This article covers in detail the socio-political situation of the beginning of the XX century, the troubles of national bourgeois chauvinism, the struggle of the Jadids against the repressions of the Tsarist Empire, the relations of religion and science, as well as the selfless efforts and initiatives of Mahmud Khoja Behbudiy, the interpretation of Jadidism by researchers. In addition, the personality and mentality of Mahmud Khoja Behbudiy, discussions with contemporaries, efforts to integrate the new world into the consciousness of the people, and the wise struggle against the prevailing ideology will be highlighted.

KEYWORDS: *Enlightenment, jadid, Education, press, Turkestan nations, Newspaper, National awakening, Muslims, Nationalism, Ideology.*

INTRODUCTION

Today, the study and research of the spiritual heritage of our ancestors is of great importance in the formation and development of national pride, honor and dignity, patriotism, nationalism in our youth. In particular, the scientific and philosophical heritage of the representatives of Jadidism, in particular Mahmud Khoja Behbudiy, serves as a methodological basis in this regard. The socio-political situation in Turkestan at the beginning of the twentieth century, the vices of national bourgeois chauvinism, the struggle of the Jadids against the repressions of the tsarist empire, religious and scientific relations, as well as the selfless work and initiatives of Mahmud Khoja Behbudiy, his personality and believing that his attempts to introduce them into the minds of people, his rational struggle with the mainstream ideology was a true example of courage among his contemporaries. However, we see that various researchers expressed their views without expressing their views one-sidedly and deeply. In particular, the German scientist

I. Baldauf does not correctly reflect on the works, and the teachings of Behbudiy, at least does not attach importance to the fact that the Jadids themselves quite clearly explain what meanings are hidden in the term "Jadid". Perhaps one-sided, but for some reason ignoring these factors should not lead to the formation of misconceptions and concepts in science and philosophy. However, since H. H. Niyazi began to study the statements "Vakt", "Tarjumon", day after day began to study old superstitions, madrasah readings, changes in the life of the people, such issues as culture, economy, A. Badri Jadids "... thoughts and illusions, the desire should free us, the poor and the poor from grief, that is, from the oppression of emirs, princes and the rich, and make efforts and progress for our comfort and peace", while the enlightened Abdurashidkhanov said that "the loss of the tsarist government was a desire the Jadids. It is no secret that our political task and goal should also be this, "he admitted, arguing that these ideas and actions are ten or even a hundred times more difficult than" removing the rotten parts of something and putting in place a new one."

Apparently, A. Khalid and I. Baldauf thought more abstractly and, more importantly, considered means of communication and new forms of communication as a decisive factor. Given that these definitions were relatively recent, only in the next two decades, it is clear that the descriptions of the dictatorial Soviet period are somewhat "all-encompassing". For example, Academician I. Muminov writes about this: "The colonial methods of the police, patriarchal-feudal and capitalist forms of exploitation of the masses were the main reason for the growth of the liberation movement in Turkestan." According to the scientist, during this period the concept of democratic life in public thought became larger; its influence expanded, intensified, and became more significant than in previous times. Satisfied with the situation, the academician said that in the political situation of 1907-1910, national progressive thinking was severely persecuted by the tsarist police and attacks by the Jadids, he says and continues: "Many scientific works and articles have been written about Jadidism, in which Jadidism was emphasized. Some people see Jadidism as a progressive movement, while others point to Jadidism as a movement that played a progressive role in its early days, but later opposed the revolution. But the Jadids need to be approached specifically. "As an example of a "concrete approach" I. Muminov asks the question "How can you characterize the activities of the Jadids and ideologists?" And he answers: there was an attempt to resist the revolutionary liberation movement, the spread of the philosophy of dialectical materialism. The leaders of the Jadids, relying on deep-rooted traditions, almost did not demand reforms in confessional schools and madrasahs. Thus, they tried to convey the influence of religion and clergy to the general public in new but dangerous ways. Theoretically, in philosophical questions, the Jadids defended the principle of fideism, that is, a combination of science and religion. They did everything in their power to help the tsarist military administration with the help of the Malays and to fight the growing social democratic movement among the local workers in Central Asia. "Indeed, most researchers of communist ideology came to this conclusion long before Ibrokhim Muminov. For example, the secretary of the Central Committee of the Communist Party of Uzbekistan A. Ikramov at the congress of cultural workers on October 4-5, 1927, noted that "the Jadid schools served the interests of the bourgeoisie and prepared the necessary personnel for the bourgeoisie," and literary critic O. Khoshim "Jadid literature reflects the idea of the Uzbek bourgeoisie and the circumstances that she experienced works for her, burns, cries, "he said. Professor A. Saadi tried to prove that "the Jadid movement was the bourgeois wing of the national liberation movement based on capitalism (industrial capitalism) against the war-torn feudal imperialism of Russia", and

continued: it was the movement of the bourgeois intelligentsia. In this bourgeois wing of the national liberation movement, the ideological leaders were also petty-bourgeois intellectuals."

In short, since the second half of 1927, the historical services of the Jadids to the peoples of Central Asia, as well as aspects of their thinking and worldview, have been severely criticized. For example, the historian H. Tursunov wrote that "these strata of the national bourgeoisie, in alliance with the Russian bourgeoisie, opposed the ideological views of the local population, opposed the revolutionary movement in Russia and Turkestan as a whole." The peoples of Central Asia promoted their views and fought for it ". "The Jadids," says the author", presented themselves as supporters of cultural development, fought against feudal regimes, and suddenly became supporters of a reaction that betrayed the views of the masses." Academician T. N. Koriniyazov also took part in the discussion on the essence of the Jadid movement from the point of view of the Communist Party. The national bourgeoisie, "he wrote," has entered into an alliance with the Russian bourgeoisie, which has seized power and sought to take advantage of the growing spirit of national liberation among the workers." To this end, he created the organization of local bourgeois nationalists "ShuraiIslamiya" and the society of the reactionary clergy of the Ulema. Through these organizations; they promoted the slogans of pan-Turkism and pan-Islamism against the revolution. Education in many Uzbek schools under the "leadership" of the Jadids was poisoned by the spirit of bourgeois nationalism.

T. N. Koriniyazov is also forced to say that "the ideological trend of pan-Turkism and pan-Islamism, promoted by bourgeois nationalists and completely contrary to the interests of the people, has jeopardized the fate of our Uzbek national culture." Thus, the Turkestan Jadid movement is based on extremely reactionary doctrines, whose representatives are carriers of bourgeois-nationalist ideas, and contradict the aspirations and plans of the working people. This continued until the late 80's, when meaningless definitions migrated from articles to pamphlets, from them to monographs, textbooks.

In 1991, when the ideology that prevailed during the "decisive victory of socialism", "developed socialism" or "pre-communism" was blurred, Kh. Vakhidov "put forward" the following comment. "Although the Enlightenment as a cultural and historical phenomenon, as a whole, objectively expresses the needs of a dying capitalist society, its bourgeois orientation cannot be interpreted in the same way as the democratic one". The author means that the class nature of the bourgeois enlightenment, which objectively expresses the needs of capitalist society, must be scientifically justified and proven. Because "... historical facts exist as objectively as, they actually, exist. Comparing them with a certain (even assumed) point of view leads to the silencing or exaggeration of the weaknesses of certain persons or events."

Unfortunately, the comments marked by a period of repression and stagnation were recently repeated by the Doctor of Historical Sciences, Professor G. Khidoyatov. "The Jadids" he wrote in his book "My Dear History", have become an important social and political movement. Their leaders and patrons hoped to solve all their problems by agreement and cooperation with the tsarist government. "They sympathized with the Russian government. It was a clear betrayal of the national interest".

The social and philosophical views of Mahmud Khoja Behbudiy were described from the same point of view, that is, in accordance with the principles of class. It should be noted that Mahmud Khoja Behbudiy was the most criticized person during the Communist ideology. For

example, in the dissertation of the researcher R. Aslanov on the worldview of the famous Samarkand Jadid Said Ahmed Siddiqui Aizi, he is considered as a representative of progressive social thought, progressive and representative of the emerging bourgeois interests of Behbudiyand Munavvarkori.

However, in the thinking of Behbudiy and Aizi, there was no sharp difference in views on the system of science and education, national development, but there was unity and cooperation. Therefore, Behbudiy protected Siddiqui from the antiquities, through the magazine "oyina" at the time of the proclamation of the "infidel". The researcher R. Aslanov was either completely unaware of these cases, or deliberately closed his eyes.

The famous article by S. Kasimov from the Uzbek Soviet Encyclopedia is not without drawbacks. "Behbudiy's work is contradictory and reflects the mood of the local liberal bourgeoisie, which forms ideological, political and ideological views. In the complex work of Behbudiy, there are 2 main important periods. Before the Great October Revolution, Behbudiy promoted the ideas of the Jadids, which contradicted the ancients... On the one hand, he called on the people to master science, defended the right of women to receive knowledge, encouraged the opening of schools in a new way, the study of secular sciences, tried to understand the phenomena of nature, the roundness of the Earth, rotation and hanging around its axis, lunar and solar eclipses tried to explain from a scientific point of view ... On the other hand, in his practical activities and works, he expressed views in the spirit of counter-revolutionary bourgeois nationalism, described views in the spirit of nationalism, called for the use of scientific education as a tool for squeezing foreign capital out of Turkestan, and tried to combine science with religion in the interpretation of certain natural phenomena...»

To prove the failure of these "charges" against the personality and thinking of Behbudiy, we think that it is enough to describe the conditions of the early twentieth century, the complexity of the environment itself. In our opinion, the recognition of Usman Yusupov is particularly characteristic. "How were we?" In response to a question, he said: "If there is a revolution (the state coup on February 1917 you will see that the Mensheviks, the Social Revolutionaries, the Jadids were shocked. ... One said: "The rich can also be for the workers!" another shouted: "First we must defeat the Germans, and then make a revolution," and a third said: "Our brothers are Turks, and we must be with them ..." Not knowing who to listen to, my head was splitting: you are like a drowning man, you do not seem to be unconscious, you are ready to grab someone who will give you a hand, you run away and save yourself...»

As you know, the multi-faceted activities of the representatives of Jadidism-a stable national intelligentsia-are of great historical importance, served to increase national consciousness and strengthen the idea of independence. This can be understood from the descriptions of the Jadid movement and its representatives, their scientific and creative heritage. For example, in "Nezavisimosti: popular science annotated dictionary" the term "Jadidism" is interpreted as follows: Jadidism originated in the late XIX - first quarter of the XX century in the national bourgeois environment, which developed in the Turkic-Muslim lands (Crimea, the Caucasus, Volga-Bulgaria and the Southern Urals, Turkestan). Since then, it has served as the ideology of the national liberation movement in Turkestan - the ideology of the national independence of Turkestan. This dictionary also gives a very brief scientific description of Mahmud Khoja Behbudiy, which cannot be ignored. Mahmud Khoja Behbudiy, in it says, is the founder and leader of the Jadid movement in Turkestan," the report says. He was one of the

propagandists of the progressive ideas of the famous progressive intellectual, scientist, public figure Ismail Gaspirali (on behalf of the Crimean city of Gaspr, in Russian Gasprinsky), a well-known scientist, public figure, in forming ways to solve problems and tasks that the era dictates and exposes the need. MahmudhojaBehbudi put forward the following three rules: 1) act in accordance with the requirements of the time; 2) training of national personnel who determine the fate and prospects of the nation; 3) go beyond national borders and become a nation that can think globally, work at the level of world standards in political, economic, cultural and educational relations and dialogue with foreign countries.

Hence the famous literary critic A. Aliyev expressed: "... it is impossible to imagine Behbudi without the movement of the Jadids, the movement of the Jadids without Behbudi." Our scholars, such as SadridinAini, FayzullaKhodjaev, AbduraufFitrat, AbdulhamidCholpon, LazizAzizzoda, also highly appreciated the role of Behbudi in the history of Turkestan. "The service of Behbudi," wrote LazizAzizzoda, "is the same as that of Jean-Jacques Rousseau of France, Lomonosov, Chernyshevsky, and Dobrolyubov of the Russians, FathaliAkhundovand NajarbekVazov of the Caucasian Turks, and Sh.Marjani and K. Nosiri of the Tatars. "If, in addition to Navoi and Ulugbek, a third statue of a scientist and cultural figure is erected in Uzbekistan,"the author said at the end of the article," it will undoubtedly be a monument to Behbudi."

In conclusion, first of all, it is impossible to consider the works, teachings, worldview and thoughts of Behbudi one-sidedly. Secondly, to ignore the socio-political situation of the early twentieth century is to depart from an objective assessment of the science, philosophy, and essence of the Jadid movement of this period. Third, the attitude of the leaders of the Jadid movement to the arbitrariness of tsarist Russia was realized not only through education, but also through the development of national values, customs and traditions of the national liberation movement. FourthlyMahmud Khoja Behbudi and the representatives of Jadidism, in pursuit of their goals, opposed the policies of the dominant ideology and preferred to act more wisely than to stop their activities.

CONCEPT OF DEVIATION BEHAVIOR

Umarova Iroda Bakirovna*; Gazixojaeva Mushtaribonu Shovkatovna**

^{1,2}Master's of Pedagogy and Psychology,
Gulistan State University
UZBEKISTAN

ABSTRACT

There are given information about deviation behavior and shown its types in this article. After you read this article, you will know using of deviation behavior in two main contexts and you will be introduced to eight species of deviation behavior. It is worth noting the complexity of the concept under study and its interdisciplinary nature. Currently, the term is used in two main contexts. Deviant behavior first manifests itself as a subject of psychology, pedagogy, and psychiatry in the sense of "behavior and human behavior that is not formally established or actually conforms to the norms that exist in this society". Second, it is the subject of sociology, law, and social psychology in the sense that it is a "social form of human activity that is expressed in relation to mass and fixed forms and conforms to the norms and expectations that are officially established or actually exist in this society".

KEYWORDS: *Deviation behavior, Behavior, Psychology, Pedagogy, Psychiatry, Sociology, Attitudes, Person.*

INTRODUCTION

It is known that in the specialized literature the term "deviant behavior" is often replaced by a synonym for deviant behavior (deviatio - deviated in Latin). In the future, we will use both terms as complementary, that is, the words "deviant behavior" and "deviant". In this case, the first term is preferred because it is scientific, clear, and studied.

It is worth noting the complexity of the concept under study and its interdisciplinary nature. Currently, the term is used in two main contexts. Deviant behavior first manifests itself as a subject of psychology, pedagogy, and psychiatry in the sense of "behavior and human behavior that is not formally established or actually conforms to the norms that exist in this society". Second, it is the subject of sociology, law, and social psychology in the sense that it is a "social

form of human activity that is expressed in relation to mass and fixed forms and conforms to the norms and expectations that are officially established or actually exist in this society". In this guide, we will try to consider deviant behavior as a manifestation of the first aspect of preference - individual activity.

MAIN BODY

It is well known that the definition of a concept implies the separation of important features of appearance. In this sense, it is expedient to distinguish such special features of a person's deviant behavior so that it helps us to distinguish this behavior from other phenomena, as well as the need to determine its presence and dynamics in a particular person.

1. Deviant behavior of a person is a morality that does not conform to generally accepted or formally established social norms. In other words, such behavior is inconsistent with existing laws, rules, traditions, and social orders. When defining deviant behavior as deviant morality or behavior, it is important to keep in mind that social norms change. This, in turn, gives the deviant behavior a historically transient character. Examples include period and state, attitudes toward smoking, and more.

Clearly, deviant behavior is not any norm, but a violation of social norms that are somewhat important for this society at this time.

2. A person and deviant behavior and its manifestation are negatively assessed by other people. A negative assessment may take the form of a criminal prosecution, including a public hearing or social sanctions (norms). First, sanctions serve the purpose of preventing unwanted behavior. But on the other hand, they bring a stigmatization of the person (label, stamp) - a negative appearance to him, such as hanging a stamp. For example, in the form of difficulties in the adaptation of a person who has returned to a "normal" life after serving his sentence.

A person's desire to start a new life often fails as a result of the disbelief and rejection of those around him. The mark of a deviant (drug addict, criminal, suicide, etc.) gradually forms a deviant stability (self-consciousness). Thus, foolish fame reinforces dangerous isolation, hinders positive change, and leads to a recurrence of deviant behavior.

3. A characteristic of deviant behavior is that it causes real harm to a person or to others, significantly reducing their quality of life. This can lead to instability of the existing order, moral and material damage, physical violence and pain, deterioration of health. Deviant behavior in its most recent manifestations poses an immediate threat to life. For example, suicidal behavior, violent crime, "heavy" drug use. The psychological manifestation of harm is the suffering of that person himself or those around him.

This sign indicates that deviant behavior, regardless of its form - destructive or autodestructive - is destructive. In our view, close social manifestations such as radicalism, creativity, and marginality cannot be deviant behaviors and do not satisfy this character. Although they are also limited by generally accepted norms and provoke resentment in the conservative part of the population, these phenomena are more beneficial to society than risk. In short, individuals with radical tendencies aim to radically renew society, leading to promising changes in them. Creators are distinguished by their non-standardity and emerge as researchers and first discoverers. Marginals set themselves against the majority by expanding the boundaries of social norms. The listed phenomena can be combined. For example, often adolescent behavior reflects all three

trends, and a teenager who has experimented with a piercing, tattoo, or even a scar cannot really be included in the group of deviants. However, a heroin-consuming adolescent clearly exhibits a high-risk deviant behavior for life. Thus, deviant behavior is inherently destructive.

4. Behavioral deviation can be characterized as repetitive (multiple or long-term). It would be impolite to describe this behavior as deviant if a seven-year-old child received a small sum of money for sweets without asking his parents, unless he violated the social order in the future.

Conversely, if money theft is committed by a teenager with constant awareness - it is one of the forms of deviant behavior.

5. In order to classify a behavior as deviant, it must first be consistent with the general orientation of the individual. In this case, the behavior should not be the result of non-standard situations (e.g., post-traumatic stress disorder behavior), the result of a crisis situation (e.g., a grief reaction during the first month due to the death of a loved one) or the result of self-preservation (e.g., in real life).

6. Another feature of deviant behavior is that it is considered within the limits of medical norms. Although it is associated with a pathological condition, it should not be equated with a mental illness or pathological condition. In a state of mental disorder, it is natural for a mentally ill person to exhibit pathological behavior. Pathological behavior deviates from medical norms and the degree requires medical intervention and is studied in psychiatry, for example, as deviant behavior of mental patients. Pathological behavior refers to a significant decrease in a person's ability to understand and control their own actions under the influence of a disease condition.

At the same time, under certain conditions, deviant behavior can turn into a pathological appearance. For example, needy behavior can lead to a systemic disease - pianism, addiction. Thus, a deviant person can take any place in the psychopathological spirit of "health - disease - disease."

7. Another characteristic of deviant behavior is that it is accompanied by various manifestations of deregulation of social adaptation. This behavior does not necessarily lead to illness or death, but it does naturally lead to a state of disruption of social adjustment. The state of adaptive dysfunction, in turn, can be an independent cause of a person's deviant behavior.

8. The last sign of deviant behavior is its expressed individual and age-sexual identity. Deviant behavior primarily reflects an individual's external presence in society. It can be very "internal". The same types of deviant behavior are observed differently in different people at different ages.

DISCUSSION AND CONCLUSION

Individual differentiation of people is related to the causes of behavior, appearance, forms of dynamics, sign and level of expression. For example, the form of deviation and the degree of its expression is a more explicit description of a person's deviant behavior. They can change a person's life activities from a completely carefree appearance to a severe disruption.

Another important individual trait relates to how a person views deviant behavior as alien, unwanted behavior, temporary satisfying, or simple and charming behavior. Therefore, a person's attitude towards deviant behavior (personal point of view) often determines his or her destiny.

Based on all of the above, deviant behavior can be defined as a stable behavior of an individual that deviates from some important social norms, harms society or itself, as well as is accompanied by a violation of social adaptation.

The leading indicator of behavioral normality in terms of socio-normative criteria is the degree of social adaptation of the individual. At the same time, the successful adaptation of the norm is characterized by an optimal balance of values, the characteristics of the individual and the requirements of the social environment that surrounds him. Clearly, the manifestation of individuality, such as the explicit denial of social demands, in the form of conformism, for example - the complete subordination of the interests of the individual to the pressures of the environment - is equally a problem.

Insufficient adaptation is a state of inability to accept and fulfill the requirements of the environment as well as personal importance, as well as to realize one's individuality in certain social conditions.

Social and individual manifestations of social adaptation weakness can be distinguished. Social manifestations of adaptive weakness are:

- Low mastery, inability to earn money by their own labor;
- Chronic or overt failure in vital areas (family, work, interpersonal relationships, health);
- Disputes with the law;
- Isolation.

The following can be considered as individual manifestations of incompatibility:

- Negative internal order in relation to social demands (disagreement, misunderstanding, protest, counter-action);
- High protest against others, egocentrism in an attempt to avoid responsibility;
- Chronic emotional instability;
- Ineffectiveness of self-government;
- Weakness of coordination and communication skills;
- Cognitive distortion of reality.

ABSTRACT

This article is entitled "Methods of creating a database in MS Access and its scope. Planning and creation of a database for storage of medical and biological information in MS Access" in a modular system. Methods and scope of creating a database in MS Access. MS Access describes the importance of planning and creating a database for the storage of medical and biological information in medicine, its use in diagnosis.

KEYWORDS: MS Access, Database, Module, Platform System, "ZOOM" Program, Test, Video Conferencing, Independent Transfer.

INTRODUCTION

The development of information technology and the increasing flow of information, the rapid change of data is urging humanity to look for new ways to process this information in a timely manner. Creating a Database (DB) for storing, transmitting and processing data, and then using it more widely, remains relevant today. The work of medical, manufacturing, finance, trade and other enterprises cannot be imagined without a database.

It is well known that before the concept of MB entered science, it was very difficult to use data in different forms. The programmers organized the data in such a way that it would only be relevant to the issue under consideration. In solving each new problem, the data was reorganized, making it difficult to use the created programs. The purpose of some information system is to process information about real-world objects. A database in the broadest sense is a collection of data about specific objects of the real environment in a particular subject area. Subject area refers

to a specific part of the real environment being studied in order to organize automated control. For example, an enterprise, a factory, a research institute, a university, and so on.

In the current year of globalization, the development of data storage, management and security tools are the basis of any information system built on the basis of information technology. A data database is an interconnected and ordered set of some medical, physical, social, statistical, organizational, and other objects, processes, and situations stored in the memory of a computer or server. In the field of medicine, the MB is designed to ensure the lack of information of every medical staff. In practice, most databases are designed for a limited subject area. Multiple databases are created on a single server computer. It is also possible to merge some databases designed to perform related tasks over time. This topic covers the methods and scope of database creation in MS Access. Dedicated to the planning and creation of a database for storage of medical and biological information in MS Access. Samarkand State Institute of Medicine (candles) at the module system of teaching conducted since 2013.

More than six and a half terabytes of data were collected on the basis of the modular system of the institute platform. State educational standards for the science of medicine, information technology, and the pedagogical Institute on August 14, 2020, the of laboratory work and 36 hours of independent work time allocated for Baar. [1.2.3.4.]

Today, around the world coronavirus pandemic spread, in some States, a variety infectious diseases in case of frequently repeated to maintain the base of the candlesticks platform module system education priority aspects of the course will explain the transition period.

Methods and scope of creating a database in MS Access. MS Access database program in medical and biological information storage planning and create a practical lesson on the theme entitled to 80 minutes of time allocated. This broker main purpose of writing applications with candles on the platform, module, system, 'zoom and "telegram programs online to handle the detailed account of his priority evaluation criteria sets

I « Methods of creating a database in MS Access and the scope of application. MS Access program in medical and biological planning and creation of a database to store the information on the time of the lesson on the theme distribution.

1. The organizational part of the lesson (5 minutes)
2. Students with a question and answer strictly for evaluation (10 minutes)
3. « Methods of creating a database in MS Access and the scope of application . MS Access program in medical and biological planning and creation of a database to store information about the theoretical data (15 minutes)
4. MS Access program to work on the case , whenever (20 minutes)

7. Part of the **conclusion of the lesson (5 minutes)**

II. Students should know about the topic : [15. 2.3 .4].

1. The main concepts of information about the database .
2. MS Access program, the tables turn and create a new table .
3. MS Access program to create requests .
4. MS Access program to create forms and reports .
5. Data base Management System (DBMS)

III. Ligation to strengthen the practical lesson for additional questions : 15. [1.2.6.7].

1. What do you mean by MB design ?
2. Tell types of database models ?
3. **The process of working with MB tables**
4. **Organization of the request**
5. **Reports management**
6. **The function of the macro**
7. MS Access program for medical and biological information to create a database of data in planning and in medicine, what is the significance ?

IV. Candlesticks platform module system data in MS Access program to create a database of methods and applications to identify area. MS Access program for medical and biological information

V. Storage data in the database planning and creation on the theme of practical training brings the text (see also explain the reduced text document) [15]

Such a connection between the physician and the e-medical supervisor ensures that clinical trials are conducted more qualitatively and efficiently. Data from several clinical and regional medical institutions can be addressed at the state level in health planning. The Internet and digital information exchange have become an integral part of medicine and healthcare today . ^[1]

The creation and widespread use of electronic data access systems in the health care system is a topical issue. Today, the creation of the database is carried out in all government agencies. The health care system is no exception. This system is widely used in centralized medical institutions.

A database is named set of structured data related to a specific subject area.

Databases are the most important component of information systems. Database management systems have been created to make it easier for the user to use the database. These systems separate the database from the applications.

A database management system (DBMS) is a complex set of software and hardware that allows a user to create a database and work on the data in that database.

There are many types of MBBT. They also have their own special programming languages, which are called SUBD (System upravleniyami bazami dann y x) command programming languages. Examples of MBBT include Oracle, Clipper, Paradox, FoxPro, MS Access, and more.

MBBT - Applicants to the database management system can be conditionally divided into two groups:

- User group
- Team of designers.

Developers - work on creating and improving the structure of the MB table, taking into account the requirements of users of the MB.

Users - Representatives of MBBT applicants have the right to fill in the designed MB and access the data.

(Users do not have the right to manage or change the MB structure)

The main objects of MBBT.

An object is a being that expresses a whole with itself in terms of its application.

