to the listeners.

The retelling is designed for the imaginative thinking of the audience, it seeks to excite their imagination and feeling. An essential feature of storytelling is its improvisational character. This is the difficulty of storytelling and this is its educational role. Storytelling enhances speech culture more than expressive reading. It is in the process of telling that the vocabulary and phraseology of the narrator is enriched. Of the vast vocabulary that makes up the dictionary of the Russian language, everyone owns a relatively small vocabulary that makes up his personal dictionary.

There are several classifications of paraphrases. We give the classification proposed by Naydenov B. S. Naydenov B. S. Expressiveness of speech and reading. M.: Education, 1969.

1. Telling based on personal impressions
2. Retelling close to the text (detailed retelling);

3. A brief transfer of the content of the work or part of it (short retelling);
4. Selective retelling;
5. Creative retelling.

Let us briefly explain each of the types of retelling.

- **Storytelling based on personal impressions**

This type of retelling involves the presentation of facts and impressions by children from personal experience. It is easier for a student to talk or write about something that is well known to him, about what he himself observed, than to understand the author's text, to comprehend the content and then writes or tell. That is why it is more expedient to start teaching retelling with this type of storytelling.

The success of the story depends on three things: the clarity with which the child imagines what he is talking about; the degree of his passion for the story; the activity of transmitting your thoughts and feelings. All this is much more inherent in storytelling based on personal impressions than other types of retelling.

Detailed Retelling

Among the various types of retelling, the most widespread in practice is a detailed retelling - a retelling of a text in the sequence in which it is perceived when reading. At the same time, it is viewed mainly as a means of fixing the content of the read texts in children's memory and thereby enriching the range of students' ideas and knowledge.

Observations show that the student's tenacious memory captures for a short time the words and expressions from the text required by the teacher for retelling. However, retained by the memory for such a utilitarian, close goal, they then very quickly "erode", never entering the student's active vocabulary. Meanwhile, of all types of retelling, a detailed retelling contributes to the enrichment of the children's vocabulary, the formation of a sentence structure and the development of coherent speech of students. In addition to the fact that students get acquainted with vivid turns of speech, samples of the literary language, they master the words necessary to connect one thought with another, expressing various temporal and. causal relationship. This is how pronouns, conjunctions and other grammatical categories appear in the students' speech, which they practically master.

Brief Retelling

The ability to concisely formulate and transmit your thoughts to others, to reproduce briefly what you have read, to briefly tell about what you have seen, heard, viewed - the most important quality of coherent speech. To tell briefly is a much more difficult task than to tell in detail, everything in a row. What is its peculiarity, what requirements does it make to mental activity?

The complexity of the task of a short story (or retelling) lies, first of all, in the fact that it presupposes the selection of material necessary to reproduce the main meaning of the perceived. When asking a student to tell him briefly, the teacher usually formulates this task as follows: "Tell me briefly, do not tell everything, but only the most important thing, the most essential". Some parts of the read, which are the main thing in its content, the student must necessarily absorb into his story, but the less essential parts of this content must be weeded out, not included

in the retelling. Thus, in order to carry out a brief retelling, the student must first of all carry out a complex analysis of the perceived content: highlight the main thing in it and separate it from the secondary one. Since the minor parts, which most often complement the main ones and "go" next to them, should not be included in the retelling, the student must independently unite the thoughts selected for reproduction, that is, make a new synthesis of the content selected for reproduction, establish in it new connections. However, the complexity of the problem is not yet exhausted by this.

The brevity of retelling cannot be achieved by simple mechanical discarding, screening out, cutting off more secondary parts of the content. The brevity of the presentation of topics is also difficult, that it always requires other, in comparison with the perceived, speech means, turns, methods, other formulations to express the perceived content. A brief retelling is always the result of a complex rethinking of what has been read, the transfer of its content in a more generalized speech form.

In this sense, a brief retelling is a much more difficult task than a selective retelling. For selective retelling, some parts are also selected and others are sifted out, but the mechanism of this selection in selective and short retellings is fundamentally different. In a selective retelling, it is usually required to reproduce only a certain part of the content, and this part is always given, defined ("Tell only about the habits of a swan, do not tell about everything else", "Tell us what you read about the nature of the winter forest, about the life of animals about the winter there is no need to tell the forest ", etc.).

Solving such a problem is much easier than highlighting the main thing; in order to fulfill the latter, one must understand what the main thing is and, accordingly, what the secondary one is. The main difficulties that children experience when preparing a short retelling are primarily associated with the task of determining what is the main thing, as well as with finding the appropriate speech forms for expressing it.

The main thing cannot be distinguished by cutting off the ooze by simply skipping some parts of the content and reproducing others. The main idea, the main idea of the content 'is usually present to one degree or another in all its parts, intertwined (sometimes very difficult) into the fabric of the entire work, when it comes to a verbal text. The expression of the main content is almost always associated with the reformulation of the text, with the introduction of certain generalizations and conclusions into its content.

Selective Retelling

Selective retelling usually includes only certain parts, certain lines of the work. The very name of this type of retelling indicates that its main, most essential feature is selection, choice.

First of all, the students are faced with the task of isolating from the content of the text those parts of it, those lines that relate to the topic assigned to it, and focus their attention on them. Thus, he must first of all carry out a complex analysis of the entire content. Selected, selected for retelling parts (lines or parts of the content), he must then combine in such a way that a coherent story on a given topic is obtained, that is, to carry out a synthesis of the selected content. And, finally, the student must always take care that this retelling does not include the material, the content that, although he was perceived nearby, is not directly related to the topic set for

retelling, that is, students are required to be able to abstract from certain parts of the perceived content.

It is known what great obstacles a student faces when it comes to answering a question that only applies to any part of the text. How often, in response to a teacher's suggestion to continue, a story started by another student, the student begins to tell all over again.

Selective retelling makes much more serious demands on the mental activity of children than detailed ones. However, the complexity of the task does not mean that it is inaccessible to students.

Creative Retelling

The following options for creative restructuring and additions during retelling are known:

- Retelling with a change in the face of the narrator; most often this is a retelling in the third person, if in the original the narration is in the first person

Strictly speaking, a retelling with a change in the face of the narrator cannot yet be called a creative work, since the restructuring of the text is predominantly grammatical. However, replacing the first person of verbs with a third party leads to the need for some changes in the content of the text, for example, it is necessary to translate direct speech into indirect speech.

- Retelling from the person of one of the characters

A work that has much in common with selective retelling, but sometimes requires very significant changes and additions, to successfully cope with such a retelling, the student must enter the role of the character; understand his age, character, and look at events through his eyes.

- Retelling of the entire text or part of it with creative additions, with fictional episodes, details, descriptions of the landscape, descriptions of the appearance of people

- Continuation of the story, the fate of the hero

Students are especially attracted by such additions, which set out (more precisely, projected) the future fate of their favorite heroes.

- dramatization of a story, that is, drawing up dialogues based on a read work of art, reading them by roles, as well as stage embodiment

It consists in conveying the events of the narrative in a dramatic form. It is recommended to stage texts in which there are many dialogues and a relatively simple setting. Role-based reading serves as a transition from regular reading to staging. Reading in faces, children practice expressiveness, better highlight the words that belong to the characters. When retelling students, only dialogues are conveyed, and the presenter (or presenters) in brief words outlines the situation against which the action takes place.

- Verbal drawing ("what I would depict in a picture").

To increase the emotional level of perception of a literary text, verbal drawing or illustration is also given. When the story or description is read, the teacher says: "How do you imagine the situation at such and such a moment of action? Tell it as if all this is in front of your eyes, as if you yourself sees and describe. "Usually, verbal pictures are drawn for those episodes that are especially important for understanding the ideological concept of the story. If the description is

illustrated, then the most beautiful and at the same time available to students paintings are selected.

Thus, retelling refers to the free transfer of the text "in one's own words" or the transfer of the narration or description created by the speaker to the listeners. There are several types of retelling used in school: storytelling based on personal impressions, detailed retelling, short retelling, selective retelling, creative retelling. Storytelling based on personal impressions involves the presentation of facts and impressions from personal experience. The task of a detailed retelling is to reproduce the text in the sequence in which it is perceived when reading. A brief retelling assumes a concise transmission of the semantic parts of the text. Selective retelling usually includes only certain parts, certain lines of the work. With creative narration, additions are made and various rearrangements are made in the original text. A one-way form of communication is present not only in lectures, but also in practical ones. The only difference is that it is not the teacher, but the student who broadcasts some information. These can be answers to questions posed by the teacher before the start of the workshop, abstracts, reproduction of lecture material. This form of communication does not meet the principles of the competence approach. The form of multilateral communication in the educational process is fundamentally different. The essence of this communication model presupposes not just the admission of students' statements, which is important in itself, but the introduction of their knowledge into the educational process. Teaching that is open in a communicative sense is characterized by the following statements: 1. Students are better at mastering certain skills if they are allowed to approach the subject through their own experience. 2. Students learn better if the teacher actively supports their way of learning. 3. Students perceive the material better if the teacher, on the one hand, structures the subject for easier assimilation, on the other hand, accepts and includes in the discussion the opinions of students that do not coincide with his own point of view. The transition to a competence-based approach in organizing the learning process provides for the widespread use in the educational process of active and interactive forms of conducting classes (computer simulations, business and role-playing games, analysis of specific situations, psychological and other trainings) in combination with extracurricular work.

During a lecture, any student should be ready to participate in mini-discussions, ask the lecturer questions and answer his questions on the topic of the lecture. Thus, there is an intensification of work in lectures, which cease to be exclusively a teacher's monologue. Self-preparation for practical lessons consists in the mandatory fulfillment by the student of all types of tasks on the topic of each lesson. The student must be ready to answer questions on the lesson plan, reliably master the basic concepts and categories, answer questions for self-examination and complete problem assignments in writing. When using interactive methods, the teacher's role changes dramatically, ceases to be central, he only regulates the process and is engaged in its general organization, prepares the necessary tasks in advance and formulates questions or topics for discussion in groups, gives consultations, controls the time and order of the planned plan. The use of interactive forms and methods of teaching in the process of studying at a university will allow acquiring:

- a specific student: - experience of actively mastering the content of future professional activity in conjunction with practice; - development of personal reflection as a future professional in his profession; - mastering new experience of professional interaction with practitioners in this area;
- study group: - development of communication and interaction skills in a small group; - the formation of value-orientational unity of the group; - encouragement to

flexible change of social roles depending on the situation; - adoption of moral norms and rules of joint activities; - development of skills of analysis and introspection in the process of group reflection; - development of the ability to resolve conflicts, the ability to compromise; • teacher - group system - non-standard attitude to the organization of the educational process; - formation of motivational readiness for interpersonal interaction, not only in educational, but also in professional situations.

DEVELOPMENT OF RUSSIAN SPEAKING SKILLS IN PRIMARY SCHOOL STUDENTS

Nabieva Dilshoda Urakovna*

*Teacher Russian language,
Department of Uzbek Language and Literatures,
Shahrisabz Branch of Tashkent State Pedagogical University
Named after Nizami, Shahrisabz, UZBEKISTAN

ABSTRACT

The article is based on the concepts of educational conditions, theories that scientifically substantiate the objective laws of learning a foreign language in the natural environment and its study in the school environment in the modern methodology, the goals and objectives of teaching Russian in primary school. Also, there are discussed in this article: practical, educational, pedagogical and developmental goals of teaching Russian in the primary grades, Russian teaching aids in the primary grades, teaching content, language material, language unit, topic of conversation, and the qualifications and skills of the teacher.

KEYWORDS: *Speech activity, Methods of speech development, Fluency, Accuracy, expressiveness and content of speech, Problem-based learning, Linguistic principles, Lexical skills in a foreign language formation.*

INTRODUCTION

The pedagogical principles of foreign language teaching in primary school are described in detail in Uzbek and Russian scientific sources as didactic principles. But in foreign literature the pedagogical principle is studied separately. We used scientific sources in three languages to generalize the pedagogical principles.

1. To bring up the younger generation in all respects. The information acquired through a foreign language and the mental and verbal skills and competencies acquired while learning a foreign language are nurtured.
2. Encourage students to use the language they are learning.

3. Take into account the individual characteristics of students.
4. Educate students in the spirit of tolerance for others and respect for different values.
5. Creating an optimal environment for independent learning in the classroom.
6. To develop students' skills and abilities to independently and independently determine the indicators of mastery.
7. Provide opportunities for students to express their knowledge in the language being studied.
8. Organize lessons based on an integrated approach to competency acquisition. Competent oral speech contributes to the speed, ease of communication between people, gives the speech communicative perfection. All this forces us to make high demands on the correctness of the sounding speech. The task of consciously mastering the norms of speech, instilling maximum respect for the rich traditions of the Russian language is now not only highlighted, but also defined as the most important social task of our time, as a social order of society.

Modern society needs people who own, in a word, who know how to defend their beliefs, views, conduct a discussion, creatively involved in the process of interpersonal communication. In this regard, one of the main tasks of a modern school is to prepare a graduate of an elementary school who would be able to communicate, listen and speak in such a way that they would listen to him, would be able to evaluate someone else's speech, and of course his own speech.

However, it is in elementary school that teaching the living word is often underestimated by teachers; defects in speech become obsolete, and it turns out to be very difficult to correct them later.

Speech is language in action. Language is a system of signs, which includes words with their meanings and syntax - a set of rules according to which sentences are built. The word is a kind of sign, since the latter are present in various kinds of formalized languages. Language and speech are two sides of speech activity, which includes two opposite processes - the process of generating speech and the process of its perception.

Speech is one of the types of communication that people need in their joint activities, in social life, in the exchange of information, in cognition, in education. It enriches a person, serves as an object of art.

Observations received by children on walks, excursions, and hiking help in the development of students' speech. We try as often as possible to go with the guys on excursions and to the forest, to the river. Walking is a short lesson in sensory education.

The upbringing of a comprehensively developed personality is impossible without improving such an important tool of cognition and thinking as speech. The development of students' speech is currently one of the priority tasks of the school. Without the systematic enrichment of the oral and written speech of students, it is impossible to effectively improve the culture of speech of children, their general literary development. Speech development is an important task of teaching a native language. Speech is the basis of all mental activity, a means of communication. The student's ability to compare, classify, systematize, generalize is formed in the process of mastering knowledge through speech and is also manifested in speech activity. Logically clear,

evidence-based, figurative oral and written speech of a student is an indicator of his mental development.

Speech helps the child not only communicate, but also learn about the world. For a child, good, competent speech is the key to successful learning and development, the ability to fully exist in society. The development of speech activity is not a spontaneous process; it requires a certain pedagogical guidance. The speech activity of students is manifested in their sociability, in the absence of stiffness, silence, fear of speaking. The teacher is obliged to "talk" his students in any conditions and situations. It is important to develop in him the ability to correctly and beautifully express his thoughts, finding accurate and figurative expressions for this, to teach creative imagination, associative thinking. Speaking and writing skills are formed in a child under the influence of many factors. That is why it is so important to create conditions for the speech activity of children, for communication, for expressing their thoughts. I pay special attention to enriching the speech of students with various linguistic means, to preventing and overcoming various speech deficiencies, to mastering pronunciation norms and means of speech. enrichment of students' speech with lexical and grammatical means; prevention and overcoming of errors (in the pronunciation of words, in word formation, in the construction of sentences); the formation of coherent speech skills (oral and written)

In his work "On the Initial Teaching of the Russian Language" K.D. Ushinsky put the development of the "gift of the word" in the first place along with the conscious possession of the treasures of the language and with the study of grammar. What should be done to develop this innate language ability? "The gift of speech" develops only from exercises, which should be as independent as possible: by your efforts to express your thought, first simple, then more and more complex, first orally, and then in writing (in essays). The ways to this are clarity, highlighting the features of an object, comparing objects.

It should be noted separately work with words, since vocabulary work is not an episode in the teacher's work, but a special part of all systematic work on the development of students' speech. The richness of the vocabulary is a sign of the high development of both society as a whole and each individual person. Therefore, I attach great importance to this type of work. It consists of: enrichment, clarification, activation of the dictionary, elimination of non-literary words. When working on vocabulary words, I use a technique from V. Agafonov's book "Wrong rules, or how to memorize vocabulary words." The technique is based on the associative connection of the dictionary word with another "adoptive relative", which will help to remember the correct spelling in the word exactly. For example, when a robot with the word "coat", the teacher reports that the wind blew, scattered letters in the word, and the word "bast" was obtained. Such associative threads stretch from image to image, from word to word. In addition, pictures, riddles, rebuses, short poems are selected for each word.

I will dwell in more detail on the development of the coherent speech of children. The development of coherent speech is carried out on the basis of a system of gradually becoming more complex oral and written exercises that require more and more independence from students. The success of the work depends: on the interconnectedness of the work, on their purposefulness, on the observance of a clear sequence in the use of various types of essays, on the systematic subsequent work on speech and stylistic mistakes made in the creative works of children.

Developed oral speech is the ability, in accordance with the requirements for speech, to determine which word, which turn, which intonation, which manner of speech are appropriate, and which are undesirable in each particular case. The development of oral speech is also an effective condition for the development of thinking. Speech is a channel for the development of thinking, and thinking stimulates speech. Considering all this, I define the work on the development of oral speech in younger schoolchildren in my practice as one of the most important and recommend starting it from the very first days of a child's stay at school. As V. A. Sukhomlinsky wrote, teaching to convey thought by word is the main task of elementary school. Experience shows that for this it is effective to use speech exercises and other types of work described above. They attract the attention of children, are appropriate for their age and should be organized systematically, systematically throughout the years of primary school. Such work helps children to comprehend the meaning of language as a tool for communication, understanding the world around them and master the richest resources of their native language. In the lesson, I create an atmosphere of verbal communication, interviews, exchange of views, so that there is a dialogue "teacher-student" or "student-student", where the student's personal position is expressed, where the student does not feel constrained, not pinched, is not afraid of his own mistakes. In my work, I always give children the opportunity to express themselves, I do not criticize the speech of children, I encourage their statements in the form of any praise. Such training contributes to the development of the child's desire to speak, helps children in the lesson to become our helpers, friends. Experience has shown that over time, even my weak students and those whom we call silent; begin to work more actively in the classroom.

It is important for my students to understand that the ability to convey information, maintain a conversation, establish contact, and find the ability to get away from a quarrel during an argument is necessary in everyone's life. Children should understand that eloquence and the ability to speak is not idle talk, not rhetoric. I teach them to feel the difference between chatting and conversation, between wit and a set of clichés; I teach them to use the gift of speech. Speak without thinking - shoot without aiming. By the way, you need to be responsible!

THEORETICAL STUDY OF PROOF LIMITATION PROBLEMS IS AN IMPORTANT FACTOR IN INCREASING THE EFFICIENCY OF TRAFFIC ACCIDENT INVESTIGATION

Majidov Jamshed*

*Teacher,

Department of Preliminary Investigation and Criminalistics,
Academy of the MIA of the Republic of UZBEKISATAN

ABSTRACT

The author illustrates topical issues of the theoretical study of the problems of the proof limitation in the investigation of traffic accidents through this article. An observation to existing theoretical, practical, legal gaps in the field is issued. The thoughts of practitioners are analyzed completely and comprehensively. Subsequently, the scientifically grounded proposals and recommendations are developed in terms of elimination of existing problems. The widespread incidence of vehicles in the roads throughout the world today, along with its positive factors, also leads to many negative consequences. The overall number of deaths on the motorways in the world has reached 1.240 million per annum, and unfortunately by 2030 this number may reach 3.6 million per annum, in accordance with the statistical data of foreign center "Pulitzer". The number of deaths due to crimes related to the rules of traffic or safety use of vehicles has taken the next place after HIV, malaria, tuberculosis (according to WHO) in developing countries in the recent years

INTRODUCTION

The widespread incidence of vehicles in the roads throughout the world today, along with its positive factors, also leads to many negative consequences. The overall number of deaths on the motorways in the world has reached 1.240 million per annum, and unfortunately by 2030 this number may reach 3.6 million per annum, in accordance with the statistical data of foreign center "Pulitzer". The number of deaths due to crimes related to the rules of traffic or safety use of

vehicles has taken the next place after HIV, malaria, tuberculosis (according to WHO) in developing countries in the recent years [1].

Unluckily, Uzbekistan is no exception too. There were 8,588 traffic accidents, in which 1,915 people died and 6,673 were injured in 2019 [2]. Regular measures taken in the recent years to reform the judicial system in Uzbekistan are aimed at ensuring reliable protection of the individual, his rights and freedoms, peace and security from criminal invasion, early crime prevention, as well as educating citizens in the spirit of compliance with the Constitution and laws.

The Presidential Decree No. PD-3127 “On measures to further improve the system of traffic safety provision” dated on July 11, 2017 by the President Shavkat Mirziyoyev, aimed at further prevention of the occurrence of traffic accidents, elimination the causes and conditions that allow this type of crime, reliable protection of the rights, freedoms and legitimate interests of citizens defined that, one of the vital tasks of the Ministry of internal affairs of the Republic of Uzbekistan and its territorial divisions is to systematically-complex analyze and eliminate the causes and conditions of traffic accidents, to improve the system of prevention of traffic accidents [3].

In our opinion, the theoretical study of the problems of the limitation of criminal procedural evidence should become the topical matter as an important factor in increasing the effectiveness of the investigation of traffic accidents. This is owing to the fact that the truth is identified in each criminal case on traffic accidents on the basis of examination and evaluation of the evidence by investigation organs and other participants. In this process, the main task is to determine the specifics of the identification, verification and evaluation of evidence on traffic accidents.

However, the relationship between the acceptability and reliability of evidence and the practical features of the investigation of traffic accidents in the single scientific-logical comprehension of the subject of proof was not at the centre of attention for a long time. The main interest was in developing proposals to improve traditional methods and means for collecting and assessing the evidence.

At the same time, on the basis of the analysis of the system, the problems connected with the development of interrelated measures to improve the efficiency of the evidentiary process in the investigation of traffic crimes is also disregarded.

According to the Russian scientist S. N. Perlov, it is fairly stated that today the traditionally organized legal and organizational support of the investigation process, as well as forms and methods of obtaining and using evidence-based information are based on personal sources and relevant procedural actions (interrogation, resistance etc.). Accordingly, it does not meet the interests of increasing the level of preliminary investigation and strengthening the rule of law [4].

Based on the above, it is expedient to study the problems of the limitation of criminal procedural proof as an important factor in improving the efficiency of the investigation of the traffic accident. It is of paramount importance to know the lexical meaning of the expression of proof in order to fully understand what the limits of proof are.

The term “proof” means the affirmation of “opinion, claim, hypothesis” and so on, or “confirmation of the truth of the accident (event) with evidence, document”, “proof of the

correctness of the rule or claim by logical reasoning and evidence on the basis of other known rules” in the explanatory dictionary of the Uzbek language [5].

The legal clarification of this expression is “the activity of criminal proceedings regulated by the law on interrogation, preliminary investigation, and determination of the prosecutor and the court with the participation of other subjects of criminal assessment collection, investigation and evaluation of factual information necessary for the proper solution of the case” [6].

The conduction of public opinion survey among interrogators and investigators directly involved in traffic accidents revealed that the majority of interrogators and investigators (62%) stated that it is necessary to pin the blame for the guilt of the person, not the situation, and that this is the problematic issue [7].

The equal percentage of interrogators and investigators argued that the more effort is made to prove a person`s guilt, the greater the need to begin to identify the circumstances that prove his or her innocence [7].

As a result of the survey, it becomes clear that the practitioners (practice staff) are currently investigating the criminal case in terms of foregone conclusion. The abundance of vehicles, further complicates the committing mechanism of this type of crime and makes it difficult to prove a person`s accusation or innocence especially in the metropolitan areas. It is more arduous to identify the causal relationship in the interaction of drivers and the causal relationship with the accident in such type of the traffic accidents [7].

It should be highlighted that determining the causal link between the violation of traffic rules by the driver of the vehicle and the operation of the vehicle, which caused the accident and caused illegal consequences, is a necessary component of the sequence of evidence in crimes related to traffic accidents.

It should be indicated that the vague conclusion that there is a possibility of violation of traffic rules or that there are no signs of an offense in the traffic excludes the existence of the spontaneous causal link. Specifically, answering such questions is particularly challenging when multiple traffic users commit multiple violations simultaneously, resulting in multiple causal links and legal consequences.

It is vitally important to determine at what stage and how it will the criminal case be carried out in the process of proving this type of case. The general question of whether evidence should be collected at the stage of gathering or examining and summarizing evidence, or at the stage of evaluating evidence, has not yet been resolved. This issue needs to be approached more deeply and broadly by virtue of the issue of initiating the criminal case or refusing to initiate is specifically related to proof.

Because of various highlights of the current criminal system prerequisites, ie the vagueness of certain guidelines, methodological and authoritative issues, there are numerous legitimate, strategic and methodological issues in conducting investigations concerning traffic accidents that form the basis of the evidentiary process (eg, appointment of expertise, investigation of the scene, interrogation of witnesses and participants in the incident, in carrying out experimental actions, etc.).

At this point, the internal confidence of the interrogator and investigator, which clarifies the details of the incident, is of great importance in determining the causal link between the commission of the crime and its consequences. According to the Article 95 of the Criminal Procedural Code of the Republic of Uzbekistan, the interrogator, investigator, prosecutor and court evaluate the evidence along with their inner convictions in accordance with the law and legal consciousness on the basis of careful, complete, comprehensive and impartial consideration of all cases. Each piece of evidence should be evaluated in terms of relevance, acceptability, and reliability. It is noteworthy that evidence is considered relevant in case it reflects information about facts or things that confirm refute or question the conclusions about the existing circumstances that are applicable to the criminal case [8].

One of the important factors in improving the efficiency of the investigation of traffic accidents is the study of the problem of improving the criminal procedural evidence on the basis of a comprehensive analysis of theoretical, organizational and methodological problems of investigating the objective truth in the investigation of this type of crime.

It should be pointed up as conclusion that the solution of the above problems depends not only on the development of the theoretical basis of proof, the search for ways to increase the efficiency of this process and the optimization of the investigation of traffic accidents, but also the introduction of amendments and additions to existing legal norms. Concurrently, it is significant to further enhance the professional training of participants in the process of identifying and investigating traffic accidents, to develop cooperation and to bring the technical equipment of activities to the new level in conformity with current requirements.

STAGES OF SPORTS TRAINING IN BADMINTON AND ITS CONTENT

Bakhodir Bakhridinovich Kipchakov*

*Associate Professor,
Samarkand State University,
UZBEKISTAN

ABSTRACT

This article discusses the stages of preparation for badminton and their specific features. The content of the preparatory stages and the requirements for them have been studied and interpreted from the author's point of view. Age-specific features of the preparatory stages and ideas for their organization are summarized. Sports activities usually include a number of periods in the age development of an athlete [1]. In particular, badminton is no exception. At the same time, the content and structure of the exercise change significantly in accordance with the age characteristics of the athlete and the logic of sports maturation. The stage of initial sports training usually begins at early school age (in some cases even earlier) and proceeds to the next stage along with the choice of the subject of sports specialization. About sports exercise in its meaning can be spoken here exclusively conditionally, since its characteristic features are still almost not expressed.

KEYWORDS: *Badminton, Preparation Stages, Age Characteristics, Planning.*

INTRODUCTION

Sports activities usually include a number of periods in the age development of an athlete [1]. In particular, badminton is no exception. At the same time, the content and structure of the exercise change significantly in accordance with the age characteristics of the athlete and the logic of sports maturation. The main stages of the formation of shugaring for many years of sports can be listed as follows:

- Stage of initial sports training;
- Stage of initial specialization;
- Stage of deep improvement;

- Stage of "longevity" in sports.

The age limitation of these stages undergoes significant changes depending on the characteristics of the sport [2], the personal characteristics of athletes and other conditions [3]. Research conducted before and after the 1970s revealed specific periods of age restriction in sports. But today these boundaries have to some extent lost their relevance. In sports, the parameters of age restrictions have changed. (For example, O. Chusovitina at the age of 41 took part in the Olympic Games 7 times and set a record).

Now it's worth talking about the stages and explaining them.

The stage of initial sports training usually begins at early school age (in some cases even earlier) and proceeds to the next stage along with the choice of the subject of sports specialization. About sports exercise in its meaning can be spoken here exclusively conditionally, since its characteristic features are still almost not expressed. Classes are organized in a comprehensive manner - mainly in the form of general training, with an incredibly wide use of the available means of physical education and training. Beginner athletes, trying their hand at various sports exercises, under the guidance of a coach, determine the subject of their future specialty that best suits their abilities.

During the initial stage of specialization, especially in cases where sports specialization begins in adolescence and even earlier, the widespread use of general training continues to occupy a major place. The most important task at a special stage is to lay a reliable foundation for future achievements, that is, to ensure a comprehensive harmonious (hormonal) development of the body, to increase the level of its functional capabilities, to enrich the variety of movements, skills and abilities, to master the basics of sportsmanship. Aiming for the highest possible athletic performance should not be limited here, but in the long term.

Experiments and observations show that primary specialization is preferable to the manifestation of "multiculturalism".

For example, in badminton, a general specialization initially arises. In other sports, in particular in athletics, athletes specialize in triathlon, pentathlon, etc. This corresponds to the general direction at this stage of a sports exercise and at the same time creates additional ground (Guarantee) against mistakes in determining the subject of narrow specialization without interruption. In some cases, the athlete chooses the subject of the main specialization through the approximation specialization, in which exercises are performed that are easier for him to cope with (for example, the future Styer in the initial specialization runs much shorter distances). This way makes it possible to get the necessary training period and competition experience, without waiting for the age characteristics to reach the level that allows. Therefore, the higher the age conditions in the training of the chosen sport, the more widely this path is used.

During the years of initial specialization, the training process only gradually acquires all the characteristic features of a sports exercise. Initially, the weight of the special training is comparatively low. The volume and intensity (intensity) of physical activity will grow at a much slower pace than in the future. This is especially true of sports activities for children and adolescents, since in them, due to the natural growth of the body, plastic metabolism is incredibly increased, which in itself is a great functional load for the child.

This stage also has its own way of preparing for sports exercises. During the training period, at first, the main place is occupied by almost completely the preparatory period. The competition and transition periods will look like they are "cut back". At the same time, the means, styles and forms of training, the magnitude and the closest orientation of the loads alternate within wide limits. In many cases (especially for children and adolescents), the duration of the exercise periods should be shortened. As we approach the end of the stage in question, the training process is more and more modified in accordance with the laws necessary to achieve high results in full-fledged sports.

The initial specialization stage takes about 2-3 years. At the same time, depending, first of all, on the individual characteristics of the athlete and the nature of the sport, these terms can vary significantly. By the end of this stage, the athlete must have reached approximately the second level (category) of the unified sports classification.

Deep Cultivation Stage Age ranges at this stage are in the 17-20 to 35-40 age range in most sports. It is this time that is considered the time of the most active sports practice, when the highest level of sports abilities is noted, and the heights of sports mastery are achieved.

All the specific patterns of sports exercise find their fullest expression at this stage. The learning process will be very deeply specialized. The weight of special physical, technical, tactical and volitional training increases significantly. But it should not increase by reducing the time allocated for general training, but by significantly increasing the time allocated for special training. The concentrated volume and intensity of physical activity will reach their absolute maximum during this stage, reaching significantly higher rates than before. Also, the influence of competitive practice and the structure and content of training will increase significantly.

As the athlete approaches the peak of achievements, the level of additional increase in sports results decreases, and after 6-8 years of specialized training, a temporary decrease in indicators occurs.

Apparently, the following two types of reasons can be attributed to such a decrease in the long-term dynamics of sports achievements: a) biological reason - a natural decrease in the adaptive capabilities of the organism as it grows; b) insufficiently perfect modern method of organizing long-term training.

It is necessary that further rationalization of the training process could minimize such a decrease or even push it away before reaching a much older age. At the same time, the most important is, among other things, a purposeful renewal of means, methods and forms of exercises, as well as the optimal alternation of cycles, characterized by different ratios of general and special readiness, as well as varying degrees of volume and intensity of loads.

As mentioned above, the dynamics of physical activity, including perennial ones, should have a wave-like character [4]. On the scale of long-term "waves" of loads, first their volume, and then the intensity reaches its maximum. Although this community is a learning process, it usually varies between the ages of 35 and 40 in order to maintain a high level of general performance as well as special qualities and qualifications for as long as possible. What has been achieved earlier is also being improved to a certain extent (especially in terms of technical and tactical training).

At this stage, the content of the exercise by its nature from year to year approaches general physical fitness. The role and place of the competition is decreasing. The upward trend in loads

now persists only for a short period of time and applies only to certain groups of exercises. In accordance with this, the structure of the training process will also be rebuilt [5]. The boundaries between periods seem to disappear.

Annual and multi-year planning is a program for a sports coach. With its help, the trainer controls and controls the entire training structure. When drawing up annual and multi-year plans, it should be possible to change, supplement or improve them. Since by now a sharp increase in sports results and the use of various means and techniques in training athletes leads to the fact that the athlete is ahead of the planned plan, and in some cases, on the contrary, the athlete's inability to fully master the assigned tasks also requires a change in the plan. Besides unexpected trauma for the athlete, some problems in social life also require a change in the plan.

The rhythm and other states (moments) of the structure of the exercise begins to be more influenced by the mode of work. In sports practice, annual and long-term planning is of particular importance. This type of planning summarizes the general view of the athlete's training. This process unites in its structure all directions and sections of the side of sports training and serves as the basis for further plans. The annual and long-term planning includes such necessary indicators as theoretical and practical knowledge, abilities, skills and qualifications that are provided for by the plan and which the athlete must master.

The peculiarities of the sport, the level of the athlete's capabilities, climatic conditions, material and technical security should be taken into account in annual and long-term planning. The schedule of the competition is also of particular importance. The planning of training sessions according to the time, place and conditions of the competition will be more accurate and efficient.

The general signs of the main stages in the long-term process of sports training are such that today these indicators have not changed their structure, both in content and in form. The stages and results achieved on them are updated in modern sports. Nevertheless, the content of the tasks by stages has not lost its relevance.

The organization and planning of sports activities is a complex pedagogical process and requires a high level of knowledge from the coach. Before covering these points, it will be necessary to periodize in accordance with the age characteristics of the athlete.

Taking into account pedagogical, psychological and biological knowledge, children and adolescents are divided into the following age groups:

- Junior school age. 1-4 grades (from 6-7 to 10-11 years old);
- Middle school period. 5-9 grades (from 11-12 to 14-15 years old);
- Teenage years students of academic lyceums and professional colleges (from 15-16 to 17-18 years old).

The coach as a whole must be careful with his students. In sports practice, the specifics of training are distinguished. These differences are characterized by the shortness of the training time, the lower volume of loads, and the specificity of the methods of teaching exercises.

At the heart of any sports activity is sports exercise planning. Without planning, it is impossible to achieve any results or establish sports activities.

Sports training planning means a guarantee of future sports results in advance (Kerimov F., 2004). Therefore, it is advisable that trainers or specialists attach particular importance to this process.

The most important criterion to consider when planning an athletic training is the age, personality and qualifications of the athlete. Athletes can be trained according to a common plan when all three indicators are close to each other. In this case, it is also important not to forget to give them exercises individually.

There are the following types of sports training planning [6]:

1. Long-term planning.
2. Annual planning.
3. Monthly (mesocycle) and weekly (microcycle) planning.
4. Plan for a specific workout.

Each type of planning implies a certain level of tasks. It is wrong to say that there is a specific border between them. Each process acquires its own individuality and has a common unity. When planning sports activities, especially at the stage of initial sports training, the main attention should be paid to the issues of the comprehensive development of athletes. Because young athletes who have just started training, who have insufficiently formed motor forms, will not be able to perfectly master the technique without the physical qualities necessary for sports. We can say that when planning long-term training with young athletes, it is necessary to achieve the formation of a large-scale basis, which will be necessary for the athlete's further sports activity.

At this point, the ratio of general and special training alternates for many years (Fig. №1)

Figure № 1. Dynamics of changes in general and special readiness for long-term preparation.

When planning a sporting event, a number of aspects should be given special consideration. Whether it's a long-term plan or short-term plans - all this should be built on the basis of certain procedures, based on certain patterns. At the same time, the issues of further sports activity,

health, spiritual and moral education of a young athlete and other similar issues are taken into account. It is especially recommended that when planning and conducting trainings for young athletes, the issue of improving their health, hormonal development, and further increasing functional capabilities remains in the center of the trainer's attention.

In the process of planning sports activity, the inclusion of a large volume of loads in the plan being drawn up, the settings of complex tasks in front of the plan create problems in the training process.

ABSTRACT

Today, teachers all over the world are trying to incorporate critical thinking skills into the learning process in order to raise their students as independent critical thinkers. The article discusses about critical thinking development through reading authentic news articles in English classes.

KEYWORDS: *Critical Thinking, Reading, Analytical Reading, Authentic Materials, Newspaper, Critical Discourse Analysis*

INTRODUCTION

How does critical thinking relate to the educational process and how important is its role in modern society? Reality shows that it is difficult to incorporate critical literacy and critical thinking into the process of learning English as a foreign language, as it often exceeds the capabilities of students. Today we can state the fact that this problem is not given due attention in language classes, not only in our country, but throughout the world, as evidenced by numerous experiments and studies. It was revealed that the interpretation of texts is reduced to a retelling, a description of insignificant details, and the key points of the content are not mentioned by students due to a lack of understanding of the meaning, as well as the inability to distinguish the main from the secondary.

MATERIALS AND METHODS

Let's discuss some reasons explaining the existence of this problem.

First, when teaching analytical reading in English, priority is given to explaining the lexical and grammatical subtleties of the text, rather than teaching comprehension.

Secondly, in the conditions of intensive and rich study programs, teachers do not have enough time and dedication to teach students the appropriate skills.

Thirdly, the teachers do not have a lot of experience and a sufficient level of training to develop students' critical thinking skills.

We know that, English as a Foreign Language students absorb new knowledge and bring it to their culture. In this case, good language training and critical thinking allows you to understand the latent meaning of the information received, to avoid the imposition of alien ideas or reject them. Nowadays, the method of critical discourse analysis in teaching is widely promoted abroad and in our country as well, which makes it possible to increase the level of critical language thinking of students. We have a discourse analysis course, which one of the Pre SETT modules at our university [1]. The methodology is aimed at developing the ability to explore the world around us, form critical judgments and find ways to change the course of events. Critical discourse analysis offers a revolutionary new approach to language and its teaching. There is an expression "language in action", which means that its use is sometimes ambiguous and problematic, reflecting social and ideological processes and influencing these processes [2].

According to critical discourse analysis, the text is studied meaningfully, taking into account the linguistic environment. Three aspects underlie the analysis of a communicative event: text, discursive practice, social and cultural practice. In contrast to critical discourse analysis, critical language awareness is a mental and internal ability that develops gradually in motivated students interested in independently "discovering" the language for themselves [2]. In other words, we can call this approach self-education.

Developing and educating a student as a person capable of critically evaluating his work, analyzing the thoughts of other authors, we always ask ourselves the question of what critical thinking is. Of course, this is a complex concept due to the fact that people perceive information differently in the conditions of the existence of intercultural and interethnic differences, peculiarities of logic, thinking, etc., therefore, the same facts or events are considered from different positions, and the conclusions are opposite.

We understand critical thinking as a combination of abilities and attitudes. Ability is a cognitive element that gives an idea of what to do, and students' disposition is this or that attitude or inclination that forms critical thinking in a certain direction. EFL teachers face with the urgent task of organizing work in the classroom in a new way. Students should have time to search for an approach to solving the problem posed, formulating adequate questions, considering hypotheses, and putting forward valid arguments. At this stage, the teacher's methods of work play a decisive role in shaping students' critical thinking. There is a widespread misconception that students learn exclusively through the transmission of information according to the teacher-student scheme. In this case, it can rightfully be argued that students are not interested in working together and exchanging ideas, since they work under duress. On the contrary, discussions and the formulation of one's own judgments stimulate the intellectual development of students, which contributes to a better understanding of ideas, including scientific ones. We emphasize that there is a circumstance that we should not forget: the text in English is a cultural source of values, the meaning of which is determined by a particular historical era. In other words, the author is not a neutral person, but a personality with its inherent culture, knowledge, intentions, actions that are reflected in the text, and each reader interprets the author's ideas,

guided by his own critical point of view. Knowledge is always contextual, and readers construct their understanding based on everyday and cultural views based on their own life experiences. Thus, critical thinking will always depend on a whole range of socio-cultural factors and be characterized by situational conditioning.

It is the ability to critically analyze texts and reasoning that help the reader understand the author's ideas and go beyond the text, draw conclusions, thereby forming a personality in himself, armed with new knowledge and capable of fighting, defending his civic position in our contradictory world [2].

In the discussions and debates, students develop not only critical thinking, but also to improve the skills of all types of speech activity: speaking, listening, writing, reading. There are advantages of using newspaper material in English classes: diversity, gradation of difficulty levels, consideration of socio-cultural, political-economic and other topics, contextual reading, text design in literary English, the ability to look at the text analytically, interacting with other students through hypothesis, the possibility of individual interpretation of facts. Among the above listed advantages of using newspaper material in the classroom, the most significant factor for anyone learning English as a foreign language is the literary language in which the articles are written. It is in this connection that it is appropriate to recall that the dictionary of applied linguistics characterizes literary English as follows [3]: “the language that has the highest status in society, which is spoken by educated people, which is also used in the media and fiction, dictionaries, grammars. This language is taught in educational institutions, it is studied as a foreign one”. Thus, it can be stated that the press is an excellent source of living English. It is very important to note that journalists, editors, columnists, reporters and other professionals write texts in the literary language, so the use of authentic materials is essential for effective work in classrooms.

RESULTS AND DISCUSSIONS

The advantage of using newspaper material in the classroom is obvious, since in this case a critical vision of a fact or event is encouraged, which leads to the creation of a special creative atmosphere in the class, as we have already written about above. The teacher has an urgent need to learn more about the interests of his students in order to correctly navigate in the selection of material for analytical reading or other types of activities for the formation of critical thinking, which we will write about below. The most important condition for success in this work is to increase the level of students' motivation to read the press. The choice of a newspaper depends not only on the interests of students, their level of preparedness, educational goals that are set for them. Developments are an excellent didactic material for preparing for classes. Students who are just starting to work with an English newspaper must be familiar with its structure, know the names of sections of newspapers. Knowledge of the features of a particular newspaper allows a critical comparative analysis of the structure of English and foreign newspapers. When discussing the organization of articles, relevant vocabulary is introduced, which is discussed in a group or frontally: an article with the name of the author, an expression of gratitude, the structure of an inverted pyramid, the first paragraphs of the article. In the first lessons, students introduce with grammatical features of newspaper material, in particular, headings, which are characterized by shorter sentences, the absence of clauses, the use of substantive phrases, the use of word forms without prepositions. The teacher's function in the subsequent work on the newspaper is for students to know exactly how to approach the analysis of the material read from the

standpoint of a critical reader. We give an algorithm of actions that a student should follow when working on an article:

- 1) Information about the article: before you start reading the article, you need to know all the data about the journal, the author, etc .;
- 2) information about the analysis: it is necessary to research the article as a whole and try to determine what goals the author has set, for which readership the article is intended; before reading, find clues in the title and / or subtitle;
- 3) The main details: find the formulation of the question, the thesis statement of the author, and also find out what facts the author uses to substantiate his position;
- 4) general presentation and argumentation: as you delve into the process of "observational" reading, it is necessary to achieve a deep understanding of the facts used and how harmoniously they fit into the argument; inquire about the meaning of unfamiliar words in the dictionary or try to guess their meaning; follow the author's progress in the final part, after analyzing the last few paragraphs; think about the meaning of the article, about the logic of its construction;
- 5) Assessment: after reading the article carefully, it is advisable to determine your attitude towards it, whether the reader liked it; whether it was difficult / easy or interesting / boring to read it, try to make some judgments about the article.

Analyzing the article critically and comprehensively, the student needs to logically build his train of thought, relying on the following strong points: the purpose of the article, target audience, subject of discussion, reason, main position, facts, style, presentation of arguments, conclusions, meaning, impact on the reader, dignity ... For each of the listed sections, a standard series of questions is posed for a faster and more qualitative analysis of the material. For example, in the section "Purpose" the student is required to: explain his point of view regarding the reasons why the author wrote the article; express an opinion on whether the article contains refutation / approval of the views of other people regarding the phenomena or events mentioned in the article; present a point of view on whether the author presents new information in his article, whether there are elements of novelty in it, what is the degree of its uniqueness.

In order to show the requirements for newspaper articles, determine the strategies of students for working with them, determine the assessment criteria and evaluate the work, we offer the template below.

Article ... - taken from the recommended source; - has sufficient volume; - provides opportunities for analysis.

The summary of the article assumes that ... the student ... - defines the purpose of the article; - summarizes her key points.

The presentation of the content implies that ... the student, using language means and critical thinking skills, demonstrates understanding of the content of the article and tries to interpret the author's position on the issue under consideration, as well as express consent / disagreement, approval / disapproval, etc., as well as draw conclusions ...

Criteria for evaluating article analysis

Objectivity of a critical assessment of an article _____

Reasoning logic _____

Validity and integrity _____

Lexico-grammatical design _____

Compliance with the rules for registration of work _____

Work methods _____

CONCLUSION

In conclusion, we recommend the abovementioned types of practical activities in the lesson focused on reading newspaper materials, aimed at further developing students' critical thinking skills. Students learn to review the material that they have to read in writing, as well as develop a leadership position in the discussion.

ABSTRACT

This paper discussed the errors made by children in subtraction with bringing backward. The main objective of this study is to identify the error pattern among the primary school children. A paper pencil test was administered to 1824 children in Grades 4 and 5. Each paper consisted of 25 questions. An interview also was conducted with few children selected at randomly. The researcher marked the students' answers. He sorted out the wrong responses made by the children. Most of the errors identified were systematic errors. There were 10 types of errors identified in this study. Subtracting the smaller number on the right hand side from the larger number on the right hand side was the popular error pattern among the children.

KEYWORDS: Subtraction, Errors, Systematic Errors

INTRODUCTION

Mathematics is considered as an important subject in both the primary and secondary levels in Sri Lanka. A person who intends to follow the General Certificate of Education Advanced Level (GCE AL), should have passed Mathematics and the First Language in the General Certificate of Education Ordinary Level (GCE OL) examination. Thus Primary mathematics is the foundation for the secondary mathematics.

Sri Lankan Primary Mathematics syllabi consist of six main topics – Numbers, Mathematical Operations, Measurement, Money, Space and Shapes, and Data Handling. These concepts are introduced at Grade One and develop gradually up to Grade Five in the primary circle (Mukunthan, 2013). Algebra, number theory, geometry, and algebra are the four primary branches of mathematics. The usefulness of arithmetic for daily life is important, its instrumental role in other disciplines, the need for a basic knowledge in many professions and the important role of arithmetic in developing critical reasoning cannot be ignored (Mishra, 2020). The four

mathematical operations –Addition, Subtraction, Multiplication and Division are included under the main topic Mathematical Operations (arithmetic) .The idea about subtraction is introduced in Grade 2. Subtraction using objects and figures (quantity not exceeding 19) and Subtracting a number not greater than 9 from another number not greater than 9 are in Grade 2 syllabus. Subtraction without bringing backward, of numbers not greater than 99 is introduced in Grade 3. Subtraction with bringing backward in one occasion (numbers not exceeding three digits) is included in the Grade 4 and Subtraction with bringing forward in two occasions (numbers not exceeding four digits) in Grade 5.

Addition and subtraction consist of additive relationships constituted of part-part-whole relations, and the ability to discern and handle this structure has been described as critical for children's development of powerful arithmetic strategies and skills (Baroody, 2016; Fritz, Ehlert, & Balzer, 2013; Resnick, 1983).

Subtraction involves more than applying an algorithm. It is not merely rote learning and mechanical process, but rather includes a process of acquiring the algorithmic procedure and interpreting that procedure, which has to be taken into account when and how the algorithm is applied and what it means. The importance of the subject understanding the conceptual basis of the algorithmic process of subtraction has been emphasized as essential in many studies. Several studies have highlighted that children make errors in subtraction.

LITERATURE REVIEW

Generally error can be defined as something a person has done which is reflected to be incorrect or wrong. Mathematical error can be defined as a mistake in a mathematical calculation. Children make several types of mathematical errors in the classrooms. According to Drew's (2005) error could be made due to many reasons. It could be the results of carelessness, misinterpretation of symbols or text, lack of relevant experience or knowledge of mathematical topic / learning objective / concepts, a lack of awareness or inability to check the answer given, or the result in misconception.

Mulhern and Greer (1989) noted that,

- a) Errors are frequently 'surprising' usually because they may have remained undetected by teacher for some time.
- b) Errors are often extremely 'persistent'. Typically, these are resistant to change themselves and correction of errors may involve fundamental reorganization of pupil's knowledge.
- c) Frequently errors 'ignore meaning'. So that an answer which is obviously incorrect is rejected with no questioning.

Errors can occur in many ways, as described above. According to Brousseau et al (in Mulhern and Greer, 1989) errors may occur in four main ways in mathematics.

- a) As a result of major misconceptions about fundamental aspects of mathematics
- b) As a result of correct and faithful application of systematically flawed procedure
- c) When the flawed rules and misconceptions the pupils possess are not recognized by the teacher.

- d)** Due to the use of highly original, non-formal methods of solving problems invented by pupils.

Mathematical errors are significant in practice because they can be used to enhance teaching and learning.

Fiori and Zuccherri (2005) found that certain error patterns depend on different ethnic-cultural situations, teaching methods and algorithm used, and to what extent.

Many researchers analyzed several types of mathematical errors. They have classified errors under few patterns. Cox (1975) classified the mathematical errors into three major categories viz (i) Careless error, (ii) Random error and (iii) Systematic error.

Cox (1975) defined the Careless error as: ‘A student misses one or two problems out of five problems of a given type, random error as: ‘A student misses three or more problems out of five problems of a given type, but no pattern is apparent, and Systematic error as A student misses three or more problems out of five problems of a given type, using the same incorrect process as evidenced by the presence of a repeated pattern’.

Radatz (1979) classified the errors in terms of

- (1)** Language difficulties. Mathematics is like a “foreign language” for students who need to know and understand mathematical concepts, symbols, and vocabulary. Misunderstanding the semantics of mathematics language may cause students’ errors at the beginning of problem solving;
- (2)** Difficulties in processing iconic and visual representation of mathematical knowledge;
- (3)** Deficiency in requisite skills, facts, and concepts; for example, students may forget or be unable to recall related information in solving problems;
- (4)** Incorrect associations or rigidity; that is, negative transfer caused by decoding and encoding information; and
- (5)** Application of irrelevant rules or strategies.

Department for Education and Employment (1999) of United Kingdom published a model for diagnosing children’s error.

- (i)** Computational error / Careless mistake
- (ii)** Misconceptions
- (iii)** Wrong Operation
- (iv)** Over-generalization
- (v)** Under-generalization
- (vi)** Random response

Young and O’Shea (1981) noted that, many of the errors that occur in children's subtraction are due to the use of incorrect strategies rather than to the incorrect recall of number facts. A production system is presented for performing written subtraction, which is consistent with an earlier analysis of the nature of such a cognitive skill. Most of the incorrect strategies used by

schoolchildren can be accounted for in a principled way by simple changes in the production system, such as the omission of individual rules or the inclusion of rules appropriate to other arithmetical tasks.

Children's difficulties in subtraction appear to be due, in part, to difficulties with their informal approach. Moreover, difficulties at the informal level may hinder the development of more advanced procedures such as reasoning out facts (e.g. $6 - 4$ is 2 because 2 is what has to be added to 4 to make 6) or recalling facts (Carpenter *et al* 1996).

Grossnickle & Snyder (1939) noted that, many students made careless mistakes in subtraction sums. Buswell & John (1926), Cox (1975), and Smith (1968) identified that, inversion errors are by far the most common type of all systematic errors. (Example: $95 - 38 = 63$, $73 - 29 = 56$).

The significant lack of understanding of basic mathematics is a circumstance that is accepted by the education community, while the continued use of algorithmic calculations remains a priority aim in the majority of countries worldwide. For example, subtraction tends to be considered, following rote learning, as a mechanical process that consists of applying algorithmic steps in the appropriate order.

Methodology and Results

The objective of this study is to identify the patterns of errors made by the students in subtraction with bringing backward.

There are five types of schools in Sri Lanka: National Schools, Type 1 AB, Type 1C, Type 2 and Type 3. The National Schools do not have primary sections. Sinhala, Tamil and English are the instructional media in these schools. All schools having that have primary sections were selected using Stratified Random Sampling Method for this Study. Accordingly, 25 schools were selected.

A question paper consisted of 25 subtraction sums with bringing backward. The Researcher designed the Question Paper. All the question consisted numbers less than 99. The second digit of the first number of each problem is greater the second digit of the second number in each problem. The question paper was administered to 1824 students in Grade 4 and 5 selected from these 25 schools. The duration to answer the questions was One hour and twenty minutes. All the sums ($1824 \times 25 = 45600$) were marked by the researcher. Then the researcher sort out the sums with the errors. Then he identified the pattern of errors from those sums.

Only 138 students answered all the questions correctly. The sample answered 26137 sums out of the 45600 sums correctly. Therefore 19,463 (42.68%) answers were wrong. There were 23 students who did not answer any questions. Therefore the balance 18888 answers were analyzed by the researcher. 200 students were randomly selected and interviewed and the reason for their answers were inquired by the researcher.

According to Cox (1975) *children's errors were sort out as random errors, careless errors and systematic errors. The type of errors and the percentages are given in below Table*

TABLE 1 ERROR TYPE AND STUDENTS NUMBERS

Error Type	Number	Percentage
Careless Error	434	2.30
Random Error	368	1.95
Systematic Error	18086	95.75
Total	18888	100.00

There systematic errors (18,806) were further grouped.

Analyzing the Systematic Errors

According to Nanayakkara (1992) Systematic Errors could have arisen for many reasons. Data collected during interviews enabled to find the most important reason. Observation of the children's answers and the interview with them enabled the researcher to identify the following eight error types.

The question format is given bellow:

ab

-cd

.....

Where 'a' is greater than 'c'.

The identified students' error patterns are as follows:

(i) Error type I (recalling error)

Recalls subtraction basic facts incorrectly.

Example:

76	83	60	91	52
-59	-47	-36	-28	-13
.....
22	45	37	77	47

(ii) Error Type II(direction of operation)

Starts the subtraction from the left side.

Example

76	83	60	91	52
-59	-47	-36	-28	-13
.....
2	4	3	7	4

(iii) Error Type III (Zero related error)

Subtract incorrectly when zero is included as one of the numbers.

Example:

76	80	60	91	50
-50	-47	-36	-20	-13
.....
20	40	30	70	40

(iv) Error Type IV

Bringing one from the 10th place and subtracted correctly but when subtracting in the 10th place forgot the number that was brought backward.

Example

76	83	60	91	52
-59	-47	-36	-28	-13
.....
27	46	34	73	49

(v) Error Type V

Adds both numbers.

Example

76	83	60	91	52
-59	-47	-36	-28	-13
.....
135	130	96	119	65

Sign problem.

(vi) Type VI ($b - d = d - c$)**Example**

76	83	60	91	52
-59	-47	-36	-28	-13
.....
2 3	44	36	77	41

Subtracts the small number of the right hand side from the big number of the right hand side.

(vii). Type VII error $b - d = b$ **Example**

76	83	60	91	52
-59	-47	-36	-28	-13

.....
26	43	30	71	42

Writes the small number.

(viii) Error Type VIII ($b - d = d$)

Example

76	83	60	91	52
-59	-47	-36	-28	-13
.....
29	47	36	78	43

Writes the larger number.

(ix) Error Type IX ($b - d = 0$)

If they cannot subtract they just write 0

Example

76	83	60	91	52
-59	-47	-36	-28	-13
.....
20	40	30	70	40

(x) Error Type X ($b - d = ..$)

If they cannot subtract they just leave it blank.

Example

76	83	60	91	52
-59	-47	-36	-28	-13
.....
2	4	3	7	4

Writes the larger number

TABLE 2

Error type in systematic errors	numbers	percentages
Error Type I	1002	5.54
Error Type II	2171	12.00
Error Type III	1418	7.84
Error Type IV	1820	10.06
Error Type V	1112	6.15
Error Type VI	8471	46.84
Error Type VII	1735	9.59

Error Type VIII	90	0.50
Error Type IX	201	1.11
Error Type X	66	0.36
Total	18086	100.00

(E) Discussion And Conclusion

As already noted, Cox (1975) defined that, systematic error as a student misses three or more problems out of five problems of a given type, using the same incorrect process as evidenced by the presence of a repeated pattern. According to Cox's error classification, more errors (95.7%) found in this study are systematic errors.

Error types VI – X are related to borrow the number from the 10th place.

Errors induced by a borrow: (a) Misreporting of higher-order minuend values. (b) Forgetting the tens-column digit of the subtrahend, after executing a borrow. (c) Errors within the borrow operation itself, depending on location of the borrow, forgetting the tens-column value while executing the unit-columns addition of 10 and fact retrieval, and (d) forgetting to decrement the tens-column value in completing the borrow (Kase et al 2006) .

Further, systematic errors analyzed, showed that 46.84% of the errors were Error Type VI. That is children subtract the smaller number from the larger number in the right hand side. When the children do the addition or multiplication sums they do not need to consider the order of the numbers (example $2+3 = 3+2$, $4 \times 5 = 5 \times 4$). But in the operation subtraction and division this should be consider. Children may confuse this order of the operation.

12% of the errors in the sample are the Error Type II (direction of operation). When the children read or write in language they starts from left to right. But in the mathematical operations addition, subtraction and multiplication start from the right hand side. This may be the reason for children's error on direction of operation in the subtraction.

10.06% of the errors in the sample were related to sign. Children add both numbers. Because they did not consider the sign of the operation. Children learned addition first then they learned subtraction. When they do addition, they only have to add. Therefore, they did not seriously consider the sign but simply add the numbers. When they start subtracting the numbers, they, again, add the numbers.

The wrong answers for the Error Type II (Directional Error) and Error Type IX (writing zero) are the same. But the method of getting the answers are different. This error pattern was identified through the interview.

Finally it can be concluded that most of the children made systematic errors. If the bottom number is larger than the top number many children subtract the numbers from the bottom to top.

SCIENCE FICTION AS A GENRE OF FICTION

Savenko Olesya Viktorovna*

*Teacher,
Department of Russian and World Literature,
Termez State University,
UZBEKISTAN

ABSTRACT

The article considers science fiction as a genre of fiction; explains the reason for the attractiveness of science fiction among the younger generation; indicates the characteristic features of the genre; the most famous works that have become almost cult are indicated. Thus, based on all of the above, we can come to the conclusion that science fiction as a genre, due to its popularity, is very important in modern fiction. This genre characterizes an entire era, an era of progress and technical growth.

KEYWORDS: *Genre Of Fiction, Utopia Or Dystopia, Unreality Of Current Events, Fantastic Detective Story, "Interbreed" And Mutate.*

INTRODUCTION

Science fiction is a genre of fiction that combines unreal, currently unrealizable events with our reality. Science fiction differs from fantasy in that it contains as unreal phenomena not mystical, but scientific (that is, the distant future of people, new technologies, a new social order, and so on).

Science fiction as a genre in fiction has existed not so long ago. It arose at the end of the nineteenth century, and gained its particular popularity at the end of the twentieth and the middle of the twenty-first century.

Science fiction gained its popularity at the moment when the first man flew into space, and astrophysics began to develop. All these events gave rise to science fiction writers, room for reflection on whether there are other civilizations in this universe.

Science fiction, as you know, can be mixed with other genres - for example, short story, utopia or dystopia. An example is Zamyatin's novel "We", in which the utopian world is presented as

the result of technological progress. However, the ideological concept is still to represent the existing state system in an unfamiliar light, so the novel can be classified as a dystopia.

The characteristic features of fantastic works include the following:

1. The unreality of the events taking place. The plot can develop anywhere: from the depths of the sea to space. It is important to note that the fantastic plot will necessarily involve the interaction of the protagonists with extraterrestrial life forms. These life forms will be characterized by different from people, that is, they may have two heads, several legs, a different skin color, and the like. All this characterizes the fantastic work.
2. The main character is a simple person. It is with some ordinary person, nothing seemingly unremarkable, that fantastic events take place. That is, the main task of the author in choosing a hero was his "ordinariness" and mediocrity. Almost every fantastic work can serve as an example of this.
3. The presence of several concurrently developing storylines. It can be a romantic line, a battle line, a history line, and the like. The plot itself contains intrigue - that is, it keeps the reader in suspense until the last moment. This kind of fantastic fiction can be called a fantastic detective story.

These are some of the hallmarks of fiction as a genre in fiction. However, the presence of all these traits at the same time is not at all necessary.

In Russian fiction, science fiction has arisen relatively recently. This genre, so unlike others, aroused interest and curiosity, especially among schoolchildren. Many books have been filmed, and films have become truly iconic. An example of this is the famous Soviet film "Electronic", based on the novel of the same name. Also, at this time, the film "Guest from the Future" about the girl Alice, who became the heroine of a whole cycle of books by Kir Bulychev, is released on screens.

Modern books are in many ways a continuation of the fashion for fiction, so one can safely say that fiction as a genre in fiction is relevant to this day.

Fiction was of equal interest to readers both abroad and in Russia. The most famous works that have become almost cult are the following books:

1. Kir Bulychev "Guest from the Future". This novel about a sixth-grader girl Alisa Selezneva won the hearts of many readers. Later, he was filmed. This story is about a brave girl, space pirates, an amazing melaphone instrument that can read other people's minds, as well as brave guys from the twentieth century. This work reflects the Soviet spirit, the history of our country and at the same time is a fun and exciting fantasy novel.
2. Evgeny Veltistov "The Adventures of Electronics". This is a story about a robot boy who wanted to become a human. In this he was helped by guys from an ordinary high school, as well as his double, Syroezhkin. A funny story about the adventures of teenagers in Soviet Moscow won the hearts of millions of TV viewers.
3. Douglas Adams, The Hitchhiker's Guide to the Galaxy. This novel includes several stories. At first it may seem delusional, however, later the idea becomes clear. The novel "The Hitchhiker's

"Guide to the Galaxy" was filmed in two thousand and five and will be remembered by the audience for a long time.

4. Rachel Meade "The Oath of the True Valkyrie." This is an example of modern fiction mixed with fantasy. This mixture is new and quite unique in contemporary fiction. However, this book is a good example of fiction.

5. Natalia Shcherba "Chasodei". Contemporary Russian science fiction never ceases to amaze readers. The cycle of books "Chasodei" by the famous Russian writer won the hearts of millions of readers. In this book, time is the main value, and the watch is the most powerful tool. So, this book is one of the best works of Russian fantastic fiction.

The genre of science fiction has developed many trends and subgenres over its more than 100-year history. Each of them had their own founding fathers and their fans. Over time, some directions began to "cross" and change, and yet, even today, in science fiction literature, several of the most popular topics can be distinguished:

1. Space: travel, exploration, other galaxies, stars. A separate refrain of this group is the works about extraterrestrial civilizations, aliens and aliens;
2. Time machine: travel in time, invention of devices that allow moving in the temporal space of the future and the past;
3. Evolution of the human race: mutation, reincarnation, extraterrestrial origin, supernatural abilities, telepathy and telekinesis;
4. Utopian perception and modeling: an ideal world, a deliberately imperfect world (dystopia), the future of the planet and life after people. Also, stories about what we do not know to the end: civilizations and societies unexplored to the end (Maya, Tibetan valleys, islands, etc.);
5. Parallel worlds: mythical planets, spaces of another universe, wars for existence and survival between earthlings and representatives of another universe;
6. Scientific works: everything related to sci-fi inventions of mankind not confirmed at the moment, intelligent robots, androids, thinking computer tools;
7. Global disasters and cataclysms: viruses, diseases, zombies, flood, asteroids, comets;
8. The end of human civilization: this should include all kinds of predictions about the future end of the world for earthlings.

Thus, based on all of the above, we can come to the conclusion that science fiction as a genre, due to its popularity, is very important in modern fiction. This genre characterizes an entire era, an era of progress and technical growth. Perhaps everything that is written in science fiction books will someday become reality. However, so far, science fiction is only a part of fiction.

ABSTRACT

To effectively manage the development of coordination skills, the formation and improvement of balance function in preschool children is aimed at determining the level of development of coordination skills in each child. Uneven development of coordination skills of preschool children was observed. The highest rates of development of the ability to maintain static and dynamic balance were observed in children aged 5-6 years. The development and implementation of new pedagogical methods, technologies, approaches to improving the physical education of children is becoming a priority.

KEYWORDS: *Preschool Education, Physical Education, Coordination Skills, Development, Effective Management, Static, Dynamic, Balance.*

INTRODUCTION

It is necessary to create a new type of modern kindergartens in the world education system through the introduction of new curricula in preschool education, the development of science-based authoring programs, the organization of modern educational courses, individualization in various forms and the introduction of other innovative processes.

In many countries around the world, pre-school education is the first link in the general education system. Each country has its own national education system, the purpose of which is to develop the child in all respects, to create the most favorable conditions for their life activities.

Each country has its own national education system, the purpose of which is to develop the child in all respects, to create the most favorable conditions for their life activities. The development and implementation of new pedagogical methods, technologies, approaches to improving the physical education of children is becoming a priority. Deficiencies in the methodology of physical education, the irrational organization of the movement regime of preschool children are considered by scientists as a pressing problem in the field of preschool education. [1]

The Action Strategy for the further development of the Republic of Uzbekistan, developed under the leadership of the President of the Republic of Uzbekistan, which has launched a new phase of reforms, serves as a methodological basis for this research.

T.S.Usmankhodjaev, A.N.Livitsky, R.S.Salomov, K.M.Makhkamjanov on the formation and development of basic motor skills and abilities necessary for life in preschool children; on the theory of physical fitness of preschool children and adaptation to physical activity F.Kh.Khadjaev, G.Q.Jalolova, F.A.Raimbekova and other experts conducted research in the field. On the peculiarities of increasing the effectiveness of the educational process of preschool children in the field of education, leading scientists from both Russia and the countries of the Commonwealth of Independent States received M.N.Aliyev, V.K.Balsevich, M.A.Vershinin, M.A.Godik, S.I.Isaak; the effectiveness of the use of new technologies in the process of physical education in preschool education M.P.Mukhina, T.M.Osokina, V.P.Nazarov and L.V.Abdulmanova; improving the indicators of physical development and physical fitness in preschool education N.A.Fomin, V.M.Shebeko, A.S.Makhov, N.V.Sedix; the main factors in the development of physical qualities and coordination skills of preschool children have been studied by L.P.Matveev, L.I.Penzulaeva, V.I.Lyax and others. The works of the First President of the Republic of Uzbekistan, the Action Strategy for the further development of the Republic of Uzbekistan, developed under the leadership of the President, who launched a new phase of reforms, serve as a methodological basis for this research. [2]

The aim of the study is to determine the level of development of coordination skills in preschool children.

To achieve the goal, the research tasks identified the levels of physical development, physical fitness and balance ability of preschool children.

In order to effectively manage the development of coordination skills, it is necessary to form and improve the balance function in preschool children, determine the level of static and dynamic balance achieved in each child and use the available means and methods of education accordingly. [3] Criteria for the development and assessment of coordination skills were implemented in four ways: accuracy, speed, rationality and ingenuity, quantity and quality. (See Figure1) For example, a child can run (jump) correctly, jump, and throw any object. On top of that, he can do it quickly and intelligently, while at the same time allowing the child to find a way out of difficult games or life situations in a timely and resourceful manner. This determines the good appearance of the coordination ability.

Figure 1. Criteria for assessing coordination ability (V.I. Lyakh, 2006)

Based on statistical analysis of static balance maintenance indicators by defined criteria, a group of children with low and moderately developed balance function was identified using special control exercises, tests and methods.

The highest level of static balance maintenance was observed in children aged 5-6 years. High static balance was observed in girls of all ages. However, no obvious differences were found between them. Uneven development of coordination skills of preschool children was observed. The highest rates of development of the ability to maintain static and dynamic balance were observed in children aged 5-6 years. It was found that the time of rapid growth of coordination ability and simplification of static and dynamic balance exercises and maintaining a stable position during the performance of simplified exercises are maintained during the growth of preschool age.

TABLE 1 AGE INDICATORS OF SMS ABILITY IN 5-6 YEAR OLD CHILDREN WITH DEVELOPMENTAL DELAYS

№	Control exercises	Gende	Duration of a given condition			
			5 years old		6 years old	
			$\bar{x} \pm \sigma$	v	$\bar{x} \pm \sigma$	v
1	Maintain static balance on one leg, seconds	B	5,36±0,67	12,5	6,84±0,84	12,3
		G	6,15±0,75	12,1	7,10±0,83	11,7
2	Maintain static balance on one leg without closing eyes, seconds	B	2,11±0,26	11,6	2,46±0,29	12,0
		G	2,26±0,28	11,7	2,64±0,27	10,2
3	Maintaining balance on both feet,	B	59,6±7,01	13,7	76,8±8,62	11,3

	seconds	G	67,8±7,7	13,4	80,9±8,99	11,1
4	Keeping balance on both feet with eyes closed, seconds	B	8,94±1,05	10,1	10,95±1,23	11,2
		G	9,65±1,12	10,6	11,12±1,28	12,5
5	Hold the "Swallow" position, seconds	B	2,11±0,26	11,3	2,46±0,31	7,9
		G	2,24±0,34	11,8	2,57±0,37	14,5
6	Hold the "swallow" position with eyes closed, seconds	B	1,24±0,20	16,1	1,35±0,23	15,3
		G	1,33±0,22	16,7	1,56±0,24	15,6

A comparative analysis of the developmental indicators of coordination skills on static and dynamic balance maintenance data in girls and boys found that they had a higher rate in girls. The study found that girls of all ages had a higher rate of development of balance skills. This is determined by the better formation of balance management and the higher level of development of the vestibular analyzer involved in the regulation of balance in girls than in boys.

The study found that 74 (37%) and 88 (44%) of the children examined had low and moderate levels of static and dynamic balance maintenance. In this category of preschool children, slow coordination of movement was observed during the transition from one movement to another. This indicates that the functional training of vestibular and motion analyzers, which regulate the development of balance in preschool children, it is underdeveloped.

Come to the conclusion, in many scientific sources, scientists acknowledge that one of the important tasks in the field of physical education of preschool children is the targeted development of coordination skills. The development of coordination skills has been shown in the scientific literature to have a major impact on the level of development of children's ability to maintain static and dynamic balance. However, the use of special exercises aimed at developing the vestibular apparatus for children with developmental deficits in coordination and balance skills in preschool children has not been sufficiently covered in the literature, and almost no research has been conducted.

At the end of the study, a comparative analysis of the developmental indicators of coordination skills on data on static and dynamic balance maintenance in preschool boys and girls showed that the results were better in girls.

WORD-FORMATION SEMANTICS OF COMPOSITES

Ramazanova Shoira Ravshanovna*

*Associate Professor,
Candidate of Philology,
State Institute of Arts and Culture of UZBEKISTAN
Email id: shoira-ramazanov@mail.ru

ABSTRACT

Concepts and terms “Composite” and “Compound word” were separated. System description of ways of Russian synchronic composites-building with consideration of possibility of primary and secondary composites appearance was made, Specific, formal and semantic indications of different forms and types composites were found.

KEYWORDS: *Composites, Derivation, System In Word-Building, Word-Building Nest, Word-Building Chain, Word-Building Paradigm, Morphonology, Primary Secondary Composite-Building, Composites-Additions, Composites-Joins, Composites-Abbreviations, Secondary Composites-Substantiates.*

1. INTRODUCTION

Considering the specifics of the formal structure and semantics of Russian composites, it is necessary to note their direct connection with the method of compositing. Thus, addition composites are characterized as multi-root derivatives of words, which certainly include an interfix (materially expressed or zero) in their morphemic composition. It is the interfix that expresses the “idea of connection” that is an indicator of the general derivational semantics of composites-additions, both primary and secondary. Fusion composites, which have arisen on the basis of “fused” phrases, retain the status of derivative affix elements in the morphemic composition of the derivative. The prefix, suffix and inflectional morphemes of the producing word forms are transformed into indicators of the “internal syntax” of fusion composites.

Abbreviation composites are a combination of truncated producing bases of different types, which is not related to their morphemic composition. The word-formation semantics of abbreviations-composites is specific: reflecting the compressive function of word formation, it consists in modifying the linguistic form of representation of the called reality.

2. LITERATURE REVIEW

Our analysis of scientific literature on the problem under study, the semantics of composites (compound words) are one of the most characteristic features of the Russian word-formation system that determine the national identity of the Russian language. Their study has a long tradition, however, questions of the formal structure and semantics of composites, their relationship with single-root derivatives and phrases, methods of compositing, morphonological processes accompanying the formation of complex words, etc. until now have no unambiguous solution. The interest of researchers in Russian composites is also due to the fact that their characterization is impossible without solving a number of central problems not only of word formation, but also of lexicology, in particular, the problem of “word identity” and “word separation” [Smirnitsky. 1956. - P.114]. It is significant that there is still no single scientific definition of a compound word. Various approaches to the definition of a composite are associated with the fact that some researchers focus on the morphemic composition of the composite, emphasizing its multi-root morpheme structure, while others - on the derivational analysis of a complex word.

So, in the “Dictionary of linguistic terms” by O.S.Akhmanova “A compound word (of a composite).....a compound word that has at least two non-affix morphemes in its composition, i.e. morphemes that are not used as affixes and, naturally, acting as the basis (base) of the word”. [Akhmanova. 1966. - P.430]

According to E.A.Zemskoy, “A complex word is a combination of two or, less often, three bases, functioning as a whole and highlighted in the sentence as a special lexical unit”. [Zemskaya. 1973. -C.313]

In the encyclopedia “Russian language” a complex word is characterized as “a word that has more than one motivating basis” [Russian language. 1979. - P.313]. In his work “Basic concepts of word formation in terms” V.N.Nemchenko emphasizes that “a complex word is a derivative word, which includes at least two generating words or stems” [Nemchenko. 1985. - P.165].

E.A.Vasilevskaya in the monograph “Composition in the modern Russian language” offers the following definition: “...A compound word is a lexical unit consisting of two or more significant elements, characterized by the unity of meaning and correlated in the lexical-semantic system of the Russian language with one or another part of speech”. [Vasilevskaya. 1962. - C.22]

The Linguistic Encyclopedic Dictionary (edited by V.N.Yartseva) states that word composition is one of the ways of word-formation, consisting in the morphological combination of two or more roots (stems), as a result of the composition a complex word or composite is formed. Composition occupies an intermediate position between morphological and syntactic ways of combining language units, possessing the features of both.

We consider it important to distinguish between such concepts and terms as primary composites and secondary composites. Primary composites are the result of multi-root morphemic combining in the first step of derivation. Secondary composites are correlated with the idea of compound derivatives, or “false” compound words [Akhmanova. 1966. - C.431]

3. Research methods. The following research methods are used in the work: in general, the synchronous-descriptive method is used in the work. When analyzing the formal structure and semantics of composites, the appositive and distributive methods were used. When

characterizing the morphemic status of interfixes and structures in the composition of composites, the method of paradigmatic identification of linguistic objects by essential features was used. In the study of the semantics of composites, the elements of component analysis were used.

4. DISCUSSION AND RESULTS

The relevance of this article is also due to the fact that in the modern scientific literature there is no systematic description of the methods of Russian compositional education. Secondary compositional formation, i.e. word formation based on complex words, remains poorly studied. Many controversial issues are related to the place and role of complex words of different types in complex units of word formation, and composites in the aspect of the typology of word-forming nests of the Russian language are practically not studied.

Russian language and literature in Uzbekistan were discussed at the meeting of the theoretical seminar of the Department of Russian Linguistics, at the Tashkent scientific and practical conference "Russian language and literature in Uzbekistan".

5. CONCLUSIONS

Russian composites are considered to be a special subclass of Russian derived words with sufficiently clear formal and semantic features, as well as a systematic description of various ways of composing in the Russian language.

In theoretical terms, it is important to distinguish between primary and secondary composites, to identify the specifics of their formal structure and word-formation meaning.

We consider it appropriate in the article devoted to the word-forming semantics of composites to consider not only the specifics of the word-forming meaning of composites of different types, but also the nature of the syntactic relations between the components of complex words. According to the fair remark of E.S.Kubryakova, "the deep isomorphism of word formation and syntax is also manifested in the fact that word-formative meanings are constructed and organized rather exactly as syntactic ones are - by the name of relations, hierarchically, and not as morphological ones-by the name of individual entities" [Kubryakova, 1981. - p.141]. E.S.Kubryakova in the monograph "Types of language meanings. Semantics of a derived word" (Kubryakova E.S.-M., 1981) pays considerable attention to complex words. She emphasizes that "...on the scale of linguistic units, derived and complex names occupy a very specific place, being placed between simple words and phrases. On the one hand, they complete the series "morpheme-service word-simple full-valued word", on the other-open such a series of units of non-elementary nomination as "derived word-complex words of different types-phrase-sentence". [Kubryakova. 1981. - P.20] E.S.Kubryakova also points out, "...that syntactic constructions and complex words are different transformations of one deep essence, and in additions with a supporting verb component, the prepositional unit is considered as an object (vegetable storage)" [Kubryakova. 1981. -P.64-65] When forming a derivative, including a complex word, "...we observe the elimination of the means of the external syntax": prepositions, conjunctions, inflectional indicators of syntactic relations and their replacement by means of "internal syntax", where the center of gravity falls on the order of the elements. [Kubryakova. 1981. - P.72] At the same time, it emphasizes that in a complex word, syntactic relations are eliminated, and the indicators of these relations are removed. "The only way to mark such latent

predicates is to build a word-formation model itself. Establishing a connection between the components of a complex word-the interweaving of the linguistic and extralinguistic experience of a person” [Kubryakova. 1981. - P.63-64]

The problems of word-formation semantics of composites have been studied in studies on the “grammaticality” of a complex word (M.Stepanova, O.D.Lazerzon, etc.) in connection with the possible transformation of word combinations into complex words.

The work of E.A.Makukhina is devoted to the word-forming semantics of complex nouns, which introduces into the definition of a complex word its semantic connection with the meaning of the syntactic construction. [Makukhina. 1987. - P.7] E.A.Makukhina classifies complex words according to the types of motivating syntactic constructions (with attributive, attributive-object, subject-object relations, as well as circumstantial, comparative), “since the semantic relations between the elements of word combinations are transferred to the semantics of the corresponding composites, complex nouns are characterized by object, attribute-object, subject-object, attribute, quantitative-determinative, circumstantial, comparative-comparative relations between the components” [Makukhina. 1987. - P.17-18]

Altayeva considers the meaning of a complex word as based on the semantics of a motivating phrase, which together with the formant determines the motivated meaning.; we consider complex words, in which the meaning is reduced to the sum of the values of the motivating bases and the formant (**wood-melting, ship repair, film artist**), and complex words with semantic extensions (**carbon disulfide, forest tundra**), as well as composites whose meanings do not follow from the meaning of the motivating part and formant (**alumina, lobogreika**) [Altaeva. 1987. - P.11]

So, there is no doubt that “the semantic framework of complex words, the scheme of their semantic structure is the naming of two quantities, between which, due to their direct juxtaposition with each other, the presence of a certain connection is postulated” [Kubryakova. 1981. - C.66]

This “connection” of meanings is traditionally defined as a connective word-formative meaning. “The connective word-forming meaning is reduced to combining the meanings of two or more bases in one complex meaning (as part of a complex word, a fusion, and an abbreviation” [Grammar.1980. - P.296]

The abstract “idea of combining” several meanings into a single whole is most clearly manifested in the primary composites in the implementation of the act of composing itself:

белый и розовый → бело-розовый, долго играющий → долгоиграющий, Commonwealth of Independent States → CNG.

The idea of combining meanings is also “inherited” by secondary composites, in the formation of which it is supplemented by the derivational meaning of prefixes and suffixes: пешеход – н(ый) ← related to a “pedestrian” i.e. a person who “walks”; неморозостойк(ий) ← lack of frost-resistant trait i.e. “Hardy, frost-resistant”. The “connection of meanings” in the derivational meaning of composites is not, however, a simple sum of the meanings of the constituent elements. According to the E.U.Kubryakova: in “complex words, oddly enough, the metaphorical nature of names is more clearly felt - not an identity, but a comparison of entities”

[Kubryakova. 1981. - P.76] In the dictionary of O.S.Akhmanova, such complex words are recognized as indirect [Akhmanova. 1966. - P.430]

A.I.Smirnitsky believes that the greater semantic integrity of a complex word in comparison with a phrase is a consequence of the whole-formedness. "The wholeness of a word, naturally, in itself, expresses a certain semantic wholeness: it emphasizes that a given object or phenomenon is thought of primarily as one, a special whole, even if the complexity of its structure is noted for its individual features are highlighted. So, speaking shipwreck, we pay the main attention to the phenomenon designated by this word as a whole, although we mean its individual sides: (a) wreck, accident, and (b) attribution of the accident to the ship. On the contrary, if we say (the) wreck of (a) ship, the individual aspects of the designated phenomenon are brought to the fore, and already through the perception of the individual aspects of this phenomenon, the phenomenon as a whole is realized" [Smirnitsky, 1956.-p. 34] Considering idiomaticity as "the non-deducibility of the meaning of the whole language formation from the totality of the meanings of its parts", A.I.Smirnitsky draws attention to the following: "...semantic wholeness, based on idiomaticity, and semantic wholeness, based on wholeness, are so different moments that they can exist separately. A variety of combinations are possible here" [Smirnitsky, 1956. - p. 34].

Much attention is paid to the semantics of complex words by V.V.Lopatin when considering metaphorical motivation in Russian word formation. He believes that the classical position of G.O.Vinokur "...the meaning of words with a derived basis is always determined by reference to the meaning of the primary basis" [Lopatin, 1975.- P. 53-57], requires clarification, taking into account the phenomenon that can be called metaphorical motivation.

"A typical illustration of this phenomenon can serve, for example, the word skyscraper. Its nominative meaning is "a very high multi-storey building", but at the same time this word expresses in its word-educational structure a certain figurative expression – "scratching the sky". Most often, such figurative content is found in expressive words-characteristics, especially in additions - such as heartbreaker, loafer, golovotyap, sycophant, fat cat, etc. Just as for "ordinary" motivated words (cf. at least guide, brakodel, etc.), such expressive formations are characterized by a connection with motivating words; however, this connection in them is not direct, but figurative, metaphorical, and the metaphorical meaning turns out to be the nominative meaning of these words, as a result of which only it is reflected in dictionary interpretations. But in addition to this metaphorical meaning, in the semantics of such words, due to the clarity of their morphemic structure, the compatibility of certain roots in them, there is also a second plan associated with the direct meanings of motivating words. The interaction of literal and figurative meanings creates an image that lives in the semantic structure of such words, and it is in this that their motivation is revealed" [Lopatin, 1975. - p.53] V.V.Lopatin examines in detail the figurative semantics of such complex words as lickspittle, golovotyap, heartbreaker, etc. and makes an important point about the semantics of complex words in terms of motivation: "It is clear that in the semantics of such formations, the "figurative plan" is felt to different degrees and, accordingly, different degrees of semantic convergence with the motivating word are possible. But it is important that the vividness of the figurative content of the word is preserved, contributes to the preservation of its motivation. It is no accident that complex words occupy such a large place among metaphorically motivated words. The motivation of complex words, as we know, is generally much more specific, more definite than the motivation of affixal

derivatives, and, consequently, the metaphorical image contained in such words is more specific and therefore easier to feel". [Lopatin, 1975. - p. 54]

The array of composites presented in the "Word-forming Dictionary of the Russian Language" by A.N.Tikhonov allows us to illustrate metaphorical motivation with the following examples: зубоскал, очковтира-тель, сорвиголова, вертишейка, вертихвостка, сердцеед, блюдолиз, скалолаз, толстосум, лобогрейка, лоботряс, меднолобый and etc.