The following "objects" are used in the Microsoft Access MB file:

" Object "

- 1 - Table - tables;
 - 2 - " Requests - requests";
 - 3 - " Form - forms";
 - 4 - Full reports;
 - 5 - " Page - dataaccesspages".
- 1 - Table . - All data in MB is stored in tables.
 - 2 - Zaproz (quest). - It is a tool that allows the user to easily select the required data from MB tables.
 - 3 - Forms (Forms). - It is a tool for entering new data into the database, as well as reviewing existing ones.
 - 4 - Report . - Reports are used to print the data in the database.
 - 5 - Pages (Data Access Pages) .- This object is placed on a Web page and transmitted to the user.

Working with Microsoft Access

Working with any object in Microsoft Access begins with a dialog box called " Base dann y x ".

Download Access:

- 1 - Download the Access program in the office using the " Start " button;
- 2 - In the resulting Microsoft Access window, click the Create button and create the following window:
- 3 - *On the right side of the resulting window is selected " New Base"*
- 4 - When the file Novo Some dann y x 'at the bottom of the window,' The name of the file window, the name of the file created called ' models ' and ' Create ' button.

5 - The main toolbar of the " Base Dunn y x " dialog box is created.

Database in the left pane of the dialog, Microsoft Access' object ' audience Controls Enables access to the Reformation.

Creating a Table project.

1 - In the " Base dann y x " window, select the control named " Tables y " .

2 - Then select one of the three controls available on the right side of the activated panel:

- creating the Table V to the designer '
- creating theTable with helper master '
- creating the tables with the entering the informations

6 – creating the Table with the designer '.

The resulting Table Create window has two horizontal sections, with three columns at the top:

- the name of the area
- Data type
- Label ' ' (Note) called.

They display a *list of properties of the named field* in the line that is selected separately in the transverse subsection, i.e. a black triangular *marker* on the left *and a flashing cursor on the right*.

7 - The "field type" defined for each field is selected from the drop-down list via the " Deliberately hidden" control in the cell adjacent to the field name (for example, the " numeric " field type is selected by year of birth).

(There are many such hidden controls in Microsoft Access that remain invisible until data entry begins).

When creating a table, you need to specify its base area (Primary key area).

(This will be needed later in the inter-table connection)

8 base area (primary key), the mouse cursor to set the *name of the field* , standing on the *right mouse button* , and clicking on a pop-up menu that appears *Klyuchevoe pole* is enough to check.

Defining the base area (Primary key area)

Save Table Draft - To save a prepared table project, it completes the work on the table structure and displays a question about saving the MB table when we try to close the Designer window.

If the MB table is saved in this way for the first time, when the confirmation button is pressed in the first interrogation window, another interrogation window titled " Save " will appear with a field called " Name Table y " .

In the resulting field, the name of the table is "Enter Models" and click OK.

Fill in the table with data. Data base - to restore the name of the project is specified in the table, the tables turn. We write down several models of cars listed in the slide below. In the "Models"

table, each car model has its own code, and the entry involving this code occurs once. Enter and save the following information to complete the table. (Enter numbers without semicolons, Access will set the " denejn y y " format for them).

Create another table based on an existing table . We have a single table in our database called Models. Now we start to create the second table "Customers", which contains information about the names of customers, their addresses, their orders .

Objective: *To link the table " Clients" with the table "Models" .*

Based on the model code, for each customer, you can get the necessary information about the ordered car from the "Models" table.

Just like you created the first table, create another new table called “ Customers ” .

The names of the fields in the Customers table are given in Table 2.

In the "Customers" table, the car model code can be found several times. Because a certain model car can be bought by several people.

Note: The telephone area (text format has been paid. The reason for writing phone numbers, special characters, for example '-'; '('. For example: (371) -223-44-66. CHislovoy point format numbers, it is not possible to use characters other than commas.

TABLE 2

The name of the field (imya polya)	Data type(type danniyx)
Model code	numeral
Contract number	numeral
Name	Text
Last name	Text
Address	Text
Index	Text
Phone	Text
Date of order	Data
Discount	numeral

9 - Name the finished table project "Clients".

10 - Now enter the information in Table 2 in the table "Customers" where the project is created:

- When entering data in the "Customers" table, you can enter some addresses, phone numbers, surnames. Care should be taken when entering the model code.
- The model code in this table should match the model code in the Models table.
- In the discount field, you can specify the percentage of discounts for regular customers.
- (For other customers, the number 0 is placed in this field).
- Multiply this field by Access 100 to set the percentage. Suppose a customer is given a 10% discount. In this case, the number 0, 1 is set. Linking tables

To link tables that have the property of linking to each other in Access, this is done by linking the initial key field of one table to the corresponding field of another table.

In the example we are considering, we need to link the “Models” and “Customers” tables.

11 - To link the "Models" and "Customer" tables, select "diagrams x" from the "Service" menu. « entering the Table dialog box appears. Entering the Table dialog box.

12 - Table y 'to' models' tables' Add ' button.

13 - In the same operation, fulfilling the customers 'table with Zech y t ' button.

Use the mouse to link the 'Model Code' field in the 'Models' table to the 'Model Code' field in the 'Customer Table'.

Use the mouse to link the Model Code field in the Models table to the Model Code field in the Customer Table.

Linking tables should be done in such a way that when working with the "Customers" table, it is enough to enter the model code if you need information about a particular type of car. « the change of the connection 'dialog box appears.

14 - When you click the Create button, the relationship between the tables is displayed graphically. Now multiple customers can order a car of the same model.

Note: The names of the linked fields do not have to be the same. The key is to match the type (format) of the data.

" Requests - requests";

The uniform was prepared

You can enter information in the table

Using the wizard, you need to select the information field required to prepare the report

The marked ones were moved to the right field

All the work needed to create a table connection is done with the mouse in a special window called “ *schema y x* ”.

This window can be opened with the command "Service" - "Schema y x" or activated by clicking on the view button located on the toolbar.

The resulting table link is displayed in the Schema y x window as a directional line connecting the two fields of the different tables.

The resulting table link is displayed in the Schema y x window as a directional line connecting the two fields of the different tables.

Establishing a relational relationship between MB tables should be considered when working on the MB structure.

Database, types. Creating, storing, formatting, sorting, and managing a database

Database - What is MB, how does it work? In the language of programmers, MB is a programmatically organized structure that stores, sorts, systematizes, corrects and complements information, and has the necessary tools and methods to create queries, selections and reports. The data in the MB will of course be relevant to a specific area, a series of related topics, or a specific topic. This program is part of Microsoft Office.

The following objects are used within the Microsoft Access MB file:

"Tables" for data storage;

"Queries" that serve to search and extract only the required information;

"Forms" aimed at viewing data in the MB table, making additions to them, and assimilating them;

"Reports" for data analysis and printing in a specific format;

"Data access pages" designed to view, update and analyze data in the MB via the Internet or other network.

We hope that the following statement will help you to gain a better understanding of Microsoft Access databases and their constituents, as well as to create your own personal database.

A lot of comply with database management systems, and these systems in ommaviylikda above all of the Microsoft Access program.

Properties of MB fields

In addition to defining the database structure, the MB fields also define a property that is common to the data that is written to the cells corresponding to a particular field. The concept of field property occupies a leading position among the expressions related to MB. Therefore, we briefly describe the basics of field properties.

The name of the field (imya polya) - a database with automatic action is taken in this area provide information the way you want to contact tissue. Field names can be used as table column headings.

Field type (type polya) - the type of information contained in the area.

The size of the area (size polya) -berilgan square tiles tones can set the maximum length of the data structure.

The format of the field (the format polya) - the field to determine the appropriate method of formatting the data cell.

Details of the mask (mask Swype) - this feature as a tool to automate the data input, the field will determine the implementation of the information in any form to be submitted.

Signature (podpis) - the texture of the field in the table to determine the appropriate column header. If the signature is not specified, it is replaced by the "field name".

The default value (значение по умолчанию) is an automated means of data entry, which means a value that is automatically written to the field cells.

Types of MB fields.

Field types are usually data types that are entered into the fields of a database table.

A *field type* is a field property that requires a separate statement, and its appearance is as follows:

Text field (tekstovoe pole), more than 255 character limit equal to the size of a specific text intended to keep unused space.

Memo field (pole Memo) - designed to store large volumes of text, the number of characters of which does not exceed $256^2 - 1$. In this case, the text is actually stored somewhere else in the MB, not in the field, which may not be known to the user.

Numeral area. (chislovoe pole) is designed to keep the true numbers.

Date / time field (pole « дата / время ») - a field that stores the calendar, date and current time.

Paid field (denejnoe pole) - the value of money funds thigs area, the number of field data stored money on the money varies with the specific features and steps further convenience, the corridor.

Accountant area (Schetchik) -qaydlarni numbering numbers for the area.

OLE object area (pole Object OLE), and to the introduction of (L & E) technology installation item or a shortcut indicators are designed to keep the natural area. Naturally, such objects are stored in the MB file, but somewhere other than the base table.

Hyperlink field (pole giperss lka) - Internet Web URL addresses a specific area for storage of objects. The notes in it are hyperlinks.

Master put in place (master podstanovok) - set this object using the keyboard, mouse, through the dissemination of information by selecting from a list field data entry automation.

Applicants to the MBBT (Database Management System) can be conditionally divided into two groups: the user group and the designer group. The project - pumped MB, MB, taking into account the requirements of users who need to improve the structure of the table and working on it.

Representatives of the user group of MBBT applicants are busy filling in the designed MB and expressing them. In general, users do not have the right to manage or change the MB structure, they usually only have access to information related to their functional functions.

The main objects of MBBT

An object is usually understood to be an entity that expresses a whole with itself in terms of application. In MBBTs, the term objects is given a special meaning, and in MBBT, which has its own complex structure, objects are used to perform complex operations related to the management of information flow, data entry, storage, sorting, protection, analysis and transmission. They serve to establish a certain order and at the same time create sufficient relief for the users. There are seven types of basic objects in Microsoft Access that we started exploring with you. Let's take a look at a number of them.

Tables are the main objects of any MB. All the information that needs to be stored in the MB is stored in the tables, and the tables also represent the structure of the MB - the structure of the fields, types and properties of the fields.

Queries are a tool that allows the user to easily select the required data from MB tables. Queries perform many operations on MB tables, ie sorting data by queries, ie filtering, changing data in a given order, calculations on data, tables from other sources automatically filled in with recalled data, etc. Most of the above operations can also be performed directly on the MB tables themselves. But it will take more work, more time. Queries are also convenient in terms of processing speed and MB security.

Forms are a tool for entering new data into the MB and reviewing existing ones. The user can enter information only in the allowed fields through the forms. The developers of the tissues, in order to automate data input form controls (counters, circles, squares, drop down *lists* advantage of the form and place the others. Completed forms to access the information more clearly seen In this case, everything on the finished form (ornaments, etc.) is reflected exactly in the form with the help of graphic tools. This means that not only data is entered using the forms, but also the existing rules in the MB are displayed visually.

Reports are more like shapes in terms of their properties and structure. Reports serve to print the data in the database. Therefore, they can be used to categorize printed data from other objects, as well as special design elements such as headers and footers, page numbers, date and time of the report, which are specific to other documents. is distinguished by the presence of special aspects intended for extraction.

Pages - this object, which is actually called "data access pages", is not mistaken in saying that it was created as a result of the very rapid popularization of the WWW service on the Internet. This object is placed on a Web page and transmitted to the user with it.

Macros are used to automate the execution of repetitive operations when working with MBBT.

Modules are created in VBA (Visual Basic for Applications). With the help of modules, the functional capabilities of the MB can be expanded, the specific requirements of the MB customer can be met, the speed of the MBBT and the level of protection can be improved.

Now let's get acquainted with the tools for developing the main objects of the MB in Microsoft Access. In simpler cases than "object masters" use tools such as auto-form, auto-report, which give faster results. For learning purposes, we recommend using each of these tools to create a database table, create a query, form, or report, and create a data access page.

While the use of "Wizards" speeds up the creation of tables and queries, the Designer *mode* is more *useful* than them for mastering the concepts and methods of *MBBT*.

Conversely, "Wizards" are more effective when creating forms, reports, and "data access pages" than Designer mode. Because it takes more work to beautify these objects than to fill them with content.

Working with any object of Microsoft Access begins through its dialog box "Base y x ". The left pane of this dialog box contains controls that enable access to Microsoft Access objects. Acquaintance with tables. Includes creating tables.

Table Table to make sure first of all, ' dann y x ' box ' Database Table ' 'and controls need to be selective. Then the active pane, select one of the three elements of management, that is the designer sozdanie Table V mode , sozdanie Table C pomoshyu master and sozdanie

Table Puteri Swype dann y x known as label we choose one.

Let's take a closer look at the window that corresponds to the first of these icons - the "Table Builder" window. This window represents a specific template tool for creating and editing table structures. It has two horizontal sections, in the upper part there are three columns called " the name of the area", " tip dann y x ", " description " and in the lower part of the transverse they are

selected separately, i.e. black on the left. a triangular marker, and a line with a blinking cursor on the right displays a list of properties of the named field.

The "field type" to be assigned to each field is selected from a list that is spread over a deliberately hidden control in the cell adjacent to the field name. It should be noted that Microsoft Access has many such hidden controls, which remain invisible until the data entry begins.

It is not necessary to prepare certain properties for the field. Some properties are pre-installed. They can be changed as needed.

When creating a table, it is advisable to define its base area. This will then help in establishing the inter-table connection. To set the base area of the mouse cursor over the name of the field with the right mouse button and a pop-up menu that appears *Klyuchevoe pole* handle is enough. Assigning a base area when creating a table is generally not necessary.

If no field in the table has the property of non-duplication of data, and at the same time, this table needs to be linked to other tables in the MB, then two or more fields should be selected as the starting base instead of the base field. possible. This is done, as before, through the context menu. In this case, selecting multiple fields is done by holding down the Shift key and selecting the square markers to the left of the selected field names once with the mouse pointer and the left mouse button.

Each time we complete the work on the table structure and try to close the Constructor window, it displays a question about saving the MBBT table. If the MB table is saved in this way for the first time, when the confirmation button is pressed in the first interrogation window, another interrogation window titled "Save" will appear with a field called "Name Table y". In the field, enter the name of the table, then press ENTER.

The resulting table is opened in the usual way, that is, by placing the mouse cursor over its icon, in which case the left mouse button is pressed twice in a row almost continuously. The label tables (indications) y x 'window' Database Table y 'element of the panel, there is no possibility to move (for example, Form N' Control panel). The newly created table will not have records. Initially, it contains only the names of the columns that describe the table structure. Filling the table with data is done in the usual way. Then the text cursor is set to the desired cell using the mouse cursor or the cursor control keys. Adding the next record to the table is done after the cell at the end of the previous record is filled. In this case, of course, the field "MB field" must be loaded with the property "educational field".

CREATING A DATABASE IN MICROSOFT ACCESS

To design and create a database, you need to run Microsoft Access. To do this, move the mouse pointer over the 'start' button on the taskbar of the WINDOWS window, left-click and go to the "Program y" section and select the Microsoft Access section.

The following window will appear after the program starts.

In the first window of the MB, in addition to the applications of the 6 main objects listed above, there are 3 more command buttons. These are: open, Constructor (Developer) Create (Create) button.

Open is button to open the selected item, Konstrutor (Developer) Opens the selected object, but the object do not open and the contents of the structure. If the object is a table, you can add ten new fields. The Create button is used to create new objects: tables, queries, forms, and reports.

Before creating an MB, of course, it is necessary to develop its design. To do this, it is necessary to determine the structure of the MO. A good structure of the MB will be the basis for creating an effective MO that meets the requirements.

There are two ways to create MB in MS Access. One is to create an empty database and then insert tables, forms, reports, and other objects into it. Although this method is much easier and more convenient, it is necessary to identify each element of the MO separately. Therefore, the second method is used more. In it, a certain type of MO with all the necessary tables, forms and reports is created at once using the "Master", and then the appropriate changes can be made. This is the simplest way to create a starting MO.

Creating MO using " Master ".

1. MS after the launch of the Access window and launch a master (Master), press the OK button to select the option to start the frame. If CA is opened or closed the first dialog box, the toolbar Create bazooka dann y x (Monica) by clicking on the button.

2. Place the mouse pointer over the template (template) of the desired MO and double-click the left mouse button.

3. File Novo Baz y ' (a new database file) in the dialog box Folder (folder) list, created to remove the folder you want to save Monica, Imya file (file name) field, enter the name of Monica and click the " Create " button.

4. In the next dialog box, the Master will display information about what information the MO to create should store. At the bottom of this dialog box are the following buttons:

'Undo ' (Cancel) - His job cuts; _

"Back " - Returns to one previous step in the master's work;

'Next ' (After) the bonfires will take the next step in the work;

'Touch ' (ready) to create a curious parameters Monica launches the wizard. Before you press this button, the information stored in Fashion will be displayed.

5. Press the " Next " button to continue .

6. The dialog box that opens will consist of two lists.

One is a list of MO tables, the other is a list of fields in the selected table. This list will mark the fields to be entered in the table. Usually almost all fields are marked (except for very rarely used areas). You can add or exclude fields to the table by setting or removing the flag icon (v-symbol) for the fields. Then click " Next ".

7. In the next step of the wizard , select the screen equipment from the suggested samples and click " Next " again .

8. In the next stage of the master work, it is possible to determine the appearance of the reports being created for the MO.

9. The next dialog box that opens allows you to add a title and image to the report. They will appear in the appropriate place in all subsequent reports. If you need a picture Da (Yes) flag in front of record should be set up. The risunok (Photo) button can be used. When this button is pressed, the window " V y bar risunka " (image selection) will open.

10. Clicking the " Done " button in the last window will launch the wizard to create the MO, and it will automatically create the MO with the above parameters.

Homework. Create a table using the wizard.

Instruction.

1. Dann y x 'window Database Table button, then press the Create button.
2. In the New Tab dialog box, click the Master Tabs button, and then click OK.

Sozdanie Table dialog box, image Table list Address option.

1. Identify the areas that need to be added to the table. To do this , select the name of the desired field from the list of field images with the mouse and press \geq , so that the resulting field image will move to the newly created table. Select the following fields: code , name , address Imya , address , domashniy phone .
2. Click Next . Next , when it is active, click Touch button to apply only in the last case.
3. In the next dialog box, enter a table name (you can also leave the old name - _ Address) and allow Microsoft Access to define an independent key.
4. In the last dialog box, agree to enter the data directly into the table. Click Done .

Information. The table has been created. You can find their names in the title bar of the table. All field names are given as table column headings

In the process of creating the table, you came across the key concept.

The primary key is one or more fields whose set of values identifies an arbitrary record in the table. Our table shows key code address area. This type of information field - counter , a single cell of the table t o automatically starts with wounding. For this reason, the address of the code do not need to fill.

V In the module system "Methods of creating a database in MS Access and the scope of application. MS Access program in medical and biological planning and creation of a database to store the information on the subject of additional texts have been award .[15].

THE ROLE OF MEDIA WHILE TEACHING YOUNGSTER LEARNERS

Tursunova Odina Salimovna*

*Teacher,
Department of "Teaching languages",
Ferghana Polytechnic Institute, UZBEKISTAN
Email id: tursunovaodina65@gmail.com

ABSTRACT

This article surveys a choice of considers on advanced media and learning for little youngster ages 3 to 6. The scope of advanced media for this age group is developing and incorporates PC conveyed and online exercises; support video games; handheld media, occasionally with GPS or an accelerometer, in cell phones and other remote mobile devices; electronic toys and learning systems; dolls and robots that move and talk; physically active games using dance pads, sports equipment, or stationary bikes as the interface to the game; and online communities and social networks; among others. The examination has tried the adequacy of a few advanced media items for little youngsters' learning and has found, for instance, improvements in kids' information and abilities for speculation, arranging, noticing, critical thinking, perusing, language, math, hypothesis arrangement and testing, innovativeness, and collaborative learning. In any case, large numbers of the most popular commercially accessible advanced media items for small kids have never been studied or tested, thus there is no authoritative proof of their advantages or drawbacks. The article concludes with a conversation of examination moves toward that could be utilized to research small kids' preparing of advanced media to improve the plan and adequacy of future media items planned for this age group.

KEYWORDS: Children, Preschool, Kindergarten, Media, computer, Research, Learning, Cognitive skills, Reading.

INTRODUCTION

What are young children learning with advanced media? Increasingly, children ages 3 to 6 and their parents and teachers are using interactive digital media and toys for learning and entertainment, playing alone, and with others (Anand & Krosnick, 2005). A significant number

of the higher caliber media made particularly for kids in this age group have unequivocal learning objectives, utilize grounded and successful learning methodologies, and are created by specialists who comprehend little youngsters' formative requirements and capacities, which change drastically from year to year. Be that as it may, not all advanced media for small kids are made with such a lot of ability and care. This article presents a portion of the examination that has explored the impacts of advanced media on little youngsters' learning and it talks about headings for future exploration. It starts with an outline of the kinds of advanced media small kids are utilizing today.

MATERIALS AND METHODS

Youngsters have a developing assortment of media alternatives, which range from the standard presentation of modified substance on a screen with a console or game regulator as the info gadget to fresher approaches to play. More up to date media choices incorporate dealing with actual articles that have electronic, computer-based abilities (interactive storybooks, the Tag reading system and the Tag Junior smartpen, electronic keyboards and music-makers, dolls and robots that move and interact, electronic toys, durable portable computers with kid-friendly buttons); engaging in physical activities by using dance pads and sports equipment as interfaces that involve exertion, physical movement, and feedback (*Dance Dance Revolution* that uses a dance pad, *Wii Sports*, *Wii Fit* balance board, *Smart Cycle*); using mobile devices for screen-based games and activities (ABC Memory Match, Peekaboo Barn, Mickey Mini Golf, Nickelodeon's iPhone games for young children, games for the TicTalk children's mobile phone, DiaBetNet mobile games for children with type 1 diabetes) and GPS-supported outdoor scavenger hunts and other location-based activities; or - for 5- and 6-year-olds, and sometimes for younger children who sit on a parent's lap - communicating with online communities of peers (social networks such as Whyville, Club Penguin, and Webkinz).

A storm of intelligent items is presently focused on little youngsters. A few surveys of examination writing have distinguished significant qualities and restrictions of cutting edge media for little youngsters (e.g., Calvert, Jordan, & Cocking, 2002; Chen, Lieberman, & Paisley, 1985; Fisch, 2004; Gimbert & Cristol, 2004; Greenfield, 1984; Haughland & Shade, 1994; Kirkorian, Wartella, & Anderson, 2008; Lieberman, 1985; McCarrick & Li, 2007; Shuler, 2007; Thai, Lowenstein, Ching, & Rejeski, 2009; Vandewater et al., 2007; Vernadakis, Avgerinos, Tsitskari, Zachopoulou, 2005; Wartella, Caplovitz, & Lee, 2004; Yelland, 2005). However, there is still a ton to be found out about the advantages and drawbacks of these media, their steadily developing substance and organizations, and how to plan them well. What follows is an examining of a portion of the learning results that have been tried in examination and a couple of musings about subsequent stages.

CHALLENGING ASSUMPTIONS

A few investigations (e.g., Resnick, 1998; Resnick et al., 1998) have discovered that computerized media can acquaint kids with conceptual ideas that were recently considered excessively progressed for their age gathering, for example, ideas about mathematics, dynamic frameworks, and communication competence... Other studies (e.g., Yelland, 2005) have discovered that advanced media-based exercises in school settings can draw in youngsters in shared getting the hang of, thinking, and critical thinking exercises that had been believed to be

excessively refined for them to comprehend and do at youthful ages. Following is a discussion of these studies.

To show progressed ideas and cycles, computerized media are currently being incorporated into involved materials that encourage learning. Instructive toys called "digital manipulative" have been created at the MIT Media Lab to empower little youngsters ages 5 and more seasoned to investigate, for example, the concepts of feedback and emergence (Resnick, 1998; Resnick et al., 1998), which the creators guarantee can be learned well through the programming and utilization of digital manipulatives, for example, programmable Lego bricks and digital beads.

Programmable Lego blocks contain a central processor and infrared lights that youngsters program to set up two-way communication and activities. They have output ports for controlling engines and lights and information ports that can get data from sensors that recognize light, contact, temperature, and different states of the environment. Youngsters program the blocks and use them to assemble automated animals and networks of animals that move around and cooperate with each other, each with their own practices and inclinations. In this movement, youngsters find how their animals speak with one another and with what outcomes; accordingly, they learn fundamental ideas and general standards of successful communication. They learn, for example, that a communicator should have an exact model of the other animal and what the animal definitely knows, so clear and viable equal communication can happen. The robot animal networks make the ideas remarkable and genuine for kids, and the computerized manipulative give them another climate were to think and test out thoughts.

In another line of exploration, advanced media upheld youngsters' mastering of numerical abilities and fundamental theoretical numerical ideas by giving computer-delivered manipulatives, which were found to have a few preferences over actual active math manipulatives (Clements & Sarama, 2007; Sarama and Clements, 2004). For instance, the computer-delivered manipulatives empowered students to make their insight express, offered adaptability in the manner in which mathematical ideas were shown, permitted students to save their work and recover it later, connected the solid with the theoretical both outwardly and with unequivocal input, progressively connected a few portrayals of similar ideas, centred consideration, expanded inspiration, and energized issue presenting and guessing.

LANGUAGE AND READING

Numerous advanced media items and intelligent toys for little youngsters to use at home are intended to show language and perusing status abilities, for example, the letters in order, phonics, word acknowledgement, word building, and learning a subsequent language. The examination has discovered that all around planned computerized learning programs in these zones can be powerful (Fisch, Shulman, Aker man, and Levin, 2002; McGee and Rich gels, 2006; Segers and Verhoeven, 2002). For example, River deep's Destination Reading curriculum for pre-kindergarten to first grade and Leap Frog's Leap's Phonics Library improved children's acquisition of fundamental language knowledge and skills, such as the alphabet and word concepts (e.g., Spencer & Baskin, 1997).

Advanced media can help boost children's vocabulary skills and their acquisition of spelling and reading (Din & Calao, 2001), can improve their early writing skills (Moxley, Warash, Coffman, Brinton, & Concannon, 1997), and can enhance word recognition and word creation, compared to traditional teaching methods (Reitsma & Wesseling, 1998). An experiment found that

animated multimedia books enhanced awareness of letter sounds and words among children ages 3 to 6 (Chera & Wood, 2003).

Online learning has assisted preschoolers with learning unknown dialects. One investigation found that Internet-based advanced stories improved English listening understanding among 6-year-old Spanish kids (Verdugo and Belmonte, 2007). Other internet learning considers found that kids who were not hard of hearing improved their capacities with gesture-based communication (Daniels, 2001; Ellis and Blashki, 2007).

MATHEMATICS

Advanced learning media can add to little youngsters' learning of mathematics. Numerous parts of early casual math learning, for example, enumeration, number juggling critical thinking, spatial thinking, and mathematical knowledge, grow significantly during the preschool years; consequently, digital technologies and programming that instruct early learning of mathematical concepts have been getting more consideration. One study found that the leisure-time computer learning programs *Millie's Math House* (1992 edition by Edmark) and *James Discovers Math* (1995 edition by Broderbund) when placed in a preschool classroom, enhanced children's mathematical knowledge (Starkey, Klein, & Wakeley, 2004). Different investigations have discovered that small kids can create mathematical competence and related reasoning and thinking abilities with formatively suitable math mastering programming (Elliot and Hall, 1997).

CREATIVITY AND LEARNING

All around planned PC programs that are open-ended and offer the client some command over learning exercises, and give freedoms to creative decisions or innovative articulation, can encourage kids' inventive approaches to learning and can build revenue and commitment. An examination found, for instance, that small kids who were presented routinely to this sort of open-finished computer-based learning showed greater curiosity, speculating, issue formulization and arrangement, cooperation, motivation, positive self-assessment, and positive learning assessment than did youngsters who occupied with more organized computer-assisted guidance with almost no client control (Clements and Nastasi, 1992, as referred to in McCarrick and Li, 2007).

Advanced media can show abilities for creative and innovative articulation in areas, for example, music, drawing, painting, movement, composing, narrating, and verse. For instance, there are computerized devices that draw in little youngsters in making stories utilizing sight and sound (Montemayor, Druin, Chipman, Farber, Guha, 2004) and devices that assist them with learning tones and how to blend them. Chromarium is a blended reality climate that joins advanced media shows and active materials to empower little youngsters ages 4 to 7 to explore different avenues regarding and find out about shading blending via completing different computerized and actual activities. The examination has discovered that it is a compelling learning climate that shows the scope of ideas tone and shading blending (Price and Rogers, 2004; Rogers, Scaife, Gabrielli, Smith, and Harris, 2002).

COLLABORATIVE LEARNING AND MOTIVATION TO LEARN

Collaborative learning and social cooperation abilities can be upgraded with well-designed digital technology (Bers, New, and Boudreau, 2006; Freeman and Somerindyke, 2001; Shahrimin and Butterworth, 2002). Two studies, for instance, discovered that small kids who

shared PCs did as such fairly and agreeably, for example, immediately captivating thus taking and offering each other verbal and non-verbal assistance (Bergin, Ford, and Hess, 1993) and demonstrating an inclination for working with peers and doing so helpfully (Muller and Perlmutter, 1985).

The examination has additionally demonstrated expansions in small kids' inspiration to realize when they are associated with drawing in and fun computerized media. Computer learning exercises can evoke undeniable degrees of premium in and centre around learning task that doesn't will in general decrease over the long haul (Bergin et al., 1993), and small kids revealed significant degrees of pleasure and engagement (Liu, 1996). Regard for PC based learning can be high among preschoolers, including, now and again, those with attention deficit hyperactivity disorder (ADHD). The scientists guessed that this may happen on the grounds that the PC can give quick input on the kid's presentation and progress so that there is no defer that could make consideration meander (Shute and Miksad, 1997).

NEXT STEPS

This review is a little determination of studies that have inspected an assortment of effects of more seasoned and fresher advanced media on small kids' learning. The majority of studies in this field have noticed significant impacts, for instance, on youngsters' commitment to computerized media-based exercises, study hall and family practices with media, intellectual expertise results, and learning results. Out-come and impacts consider like these are very valuable to help recognize and approve advantages and downsides of advanced media for learning. As new types of media show up, result and impacts studies will keep on being required.

Many experiments have been led to contrast media and other instructional configurations. Media correlation considers are hard to control tentatively, and it is subsequently hard to confine the reasons why one medium or instructional climate may have been more successful than another. Frequently there are contemplates that think about two sorts of media (e.g., do children learn more from television or from the Internet?) or that think about interactive innovation versus customary study hall guidance (e.g., do children learn more from a video game or from a standard classroom lesson plan?). Are we evaluating the medium or the message? In some cases that aren't clarified. What would we be able to finish up from the discoveries of media examination contemplates if the two looked at learning exercises are not conveying a similar substance, or students' experience on an errand isn't the equivalent, or the hours spent setting up the material are not the equivalent (e.g., the thousands of person-hours that might go into making a highly entertaining and visually rich educational video game versus the time a teacher might spend preparing and delivering a classroom lesson plan)? How can these discrepancies be reconciled before we use the results of these studies to make major policy or purchasing decisions?

While some media examination concentrates accommodatingly give a decent confirmation of-idea (e.g., indicating that youngsters do learn with advanced media, or recognizing the sorts of substance and abilities kids acquire with computerized media), analysts can likewise help originators and professionals by utilizing other exploration moves toward that are all the more firmly controlled and can all the more explicitly help create successful learning encounters for kids. All the more all-around controlled test research is required that fluctuates just one element of computerized media substance or organizing, and that contrasts learning results and the two

practically indistinguishable forms so we can comprehend each plan issue in turn, as an approach to see how to configuration great learning encounters. Firmly controlled and, as usual, hypothesis-driven examinations, each with one control this way, could yield important bits of knowledge into instructional plans and cycles of learning with advanced media and could direct the route toward better plan and usage.

Another significant territory for additional investigation centres on the adaptability of learning with computerized media. Do computerized media students move their new information and abilities to new conditions and circumstances? Is move better when learning happens with some media or instructional plan methodologies than with others? Will advanced media be planned to support students' exchange of information and abilities, and can the exchange be just about as compelling as, or maybe far better than, the exchange that ordinarily happens in the wake of learning with a guide, companion, or study hall instructor? If the move is effective with exercises gained from computerized media, what are the plan rules that help fruitful exchange and for which kinds of students? The examination that has just been done, alongside future exploration that will execute upgrades and developments in its inquiries, measures, and strategies, can contribute significant examination proof to the field. This proof is valuable to analysts, subsidizing organizations, strategy producers, media planners, media distributors, media buyers, and instructive experts every one of whom is searching for all-around approved, powerful approaches to help to realize so that eventually they can improve and believe in the nature of the advanced media encounters they offer to little youngsters.

ABSTRACT

The regional distribution and number of reptiles around the Dengizkul, Zamonbobo, Qoraqir lakes in the spring season were analyzed by biotopes. It is necessary to pay special attention to the work of protection, conservation of biological diversity and rational use of bioresources by studying reptiles around the Dengizkul, Zamonbobo, Qoraqir lakes.

KEYWORDS: *Gymnodactylus Fedtschenkoi, Agama Lehmanni, Ophisaurus Apodus, Eryx Miliaris, Echis Carinatus, Testudo Horsfieldi, Phrynocephalus Mustaceus, Gymnodactylus Caspius, Natrix Tessellata, Vipera Ursini, Phrynocephalus Interscapularis Eremias Velox, Eremias Grammica.*

INTRODUCTION

The object of research: To study the regional distribution and diversity of the number of reptiles in the spring season around Dengizkul, Zamonbobo, Kora-Kir. The main goal is to preserve biological diversity by studying the characteristics of reptiles in different habitats.

The subject of the research is to determine the number of reptiles around the lakes Dengizkul, Zamonbobo and Kara-Kir by studying their current status in different habitats, to determine their importance in nature and in the economy.

MATERIALS AND METHODS

The survey carried out in the region qisminigil grounded, stony desert, saline marshes and its parts. Desert's plants Tamarix, Haloxylon persicum, Haloxylon belangeriana, Descurainia

sophia, Artemisia diffuse, Alhagi pseudalhagi, Ammodendron conollyioccurva. Desert pastures are mostly used for livestock, especially sheep and goats. In recent years, the construction and transportation in these areas, as well as the construction of railways, gas pipelines have had an impact on the biodiversity of the region. Basically, March, April and May were taken and research work was carried out. The study area has surveyed a total of 24 times on land using the stationary, route, and 5-minute counting methods [2; 3; 4; 5; 6]. The results of the animal count were extrapolated to a 10-hectare area and the density of the animal community was as follows. determined by the formula:

$$D = \frac{n}{2 \cdot L \cdot W} ;$$

where D is the density; n is the number of reptiles encountered; L is the route length; W is the width of the route or the distance from the route axis to the boundary of the calculated corridor. Multiplication 2 was used in the formula to account for reptiles to the left and right of the route axis.

Results and discussion In the spring of 2019, the fauna of waterfowl around Dengizkul, Zamonbobo and Kara-Kir lakes were studied, and based on the analysis of the data obtained, 32 species of waterfowl belonging to 2 groups were identified. Territorial, hilly and remnant mountains, as well as the number and quantity of species recorded in the settlement, their peculiarities are described.

In our country, special attention is paid to the improvement of normative and legal documents aimed at the conservation of biological diversity, protection and rational use of wildlife, as well as the implementation of program measures. In particular, as a result of the work carried out in this direction, the status of declining species has been granted, the area of protected natural areas is being expanded, opportunities for public control over the protection of wildlife have been created and hunting tourism has been introduced. The Action Strategy for the further development of the Republic of Uzbekistan sets the task of "ensuring the comprehensive and effective use of natural, mineral resources, industry, agriculture, tourism and labour potential of each region to accelerate socio-economic development." Based on these tasks, scientific research aimed at studying and justifying the reptile fauna, bioecological features, their sustainable use in the Bukhara region, identifying and assessing the impact of anthropogenic factors on reptile objects and their habitats is of great importance. Decree of the President of the Republic of Uzbekistan dated February 7, 2017, No PF-4947 "On the Strategy for further development of the Republic of Uzbekistan", Cabinet of Ministers of the Republic of Uzbekistan dated July 19, 2017 No 530 "On measures to further improve the forestry management system" and Resolution No. 914 of November 7, 2018 "On the state accounting of objects of flora and fauna, accounting of volumes of their use and the state cadastre" and the implementation of the tasks set out in other regulations related to this activity. 7 species of reptile fauna found in the region during the spring season of reptiles around Dengizkul, Zamonbobo and Kara-Kir lakes are included in the Red Book of the Republic of Uzbekistan, 3 species in the IUCN Red List, 5 species in CITES Appendices I and II [1]. However, the species composition, number, biotopic distribution, reproduction, seasonality and duration of waterfowl around Dengizkul, Zamonbobo and Kara-Kir lakes have not been studied. (Table 1).

TABLE 1 SPECIES COMPOSITION AND NUMBER OF REPTILES AROUND DENGIZKUL, ZAMONBOBO AND KARA-KIR LAKES

№	Group and species names	Reserve name	March	April	May	Total	%
Lacertilia Gekkonidae							
1	Crossobamon everesmanni		5	12	14	31	4,1
2	Teratoscincus Scincus	UzRDB	2	1	3	6	0,8
3	Gymnodactylus russowi		8	9	11	28	3,7
4	Gymnodactylus caspius		6	11	9	26	3,4
5	Gymnodactylus fedtschenkoi		4	6	15	25	3,3
Agamidae							
6	Agama Lehmanni		6	9	17	32	4,2
7	Agama caucasica		-	5	7	12	1,6
8	Agama sanguinolenta			3	3	6	0,8
9	Phrynocephalus mustaceus		2	8	10	20	2,6
10	Phrynocephalus interscapularis		17	34	56	107	14,3
11	Phrynocephalus helioscopus		10	4	13	27	3,6
12	Phrynocephalus raddei		5	6	8	19	2,5
Varanidae							
13	Varanus griseus	UzRDB CITES I	1	4	5	10	1,3
Anguidae							
14	Ophisaurus apodus		1	2	3	6	0,8
Lacertidae							
15	Lacerta agilis		12	14	22	48	6,4
16	Eremias grammica		11	13	23	47	6,2
17	Eremias scripta		9	11	13	33	4,4
18	Eremias lineolata		8	10	17	35	4,6
19	Eremias velox		14	16	26	56	7,4
20	Eremias arguta		5	4	9	18	2,4
Serpentes Typhlopidae							
21	Typhlops vermicularis		-	1	1	2	0,26
Boidae							
22	Eryx miliaris	UzRDB, CITES II	4	5	6	15	2
Colubridae							
23	Natrix tessellata		11	15	31	57	7,6
24	Psammophis line olatum		2	4	6	12	1,6
25	Coluber ravergieri		1	2	2	5	0,66

26	<i>Colubter karelini</i>		1	3	4	8	1,06
27	<i>Elaphe diol</i>		2	6	8	16	2,1
Viperidae							
28	<i>Vipera ursini</i>	UzRDB, RL, CITES I	-	1	2	3	0,40
29	<i>Echis carinatus</i>		3	4	5	12	1,6
30	<i>Lythorinchus ridgewayi</i>	UzRDB,	1	2	4	7	0,9
31	Central Asian	UzRDB, RL, CITES II	-	1	1	2	0,26
Chelonia							
32	<i>Agrionemys horsfieldi</i>	UzRDB, RL, CITES II	5	7	5	17	2,2
	TOTAL		156	233	359	748	100

Note: UzRDB - Species included in the Red Book of the Republic of Uzbekistan (minor species) (2019)

RL - Red Listed Species of the International Union for Conservation of Nature and Natural Resources (IUCN) (2004)

CITES I, CITES II - Species (subspecies) included in the annexes to the Convention on International Trade in Endangered Species of Wild Fauna and Flora.

A total of 7 species of protected reptiles were found during the study in the area, of which 7 species are listed in the Red Data Book of the Republic of Uzbekistan, 3 species are on the IUCN Red List, 5 species are CITES I; Inclusion in CITES II was determined by studies (Table 1). In March, the number of reptile species increased until May (32 species), including 203. *Phrynocephalus interscapularis*, *Natrix tessellata*, *Eremias velox*, *Lacerta agilissoni* were observed. The increase in the composition of these species is directly related to the development of nutrient reserves. The misconception among the population about the healing properties of the meat and bones of the grey goat is leading to unplanned and disorderly hunting by the locals. The Central Asian desert tortoise and its eggs have now declined sharply as a result of being trampled underfoot by livestock and killed by herding dogs. barrier factors. *Varanus griseus*, listed in the Red Data Book of the Republic of Uzbekistan, was killed in a head-on collision with a car on the way to Dengizkul, Zamonbobo and Kara-Kyr lakes. In late May, *Agrionemys horsfieldi* was captured and held captive by shepherds.

In recent years, the growing demand for food prepared by the population as "medicinal" and hunted animals (*Varanus griseus*, *Eryx miliaris*) is also leading to their illegal hunting. In some districts, food outlets selling these types of food have been set up, and it has even been noted that some species are kept in cages in front of these outlets (in the Labi-Hovuz teahouse in the village of Sofidehqon, Vobkent district).

Every year in June and July, it is almost a tradition for locals to offer food prepared from *Eryx miliaris* to people who come for treatment in the sand and salt of the Alat district on the border with Turkmenistan. Until this "traditional" season, many sand-snakes are hunted. The study also

shows that the sale of species and their carcasses (meat, fat, skin) in markets and public catering establishments, as well as the hunting of protected species, indicate that there are still many unresolved issues in the field.

CONCLUSION

The State Cadastre of Wildlife Objects consists of a systematic report of qualitative and quantitative information on the diversity, classification, number dynamics, level of study and other information necessary for the organization of measures for the protection and sustainable use of wildlife. . Today, the data of the state cadastre of objects of fauna do not allow to obtain accurate information on the total number of animal species found in Uzbekistan, including Bukhara region. Therefore, it is advisable to carry out practical work in this area.

ABSTRACT

In this study, the process of activation of off-balance phosphorite ore of the Central Kyzylkum desert (14,33% P_2O_5) by extraction phosphoric acid (14,32% P_2O_5) with the addition of sulfuric acid (93%) at 75 °C, reaction time 30 min. at different mass ratios P_2O_{5PAE} : P_2O_{5FC} and P_2O_{5PAE} : H_2SO_{4mg} . It is shown that the addition of H_2SO_4 significantly intensifies the process of phosphoric acid activation of the phosphate mineral of the raw material. The water-insoluble part of the products of phosphoric acid activation with the addition of sulfuric acid has been studied. It has been shown that both the fertilizer itself and its water-insoluble part contain a significant amount of the P_2O_5 form assimilable for plants.

KEYWORDS: Off-Balance Phosphorite Ore, Phosphoric And Sulfuric Acids, Activation, Single Phosphorus Fertilizers, Water-Insoluble Part.

INTRODUCTION

Phosphorites of the Central Kyzyl Kum deposits are the main phosphate raw materials for the factories of Uzbekistan that produce phosphorus-containing fertilizers. But this is a raw material poor in phosphorus, containing a large number of undesirable impurities, in particular carbonates and chlorine, which is not subject to flotation enrichment [1].

To obtain high-quality phosphorus-containing fertilizers from such raw materials, the Kyzylkum Phosphate Plant (KPP), with the participation of the German company Engineering Dobersek GmbH, carried out a multi-stage enrichment: crushing, dry enrichment to obtain ordinary phosphorite flour, washing from chlorine, roasting to remove CO_2 . Since 2007, this plant has put into operation capacities for the production of 400 thousand tons per year of washed calcined phosphoconcentrate (WCPC) with a content of up to 30% P_2O_5 , 200 thousand tons per year of washed dried phosphoconcentrate (MSA with a content of 18-19% P_2O_5) and 200 thousand tons per year of ordinary phosphorite flour (OPF with a content of 16-18% P_2O_5). Of these, WCPC is the only phosphate raw material suitable for the production of ammophos at Ammophos-Maxam JSC. There is a lack of phosphate raw materials. In order to increase the production of ammophos in 2014 within the framework of the project "Expansion of the existing products for the enrichment of phosphorite raw materials", on the basis of the KPP according to the new enrichment scheme, the production capacity of WCPC was increased from 400 to 716 thousand tons per year with an average content of 26% P_2O_5 (picture).

At the same time, the volume of extracted phosphate ore with an average grade of 17.58% P_2O_5 is 1,874.6 thousand tons or 320.93 thousand tons of P_2O_5 .

The investment project, although it will significantly expand in the future the resource base for WCPC (1.8 times) of ammophos production, but the volume produced (186.16 thousand tons of P_2O_5) cannot radically change the situation, since the planned volumes do not allow to cover the needs of agriculture in phosphate fertilizers (525.21 thousand tons of P_2O_5). In addition, the enrichment scheme currently functioning in KLF cannot be considered rational.

Since the new enrichment scheme does not provide for incidental production of both MSA and OPF. And an increase in the concentration of P_2O_5 in WCPC (26%) compared to its concentration in the original raw ore (17.58%) by only 8.42% occurs against the background of a significant loss of P_2O_5 (134.77 thousand tons of P_2O_5 or 42% of the initial P_2O_5 in ore) with dressing tailings with the status "Off-balance ore". These, 9.6% occurs during dry sorting at the site of the ore control station, 28.3% during hydro-sorting and 4.1% at the stages of drying and roasting. These are, respectively, a mineralized mass (12-14% P_2O_5), slurry phosphorite (10-12% P_2O_5) and a pulverized fraction (18-20% P_2O_5).

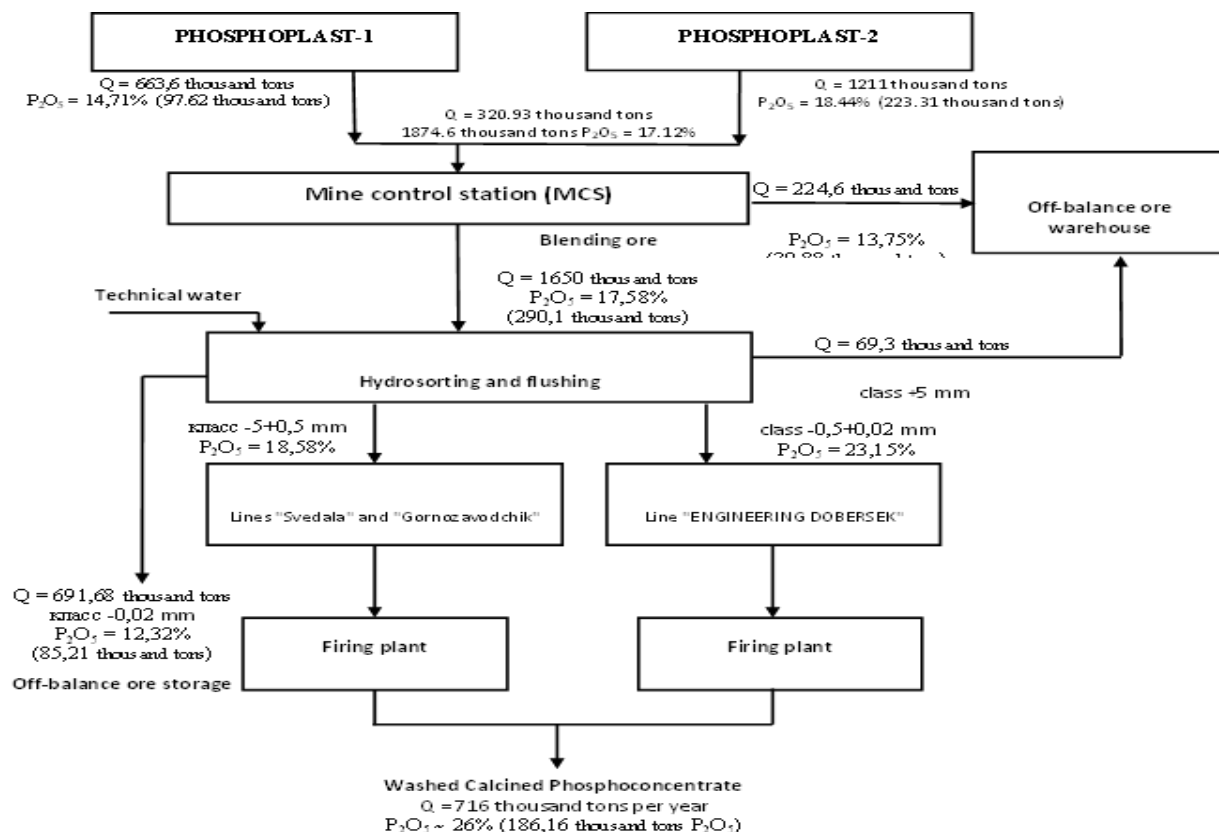

Fig. 1. New technological scheme of thermal enrichment of phosphorites of Central Kyzyl Kum

In this waste, we see a reserve for increasing the production of phosphorus-containing fertilizers. Traditional methods of processing phosphate raw materials, such as nitric and sulfuric acid, are not acceptable for them. Therefore, it requires an unconventional approach to the search for an alternative method for processing poor phosphorites into phosphorus-containing fertilizers. Therefore, we stopped at their phosphoric acid activation [2].

This allows, firstly, to involve poor phosphate raw materials in the production of concentrated fertilizers, and secondly, to obtain single phosphorus fertilizers, which are so necessary for applying for autumn ploughing. The essence of the activation process is the treatment of raw materials with phosphoric acid, but in much smaller quantities than is required for the complete decomposition of phosphorites. In this case, the so-called undecomposed or partially decomposed phosphates are formed, agrochemical tests of which have shown their high efficiency [3, 4].

Earlier [5], the mineralized mass was activated with the following composition (wt.%): 14,33 P_2O_5 ; 43,02 CaO ; 1,19 MgO ; 1,38 Fe_2O_3 ; 1,18 Al_2O_3 ; 2,22 SO_3 ; 14,70 CO_2 ; 13,23 H.O.; $CaO : P_2O_5 = 3,0$ n.d.; $CaO : P_2O_5 = 3,0$ by treating it with extraction phosphoric acid of three concentrations (14.32; 18.55; 24.23% P_2O_5) at a temperature of 75 °C, a time of 30 minutes and at various rates of phosphoric acid (in the range of weight ratios P_2O_5 in acid to P_2O_5 in raw materials from 1: 0.66 to 1: 0.17, that is, in the range of phosphoric acid rates from 20 to 75% of the stoichiometric rate for the formation of monocalcium phosphate). At the request of agriculture, a single phosphorus fertilizer must have a high content of the total and assimilable

forms of P_2O_5 , and the relative content of the water-soluble form of P_2O_5 must be at least 50%. Based on this requirement, the optimal rate of phosphoric acid for processing the mineralized mass is 55% of the stoichiometry ($P_2O_{5PAE} : P_2O_{5FC} = 1 : 0,24$). In this case, the product contains $P_2O_{5tot.} - 40,98\%$; $P_2O_{5ycb.} - 30,06\%$; $P_2O_{5wate.} - 21,28\%$; $P_2O_{5ycb.} : P_2O_{5tot.} = 73,35\%$; $P_2O_{5wate.} : P_2O_{5tot.} = 51,93\%$. It is calcium dimonophosphate. The main component of calcium dimonophosphate is a mixture of salts of water-soluble monocalcium phosphate $Ca(H_2PO_4)_2 \cdot H_2O$ and citrate-soluble dicalcium phosphate $CaHPO_4 \cdot 2H_2O$. The advantage of this fertilizer is that it contains phosphorus in both fast- and slow-acting forms. The fast-acting form of P_2O_5 in the fertilizer is monocalcium phosphate, and the slow-acting form is dicalcium phosphate and undecomposed but activated phosphorite. Therefore, this fertilizer has a prolonged action. The results of this work showed that an increase in the concentration of phosphoric acid has practically no effect on the composition of the fertilizer.