Summarizing the consideration of the specifics of the word-formation meaning of composites, we emphasize the complexity of this problem in connection with the diversity of the composites themselves, on the one hand, and the relations between their constituent parts, on the other. We consider it possible to limit ourselves to the traditional scheme of defining these relations as compositional (for primary composites – additions) and subordinate (for primary composites-additions, abbreviations, and splices). In the terminology of O.S.Akhmanova, these are complex words of composition and subordination [Akhmanova. 1966.-C.431]

The specificity of composite abbreviations, which, according to E.S.Kubryakova, belong to the periphery of Russian word formation, makes it possible for them to deny the word-forming meaning in general. See, for example, the works of R.I.Mogilevsky. [Mogilevsky 1972. - P. 1-156]. During abbreviation, there is neither an "increment" of meaning in relation to the generating base, nor its semantic change. However, it is difficult-abbreviated words are undoubtedly "secondary and derived on the basis of expanded phrases. In this case, their semantics is characterized by the transition from the motivated to the demotivated". [Kubryakova. 1981.-C.79] It was the study of the word-formation semantics of abbreviations that allowed E.S.Kubryakova to make the most important conclusions about the specifics of derivational meanings in general: "The overall result of the study of complex abbreviated names is to derive an important rule that is relevant for the entire system of relations of word-formation production: the semantic shift between the generating and derived units can be reduced not only to the transfer of a new meaning, but also to transformations in the degree of dissection of the semantic representation of the same thing. As a result, strict correlations between derivatives and generating units can exist in the system of word formation as supported by the modeled difference in the degree of explicitness of the same features in the structure of names of different levels. So, the act of word formation takes place not only when the secondary unit of the nomination differs from the word that directly motivated it by its semantics, but also by the internal organization of this semantics and the measure of explicitness in the expression of individual components of meaning" [Kubryakova. 1981. - P.71-72]

ANALYSIS OF THE PREVALENCE OF HEADACHES AMONG THE POPULATION IN BUKHARA REGION

Akhmedova D. B*; Xodjiev D. T**

^{1,2}Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

Primary headaches are common in the population and in some cases lead to impaired quality of life. The article discusses the prevalence of primary headaches among the population of Bukhara region. Headache intensity was found to be mild in 62% of cases, strong in 32% of cases, and very strong in 6% of cases. 73% of patients reported that headaches persisted using painkillers, 18% reported that painkillers occasionally worked, and 9% said they did not. The prevalence of primary headaches among the population of Bukhara region is higher than the world average.

KEYWORDS: *Migraine, Tension Headache, Nonsteroidal Anti-Inflammatory Drug, Antidepressant.*

INTRODUCTION

Primary headaches occur in 90–95% of the population, with primary headaches occurring in most cases: migraines and tension headaches [1]. Rare episodic pain has been observed in patients and they may not require any treatment. In some patients, the pain may become chronic and be complicated by medicated abuses. This in turn leads to a decrease in the patient's quality of life. According to an epidemiological study, chronic headaches account for 10.5% in Russia [2]. According to the International Classification of Headaches (ICHD-3), migraine-specific symptoms should be monitored for more than 8 days per month to diagnose chronic migraine [3]. Worldwide, 11-15% of the adult population suffers from migraines, of which 18% are women and 6% are men [4, 5, 10]. According to an international study, 1-4% of the population has chronic migraine [6, 7, 5, 8]. In Russia, this figure is higher - 6.8% [34, 9].

Materials and methods: An online survey was conducted among the population.

Results: An online survey found that the prevalence of headaches among the population was 91%. 86% of patients suffering from headaches reported headaches for a few days a month, 5%

for up to 15 days, and 9% for more than 15 days. 53% of patients had days when they could not perform their daily tasks due to headaches, while 47% of patients found that headaches did not affect their daily labor activities. When the headache characteristics were studied, 27% of patients reported suffering from depressive, 45% constrictive, and 28% pulsating headaches.

In 34% of patients, the headache increased during physical activity (climbing stairs, falling, etc.), in 66% of cases, physical activity did not affect the headache. Loud noise, noise caused an increase in headaches in 80% of patients, an indicator that affected a sudden increase in headaches under the influence of a suddenly lit lamp, or light, in 42% of cases. Headache intensity was found to be mild in 62% of cases, strong in 32% of cases, and very strong in 6% of cases. 73% of patients reported that headaches persisted using painkillers, 18% reported that painkillers occasionally worked, and 9% said they did not. It was found that 76% of the populations take nonsteroidal anti-inflammatory drugs, 11% antidepressants, 13% triptans for headaches. Headaches account for 72% of cases of tension headaches, 13% of migraines, of which 9% are chronic headaches.

CONCLUSION

The prevalence of primary headaches among the population of Bukhara region is higher than the world average. Therefore, it is necessary to develop special measures for doctors and patients to reduce the disease and prevent its transition to chronic forms.

FLOW CONDITIONS FOR COATING SHELLS AND CALCULATIONS OF CARRYING CAPACITY

Yadgarov Uktam Tursinovich*

*Associate Professor,
Candidate of Technical Sciences,
Bukhara Engineering Technological Institute,
Bukhara, UZBEKISTAN

ABSTRACT

The article discusses the procedure for calculating the bearing capacity of rigid plastic shells based on linearly programmed methods. For this reason, it becomes necessary, instead of the curvilinear flow conditions of coating shells, to obtain their linear approximations of bodies bounded by sections of hyper planes.

KEYWORDS: Coating Shells, Hyper surface, Coating Shell, Hypersurface, Fluidity, Tension, Compression, Bending, Equilibrium.

INTRODUCTION

The static and kinematic formulation of the limiting equilibrium problems for the shells of the coatings shows that the yield condition plays an important role in determining the upper and lower bounds for the limiting load.

In the general case, eight internal forces act at each point of the shell: normal forces N_x and N_y , shear forces N_{xy} , transverse forces Q_x and Q_y , bending moments M_x and M_y , and torques M_{xy} . transverse forces on the transition of the material to the plastic state are small, therefore often the plasticity condition connects only six of the eight listed forces and has the form [1]:

$$F_1(N_x, N_y, N_{xy}, M_x, M_y, M_{xy}) \leq K_1 \quad (1)$$

Where K_1 is a constant that depends on the flow rate of the material under simple tension (compression).

Equation (1) in the space of internal efforts N_x , N_y , N_{xy} , ..., M_{xy} . describes a closed convex hyper surface surrounding the origin. There are various kinds of specific conditions of yield (1) and variables N_x , N_y , N_{xy} , M_x , M_y , M_{xy} . are included in them, as a rule, in the second degree. The type of F_1 depends on the properties of the material, on the shape of the shell and other factors. An essential feature of the yield conditions (1) is that the function F_1 connects all six force factors.

In addition to the yield conditions of the type (1) and the theory of the limiting equilibrium of shells, such conditions have become widespread which relate only a part of the variables to each other, for example, [1]:

$$\begin{cases} F_2 (N_x, N_y, N_{xy}) \leq K_2 ; \\ F_3 (M_x, M_y, M_{xy}) \leq K_3 . \end{cases} \quad (2)$$

Or

$$\begin{cases} F_4 (N_x, N_y, N_{xy}) \leq K_4 \\ F_5 (M_x, M_y, M_{xy}) \leq K_5 \\ F_6 (N_{xy}, M_{xy}) \leq K_6 \end{cases} \quad (3)$$

Here K_1 , K_2 , ..., K_6 -constants.

From (2) and (3) it can be seen that instead of one condition (1) we obtain two or three conditions. In (2), only bending forces enter into two equations, respectively, and three equations (3) combine internal forces of the same directions. Instead of the regular "smooth" hypersurface (1), we now obtain the yield condition in the form of the intersection of two or three hyper surfaces. This condition is singular; it has edges and vertices.

Yield conditions of the type (2) or (3) are called "with partial interaction" yield conditions, in contrast to condition (1) with full interaction of all internal force factors.

Moving along the path (1) \rightarrow (3), one can obtain a condition of the form

$$N_x \leq K_1, N_y \leq K_8, \dots, M_{xy} \leq K_{12} \quad (4)$$

Assuming complete independence between the force factors in the limiting state. In the six-dimensional space of internal forces, condition (4) is met by a hyperparallelepiped.

The modern theory of the limiting equilibrium of shells allows the researcher to choose the yield condition in the finished form. Another possibility is to obtain this condition in the space of internal forces N_x , ..., M_{xy} , proceeding from the yield condition formulated in the expressions σ_x , σ_y , σ_{xy}

The transition from the stress space to the stress space is a rather difficult task, often impossible due to the impossibility of integrating the stress condition over the shell thickness.

There are various simplifying hypotheses and models, for example, a three-layer solid shell model, which allows one to obtain an acceptable solution in some cases. The content of this problem is beyond the scope of this dissertation work, therefore, here we will restrict ourselves

only to conclusions about the diversity and possible irregularity of the fluidity conditions, which should be analyzed.

As can be seen from the description of mathematical models of limiting equilibrium problems, equilibrium conditions play an important role in them. They are usually written in differential form [2]:

$$\left\{ \begin{array}{l} \frac{\partial N_x}{\partial x} + \frac{\partial N_{xy}}{\partial y} = 0; \quad \frac{\partial N_y}{\partial y} + \frac{\partial N_{xy}}{\partial x} = 0; \\ \frac{\partial^2 Z}{\partial x^2} N_x - 2 \frac{\partial^2 Z}{\partial x \partial y} N_{xy} + \frac{\partial^2 Z}{\partial y^2} N_y + \frac{\partial^2 M_x}{\partial x^2} - 2 \frac{\partial^2 M_{xy}}{\partial x \partial y} + \frac{\partial^2 M_y}{\partial y^2} - q = 0 \end{array} \right. \quad (5)$$

These are partial differential equations.

Since the goal of the solution is the definition in the final form of expressions for all internal efforts, the problem is reduced to integration (5). Instead of analytical methods, numerical methods are often used, and then they resort to some kind of discretization of relations (5) -wave or corpuscular.

For example, the transition from differential to algebraic relations is possible using finite differences.

Let us first consider a particular case without an instant problem statement. From (5) with $M_x = M_y = M_{xy} = 0$, we obtain

$$\left\{ \begin{array}{l} \frac{\partial N_x}{\partial x} + \frac{\partial N_{xy}}{\partial y} = 0; \quad \frac{\partial N_y}{\partial y} + \frac{\partial N_{xy}}{\partial x} = 0; \\ \frac{\partial^2 Z}{\partial x^2} N_x - 2 \frac{\partial^2 Z}{\partial x \partial y} N_{xy} + \frac{\partial^2 Z}{\partial y^2} N_y + q = 0. \end{array} \right. \quad (6)$$

where $Z(X, Y)$ is the equation of the median surface in Cartesian coordinates;

q is the intensity of the distributed load normal to the median surface.

Draw a regular grid with a square cell on the area occupied by the shell. For the node with the number i, j , we obtain from the first and second equations (6), using the one-sided differences

$$\begin{aligned} (N_x)_{i-1,j} - (N_x)_{i,j} + (N_{xy})_{i,j-1} - (N_{xy})_{i,j} &= 0, \\ (N_y)_{i,j-1} - (N_y)_{i,j} + (N_{xy})_{i-1,j} - (N_{xy})_{i,j} &= 0. \end{aligned} \quad (7)$$

In the third equation (6), the coefficients under the efforts N_x , N_y , N_{xy} are the curvatures of the middle surface, which are constant or varying from node to node. It is important to note that the system formed by the third equation (6) and equations (7) is an algebraic system of linear equations. Denoting the curvatures

$$K_x = \frac{\partial^2 Z}{\partial x^2}; \quad K_y = \frac{\partial^2 Z}{\partial y^2}; \quad K_{xy} = \frac{\partial^2 Z}{\partial x \partial y}$$

and moving on to dimensionless efforts

$$n_x = N_x N_0^{-1}; \quad n_y = N_y N_0^{-1}; \quad n_{xy} = N_{xy} N_0^{-1}; \quad N_0 = \sigma_0 k h,$$

h is the thickness of the shell, we obtain a system of linear equations for the mesh node with the number

$$\begin{aligned} (k_x n_x)_{i,j} - 2(k_{xy} n_{xy})_{i,j} + (k_y n_y)_{i,j} + q_{i,j} &= 0, \\ (n_x)_{i-1,j} - (n_x)_{i,j} + (n_{xy})_{i,j-1} - (n_{xy})_{i,j} &= 0, \\ (n_y)_{i,j-1} - (n_y)_{i,j} + (n_{xy})_{i-1,j} - (n_{xy})_{i,j} &= 0. \end{aligned} \quad (8)$$

An equation of the form (8) can be written for each node of the grid area.

In a more general case, that is, in the moment theory of shells, to represent the second derivatives of the moments in the third equation (5), we use the second differences. For a point with a number, we get

$$\begin{aligned} \frac{\partial^2 m_x}{\partial x^2} &= \Delta x^{-2} [(m_x)_{i-1,j} - 2(m_x)_{i,j} + (m_x)_{i+1,j}], \\ \frac{\partial^2 m_y}{\partial y^2} &= \Delta y^{-2} [(m_y)_{i,j-1} - 2(m_y)_{i,j} + (m_y)_{i,j+1}], \\ \frac{\partial^2 m_{xy}}{\partial x \partial y} &= \frac{(m_{xy})_{i-1,j-1} + (m_{xy})_{i,j} - (m_{xy})_{i-1,j} - (m_{xy})_{i,j-1}}{4\Delta x \Delta y}. \end{aligned} \quad (9)$$

Here ΔX , ΔY is the grid step in each direction, the quantities m_x , m_y , m_{xy} are dimensionless bending moments introduced by the formulas

$$m_x = \frac{M_x}{M_0}; \quad m_y = \frac{M_y}{M_0}; \quad m_{xy} = \frac{M_{xy}}{M_0}; \quad M_0 = \frac{\sigma h^2}{4}$$

Substitution of relations (9) into (5), replace the third equation with the corresponding algebraic expression. It is important to note here that all algebraic equations obtained by grid discretization are linear with respect to the efforts n_x , n_y , m_{xy}

Consider the $\frac{1}{4}$ part of the shell, square in plan. Figure 1 shows the finite difference mesh and the numbering of its nodes. Composing the equilibrium equations (5) in algebraic form, we take into account that (8) - the equilibrium equations must be made only for loose nodes of the shell. If we assume that the shell is supported on four sides, then the equilibrium equations will be compiled only for the internal nodes 1, 2 and 4. Since for each node we compose three equilibrium equations, we will get nine algebraic equations in total:

the symmetry conditions of the problem allow, when drawing up the equilibrium equations, to identify the nodes (Fig. 1 b) 2 and 7, 3 and 8, 9 and 5, as well as 7 and 10, 4 and 11, 2 and 13, 4 and 14, and due to this simplify equations noticeably;

- the conditions for fixing the edges allow you to immediately indicate the values of internal forces at the points of the mesh coinciding with the contour, for free feathering of the edges at

$$x=\pm a, N_x = 0, M_x = 0, N_y \neq 0 \text{ и м.н.}$$

$$y=\pm a, N_y = 0, M_y = 0, N_x \neq 0 \text{ и м.н.}$$

For definiteness, let the middle surface of the shell be an elliptic paraboloid

$$Z = \frac{f}{2a^2} (x^2 + y^2) \quad (10)$$

where $2a$ is the size of the shell side in plan; f -boom lift.

Calculating the curvature of the middle surface, we find

$$K_x = \frac{\partial^2 z}{\partial x^2} = \frac{f}{a^2},$$

$$K_y = \frac{\partial^2 z}{\partial y^2} = \frac{f}{a^2}, \quad (11)$$

$$K_{xy} = \frac{\partial^2 z}{\partial x^2} = \frac{f}{a^2} = 0.$$

In order to construct a promising procedure for calculating the bearing capacity of rigid-plastic shells based on linear software methods, it is necessary to obtain linear approximations in the form of bodies bounded by sections of hyperplanes (polyhedrons) instead of curvilinear yield conditions. The problem of such linearization contains the following aspects.

Fig.1

1. The linearization technique should be suitable for both regular and piecewise regular surfaces.
2. In order to control the details in the approximation of hypersurfaces by polyhedra, it is necessary to construct both inscribed and described ones each time.

3. The size of the problem, the amount of computation and computer time per metro depend on their number of polyhedron faces and increases sharply with an increase in their number. Therefore, the question arises about the choice of the optimal number of faces, which allows you to obtain the specified accuracy of calculations for unnamed time spent.

So, we have the coefficient of the faces of the secant or tangent polyhedra, which is the elements of the main matrix - the matrix of the plasticity condition in the linear programming problem, which in turn calculates the lower bound for the carrying capacity of the covering shells. The calculated results are shown in Fig. 2.

Fig.2

This approach makes it possible to consider from the same positions not only regular, but also piecewise smooth flow conditions, for example, conditions with "limited interaction" (3).

THE PROBLEM OF HOMOGENEOUS AND WELL - KNOWN NOUNS IN ONOMASTICS

Turdibekov Mominjon Turaevich*

*Associate Professor,
Candidate of Philological Sciences of Tashkent State University of Uzbek Language,
Literature named after Alisher Navoi,
UZBEKISTAN

ABSTRACT

We know that onomastics is taking shape as a special branch of linguistics within lexicology, and that onomasiological scientific thinking is important in the formation of a semantic structure, and it provides information on how to name a concept that has emerged in our minds. The first stage in the formation of existing words and terms in a language is the onomasiological process. This process is always addressed, and at the same time it is important to understand the identity of the nation.

KEYWORDS: *Onomastics, Lexicology, Nickname, Cognatename, Toponym, Anthroponym, Hydronym, Oykonim.*

INTRODUCTION

Man recognizes and studies the phenomena of the external world, perceives some of their internal and external features, and on this basis gives them human rights - form. In this, the phenomena of existence are partially felt.

Because man is not able to perceive every event and all its features in a comprehensive way at once, a complete understanding of things and all their characteristics involves several stages in the development of human thought [1].

It is well known that at the onomasiological level, scientific thinking moves from meaning to form, talking about how to call a concept that has emerged in the mind. The first stage in the formation of existing words and terms in a language is the onomasiological process. Especially in the current context of the collapse of the former Soviet Union, the realization of the identity of

national peoples, the nomenclature, abnormal naming of places, the reconsideration of some of the resulting toponyms, the renaming of some concepts, the national identity of children.

There is a need for this process when choosing a traditional name. Therefore, onomasiological research has become of great theoretical and practical importance these days.

MATERIALS AND METHODS:

The fact that the branch of onomasiology called onomastics is now considered as a separate branch of linguistics within the scope of lexicology is of great scientific and theoretical importance. Onomastics is a branch of lexicology that deals with the art of naming. From the modern point of view of linguistics, this aspect has the status of an independent branch of linguistics. This section explores the famous horse system, also known as the term mother. Until the 1960s and 1970s, the term onomastics was used to refer to a system of human names.

In writing this paper, we used a wide range of inductive and deductive methods to compare and summarize a wide range of scientific data.

We have also studied the work of many scholars to analyze the roots of ancient lexicology. For example, we have studied the work of Lebedeva (1952), Hasanov (1953), Ripetskaya (1954), Miroslovskaya (1955), Podolskaya (1956), Mikhailov (1956), Mitrafanova (1958), Superanskaya AV and a number of other scientists.

Result:

In the course of this research, we have obtained a number of unique analytical results. Onomastics is a unique heterogeneous system with a number of homogeneous tags. In particular, anthroponymy, toponymy, zoonymy, astroponymy and others [2].

In addition, onomastics includes real names that represent the real names of real concepts in nature and society, as well as famous names of non-real life concepts - mythonyms.

Famous names studied in the field of onomastics have an invaluable pragmatic convenience. Their invaluable pragmatic convenience is that famous horses create a universal opportunity for a person to exist or a natural-geographical object without prior agreement [3;4;5;6].

Fundamental research in the field of onomastics in the linguistics of the former Soviet Union began to emerge in the 1940s. In the 1950s, a number of works on toponymic characterization emerged. The dissertations of Konkashpayev (1948), Lebedeva (1952), Hasanov (1953), Abdurahmonov (1954), Ripetskaya (1954), Miroslovskaya (1955), Podolskaya (1956), Mikhailov (1956), Mitrafanova (1958) are among them.

In 1958, Superanskaya's study of general issues of onomastics was published. A number of dissertations on onomastics have been written in Turkology, mainly since the 1950s. They can be grouped thematically as follows: 1) Toponymic research (Ph.D. dissertations by K. Abdimuratov, R. M. Yuzboshev, A. Abdurahmanov, S. Otaniyozov, D. Isayev); 2) Anthroponomic research (Januzakov's candidacy); 3) Research on hydrominic characteristics (A. Kamolov's dissertation).

Uzbek onomastics has had a "foundation" since the 1960s. In this regard, E.A. Begmatov has a remarkable service. He is one of the first scientists in the field of Uzbek scientific anthroponymy.

The scientist has published a number of scientific works on Uzbek onomastics.

It was also mentioned above that onomastics is taking shape as a special branch of linguistics within the scope of lexicology. Each linguistic field, which gains the right to independence, independence, has its own theoretical issues. When approached from the perspective of the problem, onomastics also has its own theoretical issues that determine its position and status. One of these issues is the relationship between common nouns and the basic unit of vocabulary - common words, related names. Onomastics studies nouns. The types of nouns that are considered onomastic units are different.

It ranges from very simple words that can be understood by those who speak the language, to the most complex ones, the meaning of which is difficult for even the most intelligent linguists to know, and which language the name belongs to. At all stages of development of any language, in the process of naming a subject or object, the names of sometimes modern, sometimes already historical treasures, sometimes imaginary persons, objects are chosen. This is due to the fact that the basic unit of onomastics is the composition of the elements. A famous horse is different from a famous name concept. Famous names may not be famous horses, they may be related horses. In particular, while toponyms, anthroponyms, hydronyms, oykonims, oronyms, and urbonyms are also well-known names, some realonyms, especially ethnonyms, cannot be included in well-known names [7;8].

Famous names are the basic lexical unit of onomastics. It is universally acknowledged. Related names are a lexical unit of the general lexicon of a language. This feature of related names is also widely recognized.

One of the main divisions of the lexicon of any language is the grouping of words in any language. Both groups of words have their own purpose and function. Related horses organize a series of names. Names organized into a category are linked based on common characteristics. Such names represent a generalized representation of objective phenomena. Pronouns are used to name certain objects that belong to a certain group of objective beings.

In addition, Mill admits that famous horses are illegal. Although they name objects, they do not embody any of their properties. Well-known names are related to the concept of individual objects and do not provide any confirmation or denial of them. Therefore, such horses are not translated, nor are they given a superlative name by means of figurative expressions. Mill points out that famous names are like chalk marks on houses. These characters have a purpose, but they don't make sense. The purpose of the names is to denote denotation. Logically, if there are no single objects, there will be no proper names to express them in speech. Unlike famous horses, an object named after a similar horse is vague and unrestricted.

An object named after a famous horse is always clear and strictly limited to others. There is no similarity in science between the name and the common word, that is, the relationship between the common name and their dimension. This is confirmed by some evidence in Russian linguistics. For example, VD Bondaletov's monograph "Russian Onomastics", published in 1983, elaborates on the differences between famous and related names. We find it necessary to quote the views of the three great Russian scholars mentioned in that play, and thus to emphasize the diversity of attitudes to the subject [9;10].

Russian onomasiologist A. A. Beletskaya connects the difference between famous and related horses with differences in their characteristics.

It is acknowledged that atoklinoms act as individualizers as the names of individual events, while cognate words serve as classifiers. The former separates the events of some object in a class, a gang, from the events of another object of the same class in the same class, the latter by combining an event and an object with another object or event of the same sex. shib stands.

Another Russian nominee, A. V. Superanskaya, tries to distinguish well-known names from similar names based on their three characteristics. According to the scientist, there are three signs for related words in well-known names.

Famous names are not given for gangs or groups, but for a particular group or individual. A well-named object does not have the same characteristics as the group to which the object belongs, or other objects in the group.

As the name implies, the event is always clearly demarcated:

A noun does not have a concept, it is not associated with any concept, it does not have a clear and specific connotation specific to the level of the language. According to the scientist A famous name is not connected with a concept. It is in close contact with a specific object in a single description.

V.A Nikonov distinguishes a well-known name from a similar one on the basis of another feature. He uses the 'social stamp' on famous names to distinguish them from related horses.

In the monograph "Essay on the General Theory of Famous Names" published in 1973 by the Polish linguist E. Grodzinski, onomastic units are characterized by similar names: 1) one-syllable; 2) multi-design; 3) think of groups as empty (empty) design. This scientist also admits that the name cannot be directly related to certain specific concepts.

There is another difference between a noun that is a unit of onomastics and a common word: a noun always belongs to the noun category, which is a characteristic of all nouns.

Ordinary words that are not considered onomastic units may or may not belong to the horse family. But the important thing is that in the formation of the well-known name - onomastic units, related names play the role of the base. Because all famous horses are based on the material of the soil of related horses. The naming of names is a post-period phenomenon. There is another reason why famous names belong to the category of horses: when words belonging to another category without a name also become an onomastic unit, it moves to the horse, regardless of which word group it belongs to. For example, Bought (verb) - Sotvoldi (horse), sharp (adjective) - Sharp (horse), beautiful (adjective) - Beautiful (horse), eighty (number) - Eighty (at) and so on. At the same time, it is necessary to clarify the question of whether the onomastic unit always belongs to the famous horse. No, onomastic units can also be related to a horse. For example, Uzbek, Tajik, Russian, Kyrgyz, and Kazakh ethnonyms are onomastic units, but they are not nouns. So there is a difference between a famous horse and a famous name. The famous name is a unit of onomastics. Famous horses are onomastic units written in capital letters. Famous horses are a wide range of concepts: they include horses that are written in lower case.

It should be noted that just as famous horses with "invaluable pragmatic convenience" (Dj. Siril) originated on the land of related horses, there are also cases of famous horses switching to related horses: "Some signs of denotation" "If the relations between the features remain common

and stable, the nouns become related names, that is, the nouns belong to the generalized concept, which includes all the objects to which it belongs”.

DISCUSSION:

A.V. When Superanskaya writes about controversial issues of onomastics, they include, among other things, the current problems of Uzbek onomastics.

1) Current and historical aspects of onomastics: 2) real and life names: 3) names that are understandable and incomprehensible to language owners: 4) name issues in language and speech: 5) names in literary language and specific to regional and social groups [11].

Only when these problems are solved together will it be possible to talk about the semantics of nouns and begin to develop a general theory of onomastics. Currently, Uzbek onomastics is studied in the following areas: 1. General theoretical issues of onomastics (theoretical onomastics): 2. Problems of onomastic names and terms used in our classical literature, artistic onomastics (poetic onomastics): 3. Spelling of famous horses , naming problems (practical onomastics).

These three branches of Uzbek onomastics are so interconnected that one of them complements the other, and one of them is inseparable from the other. In particular, onomastic terms used in classical sources serve as a reliable linguistic object in the knowledge of the history, culture, psyche, spiritual world, way of life of the people - their level [12;13].

CONCLUSION:

In short, it is obvious that the study of historical onomastics is possible only through the study of scientific, philological and artistic works of historical classification. The lack of historical development of Uzbek onomastics has caused concern among many scholars.

Concerned that this important and topical issue was not included in the study, B. Bafoev wrote: “In the history of the Uzbek language, there is almost no research on words on onomastics in written sources. Personal names and place names, like other groups of words in the language, should be checked phonetically, morphologically, lexically and semantically. However, in the modern Uzbek language there are no works that have studied linguistics in detail. There is still no scientific literature on the names of people used in Uzbek written monuments.

The number of stages in the study of names in the history of the Uzbek language must be determined. In time, it is possible to support the views of scholars dealing with onomastics that the onomastic lexicon of the language of historical works is an undiscovered reserve of Uzbek historical lexicology. Their study is of great historical, geographical, historical-ethnographic, historical-enlightenment and historical-linguistic significance. Indeed, many current problems of Uzbek historical nomenclature await their researchers." Undoubtedly, every effort in this direction can be a good thing for the development of Uzbek linguistics.

Since the 60s of the last century, Uzbek anthropology has made significant progress. Monographs and a number of articles by E. Begmatov (1965), G. Sattorov, S. Rakhimov on the study of Uzbek anthroponymy, and on the organization of the system of Uzbek toponymy and ethnonymy by A. Ishayev, H. Hasanov, Kh. Doniyorov, B. Orinboyev, S.Qorayev, T.Nafasov, Z.Do`simov, Y.Khojamberdiyev, J. Latipov, Sh.Qodirova, L.Karimova, N.Oxunov, T. Rahmatov, S.Nayimov , H. Kholmuminov, A. Otajonova, A. Turobov, T. Enazarov's

monographs and numerous articles appeared. In addition, many linguists have to some extent touched upon the field of Uzbek onomastics.

Our observations show that almost all the works on Uzbek nomenclature are devoted to the study of modern Uzbek language and famous horse materials in its dialects and dialects, and almost all works on Uzbek historical onomastics. not done.

ABSTRACT

The article examines the origin, clinical course, treatment and prevention of colitis. The arsenal of specialists includes our own modern diagnostic laboratory, the latest examination methods and extensive experience in the effective treatment of diseases. See your doctor in time to avoid complications, learn more about the prevention, diagnosis and treatment of chronic colitis.

KEYWORDS: *Colitis, Disease Symptoms, Diagnosis And Treatment, Prevention And Prognosis.*

INTRODUCTION

Chronic colitis is a disease localized in the colon. This is an inflammation of the mucous membrane, which is accompanied by characteristic symptoms - diarrhea, pain, constipation, rumbling, excessive gas formation. This is one of the most common diseases of the digestive system, affecting mucous, sub mucous and muscle tissues.

Causes and risk factors

Chronic intestinal colitis can be triggered by a number of reasons:

- Improper nutrition is the most common cause of the onset of the disease. Monotony, a minimum of vitamins, a lot of proteins and carbohydrates, little fiber - all these are factors that can affect the development of pathology.
- Low mobility, alcohol consumption.

- Diseases of the stomach and digestive system as a whole - gastritis, pancreatitis, enteritis, cholecystitis, as a result of which food is improperly processed by enzymes.
- Consequences of acute intestinal infections, worms and other parasites.
- Impaired bowel function, including congenital.
- Consequence of taking drugs that affect the intestinal environment.
- Exogenous intoxication with mercury, arsenic, phosphorus salts, lead.
- Endogenous intoxication caused by uremia, hyperthyroidism.
- Liver failure.
- Exposure to radiation, radiation therapy.
- Atherosclerosis - causes ischemic colitis in older patients.
- In women during pregnancy.
- After

Most of the mentioned risk factors are united by impaired digestion of food, as a result of which the multiplication of pathogenic bacteria is accelerated. The process of assimilation of the basic elements from food is disrupted, and dysbiosis begins.

Symptoms of the disease

- The emergence and exacerbation of chronic colitis in adults and children is characterized by a number of signs:
 - First of all, the manifestation of the disease is pain of a spastic aching nature. Often localization is the left iliac region, stomach. On examination, the doctor determines the enlarged areas of the rectum. The pain becomes more pronounced after eating and goes away after a bowel movement and flatulence.
 - Problems with stools - often with constipation and faeces that are fragmented and covered with mucus or diarrhea. There is also "obstructive diarrhea" - the release of liquid feces after a portion of the normal.
- Pain with the urge to empty the bowels.
- Bloating, rumbling, flatulence.
- Colitis types
- Colitis classification depending on the main symptom:
- According to the etiology of occurrence, the following types are distinguished:
- 1. Primary:
 - ◦ Infectious - caused by pathogenic fungi.
 - ◦ Toxic - chemical intoxication.
 - ◦ Parasitic - caused by parasites.

- Allergic - a reaction to drugs or food.
- Radiation.
- Lymphocytic, collagenous and others - etiology is still unknown.
- Mechanical - a consequence of multiple constipation.
- Medication - a reaction to taking antibiotics and other medications.
- 2. Secondary - is a consequence of other diseases, how to treat it depends on the circumstances that provoked the disease.
- Ulcerative colitis is most likely due to allergies. It rarely manifests itself and passes with inflammation and the formation of necrotic ulcers.
- Diagnostics
- Chronic colitis is detected by the following stages of the examination:
 - Coprological studies - analysis of feces in order to determine the quality of metabolic processes and the state of the digestive system as a whole. Signs of colitis are usually white blood cells and red blood cells in the test samples, as well as mucus in large quantities.
 - Irrigography or X-ray of the intestine to determine the localization of the disease, assess the state of the mucous membrane, determine dyskinesia.
 - Sigmoidoscopy and colonoscopy are important studies to help diagnose catarrhal and atrophic changes in the colon.

Chronic colitis treatment

The chosen treatment depends on the patient's condition, the exact diagnosis. If it is possible to treat a patient on an outpatient basis, he does not need to be in the hospital. The treatment regimen depends on which doctor is treating and how serious the situation is.

First of all, it is important to follow the diet. The patient receives recommendations on the menu, a list of what not to eat, advice on diet. The basic rule is fractional meals only with permitted foods. In the stage of exacerbation of the disease, work related to business trips and interfering with the observance of the correct daily routine is prohibited.

Compliance with the diet is complemented by medication and pain pills. Usually these are antibacterial agents, vitamins, enzymes, sorbents, decoctions and herbal tinctures. Physical therapy also has a beneficial effect on the healing process. These are electrophoresis, amplipulse, diadynamic currents, **and acupuncture**.

Possible complications

In case of untimely or incorrect treatment, as well as non-compliance with the recommendations, the patient runs the risk of getting:

- Intestinal bleeding.
- Perforation of the ulcer.

- The appearance of adhesions.
- Diverticulitis
- Intestinal obstruction.

Which doctor to contact

When the first warning signs appear, you must make an appointment with a gastroenterologist. Treatment of chronic colitis in the acute stage in a hospital requires an appointment with a proctologist. Better doctor's proctologists in Moscow are available in the clinic of the Central Clinical Hospital of the Russian Academy of Sciences. The arsenal of specialists includes our own modern diagnostic laboratory, the latest examination methods and extensive experience in the effective treatment of diseases. See your doctor in time to avoid complications, learn more about the prevention, diagnosis and treatment of chronic colitis.

ABSTRACT

The economic description of the foreign textile enterprise is given in the analysis of a condition of use of the basic production capacities and the analysis of a condition, movement of a fixed asset in the foreign enterprise "POSCO International Textile" and level of fixed assets of the enterprise. The level of formation and effective use of working capital in the enterprise was assessed. The impact of the efficiency of fixed assets and working capital on foreign enterprises on the competitiveness of the industry, the improvement of the process of commissioning and use of fixed assets at the enterprise and the effective use of working capital of the enterprise were discussed.

KEYWORDS: *Foreign Enterprises, Textile Enterprise, Fixed Assets, Working Capital, Intangible Assets, Capital Investments.*

INTRODUCTION

In the context of economic liberalization, fixed assets play a key role in all factors that increase production efficiency and ensure economic growth.

On the scale of the whole national economy, fixed assets constitute the national wealth of the country. The term fixed assets of an enterprise can also be used in practice and in the literature with the term “fixed assets” or “fixed capital”.

In the process of production, the workers of the enterprise use the means of labor to influence the objects of labor and turn them into finished products.

The main feature of enterprises is the availability of property belonging to them. This is what determines the material and technical capabilities of enterprises and ensures their economic freedom and future. No enterprise can carry out its economic activities without the use of certain property.

Enterprise property can be divided into current assets and long-term assets. This takes into account not only the social appearance of the enterprise property, but also the role, importance and impact on the economy of the enterprise in the production process.

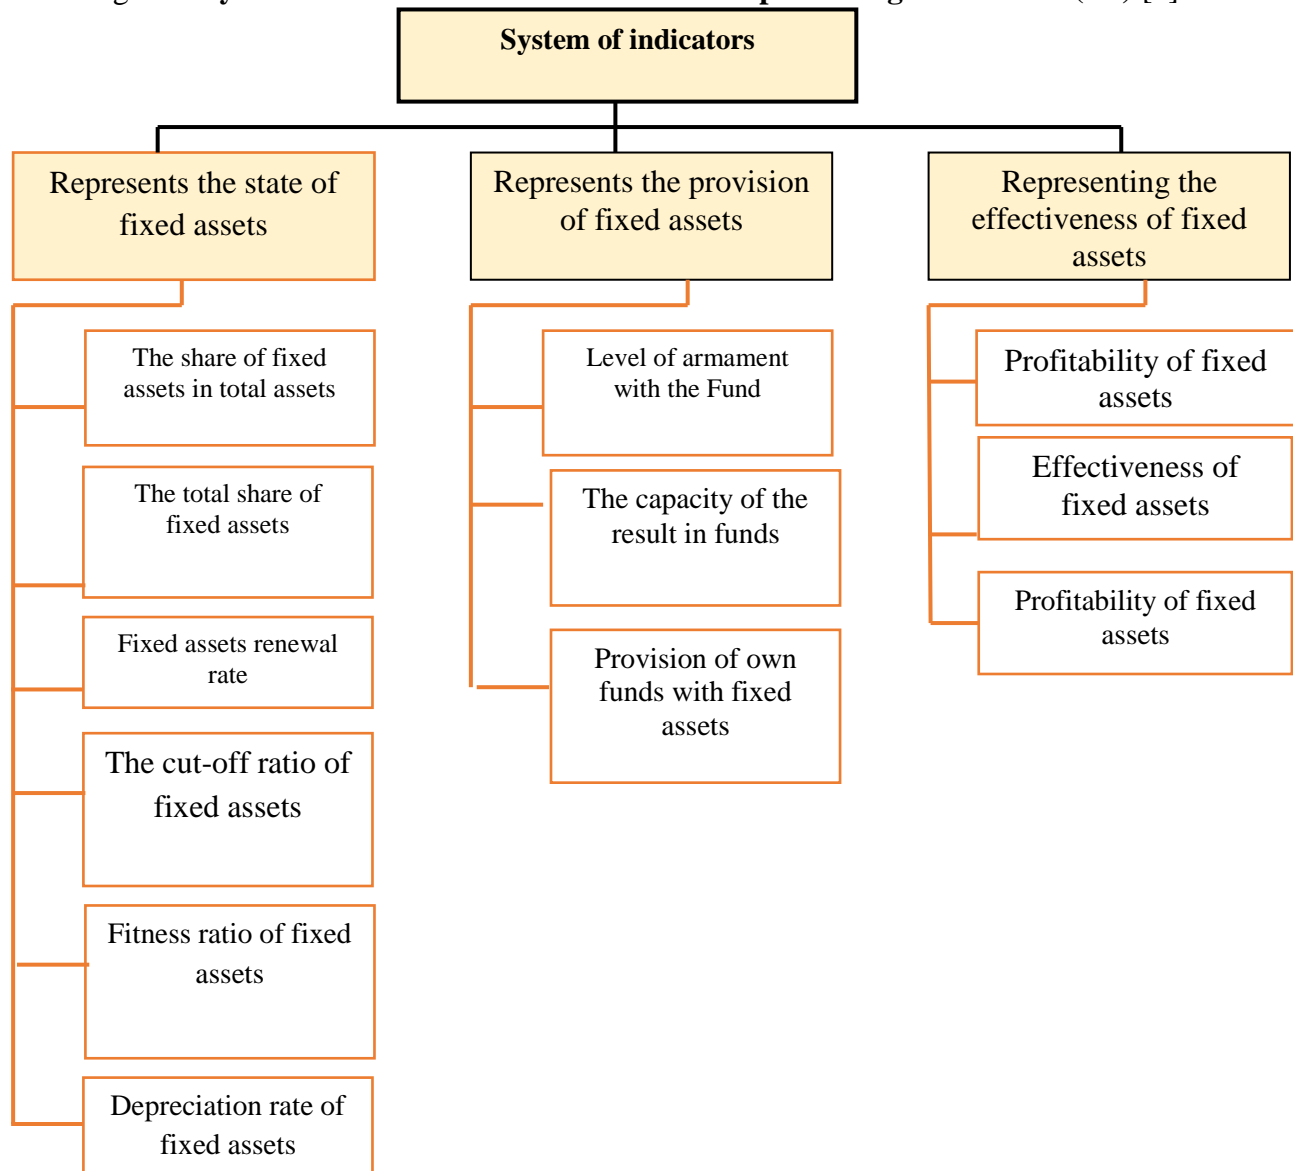

Long-term assets account for 65-85% of the assets of large and medium-sized enterprises. Structure of long-term assets [1]:

1. Fixed assets
2. Intangible assets
3. Capital investments
4. Long-term financial investments

Long-term assets are involved in the economic activities of the enterprise for a long period of time. This is due to the duration of the depreciation process and the slowness of the rotation speed. Therefore, they are called long-term or slow-moving assets. They are also called immobilization funds.

Fixed assets (fixed assets) are not only means of labor, but also the material wealth of enterprises. It has value, so it can be mortgaged as property. In addition, if the company does not have enough funds to repay the debt at the time of liquidation, it is possible to repay the debt by selling this real estate. The main means is the wealth of the property owner. The state and the enterprise are interested in their effective use. Because the financial result of the enterprise increases with the effective result. He pays tax on income.

Figure 1 System and classification of indicators representing fixed assets (Av) [2]

We begin the analysis of fixed assets at the foreign company POSCO International Textile by studying the composition, structure and dynamics of fixed assets (fixed assets). Changes in the composition of fixed assets occur throughout the year. Therefore, it is necessary to analyze in detail the structural changes in their composition.[5]

Indicators representing fixed assets have a certain place among the indicators of economic potential. Significant funds of business entities will be involved in these funds. The return of these funds will be made through the efficient use of fixed assets [2].

Indicators representing fixed assets are divided into three groups: indicators of the state of fixed assets, indicators of the availability of fixed assets, indicators of the efficiency of fixed assets. The classification of this group of indicators is shown in the following diagram (Figure 1).

The ways to determine the indicators representing the condition of fixed assets are given in the table below (Table 1).

TABLE 1 INDICATORS OF THE CONDITION OF FIXED ASSETS [2]

	ame of indicators	What does it mean (content)	Determination formula
1.	The share of fixed assets in total assets	Indicates the percentage of fixed assets in total funds	Av / B
2.	The structural structure of the active part of fixed assets (Avf)	Represents the percentage of the active part of fixed assets in the total amount of fixed assets	Avf / Av
3.	Renewal ratio of fixed assets	This represents the share of new fixed assets in total fixed assets at the end of the year	$Av.yang / Av.b.q.yo$
4.	Depreciation rate of fixed assets	Represents how much of an item of property, plant and equipment is written off	$Av.chiq. / Av.b.q.yb$
5.	Fitness ratio of fixed assets	Represents how much of the value of total fixed assets is in residual value	$(Av-Av.esk.) / Av$
6.	Depreciation rate of fixed assets	Indicates how much of the total value of fixed assets is equal to the amount of depreciation	$Av.es / Av.yb$

We begin the analysis by finding the coefficients shown in the table, using a table based on the balance sheet of the foreign company POSCO International Textile (Table 2).

TABLE 2 ANALYSIS OF THE PROPERTY STATUS OF POSCO INTERNATIONAL TEXTILE LLC [3]

Indicators	Beginning of 2018 y		At the end of 2018 y		Difference	
	Amount, mln. sum	Amount, %	Amount, mln. sum	Amount, %	Amount, mln. sum	Amount, %
Total property	525 638,33	100	574 417,37	100	48 779,04	-
Including: 1. Long-term assets	309 254,83	58,83	308 142,67	53,64	-1 112,16	-5,19
Including, A) Fixed assets (at residual price)	195 464,94	63,21	210 038,50	68,16	14 573,56	4,96
B). Others	113 789,89	36,79	98 104,18	31,84	-15 685,71	-4,96
2. Current assets (current assets)	216 383,50	41,17	266 274,69	46,36	49 891,20	5,19
Including A)Reserves and expenses	133 138,86	61,53	191 612,66	71,96	58 473,81	10,43

B) Cash	42 695,92	19,73	37 358,17	14,03	-5 337,74	-5,70
C) Accounts receivable	40 548,73	18,74	37 303,86	14,01	-3 244,87	-4,73

According to Table 2, the company's economic assets amounted to 48779.04 mln. sums. At the beginning of the reporting year, the share of long-term assets in total assets was 58.83%, while current assets were 41.17%. The share of fixed assets in long-term assets was 63.21%, and the share in total assets was 37.19% ($195464.94 : 525638.33 * 100$). By the end of the reporting year, the share of fixed assets in long-term assets increased by 4.96% to 68.16%. The share of fixed assets in total property at the end of the reporting year was 36.57% ($210038.5 : 574417.37 * 100$), the share of decrease was 0.62% ($36.57 - 37.19$). This information can be more accurately represented by the following diagram (Diagram 1).

Diagram 1 POSCO International Textile's share of fixed assets in total assets [3] (2018)

cash flow

at the end of the year

debtor debts

in the beginning of the year

From the data of Diagram 1, it can be seen that the amount of reserves and expenses at the enterprise by the end of 2018 increased by 10.43% compared to the beginning of the year and amounted to 191,612.66 mln. sums. This leads to the stagnation of working capital in warehouses, a decrease in the turnover rate of working capital. [6]

The share of each type of fixed assets in total fixed assets represents its structure. The structure depends on the nature, nature, level of specialization, technology of production. In the analysis of the structure, attention is paid to the ratio of active (active) and passive parts of fixed assets. Production capacity depends in many ways on the active part of fixed assets. Their passive part is not inextricably linked with production, they only create conditions for production.

There is no definite conclusion about the active part of fixed assets in the literature on economics. One group of economists includes total fixed assets in addition to buildings and structures, the second group includes machinery and equipment, vehicles. Buildings and structures are part of the passive part of fixed assets, but facilities in the fields of electricity, oil refining, gas and others are included in the active part. Thus, the active part of fixed assets can include machinery and equipment, computer equipment and computers, vehicles.

The higher the active part, the more progressive the fund. The statement of fixed assets in the report on the movement of fixed assets (Figure 3), the representation of information on long-term leased fixed assets further expands the object of complex economic analysis of fixed assets.

Below, by analyzing the structure and dynamics of the fixed assets of a foreign enterprise, we can see the change in the active and passive part of fixed assets.

TABLE 2 ANALYSIS OF THE STRUCTURE AND DYNAMICS OF FIXED ASSETS AT POSCO INTERNATIONAL TEXTILE [3]

Indicators	In the beginning of 2018 year		At the end of 2018 year		Change	
	Amount, mln. sum	Share, in percent	Amount, mln. sum	Share, in percent	Amount, mln. sum	Share, in percent
Total fixed assets	644 557,06	100	657 078,23	100	12 521,17	-
Including:						
Active part	625621,80	97,06	636 491,97	96,87	10 870,17	-0,19
Passive part	18 935,26	2,94	20 586,26	3,13	1651	0,19

From the data in Table 2, it can be seen that the total value of fixed assets increased from 644557.06 million sums at the beginning of the year to 657078.23 million sums by the end of the year. sums and amounted to 12521.17 mln. increased by UZS. Its active part was high weight (96.87%), an increase of 0.19% compared to the beginning of the year, while the share of liabilities decreased by 0.19% during the period under review.

We use the following data to calculate and analyze the indicators related to the movement of fixed assets (Table 3).

TABLE 3 FIXED ASSETS MOVEMENT AT POSCO INTERNATIONAL TEXTILE IN 2018 [3] (MILLION SUM)

Indicators	Residue at the beginning of the year	input	output	At the end of the year
Fixed assets (initial value)	606 836,44	50 671,78	429,99	657 078,23
Including:				
New fixed assets		50 671,78		
Depreciation of fixed assets	411 371,5			447 039,73
Residual value of fixed assets	195 464,94			210 038,5

Based on the data presented in Table 3, we determine the following coefficients representing the movement of fixed assets.

The replacement rate of fixed assets (Kyang) is determined by the following formula as the ratio of new fixed assets to the initial value at the end of the year:

$$K_{yang} = Av.yang / Av.b.q.yo. * 100$$

That is,

$$K_{yang} = 50\,671.78 : 657\,078.23 * 100 = 7.71\%$$

where: Av.yang - the amount of newly arrived fixed assets; Av.b.q.yo - the initial value of fixed assets at the end of the period;

The depreciation rate of fixed assets (Kchiq) is determined by the following formula as the ratio of fixed assets written off during the year to the initial value at the beginning of the year:

$$K_{chiq} = Av.chiq / Av.b.q.yb * 100$$

That is,

$$K_{chiq} = 429.99 : 606\,836.44 * 100 = 0.07\%$$

where: Av.b.q.yb - the initial value of fixed assets at the beginning of the period;

Av.chiq - fixed assets written off during the reporting period.

As a result of the following business operations, fixed assets are excluded from the assets of the enterprise:

- when realized;
- due to the inexpediency of further use;
- free transfer to foreign enterprises and individuals;
- contribution to the charter capital of other enterprises as a share;
- when transferred under a financial leasing agreement;
- when a deficit or loss is detected.

Updating the product range, raising its quality to the level of demand, increasing labor productivity, reducing costs require constant equipment of production with new equipment.

$$\text{replacement coefficient: } (K_a) = Av. \text{ output} / Av.kel * 100,$$

That is

$$K_a = 429.99 : 50\,651.78 * 100 = 0.85\%$$

Machine and equipment fleet expansion coefficient (Kk): $100 - 0.85 = 99.15\%$

The technical condition of fixed assets is represented by the following indicators:

- suitability coefficient;
- wear coefficient.

The coefficient of suitability of fixed assets (Kyar) is determined by dividing their residual value by the initial value (Table 4).

TABLE 4 ANALYSIS OF THE USEFUL LIFE OF FIXED ASSETS AT POSCO INTERNATIONAL TEXTILE [4] (MILLION SUM)

	Indicators	beginning of the 2018 year	At the end of the 2018 year
1.	The initial value of fixed assets	606 836,44	657 078,23
2.	Depreciation of fixed assets	411 371.5	447 039,73
3.	Residual value of fixed assets (1-2)	195 464,94	210 038,5
4.	Fitness ratio of fixed assets (3/1*100)	32,21%	31,97%

From Table 4, the suitability ratio can be determined for each type of fixed assets, including total fixed assets, including fixed assets. The level of usability of fixed assets at the enterprise decreased from 32.21% at the beginning of the year to 31.97% at the end of the year.

Depreciation rate of fixed assets (Kesk) is determined by the ratio of the amount of depreciation to the initial value of fixed assets (Table 5).

From the data in Table 5 it is possible to estimate the renewal of fixed assets, the useful lives of fixed assets by studying the dynamics of the level of depreciation of fixed assets.

TABLE 5 ANALYSIS OF THE DEPRECIATION RATE OF FIXED ASSETS AT POSCO INTERNATIONAL TEXTILE, [4] (MILLION SUM)

T/p	Indicators	The initial value of fixed assets	Depreciation of fixed assets	Depreciation factor, % (4/3*100)
1	2	3	4	5
2	The beginning of 2018	606 836,44	411 371.5	67,79
3	The end of 2018	657 078,23	447 039,73	68,03
4	Change (3-2)	50 241,79	35 668,23	0,24

Depreciation rate depends on the methods of calculating depreciation allowances, changes in the composition of fixed assets, depreciation rates. The level of obsolescence at the enterprise under analysis increased from 67.79% to 68.03%, while its serviceability decreased from 32.21% to 31.97% per year.

The structure of fixed assets is determined by the specialization of the industry and reflects the characteristics of production and maintenance of the enterprise. It depends on the total amount of fixed assets of the enterprise and the volume of non-production, assets and liabilities, as well as their changes and dynamics during the year.

A sharp increase in the initial value of fixed assets relative to the residual value indicates an increase in depreciation in the coefficients and a decrease in their suitability, i.e. a deterioration in condition.

The sharp increase in the residual value relative to the initial value indicates that the fixed assets have been updated, their depreciation has been reduced. One way to reduce obsolescence, that is, to improve the condition of fixed assets, is to make timely capital repairs, purchase new ones, as well as write off obsolete equipment. This measure should be taken into account in the context of free market relations.

The availability of fixed assets is a measure of the technical support of the enterprise, the mechanization and automation of labor and work. These indicators can be used to determine the level of material and technical base of each enterprise. As a result, these indicators are key indicators (Table 6).

The indicators in Table 6 are determined by the example of a foreign company POSCO International Textile.

1. The degree of armament with funds is the ratio of the value of fixed assets (according to initial estimates) to the number of workers in the largest shift. It reflects the level of provision of workers with tools (fixed assets) and is determined by the following formulas:

$$Kf.t = Av.f / Is = 636491.97 : 1100 = 578.63$$

where: Kf.t - coefficient of provision of employees with fixed assets; Av.f - value of fixed assets; Work is the number of workers in the largest shift.

Data are obtained from Figure 3 financial report and Form 1-T statistical report for analysis.

Production at the foreign company POSCO International Textile is carried out in 3 shifts 24 hours a day. There is also a day shift. The total number of employees is 3942 people, the largest shift employs 1100 people.

2. The maintenance ratio (Kt.t) is calculated as the ratio of the amount of production equipment (i.e the active part of fixed assets) to the number of workers in the largest shift and is determined by the following formula:

$$Kt.t = I.us / Is = 524513.04 : 1100 = 476.83$$

where: Kt.t - coefficient of technical support; I.us is the sum of production equipment.

TABLE 6 INDICATORS OF THE AVAILABILITY OF FIXED ASSETS (AV.) [3]

Indicators	What does it mean (content)	Determina tion formula
1. With funds degree of armament	Active Av. Corresponding to one employee. represents the value of	$Av.f/Is$
2. Technical support percentage (Kt.t)	The ratio of the amount of production equipment to the number of workers in the largest shift	$I.us / Is$
3. Funding level of the result (Fund capacity)	How much is Av 1 for the result indicator? indicates that the sum is correct	$Av./Q$
4. Provision of own funds (Um.) With fixed assets	How much is 1 sum Av. represents the amount of capitalization or the degree of capitalization of own funds	$Av./Om$

3. The stock capacity of the product indicates how much the amount of fixed assets corresponds to the result of 1 sum and is determined on the basis of the following formula:

$$Fc = Av./ Q = 650817.65 : 955697.48 = 0.68$$

$$Fc = Av./ Q = 639557.03: 778521.37 = 0.82$$

Fund capacity is inextricably linked with saving or increasing capital investment. For example, when the stock capacity of a product decreases and its production volume is constant or growing, the conditions for the use of fixed assets improve, which means that there is an opportunity to save capital investment. The following formula is used to find it:

$$Ek = Fc.o'zx Q = (0,82-0,68) \times 955697,48 = 133797,65$$

Here: Ek - capital investment savings, sums; Fc.oz - change in stock capacity of the product in the reporting year compared to the previous year, sums.

4. Own funds (Om.) Av. provided that 1 sum is how much Av. represents the amount of capitalization or the degree of capitalization of own funds:

$$Ko'm = Av / O'm = 650817,65: 305105,91 = 2,13$$

The ratio of fixed assets to fixed assets in the enterprise was 2,13.

In conclusion, it can be said that in other sectors of the textile and light industry to ensure deeper processing of raw cotton, export of finished products such as dyed yarn, knitted fabrics and fabrics to foreign countries, and then, based on the active adoption of modern technology and design, finished textile products we can achieve tremendous efficiency in production.

At the same time, it is necessary to increase the production capacity of textile enterprises, introduce more quality control of raw materials, expand the production of high quality products that meet international standards based on our national traditions, and attract foreign investors and designs to Uzbekistan. we need to study marketing and produce and export knitwear in line with our traditions in a new design style.

The article "Improving the efficiency of the use of fixed assets and working capital in the textile industry of the country" using the data of the foreign company POSCO International Textile, a large textile company located in Fergana region. Since this enterprise is a weaving enterprise of great importance not only in the region, but also in the Republic, its data were taken as the object of this article.

THE HISTORICAL ROOTS OF SPIRITUAL EDUCATION OF YOUTH

Latofat Sultanova*

*Senior Lecturer,
Bukhara Institute of Engineering and Technology,
UZBEKISTAN

ABSTRACT

The article covers the origins of the Uzbek people, the stages of development, and the attitude to the education of young people. The teachings of Sufism cover the upbringing of children and its practical significance. In the Middle Ages, either during the khanate period or during the colonial period, it was a major trend. Berdakh believes that a person's personal happiness is related to the happiness of the people. The Uzbek people express their ideas of patriotism, sense of homeland, people's freedom, peace, liberty, peace in the legends "Tomaris" and "Shirak", such as honor, justice, faith, courage and bravery, devotion to the people.

KEYWORDS: Khorezm, Sughd, Bactria, Parthia, Spirituality, Religion, Customs, Values, Language, Spiritual And Moral Education, Lifestyle, Art

INTRODUCTION

The origin and formation of the statehood of the Uzbek people, as well as the emergence and development of pedagogy are studied, its culture, spirituality, religion, customs, values, language, spiritual and moral upbringing, lifestyle, art are recognized by the Turkic peoples. emphasize the work of the independent nation-Uzbek people. The formation of the spiritual and moral education of the modern Uzbek people goes back a long way. Located between the two rivers, the Amudarya and the Syrdarya, this people and homeland, as a Turkic-speaking people, inherited Turanzamin and paid special attention to the education and spiritual outlook of the young people who are their future. In the ancient cities of Turan, Khorezm, Sughd, Bactria, Parthia, Parkana, Margiyana, special attention was paid to the cultural conduct of public affairs, education, morality. Science, art, culture and literature were revived in these cities. As a result, the folklore of the region was formed, which reflected the national spirituality, education, morality, and they served as the primary source of spiritual and moral education of the Uzbek

people. After all, the people's hopes, joys and sorrows, joys and sorrows, spiritual and moral worldview, philosophical and legal ideas, ideas about morality are reflected in them.

MATERIALS AND METHODS

President Sh. Mirziyoyev stressed the important role of morality in the upbringing of children and their development into a harmoniously developed generation: "We must pay special attention to our youth today. They are not only our confidence and future, the youth - the decisive force of today and tomorrow. In other words, in order for tomorrow to be as we expected, we need to pay serious attention to the education of young people today. "Proverbs, epics, fairy tales, legends, myths, legends, myths, melodies, songs, proverbs, etc. the word has become an example of the oral creation of the people - messages that have an all-miraculous effect. As we get acquainted with the examples of folklore, "... we realize that our people have a great foresight, foresight and talent for foresight, that he never lived without dreams, always striving for the future." For example, in the examples of Uzbek folk art, including proverbs, fairy tales, proverbs, legends, proverbs, epics, music and songs, the people's spirit, high feelings, dreams, hopes, goals, patriotism, diligence, heroism, parents and respect for teachers and social status.

The Uzbek people express their ideas of patriotism, sense of homeland, people's freedom, peace, liberty, peace in the legends "Tomaris" and "Shirak", such as honor, justice, faith, courage and bravery, devotion to the people. He expressed his moral ideas in such epics as "Alpomish", "Rustamkhan", "Murodkhan", "Oysuluv", "ShirinbilanShakar", "Yusuf and Ahmad". These epics teach our youth the qualities of humanity, patriotism, generosity, friendship, heroism, to make them brave, courageous, to put their country, people, sacred values above all, to be brave, courageous, just, able to protect their people from various aggressions. encourages. Proverbs, sayings, and legends, which have been created and refined over thousands of years, contain the wisdom and wisdom of the people, which includes a wide range of spiritual and moral education, including justice, diligence, wisdom, humility, humility, modesty, kindness, loyalty, generosity, honor, non-betrayal of trust, gentleness, courage, bravery, courage are glorified, enmity, betrayal, hypocrisy, slander, ignorance, laziness, lying, arrogance, slander, slander, envy are condemned. The upbringing of young people and the attention paid to them have been given special attention in every period. In the Middle Ages, either during the khanate period or during the colonial period, it was a major trend. Berdakh believes that a person's personal happiness is related to the happiness of the people. He stressed that in order to achieve true happiness, everyone should combine their personal interests with the interests of the people, and not spare their lives if necessary for the happiness of the people. According to Berdakh, a person should have high moral qualities, such as impartiality, nobility, conscientiousness, diligence, courage. Berdakh emphasizes the important role of school in the mental education of young people. At school, the child should be brought up in a good manner. In his opinion, a teacher who teaches at a school should be an example to children with his politeness, pure heart, honesty, good knowledge of his subject. Virtue is the most valuable spiritual and moral quality of a person.

CONCLUSION

Its content embodies such behavioral criteria as kindness, generosity, trust, loyalty, humanity, perseverance. The nature of the work of goodness and its importance in human perfection is stated in the wise words of the wise people. The sages encouraged people to do good, knowing

that the basis of goodness is to do good. "Do good and go to the river - a fish knows, a creator does not know", "Everyone has a good deed, of course he will gain prestige", "If you want, the people will love you", He asked the sage, "What should be saved and forgotten?" He replied, "If people have done good to you, do not forget them, and if you have done good to anyone, forget them." "Good is the work of every man, and evil is the work of every man." In short, the views of the Uzbek people on the early spiritual and moral education are reflected in the proverbs, sayings, stories, myths, legends, fairy tales, songs, wise sayings, aphorisms, epics, etc. They have been a tool of wisdom of the people in every period of socio-economic development and have been passed down from generation to generation.

ABSTRACT

This article discusses the differences between genders in foreign language learning strategies, the gender characteristics of students' personality: "gender", "masculinity", "femininity", "strategy" during the process of foreign language teaching. It should be noted that in pedagogy, gender socialization means a socio-pedagogical two-way process of creating ideas about femininity and masculinity in girls and boys. We think that the definition of a gender-created personality given by S. Boehm seems interesting to us: "A gender-created personality is both a product and a process."

KEYWORDS: *Gender, Gender Approach, Gender Characteristic Of Personality, Gender Identity, Foreign Language Learning Strategies.*

INTRODUCTION

The attention to the gender characteristics of students' personalities, orientation to international standards, as well as an increase in the role of self-development are clearly distinguished in linguistic education at the present time. Lack of taking into account the gender characteristics of a person in the process of teaching a foreign language, there is insufficient understanding of pedagogical phenomena in the context of the system of expectations regarding the norms for the performance of gender roles by students become a serious obstacle to improving the educational process in a pedagogical university.

MATERIALS AND METHODS

According to the fact that the gender identity of students determines their individual strategies for learning a foreign language requires substantive concretization of the basic concepts used in philosophy, pedagogical practice and psychology. One of the main concepts of paramount importance for our article is the concept of "gender".

The definitions of this concept differ from each other depending on the aspect of its consideration. It is interesting to highlight the meaningful characteristics of the concept of "gender" in psychological, pedagogical and sociological sources.

The term "gender" is borrowed from the English language. Macmillan English Dictionary for Advanced Learners define the term "gender" is (1) the fact being either male or female = sex. (2) In Linguistics the gender of a word is whether it is masculine, feminine or neuter [1]. The term "gender" is defined as a cultural phenomenon in many sociolinguistic books. According to the social classification, it is subdivided into "masculine" and "feminine". "Sex" is a word that correlates with biological differences between a man and a woman. According to the American psychologist S. Boehm, gender is a set of social and cultural norms, which in society, through power and domination, are can be performed by people depending on their gender [2]. We think that the definition of a gender-created personality given by S. Boehm seems interesting to us: "A gender-created personality is both a product and a process. This is both an individual set of masculine or feminine traits, and a way of creating reality, which in itself creates these traits". [2]

From the point of view of modern sociology, the term "gender" means the social role intentions of men and women in relation to each other. Unlike the concept of sex, gender concerns not only the physiological properties by which representatives of different sexes differ from each other, but also socially formed traits inherent in the concepts of "femininity" and "masculinity" [2].

Thus, the term "gender" is used in cases where it is important to emphasize the socially and culturally determined differences found in the behavior of men and women, and to give a holistic mental representation of gender, filled with cognitive and behavioral meaning, obtained by a person in the process of gaining personal experience...

Currently, in world culture, there is a weakening of the polarization of female and male social roles, which makes noticeable changes in the process of gender socialization of the individual. It should be noted that in pedagogy, gender socialization means a socio-pedagogical two-way process of creating ideas about femininity and masculinity in girls and boys. This process is aimed at improving their personality and is focused on the formation and development of behavior inherent in the representation a certain gender in the process of performing various social roles [3].

In the process of pedagogical interaction, it is necessary to create conditions for maximum self-realization and disclosure of the abilities of both female and male students. Taking into account gender psycho physiological and personal differences helps to increase the efficiency of the process of teaching a foreign language. Scientific knowledge about gender characteristics, the dynamics of the formation of the psychological sex, the main features of the manifestations of gender in communication, behavior and learning activities contribute to the implementation of

taking into account the individual and age characteristics of students, the implementation of a differentiated approach in the educational process.

The use of a gender approach in teaching a foreign language contributes to solving the problems facing the teacher during classes, drawing his attention to his own gender characteristics, expanding self-awareness, the ability to reflect on his mental organization and himself as a subject in the pedagogical process.

For the successful implementation of a gender approach in foreign language classes, it is necessary to have a clear understanding of the essence of the categories "masculinity" and "femininity". Masculinity and femininity are social categories and are only indirectly related to the biological sex of a person. According to researchers, the gender identity of students determines their individual strategies for learning a foreign language.

There are various definitions of strategy. So, in the psychological encyclopedia, the word "strategy" means skillful leadership, a plan of behavior or action, a deliberately composed set of operations to solve a problem or achieve a goal.

According to E. Kassels, the strategy is a model of the organization's behavior, which it follows to achieve its long-term goals [4].

According to R. Oxford, a strategy is a mental process that learners use to support the storage, acquisition, reproduction and use of information. These are concrete actions of students aimed at increasing efficiency, speed, ability to transfer to new situations, self-direction of learning [5]. These are memory strategies, cognitive, metacognitive, affective, compensatory and social strategies.

- Memory strategies are aimed at improving the memorization process. Cognitive strategies are mental processes focused on the assimilation, storage and retrieval of information from memory. According to R. Oxford, memory strategies do not provide "deep processing" of information, unlike cognitive strategies. However, they make it possible to translate information into long-term memory and ensure its reproduction [5].
- Metacognitive strategies are a sequence of actions aimed at planning, organizing and controlling cognitive processes.
- Compensatory strategies allow students to use a foreign language in the production process speech despite missing knowledge or information. They compensate for the insufficient set of grammatical and lexical means.
- Affective strategies are aimed at the ability to exercise emotional self-control, help to cope with feelings of fear during classes.
- Social strategies determine the ability for cooperation and cooperation, the manifestation of a tolerant attitude towards another culture, empathy, etc.

CONCLUSION

In conclusion, we say that the gender identity of students to a certain extent determines their individual strategies for learning a foreign language. Taking into account the gender characteristics of a person in the course of teaching a foreign language will increase in the effectiveness of the educational process.

(Banaras Hindu University) Varanasi, INDIA

ABSTRACT

Adolescence is the most vital and delicate age of human life. During this stage they try to follow new fashion, culture and style that are presented to them through different programs and advertisements on television. As they have strong desire to adopt something new and different that differentiates them from others, they are targeted audience for advertiser on television. In India 19.6 % of total population is adolescent (10-19) year as per the study of census 2011. In this context, the present study is undertaken to measure the impact of television commercials on the purchasing preferences of adolescent girl of Allahabad city. A questionnaire was prepared to meet out the objectives of the study. The responses are compiled into tables. For examining variables, percentage analysis was used. The outcomes of the research revealed that adolescent have strong belief in television commercial. It considerably influenced their purchasing preference. Finally, finding and conclusions showed that television advertisement significantly influence the buying preferences of Adolescent girls of Allahabad city.

KEYWORD: Advertisement, Purchasing Preference, Adolescent, commercials

INTRODUCTION:

Television is the most powerful and influential medium of communication around the world. Due to its powerful effect, most of advertisers opted television for advertising their products. Advertisers try to attract the teenagers as they are easily to influence in most of the cases. This is because it is believed that adolescents (10-19) are easy to be persuaded to buy any goods or a service which is being advertised on television. Television influences their life style, preferences and perception towards any product. Advertisers try to establish “brand-name preference” at an early age of the adolescent. They often try to imitate what they are begin presented in advertisements because they found it as smart, attractive, powerful and having a profligate life style. Thus television is the most powerful medium that affects its viewers through its content i.e., infotainment and advertisement. The present paper is the study of impact of television advertisement on the buying pattern of adolescent girl of Allahabad city. The study was conducted in Naini, town of Allahabad city. A sample of comprising 50 adolescent girls of two schools were selected purposively and structured questionnaire method was employed. The study observed that television advertisement is the most important significant source of information about products, fashion, services among them. While friends and other reference group were taken as next important source of information. The respondents are agreeing that television advertisement is an important means of multimedia in the world that is easily accessible to the large number of consumers within a second.

LITERATURE REVIEW:

Buying pattern of young consumer particularly adolescent girls has always been a main focus of researcher in the field of consumer behaviour.

According to the study of **Atkin (1978)** adolescent are the primary and targeted customers for advertisers’ as they can easily attracted towards the advertisement.

Moschis and Mitchell (1986) stated that television affects its viewers’ buying behavior and also influences the communication and household decision of adolescent. His study also revealed that teenagers have always been a targeted audience for the advertisers.

Another study in this context Saxsena (1990) described that adolescents influenced by TV advertisement and usually preferred to purchase the brands and products which are advertised more on television.

Modern (1991) described that advertising establish a basic awareness about product or services in the mind of youngster and provide the knowledge that affects their choice of products and services.

Rana (1995) described in his study that T.V. advertisements Influenced the social behavior, including purchasing behavior to a large extent. The reason behind this television has charm; instantaneous transmission capability and universality of appeal. These factors easily attract the adolescent.

Another study conducted by **Mahajan and Singh (1997)** on the impact of media on lifestyle of adolescents (12-18 years) found that television advertisement affected the lifestyle of individuals. They inclined to purchase the product advertised on TV. They don’t much concern about the price of the product.

Cotte and Wood (2004) revealed in their studies they found substantial variation in the degree TV advertisement influenced the adolescent purchasing behaviour. It depends on different factors like age, ability, educational attainment level, explaining the advertisement according to their own perception.

Anywale et al (2005) stated that TV advertisement influenced the buying pattern of adolescent. They found that adolescent started to evaluate them by comparing with advertised products. Television advertisement greatly influences the adolescent girl's consumption behavior and preferences.

Ahmetoglu et al.(2010) in his study conclude that advertisements have a great convincing and motivating power to persuade the viewers.

Abideen and Saleem (2011) said that advertisement created positive effects on the purchasing intention of consumer's in the Pakistan's second largest city Lahore.

Rafique et al, 2012 described that advertisement is the most common and easy way to communicate with the larger mass at a same time. They argued that culture is one of the most significant factors influencing the buying behaviors of the people as different people have different wants and trends according to their life styles. So it may be said that advertisement works like a magic to the adolescent that changes the needs and wants of the people.

Bolatito 2012 study showed that impact of advertisements on behavior of adolescent consumers that it play role of advertisement in brand and creating preference to a particular brand in telecommunication industry.

Sharma &.Parul 2013 investigated the impact of TV ads on buying behavior of adult consumers. Their study found that TV ads had considerable influence consumer buying process. They revealed that adolescent who are fond of watching TV advertisements strongly considered that TV advertisements had impact on consumer mind and the exposure to TV ads had not only enhanced their involvement in purchasing but had resulted in their purchasing frequency.

Rammurthy Marula Kumar et al. (2013) conducted a study to understand the impact of TV advertisements on its viewers. By using scheduled questionnaire and simple percentage analysis for data collection and interpretation, their study revealed that 70 respondents agreed that TV created a positive perception for TV ads as there is a creative and innovation in TV ads. It also observed that there is significant relationship between TV ads and its impact on the purchasing pattern of its viewers. The other factors affecting the behaviour of viewers such as information about products, product quality, changing consumer lifestyle

Ibitsyo & Tejumaie 2015 in their study conducted at University of Lagos students between (16 – 26 years) authors found that use of celebrities in advertisements largely Influence the purchase decision of the students. Majority of the students (78.75%) preferred to buy products advertised by celebrities and 69% said that it is necessary to use celebrities in advertisements. Study also revealed that 97% of the students are influenced by advertisement while making their purchasing decisions and with use of celebrity in advertisements increase the memorability of the students.

Methodology:

The present study was conducted in two girl's higher secondary school- one government and one private, situated in the area of Naini, Allahabad city. A sample of 100 adolescents girls has been selected randomly (50 from each school). The students of 9th-12th classes were taken for the study. A structural questionnaire was used to collect the information from the respondents. The data was collected in the month of September and October, 2017 to find out the impact of TV advertisement on the purchasing preference of adolescent girls of Naini, Allahabad city. The obtained data were complied and tabulated. The analyses of the result were done by using simple percentage technique.

Objectives:

1. To find out the purchasing behaviour of the adolescent girl of Allahabad city
2. To explore the role of TV advertisement in influencing the purchasing behaviour of adolescents girls.

RESULTS AND DISCUSSION:

TABLE 1: OPINION REGARDING THE ROLE OF TV ADVERTISEMENT IN PURCHASING DECISION

Introduction of new product	56 %
Reinforcing & familiarity to the product	29 %
Stimulate to purchase the product	15%

Table 1 shows majority of the respondents (56%) were agree that TV advertisement has important role in introducing new product to its viewers. whereas on the question on reinforcing & familiarity to the product 29% favored. Further, 15% respondents' opinions that TV's advertisements stimulate to purchase the product.

TABLE 2: IMPACT OF TV ADVERTISEMENT ON THE PURCHASING PREFERENCE

Have intense desire to buy advertised product	65%
Most of decision/taste influence by TV advertisement	35%

Table 2 depicts that more than half percent of respondents (65%) agree that T.V advertisement create intense desire to buy advertise product and 35% said that most of their decisions or taste are influenced by TV advertisement.

TABLE 3: REACTION ON NOT BEING ABLE TO BUY ADVERTISED PRODUCT

Disappointed	(48%)
Frustrated	(13%)
Don't mind	(39%)

Table 3 clears that reaction of respondents on not being able to buy advertised product 48% reported that they were disappointed, while 13% frustrated and some (39%) said that they do not mind it at all.

TABLE 4: TV ADVERTISEMENT ON DECISION MAKING

Help us to make better choice	(47%)
Usually mislead us or confused us about product	(21%)
Don't influence	(32%)

Above table 4 reveals that majority of respondent (47%) said that TV advertisement help them to make better choice among the available product. It shows that respondents mostly attracted towards the product that is advertised. 21% said that T.V advertisement usually confused and mislead them in choosing the product. However, collected data shows that 32% revealed that their purchasing decision is not influence by TV advertisement.

TABLE 5: REFERENCE GROUP THAT INFLUENCE YOUR PURCHASING PREFERENCE/DECISION

Family & Relative	51%
Friends	
28%	
Social environment	21

Table 5 describes that the majority of respondents (51%)were influence by their friends while purchasing some product while 28% reported that their decision influenced by their family and relatives and 21% opinioned that their decisions affected by social environment in which they lived.

TABLE 6: PREFERENCE TO BUY PRODUCT WITH YOUR POCKET MONEY

Clothing	51%
Cosmetic	39%
Gifts	6%
Foods	4%

Table 6 reveals the responses of the respondents on their preference to buy a product with their pocket money. In majority number of respondents (51%) answered that they prefer to spend their pocket money on clothing while 39% and 6 % prefer to spend on cosmetic and on food respectively. According to Russel et.al (1998) study on the spending pattern of adolescent boys in America shows that boys aged between 16-19 years mostly prefer to spend their pocket money on movie, dating entertainment, car expenses whereas girls from same age prefer to spend their money on clothing cosmetics and fragrances.

TABLE 7: PREFER TO BUY PRODUCTS

Local	14%
Branded	62%
Standardization	24%

Table 7 shows that most of the respondents (62%) said that they prefer to buy branded products and 24% respondents choose to buy standardized products.

TABLE 8: TV ADVERTISEMENT ENHANCE THE DEMAND OF PRODUCTS

Yes	86%
No	14%

Table 8 play significant role in enhancing the demand of the products 86% of respondent agree that after watching the advertisement on TV their demand for specific product has been increased, while 14% of the adolescent girl respondent that TV advertisement do not enhance their demand for specific product or services.

TABLE 9

TV ad across interest about changing Life style and consumption pattern	45%
Do you attracted to purchase particular good after watching its advertisement	35%
Product advertise by favorite model/actor Convince you to buy product	20%

Table 9 reveal that 45% of respondent says that TV advertisement arise the interest about changing life style and consumption pattern 35% said that after watching the advertise product they are attracted towards it to buy. While 20% said that product advertised by their favorite actor/model convince them to purchase that specific product.

CONCLUSION:

Television advertisement become integrated part of day today life. It is the most convent and accessible medium of communication to the adolescent. They are mostly prefer to spend their leisure time in watching TV and attracted towards the advertisement. And on the advertiser side adolescent are easy to influence and manipulated that not only increase the organization sale revenue.

The result of the study reveals that TV advertisement arouses their interest and influences their purchasing decision. They consider TV advertisement play significant role in introducing a new product. Apart from providing information TV ad also create intense desire to buy the advertised product. Majority of adolescent girls reported that they get disappointed when they do not able to purchase the advertise product that they want. They also agree that TV advertisement help them to make better choice of product. They consider that through the advertisement they got the information regarding the products' features that satisfied their need. On the question of influence of reference group on their purchasing decision, most of them answered that their friends are most influencing group to their purchasing decision.

However, the adolescent girls utilized their pocket money on clothing and on cosmetic and they prefer to buy branded product, beside it they said that after watching the TV advertisement their demand for that particular advertisement their demand for that particular advertised product has increased. Most, of them said that TV advertisement significantly arouses their interest about changing life style and consumption pattern. On the basis of this purposed study it may be concluded that TV advertisement greatly influence the purchasing preference of its viewers.

ABSTRACT

At the first sight, testing reading comprehension seems easy and straightforward compared to productive skills. In testing oral abilities or writing there is hearable and seeable data to assess, while in receptive skills it is difficult to assess the process which occurs consciously or unconsciously in the brain system. However, taking any passage and designing simple items and addressing it to students cannot give the expected results on the measuring reading comprehension of students. Due to the unobservable process in reading assessment, designing reading tests cause major difficulties for test designers. For instance, on measuring a particular skill it is impossible to measure that particular skill since it is cannot be observed cause of conscious process in the brain and the teacher cannot know exactly student uses that particular skill which is intended to measure by the test designer. While reading there is several stages to achieve ultimate comprehension of the text including decoding the symbols into words, transforming the words into meaningful content, and understanding them. As a second language reader, this process may contain extra stages.

KEYWORDS: Reading Comprehension, Assessment, Summative, MCQ, Gap-Filling, Matching Headings

INTRODUCTION

Assessment is one of the essential tools in the education process for further instructions. While designing or constructing reading comprehension check question items, the test designer should take into account the students' basic knowledge and overall comprehension on reading competence. Another important point is that covering all of the students and providing reliable

reading test items is much harder than expected. Since every student has their own diverse backgrounds on literacy. The level of the students while mastering certain skills can be totally different, some of the students need basic skills on reading comprehension, while some of the students may already mastered sub-skills of reading. Considering these factors test designer need to provide the material that fits all of the students' needs in the classroom. Basic needs can be determined by ongoing assessments. Cause of the diversity of students, implementation of one method of assessing cannot be appropriate for all students. Applying different techniques on assessment is considered a beneficial tool among teachers. There is a competitive misconception have among teachers on assessing students. Some group of the teachers sees the assessment as a checking tool, while more modern teachers see assessment as a tool which should promote the student towards the learning process. It is also a great tool for gathering data about students and designing further implications for teaching strategies on reading comprehension.

In the research field, there are competitive two paradigms on assessing reading. The former stereotype is on the purpose of testing students' strengths and weaknesses in the process and the other one's aim is to assess and diagnose the obstacles which are causing some challenges for students while reading process. As two of the above-mentioned terms can be interpreted as formative and summative assessment types.

The main objectives of this paper are analyzing the test items which are related to reading comprehension and achieving a reliable result from the students taking into account the majority of test designing methods and strategies. Another important primary objective of this paper is help to students to reach the ultimate comprehension of reading passage through implementing variety of test designing techniques. As in designing process of test items general knowledge of students and speed of the reader should be taken into account.

The importance of this project for teachers is that assisting for teacher in designing test items and views of researcher on how to address the test items for students so that they can differ the terms test and assessment. Regarding the assessment, designing and conducting the test items researcher tries to provide more rationale, justification and evidence to support his perspectives on testing reading.

METHODOLOGY

As the next generation of majority of the students belongs to Generation Z after Millennials, assessing and testing them in educational field is becoming harder. To design appropriate test items which fit student's needs, taking into consideration the students' needs analysis allows teachers and test developers to collect deeper data and understanding regarding the students. The paper highlights the important points while designing and constructing the test items and analyzes the weak and strong sides of original example, which is taken from the Academic Lyceum under Uzbek State World Languages University. After analyzing and synthesizing process researcher compares the original version and modified version of the test and tries to give more justification to support his rationale in terms of their reliability, practicality, validity and authenticity. Expected outcomes on designing test items are intended to receive positive wash back and promote and encourage the students towards studying.

The originally designed test for sophomore students in the lyceum is intended to address as a mid-term test in semester 1. The overall test contains three big parts including reading comprehension check questions, language use question involves mostly vocabulary items and

writing task. In the reading comprehension check part, 10 questions are involved. The grading system is quite straightforward. For the right answer in the reading and language use section is given 1 point. During the observation of this test, it seemed to be quite easy to complete. Reading passage question items contain only MCQ questions providing 4 alternatives to students. The test is intended to address for B1+ learners since majority of the students' language proficiency level is quite the same. Development of learner profile is a good way while educators gain enough relevant data about students' general knowledge and interest, their strength and weak sides, as these above mentioned information is extremely practical and valuable during constructing relevant test strategies. To check the modified version of reading strategies in terms of reliability and validity of that test, a group of students was invited to take part in this project.

The primary goal of any assessment is providing strong evidence about learner's needs and collecting information about student's overall comprehension. In that case usage of different testing methods and techniques on reading is very helpful in conducting the needs analysis of learners and approximate comprehension level of the students. In designing process of reading items and implementation, major step is identifying the base knowledge and proficiency level of students. In the lyceum context sophomore students' proficiency level in English should be higher intermediate, since lyceum is specialized in teaching foreign languages. In this regard selection of appropriate passage which fits to the grade level of students according to ESL standards, plays an important role in learning process. In every classroom has students with diverse backgrounds and undoubtedly their needs also differ from each other. Hughes (2003) assumes that to measure the exact level of the students more than one type of question type should be addressed. In this regard, author of the paper included two types of assessment strategies to check approximate level of reading comprehension of students. The nowadays, there is a stereotype that to measure the ultimate level of reading comprehension, productive skill-based assessments should be integrated for reading assessment, for instance writing summary or reflection. However, this is misleading concept, we need to recognize the fact that writing summary exercises can be difficult for even higher proficiency students. Traditional writing integrated reading assessments involve several questions which reader must answer by reading the whole passage. Main problem with that kind of assessment is lack of multi-modality which limits the students attempt to showing their general competence. Considering all of these factors test assessments which demands the minimal ability to write from students, gap-filling exercises are applied by the researcher to measure approximate level of student. For the second question types, matching headings assessment type is implemented for students.

DISCUSSION

The initial reading comprehension check questions involved only MCQ question items and it seemed to me not reliable enough to assess the exact knowledge of the students. Cause of this researcher decided to focus on reading test to modify. Any good assessment should cover three major principles: practicality, validity and reliability. Practicality can be defined from different perspectives as every subject on designing and addressing process has their own perspective while evaluating the test as practical. From the teachers' point of view, practical tests should be easy to assess and score considering effect and time. Administration members emphasize its financial sides and available human resources during the addressing process. In terms of practicality, reading section is practical as it is easy to implement and convenient to scoring. According to Brown (2010) MCQ questions should be carefully designed which characteristics

of test items and distractors need to guard the test items from unreliability. To make the test more reliable in using MCQ technique for assessing reading comprehension, distractors need to be carefully designed and implication process of the test also should be taken into account. Ambiguous test alternatives and providing more than one correct answer make the test less reliable. However, providing too many options for students can cause some anxiety and confusion which can lead to design unreliable tests again. In terms of reading section question items, there are only 4 options for each question and it may increase the possibility of guessing which means one option is equal to 25% of correct answer. Another noticeable thing in the questions is lack of distractors, as in MCQ techniques distractors play an essential role. Considering all of these factors test items seem less reliable for me to identify the more approximate level of readers. On constructing the test item, the most essential principle and the most effective criteria in evaluating the test items and techniques is validity. A valid reading test measures the exactly reading comprehension of the student and to provide content validity the test need to measure the exact performance of student directly.

When having a research about the learners needs about testing reading, most of the students assume that MCQ questions are easy to accomplish, which gives more independence for students. Most of students were in favor of this technique of assessment. It is more convenient for them to guess and find correct option. Moreover, it demands lower-order thinking abilities and doesn't require to use of cognitive abilities from students. Lack of available human recourses in the classroom also rises the higher possibility of cheating. In that point of view, level of the passage and quality of test items were not compatible with each other. The level of the anxiety during the assessment process can be lower in MCQ test, nonetheless it doesn't measure the approximate level of student.

The reading test which was addressed for students as a mid-term should base on the materials which were discussed at the previous lessons. If the mid-term reading section is intended to measure the expeditious reading skills of students and during the test it requires more detailed reading from student in that case it would not be valid enough. Another important point both teacher and test-taker need to consider is face validity. Good example for face-validity is clearly instructed direction, in addition to test appearance which does not cause any doubt for test-designers and well-designed test items. Fairly difficult and not complicated test items also serve for improving the face-validity of assessment. Considering the all of the factors reading section seems partially valid.