From the practice of obtaining double superphosphate, when phosphoric acid for the decomposition of raw materials is taken in an amount of 5-10% more than the stoichiometric norm for the formation of monocalcium phosphate, it is known that the rate of decomposition of natural phosphates by phosphoric acid at the initial stage of the process is relatively high, but over time it sharply decays and becomes so small that in practice the reaction is stopped when the degree of decomposition of phosphate reaches 80-90% [6]. The reaction of the interaction of phosphates with extraction phosphoric acid from poor phosphorites proceeds especially slowly, as a result of which this acid is considered unsuitable for the production of double superphosphate [7]. The process of decomposition of phosphate raw materials with phosphoric acid can be intensified by adding to it a small amount of nitric, hydrochloric and sulfuric acids [8-10]. The use of sulfuric acid was undertaken in this work. The chemistry of the interaction of phosphate raw materials with phosphoric acid is as follows. The phosphate mineral reacts with phosphoric acid by the reaction:

According to this equation, for 1 part by weight of P_2O_5 in the phosphate mineral, 2.33 parts by weight of P_2O_5 in acid is required. Carbonates present in the highly carbonated phosphorites of the Central Kyzyl Kum are also decomposed by phosphoric acid:

According to this equation, for 1 weight part of CO_2 in the feed, 3.23 weight parts of P_2O_5 in acid is required. Therefore, for the complete decomposition of the phosphate raw material with phosphoric acid with the formation of monocalcium phosphate per one weight part ($P_2O_5 + CO_2$) in the raw material, 5.56 weight parts of P_2O_5 in acid are required. The reaction of the interaction of a phosphate mineral with phosphoric acid with the formation of dicalcium phosphate is unlikely:

The product containing $CaHPO_4$ can be obtained by direct interaction of phosphorite, phosphoric acid and water in an autoclave under a pressure of 7 atm. at 200 °C. In our case, dicalcium phosphate can be formed as a result of hydrolysis of monocalcium phosphate [6]:

The sulfuric acid present in PAE, as a result of reaction with phosphorite, forms gypsum and phosphoric acid:

It can be seen from the above reaction equations that phosphoric acid is consumed not only for the decomposition of the phosphate part of the raw material but also for the decomposition of the impurity minerals contained in it.

The activation of the mineralized mass (14.33% P_2O_5) with phosphoric acid in a mixture with sulfuric acid was carried out in the range of weight ratios P_2O_5 in acid to P_2O_5 in raw materials from 1: 0.29 to 1: 0.24 and P_2O_5 in acid to $\text{H}_2\text{SO}_{4(\text{monohydrate})}$ from 1: 0.25 to 1: 0.5. For processing of phosphate raw materials used extraction phosphoric acid composition (wt. %): 14,32 P_2O_5 ; 0,86 CaO; 0,29 MgO; 1,32 Fe_2O_3 ; 0,32 Al_2O_3 ; 0,38 SO_3 and sulfuric acid of 93% concentration. The experiments were carried out as follows: a mixture of phosphoric and sulfuric acid was slowly poured into a thermostated glass beaker, in which a sample of phosphate raw material was located, at a temperature of 65 °C. The mixture was thoroughly mixed. The duration of contacting the components was 30 min. at a temperature of 75 °C. Then the mass was dried, first at 60 °C for a day, and then at 105 °C until constant weight. And granulation of samples of wet phosphate masses was carried out in the process of drying by the method of intensive stirring and rolling. The moisture content of the pulp was determined by drying to constant weight. The dried product was analyzed for the content of various forms of phosphorus and calcium according to generally accepted methods [11]. The strength of the granules was determined using a MIP-10-1 device [12]. The experimental results are shown in Table 1.

It can be seen from it that the more phosphate raw materials are taken for activation, the lower the content in the products of the general, assimilable and water-soluble form of P₂O₅, the assailable and water-soluble forms of CaO, the more the total form of CaO. The addition of sulfuric acid increases the content of water-soluble forms of P₂O₅ and CaO in products and decreases the content of the general form of P₂O₅. So, with the ratio P₂O_{5PAE} : H₂SO_{4mng} = 1: 0.25, an increase in the proportion of phosphate raw materials in the form of P₂O₅ relative to P₂O₅ in acid from 1: 0.24 to 1: 0.29 leads to a decrease in P₂O_{5tot.} in the product. From 38.99 to 36.75%, P₂O₅ ass. for citric acid from 28.80 to 25.56%, P₂O₅ water. from 21.83 to 16.95%, SaO_{usv.} from 18.27 to 17.70%, CaO_{wq.} from 12.11 to 10.24% and an increase in CaO_{total.} from 24.43 to 26.61%. Agrochemists and soil scientists consider the best phosphorus fertilizer to be one in which the content of the water-soluble form of P₂O₅ is at least 50% of the total form of P₂O₅. When the mineralized mass is activated with phosphoric acid at P₂O_{5PAE} : H₂SO_{4mng} = 1: 0.25, the optimal P₂O_{5PAE} : H₂SO_{4FS} ratio is 1: 0.26. The product has P₂O_{5total.} = 37.98%, P₂O₅ ass. : P₂O_{5total.} = 71.59% and P₂O₅ water. : P₂O_{5total.} = 50.87%. An increase in the amount of sulfuric acid additive (P₂O_{5PAE} : H₂SO_{4mng} from 1: 0.25 to 1: 0.5) allows to shift this limit towards increasing the amount of phosphate raw material to be processed. That is, the more sulfuric acid is introduced, the greater the amount of phosphate raw material can be involved in processing into concentrated single phosphate fertilizers. So, when adding sulfuric acid in the ratio P₂O_{5PAE} : H₂SO_{4mng} = 1: 0.375, the optimal ratio of P₂O_{5PAE} : H₂SO_{4FS} is not 1: 0.26, but becomes already 1: 0.29. In this case, the product contains P₂O_{5total.} = 35.28%, P₂O_{5ass.} : P₂O_{5total.} = 69.81% and P₂O_{5water.} : P₂O_{5total.} = 55.19%.

The resulting fertilizers contain calcium dihydrogen phosphate, calcium hydrogen phosphate, iron and aluminium phosphates, calcium sulfate, activated and undecomposed phosphorite. The presence of sulfur in the form of soluble calcium sulfate in the fertilizer promotes better utilization of basic plant nutrients. Sulfur is a part of amino acids - cysteine and methionine is of great importance in protein metabolism and in redox processes. In terms of its physiological role

in plant nutrition, sulfur should be ranked third after nitrogen and phosphorus. It has a positive effect on the formation of chlorophyll, promotes the formation of nodules on the roots of legumes and nodule bacteria that assimilate atmospheric nitrogen. It increases the efficiency of nitrogen fertilizers and increases the mobility of soil phosphates. The productivity of cotton increases from 2.1 to 16.3%, and the oil content of seeds up to 3.8%. The optimal sulfur rate is 20-40 kg/ha [13].

In the resulting products, the relative content of the assimilable form of P_2O_5 less than 100% indicates that some amount of undecomposed phosphate mineral remains in the fertilizer. We checked what is the undecomposed part of the phosphate mineral in the mineralized mass when activated with a mixture of phosphoric and sulfuric acids. For this, product samples obtained by activation were dissolved in a 20-fold amount of distilled water in relation to the weight of the fertilizer. Then the aqueous suspension was filtered under a vacuum of 550-600 mm Hg. on a Buchner funnel using one layer of filter paper. The precipitate remaining on the filter was washed with acetone. The washed precipitate was dried at 105 °C together with filter paper. The dried precipitate was weighed and analyzed. The degree of P_2O_5 transition from the product to the liquid phase was calculated as the ratio of the amount of P_2O_5 that passed into the solution to the initial amount of P_2O_5 in the product. The results are shown in the table. 2.

TABLE 2 THE COMPOSITION OF THE WATER-INSOLUBLE PART OF SINGLE PHOSPHORUS FERTILIZERS OBTAINED IN THE PROCESS OF PHOSPHORIC ACID ACTIVATION WITH THE ADDITION OF SULFURIC ACID OF OFF-BALANCE PHOSPHORITE ORE OF CENTRAL KYZYL KUM

Массовое соотношение P ₂ O ₅ ЭФК : P ₂ O ₅ ФС	Масса готового удобрения, г	Масса сухого осадка, г	Химический состав высушенного						P ₂ O ₅	P ₂ O ₅	CaO	Степень перехода P ₂ O ₅ из продукта в жидкую фазу, %

С добавкой H ₂ SO ₄ при соотношении P ₂ O ₅ ЭФК : H ₂ SO ₄ МНГ = 1 : 0,375												
1:0,29	10	5,81	27,8 1	10,6 7	9,33 22	27, 22	12, 68	7,4 5	38,3 7	33,5 5	46,3 0	54,20
1:0,26	10	5,51	27,3 6	9,01 6	7,56 82	24, 82	13, 25	8,9 6	32,9 2	27,6 2	53,7 0	58,31
1:0,24	10	4,96	27,0 5	7,93 5	6,06 80	22, 80	13, 72	9,1 4	29,3 2	22,4 0	59,9 4	63,88
С добавкой H ₂ SO ₄ при соотношении P ₂ O ₅ ЭФК : H ₂ SO ₄ МНГ = 1 : 0,5												

1:0,29	10	5,76	25,5 8	9,37	8,23	25, 85	16, 61	11, 11	36,6 2	32,1 7	64,2 6	57,87
1:0,26	10	5,40	24,9 1	7,73	6,66	24, 48	17, 16	13, 82	31,0 2	26,7 4	70,0 0	62,47
1:0,24	10	4,61	24,6 8	7,08	5,23	20, 00	17, 52	14, 00	28,6 0	21,1 0	83,5 2	69,09

From the data presented in the table, it can be seen that the greater the amount of the mixture of acids taken to activate the mineralized mass, the greater the degree of P_2O_5 transition from the product to the liquid phase. Thus, with a weight ratio of $P_2O_{5PAE} : H_2SO_{4mng} = 1 : 0.25$, a decrease in the $P_2O_{5PAE} : H_2SO_{4PS}$ ratio from 1: 0.29 to 1: 0.24 leads to an increase in the degree of P_2O_5 transition from 52.35 to 60.82%, with $P_2O_{5PAE} : H_2SO_{4mng} = 1 : 0.375$ from 54.20 to 63.88% and with $P_2O_{5PAE} : H_2SO_{4mng} = 1 : 0.5$ from 57.87 to 69.09%.

Comparison of the degree of transition of P_2O_5 into the liquid phase of the water-insoluble part of the products obtained only by phosphoric acid activation ranged from 38.69 to 52.06% [5], and when using a mixture of phosphoric and sulfuric acids, this indicator increased from 52.35 to 69.09%. Such a change in the degree of transition of P_2O_5 into the liquid phase suggests that the use of sulfuric acid as an additive to phosphoric acid intensifies the process of decomposition of the phosphate mineral. The water-insoluble precipitate obtained at optimal ratios $P_2O_{5PAE} : P_2O_{5FS} = 1 : 0.29$ and $P_2O_{5PAE} : H_2SO_{4mng} = 1 : 0.375$ contains 27.81% P_2O_{5total} , 27.33% CaO_{total} , and the ratio in it $P_2O_{5usv.} : P_2O_{5total.} = 38.37\%$, $CaO_{usv.} : SaO_{bsch.} = 46.39\%$. The high relative content of the assimilable form confirms the activation of the phosphate raw material during its phosphoric acid activation. In this case, the degree of P_2O_5 transition from the product to the liquid phase is 54.20%. This fertilizer sediment is assimilated by plants evenly during the period of their growth and maturation. Thus, the conducted studies convincingly show that the phosphate raw material base of Uzbekistan can be significantly expanded by involving local off-balance phosphorites of the Kyzyl Kum in the processing of concentrated single phosphorus fertilizers using the method of phosphoric acid activation. Establishing the production of these types of fertilizers is very promising, also in terms of reducing the consumption of acid reagent in the processing of poor phosphate raw materials.

ABSTRACT

This article discusses the existing problems in the education system, the lack of creativity in teaching staff, resulting in a decline in the quality of education and the elimination of these problems, the main forms of pedagogical creativity and the formation of creative qualities in the individual. The advantages and effectiveness of the organization of classes on the basis of pedagogical creativity in Pre-school Institutions are shown.

KEYWORDS: *Preschool Education, Pedagogue, Creative Activity, Creativity, Education, Intellect, Pedagogical Process, Independent Thinking, Creative Approach, Initiative.*

INTRODUCTION

Modern education requires the teachers and pedagogues to be creative in all types of educational institutions. The fact that the educator has the qualities of creativity or ingenuity directs his personal abilities, natural and social potential to the quality, effective organization of professional activity. The creative qualities of teachers working in the education system are the creation of new ideas that do not differ from the traditional approach to the organization of the educational process, non-uniform thinking, originality, initiative helps to avoid intolerance of uncertainty.

After all, a creative approach to the organization of professional activities of teachers with creative qualities, active in creating new, advanced ideas that serve to develop students' learning activities, personal qualities, independent study of advanced pedagogical achievements and experiences, as well as constant, consistent thinking about pedagogical achievements with colleagues focuses on having an sharing experience.

Typically, the creative ability of educators is ensured through the pursuit of pedagogical problems, the implementation of research work or research projects, and the achievement of mutual creative collaboration.

The Main findings and results

The educator does not become creative on his own. His creative ability is formed through consistent study and gradually improves and develops over a period of time working on his own. The creativity of future educators, as in any specialists, the foundation is laid during the academic years for their ability and is consistently developed in the organization of professional activities.

In this case, it is important that the teacher is self-directed to creative activity and can effectively organize this activity. In the organization of creative activity, the teacher should pay special attention to solving problems, analyzing problem situations, as well as creating creative products of a pedagogical nature.

Today's modern conditions require a teacher to have creative qualities.

In recent years, in the education system of leading foreign countries, special attention is paid to the formation of creative qualities in teachers and students. This was followed by Bronson, Merriyman (2010), Ken Robinson (2007), Fisher, Frey (2008), Begetto, Kaufman (2013), Ali (2011), Treffinger (2008), and b. Many studies conducted by can be seen from their results.

Despite the fact that significant practical work is being done, many teachers still do not have the experience of how to effectively shape the qualities of creativity in themselves and in their students as a creative person.

The governing bodies of the education system annually focus on achieving high efficiency in educational institutions. For this purpose, curricula will be developed, new textbooks will be created. This effectively contributes to the professional growth of both students and teachers. The practical actions taken create a certain level of need for students to achieve success, to strive for progress, to help them develop their learning skills to some extent. However, by the end of the school year, there is no high level of positive results in the acquisition of subjects by students in educational institutions. Many students have lost interest in learning. As a result, teachers are no longer thinking of organizing professional activities with the same enthusiasm as before. Although new measures have been introduced by the governing bodies of the education system to change the activities of teachers who do not want to teach such students, the situation remains unchanged. What is the reason for this? Probably a factor as to why they're doing so poorly is **Creativity**.

To fully understand the general essence of the process of developing the qualities of creativity in a person, it is first necessary to understand the meaning of the concept of "creativity". According to Ken Robinson, "creativity is a set of original ideas with their own value" (Azzam, 2009). Gardner explains the concept in his research: "Creativity is a practical action performed by an individual, which must reflect a certain innovation and have a certain practical value." In terms of Emebayl's (1989) approach, creativity means "having a high level of unconventional skills in addition to the thorough knowledge acquired in a particular field."

Many studies have differing views on the relationship between intelligence and creativity. While one group of researchers argues that there is no correlation between them, representatives of the second group argue that the level of creativity and intelligence are interrelated (Kim, 2005).

The concept of "creativity" reflects cultural diversity. For Westerners, creativity is, in general, a novelty. They are focus on the existence of unconventionalism, curiosity, imagination, a sense of humor, and freedom based on creativity (Myordok, Ganim, 1993; Sternberg, 1985). Orientals, on the other hand, see creativity as a process of rebirth of goodness (Hui, Sternberg, 2002; Rudovich, Hui, 1997; Rudovich, Yue, 2000). Although Western and Eastern views on creativity are different, representatives of both cultures value this quality and possession of it (Kaufman, Lan, 2012).

Many educators believe that they do not have the ability to be creative. This can be justified for two reasons: first, even most teachers are not able to adequately explain what the concept of "creativity" actually means; second, they are unaware of what qualities are directly reflected in creativity.

It should be noted that each person is naturally creative. Well, how can teachers show that they have the ability to be creative. Patti Drapeau advises: "Even if you think you are not creative, I suggest you start organizing classes to develop creative thinking right now. In fact, it's not about whether you're creative or not, it's about organizing lessons in a creative way and trying to put new ideas into practice. "

Based on the above, the concept of "creativity" can be interpreted as follows:

Creativity (Latin, "create" - to create, eng. "Creative" - creator, creator) - a creative ability that characterizes the readiness of an individual to produce new ideas and is part of the talent as an independent factor.

A person's creativity is manifested in his thinking, communication, emotions, certain types of activities. Creativity describes a person as a whole or its specific characteristics. Creativity is also reflected as an important factor of talent. In addition, creativity determines the sharpness of the mind, "ensures the active involvement of students in the educational process."

According to EP Torrens, the concept of "creativity" is based on:

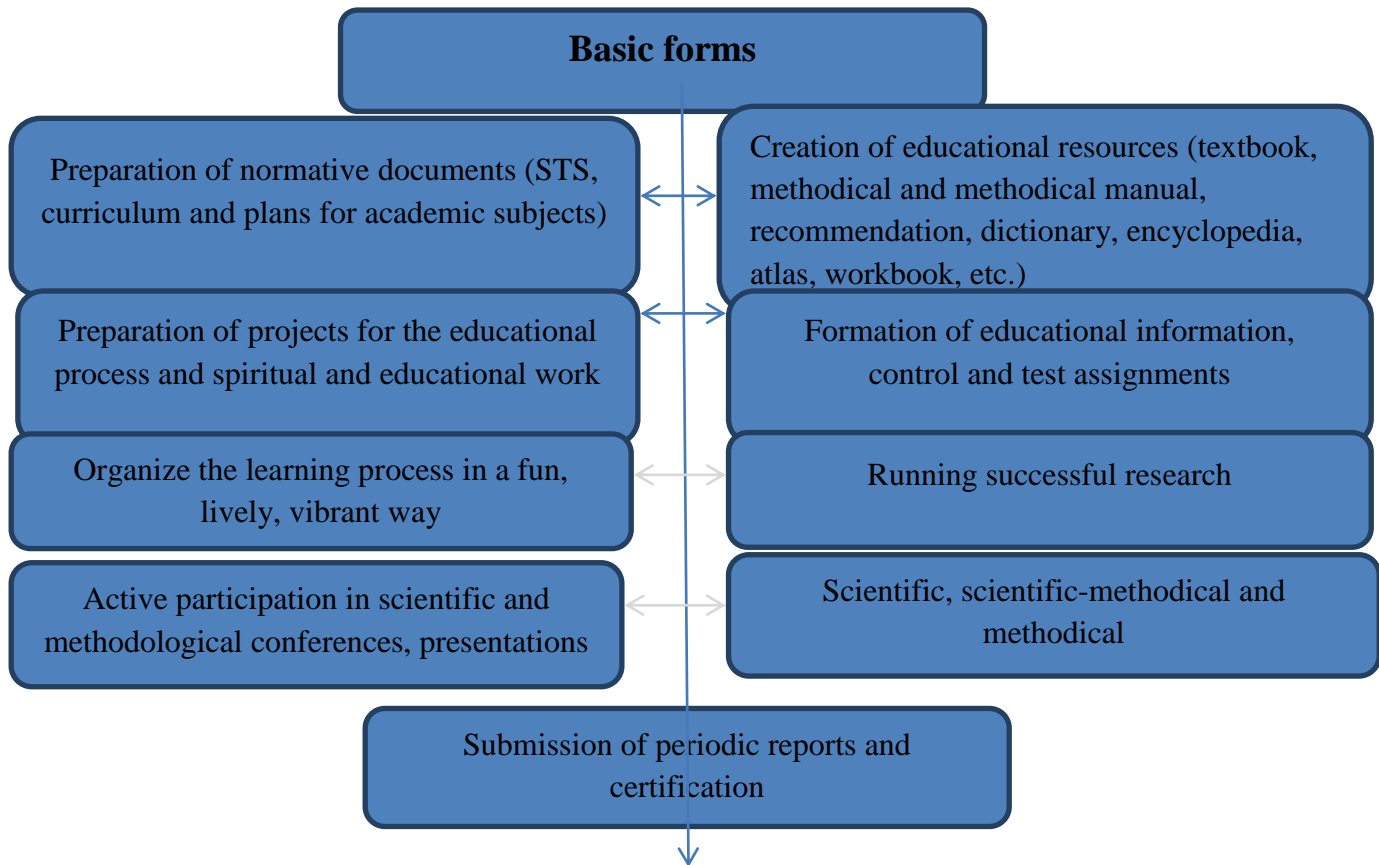

- advance a problem or scientific hypothesis;
- check and change the hypothesis;
- identify the problem based on the formation of decision results;
- Sensitivity to the interplay of knowledge and practical action in problem solving.

Pedagogical creativity is the ability of a teacher to create new ideas that serve to ensure the effectiveness of the educational process, as opposed to traditional pedagogical thinking, as well as to describe the readiness to positively address existing pedagogical problems.

Due to the educator's lack of creative qualities, students also have interesting and brilliant ideas, but still allow delays in expressing them. For this reason, the methods used in the educational process may not serve to form free, independent thinking skills in students.

The tools and strategies recommended by scientists are useful for teachers in developing creativity in students and develop students' interest and aspiration to study academic subjects.

In professional activity, the creativity of the teacher is manifested in various forms. They are:

The formation and development of creative thinking skills in a person is a uniquely complex process. Therefore, the effective organization of this process requires its methodologically correct and rational organization.

While creativity is often seen in children's activities, this does not guarantee that children will achieve creative success in the future. Only this or that creative skill by them represents the possibility that they need to master the skills. When developing creativity in children, it is necessary to pay attention to the following:

- Encourage them to ask more questions and support this habit;
- encouraging children's independence and strengthening their responsibility;
- creating opportunities for children to organize independent activities;
- focusing on children's interests.

Creativity in the learning process is reflected in the creation of creative questions that stimulate students' interest in reading, the use of various pictures, images, tables, symbolic expressions,

giving students tasks such as finding interrelationships between ideas and completely unrelated ideas, ensuring their work in small groups.

If a child has an unusual question or solution that is different from others, it is not necessary to try to return it rudely, but to encourage him to think, if he thinks wrong, to direct his thoughts correctly requires great pedagogical skills from the teacher.

CONCLUSION

In order to develop creative thinking skills in a person, first of all, it is necessary to form in them critical thinking skills. When presenting the teaching materials to the students, the question “If ...?” ensures that they effectively master both objective and subjective thinking skills in the performance of tasks.

We can conclude that the creation of opportunities for students to solve the given task in several variants also gives an effective result in the formation of their creativity.

FORMS, METHODS AND WAYS OF MORAL EDUCATION OF CHILDREN IN THE FAMILY BY MEANS OF NATIONAL VALUES

Saodat Zoirova Jabborova*

*Lecturer

Department of Preschool Education,
Bukhara State University, UZBEKISTAN

ABSTRACT

The article discusses the forms, methods and methods of moral education of children in the family through the national values of the Uzbek people, methods of education of the younger generation to prepare for family life. The educational value of countless and colorful proverbs, which for thousands of years have embodied the treasures of wise thought, sharp truth, deep content, and the treasury of the word, is invaluable.

KEYWORDS: *Folklore, National Values, Proverbs, Sayings, Riddles, Education, Generosity, Hard Work, Justice, Peace.*

INTRODUCTION

Today, such issues as the essence of education in the centuries-old experience of the Uzbek people, how its forms and methods are used in the mental, moral, labor, aesthetic and physical education of young people, how they are implemented in the education of young people in family life, are of particular relevance.

Our people have always understood the essence of education in the formation of a person and paid special attention to the upbringing of a child in the family, the upbringing of a child on the example of parents, mental, moral, labor education and craft training in the family.

From the long-term experience of the Uzbek people, it is known that the process of education is complex and multifaceted. After all, a child is engaged in human education from birth.

Someone once asked the ancient Greek philosopher Socrates: "You care more about the education of young people than about the education of adults."

Socrates replied:

"Young people are like the sprouts of trees, they bend as you bend them, they place my sermons in their hearts as if these sermons are sealed in stone. So I pay more attention to their education"

If our children are not brought up from the moment of their birth, and the time of education has passed, then it will be necessary to re-educate them. But the people have always emphasized that education is not one-day, but life-long, and expressed wise opinions on this matter.

At the same time, the Uzbek people realized that along with the correct upbringing, the pedigree is also important in the formation of every child as a good person.

On the basis of historical experience in the education of children, the people have created a whole, integral system of education. This highlights the importance of fertilizer. In the education based on this method, folk proverbs were appropriately used. Through the instruction, it is read that a sense of dignity, duty and responsibility should have such qualities as honesty and truthfulness, kindness. Fertilizer-admonition was also widely used in fairy tales. Because fairy tales are a school of life, in which the result of instruction, the decision, is manifested. The method of setting an example is also widely used in the national values of the Uzbek people. Even in the epic "Ravshan Khan" in the father, the old woman, the brothers have all the positive qualities, and we see an example of humanism. The educational value of countless and colorful proverbs, which for thousands of years have embodied the treasures of wise thought, sharp truth, deep content, and the treasury of the word, is invaluable. Because in every family, brothers are brought up and grow up depending on brothers, daughters and mothers. But when good people reap the good and bad people reap the bad, it has a negative impact on the upbringing of the younger generation. Thus, just as the exemplary behavior and actions of parents and adults have a positive impact on the children in this family, so their unfavorable behavior has a negative impact on the children. Young children in the family by nature often imitate adults. Therefore, they can have both a positive and negative character on the example of adults in their family. The most important of the methods put forward in the national values of the Uzbek people are the methods of encouragement and condemnation.

The main findings and results

In addition, the method of persuasion was used in the national values of the Uzbek people. Within the framework of the system of cooperation, the family-Mahalla-preschool educational organization in the spiritual and moral education of children on the basis of national values was guided by the following principles:

- succession,
- belonging of the dynasty to certain traditions
- age characteristics of children,
- gender identity and specific psychological qualities of children, individual education and creative approach
- pedagogical abilities of the mother,
- example,
- respect for national and spiritual values.

The process of spiritual and moral education of children by means of national values allows them to distinguish between good and evil, which are the moral and cultural values of society, as well as its spiritual and moral qualities.

- generosity,
- hard work,
- justice,
- great attention should be paid to the content of Uzbek folk tales, riddles, proverbs and sayings that contribute to obtaining information about peacefulness.

From an early age, children are introduced to the genres of oral folk art. For example: mother's cradle, games, fairy tales with children ("Claps", "Hand gestures", "Imitations of animal movements"), proverbs, sayings, riddles, fairy tales. Oral folk art provides great opportunities for the development of children's cognitive activity, independence, individuality, feelings, attitude to the world around them, and speech skills. The purposeful and systematic use of various forms of oral folk art in the spiritual and moral education of children in preschool education and in the family creates prerequisites for their spiritual and physical improvement.

The implementation of the above-mentioned organizational, pedagogical and psychological conditions in the educational process in preschool educational organizations and mahallas allows us to develop methodological training and the formation of skills of spiritual and moral education of children by means of the cradle, its use as a means of educating teenage girls.