Taking into account all of considerations and assessment principles, the test items are easy to administer, to evaluate and requires only low-order thinking skill as it allows to students giving more focus on content itself. Another strength side of this test is it is dueable within the time limit. Moreover, majority of students are familiar with this assessment technique and it doesn't require extra detailed instructions from teachers. Besides that, entrance exam of most of the local universities is wholly based on MCQ questions. However, major problem with this reading section is relying on only one technique. According to Wren (2004) to measure the approximate level of students' reading comprehension more than one technique needs to be applied. Besides that, role of distractors especially in MCQ test items is quite essential. Lack of distractors impacts to likelihood of guessing on test items. As test contains only four alternative options it raises level of guessing correctly up to 25%. Moreover, MCQ in local context especially students who are familiar with each other impacts on growth of the possibility of cheating. In micro level,

especially in local context lack of human resources and insufficiency of total control within the classroom also influences to possibility of cheating. As a consequence of these factors, even reliable and valid tests cannot measure the approximate level of students.

While modifying the chosen reading test learners' needs were taken into consideration as well as the other classroom members. Shanklin&Rhodes (1993) state that teachers or test designers should develop the test items considering the learners' needs and including all classroom members. In designing process of reading items and implementation, major step is identifying the base knowledge and proficiency level of students.

Applying product-oriented assessment assists to improve further instructions and curriculum of the local context. However, some of the reading tests mainly tend to focus on limited range of vocabulary which may not be valid for lower and higher proficient students. Reaching ultimate level of comprehension requires using different methods and applying into test practice. For the fair assessment, types of the test and intended measurement should be determined and constructing specific components can provide overall validity of the assessment. It is essential to take into account diversity of test types while constructing, since they will determine the major problems on the students, their reflection and engagement for the test items.

When the researcher addressed the modified version of reading test, students feedbacks were positive and they said that they were highly motivated by doing modified version. Major upside of modified version was also enhancement of reading comprehension percentage. Modified version demanded more detailed reading from students and it helped them to comprehend the passage better. During the analysis of results of original and modified version, we can observe that after implementation of modified version, the comprehension level of students regarding the passage was higher. The following chart describes the information about comprehension level of students between two test items.

Major disadvantage of MCQs is possibility of guessing. Concerning the guessing of students teacher cannot judge the exact level of students. Advantage of gap-filling exercises over MCQs it prevents students from likelihood of guessing. Teacher cannot identify that students read that passage carefully or they ticked and circled the possible answers. That's why teacher cannot

create the true image of students' knowledge while checking. Another interesting point is that, MCQs are not compatible with real-life situations, in actual life mostly individuals need to choose between two items. While complicated distractors may easily frustrate the students which can lead to failure of student or high level of anxiety in assessment process. Practicality of MCQ in terms of scoring, administration is undeniable fact, while actually designing reliable MCQ is time-consuming compared to other techniques and it costs much more than ordinary items as it takes much area on the papers. Heaton (1990) suggests that while designing that kind of test items, the options should be equal in length and compatible with content of passage. Having considered several drawbacks of this technique the author of the paper decided to substitute this technique into gap-filling exercise in the form of sentence completion. Alderson (1996) considers there are two types of gap filling activities including pseudo-random and rational cloze. Pseudo-random technique removes the word or words in the definite rate. Main distinction between regular gap-filling exercises is that in this technique first letter of word is omitted in the passage. It serves to prevent from confusion while filling the gaps. Without the help of the teacher or any hints are not required in this type of technique. Alderson (1996) states that that kind of testing item provide huge opportunity for test-takers and gives independence. Furthermore, this technique motivates the students on assessment process and serves to reduce the anxiety level on students. Nevertheless, concerning the several advantages of this assessment technique, it demands high level of language knowledge in terms of vocabulary and grammar. That's why providing meaningful gaps which are related to previous sentences or reading passage itself makes gap-filling test more reliable and valid. It is evident that goal of using that kind of assessment is to check reading comprehension of students. Weir (1990) states that gap-filling items are easy to administer and construct, in addition to easy to evaluate. In this regard gap-fillings are very practical. Comparing to other test techniques gap-fillings assess only exact part of the reading comprehension and knowledge of students. Learners know exactly that what kind of word type should be inserted into the gap, since it is very helpful on assessing expeditious reading skills of student. Moreover, advantage of gap-fillings, they give opportunity to focus on particular part of passage only, which reduces the possibility of confusion among the students.

For the second question type, matching headings assessment type is implemented for students. The main advantage of this type of test item is to check students detailed reading abilities and their skimming also. By summarizing the main idea of the paragraph students need to match correct headings into appropriate paragraphs. It is one of the best strategy for checking students skimming and expeditious reading skills, since matching headings activity demands skimming skills and identifying topic sentences from students. Another major advantage of this activity is it forces students to read whole passage in detail and it serves to comprehend the passage better. On improvement the confidence in the students this technique can be essential also. Doing the task within the time limit gives a confidence and motivation for students for further studying process.

CONCLUSION

As a conclusion, further improvements for chosen test items from the perspectives of researcher should consider main principles. Assessment process can promote learning process or it can diminish the inner motivation of students. In that case reading assessment should be taken into special attention while designing. Test constructors and teachers as main actors in the micro and

macro level have great responsibility on designing valuable and reliable test items. The wash back of students after implementation of assessment need to be take into consideration by test designers. Each test designer`s awareness on developing test items and involving important factors on them, makes test more reliable and valid. The primary goal of testing reading is measuring the overall ability of reader, however different reading assessment strategies can be used for different purposes. In our education system most of the time reading assessments mainly framework with the assessment of the proficiency in that particular skill or it can be referred as standardized testing which is commonly used by educational authorities. Standardized assessments are very helpful for assessing the general competence of reader and serve to construct further development of instructions. Mostly proficiency measurement assessment belongs to high stakes of assessment as it is developed by taking into account future goals and objectives on teaching reading. The major challenge in developing that kind of assessments is involving all the components of reading. As constructing reading assessment is not straightforward as it is seen. In terms of validity, reliability and time effort standardized test assessment should cover all of these and including the consequences after administration of test items.

As a teacher and student, researcher gained a lot experience regarding development of test items and doing them compatible with the major principles of assessment. Without doubt researcher can say that project practiced as an essential step on further development of career.

RESEARCH ON THE NEW UZBEK POETRY

Ulugbek Khamdamov*

*Senior Researcher,
Doctor of Science in Philology,
Language and Literature Institute, Academy Of Science,
UZBEKISTAN
Email id: ulugbek1968.68@mail.ru

ABSTRACT

XX century poetry is accounted new poetry according to its essence. Well, it was renewed. Previously, in this century, science and technologies achievements were increased, and as the result of it, the pace of life became greater than before. It was the first thing. The second thing, which we have to say, is social and political changes that occurred in our country within 100 years. In addition, the matter affected our compatriots' outlook. The factors of these two direction distinguished incomparably XX century's people than earlier epoch. Also its notion, outlook, worldliness were renewed. In consequence, literature and poetry stepped their new level. These renewals appeared in poetry both maintenance and form. It would be proper if we call the poetry of 1905-1990s as a new poetry. Because, from 1905 year it was pursued the activity of jadidism as the motion in Turkistan and becoming popular conceptions of jadidism. The reason is that to say until 1990s is, at that time Uzbekistan became an independent state and it brought new literary atmosphere with itself. Therefore, this period is separate and independent research object. One of the main peculiarities of new Uzbek poetry is its publicity. Because in XX century our compatriots overcame a lot of changing and occurrences: overcome three social systems and witnessed two world wars, revolution incidents, civil wars and their horrible results. In consequence, poetry socialized. For the time being there appeared necessity of poetry reformation for being reflected people's soul living social historical condition. As the result of it our poetry came across several quality changes, as rhythmic- intonation construction, poetic expression manner, and subjective form. Human is a difficult creature who has a biological, social and sensual condition in himself, it has a sign of them which belongs to him. From the historical development of humanity the "new era" – began in XVII century in Europe, in our

country in XX century, - characterized with turning over the sociality in humanity. The ideal-thematic changing and progressing of sociality in our poetry is characterized with it. The worldview of "new human" is also changed, he began to think about only to live and reach to the heaven, but also think to change his real life. As a result the esthetic-ideal nature in literature changed; God is not main figure of it, but the social aim that human can earn with his action is. The cultural-economical relations progressed; social-economical relations changed and shaped the "new human". In XX century we can distinguish four literal generations according to the poetic principals; new poets, ancestors of XX century, ancestors of 1960th and 1970th years. They differ from each other according to their ideal-esthetic and poetic principals.

KEYWORDS: *New Human, New Uzbek Poetry, Four Literal Generation, Social Poetry, Social Aim, Form and Content Changings In Poetry, Aesthetic Ideal, Ideal-Thematic Changing, Poetic Expression.*

INTRODUCTION

Each new period requires people recognize the passed period as the roots of today and tomorrow refers to the past. As a result of science and technological development contemporary life has got a rush speed. People have changed their views, outlook and customs. On the other hand, this connected with the last occurrences and their influence to the mind. These two changes distinguished the people of the XX century, than other periods. And this varied person started to be reflected in poetry.

As we have faced to the new period people and their psychological principle are of in great socio - political event. It is necessary to investigate people of XX century on the point, point of mind development and psycho-sociological principles. It also demands to investigate XX century Uzbek literature steps in the field of socio-psychological processes. Investigating the development of Uzbek literature, it's socio-psychological factors, soul reflection in the poetry, their mind helps to recognize our past, cut believe, life condition and our outlook. With this significance the theme emphasized common crucial character as knowing the past life, serve as a great experience. The theme makes global educational significance because; it plays admonition role to realize public life, also for its present and future. In XX century, our compatriot overcame various changes and occurrences: (they) overcame three social regimes and witnessed two world wars as well as their horrible results; (they) lived under the pression in conflict to humanity with revolutionary slogans whether they believe the future or not realizing thoroughly. Changes and turns in social political life clarified our literature themes, in addition to that author, especially, a poet put away social noteworthy problems "aimed at his cornea inside" (Ortega and Gusset) besides, he devoted himself to inner thoughts. Thus, social great altering also has been observed in poetry. In the meantime, initially, there came out the necessity of analyzing XX century Uzbek literature thematic-ideological matters on the point of current social point of view. On the other hand, there appeared necessity of poetry reformation to reflect peoples' soul living in social historical condition. In consequence, our poetry came across several quality changes, as rhythmic-intonation construction, poetic expression manner, and subjective shape.

In general, XX century Uzbek poetry appeared on the ground of different cultural and social life condition having different purpose and form. Exploring it thoroughly, on the ground giving

scientific judgment, moreover, we can summarize theoretically for our next literature development.

XX century Uzbek poetry history, poetic matters have been studied thoroughly moreover and it is permissible to say that investigation has not become sluggish until today.

In its turn, we should mention several articles and monographs created by the authors including Fitrat, Olim Sharafutdinov ("Ayn"), Usmonxon, A.Sa'diy, B.Maxmud, O.Hoshim, Oybek, H.Olimjon, I.Sulton, H.Yoqubov, S.Mamajonov, O.Sharafiddinovg, N.Karimov, B.Nazarov, N.Xudoyberganov, B.Akramov, N.Rahimjonov, I.G'afurov, I.Haqqulov, O.Abdullayev, H.Boltayev, Q.Yo'ldoshev, B.Norboyev, S.Meliyev, Ya.Qosim, J.Jumaboyeva who added their valuable contribution to the development of new poetry and literature. Meantime, some candidate and doctor dissertations came out. Some of researches in this direction elucidate to the certain stage of Uzbek poetry in XX century from a historical perspective, the highlighted, ideological, thematic and poetic peculiarity which belongs to that direction. So, their exist works directed to search literary theoretical problem and they are investigated according to the matter of poetry in XX century. Some valuable opinions are also mentioned about the works of the great writers of XX century. Thus, in spite of contemporary poetry investigation, it has just begun to be studied completely and monographically. It is natural. At first, it was learned the matters after the Independence, what had been postponed to touch on some unknown reason; Secondly the literature of XX century and poetry has just started to be comprehended as a researching object and a special stage. In a sense, our work is one of early experiments on that occasion. Throughout the century our poetry outlived such periods as rising and falling, developing and ruining. Anyway, one must emphasize that at the beginning of the XX century the progressing poetry succeeded in a new stage, renewed its essence, maintenance and form. While the verse it is the period what reflects human soul and image. Coming to the XX century our country stepped into the period called "modern life" presenting Western development history what altered the compatriot itself. He had a new look to life, with new intentions, "what formed a modern person". We must underline that social-historical events of the development in our country did not give any chance for it. Of course, such overturns have left traces in people's life and naturally in the poetry too. According to the previously mentioned, it is our duty to set conceptual-literal contents of the poetry in the XX century. First, we think that the period 1905-1990 is chronological time of the XX century in Uzbek poetry. Why? Because it means chronological century and literary century do not match to each other and it is not surprising. Though the new pages of the literature were noticed at the end of the XIX century, anyway its innovation began to appear after 1905. This idea as social may be marked that social events are tied with the history of literature may be a little bit suspicious. However, we cannot deny that jadid actions were famous and at the same time it came to an end. It is not so close to define the beginning of Uzbek literature from the middle of XIX century. But firstly it was carried out in the field of classical poetry tradition, then the features in any periods of progress of literature do not come into existence spontaneously. They set their roots referring to their past. We ground on that point to define the last boundary. After 1991, the social and political condition changed in our country, new social economic relations have occurred in society, the point of the art and the imaginations, and its duties renewed completely. Thus, on the point of the history of literature. It is beginning of new period what can be the great work to investigate fundamentally by future generation. Here in this article we are speaking about XX

century Uzbek poetry period of modern Uzbek literature. We may come across such a question that what the main features of Uzbek poetry of the XX century of course it has different features. Human is so complicated creature who contains biological, social and mental origins himself and you can see that on his each activity or his each product new period of the history of human beings began in XVIII century in Europe and in XX century in our country is characterized with changing a feature that defined in human's social essence.

Ideological thematic renewing and having advantage of social point and spirit on our poetry are annotated with that factor. Having differences from our ancestors new people started to have worldview. They began to think about not only living for the next world and reaching to paradise, they began to think about erecting their lives in real life.

As a result, aesthetic and ideal views of literature are changed: so, now it is not based on the God but it can be achieved by peoples' effort, which in near future, and that was pointed with origins of ideal good deed and beauty's essence.

The intellectuals first comprehend the requirement of renewing in society it is like a rule. At the end of the 19th century the communication our country was not so good among Russia and other countries, depending on this new economical and cultural life effected our national life so that intellectuals had to think deeply about requirement of renewing. We can say enlightened writer's poems on agitating and advocating news is the first stage of thematic renewing in our poetry. Person became active in renewed social and political condition, his life position changed; he comprehended his private life and changes in social life. Chance for comparing other countries life gave no satisfaction the exist condition of nation life. Jadidism ideology that gathered all intellectuals and the literature decided to explain this ideology – jadidist literature appeared. This is the first factor that changed our poetry to ideological side. In this operation outward factor played great role and in that case it was affected inner factor also. Particular, increasing outward cultural and economical communication appeared needs for renewing, changing existence social – political attitude and shaped new person. On the other hand, jadidists ideological communication with Turkic in Russia and reformation movement in Turkic, literal communication with developing countries also one of the important factor to increase socialization. Of course, our poetry have been ideologically depending on jadidist literature and occurred a contradiction on old and a new social life defenders, after the October revolution contradiction moved to sphere “jaded-sho'ro”. As a result, poetry was far from the art and the most poems, which were written in the period of communism, named after transient events. Namely, poetry was under the grip of ideology in condition of communist ideology, which was the support of totalitarian system. Until the end of the 50s, poetry lived as a defender, musician and propagandist of ideology and system, a person – “I” was banished from the poetry and “We” who spoke by the name of ideology took its place. By this way, the sociality, which was naturally peculiar to the literature, was defamed and the following position, which was contrast to the nature of literary work, was settled in the beginning of the 60s and nearly it lasted until the independence. There are four literary generations according to ideological- authentic position and generality of poetic principles in Uzbek poetry of century: “jaded poets, the generation of the 20s, the literary generation of the 60s and 70s. These generations are differ from according to their ideological-authentic position and the peculiarity in the poetic-principles, by chronological side authors who entered the literature among the decades come up or join to one of the following generations. At the same time, these generations tied up with each other on

the base of their law and on the ground of dependence, the whole sight of Uzbek poetry in XX century will appear. Now, there are some certain social-mental factors, which were marked on the ideological-authentic principles of each counted generation.

This position belongs to the changes in society (objective) and began to be recognized widely (subjective).

Returning poetry to imagery thinking:

1) New method representatives functioned in cultural branches, and as a result, they had a chance of aesthetic thinking:

2) The changes in the society did not appropriate them and was limited to express it clearly.

3) it was explained with social –psychological factors which appeared in the social political position and didn't appropriate to their purposes.

Creating “real literature” comprehended, as a result the beginning of xx century new imagery was originated according to the realistic bases. The usage of raw wealth sources in poetic imagery riched the poetic literature.

The development of imagery mind was resulted in limiting human speech freedom, widening of symbolical and metaphoric imagery... Epic and Dramatic type connected with each other and so it effected to improve lyric subject. Now in the poetry line “lyric I” can be (“executive lyric”, “character cal lyric”), depiction of object feeling or in description reflected (“descriptive lyric», incidental lyric”). They effected to become a wide chance of description and expression in new poetry. The end of the XX century new Uzbek poetry increased according to content.

ABSTRACT

Otechestvennaya variety of cauliflower was planted at different times in the Andijan region, to study their growth and development. Otechestvennaya variety of cauliflower was studied. It is recommended to apply 3-4 t of ammonium nitrate, 5-6 t of superphosphate and 1-2 t of potassium salt per hectare. Fertilizer, potassium salt and half of superphosphate are given before plowing, nitrate and the rest of superphosphate is given before planting or as a supplement during the growing season of plants. The head of the cauliflower is snow-white, sometimes yellowish-white and green. The bright white cabbage is delicious to eat and is well-received by the population.

KEYWORDS: Agriculture, White Cabbage, Cauliflower, Varieties And Hybrids, Light, Moisture, Heat, Agricultural Technology, Soil, Biologically Active Substances, Seedlings, Picrofka, Gross Harvest, Net Harvest, Greenhouse, Greenhouse.

INTRODUCTION

The importance of white cabbage and cauliflower in the agriculture of the independent Republic of Uzbekistan is growing every year. Therefore, we need to elaborate on the definition of these

cabbages.

In our country, the growing interest of the population is in the fact that the edible organ of cauliflower is a strongly branched, but densely packed bouquet, which is also called cauliflower.

The head of the cauliflower is snow-white, sometimes yellowish-white and green. The bright white cabbage is delicious to eat and is well-received by the population. The white color depends on the characteristics of the variety and the technology of protection from light rays, especially from direct sunlight.

The importance of vegetables rich in biologically active substances in the diet for the healthy life of mankind is very high. Cabbage is one of the highest vegetables and is grown in almost all countries of the world. The sown area of the world is 255-260 thousand hectares, and the gross harvest is 4.5-5.0 million tons.

Its composition differs radically from ordinary white cabbage, including relatively low in sugar, but high in glucose, high in ascorbic acid (up to 155 mg%), nutrients are mainly protein nitrogen, dry matter content is 8.6-11. , 7%, nutritional value - 100 g, 29 kcal or 121 kJ of energy in the product. Cauliflower is also rich in mineral species, with 25-89 mg of calcium, 21-29 mg of potassium, 22-111 mg of phosphorus per 100 g of product; Contains 0.6-1.3 mg of iron.

The timing of planting cauliflower in the experiment

TABLE 1

№	Sort	Sowing time
1	Otechestvennaya	10.03.2019y
2	Otechestvennaya	20.03.2019y

In the experimental system, the main crop was cauliflower "Otechestvennaya" grown in two terms. The first term was March 10, the second term was March 20.

According to our calculations, the yield of cauliflower "Otechestvennaya" sown on March 10 was 128.5 quintals, and the yield of cabbage sown on March 20 - 107.1 quintals.

Formation of surface parts of cauliflower varieties and hybrids, as well as the average weight and marketability of cauliflower

TABLE 2

Varieties and hybrids	The day after planting		Duration of cabbage formation, days	Harvest time	Harvest duration, days	Number of leaves in 1 bush, pcs	The length of the largest leaf, cm	Average weight of cabbage, gr	The amount of marketable cabbage, %
	Until the cabbage begins to form	Until the first harvest							
Otchechestvennaya	60	72	15	10.05	29	21,0	46,2	436	92,8
Rannyaya gribovskaya 1355	61	74	13	15.05	26	20,3	42,0	386	91,1
Gudman F ₁	61	77	12	16.05	25	23,3	48,3	380	90,6

The figures in Table 2 show that when 30-32-day-old cauliflower seedlings were planted on a 70 × 35 cm scheme on March 10, the following was determined in terms of their growth and development.

Cauliflower Rannyaya gribovskaya 1355 variety and GudmanF1 hybrid seedlings began to form cabbage 61 days after planting, and the first crop was harvested 73-74 days later. Otechestvennaya variety of cauliflower is known for its earliest ripening. That is, 60 days after planting, cabbage begins to form, and the first crop is harvested 72-80 days after planting.

The largest cauliflower of the studied cauliflower varieties and hybrids was Otchechestvennaya variety, and Rannyaya gribovskaya produced 1355, and Goodman F1 hybrids 380 g.

Based on the following information, each agro-technical measure in the technology of growing cauliflower should be aimed at achieving the intended goals.

1. The main purpose of growing cauliflower is to grow high quality and durable crops.
2. In the technology of growing cauliflower, the planting density of seedlings determines the rate of growth and development, as well as the amount of harvest and product quality.
3. Planting cauliflower Otechesvennyi in the scheme 70x35-1, March 10, will ensure a high yield and almost 40% of the harvest will be high and high quality.

In the cultivation of high and early yields of cauliflower should pay close attention to its planting scheme and sowing period to sow on March 10 to get a high yield (70x35-1 cm) and ensure good formation and high yield of bouquets grown in these planting schemes .

Cauliflower prefers fertile soil and quality cultivated fields. Therefore, in the conditions of Uzbekistan, it is preferable to plant this crop in areas rich in organic matter, high water capacity, cool meadows and meadows. However, it also gives good yields on well-fertilized gray soils on high terraces.

High soil fertility and moisture requirements are the main factors in choosing a place for cauliflower.

This requires the selection of fertile soil and regular supply of moisture to ensure high yields from the plant.

In the Central Asian region, the most suitable places for cauliflower are rich in organic matter, low temperatures, high moisture content, peat bogs or meadows, meadow-swamp soils in the lower reaches of rivers.

Cauliflower grows poorly in light loam and sandy loam soils and in areas with low organic matter content. It does not like salty, salty and sour soils.

For cauliflower, legumes and autumn cereals are the best past crops. In vegetable growing, tillage before planting is unique. The time of tillage before planting and the methods of its implementation depend on the time of planting vegetables, the physical condition of the soil. Cauliflower is a good source of fertilizer, especially organic fertilizers. Therefore, it is recommended to apply a large amount of manure (50-60 tons per hectare).

However, scientific and practical experiments in the south on the cultivation of cauliflower show that it is possible to increase the fertilizer rate to 20-30 tons per hectare by mixing organic and mineral fertilizers. It is recommended to apply 3-4 t of ammonium nitrate, 5-6 t of superphosphate and 1-2 t of potassium salt per hectare. Fertilizer, potassium salt and half of superphosphate are given before plowing, nitrate and the rest of superphosphate is given before planting or as a supplement during the growing season of plants. Cauliflower is fed with nitrogen fertilizers in the early stages of development, and with a mixture of nitrogen and phosphorus during the formation of cabbage. The first feeding of cauliflower is carried out 1-1.5 weeks after transplanting, and it is recommended to feed 2-3 more times at intervals of two to three weeks.

This means that when cauliflower is grown in the evening, it should be fed in accordance with its biological requirements.

Preparing the seedlings

Regardless of the type of vegetables grown from seedlings (white and cauliflower, tomatoes, peppers and eggplant, etc.), if they are prepared with good quality, they will yield early and give a high quality yield, and the farmer will have economic benefits.

So, in order to get an early harvest of early cauliflower, it is necessary to start preparing the seedlings early and bring it to a level that meets the standard requirements. To do this, pre-sorted, treated and high-yielding seeds are used.

Seedling care is very important for high yields of cauliflower. Early cauliflower seedlings are grown in heated film and in some cases in glass greenhouses and greenhouses, while cauliflower seedlings grown in the middle and summer periods are grown in field nurseries in rows or in rows.

Irrigation

Cabbage grows well in areas with low temperatures and high humidity, and farmers know that it gives high yields. Therefore, it is important to have enough moisture in the soil during the growth and development of cauliflower.

Cauliflower is grown in our conditions, planted in two periods in early spring and summer. Regardless of the period of cultivation, it requires a lot of moisture during the growing season, especially during the formation of the inflorescence.

According to N.I. Akulova, Y.X. Pantiyelev, cauliflower should have an optimal level of humidity during the period of growth and development. Those planted in the period are watered 10–12 times. It is recommended to give 2-3 m³ to 4-6 m³ or 40-60 l / m² per 100 m², taking into account the development of the plant and the depth at which the root system grows.

CONCLUSION

Cauliflower is a soil-demanding vegetable, so it is important to feed it during the growing season. Therefore, in its cultivation is applied in large quantities per hectare (20-30 t), 4-5 t of ammonium nitrate and 5-6 t of super-phosphate and 1-2 t of potassium salt. Organic fertilizer and potassium salt are all applied, half of the phosphorus fertilizer is applied to the soil before the main tillage, and the rest is applied during feeding.

CLASSIC TRADITIONS AND FOLKLORE MOTIVATIONS IN THE STORIES OF ISAJAN SULTAN

Feruza Qurbonova*

*Senior Teacher,
Department of Uzbek Literature,
Kokand State Pedagogical Institute
UZBEKISTAN

ABSTRACT

The exposition portrait consists of a set of typical characteristics that reflect the unchanging, stable qualities and attributes of the person, regardless of the character's state of mind. In the stories of Manzil and Baghi Eram, these two concepts complement each other and discover art. Therefore, it can be said that these stories differ from each other in their ideology and art. The "stream" used here in ancient mythology served as a mythical means of uniting "own" and "other" worlds. Therefore, as soon as the protagonist crosses the ditch, he passes to the "other world" and in front of his eyes appears a "garden with golden lids and crystal handles", i.e. the garden of Eram.

KEYWORDS: *crystal handles, attributes,*

INTRODUCTION

One of the true talents of today's literary process is reading the works of Isajon Sultan, observing and analyzing the idea and purpose in them, and witnessing how the simple truths of human life are reflected in beautiful artistic colors.

It should not be forgotten that the image that will be created in any work of art, first and foremost, a means of reflecting the writer's attitude toward people and life is calculated. At the same time, it is the aesthetic that the author gives to the events of life price is also. Each character has one or another aesthetic ideal of the writer incarnate. That image is specific to this task it is necessary to move in a social environment, in a spiritual environment. This is natural should happen. Where the author is alive in the work of art only an artificial, formal imitation of things, events and the fate of people this is not a work of art, but a work of art consists only of a

set of objects. From such artificiality In order to be free, the artist's aesthetic thinking must be clear and stable.

If we look at all the works of the writer in large and small genres, we can see in them the commonality of the relationship of modern prose and folklore, along with the elements of art in our classical literature. "Wooden bucket", "Windy night". In the stories of Manzil and Baghi Eram, these two concepts complement each other and discover art. Therefore, it can be said that these stories differ from each other in their ideology and art. Regardless of the subject, the writer Isajon Sultan considers the understanding of what is the purpose of life and coming to this world as the main criterion for describing his most honorable work for man. The exposition portrait consists of a set of typical characteristics that reflect the unchanging, stable qualities and attributes of the person, regardless of the character's state of mind. It is artistically generalized and at the same time represents the characteristics of the forces that influence the fate of the main characters. The story of Manzil, which we want to analyze, is also based on ideas that discuss human life and its essence. In most of his works, the spirit of self-discovery and understanding of the meaning of life leads. An example of this is the Muslim portrait in the play. It is fair to say that the components of a work of art that manifest psychic analysis are conventionally called forms of psychology. Munakkid H. Umarov said, "Just as the forms of psychology are diverse, so are its poetic means, such as portraits, dialogues, monologues, dreams, psychological symbols, emotional movements, landscapes, hallucinations. Each of them helps the writer to reveal the secrets of the hero's inner world. "

The protagonists of the story "Manzil" Muslim, Muhammad and Abdullah also set out in search of the treasure of their lives. On their way to the destination, they encounter mountains, oases, and deserts on these roads. These scenes involuntarily remind us of the birds and the valleys they crossed in search of Semurg in A. Navoi's epic "Lisonut-tayr" or Santiago, the protagonist of "The Alchemist". All of these heroes set out in search of the treasure and meaning they needed. However, not all the heroes of the work were able to reach this address. The other companions of the protagonists of our story, Muslim, Muhammad and Abdullah, also did not have the opportunity to reach this address. This is also a matter of fate. Here we see that the names of the heroes of the work are not in vain: Muslim, Muhammad.

Their friends became victims of the promised wealth and pleasure along the way. In a word, they forgot the purpose for which they set out by indulging in the lusts of the world. In the language of mysticism, they could not rise from the Shari'ah to the sect, from the sect to the enlightenment. The main protagonists of the story, due to the strong faith, patience and faith in their hearts, reached their goals and destinations. In this way, they overcame lust, which was their greatest enemy.

Look, they did what they were looking for, but they came across an unexpected, unthinkable situation. They went and saw that there were a number of talisman gates. But there is not a single gate in them that mentions the names of their partners left on the road. There is no name for them among the gates of Mount Tilsim in the Tilsim Valley, which have been sought for almost a lifetime. There is wisdom here, too, that it is not written in their destiny to come here.

It is no coincidence that the name of this lifelong mountain and valley is Tilsim. The spell will have a solution to a puzzle that is unknown to everyone. They were eager to know the meaning and solution of their lives, and this magic was found. It read: "This treasure is enchanted in the

name of one of the servants of God. I swear by the attributes of the Creator that I, the possessor of this magic, will deliver my demon-possessed Palbos horseman to his husband in the blink of an eye. I will pour out the riches of the world under my feet. I will make you king over whomever you want. I teach worm-birds and animal language. I am weak only before God and before the judgment he has decreed. ” As they read these words, whatever they see with their eyes on the outside of the ring, they see their reflections. They realize that what they have been searching for all their lives is only in themselves. In our author's *Eternal Wanderer*, the *Eternal Wanderer* asks the saint on the mountain to perform a miracle.

Indeed, man often does not appreciate all the miracles that surround his treasure. They look for him elsewhere. Jalal al-Din Rumi, in one of his sayings, likened this state of a man to a madman who seeks water from another place without seeing a stream flowing past him.

The Semurg birds also went to the places they were looking for with some difficulty, and they realized that the Semurg they were looking for was actually themselves.

The protagonists of our story also realized this fact and wanted to return to their homeland, and the time was approaching for Muslim and Muhammad to hand over the deposit. Although they were at the end of their lives, they achieved the truth they were looking for.

The protagonist of the story "Garden of Eram" also remembers his immaculate childhood, when he met his grandfather Kholmuhammad, who was heartbroken by the pollution of nature and the pollution of the canals that once flowed with clear water: "The old man came to us and played pizza. After a while, we saw that his eyes were watering. "Why are you crying, Grandpa?" I asked. The old man, his beard trembling, said, "Once upon a time, I used to pour the bread my mother baked like that, and I remember that, my son. Well, I've flown like bread in this ditch myself. 'Did I think the breadwinner was coming, anyway, I remember taking my soaked bread and handing it to him. The old man took the bread and wept without shame. "The narrator-hero follows Kholmuhammad, who continues on his way in tears. As he crossed the ditch in front of him, he saw a strange landscape of a legendary corner: "I saw myself in front of a garden with golden gates and crystal handles." In Uzbek folklore, the writer creatively uses the mythological notion of the hero's journey to another world. Used the detail effectively. The "stream" used here in ancient mythology served as a mythical means of uniting "own" and "other" worlds. Therefore, as soon as the protagonist crosses the ditch, he passes to the "other world" and in front of his eyes appears a "garden with golden lids and crystal handles", ie the garden of Eram. Through the depiction of this strange garden in the hero's imagination, the author uses the ancient mythological imagination as a conditional-symbolic background and uniquely expresses the spiritual experiences of modern man, whose heart is fed up with the fact that the environment is becoming more and more deprived of its original beauty.

The author has skillfully incorporated the mythological views of our people about the Garden of Eram into his work in order to describe the fact that the human psyche is always full of instantaneous beauty.

ABSTRACT

The purpose of the study is to assess the environmental and hygienic impact of production factors on the health of poultry farm workers and to develop measures to improve working conditions, improve the environmental situation on the territory of farms. It is established that the unfavorable factors of the production environment of poultry farms are strenuous physical labor, neuropsychiatric stress, the impact on the human body of chemicals, bacterial and dust aerosols, fungal microflora, excrement and other products of poultry life.

KEYWORDS: Ecology, Hygienic Requirements, Working Conditions, Production Factors, Manual Labor.

INTRODUCTION

Poultry farming is the most industrially developed branch of animal breeding. Working conditions at poultry enterprises have a pronounced specificity, which determines the specifics of sanitary supervision at each technological process stage. The leading organizational forms of industrial poultry farming are their specialization in the eggs and meat production. Industrial poultry farms are built mainly according to standard projects designed for the maintenance of 250-500 thousand laying hens, 3-10 million broilers, 1-1.5 million ducklings, 0.25-0.50 million turkeys or ducklings per year. According to the State policy, in order to provide the population with meat products and eggs, at the initiative and support of President Sh.M. Mirziyoyev, starting in 2017, the organization of poultry complexes and poultry farms began to develop rapidly. At present, there are more than 60 poultry complexes and about 250 poultry farms in Bukhara region alone.

The research purpose: giving an ecological and hygienic assessment and the production factors influence on the health of workers in poultry farms and developing measures to improve them.

Materials and methods: The work was carried out on the basis of JSC "Bukhara Parranda" of Kagan region. The study of working conditions at each production stage was carried out by the sanitary inspection method and observation. The temperature measurements and the premises humidity at each production stage were carried out using an aspiration psychrometer (Sanitary Rules And Norms of the Republic of Uzbekistan 0324-16), which consists of ammonia, hydrogen sulphide, carbon dioxide - by aspiration method using the analyzer (SS 12.1.005.88) and dust by aspiration method.

RESULTS AND DISCUSSION

The production process at the enterprises is organized according to the flow method, taking into account the biological characteristics of the bird's body and consisted of a number of technological stages. These include obtaining hatching eggs from parent (brood) flocks; incubation and withdrawal of day-old chicks; their cultivation and recruitment of replacement and industrial herds; an industrial herd maintenance that provides the main products; primary processing of birds; preparation and distribution of feed; recycling. In the shops of the parent flock, intended for obtaining fertilized eggs, birds are kept in groups (4-5 roosters and 30-40 chickens) in two - three-tier automated cage batteries of the KBMP, KBR-3 type, or on the floor on a deep non-removable mat, mesh floors.

In the shops of an industrial herd, laying hens were housed in mechanized and automated cage batteries. The main operations in batteries (feeding, drinking, cleaning manure) are mechanized and automated, the eggs collection in automated sections was carried out by belt conveyors with a storage drive fed to the table, from where the eggs were collected, packed in cardboard boxes, or immediately fed by conveyors to the egg warehouse.

For the cage keeping of the parent and industrial herd, pavilion-type premises were built, for the floor, as a rule, one-story. The poultry houses size and their number are determined by the farm capacity. One poultry house accommodates 12-80 thousand laying hens, 10-20 thousand broilers and 4.5-6.4 thousand heads of parent stock. Buildings for keeping poultry, especially bearing chickens, were envisaged mostly windowless with extended daylight hours to 17-18 hours due to artificial lighting.

The microclimatic keeping conditions of an adult livestock of productive poultry in the workshops of the parent and industrial flocks corresponded to 12-18 °C in the cold and 18 -20 °C in the warm periods of the year with a relative humidity of 60-75%. At the same time, the maximum permissible concentration of ammonia is 10 mg/m, hydrogen sulfide -1 mg/m - for broilers and 5 mg/m for other bird species, and carbon dioxide 0.2% by volume. To ensure the required parameters of the air environment in the poultry premises, ventilation and heating systems of the "Climate" type are equipped, capable of operating in automatic mode according to a given program.

In hatchery shops, hatching eggs are sorted and stored in a warehouse at a temperature of 4-12 °C. According to a specific schedule, batches of eggs in the amount of up to 14-15 thousand pieces are most often disinfected with formaldehyde vapor, placed in trays and placed in incubators. During incubation, the equipment operating mode is monitored with the help of instruments and biological control is carried out on the 6th, 12th and 18th day (translucent eggs on mirage tables and weighing trays with embryos). Tilting egg trays are transferred to hatcher on days 19-20. At the end of the incubation, the young are selected from trays into boxes,

subjecting them to zoo technical sorting and, if necessary, additional sorting by gender, and transferred to other workshops. Hatchers, implements and workplaces are thoroughly cleaned and disinfected. Incubation waste is sent for recycling.

The hatcheries were located in free-standing one-story buildings, where incubation and hatching zones for the installation of incubators, rooms for sorting and storing eggs, a disinfection chamber, a washing room, utility and auxiliary rooms, including a sanitary inspection room, were provided. The most widespread are incubators with external servicing of the "Universal" type, the operation of which is fully automated, and the temperature in the chamber is maintained at 37.2-38.3 °C at a relative humidity of 49-64%.

In the workshops for growing young animals, the livestock were housed in age cage batteries (KBE-1, KBA-4, BKB) with transplants on the 30th, 60th and 120th days or in universal cage batteries designed for one-stage non-stop poultry rearing (KBU -3). Cell batteries are equipped with devices for mechanized distribution of feed and manure removal, groove, nipple micro-bowl shelves and removable electric heating devices. When fully kept on deep, permanent bedding, the birds were planted on the floor covered with a layer of wood shavings cut with straw 20-25 cm thick.

The air temperature in the places where the birds are located should be maintained at 35 °C -26 °C for the first 10 days and 26 °C -20 °C thereafter at a temperature in the hall of 28 °C -18 °C, relative humidity 55-70% and movement speed air 0.5-0.6 m / s. The gases content, according to zoo technical requirements, should not exceed 10 mg/m³ for ammonia, 5 mg/m³ for hydrogen sulfide and 0.2% for carbon dioxide [5,6,7].

Slaughterhouses of poultry farming were completed with flow-mechanized conveyors with spatially suspended conveyors with a capacity of 500-3000 heads per hour. According to the technological stages, the labor division of workers of poultry farms is carried out. To care for poultry in the workshops of the parent and industrial herd, teams and teams are organized as part of poultry operators, mechanics, operators, night and auxiliary poultry women, electricians. Work in these workshops with caged birds was characterized by moderate physical exertion and a certain neuro-emotional stress during the performance of operator functions. In workshops with floor keeping of poultry, the low productivity of manual labor increases.

The poultry-operator in the workshops of the parent and industrial flock from 15-25% of the time was busy with the poultry culling, 10-15% - watching the feed distribution, 30-35% - collecting and laying eggs in containers and up to 20% - washing troughs with a brush. At the same time, the operations associated with walking make up 35-55% of the time, and during the shift, the worker walks a distance of up to 10-12 km. (time study materials). A significant amount of physical labor, especially in the first 10-15 days of caring for a bird, a pronounced dynamic component and the need to maintain a forced working position for a long time are characteristic of work in the workshops for rearing young animals; in cage keeping - bending low or standing with arms raised high at the low upper tiers of cage batteries; in outdoor keeping birds - low bending state. In the majority of poultry farms, in the first 10-20 days, especially with floor keeping, the young were handled manually, which creates great physical activity.

In the first 15-30 days, the poultry operator spends up to 40% of the time, by clear regulation of work processes for day and night, for manually dispensing feed at least 4 times in a 6-hour shift, 15-20 for washing drinkers, feeders and equipment hot (90 ° c) solutions of disinfectants. At this

stage of the technology, the operator is exposed to physical stress, high humidity of 60-90% and the influence of disinfectants. Work in hatcheries was characterized by a certain cyclicity, associated with significant physical exertion and accompanied by pronounced neuro-emotional stress. [5,6,7]

Slaughter shops were serviced by personnel with a narrow specialization in individual technological operations slaughter, gutted and monotonous production operations in the slaughter shops were carried out manually with intensive working movements at a high speed of execution of the technological process cause a high monotony of labor against a background of significant eye strain and concentration of attention (established by a survey personnel) within 10-18 mg/m³ (research continues in this direction).

The greatest amount of dust is found in the breathing zone of workers during the dry feed distribution, culling and catching of poultry, cleaning of premises 14-18 mg/m. The dust of poultry houses is predominantly organic, animal (down, feathers, dandruff, droppings, etc.), vegetable (feed, litter) origin, which are strong allergens. The production intensification and the rapid development of poultry farms in the context of industrial technology are accompanied by the rapid accumulation in the environment of various kinds of microorganisms, including those pathogenic for humans. With a specific feature of poultry production, bacterial contamination of the air reaches significant values. According to the literature, 7.5-22 thousand microorganisms are found in 1 m³ of air in poultry houses. When the content of single-tier cell bacteria is up to 509 thousand, with a full content of poultry per 1 m - 1 million microbes. Microbial contamination of the open atmosphere on the territory of poultry farms is 20-45 thousand colonies per 1 m³. The microflora of poultry farms consists of opportunistic microorganisms (Staphylococcus aureus and White, hemolytic streptococcus, intestinal coli, etc.), along with them, pathogenic microorganisms of the intestinal group, especially Salmonella, causative agents of psittacosis and toxoplasmosis, fungal microflora are found. This is the material for further research. [3,4, 7, 8] The conducted research showed that poultry farms had a significant impact on the state of the air environment in the surrounding area (tab).

Some parameters of chemicals around the poultry complex

Distance from the poultry complex (m)

	chemical substances	200	400	600	1000	1500	2000
1	Ammonia content mg/m	250	175	98	42	19	9
2	Hydrogen sulfide content mg/m ³	18	13	9	6	4	1,5
3	Carbondioxide content %	0,9	0,7	0,6	0,4	0,3	0,2

The maintenance personnel of poultry farms, when caring for poultry livestock, had to stay for a long time (6-8 hours) directly in the premises for keeping poultry, where, according to zoo technical requirements, a certain microclimate is maintained (temperature 30-35 ° C, humidity 70 + 80%).

In the studied poultry farm in the workshops and in some areas, the microclimate parameters did not always correspond to the sanitary and hygienic standards: in the cold season, the air temperature in the buildings for young animals was 28-35 ° C, in the buildings for keeping the

parent flock and industrial meat breeds of poultry, on the contrary the temperature is kept at a relatively low level (2.5-12 °C), the relative humidity of the air during this period ranges from 49 to 90%, depending on the features of heating and ventilation at an air speed of up to 2.5 m/s. The air environment of poultry houses is polluted by gaseous products, in particular ammonia, hydrogen sulfide, intestinal gases, carbon dioxide, which are formed during the life of the bird and as a result of the decomposition of organic substrate (feed, litter, droppings, down, feathers). The amount of continuously generated gases is determined by the age of the bird, the way it is kept, the state and organization of forced air exchange.

When chickens are kept from 1m of litter, ammonia 10-25 mg/h, hydrogen sulfide 4-15 mg/h, carbon dioxide 4-5 mg/h are released. With a cage keeping of 50 thousand laying hens, 127.5 m³ of carbon dioxide are produced every hour. According to our data, in the premises for the content of laying hens, the ammonia content was 15-35 m³, hydrogen sulfide 10-15 m³ and carbon dioxide 5-8 m³. The above factors are not indifferent to the body of those working in poultry farms. The most unfavorable factor on poultry farms is dust. The concentration of dust in the air in poultry houses varies widely.

In a laboratory study around a poultry farm at a distance of 1000 meters in the atmospheric air, the concentration of ammonia was 42 mg/m³, hydrogen sulfide - 6 mg/m³, which dictates the need to revise the sanitary protection zone when planning the construction of poultry farms and complexes.

CONCLUSION: Thus, the unfavorable factors of the working environment of poultry farms are intense physical labor, neuropsychic stress, exposure to the human body of chemicals, bacterial and dust aerosols, fungal microflora, excrement and other poultry waste products.

The above urgently requires a qualifying scientific analysis and the development of scientifically grounded and effective health improvement measures to improve working conditions for workers and protect the atmospheric air around poultry complexes and farms. Among the important recreational activities is the planning solution for the placement of poultry complexes and farms in relation to settlements. Poultry houses, auxiliary buildings and structures of poultry farms, in accordance with the sanitary standards and rules for the protection of atmospheric air SanRN No. 0350-17, should be located on the territory separated from the residential development by a sanitary protection zone from 300 to 1500 meters, which is subject to their adjustment.

The planning and organization of the territory, the placement of individual production facilities on it is carried out taking into account the zoohygienic and veterinary and sanitary requirements aimed at preventing the introduction of infection from the outside, preventing the spread of infectious diseases among the population, preventing air pollution from emissions from poultry farms. In order to radically improve working conditions and reduce the incidence of poultry farmers, the pace of transition from private mechanization to continuous automated technology based on multi-tier cage batteries with full automation of the processes of feed distribution, drinking, dropping, collecting eggs, management and control of the microclimate and other technological operations should be accelerated (disinfection of premises, eggs, washing equipment, inventory, etc.).

For the transportation of manure, it is necessary to use more extensively pneumatic removal systems, which allows reducing the number of maintenance personnel and vehicles, as well as improving the sanitary working conditions of workers in poultry farms. A prerequisite for the

protection of atmospheric air when cleaning poultry houses, hatcheries, feed shops and other production areas from dust and bacterial aerosols is the installation of mechanical filters of various designs on the inflow and discharge into the atmosphere. [1, 2, 3]

In incubator shops, it is recommended to use not only light, but also sound alarms on control and automatic control panels, in places of intense dust formation, local exhaust ventilation. Egg testers, candling and sorting of chicks should be done in dark colored clothing against a dark background. In slaughter shops, it is necessary to mechanize and automate production operations. The epidemiological well-being of poultry farms is ensured by the admission of service personnel and visitors to the production areas through sanitary and veterinary access checks with a change of everyday clothes for special clothes, clothes and shoes.

Preliminary and periodic medical examinations are important for the prevention of occupational diseases in poultry farmers, according to Order No. 300 M3 of the Republic of Uzbekistan of 2000.

THE NEED FOR INTEGRATION OF SOCIAL AND TECHNICAL KNOWLEDGE IN THE DEVELOPMENT OF TECHNOLOGICAL CULTURE OF STUDENTS OF HIGHER TECHNICAL EDUCATIONAL INSTITUTIONS

Gulnoza Alimjonova*

*Independent Researcher,
Fergana Polytechnic Institute
UZBEKISTAN

ABSTRACT

The article analyzes the modern pedagogical conditions, factors, stages, components, methods of developing the techno-cultural culture of students of higher technical education institutions. The article also explores the pedagogical mechanisms of ensuring the integration of social and technical knowledge in the formation of axiological attitudes in the conduct of technical creative activities of students. Systematic reforms have been carried out in our country to form the content of higher technical education on the basis of the integration of science and industry. The Action Strategy for the further development of the Republic of Uzbekistan includes the implementation of priorities such as "development of mechanisms for assessing the quality of education, improving the availability and efficiency of educational services" [1] and "large-scale training and retraining in the required specialties" [2]. The formation of integrated and systematic integrative knowledge, skills and competencies in learners and diagnostic assessment of learning outcomes play an important role in ensuring.

KEYWORDS: Education, Higher education, Higher technical education, Technology, ethics, Techno-ethics, Technical Creativity, Axiological attitude, Humanitarian knowledge, Technical knowledge, Integration.

INTRODUCTION

Today, the formation of the techno-cultural culture of future professionals, especially students of higher technical direction, is one of the important pedagogical problems. As a phenomenon,

techno-culture is an intellectual-cultural medium between techno-optimism and technopessimism, which combines the knowledge used in technology, different ethical-cultural approaches to the place of technology in the system of human-society-nature relations and technical behavior of people.

According to international experience, the deepening of the integral connection of production structures with the natural, technical and social sciences has a positive impact on the effectiveness of education. Integration processes such as further expansion of the integrative organizational function of education, modernization of forms and methods of education, formation of important personal and professional qualities also play an important role in further development of the theory and practice of techno-ethics, ensuring the harmony and continuity of innovative professional and technical potential. This requires examining the process of development of techno-cultural culture of students of higher technical education institutions on the basis of integration of pedagogical and technical knowledge by pedagogical diagnostic methods and development of relevant methodological recommendations on identified problems and expanding didactic opportunities of educational integration.

Systematic reforms have been carried out in our country to form the content of higher technical education on the basis of the integration of science and industry. The Action Strategy for the further development of the Republic of Uzbekistan includes the implementation of priorities such as "development of mechanisms for assessing the quality of education, improving the availability and efficiency of educational services" [1] and "large-scale training and retraining in the required specialties" [2]. The formation of integrated and systematic integrative knowledge, skills and competencies in learners and diagnostic assessment of learning outcomes play an important role in ensuring. In this regard, the study of the state of development of techno-cultural culture of students of higher technical education, the study of their professional competence in their field of specialization, the development and implementation of innovative methods of pedagogical diagnosis.

MATERIALS AND METHODS

The analysis of the literature shows that a new direction in the theory of technical education is the study of techno-culture - the culture of technology and human relations. Techno-cultural culture reflects the specificity of these relations and the importance of educational relations, the moral qualities of future professionals in the technical field and the nature of the factors that affect their personal and professional development.

Some scholars argue that techno-cultural culture is an interdisciplinary field of knowledge that embodies a broad reflection on technology, not philosophy [3]. There are basically two arguments to support this view. The first is that techno-cultural culture includes various forms of understanding this phenomenon and, as a result, is far from the classical philosophical-pedagogical traditions in terms of language. The second argument relates to the nature of the decisive tasks of techno-culture. A look at the methodology of solving these tasks shows that techno-cultural culture is mainly focused on solving two tasks. The first task is to understand technology, to form a clear idea of its nature and essence, not by the crisis of technology, but by the crisis of modern "man-made civilization." In the process of solving it, it is understood that the ecological, eschatological, anthropological (spiritual) and cultural crises of our civilization are inextricably linked. The number of so-called "civilizations" is growing. This implies the

impact of technology on all aspects of civilization and man, as well as the deep technical foundations of the development of civilization. [4]

RESEARCH METHODOLOGY

In the course of the research were used scientifically-philosophical principles and methods such as systematic, theoretical deductive conclusions, analysis and synthesis, history and logic, hermeneutic analysis, inheritance, universalism and nationality, comparative analysis.

ANALYSIS AND RESULTS

Many scientists associate the crisis of human culture and civilization with technical and technological progress. For example, M. Heidegger considers that the main problem of our time is that modern technology has turned both nature and man into its "servant" (a functional element of technology) [5]. K. Jaspers also speaks about the same point, noting that man is becoming one of the types of raw materials for processing and can not get rid of the judgment of the technique he created [6]. The saddest thing is that as a result, both nature and man are degraded, destroyed, because the inanimate machine is becoming a simple functional element and material of the factor of production. L. Memford sees the cause of the crisis in something else - when the importance of "megamines" (complex hierarchical structures of human activity) in culture has increased. It is clear from such considerations that there are views on technology as a factor in not only progress but also crisis. Therefore, the decision of the axiological approach to technology and the formation of skills of techno-cultural culture in the future specialists of the technical field has an urgent pedagogical significance.

The University of Massachusetts (USA) is working to create a methodological framework for multidisciplinary educational complexes in the formation of techno-cultural culture among students of technical higher education, to ensure the sequence of integration-divergent processes, to develop systematic models of integrative education and to improve diagnostic methods. Belfield Pedagogical University (Germany), National Advice on Pedagogical Technology (UK), Seoul Cyber University (South Korea), Center for Pedagogical Technology (Russia), Republican Agricultural Research and Production Center (Uzbekistan) and other prestigious research centers and universities scientific research is being conducted in educational institutions.

In recent years, a number of important scientific results have been obtained on the research problem. Methods for the implementation and diagnosis of an integrated system of knowledge aimed at shaping the techno-cultural culture of students of higher technical education (Massachusetts University); on the basis of modern didactic means of teaching the system of an assessment of development of professional opportunities of future experts on the basis of integrated technology (Institute named after Frica Bauer) is created; the organization of the process of vocational education on the basis of interdisciplinary integration, the development of professional intellectual and psycho-emotional development of future specialists in the field of technology and the technology of its assessment (National Advice on pedagogical technology); the theoretical foundations of interdisciplinary interaction of subjects in the humanities and technical cycle and their application to practical activities are diagnosed (Seoul Cyber University); developed an algorithm for designing the activities of teachers and students in the context of the principles of integrative design and quantitative-qualitative approach (Tsentr pedagogicheskix technological); The mechanism of integration processes based on the use of modern resource-saving technologies in the education system of the republic has been developed

and the directions of complex diagnostics of real demand and needs for future specialists in the labor market have been introduced (Fergana Polytechnic Institute).

Today, scientists are talking about integrative-pedagogical concepts, that is, the unity of systematized views, rules and ideas that determine the content and direction of integrative-pedagogical activity in this or that field.

The results of the analysis show that there are different views on the conditions of integration of educational content. But, in our view, from a general point of view, they do not contradict each other, but rather complement each other in content. Admittedly, the views of scholars in some areas are close. For example, the terms “research objects must be compatible or close enough in content”, “research methods that use the same or similar content in the integration of academic disciplines” are more appropriate in terms of meaning: “integration components to specific connection points , Must have a degree of "brotherhood." Despite the differences in the expressions, we see a commonly calculated sign for the conditions listed above. This is the semantic closeness of the integrating components.

Based on the analysis, the following conditions of integration of methodological significance for the study were identified:

- The presence of different elements that are close to each other in terms of content (proximity of research objects, the same research methods or their proximity to each other, general theoretical concepts, laws);
- The need to integrate them into a whole, based on the purpose of education (the basics of integration);
- Maintaining the independence of the components at the minimum level necessary for the formation of integrity.

Ensuring interdisciplinary integration is now an objective need, as improving the professional training of future vocational education teachers requires a combination of training in general (pedagogical) and field (technical) disciplines. The interdisciplinary integration proposed in the study served to reveal the potential of academic disciplines in the study of cognitive and technological problems. The study clarified the differences between concepts that are close in content, such as integration, interdisciplinary, interdependence, membership. In fact, they are concepts that complement each other with content, character, connection, and relationship, reflecting the holistic picture of the unification process that takes place in education. These concepts were interpreted as integration, interdisciplinary, interdependent. The relationship between integration and interdisciplinary interdependence is much more complex.

A unique system is created on the basis of interdisciplinary, interconnected, integrated. Interdisciplinary connections allow the content to be established at the level of closely related concepts, topics, sections of academic science, and for students to consciously deepen their knowledge, but this does not ensure their systematic connections. Testing the possibilities of interdisciplinary connections in practice did not lead to significant changes in the level of knowledge acquisition, the nature of learning motives, or the level of personal development. According to researchers, it is desirable to prioritize the concept of interaction between general and vocational education, which is ensured not only by means of interdisciplinary communication, but also through the application of specific principles: polytechnic, membership,

professional orientation, problem-solving and others. However, despite some achievements, it does not allow students to significantly increase their level of knowledge, skills and abilities. In our opinion, a qualitatively new level of vocational education can be achieved in the context of an integrated educational process based on integration and differentiation of knowledge, semantic generalization, the principle of "enlarged units" and the "technological principle". The integration (synthesis) of general and special knowledge is an important condition for improving vocational education.

In the process of higher technical education, it is important to form the techno-cultural culture of future specialists on the basis of the integration of socio-humanitarian and technical knowledge. At the same time, it is necessary to integrate technical knowledge with philosophical and moral knowledge about the current place of technology in the human-society-nature system in the formation of students' techno-cultural culture. At the same time it is necessary to teach students the subject "Technical Philosophy and Techno-Cultural Culture".

Given the characteristics and nature of techno-cultural culture, the content of teaching this subject is systematized as follows. All its components are divided into three sections: basic, additional and basic sections.

The following courses are taught in the main department:

- History and essence of technology;
- Technical concepts and essence;
- The genesis of technology in culture;
- Concepts and essence of technology;
- Technical environment and technical presence;
- Ethical and axiological problems of techno-cultural culture.

Additional section courses:

- Technical history;
- Properties and formation of science;
- Features and formation of engineering activities;
- Traditional and non-traditional design;
- The structure and formation of technical sciences;
- Technique and beauty (design research).

The Basics section includes the following courses:

- Ethics and techno-cultural culture;
- Theory of activity and techno-cultural culture;
- Axiology and techno-cultural culture.

We will discuss these sections in more detail. First, it is important not to be content with stating certain points in the main section, for example, only the author's point of view or any other

authoritative point of view. At the same time, the content of education is determined by the communication of different perspectives, research programs. But this means that the basic unit of educational material is the intellectual situation. The intellectual situation can be different, for example: overcoming certain difficulties and problems, promoting a certain research program and trying to implement it, criticizing the approaches defended by representatives of other directions, and so on.

The second feature of the approach is the separation of 'reflexive' content. In turn, this implies a special methodological reconstruction of the content on the basis of activity theory, thinking theory, cultural studies and some other special disciplines.

It is self-evident that the forms of narration in the main section should be problematic and dialogical, in which reflexive factors should be widely used.

Through this science, for example, the great philosopher Heidegger must understand the problem that man himself has already become a "factor" of technology, and that nature must also become a "factor," and form a critical attitude to it. While researcher J. Martin acknowledges that it is easier to destroy the planet itself today than to end the damage it has done to the planet, at the same time, "technology has created this problem, but its only solution is not to hinder the development of technology. is a two-way development. To abandon technology or to stop its development is to condemn the world to unprecedented needs ... It is necessary to choose and develop technologies that are compatible with nature. " [8] In short, some philosophers believe that technology should be humanized, harmonized with nature and man. At the same time, some philosophers [9] try to justify the idea that any attempt to humanize modern man-made civilization is in vain, because the system is able to demonstrate extreme resistance to such "cosmetic operations". It is noteworthy that both parties to the dispute provide more convincing evidence to support their views. Communicating such ideas to students in the classroom and interpreting their content will greatly contribute to the development of techno-cultural culture in them.

The methodological problem in the development of techno-cultural culture of students of higher technical education institutions is to achieve in their worldview - the process of reduction of technology to non-technical: activities, forms of technical rationality, values, certain aspects of culture. To achieve this, it will be necessary to acquaint students with the definitions given to the technical concept in the social sciences. For example, in the course of the lecture, the teacher of social sciences and humanities should give the answers of technical specialists to the question of what is technology and influence the development of their techno-cultural culture by rationally shaping their attitude to this definition. For example, the following definitions of technology can be used: technology is a means to an end, a specific human activity. Some definitions emphasize ideas and the role of their realization, the importance of certain values. For example, while analyzing the definitions of concepts proposed in techno-cultural culture, F.Rapp argues that for H.Beck, technology is the transformation of nature through the human spirit [10]. In his view, everything that gives material meaning to human desire is in fact technique. The idea of creative transformation of nature is one of the central ideas of F. Dessauer's work. After enumerating the numerous definitions given to the concept of technique, he gives it his own definition: technique is the real existence of ideas, which arises as a result of the processing of natural materials and objects. F. According to von Gottl-Ottlilienfeld, technique is the art of finding the right path to a goal in the subjective sense, and in the objective sense - a set of means and methods of action in

the context of a particular area of human activity. L. Tondl considers everything that a person uses to change certain properties of the objective world to achieve his goal as a technique [11].

It should be noted that in all such definitions of the concept of technology (reflecting certain approaches of researchers) its materialization occurs, that is, technology seems to disappear and is replaced by certain forms of activity, values, human spirit, various aspects of culture. Sometimes the technique is presented to the researcher not as a substance, but as a deep and universal aspect of any human activity and culture. This begs the natural question: is technology an independent entity, that is, a technique, or is it an aspect of human activity and culture?

Cultural studies, for example, show that in archaic culture the tools of labor, simple mechanisms and devices are understood in terms of the animistic landscape of the world. The ancient tools of human labor (weapons) contain spirits that help or hinder man, so the act of making or using weapons implies influencing these spirits (sacrificing or turning to oneself through prayer), otherwise the action is useless. or those who thought that the weapon would come out of the judgment of man and be directed against him. Such an animistic understanding of technology has also defined the essence and nature of ancient technology. In this sense, in the ancient world, technology was compatible with magic, and technology was completely sacred.

The formation of technology in the culture of the new era leads to the fact that modern man begins to see in technology the application of the laws of nature and his own engineering creativity. It is not a question of a particular interpretation of the technique, but of its cultural existence and existence. Technology (tool, mechanism, machine) lives as a spirit according to one "logic", according to another "logic" as a product of divine creation (medieval interpretation of technology), and according to another "logic" as a process of nature (power). In culture, technology lives and develops not according to the "laws of need and necessity," but according to the logic of the existence of ideas, cultural forms of consciousness, perceptions of the world (worldviews). But the perception of technology was different in every culture. Doesn't this mean that technology develops in sync with the process of evolution, even when cultures change? For example, the separation of technology in modern culture coincided with the formation of a separate cultural idea and scenario: in the natural sciences to describe the laws of nature, to create conditions that allow the separation and consistent use of natural forces and energy (defined as an engineering task); creating an industry capable of meeting human needs based on engineering developments. This raises the question of whether this idea and scenario should be included in the description of "modern nature" or whether they are directly related to technology [11].

Many scholars of the problem of techno-cultural culture, primarily historians and sociologists, advocate a view that can be called a socio-deterministic or contextual approach. According to this approach, techno-cultural culture is not a neutral means of solving problems, but an expression of social, political and cultural values. Techno-cultural culture combines not only technical ideas, but also the broad social values and interests of its designer and users [12].

CONCLUSION

Based on the above, the following was concluded:

1. Preparation for future technical and professional activities requires a systematic approach to improving the techno-cultural culture of students on the basis of integration of pedagogical-psychological theoretical and practical knowledge, interdisciplinary integration, integration of pedagogical and technical knowledge.
2. The growing demand for technical specialists in society is due to the need for integrative (complex) application of social and technical knowledge in higher education, the need to equip future professionals with integrative knowledge and insufficient pedagogical conditions and methods for the widespread introduction of integration trends in pedagogical practice. shows.
3. An algorithm for the introduction of integrative education and the method of diagnosing its results, which serves to increase the effectiveness of professional and pedagogical training, is an important factor in the formation of the techno-cultural culture of students of higher technical education.
4. In the formation of the techno-cultural culture of students of higher technical education it is necessary to include the subject "Technical philosophy and techno-culture" in the block of social sciences and humanities.

MODERN PEDAGOGICAL FACTORS FOR THE DEVELOPMENT OF ANALYTICAL THINKING IN FUTURE ECONOMISTS

Gulsanam Nazarova*

*Independent Researcher,
Fergana Polytechnic Institute
UZBEKISTAN

ABSTRACT

The article analyzes the modern pedagogical conditions, factors, stages, components, methods of developing analytical thinking in future economists. The article also examines the pedagogical-hierarchical system of analytical thinking skills, forms of manifestation in future economists. In the process of educating future economists, the formation of their analytical thinking should always be approached from the point of view of nationality and national interests. In studying and evaluating the level of economic development and the system of economic relations in each period, it is expedient to rely on objectivity and fairness, to form the skills of communication on the basis of analytical thinking.

KEYWORDS: *Thinking, Analytical thinking, Future economist, Education, Higher education, Teaching and learning process, Method, debates, Methodological requirements, Effectiveness of teaching and learning, Debate, Independent thinking.*

INTRODUCTION

Today, educating new independent-thinking, creative students remains one of our main challenges. Indeed, in the student years, young people rise to the stage of biological perfection, social maturity, and physical fitness. Important aspects of intelligence in students, such as self-control, self-assessment, self-awareness, self-management, rise to a new high stage of development. In general, the development of analytical thinking in future economists, the formation of the scientific worldview plays an important role in general, social, economic and specialized sciences [1, 143].

As we build the national economy today, we need to deliver economic education in line with our national values, teaching a new system of economic relations in the minds of future economists. it is reasonable to assume.

In the process of educating future economists, the formation of their analytical thinking should always be approached from the point of view of nationality and national interests. In studying and evaluating the level of economic development and the system of economic relations in each period, it is expedient to rely on objectivity and fairness, to form the skills of communication on the basis of analytical thinking.

In future economists, analytical thinking develops rapidly and continuously, mainly in reading, practical training, and independent learning activities. Sometimes the process of speaking requires them to reproduce thinking, but practical exercises, independent assignments, laboratory assignments require productive (creative) thinking activities. Both forms of education are realized in future economists with the help of analytical thinking, mental labor, goal-oriented and coordinated attention. In the educational process, the theoretical, practical and methodological foundations of modern economics, in-depth theoretical, methodological, scientific and methodological knowledge on the laws of entrepreneurship and business are mastered. Especially in this period, analytical thinking serves as an effective intellectual tool for the student [2, 34].

MATERIALS AND METHODS

Psychologist AV Petrovsky said: "Thinking is a mental and socio-causal process closely related to speech, which is the search for and discovery of an important innovation ... thinking is the process of directly generalizing and reflecting reality in the analysis and synthesis." [3,14.] explains, E. Ghaziev noted that thinking has become the object of research not only in psychology but also in logic, philosophy and even cybernetics, and only in the framework of these disciplines thinking is studied in terms of scientific problems.[4,13] According to the scientist, thinking occurs in harmony with other mental processes, such as memory, attention, imagination, perception, which are closely linked to each other.

Psychologists divide thinking operations into types such as analysis and synthesis, comparison, abstraction, generalization, concretization, classification, systematization.

Analytical thinking is a type of thinking that is distinguished by its effectiveness in enhancing a person's erudition and intellect. Analytical thinking requires a different approach to the object of study, the ability to comprehensively examine its internal and external relations, as well as to come to an agreement. People with such thinking potential were called analysts in ancient Greece.

"Philosophy in the encyclopedic dictionary, the term "analytics" is interpreted as the art of analysis, discussion, proof [5, 25]. The term analytics was first used by Aristotle as the name given to the technique of logical analysis. His work, Analytics, focuses on two aspects of this way of thinking: the initial division of an object with a complex whole into simple parts and the complexity of thinking as they are examined.

The German philosopher Immanuel Kant called analytics the ability of man to comprehend and in his Critique of Pure Consciousness he was the first to suggest that the process of cognition be divided into two stages, analytical and synthetic thinking. G. Frege, the symbolic father of analytical philosophy, argues that in analytical philosophy, language is not only a means of conducting scientific research and expressing its results, but also the subject of philosophical analysis [7]. Analytical philosophy differs from other philosophical styles in that it expresses its

ideas in a separate sentence rather than in a general text. The philosopher-analyst pays serious attention to the clear meaning, logical connection, and accuracy of the thought and the statements in it. That is why it is always important to develop the analytical thinking of future economists, to educate them as independent thinkers, to develop their speech, to teach language.

RESEARCH METHODOLOGY

In the course of the research were used scientifically-philosophical principles and methods such as systematics, theoretical deductive conclusions, analysis and synthesis, history and logic, hermeneutic analysis, inheritance, universalism and nationality, comparative analysis.

ANALYSIS AND RESULTS

Today, research by scientists has shown that the development of analytical thinking in future economists will take place primarily under the influence of teaching. Thinking, on the other hand, takes place through pedagogical categories such as the content of education, the principles and forms of teaching. Therefore, the concept of “thinking” is accepted as a pedagogical category. Therefore, it is very important to study the formation of thinking in students from a pedagogical point of view.

Given that the development of analytical thinking in future economists takes place through pedagogical categories in the educational process, it is important to determine the extent to which forms of knowledge, principles, methods and forms of teaching are aimed at the development of thinking, especially conceptual thinking. This allows us to identify the conditions, ways and means of developing analytical thinking [1, 129].

You have to deal with different forms of knowledge during training. It is usually a common form of imagination, concept, law, principle, theory, idea, proof, rule, method, and other knowledge. In teaching, they are studied not in a general way, but in terms of the content of a particular subject. The mentioned forms of knowledge can also be studied as concepts. All types of activities aimed at mastering them are primarily aimed at the development and formation of conceptual thinking.

Contemplation is the highest form of human mental activity, intelligence and conscious behavior. Thinking is a tool for knowing the environment, social environment and reality, as well as the main condition for the rational implementation of a wide range of human activities. In the process of thinking, students form thoughts, reflections, ideas, hypotheses, etc., and they are expressed in the mind in the form of concepts, judgments, conclusions. [8, 114]

Directing future economists to analytical activity and forming the skills of logical, critical and analytical thinking in the development of this activity form the dynamic basis of their development as individuals. Indeed, analytical thinking is distinguished by the fact that the conclusions reached, along with a deep, comprehensive logical thinking on any issue, are proven. Therefore, it is important to teach future economists a specific approach, clear, logical, expressive and justified approach to analytical work. The level of thinking of each person also allows analytical thinking to emerge as a result of the diversity of knowledge. Therefore, from the middle of the twentieth century, special attention was paid to the development of analytical thinking in the pedagogical practice of Western countries.

Analytical thinking also prioritizes aspects such as logical thinking, speed of thinking, requiring a different approach to the problem, comprehensiveness, finding a reasonable solution to the problem. The owner of such thinking will also have the ability to understand the essence of the problem, to understand its causes and consequences, to come to the right decision. Analytical thinking allows you to search for new information, study it, systematize, compare, evaluate, think logically, rely on evidence, look critically at existing information, draw the right conclusions based on the information obtained. Consequently, the current level of development requires any professional to plan their activities through simulation, comparison, fragmentation, generalization, systematization, modeling, classification, targeting. The determination of these qualities is the basis for the formation of a unified information culture and a modern, humanistic worldview in students.

So how does the development of analytical thinking in future economists work?

1. The formation of analytical thinking is aimed at solving common problems in professional practice on the basis of interdisciplinary integration, directly related to the practical activities of students;
2. Through the use of advanced teaching methods, techniques and tools, innovative technologies that ensure the effective completion of this process;
3. Organization of professional debates, conducting analytical trainings, involvement in research projects;
4. Creating pedagogical conditions for students to master the mechanism of analytical thinking, effective use of various learning tasks and case studies.

Future economists will be able to assess their abilities, strive to analyze their achievements, increase the level of competence in science, based on the development of analytical thinking. This allows for the prediction of learning outcomes. We recommend that future economists prioritize the following practical components in the development of analytical thinking: valuable motivational, reflexive-evaluative, activity-oriented, cognitive components. The value-motivational component involves the formation of students' ability to clearly define tasks, effectively use the collected materials and information.

The reflexive-evaluative component influences the development of emotional-intellectual and evaluative-axiological abilities in students.

The activity-oriented component involves the formation of operational competencies, from simple views to the creation of a scientific concept, through the systematization, rounding of data, finding their specific aspects and proving one's point of view.

The cognitive component includes the formation of the ability to draw vital, scientific, philosophical conclusions, to develop thinking, to develop practical skills.

The development of analytical thinking in future economists will have a positive impact not only on the growth of the scientific status of each university, but also on the development of society.

Higher education institutions consist of a system of tasks and issues of a problematic nature that require continuous creative thinking. Every lecture, seminar, independent study, laboratory work also the problematic situation will be composed of components of the situation. Solving them

requires creative research from the student. This is because the period before the problem situation, the problem situation, and the mental processes after the problem situation also require the student to carry out creative search, research activities. Independent performance of tasks requires students to use thinking operations (analysis, comparison, comparison, abstraction, generalization, and grouping) and forms (comprehension, judgment, inference). Future economists will work tirelessly to produce a creative product in the process of mastering the basics of economics. Their desire to know, to acquire knowledge, becomes a constant, strong and lasting interest. In particular, students begin to engage in entrepreneurship and small business.

Even these young people can successfully participate in the Olympics, scientific and practical conferences, and competitions of inventors and innovators with the products of their intellectual labor. All this is done with the help of thinking, as a product of the process of more accurate expression of material existence, the desire to actively participate in creative activities, problem-solving and situation-solving processes. [9,45].

Modern education in economics universities is problem-based teaching, research, and problem-solving. Such a learning process is widely used in the practice of educational institutions in accordance with the goals of educating the creative activity of the individual, along with problem-based learning, illustrative explanation, information and programmed educational technology.

In our opinion, the role of student independence in the process of problem-based learning of economics is much more effective when compared to reproductive learning methods. The purpose of problem-based learning is to find answers to problems and questions that arise in the process of working with students, to acquire new knowledge by solving them, to arouse the interest of professors and teachers in creating and solving problem situations in student learning. Including:

1. Analyzing and thinking about the problems that arise in the economy is one of the important requirements for the development of independent intellectual activity of students. Such thinking is aimed at shaping the mindset, realizing that the student did not understand this, and paying serious attention to the meaning of the problem.
2. In order to make analytical thinking effective and purposeful in the process of teaching in higher education institutions, it is necessary to make it a part of the educational process, the basis of educational work. With the help of problem-based education, future economists develop a research approach to solving educational problems and specialization issues, the development of analytical thinking, the formation of skills for independent study.
3. Economic education helps students to effectively master their knowledge systems and intellectual and practical activities, to form analytical thinking, to use their new knowledge effectively in future situations, to solve educational problems, to teach independent research, to gain and develop creative experience. Analysis of tasks reveals opportunities to identify problem-based learning.

In order to build a strong democratic state governed by the rule of law and civil society in our country, the formation of a socially oriented market economy, the creation of a multi-sectoral economy, the implementation of structural reforms in the economy, ie economic reforms the formation of economic thinking plays an important role. This is because economic thinking is the

basis for the members of society to learn to think independently, to make decisions according to the situation in shaping their worldview.

In the current situation, the development of analytical thinking will play an important role in future economists. This is because analytical thinking is the basis for members of society to learn to think independently, to make decisions according to the situation in shaping their worldview. Analytical thinking is characterized by feeling the limit, knowing the norm, making a decision by comparing real possibility with desire, desire through calculation. [10, 78].

The development of analytical thinking in future economists will allow them to determine the accuracy, precision, authenticity, or relevance of what they reflect, feel, perceive, and imagine; In social life, in the educational process and in production, objectively occurring communication and subjective relationships between people are also manifested through analytical thinking.

CONCLUSION

In the pedagogical process aimed at the development of analytical thinking in future economists, it is necessary to pay special attention to the following:

1. Formation of integrity of educational activity and logical, analytical thinking in students.

Research shows that students are able to master the learning process from school, along with its components - learning issues, learning activities, and self-assessment. In this regard, it can be suggested that it is possible to start with the formation of learning activities in students, self-monitoring and assessment [11]. Because in this case, students can analyze and compare their learning behaviors;

2. Development of independent learning activities of students.

In the process of organizing lectures and practical classes, developmental education involves strengthening students' independent learning. Independent learning is defined as the teacher's homework and the usual learning activities that take place during the allotted time, as well as without his or her direct participation.

3. The formation of thinking characteristics for the development of analytical thinking in future economists. The basic operations of thinking are analysis-synthesis, generalization, comparison, classification. Thinking operations can be activated mainly during the training process. This includes the teacher's "Why?", "For what purpose?", "What are the reasons?", "Why was the result?" can be done through the discussion of questions such as.

4. Development of dialectical thinking in future economists in the course of training. It is extremely important to raise the philosophical consciousness of students of economics to teach them to think analytically. By engaging students in debates, discussions, and contradictory situations, explicit and implicit, open and closed contradictions, changes-subject relationships are clarified. During such lessons, the flexibility of thinking is formed, in which the student learns to analyze any situation, to identify changes and developments in it, to look at objects and reality from a different perspective. This feature is very important for every student in today's fast-changing world.

5. Formation of creative thinking in students in the transition to the disciplines of "Knowledge Economy", "Innovative Economy" and economics.

Involving future economists in problematic situations, discussing critical situations, finding and solving their problems independently, creating and defending their own projects, cases, serve for the effective formation of analytical thinking in them.

ABSTRACT

The family is an important part of society. The formation and development of the family took important place in direct connection with the political, economic, social, spiritual relations in the life of society. Changes in the life of society, people's lifestyle, living and working conditions, national moral norms, psychology, and religious beliefs also influenced the moral, legal, social criteria of family relations. When we study research on the problem of the family, the legal and moral foundations of family relations, the duty of parents to society and their children have always been in the focus of scholars. In this article, oriental thinkers and statesmen - Abu Nasr Farobi, Abu Rayhan Beruni, Abu Ali ibn Sino, Alisher Navoi, Shal (Tileuke) Kulkeoglu, Ahmad Donish, Abay Kunanbaev, Rizouddin ibn Fakhruddin, Fakhr-ul Banot Sibgatullah kizi, Abduraufit Fitrat and in the works of others, described exemplary advice and counsel on family-marriage relations, interpersonal relations in the family, the duties of parents, and the duty of children. Their works also pay special attention to family and family relations, so by analyzing the works of some of the great thinkers of the above, highlighting their pedagogical and psychological views, it is emphasized how relevant the problems of family life are today.

KEYWORDS: Family, Family-Marriage Relations, Interpersonal Relations In The Family, Family Upbringing, Parenting, Child Rearing.

INTRODUCTION

At various times in society, the issue of the family has been the focus of scholars. In particular, Eastern thinkers and statesmen - Abu Nasr Farabi, Abu Rayhan Beruni, Abu Ali ibn Sino, Alisher Navoi, Shal (Tileuke) Kulkeoglu, Ahmad Donish, Abay Kunanbaev, Rizouddin ibn Fakhraddin, Fakhr-ul Banot Sibgatullah kizi, Abdurauf Fitrat and in the works of others, family-marriage relations, interpersonal relations in the family, parental responsibilities, and exemplary advice and counsel on the duty of children are described.

Their works also pay special attention to the family and family relations, so we will explain how relevant these problems are today by analyzing the works of some of the great thinkers of the above, highlighting their pedagogical and psychological views.

The most valuable ideas in the sacred book "Avesto" of Zoroastrianism about family and sharia marriage, the relationship between parents and children, their duties and responsibilities, marriage and the choice of the bride are still relevant today. The Avesto also contains a number of ideas on family relations, family duties and child rearing. It depicts the head of the family as Nmanapati and his wife as Nmanapatni. The book contains information about Vira, the need for a man to think about marriage and children in addition to moral guidance, that a man has the right to marry and have more than one wife at the age of 16, and that the first wife is always the head of others. There are also. In the Avesto, intermarriage is strictly forbidden. This was done to keep the blood of the people and the seed pure, the offspring perfect. It states that large families should receive state benefits, and that women who give birth to two or three children at a time deserve to be rewarded. [12]

In the epics of the peoples of Central Asia, such as "Alpomish", "Kuntugmish", "Gorogli", "Oysuluv", "Layli and Majnun", "Yusuf and Zulayho", "Manas", "Qizjibek", "Qazi Kurpesh Bayan suluv", the theme of pure human relations, love, devotion, and fidelity is glorified. A woman has always been revered as a loyal friend and companion to a man, as a wise, resourceful, guardian of family peace. The woman has become an angel of grace to the family.

In our famous epics, such as "Alpomish", "Qizjibek" and "Manas" mentioned above, in the customs of marriage, special attention is paid to the physical abilities of the young man. The young man's physical ability was tested. For example, sport competitions such as cross-country horse racing, archery, long-distance shooting, and wrestling were held to determine whether a girl was worthy or unworthy. The contest is also reflected in such folk games as "Girl chasing", "Contesting", "Oltiboqan". These epics can give us a complete picture and information about the traditions of preparing young people for family life in ancient times.

REVIEW LITERATURE

Our holy religion, Islam, the Koran and the Hadith, which are its main sources, pay special attention to the formation of the future family and the need to choose future fathers and mothers-in-law, taking into account the purity of the offspring. The requirement that every parent who wants to be a bride or groom should ask about the future offspring of the bridegroom, or that every Muslim should know his "seven roses" is also rooted in Islamic spirituality, special emphasis is placed on family upbringing [8].

In "Hidoya" of B.Marginoni, it is written that the requirements for abortion and abortion are expressed in the concept of "guarantee". "Guarantee" means equality between husband and wife.

In marriage, both parties must be equal and worthy. On the contrary, there will be no marriage, the husband will not be satisfied with the wife, a wife will not be satisfied with the husband. It is wonderful for the bride and groom to be close to each other in lineage, social status, education, taste, faith, and property. But it doesn't matter if the bride is at a slightly lower level. Because, the husband is the head of the family, but if not, the bride may feel humiliated. Moreover, it undermines the groom's position as head of the family.

Among the monuments carved in stone, one of those who left a spiritual legacy with his educational ideas is the teachings of Korkit ota.

Korkit was a famous Kazakh singer, musicologist and scientist of the VIII-IX centuries. The educational advice and aphorisms of the scientist are of great educational value. Korkit left instructive advice to the next generation on respecting parents, family relationships, upbringing of a boy and a girl, various qualities of human character. For example, a girl who does not learn from her mother is bad, and a boy who does not learn from his father is bad. The saying that such a child is not good enough to unite the people and feed them from home is thought-provoking. The father pays special psychological attention to the character of women and divides them into groups. One group of women is the backbone of the family, hospitable, grown-up women, while the other is dishonest, impatient; the third is gossip, women who do not adhere to cleanliness [7].

The world-famous scholar and enlightener Abu Nasr al-Farabi (873-950) expressed his views on human perfection, happiness, education and upbringing, morality, and attitude to religion in his famous works "The City of Noble People" and "On Achieving Happiness" [3]. Speaking about ways to get rid of unnecessary traditions (which are still found in family life and marital relationships), Farabi says: "Leaders (husband or wife) must also change the past, which embodies bad habits. Otherwise, if he follows the requirements of the past and keeps his mood, there will be no ease, change and growth in life." He also emphasizes that "whatever helps (knowledge, morality, profession) to achieve happiness, it is necessary to try to turn it into something useful, to preserve and strengthen it" [3].

Another view of Abu Rayhan al-Biruni (973–1048), one of the thinkers of the East, on family relations is also noteworthy. In his views, Biruni pays special attention to the upbringing of women. In his book Mineralogy, he quotes parents' advice to girls who are getting married, emphasizing that peace, harmony, and happiness in the family are the responsibility of more women, and writes:

"My daughter! You leave the house you studied and go down to an unfamiliar house. You don't know all the qualities of your future groom. You will be the earth, and it will be heaven. So you treat him in such a way that if you are as humble as the earth before him, he will be as noble as heaven. Just as heaven makes the earth green with its healing rain, so it pleases you with its tender mercy. Again, if you are her maid, she will be your servant. Let your husband hear only soft and sweet words from you, do not sit in front of him in a naughty or old dress or without braids on your face and hair in order. A father named Abdullah ibn Jafar said while marrying his daughter:

- You should avoid jealousy, because it is the key to separation. If you are angry with your husband, he will arouse hatred. It is better for you to be kind to your husband, who is better than any magic, and to use water, which is the first of all fragrances." [6]

In his views, Beruni emphasized that family peace is in the hands of intelligent, intelligent, educated women.

Abu Ali Ibn Sina (980–1037) was one of the most distinguished thinkers in the field of family relations. Alloma's valuable insights, especially about how women should be in life, never lose their relevance. The section "Afsofi bekhtarin zanho" in her book "Tadbiri manzil" talks about the well-being of women.

The great scholar Alisher Navoi's (1441–1501) views on the relationship, duties, virtues of women and their role in the family are incomparable. In the chapter "On marriage and wives" of the work "Mahbub-ul-qulub", the thinker gave a wonderful account of marriage and its benefits, family etiquette and the virtues of women in the family. Navoi emphasizes the role of women in marriage: "A good wife is the state and happiness of the family. The cleanliness of the house is from it, the calmness and serenity of the host is from it. If it is beautiful, it is sad, if it is kind, it is nourishing. When there is wisdom, there is order in the household, and the utensils are clean and tidy." [4]

The pedagogical and psychological views in the poems of the Kazakh poet Shal (Tileuke) Kulkeoglu (1748–1819) are built on a social basis, suggesting that the garden at the head of the young man begins with the family. She said, "When a man meets a young man, he is a good wife. If his wife is bad, then he will leave the name of the husband in a bad name" he said, noting that if the young man's wife is good - the state of his head, and if he is bad - the husband is the salt of the land. Accordingly, the poet says in his poem "on women" that a bad wife fights with her husband, and when a guest comes, she frowns, saying that it is useless to drink tea from this house, and the guest leaves the house" [7].

In particular, Ahmad Donish, an oriental thinker who lived and worked in the second half of the 19th century, described in detail in his book Navadir ul-Waqoe (Rare Events) the "Description of marriage etiquette, conditions of marriage, hostility of mother-in-law and daughter-in-law." According to the thinker, after reaching a certain age, a person needs to get married. Of course, during this period, a person will understand the duties of family, family happiness, marriage, childhood, parenthood. Indeed, the sage states that it is the duty of every man (husband) to love and respect a woman. Family happiness is the desire of people to live up to their goals. According to Ahmad Donish, family happiness depends more on wives, because for a man there is no greater blessing than a righteous wife, the idea that unity, harmony and order in the family are in their hands, as well as the motives for marriage in marriage [5].

The poet and enlightener Abay Kunanbaev (1845–1904) in his works and sermons paid great attention to educational issues. The educational significance of the scholar's exhortations is extremely remarkable. In his poems, the scientist describes in detail the peculiarities, customs and traditions of the Kazakh people. For example, "Call the groom, hand the girl, start the wedding. Introduce the girl - let the people share your joy, there is a mess with friends, they will not be interesting without death", - said [1]. In the above verse, Abay described the existence of specific traditions of the Kazakh people - the introduction of the girl, the transfer, yor-yor, face opening. Abay also described the peculiarities of Kazakh girls in detail in his poems "Pen", "Girl's word", "Black of my eyes" and others.

Rizouddin ibn Fakhraddin, a Tatar scholar who lived in the second half of the 19th century and the beginning of the 20th century, wrote in his book "Family": morality, family and marriage,

family relationships, parental duties, children's duties, the role of wives in raising children, the general role of wives in marriage. Extremely exemplary advice and guidance were given on the role of the mother [9]. In this play, he emphasizes the following on the role of marriage and wives: "... it is known that the issue of marriage is one of the great things of Islamic law, and marriage is as necessary as the establishment of a country, and a number of regulations have been issued in this regard. Those who follow the rules that came out for the family will one day be able to make their families beautiful and finally be able to govern this small country. Therefore, more or less, they will live their lives with pleasure, and the few hours of their lives will be blessed." [9]

"If the family is like a ship, the wife is the rudder of the ship. Just as a ship with great power on the river follows the movement of the tail, so in the example of the country, the movement of the wife within the family is followed. The fact that the condition of the nations before us, at the same time as the condition of women, is worthy of proof proves the validity of this claim. It is clear that a nation whose wives are educated is educated, and a nation whose wives are uneducated is a nation without education, a nation whose wives are industrious, enterprising, and strong-willed is a nation that is tall and whose wives are lazy or extravagant." [9]

Fakhr-ul Banot Sibgatullah kizi, a scholar who lived in the late 19th and early 20th centuries, has such important educational works as "Girls' Education" and "Family Lessons". The scholar's book "Family Lessons" contains educational advice on women's upbringing, morals, etiquette, home and child rearing, health and family health, the relationship of relatives, mother-in-law and duties of the bride. [10].

He gives the following instructions on the relationship between mother-in-law and daughter-in-law: "When you say mother-in-law, the cold effect on the faces of brides and mothers-in-law when it comes to brides, unfortunately, is seen in every home. Few mothers-in-law are happy with their mother-in-law or mothers-in-law who are happy with their daughter-in-law. These misfortunes are undoubtedly due to a lack of upbringing. It is something born of ignorance. An educated lady knows how to honor and respect her mother-in-law, and a mother-in-law who knows herself knows how to love and treat the bride well. Saying that "The bride and her mother-in-law do not boil in the same cauldron," is nothing but empty words uttered by a hostile and uneducated woman.

Girls who go to the groom should think once and for all that a man called a mother-in-law is the mother of his wife's life. Her husband is someone who has lost her body. If this woman had not given birth to that land, she would not have been able to find this good land. He would not have taken her to his son if she had not wanted him. Just as it is a religious duty for women to respect their husbands, so it is their duty to pay homage to their mothers and relatives. Mothers-in-law should know that the eldest lady in the house is the mother-in-law. It is obligatory to follow the elders not only among the family, but everywhere. The bride is also a lady, but she must show her ladyhood by respecting her mother-in-law and her relatives. The mother-in-law is the eldest in charge of the house." [10]

Abdurauf Fitrat, one of the great representatives of the twentieth-century Turkistan Jadid movement, pays special attention to the family and its role in society. Book of thinker "Family or family management procedures" provides in-depth coverage of the need to start a family, the relationship of family members, the rights and duties of parents, children, the upbringing of

children [2]. In this play, the sage puts forward his valuable thoughts on what marriage and the future couple should focus on in the first place.

CONCLUSION

The conclusion from the opinions of our above scholars is that in women it is expedient not only to have external and internal beauty, but also to have a perfect moral image. This, in turn, is directly related to family upbringing. Many aspects of upbringing are directly related to the moral maturity of the father and mother, the warmth of the relationship between them, and the psychological environment in the family. Because the moral image of the parents plays an important role in upbringing.

The ideological unifying basis of all Eastern thinkers was that they emphasized the role of the family in the upbringing and development of the individual, especially the role of the family in the mental and moral development of the individual, the guiding and educating functions of parents and loved ones. While they place a number of qualities that can only be developed in the family - honesty, purity, courage, eloquence, kindness, honesty - above all other qualities, the high qualities of human relationships are passed from parent to child and their positive impact on society and expressed practical guidance in this regard in their philosophical, sociological, and psychological views.

LEXICAL AND SEMANTIC CHARACTERISTICS OF GEOLOGY TERMS IN ENGLISH AND RUSSIAN LANGUAGES

Nargiza Shuxratjonovna Sanokulova*

*English Teacher,
University of Geological Sciences,
Tashkent, UZBEKISTAN

ABSTRACT

The article discusses English and Uzbek terminological system of geology in lexical and semantic characteristics. The terminology systems of both languages are dominated by compression types of variance performing compression functions scientific text and compact presentation of scientific and technical information. However, in the Russian-language terminology system, synonymy wider: 67% options in Russian language, 47% in English language. During its formation, the geological term system has come a hard way. Between the state of this term system during its formation and in there is not and cannot be a complete correspondence, evidence of which are heterogeneous in time, sources and principles of nomination terms.

KEYWORDS: *Term, Terminological System, Synonymy, Antonymy, Polysemy, Homonymy, Doublets, Abbreviations And Acronyms*

INTRODUCTION

Progressive changes in modern science, technology of the late XX - early XXI centuries and occurring in the world globalization processes increase the role of information exchange between representatives of the world scientific and technical communities. Integration of scientific knowledge, their constant expansion and deepening raises interest of linguists in problems terminology. The importance of research in the field of terminology is that currently in the general literary language more than 90% of new words are special vocabulary.

It is noted that currently, along with new directions of terminological research (historical, cognitive, typological, sociolinguistic), the comparative terminology. Comparative analysis of terminological systems in different languages is carried out on the basis of the principles of

comparability, consistency, terminological adequacy, and sufficient depth comparison, accounting for positive and negative carryover linguistic knowledge, two-sided comparison, accounting functional styles and territorial unlimited.

The term, being a multifaceted phenomenon, is a multifunctional unit with a number of features that allow you to fully implement the specifics of its denotative and connotative meanings within the term system a certain area of knowledge. [5; 20] In our research, the term is understood as expressed in verbalized the result of professional thinking, an essential element professional communication: a term is a word or a phrase that calls the concept of a certain field of knowledge, requiring definition and being an element of a certain terminological system. Applied to the object of our analysis as a term we consider a word or a phrase, denoting the concept of the sphere of geology, which is an element of this terminological system and serves to ensure professional communication. Terms geology, forming a harmonious system, are included in macro system of terms of geological affairs and form common terminological space.

Main part

The evolution of geology terminology as a strict hierarchical system of concepts is inextricably linked with industrial development. During its formation, the geological term system has come a hard way. Between the state of this term system during its formation and in there is not and cannot be a complete correspondence, evidence of which are heterogeneous in time, sources and principles of nomination terms. Current terminology geology is an established, an orderly, but continuing its development system. Content term of geology that relates to a special concept characteristic of a private field of knowledge, determined by the current level of development of the relevant industry national economy. The relationship between the elements of a given specific terminological systems are due to the internal organization and the orderliness of the system of concepts of geology.

Research has shown that the terms geology can enter into a paradigmatic systemic relationship and demonstrate ambiguity and laxity of meaning. The data units are characterized by synonymy, antonymy, polysemy and homonymy.

Whilst analyzing term system, the presence of intra-industry synonymy and unconditional similarity of types of doublets (absolute synonyms, variants) of one term in both languages. The variety of types of variation of the term has led to the selection of several groups of analyzed units, among which the most frequent are as follows:

1) doublets that differ in complete coincidence of semantics with a partial difference in structure (opposition by variance create components of the term-phrase): a) doublets are term elements in an inconsistent definition function: *Газонапорный режим - режим газовой шапки*, [1;22] *axis - direction (ось)* [2;18]; b) phrases that match the base word, a doublet is a term element – terminologized adjective or participle in classifying function: *слой сбрасывания - слой опадания, ablation breccia - solution breccia (абляция брекчия)*; c) terms-phrases in which as a doublet term is the base word: *абсолютная хронология - цифра абсолютного возраста, abandoned mine - abandoned workings (заброшенная шахта)*;

2) doublets, semantically identical units of different language levels that have at least one material bond, which gives variants with different morphological and syntactic characteristics formal similarity: a) morphological and syntactic variants (elliptical

synonyms): *вулканический пенел* – *пенел*, *absolute bulk strength* – *bulk strength* [2;22] (*абсолютная объемная прочность* – *объемная прочность*); variants differ in complete coincidence of semantics when the presence of different types of formal structure of the term-word combination; when such doublets are formed, truncation occurs (due to certain professional lack of information) a term element restored from the context; this way variation in terms of geology is the most frequent; b) doublets formed by an elliptical way with the help of derivational affixes followed by transformation of the phrase into a separate significant word: *воздушная атмосфера* – *воздух*, [1;18] *accessory mineral* – *accessory* [2;29] (*аксессуар минерал* – *аксессуар*);

3) Abbreviations and acronyms: *Аномальновысокоепластовоедавление (АВПД)* [3;6], *Air Pollution Control Association – APCA* (*Ассоциация по контролю за загрязнением воздуха*);

4) Doublets - derivational synonyms: *Наращивание* – *аккреция*, *drill* – *drilling*;

5) Doublets - graphic options: *API gravity* – *общепринятая шкала Американским нефтяным институтом выражение удельного веса масел*. [1;74]

Synonymous relations of units of terminological systems are complemented by antonymy, which plays an important role in determining the place of the relevant concepts within a specific areas of knowledge. In the terminology system of geology in Russian and English, the antonymy is based on opposing denotations for the purpose of their subsequent classification when building a strict hierarchical system within the framework of this the field of knowledge and the terminology system serving it.

In the Russian- and English-language terminology system of geology, depending on the expressed type opposites identified the following groups of terms-antonyms:

1. By the structure of the root: a) antonyms of different roots, expressing the qualitative opposite; value opposite is represented by the meaning of the root of the word: *надземные воды* – *подземные воды*, *backsight* – *foresight* [2;217] (*обратное визирование* – *предвидение*); b) single-root antonyms in which the semantic opposition is expressed by the first part of a compound word or various prefixes: *подземная кладовая* – *надземные ресурсы*, *productive horizon* – *unproductive horizon* (*продуктивный горизонт* – *непродуктивный горизонт*); this type of antonymy is the most common in the English terminology system. Most often in the role indicator of semantic opposition are the following prefixes: *не-*, *без-(с-)*, *дез-*, *де-*; *-un-*, *im-*, *in*; paired prefixes: *над-* – *под-*, *микро-* – *макро-*, *за-* – *внутри*, *гипо-* – *гипер-*, *суб-* – *сверх-*, *олиго-* – *поли-*, *ре-* – *де-*: *confined aquifer* – *unconfined ground water* (*замкнутый водоносный горизонт*) [4;390]

2. By semantic structure: a) gradual (contra, opposite): *degradation* – *aggradation* (*деградация*) [4;438]; b) non-gradual (contradictory, complementary): *destructive wave* – *constructive wave* (*деструктивная волна*, *разрушающая волна*) [4;446]; contradictory is transmitted using single or paired antonymous prefixes: *не-*, *без-*, *non-*, *dis-*; *anti-*, *un-*, *in-*; *вос(з)-* – *нис(з)-*, *на-* – *под-*, *а-* – *де-*, *ex-* – *in-*, *de-* – *re-* and the suffix *-less*: *concordant coastline* – *discordant coastline* (*согласная береговая линия*) [4;386]. Similar antonyms prevail in the studied term system and are quite common in the same context, including contact use.

3. Contextual antonyms: *closed lake* – *open lake* (*бессточное озеро*) [4;361]

CONCLUSION

The study showed an unconditional similarity in education variants of the term in Russian and English: availability in one the terminology system of original and borrowed terms, morphological, grammatical and elliptical variants, and different types of abbreviations based on the principle language economy. The terminology systems of both languages are dominated by compression types of variance performing compression functions scientific text and compact presentation of scientific and technical information. However, in the Russian-language terminology system, synonymy wider: 67% options in Russian language, 47% in English language.

Research has shown that antonymic terms in both languages have a similar structure, express a relationship of contradiction a qualitative feature that can be analyzed and measured, a binary representations of the concept in the oppositions "top - bottom", "inside - outside", "Increase - decrease", etc. Antonyms included in the investigated term system, differ in contact use and coincidence lexical compatibility.

ABSTRACT

The article describes the pedagogical foundations for the formation of readiness of students to work. The concept of labor activity or readiness to any activity is widely interpreted in pedagogy. The formation of students of employees is one of the most pressing issues of today. The article features ways to attract students to useful labor and the formation of students for employment.

KEYWORDS: *Work for Work, Education, Work Education, Labor, Continuous Work Activities, Criteria and Principles, Indicators.*

INTRODUCTION

The issue of involvement of students in the employment and beneficial activity is one of the modern teacher's goals. Student training is a process directly connected with radical changes in society and production. The concept of readiness to work is interpreted differently in the field of pedagogy, despite its widely used literature. And Kruteskiy describes the concept of readiness in its "Psychology of students' mathematical skills": "The sum of the characteristics is a much wider understanding than abilities; we call it readiness for any activities. We find it appropriate.". In other publications, an important condition for the opinion of any activity, in particular activities, is determined in the meantimes that encourage the future activity. In order to prepare readiness for employment should not be limited to taking into account the activity and skill of the person, taking into account its inner strengths, creative opportunities and specific character characteristics in assessing the readiness of the individual is also important.

Readiness to work with work has a complex structure, the consideration of many syllabilities is the main leading directions in their study. There is a complex structure of labor activity and training, which includes the moral and reward qualities of mutually close to each other, the knowledge of socially important motives, professions and work activities and skills and practical skills and practical skills. covers the skills.

Recently, observations show that the analytical functional approach is limited to studying readiness to work. Well-known Russian Peagogi V.A. Sukhomlinsky's opinion pollutes: "We are not only able to enter the skill achieved by practical skills and qualifications, and the skills achieved by adults. This is just one side of the labor. The essence of labor culture is the role and importance, intellectivity, intellectivity, spiritual wealth, and vocational, vocational activity of the work of a person is the guibution and improvement of human goals. "

Readiness to employment is also considered as a single concept that uses all the researchers, which set the individual, which allocate the individual.

The readiness of the readiness to work is a concept that combines all the features of the human activity to society, substitutes to the social duty to society, substitutes to the active profession, the foundations of knowledge, the basics of the identity of the person, individual psychoselessness and socially beneficial involves the skills.

Preparation of students for employment is a broader sense that it is perfect in all respects.

The pedagogical scores show that schoolchildren should form the following two types:

1. Polytechnicization Klabs, the willingness of nationalornomial preparation that contains national engineer Polytechnical Skills and Qualifications.
2. Moralism based on social and labor activity of the person in accordance with the requirements of the community.

Preparation of students in the educational process in general education schools is to form preparation in the field of agriculture to perform the tasks that each worker should perform.

Depending on the above statement of the readiness of work, students can be divided into the following structural parties: knowledge, economic knowledge, skills, and skills, and spiritual readiness, physical readiness, physical readiness , choosing a profession and consciously choice of profession.

The current stage of the development of our society, the nature and content of labor, the nature and high demand for human development will be given to life. Accordingly, the one should make clear changes in the joy of life. Each student must develop education and even pre-school schools and even pre-school classrooms, later in grades of higher grades above, and then continue their knowledge in vocational education. It is to teach all its strengths and abilities to expand political knowledge, arms with modern knowledge, and combine physical labor in every way.

Based on these cases, the youth of business and entrepreneurs seeking to convey the public education system, disciplined, disciplined and initiative, creative, and regularly increase its knowledge and skills, and business. Preparation of the younger generation for labor is one of the main tasks of the training process at general education schools.

Labor education and tasks are resolved in primary schools in primary education systems and throughout the educational and entities. At this point, job classes play a leading role. The issue of training and life of students to work and life is one of the current issues today. Students should always be clear, its various types of their types are a strong place, which are strictly identified in the social production process. The current production process is facing high demands not only to technologies, but also on people ruling this technique. Closing students in detail, they involve attracting them to the various various activities of useful activity, which is considered a key leading activity. This requires students with the socially beneficial work of students in general education schools and requires the implementation of education by combining education. Labor is a key toilet in comprehensive way, is an important spiritual virtue of man in manusing his identity. The proper organization of labor education should be taught to overcome the challenges, not abruptly abandoning the hardships, but not to abandon the case in achieving the assignment. . Positive results here are important to show the feelings of pleasure, enjoyment and satisfaction of satisfaction. Personal psychological properties such as the interest, ability, aspiration of the person are formed in labor.

Organization of students in national values in improving the efficiency of students on the basis of national values, the widespread use of labor traditions and national crafts of the Uzbek people is one of the main directions.

Today, the school students' readiness to work with the formation of scale soyosiy social, economic, demographic, ethnic, educational point of view, looking optimistically. In secondary schools, students show that they have a number of shortcomings that need to be decided to work.

Including:

- The need to form economically and practical readiness on students today;
- Not their adequate identity in the educational process with different conditions for the labor activity;
- These include the fact that the types of national handicrafts are not reflected in the context of labor education in preparing students for their employment.

It should be noted that the growing principle of schools, the growing principle of labor activities in the field of industrial and agriculture is largely determined the relevance of this economy in many ways in terms of the growing principle of labor.

It is known that labor is a necessary socially useful activity to create necessary material and spiritual resources for the lives of people. Labor is one of the intellectual activities of this man and one of the most glorifiable. Working is the supreme form of a unique mind - matter. The two characteristic funds of any manufacturing process is available and the working section, and on this basis, we view a number of technological and labor processes. When it is said technological process, a part of the production process related to changing the product of production is understood. When we are called the labor process, a part of the production process is the work or part of the manufacturing process, which embodies the mental and physical actions aimed at performing a particular technological process. However, such work can be highlighted in such a unique methods for specialists in all professions. We will show this as follows:

Planning methods: to study technological documents, technological process and sequence of technological process, conditions of performance, performance of labor and doing the work, and similar such similarities.

Apparently, it is advisable to get acquainted with the study of basic methods of work in the process of working education in systems of continuing education. The pedagogical science studies the general education and professional skills in the course of employment of students:

- The skills of hummimorne skills - to read, control, monitor and measure machinery, and their self-control skills are included.
- The use of technical skills - the use of technical documentation, work preparation and performance of labor movements, the quality of processing is included.

In addition, the skills are separated by the type of tools, carpentry and hocozo, depending on physiological and psychological processes, and sensitive skills. The skills in different ways in different ways, the teacher's words, examination, testing through sample and formation through exercise methods were shown in detail in pedagogy. That is the difference in any skills and practice that he is an important difference in his knowledge. The culture of labor culture will be formed with a lot of exercises that will be accompanied by a regular explanation that it is regularly explaining to follow the order and action seizures in this work.

In short, teachers who want to work in teaching work should begin to master a certain fact. Students should always be clear, and different types of it must be a certain position, which are strictly determined during the social production process. The success of the knowledge of labor education, the success of this process shall be largely due to the success of this process depending on the knowledge of the teacher and work. The important task facing general education schools is closely linked to the task of fully approval.

ABSTRACT

In this article, we focus on informing young school-age children about some of the economic terms found in math textbooks. In this regard, in the next school year in the primary grades will be introduced "National curricula" that will not overload children on the basis of advanced foreign experience, instead of state educational standards. In addition to imparting mathematical knowledge to elementary school students in mathematics lessons, the teacher is also tasked with developing the necessary skills and abilities to solve problems related to the practical application of this knowledge in people's daily lives.

KEYWORDS: *Economy, Sum, Shop, Buyer, Purchase, Money, Budget, Income, Economic Education, Economic Literacy, Trade Culture, Debt, Profit.*

INTRODUCTION

Since the independence of the Republic of Uzbekistan, great changes have taken place in the economic sphere, as well as in all spheres of our life. Before independence, the economy of our country was based on command, but after independence, it lived on the basis of laws and regulations based on market relations.

We all know that in a market economy, all members of society need to be economically literate. Economic literacy cannot be achieved in a day, a month, or even a year. The only way to solve this problem is to start economic education at school or even in kindergarten.

“In order to radically improve the quality of education, first of all, curricula, textbooks for teachers and professors should be developed in accordance with the requirements of the President of the Republic of Uzbekistan ShavkatMirziyoyev. It is necessary to create meaningful and comprehensible textbooks for children in order to develop their analytical and creative thinking skills. In this regard, in the next school year in the primary grades will be introduced "National curricula" that will not overload children on the basis of advanced foreign experience, instead of state educational standards. In this regard, the relevant ministries will soon instruct their educational institutions to create a new generation of textbooks on specialties.

The petition states that this update will be implemented in primary education from the 2021-2022 academic years.

These are issues that can be addressed in economics or environmental education if we focus on the practice exercises in all math classes in primary education. In this article, we will focus on the implementation of economic education, based on the content of the issues in the process of solving problems in order to integrate educational and pedagogical tasks in teaching.

Resolution of the President of the Republic of Uzbekistan Sh. Mirziyoyev dated May 7, 2020 No PK-4708 "On measures to improve the quality of education and development of research in the field of mathematics". Improving the quality of teaching in mathematics and the development of scientific research in this field and the implementation of scientific developments in practice has been identified as one of the priorities. It is clear that in the process of teaching mathematics, one of the most important tasks is to provide students with the knowledge and skills to apply the results of research in practice, as well as to form their economic literacy.

Even in ancient times, people faced the problem of how to raise and spend money. Only economically literate people can solve this problem wisely. This begs the question of what economic literacy is all about.

In general, economic literacy means a conscious understanding of basic economic concepts and making wise decisions from the concepts in order to improve people's living conditions. More specifically, economic literacy is a set of knowledge, skills, and abilities that lead people to improve their well-being. Making short-term decisions based on the extent and scope of the use of basic economic concepts in society, and making long-term economic laws based on the potential of natural and human resources.

Accumulating one's money honestly and using it wisely is one of the main economic problems facing everyone. We all know that not all young family heads today are able to solve this problem in a positive way. According to Methodist economists O.V.Krivos and A.N.Kolomeychuk, students' economic literacy can be formed not only in the social sciences, but also in all subjects studied during school. The role of mathematics, in particular, is enormous.

All the processes that take place in nature (physical, chemical, biological, physiological, mechanical, even social, pedagogical and psychological, in general, all social) take place on the basis of certain mathematical laws. Many of these processes are now being studied by scientists, who have invented their mathematical expression, the mathematical formula.

They ask: Why do some people still need these mathematical formulas today? These formulas are not used in our daily practical life, are they? We will be able to observe all the processes that led to the mathematical formula.

In a short period of time, our country has become one of the most developed countries in terms of economic potential and is one of the leading countries in many areas. But in order to maintain this potential and leadership, our state needs talented, educated young people who have a good understanding of economic affairs.

Economic problems cannot be solved without mathematical calculations. It is impossible to run a business and entrepreneurship successfully. It is obvious that in order to increase the economic literacy of the population, life itself requires the development of the concept of literacy under the motto "all economic literacy".

Over the past three years, the government has done a lot to improve the financial literacy of the population. These include the opening of training centers and courses focused on specific specialties, the reorganization of faculties for retraining and advanced training of new types of personnel, the teaching of financial sciences in secondary and special, secondary education and etc.

In our view, it is time to create an organizational pedagogical model for the study of financial literacy for students in grades in secondary schools. The first step in creating this model should be to consider what financial concepts should be given to preschool children based on their mathematical knowledge in a preschool organization, and how these concepts can be imparted through didactic games supplemented with mathematical concepts. It will be necessary to determine which of the financial concepts should be taught to each group in kindergarten.

The meaning of the economic term studied in each of the 4 groups in kindergarten (small, medium, large, middle and preschool) is more related to the daily practical lives of children, as well as to the teaching will be appropriate.

The set of economic terms that should be taught to students in primary education should also be defined. It is a logical continuation of the economic terms that most children learn in kindergarten, and these terms need to be continued from simple to complex in content. In addition to imparting mathematical knowledge to elementary school students in mathematics lessons, the teacher is also tasked with developing the necessary skills and abilities to solve problems related to the practical application of this knowledge in people's daily lives. Many entrepreneurs today face difficulties and even crises in their business because they are well aware of the economic laws of a market-based society. To be a good entrepreneur, you must first know the basics of economics and economics, that is, the laws of economics. Students need to be taught this from the school desk. If there are fewer articles in newspapers, magazines, and popular literature devoted to a particular education, devoted to raising the economic literacy of the population, all of them are intended only for students in grades 5-11.

We believe that economic education should start in kindergarten and primary education. In this methodological article, we will try to focus on small school-age students, some economic concepts in mathematics lessons, and issues that determine their place in people's practical lives.

Problem 17 (4th grade math textbook)

39 buckets of water have been prepared to irrigate the crops. After 4 buckets of water were prepared for each hole, 3 more buckets of water were added. How many furrows are irrigated?

The given problem can be solved in both ways.

The structure of the problem shows that it is a complex problem, consisting of two simple problems. When solving a problem arithmetically, a complex problem is solved by dividing the given problem into 2 simple problems and solving each of them separately.

All elementary school math classes focus on solving simple and complex problems arithmetically, so that students have enough knowledge, we solve the problem algebraically, taking into account the availability of skills and abilities, and pay attention to its economic education.

The issue's end has the recaptured Doomsday in the control of the KGB. Let's define the number of these unknown slots as x . From the content of the issue, it is clear that this is the solution:

$$4x+3=39$$

It is the root of the equation.

We find the solution of the problem by developing the equation:

$$4x+3=39; \quad 4x=39-3; \quad 4x=36; \quad x=36:4; \quad x=9$$

We check the correctness of the solution by placing the value of the unknown x in an unknown position in the constructed equation to make sure that the equation is a numerical equation. Indeed:

$$4*9+3=39; \quad 36+3=39; \quad 39=39$$

So the solution to the equation is 9, and 39 buckets of water are put in 9 buckets of 4 buckets, and 3 buckets of water are left over. By solving the problem, the main didactic goal of the lesson was to strengthen the students' mathematical knowledge of problem-solving equations and to form the skills and abilities to solve equations in a certain sense.

It is well known that the main purpose of solving any mathematical problem is to provide students with educational tasks in addition to education. Once we have a solution to a problem based on the content of the problem, we can give students an understanding of both environmental and economic knowledge at the same time. Based on the purpose of the article, it is possible to inculcate in students the importance of both economic and environmental linkages.

The key issue is to explain the role of water in human life, its importance in the flora and fauna of nature, the limited availability of clean water, and the need to use it wisely, without wasting it. The teacher can focus the economic part of the problem on economic education in the process of completing various tasks (creating problems based on tables, diagrams, numerical expressions and equations) given in the Primary Mathematics textbooks.

In this regard, let's look at the following assignment from the 4th grade math textbook:

437. Create a problem using the table and check the solution.

Price	Quantity	Cost
250 sum	6kg	270 sum

?	3kg	
---	-----	--

Exercise. In the shop, Sharofat bought 6 kg of candy for 2,500 sums per kg and Noila bought 3 kg of biscuits for a few sums each. If they both paid 27,000 soums to the shopkeeper, how much did Noila pay for 1kg of biscuits?

We solve the exercise algebraically, that is, by constructing an equation. If we denote the quantity sought by x , then the quantity sought in the problem is as follows

$15000 + 3x = 27000$ is found by processing the equation.

$3x = 27000 - 15000$

$3x = 12000$

$x = 12000 : 3$

$x = 4000$

We check the solution of the equation.

$15000 + 3 \cdot 4000 = 27000$

$15000 + 12000 = 27000$

$27000 = 27000$

The equation is solved correctly.

Once the problem is still solved, the teacher can directly inform the students about some of the economic concepts (money, sum, customer, shop, shopping) given in the problem.

An elementary school teacher has a great opportunity to implement financial education through the interaction of disciplines, as primary education teaches only the basic subjects. In addition, information on all types of parenting can be provided at all extracurricular activities.

In short, the more educated each family member is, the richer the family will be. And our state will be stronger.

ABSTRACT

The success of athletes in high-level competitions is an important component of the country's international prestige. In this regard, the situation regarding the importance of the health of athletes for their achievement of high sports results has acquired particular relevance [4; 17; 19]. The results of scientific research have proven that the optimal health indicators of athletes are based on the state of dynamic balance between the functional reserves of the body and the factors affecting it [1; 9; 22; 23]. At the same time, the magnitude of the influence of the factors that are inherent in the modern system of training athletes on the body of those involved increases in proportion to the stages of their professional development, which requires not just optimal health indicators, but the presence of an appropriate level of reserves of functions of its components [7; 12; 26]. The value of the latter is the basis of the athlete's reliability - an indicator that is characterized by high performance of actions and its stability in extreme conditions of activity [5].

KEYWORDS: *Sport Medicine, Sports Genetics, Predicting The Capabilities Of Athletes, Selection Of Athletes.*

INTRODUCTION

In the classical practice of sports medicine, it is generally accepted that all preventive, therapeutic and rehabilitation measures should be carried out on the basis of data from an in-depth medical examination of athletes, the resulting component of which is a conclusion on the admission of the examined to training activities [5; 15; 24]. The admission is carried out according to the following criteria: "healthy", "practically healthy", "requires a limitation (full or partial) of training activity." But it follows from practical experience that the data obtained are

sufficient for carrying out therapeutic and rehabilitation measures for a specific athlete, but not enough to substantiate the organizational and methodological foundations of the system of measures aimed at protecting the health of a vast contingent of athletes, especially during critical periods of ontogenesis.

Thus, it becomes clear that, from the point of view of health savings, it is of particular interest to study not just the health status of young athletes, but a comprehensive level-by-level screening of the functional state of those involved. This type of layer-by-layer "screening" will allow to determine the corrected risk factors for the development of somatic pathology in athletes within the framework of uncorrected factors (determinants), in this case it is sports specialization and a stage in the process of many years of training.

According to the research by Svetlana Lyugailo (Results of studying the health status of young athletes: the first level of screening studies) _ using classical approaches to assessing the health status of young athletes, on the basis of the existing criteria for their admission to sports, the previously determined trends in the influence of ontogenetic risk factors for the emergence and development of somatic pathology in the age aspect and in the aspect of professional development. At the same time, a number of negative points were established:

- firstly, despite the presence of diseases and dysfunctional disorders in the somatic systems, athletes continue the training process, which indicates insufficient control over the functional state of the trainers by the coaching staff and medical workers, who provide the process of training young athletes directly at the place of training;
- secondly, despite the comprehensive examination provided for by the algorithm for conducting an in-depth medical examination, the information received regarding the health status of athletes is not sufficient to formulate a rehabilitation diagnosis, since it is impossible to draw a true conclusion about the adaptive capabilities of the body of a young athlete to physical activity from the data obtained, to obtain quantitative characteristics of the parameters that form the adaptation reserve and, moreover, to predict the occurrence of dysfunctional disorders in various systems of the body of athletes.

The above organizational miscalculations in the development of the structural components of the concept of physical rehabilitation for dysfunctional disorders of the somatic systems of the body of young athletes (somatic diseases) will be taken into account in the group of exogenous corrected risk factors for diseases in athletes.

One of the rapidly developing areas of modern genetics is the development of molecular genetic approaches to determine a person's predisposition to various types of activity. So, in particular, in recent years, a search has been carried out for molecular genetic markers that determine a person's ability to perform high sports loads (Montgomery, 2000; Rogozkin, 2004), which is determined by the need to substantiate a system for selecting people for sports and correcting the training process. This approach is the most promising, since it allows you to determine the genetic predisposition to high physical activity and to carry out a targeted differentiated selection of children for sports at the earliest stages of their sports activity. It should be noted that in 2000 a human genetic map was created, in which genes were introduced, which in at least one study revealed associations with physical indicators and / or influenced human health (Rankinen, Bray et al, 2006). In the early 2000 version, the map included 29 genes. The 2005 version, 6th - amended, includes 165 autosomal genes, 5 - located on the X chromosome, as well as 17

mitochondrial genes. To date, work of this kind is carried out only in five countries: the USA, Great Britain, Australia, Russia (Scientific Research Institute of Physical Culture - under the leadership of Doctor of Biological Sciences, Professor Rogozkin V.A.; laboratory of molecular genetics research of the Department of Genetics at the Bashkir State Pedagogical University - under the leadership of Doctor of Biological Sciences, Professor Gorbunova V.Yu.) and Kazakhstan. On the site www.genoterra.ru - the register of leading scientific institutions, the laboratory of molecular genetics research of the Department of Genetics of the Belarusian State Pedagogical University is included in the list of groups engaged in the search for genetic markers that determine people's predisposition to sports activities.

Currently, predictive medicine is actively developing, the purpose of which is to identify possible diseases in a particular patient by the DNA structure, as well as to develop a set of preventive or health-improving measures based on these studies. Such preventive measures are also important in sports, which is why sports genetics can achieve high results using scientific methods.

A lot of data, including the results of recent studies, confirm the influence of polymorphism of some genes on the physical characteristics of the athlete and, as a result, on the predisposition of the athlete's body to strength loads or endurance training.

It is necessary to take into account that the development and manifestation of a person's physical qualities depends on both genetic and environmental factors. The more genetic factors influence physical qualities (high degree of heritability), the less successfully these qualities are trained, and vice versa [1].

Sports genetics allows you to calculate the limit for each person to perform any type of exercise, depending not only on the nature of the task, but also on the genetic components. The human genotype largely determines such important characteristics for athletes as strength, endurance, muscle fiber composition and muscle mass, flexibility, neuromuscular coordination, and reaction speed [2, 8].

Over the past few decades, certain hereditary factors have been identified that are responsible for the development of the above qualities in humans. Therefore, sports genetics provides useful information on how to improve the performance of performances, which athletes to select for competitions and which of them will be able to cope with the task at hand. The selection of young, promising in their hereditary qualities athletes (at the same time the minimum risk of intense physical activity for their health) is an important issue in sports medicine, which can be solved by modern methods of genetics.

The introduction and active use of molecular genetic technologies allows you to create an optimal training program specifically for each athlete, in which the body's energy resources will be used as efficiently as possible, which will allow achieving high sports results.

I would also like to note that in connection with the active development of genetics as a science and methods of its study, genetic research is becoming more and more accessible. At the moment, sports genetics is present not only in elite sports, but also in amateur sports. Fitness is an important part of a healthy lifestyle, and you should approach the issue of its correct organization responsibly. In this case, on the basis of genetic research, a geneticist can recommend a specific diet, diet, exercise regimen, as well as the nature of the exercises, taking

into account the individual characteristics of the organism. In addition, sports genetics makes it possible to identify diseases to which a person is genetically predisposed (for example, cardiovascular diseases, bronchial asthma, obesity). Based on the data obtained, it is possible to recommend preventive measures to prevent these diseases for each individual person.

Sports genetics is a young science. Its proclamation as a branch of knowledge took place at the Olympic Scientific Congress "Sport in Modern Society", which was held in Tbilisi in 1980. The International Scientific Society for Sports Genetics and Somatology was also established there.

In 1983, Claude Bouchard first coined the term genetics of fitness and physical performance. Then he published two reviews in one issue of the journal "Exercise and Sport Science Reviews", where he presented generalizing facts, firstly, about individual differences in response to physical activity, and secondly, about the heritability of many qualities involved in the process of physical activity [3, 10].

1995 was marked by the beginning of the international project HERITAGE (HEalth, RiSk Factors, Exercise Training and GENetics) led by Claude Bouchard. The project involved several research centers and more than 800 volunteers who were subjected to physical activity for several weeks. K. Bouchard and his colleagues searched for polymorphic loci associated with physical activity, and published hundreds of works on the topic of heritability of physical factors in humans. The progress in understanding this issue has been significant.

In 1998, the journal "Nature" published a scientific article "Human gene for physical performance" by a young British scientist Hugh Montgomery. He presented the results of his work with a team of authors (19 people) on the study of the role of the ACE gene (angiotensin converting enzyme) in sports activities. H. Montgomery and his colleagues investigated a group of alpine climbers [4,9,11.]. The size of the article is only one page, which says that one of the polymorphic alleles of the ACE gene - allele I provides endurance, and allele D - the speed-strength qualities of an athlete. The conclusion was based on the fact that in athletes who are successful in sports requiring endurance, the frequency of allele I is higher than in the control group, and in athletes of high-speed types, allele D predominates [5].

This publication attracted the attention of the entire scientific community and society as a whole. The world media reported on the discovery of the "sport gene" (ACE gene), thanks to which it was now possible to identify a predisposition to a particular sport or physical activity in any person.

Among domestic scientists, it should be noted Eduard Georgievich Martirosov, who created on the basis of Russian Research Institute of Physical Culture and Sports in 1972 the Laboratory of Sports Anthropology (later called the Laboratory of Sports Anthropology, Morphology and Genetics) [6, 29].

Later, research in the field of sports genetics was started in the laboratory of prenatal diagnostics of the Research Institute of Obstetrics and Gynecology. D.O. Otta (St. Petersburg), , as well as in the laboratories of the Institute of Biochemistry. A.N. Bach of the Russian Academy of Sciences (Moscow), the All-Russian Scientific Research Institute of Physical Culture (Moscow), the Scientific Research Institute of Transplantology and Artificial Organs (Moscow) and the Russian State University of Physical Culture (Moscow) [7,30]. Now such laboratories are located not only in Moscow and St. Petersburg, but also in other large scientific centers in Russia.

Sports genetics is developing quite rapidly, since the number of new studied genes that characterize the physical qualities of a person is growing exponentially: in 1997 - 5 genes; in 2000 - 24 genes; B 2004 - 101 genes [8, 27]. To date, about 200 genetic markers (DNA polymorphisms) associated with the development and manifestation of physical qualities are known [9,21,25].

In sports, in order to achieve the highest performance, talented athletes must be selected correctly and in a timely manner, and then included in long-term, planned training programs [10, 20, 28].

Today, due to the fact that investments in sports and individual athletes reach significant amounts, the issue of effective selection of athletes is more relevant than ever [10, 14, 16].

Each of us is individual, we carry unique genetic information. And our uniqueness can be studied with the help of DNA diagnostics methods, which shows the characteristics of metabolism, the state of organ systems, the properties of the psyche.

It is impractical and irrational to perform DNA typing for all possible genes responsible for the athletic characteristics of a person. The information obtained must be correctly interpreted and conclusions drawn in relation to each individual case. Moreover, the analysis of one gene is not informative enough.

Genetic analysis provides information about the hereditary predisposition to a particular sport. For example, skeletal muscle is made up of two distinct types of muscle fibers: fast and slow. Slow fibers are characterized by a small force of contraction, but low fatigue, they are involved in the performance of low-intensity strength work for a long time. Fast fibers, on the contrary, are distinguished by a greater force of contraction and high fatigue; they are used when performing short high-intensity strength work [11,13,18,31]. For muscles, which are dominated by slow fibers, aerobic exercise will be the most effective. These sports include swimming, rowing, tennis, long-distance running, cycling, and walking. And for muscles, which are dominated by fast muscle fibers, anaerobic loads (strength training) are most effective. Wrestling, sprint running, powerlifting, arm wrestling, rock climbing are examples of physical activity based on anaerobic muscle metabolism.

The type of muscle fibers prevailing in our body is genetically determined (this is associated with the ACE gene polymorphism). Thus, the results of a distance runner (long-distance runner) in a 2000-meter run negatively correlate with his own results in a 100-meter run.

When the type of physical activity matches the hereditary predisposition, the person can achieve the best results and get the most from the training in the shortest possible time.

ABSTRACT

This scientific article is based on flexible, evolving selected pedagogical conditions, taking into account the pedagogical conditions that help higher education institutions to form cartographic competence in students majoring in "Geography", the successful formation of cartographic competence, optimizing the process of teaching individual, random, cartographic subjects issues of formation of cartographic competence of students are described.

KEYWORDS: *Individual, Randomly Selected Pedagogical Conditions, Cartographic Disciplines, Teaching Process, Optimization.*

INTRODUCTION

For the successful formation of cartographic competence of students, it is necessary to identify pedagogical conditions that facilitate this process and thus ensure the effectiveness of student training.

Based on the understanding that individual, randomly selected pedagogical conditions cannot significantly influence the formation of cartographic competence through career-oriented learning technology, we consider flexible, dynamically evolving complex pedagogical conditions necessary to optimize the teaching process of cartographic subjects.

The pedagogical conditions of effective teaching in cartographic subjects should also be

understood as a set of measures developed by the teacher to ensure the implementation of person-centered teaching technology in the learning process that contributes to the formation of cartographic competence of students.

The main part. The results of experimental teaching using person-centered learning technology aimed at the formation of cartographic competence of students confirmed the research hypothesis that the teaching of cartographic subjects is the most effective and the formation of cartographic competence will continue more effectively if the following pedagogical conditions are met:

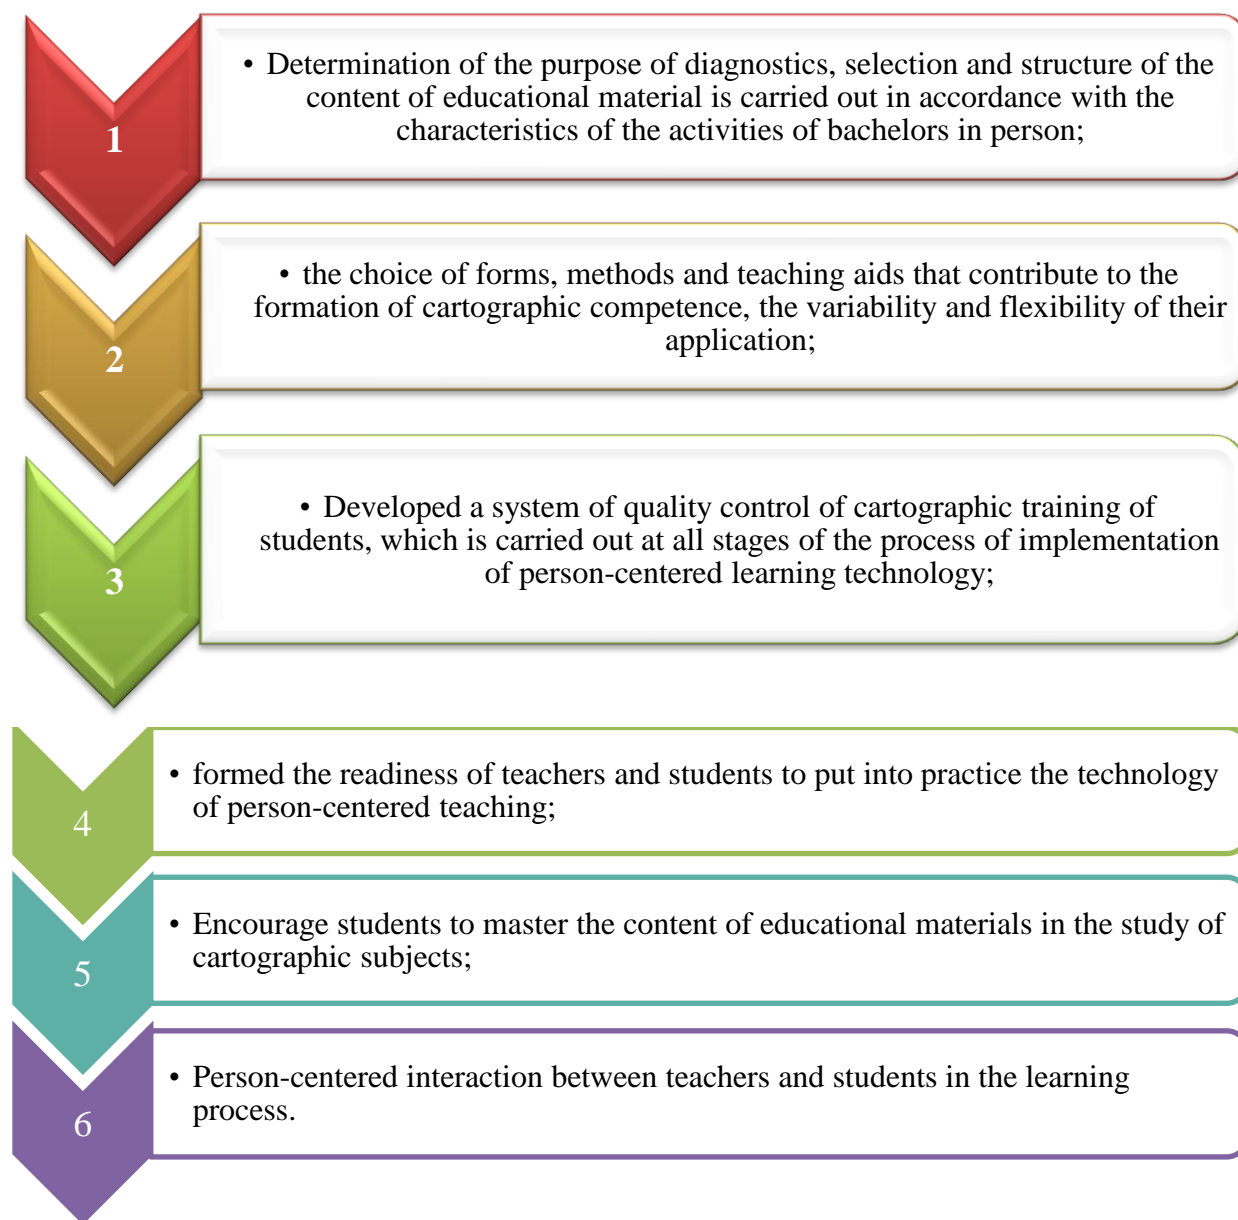

Figure 1. Pedagogical conditions

RESEARCH RESULTS AND DISCUSSION

According to the results of the experimental test, we substantiate the importance of the so-called

conditions that help to form the cartographic competence of students of higher education institutions.

An important condition that contributes to the formation of cartographic competence of students is the goal setting, selection and structure of the content of educational material in accordance with the standard of higher education.

Goal setting is one of the most important steps in designing a person-centered learning technology aimed at shaping the cartographic competence of higher education students.

Goal setting in the context of person-centered technology provides motivation: each lesson involves an appropriate system of goals: didactic, educational, developmental, mainly aimed at creating an indicative basis for student activities to master the learning content.

Goal setting requires the selection and structure of learning material. The main content of the training material is determined by the direction of education and the standard of education related to this area.

One of the conditions is the choice of these special forms, methods and teaching aids. Given that this condition is described in detail and is reasonable, we will focus only on the basic rules.

The use of certain forms and methods of teaching is characterized primarily by a special type of interaction and interaction between teachers and students, created on the basis of unity of content and goals of personal training and acting as the most important condition for personal development.

Within the framework of person-centered technology of teaching cartographic disciplines, various methods and forms of training were used to ensure maximum activation of students' learning and cognitive activity. Together, they create a tool that guides the process of shaping students' cartographic competence.

The use of the following teaching methods in the teaching of cartographic subjects - lectures (including its non-traditional forms), seminars, laboratory classes, practical and independent work, special games, tests, consultations, field practice, abstracts and individual interviews - confirmed their hypothesis. They contribute to the formation of students' cartographic competence.

Monitoring and evaluation of learning outcomes provides information about the level of formation of cartographic competence of students in the process of mastering cartographic disciplines. This allows the teacher to clarify the purpose and content of the lesson in a timely manner, to reconsider approaches to the choice of teaching methods, forms and tools, thereby changing the learning trajectory, and the student learns the correctness of mastering the material based on reflection. The following types of control were used: initial, current, intermediate, final.

Current supervision is carried out systematically during the planned classes and is directed to the student. The student must be self-directed and understand the level of mastery of their knowledge and skills, on the basis of which the teacher can, if necessary, correct the reading activity in a timely manner. To do this, it is advisable to use computational-graphical, descriptive and measurement functions.

The task of intermediate control is to determine the level of mastery of the cartographic material of each module by students in general. Test assignments are used for this (by options).

The final control is carried out in the final stages of the training, which allowed to determine the level of formation of cartographic competence of students.

The most important element of a teacher's readiness to form cartographic competence in the context of the use of person-centered learning technology is his integrated training, ie: knowledge of his subject and related disciplines, computer capabilities and skills to work with it; mastering the skills of managing students' learning activities.

In our opinion, the qualities of a teacher of cartographic sciences in higher education institutions are: knowledge of the subject, the ability to communicate with students, the ability to create an environment of interaction in the classroom, high methodological skills, ie work with pedagogical and methodological technologies. as a teacher in a higher education institution, she must have design, constructive, flexible, organizational, communicative, diagnostic, practical, evaluative and reflective skills.

The teacher should develop and build person-centered learning technology, substantiate the logic of organizing pedagogical interactions with students at the communicative level, define forms, methods and criteria of teaching, formulate pedagogical tests and test assignments to organize supervision and self-monitoring, etc. Thus, the content of the teacher's work takes on a creative character, which requires him to constantly update his integral knowledge and personal growth. Teachers, even those with extensive experience (training) in teaching, are often far from new educational technologies in the field of theory and teaching practice, do not master them and do not understand their importance due to conservative thinking. They often experience a psychological barrier to the development of innovative approaches to teaching, which is often obscured by doubts about the pedagogical potential of new technologies.

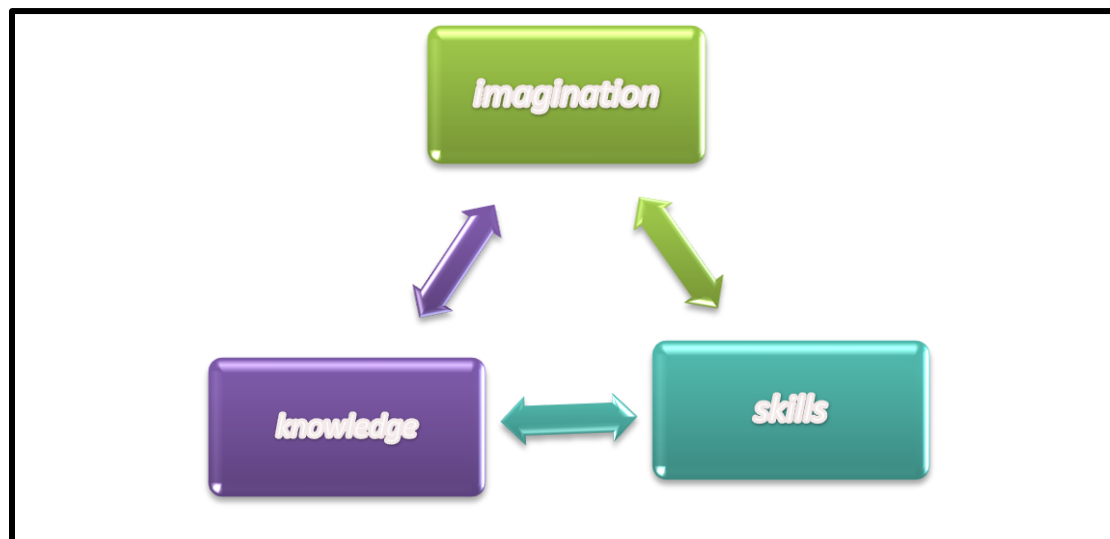

Figure 2. As a result of studying the course, teachers can get:

imagination: about the problems and trends in the development of the education system; Status and prospects for the development of educational technologies in higher education; the role of special discipline in the system of personal training; the specificity of teaching this discipline in

higher education; knowledge: about the basic concepts of the course ("technology", "teaching technology", "teaching technology design, etc."); teaching technology design methods; specific features of the use of teaching technologies in special subjects; traditional and innovative methods, forms and means of teaching; didactic requirements for the organization of such classes and methods of their conduct; the content and mechanisms of the organization of independent work of students; the basis for the development of control, test assignments and exercises; skills: design, construction and application of teaching technology; implementation of goal setting; content identification; selection and compilation of educational material; modern methods of teaching special subjects; monitoring the learning process; organization of independent work of students, determining its type, size and content; determine the level of mastery of the material studied by students; to analyze and evaluate the quality of assignments given by students, to identify the reasons for students' lag and to adjust the learning process in this regard; to diagnose, analyze and evaluate their individual activities and their results.

In order to create teachers' interest in designing educational technologies and introducing new educational technologies, in our opinion, it is necessary to provide individual competitions, encourage the work of teacher-innovators, as well as certification of developed educational models and subsequent publication of catalogs.

Live exchange of experiences in a narrow range of conferences of special science teachers working in different universities is very effective. Such conferences provide an opportunity not only to learn about new areas of science teaching, but also to see the development of advanced technologies, to compare different approaches.

The role of the teacher is changing due to the introduction of modern teaching technologies in the educational process of higher education institutions. In connection with the emphasis on the independent acquisition of knowledge, the consulting, corrective direction of the teacher's teaching activities will increase, the requirements for his personal, general cultural, communicative qualities will increase significantly. Thus, the requirements for personal training of teachers are growing in the context of excessive scientific and educational information provided to students during their studies at the university.

Summarizing the above, it should be noted that in order to realize the teacher's readiness to apply person-centered technology in practice, it is necessary to:

- 1) Mastering of new educational technologies and didactic experience by the teacher existing in other higher educational institutions;
- 2) Training on the basis of the program, which provides not only the use of professionally oriented learning technologies in the educational process of the university, but also their design.

Based on the results of the experiment, we substantiate the impact of the availability of person-centered teaching technology on teacher performance, which carries out the formation of cartographic competence of students. In terms of the application of this technology, the following trends are distinguished: first, the teacher is freed from increasingly difficult didactic functions, including control functions, leaving only creative functions; second, its capacity to manage the process of cartographic competence formation is significantly expanded; third, there is a growing demand for teacher personal preparation.

The training of not only the teacher but also the students is important for the successful

implementation of person-centered teaching technology in the educational process of the university.

Therefore, one of the features of the professionally oriented technology of teaching cartographic sciences in higher education was the targeted orientation provided by individualization, differentiation and a person-centered approach to teaching. This technology is the subject of educational activity - it should be adapted as much as possible to the student.

Analysis of the problem of readiness for work in the psychological pedagogical literature, the application of a system-activity approach, the results of experimental work allow to identify the main signs of the student's readiness to use person-centered learning technology in cartographic sciences. Among them, we highlight the following: the formation of positive motivation for the study of cartographic sciences; availability of necessary knowledge in basic school subjects; adequate mastery of communication skills and abilities; readiness for creative activity. The next pedagogical condition is the motivation of students to master the content of educational materials in the study of cartographic subjects. This stands out as one of the necessary conditions for the formation of cartographic competence of university students, as it is a necessary factor for successful learning. Acceptance of goals, understanding of their importance and significance to the individual has a great impact on the motivation of students' learning activities.

The next pedagogical condition is the motivation of students to master the content of educational materials in the study of cartographic subjects. This stands out as one of the necessary conditions for the formation of cartographic competence of university students, as it is a necessary factor for successful learning. Acceptance of goals, understanding of their importance and significance to the individual has a great impact on the motivation of students' learning activities.

CONCLUSION: The effectiveness of the educational process largely depends on the implementation of person-centered interactions between teachers and students in the educational process.

The system of teacher-student relations in the organization of pedagogical interaction in the teaching of cartographic sciences is based on the principles of a person-centered approach.

Summarizing the results of the experimental work, it can be noted that the development of professionally oriented technology of teaching cartographic sciences and its application in the educational process of higher education helps to form the cartographic competence of higher education students.

- The experimental work confirmed the pedagogical conditions for the use of person-centered learning technology, which provides the formation of cartographic competence of university students;
- the choice of forms, methods and teaching aids that contribute to the formation of cartographic competence, the variability and flexibility of their application;
- Developed a system of quality control of cartographic training of students, which is carried out at all stages of the process of implementation of person-centered learning technology;
- formed the readiness of teachers and students to put into practice the technology of person-centered teaching;

- Encourage students to master the content of educational materials in the study of cartographic subjects;
- Person-centered interaction between teachers and students in the educational process.

Thus, the complex of pedagogical conditions identified in the process of experimental work contributes to the effective operation of the developed professionally oriented technology of teaching cartographic sciences, aimed at the formation of cartographic competence of university students.

ABSTRACT

This article describes the psychological features of the child's transition from kindergarten to school. The transition to compulsory education, as opposed to free leisure activities. A child's playfulness, inability to be independent and very low level of emotional and social development prevents him or her from being ready for school. Such children cannot find their place among their peers and peers. Moral, volitional readiness for school A child's moral behavior at the end of childhood, moral behavior and a new social point of view in the development of consciousness. A child's playfulness, inability to be independent and very low level of emotional and social development prevents him or her from being ready for school. Such children cannot find their place among their peers and peers.

KEYWORDS: Education, Speech, Psychology, Kindergarten, School, Education, Thinking, Play Activities.

INTRODUCTION

The effectiveness of teaching children in school depends to a large extent on their level of preparation. Preparation for school education is an important outcome of education and upbringing of a child of preschool age in preschool institutions and in the family. The level of readiness of a child for school education is determined by a set of requirements for school. The

peculiarity arises from the new socio-psychological role of the student, the new tasks and responsibilities that he must be prepared to perform. Admission to school is an important period in the life of a child due to changes in the system of relationships with others. For the first time in a child's life, socially important learning activities take center stage. Unlike the usual free play activities, education is now mandatory and requires four serious attitudes from the first grader. As the leading type of educational activity, the child rebuilds his daily life.

Any educator can determine a child's readiness for school without using any tools. Some parents also know approximately how healthy, agile, independent, intelligent, ready to learn a kindergartener is. Kindergarten educators have sufficient pedagogical, technological knowledge and experience to correctly determine each child's readiness for school. They should be able to rely on the requirements of the education and training program in the kindergarten. If the child develops normally in the preschool period, if there were no strong influences on his physical and mental development, then the child reaches the level of education at the age of seven. But there are also some families and children who are not ready for school in kindergarten. Such children undergo a special examination under the supervision of a specialist and the specialist draws a conclusion about the level of readiness for study. A child's playfulness, inability to be independent and very low level of emotional and social development prevents him or her from being ready for school. Such children cannot find their place among their peers and peers. They need help in their daily activities: they cannot understand and perform assigned tasks independently; the fine movements of their hands are not well developed. Vocabulary richness, limited expression, poor memory, inability to generalize, etc. These are caused not only by the poor social status of the child, but also by hereditary factors, serious and complex diseases, minor congenital injuries, neuroses conditions also cause. The child begins to understand education as a responsibility to the whole country, to the participation of people in working life. Once a child is a student, he or she takes on a qualitatively new place compared to preschool age.

A distinctive feature of the education system is that the school system is constantly improving. School education requires from a first-grader not any special knowledge and skills, but more complex forms of mental activity, a higher level of moral will, the ability to control their behavior, and greater confidence than in previous years. The task of the educational institution is to prepare the whole system of educational work from children to study in a school that more fully meets the requirements of school education.

Preparing children for school education is, firstly, an educational work in preschool institutions that provides a high level of overall development of children of preschool age, and secondly, education that children should learn from primary school. Accordingly, in the psychological and pedagogical literature, the concept of preparation is defined as the development of the child's personality, and in two interrelated aspects to school, study, general psychological preparation and vaspecial. Considered in preparation.

The general preparation for school is an important result of the educational work of the kindergarten in accordance with the long-term goal of comprehensive education of preschool children.

Preparation for school is at such a level that the child has reached the level of mental, spiritual, volitional, aesthetic and physical development by the time he or she goes to school, which creates a new environment for the child's schooling and learning materials. The concept of

general preparation successfully summarizes important qualitative indicators in the mental development of a child going to 1st grade in terms of school education. Psychological preparation for school education is based on the child's aspiration to learn, the desire to become a student, a sufficiently high level of cognitive activity and thinking operations, the acquisition of elements of the child's educational activity, the will and social development. The whole complex of the child's psychological preparation for school includes the introduction of the child to the classroom, the conscious active acquisition of educational material in school, the fulfillment of a wide range of school responsibilities.

A child's special learning for school is in addition to his or her general psychological learning for school. It is determined by the child's availability of specific knowledge, skills, and competencies required studying academic subjects such as mathematics and mother tongue.

Intensive work in preschools on the development of the simplest mathematical concepts in children, the development of speech and preparation for literacy provides the necessary level of special preparation of children for school.

A child attending school must be prepared for a new way of life, a new system of interaction with people, active mental activity. He must have achieved a certain level of physical development in order to fulfill new serious responsibilities. In the context of the child's general readiness for school there are interrelated aspects, the most important of which are spiritual, mental, physical preparation. Moral, volitional readiness for school A child's moral behavior at the end of childhood, moral behavior and a new social point of view in the development of consciousness. Is characterized by the ability to actively acquire perspective and to build a relationship with the teacher, classmates on a moral basis.

The content of school, moral and voluntary training is determined by the requirements for the personality and character of the child, depending on the position of the student. The preparation for the implementation of these high requirements is carried out in the process of continuous, goal-oriented educational work with preschool children in preschool institutions and in the family.

In this regard, the child's ability to control his own behavior, which develops during the preschool years, is a conscious observance of the rules or the requirements of the educator, not to give in to nervousness, to achieve the goal. Demonstration of the ability to do the desired work to the end, which attracts, but distracts from the goal, and deserves this attention. The basis for the development of voluntary behavior in the future student The interdependence of causes is related to the voluntary, conscious aspirations of older preschoolers to overcome their current passions in the pursuit of spiritual goals. Naturally, preschool education. At this age, the child's behavior is not characterized by a high degree of voluntariness, however, it is important to establish a voluntary behavioral mechanism during this period to ensure the transition to a new type of behavior in the school.

Features such as independence, organization and discipline in the personal behavior of the child in the preparatory group are also important in the decision-making of pre-school moral and volitional training.

ABSTRACT

The article consists of the principles of artistic and psychological description of the psychology of the person in the work "Boburnoma" of Zahiriddin Muhammad Babur. The value of the work is that the information provided in it is distinguished by its accuracy and objectivity in the assessment of historical figures. The author approaches the issue from an artistic psychological point of view and focuses on drawing scientific conclusions.

KEYWORDS: *Boburnoma", Information About The Character Traits Of Historical Figures In Boburnoma", Psychology Of Personality, Principles Of Artistic And Psychological Description*

INTRODUCTION

The life and work of the great king and poet, the great commander Zahiriddin Muhammad Babur have been attracting the attention of world scholars for centuries. Among the classical medieval Arab-Muslim thinkers of the East, there is very little of the personality that became famous at the level of Babur, who was the earliest studied in world oriental studies, and who is well known and popular. Recognizing his legacy as a classical poet, it is worth noting that the work that brought him worldwide fame was "Vaqo'e" (Events), later translations into many world languages of his famous work "Boburnoma". "Boburnoma" is a perfect example of the memoir genre, a historical and artistic source. The work has also become a source of research in various languages for literary critics, historians, linguists, art historians, ethnographers, and representatives of the animal and plant industries.

Today, this unique work of prose has been translated into 31 languages. According to the authoritative opinion of Babur in The Cambridge History of Islam, "... he was a great poet not only in prose (Vaqoe) but also in poetry" [2]. Another rare work in Oriental literature, Tarihi Rashidi, mentions this: "Babur was a small king, who, in the midst of various phases, was victorious in bravery. And no one has ever recited a poem in Turkish after Amir Alisher, may God bless him and grant him peace. There is a book of Aytgan, Turkish. Very good. They called him Mubayyin. [3]

In connection with the life of Zahiriddin Muhammad Babur in "Boburnoma" historical and social events in Movorounnahr, Khorasan, Afghanistan and India in the last quarter of the XV century, as well as prominent figures in the socio-political life of their time, their character, beliefs, spiritual world, the complex situations in their psyche, the psychological processes are described in an artistically and psychologically unique way.

In the work "Boburnoma" 1551 people are mentioned. Among them, the portraits and spirits of many historical figures (Temurid rulers, military officials, representatives of science and art) are skillfully drawn, their personal characteristics are revealed through the description of their actions and activities. In illuminating the images and qualities of historical figures, Babur sought to treat them fairly, to express the most important aspects of their character in as concise and concise terms as possible, succinctly, based on their way of life and circumstances.

Preliminary information about historical figures in the "Boburnoma" (events of 899 AH), ie psychological analysis of the description given to Babur's father Umarshaikh Mirza and the surrounding emirs, shows that the character traits and moral psychological qualities of people in the text of the work not only complements the information but also increases the value and charm of the work.

In "Boburnoma" the author accurately describes the positive qualities of personalities, as well as negative ones.

For example: Speaking about the character of Umarshaikh Mirza, he said, "... he was a kind, humorous, eloquent and sweet person. He was a courageous and courageous man. "Elsewhere, he said," He was indifferent to clothes and food, or Because of the threat of land acquisition, many reconciliations turned into war and friendship into enmity." [1]

Zahiriddin Muhammad Babur, being a man of high faith, evaluates people's behavior, first of all, according to their faith, piety, and the degree to which they follow the rules of Islam, either positively or negatively, and expresses his strong views in this regard.

About Umarshaikh Mirza: "In the Hanafi school, he was a man of pure faith. He did not pray five times a day. He had completed the prayers of Umrah. "QosimbekQavchin said:" He was a Muslim and a pious man. He was a tyrant and a disbeliever." [1] He had a negative attitude towards such people.

In this short passage, Babur gives historical information about Umarshaikh Mirza and his 12 emirs, as well as psychological characteristics. Below, we have tried to compare the positive and negative psychological qualities given to historical figures:

Names of historical figures	Positive psychological qualities	Negative psychological qualities
Umarshaikh Mirzo	8	2
Emirs		
KhudoyberdiTemirtash	2	0
HafizMuhammad	2	1
HojaXusayinbek	2	0
SheikhMazidbek	2	1
AliMazidbekQavchin	0	4
HasanYaqubbek	4	3
QosimbekQavchin	4	0
BoboquliBoboAlibek	1	4
AlidustTagoyi	0	8
WeissLogariy	0	1
AliDarvesh	2	2
KambaraliMongol	0	4
Total	27	30

It is clear from the table above that Babur was right in his work. He seems to have tried to be fair and impartial in evaluating people. It should also be noted that the relative abundance of negative qualities mentioned in people shows the very demanding nature of Babur's character towards those around him and himself.

When we examine the psychological descriptions given to individuals in this section of the "Boburnoma", we see that the author focuses most on the moral psychological qualities in people, such as generosity, nobility, poverty and cruelty, cruelty, greed, hypocrisy, conspiracy and greed. Babur then refers to such volitional qualities as courage, bravery, zeal, discipline, or the verb narcissism. In the next place, the qualities of politeness and communication attract his attention, he notes such qualities as politeness, eloquence, humor - a tendency to humility, modesty or flattery, a tendency to flattery, "harshness".

On the basis of the above small section of the "Boburnoma" it can be concluded that the psychological analysis of the text of the work allows to reveal not only the importance of psychological information in it, but also new aspects of the personality of Zahiriddin Muhammad Babur.

Therefore, "... the study and promotion of Uzbek classical and modern literature at the international level, the analysis of this multifaceted topic in connection with the most important processes taking place in the world literary space today, to draw the necessary scientific and practical conclusions, to determine our future tasks [4] defines the current challenges facing Uzbek literature. Given the requirements of these tasks, one of the important methodological tasks is to study the problem of the principles of artistic and psychological image as a literary and aesthetic category in "Boburnoma".

EVALUATION OF SOME PHYSICO-CHEMICAL PARAMETERS OF POUCH MILK SAMPLES AVAILABLE IN BUTWAL SUB- METROPOLITAN CITY NEPAL

Deepak Kumar Shrestha*

*Assistant Professor,
Butwal Multiple Campus, Butwal, TU,
NEPAL

ABSTRACT

Milk is nearly complete food and contains all essentials components in nearly balanced form. In the present study four different brands of pouch milk samples viz, DDC, Lumbini, Godhuli and Panchamrit commercially available in Butwal city were collected and the physico-chemical characteristics including- moisture, pH, casein and fat were analysed. It was found that all measured parameters were found as per recommended standard as compared with reported nutritional quality of milk from various countries. The main objective of the study is to determine some of the physico-chemical properties of milk sample and to provide nutritional benefits for health. All these tests were carried out in Chemistry laboratories of BMC and DDC in Butwa Industrial Area. The value of pH ranged from 6.69 to 6.72, moisture ranged from 90.5% to 91.45%, the casein ranged from 3.12 to 3.4 and fat ranged from 2.87% to 3.06%, where Lumbini pouch milk had highest pH while Godhuli had highest moisture content and casein also while Lumbini had highest fat content. These parameters were determined and data were analyzed from period of 15 March 2019 to 30 May 2019.

KEYWORDS: *Physicochemical Characteristics, Pouch Milk, Milk Analysis*

INTRODUCTION

Milk is an important sources of all basic nutrients required for mammals including human beings. Milk is a complex colloidal solution (emulsion) containing fat globules, casein micelle and whey proteins in aqueous solution of lactose, minerals and few other minor compounds. Milk is the characteristics secretion of mammary glands of all mammals. In 2011, FAO estimates

85% of all milk worldwide is produced from cow, about 11% by buffaloes, 2% by goats, 1.4% by sheep and 0.2% by camels. So cow's milk dominates commercial production worldwide.

Fresh milk contains all the essential nutrients as lactose, fat, protein, minerals and vitamins in balanced ratio rather than other food (Hossain et al., 2013). According to (Byron et al., 1974) the average composition of fresh milk is water 87.20%, dry matter 12.80% (fat 3.70%, Protein 3.50%, Lactose 4.90% and Ash 0.70%). The average composition of the milk of each of several mammals is given by Imran Mohammad (I. Mohammad et al., 2008) pH in the range of 6.59-6.93, moisture in the range of 76.4% to 86.8% and casein in the range of 2.18% to 3.26% among buffalo, cow and goat. According to R. Minard (Penn State Univ. Department of Chemistry, USA) (R.Minard et al., 1990) moisture in range of 90.6% to 87.4%, casein in the range of 2.0% to 5.5%, fat in range of 1.1% to 6.5% and lactose in the range of 4.5% to 7% among horse, cow, human, goat and sheep.

Milk from various mammals such as human, cow, buffalo, goat, sheep, camel etc. are used for different nutritional purposes such as feeding to young ones and preparation of some nutritional products such as milk cream, butter, yogurt, ghee, cheese, ice milk, sour milk, hot chocolate, pudding etc. (Webb et.al., 1974 Hassan, 2005). Consumers always demand nutritionally enriched milk and dairy products (Kamao et al., 2007). Early lactation milk contains colostrums, which carries the mother's antibodies to its young and can reduce the risk of many diseases. Interspecies consumption of milk is not uncommon, particularly among humans, many of whom consume the milk of others mammals. (Bhatia et al., 2015).

As an agricultural product, milk is extracted from non human mammals during or soon after pregnancy. India is the world's largest producer of milk, and is the leading exporter of skimmed milk powder, yet it exports few other milk products. The ever increasing rise in domestic demand for dairy products and a large demand supply gap could lead to India being a net importer of dairy products in the future. The United State, India, China and Brazil are the world's largest exporters of milk and milk products. Throughout the world, more than six billion people consume milk and milk products. Over 750 million people live in dairy farming households. (Bhatia et al., 2015).

Mammals consume milk in the nutritionally significant weeks following birth. Whole milk contains vitamins (principally thiamin, riboflavin, pantothenic acid and vitamins A, D, and K), minerals (calcium, potassium, sodium, phosphorus, and trace metals), proteins (which includes all the essential amino acids), carbohydrates (chiefly lactose) and lipids (fat). The only important elements in which milk is seriously deficient are iron and vitamin C. Infants are usually born with storage supply of iron large enough to meet their needs for several weeks. Vitamin C is easily secured through an orange juice supplement.

Pasteurization is important processing of milk for two purposes-one for public health aspect and another for keeping quality aspect. Pasteurization is used to kill harmful pathogenic bacteria by heating the milk for a short time and then immediately cooling it. Types of pasteurized milk include full cream, reduced fat, skim milk, calcium enriched, flavored, and UHT (Ultra Heat Treatment). The standard high temperature short time (HTST) process of 72⁰ C for 15 seconds completely kills pathogenic bacteria in milk, (Ball et al., 1943) rendering it safe to drink for up to three weeks if continually refrigerated (Ranieri et al., 2009). Dairies print best before dates on each container, after which stores remove any unsold milk from their shelves. A side effect of

the heating of pasteurization is that some vitamins and mineral contents are lost. The main objectives of this study are to determine some of the physico-chemical characteristics of different pouch milk, to give baseline information regarding for human consumption and to find out the benefits of milk for human health. The significances of the study are: to find out the addition of water or other components which carry poor quality of milk, to improve farming and marketing technology for milk and to take step against selling of poor quality of milk.

RESEARCH METHODS

The sample

The present experiment were conducted in Chemistry lab of BMC and laboratory of DDC in Butwal Industrial Area. To perform the experiment, four commercial brand of pouch milk samples Viz, DDC, Lumbini, Godhuli and Panchamrit were selected from different sites of local market of Butwal. They were kept in refrigerator until analysis.

Samples preparation

Collected samples were divided into four portions. The first portion was used for the isolation of lactose content in samples. The second portion was used to determine moisture content in milk. The third portion was used to determine the fat content in milk. The last portion was used to determine the pH.

Physical analysis

The physical parameters were determined shortly after they were brought to the laboratory according to AOAC 2000's method. The pH was determined by pH meter (HI 98107, HANNA Instruments, Romania). Moisture content was determined gravimetrically by the difference between known weight of milk sample and the determined wt. of total solid after evaporating the liquid component of the milk sample on a hot plate.

Chemical analysis

Different chemical parameters such as total fat content was determined by modified Gerber Method (Acid-Butyrometer) while casein was determined by Gravimetric Method (Khadka N.M et al., 2013).

Statistical analysis

The primary data was collected after the experimentation and observation in the lab. The statistical analysis was done as per Steel and Torrie (1980), using Completely Randomized Design (CRD). The data was analyzed using appropriate statistical tools such as bar diagram, line graph etc. to find out the statistical differences within the quality of four different types of pouch milk samples.

TABLE 1: METHODS USED FOR DATA ANALYSIS

Parameters	Methods employed
pH	pH meter
Moisture content	Change in initial and final weight
Casein	Gravimetric Method

Fat

Modified Gerber method

Required chemicals and reagents

Acetic acid, Acetone, Ethanol, Distilled water, Sodium hydroxide, Magnesium carbonate, Ether and Sulphuric acid, Amyl alcohol etc.

Required apparatus

Volumetric flask, Measuring cylinder, Test tube Pipette, Beaker of different size, porcelain basin, Funnel, Filter paper, Burette, Burette stand, lamp, Tripod stand, Analytical balance, Conical flask, Water- bath, Oven, Aluminums dish, Spatula, Wire gauze, Desiccators, butyrometer, Digital Electronic balance and pH meter.

Physico-chemical Analysis of Milk

Milk samples for physical and chemical experiment were collected from different selected sites. The following physico-chemical parameters of the each samples were measured; pH, moisture content, casein and fat. After collecting the sample, different test were carried out in the chemistry lab of BMC while fat was analysed in the laboratory of DDC in Butwal Industrial Area.

Determination of pH

pH is a numeric scale used to specify whether the aqueous solution is acidic or alkaline. Milk is slightly acidic close to neutral (pH 6.6 – 6.7). The exact value depends on when the milk is produced, processing done to milk and how long it was packaged or opened. The pH of the milk samples were determined using digital pH- meter. (Hanna Instrument HI 98107, Made in Europe, Romania)

Determination of moisture content

Water content of milk is dependent upon the synthesis of lactose. Water content of milk can range from a low content in marine mammals to a high content in human milk from the dairy farm involves hauling considerable amounts of water. If water is added to cow milk the additional water is easily detectable by several methods. Moisture content is determined according to the AOAC 2000 Official Methods of Analysis. The moisture content is calculated using Equation (1):

$$\text{Moisture Content percent} = \frac{\text{Weight of water (W}_1\text{)}}{\text{Weight of milk(W}_0\text{)}} \times 100 \quad (1)$$

Where, W_1 = weight of water and W_0 = weight of milk

Determination of casein

Casein is a principle protein of milk to an extent of around 3-4 percent. It is a phosphoprotein, composed of at least 15 amino acids. Pure casein is amorphous, odourless, tasteless and hygroscopic white solid. Casein is precipitated at pH of around 4.5 by using acetic acid. The method of isolation of milk protein is listed below:

1. 100 ml of milk was taken in a round bottom flask and diluted with 50 ml water. It was heated to 45°C. Dropwise acetic acid solution(10%) was added slowly by stirring until precipitate was formed completely.
2. The precipitate was filtered and washed first with distilled water and then with alcohol, the precipitate was transferred to a mortar and was added some ether and grinded with pestle to remove fat. The solid material was filtered. This is crude sample of casein.
3. It was purified by following the process given in the practical book “A Core Experimental Chemistry by N.M. Khadka”.

The process was repeated with the same quantity of different milk samples.

Casein (protein) percentage has been calculated using Equation (2).

$$\text{Casein percentage} = (W/V) \times 100 \quad (2)$$

Where, W = weight of casein and V = volume of milk sample

Determination of fat

The fat content of milk product is an important indication of quality, both economically and physiologically. In the dairy industry, it is mainly determined by using “quick method”. Spectrometric measuring methods are often used. However, these methods have to be calibrated, which is costly. Many laboratories, are using a method developed by Swiss chemist and dairy owner Niklaus Gerber, patented in 1891 under the name “Acid - Butyrometer”. This method is still used because it is simple, fast, low- cost and suitable for a relatively high sample throughput. The fat content was determined by modified Gerber method as follows:

1. Clean and dry butyrometer was taken. 10 ml sulphuric acid was transferred with the help of pipette tilting about 30 degrees.
2. 10 ml of milk sample was measured and transferred to the butyrometer.
3. 1ml amyl alcohol was transferred with the help of tilt measure.
4. The mouth of butyrometer was covered with stopper key.
5. Butyrometer was carefully shaken without inverting until the content were mixed or dissolved.
6. Butyrometer was transferred into the centrifuge machine for 3 to 5 minutes (1000- 1400rpm)
7. After centrifuge, butyrometer was kept in water-bath at 66°C.
8. Reading was noted. Thus percentage fat was obtained.

STUDY RESULTS AND DISCUSSION

The samples of milk were analyzed by standard procedure as mentioned in chapter three using different method for each different parameter. The methods of calculation for each parameter were mentioned above and the result obtained is tabulated below;

TABLE 2: PHYSICO-CHEMICAL PARAMETER OF POUCH MILK SAMPLES AVAILABLE IN BUTWAL

Parameters		DDC	Lumbini	Godhuli	Panchamrit
pH		6.70	6.75	6.69	6.72
Moisture	Content	91.1	90.5	91.45	90.76
(w/w)%					
Casein (w/v)%		3.3	3.24	3.4	3.12
Percentage Fat		3.02	3.06	2.87	2.93

Source: Author's calculation

Variation of pH

pH is a numeric scale used to specify whether the aqueous solution is acidic or alkaline. Solutions with pH less than 7.0 are acidic and solution with pH greater than 7.0 are basic. Milk is slightly acidic close to neutral. The exact value depends on when the milk was produced, processing done to milk, and how long it was packaged or opened. Other compounds in milk act as buffering agents, so that mixing milk with other chemical brings their pH closer to neutral. Fresh milk from cow typically has pH between 6.5 to 6.7. However the pH of milk changes over time.

All the four samples were found to be slightly acidic or close to neutral in nature having the pH value ranged from 6.69 to 6.75. The pH value of all samples is tabulated in Table 2 and is graphically represented in Figure 1. The pH range found in current study was comparable with the finding in previous investigation in a dairy pouch milk (6.38 ± 0.6 to 6.77 ± 0.88) (Rehman & Salaria, 2005).

Figure 1: Variations of pH of different milk samples

Variation of moisture content

Moisture content or water content is the quantity of water contained in the material. In the present study the range of the moisture among for samples, Lumbini had the lowest amount moisture content (90.5) followed by Panchamrit (90.76), DDC (91.1) and Godhuli had highest (91.45). All these values were close to the earlier finding from 80% to 90% (Webb et al., 1974;

Hassan et al., 2005). The results are shown in the Table 2 for further discussion and graphically represented in Figure 2.

Figure 2: Variation of moisture content of different pouch milk samples

Variation of casein

Casein is the most important protein in milk. It is over $\frac{3}{4}$ of all the amino acids contained in it. Milk contains about 3.3% of total protein. Total milk protein and amino acid composition varies with cow breed and individual animal genetics. Quality wise milk protein is considered as one of the best for human use. Protein is the next after fat, most variant constituents of milk followed by lactose. In the present study, the percentage of milk protein (casein) varied from 3.12% (Panchamrit) to 3.4% (Godhuli), which is graphically represented by line graph in Figure 3.

Figure 3: Variation of casein content of different milk samples

Variation of fat

The fat content, particularly of cow's milk, is modified to make a variety of products. The fat content of milk is usually stated on the container for quick recognition. The fat content of a milk product is an important indication of quality, both economically and physiologically. In the dairy industry, it is mainly determined by using "quick methods" (Acid-Butyrometer). In the present

study, percentage of the fat content was varied from 2.87% (Godhuli) to 3.06% (Lumbini), it is represented by line graph in Figure 4.

Figure 4: Variation of fat content of different milk samples

CONCLUSION AND IMPLICATIONS

In the present study, preliminary investigation were carried out to ascertain some of the physico-chemical characteristics of various pouch milk samples collected from the Butwal city. This study was designed to evaluate some physicochemical parameters and to give baseline information about the effects and health hazards caused by poor quality pouch milk. Some experimental errors, observational errors and calculation errors might occurred during experiment.

For the study DDC, Lumbini, Godhuli and Panchamrit pouch milk were taken as samples 1st, 2nd, 3rd and 4th, respectively. The conclusion analyzed after research work are the pH value of all the milk samples was found within the limits of 6.69 to 6.75 so these samples were considered to be moderate acidic. The most acidic was Godhuli. The moisture content of the samples was found within the limits of 90.5 to 91.45. Maximum moisture content was found in Godhuli. The percentage of casein content was found within the limits of 3.12 to 3.4. Maximum casein percentage was found in Godhuli. The percentage of fat content of the samples was found within the limits of 2.87 to 3.06. Maximum fat percentage was found in Lumbini.

In this way the major conclusion of my study comes out to know the ideas and learn methods of detection of these parameters.

The result showed that parameters of the tested pouch milk samples within the recommended levels. There are no any problems regarding the quality of milk and its constituent parameters. These findings may be helpful for the concerned peoples and governmental parties to monitor the quality of milk products in the market of Butwal city.

TRANSLATION OF LEXICAL UNITS REPRESENTING THE NORMS OF INTERNATIONAL LAW FROM ENGLISH INTO UZBEK

Sirojiddinova Sh.S*; Rahimov G.H**

UZBEKISTAN

ABSTRACT

This research work is devoted to the features of the translation of legal terminology from English into Uzbek. The need for professional translation today manifests itself in all spheres of life. Including these legal services are necessary in professional activities. A high-quality written translation on legal topics will be useful, for example, both for the owner of a judicial organization who has concluded a lucrative contract abroad and for an ordinary foreman who wants to read a competent translation of instructions for legal documents.

KEYWORDS: *Law, international law, legal terms, lexical units, translation, terminology, legalization, contract, documents, dictionary, proficiency, comparison.*

INTRODUCTION

Among the many complex problems studied by modern linguistics, an important place is occupied by the problem of linguistic aspects of interlingual speech activity, which is called "translation" or "translation activity". From the very beginning, translation performed an important social function, which made possible inter-lingual communication between people.

The widespread dissemination of written translations gave people access to the cultural achievements of other peoples, made it possible for interaction and mutual enrichment of cultures and literatures.