The pedagogical and organizational structure of the process of spiritual and moral education of children in the family by means of national values is developed, the mechanism of organizing and conducting spiritual and moral events in the family by means of the family–Mahalla–preschool educational organization is improved on the basis of visual and activity thinking, synchronous influence of the cradle(phonemic sounds) and the priority of such small genres of oral folk art as the cradle, proverb, riddle, tongue twister , fairy tale.

CONCLUSION

Summing up, we can say that the national values of the Uzbek people widely use methods and techniques of education, preparation of the younger generation for family life, which is of great importance in the system of education due to its practicality, proven experience, passed down from generation to generation. In this regard, we consider it important to apply in the preparation of young people for family life the methods and techniques that were used in the preparation of young people for family life, in the education of children on the example of parents, in the mental, moral, labor and craft, aesthetic and physical education of children in the family, in folk proverbs, sayings, sayings, fairy tales, epics.

THE ROLE OF A FOREIGN LANGUAGE IN WORLD DEVELOPMENT

Elchaev Zohidjon Akhmatovich*

*English Language Teacher,
Karshi engineering economic institute,
UZBEKISTAN

Email id: Zohidjonelchayev1975@gmail.com

ABSTRACT

The decision of the president of the Republic of Uzbekistan "on measures to further enhance the system of foreign language learning", published on December 10, 2012, clearly demonstrates the necessity of knowing foreign languages for cooperation and communication with the countries of the world, comprehensive use of World Information Resources. As our esteemed compatriot said, "Our greatest base and base, the decisive force of our younger generation "should be able to learn foreign languages in depth and speak freely in this language in order to be no less than anyone else in the world. From the first days of our independence, the issue of language has also become an urgent task for the agenda.

KEYWORDS: *Language Analysis, Social-Cultural Difference, Linguistics.*

INTRODUCTION

Today there are several languages raised at the world level. These languages include English, Russian, German, French, and Chinese: these languages are used in various situations, for example, in international conferences, in international trade agreements.

Nevertheless, the perfect study of these languages requires a lot of hard work from a person. A person may not even know the meaning of some words in his native language, the question of how he can communicate in a different language. There are many ways to learn foreign language. To these, it is necessary to study mathematics, listen-understand, memorize a dictionary, etc. Before learning a foreign language, its phonetic course, that is, the sound system of the language and the skill of correct pronunciation of sounds, the role of transcription is incomparable, the reason for how words are read is given by special characters and helps us to pronounce correctly. In this process, the methods of rendering, explanation are widely used. It is

known to us that in sentences in foreign languages (Russian, German, and English) the layout of words is important.

For example,

I will go to University

ich gehe ins institute;

я иду в институт;

Also available in German, the assistant fees "haben, sein warden" is a part of the nouns in the Uzbek language.

For example,

ich bin Studentin

I am a student

Я студентка

Some students find it difficult to apply the same auxiliary verbs in the sentence. It is important that students take into account similar and different events in the process of performing exercises in a foreign language and in their native language, learn the difference between foreign languages by article and nouns by rote, cases of incompatibility with this Uzbek language.

The formation of skills of students to express their thoughts in a foreign language with several sentences, speech cultivation is the main part of the lesson, usually questions and answers are held with students. A student who wants to learn a foreign language perfectly should first understand the content of the text he / she listens to. This requires great skill from the language learner.

Language development and dissemination

The languages spoken by humans are far more diverse and numerous than many native speakers of the world's major languages believe. There are currently more than 6,000 different languages around the globe. The history of languages can be reconstructed by comparing their lexical composition and grammatical structure, but today there are studies of more distant linguistic connections that may reveal the only source of all the world's languages.

For some peoples, the formation of national languages took place in the absence of a unifying center, in an environment of competition or successive changes of several centers and the long-term preservation of feudal fragmentation. With the development of capitalism and the elimination of feudal fragmentation, nationalities develop into nations. Accordingly, the languages of the peoples grow into national languages. However, this process is not mechanical, not straightforward. In some cases, the language of a nation does not become a national language, but is relegated to the position of a dialect of a particular national language. In other cases, on the contrary, two or three different, though closely related, national languages are formed from the language of one nationality. The basis of a single norm is one of the dialects — the one that is put forward in the first place by the course of historical development. Thus, the norms of the French literary language are based on the dialect of the Ile-de-France region, i.e.

Paris and its environs, the dialect of London and the surrounding area is based on English, and the dialect of Castile, i.e. Madrid, is based on Spanish.

Religion can sometimes be an effective factor in promoting the spread of languages. Every religion, of course, needs a language that can serve as a means of spreading it. This is due to the increasing role and spread of the languages of religious worship. Religion can also have an indirect influence on the development of languages, since the assimilation of a particular religion is often associated with the assimilation of the culture of the people who spread the religion. Therefore, for example, in the era of the spread of Islam and Arabic culture, a large number of Arabic words and terms penetrated into the languages of many Eastern peoples. The publication of sacred books served as the beginning of writing in the history of many peoples. The development of the productive forces of society, technology, science, and general culture is usually associated with the emergence of a large number of new concepts that require linguistic expression.

Many nationalities develop into nations without having their own state at all, under conditions of more or less severe national oppression. This, of course, leaves an imprint on the development of the respective languages, making it difficult to form their literary norms. Sometimes the official language is the language used by the official religion (for example, Urdu in Pakistan is the native language of only 7% of the population); sometimes the same European language (English, French or Portuguese), which was the official language in this country during the colonial period and therefore is more or less familiar to at least part of the population. In some cases, the new states have two official languages that are still recognized as equal (for example, in India — Hindi and English, in Tanzania-Swahili and English, in Mauritania-Arabic and French). A characteristic feature of modern times, along with the development of nations and national languages, is also the steady growth of international relations, comprehensive and increasingly widespread contacts between peoples, including language contacts. Bilingualism of large groups of the population is widely spread in the modern world.

English – the language of international communication

English is an international language, one of the official languages of the United Nations, and is the language of international communication in such areas as politics, science, technology, business, culture, and trade. English is the language of navigation, aviation, literature, education, contemporary music, international sports, tourism, and programming. 75% of the world's correspondence is conducted in English, 60% of radio stations broadcast in English, more than half of the world's periodicals are in English, and 80% of the information on electronics is stored in English. It's no secret that English is the most widely spoken language in the world: more than 400 million people use it as their first language, but the number of people who use English as a foreign language is more than three times that number.

In the era of globalization and the expansion of international contacts, the study of English is becoming particularly important. The main reasons why people study English in our country are study, work, and recreation.

Today, Uzbekistan is developing contacts and cooperation with many countries of the world, which requires a greater number of specialists who speak English, which is necessary for conducting negotiations and concluding contracts. Due to the peculiarities of the historical development of Uzbekistan, specialists in the field of logistics and management are becoming

more relevant. These people also need fluency in English. Nevertheless, this category of specialists does not exhaust the circle of people who need knowledge of the English language. Now it is necessary for a successful career in almost any field: knowledge of English is a prerequisite for literally survival, since it is impossible to find a high-paying job without knowledge of English. It is also necessary to take into account that the knowledge of foreign languages is very important in the field of personal and professional communication of a person, which allows him to be one-step ahead of others. Students who are proficient in English at a high level are more likely to attract foreign capital to their companies, enlist the support of investors, and engage more actively with their foreign partners when building their careers in the future. Such international cooperation allows us to bring Uzbek business to a qualitatively new level, increasing the overall authority of Uzbekistan in the international market, which will lead to an improvement in the economic situation.

Previously, we used to use the services of an interpreter, but it is expensive and inconvenient, and it is optimal to learn English yourself, thereby increasing your own value in the eyes of modern ubiquitous managerial optimization.

All transactions are conducted in English, even between countries where English is not the official language: for example, transactions between China and Japan.

English is widely spoken in the business community of the world, so it has received the status of an international language in about 60 countries.

More and more countries are choosing English for study in educational institutions of different ranks.

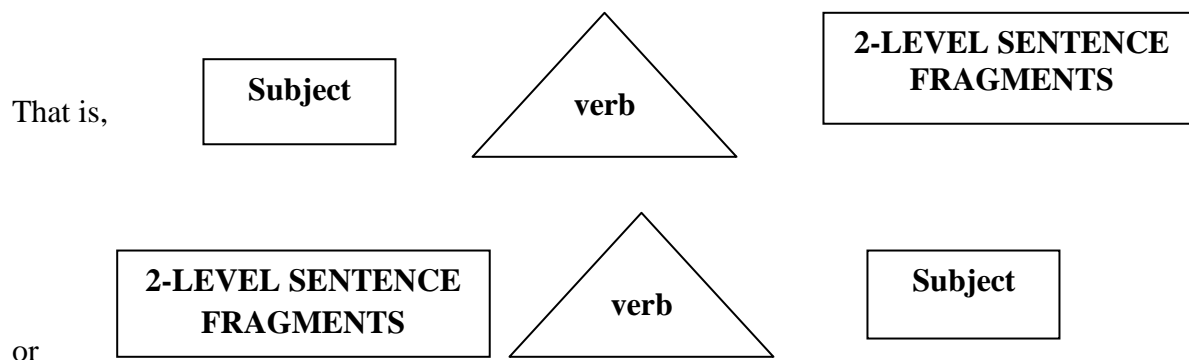

What does knowing a foreign language give us?

Firstly, a career. At the present time, in order to get a prestigious job in a large organization, you need fluency in the language. This is due to the fact that large organizations have foreign companies among their suppliers and buyers, and, accordingly, negotiations, transactions, signing of contracts, etc. are conducted in the international language - English. Knowing English, you will always be able to communicate freely with business partners, take part in international conferences, read international magazines and newspapers about business.

Secondly, travel abroad. Everyone knows that a modern person, who is a versatile and inquisitive person, strives in his life to visit as many different countries and cities as possible, to get acquainted with the culture and customs of other peoples. Moreover, how is this possible without knowing English? In tourist countries, be it Turkey or Spain, everyone who works with tourists speaks English. This improves the quality of service for visitors, which means that it attracts more and more tourists. In addition, the tourists themselves, being in a foreign country, feel much more confident, knowing that, in case of anything, they will always be able to explain themselves to the locals, ask for directions, clarify the location of something, etc.

Thirdly, study. Knowledge of English makes it possible to study at prestigious foreign universities, as it is one of the most important selection criteria for admission. Having a degree from, say, the University of London, a graduate gets the opportunity to get a job all over the world, because, as you know, a diploma issued in the United Kingdom is one of convertible.

In conclusion, it shows that students will have difficulty in explaining grammatical phenomena, because the word order in the Uzbek language is free and it is possible to put the section where they want. It is desirable that this situation is explained by the scheme of the teacher of science.

The same scheme will remain in front of the student's eyes and can comfortably compose as much as he wants.

Possession of foreign languages is becoming a period demand. Today, we must preserve our native language, which is considered our invaluable wealth, which is dying from ancestors to auto, and of course, we must know a foreign language perfectly, as the era dictates.

ABSTRACT

In the article, the role of the rules of "Fundamentals of Life Safety" in the achievement of knowledge in the school education system with the ability to think independently about the safety of students is great. Because students learn to think individually and independently through independent thinking. Every school student should have knowledge of safety in any situation and be able to take appropriate safety precautions if necessary.

KEYWORDS: School, Student, Education, Life, Safety, Emergency, Accident, Disaster, Natural Disaster.

INTRODUCTION

At present, political, social and economic reforms are being carried out in all spheres of our society. In particular, ensuring civil protection, protection of the population and territories from natural and man-made emergencies is one of the priorities of state policy in our country, and consistent reforms are being carried out in this regard.

Law "On protection of the population and territories from natural and man-made emergencies"

Article 18 stipulates that in general education schools, academic lyceums, vocational colleges and universities, industrial and residential areas, training the population to act in emergencies is general and mandatory.

One of the priorities of the state policy of our country is the protection of all segments of the population and territories from natural and man-made emergencies, ensuring security, achieving sustainable economic development. Effective measures to anticipate emergencies and warn the

population of the danger, to act quickly in the event of an emergency, to prevent human casualties, to prevent economic damage.

Today, in the field of "Fundamentals of Life Safety" a lot of work is being done in the field of research to develop the education system on the basis of innovative approaches, innovative management of educational processes at different levels or stages, training teachers for innovative activities. One of the main tasks of the education sector is the creation of advanced pedagogical technologies, modern teaching materials and didactic support of the educational process in the Law of the Republic of Uzbekistan "On Education", the "National Training Program". The implementation of the "National Training Program" involves radical reforms in the structure and content of the system of continuing education, based on the achievements of modern science and social experience.

To do this, first of all, it is necessary to provide the educational process in all forms of education with a new and modern methodology based on advanced, scientifically-methodical. One of the most pressing issues facing the education system today is the effective use of the achievements of science, technology and advanced technology in accordance with the goals, objectives, content, methodological requirements for educating the younger generation. Therefore, the words of President Sh.M. Mirziyoyev on today's youth policy, in particular, on the education and upbringing of young people, are noteworthy: "We will resolutely pursue the state youth policy. Not only will we continue, but we will raise this policy to the highest level that we need today, as our top priority. "

The only way to reduce the number of accidents, disasters, natural disasters, epidemics, riots, terrorist acts and the economic damage they cause, as well as the number of casualties in emergencies, is to teach them how to act properly in emergencies.

In order to ensure the safety of students, the course "Fundamentals of Human Security" has been taught in general secondary schools of the country since 2000 at the expense of school hours, and since 2011 this course has been integrated into the discipline.

According to the order of the Cabinet of Ministers of the Republic of Uzbekistan from July 19, 2011 "About approval of the Comprehensive program of preparation of the population for emergency situations (natural and man-made) caused by earthquakes" and the order of the Ministry of Public Education from November 23, 2016 of No. 343 Curriculum and teaching materials of the integrated course "Fundamentals of Life Safety" (sets of didactic materials for students in grades 1-9 and methodological manuals for teachers) were experimentally tested.

Cabinet of Ministers of the Republic of Uzbekistan 2017

Due to the introduction of an 11-year system of compulsory education in accordance with the Decree No. 803-f of July 25, in order to ensure the continuity and continuity of education, the course "Fundamentals of Life Safety" for grades 10-11 materials were prepared and in accordance with the order of the Ministry of Public Education No. 227 of September 10, 2018 No. 44 of Kitob district of Kashkadarya region, No. 40 of Jonboy district of Samarkand region, No. 52 of Namangan city of Namangan region, No. 13 of Fergana city of Fergana region and Tashkent was tested at School No. 69 in

On the basis of this program in the 10th grade of secondary schools integrated with the subjects "Chemistry", "Biology", "Geography", "Physics", "Physical Education" and in the 11th grade in the subject "Primary Preparation" in the section "Civil Protection" training was scheduled.

The program is designed to provide practical assistance to secondary school students to respond to emergencies, improve the education system, reflect the factors and requirements that affect the effectiveness of the formation of safety frameworks. continuity, basic means of security, interdisciplinary communication and mutual opportunities, focus on the formation of safety concepts and skills in students, and delivery to students through training.

The school has a curriculum for grades 10-11 on the integrated course "Fundamentals of Life Safety", a methodological manual for teachers and experimental science teachers assigned to experiment with projects of didactic materials for students.

Therefore, the most effective way to teach the basics of Life Safety is to provide students with first aid for emergencies that may occur based on the classification of emergencies, their causes, damaging factors, preventive measures, and correct action when they occur. An effective solution to the acquisition of knowledge, skills and competencies is to teach through the introduction of the independent subject "Fundamentals of Life Safety" in this educational process. Mass development of the population significantly raises the culture of life safety and provides a risk reduction factor and growth in the Republic of Uzbekistan.

ABSTRACT

Changes in the epistemological works of Muhammadniyaz Nishoti Najmiddin Kubro, one of the leading artists of the Khorezm literary environment of the XVIII century, was greatly influenced by the mystical images in his lyrics and as a result created mature works. His epic “Husn-u Dil”, written on the basis of symbolic images, Sufi views, is a proof of our opinion. In his dissertation he studied at the school of theology of Nishati, it was emphasized that he was aware of the state of science. Indeed, Nishati’s experiences in the process of spiritual upbringing, brought up by Eshan Sharafiddin, were one of the main reasons for the success of the work. The state of the sect reflected in the works of the sheikh, such as “Favaih ul-jamol” and comparative analysis has proved that the philosophical and theoretical views on the status of the status are expressed in a symbolic metaphorical manner in the epic “Husn-u Dil”. Through the works of Kubro and the epic Husn-u Dil, it was revealed that the essence of mysticism could be explained more deeply by showing this tradition. The mystical terms in the Sheikh’s works: husn, fuod, vahm, aql, hayrat, etc. are transformed into lyrical heroes in Nishati’s epic, creating a very vivid picture.

KEYWORDS: *Najmiddin Kubro, Muhammadniyaz Nishati, Literary Tradition, Husn and Dil, Followership, Harmony.*

INTRODUCTION

It is no exaggeration to say that the creative heritage of Sheikh Najmiddin Kubro and the teachings of Kubra influenced the literature of the whole East. However, this continuity is especially evident in the works of the creators of the Khorezm literary environment. Inspired by the teachings of Kubravianism, the artist, who did not continue the traditions of Kubravian

literature, is almost non-existent in the literary environment of Khorezm. From Pahlavon Mahmud to Muhammadrizo Ogahi, certain traces of Kubravi traditions can be seen in all great artists. First of all, the courageous life of the sheikh was an example. Of particular note is the fact that the information about the glorious life of Hazrat Kubro, which came in Tazkira and Manaqib, was transferred to fiction. From the point of view of a single sheikh, the story of the changed dog is remembered in the works of many artists, sometimes in prose, sometimes in reference to the art of Talmeh.

In Najmiddin Kubro's works, he theoretically substantiated the importance of the ten specific principles of murid upbringing, namely, tawba, zuhd, tawakkul, qanaat, uzlat, zikr, tavajjuh, sabr, murakaba, rizo. In the process of analyzing Husn-u Dil, we saw that Muhammadniyaz Nishati interpreted these ten requirements in an artistic way and skillfully incorporated them into the essence of the work:

How many times have you been a stranger?

The Kurdish taste is amazing.

Respectfully yours,

It is obvious that the House of Haram.

Vusata was a Kubra scientist,

That is, it was an anchor.

Once upon a time there was an anchor,

Nazhata is the garden of paradise.

His father's palace was Tawakkul,

The subject was every member, every flower was a flower.

It was a wonderful religion,

Time and earth followed him.

Ins ila jondin ten uzlat,

His father was Sheikh Qanat.

Sheikh Qanat, who retreated to the palace of Tawakkul, whose scholar is described as Kubro in these verses, is similar to Najmiddin Kubro's artistic perception.

And the placement of "Tavakkul, Qanoat and Uzlat" in the same sequence is the same when comparing the place of the ten methods in Al-usul al-ashara.

Because in "Al-usul al-ashara" there is a constant risk, contentment and compassion, and Nishati follows this in his work.

The author quotes one of the heroes of this work in Nay's speech:

I want to go to the world,

Every finger is the master of the craft.

In this sentence, too, he refers to the ten principles of cubism. The reason we say this is because nay's speech is mystical from beginning to end.

It is known that the most necessary and valuable thing in the spiritual caravan is Love. Sayri is a love that creates perseverance and perseverance in the leech and gives birth to trust, contentment, contentment, patience, austerity, abandonment and so on. And the power that turns all this into a spiritual way of life is also because of the love in the heart. This issue is also convincingly and reasonably covered by the author in the epic.

The land of Nishati Ishq cites place names such as the valley ushshaq, all of which are figurative references to a clear spiritual journey of Fuad on the path of Truth. Let's look at these verses in the epic:

O Lord, love the neighbor,

Love is a decision to be made.

My mind is subject to the command of love.

Make my heart a slave of love.

While there is a contradiction between the nafs and the soul, the body and the mind in the literature, the contradiction between love and the mind is at the root of these contradictions.

Although Najmiddin Kubro admits that "the wing of enlightenment is higher than the wing of love", he has repeatedly stated in all his works that it is love to end one's place in the leech. In the heart of the leech, the journey from the birth of demand to the rise to the status of guardian is the leader of love in the leech.

Ushshok Valley - Unity Square cannot be reached without crossing the Valley of Lovers. Nishati described these cases as a sight to behold:

The point of interest,

The pole was late in the sky.

There was something on the surface of the water,

The smell of musk blows the wind.

The adornment was glorious,

His father's name was Ushshok Valley.

At the end of the work, Muhammadniyaz pays special attention to Nishoti Ishq and calls him a leader and murshid. Only under his guidance can one reach from "Nafs ammora" to "Nafs sofia":

Whoever is God is his helper,

The future is the leader of love,-

Nishoti emphasizes the role of love in the plot of the epic. He is sometimes a country, sometimes a terrible valley, sometimes a guide, and so on. However, it is the main chain that connects all the images and events in the work. We read in the epic:

Love has two wings,

For Salik, a puddle of life.

For those who don't, it's a couple,

Flying is a fruit that does not give it.

Love coached Fuod -

He had a ball and someone wanted it

Hazrat Kubro also called the murid a two-winged bird. Danger and rajo, constipation and bast, sadness and peace are its wings.

In the same way, love and affection for the tax that Nishati seeks for life are two wings. Love coaching was a must for him to travel the long and hard road and reach Visol.

“One of the important features of the famous sheikhs of the Kubravian sect is their extensive use of color symbolism. Sheikh Kubro's journey through the leech process, the three curtains of man, that is, he uses this tool to explain his experiences of being free from the trinity of being, lust, and the devil.

“In his works, such as Favoyih ul-Jamal and Risala fi-l halva, Kubro focuses on the meanings of certain colors,” Suleiman Gokbulut said in his book.

In fact, not only the sheikhs of the Kubravian sect, but also many other writers used color in their works to describe the mental state of the herooof course, there is no doubt that colors are based on the meanings expressed in the works of mystical representatives.

A vivid example of this can be seen in the epic Husn-u Dil. During the events of the work, Fuad's father Aqlshah handed him the kingdom of Qalai Badan. The name of the city is also figurative. Let us focus here on what is meant by the body: The body is the whole body of man. The name of the protagonist, Fuad, means heart in Arabic. According to Amr al-Makki, Allah created hearts from bodies seven thousand years ago.

It is not surprising that in this sense, the author is first sent to Fuad, that is, the soul is created and then sent to the city of the body. Nishati's main goal is also to show what is happening in the heart, which is the most delicate organ in the human body. In this sense, he tries to show the subtle situations that take place in the human psyche through colors, just like Najmiddin Kubro.

In Najmiddin Kubro's Favoyih ul-Jamal, the human body is dark at first sight. When it is cleansed a little, it becomes a black cloud in front of you. When the body becomes the throne of the devil, it turns red. If it is reformed later, if it gets rid of material pleasures and enjoyments, if it stabilizes rights, it will become clearer and whiter”. Yellow is given as the color of weakness.

There are four bazaars in Qalai Badan, which Nishati describes, and in each bazaar there are trades of different nationalities, which the writer depicts in different colors. The business of the people of the market is trade. The word “trade” means blackness, hardship and hardship. So, in this city, Fuad, that is, Dil, is waiting for hardship and pain. And this pain was divine love. And the different nations that trade in the market are the mental states that are expected to happen in the heart. As the king of “Qalai Badan”, Fuad must subdue these circumstances and reach Husn, the divine guardian.

The various nations (states of mind) that were considered merchants, on the other hand, took different colors as their basis. For example:

On every side were the people of France,

She has a yellow coat and a sapphire color ...

said the French traders with yellow:

Another place for the Indian elite,

They wear black as a bell ...

said the Indian traders in black:

In one of them, the Chinese people,

In fact, they were the people of Talvin.

Borcha's dress is red,

Red palace, red floor ...

talvin Chinese traders, that is, in color and in red.

In one of them was the Roman people,

He wore a bullet and he crossed the border ...

and describes the Greek traders in white.

Najmiddin Kubro in his treatise Favaih ul-Jamal states that a state of weakness occurs as a result of certain causes and disorders in a person, and explains this situation in yellow. It is reminiscent of Fuad's state of mind when he fell in love with the divine.

The transformation of the spirit from color to color is a sign of development.

Nishati associates Indian merchants with black, on two different bases: one is the original color of the people; the second is the excitement and admiration of the metaphorical Fuad for his condition. The sheikh also describes black as a color of excitement and wonder in his work.

Regarding the analysis of black color, let us pay attention to the following remarks of Kubro scholar Suleiman Gokbulut on the analysis of Najmiddin Kubro's works "Risola fil halva" and "Favoyih ul-jamal":

"Sheikh Kubro argues that black is a symbol of blasphemy, polytheism and doubt. According to him, darkness and gloom are proofs of the value of turbulent pleasure, the power of bodies, and animal lust. However, it should be noted that in mysticism, black is interpreted in two different ways.

Najmiddin Kubro is referring here to the original meaning of black. In the second sense, black, in essence, is not a color. He is the source of all colors. It signifies the nature and condition of God, and at the same time the return to the original".

The situation of King Fuad in the city of Qalai Badan is consistent with the first meaning of black that Najmiddin Kubro meant.

Throughout the events of the work, the author introduces a number of discussions to substantiate the points he intends to make. One such discussion is the conversation between Purple and Powder. In the discussion, Purple is depicted in black, and the protagonist explains why:

I learned that the universe is unfaithful,

Life is worthless.

Look at my clothes for her,
 I died and I was tormented,
 Whoever dies before his death,
 The death of a group of people is a tragedy.
 This mortal life is sacred,
 Death will soon be gone.

This discussion takes place on the eve of Fuad and Husn's wedding. At that time, King Fuad had reached puberty in love, and Purple's words were purple to his liking. that is, he wears black because it corresponds to Fuad's current state of mind:

The king used magic,
 Wisdom and wisdom have said goodbye.
 She was overjoyed, her clothes were purple,
 The purple tent for sleeping is purple.

Najmiddin Kubro emphasizes that the state of the king is in sync with the second meaning of black. King Fuad had returned to the original in the same situation.

In the description of the Chinese merchants, Nishoti creates a beautiful example of the art of tajnis through the word chin. If Chin is the name of a place, in the next verse it means "To be honest, it was the hand of Talvin". The word "talvin" in this verse comes in the form of "talavvun" in Najmiddin Kubro's work, and both have the same meaning, that is, the variety of colors.

Najmiddin Kubro writes in his treatise Favoyih ul-Jamal:

"Be aware that the combination of colors shows the way and the state of being intact. The combination of colors and the formation of a single color is talvin ... "

In the epic, the combination of all the colors in the fabrics of the Chinese merchants is a "turmoil of thought and experience" that is expected to occur in the spirit of Fuad.