Any serious business activity can be achieved through contracts and agreements. The written form ensures that different people, such as buyers and sellers, interact in accordance with a particular business strategy and their interests are taken into account by their partners. One of the most popular types of translation today is the translation of documents. The documents are divided into two main groups: documents of individuals; Translation of legal entities' documents is becoming increasingly relevant in today's global economy. One of the peculiarities of

translating the documents of individuals is the need to give them legal force, their legalization for presentation outside the country.

The object of the study is scientific and technical terminology and multi-component terms. The subject of the study is the peculiarities and complexity of translation of scientific texts in general, and terminology in particular. As for the purpose of the work, it can be defined as identifying the difficulties encountered in translating scientific and technical terminology. Moreover, one of the objectives is also to create an electronic dictionary that could include multi-component terminology applicable in narrower, little-studied areas of knowledge. In accordance with the aim of the work, the following four objectives were formulated, the solution of which is aimed at fully disclosing the topic and achieving the goal:

1. Learn the basic concepts of science and technology
2. Choosing a material and toolkit for analysis and research
3. Extracting multi-component terms for further research
4. Finding an algorithm and constructing a translation hypothesis to carry out translation.

The theoretical significance of my work is due to the importance of research and study of the specifics of translation of scientific and technical terminology. As for practical significance, it is that in one way or another sometimes the translator has to deal with scientific terms and with it the difficulties of technical translation, without knowledge of which you can make many mistakes, even a good foreign language. In this regard, this research can be a good guide to translating terms of varying degrees of complexity. As research materials, we used scientific and technical texts, as well as electronic Anglo-Uzbek and Uzbek-English terminological technical dictionaries.

Structural Analysis

2. Statistical
3. Revealing the specifics of technical terminology
4. Comparative-translational method

The scientific novelty of my diploma work is that due to technological progress, more and more terms appear every day in different fields of knowledge and the need to develop a clear algorithm for translation of scientific terminology is growing. Moreover, multi-component terms have not previously been considered in the texts of scientific and technical literature in such detail that once again confirms the need to develop a clear algorithm for their translation. Our research work is aimed at identifying difficulties in translating scientific and technical terminology from Uzbek to English.

The introduction of basic concepts of economic and state relations between different countries, the continuous development of science and technology, as well as modern technologies in various industries and fields of activity increase the importance of the foreign language, which acts as a "bridge" between representatives of different cultures and languages. There is a growing need for specialists who are versed in various fields of scientific and technical translation, specialists who are familiar with the terminology of texts of such a plan and are able to competently and adequately carry out both written and appropriate translation not only of general

scientific, but also of narrow-minded technical terms. But first, let's find out what "translation" is.

There are many definitions. V. N. Commissioners defines translation as a type of language mediation, which is entirely oriented towards the foreign-language original. If we mean translation from one language to another, then the translation can be considered as a process and as a result. The Scottish linguist John Catford, who is the founder of the theoretical concept of translation, argues that translation is the replacement of textual material in one language (IA) with equivalent textual material on another. On the basis of this definition, it can be concluded that the main problem with translation is the establishment of the nature and conditions of translation equivalence.

In this work we are dealing with the translation of texts of scientific technical style. In this regard, it is necessary to find out what style is, what are the texts of this subject and what features have.

Language style is a collection of language tools. The style of non-fiction, in turn, differs by the presence of special characteristics.

First, it's vocabulary. The scientific and technical texts use special terms that are selected in accordance with the area of knowledge to which a text refers to accurately conveys thought. As for grammar, scientific and technical texts abound with the use of passive, impersonal and vaguely personal designs. Most of the sentences are complex and complex.

Consequently, alliances, composite pretexts and various revolutions are widely used in the language of scientific and technical style. In addition, it is worth noting that the author of the text, trying to convey information and explain certain facts, discoveries, processes, avoids personal forms of verb, replacing them with a suffering pledge. In this regard, it becomes clear that all processes and phenomena in the text act as subject, eclipsing the author of the text. The style of presentation of information. The main feature of the scientific and technical text is the brevity of the presentation of the material and the clarity of the wording. In his turn, the following features of the style of scientific and technical translation are singled out: the strict consistency and logic of all the components of the author's idea, the content of the text, the availability of a particular area to the specialist in terms of understanding the information presented, as well as the statement of scientific fact.

Due to the rapid development of modern technologies, the translation of scientific technical terminology is especially relevant in recent times. Today, scientific and technical translation is not only a form of translation, but also a separate applied discipline. A distinctive feature of scientific and technical texts is the abundance of terms and various phrases, formulas, graphs, the translation of which can cause a number of difficulties. And the main task of scientific and technical translation is a brief and accurate presentation of information and the absence of any emotional coloring. Due to the rapid development of technology in the scientific language constantly appear new terms (neologisms), which do not have time to fix even the latest dictionary, which also presents great difficulties in translation. Thus, the relevance of our work is determined by the lack of study of the translation of terminology from Uzbek to English, especially on the material of such narrow areas of knowledge as optoinformatics.

The group of documents of legal entities, the translation of which has its own peculiarities and most often causes difficulties, include contracts, contracts and insurance documents. It should be noted that translation theory often requires a full understanding of the translator's source code. But by making such demands, the authors do not specify how it is possible to achieve a full understanding, which causes a negative reaction in translators. It is not always a translator, even if he has many years of specialization, able to fully understand any special text, such as the legal text on the first presentation. In most cases, this is not required, as translators often acquire the knowledge they need to understand the source code directly during the translation process, more precisely at the stage of analyzing the content of the source code prior to the actual translation.

The translator can acquire the knowledge he needs in many different ways. At the disposal of the translator are intelligent and bilingual dictionaries, glossaries, databases, information-search thesaurus, encyclopedias, texts, legislation, regulations, personal contacts with specialists, etc. can certainly be useful to the translator. But the organization of search is crucial. The sequence, for example, can be such. When the language units in the text are difficult to understand, the translator turns to the dictionaries to determine whether the language unit is compliant with the concept. (1, p. 124).

During the translation process, there is a need to comply with certain rules that help to transfer certain lexical units, such as terms, names of their own or abbreviations. When translating official texts, language stamps often match in content, but differ in internal form. This is due to the fact that in modern Uzbek language less established stamps than in English. Therefore, in order to translate the text as closely as possible, while preserving the syntactical and lexical designs of the original, the technique of verbatim translation of language cliché is used.

Particular attention should be paid to the fact that in order to achieve the closest possible translation and compliance with contextual correspondences, there is a need to use translational transformations in the translation of official texts. It is customary to highlight the most commonly used techniques, such as calcification, transcription and less frequent transliteration. Their use is conditioned by a great deal of content in the text of terms and names of their own. In addition to these techniques, the reception of antonymization is often used. Generalization, on the other hand, is rarely used because documents require extremely accurate translation.

The translation of the title of the document, if it reveals the essence of the question, should be as close as possible to the original, if it is short or of an advertising nature, the translator should add a brief annotation for informational purposes. All abbreviations found in the original text must be deciphered in accordance with generally accepted rules. Non-decipherable abbreviations remain in the original language. The original spelling does not change and retains: words and sentences are not in the original language; Abbreviated names of brands of products and appliances; foreign print names. The translation usually translates: the names of parts and departments of institutions and organizations; names of posts, titles, degrees, titles; their own names and names in accordance with established practice. The translation text transcribes: foreign surnames, own names and names, taking into account the traditional spelling of famous names; articles and prepositions in foreign surnames; naming of foreign firms, companies, companies, companies, corporations, concerns, monopolies, industrial associations; Alliances and pretexts in the names of firms; branded names of machines, appliances, chemicals, products, materials. The translation is replaced by Uzbek equivalents: special terms; geographical names Conditions. (2. P.53)

The use of abbreviations and abbreviations is typical of all types of documents. Contract cuts are used in abundance; there are special dictionaries to decipher them. The content of the contract also has certain characteristics, and they guarantee the division of contracts into certain varieties in accordance with the scope of activity, etc.

SPIRITUAL DEVELOPMENT IS AN EXAMPLE OF A RENEWED UZBEKISTAN

Mamatov Maxmut*

*Associate Professor,
Teacher of the Department of Humanities,
Shahrisabz branch of Tashkent State Pedagogical University,
Candidate of Philosophical Sciences, Acting,
UZBEKISTAN

ABSTRACT

This article discusses the fact that the steady growth of spiritual development is taking place in the interpretation of the results of the efforts of the republic. There will also be a discussion of the conditions and ways to achieve spiritual heights and the realization of the intended purpose. The fact that the spiritual development of the Republic of Uzbekistan, in general, is at the highest levels of world civilization, is clearly reflected in this study.

KEYWORDS: *Uzbekistan, Spiritual Development, Reform, Training, National Traditions, Renewal.*

Only when the material and spiritual factors are combined and become a real double wing, will the processes of growth and change take place in the life of man, the state and society.

Islam Karimov

INTRODUCTION

The spirituality of the society is an important condition and guarantee of the stability and development of the country. No country can reach a high level of development without developing its spiritual potential, spiritual and moral values in the minds of the people, awakening and strengthening the national spirit of the people. Spirituality, as noted by President Islam Karimov, is a powerful inner force that encourages spiritual purification and growth, enriches the inner world of man, strengthens his faith, faith and awakens his conscience. Therefore, raising the morale of the society has been identified as a priority for the development of Uzbekistan [3.14].

"Material reforms, economic reforms are on their way. They can be solved. It is possible to provide for the people. However, there is no more difficult and honorable task in this world than spiritual reforms - liberation from slavery and mutiny, uplifting the status quo, restoring the traditions of our ancestors and becoming a worthy heir to them" (Karimov IA Uzbekistan: national independence, economy, politics, ideology. T. 1, p. 202).

Spirituality is an invincible force that affects the human mind, directs its worldview and way of thinking in a certain direction. Spirituality is based on the general concepts of society, nation's spiritual, cultural and material foundations, traditions, values, way of life, ideas and views. Historical memory has a special role in the formation of human spirituality. When a person wakes up in the morning and accidentally forgets who he is, his name, his name, and does not know the people around him, it is a great tragedy for that person and his family. If a nation forgets who it is, it is a great disaster for that nation. When the violent and aggressive forces of the world want to subjugate, subjugate, and seize the wealth of any nation or country, they must first disarm it, that is, their national values, history, and culture, which are their greatest wealth. tries to lose his temper. A nation that has lost its identity is always doomed to slavery. To know deeply the history of one's people and country, to study it incessantly, to preserve the rich heritage of one's ancestors while continuing their good deeds, to learn from the past, to objectively assess the events of history, their consequences correct understanding is the content of rational human life. Without a historical memory, a person cannot understand the essence of the social changes taking place in his life and can not imagine the future. Therefore, if every member of society knows his past well, such people will not be influenced by different beliefs. History lessons teach a person to be vigilant and strengthen his will. The main characteristics that determine the basis and meaning of spirituality are the spiritual purification of a person and the growth of the soul [7.5].

There are those in our lives who live far from the noble qualities of honesty and purity, who interpret the meaning of life on their own. They feel as if they have landed on the head of a happy bird, putting themselves above others in every way. If you observe such situations, do not have any doubts or doubts in your heart. Because our sacred books and values, the heritage of our great thinker ancestors, always call us to live with honest labor, courage, generosity and humility. Good qualities, such as honesty, honesty, diligence, thrift, diligence, and personal example, are the main criteria that determine the spiritual wealth of a perfect person. In today's fast-paced world, only a truly spiritual and enlightened person can deepen his or her self-awareness by raising his or her national values, and dedicate himself or herself to the worthy cause of a free and independent Uzbekistan in the world community. Many of our compatriots consider honest and clean living in our country to be a vital belief and a high goal. It is because of these people and their good deeds that spirituality has always been stable in this enlightened world. The history of mankind proves that a person without spirituality will never have such qualities as humanity and kindness. "People! First of all, try to have good morals, because morality is the basis of the law. "Pythagoras Spirituality is a unique force that purifies the soul, encourages the growth of the soul, strengthens the inner world, the will, the faith, the conscience, is the criterion of all his views. 8 To understand spirituality, one must first understand and comprehend man. Spirituality permeates the human mind over the years with mother's milk, family upbringing, ancestral teachings, a sense of homeland, and sometimes bitter and sometimes joyful lessons of life. In particular, closeness to nature, people, always thinking of the

good, working honestly, enjoying the incomparable blessings and beauties of the world nourish and strengthen spirituality. The main factors that shape spirituality are spiritual heritage, cultural riches, and ancient historical monuments. At the same time, the development of science and its role in shaping human spirituality is important. Raising a well-rounded child is unimaginable without a combination of community, family, and education. These are the main criteria in the formation of human spirituality. Our ancient and beautiful land is one of the cradles not only of the East, but also of world civilization. Because in this sacred land, many great people, scientists, scholars, masters and commanders have grown up. They have become an integral part of universal civilization and culture, raising secular, especially religious, knowledge to the highest level in history. The growth of spiritual development is a case in point in the example of a renewed Uzbekistan.

The role and importance of historical memory, knowledge of ancestral history, national and moral values and traditions, our sacred religion in raising the spirituality of society is incomparable. No nation can imagine its future without knowing its history, without relying on the spiritual heritage created over the centuries, and without further developing it. Therefore, on the initiative of the First President Islam Karimov, important measures have been taken to cover the history of our people, which was falsified during the dictatorial regime, to teach the history of the Motherland in all educational institutions, to publish the first textbooks and manuals. During the years of independence, the restoration of our rich spiritual heritage has risen to the level of public policy. Our ancestors who made a great contribution to our national culture and the development of world civilization - Imam Bukhari, Imam Termezi, Bahoviddin Naqshband, Khoja Ahmad Yassavi, Al-Khwarizmi, Al-Fargani, Ibn Sino, Mirzo Ulugbek, Alisher Navoi, The national and spiritual heritage of Zahiriddin Muhammad Babur and many other ancestors was returned to our people, their birthdays were celebrated all over the country, their souls were rejoiced, their works were published. Their spiritual heritage today gives our people the spiritual strength to build a new society, to serve the spiritual upliftment of our society. The names, honor and respect of Abdullah Qodiri, Cholpon, Fitrat, Usman Nasir and other people's heroes, who were martyred for the freedom of our homeland, have been restored and their works have been published.

There are 15 registered and officially functioning religious denominations in the country. There are more than 170 religious organizations, in which representatives of 130 nationalities and ethnic groups living in the territory of Uzbekistan meet their religious needs. More than 1,700 mosques and other religious centers have been renovated and rebuilt. There are 10 religious educational institutions and the Tashkent Islamic University. During the period of the tenth anniversary of the restoration, more than 2,000 monuments to the glorious and glorious history of the people were restored in Uzbekistan. At present, there are 88 museums, 40 theaters, 1,370 cinemas and more than 6,000 libraries in the country. The humane customs and traditions, cultural values of the Uzbek people, formed over thousands of years, are being carefully preserved and enriched. Dozens of contests of maqoms, wedding songs, poets and folklore-ethnographic groups are organized and high talents are recognized. Symphonic and chamber music of pianists and violinists, festivals and competitions of modern pop groups [3.20].

At the initiative of the head of our state, the idea of national independence, its goals and objectives have been developed and are being inculcated in the minds of our people. The ideology of the society helps to unite the people, to unite all citizens, regardless of their

nationality and beliefs, to mobilize them for creative work, and to lay the groundwork for intensifying efforts in this direction. From the years of independence to the present day, great strides have been made in the development of education, science, culture and healthcare. In the field of pre-school education, a network of home-based kindergartens, schools equipped with modern equipment and secondary schools has been formed. By 1997, 238 lyceums, 136 gymnasiums and many professional colleges had been established in the country. Advanced methods of assessing the level of knowledge of applicants and students on the basis of tests and ratings have been introduced. The education system, training was not linked to the democratic changes taking place in society, the requirements of market reforms, and the material, technical and information base of the educational process was unsatisfactory. There was no cooperation between the education system, science and industry, and students did not fully develop independent thinking. That is why we are working to radically reform the education system and raise it to the level of a developed state. At the initiative of Islam Karimov, ways to radically reform education have been developed. On August 27, 1997, at the IX session of the Oliy Majlis, the Law of the Republic of Uzbekistan "On Education" and the "National Training Program" were adopted. The purpose of the national program is to radically reform the education system, to free it from the ideological views and stereotypes of the past, to create a national system of training highly qualified personnel at the level of a developed democratic state, meeting high moral and ethical requirements. The success of the national program is reflected in the complex and productive work of today's youth, aimed at creating a renewed image of Uzbekistan.

IMPLEMENTATION OF AMIR KHUDOIBERDI'S POEMS IN THE RENEWED EDUCATION SYSTEM OF UZBEKISTAN

Namazova Manzura Urakovna*

*Teacher,

Department of "Uzbek language and literature",
Shahrisabz Branch of Tashkent State Pedagogical University,
UZBEKISTAN

ABSTRACT

This article discusses the expected changes in the education system of Uzbekistan today. Our young people, educated in modern educational institutions on the basis of world standards, successfully participate in prestigious international competitions, science olympiads, competitions and festivals, awakening the world with their high intellectual potential, broad thinking and intelligence. That is why our research is devoted to the classification of Amir Khudoiberdi's poems and methods of applying the poet's poems in literature.

KEYWORDS: *Education system in Uzbekistan, Reforms in education, National anthem, Female image, Love song, philosophical views, new textbooks, poems by Amir Khudoiberdi.*

INTRODUCTION

Today, great efforts and funds are directed to the comprehensive development of the education system in Uzbekistan, the training of qualified personnel. Qualitative changes are taking place in the activities of preschool education, school and higher education systems, research institutions. As the President said, "Today we are laying the foundation for a new era of development in Uzbekistan. Our closest assistants are teachers and coaches, scientific and creative intellectuals." Therefore, it can be said that Amir Khudoiberdi and his work can undoubtedly be an example in educating educated and harmoniously developed youth.

Given that the following innovations await us in the education system in 2021, we set ourselves the goal of making effective use of creative poetry during this research:

Schools:

- New textbooks will be published to develop children's analytical and creative thinking skills.

- The National Curriculum, which does not overload the child, will be introduced in the primary grades instead of State educational standards.
- Teachers who go to a remote school in another district are paid 50 percent of their salary, and those who work in another district are paid 100 percent more.
- Budget subsidies will be provided to encourage private schools in the regions.
- 10 presidential schools; 197 schools specializing in chemistry, biology, mathematics and IT will be opened [7].

Higher Education:

- The government will also start ordering private universities for training.
- 30 universities will be given the right to develop curricula, admission quotas and independently address financial issues.
- Radical renewal of science programs based on science, reflecting the spirit of today in science materials.

It is in the course of our research that we have chosen reforms in general secondary and higher education, although pre-school and post-graduate educations are still undergoing relentless reforms. The system of general secondary education and higher education is a key part of the education system of Uzbekistan, so it is important to educate young people studying in this system.

Why should Amir Khudoiberdi's works and poems be included in the education system? Amir Khudoiberdi's work comprehensively encompasses all spheres: love, love of Motherland, family, glory of independence, respect for women, religious teachings, gratitude, realities of life, and qualities of human nobility. And while studying these poems, young people achieve perfection.

Not only in the history of Uzbek, but also in the history of world literature, you rarely meet a poet who has not written a poem about the Motherland. Of course, their artistic level, power of influence, place in the heart is different. In some cases, the poet may express his love for his country without using the word "Homeland" in his poems. Sometimes the relentless repetition of the same word restores the sincerity of the lovers of poetry. Everyone understands, loves, misses, sings the Motherland; He is proud of his homeland. From its soil, from its flower, from its flowerbed, the sad nightingale fig rises to the sky. Such traditional images also signify a person's love for their homeland or their desire for divorce. In the works of Amir Khudoiberdi one can see that the feelings of love and glorification of the Motherland are often used. The artistic word about the Homeland in the poem refers to the nature of the poet, his psyche, his understanding and perception of the world. Often the poet's personality, inner personality, and external social environment are combined into a single lyrical protagonist. The homeland is reflected in this image, and, conversely, the poet's own world or the hero he created becomes a symbol of the homeland...

TURKIYLARIM

(Historically, the Turks have been brutally destroyed in countless battles. It was assimilated into the ethnic composition of other nations. Otherwise, the population of this nation today would be 1.5 billion, like the Chinese ...)

Jon berdi yov tutgan zahardan.
Yov podshosi ziyofatdan so'ng
Qanday yuvdi qo'lidan qonni?!
Tarix ko'ksin o'ymish foje, mung,
Nega qonin to'kdi mehmonning?!
Turkiylarim, bo'likli bo'la,
Go'l emassiz, soddasiz faqat.
Oq ko'ngilsiz, qalbingiz to'la
Samimiyat, mehr, ofiyat.
Shon quchdingiz maydonda doim,
Qo'rqmadingiz zinhor o'limdan.
Dahshat ba'zan o'lmoq bir xoin
Yo iprisqi qo'rqqoq qo'linda!
G'anim makkor, shafqatsiz, shonsiz,
Bisyor erur makru hiylasi.
Qoldik bugun mardsiz, maydonsiz,
Ko'ksimizda tiyrning tiyrasi!
Yig'ib oling es-hush, aqlni,
Buncha uzoq mizg'ib netdingiz?!
Kuch birlikda degan naqlni
Unutdingiz -- to'zg'ib ketdingiz!
Hamma joyda izg'ib yurar yov,
Bilmaysiz, voh, kim do'st, kim g'anim.
So'ndi qalbda olovli yalov,
Unutdi el asl tuvg'anin!
Qaylardasiz, bahodirlarim,
Gijinglagan tulporlar qani?!
Dunyo sotdi asotirlarin,
Endi qoyim nomardlar jangi!
Yog'dirarlar bomba beayov,
Yonar borliq, yonar shaharlar.
Endi ochiq jangda emas, yov

Dasturxonda pinhon zaharlar.
Farqlayolmay dushmandan do'stni
Kechar umr, nodon o'zimiz!
Yoqmas kimki aytsa rost so'zni,
Ochiladi qachon ko'zimiz?!
Turkiylarim, og'ir kechdi tun,
Ololmadim zarracha orom.
Tong otmoqda, yuzin ochdi kun,
She'rim hali bo'lmadi tamom!
Dil bering, siz botirlarim-da,
Davom etgay shoyad shukuhi!
Shoyad ushbu satrlarimga
Qanot bergay bobolar ruhi!

In Uzbek poetry, as in other poetry, the reference to the female figure as a symbol of love is more common. After all, respect for women is one of the highest values of our people. Amir Khudoiberdi also wrote such poems as "Bu qiz.../This girl ...", "Ishvalaring yolg'on/Your work is a lie", "Ko'zing daryosida/In the river of your eyes", "Xiyonat/Betrayal", "Men uchun o'lgansan/You died for me...", "Begoyim", "Oh, my brother Nozanin". takes up a sacred theme.

HUSNING

Husning olamni yaratmish, asli sendin ibtido,
Chehrangta jo aylamishdir shamsi anvarni Xudo.
Bir qiyo boqsang bahorlar boshlanar, yashnar zamin,
Chamanda gullar etur husnu qadingga iqtido.
Sen tomonga talpinur dil mastu behud, telbavor,
Husnu mulking bir duriga aylay borimni fido.
Nido keldi: "Kech yuziga termulmoqning zoridan,
Quyoshga ko'p qarayvergan bo'lgaydir ko'zdin judo!"
Gar xazon bo'lsam chechakdek qovjirab oftobidan,
Lutfing-la boshdin yana yerda ko'karmoq muddao.
Bu go'zallik, bu malohat, bu latofat, bu chiroy
Sizni taxt uzra ko'tarmish, aylamish bizni gado.

Sen tomonga boshlagaydir Shayx Shibliy har kecha,

“Tur o‘rningdan, ketdik!” deydi xochga mixlangan Iso.

Vale yo‘lsiz noilojmen, baland qo‘rg‘on ichra sen,

“Keldi!” deb bir ochmading-a lutf eshigin, mahliqo.

Bu olamning qismatidan qo‘rqar Amir, alhazar,

Nahot hajring dardi birla topsa olam intiho?!

Ey Tangrim! Qalbimni qutqar, najot ber,

Muhabbat dorusi og‘u bo‘lmasin.

Mening yuragimda ingrayotgan she‘r

Tog‘dagi eng so‘nggi ohu bo‘lmasin.

Qalbsizlardan qutqar, sevgisiz kaslar

Ko‘magiga aslo duchor aylama.

Holim qaydan bilsin oshiq emaslar,

Xoru zor aylama, nochor aylama.

Yuragimni yoqding, samoviy hislar

Sandonidan tushdi qalbga parcha cho‘g‘.

Yorning dudog‘ida yig‘lar yalpizlar,

Iforidan bahra ololganim yo‘q.

Sabr ber, sevgiga begona dunyo

Poyida xor qilma, bo‘lmayin abgor.

Quzg‘unlar oldiga tashlamagin, o,

Sevgiga limmo-lim qalbimni zinhor!

Holimdan kulmasin ishqdan benasib,

Toshtag‘ir izdihom, miskin jon uvol.

G‘ayurlar qo‘liga xanjar tutqazib,

Sabrim sinayapsan balki, ehtimol?!

Sevmasa sevmabdi bir qiz, jahonda

Yo‘qmi o‘zga suluv, o‘zga zebo qad?

Sevaman deb so‘ngra tonmoq yomon-da,

Subutsiz onlarga kerak-ku toqat!

Yurak sanchib chiqdi, uvushib og‘rir,

Kiprik yumilmadi, ko‘zdan qochdi xob.

Bu kecha yaldoli, kechdi ko‘p og‘ir,

Borlig'im qopladi alam, iztirob.
Bir bo'sa, birgina lutfu, shirin so'z
Dardlaringga malham bo'lurdi, illo.
Kafanmi egningga yopinganing bo'z,
Xazonmi kiyganing sap-sariq hullo?!
O'lim va hayotning orasi asli
Bir qadam, toysang bas, yo'qlik u yog'i.
Bir lahza ajalga bo'lsa qalb taslim,
Bir lahza umringga quyilsa og'u.
Tangrim, himoyating kerak shu asno,
O'zing sev, yorlaqa miskin qulingni.
Tilarmen, imdodsiz qoldirma aslo,
De: "Arshdan uzgaysan saylab gulingni!"
Degin: "Seni anglab yetgay sevganing,
Ko'nglingda uyg'ongay samoviy farah".
Icharmen, sharob yo og'u berganing,
Tutqazganing esa ilohiy qadah!

Also, in the work of Amir Khudoiberdi, philosophical views, understanding of the world, feeling the spirit of today are a priority. The poet's poems such as "Devonalarmiz", "Shukri yo'q kimsa", "G'ozfil bo'lma/don't be ignorant", "Ustozimning menga aytgan so'ngi so'zlari/The last words of my teacher to me", "Tavallo", "Kecholmasman/I can't forgive", "Tabiatning jazosidan qo'rq/Fear the punishment of nature" more than a hundred poems can be a life guide for the upbringing of young people.

* * *

Hayot juda og'ir, halak bo'lasan
Ovlamay deb ho'kizlarning ko'nglini.
Qiynoqlardan naq beajal o'lasan
O'rganolmay to'ng'izlarning tilini.
Mulozamat kerak eshakka,
Maqtash kerak maymunlarning turqini.
Ko'tarilay deysan yuksak-yuksakka,
O'zlashtirgil tulkilarning xulqini.
Sher haqida yomon gaplar desa kim,

Borib chaqqin, “panohim” de sig‘inib.
Eplolmasang, hech bo‘lmasa yashashin
Toshbaqaday tosh kosangda biqinib.
Kuchuk bo‘lib kirgin itning pinjiga,
De yolg‘ondan bo‘lsa-da: “Siz otamday!”
“Odamman-ku” deb ming o‘yla ichingda,
Baribir hech yasholmaysan odamday!..

O‘LIM HAQDIR

Men o‘limdan qo‘rqmam, qachondir
Yuz berishi aniq, muqarrar!
Tangrim bergan omonat jondir,
Dargohiga bir kun chaqirar!
Men o‘limdan qo‘rqmam, o‘limdan
Dahshatliroq shuursiz hayot.
Qo‘rqinchlidir qiynoq, zulmdan
Iymonsizlik va nursiz hayot!
Peshonangga o‘lim tamg‘asi
Bosilgandir tug‘ilganing on.
Vaqt yetganda ajal nag‘masi
Chalingaydir, bilasmiz qachon?
Bobolardan meros aqida
O‘tgan kunga qilmoqlik shukur.
Deganlarki: “O‘lim haqiqat
Qo‘rqmoq esa eng katta kufr!”
Yovga quldir o‘limdan qo‘rqqan,.
Shirin jonin avaylar malay.
Ajdodlarning pandini uqqan
Tubanlikka bormas har qalay!
O‘lim haqdir, tiriklik sabot,
Sabr-toqat, chidam, iroda!
Shirin, totli tuyulgay hayot
Nafas olsang erkin, ozoda!

Gʻanimat kun, gʻanimat damlar,
 Yashashga shosh, sevgil, sevilgil.
 Yuragingni ezmasin gʻamlar,
 Botgan quyosh tongda chiqqay, bil!
 Suyukliging qoshiga yugur!
 Oʻylamagil hech oʻlim haqda.
 Yuragingni ochmoqqa ulgur
 Qoʻyilmasdan umringga nuqta.
 Gar ersang musulmon, koʻrgilki, shayton
 Fitna qilur, sen-chi laqma, goʻl, nodon.
 Qoʻyvor birodaring yoqasin, toki
 Dushman shod, doʻst koʻngli boʻlmasin vayron!

In conclusion, major reforms are being carried out in New Uzbekistan in order to radically change the education system, integrate it into international standards, train qualified personnel to meet the needs of the labor market and bring up a new generation that will realize the Third Renaissance. . In particular, the development of pre-school education, improving the functioning of secondary schools, bringing the higher education system to the level of world standards, their inclusion in the international ranking of thousands, especially the establishment of an objective and fair system of admission to educational institutions, a lot of practical work is being done, such as opening branches of prestigious foreign universities. It is advisable to use the works of Amir Khudoiberdi in the organization of additional classes, literary circles, art evenings at school. The upbringing of children is a major issue in society. As Amir Khudoiberdi's poems have the spirit of respect, sincerity, trust, kindness, creativity, care and love, in this environment a harmoniously developed person can grow up, love his homeland, the traditions of his people. can care, realize the priority of universal human values, life and health.

We believe that the creative poems will also instill kindness, humanity, sensitivity, kindness in the hearts of school children and become a school for children to “nurture good feelings”. And our children will grow up to be worthy citizens of their country.

APPLICATION OF RADIO MONITORING SYSTEMS IN DEVELOPMENT REGIONS OF DANGEROUS NATURAL GEOLOGICAL PROCESSES CAUSED BY EARTHQUAKE

Nazarova Navbaxor Narzulloevna*

*Senior Research Fellow,
Institute of Civil Protection under the Academy of the Ministry of Emergency Situations,
Tashkent, Republic of Uzbekistan
Email Id: navbaxornazarova@gmail.com

ABSTRACT

This article is devoted to the development of a method of monitoring and monitoring the state of mountain layers in areas where landslides can occur - a dangerous natural geological process based on integrated sensors of optical fiber communication. The main cause of landslides in the territory of the Republic of Uzbekistan is also related to hydrometeorological conditions. Therefore, this process is seasonal, ie the higher the atmospheric precipitation, the higher the risk of landslides. Landslides in Uzbekistan are most common in Surkhandarya, Kashkadarya, Tashkent, Fergana, Samarkand and Namangan regions.

KEYWORDS: *Avalanche, Security, Optical fiber, Technological process, Optical fiber sensor.*

INTRODUCTION

Landslides are one of the emergencies that pose a serious threat to the population and the economy of the Republic of Uzbekistan living in mountainous, foothill and riverine areas. So, in such conditions, how to protect the population and the territory from emergencies and take measures to prevent it?

Although landslides are included in the category of separate processes that occur on the earth's surface, they develop in close connection with the internal movements of the earth, in particular earthquakes.

By analyzing large landslides and studying their causes, we can be sure that most of them are formed after an earthquake or in parallel with an earthquake [2].

The main cause of landslides in the territory of the Republic of Uzbekistan is also related to hydrometeorological conditions. Therefore, this process is seasonal, ie the higher the atmospheric precipitation, the higher the risk of landslides.

Landslides in Uzbekistan are most common in Surkhandarya, Kashkadarya, Tashkent, Fergana, Samarkand and Namangan regions.

MATERIALS

Today, the Ministry of Emergency Situations of the Republic of Uzbekistan, ministries, departments and other organizations that are part of the state system for the prevention and elimination of emergencies have created a unified system for monitoring, information exchange and forecasting of natural, man-made and environmental emergencies. That is, the identification of zones (zones) of the development of dangerous natural geological processes, the study and prevention of their activation, anti-landslide and other preventive measures to maintain the natural stability of slopes, healthcare facilities and other settlements. The State Committee for Geology and Mineral Resources of the Republic of Uzbekistan for Geological Processes is engaged in organizing and monitoring hazardous geological processes in the territories where facilities are located, and there is a mechanism for exchanging information with the Ministry of Emergencies [1].

The Problem in Studying Landslides: First, is in the abstraction of the time of their occurrence. Because landslides are one of the most dangerous geological processes that develop spontaneously [3].

Second, find a safe place. A comprehensive study of the area is needed to relocate people and farms to the relatively safe area. A comprehensive study should lead to a single conclusion [5].

THE RESULT

Solution of the Problem:

- An effective result can also be achieved when using a radio monitoring system based on fiber optic sensors as an innovative solution for the study of landslides. Light weight and volume of optical fiber, no fire hazard, high resistance to abrasion, low cost and explosion hazard allow the use of optical fibers as sensitive elements of the measuring system.

1- Picture. The principle of organizing a radio monitoring system.

- Optical fiber cables for data transmission can also be used as sensitive elements in determining temperature, pressure, vibration and quantities that have a physical effect. The main advantages of such systems are the ability of power grids to serve you, the absence of electromagnetic interference, high sensitivity and small size. In addition, the use of standard optical fiber cables and elements used in telecommunications shows that the cost of such sensors is not expensive.

- Optical fiber sensor (OFS) is a measuring instrument consisting of a measuring transducer (MT), which is transmitted from an optical fiber, connected to an optical signal processing and conversion device via an optical fiber communication line and measured to any optical fiber of physical size. Designed to present the measured data signals in the form of applications by varying the size of the signal [5]

The advantages of using optical fiber measuring sensors in the monitoring system of various objects and processes are:

- No effects on the measuring device;
- Absence of problems with the melter;
- Absence of problems such as arc formation and sparking;
- High resistance to adverse environmental conditions
- The ability to make measurements in potentially explosive atmospheres;
- The impossibility of the fiber to chemically react with the measuring medium;
- High mechanical strength and simplicity of system structure;
- Resistance to temperature rise.

DISCUSSION

The main advantage is, first of all, the ability to perform remote measurements when it is not possible to use electronic sensors or when their use is not recommended.

Based on the advantages and capabilities of the above optical fiber sensors, it allows for continuous monitoring of rock strata and mountain migration processes in mountain and foothill areas.

Second, in solving the problem of finding a safe place, it is necessary to create maps that reflect the specific crisis and danger. Based on these maps, security plans for the areas will be developed. Such events are taking place on a large scale in Europe and the United States.

CONCLUSION

Extensive study of innovative policies of high-tech developed countries, including the United States, Japan, South Korea in the field of life safety, the existing scientific and technical potential for the effective implementation of inventions and scientific developments, achievements in this field and capacity-building measures should be intensified.

ABSTRACT

The article discusses the state of development of rural tourism in our country in the context of the COVID-19 pandemic epidemic, the organizational and legal framework and regions, the impact of Coronavirus on global GDP growth in 2021 and how the pandemic affected his business from Europe to Uzbekistan. According to Saparboy Jubaev, an analyst with a PhD in economics, the pandemic could have less of an impact on Central Asian republics than in developed European countries. Because their share of services in GDP is less. For example, in developed countries such as Italy, rural tourism is well developed. Therefore, their rate of decline will also be large.

KEYWORDS: *Economic shock, Economic crisis, Aircraft, International flight, International tourism, Airline, Medical system.*

INTRODUCTION

According to the World Tourism Organization (WTO), this year's results compared to 2019 have led to a 98% reduction in the number of international tourists due to the disruption of the COVID-19 pandemic, resulting in a decline in international tourism revenues between January and May 2020. released As a result of a 300 million drop in the number of international tourists, international tourism revenues fell by \$ 320 billion. The result of this loss is three times that of the 2009 global financial and economic crisis. Currently, 90 countries are fully or partially closed to tourists; 209 routes, i.e. 96% of all routes in the world are restricted; the tourism industry could suffer \$ 22 billion in damage.

ANALYSIS OF THE LITERATURE ON THE SUBJECT

According to Saparboy Jubaev, an analyst with a PhD in economics, the pandemic could have less of an impact on Central Asian republics than in developed European countries. Because their share of services in GDP is less. For example, in developed countries such as Italy, rural tourism is well developed. Therefore, their rate of decline will also be large. That is, the decline in GDP in these countries is expected to be 5-6%. The negative impact on the production of the Central Asian republics due to the decline in the volume of services, as well as falling oil and gas prices may be around 1-2%. Then the overall growth in the region could be 3-4% instead of the planned 5-6% by 2020.

However, i.f.d., prof. Rakhimova Dilduza Nigmatovna's article "Impact of the Coronavirus Pandemic on the Global Economy and Uzbekistan's Economic Partners" provides an in-depth economic analysis of pre-coronavirus economic development and the impact of the pandemic on the global economy and Uzbekistan's economic partners. .

Behruz Hamzaev, a well-known tourism expert in Uzbekistan and a former adviser to the chairman of the State Committee for Tourism Development, said 50 percent of airlines had gone bankrupt, that Uzbekistan needed to focus on tourism in a pandemic, and that Uzbekistan was a rich tourist destination.

RESEARCH METHODOLOGY

The article uses methods of abstraction, analysis-synthesis, induction and deduction, mathematical modeling and dialectical modeling.

ANALYSIS AND RESULTS

The coronavirus posed a threat of a global economic crisis. According to experts, the probability of a global economic crisis in the next 12 months is 43%. The number of patients infected with COVID-19 coronavirus, originally detected in China, has declined sharply, but outside of China - in other parts of the world, the geography of the virus is expanding day by day, and the number of coronavirus patients is growing rapidly. To date, a new strain of coronavirus has been detected in 114 countries around the world.

In recent weeks, the impact of the new strain of coronavirus on the economies of countries has been actively discussed in all leading media around the world, while in global financial markets there has been a sharp - dramatic decline in assets and indices. In other words, the COVID-19 coronavirus has "entered" not only the human body but also their economic lives and global financial markets.

According to Uzanalytics.com, FocusEconomics, one of the leading analytics companies in the analysis of financial assets, global markets and countries' economies, has been conducting a survey among leading experts on the impact of the coronavirus on the global economy and its economic consequences since mid-February. Yesterday, the company announced the results of its latest survey, which ended on March 11. The survey involved 54 leading economists and financial analysts around the world. In the survey, experts were asked the following questions:

1. What is the impact of the coronavirus on global GDP growth in 2021?
2. Will the coronavirus continue to affect the global economy after 2020?

3. What is the probability of a global economic crisis in the next 12 months?

4. What is the impact of the coronavirus on the GDP growth of China, South Korea, Italy and Iran in 2021?

The results of the survey show that compared to the results of the previous survey (published on March 3), experts are overestimating the impact of the coronavirus on the global economy.

More than half of the 54 experts, or 57 percent, forecast global GDP growth to fall by 0.5 percentage points this year, while 20 percent of them forecast a decline of 1.0 percentage points.

The outbreak of the coronavirus pandemic and the consequent quarantine of countries around the world have dealt a severe blow to the tourism industry.

The cancellation of flights has led to a sharp drop in the number of foreign visitors around the world since March, following the closure of borders. By the beginning of the summer months, when travel companies and the hotel business were to thrive, the figure was zero. Uzbekistan has also been affected by everything from the national airline to hotels and regular guides.

The effects of quarantine, which spread around the world, were severe and rapid. A period of uncertainty has begun in the lives of thousands of people in the fields of tourism, transportation and hotels.

Anvar Shermatov is the chairman of the Uzbek-German society "Davra" in Germany and works in the field of tourism. We asked an entrepreneur who travels from Europe to Uzbekistan how the pandemic has affected the business. Anvar Shermatov had a different preparation for the 2020 season. In an interview with the BBC, Anvar Shermatov said that 2020 was a different year for the tourism business than the year before, but the coronavirus had ruined it all. "I'm in the tourism business. We prepared for 2020 differently than every year, Facebook, Google We have invested in advertising, participated in tourism fairs, distributed catalogs, worked more gypsies with our partners. So, 2020 was expected to be the best of the tourist seasons so far. As you know, suddenly COVID-19 was terrible news for us. " he says. According to the businessman, they hoped that the season would not end until mid-March. "We did not lose hope until mid-March. out of the fall season), we moved what was possible to the fall season, some to 2021, but it was 80% canceled".

Anvar Shermatov says that they are still hoping for the autumn season, but they are not sure that it will happen. "Now we have one hope from the autumn season, but I do not believe that it will come true. This is a good loss from the economic point of view, but we have written to most of our customers and said that we will be happy that they will travel through us again in the future. " "It's not a solution. The airlines are different; at least they don't return the money. I think it's a long process," Shermatov said. "We took the opportunity to update our website so as not to sit idle. We have been working tirelessly for 4 months, at least trying to make the website look more modern. All the preparations are now focused on 2021, we will be in the market with three websites at a time,"he said. Anvar Shermatov, who lives with his family in Berlin, has not faced financial difficulties. "I live in Berlin with my family, it has not affected my family budget, I must say that I am satisfied, my colleagues from Germany are temporarily taking their salaries from the state, they have recently been allowed to travel to the EU, many have returned to normal work, but the countries that bring in the main income will have to be a little more patient, not in the EU, "said Anvar Shermatov.

According to analysts, due to the pandemic, representatives of the tourism industry have begun to reconsider the products they offer:

- use one of the two rooms in hotels;
- Restrictions on the beaches through barriers to avoid crowds;
- Waiver of all inclusive payments;
- offer ecological species;
- opening new routes, etc.

While some travel agencies are facing a crisis, it is expected that competition will not be as strong as before in the near future.

The development of domestic tourism is expected in most countries due to the closure of borders, various restrictions and the fear that people will not be able to spread the disease abroad. While globalization has lowered borders between states to a nominal level, the spread of coronavirus has forced the situation to reverse.

However, it is possible to make optimistic predictions that such a situation will continue until a vaccine or effective treatment is discovered, and then gradually gradually recede.

After the cancellation of international flights and the closure of borders with neighboring countries, the flow of foreign tourists stopped abruptly.

CONCLUSIONS

There are a number of options to support tourism development in the event of a global pandemic:

- First of all, wide promotion of rural tourism;
- To pursue a policy of intensification of rural tourism, effectively using the fact that foreign countries have closed their borders;
- With the mitigation of the pandemic, more than 34 million people in the country will be able to activate tourist services and thereby create opportunities to improve the rural tourism infrastructure with the efficient use of time;
- To create conditions for tourism companies, hotels, cafes, restaurants, to support them as much as possible by supporting rural tourism, so that tourism professionals do not transfer to other jobs;
- In order to attract tourists to tourism, it is necessary to promote eco-tourism or rural tourism, because after the pandemic it is natural that most tourists will be very cautious. In such a situation, the use of ecotourism and rural tourism opportunities will help to get out of the situation. For tourists traveling in the bosom of nature, there is no need to maintain social distance. In rural areas, people are less likely than in cities.
- There are many opportunities for tourism in Uzbekistan and natural landscapes worth showing to tourists in the countryside, but most of our compatriots do not know about it. Therefore, we believe that it is time to create rural tourism infrastructure. At the same time, another option for rapid recovery of tourism in the post-pandemic period is to diversify tourism. Mostly foreign tourists come to Uzbekistan by air. We have a sharp decline in the number of tourists with

average means, as ticket prices are relatively expensive compared to the international level. We need to improve the quality of service in hotels and restaurants in our country. We should not modernize the hotels in Tashkent, Samarkand, Bukhara, Khiva, which are our traditional tourist centers, but encourage the construction of small and comfortable 3-4 star hotels in all places rich in tourist resources. Wealthy tourists prefer quiet places rather than crowded ones and demand services that are worth the money they spend. At the same time, 3-4 star hotels do not have to be multi-room, it is small and comfortable, but the quality of services should be high.

Associate Professor of the Department of Russian Philology,
UZBEKISTAN

ABSTRACT

The article states the role of psycholinguistic teaching of foreign language – the Russian language. The correlation between verbal and non verbal means of communication is given in the process of teaching communication. The authors process from the thesis the communication in teaching any language is based on the theory of speaking activities: extra linguistic means such as mimics, gestures, intonation, poses and etc. are used in the speech. As the practice shows these means make communication easier “supporting” its main component- language component (clicke, seals of the language they learn-the Russian language.) According to the authors, the account of psycholinguistic’s achievements further the training of bilinguists knowing the Russian language as true means of communication.

KEYWORDS: *Psycholinguistics, Verbal And Non Verbal Means Of Communication, Reading, Writing, Listening, Speaking, Communication On The Tought Language, Communication And Speaking, Bilinguists, Psychological Barrier, Mimics, Gestures, Intonation.*

INTRODUCTION

The preparation of a comprehensively educated and intellectually developed generation is especially relevant in the age of globalization and the erasing of educational boundaries, the widespread dissemination of ICT. That is why in our time the process of teaching languages is becoming more and more applied, which is due to the growing pragmatic needs of society.

The modern tasks of teaching the Russian language can be reduced to the preparation of a native speaker capable of conducting intercultural dialogue. The global goal of language acquisition is considered to be the introduction to the culture of native speakers and participation in the dialogue of cultures. This goal can be achieved with the formation of the ability for intercultural communication. Communication in any studied language is based on the theory of speech activity.

Communicative language learning is of an activity nature, since verbal communication is carried out through speech activity, which serves to solve the problems of productive human activity in the context of social interaction of communicating people.

In recent years, the attitude of non-Russian people towards the Russian language has changed in a positive direction: people want to master the language as an instrument of production. They are less interested in the history and theory of the language, since they need the Russian language exclusively functionally - for practical use in various spheres of society as a means of real communication with native speakers. The most relevant question for Russian teachers is: how to prepare bilinguals in the shortest possible time in the usual conditions of teaching the Russian language. In this matter, it is advisable to rely on the achievements of psycholinguistics.

AA Leont'ev is rightfully considered the founder of psycholinguistics^[1]: in his works, for the first time, substantiated the main provisions of this science, originally presented in the form of a theory of speech activity. Currently, psycholinguistics is defined as the science of the laws governing the generation and perception of speech utterances.

The emergence of psycholinguistics is associated ^[3] with the weak links of methodological science and practice of teaching foreign languages. Determining the strategy of the language teaching process, specialists were unable to answer a number of fundamental questions related to the choice of the optimal content, suitable methods and techniques, and priority teaching principles.

In teaching the Russian language, for a long time in our republic, the grammar-translation method, which corresponded to the tasks of teaching the grammatical structure of the Russian language, took precedence. By the way, this approach is due to the fact that both the content and teaching methods were copied from the methodology of teaching Russian as a native language.

Anthropocentric linguistics, which replaced linguocentric, takes into account, first of all, the needs of a person, people. The new science has clarified many issues related to both the study of languages and the teaching of communication and the formation of speech activity in them.

Specialists now have an idea of how a person's communicative competence is formed. Many people have real chances to master several languages in parallel, the number of bilinguals and polyglots is growing. However, for a number of reasons, these opportunities are not realized equally in all people. The results of teaching the Russian language currently do not fully meet the needs of our society.

In this regard, the integration of the efforts of methodology and psycholinguistics can lead to positive changes in the practice of teaching the Russian language. The realization that fluency in a language is possible only on condition of the formation and development of skills in the main types of speech activity (reading, writing, speaking, listening) is one of the main achievements of modern language teaching methods. The next step, in our opinion, should be the reliance on

psycholinguistics, which studies the relationship of speech activity with human consciousness, which is one of the priority directions in the development of modern methods. Psycholinguistics is a complex science that studies language, speech, speech activity, features of communication between people using verbal and non-verbal means ^[3].

When teaching languages, it is necessary to clearly distinguish between the concepts of “speaking” and “communication”^[4]: when speaking, a person is limited to using linguistic means, and when communicating, extra linguistic means are also used - facial expressions, gestures, intonation, pauses, etc.

When teaching foreign languages, it is necessary to instill in the trainees the skills in the use of facial expressions and gestures. It is especially important to learn the correct intonation, the placement of logical stress.

People with a lack of natural skills will be very different from other native speakers in that they will not speak like everyone else (native speakers): firstly, they themselves will feel awkward when communicating; secondly, such a person is perceived by his interlocutors as a “stranger” or an inferior partner.

People who study foreign languages must know not only the theory of the language, but also be true native speakers, i.e. they must be proficient in the linguistic, and situational, and social, and national-cultural levels of the language being studied. Thus, speech is a creative process that requires initiative on the part of the speaker. Speech skills acquired in the study of languages should be flexible.

Speaking is a skill that arises on the basis of language skills, but is not reducible only to them. In the process of communication, the speaker finds himself in different speech situations, is faced with the need to solve various problems. To solve them, he chooses all possible means of communication, varying linguistic and over linguistic components. Words, phrases, sentences are combined not only with clichés and clichés, but also gestures, actions, facial expressions, intonations. All these tools facilitate communication, "supporting" its main component - linguistic.

Consequently, communication is possible not so much with the help of verbal means as with the help of a synthesis of linguistic and non-linguistic means of communication. While teaching the process of communication, communication, it is necessary to teach the complex ability to use a complex of linguistic and non-linguistic means of communication.

Practice shows another typical tendency: having a relatively sufficient potential level of communication in the target language, students are unable to overcome the psychological barrier that prevents them from entering into verbal contact. When communicating in their native language, people easily and simply begin to speak, not only because they know their language well, have the necessary language material, but rather, thanks to the use of auxiliary means such as "listen, I will speak": this function is performed not only by the word, but and facial expressions, gesture, light push, or neutral words - "so", "attention", various intonation means.

These verbal and non-verbal means of communication should, in our opinion, form the basis of training exercises when teaching a foreign (Russian) language.

ABSTRACT

In this country, too, in the first years of the transition to a market economy, there was a significant decline in innovation activity. The Agency is a specially authorized state body that ensures the implementation of a unified state policy in the field of legal protection of intellectual property and protection of their rights in the country and the state registration and control of organizations that manage property rights on a collective basis. At the same time, it not only analyzes the practice of foreign countries, but also establishes and implements close cooperation with them and international organizations on the development of innovation.

KEYWORDS: *Implementation, Innovation, Establishes*

INTRODUCTION

The Republic of Uzbekistan is also a country with unique experience in the implementation and development of innovation. In this country, too, in the first years of the transition to a market economy, there was a significant decline in innovation activity. In particular, funding for research and development in 2000 in Kazakhstan, Russia and Uzbekistan amounted to 30-33% compared to 1990. This figure was 16-18% in Armenia, Georgia, Kyrgyzstan, Tajikistan and

Moldova. [1]

This situation has also led to a reduction in the number of employees working in this field. In particular, the figure for 1991-2002 experienced a decline in many countries, such as in Uzbekistan - from 5686 to 3542 (38%), in Armenia - from 4362 to 2234 (49%), in Belarus - from 6388 to 4225 (33%), in Kazakhstan - from 5045 to 3631 (28%), In Kyrgyzstan - from 1319 to 803 (39%), in Russia - from 134 176 to 102 419 (24%). [2]

This country has had its impact on innovation activity. For this reason, our government has taken a number of measures to develop innovative activities and create favorable conditions for this.

In particular, the development of innovation in the independent country was based on the Decree of the President of the Republic of Uzbekistan dated August 7, 1992 "On state support for the development of science and innovation."

Adoption of the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No. 31 of January 19, 1998 "On the development of international scientific and technical relations, state support of scientific programs and projects on grants from international and foreign organizations and foundations" has opened a wide range of programs and projects on various grants with international and foreign organizations and foundations, as well as their state support.

On the basis of the Resolution of the President of the Republic of Uzbekistan dated August 7, 2006 No. PR-436 "On measures to improve the coordination and management of science and technology development", the Committee for Coordination of Science and Technology Development under the Cabinet of Ministers was established and it is operating effectively today.

Adoption of the Decree of the President of the Republic of Uzbekistan No. PD-3860 of March 14, 2007 "On additional measures to stimulate the modernization, technical and technological re-equipment of production", and its development has played an important role in creating a comprehensive and effective system of incentives for businesses to regularly modernize, technically and technologically re-equip production, provide it with advanced modern equipment that will increase production of high quality, competitive, export-oriented products.

According to the Resolution of the President of the Republic of Uzbekistan dated July 15, 2008 No. PR-916 "On additional measures to encourage the introduction of innovative projects and technologies in production", the Republican Fair of Innovative Ideas, Technologies and Projects is held annually.

Effective implementation of the State Program "Year of Youth", approved by the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated August 7, 2008 No 173 "On improving the activities of state specialized secondary schools with in-depth study of certain disciplines", and Resolution of the President of the Republic of Uzbekistan No. PR-805 dated February 29, 2008, in order to further improve the activities of state specialized secondary schools with in-depth study of certain subjects in the country, the following types of in-depth study of certain subjects of state specialized secondary schools have been established in the country:

In order to ensure the effective implementation of the state program "The Year of Youth", approved by the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated

August 7, 2008 No 173 "On improving the activities of state specialized secondary schools with in-depth study of certain disciplines", and Resolution of the President of the Republic of Uzbekistan No. PR-805 dated February 29, 2008, and to further improve the activities of state specialized secondary schools with in-depth study of certain subjects in the country, the following types of in-depth study of certain subjects of state specialized secondary schools were established:

- specialized schools with in-depth study of certain subjects (20% of subjects);
- specialized boarding schools with in-depth study of certain subjects (40% of subjects);
- boarding schools specialized in football.

These will serve as an important factor in the training of young, qualified personnel who will make a worthy contribution to the development of innovation in the future.

Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated May 20, 2009 No 144 "On additional measures to encourage the implementation of innovative projects" is aimed at creating a system of additional incentives for the implementation of innovative projects in the country.

In order to ensure the implementation of the Resolution of the President of the Republic of Uzbekistan dated May 24, 2011 No. PR-1536 "On the establishment of the Intellectual Property Agency of the Republic of Uzbekistan", the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan of June 8, 2011 No. 166 was accepted "On measures to organize the activities of the Intellectual Property Agency of the Republic of Uzbekistan." According to him, the Intellectual Property Agency of the Republic of Uzbekistan will be established. The Agency is a specially authorized state body that ensures the implementation of a unified state policy in the field of legal protection of intellectual property and protection of their rights in the country and the state registration and control of organizations that manage property rights on a collective basis.

The Agreement between the Government of the Republic of Uzbekistan and the Government of Brazil on Technical Cooperation, signed on 28 May 2009 in Brazil, entered into force on 9 June 2011 and aims to promote technical cooperation in the following important areas:

- a) education;
- b) health;
- c) nature protection;
- d) utilities;
- e) water resources management;
- f) science and innovation technologies;
- g) agriculture;
- h) energy;
- i) telecommunications;
- j) And other areas determined by the parties.

In addition, the main goal of the project "Support in the field of innovation policy and technology transfer" for 2010-2015 in cooperation with the UN of Uzbekistan is to support the development of innovation infrastructure in Uzbekistan through the UN Development Program. The total cost of the project is USD638,566.

Uzbekistan pays special attention to the development of relations with foreign countries in the field of innovation. In particular, on October 10, 2008 at a meeting of the CIS Council of Heads of State in Bishkek, the heads of state declared 2010 the Year of Science and Innovation in the CIS. On November 14, 2008, the CIS Council of Heads of State approved the Strategy for Economic Development of Cooperation for the period up to 2020, which includes innovative cooperation.

Furthermore, on May 19, 2011 in Minsk, the Governments of the CIS countries signed the Agreement "Information for the innovative activities of the CIS member states." The main purpose of this Agreement is to create an information infrastructure of innovation activities in the CIS countries and increase the efficiency of innovation integration processes through the rapid and reliable access of participants in innovation activities.

In turn, the Concept of Innovative Development of the Republic of Uzbekistan for 2012-2020 has been developed in our country on the basis of the project of the United Nations Development Program (UNDP), as in the CIS countries, according to which the following general results are expected.

Targets of innovative development of the economy for 2012-2020 [4]

Indicators	2010 (report)	Forecast parameters	
		2012-2015	2016-2020
The share of expenditures on scientific and technical work relative to GDP, in %	0,2	1,0	3,0
Share of high-tech industries (relative to the total volume of GDP, in%)	1,3	15,0	31,0
Share of innovative products (relative to the total volume of GDP, in%)	2,9	15,0	22,0
The share of expenditures on innovation activities (relative to product	0,4	2,8	5,0
The share of exports of innovative products in total exports, in %	5,76	15,0	28,0
Percentage of student enrollment in natural sciences and engineering	28,7	40,0	45,0
Number of patents, annually registered in foreign patent offices by residents of Uzbekistan, in one.	8***	1000	1300

The data in this table show that in the future, Uzbekistan pays great attention to the comprehensive development of innovation activities, and the implementation of the developed Concept is expected to achieve high results.

In general, Uzbekistan pursues a comprehensive and promising policy on financing and development of innovation. At the same time, it not only analyzes the practice of foreign countries, but also establishes and implements close cooperation with them and international organizations on the development of innovation. This is an important factor in the development of the innovation sector, as confirmed by the table data analyzed above.

ABSTRACT

Sodium nitrite can be obtained in two ways: by reacting sodium sulfate with calcium nitrite or nitrate, calcium nitrite, formed after the absorption of nitrous gases with lime milk. Study of mutual solubility of the quaternary water system of nitrites, nitrates and sulfates of sodium and calcium and its constituent ternary systems at 25°C. Their isothermal solubility diagrams have been set up.

KEYWORDS: Binary And Ternary Water Systems, Eutonic Solutions Of Facet Ternary Systems, Thermostat, Figurative Points, Four-Water Calcium Nitrate, Isothermal Method.

INTRODUCTION

The main consumers of sodium nitrite-nitrate salts are machine-tool, metallurgical, paper, rubber, textile, pharmaceutical, food industry, construction industry, medicine and agriculture.

One of the possible ways to obtain sodium nitrate and nitrite is the conversion of sodium sulfate in an aqueous medium with calcium nitrate and nitrite.

The technological basis of these processes is based on the physicochemical properties of quaternary systems $2\text{Na}^+, \text{Ca}^{2+} // \text{SO}_4^{2-}, 2\text{NO}_3^- - \text{H}_2\text{O}$; $2\text{Na}^+, \text{Ca}^{2+} // \text{SO}_4^{2-}, 2\text{NO}_2^- - \text{H}_2\text{O}$ and their constituent ternary systems. There is no information on these quaternary systems in the literature. In this regard, for the physicochemical substantiation of the process of obtaining sodium nitrate and nitrite by conversion of calcium nitrate and calcium sulfate, the solubility in the above quaternary systems and individual components of ternary systems at 25°C was studied [1].

Sodium nitrite is obtained in two ways: According to the first option, the nitrite-nitrate solution of calcium formed during alkaline absorption is first neutralized with nitric acid (up to pH 5 -

5.5). Then the solution is evaporated and calcium nitrite is crystallized with further separation from the mother liquor of calcium nitrate-nitrite (Fig. 1).

Solid calcium nitrite and sodium sulfate are sent for exchange decomposition, which is carried out in a reactor with a circulating sodium nitrite solution. According to the second variant, the solution of calcium nitrite-nitrates, formed during the absorption of nitrous gases by circulating solutions with active CaO, reacts at a stoichiometric ratio with sodium sulfate. After that, the obtained nitrite - sodium nitrate solution is separated on the filter from the gypsum. The resulting solution is subjected to evaporation and crystallization with the precipitation of sodium nitrite into the solid phase. After separation by centrifugation of the finished product – sodium nitrite, the mother liquor of sodium nitrite is returned to the evaporation stage and processed into a solid product [2].

Also, according to the first option, solid one aqueous calcium nitrite obtained according to the scheme (Fig. 1) and ten aqueous sodium sulfates, respectively, are dissolved in solvents (item 1a and item 1b), (Fig. 1). The prepared solution is sent for exchange decomposition (Fig. 1), which is carried out in a steel reactor (item 1). The conversion process takes about 1 hour. Gypsum is separated from the solution on a drum vacuum filter, and the solution (item 2) is sent for evaporation (item 6) to the first evaporator (item 6). The incoming liquor with a content of 26.75% NaNO_2 , 0.71% CaSO_4 is evaporated at 100°C to a sodium nitrite concentration of 61.71% NaNO_2 , 0.030% CaSO_4 (Fig. 1).

The precipitated gypsum precipitate is filtered (item 2^{II}). The separated liquor is sent through the collector (item 4^{II}) using a centrifugal pump (item 5^{II}) to the crystallizer (item 7) where NaNO_2 crystals are precipitated when the solution is cooled up to 10°C . The crystalline product after separation on the filter (item 2^{III}) contains 95-99% NaNO_2 . The resulting uterine liquor A₃ (containing 43.16 NaNO_2 , 0.046% CaSO_4) from (item 4^{III}) is sent to (item 4) using a centrifugal pump (item 5^{III}), where it is mixed with the uterine liquor formed after conversion. The wet sodium nitrite precipitate is dried at $100-110^\circ\text{C}$ on a drum dryer (item 8).

Optimal conditions for the implementation of the technological process:

Concentration of calcium nitrite solution, %.....	80-90%
Conversion temperature of calcium nitrite with sodium sulfate, $^\circ\text{C}$	25-30
Concentration of sodium nitrite circulating solution, %.....	30-45
T:J ratio in slurry with gypsum sediment	1: (2,5÷3,5)
Duration of conversion of calcium nitrite with sodium sulfate, min.....	60-120
Evaporator temperature, $^\circ\text{C}$	100-110
Crystallizer temperature, $^\circ\text{C}$	10 -25
Temperature when drying wet sodium nitrite in a drum dryer, $^\circ\text{C}$	100-110

The shop for producing sodium nitrite according to the second option from nitrogen oxides, milk of lime and sodium sulfate consists of three sections: alkaline absorption, conversion and evaporation (Fig. 1). Nitrous gases containing about 2-4% nitrogen oxides pass through the absorption towers (item 1). The absorption tower is irrigated with milk of lime (100-140 g/l CaO) from the collector (item 2) with a nitrite-nitrate solution coming out of the collector (item 3). Nitrite-nitrate liquor from the absorption tower is sent to the conversion through the collector (item 3) by a centrifugal pump (item 4). After the absorption tower, nitrous gases are directed to a scrubber (item 15) and then removed to the atmosphere. Nitrite-nitrate lye obtained as a result of alkaline absorption contains about 75-95% nitrite and 5-25% calcium nitrate [3].

Solutions of nitrite and calcium nitrate are sent for exchange decomposition, which is carried out in a steel reactor (item 5) heated by steam. Crushed sodium sulfate or its solution in the form of weak hot liquors containing sodium nitrite-nitrate is gradually introduced into the reactor.

To accelerate the conversion process and prevent clogging of the reactor with calcium sulfate precipitate formed as a result of the exchange reaction between Na_2SO_4 and $\text{Ca}(\text{NO}_2)_2$, compressed air is supplied to the lower part of the apparatus or the solution is stirred with a mechanical stirrer.

The conversion process takes about 1 hour. The gypsum is separated from the solution on fabric filters; the ratio T:J = 2.5-3:1, the concentration of NaNO_2 and NaNO_3 in the liquid phase is 14-34.0% and 1.5-4.5%, respectively. This suspension is filtered from $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ on a drum vacuum filter (item 7) and sent to the evaporation. Gypsum, containing after filtration 10.2-13.0% NaNO_2 and 1.02-1.30% NaNO_3 , is washed in a repulper with rinsing water from item 15, while the total content of NaNO_2 and NaNO_3 in the sludge is reduced to 0.05- 2%. Calcium sulfate removed from the filter (item 7) can be used for technical purposes.

Evaporation of solutions of nitrite and sodium nitrate Po (containing 22.14% NaNO_2 , 2.44% NaNO_3 and 0.56% CaSO_4) is carried out in two-vessel evaporators [3].

Vertical evaporators with internal or external heating chambers can be used. On the first evaporator (item 11), the incoming liquor with the Po content is evaporated at 100-110°C to the concentration of sodium nitrite P1 (containing 51.66% NaNO_2 ; 5.74% NaNO_3 and 0.03% CaSO_4). The precipitated gypsum precipitate is filtered (item 7). To avoid crystallization of NaNO_2 , the temperature in the tank (item 9) is maintained within the range of 90-105°C using steam heating. The separated liquor is sent through the collector (item 9) using a centrifugal pump (item 10) to the second evaporator, where it is evaporated to form a slurry containing 76% sodium nitrite and 8.0% sodium nitrate. A hot solution of nitrite and sodium nitrate is sent to the crystallizer (item 12) Here, when the solution is cooled to 21°C, crystals of NaNO_2 are isolated.

The crystalline product after separation on the filter (item 7) from the uterine liquor contains 95-99% NaNO_2 . The resulting uterine liquor from (item 9^{III}) is sent to, conversion or inversion (item 9) using a centrifugal pump (item 10) to obtain sodium nitrate. The wet sodium nitrite precipitate is dried at 100-110°C in a drum dryer (item 13).

To obtain purer sodium nitrite, crystalline sodium nitrite after the first crystallization is usually washed with cold water, dissolved in steam condensate and subjected to crystallization. A concentrated NaNO_2 solution obtained by dissolving salt in a steam condensate is filtered off on

a filter and sent to a crystallizer. After separation from the mother liquor on the filter, crystalline sodium nitrite is dried with hot air (105-110°C) in a rotating drum [4,5].

As shown by toxicological studies of the Republican Center for State Sanitary and Epidemiological Supervision, synthesized sodium nitrite complies with GOST 19906-74 (toxicological conclusion is attached). The proposed technology for the production of sodium nitrite (Appendix 1) has been tested on the model plant of Chirchik JSC "Elektrkimyosanoat". A pilot batch of sodium nitrite has been produced, the following main technological parameters of its production have been worked out and established (Appendix 2). Laboratory regulations and test report are attached (Appendices 2 and 3). Optimal technological parameters for the production of sodium nitrite.

Concentration of milk of lime, g/l.....	100-140
NO:NO ₂ ratio, mol	(60-70):((40-30))
Duration of irrigation of nitrous gases, min...	30
Absorption tower temperature, °C.....	30-45
Conversion temperature of calcium nitrite with sodium sulfate, °C.....	25-30
Concentration of sodium nitrite circulating solution, %.	25-50
T:J ratio in pulp with gypsum sediment, mol	1: (2,5-3,5)
Calcium nitrite: sodium sulfate ratio at conversion, mol	1:1
Duration of conversion of calcium nitrite with sodium sulfate, min	60
Evaporator temperature, °C.....	100-110
Crystallizer temperature, °C.....	10-25
Temperature when drying wet sodium nitrite in a drum dryer, °C.....	100-110

Thus, not on the basis of the studies carried out, a generalized technological scheme and initial data (Appendix 4) for obtaining sodium and calcium nitrite from limestone, mirabilite and nitrous gases have been proposed.

COMPARATIVE ANALYSIS OF ALTAI LEXEMES SUCH AS “QUT”, “TYN”, “SYN”, “SUNE”, “SUR”, “SUS”, “JULA”, “UZUT” WITH THE SAME LEXEMES IN THE KIPCHAK DIALECT OF THE UZBEK LANGUAGE

Anvar Buranov*

*Independent Researcher,

Tashkent state University of Uzbek Language and Literature named after Alisher Navai,
UZBEKISTAN

ABSTRACT

This article examines some of the lexemes related to the ancient Turkic culture which are preserved in the Altaic language. The etymology, content and essence of words related to the human psyche, identified on the basis of research by leading orientalists and linguists such as L.P.Potapov, V. I. Verbitskiy, Anoxin, N.A. Baskakov, are compared with the same words in the Kipchak dialect of the Uzbek language.

KEYWORDS: *Kultegin's Letter, Ontological Views, Monotheism, Polytheism, Values, Ethnology, "Spirit", "Qut", "Tyn", "Syn", "Sune", "Sur", "Sus", "Jula", " Uzut " ..*

INTRODUCTION

The concept of "spirit" in Altaic is completely different from the same concepts in other languages. For in most, monotheistic religions, the soul is conceived as the only concept that provides life in the human body. Abu Hamid al-Ghazali, one of the Islamic scholars, in his work "Kimyoyi saodat" ("Chemistry of happiness ") divides the spirit into two types, animal and human.¹ The ontological views of Aristotle and al- Fraganus, however, state that there are three in the organic universe: the plant spirit, the animal spirit, and the human spirit. But they all represent a single spirit. That is, the spirit is considered by all religions to be a divine but immaterial living being without a body or capable of living in a body.

In the worldview of the Altai, the concept of "spirit" is formed within the religion of the gods and has a very complex structure. These complications were first identified by Christian linguists who were engaged in missionary work in the Altai.

It was difficult for them to explain the spirit to the Altai. The reason for this is that the Altai people named the soul by dozens of names, and each of them had a special meaning.

L.P. Potapov emphasized that missionary linguists felt the need to translate the word "spirit" to teach their teachings to the local population and faced a very complicated problem in studying it. They originally wanted to use the lexeme "tyn" to express "spirit." However, they could not use it because it means "breath" in Turkish. Because the body was needed to breathe. One of the three basic saints of Christianity, the "holy spirit," does not have a body. Then they tried to find other lexemes representing "spirit." As a result, dozens of lexemes were identified. But they were all different in content and the work was very confusing. Thus, they made a comprehensive analysis of the oral art, folklore, ethnic and everyday life of the Altai people, and they had to study dozens of lexemes "Qut", "tyn", "syn", "sune", "sur", "sus", "jula", "uzut" the words used in the sense of "spirit", extensively.²

The lexeme "Qut" is, in fact, a common Turkish word that has been preserved since ancient times. In the ancient Turkic language, "Qut" has three meanings:

1. Spirit, life force, heart.
2. Happiness, bliss, luck.
3. The wife of God³

The first meaning of the lexeme "Qut" has been preserved in all Turkic languages, and it is known that it means the human soul. The meaning of life force has also been preserved in phrases such as "Hut entered, Qut entered", "Qut-baraka"(blessing)

The second meaning is reflected in the name "Qutadg'u bilig" Masnavi which was written by Yusuf Khas Hajib. In addition, M. Kashgari's work - "Devonu lug'atit turk" also describes "Qut" as happiness, a state.⁴

The third meaning is found in ancient writings, especially in the ancient Turkish dictionary, where the word "Qut tengri hatuni" is used.⁵ While this sentence is considered a misconception in monotheistic religions, it is a correct concept in polytheistic religions. In the worldview of the Altai, too, Qut is conceived as a spirit that God gives to the womb of women. The lexeme of Qut is also common in the Orkhon- Enasay inscriptions, and it is in Kultegin's inscription that the following sentences appear: "With my mother Umay xotun's Qut my brother is called as a man"⁶

In the Altaic language, "spirit" is called "Qut", but "Qut" does not apply only to the human soul. The Qut lexeme is also used to refer to animals, insects, plants, and all beings in general. In ancient times, the greatest "Qut" was the blessing of the god of sky. In Altai, Qut has two different meanings:

1. Fetus, embryo;
2. The spirit is the force that sustains human life.⁷

According to the Altai concept and belief, the "Qut" sits in the womb of the embryo like a red ant and gives it life. Then it begins to grow together with the fetus in the mother's womb. Qut is not a human soul, but a person without Qut is considered insane. Sometimes a Qut can leave a person. In these cases, if the shaman or other spirits do not drive him back into the body, he will

suffer and may even die. "Qut" can leave a person even when he is very scared. The Altai called it a heart attack (djurek jariilu). When the heart was broken, even the shamans could not bring the soul back, but if the heart did not burst when it was feared, the spirit itself returned to the body. According to the Altai belief, only shamans can control their own spirits, and these cases have been observed in shamanic sessions.

When the connection between the human body and the Qut is broken, the person can go insane and eventually one day it leaves the body. Shamans summon these spirits first, and if they have joined the evil spirits, they will have to sacrifice something to buy it and then enter the body by holding it.

According to Kazakh researcher U.K. Isabekova's research, the lexeme "Qut" is also actively used in the Kazakh language and is considered not only as a spirit but also as a divine spirit that brings productivity to the livestock and crops. He quotes the following aphorisms about the Kazakh lexeme "qut"⁸: "If come guests with Qut, sheep will give birth to twins, if guests come without Qut, the wolves will kill the sheep.", "If guests come, Qut will come, If you chase the guest, Qut will run away."

The lexeme "Qut" is also preserved in the Uzbek language. But the content has changed a bit. The explanatory dictionary of the Uzbek language gives two different meanings of "Qut":

1. Increasing meal and food
2. Happiness, abundance, plenteousness

Qut is often used in conjunction with the Arabic word "baraka". For example: Qut-baraka - in honest work. However, in the Uzbek language, the words derived from the root "Qut", are preserved: Qut(richly blessed), Qutlug(felicitation), Qutlov(congratulation), Qut ilmoq(get rid of), Quturmoq(rage), Qutqu(bad character), etc.

In the Altaic language, the phrase "kiji korkup, Quti chyqty" is often used. This is exactly the phrase in Uzbek, "Someone was scared and the Qut went off."

The Altai lexeme "tyn" is written in Uzbek as "tin". In the ancient Turkic language "tin" means spirit, soul, breath⁹, but in Uzbek the meaning of spirit and soul has been forgotten, and today only the meaning of breath is preserved.

In Altai, "tyn" means a spirit different from Qut. The difference between Tyn and Qut is that Tyn has a little of materiality. That is, "tyn" breathes. Not only in humans but also in animals, birds, grasses, and giant trees have this spirit. Tin is given to all beings only for their survival, that is, for the physiological process. In the Altai concept, "Tyn" also means the soul, and they perform "khalos-khalos" actions to make it easier for a tin to leave the body before a person dies. They do not enter the morning ceremony until the "tyn" has left the body. When John comes out, they start preparing to bury the corpse by saying "tyn chyqty" or "tynchydy". In the imagination of the Altai, the spirit of shamans differs from the spirit of ordinary people and is called Tyn-bura. The reason why shamans have sharp breaths and unstable spirits is that they are considered to be God's chosen ones.

The lexeme "Tyn" is written in Uzbek as "tin", but in Uzbek Kipchak dialects, it is pronounced as "tyn" as in Altai. Dozens of words are formed in the Uzbek language with the

help of the "tin" stem: calm, quiet, clear, quiet, quiet, quiet. In the Kipchak dialect of Uzbek, "tyn" is pronounced very similarly to Altaic.

In the Altai language, the forms of the spirit in the form of "syn" and "sune" are also preserved. "Sune" is an ancient Turkish word meaning a person's state of mind and character. M. In Kashgari's *Devonu lug'atit turk*, a "gentle, pure-hearted man" is described as "sune."¹⁰ The word "sune" does not exist in the Uzbek spelling dictionary today. However, in the Kipchak dialect, the lexeme "syn" meaning "sune" has preserved. "Syn" means peace of mind in people, animals and plants:

In the Kipchak dialect, there are aphorisms such as "If you marry, marry according to his syn", "If you marry, take a bride from a man who has syn". There are also people in the Kipchak people who are called "synchi". These people are able to assess the mental state of animals and people based on their faces and behaviour.

In the 15th century, the "synchis" served as trustees¹¹ of the khans in the Dashti Kipchak khanates, warriors, warriors, and experts who assessed the morale and strength of the army. A special feature of the critics was their intuition. That's why they've been getting so much attention.

"Syn" actually refers to the appearance of a human or other being. Even today, this lexeme is actively used in fiction:

1. The young man, his complexion a little tired, but with a firm gleam on his beautiful face, was sleeping with his eyes closed.¹²
2. An unfulfilled wish to get lost from somewhere -A mysterious fracture enters your soul.¹³
3. He has Ko'sa sinchi, he said his sinchi: get off the horse and assess the horse of uzbek.¹⁴

Although the Uzbek literary language today the lexeme "syn" does not exist which expresses the human spirit, the words changed at the root "sin" are still used in communication, such as sinchi(who able to assess at first see), sinalgan(tested), sinashta(reliable), siniq(broken), sinamol(faithful).

In the Kipchak dialect of the Uzbek language, "sune" is also preserved. "Sune" is pronounced "sungu" in the Kipchak dialect and means to stare at someone's face or a certain object: "Do not stare at someone's face!", "Do not stare at someone's yard!"

In the Altai language there is a concept of "sur", which reflects another state of the spirit. "Sur" means the appearance of man and animals, and more precisely, the meaning of the face. It is said that "sur" is clearly visible on a person's face when "kut" leaves him, and therefore has a more negative meaning. "Sur" has a similar meaning to the Uzbek word "turq"(rude meaning of the face). According to the divine belief, the "sur" is given to a person by the Great One, and after the death of a person he can move on to another world. "Sur" is now preserved not only in the Kipchak dialect, but also in the Uzbek literary language, and dozens of words have been made for a long time: sur(face), surat(rate), surbet(insolent), surkamoq (yuzga)(rub to face), surrang(it is a kind of colour like brown), surur(it looks like happiness), etc.

The next lexeme is called "sus". "Sus" is also seen in the Altai language as a part of the spirit, and it gives people dignity and greatness. This lexeme is widely used in Uzbek mythology and oral

literature. For example, in the story of Ergash Jumanbulbul's son "Kunduz and Yulduz" the lexeme "sus" is used as follows:

Gulqiz was suffocated by Vallamat

She cannot speak and looks at the ground and cries.¹⁵

According to its use in Altai occultism¹⁶, "sus" may be synonymous with the Uzbek word "kinna" ("kirna" in the Kipchak dialect). L.P. Potapov, who analyzed the rituals of the Altai shamans. In addition, in Potapov's view, sus can be passed from one creature to another. Similarly, L.P. Potapov was analyzing the texts of the Altai shamans, which was written by A. B. Anokhin in the Khotun valley, he finds that to living things, there is a "sus" in things, for example, sus of animal, sus of a young boy, sus of a gun¹⁷. This means that in the notion of "sus" Altai, it is not a subordination to the body, but the twin of the soul. The lexeme "sus" is also widely used in the Kipchak dialect. Although it is sometimes used to mean "kinna kirdi" or "koz tegdi", it is often used in the form of "susi kirdi", "susi bosdi". (all idioms mean that being ill from one's look). There is also a concept of "minaz" in the Kipchak dialect, which is used with "sus": *Falonchigabirovningsusikirdimi, minaziaynibo tiribdi.* (someone's "susi kirdi" to somebody, his mind changed)

The Altai also use the lexeme "uzut" associated with the human spirit. A. V. Anoxin says that "uzut" is the spirit of a dead person¹⁸. According to him, the "sune" will be with him while the creatures are alive. It is said that when he dies, he leaves his body and walks in this house until he is buried. After the body is buried, the sune changes its position and is called "uzut". If we consider both sune and uzut as one body, then their common feature is related to the ability to see. It seems that in the imagination of the Altai, the "sune" could also be the spirit that provides vision in the bodies of living beings. Therefore, when creatures do not return to their bodies, they become "sune" and "uzut" and travel everywhere. Uzut can get bored when he is without a body and make funny jokes to people. That is, it can enter living people, infect them, and even cause disease. That's why people made "is" their spirits on certain days for spirits.

Today, it is very difficult to find words related to the lexeme "uzut" in Uzbek, but some sources confirm that the lexeme "uzut" was used in M.Kashgari's "Devonu lug'atit turk" and meant "identity".¹⁹ The Kipchak dialect of the Uzbek language also contains some words related to "uzut": uzlug (to do lots of physical exercise after recovering from illness), uzulish (pulled apart), uzula (like: lying).

Application:

"Tavub kemaymakan, bolamding SINI ketip, uzlugib qoldi." (whether the doctor come or not, my child's color faded and he fainted.)

Another surviving lexeme in the Altaic language is the "jula" (jula) lexeme. The concept of "Jula", along with other lexemes, has caused much controversy among scholars. When V.V. Radlov and V. I. Verbitsky called "jula" the spirit of a dead man¹⁹, A.V. Anoxin emphasized that "jula" means the spirit of a living person²⁰. On the other hand, N.A. Baskakov and N.A. The Yaimovas described²¹ jula as an intangible, invisible substance, a metamorphosis²² of the spirit, which has the peculiarity of leaving it for a certain period of time during human life. The lexical features of the Altaic language may not allow us to comprehend the full meaning of "jula", but the fact that this lexeme is also preserved in

other Kipchak dialects expands the possibilities of understanding its content. In the ancient Turkic language, "jula" means a lamp, and the words "star" and "twinkle" are made in the same way. It is also used in the sense of "jula" - spring, source, source of power. In the same way, in the ancient Turkic language, the word "julun" made from this core was preserved, and Julun, which means the spinal cord formed the basis of the spirit and provided movement throughout the body. The concept of julun is applied in the Kipchak dialect of modern Uzbek to the thick vein around the neck of the human body. It is recognized that the person who has cut the julun, will be paralysis or die.

"Be careful, wrestler, your opponent is powerful, do not break your julun" (Surkhandarya dialect)

"In one move, he has the ability to bend his julun and cripple. But the shepherd's say is not true." (Anvar Suyunov. Arrowhead)

A comparative analysis of lexemes such as "qut", "tyn", "syn", "sune", "sur", "sus", "jula", "uzut" in the Altai language with the same lexemes in the Kipchak dialect of the Uzbek language shows that the human spirit it is not only a creature that provides life in the body, but also a concept that allows a complex understanding and control of all aspects of human life function, psyche, emotions. Based on the above sources, it becomes clear that a person's face, appearance, strength, health, and luck are mainly related to his spirit. "Tyn" signifies human vitality, "syn" health and strength, "sune" the ability to see, hear, taste and anticipate the situation, "sur" the intensity, "sus" the greatness, and "jula" the power. Qut, on the other hand, is a creature that provides balance, blessing, happiness and bliss in the human psyche, as well as higher nervous activity, the ability to think.

In fact, these concepts are not only specific to the Altai, but are the fruit of the thinking of the ancient Turkic peoples. It is not surprising that their survival in the Altai is probably the result of their geographical separation from other Turks in the past centuries and their desire to preserve their identity and values. Today, the study and research of the values of the Altai is equally relevant for all historians, ethnologists, turkologists and linguists. Because it is in Altai culture that our traditions have been preserved in ancient Turkic.

ABSTRACT

Today, our world includes billions of sensors and computing devices that are continually sensing, collecting, consolidating, and analyzing significant amount of our personal information. Such information may include our location, contact list, browsing patterns, and health and fitness information. Many researches focus on IoT security and privacy, but the countermeasures presented in these research often aim at a particular type of attack. Therefore, it is necessary to consider the IoT architecture as a whole and provide holistic protections. Furthermore, the technologies and devices themselves are highly heterogeneous. This makes their management a difficult and complex enterprise.

KEYWORDS: IoT security, IoT taxonomy, Vulnerabilities

INTRODUCTION

The early years of the Internet-of-Things (IoT) primarily involved data communication through machine to machine (M2M) interactions. However, the concept has evolved rapidly to include human interactions as well, ushering in an era of Internet-of-Everything (IoE). Today, our world includes billions of sensors and computing devices that are continually sensing, collecting, consolidating, and analyzing significant amount of our personal information. Such information may include our location, contact list, browsing patterns, and health and fitness information. The sensing, collecting, and propagating of such intimate personal data by computing devices is primarily motivated by convenience: as devices get smarter, they can react better to our needs, wishes, and even moods (e.g., a home thermostat can adjust temperature based on number of occupants, time of day, day of week, season of year, etc.) and handle emergencies (e.g., a home security system can react to a fire or break-in). Unfortunately, this convenience comes at the expense of security and privacy challenges: the private, personalized information, if accessible to an unauthorized, malicious agent, can result in significant damage to our wealth, reputation, and personal security. In addition to our own personal data, these devices also include assets introduced by their manufacturers at various stages during their production supply chain. These include fuses, firmware, and debug modes. Unauthorized access to these assets can result in loss of millions of dollars in stolen intellectual properties, as well as potentially dangerous misuse of the assets. With the ubiquitous deployment of these devices, such security vulnerabilities can be catastrophic.

Generic IoT Architecture

Internet-of-Things architecture can be conveniently viewed as an abstraction of several hierarchical layers. Three key layers in the abstraction are the application layer, the network layer, and the perception layer. The technologies of each layer are different, even though the technology used by the device of the same layer may be heterogeneous. The devices and technology in the Internet-of-Things are used to provide a diversity of services, each with its own requirements, constraints, and trade-offs. Furthermore, the technologies and devices themselves are highly heterogeneous. This makes their management a difficult and complex enterprise. To address this challenge, a middleware layer is also sometimes added to manage different types of service, shielding the underlying implementation details. The task of the middleware layer is to collect information from the network layer and store them into the cloud and database. Besides, the middleware layer also provides data processing ability. The four-layer architecture of the IoT constituted by the above factors is used in this paper, and this architecture can be applied to the actual application development. Figure 1 describes the four-layer architecture of the IoT and the corresponding technologies in each layer. In this section, we discuss the functionality of these layers to motivate their unique security needs.

Application Layer

The application layer is the social division of the Internet-of-Things, combining with the industry demand and realizing extensive intellectualization. This layer implements different applications for different scenarios. This layer is used to manage and process data from the middleware layer, also providing quality service to the final user. The problem of application layer mainly occurs in the operation of sensitive data, such as illegal access to data, malicious

modification of data, and the lifetime of permission. Attackers can exploit code vulnerabilities to attack systems to gain sensitive data and modify it

Middleware Layer

The middleware layer obtains data from the network layer, links the system to the cloud and database, and performs data processing and storage . With the continuous development of cloud computing and IoT, middleware layer can provide more powerful computing and storage capabilities. Meanwhile, this layer provides APIs to meet the demands of the application layer. Database security and cloud security are the main issues in the middleware layer, which affect the quality of service in the application layer.

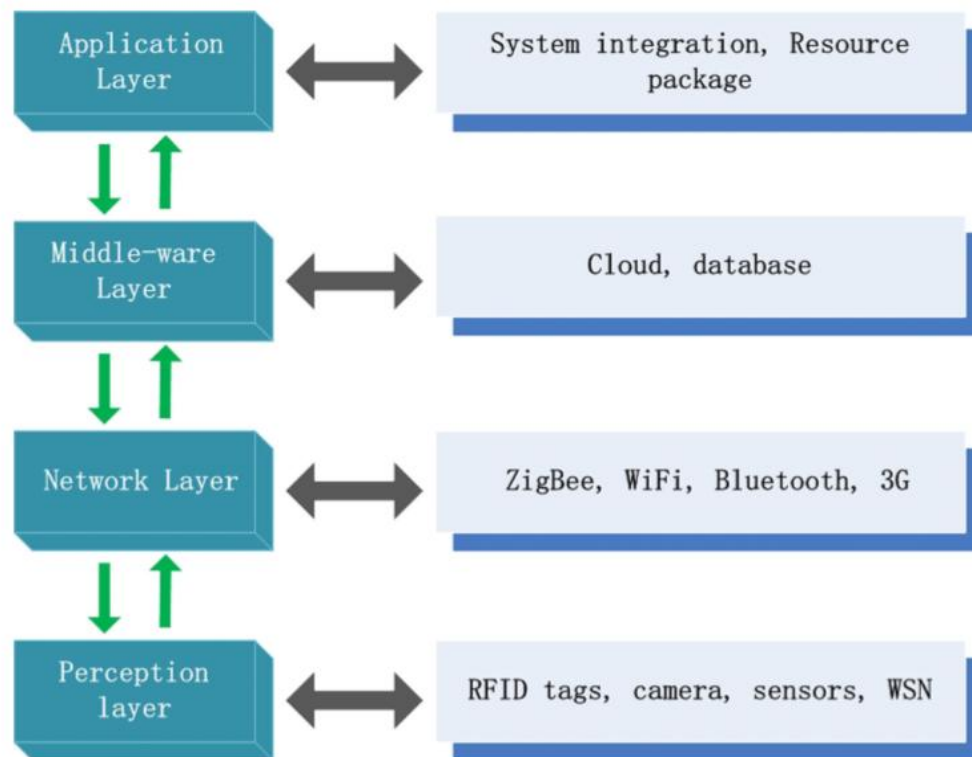

Fig. 1 Four-layer architecture of IoT

Code Injection

This attack entails introduction of malicious code into the system by exploiting program errors . Code injection can be used for a variety of purposes, e.g., to steal data, get system control, and to propagate worms . The common attacks include shell injection and HTML script injection. This type of attack can cause the system to lose control and compromise the user's privacy to the attacker, or even to a complete system shutdown.

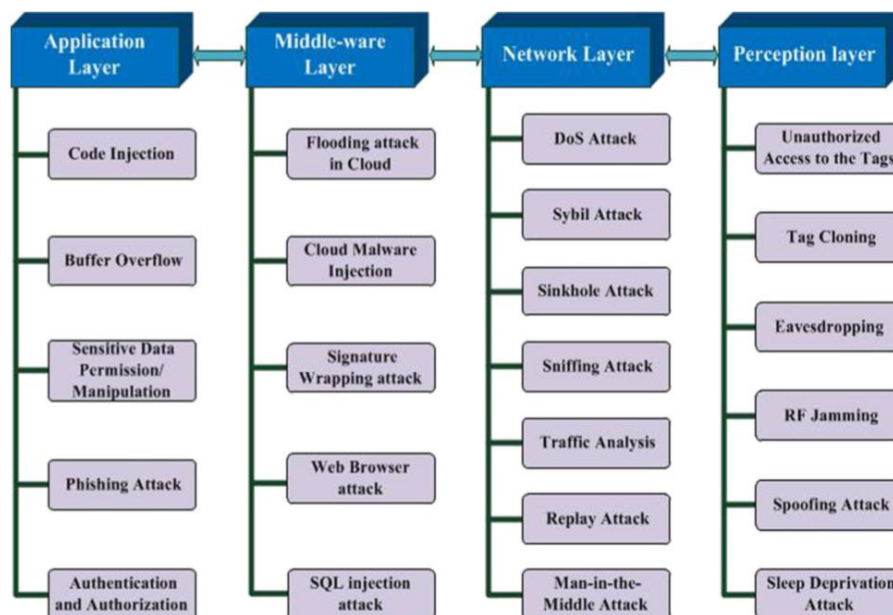

Fig.2IoT attacks based on architecture

CONCLUSION

The IoT technology has changed people's life style due to information collection, communication, and processing abilities. In the development of the Internet-of-Things, one of the major obstacles is security and privacy issues. IoT attacks may cause privacy violation and threaten people's life and privacy safety. Protecting the privacy of users has become another important challenge in the development of IoT. Many researches focus on IoT security and privacy, but the countermeasures presented in these research often aim at a particular type of attack. Therefore, it is necessary to consider the IoT architecture as a whole and provide holistic protections. In this paper, we discuss the security threats and privacy concerns in each layer of the IoT architecture. We discussed two attack classifications, one based on the IoT architecture and another based on application scenarios. The attack in IoT is analyzed according to different classification standards. The security of each layer on the IoT architecture should be implemented at the same time. Significant further research is required to design a comprehensive security mechanism for the entire IoT architecture.

ABSTRACT

The article analyzes the existing and proposed methods for the development of oil fields. The model of V.D. Lysenko and its efficiency of use, advantages and disadvantages, the results of practical application are given. From the program, you can get not only a numerical result, but also a result in the form of a diagram or a list. Each result obtained was only comparative and its various external factors were not taken into account.

KEYWORDS: Filtration, Oil and Gas Fields, Reservoir, Lysenko Model, Flow Rate.

INTRODUCTION

Today, there is practically no industry in which information technology has not penetrated. This allows the use of information technology in any area. The use of information technology in various industries has led to the development of the industry and high economic efficiency.

There are also several types of methods and algorithms for forecasting oil fields. They were studied by the following scientists.

ANALYSIS OF LITERATURE AND METHODS

A simple approximate method for calculating the filtration movement in an oil field was developed by B.B. Lapuk [1]. Shows the sequence of the amount of water entering the oil field and the actual amount of water entering the oil field.

S.N. Zakirov considered the calculation of the coefficient that determines the amount of oil produced. New production methods and algorithms for determining oil properties have been developed [2].

Academician L.S. Leibenzon was the first to investigate the problem of fluid motion in a layer according to the laws of hydromechanics.

To facilitate the solution of the problem, L.S. Leibenzon suggested that the ultimate pressure, which actually changed during the development of the gas field, was constant and equal to the initial pressure [3].

I.A. Charn first studied the application of sequential changes in the steady state, which allows to evaluate the elastic properties of the aquifer, and the pressure in the water supplied to the oil field [4].

And research by Yu.P. Korotaeva, G. Stepanova and S.L. Kritskoy [5] show that the object of information for optimal classification is hydrocarbon deposits. They are calculated according to the following indicators:

$$x_1 = 10p_{\text{нп}} / C_5 H_{12} + \text{higher.};$$

$$x_2 = (CH_4 \dots C_4 H_{10}) / (C_5 H_{12} + \text{higher}) + C_2 H_6 / C_3 H_8$$

$$x_3 = (CH_4 + C_2 H_6) / (C_4 H_{10} + \text{higher})$$

According to the research of V.V. Savchenko [6], the usefulness of oil wells can be judged by the following features:

- 1) Containing more than 1.75% or more of stable C_5H_{12} + condensate emissions and more than $80 \text{ cm}^3 / \text{m}^3$;
- 2) the presence of petroleum hydrocarbons in stable condensate;
- 3) Outflow of stable condensate to the gas condensate wall.

In the work on non-isothermal filtration in the development of oil fields, the effect on productivity and oil production rates in large volumes of water at low temperatures is described, as well as their dependence on thermal methods of stimulating the formation. Mechanisms for replacing oil from seams during heat generation are considered. Examples of determination of filtration indicators and indicators of technical and technological development when replacing oil with water are given.

K.M. Don u s [7] considered the theory of the development of oil fields. It provides an overview of the production process, geological study of deposits based on the hydrodynamics of porous, fractured and fractured porous layers, as well as the development and economics of oil fields. The necessary guidelines for the development of oil fields for different reservoir methods are considered. Methods of control and regulation of the process of oil field development are described.

Yu.P. Zheltov and I.S. Gutman considered and the basic ideas of the development of oil fields, methods for constructing models of oil reservoirs and the processes occurring in them, [8], [9]. Methods for calculating the development of oil fields in natural modes and artificial impact on them by pouring water, various substances, as well as creating intraplastic processes associated with a change in the physical and chemical state and the achieved temperature regime of the developed objects are described.

RESULTS

The process proposed by V.D. Lysenko, based on the law of decreasing flow in the mathematical model of technological parameters and dynamics data during the development of oil fields, is characterized by the following function:

$$q = q_0 e^{-\frac{q_a}{Q_0} t}$$

The function works as follows:

- Start
- Input of primary data of an oil field
- Selection of points used in the calculation
- Find the initial supply for mining
- Calculate the reserve for production
- Calculate the remaining oil reserve after production
- Calculate the dynamics of the development process for each well for the next period
- When the set debit value is reached, $q_{p-r} = 1t / d$ is calculated.
- The result is determined and the analysis is carried out
- the end

Algorithm for forecasting the flow rate according to the model of V.D. Lysenko is the following: and. preparation of incoming data for mining ; b. Identify hotspots under specific conditions:

- The average value of the change of points is determined;
- Points that are far from the specified values are considered inactive, and their relatives are considered active;
- The entire distance is divided into small sections, on which the average values of these sections are located;
- Points that are far from the found values are not activated, and their relatives are considered active;
- Sudden changes, that is, a sudden increase or decrease in the debit value, are divided into active and inactive by comparing the following points.

C. build a graph by active points;

D. complete the calculation when the set debit value is reached ($q_{P-r} = 1t / d$).

DISCUSSION

The algorithm was used to predict the production on an oil well " Umid " .

Design parameters of oilfield wells " Umid " and predicted flow rates for the next period are given in the table below.

**TABLE 1. PRODUCTION INDICATORS FOR THE NEXT PERIOD FOR WELL 72
" UMID "**

<i>Deposit name :</i>	<i>Umid</i>
Skavazhina number	72
Initial production stock , t	49141.76
Total working day of the well	4,735.04
The rest of the working days of the well	5.76
Oil stock after production , t	6,538.81

One of the most important parameters determined by the method of V.D. Lysenko, is to predict the amount of the debit. The advantage of this model over other models is that it takes data, processes it, and predicts how long the oil reserves will last.

Based on this technique, a program has been developed that predicts the amount of debit (Fig. 1).

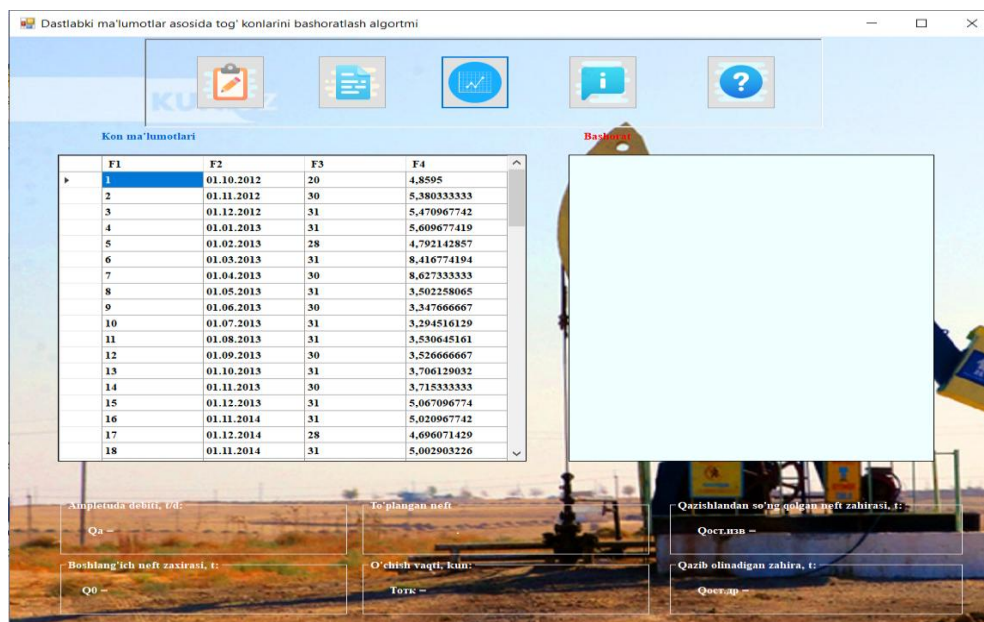

Fig. 1. The program interface prediction I debit amount

The program loads already existing data. To update the data, you need to open Excel and change the data, then restart the program. The program takes data and prepares it for processing (Fig. 2).

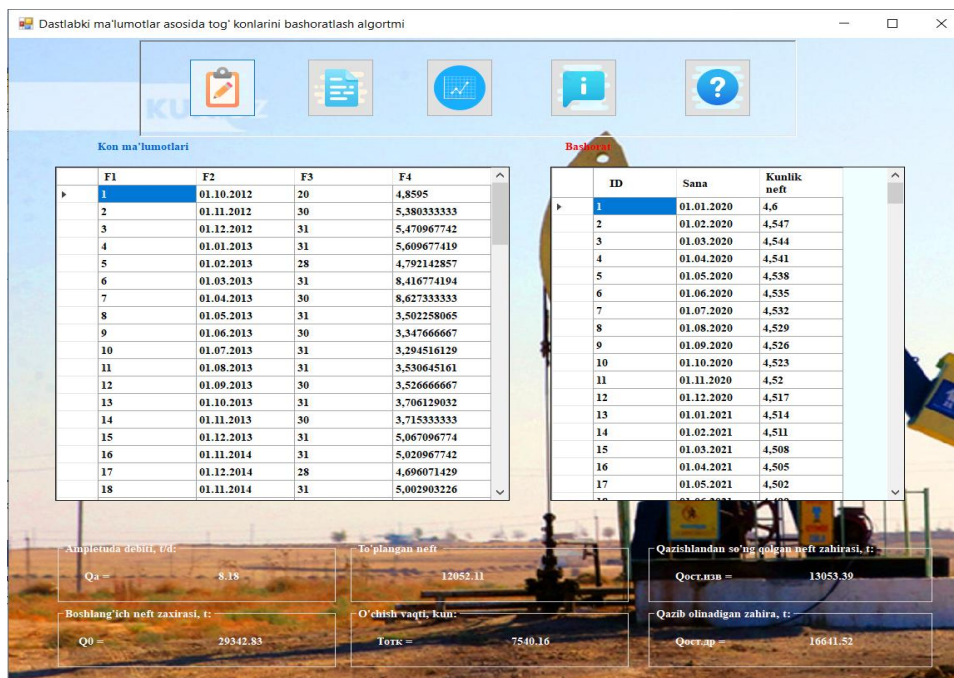

Fig. 2. Data processing

After the completion of the calculation, the data will begin to be displayed in an empty window next to the window, in which the information of the field of data analysis is loaded. The program calculates each step and then returns the result (Figure 3).

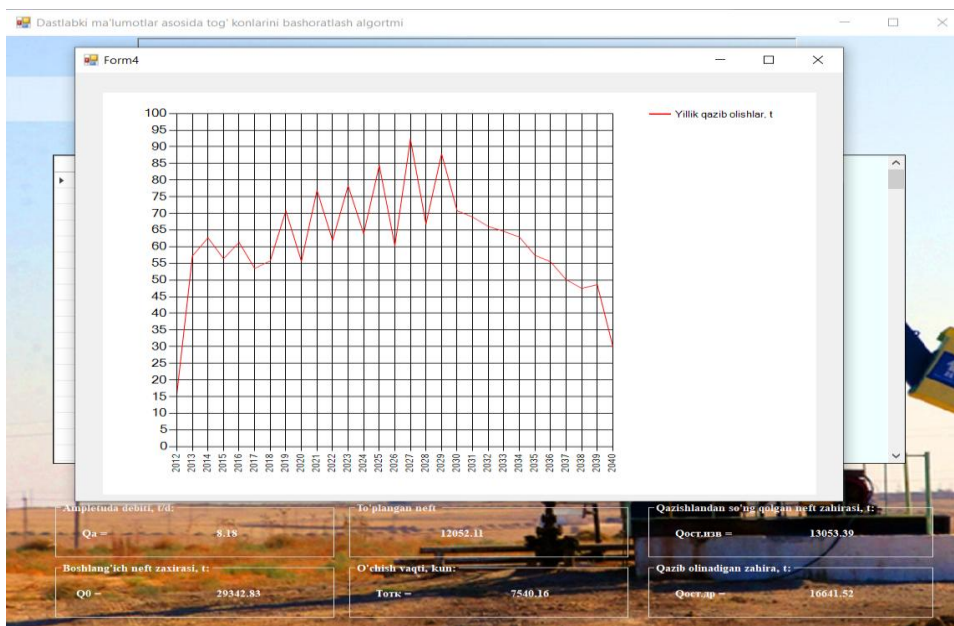

Fig. 3. The result of the program

From the program, you can get not only a numerical result, but also a result in the form of a diagram or a list. Each result obtained was only comparative and its various external factors

were not taken into account. Its effectiveness is comparable to that of other programs. The program works only according to V.D. Lysenko gives the result in exactly this way.

To make it easier to solve the problem, L.S. Leibenzon developed a solution to the problem by assuming that the ultimate pressure, which changes during the development of a gas field, is constant and equal to the initial pressure.

In the methodology of V.D. Lysenko, active points are taken and this is done according to special formulas. Yu.P. Zheltov developed a model for predicting the oil field cycle, taking into account the situation that was not taken into account in Lysenko's model. In the model of V.D. Lysenko carried out only settlement practice. Exceptions were not considered, ie. E. with uschestvuyut externalities for oil. For example, bad weather influence can affect the operating mode, or a strong earthquake may cause varying degrees of damage to the oil field by varying ix flow and oil influence on oil wells .

Of course, the V.D. Lysenko works with approximate numbers and determines the approximate life of the field.

CONCLUSION

According to the method of V.D. Lysenko processed data 72- well field " Umid " and a forecast of stocks of these wells and production indicators for the next period. It predicts production rates to be produced in the coming years by processing the initial monthly data for the specified wells. For forecasting, hot spots are first separated from well observation points and used in the calculation process. The software has been tested by comparing the results obtained with the exact results.

In practice, this model was used in the hole 72 - oil and gas field " Umid " in Kasbinskom area Kashkadaria region to the present time using this model, calculations were performed on a number of wells.

ABSTRACT

The Covid-19 pandemic, which has become an unpredictable threat to the entire world, has shown that a lot of work remains to be done in the field of medicine. The article discusses the importance of organizing the nurses work in the treatment of Covid-19. Paying great attention to the clinical aspects of the disease and medical tactics in these protocols, an important point in the organization of the work of nursing staff is missed, which is directly the first barrier between the sick person and the specialist doctor.

KEYWORDS: *Pandemic Covid-19, Medicine, Paramedics, Organizational Work.*

INTRODUCTION

The COVID-19 pandemic is the current global pandemic of the coronavirus infection COVID-19 caused by the SARS-CoV-2 coronavirus. The outbreak was first reported in Wuhan, China in December 2019. The outbreak was declared as a public health emergency of international concern by the World Health Organization on 30 January 2020 and a pandemic on 11 March. As of October 11, 2020, the pandemic has reported over 37.5 million cases in over 188 countries and territories; over 1.07 million people have died and over 28.1 million have recovered.

Basically, the SARS-CoV-2 virus is transmitted by close contact, most often through small droplets formed when coughing, sneezing and talking. The droplets usually fall to the ground or surface, rather than travel long distances through the air. Transmission can also occur through smaller droplets that are able to remain suspended in the air for longer periods of time. Commonly, infection is possible after touching a contaminated surface, and then to the face. Infected, it is most infectious during the first three days after symptom onset, although spread is possible before symptoms appear and through people who do not show symptoms.

Common symptoms include fever, cough, fatigue, shortness of breath, and anosmia (loss of smell). Complications can cause acute respiratory distress syndrome (ARDS) and pneumonia (inflammation of the lungs). The incubation period, which is the length of time from infection to onset of symptoms, is usually about five days, but can range from two to fourteen days. There are several possible vaccines for COVID-19, although none have been clinically tested. Since there are no antiviral drugs to treat the disease, the primary treatment is symptomatic therapy (elimination of individual symptoms).

Preventive measures include hand washing, covering the mouth when coughing, maintaining distance from others (social distancing), wearing a face shield in public, disinfecting surfaces, increasing ventilation and filtering indoor air, and monitoring and self-isolating for people who suspect that they are infected. Authorities around the world have taken action by imposing travel restrictions, workplace risk controls and facility closings. In addition, many institutions are working to improve testing capacity and contact tracing of infected individuals.

The COVID-19 pandemic has caused serious socio-economic consequences, including the world's largest recession since the Great Depression and massive famine affecting about 265 million people. This has led to the postponement or cancellation of many sporting, religious, political and cultural events, and widespread supply shortages have been exacerbated by panic buying. Reduced emissions of pollutants and greenhouse gases. Schools, universities and colleges have been closed either nationally or locally in 172 countries, affecting approximately 98.5% of the world's school and student age population. Misinformation about the virus has spread through social media and the media. There have been cases of xenophobia and discrimination against the Chinese people and those perceived to be Chinese or from regions with high infection rates.

As of 10/11/2020, 60894 cases of COVID-19 infection were registered in Uzbekistan, 503 deaths were recorded due to complications of this pathology, and, unfortunately, this is not the limit. Over the past few months, the country has been in the conditions of a decrease in the main macro- and microeconomic indicators, which directly affects the life of the population. According to the preliminary results of the first quarter, compared to the same period last year, the economy of Uzbekistan is observed:

- Decrease in imports of consumer goods and medicines (according to the Chinese side, in the first quarter of 2020, China's exports to Uzbekistan decreased by 14.3%);
- decrease in remittances of migrants (according to the forecasts of the World Bank by 20%, the number of citizens who could not go to work abroad amounted to 143 thousand people);
- Slowdown in the import of technologies, semi-finished products and raw materials (due to the temporary suspension of intercountry freight traffic);
- decrease in exports of goods and services (as a result of a decrease in external demand and prices for basic raw materials, according to the Chinese side, in the first quarter of 2020, Uzbekistan's exports to China decreased by 31.2%);
- Decrease in budget revenues (as a result of a decrease in economic activity);

- Growing social responsibility of the state and pressure on the budget, growth of state debt (the country intends to attract loans from international financial institutions in the amount of \$ 3.1 billion);
- An increase in unemployment (according to the results of some opinion polls, 21% of people temporarily lost their jobs);
- decrease in demand for durable goods and services (as shown by a poll by the Center for Economic Research and Reforms, 68% of the population believe that now is not the time to buy durable goods, versus 13%);
- Decrease in savings and investments;
- An increase in the share of non-performing debts and a decrease in banks' liquidity.

Given the interconnectedness and interdependence between sectors and agents of the economy, without an interventional economic policy, an economic recession can turn into a financial crisis (due to liquidity problems in the banking system), a debt crisis (due to an increase in additional debt) or a foreign exchange crisis (due to for the downturn in foreign trade).

According to the Minister of Finance of Uzbekistan, at the seventh plenary meeting of the Senate of the OliyMajlis, state budget expenditures for the first half of 2020 amounted to 64.9 trillion soums, which is 1.2 times more than in the same period last year.

The main factor that contributed to the increase in spending on health care, pensions and benefits, the economy and investments was the cost of measures to ensure sanitary and epidemiological well-being and safety of the population, to prevent the spread of coronavirus infection, as well as measures to provide social support to the population in a pandemic. According to the World Health Organization's disappointing forecasts, the entire world should survive about 2-3 years in pandemic and quarantine measures. In this regard, a set of measures is being developed everywhere to prevent the incidence of coronavirus, reduce mortality among the population, stabilize the world economy, etc.

One of the most important points to curb the spread of the virus is the organization of the work of medical personnel in the context of the COVID-19 pandemic, leading specialists develop and approve national protocols for the management of this pathology. Paying great attention to the clinical aspects of the disease and medical tactics in these protocols, an important point in the organization of the work of nursing staff is missed, which is directly the first barrier between the sick person and the specialist doctor. This leads to an increase in the number of sick nurses and nurses, an acute shortage of which has been one of the main problems in providing adequate therapy to those in need. That is why it is important to determine the goal and tasks of nurses in the context of the COVID-19 pandemic, to determine a set of measures to protect them, to create optimal and safe conditions for their work.

It should be noted that the COVID-19 pandemic symbolically began and continues as the whole world celebrates the "International Year of Nurses and Midwives."The pandemic of infection has shown how important a competent and trained medical staff is, an acute shortage of which has led to tragic consequences and many deaths. According to the ICN (International Council of Nurses) report on August 14, 2020, 1,097 nurses from 44 countries of the world died from complications of COVID-19. These deaths are primarily associated with low awareness and

insufficient training of medical personnel, lack of personal protective equipment (PPE), significant overtime, physical and emotional "burnout" of nurses.

The whole world tensely and attentively watched videos from social networks, where nurses literally "splashed" their emotions and tears, talked about those shortcomings and "failures" in the health care systems of developed countries, warned and alerted all people to adhere to the principles of preventing infection, and finally asked help in this current situation. Of course, they are "heroes of the present", soldiers on the front lines of the war against the coronavirus, and their work cannot be underestimated.

Based on this, it is necessary to learn lessons from the consequences of the pandemic, to outline a new strategy in vocational training, management and provision of nursing care at all stages of the treatment of coronavirus infection.

ABSTRACT

The article discusses specific aspects of Rauf Parfi's poetry. Thoughts that the poet broke the stereotypes and stereotypes of artistic thinking in the 50s and 60s of the twentieth century, and perfected this philosophical and aesthetic experience in the early twentieth century, served as a special assessment of the poet. The idea that the poet is a poet who has made a great contribution to the development of this content by expanding the artistic interpretations of the issues of independence, national freedom, individual freedom, ideas and concepts about Goodness, Justice, Beauty in the sense of universal values is also substantiated in this article. In particular, the artistic-aesthetic, socio-philosophical significance of the artist's works is not determined by the author's nationality or the culture of the East, the West, the East and the West. the idea that the need to understand how far he can discover remains the main criterion of the world of fiction today determines the basic theoretical value of the article. The main content of the article is that this described process, of course, is also a high assessment of the poet's views on the fact that the poet is a product of a new worldview and worldly taste. The idea that Rauf Parfi and his generation were not children of the Soviet era, but children of universal culture, formed the concluding part of the article.

INTRODUCTION

One of the brightest representatives of Uzbek literature of the XX century, Rauf Parfi, is a poet-Riddler, the owner of the title sohir. Rauf Parfi was a true worker of poetry. There are many pages in the poem, and he polished it so that he did not notice, or rather, did not pay attention to the fact that he spent many years of his life on this work. For Rauf Parfi, such hard work has become as simple, routine, everyday work as drinking tea and eating bread. In particular, the "Caravan Road". Of the 31 poems listed in the first book, ten were not included in the "Caravan Route", remained in the notebooks of the poet and, nevertheless, are works that were reprinted more than once during the following years. They are authoritative not only in the chronological order of the arrangement, but also, importantly, in the coverage of the nature of the fractures in the artistic and aesthetic thinking of the poet. Studying the results of this painstaking work, familiarizing today's readers with their artistic and aesthetic value remain relevant issues of today. The object of the study was all the poetry collections of Rauf Parfi, sources about the poet's work in the author's personal archive, mainly his selected book "Sakina", published in 2013. Methods of classification, descriptive, historical-comparative, contextual, complex and functional analysis were used to cover the research topic. The main theme of Rauf Parfi's poetry is the will of the individual, the independence of the Motherland and the unity of Turkestan, the Turkic world; the courageous poetry of the XX century, doomed to express the eternal consciousness, the acute tragic spirit of the Turkish man in the sacred Turkic language. Despite various loving views on the poetry and personality of Rauf Parfi, however, for fifty years, the interest of readers in him has never waned. His work was highly appreciated by such poets as Askad Mukhtor, Shukrullo, Miraziz Azam, Mirzo Kenzhabek, Chori Avaz. Such well-known scientists as Ozod Sharafiddinov, Ibrahim Gafurov, Ibrahim Hakkul, Botirkhan Akramov, and Ulugbek Hamdam wrote about him. Such famous poets and scientists as Vokif Samadugli (Azerbaijan), Atner Khuzangay (Chuvashia), Uldis Berzins (Latvia), Lia Seppelu (Estonia), Huseyn Uzbekay (Turkey), Edward Walurs (USA), Temur Khoja (Germany), Omondurdi Annadurdi (Turkmenistan), Rene Kalandi (Georgia), Jacques Manet (France), Victor Sosnora (Russia) have written about him abroad.

They translated his poems into their native language. The poems dedicated to him by Uzbek poets will become a book in themselves. Rauf Parfi is a poet who created a very special school in Uzbek literature. He is one of those people who have come a long way to meet and learn the high national spirit of the Uzbek Turks through his poetry. His contemporaries recognize him as a brilliant poet of Turkestan, the Turkic world, and great Turkestan.

MATERIALS AND METHODS

The change of seasons is a natural process, a derivative of the unchanging law of nature. Even in fiction, the appearance of light generations together with light ones is a spiritual and intellectual necessity, a spiritual necessity. This means that new tastes and aesthetic tendencies always manifest themselves in artistic and aesthetic thinking "This is the art of understanding the phenomena of nature and society, the mysteries of man and the universe, explaining them with new images and artistic means" There is nothing secret in poetry that a poet can hide from someone. Only there will be the mystery of the poem. It is fate that has become art. A poem that captured the fiery eyes of fate in his heart.

Rauf Parfi from his early poems showed himself as a creator who formed a worldview, spirituality, and spiritual beliefs. "There are many sorrows in the world", "Midnight falls asleep...", "Poetry", "Dawn". In dozens of his poems, such as the dawn shoots arrows the sky becomes brighter I am far beyond the horizon infinite-consists of endless minutes, you can trace the bright signs of his socio-aesthetic ideal. "A bird sings in my soul, I do not know your name, my bird...", - says the poet in the poem "gazelle written on the banks of the river". Having penetrated into the poetry of the mid-60s, early 70s of the XX century, Rauf Parfi, showing a bright identity, won the love of the literary community with new, indelible, unexpected non-traditional images (bird, lantern, tree, flute, light); by the nature of artistic thinking built on imagery, he fell into the eyes of the people

In the poems of Rauf Parfi, the warmth of affection for a person, the spirit of trust and attention, the mournful-sad and melancholic melody, the sincerity that the eyes did not see and did not hear, found their expression in the eyes. . And, importantly, the social and philosophical meaning of the poet's works was a new direction in our poetry. In particular, first, the goal of life, of the living, is the perfection of the soul. Secondly, the prevailing ideas that without spiritual freedom, a person cannot manifest himself; thirdly, that without national unity, a nation, a people cannot maintain their existence. To live in the same dreams, in the same sorrows, in the same joys " - this is the essence of life, - he believes.

From the earliest poems of Rauf Parfi, the desire for courage and the spirit of freedom, the ideas of rebellion against oppression in society, social injustice, inequality, injustice, are leading the way. The ideas of freedom of the spirit, freedom of thought, and peace of mind, laid down by the poet in the early 70s, became the basis of the nationalist trend in the development of our poetry of the next stage. Rauf defined the socio-aesthetic essence of Parfi's work, the nature of his art, which was different from his predecessors, teachers, and like-minded poets. The symbolic images of the lantern and the sun carry a deep meaning to the poet. It burns, it sings, it burns and it sings. The burning lamp is a favorite dream of the lyric hero. He listens to the syllables in people's tongues, their grief, their pain that burns on the tip of his tongue. In particular, a lamp that lights up at the end of winter does not just illuminate the room surrounding it. It burns, it sings, it burns and it sings. The burning lamp is a favorite dream of the lyric hero. He listens to the syllables in people's tongues, their grief, their pain that burns on the tip of his tongue. The content, loaded with symbolic images, is not so difficult to read. Night is a society steeped in the darkness of colonialism, light is a poet who seeks to convey the light of thought into the minds of people. Lamp-silence.

He, again in anguish, sings. This means that people enrich and purify their hearts with new feelings and experiences. Dawn, arrows, dawn, Sun-Lily, is a direct hint that since the 60s the political situation in society has softened, attention to people has increased, the word of a fighter for personal freedom has begun to acquire the status of dawn, sunset in the spiritual life. Rain-according to Eastern ideas-is a blessing, a divine blessing, a seed of goodness and goodness. Poets impose monotheistic meanings on it in their spiritual states and moods. That is, each poet, based on his aesthetic principles, seeks to express a variety of artistic and philosophical content by means of words. Someone sees the tears of a loved one in the rain. Someone else imagines a crying heart. In another poem by the poet, rain is understood as the pathetic words of clouds, a black-brown sky directed at the earth. In the image of Rauf Parfi, the rain-bag is in the form of a dark night. And the night flows like water. Therefore, the night is fun and carefree.

RESULTS AND CONCLUSION

The experiences of the lyric hero are like rain falling on a dark night. In that sense, in his eyes, the leaves were dancing. Even the winter darkness is pleasant, delicious in shape. Defensively, like flowers, it seems that legends are told before dawn. Therefore, the lyric hero with trepidation plunges into his heart, his cypresses radiate light. The illusion is not emptiness, it is the winter darkness inside the rain. You can trust him. Despite the fact that at dusk, on a lunar Saturday under heavy rain, it gives hope for tomorrow's dawn. It seems that figurative, lyricism is, one might say, the fiery breath of Rauf Parfi's style, its core. Rauf Parfi's heart is burning in the fire of immortal poetry ("my words are boiling in my heart, the fire of feelings is burning in my heart"). The light in people's minds, the warmth in their hearts, creates waves, they flare up. This is the bright fate of the poet. It's fate with an inscription on its forehead. This is the happiness of the culture of the Uzbek artistic word. The poet's lyrics, built on metaphors with a broad meaning, not only gave birth to new poetry, but also marked the beginning of the birth and formation of a new generation of personalities. The rebellious lyrics against despotism, treachery, lies and tyranny recall the fevers of blood dripping from the hearts. The taste, color, and expression of a person's face, truth, goodness, and beauty are universal. Familiar to all the peoples and nationalities of the world. The images of love, birds, trees, and light in the poetry of Rauf Parfi acquired a new symbolic meaning, reflecting the life of a human priest, burning with the desire for will. This is not the case when the lyric character expresses an instant mood. The rebellious lyrics against despotism, treachery, lies and tyranny recall the fevers of blood dripping from the hearts. The taste, color, and expression of a person's face, truth, goodness, and beauty are universal. Familiar to all the peoples and nationalities of the world. The images of love, birds, trees, and light in the poetry of Rauf Parfi acquired a new symbolic meaning, reflecting the life of a human priest, burning with the desire for will. This is not the case when the lyric character expresses an instant mood. He is the cry of the soul. A true word, turned away from the vices of society, escaped from an ugly environment and plunged into clean air, ignited by fire. He prefers to kiss the feet of virginity, light, and not to shed blood on lies, betrayal, and oppression. Knows with dignity. In the works, the lyrical hero enjoys conversations with lightning, thunder. he knows that the real poet lives at the feet of the sun, in the arms of the fire. The poem is a child of fire with light, he says. Why didn't you wake up the lightning, he says in the "I've been asleep for a long time "trilogy. When I hide the lightning, I forget about the world, I come to myself," says my beloved man..." at the age of three. The sun melted in my eyes, the moon fell, melted on my chest, says another trio. In the poetry of Rauf Parfi, the elements of nature, the material world lives its own life, fantasies. Whether it is the expanses of the sky, the stars, the clouds, or the sun's rays, they all express their joy, anxiety, and pain. Helps you understand the mysteries of the mysterious world. Images of nature occupy a place in our hearts when they enter our eyes. More importantly, the details, colors, and images of nature help us understand society and man. Just as the drops are reflected in the poems of Rauf Parfi, it is a reflection of the states of manifestation of the spirituality of the individual. No matter what line you read, you will catch the poet's eye, feel his breath. You will see sharp, penetrating, fiery eyes. As you go through each page, reach out your hand. From the early poems of the poet, images of dawn, death, sunset, light, tree, bird, images of white and black colors penetrate the unconscious psyche of the waking "I", a unique person. The edges of deep meaning in them remind of spring waters that beat on the banks and boil, opening their tributaries. We can say that in each of his poems the poet is looking for himself. The eyes are opened by groans, pains, groans, groans of the awakening language,

reacting to the troubles of society and man, to the games of representatives of the dominant ideology.

ABSTRACT

The article discusses the improvement of the methodology for calculating the level of congestion of vehicles per vehicle. To assess the significance of the influence of operating conditions on the technical readiness of vehicles, the method of expert assessments was used; the methods of mathematical statistics were used in processing the answers of experts and assessing the errors of improved methods for monitoring operational factors.

KEYWORDS: *Workload level, Development of road transport, Operating conditions, Technical readiness of vehicles.*

INTRODUCTION

At the present stage of development of road transport, based on the impossibility of quickly renewing a worn-out vehicle fleet, an important and urgent task is to increase the technical readiness of vehicles and the efficiency of their use. One of the main directions for solving this problem is taking into account technical readiness when planning the stages and volumes of maintenance. In cases of constantly changing load, changes in a wide range of climatic conditions of operation and the complexity of control of operating conditions, the introduction of expensive diagnostic tools for the main components is not advisable [1-2]. If it is not possible to introduce control methods for the main technical and operational characteristics and the complexity of the implementation of direct diagnostics, it is advisable to use methods of indirect control of the technical readiness of vehicles.

LITERATURE REVIVE

To increase the efficiency of using the fleet of vehicles is inextricably linked with the need to take into account its actual readiness when planning the periods and volume of maintenance. The work of E.S. Kuznetsova, R.K. Khasanova, N. Ya. Govorushchenko, G.M. A.G. Sergeeva, V.A. Bondarenko, A.P. Boldina, M.M. Bolbas, V.P. Voronov V.P., I.B. Gurvich, I.E. Dyumin, B. S. Kleiner and other authors is devoted to taking into account the operating conditions when planning the repair of motor vehicles and optimizing the overhaul run. In the direction of developing means and methods for diagnosing technical readiness and monitoring the operating conditions of transport means, the works of E.S. Kuznetsova, R.Kh. Khasanova, N. Ya. Govorushchenko, V.P. Voronova, N.N. Yakunin.

Among the works devoted to determining the technical readiness of vehicles during operation, two main directions can be distinguished - direct (improvement of diagnostic tools) and indirect (improvement of methods for monitoring operating conditions). The presented work is devoted to the subsequent improvement of methods for monitoring operating conditions. The purpose of the study is to develop a comprehensive methodology for managing technical readiness based on monitoring operating conditions.

MATERIALS AND METHODS

To solve the tasks set in the work, there is a systematic approach. To assess the significance of the influence of operating conditions on the technical readiness of vehicles, the method of expert assessments was used; the methods of mathematical statistics were used in processing the answers of experts and assessing the errors of improved methods for monitoring operational factors [3-5]. An analytical method for the distribution of passenger traffic was used to calculate the level of loading of vehicles. The theory of fuzzy sets is used to build a model of the influence of operating conditions on the statistics of vehicle failures. Relevant is the improvement of methods for monitoring the operating conditions of vehicles and the development of methods for accounting for their changes when planning maintenance stages. Increasing the competitiveness of any road transport enterprise is inextricably linked with the need for widespread introduction of resource-saving technologies. The main direction of solving this problem is to increase the efficiency of the use of vehicles.

RESULTS AND DISCUSSION

Traditional methods of determining the mass of vehicles using scales are successfully used in industry, but in the conditions of suburban and urban traffic, their use is unjustifiably expensive and difficult. Among the analytical methods of calculation, one can single out as the main direction - the control of passenger traffic using the dynamic probability of their distribution. Since the installation of on-board systems is undesirable under the conditions under consideration, we will consider the mathematical foundations for calculating passenger traffic and test it for the bus route. To predict the level of congestion at interchange and passenger-forming points, it is proposed to use the theory of graphs and dynamic probabilities of the distribution of passenger flows that enter and exit at the stopping points. The method is based on the assumption that passengers who enter a point at a given time interval are sent from other points in proportion to the probabilities of passengers leaving. Imagine a sequence of vertices (transfer points) and arcs (route sections) that make up the route considered in the example [5-7]. To test the validity of the chosen calculation method, we use the results of the last reference

study carried out for route networks. The method provides for the calculation of the dimensionless relative intensity of sources, calculated for a certain period of time.

$$J_N = \frac{Q_{BX_N}}{\sum_{\phi=1}^{N_{\text{пункт}}} Q_{BX_\phi}} < 1 \quad (12)$$

Where J_N – the intensity of passengers at point N ;

N - Conditional item number;

Q_{BX_N} - The number of passengers entering the transfer point (the point for which the value is calculated);

ϕ - The serial number of the item;

$N_{\text{пункт}}$ – The total number of active route points;

Q_{BX_ϕ} - The number of passengers entering the point with numbers ϕ .

From expression (11) it can be seen that $\sum_{\phi=1}^{N_{\text{пункт}}} J_\phi = 1$. Similarly, for each vertex, the dimensionless relative intensity of the exit of passengers is calculated

$$q_N = \frac{Q_{BbX_N}}{\left(\sum_{\phi=1}^{N_{\text{пункт}}} Q_{BbX_\phi} \right)} < 1 \quad (13)$$

где q_N - the relative intensity of the exit of passengers for point N ;

Q_{BbX_N} – The number of passengers leaving at the transfer point;

Q_{BbX_ϕ} – The number of passengers leaving at point N with numbers for the period of time for which the calculations are carried out.

The assumption about the constancy of the distribution of passenger flows that enter and leave the network nodes in expressions (1) and (2) is justified for a certain sense of the sampling period in time. The period should correspond to the period of time due to the length of the network route itself and the conditions for the functioning of the city's enterprises. Therefore, to approximate the calculation results to real ones and to test the method, we will choose a time interval from 10.00 to 11.00 and carry out calculations for each node (point). The calculation results are summarized in the table (Table 1.).

Based on the results of calculations, we find the proportion of the direction of movement of the flow of passengers entering the point. In accordance with the method, we use the expression for calculating the shares of passenger traffic

$$\bar{Q}_{BX_N} = \frac{Q_{BX_N} \cdot \sum_{\phi=N+1}^{N_{\text{пункт}}} Q_{BbIX_\phi}}{\sum_{\phi=1}^{N_{\text{пункт}}} Q_{BbIX_\phi}} \quad (14)$$

Where \bar{Q}_{BX_N} - the proportion of passengers entering point N , and will go to the point with serial numbers starting from $(N+1)$ до $N_{\text{пункт}}$.

Further direction of movement of the flow of passengers leaving at the point

$$\bar{Q}_{BbIX_N} = \frac{Q_{BbIX_N} \cdot \sum_{\phi=1}^{N-1} Q_{BX_\phi}}{\sum_{\phi=1}^{N_{\text{пункт}}} Q_{BX_\phi}} \quad (15)$$

Where \bar{Q}_{BbIX_N} - the proportion of passengers leaving at point N and arriving from point with serial numbers from 1 to $(N-1)$

TABLE 1 RESULT OF CALCULATIONS OF THE INTENSITY OF PASSENGER TRAFFIC

Nodes (interchange and passenger- forming points)	Number of passengers, people		Dimensionless Intensities	
	incoming Q_{BX_N}	outgoing Q_{BbIX_N}	at the entrance J_N	on exit q_N

25-26	453	312	0,09749749	0,0651

The mass transported by a bus with serial number n , which was in the control time interval between points N and $N + I$, can be obtained from the expression:

$$\bar{M}^{N,N+1} = \frac{G_{N,N+1} \cdot m_{\text{пac}}}{KB} = \frac{\sum_{\phi=1}^N Q_{BX_{\phi}} \cdot \left(\sum_{\rho=N+1}^{N_{\text{норм}}} Q_{BbIX_{\rho}} \right) \cdot m_{\text{пac.cp}}}{\sum_{\rho=1}^{N_{\text{заз}}} Q_{BbIX_{\rho}} \cdot KB} \quad (16)$$

Where $\bar{M}^{N,N+1}$ - the average mass transported by the bus, which was involved in the transportation of passengers during the estimated period of time;

$m_{\text{пac.cp}}$ - Average passenger weight (accepted $m_{\text{пac.cp}} = 70$ kg);

KB - The number of buses that were recorded on the site for the period of time during which the calculations were carried out. Based on the data, we will construct a comparative diagram of the actual and theoretical load of the route sections (Fig. 1.).

Figure 1 the Workload of the Sections of the Calculated Route from 10:00 to 11:00

Analysis of the results of calculating the congestion of the sections shows that the error does not exceed 10%, and in 10 cases out of 14 it did not exceed 5%.

As a result of processing the error data using the STATISTICA program, the Quick Basic Stats module, the following values were obtained:

Mean = 4.135714 - average value of the error;

SD = 4.558273 - standard (root-mean-square) deviation.

Improvement of the method, namely, an increase in the accuracy of calculations, can be obtained by taking into account the time spent by passengers to overcome the route. This approach can be implemented with a period of control of passenger traffic close to the interval of bus traffic (5-7 minutes). Combining the described calculation method with the approach proposed in, the improvement of the method for calculating the level of bus congestion was carried out by taking into account the time shift in determining the dynamic probability of passengers leaving the route and, accordingly, the congestion of the route section. The value of the time shift corresponds to the time of passenger movement from the point, the passenger flows of which are taken into account, to the point of the network, for which the calculations are carried out. The improved method makes it possible to increase the accuracy of determining passenger traffic at any time interval. Let us take T - the sampling interval in time, then it is expedient to express the time of the passenger's movement between points in the number of intervals T , which is spent on overcoming the route section. A matrix is formed with data on the time that the passenger should spend on moving between points of the route

$$Y_{\bar{t}} = \begin{vmatrix} 0 & \bar{t}_{12} & \dots & \bar{t}_{1N} \\ \bar{t}_{21} & 0 & \dots & \bar{t}_{2N} \\ \vdots & \vdots & \ddots & \vdots \\ \bar{t}_{N1} & \bar{t}_{N2} & \dots & 0 \end{vmatrix} \quad (17)$$

Where $Y_{\bar{t}}$ - spent time matrix;

\bar{t}_{NN} - The number of intervals T , which the passenger must spend on the movement between the points of the route;

Matrix with data on the number of passengers who are at the transfer point:

$$U_S^{BX} = \begin{vmatrix} Q_{BX_1}(S) & Q_{BX_2}(S) & \dots & Q_{BX_N}(S) \end{vmatrix} \quad (18)$$

Where U_S^{BX} - matrix of the number of passengers who are at the transfer point;

S is the ordinal number of the period T from the conditional start of time;

$Q_{BX_N}(S)$ - The number of passengers who entered point N during period S .

Similarly to expression (8), a matrix is compiled with data on the number of passengers who left the route at the point. Expressions (7) and (8) form the basis for improving the method for determining the dynamic probability of passengers leaving at point N for the period with the serial number S .

$$q_N(S) = \frac{Q_{BIX_N}(S)}{\left[\sum_{\phi=1}^{N_{\text{нум}}} Q_{BX_\phi}(S - \bar{t}_{N\phi}) \right] - Q_{BX_N}(S)} \quad (19)$$

Where $q_N(S)$ - the probability of passengers leaving at point N during the period S ;

$Q_{BIX_N}(S)$ - The number of passengers who got off at point N during period S .

The workload of the site is determined as:

$$G_{N,N+1}(S) = \sum_{\phi=1}^N Q_{BX_{\phi}}(S - \bar{t}_{N\phi}) \cdot \sum_{\rho=N+1}^{N_{\text{мультим}} } q_{\rho}(S + \bar{t}_{N,N+1} + \bar{t}_{N\rho}) \quad (20)$$

Where $G_{N,N+1}(S)$ - the workload of the section between points N and $N + 1$ for a period of time S .

Substituting expression (19) into (20), we have:

$$G_{N,N+1}(S) = \left\{ \sum_{\phi=1}^N Q_{BX_{\phi}}(S - \bar{t}_{N\phi}) \right\} \times \\ \times \sum_{\rho=N+1}^{N_{\text{мультим}} } \left\{ \frac{Q_{BbIX_{\rho}}(S + \bar{t}_{N,N+1} + \bar{t}_{N\rho})}{\left[\sum_{\phi=1}^N Q_{BX_{\phi}}(S + \bar{t}_{N,N+1} + \bar{t}_{N\rho} - \bar{t}_{\phi\rho}) \right]} - Q_{BX_{\rho}}(S + \bar{t}_{N,N+1} + \bar{t}_{N\rho}) \right\} \quad (21)$$

The workload of the section (10) in a certain period of time will determine the workload of the bus following the section. The above expression (10) does not take into account the uneven boarding of passengers on buses, however, unlike (6), it makes it possible to obtain the value of the congestion level for any period of time. When additional research is carried out and the corresponding coefficients are formed, the expression can be supplemented.

CONCLUSION

The study of operating conditions using the method of expert assessments and processing of the results by the mathematical apparatus of statistics made it possible to identify the most significant factors that affect the technical condition of vehicles, and to calculate the weighting coefficients of factors that need to be controlled: mileage (0.2139), the level of workload (0, 1798), the average technical speed (0.1476), as well as the quality of the road surface (0.1837). Considering that during the operation of the convoy, vehicles are operated with different loads, a method for mediated monitoring of technical and operational characteristics for each individual vehicle has been developed, which made it possible to individually record the characteristics. The developed method is based on a complex analysis of the parameters of the functioning of the existing means of monitoring the modes of operation of the objects of a motor vehicle, which leads to an increase in the efficiency of determining the technical condition of vehicles.

ABSTRACT

This qualitative research aims to investigate that if the puppets can be utilized as a showing instrument in kindergarten schooling and how it is viable for youngsters to learn. The inquiry that this research is attempting to discover is who the pre-school language students are. The information is assembled using two various types of exploration strategies: perception and meeting. It is a contextual investigation where 20 kindergarten youngsters are instructed English with puppets named Pepe and understudies are seen whether they get familiar with the language. Furthermore, two kindergarten instructors are met about the utilization of puppets in English language study rooms. The information show that puppets are drawing in and rousing for youthful students. They are compelling apparatuses, which can be utilized in English language homerooms. Anyway the examination is restricted to the job of puppets in kindergarten instruction in English language study rooms. Further examinations may zero in on the part of puppets in kindergarten education in different fields like science, craftsmanship, etc.

KEYWORDS: *Puppets, Preschool Education, Young Learners (YLS), Kindergarten.*

INTRODUCTION

The pre-school years which are between ages 3 - 5 are known to be an extraordinary time in the existences of small kids. It is a urgent phase of life where a youngster creates himself/herself actually, mentally, sincerely and socially. The kids' psychological and actual capacities progress at a high rate from birth to the age of six. This period is the time where they begin to cooperate with the world particularly their families and meet new individuals because preschool is the main

acquaintance of the kid with the outside of the world. They acquire independence and self-control. Besides, they begin to notice their general surroundings and gain insight to the occasions when they interact with individuals. Furthermore, the youngsters can gain some new useful knowledge with a high extent. It implies that the time frame from birth to age six is an appropriate stretch for the youngsters to occur of learning. People's learning limit proceeds altogether times of their lives notwithstanding; learning is more exceptional in the pre-school years when contrasted with different periods [1-3]. The youth training likewise empowers the kids to be effective in later school lives expresses that youth is a time of individuals' lives where they create themselves with respect to physical, intellectual, passionate and language spaces. This is a period when people are faster learners than other periods in their lives. Crain adds that children go a lot further than the other stages in their world, and they decode the language in the early ages [2-6].

Thus, the inquiry that could be posed is "who are the pre-school language students?" They are called as extremely youthful students (VLYs) who get familiar with another dialect in youth. They are between the ages of 3 and 6 years. Kids start the compulsory training when they are six years of age. Youngsters will most likely be unable to peruse and compose the language in these ages till they start the grade school. Kids are consistently excited students when contrasted with the grown-up students. They need to satisfy the educator in the study room exercises. They have a go at a movement regardless of whether they don't get why or how. Youngsters feel looser in the classroom contrasted with grown-ups and they are less humiliated in communicating in another dialect. Additionally, they have a local like complement with the assistance of their absence of inhibition. Meisel states that speech is a miraculous development of infants, toddlers and very young children because they are not formally taught it. The children do not spend effort to learn the speech of the language [5-8]

LITERATURE REVIEW

It is acknowledged as a typical view that youngsters are superior to grown-ups in language learning. Not with standing, how the instructing ought to be in youthful students' schooling. The pre-school instruction educational plan is play-based in light of the fact that learning through play is principal to small kids in training. It assists them with building up the essential abilities throughout everyday life. For example, puppets give a fundamental connection among learning and play which makes them awesome showing instruments for at home, pre-school, homeroom and in the more extensive local area. Puppetry is a teaching aid, rather than a teaching method. The use of puppets should be coordinated with the curriculum and the syllabus to work well for the children language learning. Korosec indicates that motivation gets high and that is an important reason for including the puppet in the educational process as a means to reach the curriculum goals

What is Puppetry?

Puppetry is an old and conventional type of workmanship that is as yet dynamic in pretty much every culture. Puppetry is utilized in various settings, for otherworldly, social, and instructive educating. Puppetry is a type of theater or per-formance, which includes the control of puppets. It is an antiquated fine art, and is accepted to have begun around 3000 years prior. Puppets have been utilized since the most punctual occasions to quicken and convey the thoughts and requirements of human social orders. Puppetry is utilized in practically all human social orders

both as a diversion in execution and formally in ceremonies and festivities like amusement parks. Most puppetry includes narrating. Burn states that puppets have united people of the world through a language unique to puppetry, consisting of more than words. Puppetry is a language, which passes on sentiments, goals and interests with a combination of gestures and word. All puppets wake up as characters that can depict different characters and different characteristics and they cross all societies. Puppets can share bliss or pity, they can be devious or acceptable, brassy or timid, and when a youngster is locked in by a puppet they can learn exercises without figuring it out. A puppet addresses a controlled item by a puppeteer; they are frequently figures addressing human or creature structures. Puppet developments are controlled through hand developments, sticks or strings. The most mainstream sort of puppets for little youngsters are stick puppets and hand, finger puppets instead of the more complicated one. Holler suggests that had-puppets which are controlled directly from underneath are the most useful for schools. They are a lot less complex to make and far simpler to control. Ad lib is simpler, and the puppets have a faster development to which kids react. Besides; they are in close contact with the crowd, so a functioning support can be acquired. Subsequently how is the utilization of the puppets in schooling? Can language instructors use them in their classrooms?

THE ADVANTAGES OF PUPPETS IN EDUCATION

There are many benefits of using puppets in the classroom. Puppets are an aspect of our history and everyday lives. They are important instructive apparatuses which can be utilized both for grown-up and youngsters. As puppetry is essentially a visual craftsmanship, it can convey to individuals who are not educated or who don't comprehend spoken language and it has been utilized in this manner for millennia. According to Jean Piaget's theory, puppets play helps young children develop creative and cognitive skills by forcing them to use their imagination. They make up the roles, the principles, the circumstances, and the arrangements. It is through creative play that youngsters come to comprehend the contrasts among dream and reality. This present reality turns out to be all the more genuine to kids who have opportunities to pretend. Firstly, the puppets can be used as a teaching tool in language classrooms [7-10]. Lennon and Barbato indicate that the puppets are used as a tool to encourage children to express their feelings. In additionally, puppets can change their behaviors. Low and Matthew add that puppets have a valuable impact in engaging children and promoting language development. Peyton states that puppets have a beneficial influence on learning and social development. Puppet language is unique in its ability to help teachers and children learn from one another, grow, and relate openly. The puppets establish such a climate that youngsters feel good and unsure. Accordingly, the youthful students become less restrained and they don't spare a moment to face challenges. This agreeable climate drives the understudies to investigate the language and the shows of the English language. They model the practices that educators need to advance. Grown-ups can display turn taking discussion by posing open finished inquiry and utilize various voices. Puppets additionally give understudies the eye to eye collaboration that boosts language learning. As shown previously, the puppets are vivid, material and manipulable. Subsequently they react to the youngsters' individual adapting outwardly, aurally and physically. Peyton adds that puppets are beneficial for the students who learn the language kinesthetically. Additionally, they are showing instruments, which make exercises more fun than the traditional homerooms. They make the exercises more dynamic and enthusiastic and bring fun for youngsters as well as for the educators who use puppets in their classrooms. Mishina and Wallace indicate that the puppets

destroy the barriers between the teachers and students in the classroom. The educators who attempt to keep themselves with an exacting distance in the homeroom become more amiable to the youngsters with the assistance of puppets. This engaging air in the classroom, which puppets create, makes the instructor to act more real to life to the understudies. Moreover the instructor's severe glancing in the study room is reduced. By thusly, the boundaries between the instructor and the understudies can be separated and simpler correspondence in the homeroom is accomplished by means of puppets. At that point, both the educator and the understudies in the homeroom have a good time in their learning and instructing process.

Puppets are engaging as well as enthralling. Small kids accept and identify with the puppets. Accordingly understudies might want to enter and investigate the intriguing scene. Chase adds that little youngsters acknowledge the puppets as non-undermining thoughtful companions. The youngsters may utilize puppets to communicate their considerations, fears and sentiments, which here and there get hard for them to voice to a grown-up. They talk about even the delicate issues by means of puppets. The youthful children work through their apprehensions and they get an opportunity to tell their sentiments decisively. Also, it tends to be expressed that puppets assist kids with having veils that they can conceal themselves. Thusly, kids are maintained a strategic distance from unpleasant relations and they can convey substantially more suddenly with grown-ups. The hesitant kids escape their shells and they become more expressive. The kids can communicate their considerations, fears, and sentiments, which might be hard to voice now and then, in light of the fact that the puppets go about as "ministers" just as companions. The understudies could likewise create discussion abilities, for example, hazard taking and appropriate reactions in a discussion. In addition the puppets go about as an amazing specialized apparatuses. The pleasant air the puppets make increment the correspondence between both the instructor to understudy and understudy to understudy. The youngsters additionally become ready to comprehend the semiotic-representative estimation of visual signs and the language of non-verbal communication. It implies that understudies can build up their both non-verbal correspondence, which is vital in correspondence, and verbal relational abilities with the assistance of puppets.

Moreover, puppets can assist understudies with figuring out how to function agreeably with different understudies in the homeroom. Bennett shows that understudies who are working in a gathering to plan and present a puppet play give and take and offer their thoughts so it would let them to master working agreeably. Besides; it empowers them to establish bunch union. The gathering work makes the understudies to improve their social abilities. The puppet plays comprehend having a place with a gathering. The understudies feel dependable to work and this leads them to accomplish achievement exclusively.

Puppets energize the youngsters' creative mind, inventive play, disclosure and association to the exercises. Puppets offer youngsters the chance to investigate their inventive side. They rejuvenate the story time. Puppets make the understudies to perform pretends in the homeroom. The instructors should design their exercises wherein the puppets are joined with play. The youngsters can plan and plan everything from the story line to the puppets to the stage. Understudies utilize their creative mind while they are attempting to make puppets. For instance; they can sew or utilize existing puppets. Puppets the understudies work on might be made of frozen yogurt sticks, cardboard, paper plates and so on they additionally utilize their creative mind while they are attempting to offer parts to them. They make distinctive characters, jobs,

characters to act. They are additionally an intuitive method to acquaint story with the kids. The students' inclusion to the exercises can increment since they take a functioning part while performing puppet plays. As it is demonstrated, there are heaps of advantages of utilizing puppets in the kids' learning encounters. Puppets can be utilized from infants' directly through youth and past. They are reasonable materials to be utilized particularly in pre-school instruction. The youngsters like them and they take an interest to the exercises where puppets are utilized. Little guy pets can build up their creative mind, innovativeness and disclosure abilities. Then again, they let the understudies to have a great time in the homerooms. It implies that the youngsters both gain proficiency with the language and they have pleasant time, which is quite possibly the most troublesome activities for instructors. The puppets likewise separate the obstructions between the educator and the understudies. Indeed, even the most hesitant understudies attempt to respond to them. The puppets start the communication in the study room. These properties show that the puppets are incredible teaching tools, which can be used at home, in classroom and in wider community. Therefore, the preschool English teachers should use them in their classrooms without any hesitation to teach new vocabularies and to create dialogues etc. The English teachers should plan their lesson plans in which the puppets are combined with play, which makes the learning easy for the kindergarten students.

The puppets are helpful apparatuses, which can be utilized in youngsters' schooling. In this investigation, the job of puppets in kindergarten youngsters' schooling will be talked about. The exploration center around the connection between the use of puppets in kindergarten homerooms and the understudies' consideration and association to the exercises in which puppets are utilized to show English all through the exercise. The research questions are:

Considering every one of these benefits of utilizing puppets in English language study halls, it very well may be summed up that the puppets are mind boggling language instructing apparatuses if the kindergarten educators use them routinely and consciously. The puppets energize the learning of the youngsters as well as make a clever air in the homeroom. Youngsters become more fearless in future instruction. They build up their open abilities since they feel looser while they are chatting with the puppets rather than a grown-up or instructor. Additionally, the charming air that the puppets make separates the obstructions between the instructor and the youngsters. The two instructors and youngsters in the study hall acquire the advantages of puppets on the off chance that they are utilized in the appropriate manner.

ABSTRACT

Forecasting is the prediction of variable based on known past values of that variable or other related variables. The art of forecasting is learned by experience rather than by academic study. Forecasts must results in present action to improve future. In this study, we discussed about Simple Exponential Smoothing (SES) method. By using this method, we forecast the BSE SENSEX closing point value and then compare the method with the help of RMSE measure.

KEYWORDS: *Simple Exponential Smoothing (SES), Bombay Stock Exchange (BSE) and Root Mean Square Error (RMSE).*

INTRODUCTION

The current study is focused on financial variables and hence the data considered for empirical analysis is drawn from the financial organizations. The data for the study is collected from Bombay Stock Exchange (BSE) which is one of chief trading center where almost all Indian companies are listed out for trading. Even though, there are large number of financial indices are available in this domain, the planned variable considered for the analysis of the study is BSE SENSEX. SENSEX is the short form of sensitive index and it is one of primary indices of Bombay Stock Exchange. Based on SENSEX, several investors plan their financial investments. Some of the organizations look it as a standard index.

1.0 METHODOLOGY

1.1 EXPONENTIAL SMOOTHING FORECASTING MODELS

There are three types of exponential smoothing models. They are, simple exponential smoothing or first order exponential smoothing, second order exponential smoothing and higher-order exponential smoothing.

1.1.1 First Order Exponential Smoothing

The first and the simplest of all the smoothing methods is simple exponential smoothing. If we have data with no clear trend or seasonal pattern then we can use the simple exponential smoothing method. The graph in figure 1.1 is a better example of such Data.

Figure 1.1: Time Series Plot for Simple Exponential Smoothing

The first order exponential smoothing extends this current approach by providing exponential to historical data points where weights decrease exponentially from the most recent data point to the oldest. The first order exponential smoothing can be defined as follows:

$$F_{t+1} = \alpha x_t + \alpha (1-\alpha)x_{t-1} + \alpha (1-\alpha)^2 x_{t-2} + \dots \quad \dots (1.1)$$

Here, α is the smoothing factor that lies in the interval $[0, 1]$ and controls the rate at which weights decrease and x_t is the observed value at time t . In figure 1.2, smoothing process demonstrates the decay of weights with a different smoothing factor, α . Here, the higher value of

α leads to a faster decay of weights; thus, historical data will have less impact on the forecasted value.

Figure 1.2: Smoothing Process with Different Smoothing Factors

1.1.2 Second Order Exponential Smoothing

If first order exponential smoothing does not perform well, then there is a trend in the time series data. The trend is commonly observed in many domains such as when marketing campaigns are run by e-commerce companies, the sales rise or any good annual performance by a company will have a bullish effect on its stock prices. The linear trend can occur due to relation between time and response, then,

$$x_t = \text{constant} + \omega_t + \varepsilon_t \quad \dots (1.2)$$

Here, ω is the coefficient that leads to trend. The second order exponential smoothing helps to capture the trend in time series data by including another term to the first order exponential smoothing as follows:

$$F_t = \alpha x_t + (1-\alpha)(F_{t-1} + T_{t-1}) \quad \dots (1.3)$$

Here, T_t captures the trend component of the exponential smoothing and it can be represented as follows:

$$T_t = \beta(F_t - F_{t-1}) + (1 - \beta)T_{t-1} \quad \dots (1.4)$$

Also, α is the data smoothing factor and β is the trend smoothing factor with values that lies in the interval $[0, 1]$. The next stage forecast can be generated as follows:

$$F_{t+1} = F_t + T_t \quad \dots (1.5)$$

1.1.3 Higher Order Exponential Smoothing

The concept can be further extended to higher-order exponential smoothing with an n^{th} order polynomial model as

$$x_t = \alpha_0 + \alpha_1 t + \frac{\alpha_2}{2!} t^2 + \dots + \frac{\alpha_n}{n!} t^n + \varepsilon_t \quad \dots(1.6)$$

Here, error $\varepsilon_t \sim N(0, \sigma^2)$ is normally distributed with mean 0 and variance σ^2 . The exponential smoothers used for higher order are as follows:

$$\left. \begin{aligned} F_t^{(1)} &= kx_t^{(1)} + (1-k)x_{t-1}^{(1)} \alpha_1 t \\ F_t^{(2)} &= kx_t^{(2)} + (1-k)x_{t-1}^{(2)} \alpha_1 t \\ &\vdots \\ F_t^{(n)} &= kx_t^{(n-1)} + (1-k)x_{t-1}^{(n)} \alpha_1 t \end{aligned} \right\} \quad \dots(1.7)$$

Now we will apply the exponential smoothing for the BSE data and forecast the BSE closing point value. The graph in figure 1.3 shows the movements of BSE closing points from January 2000 to February 2018.

Figure 1.3: Time Series Plot for BSE Closing Points

To understand the movements of the BSE index, let us have a close look at the data by year. In figure 1.4, we have a Box-plot by year.

Figure 1.4: Box-Plot of Time Series for BSE Closing Points

From the above box-plot, we can observe that the BSE index has increased tremendously over the past 17 years from 5 thousand points to 35 points and there is high volatility in the years 2007, 2008 and 2009, which is caused by the global recession. From 2014, the Indian market got the momentum and ever since it has an increasing trend, the main reason may be the political conditions in India and global economic situations. Now let us see how exponential smoothing helps us in forecasting the BSE index.

Figure 1.5: Time Series Decomposition Graph for Observed, Trend, Seasonal & Residual Values

In figure 1.5, from the above time series decompose graph, we can see that there is increasing trend in the BSE index data and it has high residuals around 2009 and 2015.

1.2 RESULTS AND DISCUSSION

Now we consider the method of fitting by simple exponential method to the BSE data and forecast the BSE closing point values. We know that the smoothing parameter α has a great impact on forecasting; so, the right α value is critical during forecasting. From the graphs in figures 1.6 to 1.8, we can see the actual values Vs the forecasting values at different α levels.

Figure 1.6: Actual Vs Forecasted Values by Simple Exponential Smoothing with $\alpha = 0.021$

Figure 1.7: Actual Vs Forecasted Values by Simple Exponential Smoothing with $\alpha = 0.022$

Figure 1.8: Actual Vs Forecasted Values by Simple Exponential Smoothing with $\alpha = 0.023$

The graphs in figures 1.6 to 1.8 shows that the simple exponential smoothing with α equal to 0.023 has higher impact and also the forecasted values are close to the actual values. Since it is difficult to make a decision on the accuracy of values from the graph, we need to obtain accuracy measure like RMSE value which is given in table 1.1.

TABLE 1.1: RMSE VALUES FOR DIFFERENT α LEVELS

S E S Alpha Value	RMSE
0.021	5448.6706
0.022	5299.1995
0.023	5158.8394

The RMSE value at $\alpha = 0.023$ is equal to 5158.8394 which is observed to be minimum compare to other RMSE values obtained from different values of α . Hence, the fitted equation under this method for BSE SENSEX Closing Point is given by

$$F_{t+1} = 0.023 * X_t + (1 - 0.023) * F_{t-1} \quad \dots (1.8)$$

Here, F_{t+1} is the forecast for time period $t + 1$

X_t is the actual value for time period t

F_{t-1} is the previous period forecast

In the figure 1.9, the fitted model is used to forecast the future values for all time periods of BSE SENSEX Closing Points.

Figure 1.9: Actual values Vs Forecasted Values of BSE SENSEX Closing points by using SES Method at $\alpha = 0.023$

In figure 1.10, we have the actual values versus the forecasted values only for the forecasted period.

Figure 1.10: Actual values Vs Forecasted Values of BSE SENSEX Closing points by using Simple Exponential Smoothing Method only for Forecasted Period

Table 1.2 exhibits the Actual values and forecasted values that are obtained by using Simple Exponential Smoothing method. The RMSE value obtained by this method is 5158.8394

TABLE 1.2: ACTUAL AND FORECASTED VALUES OF BSE SENSEX CLOSING POINTS FOR THE FORECASTED PERIOD BY USING SES METHOD

	BSE Closing Index	
Month	Observed values	Forecasted values
01-01-2017	27655.96	22142.04581
01-02-2017	28743.32	22293.87511
01-03-2017	29620.5	22462.38749
01-04-2017	29918.4	22633.87577

01-05-2017	31145.8	22829.65003
01-06-2017	30921.61	23015.76511
01-07-2017	32514.94	23234.24613
01-08-2017	31730.49	23429.65974

01-02-2018	34184.04	24766.30762

1.3 CONCLUSION

In this Study, we discussed about the traditional time series forecasting method like Simple Exponential Smoothing (SES). We applied this method on the BSE SENSEX closing point value and forecasted the BSE closing point value for the period from January 2017 to February 2018. We used Root Mean Square Error (RMSE) measure to compare different values of α . The RMSE value at $\alpha = 0.023$ is equal to 5158.8394 which is observed to be minimum compare to other RMSE values obtained from different values of α .

ABSTRACT

This article discusses the basic principles of using integrated language skills in teaching English. When we integrate things, they interact or work together to be more effective. An integrated system increases the level of usefulness by bringing different ideas together in one way. It is clear that language learning skills also need to be taught in a related way to improve the communication process.

KEYWORDS: *Experience, logical, perception, memory, imagination, to identify, a passionate teacher, virtuous, strong-willed, zealous, well-rounded.*

INTRODUCTION

In the experience of the world to foster professional competent in the field of foreign languages, there are different ways to develop the competence of teaching English. To modernize innovation process according to support modern pedagogics technologies techniques of reading and integrating differential reading to develop reading component step by step, to investigate the effect of psychological factors are very important in developing integrated skills.

Innovational ways of teaching foreign languages are being used in educational places of our republic. According to this, to improve four skills are: speaking, listening, reading and writing gave us productive results in the field of learning and teaching foreign language. From the given above, as it works out the skill "reading" and "receiving information" it is considered to be basic source in teaching foreign language. So, to improve to develop reading skills of pupils helps to increase their vocabulary, to understand the text logically and the ability of giving personal opinion.

During these researches, ways of using strategies, which are important to develop reading skills and the results of these, were studied. In the period of this survey, scientific books of many scientists about the strategies of developing reading skills of a pupil were learnt.

This article was completed in the framework of the priority direction of development of science and technology of the republic: "Formation of a system of innovative ideas and ways to implement them in the social, legal, economic, cultural, and spiritual and enlightenment development of an informed society and democratic state."

The degree to which the problem has been studied in the research of G.Kh. Bakieva, L.T.Akhmedova, J.J.Jalolov, M.T.Iriskulov, T.K.Sattarov, in our country, and abroad A.L. The scientific works of Gurkina, MV Dubova, I. Luka cover in detail the problems of language teaching methods. K.Hoshimov, S.Khasanov, Yuldosh Eshbek,

The historical and philosophical works of N. Goyibov, Mubashshir Ahmad, Miraziz Azam, Abdukadir Zahid, Rashid Zahid, Poyon Ravshan, Sayfiddin Rafiddin can be shown. Youth education of our classic heritage, that is, direct pedagogical problems are described in the researches of A.Bobomurodov, M.Inomova, J.Yuldashev, U.Makhkamov, M.Mahmudov. In the works of H. Boltaboev, K. Kilicheva, in the spiritual and moral maturity of the younger generation, great thinkers, spiritual and pedagogical heritage, its potential in shaping the spirituality of the individual is explored.

Foreign scholars include K.A.Dridger, I.G.Pestalotsti, M.A.Joshan, K.Yilmaz, DJ.S.Trimengem, Frederick Starr, etc., medieval scientific activity; some issues of values related to the upbringing of young people are studied.

Strategies that are important in developing reading skills how they should be applied and how the expected outcome from them will help the reader is explored throughout the study. Research papers (books and articles) on this topic have also been reviewed by a number of scholars on how to form integrated reading skills in the reader during the research period.

Students work with language at the suprasentential or discourse level. They learn about cohesion and coherence. For example, in our lesson the students recognized that the second sentence of the scrambled order was the last sentence of the original sports column because of its introductory adverbial phrase, "In the final analysis..." This adverbial phrase is a cohesive device that binds and orders this sentence to the other sentences. The students also recognized the lack of coherence between the first sentences of the scrambled order, which did not appear connected in any meaningful way.

Students work on all four skills from the beginning. Just as oral communication is seen to take place through negotiation between speaker and listener, so too meaning through to be derived from the written word through an interaction between the reader and writer. The writer isn't present to receive immediate feedback from the reader, of course, but the reader tries to understand the writer's intentions and the writer writes with the reader's perspective in mind. Meaning does not, therefore, reside exclusively in the text, but rather arises through negotiation between the reader and writer.

MATERIALS AND METHODS

By applying non-traditional repetition lessons in schools, colleges and high schools, we can achieve the desired effect. Because it is in this lesson that students assess their knowledge in the open field and try to create new games and puzzles, and at the end of the lesson, they study and prepare diligently for the nomination "The group that has mastered the chapter the deepest." It is through this method that we can achieve a truly English speaking environment. Students educated in lyceums and colleges using this method will be able to continue their education freely and comfortably in higher education institutions without any difficulties related to language learning skills.

In the processes of perception, memory, imagination and thinking, a person not only knows the reality, but also expresses an attitude to this or that thing in life, in any case, in which he feels in one way or another. Emotions are an inner attitude that a person expresses in different ways to what is happening in their life, what they are learning, or what they are doing. The concept of "emotion" is used in different senses in everyday life and in scientific psychological sources. In particular, concepts such as perceptions, unintelligible tendencies, unintelligible desires, wishes, goals, requirements are used instead of feelings. When analyzed from a scientific point of view, 'emotion' is usually used in the brain of a living being, that is, in the sense of reflecting his (man's) attitude towards objects that satisfy and hinder the needs of individuals. In world psychology, the terms 'emotion' and 'emotion' are used in the same sense (especially in foreign countries), but they cannot be understood as exactly the same situation. Such a shortcoming is common in popular literature, textbooks published abroad. It is appropriate to call emotion a specific form of mental process, which is the expression of emotions in internal experiences, which are usually manifested by external symptoms. For example, discoloration of faces, smiles on the faces, trembling of the lips, glare of the eyes, laughter, tears, sadness, hesitation, confusion, etc. are expressions of emotion. But it is unnatural to include such high qualities as patriotism, responsibility, responsibility, conscience, kindness, love in the composition of emotions. In modern research, as a rule, identity is considered at the level of person-person, person-group, and as a mechanism of socialization, from the model of parental identification to norms, role-playing models or the model of identification of another person with other important people. In this regard, A. Antyushko identifies two main areas in which the phenomenon of identification is studied:

- The first direction - identification in the sense of the explanatory principle use the concept, that is, to measure the mental characteristics of a person and compare them with a certain standard;
- The second direction is the study of identification in the process of communication, interaction, mutual understanding by people.

This direction is related to the analysis of the process of socialization of the individual. Identification is a mechanism of socialization of the person, the mechanism of formation of the person in the process of interaction, mutual understanding.

DISCUSSION

Following is the identification of events in relation to the teacher the scheme is proposed: identification with another person; group identification; identifying an individual with a large community; comparing the subject with itself, i.e., self-identification.

However, very rarely is affect when it is not possible at all can also be a good educational tool. In this case, the teacher is required to work harder, be more patient and determined.

It is also required to adhere to the following rules:

First: the strong influence of the teacher on the student's behavior yields considerable results. However, it is important to keep in mind that a person who gets excited quickly can go overboard, resulting in him not getting the results he expected.

Second: anger often affects emotions more than the human mind. Students of a passionate teacher are disciplined not out of faith, but out of fear. Observations show that children of curious teachers, including those who are meek, indifferent, and at the same time demanding enough, rarely behave well in the teacher's fat.

Third: the nature of the case must be taken into account. There will also be actions that require the application of a compelling strong effect, but insignificant work and as a small offense, it is also very foolish to irritate oneself and the "nerves" of the students.

Fourth: The teacher's belief in his or her work is also important. Children also love curious teachers, if their anger helps them to get rid of a flaw in their students, if they feel that it is caused by a genuine sense of resentment.

The effectiveness of the use of pedagogical technologies in the educational process is finding its proof day by day. At the same time, the teacher and the student are constantly forced to search, study, and develop practical skills to express their ideas independently. This paves the way for them to become profound experts in their profession in the future. The role and importance of teaching methods in educational technology is particularly interactive methods, in which the classification of teaching methods is based on the specifics of teaching methods and the criteria for selecting teaching methods. Pedagogical technology encompasses the concepts of teaching methods such as educational technology, new pedagogical experience, new pedagogical technology, modern pedagogical technology, information technology, new experience. Nowadays, with the development of science and technology, the boundaries of human activity are expanding, new technologies are entering. Qualitative changes indicate that there are new technical, informational, audiovisual, audio tools that require new methodologies and become an integral part of the educational process, introducing certain features into it, which make modern pedagogical technologies a reality. Modern pedagogical technology, in essence, is on a par with other technologies, because they, like others, have their own field, methods and tools. A modern pedagogical technology differs from production and information technologies in that it represents a complex and incomprehensible pedagogical process as a field of knowledge related to the human mind. Its distinctive feature is that it combines the components of education. The application of modern pedagogical technologies in the educational process, first of all, pedagogical technology based on the humanization and democratization of pedagogical relations, is the opposite of authoritarian technology creates a favorable social and psychological environment for development.

In this process, the student is the subject of his educational activity and in collaboration with the teacher solves educational tasks, the subject of a single educational process. The process of forming an independent personality is long and complex, requiring, on the one hand, the

improvement of the content of all state structures and social organizations, and especially the education system, and, on the other hand, the establishment of a single educational system.

The famous scientist, philosopher, physician, Abu Ali Ibn Sina made a significant contribution to the development of pedagogical ideas. His views on morality and moral upbringing deserve special attention.

Ibn Sina's moral views are evident in his advice that is educated, noble, virtuous, strong-willed, zealous, well-rounded, helpful to others, serving the common good, and beneficial to humanity.

In discussing the goals and means of education, Al-Farabi attached great importance to education, in which he meant the acquisition of scientific knowledge. According to Farabi, the purpose of human education is to show in him the pleasantness, usefulness and beauty of behavior, ability, and the fact that man is first and the most directed his nature, his features to the truth and only to the truth. Thus, Farabi derives from the tasks of state studies, ethics and pedagogy in the development of the problem of goals and means of education, revealing the essence of the political structure of the state, which serves as the best means for people to achieve true happiness.

Every reader is looking for a positive hero from a work of art with features that are close to him, with life principles. That is, he seeks evidence that his lifestyle is right. It is such a complex mental process that one may not even realize it. Well-known French literary critic E. Genneken hypothesized that there was a psychological closeness between the reader and the writer in N.A. Rubakin takes his research as a basis, and the result proves this idea.

Integrated skills to the individual and his or her activities are referred to in the English literature as the Humanity integrated skills. However, we do not think it is correct to classify integrated skills based on how language is viewed or on certain factors that optimize language-learning processes.

There are integrated skills that suggest that it is possible to recognize any factor that ensures the effectiveness of language learning, while focusing on both language in terms of the object of study and the means. Communicative integrated skills to foreign language teaching: Natural Integrated skills, Cooperative Language Learning, Content-Based Instruction, Activity-Based Instruction, and Task-Based Language teaching such methods are a striking example of this.

Language development has been conducted in the field of ontogeny and phylogeny studies have shown that a child learns from his native language a) to acquire something (instrumental function), b) to control behavior (regulatory function), c) to interact with others (interactive function), d) to express personal feelings and meanings (personal function), d) study and discovery (heuristic function), e) creation of the imaginary world (imaginary function), or) information exchange (communicative function).

Although Piaget and Vygotsky's theories differ, they are not devoid of general aspects. For example, both theories suggest that in the learning process a) the learner has ample opportunity to be an active participant in the learning process, b) the discovery of knowledge based on personal or collaborative experiences (self-initiated discovery integrated skills, assisted discovery integrated skills), c) students are individually different from each other promotes the need to be taken into account. In other words, in the process of education, priority is given to the

development of students' ability to acquire knowledge independently, to create optimal conditions for their awakening, active, free and creative thinking.

The process of integration with the world community has created opportunities for the use of new teaching technologies, rich experience, in education. In addition, it is necessary to use the current achievements of science and technology, especially in linguistics, pedagogy, didactics, psycholinguistics and psychology to increase the effectiveness of the educational process.

One of the most important issues in education today is the realization of the educational purpose based on the purpose, content, methods, tools, organizational forms and scientific material studied in the teaching process.

It is known that one of the most important links in the system of continuing education is higher education, as higher education is an important link in the training of comprehensively mature, knowledgeable and qualified personnel for various sectors of the economy.

The teacher factor, his level of knowledge, professionalism is one of the most important factors in achieving high quality in education and training of qualified personnel. Two important points should be noted in the training of personnel in higher education.

1. Professional training of the future specialist.

2. His pedagogical training.

For the first, it is important to determine the purpose, content, that is, what to teach, while for the second, it is important to solve problems related to teaching methods, that is, what teaching methods. This requires the widespread use of new pedagogical technologies, interactive methods of teaching, which are now widely used in education.

Important documents adopted in our country, the "National Program for Training" and the "Law on Education" indicates the need for effective use of advanced pedagogical technologies and interactive methods in the teaching of foreign languages. Before talking about modern technologies in foreign language teaching, it is useful to define the meaning of the term "technology". The word "technology" is derived from the Greek word "teshe", which means skill, art. "Logos" means a word, a doctrine.

In order to get success in academic life students should develop the skills and knowledge that will enhance them to acquire necessary skills to survive in academic setting, to continue their education throughout their lives and to prepare themselves for the professional life. The ability to study efficiently is one of the necessary skills that should be nurtured during their academic life so that they develop good learning habit that they can employ even after graduation.

In the methodical literature one can find very different terms related to the word technology: pedagogical technology, technical technology, educational technology, teaching technology, new technology, modern technology, humanitarian technology and so on. When talking about the use of new modern technologies in foreign language teaching, it is expedient to consider teaching, ie educational technology separately, because in educational technology to organize lessons in the process of optimizing human resources (opportunities), forms of education, to find effective ways of learning, is understood to create.

Teaching technology is also an integral part of educational technology, in which the purpose of teaching is set more precisely, that is, a process that is designed to achieve a specific topic goal, intended or defined by didactic actions (operations) performed in a certain sequence.