After Talvin, the author describes the clothes of Chinese merchants in red, a color that signifies gnosis in Najmiddin Kubro's philosophy. Irfan is the acquisition of knowledge about Allah.

In the book presented to the protagonist Fuad by his mother, Obi talks about the characteristics of Obi life (Obi life is the symbol of Allah here), from which Fuad falls in love with her, but in this book features of water are enumerated, and his address is not given. Now Fuad must master the science of it.

The last owners of the market were Greek merchants. Nishati describes them in white.

In Fawaih al-Jamal, it is said about latifs: it becomes clear, it turns white ... "According to Nishati, King Fuad of this color" reformed his nafs. when one is freed from material pleasures and pleasures. So, we summarize the views on this chapter as follows:

The study of the genius of Sheikh Kubro and the beneficial influence of the ideas of his Kubrai doctrine on later literature is undoubtedly one of the most pressing issues in literary criticism as well.

Indeed, as is acknowledged in literary criticism, it is difficult to imagine classical literature without the teachings of mysticism.

A distinctive feature of Uzbek classical literature is the predominance of tradition in it. The literary environment of Khorezm has its great representatives and huge literary heritage.

In these classics, of course, one of the literary realities is the harmony of ideas and art of writers living and working in Khorezm. Although innovations have become apparent over time, literary traditions have also left their mark.

Undoubtedly, one of the main sources of such a lifelong idea and unique art is Najmiddin Kubro's personality, the essence of his mystical works and the teachings of the sect he founded. It is a fact that such poets as Qutb Khorezmi, Haydar Khorezmi, Hafiz Khorezmi, Ogahi also enjoyed the traditions of this Kubravian literature. In particular, Nishati and his epic "Husnu Dil" fully support our opinion.

Muhammadniyaz Nishati's works, including the epic "Husn-u Dil", are, first of all, works of Sheikh Najmiddin Kubro in all respects, as they are a work that literally expresses mystical views in an mystical and artistic way.

As long as their theme is the same, both the didactic ideas they promote and the symbols and slogans in the expression of this goal are the same. especially the harmony in the world of images is remarkable. It can be said that one of the bases that define and confirm this follow-up is mystical terminology.

Terms such as "tavakkul, ishq, rizo, fuad, Husn qanoat, sabr" in the sheikh's erudite works became a certain image in Nishati's epic - the hero of the work. As a result, the unique style of expression has further clarified the reader's imagination and increased the power of influence. The epic "Husn-u Dil" is a mystical work that artistically expresses the theoretical foundations of religious education. Ways of Truth The claim that "human breath is wrong" has been mentioned many times among Sufis.

However, Najmiddin Kubro combined these paths on ten bases and wrote Usul al-ashara. The views in this work are also elaborated in the question and answer of a well-known protagonist in the epic, in the statements of his mental state. It is clear that the personalization of this situation and status in the epic as the protagonist of the work is, of course, the author's own achievement, but he relied on the Cuban doctrine in showing their meaning. Therefore, the role and place of these positions in the path of truth and in the education of the self are fully revealed.

ABSTRACT

This article analyzes the vocabulary as a genre of folklore. Each of us uses proverbs every day, often without even noticing it. These short sayings reflect the household reality of the people, the animal world, the nature of their native country, and the historical past. The Uzbek people, like other peoples, have a huge treasure trove of proverbs and sayings that make up the most important element of their spiritual cultures.

KEYWORDS: *Native word, Experience, Knowledge, Carrier, Popular wisdom.*

INTRODUCTION

Folk games do not happen by themselves. To this end, it has been created for centuries by representatives of the people who teach folk games to their children, who are free, have a bright future, and at the same time their children are healthy and energetic. After the independence of our country, our government has been paying close attention to the further development of this tradition, supporting it in spiritual, educational and economic terms .

If we take into account that the Uzbek people, its ethnic tribes and clans are the descendants of the Turkic peoples, it must be acknowledged that the formation and development of folk games in the Turks dates back to antiquity. For this reason, the Uzbek folk games are a unique product of collective and individual creative activity, a tendency of responsibility, perseverance, commitment to national traditions, customs and values inherent in the Turkic and Uzbek peoples. Examples of this are folk games such as "kupkari" and "struggle" and "sniper", which symbolize

the unity of strength, intelligence, experience, potential and mobility. That is why they were created by a wide mass of people and have been preserved for thousands of centuries.

Created and perfected by the representatives of our people, such games have been developed over the centuries as a necessary element of life and social life of many generations of the Uzbek people. It is natural that he did.

Uzbek folk dances embody the creative power, material and spiritual riches of the country's history. If we look closely, they reflect to a certain extent the historical experiences of knowing the realities around us more quickly and mastering them in all respects. These games are practical in nature. However, many of them also have theoretical aspects that they do not pay attention to. This is due to the fact that they have different names, rules of application, and over time, due to the obsolescence of the games, their content is updated and some names are renamed. In them, the peculiar integrity of the system of folk art culture, their national and individual characteristics are clearly visible, as well as their hidden theoretical aspects, which are a form of artistic culture, such as naming, renaming them. Their names are also considered to be one of the sources enriching the lexicon of the Uzbek language, only they have not been studied on a scientific theoretical and practical basis from the point of view of special scientific research as one of both lexical and onomastic units.

At the heart of the national character of these games is a complex of cultural riches of the Turkic, including the Uzbek people, a huge, interesting and controversial heritage in this area. It is natural that folklore, especially its genres such as epics and historical legends, serve as one of the important sources in the formation, development and progress of Uzbek folk games. For example, we know the different forms of the game of "kurash" in the regions of our country: back-to-back wrestling, wrestling in different ways, playing wrestling. However, in the epic Alpomish, a bright symbol of our national culture and enlightenment, Barchinoy's call to fight Alpomish as a way to fight Alpomish, who fought with Kukaldosh for forty days and nights, is not to break the rules of wrestling, but to develop and improve it. As a result, this wrestling game is becoming known not as a simple wrestling, but as "Surkhandarya wrestling". Considering that this epic has been in perfect condition for ten centuries, that is, a thousand years, the formation, development and progress of our games, as stated in the epic "Alpomish", goes back thousands of years.

Many folk games, with the individuality of their themes and the generality of their content, provide a certain opportunity to highlight the traditions and customs, ancient customs, labor activities, enlightenment and culture of the tribes.

The forgotten divine prayers of our people, which have an ancient history, and the mixed numbers of meaningful and meaningful verses and jokes continue in the folk games of today's children. That is why Uzbek folk games, which are played as a group, and even some sports games are based on the games of ancient tribes, their names and rules of play. Because, as a rule in everything, it is natural that certain rules of play in games were in force at the time of creation of games.

The original Uzbek folk dances were formed by ancient, patriotic, warlike, wise and innate educators who have confidence in the future. To do this, it is useful to refer to the texts of historical written sources. Elements of certain games are also mentioned in the historical legends "Tumaris" and "Shirak". In historical legends and historical written sources, game races are very

common among the Sak, Shak, and Masaget tribes, and there is information that they were a favorite custom of the people. According to them, the boys of the Sak // Shak and Massaget tribes had the right to marry the girls they had defeated in such games. This is also confirmed by the historical archeological and ethnographic materials collected and studied by scientists who conducted archeological excavations.

From ancient times, the Turkic peoples living in Central Asia, especially the Uzbek people, not only had games such as wrestling, archery, horseback riding, more precisely, physical exercises, but also known and popular as mass games. In historical records, the Greek historian Herodotus wrote of the skilled snipers of the Saxon tribe who lived side by side with the Khorezmians: "The Scythians were famous among all the snipers in the world as very skilled snipers who did not destroy arrows." It is obvious that the game of archery has long been popular among the people.

According to historical sources, the Roman writer Klement Alexandrius (2nd century BC) wrote about the women of the Sak tribe: "The Sak women were cunningly fleeing and shooting back like men on horseback."

It is obvious that the Turkish and Uzbek national folk games appeared in ancient times as field performances, celebrations and methods of fighting several hundred years ago. This is evidenced by archeological excavations and ethnographic materials of the ancient Roman writer Elian, as well as historical monuments and sources found in different parts of the country, Turkish tombstones, "Devonu lug'at-it turk" and other ethnographic and dialectological content. confirms substantiated dialectal meaningful examples. The history of their emergence is associated with the development of folk national games, in particular, sports, theater, dance and circus arts in the territory of our country.

The content of folk games, created thousands of years ago, is very rich, colorful and very diverse, and has a certain historical character, that is, they were created to strengthen patriotism, freedom of the people, equality and stability.

Their content embodies the best traditions and performances of folk festivals and performances. Also, with its unique originality and features, folk games have enriched our national enlightenment and culture, perfectly integrating the folk traditions, values and customs of their generations.

For example, among the national folk games, especially the ancient and exciting art of dorboz and symboz, stood out. In the past, dor games and the skill of the players in them were so popular that they were even seen by rulers and famous commanders, as well as foreign guests. It is natural that the public and local holidays and seasonal markets of Turks, especially Uzbeks, do not pass without darbozs.

Due to the great interest of the people in these games, dors were built in the Registans, market squares and Chorsu of the big cities. The continuous sound of trumpets and drums in the morning heralded the beginning of the show. Upon hearing this, when the people gathered, the dor games related to dorboz began. Of course, the assembled spectators watched with excitement the bold movements of the dorboz (s) playing on a high stretched rope with a thousand different methods and a thousand different subtleties. While they were amazed by the goalkeepers' bold but positive actions, they were also surprised and upset by their fears and negative actions.

Simultaneously with the games of dor and darboz, the game of wooden legs became widespread in Central Asia, especially in the territory of our country. Historical sources, historical epics, and novels describe how wooden-legged runners, jumping, dancing, playing melodies on national instruments such as trumpets and horns, and performing spectacular performances had a positive and sometimes negative impact on young people.

In Alisher Navoi's epic Farhod and Shirin, Farhod struck enemies who invaded Armenia by standing on a mountain and throwing a slingshot. In 1941, General Panifilov's division was made up of Uzbek men who, because of their mastery of the "stone-throwing" and "stone-throwing" games, fired grenades at enemy tanks that had come to capture Moscow, stopping and retreating the enemy. There is a lot of information in "Boburnoma" about "ball game on horseback", "wrestling", "test of hand strength", "playing on horseback", "jumping on horseback", "sniper". The games mentioned in the play intensified the fighting of the warriors so that the king and poet Babur would win the battle against the twelve thousand warriors against an army of one hundred thousand men equipped with war elephants by the king of India in Bonipart // Panipart, India.

The fact that from ancient times to the beginning of the XX century in Khorezm at the governmental level the spread of the "Game of Sticks" to strengthen young people and improve their fighting skills shows the natural need for folk games.

As one of the Turkic peoples with an ancient history, it is known from the study of the traditional way of life of the Uzbek people on the basis of scientific theory and scientific practice that the territory of modern Uzbekistan was once inhabited mainly by nomadic and semi-nomadic peoples. Their main occupations were animal husbandry and farming. Livestock was engaged not only by semi-sedentary but also sedentary farmers. Farmers used horses, sheep, and cattle to plow the land, thresh wheat, and draw water from rivers and wells. Livestock was also used by traders and artisans. As a result, a number of Uzbek folk games such as "Podachi", "Lame Wolf and Sheep", "Goats and Shepherds", "White Camel", "The Wolf Came" originated, and their rules were perfected and developed.

In order to prepare a solid and solid foundation for their future, the representatives of our people said that the most interesting games among young people on the theme of animals and birds, such as "Pigeon Game", "Baby", "Yumronkoziq", "Horse Game" will be a wide picture of dance games. provided. In this way, the people's representatives instilled in their children the idea that they should be as alert and strong as an animal, as spotless, diligent and hardworking as a bird.

Also, among the tribes and clans of the Uzbeks, "Karnaymi, surnay", which symbolizes weddings, "Nina, ip and tuguncha", "Tapir-topur kyagach", "Pumpkin planting", representing various aspects of the social life of the people, defending their homeland. , such as "The Battle of the Roosters", "The Rooster and the Chicken", "The Runner, the Bird Has Come", "White Terakmi-Blue Terak", which symbolizes mutual equality and non-discriminatory cooperation.

Although national folk games originated in very ancient times, at each historical stage of their development the content changed and performed different social functions. Values, traditions, sciences, including national games, are connected with the life of our nation and have been passed down from generation to generation. The knowledge and experiences acquired by generations have been tested in practical life, reinforced and improved by subsequent generations. Their content has been updated by each generation, the stages of development of society. Children played folk national games together under their control, which adults played at

that stage of community development. Many national games are inherited from fathers and grandfathers to children and grandchildren. For example, games such as "Kurash" and "Kupkari" are examples.

So, the origin of the Uzbek folk games is due to the following:

1. People care about the future of their children and strive to discover things that are useful to them, including games.
2. To form complex things, especially complex stage games, to make their offspring strong, resilient, intelligent, and courageous.
3. To teach conscious and skillful attitude to the tendency of changes in nature and society by mastering them, as there are certain invariable rules and laws in every game.
4. Mental adaptation to the fact that social relations, such as the rules of folk games, are delicate, controversial.
5. To accustom oneself and one's partners to live on the basis of equality and neutrality in social relations, just as it is necessary to respect the opponent (s) in every game.
6. Given the fact that in the content of folk games there is such a spiritual encouragement as courage, bravery, bravery, diligence, respect for others, to teach them to children as both a game and a serious exercise.
7. To feel that the content of the games is one of the educational processes in every open air for the presence of courage, diligence, impartiality inherent in the Turks.

The amount of these causes may increase again. At the same time, the fact that they are not in vain can be seen in the example of the process of development and improvement of folk games for thousands of years. After all, in every game of our people, the unique content of the wisdom, potential and traditions of our people is sealed. It also shows that folk games have played an important role in its history and destiny.

Folk national games are not only studied independently, but also taught at the Tashkent State Institute of Physical Culture on the basis of special disciplines. Thus, the social significance of the Uzbek people's national games in historical periods is reflected in the specific forms of modern social life, labor and lifestyle of the people, as well as their structural integrity, the principles of naming, naming and renaming. means that there are also apparent onomastic problems. According to some estimates, the number of national games of the people is more than a thousand. Such problems, of course, will be solved in this study, which is based on scientific theory and scientific practice. The Uzbek national games reflect the rich feelings and emotions of the Turks, in particular, the Uzbeks, their spiritual uplift, love and hope to protect and love their homeland.

It is clear that the Uzbek people teach national games in a large part of the country, in all regions of the country, to children, the younger generation in the family, in the educational process, and in their spare time, holidays, weddings and various ceremonies. They are also studied as special subjects taught in schools, colleges and higher education systems. With this in mind, we plan to interpret, describe and scientifically analyze the onomastic features of their naming, using examples, based on the study and mastery of the essence of Uzbek folk games in Navoi region.

METHODS FOR THE DEVELOPMENT OF LEXICAL COMPETENCE IN TEACHING ENGLISH TO STUDENTS IN THE SPECIALTY OF MINING

Saydullaeva Khusnora Utkirovna*

*Navoi State Mining Institute,
Navoi, UZBEKISTAN

ABSTRACT

The modern linguistic situation, characterized by an increase in the methodology for the development of lexical competence in teaching, has awakened an increased research interest in the phenomenon of linguistic interference that occurs in the study of foreign languages. To date, there are a large number of studies devoted to the influence of the native language on the study of a foreign language; however, the problem of the interaction of two studied foreign languages with each other is insufficiently covered. The article is devoted to the methodology for the development of lexical competence in teaching English to students of mining.

KEYWORDS: *English; Technique; Critical Pedagogy; Language Of Specialty; International Relationships; Students Of The Faculty Of Mining; Method Of Teaching.*

INTRODUCTION

The main approaches to the formation of lexical competence in the study of a foreign language in the field of professional communication. Mastering the methodology for the development of lexical competence in teaching English to students of mining, the task of studying a foreign language in the field of professional communication; Lexical competence in the field of professional communication implies knowledge of general and professional terminology, as well as the ability to use the acquired vocabulary in speech activity.

An effective tool for the formation of lexical competence in the field of professional communication can be the so-called intensive reading, which implies painstaking, detailed work on short texts in the classroom under the guidance of a teacher [5; 6].

The methodology for the development of lexical competence in teaching English to mining students is like intensive reading contributing to the understanding of how vocabulary, grammar, coherence of the text and its content jointly achieve the communicative goal of the

text in the specialty [7]. With intensive work with the text, students study in detail a small passage or short text of 150-200 words, while the tasks with which this text is provided consist of a large number of lexical exercises and text tasks for understanding, the total volume of which significantly exceeds the volume of the text itself text.

The goals of intensive work on the text in the specialty are a detailed understanding of the text and the study of linguistic phenomena using the example of the text, the development of linguistic thinking, and the expansion of vocabulary in mining [8].

The general criteria for the selection of text material for intensive reading when teaching vocabulary are the value of the text in terms of the specialty of mining from the point of view of professional orientation, the correspondence of the subject matter of the texts to the professional interests of students and their language level. Compliance with a certain subject, cognitive the value of the text, the semantic completeness and structure of the text, the representation in the corpus of educational texts of various types, the authenticity of the text material of various genres of scientific, journalistic and pragmatic styles of mining. In our case of teaching the professional vocabulary of a second foreign language, such a criterion as the intercultural nature of the information presented in the text on the specialty of mining is of particular importance.

Intensive reading of complicated authentic texts in the specialty, as a pedagogical technique designed to optimize the teaching of terminology in the conditions of linguistic contact, organically fits into the methodological concept of critical pedagogy, the advantages of which we considered earlier [2, p. 8989-8995].

Critical pedagogy is an original approach to teaching practice that instils in students the skills of independent thinking, contributing to the formation of active, critically thinking, conscious and responsible members of society [8, p. 1003-1010]. The specificity of the methods of critical pedagogy is the rejection of the rational-dogmatic methods of traditional teaching in favour of an approach that takes into account the diversity of positions and points of view of the participants in the educational process, their individual characteristics; this approach contributes to the greatest extent to the development of the professional competence of trainees. Within the framework of critical pedagogy, the traditional roles are deconstructed, implying the teacher's activity as a bearer of knowledge and the student's passivity as a recipient; a part of teaching authority is delegated to students. Such practice provides students with the opportunity for self-expression and active participation in the process of collective construction of knowledge, contributes to an increase in their social preparedness and activity.

The methods of critical pedagogy contribute to the development of students' reading skills and understanding of professionally oriented foreign language texts, help to cover all the variety of forms of modern scientific texts, on both paper and electronic media. In particular, the results of the pilot study conducted by the author have demonstrated the feasibility of applying the methods of critical pedagogy in teaching reading and understanding professionally oriented texts in English [2, p. 8989-8995].

The expediency of using the methods of critical pedagogy in teaching the language of a specialty is due, among other things, to the fact that it is in this aspect in the greatest degree, the advantage of delegating the authority of the teacher to the student is manifested. Indeed, a teacher of a foreign language, not being sufficiently competent in the field of specialization of students, can

quite organically act as a trainee in the corresponding classes. The possibility of teaching the teacher (in the target language) discipline of specialization gives the class's additional interest.

The world practice has accumulated a baggage of methods of teaching vocabulary of English as a foreign language [5; 6; eleven]. Since the native language of the trainees is Russian, for the purposes of our study, the most relevant was the methodology developed within the framework of the national school of teaching a foreign language, which is based on the use of an integrative set of exercises for teaching vocabulary in the reading process [12].

Within the framework of this methodology, the methodology for the development of lexical competence in training includes the following stages

- Pre-text stage: actualization and associative presentation of lexical units relevant for understanding the text;
- The stage of reading the text: the perception of new vocabulary in the text, its semantisation (the formation of a receptive lexical skill);
- Information processing of the text (the formation of reproductive and productive lexical skills);
- Production of creative expression - free creative inclusion of vocabulary in speech situations based on a complete understanding of the form, meaning and functional characteristics (the formation of a productive lexical skill).

Taking the above methodology for teaching vocabulary as a basis, we adapted it to the tasks of teaching English as a second foreign language with the first French in the field of professional communication. In addition, when developing the methodology, we took into account the above-mentioned expediency of using the intensive reading method based on authentic complicated texts, as well as the methods of critical pedagogy.

Thus, we have developed a set of exercises for teaching professional vocabulary, which includes exercises that contribute to the recognition, perception and understanding of various units of professional vocabulary.

This set of exercises is included in the system of exercises aimed at teaching intensive reading as a type of speech activity using the methods of critical pedagogy, and is built taking into account the interlingua transfer, intellectual and linguistic capabilities of students.

Within the framework of this integrative set of exercises, vocabulary training is carried out in three stages.

At the first (pre-text) stage of working with vocabulary, to ensure the primary consolidation of lexical competence in the field of professional communication, exercises are used to form paradigmatic and syntagmatic connections.

The second stage of the formation of lexical skills is combined with the text stage and the development of intensive reading skills using the methods of critical pedagogy. At this stage, a variety of oral and written exercises are used to develop the ability to use terms, choose a term from a number of presented ones according to the situation, and the ability to fully and accurately understand the text.

The third stage of work on the text and professional vocabulary, corresponding after the text stage, implies the consolidation of lexical knowledge and skills, as well as their activation in the process of using them in various forms of written and oral communication (speech exercises).

In addition, you can apply tasks for practicing thematic terminology in order to eliminate potential lexical interference, which may include the selection of synonyms / antonyms, filling in the gaps, two-way translation of lexical units in different contexts, exercises on combining words, the formation of one-root words using the appropriate affixes [13, with. 82-86].

Because the typical lexical mistakes of students studying English differ depending on which language was studied earlier, it seems important to develop a special methodology for teaching English, with appropriate teaching aids and exercises. This technique was developed and proposed by the author.

To test the feasibility and effectiveness of the proposed methodology, students studying English in the course "English in the field of professional communication in mining" are divided into two homogeneous groups (group B1, and group B2). Each group consisted of 20 students. The experimental group was trained according to a methodology based on an integrated complex of lexical exercises for teaching reading using methods of critical pedagogy; the control group was trained using the traditional method. Both groups studied the same course "English in the field of professional communication", with the same goals and objectives, using the same textbooks and manuals, under the guidance of one teacher. The groups were selected because of questionnaires, interviews and results on language tests / international exams).

Students studied English in the field of professional communication for one semester, two hours a week. Academic performance was measured during midterm and final attestation. In the course of training, students were interviewed and questioned about their progress in mastering professional vocabulary and emerging problems.

After completing the course, students of both groups passed tests for knowledge of professional vocabulary, consisting of 60 questions.

And as a result, the average score received by the B1 group for 1 part of the test is 18.3 points (out of 20 possible), the standard deviation is 1.65; the average score received by the B2 group for 1 part of the test is 17.1 points (out of 20 possible), the standard deviation is 1.67, T_1 (observational) = 2.286. The average mark received by the B1 group for the 2nd part of the test is 17.4 points (out of 20 possible), the standard deviation is 1.92; the average score received by the B2 group for the 2nd part of the test is 15.9 points (out of 20 possible), the standard deviation is 2.01, T_2 (observational) = 3.818. The average score received by the B1 group for the 3rd part of the test is 16.7 points (out of 20 possible), the standard deviation is 2.11; the average score received by the B2 group for the 3rd part of the test is 14.2 points (out of 20 possible), the standard deviation is 2.03, T_3 (observational) = 2.413. Since the observed T in all three cases is greater than the T critical, statistically significant differences were observed in both groups at the standard level between the mean scores obtained because of the test. Significance 0.05. The average scores of the experimental group B1 are significantly higher than the average scores of the control group B2. In other words, a statistically significant difference was found between the groups because of the application of a methodology that combines the use of an integrative set of exercises for teaching vocabulary in the process of intensive reading with the method of critical pedagogy.

Testing revealed statistically significant differences between the assessments of the experimental and control groups for all three parts of the test (table 1). There is a significant difference in lexical competence: the average score of the experimental group in all sections of the test was higher than that of the control group.

In the learning process, the students of the experimental group noted the development of reading and text comprehension skills, expansion of vocabulary, increased motivation and team skills. The results of the intermediate and final certification indicate the development of lexical skills in the experimental group after completing the training course.

Thus, we can conclude that the use of the experimental methodology developed by the author has increased the efficiency of mastering professional vocabulary by students with the first French language.

The results of the study confirm the hypothesis of the presence and high significance of linguistic interference in the study of professional English as a second foreign language in the first French; the source of the interference is French. The main source of errors is fully or partially assimilated cognate words.

In the course of the study, the author concluded that it is advisable to develop a special educational and methodological complex for teaching a second foreign language and proposed his own version, combining the use of an integrative set of exercises for teaching vocabulary in the process of intensive reading with the method of critical pedagogy.

During the experimental training, the feasibility and effectiveness of the proposed methodology was confirmed in terms of the formation of lexical skills, intensive reading skills, vocabulary expansion and a decrease in the number of mistakes made associated with language interference. The results obtained show that the use of an integrative set of exercises for teaching vocabulary in the process of intensive reading using the method of critical pedagogy contributes to the formation of lexical skills. Qualitative and quantitative research data indicate that the use of the developed methodology in parallel with the techniques of critical pedagogy has a positive effect on the assimilation of lexical material, develops intensive reading skills and expands the vocabulary of students, reducing lexical language interference and reducing typical errors.

The results obtained can be used in the process of further research on the phenomenon of lexical interference, for the development of methods for the formation of lexical skills in the study of a second foreign language. In the course of practical lessons in teaching professional English, as well as in the development of special textbooks and teaching materials for teaching a second foreign language.

ABSTRACT

The study of human development is one of the main challenges facing modern science. The problem of intelligence is one of the most studied subjects in Soviet and foreign psychology. While the idea of intelligence differs from the point of view, there is one common goal, revealing the intellectual development of a person, his features and his uniqueness. In psychology, the concept of intelligence is used to quantify abilities and to describe them in quantitative terms. According to researchers, each person reflects a certain level of general intelligence, which, in turn, depends on its relationship to the external environment. According to them, each person has different levels of personal abilities, which manifest themselves in solving obvious problems. Initially, there was no differentiation in intelligence research. The intellectual structure of the intellectual attracted the attention of psychologists in the early stages of the century. The intellectual problem has been widely studied in foreign psychology, which has been studied on the basis of various theories, concepts, approaches, attitudes, and directions. At the same time, the use of criteria for measuring intelligence, criteria, indicators of development, self-assessment, testing, and the use of various types of mental development are based on scientific theoretical foundations.

KEYWORDS: *Intelligence, Abilities, Talent, Concept, Semantics, Divergence, Convergence, Thinking, Creativity, Mental movement, Perception.*

INTRODUCTION

By the beginning of the twentieth century, a number of studies had been conducted on the study of the intellect. The study of human mental development remains one of the most important tasks facing science today. The problem of intellect is one of the most studied topics in both former Soviet psychology and foreign psychology.

In Uzbekistan, in the psychology of the former Soviet Union and abroad, the approach to the interpretation of the essence of the intellect is different, but the common goal is the same, which is to reveal the intellectual development of man,

His characteristics, originality. In many sources, especially in former Soviet psychology, it has become a tradition to think of it as a mental talent or ability.

In the psychology of the United States and Western European countries, the concept of intellect has been used to quantify ability and describe it.

Determining the structure of the intellect, especially at the beginning of the century, attracted the attention of psychologists. The famous American scientist Spearman (1904) identified some "head" factor of intelligence based on the behavior of the individual, and as a result called it the "G" factor.

According to him, the human brain never works in the same way when solving an arithmetic problem, repairing a car engine, or learning a foreign language. While some people have the same level of general intelligence as others, there is a clear advantage in performing certain types of activities.

That is why Spearman introduces factor C into science in addition to factor G. And he calls it an indicator of special ability. According to Spearman's theory, each person reflects a certain level of general intelligence, which, in turn, depends on his or her relationship with the external environment. According to Spearman, each person has different levels of ability development, which are evident in the process of solving obvious problems. Initially, there was no differentiation in intelligence research.(1, b21) Determining the structure of the intellect attracted the attention of psychologists, especially at the beginning of the century. Ch. Spearman, author of the two-factor model of intelligence, was convinced that all mental tests measure a single basic intellectual ability. In other words, a large number of diagnostic abilities are manifestations of some general factor that reflects an individual's level of mental strength.(2,1927) Later, G. Yu. Measured by tests, instrumental tools or individengine (Latin ingenium - natural inclination, ability), with the help of which mental power can be applied to certain forms of interaction.

According to Ch. Spearman, intelligence does not depend on a person's personal qualities and does not incorporate intellectual qualities (e.g., interest, motivation to succeed, or anxiety) into its structure. Modern research has shown that Spearman identified the lack of factor g as a global feature of intelligence, because in this case the study of the latter is limited to logical intellectual properties. (4, p.549) The development of the two-factor model led Ch. Between the g and s factors, the author placed group factors (arithmetic, mechanical, linguistic, and verbal skills).

The further development of ideas about the structure of the intellect took place on the path of its differentiation. In 1920, E.L. Thorndike, a representative of classical American behaviorism, distinguished social intelligence from other forms of intelligence and described it as the ability to

understand and manage men and women, boys and girls - the ability to act rationally in interpersonal relationships. (5, p. 42) developed a model in which "the general basis of intellectual action is revealed under the influence of many individual factors. The study of the structure of the intellect has been reflected in the research of a number of scientists besides Spearman. Including J. Guilford's (1959) research on the structure of intelligence is particularly interesting.

J. Guilford identifies about 120 factors (factors) of intelligence. J. Operations from the dimensions of thinking in Guilford's cubic model:

- Cognitive function, memory, divergent and convergent thinking;
- Content: figurative, symbolic, semantic, moral;
- Result: elements, levels, communication, attitude, system, change;
- Reform; application, application - tries to distinguish 120 types of specific abilities.

1. Content is when we think about something.

2. Surgery is hegrthyjkow we think.

3. The result is what our mental actions lead to (i.e., the result of our mental actions).

J. Guilford argues that creative thinking underlies divergent and convergent types of thinking. J. According to Guilford, ability resides within the overall model of intelligence, so he distinguishes four factors of creativity.

a)Combinations for originality-interpretation, the ability to show the results of unusual (unexpected) responses;

b) Semantic flexibility - the ability to separate the function of the object and suggest a new use of it;

c) Expressive adaptive flexibility - the ability to change the form of motivating factors to see new opportunities;

g) Semantic self-generated flexibility - the ability to generate different ideas in relatively limited situations. J. Guilford understands creative abilities as some approximate structures, with the result that these structures manifest as intercorrelation between test forms. D. Wexler was the first to state that there is a range of types of thinking that reflect the components of general intelligence but differ from the traditional coefficient of intelligence (6, pp.101-103) (IQ). In his 1940 article, "Intellectual Factors in General Intelligence," which is rarely quoted, Wexler focused on the "non-intellectual aspects of general abilities" in each "complete" dimension. When a scientist speaks of "non-intellectual elements", he understands not only the general functioning of the psyche, but also its affective-managerial components, thanks to which man has long been associated with problems in the field of importance. (7, 1949) Social and emotional abilities are also discussed. Unfortunately, these factors were not included in Wexler's IQ test, as little attention was paid to it at the time.

Wexler divided intellectual abilities into verbal and nonverbal types (imaginative abilities) and showed that this or that group predominated in different people. (8, 1958)

In R. Stenberg's theory, intelligence is considered as an information system that serves the adaptation of the individual to the environment. The basic premise of triarchic theory is: "Intellect can be defined as mental self-management, mental control of the whole life using a method aimed at a constructive goal." (9.) Mental self-management involves three main elements: adaptation to the environment,

Selection of a new environmental effect, or selection of an environment with the person, and shaping of the environment.

R. Stenberg's theory of three parts (triarchic) emphasizes that the intellect is connected with three processes of a person's life: internal information processes, experience and the external world. According to this concept, the intellect is affected by three types of mental processes (or components):

- Metal components, which manage the problem-solving process and include its description, the separation of stages in the problem-solving process and conclusions about the final solution;
- Components that reflect the processes associated with the solution of a particular problem, as well as through its transformation;
- A component of acquired knowledge, provided with a learning feature and retention that is useful for future information. The scientist criticizes that in other concepts of intelligence the main emphasis is placed on the components to be performed (i.e. the analysis of previously acquired knowledge), the experience and the met components are not given enough attention. Taking these into account would make it possible to spread the scale widely in the fields of social, practical, and emotional intelligence. (10, p.912-927)

R. Stenberg pays great attention to intellectual factors in his intellectual model.

- 1) Ability to solve practical tasks (business acumen, intelligence, variability in the application of knowledge) - speaking ability (accuracy and fluency of speech);
- 2) Intellectual integration (the ability to see differences and coordinate different perspectives) - goal-orientation (selective search for information, diligence);
- 3) Contextual intelligence (use of knowledge about the universe and personal experience)-existing thinking (intelligence, speed of thinking, the ability to think abstractly). (11, p.44-52)

Swiss psychologist J. Piaget approaches the problem of intelligence from his own personal point of view. He often uses the term "intellect" instead of the concept of thinking, sometimes moving away from psychological terms, and so on. J. Piaget

Divides the theory of intelligence into two and calls them intellectual functions as well as intellectual cycles. According to J. Piaget, the main functions of the intellect include coherence (orderliness) and adaptation (adaptation, adaptation), which are called functional invariance of the intellect.

The author distinguishes the following stages of intelligence:

- a) Sensomotor intelligence (from birth to 2 years);
- b) Preoperative thinking period (from 2 to 7 years);
- c) The period of specific (obvious) operations (mental actions) (7-8 years to 11-12 years);

d) The period of formal (formal) operations (implementation of actions).

According to Piaget, "the growth of the intellect begins before the child develops speech. The bud of the intellect is reflected in the child's initial erratic behavior. " (12, p.459) Subsequent implementation of the act of goal-directed action and the use of analysis create important opportunities for the study of the genetic root of intelligence. J. Piaget makes a breakthrough in psychology, emphasizing that the period of concrete operations is related to objects. When classifying the period of formal (formal) operations, it is noted that the connection with the objects gradually disappears. It is said that the growth of the intellect consists in arming the human operating system. In the developmental stage of the intellect, mental movements occur in a group. The reciprocal exchange of the intellectual age signifies the growth of thinking, while the sequence of the period represents the internal laws of development. Piaget's theory of intelligence is important for the science of world psychology, it uses an objective "clinical" method, reveals the genetic roots of the intellect, the specificity of the features between the intellect and the subject, the change of the subject in intellectual activity is proved by empirical materials and theoretical considerations. It should be noted that the multiplicity of aspects of the intellect has been gradually confirmed in science. In conclusion, the problem of intelligence has been widely studied in foreign psychology, which has been studied on the basis of different theories, concepts, approaches, positions, directions. At the same time, the criteria for measuring intelligence, development indicators, characteristics, characteristics, the creation of tests and their use in the examination of mental development of people of different ages are based on various scientific and theoretical foundations.

ABSTRACT

The article describes the basic principles to date; one of the applications of fiber-optic technologies for measuring purposes is fiber-optic multi-sensor systems. Fiber-optic multi-sensor systems include quasi-distributed sensor networks built on the basis of fiber-optic sensors, usually based on fiber Bragg gratings. One of the main advantages of fiber Bragg gratings is the unique way of converting the measured value into a change in the wavelength of radiation passing through and/or reflected from the grating, as well as the ease of manufacturing. fiber Bragg gratings have proven themselves well and are widely used in construction, oil production, energy, aerospace engineering, etc.

KEYWORDS: *Fiber-optic sensors, point-to-point sensors, phase-shift sensors, temperature sensors.*

INTRODUCTION

To date, one of the applications of fiber-optic technologies for measuring purposes is fiber-optic multi-sensor systems. Fiber-optic multi-sensor systems include quasi-distributed sensor networks built on the basis of fiber-optic sensors, usually based on fiber Bragg gratings. One of the main advantages of fiber Bragg gratings is the unique way of converting the measured value into a change in the wavelength of radiation passing through and/or reflected from the grating, as well as the ease of manufacturing. fiber Bragg gratings have proven themselves well and are widely used in construction, oil production, energy, aerospace engineering, etc.

MAIN PART

Many factors contribute to the active use of fiber Bragg gratings in various fields: miniaturization-individual developments have an external diameter of the working part of less than 100 microns, which allows them to be used in hard-to-reach places without significant structural modifications of the devices in which they work, multiplicative response to environmental parameters temperature, humidity, mechanical effects, etc., absence of the influence of electromagnetic interference, preservation of operability, in the presence of various coatings at temperatures from -100 to +300°C, etc.

Fiber-optic sensors are often used to measure various physical parameters in the field of energy, such as temperature, current, voltage, analysis of the composition of air, transformer oil, monitoring of structural integrity, etc. [1-2]. Compared to other types of sensors, fiber-optic sensors have the following advantages:

- Made of electrically non-conductive materials, do not require a separate power supply, can be used when working under high voltage;
- Ready to work in an explosive environment;
- Not subject to natural and industrial electromagnetic interference;
- Chemically inert, do not pollute the environment, and are not subject to corrosion;
- Have a wide range of operating temperatures;
- Multiplex able, operable as part of a single field of integrated fiber-optic sensors.

LIMITATIONS

Expensive optical interrogators are used for interrogation;

Require sophisticated signal processing techniques to accurately locate the central Bragg wavelength;

Demanding on the signal/noise ratio in the measuring channel;

RESULTS AND DISCUSSIONS

Distributed fiber-optic sensors for temperature measurement include systems based on the use of Raman light scattering. The sensing principle is based on the effect of Rayleigh scattering, Raman scattering, or Brillouin scattering (Fig. 1) [3, 4]. For example, a method of optical time-domain reflectometry, where the position of a region with a weak reflection can be determined using a pulsed probing signal. This method is also used to determine the temperature as a function of the Brillouin frequency shift.

Pic. 1. Spectrum of scattered optical radiation in distributed fiber-optic sensors

In some cases, the measured value is the average value over the entire length of the fiber. In other cases, position-dependent values (for example, temperature or voltage) are measured.

The light in the optical fiber is scattered by microscopically small density fluctuations, the size of which is less than the wavelength. In the backscattering, one can find, along with the elastic fraction of scattering (radiated scattering) at the same wavelength, both the penetrated light and additional components at other wavelengths, which are associated with the vibration of the molecules and, thereby, with the local temperature (Raman scattering).

Dignities:

- High accuracy (up to +/- 0.5°C);
- High spatial resolution (up to 0.5 m);
- High length of the measuring system (up to 8 km);
- Low cost;
- Wide range of measured temperatures;
- Low temperature resolution due to the large dispersion of the reflected signals when using non-encoded signals.

Quasi-distributed fiber-optic sensors can contain a series of sensor arrays for monitoring temperature, humidity, and mechanical pressure. VBR links the main mode of the light guide with the same mode propagating in the opposite direction. At a certain wavelength, the radiation propagating through the light guide is reflected from the grating in whole or in part, the main difference in the principle of operation of temperature sensors based on fiber Bragg gratings from other fiber temperature sensors is that the Bragg wavelength in the grating depends not only on its period, but also on environmental factors.

Pic 2. The principle of operation of the fiber Bragg grid

Dignities:

- Ability to reflect the light signal in a narrow spectral range
- Easy ability to combine into arrays (multiplexing);
- High measurement accuracy;
- Small dimensions, weight;
- The difference between temperature and deformation effects on the object;
- Continuous monitoring of parameters along the length (volume) of the object at any point where the sensor light guide is installed;

Point sensors are parametric sensors that respond to changes in a particular physical quantity. Point sensors in the electric power industry have a variety of applications: measuring the gas content in the environment, measuring current and voltage at substations, fixing arc formation, etc. Fiber-optic sensors installed in the compartments of high-voltage cabinets and having an almost circular radiation pattern, record the light flash from the electric arc and transmit it via optical fiber to the light detection unit of the device.

The optical radiation spectrum of an arc flash can vary greatly depending on the materials involved (gas, moisture, etc.). The figure below shows an example of such an optical spectrum. It covers a wavelength range of 300 to 800 nm, with characteristic lines of about 500 nm ("copper" lines). The arc flash emission spectrum plays an important role in selecting a suitable photo-diode for the arc protection sensor

Pic. 3. Fiber optic sensor in arc protection devices.

The disadvantage of all of the above systems, except for the last one, is the requirement for an ultra-expensive and precision interrogator. The system with a fiber optic sensor based on a fiber Bragg grid with phase-shift also looks very simple in the option of installing a single sensor. However, it is known that such sensors require at least four complete switchgears in one. In this case, the system for collecting and transmitting information will be implemented according to the scheme "one FOS– one balanced photo detector", and the number of balanced photo detectors will be determined by the number of fiber-optic sensors. In addition, each channel must include a reference fiber Bragg grating for temperature control. Given the narrow width of the transparency window of phase-shifted fiber Bragg gratings, the effect of temperature on the stability of achieving a given measurement accuracy increases incommensurably, compared to the achieved gain in sensitivity and resolution.

CONCLUSION

The light in the optical fiber is scattered by microscopically small density fluctuations, the size of which is less than the wavelength. In the backscattering, one can find, along with the elastic fraction of scattering (radiated scattering) at the same wavelength, both the penetrated light and additional components at other wavelengths, which are associated with the vibration of the molecules and, thereby, with the local temperature (Raman scattering).

Dignities:

- High accuracy (up to $\pm 0.5^{\circ}\text{C}$);
- High spatial resolution (up to 0.5 m);
- High length of the measuring system (up to 8 km);
- Low cost;
- Wide range of measured temperatures;
- Detection of the optical backscattering signal in a narrow band
- Small size of the sensors (the weight of the electronic unit is not more than 16 kg),

Disadvantages:

- Technically difficult measurement of Raman scattered light due to low backscattering power relative to peak power;
- The need for a large number of measurements in order to increase the signal-to-noise ratio.

ABSTRACT

The article examines the unemployment rate and the needs of people for housing, leading to external migration. The purpose of the study is to study the unemployment rate in the regions of Uzbekistan and its impact on migration. In conclusion, it should be noted that in regions with a high level of industrial production, a high share of small business and private entrepreneurship, labor migration will be positive and can serve as an important factor in preventing external labor migration.

KEYWORDS: *Migration, Unemployment, Economically active population, Labor migrants, Uzbekistan, Fergana region.*

INTRODUCTION

In the XXI century, the role of labor migration in the process of integration and liberalization of the world economy is constantly growing. That is why revealing the socio-economic content and essence of labor migration shows how important it is.

Problems related to labor migration in the world economy also affect the social life of Uzbekistan. The process of internal and external labor migration is regulated by law and organization, the interests of our citizens working abroad are protected, and in order to provide them with practical assistance, the Agency for Foreign Labor Migration has opened a representative office in the Russian Federation and several other countries. At a time when organizational work is being carried out, the prevention and elimination of social and economic

consequences of labor migration is supported by the state, it is important to study labor migration and its social aspects in Uzbekistan.

Therefore, the formation and development of labor migration in our country is due to the economic and social and littemics features of the region.

In particular, Fergana region is the region of the Republic of Uzbekistan. It was founded on January 15, 1938. In the east of the republic, located in the south of the Fergana Valley; Kyrgyzstan borders from Namangan, Andijan regions, south and east Tajikistan from Tajikistan.

Area: 6.8 thousand km². The population is 3 million 752 thousand people. Of these, 50.3% are men and 49.7% are women.

The urban population accounts for 56.7% of the total population. (As of January 2020)[1]

The 1990s coincided with a period of heightened political and socio-economic processes in the former Soviet Union and the international arena. Such profound changes have led to the strengthening of interethnic relations in a number of countries. As a result of the strengthening of interethnic relations, the Central Asian states have also formed their own "hot spots". One such area is the Fergana Valley, where the entire historical development of the peoples of the valley has been interconnected. In the process of demarcation of the national union in the former Soviet Union in 1924, little attention was paid to the historical, geographical, economic and social characteristics of the peoples of the Fergana Valley, Khorezm oasis, Tashkent, Samarkand and Surkhandarya. As a result, the population of the Fergana region has become one of the most complexes in terms of ethnic composition.

Today, more than 100 nationalities and ethnic groups live in peace in Fergana region and make a worthy contribution to the development of our country.

All conditions have been created for them to fully implement their traditions and customs, preserve their national traditions and values.[2]

Uzbeks, Kyrgyz and Tajiks have lived side by side in the Fergana region since ancient times. From the 17th century, Karakalpaks settled in Fergana along the Syrdarya. From the second half of the 19th century, Russians, Tatars, Ukrainians, Kazakhs, and other peoples of Russian territory migrated as a result of the Russian occupation of the Kokand Khanate. As a result, the ethnic composition of the region has become more complex.

From the beginning of the XX century Russians, in the 1930s Koreans, in the Second World War and in the post-war period Crimean Tatars, Germans (from the Volga region), the peoples of the North Caucasus were forcibly relocated to the Fergana region.

He increase in the share of Uzbeks and Tajiks in the Fergana region in recent years is explained by the high rate of natural growth, as well as the passivity of the local population in external migration compared to other nationalities.

Important political, social and economic events in the former Soviet Union since the 1990s have intensified migration processes as a result of the emergence of independent states instead of allied republics. As a result, the return of Crimean Tatars, Meskhetian Turks and other nationalities to their native lands has led to an increase in the share of indigenous peoples in the region - Uzbeks.

From 1991 to 2018, the share of Uzbeks in the region increased from 85.6% to 90.3%. This figure increased from 82% to 89% in Fergana region.[3]

Also, in the first years of independence, the share of ethnic Uzbeks in Fergana region was the lowest among the regions of the republic. The population of Sokh district in the Kyrgyz Republic of Fergana region is predominantly Tajik, with Uzbeks accounting for only 5.5 percent. The ethnic composition of the population of Fergana district of Fergana region is almost equal to that of Uzbeks and Tajiks, and about 46% of the population of Fergana district are Uzbeks. In addition, 68% of the population of Quvasoy and 89% of the population of Rishtan district are Uzbeks. In other districts and cities of Fergana region, the share of Uzbeks is 90% or more. More than 97% of the population of Margilan and Buvayda districts is Uzbeks. From the beginning of the 20th century, Karakalpaks, Kipchaks and even Kazakhs in the Fergana Valley began to call themselves Uzbeks.[4]

The population of the Fergana region is second only to the Uzbeks in the national composition, and in the analyzed years, the share of the population in the region increased from 5.1% to 5.3%. Tajiks make up 6 percent of the population in Fergana province. The share of Tajiks is high in Sokh, Fergana districts and Quvasoy city of Fergana region, accounting for 90, 44 and 20 percent, respectively.[5]

After Uzbeks and Tajiks, Kyrgyz make up the majority of the population. From 1991 to 2018, the share of this ethnic group in the population of the region decreased from 2.4% to 2.1%. Kyrgyz people are also common in Rishtan, Yazyavan districts of Fergana region and in the city of Quvasoy. It is noteworthy that 7.6% of the population of Quvasoy is Kyrgyz.

Prior to independence, Russians made up 3.2 percent of the region's population. By 2018, Russians made up only 0.8 percent of the region's population. Russians mostly lived in regional centers and cities.[6]

Due to the presence of different nationalities and ethnic groups in the region, seasonal migration related to weddings and values in the spring and autumn seasons with neighboring Kyrgyzstan and Tajikistan, as well as the establishment of kinship ties, has also developed permanent migration.

The permanent population of the Republic of Uzbekistan as of July 1, 2019 amounted to 33.5 million people, the largest population as of July 1, 2019 was Samarkand region (11% of the population), Fergana region (11.1%), Kashkadarya region (9.7%) and Andijan region (9.2%). Fergana region is one of the regions active in both internal and external migration. As of 2019, there were 12,667 immigrants and 14,482 immigrants in the area.[7]

We can also see the impact of economic factors on labor migration in the region.

Fergana region is one of the most industrialized regions of the country. There are 86 large industrial enterprises in the region. The leading industries include fuel and energy, chemicals, machinery, construction materials, cotton ginning and processing, light and food industries, and other energy bases, mainly thermal power plants, the largest of which are: Fergana, Kokand thermal power plants , Quvasoy thermal power plant. The largest enterprises of the chemical industry are located in Fergana and Kokand. These include the Nitrogen Production Association, chemical fiber, furan compounds chemical plants, Kokand superphosphate plant and others. The Fergana oil refinery is located in the region. The building materials industry is well developed.

The cement plant in Quvasoy produces more than a quarter of the cement produced in the country. In Quvasoy, slate, brick and other construction tools, spare parts for other industries are produced at Elektromash, Tekstilmash and other metallurgical plants. The food industry is developing every year. The enterprises of this sector produce various types of oils, flour, bread, pasta, canned food and other products. There are 84 joint ventures and more than 22,000 small enterprises in the region. There are Nodira, PSMK3, Polina, MargilanTongi in Margilan and Zilola in Kokand, Uzsalam, Kabul-Fergana, Besteks and Ishonch joint ventures in Fergana.[8]

Samarkand region (11% of the country's population), Fergana region (11.1%), Kashkadarya region (9.7%) and Andijan region (9.2%). Fergana region is one of the regions active in both internal and external migration. As of 2019, 12,667 people had moved to the area and 14,482 had moved.

The Kokand Free Economic Zone also operates. In the free economic zone 6 chemicals and oil, 14 building materials, 4 deep processing of agricultural products and food production, 12 light industry, 7 leather shoes, 3 electrical, 4 pharmaceutical, 3 modern production facilities are being set up in the fields of mechanical engineering and automotive, 3 paper processing and furniture.

Currently, 4 projects worth \$ 7.2 million are being produced at Shaffof Methane Industry LLC: high-pressure methane gas cylinders, Admiral Group LLC flour and flour products, KamtarBegoim LLC footwear and artificial fur products.

It is planned to implement 21 projects worth \$ 32.2 million in 2020, and 40 projects worth \$ 125.1 million in 2019-2020. [9]

TABLE 1[10] VOLUME OF INDUSTRIAL PRODUCTION BY REGIONS (BILLION SOUMS)

№	Cities and Districts	2010 й	2015 й	2016 й	2017 й	2018 й	2019 й
Total region		3265,5	7170,2	8040,7	9728,5	13613,8	18661,2
1	Oltiariq district	17,0	160,3	173,6	177,4	204,2	181,4
2	Koshtepa district	9,4	105,7	110,6	116,1	142,7	339,5
3	Baghdad District	61,0	197,1	212,1	252,8	296,3	511,2
4	Buvayda district	47,9	238,7	248,8	252,7	279,4	250,8
5	Besharik district	11,8	126,0	128,0	200,3	259,5	333,3
6	Quva district	36,5	154,7	175,9	218,7	419,8	529,7
7	Uchkuprik district	66,0	230,0	266,9	309,0	315,1	982,7
8	Rishtan district	50,5	196,5	207,6	255,6	249,4	295,0
9	Sokh district	4,8	75,4	82,5	108,9	81,3	40,4
10	Toshloq district	200,4	490,6	522,9	915,3	1610,4	2165,0
11	District of Uzbekistan	54,3	240,4	270,6	342,6	348,3	452,7
12	Fergana district	18,6	131,7	144,7	192,2	192,9	230,9
13	Dangara district	19,3	143,8	207,0	266,0	579,7	395,5
14	Furqat district	10,6	101,4	105,4	154,2	113,8	102,0
15	Yazyovan district	7,5	101,2	102,8	148,6	122,4	88,0
16	Fergana city	1913,8	2442,3	2903,3	3152,6	4536,7	6784,3
17	Kokand city	336,9	995,3	1113,4	1362,5	2264,3	2910,3

18	Quvasoy city	349,1	671,0	667,4	812,2	1063,6	1187,4
19	Margilancity	50,1	368,1	397,2	490,8	534,0	881,0

The volume of industrial production in the region in 2010 amounted to 3265.5 billion soums, in 2019 this figure amounted to 18661.2 billion soums. Fergana city, Kokand city, Toshloq district is in the first place in the region in terms of industrial production. The region has developed the production of textiles, food products, coke and oil refining products, chemicals and other mineral products.

Although the volume of industrial production in the region is growing from year to year, the region ranks second in the country in terms of the number of external labor migrants.

According to the data, 1.5 million Uzbeks work in Russia, 240,000 in Kazakhstan, 71,000 in Korea, 43,000 in Turkey, 5,000 in the United Arab Emirates and 120,000 in other countries.