CONCLUSION

It is clear that language learning skills also need to be taught in a related way to improve the communication process. Obviously, it usually requires the separation of language parts, and this is divided into separate reading, writing, literature, and communication courses. These four skills, how to conduct listening, speaking, reading activities, determine their effectiveness.

In order to get success in academic life students should develop the skills and knowledge that will enhance them to acquire necessary skills to survive in academic setting, to continue their education throughout their lives and to prepare themselves for the professional life. The ability to study efficiently is one of the necessary skills that should be nurtured during their academic life so that they develop good learning habit that they can employ even after graduation.

Only language practice supported by theory can develop language habits and skills in a desirable direction and lead to the mastering of a foreign language. Since learning a new language is connected with acquisition of new concepts by the learner, theory can help in forming these new concepts. One of the ways is an extensive use of translation-interpretation. However, this teaching technique is not approved by a majority of methodologists and teachers because pupils learn about a linguistic item more than they need for practical application.

REGULARLY USED PHRASAL VERBS GERMAN LANGUAGE

Yusufjonova Shakhlokhon Mukhtorovna*

*Teacher of German Language,
Faculty of Foreign Languages,
Department of German and French languages,
Fergana State University, UZBEKISTAN
Email id: usufzonovasahlo@gmail.com

ABSTRACT

Phrasal verbs are used very regularly in the German language, and native German speakers are found to use phrasal verbs on a daily basis and cannot do without the use of phrasal verbs in everyday communicative situations. However, phrasal verbs in German language teaching as a second/foreign language are almost non-existent. That is German as a second language German as a foreign language teaching environments, in the world, and specifically in Germany, hardly teaches the meaning of phrasal verbs to students, and neglect teaching the correct ways of using them, despite the fact that they are an essential part of daily native German communication. Therefore, and due to the vitality of phrasal verbs to native speakers of German, students should be taught and educated to be capable of understanding and using phrasal verbs when interacting in German because knowledge of phrasal verbs would normally lead to better German language proficiency and more native-like communication. Nonetheless, phrasal verbs are not easy, and students often find them difficult, because phrasal verbs carry a specific meaning which is not inferable from the meaning of its composing words inseparable form as well as other reasons which have been explained within this article.

KEYWORDS: German as a foreign/second language, phrasal verbs, *phrase*, *phraseology*, *lexeme*, *morpheme*, *syntactic connection*.

INTRODUCTION

Learning German as a second/foreign language, in the world, is a requisite and undisputable part of its educational system from primary school to upper levels such as higher university education. Yet, teaching phrasal verbs and the correct use of them in German communication and their necessity is poor and underprovided in German as a second/foreign language teaching classrooms and environments, specifically in Germany. Nonparallel to native counterparts, the use of phrasal verbs is found to be hard and difficult for non-native German language learners, especially German native speaker students who

study German as Phrasal verbs, are verbs which carry a specific meaning that cannot be referred to by analyzing the meaning of its constituent words. Phrasal verbs, furthermore, are rarely found in the German language. Nevertheless, phrasal verbs are a vital part of German language vocabulary, and are a basic part of this language's history, heritage and culture. Phrasal verbs are extremely important in German verbal communication; therefore German native speakers use phrasal verbs when they communicate spontaneously and daily.

In linguistic studies, it is said that phrasal verbs add flavor to communication and speech. Thus, learning to use phrasal verbs is necessary in order to achieve native-like German language communication. Nevertheless, learning the meaning of phrasal verbs and proper use of them is not as easy as one might think. German students and learners usually lack the ability to understand the meaning of phrasal verbs when communicating in the German language and lack the ability to communicate using phrasal verbs properly and efficiently. Most German language learners, especially German native speakers find using phrasal verbs to be extremely difficult and uneasy, unlike native German speakers, who use them subconsciously and almost every day. Recognizing the meaning of phrasal verbs which are commonly-used in the German language as well as being capable of using phrasal verbs should be regarded an essential part of German learning as a second/foreign language. Despite this, however, phrasal verbs are found to be uninclined in most German second/foreign language learning classrooms and materials. Important feature of German language and necessary part of everyday vocabulary is the reason behind this research article with the aim to emphasize the importance of phrasal verbs through clarifying the necessity of understanding and using phrasal verbs in educational systems.

The aim of this article is to stress on the fact that using German phrasal is an obligatory part of German vocabulary and native/native-like communication in German. This research suggests reasons why such an important language skill is lacking in classrooms, dissimilar to native German colleagues. Possible reasons behind the nonexistence of phrasal verbs are explained within this article, as well as listing explanations of why learners face difficulties in the ability to comprehend phrasal verbs, their meaning and aptitude to communicate confidently using phrasal verbs. Here, suggestions have been given in the hope of arriving at a clear analysis of the causes of such a problem and possible solutions to overcome stated difficulties.

LITERATURE REVIEW

Phrasal verbs are abundantly used by native German speakers in both formal and informal communication. Phrasal verbs are highly important and are considered a basic part of the German language. There are more than 5,000 different phrasal verbs used in German. (McCarthy & However, it is necessary to explain what is meant by "phrasal verbs". First of all, phrasal verbs are verbs which are composed of both a verb and a particle. For example, the phrasal verb "look up" is a phrasal verb which has the verb "look" and the particle "up" as its constituent words.

Similarly, the phrasal verb "get through" consists of the verb "get" and the particle "through" as its component parts also. Nonetheless, students and learners, of different backgrounds, are found incapable of using phrasal verbs. Non-native speakers, unlike natives, lack the ability to use phrasal verbs effectively and also lack the ability to understand their meaning. This is considered a problem in non-native speakers' knowledge and proficiency of the German language and a gap in German language learning attempts. One possible explanation to the fact that students and learners lack the ability to comprehend the meaning of phrasal verbs and are incapable of using them in communication is due to the fact that phrasal verbs in German language carry a meaning that is different from the meaning of the constituent words of a phrasal verb. As such, learners must know the meaning of the phrasal verb as one whole unit and not to be inferred by analyzing the meaning of its words (verb/particle) separately. Therefore, the phrasal verb "look up" is composed of the verb "look" which means "to see" and the particle "up" which is the opposite of "down".

For example, the phrasal verbs:

jmdn. in Atem halten- 1. to attract everyone's attention; to steal rest; 2. not to breathe, to be fully employed

(große) Augen machen (bekommen) - to make one's eyes water; to freeze in astonishment

die Augen sind größer als der Magen- insatiable

den Ausschlag geben- to solve a problem, a case; play a key role

etwas auf die lange Bank schieben- to pause, to push back

(alle) durch die Bank- all equally, en masse, equally jmdn. einen Bären aufbinden- boplab ketmoq, dog'da qoldirmoq, tovlamoq; qulog'iga lag'mon ilmoq; carries a meaning as one whole unit and not separable meanings of its constituents.

The phrasal verb "look up" may mean "search for information in a book or computer" as in the sentence "I will look up for the meaning of this word in the dictionary. The phrasal verb "look up" may also mean "visiting someone you have not visited for a long period" as in the example "I will look her up next time I am in Egypt". The phrasal verb "look up" may have a third different meaning which differs according to the context it is used in. This phrasal verb also, for instance, mean that "things are improving" as when saying "things seem to be looking up" carrying an non-ordinary meaning which is "things seem to be improving or getting better."

German phrasal verbs should be required and a must. Phrasal verbs need to be included in teaching materials and in classrooms. Taking these facts into consideration will help non-natives of German improve their German language skills.

For Example:

mit beiden Beinen aufder Erde (im Leben) stehen- hayotning baland pastini yaxshi bilmoq;

über den Berg sein-

1. o'zini o'nglab olmoq;

2. suvdan quruq chiqmoq; ilojini topmoq;

(längst) über alle Berge sein- suvga tushgan toshdek, dom-daraksiz yo'qolmoq ; anqoning (tuxumiday) urug'iday bo'lmoq;

jmdm. goldene Berge versprechen- og'ziga siqqancha, qop-qop (katta-katta) va'dalar bermoq;

jdm. Bescheid sagen- kimgadir ko'rsatma bermoq, yo'l-yo'riq ko'rsatmoq;

jmdm. Bescheid tun (trinken)- kimningdir sog'lig'iga qadah ko'tarmoq; kim bilandir qadahlarini urushtirmoq.

A phrasal verb is a verb that is made up of a verb and a particle. As well, a particle means that it is either an adverb or a preposition or both. I.e., sometimes, a phrasal verb may contain two particles and not just one, such as "put up with", "look forward to" and "catch up with". Common phrasal verbs, for instance, include "get up", "deal with" and "turn off". A phrasal verb entails a preposition or an adverbial particle. A phrasal verb is, most often, composed of either one of the following particles: back, up, down, round, around, away, at, about, for, in, into, off, on, out, over, though, to. As mentioned earlier also, we need to know the meaning of the phrasal verbs as a complete unit and not the meaning of its verb and particle in a separable form. So, "look up" is a phrasal verb that as one whole unit has a different meaning than the

meaning of its constituent verb "look" which means "to see" and its particle "up" which means the opposite of "down". Therefore, the meaning of phrasal verbs is not related to the ordinary meaning of its components. That is, the meaning of the phrasal verb "carry out" which means "to do" or "to conduct" does not carry the common ordinary meaning of its constituents. So, "carry" which means "to lift" and the preposition "out" which means the opposite of "inside" is not similar to the meaning of the phrasal verb "carry out" as one whole unit. Nonetheless, it is also important to be aware of the grammar pattern of a phrasal verb. A phrasal verb may follow either one of the beneath grammar patterns. A phrasal verb may consist of a verb with no following object as in "We finished the meeting late so we decided to eat out" in which the phrasal verb "eat out" has no following object as, for instance, "eat out the meal" which is incorrect.

A phrasal verb may consist of a verb which must have a non-human object. For example, "This photo brings back happy memories" or "This photo brings happy memories back" in which the phrasal verb grammar pattern is "brings back something" or "brings something back" and not "brings back my sister". A phrasal verb may have a grammar pattern wherein the verb must be followed by a human object as in "ask somebody out" or "ask out somebody" as in the sentence "I really want to ask Ann out" and not "ask my cat out" which is illogical and incorrect. Some phrasal verbs may entail either a human or non-human object.

Some phrasal verbs must follow either the grammar pattern wherein the particle must come after the object as in "I will ring her back later" not "I will ring back her" and "Please, look after my cat while I'm away" and not "Please, look my cat after while I'm away". The final grammar pattern, a phrasal verb may consist of, is the pattern wherein the object can be before or after the particle. So, one may say "drop off somebody/something" or "drop somebody/something off". As in the example "I dropped off the delivery at his house" or "I dropped the delivery off at his house". Nevertheless, it must be realized that a verb that is followed by a number of prepositions or adverbs and does not change its meaning, but keeps its ordinary meaning, is not a phrasal verb.

I.e., the verb "run up" is not a phrasal verb because "run up" which means "to move quickly" as in the sentence "The child ran up the hill" keeps its ordinary meaning "to move by foot" despite being followed by a number of different particles, such as "across", "away", etc. And, therefore, all the above are ordinary verbs that have a normally predictable meaning and do not carry an abstract or different meaning. Thus, the above examples are, despite being similar in shape and form to a phrasal verb, are not phrasal verbs. There are several verbs, which make up a large number of useful everyday phrasal verbs. These verbs are break, bring, call, come, get, give, go, look, make, pass, keep, knock, pick, put, pull, run, set, take, turn. These verbs form parts of a huge number of the most common used phrasal verbs. Verbs can have a concrete meaning in which the verbs refer to a concrete action as in "break" which means "put into pieces or parts" but more often has an abstract meaning too. As in "Look back on your past memories" which has an abstract meaning that is "to recall" or "to remember." Not with standing, the verb "look back" has a concrete meaning as in "As she was walking she looked back at her crying child" meaning "she turned back to see her child as she was walking away". So, the verb "look back" can be both a regular verb, with an ordinary meaning, or a phrasal verb, with its own special meaning. Likewise, the verb "ran away" in the sentence "I ran away from the large dog" is not a phrasal verb because it carries an ordinary meaning which is "move quickly by foot". While, the same verb in the sentence "you shouldn't run away from your responsibilities" is a phrasal verb because its meaning, in this sentence, is abstract. By an "abstract" meaning, we mean something different, and not ordinary. Also, the verb "ran across" in the example "I ran across the green field" has an ordinary meaning which is also "to move by foot" while "ran across" is considered to be an example of a phrasal verb in the sentence "I ran across my school teacher last week" because it carries an abstract meaning, that is different from the meaning of its composing verb and particle when separated. Hence, the phrasal verb "ran across" in this

example means "to meet by chance", which has an abstract and figurative meaning, not an ordinary, unchangeable, normal, and predictable meaning.

Phrasal verbs are used in both written and spoken German and are part of everyday vocabulary, especially common native and native-like communication. Native German speakers do not do without phrasal verbs when speaking and communicating in typical, day to day, communicative situations and settings. Nevertheless, in formal communicative situations, usually a phrasal verb could be replaced by a single verb which carries the same meaning of a phrasal verb.

METHODS

Methodology this article follows is a qualitative one. By teaching German as a second language, in and outside Germany, it has been noticed that students and German language teaching materials, as well as other ESL/EFL environments and settings lack the presence of German phrasal verbs and hardly even implement them in ELT (German Language Teaching).

Hence, and by relying on the analysis and description of previous studies of phrasal verbs, their requirements and their importance, results and data within this article have been thoroughly reached.

DISCUSSION AND RESULTS

Despite the necessity and requirement of phrasal verbs in everyday native communication, they should not be attempted to be taught all at once as a list of vocabulary. German as a second/foreign language students should try to learn phrasal verbs as they come across them and should not attempt to memorize too many all at once. Giving examples of phrasal verbs will usually help learners of German to remember their meanings and understand ways they are used. None the less, and as explained earlier, phrasal verbs have certain grammar patterns that differ from one phrasal verb to another, for instance, some must have an object (someone/something) while others do not. Some phrasal verbs, in addition, may be separated by the object and are known as "separable" phrasal verbs, while others are otherwise. Therefore, grammar lessons on ways to correctly use phrasal verbs should be given, from time to time, in order to familiarize ESL/EFL students and German language learners of the proper ways to communicate using phrasal verbs, similar to natives. Natives of German, unlike non-native speakers, especially in Germany, grow up and are nurtured in an environment where phrasal verbs are used daily, subconsciously and spontaneously.

Therefore, Phrasal verbs are used by native speakers habitually and frequently because native German speakers are raised capable of understanding and using phrasal verbs without any difficulty or strain.

Non-native German speakers, especially students with German native speaker, are not accustomed to using phrasal verbs and are unaware of their necessity and importance because, for one reason, phrasal verbs rarely exist in German language. Thus, students of German native speaker, particularly in Germany, are ignorant of the need for phrasal verbs' knowledge, their meaning and ways of using them. Students, especially in Germany, are unexposed to phrasal verbs and ways of communicating applying phrasal verbs accurately. Another reason of difficulty in learning meanings and use of phrasal verbs is that one phrasal verb may have a number of different meanings. As exemplified earlier with the phrasal verb "look up" which has a number of different meanings and not just one or two. This, therefore, could confuse non-native German students and learners, especially if not brought up to be accustomed to phrasal verb use and are unfamiliar with this native speakers' skill.

A third reason for the difficulty that students of German as a second/foreign language may encounter when trying to learn the proper ways in using and producing phrasal verbs when communicating in German, is the various ways that phrasal verbs may be formed according to. As known earlier, there are various grammar patterns in which phrasal verbs may be formed into. So, a grammar pattern for one

phrasal verb may or may not be the grammar pattern for another phrasal verb. This, accordingly, may be confusing for German language students and learners, especially if not being taught or acquainted to these points and matters. Reason in why it is difficult for language learner students to understand and use phrasal verbs well enough is that some verbs are similar to a phrasal verb but are, in fact, not phrasal verbs. This could be something well distinguished and realizable by native German speakers but a major source of confusion for non-native German speakers, especially if these non-native German speakers are not used to dealing with phrasal verbs and are not aware of differences between phrasal verbs and non-phrasal verbs. The meaning of phrasal verbs and how to be capable of using them appropriately is that phrasal verbs are almost non-existent in classrooms and German language teaching environments and materials.

For example, As an German language teacher, it has been noticed that educational systems regarding the teaching and study of German as a second/foreign language lack the presence of exercises, drills, grammar lessons, speaking and listening audio practices which involve German language phrasal verbs. Another possible explanation of students' weakness regarding phrasal verbs is that phrasal verbs also have a meaning which cannot be known from the meaning of the words that it is made up of. Therefore, it is usually difficult for non-native speakers of German to reach and realize the meaning of a phrasal verb without previous knowledge of its meaning and it is normally hard for a non-native speaker to arrive at the correct meaning and use of a phrasal verb without being taught. This, as a result, distinguishes non-native speakers of German, from native speakers, who conventionally understand the meaning of phrasal verbs.

Teaching phrasal verbs in EFL/ESL classrooms should be required because learning the meaning of phrasal verbs and how to use them will help students and speakers of German, of a non-native origin, to pertain better German language proficiency. Lacking the skill to understand and use German phrasal verbs is a lapse in that learner's knowledge of proper German.

The inability to communicate properly and native-like by learners of German as a second/foreign language, regardless of their backgrounds, could be for one reason, a result of their incompetence to understand phrasal verbs whether misunderstanding their meaning when listening to natural native German or misunderstanding ways to properly use them when speaking German. Uncovering German phrasal verbs in teaching is a main source of difficulty and unlikely source of learning incapability. Failure to adequately learn, use and understand phrasal verbs is due to lack of exposure. German language teaching environments, classrooms, and materials lack phrasal verbs as a part of common vocabulary, do not include such a necessary language skill and lack teaching knowledge of them well enough.

Inability of ESL/EFL students to correctly understand and use phrasal verbs in the German language could be a source of mistakes and errors in students' performance. This, in turn, results to ESL/EFL students' language incompetence. Phrasal verbs being large part of the German language's vocabulary are based upon that language's history, heritage, and culture. Accordingly, phrasal verbs should be taken into consideration and not to be overlooked. Students should be given chances to try and exercise using and communicating with phrasal verbs through class exercises, tests, workouts and drills as well as listening and audio lessons that show ways native speakers use phrasal verbs and ways phrasal verbs are pronounced through in-class listening practices. Students need to be familiar with phrasal verbs by hearing native-speakers' daily speech in German with phrasal verbs use as part of the lexis.

Phrasal verbs are very important and necessary in German teaching as a second/foreign language because phrasal verbs are used in formal and non-formal speech, and are a large part of German vocabulary. Phrasal verbs are found a part of standard business, media, and everyday life.

Therefore, phrasal verbs that are frequently used in German should be taught the most, so, for instance, phrasal verbs that come about while watching T.V. programs, listening to music, reading books, surfing the internet and so on, ought to be taught to students and learners. Listening and speaking courses, should

include phrasal verbs, as a part of German vocabulary, especially in college education wherein German language is taught as a second/foreign language. Non-native speakers of German, who use and understand Phrasal verbs, become more fluent and sound more native-like. Additionally, learning phrasal verbs will increase students' and learners' vocabulary and lexicon of the language. The more students learn about phrasal verbs and apply them, the more creative and natural their German language shall seem. As such, the more students become capable of understanding and using phrasal verbs, the more profound.

CONCLUSIONS

To conclude, phrasal verbs are used on a daily basis by native speakers, unlike non-native German speakers who lack understanding and communicating using this essential and important skill in German language. There is a need to include phrasal verbs in German as a second/foreign language teaching. It is also crucial in ESL/EFL environments and materials to clarify grammar patterns of phrasal verbs, their meanings and how to properly use them in German. German language teachers and students should be capable of understanding and using phrasal verbs when speaking in German and when dealing with the German language and its native users. German as second/foreign language teachers should highlight, to their students, the importance of using phrasal verbs and the importance of recognizing their meanings. Likewise, teachers should be familiar with commonly-used phrasal verbs and teach them, in order to help and make it easier for their students. Teaching phrasal verbs should be taken into serious concern in German second/foreign language teaching classrooms and materials, which should include phrasal verbs as a part of vocabulary, listening and speaking drills and classroom exercises.

Learning German language, native-like, requires that students of German as a second/foreign language and non-native German language learners, practice using German phrasal verbs and become more knowledgeable about the meaning of, at least, the most common-used phrasal verbs.

INTRODUCTION

Initially, wireless systems were not widely used due to low reliability. But now there is a wide range of various additional devices, and new generations of wireless communication systems are actively used. The capabilities provided by mobile operators are increasingly used in security systems. To date, wireless security systems based on the base have become widespread due to their relatively low cost and ease of installation and operation. The GSM-900/1800 cellular network provides good communication quality and is already deployed in most cities.

MAIN PART

The use of GSM eliminates the need to deploy your own network of repeaters-the repeaters of GSM operators are used. As a result, it is possible to protect objects wherever the GSM operator's network works confidently. The use of new 3G protocols and networks specifically designed for corporate clients - virtual corporate data transmission networks with information protection-is promising. However, a significant disadvantage of such systems is low noise immunity. GSM systems use SMS messages, modem connection (CSD), tone transmission (DTMF mode), and GPRS packet message transmission as a method of transmitting information. The appearance of the GPRS mode has significantly reduced the cost of operating radio protection systems. To date, wireless security systems based on GSM have become quite widespread due to their relatively low cost and ease of installation and operation. However, a significant disadvantage of such systems is low noise immunity; the operation of the GSM network is not always very stable and can fail at the most inopportune moment.

A typical GPS monitoring system consists of three parts: terminals installed on cars, servers, and client workstations. The terminals are specialized GPS trackers containing the GPS module itself and the cellular communication module (GSM or CDMA). The server functions can be performed by a regular PC with server software installed. Unlike workstations, the server must always be turned on, since it is on it that route data is accumulated. In rare cases, the client software can be combined into a single program with the server part, but as a rule, it is allowed to connect several workstations to the same server at the same time.

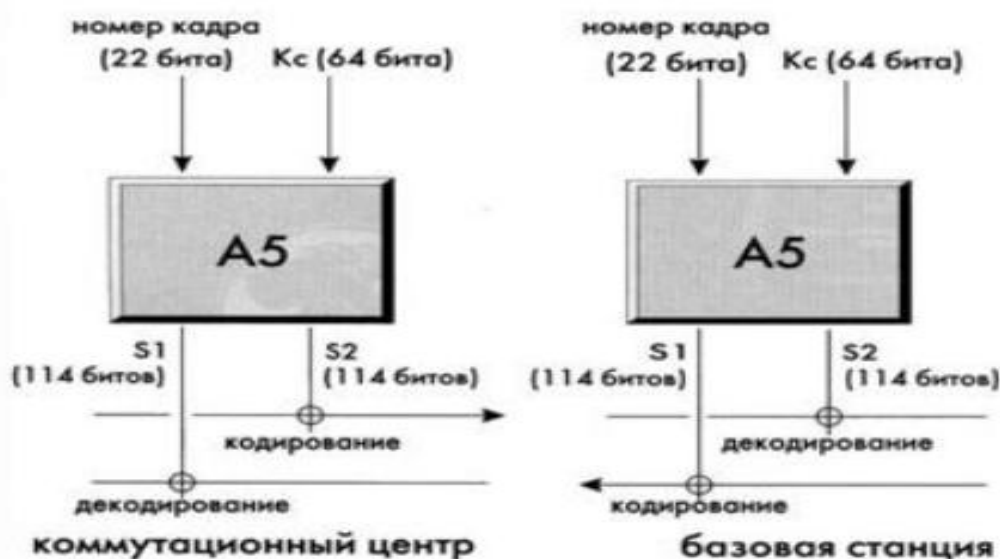

When building security systems in GSM channels, a password (or PIN code - a personal identification digital code) is used - one of the simplest authentication methods. It provides a very low level of protection in the conditions of radio communication use. It is enough to hear this personal code just once to bypass the security measures. In reality, GSM uses a PIN CODE in combination with a SIM (Subscriber Identity Module): this PIN CODE is checked on the spot by the SIM itself without being broadcast.

Pic. 1. Calculating Authentication

GSM uses a more complex method, which consists of using a random number that can only be answered by the corresponding subscriber equipment (in this case, the SIM). The essence of this method is that there are a huge number of similar numbers and therefore it is unlikely that it will be used twice.

Authentication is performed by requiring a correct answer to the following: the subscriber can deduce the SRES response from the incoming RAND by applying an algorithm with the private (secret) key K_i . The response, which is called SRES (Signed Result), is obtained in the form of a calculation result that includes a secret parameter belonging to this user, which is called K_i . The secrecy of the K_i is the cornerstone of all security mechanisms - even the subscriber cannot know his own K_i . The algorithm that describes the order of calculation is called the A3 algorithm. As a rule, such an algorithm is kept secret. In order to achieve the required level of security, the algorithm must be a unidirectional function, as it is called by cryptographic experts. This means that calculating SRES for known K_i and RAND should be simple, and the reverse action - calculating K_i for known RAND and SRES - should be as difficult as possible. Of course, this is what ultimately determines the level of security. The value calculated by the algorithm must be 32 bits long. K_i can have any format and length. Cryptographic methods make it possible to achieve a high level of security using relatively simple means. GSM uses uniform methods to protect all data, whether it is user information, transmission of user-related signals, and transmission of system signals. For example, messages that contains the numbers of the called phones or the transmission of system signals of messages containing the results of radio measurements to prepare for transmission. It is necessary to distinguish only between two cases: the communication is secure, or the communication is unsecured, then all information is sent as an unencrypted digital sequence.

Pic.2. Encryption and Decryption

The algorithm outputs an encryption sequence of 114 bits for each packet separately, taking into account the frame number and the encryption key of the Cs.

Both encryption and decryption are performed by applying the "exclusive or" operation to the 114 "encoded" bits of the radio packet and the 114-bit encryption sequence generated by a special algorithm. In order to get the encryption sequence for each packet, the algorithm performs a calculation using two inputs: one is the frame number, and the other is a key known only to the mobile station and the network (Figure 2). Two different sequences are used in both directions of the connection: in each packet, one sequence is used for encryption in the mobile station and for decryption on the BTS, while the other sequence is used for encryption in the BTS and decryption in the mobile station.

The frame number varies from packet to packet for all types of radio channels. The Cs key is controlled by the means of signal transmission and changes, as a rule, with each message. This key is not made public, but since it changes frequently, it does not need as strong security as the Ki key; for example, the Cs can be freely read in the SIM. The CS key must be agreed upon by the mobile station and the network before encryption begins. The peculiarity of the GSM standard is that the Cs key is calculated before the encryption begins during the authentication process. The CS is then inserted into the non-volatile memory inside the SIM so that it is stored there even after the end of the communication session. This key is also stored on the network and used for encryption.

Interference in the radio channel is created both due to distortion of the signal during its propagation, and as a result of the influence of external sources. The first type of distortion is relatively easy to eliminate, at the same time, interference from external sources is combated by expanding the spectrum of the transmitted signal. Theoretically, increasing the signal base allows you to reduce the interference to an arbitrarily small level.

The main difficulty in building a GSM channel is associated with the inability to ensure the continuity of GSM/GPRS communication with the operator due to network outages, which lead to data transmission interruptions, but also to modem hang-ups. Practice shows that no GSM operator currently provides a guaranteed GPRS communication channel. In attempts to implement continuity of connection, developers are forced to additionally equip traditional GSM modems with additional devices - external controllers, watchdog timers that reset the modem when it freezes. Unfortunately, such solutions, although usually "economical", still do not guarantee a continuous and uninterrupted data transfer process, and also lead to a complication of the system as a whole and, as a result, to a decrease in its reliability.

CONCLUSION

Noise immunity in the field of radio-channel fire and security systems is determined by the number of frequency ranges in which the radio system can operate, the number of frequency channels in each range, the ability to automatically select backup channels, and the presence of automatic adjustment of the radiation power. From time to time, the connection with a particular radio device is lost. Most likely, the reason is not deliberate sabotage of the system, but the operation of other devices and systems on the selected communication channel when installing the system. To reduce signal jamming, you need to have a duplicate channel for exchanging important information, use a periodic test from the object, and use remote antennas.

INTRODUCTION

Errors of optical moisture meters are determined at two stages: choosing the optimal measuring scheme and during calibration and verification of moisture meters.

The existing variety of measuring circuits brings to the first place the problem of choosing the optimal measuring circuits, their structural and parametric optimization in terms of metrological indicators (random and systematic errors). The vast majority of moisture meters are based on a ratio metric scheme.

In operating conditions, the output signal u_{vh} depends not only on the informative parameter - humidity W and changes in external factors, but also on non-informative parameters of the controlled environment, including the ambient temperature θ , supply voltage U_{cc} , time t (when evaluating stability), the concentration of uninformative parameters y (density, scattering

properties, etc.), the temperature of the controlled environment, sun, nonselective mechanical impurities d). In view of the above, the output signal and, consequently, the transmission coefficient are functions of external factors and uninformative parameters [8, 17]:

Where U_H is the nominal value of the output signal under normal conditions; A_i is the coefficient of influence of external factors on the output signal (A_i is easily determined experimentally).

To ensure the linearity of the scale when designing moisture meters, such measurement conditions are chosen under which the dependence of the transmittance on the informative and non-informative parameters is linear or close to it. This condition is observed when measuring humidity within a small range (10 ... 25%). Then the transmittance can be represented by a linear function [17, 110, 122, 123, 269, and 277]

$$K_P = [1 - I \cdot w (W - W_0)] [1 - K_u \{y - m\}] [1 - K_v \{0_c - 0_{so}\}] b = \\ = [1 - I \cdot w (W - W_{min})] B_i. \quad (10.5.2)$$

Under normal conditions, $y = y_0$, $\sin = b_{co}$, $r = 1$; IN 1; then the transmittance

$$K_P = 1 - K_w \{W - W_{min}\}, \quad (10.5.3)$$

Where $I \cdot w$ is the coefficient characterizing the relative change in the transmittance of the controlled medium per unit of humidity W , K_u , K_s are the values characterizing the relative change in the transmittance per unit of concentration of non-informative components of the medium (density, pollution) y and $1^\circ C$ change in temperature $6C$, respectively.

The relative characteristic of the random error σ , reduced to the measurement range (under normal conditions $A_i = 1$ and $B_i = 1$) is described by the expression [122]

$$0.4 = \frac{\Delta U_{wi} (W_{max} - W_{min})}{S_w}, \quad (10.5.4)$$

Where S_w is the sensitivity of the moisture meter to a change in moisture content at the averaged values of the moisture meter parameters ($S_w = dU_{vix} / dW$), moreover, $\sigma^2 = 72 \text{ [1/ out]}$ is the dispersion of the output signal.

The characteristic of the random error for the ratiometric structural diagram is described by the expression

$$(\Delta U_i - \Delta U_{ti} - J +$$

$$\Delta U^{\Delta} \Delta U_{av}$$

$$7, \quad (10.5.5)$$

$$7^{\Delta} 71.1$$

$$1 - T^{\Delta} \Delta U_{shah} 61$$

where q_i is a value that depends on the cross-correlation coefficient 72 , signals of the reference U_1 and measuring U_2 channels and the ratio of the squares of the relative errors $6N$ and $6c$, caused by electrical noise and photoelectric signal, respectively, $\Delta U_1 = 2 (1 - V.) + \Delta U_{shch} / 6ts$, and the relative error $6ts$ is the same for the reference and measuring channels and does not depend on their level:

Where $\sigma^2 = D[U_i]$, $\sigma^2 = \sigma^2 / 2$ are the variances of the reference and measurement signals, respectively; $M[U_1]$, $L_7[7/g]$ - mathematical expectations of the reference and measuring signals, respectively; $\sigma_{SH} = \sigma_{tsh} / M[7/w]$; σ_{crsh} , $M[U_m]$ - variance and mathematical expectation due to the noise signal T_{ssh} .

The relative error of the inverse transducer σ_{kos} (logarithmic or device that implements the ratio), equal to the ratio of the variance $\sigma_{kos} = \sigma^2 / [L'oc]$ of the feedback coefficient of the divider and its mathematical expectation $M[1/oc]$:

$$\sigma_{braid} = \sigma_{braid} / -L' \sigma^2 [1/os] - (10.5.7)$$

The relative error σ_{cn} due to the dispersion $\sigma_{Uon} = D[U_{on}]$ - the reference voltage source U_{on} and its mathematical expectation $M[7/op]$,

$$\sigma_{Uon} = \sigma_{Uon} / M[U_{on}] - (10.5.8)$$

A parameter characterizing the relative change in the signal of the reference channel U within the scale ($U^t; n, U^{\max}$),

$$Z_{\max} = K_w \{W_{\max} \sim Z_{hpt}\}, (10.5.9)$$

Where: K_w - coefficient characterizing the relative change in the transmittance of the controlled object per unit of humidity; V_{fmin} , W_{mBX} - minimum and maximum values of humidity, respectively; y - coefficient characterizing the scale of the instrument in dimensionless quantities, and $y = (W - W_m \setminus n) / \{W_{mBX} - U^m; n\}$; W is the measured value of humidity.

Expressions for determining random errors were obtained on the assumption that random variations of K_{os} , U_{on-u} (U_{sh} are stationary, mutually independent, with the exception of U and U_2 , correlated with each other by the correlation coefficient R).

The relative reduced to the measurement range (W_{mBX} , $W_m \setminus n$) characteristic of the systematic error A , - depends on changes in external influencing factors and is found by the formula [123]

$$= M[u_{vykh} - U_H] / [S_c (W_{\max} - W_{mm})], (10.5.10)$$

where $M[u_{vykh} - \{/, \}]$ is the mathematical expectation of the deviation of the current value of the output signal C / out from its nominal value U_H under nominal conditions; S_c is the average value of the moisture meter sensitivity to the measured humidity, and

$$S_c - AU, / Aw = (t / out \checkmark ^{out} min$$

$$) / (W_{mBX} - (10.5.11)$$

Where $7 / vyshax$ $U_{Bbixmin}$ - output signals corresponding to the maximum $W_{T,ax}$ and minimum W_{mm} moisture values.

The additive component is the smaller, the smaller the relative standard deviation of the signals and the greater their cross-correlation coefficient. When $R = 1$, the additive component is determined by the signal-to-noise ratio of the circuit elements.

Systematic errors depend on the influence of external factors (ambient temperature, supply voltage, operating time) on the signal of both the reference and measuring channel, as well as on the transmission coefficient, measurement range and feedback coefficient of the device that implements the signal ratio.

It is possible to reduce systematic errors by thermostating or introducing temperature correction into the measuring circuits, increasing the stability of the supply voltage, narrowing the measurement range and stabilizing the feedback coefficient. The latter errors are easily eliminated by using a functional sweep.

Let's consider the main errors of optoelectronic moisture meters with functional sweep. The sources of errors are: inaccuracy of the formation of the radiation flux according to the exponential law; inaccuracy of the exponent reproduction by the photodetector; influence of temperature and time instability of emitting diodes.

(10.5.12)

In the general case, a generator of exponential radiation pulses (IPPE) is a master oscillator, a switch and an RC circuit. If you pre-charge the capacitance from the master oscillator

Pulses of limited duration, then with parallel connection of capacitance C and resistor R we obtain

$$U_R = U_m \exp \{-t / \tau\}$$

Where u_m is the pulse amplitude; τ - time constant; t is time.

(10.5.13)

Assuming that the emitting diode has linear current-voltage and power characteristics, when passing an exponential current through the emitting diode, we obtain [10]

$$I = I_m \exp \{-t / \tau\}, P_L = \eta K_L I_m \exp \{-t / \tau\},$$

Where I is the emitting diode current; I_m - the initial (maximum) current value; P_L is the radiation power of the emitting diode; K_L is the coefficient of conversion of current into radiation intensity.

Since the initial sections of the current-voltage and power characteristics are nonlinear, exponential distortions arise. To eliminate these distortions, it is necessary to apply an initial bias to the emitting diode, the value of which can be determined from the current-voltage characteristic of the emitting diode.

One of the disadvantages of emitting diodes is their temporal and temperature instability, which are determined by the coefficient of instability of the radiation power [29]. The stabilization of the radiation power of the emitting diodes can be carried out by the following methods: thermostating, introducing thermosensitive elements into the power circuit of the emitting diode, choosing the optimal resistance values in the power circuit, introducing feedback on the thermosensitive parameter and displacing the working area, stabilizing the radiation power, by introducing an optical comparison channel.

ABSTRACT

The article illustrates about Communicative Language Teaching and some effective ways of CLT. Moreover, the usage of fairy tales and effects of them in CLT are given in the article. Communicative language teaching (CLT) or the communicative approach is an approach to language teaching that emphasizes interaction as both the means and the ultimate goal of study. Language learners in environments utilizing CLT (Communicative language teaching) techniques, learn and practice the target language through the interaction with one another and the instructor, the study of "authentic texts" (those written in the target language for purposes other than language learning), and through the use of the language both in class and outside of class. Learners converse about personal experiences with partners, and instructors teach topics outside of the realm of traditional grammar, in order to promote language skills in all types of situations.

KEYWORDS: *Communicative language, authentic texts, characteristics of CLT, interaction and communication, method, approach.*

INTRODUCTION

Communicative language teaching (CLT) or the communicative approach is an approach to language teaching that emphasizes interaction as both the means and the ultimate goal of study. Language learners in environments utilizing CLT (Communicative language teaching) techniques, learn and practice the target language through the interaction with one another and the instructor, the study of "authentic texts" (those written in the target language for purposes other than language learning), and through the use of the language both in class and outside of class. Learners converse about personal experiences with partners, and instructors teach topics outside of the realm of traditional grammar, in order to promote

language skills in all types of situations. This method also claims to encourage learners to incorporate their personal experiences into their language learning environment, and to focus on the learning experience in addition to the learning of the target language.

MATERIALS AND METHODS

Language teaching was originally considered a cognitive matter, mainly involving memorization. It was later thought, instead, to be socio-cognitive, meaning that language can be learned through the process of social interaction. Today, however, the dominant technique in teaching any language is communicative language teaching (CLT).

It was Noam Chomsky's theories in the 1960s, focusing on competence and performance in language learning, but the conceptual basis for CLT was laid in the 1970s by linguists Michael Halliday, who studied how language functions are expressed through grammar, and Dell Hymes, who introduced the idea of a wider communicative competence instead of Chomsky's narrower linguistic competence. The rise of CLT in the 1970s and early 1980s was partly in response to the lack of success with traditional language teaching methods and partly due to the increase in demand for language learning. In Europe, the advent of the European Common Market, an economic predecessor to the European Union, led to migration in Europe and an increased population of people who needed to learn a foreign language for work or for personal reasons. At the same time, more children were given the opportunity to learn foreign languages in school, as the number of secondary schools offering languages rose worldwide as part of a general trend of curriculum-broadening and modernization, and foreign-language study ceased to be confined to the elite academies. the introduction of comprehensive schools, which offered foreign-language study to all children rather than to the select few in the elite grammar schools, greatly increased the demand for language learning. This increased demand included many learners who struggled with traditional methods such as grammar translation, which involves the direct translation of sentence after sentence as a way to learn language. These methods assumed that students were aiming for mastery of the target language, and that students were willing to study for years before expecting to use the language in real life. However, these assumptions were challenged by adult learners, who were busy with work, and some schoolchildren, who were less academically gifted, and thus could not devote years to learning before being able to use the language. Educators realized that to motivate these students an approach with a more immediate reward was necessary, and they began to use CLT, an approach that emphasizes communicative ability and yielded better results. Additionally, the trend of "progressivism" in education provided further pressure for educators to change their methods. Progressivism holds that active learning is more effective than passive learning; consequently, as this idea gained traction, in schools there was a general shift towards using techniques where students were more actively involved, such as group work. Foreign-language education was no exception to this trend, and teachers sought to find new methods, such as CLT, that could better embody this shift in thinking.

RESULT AND DISCUSSION

Communicative Language Teaching is an approach that aims to:

- (a) Make competence the goal of language teaching
- (b) Develop procedures for teaching of the four language skills that acknowledge the interdependence of language and communication"¹. CLT views language as a functional system.

It holds that language is a vehicle for the expression of functional meaning. The primary function of language is for interaction and communication.

"Language is communication, the intimation to another being of what one wants and thinks; language is activity, basically of four kinds (listening, speaking, reading and writing), as well as body language and semiology " (Seaton, 1982). According to Broughton, (around 1980s), spoken language is the major and most complex techniques we have of communicating information. It allows us to produce a sequence of vocal sounds in such a way that another person can reconstruct from those sounds a useful approximation to our original meaning. In the process of oral communication, the sender starts with a thought and puts it into language. The receiver perceives the language and thus understands the thought.

It is summarized that by scholars some of the characteristics of communicative view of language as following:

- 1) Language is a system for the expression of meaning.
- 2) The primary function of language is for interaction and communication.
- 3) The structure of language reflects its functional and communicative use.
- 4) The primary units of language are not merely is grammatical and structural features, but categories of functional and communicative meaning as exemplified in discourse.

CLT stresses on both 'what to teach' and 'how to teach' and it focuses on the significance of language functions rather than depending solely on grammar and vocabulary. According to Richards (2006), language instruction and learning in the early decades of CLT focused on fluency and the integration of language skills, rewarding learners' efforts to speak or write even if errors resulted. Many kinds of instructional activities were recommended, from mechanical language practice involving the entire class or individuals, to much more open-ended communicative practice, some of it requiring either one-way or two-way exchange of information through activities in which partners need to share and consolidate information to carry out the task. However, now other types of activities such as inductive, discovery-oriented learning where students try to find patterns in language texts and datasets (e.g., common collocations of words, and guess their meanings or usage) are also encouraged. The teacher's role is to create a nurturing, collaborative learning community and worthwhile activities for students. Richards' own English language textbooks embody CLT principles as well (e.g., *New Interchange*, Richards, 1998; and *Passages*, Richards & Sandy, 2008). The existence of a flexible curriculum over which the teacher and students have a fair amount of control and input, small class sizes, and relatively little formal assessment is assumed in much CLT pedagogy. In CLT, contextualization, meaning-making, and the usefulness of the language being learned and the activities being engaged in should be very evident in curriculum and instruction, keeping in mind that communication takes place in different ways, using different means.

As learning foreign languages has been increasing year by year, Communicative Language Teaching is getting improved. In order to improve teaching CLT, teachers can use variety of methods. Teaching communicative language through fairy tales can be an effective a method which can be useful in CLT. Using fairy tales in Communicative Language Teaching can be very useful as fairy tales are fun to read. Fairy tales attract readers' attention with colorful words and set of the event. Moreover, both adults and children like reading stories and fairy tales as well as,

there is a very interesting linguoculturology that the fairy tale includes. I suggest to use the following method in CLT

CONCLUSION

Language is defined in many different ways by various linguists. The structuralists view language as rules, and focus on ways in which linguistic entities can be combined together. Language is considered as the knowledge of grammar, consisting of syntax, inflectional morphology, and phonology, encompasses knowledge of formal rules or operations that operate on abstract linguistic categories, for example verb and noun, and phrases.

Communicative Language Teaching is best considered an approach rather than a method. Thus although a reasonable degree of theoretical consistency can be discerned at the levels of language and learning theory, at the levels of design and procedure there is much greater room for individual interpretation and variation than most methods permit. It could be that one version among the various proposals for syllabus models, exercise types, and classroom activities may gain wider approval in the future, giving Communicative Language Teaching a status similar to other teaching methods. On the other hand, divergent interpretations might lead to homogeneous subgroups. Communicative Language Teaching appeared at a time when British language teaching was ready for a paradigm shift. Situational Language Teaching was no longer felt to reflect a methodology appropriate for the seventies and beyond. CLT appealed to those who sought a more humanistic approach to teaching, one in which the interactive processes of communication received priority.

ABSTRACT

This article discusses the specifics of the validity of a statute of limitations in civil law. The author explains that the duration of treatment is a certain period of time during which procedural actions can be performed. Terms of exercise of subjective civil rights and fulfillment of obligations are determined by the relevant legal norms regulating certain types of property and personal-non-property relations. The same norms also define the time limits on which protective measures can sometimes be applied in the event of a violation of subjective civil rights. Such periods are called statute of limitations in civil law.

KEYWORDS: Civil law, statute of limitations, procedural actions, substantive law.

INTRODUCTION

While the path we have taken at the current stage of development of our society and the profound changes that have taken place in the life of our society can be proved, the direction, goals and tasks facing the economy today have changed radically.

The head of our state Sh.M.Mirziyoev noted: "Justice is a solid foundation of statehood. The judiciary plays a key role in ensuring justice and the rule of law.

From this perspective, we still have a lot of work to do in this regard.

First of all, the principle of "one court - one instance", which will be introduced from the New Year, should be the main criterion in ensuring the fairness, legality and stability of court decisions.”[1]

Reforms in the country are being carried out consistently, with a clear purpose, and many laws aimed at guaranteeing the rights of citizens have been adopted and are being implemented in practice.

Like other institutions of civil law, the institution of "time limits and statute of limitations" plays an important role in the legal regulation of new relations in economic life. It is through these terms that the cases of "accuracy", "time", "proper performance of obligations", "attention to the rights of the subjects", "delay in the performance of actions" are taken into account in civil law and are necessary for each ongoing civil relationship. is one of the conditions. At the same time, timeframes play an important role in the interdependence of the subject and the object, determining the maximum and "minimum" period of validity of the rights and obligations of the person in relation to the object. Therefore, through the acquisition of the statute of limitations is divided into knowledge and skills about the periods associated with the emergence, change, termination and protection of civil rights and duties.

Terms of exercise of subjective civil rights and fulfillment of obligations are determined by the relevant legal norms regulating certain types of property and personal-non-property relations. The same norms also define the time limits on which protective measures can sometimes be applied in the event of a violation of subjective civil rights. Such periods are called statute of limitations in civil law.

First of all, “claim” is originally an Arabic word that means a claim made by a court or otherwise to protect one's rights.[2,3]

In Mukhtasar, the literal meaning of the word claim is to demand. According to the Shari'a, a claim is to inform a judge in the presence of a judge or on the eve of a judgment that he has a right over him. The plaintiff is such a person that he is not compelled to make a claim. The respondent is such a person that he is forced to answer. [4]

A statute of limitations is a period of time during which a person can defend his infringed right by filing a lawsuit.

There are two sides to any civil suit:

First, the substantive aspect - in which, first of all, the plaintiff is required to have a specific substantive claim against the defendant, for example, the delivery of an item, payment, service, compensation for damages;

Second, the procedural legal side - in this case, the content of the dispute between the parties and the protection of the violated or disputed right is requested to the court.[3]

Professor Sh.Sh.Shorakhmetov in his work states that procedural time limits are defined by the terms established by law or appointed by the court for consideration and resolution of civil cases in court.[3]

E. Egamberdiev defines procedural deadlines as follows: procedural deadlines are the time established by law or established by the court for the execution of procedural actions to be

performed or to be performed.[5] It is obvious that the views expressed by legal scholars of our country on the definition of procedural terms are almost the same. Even procedural scholars living and working in the CIS member states do not express significantly different views on this issue. For example, in the opinion of A.A. Vlasov, procedural deadlines are the part of the time established by law or appointed by the court to perform procedural actions.[6]

It should be noted that the term "term" is widely used in the field of material law (citizenship, family, labor, housing, etc.). It is therefore advisable to identify and specify specific aspects of procedural timeframes.

The First Difference: The main peculiarity of procedural deadlines is that these deadlines determine the time of the procedural actions. Procedural time dispute does not affect the substantive relationship. It is also necessary to determine the difference between the procedural deadlines and the statute of limitations. According to the legislation of our country, the expiration of the statute of limitations does not lead to the termination of the substantive right and does not deprive the person of the right to judicial protection. For example, according to Article 153 of the Civil Code, a claim for protection of a violated right is accepted for consideration in court regardless of the expiration of the statute of limitations. A statute of limitations is a period during which a person can defend his infringed right by filing a lawsuit.[7]

However, the expiration of the statute of limitations stated by the party to the dispute in the application will be the basis for the court to decide to dismiss the claim (Article 153, Part 3 of the Civil Code). The existence of this norm, in turn, raises the question of whether the statute of limitations can be included in the category of procedural time limits. In our opinion, no. Because the period of limitation in this case does not determine for the court any specific time elapsed or the time to take procedural action. The statute of limitations in this case is only the basis for the court to decide on the rejection of the claim. This shows that the term of the claim is almost indistinguishable from the other substantive claims of the defendant, which are the basis for the denial of satisfaction of the claim.

The Second Difference: Procedural time limits are set by law or set by the court (Article 126 of the CPC). Neither the persons involved in the case, nor the persons assisting in the administration of justice, shall have the right to change the procedural time limits through their agreement.

As stated in Article 10 of the Civil Code, civil rights are protected by a court or a jury, depending on which court the case belongs to, as defined by procedural laws and the contract.

It is known that in order to properly resolve the claim within the prescribed period, it is necessary to collect evidence in a civil case and thoroughly examine them. But if the dispute has been going on for a long time since the legal relationship arose, it will be much more difficult to gather evidence. Because some witnesses were absent (moved, died) during the trial, some may have forgotten or distorted the facts, the costs necessary for the case to be resolved properly, and so on. If the statute of limitations were not set by law, a person who entered into an agreement or violated any of someone's rights would always be at risk of being sued by another person for a long period of time.

In short, the establishment of statute of limitations greatly helps to protect the rights and interests of organizations and citizens, to strengthen civil relations.

In this regard, the study of the statute of limitations in civil law was of particular importance and led to the following conclusions:

In the regulation of property relations, it is important that the statute of limitations is determined by law. The establishment of the statute of limitations helps to strengthen civil relations, ensure timely collection of claims for debt collection, fulfillment of obligations, speed up settlements between organizations, ensure compliance with contract and financial discipline, strengthen economic accounting. The establishment of statute of limitations is also important for strengthening legal relations between citizens.

It is known that in order to properly resolve the claim within the prescribed period, it is necessary to collect evidence in a civil case and thoroughly examine them. But if the dispute has been going on for a long time since the legal relationship arose, it will be much more difficult to gather evidence. Because some witnesses were absent (moved, died) during the trial, some may have forgotten or distorted the facts, the costs necessary for the case to be resolved properly, and so on. If the statute of limitations were not set by law, a person who entered into an agreement or violated any of someone's rights would always be at risk of being sued by another person for a long period of time.

In short, the establishment of statute of limitations greatly helps to protect the rights and interests of organizations and citizens, to strengthen civil relations;

The Civil Code of the Republic of Uzbekistan does not directly specify extended periods of limitation compared to the general limitation period. In the civil law of some states, for example, Article 181 of the Civil Code of the Russian Federation stipulates that when an agreement is declared invalid, its consequences can be claimed for up to ten years. It would be expedient if such rules were reflected in our legislation as well;

Article 163 of the FC does not explicitly limit the scope of claims for which the period of limitation is not claimed, which may be extended. Therefore, the scope of such requirements may be expanded by the norms established by other legislation. In addition, in some scientific literature, civilians have also expressed some of their views on the scope of the requirements for which the statute of limitations does not apply.

For example, in addition to the above, it is proposed to include in the list of claims that do not apply the statute of limitations claims for compensation for non-pecuniary damage arising from the employment relationship.[8] As society develops, such ideas also expand, and they lead to an expansion of the scope of claims for which a statute of limitations does not apply by subsequent inclusion in legislation.

ABSTRACT

The concept of 'competence' is related to the notion that all professional processes need to be considered and that there is a lot of collaboration in the pedagogical context and that the participants in the learning process need to acquire. Therefore, competence is a way of behaving in different professional situations, communicating, new behaviors in relationships, unclear tasks when working with competitors, use of information full of contradictions, adapting to a plan of work in evolving and complex processes. Professional competence is defined not by the acquisition of skills, but by the knowledge of a specialist, which implies the acquisition of independent independent knowledge and actions in each field, constantly enriching the knowledge of competence specialization, learning new works to understand social problems, seeking new edits, it requires the ability to process them and work in their own activities. The purpose of this article is to clarify the concept of competence and the essence of professional competence, as well as to review the cases of professional competence, to clarify its structure and capabilities, as well as to highlight the professional competencies and skills that foreign

language teachers should possess. In expressing such things and illuminating the components, the ideas are generalized using diagrams and tables as well as work done earlier.

KEYWORDS: *Competence, Competency, Component, Combination, Strategy, Professional Competence, Levels (Practical, Theoretical, Creative), Methodology, Activities.*

I. INTRODUCTION

The key concepts in this research are the terms “competence” and “competency”. According to A.V. Khutorskoy (2002) by competency we mean “a set of interrelated personality traits (motivation, knowledge, skills, ways of working), defined with respect to a particular range of subjects and processes necessary for high-quality and productive activities in relation to them”. Competence is “a possession of a certain competency by a qualified person, including his personal attitude to it and to the subject of activity”. In other words, competence is the levels of formation of competency as a theoretical construct. Competence is a broader concept than accepted in the technique of “competency”, which is traditionally understood the combination of knowledge, skills and teacher skills needed to carry out his professional activities (V.V.Safonova.).

In all areas of modern society, a serious reappraisal of past values is taking place, the content of social life and consciousness is changing, the need for highly qualified personnel capable of contributing to the progressive development of society is growing. In this regard, the professional competence of a specialist comes to the fore. A fairly large number of studies in the field of professional competency are currently being conducted as a whole (L. I. Berestova, E. N. Gusinsky and Yu. I. Turchaninova, V. A. Naperov, J. Raven, I. N. Trofimova) and professional and pedagogical competence in particular (V. A. Adolf, N.V. Kuzmina, V.A.Sitarov).

O. B. Khovov considers professional competence as a level of creative realization of professionalism, socio-communicative abilities and autonomy, understood as independence, law and responsibility for making independent decisions in his professional activities.

These questions can be discussed in the research:

- a) What is the essence of the concept of competence?
- b) What are the qualities reflected in professional competence?
- c) What skills does the professional competence of foreign language teachers include?

Professional competence is not a process of acquiring skills, but a process determined by the knowledge and skills of a specialist, which involves the acquisition of independent independent knowledge and actions in each field. review, clarify the content and capabilities, and highlight the skills of foreign language teachers. All the components that make up professional competence are the object of this scientific work.

II BACKGROUND KNOWLEDGE

The concept of competency implies combination of physical and intellectual qualities of a person and the abilities necessary for an independent and effective solution of life situations, in order to create the best conditions for oneself in a constructive interaction with others. Thus, studying

professional competence as a phenomenon multidimensional, V. A. Napierov defines it at four levels:

- Theoretical (cognitive) level - a set of professional knowledge and skills acquired during professional training and practical activities.
- Practical (operational) level involves analysis structures of the need-motivational sphere of personality, professionally important personality traits.
- The creative level testifies to the growth of professional skill, its components can be considered a creative non-standard approach to solving professional problems, intellectual lability, ability to navigate in non-standard situations.

The presence of the above conditions contributes to the formation of the competence of the individual. However, one does not have to talk about stability, sustainability of competence, because it depends entirely on the flows that it is supported by the “drains” through which it is lost.¹

According to I. N. Trofimova, the flows in this case are:

- 1) The energy characteristics of the body; they change with age, as well as under the influence of biological (e.g. illness), psychological (e.g. stress or achievement of success) and social (for example, war) factors;
- 2) Informational characteristics of the environment, on the basis of which the subject forms his motivation, the range of goals and objectives everything that acts as a stimulation of his activity;
- 3) With the development of activity to achieve their goals the subject forms what his experience is - functional systems in the form of skills, assessments, attitudes and behavioral strategies.

III METHODOLOGY

A. Research Design

As teachers teach their students the language they need, they also need to introduce culture in societal societies where learners are taught. Therefore, future English teachers should first of all create socio-cultural components. It is clear that the key role in the disclosure of the peculiarities of the formation of social and cultural comprehension through this subject is obvious. One of the main objectives of the research is to rise awareness of language learners about target language as well as its culture and social and cultural life of language studied country and social characteristics. This study aims to investigate Uzbek teachers' opinions and beliefs on the place of target cultural-social information in English language teaching, as well as their related practices and applications in English as Foreign Language classroom in all kind of education in Uzbekistan. Also, this research's aim is to open and clarify the main features and peculiarities of the development cultural-social components of future English teachers and to create new methodical guide and educational supplies.

B. Instruments

Based on professional competence the following qualities are reflected (Fayzullaeva N, 2006). Below are the qualities reflected on the basis of professional competence the essence is briefly dissolved.

1. Social competence - activity in social relations demonstrate skills, mastery of skills, subjects in professional activities be able to communicate with.
2. Special competence - the organization of professional and pedagogical activity preparation for training, rational solution of professional and pedagogical tasks, Consistently develop a realistic assessment of performance On the basis of this competence, psychological, methodological, informational, creative, innovative and communicative competence is evident.

C. Data Collection and Analysis

Qualities reflected on the basis of professional competence

- 1) psychological competence - a healthy psychological in the pedagogical process to create an environment for students and others in the learning process establishing positive communication with participants, various negative to be able to understand and resolve psychological conflicts in a timely manner;
- 2) methodical competence - methodologically of pedagogical process rational organization, correctness of forms of education or educational activity designation, selection of methods and tools in accordance with the purpose, effective use of techniques, successful use of tools;
- 3) Information competence - necessary, important in the information environment, search, collection, sorting, processing of necessary, useful information and their targeted, appropriate, effective use;
- 4) Creative competence - critical, creative to pedagogical activity to be able to demonstrate his / her creative skills;
- 5) Innovative competence - improvement of pedagogical process, improving the quality of education, the effectiveness of the educational process to put forward new ideas for improvement, to put them into practice implementation;
- 6) Communicative competence - the whole of the educational process in sincere communication with students, including participants to be, to be able to listen to them, to be able to make a positive impact on them.

In the methodology of professional training in foreign languages, professional competence is understood as an ability based on professional knowledge and skills, educational and life experience, values and individual inclinations, allowing to effectively solve communicatively-teaching tasks arising in real situations of professional pedagogical activity.

Foreign language teacher profession's frame (see Fig. 1), developed by S. F. Shatilov, K. I. Salomatov and E. S. Rabunsky, interprets the professional competence of a teacher foreign language as follows. Since the main purpose of teaching a foreign language in education is the mastery of students of a foreign language as a new way of communicating communicatively level, then, according to the compilers of the profession's frame, the communicative and educational function of pedagogical activity a foreign language teacher is the leading, fundamental, it largely determines the content of all other functions. The above functions in the professional activities of a foreign language teacher can be divided into two groups: to the group of goal-setting functions (communicative-educational, developing, educating) and the group of operational-structural functions (Gnostic, constructive-planning, organizational).

Functions in the professional activities of a foreign language teacher

Figure 1 Functions in the professional activities

IV. RESULTS

N.V. Bagramova, M.K. Kolkova, I.P. Shishkin offer own scheme (see Fig. 2) of the professional competence of a foreign language teacher. According to the scheme, the basis of professional competence teachers of a foreign language compose linguistic and speech competencies.

Language competence is knowledge and erudition in a foreign language, possession of the rules of analysis and synthesis of units that allow you to build sentences; This is the possession of a system of information about the language being studied by its levels: phonetics, vocabulary, composition of words and word formation, morphology, simple syntax and complex sentences, the basics of the style of the text. On quality language competence in the studied language is affected not only by the degree of proficiency in it, but also by the level of competence of students in their native language. According to Chomsky, linguistic competence means the ability to understand and produce an unlimited number of linguistically correct sentences with the help of learned linguistic signs and rules for their connection (Azimov E. G., Schukin A. N. 1999).

Speech competence is the ability to use a foreign language for the purposes of personal and professional foreign language communication, adapt the language in order to teach schoolchildren the basics of foreign language communication; it is the possession of the ways of forming and formulating thoughts through language and skill use such methods in the process of perception and generation of speech.

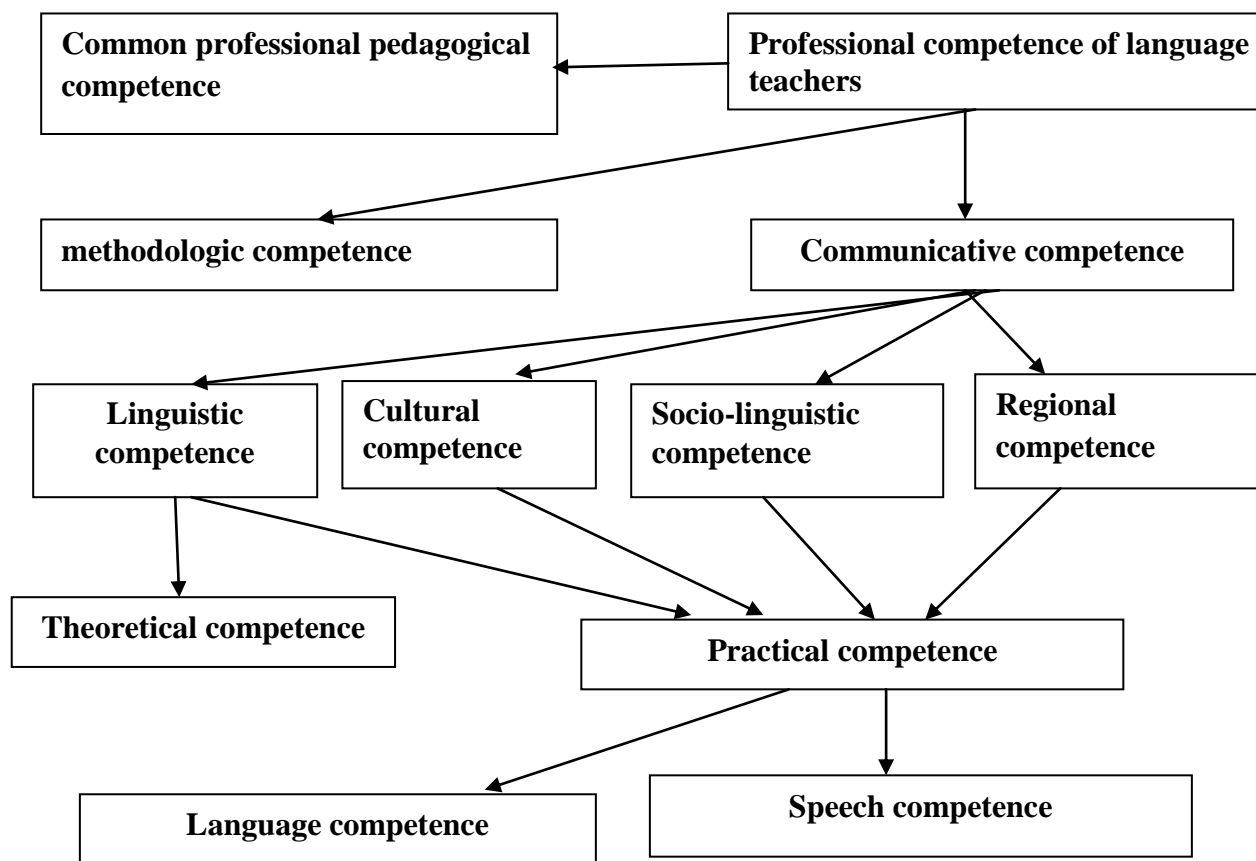

Figure 2. Professional competences of teaching foreign language

Based on the professional competency scheme of a foreign language teacher proposed by A.F. Kononova, we in turn, we single out a number of skills within the framework of basic and special competencies. So, to general professional skills (basic competencies) foreign language teachers include: taking into account the level of formation of key competencies (level of training and culture) of students; taking into account the psychological characteristics of the personality of the student; organizational skills; planning of lessons and independent work of students; mastery of a teacher's didactic speech; taking into account socio-cultural interference and positive transfer; the ability to notice and correct errors; control of student knowledge; work with technical training tools; the use of special literature in their professional pedagogical activities. To special professional skills (special competencies) include methodical skills (in which we also include acting (playing) skills) and communicative skills, which are based on theoretical and practical (linguistic, speech) knowledge and skills, and also competence in the socio-cultural sphere, interactive competence, educational and cognitive and compensatory skills (Kononova A, 2004). All these skills are closely interconnected and complement each other, and together indicate the professional competence of a foreign language teacher.

Within the framework (Figure 3) of basic competencies are distinguished (Kononova A.2005): - psychological and pedagogical competence of the teacher allows to shape the personality of students, conduct moral, aesthetic, patriotic and socio-cultural education in educational process and extracurricular activities using foreign language means taking into account regional

geographic and socio-cultural information, form the motivational sphere of students, interest in learning a foreign language;

- intercultural competence, ensuring the implementation of the dialogue of cultures in the process of teaching a foreign language as a means of intercultural communication, familiarization with culture countries of the language studied;

- Reflective competence, including the ability to analyze one's own activity and correct it, to critically approach oneself.

Figure 3. According to Kononova, components of professional competence of language teacher

To sum up, activities to improve, deepen teacher competency is carried out in various directions. This is the mastery of the culture of society, world culture, awareness of the learning process, the improvement of their pedagogical abilities, the orientation of the individual towards self-development, the development of research interests. The above approaches to the characterization of professional competence allow us to conclude that professional competence is the presence of appropriate knowledge, skills, formation of the inner world personality - needs, attitudes, professional orientations and motives of activity, ideas about oneself, one's own professional qualities, results of one's own activity.

V. DISCUSSION AND CONCLUSION

So, professional competence is the ability to combine different types of activities, skills knowledge which includes methodological competence, the socio-psychological competence, differential psychological competence as well as the auto-psychological competence. When summarized from the above considerations, professional and pedagogical skills are an integral part of professional and pedagogical training of a future teacher and, along with knowledge, are included in the general structure pedagogical activity. We can judge not only the level of professional and pedagogical training of a teacher in the number and content of pedagogical knowledge, but also in the presence of professional and pedagogical skills acquired on the basis

of knowledge and through exercise, i.e. practical meaningful application of knowledge in the specific conditions of professional activity.

From the point of view of the present period, the professional pedagogical competence of a teacher is a generalized personal education, which includes a high the level of his theoretical and methodological, psychological and pedagogical, methodological and practical training. The professional competency of the teacher is a means providing a conscious solution to professional problems and the criterion for the formation of a professional teacher. Professional and pedagogical skills are an integral part of professional and pedagogical training of a future teacher and, along with knowledge, are included in the general structure pedagogical activity.

To sum up, the professional competency of the teacher is a means providing a conscious solution to professional problems and the criterion for the formation of a professional teacher. So, teachers who possess the ability to think creatively qualify as an asset in their education process. These teachers are able to differentiate instruction to better meet the needs of individual students and are able to handle the ever-changing tide of educational regulations with ease. These teachers are often assets to their team members and sources of innovative information and ideas.

CIVIL SOCIETY AND THE TRANSFORMATION OF ISLAMIC VALUES

Abdullaev Akmal Nasriddinovich*

*Senior Lecturer,
Department of National Ideology and Legal Education,
NamSU, UZBEKISTAN

ABSTRACT

The article is devoted to the transformation of civil society and Islamic values, showing that Sharia law is aimed at regulating the behavior of believers, as well as the lifestyle of the Muslim family and protecting the basic values of Islam. The most important value in Islam is religion. It is well known that religion - one of the forms of social consciousness - is a set of spiritual ideas based on belief in supernatural forces and beings (gods, spirits) that are the subject of prayer. Hence, religion, life, intellect, property and the continuation of a generation are the core values of Islam. Sharia law is primarily aimed at protecting these values. In fact, the Sharia encompasses the life and work of a Muslim from cradle to grave. Today, based on a purely theoretical problem, this problem is quickly becoming a matter of practical legal policy. According to G.I. Gurdjieff, "... any true religion consists of two parts. One of them teaches people what to do.

KEYWORDS: *Civil Society, Transformation Of Values, Religious Behavior, Muslim Family, Sufis.*

INTRODUCTION

Islam links many cultural issues to the field of law. Therefore, the efforts of the state to ensure freedom of religion and the unimpeded fulfillment of Muslim religious obligations by Muslims, the adoption of specific organizational and legal measures (for example, creating conditions for prayer, pilgrimage) or fasting), taking into account the relevant rules. However, this issue is not limited to issues of religious value (mainly related to the right to freedom of religion) or closely related to guarantees of general civil rights, regardless of the religious affiliation of Muslims. It is equally important to use the achievements of the Muslim legal culture in the interests of the development of the country's legal system. Today, based on a purely theoretical problem, this problem is quickly becoming a matter of practical legal policy. According to G.I. Gurdjieff, "...

any true religion consists of two parts. One of them teaches people what to do. The content of this part revolves around the common spiritual property (value) of everyone, and over time they change (collapse), that is, they move away from their source. The other part teaches how to do the work indicated in the first part, and the content of this part is kept secret in special schools. With its help, you can fix the changed (damaged) content in the first part or restore forgotten lands. Without the latter, there can be no religious knowledge, even if it is not true.” [1] To clarify the issue from the point of view of Islamic religious culture, we consider it appropriate to add the approach of Umar Khayyam to this approach. Such thoughts are in the chapter of his book “Letter to the Applicant”, which describes “seekers for the knowledge of God.” “It is well known that those who seek to know God, pure and exalted, are divided into four categories: Second - philosophers and scientists who generate knowledge using pure scientific data based on the laws of logic. Third, it is the Ismailis and the teachings that are confused because there are so many difficulties and contradictions in proving knowledge, so they believe that only a godly message about God, His existence and attributes is the correct way to know God. Fourthly, they are Sufis who do not seek to know God through thought, but seek to cleanse their hearts, nature and bodies from impurity by achieving moral perfection ... This is the best way.” [2]

It should be noted that turning to the foundations of Sharia and Muslim law is possible only if a number of interrelated conditions are met. The key point is a consistent legal approach to the selection and use of Islamic heritage. Since we are talking about the recognition of world affairs and some of the achievements of Islamic civilization by the whole society, including non-Muslims, the prospects of Islam in our country largely depend on the legal dress of its core values. In other words, Sharia can be recognized by society and the state in Uzbekistan only as a law that goes beyond religious values and only in everyday affairs. And vice versa - the separation of Muslim legal culture from the entire Islamic heritage makes it possible to put its achievements at the service of the legislation of Uzbekistan. If the question of the possibility and necessity of using the experience of other legal systems, the successful solutions of which are being actively mastered, is reasonably raised, then, in principle, the prospect of a return to Islamic legal culture, including its cultural life, cannot be ruled out. Islam has certain values as one of the three great religions. Sharia norms are aimed at their support, ensuring their normal functioning. In Islam, the following basic values should be distinguished and protected: religion; a life; mind; generation these values are the main objects of protection of the Shariah. The most important value in Islam is religion. It is well known that religion - one of the forms of social consciousness - is a set of spiritual ideas based on belief in supernatural forces and beings (gods, spirits) that are the subject of prayer.

The word “religion” in Arabic has a broader meaning - it is a tradition, a person's worldview and religious teachings themselves. Islam is a certain attitude of a person towards God. In the Qur'an, the term “religion” is used over 100 times in various senses. This can mean “condemnation”, “revenge”, “religion”, “faith” of a person and religion as a system of ceremonial practices that form the basis of the life of a religious society. A common definition of this is that “religion” is faith (al-iman), the fulfillment of religious precepts (al-islam), and the enhancement of the sincerity of faith (al-ih-san). “Religion” is, first of all, the fulfillment of the commandments of God to man. “Religion” includes the five pillars or five basic principles of Islam that every Muslim must follow and follow. This is the credo (shahada - testimony); prayer (as-salat,

prayer); fasting (as-saum, fasting, fasting Ramadan); charitable taxes and alms for the poor (zakat, sadakat); Pilgrimage to Mecca [3].

Islamic values. And this is no coincidence. Indeed, religion is the foundation of Islam. A person's attitude to other important values - life, reason, procreation and property - and then its definition and development is religion, its five pillars are the main tenets of Islam. The Five Pillars of Islam were compiled by our Prophet Muhammad in response to Muadhi ibn Jabl's question about what actions can lead to heaven and save you from hell. The Prophet answered this question: "You should worship only one God, Allah, without associating anyone with Him; you must pay charitable zakat; you must fast during the holy month of Ramadan; and finally, you must go on a pilgrimage to Mecca"[4].

There is no single norm in the Quran that reveals the meaning and significance of the declared foundations of Islam. This is done in various suras of the Qur'an and in the hadiths of the Sunnah of our Prophet. It is well known that "religion, by its very nature, claims to be a leader in all affairs and relationships. He seeks and finds the highest and last word; he shows a person that his life is a true life, and that every action acquires its essential meaning, its final enlightenment"[5]. Religion is the unconditional beginning of existence and the interdependence between man and the world.

Sharia law prohibits self-esteem. The right to trial can only be exercised after a verdict confirming that the murder was premeditated has been confirmed by an official judicial authority. The Qur'an prohibits the death of another person under illegal circumstances and at the same time warns of the consequences of not observing the imposed prohibition. Establishing the right to revenge, Sharia requires strict observance of its proportionality. The actions of the person who participated in this bloodshed will be considered primarily on the Day of Judgment. Anyone who deprives a person of life in exchange for another life will forever remain in hell.

The third value is reason, that is, a person's ability to generalize the results of understanding, logical and creative thinking, cognition. Wisdom is a wonderful gift to a person compared to other emotions. "There is no doubt that people's voluntary actions and their diversity stem from their intrinsic motivation. All our actions are a reflection of our intentions and ideas, our attempts to implement them; they are like positive responses to our inclinations and desires ... We are solely responsible for our actions, because a person can act in this life as he pleases, not considering himself a normal tooth in society or history"[6].

In Islam, particular importance is attached to the mind. After all, only an intelligent person takes responsibility is responsible for the actions taken. A person can only be blamed for an act that he committed of his own free will. The difference between man and other creatures is that he is endowed with the will of reason and will. Islam stems from belief in the Day of Judgment and the Hereafter. So, the meaning of a Muslim's life on earth is that he must prepare himself for an unnatural life and lead a correct way of life. We must act, being aware of every action. For this, a Muslim must not harm his mind, but protect it from various aggression. M. Kurmanaliev writes about these problems: "According to the results of a survey conducted in 1991 by Parviz Khudbha, a Pakistani physicist and author of a study on the relationship between science and Islam, published in his book "Islam and Science, Religious Struggle and the Struggle for Wisdom". Despite the fact that they make up one fifth of the world's population, the contribution of Muslims to world science is very small, less than 1%. In one small Israel, there are twice as

many scientists as in Muslim countries as a whole. What is it? From the 8th to the 14th century, the Muslim worldview, which is 600 years old, according to advanced knowledge, still suffers from ignorance.” [7].

The mind can be attacked, damaged, or damaged due to various factors. These include, for example, nervousness, anger, greed, instability, and so on. Consequently, the hadiths of the Prophet's Sunnah have repeatedly spoken of the negative consequences of anger as a confusing factor. According to legend, when a person repeatedly turned to the Prophet about something he considered particularly important, the Prophet would reply, “Never, under any circumstances, be angry.” [8]

Sharia law prohibits judges from judging two opponents in anger. Overcoming anger is one of the best qualities. Indeed, strong is the one who can control his anger. By declaring the use of alcohol and drugs Hamrom, Islam established general rules according to which the use of substances that cause addiction and deprive a person of sanity is prohibited [9]. Therefore, in Islam, any intoxicating drugs are prohibited. “Allah cursed the wine and its producers, for whom it was made, for those who serve it, for those who wear it, for whom it was brought, for sellers and buyers” [10]. The prohibition of the use of alcohol and drugs is based on the general Muslim teaching that our bodies belong only to Allah, therefore all substances that harm them are not only wine, but also haram (evil). So, the mind is an invaluable gift given to a person. The sacred duty of man is to protect the mind from the effects of harmful means. Therefore, a Muslim is prohibited from using things that “intoxicate and poison the mind,” and is considered a violation of the moral foundations of society. According to the hadith of our Prophet, an increase in the consumption of intoxicants and substances that poison the mind will contribute to the end of the world [11].

The fourth value of Islam, protected by Sharia, is property. As mentioned above, property is considered sacred and inviolable in Islam. This principle is now enshrined in the constitutions of many Islamic states with special emphasis on the comprehensive strengthening and development of private property, which is the economic basis of these states. Islam does not reject economic activity. Its economic principles serve to build a just civil society in which honest and responsible people can find a worthy place for themselves and do a righteous cause. That is why Abu Mansur Moturudi said: “Everyone creates his own world and his own destiny in this world. The strength that ensures human freedom and freedom is the ability to adhere to the principles of reasonable norms and compromises in any life situation ”[12].

In Islam, it is important to work. Property is the result of honest, conscientious work. Idleness is condemned; should not be a burden to others. Parasitism in society is considered to be unfair behavior. Begging is strictly prohibited in Islam. Only three categories of people are allowed to beg: those who are in extreme poverty, those who have too many debtors, and those who borrow and cannot pay it back. Able-bodied people should earn their own money, and not need someone else's charity, which is very embarrassing. In Islam, there is no difference between the types of labor and their characteristics. Any socially useful work is respected. The main criterion is the legal nature of labor. Every Muslim should make his own money and create his property only legally. According to Muslim teachings, a person living illegally will not go to Paradise. It is illegal and unworthy to do harm to other people. Making money by usury is extremely disgusting.

In Islam, property rights are protected and guaranteed by the Shariah. In modern Islamic countries, property is divided into two forms: private and state (public). Violence against property is severely punished. However, such an indefinite determination is made depending on the form of theft, form of ownership, category of offenses and punishment. Punishment in sharia is classified as follows: hudus, qasas, diyat and tazir. According to the Shariah, encroachment on property entails the imposition of fines belonging to the categories of territorial (emergency) and influence (corrective). Indeed, "Religion never leads humanity astray ... We will continue to create all the conditions for religion." [13]

The continuation of descendants is the fifth main value of Islam. The continuation of generations is seen as the continuation of faith and life. Therefore, Sharia law prohibits artificial termination of pregnancy, chastity, castration, and so on. Islam has no institutions of monasticism and isolation. Sharia norms regulate family and domestic relations in some detail and define specific rights and obligations of spouses in relation to each other.

In a Muslim family, having a baby is considered a gift from God, not a "coincidence" or "mistake." Killing children is the greatest sin, even in conditions of poverty. In Islam, childbearing is considered only through marriage. According to him, "the person entering into marriage has already fulfilled half of the commandments of his faith." The Qur'an says about marriage: "One of His signs is that He created wives out of you so that you could live with them, and showed you love and mercy."

Sharia demands family fidelity from believers. Adultery is severely punished. The Qur'an says: "And do not approach adultery, for it is an abomination and an abomination. Hit the adulterer and the adulteress with a hundred lashes. In Islam, marriage is mutually voluntary and can be dissolved on this basis.

Divorce is not prohibited in Islam. However, according to our Prophet, of all that is permitted in Islam, the most hated divorce in the right hand of Allah is divorce. The Qur'an regulates the procedure for divorce and the relationship between divorced spouses, and there are opportunities for saving the family. Hence, religion, life, intellect, property and the continuation of a generation are the core values of Islam. Sharia law is primarily aimed at protecting these values. In fact, the Sharia encompasses the life and work of a Muslim from cradle to grave. Sharia covers secular and religious issues. Sharia is aimed at regulating both the behavior of believers and the lifestyle of the Muslim family, as well as protecting the fundamental values of Islam.

In short, the compatibility of the concepts of civil society and democracy with Islamic principles and values must be addressed within the framework of existing social values. Given the level of development of the system of spiritual and moral education in the International Islamic Academy of Uzbekistan and other religious educational institutions of our country, it is important to further expand the process of teaching students in foreign Islamic educational institutions. Further expansion of the activities of licensed Islamic educational institutions for Uzbek specialists will play an important role in solving problems related to the education of young people in society.

ABSTRACT

This article provides recommendations on the repair and maintenance of roads, the main tasks of the maintenance service. It is known that the growth of traffic in recent years, the emergence of transit traffic of international carriers through the territory of the Republic, these facilities play an important role in improving the efficiency of the road transport complex. In addition, the highways will provide comfortable and safe movement for passengers and drivers. The main focus in planning the repair and maintenance of highways should be to follow a program of action structured according to a clear scheme to achieve one or more goals and objectives under certain conditions.

KEYWORDS: Road Maintenance, Perspective Plans Safe Movement, Assessment Of Technical Condition, Roadside Facilities, Infrastructure, Category, Master Plan, Recreation Areas, Parking, Relief Condition, Cement Ditches, Water Pipes.

INTRODUCTION

Road repair and maintenance works are divided into the following types: on repair: perfect repair; current repair. On storage: highway maintenance; winter storage; landscaping. The main tasks of the road repair and maintenance service are:

- organization of timely quality maintenance and repair of roads in accordance with the classification of repair and maintenance of roads and ensuring the interval between repairs;
- assessment and constant monitoring of the technical condition of the road and its structures;
- Development and implementation of annual and long-term plans to improve the safety of pedestrians and vehicles, the technical and operational condition of roads and structures;
- identification and accounting of traffic-hazardous sections of roads and bridges, as well as the development and implementation of measures to improve traffic safety at different times of the year;
- Development of measures to eliminate traffic restrictions and interruptions, to eliminate the consequences of seasonal deformations and natural disasters, to timely inform interested organizations and road users about the traffic conditions on the road;
- organization and development of automated databases on technical accounting and certification of roads and their structures, traffic accounting, condition of roads and bridges, information retrieval and other automated systems;
- maintaining the constant compliance of all means of high-speed communication, automation, telemechanics and computer technology on road organizations and highways, improving these tools, expanding their use for automatic traffic control;
- preparation of assignments for the project of engineering and architectural equipment of roads, landscaping, architectural and artistic decoration, landscaping and snow protection from snow and sand;
- Ensuring the effective use of buildings, structures, vehicles, vehicles and other fixed assets for the organization of timely repair and maintenance of roads;
- Development and implementation of measures to improve the quality and reduce the cost of road repair, maintenance, including the use of new scientific and technical achievements and best practices, modern technologies, local building materials, automation and mechanization of production processes and elimination of manual labor implementation of measures;
- Together with the Departments of Internal Affairs and local authorities to develop and implement measures to ensure the protection of roads and their structures, to monitor compliance with the rules of protection and proper use of roads and their structures, the rational use of natural resources in road repair and maintenance;
- Standard service life between repairs is a period of time that is cost-effective and is equal to the estimated service life. This will ensure a minimum of total road, transportation and non-transportation costs [1].

In recent years, as a result of increasing traffic, transit traffic of international carriers through the territory of the Republic and structural changes in the fleet, the movement of vehicles of the design group with a load capacity of 130 kN, which leads to many disturbances in the road structure. As a result, the demand for perfect repairs is emerging ahead of schedule. This requires the revision and refinement of existing existing standards. The problem is exacerbated by the slow pace of repair work in the country, the poor quality of work and materials. As a result of untimely repairs, the number of “unrepaired roads” is increasing today, accounting for 59% of the public road network.

Today, the existing problems in the use of roads in the country, such as obsolescence of existing machinery, lack of modern technologies, low quality and inadequacy of construction materials, high demand for qualified specialists in the field, exacerbate the problem.

When planning the repair and maintenance of roads, it is necessary to follow a program of action structured according to a clear scheme to achieve one or more goals and objectives under certain conditions. In order to solve these tasks and achieve the set goal, it is necessary to carry out a full set of technical and organizational measures on the equipment and elements of the road, traffic organization and safety. The types and composition of works provided for in the classification of road repair and maintenance complement each other and represent a single system of measures aimed at ensuring the operational quality of the road in accordance with traffic requirements [2].

Materials and methods of research. Storage operations have a very broad meaning for all elements of the highway during the year, artificial structures, carriageway, embankment and highway area, streets and airfields, and are usually divided into two groups:

Spring - summer and autumn period - when washing, sweeping and dusting of bus stops and pavilions; whitewashing of road constructions and signs, cleaning and washing of road barriers, signs; cleaning and washing of ditches, side ditches, cement ditches, culverts and overpasses, bridge supports and roads; clearing of return roads, dividing roads, roadsides and waste-filled slopes; mowing and leveling of grass on sloping and return roads, cutting of bushes and small shrubs; processing of cut bushes and small meadows, use of chemical pesticides, watering and pruning of trees, whitewashing of trees, timely elimination of small-scale minor repairs, etc.

Winter period - snow removal of carriageways, ascent and descent slopes, turns, curbs, parking lots, bus stops, sidewalks and walkways; removal of icy slips and landslides; clearing snow piles in front and behind barriers; distribution of solid and liquid ice melting materials against freezing; construction of protective trenches and barriers from snowdrifts, removal of compacted snow layers on the carriageway.

In all of these machines (on the highway, in universal tractors on pneumatic tractors) in the development of road technology appeared the first major direction to expand the amount of measurements taken and the model of all types of machines. This, above all, meets the requirements of a market economy and its basic principles. The working capacity, size, power and object of use of the machine must meet the operating conditions.

With the arrival of spring, when the snow melts and the ice layers are lost, all types of coatings are cleaned of mud, dust, sand and materials used in winter slippage.

On hot summer days, dust builds up on fine, gravelly paved, dirt roads, so storage is focused on preventing dust from rising. In the summer, storage of improved coatings will include cleaning

with sprinklers or mechanical brushes. Sweeping of the pavement starts from the road axis and continues to the edge of the carriageway. The next transition should cover the previous one 0.25-0.50 m. Depending on the condition of the carriageway, it is periodically washed at the most dangerous sections (intersections and stations) and in places with high aesthetic requirements.

In other sections of the improved coatings, excessive binding material may come out on the surface of the coating under the influence of sunlight during the movement of vehicles. Such plots are treated with a small amount (0.1 ... 0.2 l / m²) of organic solvents (kerosene, diesel, oil), followed by sprinkling of small stones or coarse sand and after 0.5 hours wiped with a machine [3].

In autumn, the maintenance of various paved roads consists of preparations for the winter: mud and soil, waste is removed, cracks are closed, and measures are taken to drain the surface water. Certain types of work at different times of the year are determined by the type of coating.

Storage of unpaved roads consists of leveling the surface with the help of a motor grader or other machines, as well as compacting the soil with a roller, leaving the soil in deep tracks. Fine and gravel pavements are cleaned, transverse waves and deep traces are removed, cross-section elements are corrected, water is removed from the carriageway, most areas are repaired in spring and dust is sprayed or emulsified during the dry seasons. It is leveled from time to time in spring, summer and autumn, which allows for a flat spread of fine stone material.

Research results. The main purpose of looking at the pavements during the snowless times of the year is to maintain the transport and operational quality of the road. This eliminates the damage caused by various factors such as moving vehicles, freezing, excessive humidity, temperature changes. These are routine works that are carried out with the technical, material and labor resources of the organizations operating the roads. Let's talk briefly about the technology of doing this.

Cleaning of the coating from mud is carried out regularly in spring, summer and autumn. During these seasons, there are cases of wet soil, dust and plant debris scattered on the road clinging to vehicles. The mud of the carriageway reduces the adhesion of the car wheels to the pavement and contaminates the cars. The mud should be removed immediately. If there is a lot of mud, a motor grader is used, if there is a little bit, metal brushes or machines with sprinklers are used; the brushes scrape the mud, the stream of water washes it away. The mud left in the pits dries and forms dust. Dust is also generated by the erosion of the coating and the erosion of the stone materials used with the bonding materials. Dust rises from the formation of air bubbles in the crack between the moving car wheel and the road surface. When the truck is moving, the dust can reach a height of 6 ... 12 m, its concentration in the air can reach 1.5 ... 2.0 g / m³. When there is no wind, dust stays in the air for a long time and has a negative effect on traffic flow: it limits visibility, reduces the capacity of the road due to the need to keep the distance greater, adversely affects people on the road and vehicles, increases the wear of car parts, reduces crop yields in road areas, and in cotton fields, reduces fiber quality, creating favorable conditions for spider reproduction. According to the Cotton Research Institute, 4 million uzs are lost annually in Uzbekistan due to dusting of cotton fields. It is advisable to take these into account when solving the problem of dusting the roads [4].

Dusting of roads consists of a set of measures. These are: cleaning the roadway with brushes, spraying with water, spraying with aqueous chloride solutions, treatment of the road surface with bitumen emulsion, liquid bitumen and other binders.

FINDINGS: In short, the repair and maintenance of highways means the organization of convenient and safe service for them on this road, based on the needs of passengers, drivers and vehicles. Repair of roads that are currently unrepaired as a result of untimely repairs. The main purpose of the road service is to increase the economic efficiency of the road transport complex. This has been proven in the example of many developed countries.

DEVELOPMENT OF CREATIVE THINKING IN SCHOOL CHILDREN

Akramov Khusnitdin Mukhitdinovich*; **Umarov Komiljon Mirzabdullaevich****

*Associate Professor,
NamSU, UZBEKISTAN

**Senior Lecturer,
NamSU, UZBEKISTAN

ABSTRACT

The article examines the development of creative thinking skills in school-age children, the possibilities of students, the process of their development. In the educational process, the focus is on the choice of ways to improve the development model of students' creative thinking skills and content, forms, tools, methods and techniques for developing students' thinking skills.

KEYWORDS: *Creative Thinking Skills, Competence, Technical Creativity, Methodological Foundations, Development Model, Activation Methods, Advanced Foreign Experience, Guidelines, Shaping Factors, Creative And Social Activity.*

INTRODUCTION

In the developed countries of the world, education is recognized as a key factor in ensuring sustainable development, and the concept of international education until 2030 defines “quality education and active socialization of youth” as an urgent task. This, in turn, leads to the need to familiarize students with the types of work that contribute to the rapid socio-economic development of society, improve pedagogical mechanisms for teaching innovative technologies in the labor market, develop advanced foreign experience and pedagogical opportunities to develop creative thinking skills.

Analysis of studies on the development of creative thinking skills among students in developed countries shows that the process of forming creative thinking among students does not occur spontaneously, but develops as a result of systematic purposeful pedagogical activity. Also, the gap between the modern requirements for the process of orientation of schoolchildren to technological education through their creativity and their knowledge, skills, abilities and competencies, the existing didactic system does not meet the needs of society. This, in turn, is important for developing creative thinking skills.

As a result of successive reforms in our country, it is necessary to deepen the methodological foundations for the development of creative thinking of schoolchildren, to educate proactive, courageous youth, capable of taking responsibility for the life of the country. future. The strategy of actions for the further development of the Republic of Uzbekistan defines areas such as “intellectually developed, independent thinking, a firm outlook on life,” which, in turn, emphasizes the need to consider this process as a didactic system.

Decree of the President of the Republic of Uzbekistan Sh.M. Mirziyoyev dated February 7, 2017 No. PF-4947 "On the strategy for the further development of the Republic of Uzbekistan", January 25, 2018 "On measures to radically improve the public administration system." general secondary, secondary specialized and vocational education "Resolution No. PF-5313 of April 29, 2019, Resolution No. PF-5712" On the Concept for the Development of the Public Education System until 2030 ".

This study, to a certain extent, will serve the implementation of the tasks set by the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated April 6, 2017 No. 187 "On the approval of state educational standards for general secondary and secondary specialized, vocational education." education "and other relevant regulations.

A number of educational scientists in Uzbekistan studied the methodological foundations of developing students' skills of creative thinking, technical creativity of young people, the development of creative thinking skills in secondary school students, research problems of students, psychological problems of youth orientation. to research activities. At the same time, research in the field of problems of the theory of developing education is being studied and scientific and methodological foundations have been developed.

Some of the educational psychologists studied the problems of the development of technical creativity, the development of the thinking abilities of students of general education schools.

Although the methodological foundations for the development of students' creative thinking skills are studied by scientists in various fields to study their creative abilities, there are problems in pedagogy that have not found their logical solution in this regard.

In particular, the lack of a methodological base for the development of students' creative thinking skills indicates the need for in-depth scientific approaches and new knowledge.

Improving the development model of students' creative thinking in the learning process:

- the choice of the content, forms, means, methods and techniques of the process of developing the creative thinking of students of secondary schools on the basis of advanced foreign experience;

- development of scientific and methodological recommendations aimed at developing students' creative thinking skills through pedagogical processes carried out in educational and production complexes.

The model for the development of students' creative thinking skills should be improved on the basis of the introduction of technologies into the content of science, the integration of advanced foreign experience and an orientation towards taking into account the requirements of the content of education.

The content of the development of creative thinking skills in students should be selected on the basis of activation methods, taking into account the individual characteristics of students (games with creative thinking; creative games; puzzles; exercises - brainstorming; games - brainstorming; activating questionnaires).

Factors in the development of students' creative thinking skills in teaching natural and technical sciences (scientific and technical development process, problems of production processes in the environment, socio-demographic relations, creative literacy of family members, personal creativity, psychological counseling, leadership function of the class teacher (necessity determination of indicators of the formation of creative thinking based on the positive impact of natural, technical sciences).

Scientific and methodological recommendations have been developed for the organization of pedagogical processes aimed at developing the thinking abilities of students in teaching natural and technological sciences on the basis of a creative, heuristic, active approach. The choice of methods is carried out as follows:

- improving the development model of students' thinking based on the development of teaching natural and technical sciences;
- Enrichment of the content of the development of thinking skills in students through the choice and application of methods focused on creative thinking;
- Improvement of the pedagogical process based on the creation of favorable conditions for the expression of students' creative attitude to their chosen activity.
- identification of factors in the development of students' thinking skills, indicators of the formation of thinking skills and the development of scientific and methodological recommendations for the effective organization of the pedagogical process in this area.

Developing students' creative thinking skills in teaching natural and technical sciences, using students in the process of career guidance; The use of the opinions of parents and teachers as guidelines in their activities aimed at the formation of independent thinking about choosing a profession in accordance with their interests and abilities, serves to increase the scientific and pedagogical effectiveness of the process of their professional orientation.

In this regard, the formation of creative and social activity in teaching technology is based on the positive influence of factors (environmental relations, socio-demographic relations, professional literacy of family members, creativity, psychological counseling, the role of the class teacher, school subjects). We see that the foundation of professional work has been formed, and this foundation has contributed to the development of creative abilities in students.

In addition, the opportunities for students to use the factors of the formation of creative and social activity in teaching technologies have been increased.

Therefore, it is necessary to develop scientific and methodological recommendations for the organization of pedagogical processes in educational and production complexes on the basis of a creative, heuristic, practical approach aimed at developing students' creative and social activity. As a result, the mechanisms for the formation of creative and social activity of students in teaching technologies will be improved.

ORGANIZATION OF THE SPECIAL COURSE "CULTURE OF SAFE LIFE" IN PROFESSIONAL SCHOOLS OF UZBEKISTAN

Akramov Khusnitdin Muhitdinovich*; **Sayfitdinov Anvar Sadritdinovich****

*Docent,
NamSU, UZBEKISTAN

**Senior Lecturer,
NamSU, UZBEKISTAN

ABSTRACT

This article reveals the rationale for the study of the special course "Culture of safe life" in professional institutions. The conditions for the implementation of the course and the impact of this course on the professional training of students in professional institutions are considered. Since the establishment of the Ministry of Emergency Situations of the Republic of Uzbekistan, one of the priority areas of the Ministry's activities has been training the population in the field of civil protection and emergency situations. According to experts in the field of human and social security, if humanity does not change the nature of its life, then the irreversible consequences of environmental changes during the lifetime of the present generation will lead to social and ecological catastrophe.

KEYWORDS: *Culture Of Safe Life, Pedagogical Process, Personality Development Theory, Occupational Health And Safety, Human Activity, General Culture.*

INTRODUCTION

For centuries, mankind has been constantly exposed to catastrophes that claim millions of human lives and cause enormous economic damage. Unfortunately, a person practically does not notice the dangers that accompany him throughout his life, does not react to them, he himself generates them.

Scientific and technological progress exerts strong pressure and influence on Nature. This leads to dangerous consequences for the existence of mankind. Economic transformations in society have caused a significant part of the population to lose moral, social values and guidelines, to deny moral criteria of behavior. Security ideas are not perceived by the population as socio-

economic, vital categories. Since the establishment of the Ministry of Emergency Situations of the Republic of Uzbekistan, one of the priority areas of the Ministry's activities has been training the population in the field of civil protection and emergency situations. The adopted resolution of June 2, 2017 No. PP-3030 "On measures to further improve the system of training specialists in the field of protecting the population and territories from emergencies" gave a great impetus for secondary specialized, vocational education, which is aimed at the professional orientation of the younger generation, their response for emergencies, as well as for the acquisition of skills to protect the population and territories from emergencies.

At the same time, the educational level in the field of life safety from children to the elderly is low in all areas of state, public and private activities.

In accordance with this, the modern school is focused on creating a new model of education, in which the leading ideas are humanism and an individual approach to teaching and education, i.e. education of the younger generation. Only from the position of pedagogical activity can the process of forming the personality as a whole can be carried out. With this approach to personality education, two sides are taken into account: the individual development of a person as a person and the socio-historical development of a person as a person. In accordance with the individual approach, lifelong education is designed to develop in a person that system of values that can become the basis for the formation of the main components of a culture of safe living, to lay in it the mechanisms for the realization of spiritual, moral, physical qualities, the most important elements of a person's individual culture, which determine his attitude to the environment. the world.

Analyzing the possibilities of the currently implemented education in the field of the culture of safe life and comparing them with the real organization of the pedagogical process in vocational schools, we can conclude that scientific research in the field of culture of safe life is not properly implemented in practice in vocational schools.

Revealed contradictions between:

—Requirements for vocational schools for the training and education of the student's personality in the field of life safety and work to form the foundations of a culture of safe life in students;

- The level of teaching the course of safe life as a discipline and insufficient professional level of training of teachers - the course "Culture of safe life" in vocational education institutions;
- The level of knowledge of students on the culture of safe life in the chosen profession and the increased safety requirements of modern production for the preparation of a worker.

The revealed contradictions show the insufficient training of graduates of educational institutions of vocational education in the field of culture of safe life and increased safety requirements for the organization of work in the conditions of modern production.

We have set the following goal for ourselves; to analyze the state of the problem of forming a culture of safe life in pedagogical and special literature; substantiate the concept of a culture of safe life.

To study the features of the pedagogical process in vocational education institutions. Implementation of pedagogical conditions conducive to the formation of a culture of safe life in students.

To enrich the educational process with didactic materials on the formation of a culture of safe life in educational institutions of vocational education.

Develop a system for monitoring and evaluating the culture of safe life among students in vocational education institutions.

modern psychological and pedagogical theories of personality development; provision on the relationship of ongoing socio-economic changes and the renewal of the content of education; provisions on the biosocial essence of a person; the concept of the gradual formation of a culture of personal safety on the basis of a personal approach is the theoretical and methodological basis of the study.

In our research we provide:

1. Concretization of the concept of a culture of safe life with the allocation of its main components that ensure the individual's survival in the modern environment. Which must be formed in the process of training vocational education specialists (consisting in knowledge of the dangers in the implementation of professional and household activities, the ability to adequately respond to emerging dangerous and other situations; communicative qualities that allow minimizing the negative impact of hazards, etc.);
2. Determination of the pedagogical conditions for the formation of a culture of safe life in students, allowing to implement integral pedagogical systems in the field of safe life in vocational education institutions;
3. Determine the systems of criteria for diagnosing the culture of safe life of subjects of the educational process in vocational education institutions.
4. Scientific substantiation and experimental verification of the model of the learning process and the formation of personality traits, which has the components of a culture of safe life, ensuring the minimization of the negative impact of the dangers arising in the course of the activities of graduates of vocational education institutions.

From a theoretical point of view, our research assumes:

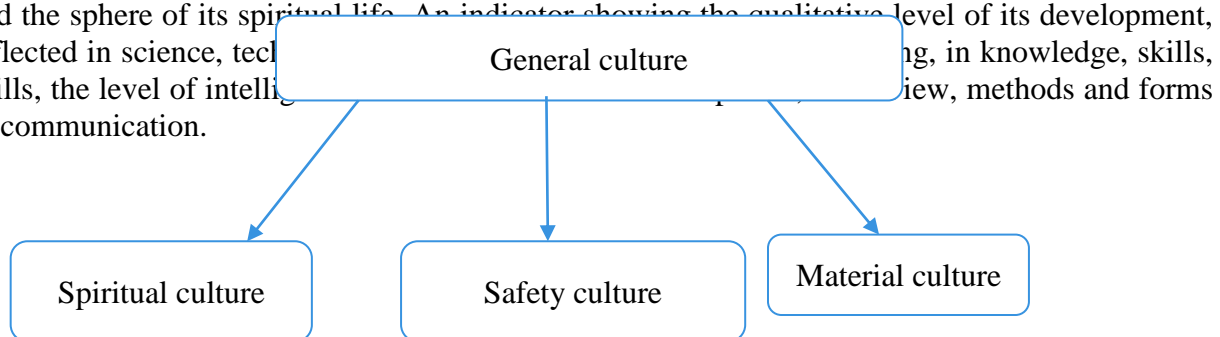

Determine and scientifically substantiate the components of the culture of safe life of graduates of vocational education institutions, as well as the pedagogical conditions for their formation.

To develop a methodological system for studying the subject "Fundamentals of safe life", which is a complex of didactic materials that allow the graduates of vocational education to form the components of a culture of safe life and ensure that the negative impact of the environment on the activities of future employees is minimized.

From a practical point of view, we plan to develop and create an educational and methodological complex including: courses "Basics of life safety" and "Labor protection and safety of life". To offer guidelines for teachers of the basics of life safety of vocational education institutions, as well as criteria for assessing the work of educational institutions for the safe organization of the educational process.

The main components of the culture of human life safety and the need for their formation at the present stage of development of society were proposed in his work by V. Yu. Mikryukov, he claims that "The life of an individual and humanity as a whole is carried out through life. The

The social role of culture is that it is a system that includes the practical experience of humanity and the sphere of its spiritual life. An indicator showing the qualitative level of its development, reflected in science, technology, art, and in knowledge, skills, and abilities of the population, the level of intellectual development, the level of communication, the level of scientific, technical, and artistic view, methods and forms of communication.

This is an approach in science, which consists in defining culture and looking for their specific characteristics. Of course, this approach continues to retain its theoretical and practical significance: at the heart of the selection of any aspect of culture are specific values (rules of behavior, beauty criteria, norms of physical condition, possession of controlled procedures, etc.). The specificity of life safety culture lies in the values of the ethical style of interaction between a person and the surrounding reality.

The concepts of "life safety" and "safe life" reflect interrelated phenomena and processes. Life safety as a social phenomenon is embodied in science (includes scientific knowledge about the safety of man and society), art, mythology, ideology, religion, sports. Life safety as a scientific discipline systematizes and generalizes data from different sciences, in conceptual form reflects the laws of human and social safety.

The culture of life safety is life according to the laws of safety (prevention, minimization, overcoming, elimination of the consequences of harmful and dangerous factors).

The culture of safe life of an individual at least includes a number of additional components - this is not only safe life, but also motivation, experience of self-improvement of readiness for safe life, and so on. It follows that the concept of "culture of life safety" is broader than the concept of "culture of life safety".

For a more complete disclosure of its content, we will analyze various approaches to disclosing the essence of the culture of safe life in its relation to the general culture of a person.

Creation of an environment (social, economic, ecological, etc.) safe for human life, however, still does not guarantee that society will be spared tragedies at work and in everyday life, as a result of accidents. Obviously, safe life is not limited only to organizational measures that regulate the behavior of individuals and social responsibilities. Safe life is realized only through oncoming traffic: creating a safe environment for humans.

The culture of safe living, based on the values of safety, belongs to the area of spiritual culture. It is the culture of safe life, reflecting the values of safety, recognizing the ethics of life safety, that becomes decisive in the structure of both spiritual and general culture (see Fig.). The figure shows the composition of the general culture, the relationship of its two types: material and spiritual. The culture of safe life is an integral part of the general culture and interacts with both spiritual and material culture.

The culture of safe living is universal:

1. Is the unity of the process of creating values and the process of mastering these values (performs an axiological function);
2. It is a system of qualities that regulate the effectiveness of the application of knowledge, skills and abilities of safe behavior both in normal and in extreme conditions (performs a regulatory function);
3. Performs a normative function. As in the general culture, in the culture of safe life there are the simplest ideas about how to act, fixed in the norms. The norms are fixed in the mind of a person and are subject to strict implementation.

As a result of our research, we propose the development and creation of an educational and methodological complex including: the curriculum for the study of the profile course "Culture of safe life, which includes courses" Occupational health and safety "and" Fundamentals of life safety "; textbook for students in vocational education institutions and guidelines for teachers of the course "Culture of safe life" in vocational education institutions.

ABSTRACT

The article is devoted to the review of the concept of the Internet of Things. The reference model of the Internet of Things is illustrated and described. The architecture is shown, and the technologies and protocols of interaction within the framework of the Internet of Things concept are also described. The state of standardization of the Internet of Things is analyzed. Modern international standards for the Internet of Things platform are also provided. The paper considers the protocols used in the Internet of Things networks that provide interaction between the technology levels, analyzes their features based on the procedures performed with their help.

KEYWORDS: *Internet Of Things, Internet Of Things Reference Model, Internet Of Things Architecture, Technologies, Protocols, Standardization, Qos, Quality Of Service.*

INTRODUCTION

Today, IoT technologies are being actively implemented in all spheres of human life, thereby allowing the use of various devices that make life easier for society as a whole. The concept of the Internet of Things is that by connecting an object to the Internet, the possibilities of virtual and real functioning are combined.

Devices of the Internet of Things for correct and efficient operation must correctly interact with other devices so that the end result can improve the quality of life of citizens. The Internet of Things copes with its goals, using modern computing, radio frequency identification (RFID - Radio Frequency Identification) technologies, a wireless sensor network (WSN - Wireless Sensor Network), short-range communications (NFC - Near Field Communication) and machine-to-machine communications (M2M - Machine-to-Machine). Nevertheless, in the modern world the variety of technologies and devices is growing, and, consequently, new problems of their interaction appear, which leads to the need to develop new standards [1].

Research methods and results obtained:

In accordance with ITU-T (Telecommunication Standardization Sector -

ITU-T, International Telecommunication Union - Telecommunication sector) Y.2060, Internet of Things (Internet of things - IoT) is a global infrastructure for the information society, enabling advanced services connecting (physical and virtual) things based on existing and developing interoperable information and communication technology [2].

The main organizations involved in the standardization and practical implementation of the individual components of the Internet of Things above are involved in many international companies, such as the International Telecommunication Union ITU-T, the European Telecommunication Standards Institute (ETSI), the oneM2M partner project, the 3GPP partner project, the Federal Agency for Technical regulation and metrology (Rosstandart), all of them make a special contribution to the development of standardization of the IoT network and services.

The main decisions in the IoT architecture have already been identified. Therefore, the main problem of the future is the formation and establishment of standards in order to determine a unified regulatory framework for the practical use of the Internet of Things.

There are currently three Global Standards Initiatives (GSI) under the ITU-T consortium, which are listed below:

- Standardization of the Internet of Things;
- Standardization of next generation networks;
- Internet-based television systems.

Consider the IoT-GSI (Internet of Things Global Standards Initiative), a global standardization initiative for the Internet of Things, which created a reference model for the Internet of Things that includes horizontal levels of device operation (Figure 1).

Figure 1. Reference model for the Internet of Things according to ITU-T Y.2060

Today, in the context of NGN (Next - Generation Network) networks, recommendations on IoT have been approved, namely Y.2060 "Overview of the Internet of Things", Y.2063 "Basis of WEB of Things" and Y.2069 "Terms and Definitions of the Internet of Things" ... Consider the IoT reference model in Recommendation Y.2060, which describes four basic horizontal layers (Figure 1):

- IoT application layer;
- support level for applications and services;
- network layer;
- Device level.

The Internet of Things consists of a set of different devices and technologies that enable the operation of the IoT, and its architecture shows how these components interact with each other. The architecture of the Internet of Things is based on four functional levels (Fig. 2), presented below [3].

1. Application layer. At this level of the IoT architecture, there are various types of applications for the respective industrial sectors and spheres of activity (energy, transport, trade, healthcare, education, business, etc.).

2. Service level. This is where services are created and managed. We can say that at this level a set of information services automates technological and business processes in IoT: support for operational and business activities, processing of analytical information, data storage, information security, etc.

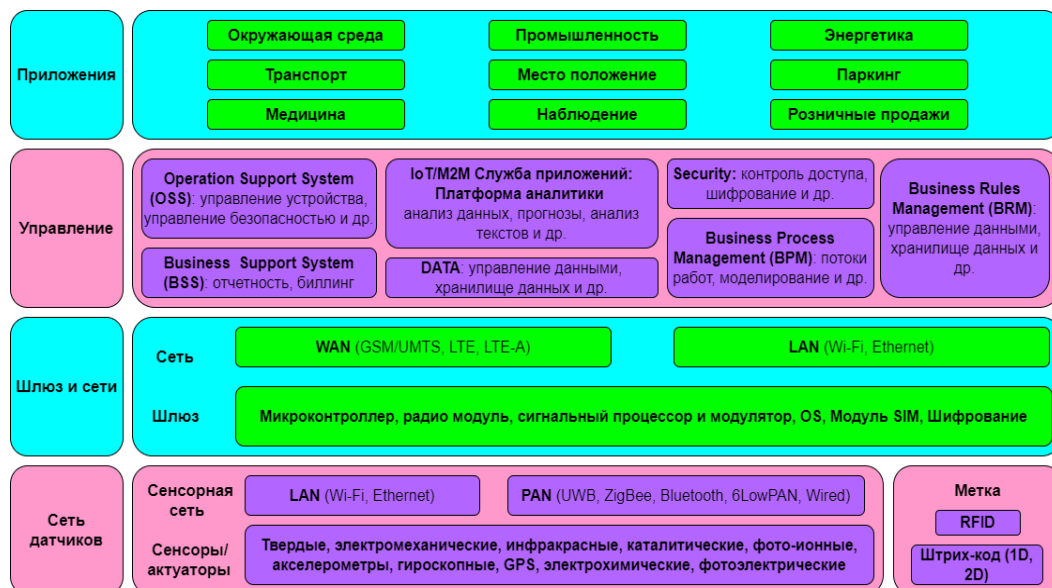

Figure 2. Architecture of the Internet of Things according to ITU-T Y.2060

3. The level of gateways and networks. The huge flow of information from the first layer of the Internet of Things requires a reliable and high-performance wired or wireless network for transport. These networks must conform to the quality of service (QoS). Therefore, we can conclude that one of the important factors is the provision of QoS for the IoT, which is very critical due to the heterogeneity of the network.

4. The level of sensors and sensor networks. This level consists of "smart" (smart) objects, combined with sensors (sensors). With the help of sensors, the process of connecting physical and digital objects takes place, which collect and process information in real time.

If you look into the future, IoT will capture all spheres of activity, while it is important to understand what requirements and characteristics the upcoming IoT systems should have: "self-configuration, self-optimization, self-defense and self-healing", large memory capacity, ample processing capabilities, as well as the ability to reason [4].

The lower level of the architecture of the Internet of Things is based on the following technologies [3]:

Identification tools. In order for an object to be automatically identified, various systems are used, for example, a radio frequency tag that is attached to each object, optical (barcodes, Data Matrix, QR codes), infrared tags, etc., all of them allow to simplify, automate and protect a wide variety of processes. But in order to ensure the reliability and uniqueness of identifiers of different types, it is necessary to work on their standardization.

Measuring. This type of technology makes it possible to process information about the external environment into data suitable for transferring them to means of transformation. These can be as separate sensors for temperature sensitivity, tens sensitivity, moisture sensitivity, illumination, etc.

In the modern world, promising methods of generating energy, alternative to traditional methods, are already widely used, for example, solar energy, geothermal energy, wind energy, biomass

energy, etc. In this regard, the issue of introducing autonomous measuring instruments becomes urgent, so as not to waste time and money on recharging batteries or replacing batteries, thus providing power to the sensors.

Data transmission facilities. Wireless and wired technologies are used to transfer information, but taking into account the peculiarities of each of them. In the first case, much attention is paid to improving the reliability of data transmission. The second method is based on the widespread use of data transmission technologies over power lines (PTL), since many objects are connected to power grids.

Data processing facilities. According to Microsoft, the main part of the Internet of Things is cloud systems that provide high bandwidth and provide prompt action in various situations (for example, to be able to calculate from the readings of sensors that no one has been in the house for 10 minutes, and the iron has remained on). Cloud technologies will allow you to cope with huge data flows. Also, it is worth abolishing foggy computing, with the help of which data, their processing and applications are not in the cloud, but in computing centers at the edge of the network, which allows you to be as close to the device as possible. All of this makes fog computing optimal for the Internet of Things. The above, fog and cloud computing have close interaction with each other, which allows them to effectively compensate for each other, for the effective operation of the IoT as a whole.

Actuators are designed to modify digital electrical (command) signals coming from communication networks in various operations that affect the control object. For example, in order to be able to turn on the power supply in the “Smart Home” with the help of modern gadgets, you need a device to which a signal will be sent. In practice, sensors and actuators are combined with each other.

Due to the fact that the IoT architecture at the level of sensors and sensor networks consists of sensors, sensors and actuators, it is important to use the appropriate protocols to ensure the guaranteed exchange of information between:

- devices;
- device and gateway;
- gateway and data center;
- gateway and cloud;
- Data centers.

All this is necessary for the transmission of reliable information to the end user. International organizations such as ITU-T [2], IEEE (Institute of Electrical and Electronic Engineers, Institute of Electrical and Electronic Engineers) [5, 6], ETSI (European Telecommunications Standards Institute) [7], OASIS (Organization for the Advancement of Structured Information Standards, Organization for the Development of Structured Information Standards) [8]; non-governmental associations: oneM2M (Open source implementation of the ETSI M2M standard) [9]; alliances of manufacturers and operators: IERC (European Research Cluster on the Internet of Things) [10], ISO / IEC (International Organization for Standardization, International Electro technical Commission, International Electro technical Commission) [11] ; partner projects: IoT-A (Internet of Things - Architecture, Internet of Things - Architecture) [2].

In 2020, a group of experts of the International Organization for Standardization (ISO, International Organization for Standardization), in the field of developing standards for the Internet of Things, published three new standards.

The first of these, ISO / IEC 21823-2, includes a framework and interoperability requirements at the transport layer to enable the construction of an IoT platform with data exchange, peer-to-peer connection and continuous communication between IoT systems.

The second is ISO / IEC TR 30164, which provides general definitions, characteristics and technologies for data management, networking, security, hardware and software optimization, and remote computing services for IoT applications. ISO / IEC TR 30166 is the third new standard found its application in the general platform of the Industrial Internet of Things (IIoT, Industrial Internet of Things). It describes the characteristics, technical and functional components [20].

Internet protocols such as Telnet (Teletype network), HTTP (Hyper Text Transfer Protocol), UDP (User Datagram Protocol), SSH (Secure Shell), SNMP (Simple Network Management Protocol), ICMP (Internet Control Message Protocol) have been taken over by IoT applications.

The IEC 60870-5-104 protocol, taken from the industrial Internet network, is used in telematics. This protocol is designed to transmit data of serial binary codes to control and manage geographically distributed processes; it was also used in the Internet of Things. In special cases, protocols are specially designed for low power consumption networks. The positive side for the Internet of Things is the use of existing Internet protocols, an example would be the IPv6 protocol, since this allows you to directly access IoT objects via the Internet [12].

For the implementation of the IoT, it will be advisable to use the classification of IoT protocols according to the zones of their application in the network between the client and the server, such as:

- D2D (device-to-device) - protocols that allow terminal devices to communicate directly;
- D2S (device-to-server) - protocols that are designed to transfer information received from devices to the server infrastructure for data processing;
- S2S (server-to-server) - protocols that allow servers to “communicate” with each other.

A protocol such as MQTT (Message Queue Telemetry Transport), a data exchange protocol for transmitting information from various devices using remote monitoring, is widely used in IoT networks at the application level. MQTT is used for data interchange, i.e. send and receive messages when an interaction occurs between clients that send data (publishers, Publisher) and clients that receive data (subscribers, Subscriber) on the TCP transport layer. This protocol uses fourteen messages based on request and response, through which it is possible to control the sending of messages using three QoS classes.

Another of the most common protocols used by devices and applications of the Internet of Things, which is used at the same level as the MQTT protocol, is the Constrained Application Protocol (CoAP), which is a web transfer protocol that uses the UDP transport protocol.

CoAP is a specialized transport protocol developed by the IETF working group - CORE, built for resource-constrained networks and devices, M2M applications, and more. [14]. CoAP can be

defined as an adjunct to HTTP, but with one difference, CoAP is targeted for use in restricted devices.

CoAP uses the following request-response messages: GET - Requests a resource representation; PUT - replaces all current resource representations with the request data; HEAD - requests a resource in the same way as the GET method, but without the response body; POST - used to send entities to a specific resource; DELETE - deletes the specified resource; CONNECT establishes a "tunnel" to a server identified by a resource. User applications use these messages to manage and monitor the resource. At the request of the client, the watch flag is set after the first message is sent, the server continues to respond, allowing them to stream the sensor state changes. [15]

Because the Simple Object Access Protocol (SOAP) uses the Remote Procedure Call (RPC) access mechanism, it is often used in distributed computing and Web services.

SOAP is a protocol for the exchange of structured and free messages in XML (eXtensible Markup Language) format in a distributed computing environment [16]. This protocol uses a basic connection model, which provides a consistent transfer of information from the sender to the receiver, potentially allowing the presence of intermediaries that can process part of the data or add additional components to it [15].

SOAP supports access mechanisms such as SOAP RPC and SOAP Message [16]. The first is SOAP RPC, a simple request-response protocol that builds on a Call object for synchronous remote procedure calls using XML. The second mechanism, SOAP Message, is a protocol for sending and processing SOAP messages that is used for asynchronous communication and implies an immediate or delayed response to a request. This protocol is based on the Message object.

A commonly encountered protocol in IoT is the DDS (Data Distribution Service) protocol, which is designed to provide communication between sensor nodes and sensors. This protocol distributes data between devices [17]. The DDS protocol implements direct bus communication between devices based on a relational data model. DDS implements a multicast system using UDP as its transport. This protocol provides two operations, read and write, using the appropriate classes. Of these, the most elementary is the operation, for this reason the read operation will be described in more detail.

The read operation is deployed to all available devices. As a result of this operation, the information is not deleted from the local DDS cache, and can be read again when certain parameters are requested. Data can be obtained in three ways: [17].

- Polling - the application (usually interval) polls the DDS to receive new data or inform about a state change. The frequency of polling depends on the application and on the message.
- WaitLists (WaitSets) - The application registers waitlists with DDS and waits until one of the incoming events occurs.
- Listeners - the application registers in the DDS (in the classes where the events are characterized) special listener classes that will be informed when these events occur.

I would also like to note the protocols that are used at the data link and transport layers. Ethernet is a networking standard based on the experimental Ethernet Network. The IEEE 802.15.4

protocol is a standard that provides two-way, half-duplex data transmission over low-speed wireless personal networks. NFC (Near Field Communication) is a short-range wireless data transmission technology that enables the exchange of messages between devices that are about 10 cm away.

ANT is a low power consumption wireless sensor communication protocol that operates in a specific frequency range, etc. To control devices, the most often used protocol is CWMP (CPE WAN management protocol) - monitoring by customer premises equipment (CPE) in accordance with the TR-069 specification (Technical report 069), which describes this protocol [15].

CONCLUSION:

In the future, the Internet of Things will be defined not only as objects of “Smart Things”, but also as “Smart Cities” and “Smart Countries”. In this regard, the Internet of Things is a promising concept, which has already received active distribution and popularization [18], but this is a concept about which there is no definite idea, hence many questions arise on the way of its development [19].

The IoT architecture assumes the presence of the following functional levels: sensor network, gateway, control, application. Since the lower layer consists of components such as sensors, sensors, and actuators, there is a need for protocols that allow these devices to communicate with each other and with higher layers. The descriptions of the protocols that were given above show pronounced differences between them, namely the functionality and the need for use. Some of the protocols were introduced into the Internet of Things from other technologies, but the rapid development of this concept leads to the creation of new protocols [19]. Given the intensive penetration of devices, the Internet of Things leads to the need for timely research aimed at studying the quality of service QoS. To ensure that, technical standards, specifications must be developed that define the exchange of information and its processing, as well as the relationship between things.

ABSTRACT

In this article, it was found that the yield rate is higher if the buds are left in the buds in moderation. It was found that if more or less buds are left than the norm, the mechanical composition, grape heads are small and large, leading to a decrease in the sugar content and acidity in the chemical composition.

KEYWORDS: *grape head, chemical, bud, loading, yield, variant, control, content.*

INTRODUCTION

In recent years, in the Republic of Uzbekistan, comprehensive measures have been taken to create new varieties and hybrids of grapes with high yields, resistant to common dangerous diseases and pests, as well as to develop optimal agricultural technologies for growing. However, the improvement of agrotechnical measures used in viticulture, depending on the soil and climatic conditions of each region, will further increase the productivity of the viticulture sector [1].

High efficiency can be achieved through the fullest possible use of all the factors that determine the quantity and quality of the crop of grapes. Given the importance of vine loading in the formation of grape yields, we set ourselves the task of determining the optimal amount of bud

load on the vine, the aim of the study is to explore the possibility of making fuller use of the voices[2].

Experiences:

It is carried out at the farm “Karima Muruvvat Agro”, established in 2009, located in Tashkent district of Tashkent region. The total area of the farm was 36 hectares of which, the area of grape varieties grown by the “Voish” method is carried out in vineyards on 5 hectares.

They are given different vine bush loads. The selection of experiments, the method of placement of options were carried out in the generally accepted ways, statistical analysis of the obtained data Buriev H.Ch., Enileev N.Sh., N.I. Ryabova., V.L. Viktovskiy and B.A. Dispersion analysis was performed according to Dospekhov's method.

In the cultivation of vines by the voish method, the vines are not cut (control), 80-120, 121-160, 161-200, 201-240, 241-280. By forming a vine bush with bud load, it was determined that the yield and chemical composition of the bush load depend on the “White Husayni” variety[3-4].

MAIN BODY

The yield of twigs depends on the average weight of each vine head on the number of grape heads available on these twigs per unit of land or on the number of harvested twigs per hectare. Options with high performance on these factors will always yield higher yields per unit of land.

The results of the study showed that, The effect of yield characteristics of buckwheat “White Husayni” on the bud load. The following results were obtained. In the uncut (control) variant, there were 34.0 single-crop rods, 3.4 double-crop rods and 37.4 total-yield rods. It was found that the average number of grape heads per single-fruited branch yielded 1.3.

When the current bush load is left in 80-120 variants, 5.8 units of single-crop rod control variant, it was found that the two-fruited twigs had a total of 5.2 fewer grape heads than the 0.6 ones, and it was observed that the average number of grape heads corresponding to a single-fruited twig was equal.

When the current is left at 120-160 bush loads, the single-crop rod is 0.8 units less than the control option, it was found that the average number of grape heads per double-yielding rod was 0.9 and that of a single-yielding rod was 0.1 less.

When 160-200 buds are left, the single-crop rod is 5.0 more than the control variant, the two-fruited twigs differed by more than 0.6, and the average number of grape heads per single-fruited twig yielded less than 0.2.

When 200-240 buds were left, the single-yielding rod yielded 5.8 fewer than the control variant, the double-yielding rod yielded 2.7 more, and the average number of grape heads per single-yielding rod yielded 0.1 less. With 240-280 buds left, single-crop rods are 7.7 less than the control variant and double-crop rods are 3.5 more and it was found that the average number of grape heads per one fruiting twig is equal.

(Picture)

Picture. The yield indicators of “White Husain” variety of grapes

The results obtained when studying the mechanical composition of grape heads of edible grape varieties revealed that not all varieties differed significantly from each other[5].

The grape heads, flesh, grains, and seeds of edible grape varieties were weighed on an analytical balance, calculated as a percentage, and the size of the grape head was measured on a ruler.

The results obtained from the data in Table 1 show that the weight of the “White Husayni” head of grapes in the uncut (control) variant was 317.8 g, the length of the grape head is 21.7 cm, the width is 11.2 cm, the flesh and juice of the grape head is 87.8%, the bunch is 4.6%, the skin of the grape is 0.5% and the seeds of the grape are 7.1%. The weight of a bunch of grapes at a load of 80-120 buds is 22.7 g from the control option, the length of the head of grapes is more than 2.6 cm, width was less than 0.1 cm, the flesh and juice of the grape head was 3.0% more, the bunch was less than 1.2%, the skin of the grape was 0.1% and the seed of the grape was 1.6% less than the control, grape heads of vine buds with 120-160 buds load 27.3 g compared to the control variant, grape head length 2.5 cm, width 1.2 cm, grape head flesh and juice 3.3% more, bunch 1.2% low, the husk of the bunch was found to be 0.1% less, and the seed of the bunch of grapes was found to be 2.8% more.

The weight of grape heads of vines with 160-200 buds is 38.0 g heavier than the control variant, the length of the vine is 2.7 cm, the width is 4.0 cm, the flesh and juice of the vine is 3.0%

more, the bunch of grape head was reduced by 0.5% and the husk of the bunch was reduced by 0.1%, and the seed of the bunch of grapes was reduced by 2.0%. Grape heads of vines with a load of 200-240 buds are 35.9 g more than the control variant, the length of the vine is 2.6 cm, the width is 2.3 cm, the flesh and juice of the vine is 1.6% more, the bunch of the vine is 0.5% low and the husk of the bunch was 0.1% less, and the seed of the bunch was 2.8% less.

Grape heads of vines with a load of 240-280 buds are 25.9 g more than the control variant, the length of the vine is 2.5 cm, the width is 1.6 cm, the flesh and juice of the vine is 1.1% more, the bunch of the vine is 0.6% low and the husk of the grape was equal and the seed of the grape was 1.6% less (Table 1).

TABLE 1 THE EFFECT OF BUD LOAD ON THE MECHANICAL COMPOSITION OF FOOD GRAPE VARIETIES WHEN GROWN BY THE METHOD OF “VOISH”.

Options	Head of grapes average weight, g	Grapeheadsize		Grape head body and juice, %	Grapeheadband, %	Skins of grapes, %	The seeds of the vine, %
		length, sm	width, sm				
The type of grapes which is not cut off (control)	317,8	21,7	11,2	87,8	4,6	0,5	7,1
80-120 bud	340,5	23,18	11,13	90,78	3,4	0,4	5,38
120-160 bud	345,1	24,20	12,40	91,05	3,4	0,4	5,25
160-200 bud	355,8	24,43	15,18	90,83	4,1	0,4	5,08
200-240 bud	353,7	24,33	13,55	89,43	3,9	0,4	5,33
240-280 bud	343,7	24,38	12,75	88,93	3,7	0,5	5,48
EKF ₀₅	2,2	0,4	0,2				
Sx	0,36	0,07	0,03				

One of the main factors in obtaining a high and quality crop from edible grape varieties is its navigational dependence. Yield quality and chemical composition of grape heads depend on both the biological properties of the varieties and the technology of cultivation[2,5].

In the case of uncut (control) variant of “White Husayin” variety of grapes, the number of grape heads in the vine was 37.4, the yield in the bush was 11.8 kg, the sugar content was 19.7%, the acidity was 4.9%. When 80-120 buds were left in the vine, the number of grape heads in one bush was 5.2 less than the control variant, the yield in the bush was 0.9 kg, the sugar content was 3.5% higher and the acidity was 0.7% lower.

When 120-160 buds were left in the vine, the number of grape heads in one bush was 1.7 less than in the control variant, the yield in one bush was 0.5 kg more, the sugar content was 2.55% higher and the acidity was 0.4% lower.

When the load of buds was left at 160-200 in the vine, the number of grape heads in one bush was 5.6 compared to the control variant, the yield was 1.8 kg more, the sugar content was 2.6% higher and the acidity was 0.4% lower. When 200-240 buds were left in the vine, the number of

grape heads in one bush was 3.2, the yield in one bush was 1.0 kg less, the sugar content was 1.6% higher than the control variant, and the acidity was 0.3% lower.

When 240-280 buds were left in the vine, the number of grape heads in one bush was 4.2, the yield in one bush was 1.4 kg less, the sugar content was 0.2% and the acidity was 0.1% higher (Table 2).

TABLE 2 DEPENDENCE OF THE CHEMICAL COMPOSITION OF THE “WHITE HUSAYIN” VARIETY ON BUD LOAD

№	Options	Number of grape heads in the bush	Yield in per bush, kg	Sugar content, %	Acidity, g / l
1	The type of grapes which is not cut off (control)	37,4	11,8	19,7	4,9
2	80-120 bud	32,2	10,9	23,2	4,2
3	120-160 bud	35,7	12,3	22,2	4,5
4	160-200 bud	43,0	13,6	22,3	4,3
5	200-240 bud	34,2	10,8	21,3	4,6
6	240-280 bud	33,2	10,4	19,9	4,8
	EKF05 =	3,0	0,1		
	Sx =	0,49	0,02		

CONCLUSION

The effect of “White Husain” varieties on yield was studied, the highest yield was 43 seedlings in 160-200 stem vines, the lowest yield was 32.2 seedlings in 80-120 stem vines.

The dependence of the mechanical composition of the grapes on the vine load was observed when the heaviest vine in the variants was 355.8 g with 160-200 buds left, the minimum weight of the vine was 317.8 g in the uncut variant.

The effect of budding on the sugar content and acidity of the “White Husain” variety was as follows: the lowest blood pressure was observed in the uncut (control) variant of 19.7 current tubers. Acidity was observed in the vine bush with a minimum load of 80-120 buds, the maximum bush was found to be 4.9% in the uncut (control) variant.

ABSTRACT

The article describes the role of mathematics in the world, its history and development. There is also talk of mathematical expressions, of several types. And in general, they enriched the science of mathematics with new creative discoveries. But math there are such misconceptions in the history of Central Asia in the IX-XV centuries has no math news. The definition of this value depends on the semantics assigned to the expression symbols. These semantic rules may declare that some expressions do not define any value (for example, when they include division by 0).

INTRODUCTION

As you know, there are many different sciences in the world. Each of them has its place in science. One such science is Mathematics. Mathematics is one of the fastest growing and most needed sciences in the world. Also, this science has been developing at various stages since ancient times. Scientists around the world have done a lot of research in the field of mathematics.

The demands of human life in mathematics, astronomy and other natural sciences satisfaction, improvement of various computational tasks and identification of new computational methods. In order to do this, various scientific research has been carried out in depth and extensively. Medium in this area In Asia, Baghdad and other cities, scientists of different nationalities worked together creatively and have achieved many scientific results.

In order to centralize the sciences, in Baghdad, "Baytul Hikmat" ("Wise Men." house ") was established. A large library and observatory were built in his presence. Scientists at this observatory made various observations and made various astronomical instruments. This is wisdom a number of scientists from several countries, including Central Asia, came to work at his home. Muhammad Khorezmi, Ahmad Fergani, Abbas Javhari and others are scientists at this university engaged in work.

During this period, Arabic was spoken in various languages under the rule of the caliph became not only the state language of the peoples, but also the language of science. That is why Medium Scholars of Asian and different nationalities: Persians, Uzbeks, Tajiks, Azerbaijanis, Turkmens and others have written in Arabic, and their manuscripts are mostly in Arabic preserved to this day. Well-known scholars of Greece and India also studied and analyzed them during this period and commenting on these works. The translation of works of Greek and Indian scholars into Arabic is also of great interest to scholars woke up. For example, Euclid's "Fundamentals" (third century BC), Archimedes' (3rd century BC) previous III century) "About the city and the cylinder", "Measurement of a circle", Ptolemy (II century) Algamest was translated into Arabic and commented on many of them.

Thabit ibn Qurra, a student of Khorezmi, wrote several works of Greek mathematicians translated into Arabic. Archimedes' Lemmas on the Seven Angles is in Arabic only copies of Euclid's Fundamentals III, VI, VII only in Arabic only the translation is preserved to us.

Central Asian mathematician's use their own knowledge in the field of mathematics comprehensively studied and analyzed and created new areas of mathematical research. And in general, they enriched the science of mathematics with new creative discoveries. But math there are such misconceptions in the history of Central Asia in the IX-XV centuries has no math news. These countries are the works of Indian and Greek mathematicians those who have studied and, in some cases, perfected previous conclusions.

In mathematics, a (mathematical) expression is a finite combination of symbols that is correctly constructed according to context-dependent rules. Mathematical symbols can represent numbers (constants), variables, operations, functions, punctuation, grouping, and other aspects of logical syntax.

Mathematical expressions include arithmetic, polynomial, algebraic expressions, closed forms, analytical expressions. The table below shows some of the similarities and differences between them.

Syntax

Being an expression is a syntactic concept. The expression must be well-formed: operators must have the required number of inputs in suitable positions, the characters supplied to these inputs must be significant, etc. The character strings that violate the syntax rules are constructed incorrectly and do not form an acceptable mathematical expression. For example, in normal

arithmetic notation, the expression $2 + 3$ is constructed correctly, but the following expression is unusable:

$$\times 4) x +, / y \times 4) x +, / y$$

Semantics

Semantics studies meanings. Formal semantics is concerned with the application of values to expressions.

In algebra, an expression can be used to denote a value that depends on the values of the variables included in the expression. The definition of this value depends on the semantics assigned to the expression symbols. These semantic rules may declare that some expressions do not define any value (for example, when they include division by 0). Such expressions are said to have undefined meanings, but nonetheless, they are well-formed expressions. Generally speaking, the meaning of expressions is not limited to the designation of quantities; for example, an expression can denote a condition, or an equation, that must be solved, or it can be treated as some object in its own context, which is governed according to certain rules. Certain expressions that denote a quantity simultaneously fix a necessary condition that is considered to be accepted.

Formal languages and lambda calculus

Formal languages make it possible to clarify (formalize) the concept of well-formed expressions. In the 1930s, a new kind of expression, called lambda expressions, was introduced by A. Church and S. Kleene to define functions and calculate them. These expressions form the basis of the formal lambda calculus system used in mathematical logic and the theory of programming languages. The equivalence of two lambda expressions is undecidable. Undecidability also occurs for expressions representing real numbers constructed from integers using arithmetic operations, logarithms, and exponentials (Richardson's theorem).

Variables

Many mathematical expressions contain variables. Some variable can be considered free or bound. For a given combination of values of free variables, the expression can be evaluated, but for some other combinations, the value of the expression may remain undefined. For example, the expression

$$x / yx / y$$

calculated for $x = 10$, $y = 5$, gives 2; but it is undefined for $y = 0$.

Thus, an expression represents a function whose inputs (arguments) are the values assigned to free variables, and whose result is the computed value of the expression. The result of evaluating an expression depends on the definition of the mathematical operators and on the system of values that is its context.

Two expressions are said to be equivalent if, for each combination of the values of the free variables, both expressions give the same result, that is, they represent the same function. For example, the expression

$$\sum n = 13 (2nx) \quad \sum n = 13 (2nx)$$

has a free variable x , a bound variable n , constants 1, 2, and 3, two occurrences of an implicit multiplication operator, and a summation operator. The expression is equivalent to the simpler $12x$ expression. The value for $x = 3$ and $n = 3$ is 36.

ABSTRACT

The article analyzed the opportunities of Business Intelligence (BI) systems as an effective solution in eliminating existing problems in small business activities and determining prospects. As a result of the analysis, the advantages and disadvantages of BI systems in determining the prospects of small business activities were discussed. Further stages of the study were identified as a result of the analysis. As "data", it is possible to understand the daily incoming voluntary view data collected in the process of business activities can be collected by software-hardware systems, that is, "raw irregular data".

KEYWORDS: *Business Intelligence, Benefits, Risks, Information Systems, Small Business*

INTRODUCTION

Today, the integration of information systems not only in the process of business activity in an accelerated fashion is going on, but they are also becoming an integral part of the business. One of the areas in which information systems are widely used is increasing the efficiency of business processes. This sphere includes tasks, for example, looking for effective solutions of business processes, automation of them, analysis of collected data, risk forecasting and improving the

financial situation of the business, as well as determining the prospects of business activity. There appears a need for software and hardware solutions consisting of information systems to perform these tasks effectively. Thanks to technological progress, new devices, technologies, systems are being created almost every day. This, in turn, provides an opportunity to effectively meet the needs of small scale business.

One of the problems in the small-scale business activities is data collection. It includes collecting data, storing it, comparing and analyzing it regularly, determining its source, and finding weaknesses in reports based on it. As the number and type of data also increase day by day, their collection and analysis begin to require a lot of time and factor, and in business activities, the timely analysis leads to a delay in the adoption of decisions that must be made based on the necessary analytical data, the implementation of appropriate changes, the use of measures to combat. This, in turn, will have a direct impact on the profits of the business on its financial situation.

Now there are a lot of ready-made Information Systems, Solutions in the collection and analysis of data. Most of them do not have the capabilities and advantages of BI systems in solving the abovementioned problems. The purpose of the study is to examine the opportunities and disadvantages of BI systems in determining the prospects of small scale business. At the beginning of the article, the problems in small business of Uzbekistan were analyzed. After that, the authors analyzed the possibilities of BI systems, their architecture, components, functions, as well as the potential risks of BI systems in the implementation of business activities.

MATERIALS AND METHODS

The Republic of Uzbekistan was chosen to analyze the problems and risks of small business on a state scale. One of the main reasons for this is the fact that entrepreneurship is developing very rapidly in Uzbekistan and the economy has entered the top 20 ratings of business environment improvement [1]. "A small business is an organization that has a private sector (usually senior management), but not dominant in its market, supporting local operations and employs fewer people" [2], writes Fayoza Bazarova in her article titled "Problems and solutions to the management of small business and entrepreneurship in Uzbekistan". Statistical data provided by Bazarova's study indicate that the share of small business in the GDP was 59.4 percent in 2018, 48.9 thousand new small business entities were created, 28.2 percent growth compared to 2017. It can be seen from this that small-scale companies are rising rapidly in this state. This, in turn, illustrates the rising value of information systems in small-business operations.

According to research, 25-33 percent of all independent small businesses suffer from failure in the first two years in Uzbekistan. 8 out of every 10 businesses will end in 10 years. [2]

Small business participants, unlike large corporations, usually do not have large financial and Human Factors. The consequences of errors, risks, or unforeseen events during the activity often lead to the end of small business activities. This trend is caused by the fact that financial resources are limited in a small business, as well as the use of inefficient analytical devices in the management of an organization, risk management, analysis, preparation of reliable reports on the state of business activity, risk forecasting and counter-measures against problems, or lack of use of such devices in general.

What is Business Intelligence (BI) systems itself? Scientists gave different definitions for it. This term was firstly used by Hans Peter Lun in an article published in the IBM System Journal under the name "A Business Intelligence System" in 1958. Lun presented business as a collection of all sorts of directions in science, technology, trade, production and legislation. And he tried to explain the systems used in them as a system of conscious activity (Intelligence System) [3]. In 1989, Howard Dresner, a business analyst at Gartner, which is a major analytical consulting company in the United States, described BI systems as "Technologies that combines under one umbrella for decision-making [4]. Jonathan Wu gave definition for BI terminology as the process of collecting multi-aspect information and the software as a means of answering business questions, as well as researching data as identifying significant trends in his article titled "What is Business Intelligence?" in 2000 [5].

By analyzing these definitions, BI can be divided into three major parts. They are "Data", "Information" and "Knowledge". As "data", it is possible to understand the daily incoming voluntary view data collected in the process of business activities can be collected by software-hardware systems, that is, "raw irregular data". "Information" refers to data that has been organized, analyzed, and given significance. As a result of the analysis and study of information, "intelligence" can be understood as a fundamental tool for decision-making in business activities. Databases, data processing technologies, and devices are often used to distinguish information from raw data (Data Mining, Machine Learning, Data Warehousing). BI devices (decision-making, dashboard, statistics, visualization) are used to bring information from the data object to an accessible appearance for users. In all market operations, the amount of incoming data tends to increase at a much faster rate from year to year. They don't bring benefit anyone in the case of raw data. They will not benefit anyone in the case of raw data, in the data collected in any business activity, there will be the knowledge that will add to the development of this business. The main task of BI systems is to generate this knowledge and thereby create the maximum productive use of information, which seemed to be unnecessary before business activities.

RESULTS AND DISCUSSION

So, BI is:

- Transfer of data to information and knowledge about business activities, the process of increasing the efficiency of the decisions that a business makes using the synthesized knowledge;
- Information technology methodology and programming. Collection of large data, storage, processing, sorting, analysis to bring to the appearance that a person can understand;
- Information and consolidation (systematized, regulated) are the knowledge acquired about business activities as a result of in-depth analysis of data.

The functions of BI systems in the strategic development of business:

- To assess the effectiveness of business lines;
- Control over the implementation of business plans;
- Control of financial devices;
- To analyze the effectiveness of the use of financial factors;

- To assess investment, financial and operational activities and determine prospects;
- Business activity modeling;
- control, manage and plan of expenses.

The business intelligence concept is characterized as the process of making decisions about business activities and implementing data (meta-data) on the prospects of business activity following a detailed review.

Components of BI systems:

- Data Collection;
- Data Integration;
- Data Storages;
- Data Processing;
- Data Presentation.

Data Collection includes software systems that provide the necessary information for the BI system. Specifically, it is necessary to distinguish between internal and external systems as a source. The required data is transferred into advances systems, processed, and condensed through *Data Integration*. This process is called the ETL (Extract Transform Load). The purpose of the ETL process is to ensure that the processed data is stored in the desired form to the database. Different tools may be used in *Data Storages*. The Data Warehouse and Data Marts tools are used in this section. When processing or analyzing data, first of all, all concepts and tools related to the analysis of data are selected. As a result, at this stage, the data stored during the Storage Process is attached to analytical programs that analyze the data using previously defined criteria. *This process* also includes the data production components used for online analytical processing (OLAP) and Data mining. Predictive modelling and Data mining – these tools are designed to help users classify data, formulate nominal and quantitative measurements, as well as use mathematical tools developed for analysis. In the *Data Presentation*, the results of the analysis are presented for targeted groups by special analysts [9].

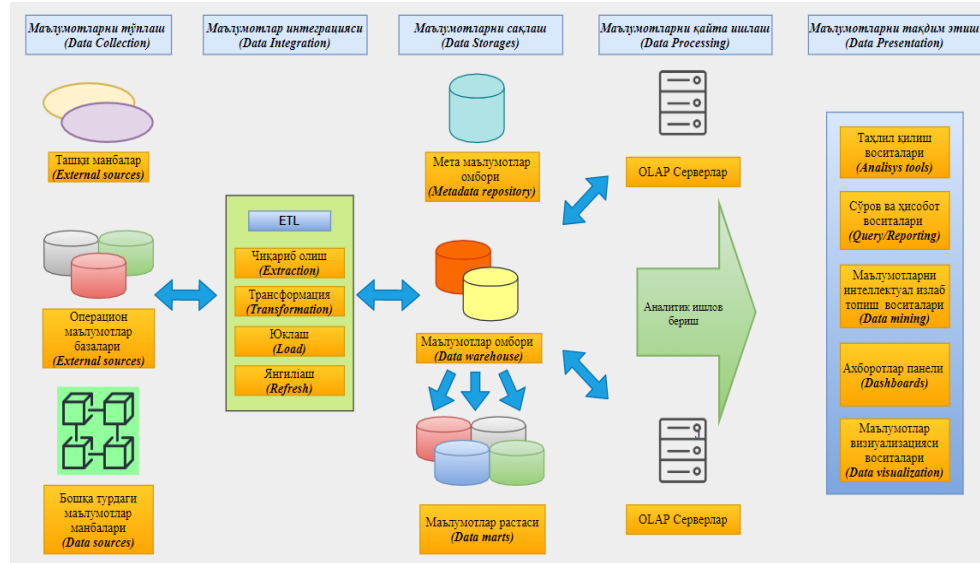

Figure 1. Data flow diagram in BI systems

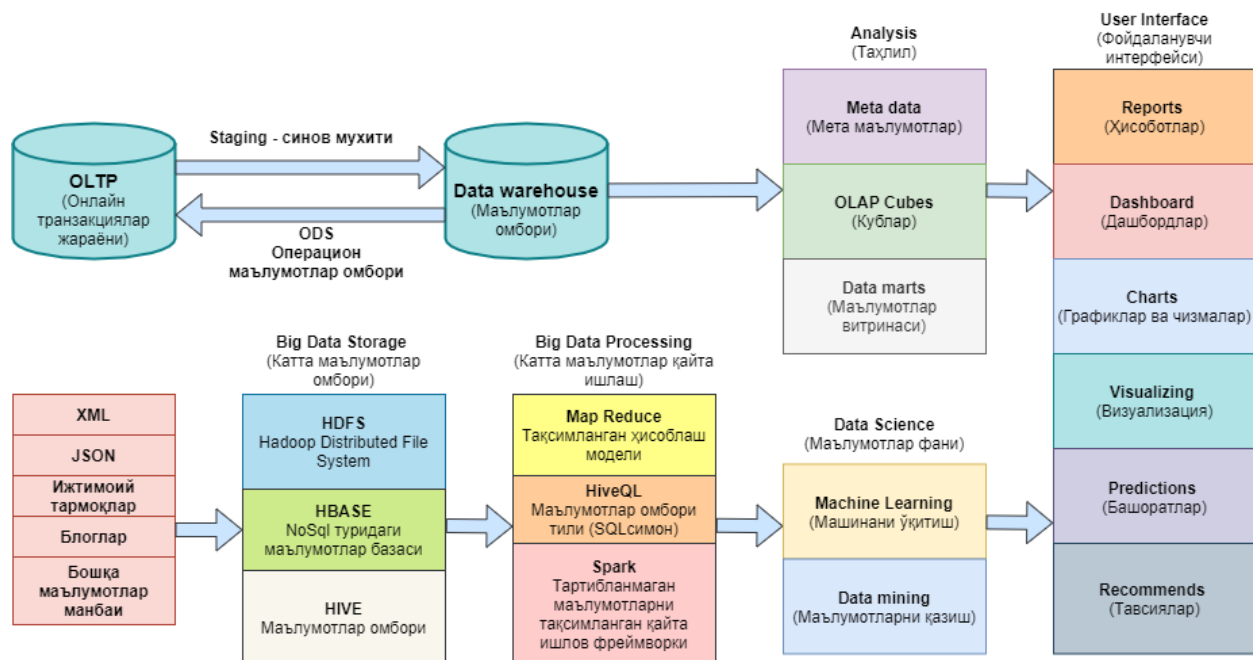

Figure 2. The general architecture of the BI system, which consists of different components

There are potential risks in the implementation of BI systems, among which:

- Implementation of BI systems requires additional costs in the first place. There is a certain level of costs for additional techniques, software tools, and Human Factors.
- The success of the implementation of BI systems depends on the qualification of management personnel, motivation.
- If the analyst and management staff make errors in the data evaluation and classification, the expected results will not be achieved.

- One of the risks is that after attracting active and qualified employees of the business to the implementation process, they can directly affect the current state of the business, not being able to fulfill their duties in business activities.

CONCLUSION

Now many small business organizations are trying to improve their skills in the field of business analysis, developing this direction. The management staff increasingly understand how valuable the unprocessed data stored in organization systems as a factor is. The collection, storage, analysis, processing, and presentation of data is the fundamental function of BI systems. It is possible to become an intellectual organization based on knowledge formed from the data of the organization with the help of BI systems. They not only increase the productivity of the current work process, but also determine the organization's prospects.

The following conclusions were made during the analysis.

Opportunities and advantages of BI systems:

- increase the efficiency of business processes, automation, development of structure;
- modeling of business activity processes, status within the framework of a single Information System;
- quick analysis of non-standard queries, cases, processes;
- improve the work efficiency of business employees through automation of business processes;
- keep working pace as the data grows exponentially.

Risks of the implementation of BI systems:

- The business of implementing BI systems in the first place requires additional costs. In this, there are a certain level of costs for additional techniques, software tools.
- The success of the implementation of BI systems directly depends on the qualification of management personnel, willingness to make changes to business processes, and motivation.
- Intended results cannot be achieved if the analyst staff, management make mistakes in the evaluation of data, their classification.
- Another one of the risks that may arise in the implementation of BI systems is that after attracting active and qualified employees of the business to the process of implementation, they can directly affect the current state of the business, not being able to fulfill their duties in business activities.

ABSTRACT

Nutrition is the study of food and its relation to health. Nutrition plays an essential part in body growth, development, maintenance and the utilization of food. People need enough food to reach their optimal physical growth and to live a healthy life. Primary malnutrition occurs as a result of an inadequate diet. There are many contributors to malnutrition, including access to food, maternal and child health, personal and environmental risk factors. Even if these root causes are present, poverty, lack of resources, and social, economic and political factors still play a role. Malnutrition is a common problem in Nepal, affecting children's growth and development. Children who are physically or mentally undernourished are less productive than normal children. Malnutrition in the early years may have an impact on future cognitive development. The concern about why malnutrition is prevalent in marginalized communities is one of Nepal's current health concerns. Mismanaged resources have caused a severe health crisis in remote areas of the country. The Chepang are among the most underprivileged indigenous ethnic groups with a complete lack of knowledge and awareness, leading to severe malnutrition. This study sought to discover trends in the causes of inadequate health among the Chepang people. A

mixed-method approach combining the census sampling method with a cross-sectional study design was used for this study. All significant causes of malnutrition were found to be poverty-stricken rural communities. In this area of study, the principal causes of malnutrition are early marriage; teenage mothers, low birth spacing, inadequate food, poor personal hygiene, early weaning practice, and maximizing money spend on alcohol and smoking.

KEYWORDS: *Malnutrition, under nutrition, over nutrition, stunt, wasting*

INTRODUCTION

Malnutrition refers to deficiencies, excesses, or imbalances in the energy and nutritional intake of a person. The term malnutrition applies to two broad groups. First is under nutrition and other one is overweight.¹⁴ According to estimates by World Health Organization, malnutrition leads to more than one-third of all child deaths, although it is rarely reported as a direct cause.¹³ Poor feeding practices or inadequate breastfeeding offer dirty foods, hand washing before food, and they do not ensure that the child is getting enough nutritious food to contribute to malnutrition.^{8,11} Children under the age of five face a number of burdens: 150.8 million are stunted and 50.5 million children under the age of five are wasted in worldwide.³

Nepal has made impressive steps in reducing chronic under nutrition (stunting) nationally, which fell from 57 % in 2001 to 36 % in 2016. Acute malnutrition (Wasting) is around 10 % of children under 5, which is deemed “high” according to 2017 WHO public health prevalence thresholds.^{5,6,7} Still, most of remote areas and endogenous communities are found more malnutrition than urban areas. It is due to the poor maternal nutrition, poor child feeding and low child birth spacing. In this study, the Chepang are living with depending on traditional farming systems. The economy of the Chepang is farming, forest and stream-based with traditional and indigenous technology.⁴ The major crops are Maize and Finger Millet.^{1,15} The average of their own food production is sufficient for about 6-8 months per year.^{9,10}

MATERIAL AND METHODS

A cross-sectional study design utilizing the census method (All 128 malnourished child of Benighat-Rorang whose were identified by Shanti Nepal on October 2019) was used for the study. Both quantitative and qualitative approaches were applied to get valid and reliable information. This study's population was under nutritious Chepang children of under five years (6-59 months) of Benighat-Rorang rural municipality, Dhading. The children cannot respond to the question, so the mother of under nutritious children was selected for this study. Mix methods (qualitative and quantitative) were applied for this study.

A structured self-administered questionnaire collected the quantitative data with an interview and qualitative data were collected using a semi-structured interview schedule by in-depth-interviews. Two Key informants' interview and four focus group discussions were conducted to collect the informations from studies areas. This study has its charm and importance, and this part has different identities to focus on and concentrate on research. In this research, Statistical Package for Social Sciences (SPSS) version 16 was used for quantitative data analysis.

Result

Among 128 respondents, 39.1 % of respondents had completed primary education followed by 34.4% who had informal education, 4.7% had lower secondary, 3.1% had secondary and only 1.6% had higher secondary and above. Unfortunately, 17.2% of respondents were found stills uneducated. Maximum respondents (68.8%) were drinking tap water, 15.6% were drinking spring water, 14% were drinking well water and 1.6% was drinking river water.

Access to food means that individuals have access to adequate resources (entitlements) for the acquisition of appropriate foods for a nutritious diet.^{2,12} In this study area's peoples are producing different crops. In the Chepang community, a maximum (50%) of respondents had food sufficient for only six months; 23.4% had twelve months, 10.9% had ten months, 6.3% had eight months, 4.7% had three months, 3.1% had nine months and 1.6% had one month. More than 75% of respondents had not sufficient food for a whole year. 73.4% respondents have managed the insufficient food from the market. 10.9% of respondents were managed by begging to be returned and only 25% of respondents had sufficient food. Similarly, 14.1% of respondents managed insufficient food by doing different business activities, such as selling Doko and vegetables.

In Nepal, the prenatal and postnatal care practice has not developed too much. Most pregnant women are not found proper diet, health check and proper care from their relatives. The demographical difficulties and lack of health facilities and rural communities' women do not get ANC checkups and postnatal checkups. Due to the lack of education, traditional and social norms, lots of child marriage and teenage childbearing are found in rural and moralized communities. So, the parental care practice of Nepal affected the nutritional sector.

According to the Nepal demographic health survey 2016, women in Nepal are married earlier than men. The median age at first marriage for women aged 25- 49 is 17.9 years, compared to 21.7 years among men aged 25-49 years. The legal age for marriage in Nepal is complete of 20 years.^{6,7} In the study area found maximum numbers of respondents (72%) were remarried between 15 and 19. Similarly, 17% of respondents were married less than 15 years. Only 11% of respondents were married between the ages of 20-24 years. Most of respondents (69%) had a first child born in age between 15-19 years and only 28% of respondents had a first child born in age between 20-24 years. In this study, most children (48.4%) were found mild malnutrition. The severe cases of malnutrition were found too much in Chepang communities in the context of Nepal. According to this study, 62.5% of female children found malnutrition, and only 37.5% of children were found malnourished.

Nepal's government has an ANC protocol, where mentioned the ANC checkup visits at the fourth, sixth, eighth, and ninth months of pregnancy. In the study population, most of respondent (89%) had ANC during pregnancy and only 11% had not done ANC visit during pregnancy. Pregnancy women do not visit health facilities due to the various regions. In Chepang community maximum number of respondents (57.1%) did not know the importance of ANC, 28.6% were due to their family obstructions, and 14.3% were due to the health facility near their home. Regarding to place of childbirth, more than half (56%) of respondents were found they gave childbirth at home, only 42% of respondents had given their childbirth in health facility and two % had other places. The maximum numbers of respondents (73.4%) were found a usual meal during pregnancy, 25% were found to take food and fruit during pregnancy, and only 1.6% was found to take food, meat, and fruit during pregnancy.

Breastfeeding duration was found to be up to six months (94%) and 6% was found up to one year. Due to the traditional norm and lack of awareness in the Chepang community, early weaning is a major factor in Chepang children's malnutrition. The majority (61%) of respondents had done weaning before six months and only 39% of respondents had done weaning after six months. Most people's (82.8%) found they checkup the sick child at the health post, 7.8% peoples check up their child at PHCC, 3.1% check up their child at private health facility, 4.7% checkup others place such as traditional healers, and 1.6% peoples did not take any place for checkup their child and they care at home.

Most of the respondents (98%) were found hand washing before and after child feeding; only 2% of people found they do not hand washing before and after child feeding. 57.8% of respondents were hand washing with soap and water (proper hand washing). In the Chepang community, there were also found that peoples still used the soil, ash and other materials for hand washing. Regarding the use of the place for child toilet, more than half (54.7%) respondents were used open place during child toilet and only 37.5% respondents were used toilet during child toilet and 7.8% respondents were used other place (cloth, pot etc.) during child toilet.

After the doing of child toilet, all most half (56.2%) respondents had disposal their child facial in the toilet, 31.2% had an open place and 12.5% had the disposal of their child stool in the farm.

Regarding the Chepang community's birth spacing, most of the respondents (45.3%) had 13-24 months of birth spacing. Similarly, 28.1% of the respondent had 0-12 months, 18.8% respondents had 25-36 months, 4.7% respondents had 37-48 months and 1.6/1.6% respondents had 49-16 months and 60+ months of birth spacing. Maximum respondents (95%) had listened about family planning methods and only 5% had not listened about family planning methods. 87.5% of the respondents had to listen about Depo, 84.38% of respondents had listened about Norplant and 72.44% had listened about Pills. Similarly, 39.06% of respondents had listened about Copper-T, 35.94% of respondents had listened about vasectomy, 34.38% had listened about Condom, and 21.88% had listened to Minilab. 61% respondents were currently used to family planning methods and only 39% were not used family planning methods.

In the under nutritious children's family had seen excessive alcohol and smoking behavior. Most of the family members, including adults, were also found taking smoke and alcohol. Most of the respondents (79.7%) had a behavior of taking smoke and alcohol, and only 20.3% had no behavior of taking smoke and alcohol. Two-thirds (62.5%) of respondents took both alcohol and smoking, 12.5% of respondents had smoking and 4.7% had smoking behavior. This study found that the average monthly spending on alcohol and smoking was found NRs. 2666 in the Chepang community. It is a big amount for the poorest families.

DISCUSSION

The study found that demographic characters influenced child nutrition. Most uneducated families had found more malnutrition than educated families. The primary cause of malnutrition was found in poverty. Due to poverty, most of the study population had no permanent home, own toilet, sufficient land for agriculture and money for the study. The average month of food sufficiency was found six months in the Chepang community.

Similarly, parental and child care practice had also helped to become malnutrition. Due to early marriage and teenager childbearing, most of the child falls under nutritious condition. In this

study, the average age of marriage was 16 years, and the average of first childbirth was 17 years. In Chepang community had also found discrimination in son and daughter, which resulted in 63% of female children were found under nutritious conditions.

Nepal's government had established lots of birthing centers in a rural community, but still, most Chepang had not practiced delivering in health institutions. In this study, 56% childbirth was found at home. Balance diet and extra food needed during the pregnancy period, but the study population were found 73% had not taken extra food and fruit during pregnancy.

The average age of under nutritious child was found 31 months. It was due to a lack of proper care of children, such as exclusive breastfeeding. In this study, 59% of respondents had to breast-feed the newborn baby within an hour and 61% of the respondents had conducted weaning before six months.

The other cause of malnutrition was found in sanitation behaviors. 98% of the respondent had hand wash before and after child feeding, but they had not correctly hand wash. Only 57.8% of the respondent had hand wash by using soap and water (proper hand wash). In the study population, 54.7% of children were toilets at an open place. Moreover, 56.2% were the disposal of their child stool in the toilet.

Family planning practice also had a role in malnutrition. Poor child spacing is a major cause of malnutrition. In this study, 73% of respondents had less than 24 months of birth spacing. The average birth spacing was found at 19 months in the study population. There was found low birth spacing so that the children are suffering from malnutrition.

Similarly, personal drinking and smoking habits affect family economics. People can manage insufficient or nutrient food from the market if they have saved money. The study population was found NRs. 2666 average monthly spend on alcohol and smoking.

CONCLUSION

Chepang ethnic group of Nepal is one of the most underprivileged communities regarding access to quality health and education facilities. Due to their traditional living of Chepang, the people are not friendly in coping with modern development practices and hence they live in extreme poverty. Agriculture is the primary source of their sustenance. However, most of the family would produce for less than six months. So, either they go to the jungle searching for yam and other wild foods or seek short-term labor for their sustenance. Limited Chepang families have necessary household facilities such as permanent toilets and safe drinking water.

Early marriage tendency was found very common in Chepang youths because they get the child in their teenage. Due to their traditional beliefs, the Chepang people hesitate to visit ANC and are forced to give birth at home. Due to the poor living standards and lack of awareness, most families were found not providing extra support and diets during pregnancy.

Peoples of the study areas were not found sensitive to care for their newborn babies. There were found early weaning practice. Exclusive breastfeeding for six months is the best for child health, but the Chepang community did not find the same practice.

Traditional cultural beliefs, poverty and lack of health education peoples do not adequately care for the pregnant, lactating mother and children in Nepal. The significant regions of malnutrition are poverty, health education and culture in our community. Early marriage and childbirth, low

birth spacing, insufficient food, proper personal hygiene, early weaning practice, maximum investment of money in alcohol and smoking are the leading causes of malnutrition in Chepang community.

Community-based interventions are needed to improve the number of families engaged in income generation works. The local government has to take a package to the reduction of malnutrition. There is also a need to implement policies such as reducing alcohol and smoke supply in the community, stopping early marriage practice, and prompting sufficient food for the most impoverished families and treating severe malnutrition in local health facilities.

ABSTRACT

The article deals with historical facts of appearance writing in human civilization. It is believed that the discovery of writing signifies the beginning of civilization is that man has the opportunity to preserve memories of past events and thus leave his experience to others. Writing is an invaluable means of transmitting the spiritual riches created by human thought from century to century, from generation to generation. And it is considered to be one of the highest discoveries of man. The advances made in the study of the history of primitive society in the second half of the nineteenth and early twentieth century's, and the many monuments found and read (deciphered), made it possible to trace the emergence and historical development of writing.

KEYWORDS: *Writing, Civilization, Inscription, Record, Ideography, Script, Pictographic signs.*

INTRODUCTION

It is known from history that civilization claims that the stage of civilization of the three great historical periods in human history (savagery, savagery, and civilization) began with the emergence of civilization. This phenomenon began 5-6 thousand years ago. The first writing consisted of pictures, but over time the alphabet began to appear in different parts of the world [1]. The reason why it is believed that the discovery of writing signifies the beginning of civilization is that man has the opportunity to preserve memories of past events and thus leave his experience to others. Writing is an invaluable means of transmitting the spiritual riches created by human thought from century to century, from generation to generation. He is one of the highest discoveries of man.

A writing record is a set of special characters adopted in a language. The concept of writing includes not only the symbols that represent the phonetic elements (words, syllables, sounds) of the language, but also the forms of pictography (Latin pictu - picture, picture, and pictorial inscription. Ideography (inscription representing individual words); as a set of traits, it is contrasted with pre-writing characters (memory traces, computational traits, etc.). In the era of the hereditary system, the picture was first created. In a society where human society is small and scattered, people communicate with each other only orally thought.

The advances made in the study of the history of primitive society in the second half of the nineteenth and early twentieth century's, and the many monuments found and read (deciphered), made it possible to trace the emergence and historical development of writing.

During this period, basically four groups of ancient inscriptions were deciphered:

1. Egyptian hieroglyphs of different types. The inscription of this species was read in the 1920s by the French scholar Champion. The ancient Cretan inscriptions read by Evans in the 70s and 90s of the 19th century and the Cypriot inscriptions read by Sims belong to the type of Egyptian inscriptions.
2. Different types of Mihat inscriptions. This type of Scripture was used in the languages of a number of ancient peoples in Asia (Sumerian, Assyrian-Babylonian, Elamite, Khald, Hittite, Persian, etc.). This type of writing began to be deciphered in the early 19th century and was completed in the first decades of the 20th century.
3. The oldest forms of letter (sound) writing recorded in the Sami peoples and adapted to their languages. These are the Phoenician and Canaanite inscriptions (the main monuments were found in the 60s and 70s of the XIX century and the 20s of the XX century): Southern Arabic, Aramaic inscriptions (the oldest examples were found in the 60s and 70s of the XIX century). Many scholars believe that the ancient Uyghur and Urhun enesey inscriptions also originated on the basis of the Aramaic script. It was deciphered in the 90s of the XIX century by linguists V. Thomsen and V. Radlov[2].
4. The ancient form of the Greek alphabet and a separate variant of the Latin alphabet, as well as these types of inscriptions in various other variants (various monuments reflecting dialects such as Phrygian, Etruscan, Italian, Venetian) have come down to us. These writings became known to scholars in the eighteenth century, and their grammatical study greatly contributed to the development of the science of comparative and historical linguistics in the nineteenth century.

The first record appeared 5,000 years ago [3]. The writing that people have learned consists of gestures, which for the first time were trampled on by stones with bird claws, bones, and stones. Later, as society developed, these gestures were studied. The first alphabet was created in Phoenicia and Greece. It later spread to other regions. After that, when people started to crush with bird feathers, not with claws, they began to crush trees, pieces of metal. Pictography (Latin pictus - drawing, depicting and ... graphics) - a type of writing before the developmental stages of writing, phonetic writing: a method of displaying the content of certain information in any picture or in a series of pictures. The American Indians, the indigenous peoples of Tropical Africa, the indigenous peoples of Australia and Oceania, were scattered among some peoples in Siberia and even practiced after the twentieth century. The oldest examples of pictography belong to the Paleolithic (according to some scholars - Neolithic). Pictographic signs -

pictograms differ from phonetic (sound, letter) punctuation in that they do not depend on a specific language unit and can be interpreted in any language: a pictogram is a specific word, its synonym, phrase, sentence with several meanings can be “read” in a few sentences[4]. Pictographs later became the basis for the origin of hieroglyphic and phonetic inscriptions. Inscriptions in the form of pictograms have been found in a number of archeological sites in Central Asia, including Uzbekistan. One such address is the village of Darband in the Boysun district of Surkhandarya province. Historians and archeologists of Termez State University have found a collection of the oldest stone inscriptions from the above-mentioned village. According to its method of crushing, it dates back to the 3rd-2nd millennia BC, and is about 5 years old. The inscriptions on the stone are so clear that we can easily read the images of simple animals, mountains and trees at a glance.

According to Zoir Choriev, there are about 70 large, about 30 small horns, and a total of about 100 images. That is why we have no hesitation in calling this book a stone book. Most importantly, this original pictographic work has not yet been found in any part of the world. And it confirms that the territory of Uzbekistan, along with Mesopotamia, China, Egypt and Ancient India, is a hotbed of civilization. A thorough study of these pictographic inscriptions by experts reveals aspects of the past that are also unknown to us [5].

The first record is completely different from our record today. The following historical event testifies to this. People have found paintings drawn in the Paleolithic period, 40-10 thousand years BC. The ancient man carved a pattern on the stone, carved symbols on the bone, and painted on the walls of the cave images of animals — bison, mammoths, owls, rhinos, horses, deer, and humans. So he described the duo as he knew it.

Over the course of the period, the recording of events through the object also changed (by type). Both the eloquent writing and the narration with the pictures performed their main function, as this writing could not become a peculiar memory that would preserve the knowledge accumulated by mankind. Traditions that took a certain form had to pass on traditions to a new generation. The division of labor and the exchange of goods required precise accounting. It was this necessity, the evolution that developed out of need. Thus began to serve the progress of society. Initially, it was used by certain classes - government officials, those who were constantly engaged in writing. The twelfth Pharaoh of Egypt wrote a letter to his son: Look at the shoemakers, they sew boots in the lamplight all night, get sick from starvation, and die prematurely. Look at the stonecutters, no matter how hard they work, no matter how hard they work, they will not get out of poverty. That is why you will be happy if you learn to write, be literate, and know how to write.

Ancient peoples highly valued the writing as a form of miraculous art, believing that the writing was created by their great gods. Writing seemed like a miracle to illiterate people. Literate people — priests, scribes, scholars, and statesmen — were considered privileged.

There are also some legends about writing. For example, there is a legend among the Indians living on the American continent about the origin of the world: The first man in the world had two sons, one white and one black. One-day God called the two children to him and placed gold and a book in front of them and said, “Take what you want from these two things, and which one you want to take.” Then the black boy took the gold and the white boy took the book. But the black boy finished spending the gold and left nothing to his children. That is why her children

were unhappy. The white boy took the book and taught it to his children and made them knowledgeable, literate. He made his children and grandchildren happy.

The fate of the inscriptions appearing in different nations is different. Today, there are about four hundred types of writing in the world. But the origin and origin of all writing is not known. Every writing system is alive, changing and evolving. More than two hundred years of work have been done in the field of the study of the writing system. The secret of some records has been fully revealed, others are waiting their turn. For example, the earliest documents of the Sumerians, written at the end of the fourth millennium BC and the beginning of the third millennium BC are still a mystery. The Sumerians were a spiritually advanced people from the earliest stages of social development. They were among the first creators of writing. Unfortunately, only the later letters of the Sumerians were read.

The Aramaic script dates back to the beginning of the first millennium BC. The original homeland of the Aramaean was the Arabian Desert in southern Syria and Mesopotamia. The spiritual and material needs of the culturally growing population in these deserts remained unchanged. Nomadic Aramaic tribes settled in the countries of Ancient and Lesser Asia (Syria, Palestine, Mesopotamia, Phoenicia, etc.) in the second millennium BC. These places were wet pastures and could be settled and more spiritually uplifted. When they became acquainted with the Phoenician script in Phoenicia, they adapted the script to the Aramaic language. The early Aramaic script was almost indistinguishable from the Phoenician script. Later, in the middle of the first millennium BC, the Aramaean made some changes to the Phoenician script. They also simplified the shape by reducing the number of letters. This change was due to the widespread use of Aramaic in trade and administrative activities and the need for rapid wear [6].

In the Aramaic script, words are separated, and a vertical line or two dots are used to separate the words. Later, leaving a space between the words was a picture. The Aramaean held a leading position in the socio-political and economic life of Old and Little Asia. From the 8th century BC, the Aramaic language and dialect rose to the international level in these countries. Then the Jews, the Babylonians, the Assyrians, the Persians, the Arabs adapted the Aramaic script to their own language.

By the 4th century AD, the Aramaean was mixed with the Arabs. As a result of the widespread use of the Arabic language, the Aramaic language also disappeared. The oldest Aramaic texts date back to the IX-VIII centuries BC.

In short, the emergence of oppression was a product of human activity and an important tool that formed the basis of human civilizations. After the arrival of the Phoenician Aramaic Jesuits in our country, the Khorezm Jesuits were formed due to local conditions.