The indicators of the share of labor migrants in the regions are as follows:

From Samarkand - 268 thousand;
 From Fergana - 247 thousand;
 From Kashkadarya - 178 thousand;
 From Surkhandarya - 164 thousand;
 From Khorezm - 140 thousand;
 Andijan - 132 thousand;
 From Tashkent region - 102 thousand;
 From the city of Tashkent - 90 thousand;
 From Bukhara - 88 thousand;
 From Jizzakh - 88 thousand;
 Namangan - 69 thousand;
 From Karakalpakstan - 66 thousand;
 Syrdarya - 57 thousand;
 25,000 people from Navoi work abroad.[11]

The explanation of such statistics can be given for several reasons. Including:

In terms of population density, the region ranks 2nd in the country after Andijan region and has 544.8 people per 1 km²;

The average monthly nominal wage of employees of legal entities in the Republic of Uzbekistan is 1892.2 thousand soums. It is ahead of the last Surkhandarya and Namangan regions in the republic.

The migration structure of the region, the diversity of factors influencing it, requires a comprehensive analysis of labor migration in the country to study the regional, demographic and social characteristics of the emergence of labor migration in Fergana region.

Based on the above, the following conclusions and suggestions were developed:

- The labor migration performance will also be positive in areas where the share of industrial production is high, the largest share of small business and private entrepreneurship

• Differences between the living conditions of the village and urban population, the state of infrastructure are also affected by labor migration. Development of water, gas and production infrastructure in rural areas can serve as an important factor in the prevention of labor migration.

THE ROLE AND OPPORTUNITIES OF INFORMATION TECHNOLOGY IN TOURISM

Juraeva Feruza Jumaqulovna*

*Independent Researcher,
Bukhara State University
UZBEKISTAN

ABSTRACT

The article provides an overview of innovative services based on information technology (IT) and successfully used by domestic and foreign tourism enterprises. The considered three areas of IT allow us to conclude that they serve as a source of innovations that can bring the activities of a tourism enterprise to a higher level of quality of products or services. Promotion of any activity and production sphere is impossible without the introduction of new technologies and scientific achievements, improvement of existing models, taking into account changes in the market and the needs of the buyer, as well as without the ability to be mobile among competitors. Such changes determine the innovative way of the industry development. Tourism innovation is innovation and fresh ideas in travel and recreation. The result of the introduction of such innovations is an increase in the tourist flow and an increase in profits.

KEYWORDS: *Innovation, Information technology, Tourism, Hospitality, Mobile applications.*

INTRODUCTION

The development of telecommunication networks and information technologies has radically changed the activities of tourist enterprises: many processes have become automated and can be controlled remotely, a huge amount of data is stored in digital form, the time for processing requests and performing operations is minimized. However, the issue of innovative development for each enterprise is still relevant, since Intense competition in this area forces the participants of the tourism market to seek, develop and introduce innovations in their work.

Tourism is the main economic activity that has a positive impact on economic growth and employment in the country, as it has a huge impact on such key sectors of the economy as

transport, hotel and restaurant services, trade, construction, production of consumer goods and many others.

Tourism is an important tool to strengthen the opinion of Uzbekistan in the world, forms our values and contributes to the development of the country's attractiveness, which is the result of centuries of cultural exchange, linguistic diversity and creativity.

In addition, tourism is becoming an increasingly important aspect in the lives of citizens who travel more and more for business or leisure purposes. As an activity that affects the cultural and natural heritage, as well as traditions and modern culture in the country, tourism provides an opportunity for economic growth and sustainable development in Uzbekistan.

Thus, tourism is a complex intersectional complex that requires a systematic approach to regulating the socio-economic interaction of many sectors of the economy, both at the state and regional levels.

The economic and financial crisis that has affected the economies of all countries since 2008 has had a significant impact on the demand for tourism services, so the issue of an innovative approach to tourism is now becoming acute.

METHODOLOGY

Innovations in the tourism industry are mainly aimed at the formation of a new tourism product, new approaches in marketing activities, as well as the application of new management methods using information technology. Innovative activities in this area can also be aimed at changing an existing product, at improving transport, hotel and other services, and developing new markets. Information technologies play a key role in such activities, since they are able to radically change the methodological, informational and technological components of management processes and implement them at a qualitatively new, more effective level.

Innovation, the science of innovation, identifies different grounds for classifying them. The practice-oriented classification, which includes ten types of innovations, developed by an innovation consultant Larry Keely, deserves special attention. The first four types of innovation relate to the structure of production. One of them is the profit-making model. The following types of innovation involve collaborating with other companies, restructuring the company, and introducing new ways of working. Another two types of innovation involve making changes to a company's product. The product must be unique and functional and must be accompanied by a package of additional goods and services in order to maintain customer loyalty.

New information technologies play an even more important role for suppliers of cultural products into tourism destinations. Whereas initially only the establishment of Internet platforms for the promotional presentation of cultural offers seemed to be important, ticketing is now increasingly pushed by the supply side. The main reason for this is the increasing tendency towards late booking of offers by lo-call's as well as tourists. Interestingly, one can see general tendency towards local tourism organizations cooperating in traditional tourism destinations. The intention of this cooperation is to establish larger regional destination organizations.

Mobile applications, which have become widespread due to the technical improvement of mobile devices and the availability of the Internet, are becoming an effective tool for implementing innovations in any of these types. Travel guides are also actively moving to mobile applications.

Moreover, in this case, the mobile application becomes multifunctional, and therefore more convenient for users in comparison with printed counterparts.

This innovation is interesting in that it combines several of the types described above. Firstly, the model of making a profit in it is not the standard "commodity-money", but the so-called freemium (from the English free minimum), i.e. the product itself is free, and the additional product or service costs money. Secondly, it reveals mutually beneficial cooperation with companies (tourist attractions), which a tourist gets access to when buying an electronic card. Thirdly, the multi functionality of the mobile application makes it more attractive to consumers in comparison with separate analogs: navigators and Internet sites of certain attractions.

If we consider the museum sphere, then mobile applications are becoming more widespread in it. Large museums, such as the Hermitage, develop audio guides for their exhibitions, and this, in turn, qualitatively changes the workflow. Paid audio tours for a mobile application allow the museum, firstly, to receive additional income, and secondly, to optimize its costs for maintaining traditional technical means (their repair, charging, etc.).

Accommodation facilities are actively mastering mobile applications using NFC technology (Near field communication), a short-range wireless data transmission technology that enables data exchange between devices located at a distance of about 10 centimeters. The first hotel to showcase innovation was the Clarion Hotel Stockholm. NFC technology is changing the traditional check-in process for hotel guests. At the set time before arriving at the hotel or already being there, the guest receives a notification that his room is ready to move in and he can go through the registration procedure. After completing online registration in the mobile application, the key to the number is activated. By attaching a mobile device to the electronic lock, the guest gains access to the room. Thus, the hotel's working process is changing, which becomes more perfect in terms of safety and reliability, as well as convenient for guests and staff.

CONCLUSION

In modern research, much attention is paid to theoretical issues related to innovation and innovation processes in tourism. The considered directions of IT innovations are of practical importance and do not exhaust all the possibilities of using IT in tourism and hotel business. The wide range of IT applications for creating innovations of various types - from process to product - makes them attractive for investments. Moreover, it can be assumed that the implementation of ready-made IT solutions that have proven their effectiveness will be the best option for those companies in the travel industry that are just going to step up innovation.

THE ECONOMIC CONTENT OF THE ORGANIZATION OF PUBLIC PROCUREMENT AND ITS ROLE IN THE ECONOMY

Turabov Sarvar Abdumalikovich*

*Independent Researcher,
Tashkent Financial Institute
UZBEKISTAN

ABSTRACT

The article discusses the role of public procurement in the national economy in the context of the pandemic, the wider introduction of modern forms and methods of procurement, the prevention of corruption and a number of similar measures. Further development of public procurement plays an important role in the efficient use of budget funds. Because today public procurement is an important factor in the socio-economic development of the country, the timely provision of recipients of funds from state bodies, the state budget and state trust funds with necessary and affordable goods and services. This saves both time and finance for public procurement participants.

KEYWORDS: *Government procurement, government customer, government procurement entities, government procurement contract, special information portal, procurement procedures, electronic government procurement, procurement announcement.*

INTRODUCTION

Along with the development of modern sectors of the economy, in recent years, reforms have begun in the budget and tax system, in particular, the establishment and strengthening of strict control over the targeted use of budget funds, ensuring the openness and transparency of this process have become one of the important issues. In particular, the President expressed the following views on the prevention of various illegal actions when using budget funds, the effective use of budget funds: "It is necessary to further improve the system of effective use of budget funds, any program or project financed from the budget should have qualitative and quantitative indicators oriented towards results¹".

Further development of public procurement plays an important role in the efficient use of budget funds. Because today public procurement is an important factor in the socio-economic

development of the country, the timely provision of recipients of funds from state bodies, the state budget and state trust funds with necessary and affordable goods and services. This saves both time and finance for public procurement participants.

LITERATURE ANALYSIS

A number of our foreign and domestic scientists have conducted their own research in the field of public procurement and their development. In particular, in some foreign literature the term “state order” is used instead of the term “public procurement”. According to L.M. Davletshina, V.S. Gladkov and a number of other young scientists, the current interpretation of the state order does not reflect its essence, confuses the concepts of "state order" and "state procurement" and thereby negatively affects the order of practice².

According to the German scientist T.V. Freiberg, “state order” is a form of organizing financing from the budget, which has its own characteristics, principles, classification and stages of development.

A.F. Nozdrachev noted that the state order is one of the main instruments affecting the economic and social development of the state in market conditions, as well as a market instrument that regulates legislation³.

According to Professor T. Malikov, Ph.D., one of our local scientists, the state, as a legislative and regulatory body, bears full responsibility for regulating the financial system⁴.

Economist U.Burkhanov defines public procurement as the purchase of goods, works and services for public needs, that is, public procurement of goods (works, services) for public needs is partially or fully purchased at the expense of public funds⁵.

As a result of his research, N. Zosimov explained several advantages of using e-commerce in public procurement. First, participation in public procurement provides access to a large market for goods and services. Each participant can sign a contract offering their business opportunities, and at the same time have a certain portion of the funds allocated for public procurement from the state budget. Secondly, e-commerce is carried out online and does not require additional costs (travel costs, time and money). Third, public procurement contracts for the supply of goods, works and services are long-term and do not pose a risk to reliability⁶.

Also, the Law of the Republic of Uzbekistan "On Public Procurement" dated April 9, 2018 defines public procurement as follows: "Public procurement is the receipt of goods (works, services) by government customers on a paid basis."

ANALYSIS AND RESULTS.

Since the first days of independence, measures have been taken to improve the living standards of the population and the gradual development of the country's economy. As a result of reforms in the state system and management, a new legal system of cost management is being formed. This, in turn, will ensure the efficiency of public expenditures, the introduction of modern management mechanisms in them. The new economic situation in the international arena increases the importance of the tasks set by governments in spending with public funds. It is known that the state incurs a number of expenses in the performance of its duties. These expenditures are primarily aimed at investing in various sectors to develop the country's economy, improve the living standards of the population, as well as to implement social tasks,

and are aimed at specific goals, such as the management and defense of the country. Government spending is mainly financed from the state budget and other centralized government funds.

Public procurement has a special place as an important component of public spending. The purchase of goods and services plays an important role in world practice, it is a continuous process aimed at the efficient use of funds and investments. The Uzbek term “xarid” is used synonymously with the word “sotib olish”, which in the modern sense means receiving goods, performed work or service for certain payment. *Public procurement* is the purchase of goods and services for government needs, partially or wholly at government expense. More precisely, this is a systematic approach to public procurement management. Thus, all processes related to the planning, implementation and control of purchases for public needs create a *public procurement system*. Public procurement is carried out to provide material and financial support to public infrastructure. Public infrastructure can be roughly divided into two main components (Figure 1):

Figure 1. Components of Public Infrastructure

The need for public procurement in the social sphere stems from the public interest. As part of the ongoing changes in the public finance management reform, the radical reform of the organization of public procurement, the formation of a regulatory framework for them is an important tool for increasing the efficiency of public spending. An effective direction is the use of the following elements to improve the public procurement management system:

use of advanced foreign experience in public procurement management;

harmonization of public procurement policy with the goals of the state economic policy;

monitoring and evaluation of public procurement policy.

The effectiveness of the procurement mechanism for public needs largely depends on the level of qualifications, professional training and integrity of civil servants who make public procurement decisions. In many countries, training and retraining of public procurement officers is the direct responsibility of the government. The Government of the Republic of Uzbekistan pays great attention to overcoming problems in the above areas and is actively working to improve the

mechanisms of the public procurement process and its regulatory framework with the participation of other entities involved in public procurement. In particular, there is a need for a systematic approach to public procurement management and a strategy for using public procurement as a mechanism for influencing certain sectors of the economy.

Due to the organization of state purchases, the volume of sales of small businesses increased and budget savings were achieved.

Figure 2. Dynamics of the volume of electronic tenders for public procurement of budgetary customers in 2014-2018. (Billion soums)

It can be seen from this figure that in 2014-2016 e-commerce in the field of public procurement had growth rates, that is, in 2016 it increased by 1.2 times compared to 2014. By 2017, it was 1.4 times lower than in 2016. However, in 2018 compared to 2017, we see that electronic sales of budget orders increased 1.6 times, and in 2019 - 1.4 times compared to 2018.

In the following figure, we can get information about the savings of budget clients as a result of electronic sales through government procurement (Figure 3).

Figure 3. The amount of funds saved by budget customers through public procurement as a result of electronic auction sales, in percents.

From the data in this figure, it can be seen that in 2014-2019 budget customers achieved an average of 21% budget savings. Based on the results of this analysis, we see how important is the role of public procurement in the efficient use of budget funds.

CONCLUSION AND RECOMMENDATIONS

In conclusion, we note that the role of public procurement in the effective use of budgetary funds in our country is invaluable. Therefore, in our country, a number of measures are being taken to develop public procurement, to effectively organize their activities, but there are still a number of problems that need to be addressed, the main of which are:

Non-compliance with the terms of the contract by the supplier of goods and services;

The presence of corruption in budgetary organizations, despite the implementation of a number of measures to organize public procurement in order to eliminate corruption;

Lack of trading skills and irresponsibility of suppliers of goods, works and services participating in electronic bidding for goods, works and services in which they participate;

The cost of some goods and services is higher than market prices and of poor quality;

Lack of all the necessary goods and services for budget organizations in e-commerce;

Lack of experience of advanced foreign countries in the development of e-commerce, etc.

To overcome these problems, the following scientific proposals and practical recommendations have been developed:

To increase the responsibility of the customer and suppliers for non-compliance with the terms of the contract;

Regulation of suppliers of goods, works and services involved in electronic commerce in order to have complete information about their goods, works and services, if necessary, conduct seminars and trainings for them, improve their qualifications;

It is necessary to ensure that prices in e-commerce do not exceed market prices;

expanding the range of goods and services offered in electronic commerce;

widespread use of modern technologies in e-commerce, the use of advanced foreign experience, etc.

We are confident that the implementation of these scientific proposals and practical recommendations will make a positive contribution to improving public procurement in our country.

ABSTRACT

The interest in happiness, its material attributes and intangible components in different cultures within the framework of various areas of humanitarian anthropological knowledge is evidence that feelings associated with happiness, its attributes characterize the spiritual essence of man. The relevance of the topic of our study is determined by the fact that understanding of happiness reflects the value needs of a person in different cultures, thereby allowing researchers to draw conclusions about the origins of culture, which is the foundation for the formation of the ethnic, collective, national consciousness of its carriers. Attitude to happiness allows revealing the existential characteristics, norms, traditions of different social groups, since a different interpretation of happiness within the framework of different cultures reveals their ethno cultural specificity and perception of the world and people.

KEYWORDS: *Appiness, Different culture, National consciousness, Collective, Joy, contentment, Good, Well-being, Bliss, happiness, Fortune, Luck, booty, Treasure.*

INTRODUCTION

The purpose of this work is to identify common and specific components in the content of the concepts of "happiness" and "baxt" in English and Uzbek languages. To achieve the goal of the study, we carried out a comparative analysis of the lexicographic meanings of the lexemes "happiness" and "baxt"; during the study, we identified common and specific components in their semantics. In addition, the conceptualization of happiness in the two studied linguistic cultures was studied by comparing phraseological units verbalizing the semantic component of "happiness"

The scientific novelty of our study lies in the fact that it made an attempt to determine the content of the concept of “happiness” in English and Uzbek languages and describe its national-specific characteristics. The content of the concept was analyzed through the study of vocabulary definitions and phraseological units; as sources for the study of the concept of “happiness” the data of etymological, translational, synonymous and phraseological dictionaries are used.

This research method is widely used in modern humanities, in them vocabulary definitions and phraseological units (hereinafter - phraseological units) are considered as objects of research for describing various concepts. The lexicographic meanings of the lexemes “happiness” and “baxt” are analyzed using descriptive and comparative methods; methods of semantic and component analysis were used to describe the content of the concepts “happiness” and “baxt”.

The formation and development of human consciousness cannot be imagined without the formation of the language itself, while the language, according to E.F. Tarasov, being an instrument for the formation of human consciousness, serves as a means of “generalizing the images of consciousness that arise in reality”, and the formation of consciousness structures associated with language signs, has a social character. E.F. Tarasov interprets linguistic consciousness as “a set of images of consciousness formed using linguistic means - words, free and stable phrases, texts and associative fields” (6, p. 36).

In the framework of cognitive science, linguo cultural logic, psycholinguistics, a large number of studies are carried out devoted to the analysis of the content of various concepts in the linguistic consciousness of various ethnic groups by studying associative fields, phraseological units, free phrases, texts, etc. The type of the studied concept (substantive, structural) determines the choice of research methods; in addition, the leading role is played by the scientific research paradigm - philosophical, psychological, cognitive, linguo cultural. The following main sources can be used as research material: material presented in dictionaries and thesauruses; various types of texts in which lexical units function that verbalize one or another concept; data from psycholinguistic experiments.

The “Concept” is an abstract unit in which the knowledge and experience of a person are represented and with which he operates in his activities. Following N. Y. Shvedova, we regard the concept as “the substantial side of the verbal sign, behind which is the concept (that is, an idea that fixes the essential “intelligible” properties of realities and phenomena, as well as the relationship between them), belonging to the mental, spiritual or the vital material sphere of man’s existence, developed and consolidated by the public experience of the people, having historical roots in his life, socially subjectively comprehended and - through the stage of such understanding - correlated with other concepts, closest to related to them or, in many cases, opposed to him” (7, p. 603).

Despite the seeming universality of the concept of “happiness”, the emotional and semantic components contained in the Uzbek and English tokens “happiness”, “baxt” do not fully coincide. So, according to the etymological dictionary of the English language, “happiness” comes from the word “hap”, used in the meaning of “chance, a person's luck, fortune, fate, unforeseen occurrence” (“chance, luck, wealth (fortune), fate, unforeseen case”) (here in after the translation of the authors of the article. - S. F., A. X.). Since the end of the 14th century, the adjective “happy” has been used in the meaning of “very glad”, since 1520 the word has been assigned the meaning of “very pleased and content”. Then from the adjective the noun

"happiness" was formed, which since 1590 has been used in the meaning of "pleasant and contented mental state". According to researchers of the Uzbek and Turkic languages, one of the main hypotheses of the origin of the word "baxt" is the opinion that it is borrowed from the ancient Turkish languages. In the "Dictionary of the Uzbek language" by E. K. Pekarsky, a reference is made to the ancient Turkish origin of the Uzbek word from "yo'l", which means "road, fate", as an etymological parallel, words from the Mongolian and Buryat languages with the meaning "happiness, happy trip success" (4, p. 838).

In the etymological dictionary of Turkish languages, data are provided that the word "yo'l" has the following meanings in Turkish languages (here in after, the data are abbreviated without specifying specific Turkish languages and sources given in the dictionary of E. V. Sevortyan): 1) road, path ; Street; trail; 2) direction; 3) trip; journey; being on the road, flight; 4) stroke, speed; exit; pass; channel; paths, duct; 5) strip; trait; line; parting; 6) the path; way of being; right road; life path; opportunity; reception; method; means; way out); 7) custom (+ "routine"), (+ "rule"); order, rules, system; modus operandi); manner; persuasion, doctrine, sharia; law, legality; permission; 8) fate; happiness; share; luck; 9) times; 10) a gift; a monetary gift given at a wedding from a guy's side to a girl's side; and a number of singular meanings in different Turkish languages and dialects (5, p. 217-218). The dictionary also mentions the Mongolian parallel with the meaning "happiness, happy trip, success", which has narrowed semantics, reflecting one of the figurative meanings of the Turkish "yo'l". Thus, the Mongolian word borrowed from the Turkish languages was characterized by narrower semantics, while being "a Turkish loan, which in turn fell into some Turkish languages (see."Prosperity, happiness, luck ")"

RESULTS AND DISCUSSION

A comparative analysis of etymological data shows that the word "happiness" in the English language was formed as part of an onomasiological representation of concepts related to joy, luck, the case when a person's impersonal efforts cause joyful feelings, namely, and random circumstances. In Uzbeks, the word "baxt" is etymologically associated with the road, destiny, and happy trip; in addition, researchers believe that the Turkish word was borrowed into the Mongolian language with a narrowed meaning, and then the Mongolian word with this semantics was borrowed in some Turkish languages, including Uzbek.

In "The Dictionary of the Uzbek Language", the following definitions are given: "good", "well-being", "bliss", "happiness", "fortune", "luck", "booty", "treasure" (4, p. 838). In the Uzbek online dictionary, "baxt" is simply defined as "happiness, luck // happy, lucky; luck on the hunt; happy, lucky day", in addition, the following English correlates of the word "baxt" are presented in the dictionary: "happiness, welfare, well-being" ("baxt, farovonlik, tinchlik").

The definitions of the concept of "happiness": "the quality or state of being happy" (baxtlibo'lishningsifatoyikiholati), "good fortune"(omad), "pleasure"(zavq), "contentment"(mamnunlik), "joy"(baxt); "A state of well-being characterized by emotions ranging from contentment to intense joy"(farovonlikholati, mamnunlikdantortib to quvonchgacha), "emotions experienced when in a state of well" -being "(farovonlikholatidabo'lgan his-tuyg'ular); out of date. "Good fortune: prosperity"(omad, farovonlik), "a state of well-being and contentment: joy"(farovonlikvamamnunlikholati: quvonch), "a pleasurable or satisfying experience" (yoqimliyoki qoniqlitajriba), "felicity, aptness"(baxtlilik, moslik).

An analysis of synonymic dictionaries reveals the structure of the concept's content. The following most relevant words are included in the synonymic series of the token "happiness":

“Saodat”, “mamnunlik”, “zavqlanmoq”, “quvonch”, “zavqlanish”, “ko’tarinkikayfiyat”, “vaqtichog’lik”, “xursand”, “baxt”, “shodlik”, “kulgu”, “nekinlik”, xotirjamlik”, “zavq”, “farovonlik”, “tinchlik” and others ("bliss", "contentment", "delight", "elation", "enjoyment", "euphoria", "exhilaration", "glee", "joy", "jubilation", "laughter", "optimism", "peace of mind", "pleasure", "prosperity", "well-being").

Thus, a comparative analysis of etymological, explanatory, translated, and synonymous dictionaries allowed us to identify the following common features in the content of the conceptual concept of “happiness” in the English and Uzbek languages: well-being, prosperity, bliss, joy, fate, luck, fortune. The components marked as specific in the concept of "happiness" are: chance, wealth, luck, satisfaction, pleasure, contentment, glee, prosperity, delight, pleasant experience. In Uzbeks, the concept of “baxt” is associated with the road, the trip, and luck in hunting, prey, victory, success, good, kindness, and foreboding. We made an attempt to present the contents of the conceptual concepts of “happiness” and “baxt” in the form of two circles, in the area of intersection of which the components common for the two languages are listed in alphabetical order (the specific components for English and Uzbek linguocultures are listed in circles on the left and right, respectively). In the thematic groups of English phraseological units, the prevailing group is “happiness as a fortune”, followed by the groups “feeling of happiness itself” and “material attributes”. Among the Uzbek F.Es, the prevailing group is the “ways of expressing happiness”, which describes the emotional manifestation of feelings of happiness: through laughter, through good mood, through the figurative organization of the holiday, etc. Also prevailing thematic groups are “happiness as a fortune” and “intangible attributes of happiness”. It should be noted the presence among the groups of English phraseological units of the theme “man himself is the blacksmith of his own happiness,” which we have not identified among the Uzbek F.E. Thus, the study revealed common and specific features in the perception and understanding of happiness among the British and Uzbeks. Cultural factors, ethnic peculiarities, different linguistic pictures of the world determine the presence of national-specific components in the concepts of "happiness" and "baxt", in which the features of the national worldview, linguistic consciousness and culture are manifested.

The language reflects the cultural and national mentality of the people. Each native speaker is also a native speaker of culture, therefore linguistic signs acquire the ability to fulfill the function of cultural signs and thereby serve as a means of representing the basic settings of culture.

As academician D.S. Likhachev, “the twenty-first century will be the century of the humanities”. The current stage in the development of scientific thought is characterized by the most important methodological shift towards humanitarian knowledge. For linguistics, this methodological turn means an increase in interest in language as a phenomenon of human culture. Language is gaining "increasing importance as a guiding principle in the scientific study of culture". Inside linguistics, disciplines are studied that study the language in close connection with the consciousness and thinking of a person, culture and spiritual life of peoples. One of them is linguoculturology (from Latin: lingua - language, cultura - culture, logos - science, teaching) as a scientific discipline of the synthesizing type, considering culture and language in linguistic units. In this paper, we consider the lexical and semantic field of the concept of "happiness" in Russian and English. In the framework of this trend, the study of linguocultural issues is becoming

increasingly relevant. The linguocultural approach to the study of the emotional sphere and its verbal representation allows us to identify the specific logic inherent in the carriers of a particular linguistic culture.

It should be noted that the concept is the subject of heated scientific discussions not only of linguists, but also of psychologists, culturologists, and philosophers. The study of this concept in modern linguistics is still open, despite the many ongoing studies. The concept of “happiness” is one of the dominant in Russian culture, which explains the interest of linguists in this cultural phenomenon (S. T. Vorkachev “Happiness as a linguocultural concept”, V. V. Kolesov “Fate and happiness in the Russian mentality”, A. D. Shmelev “Love and Happiness”, AA Smirnov “The Concept of Happiness in Karamzin's Journalism”).

In Russian, “счастье” is a nuclear token, just as in English, “happiness”. In English, the state of happiness “happiness” can have such basic concepts as luck “luck”, gladness “joy”, delight “delight”, blissfulness “bliss”, and satisfaction “satisfaction”. In Russian, the lexical and semantic field of the concept of “happiness” is wider. It manifests itself in such concepts as “fate”, “luck”, “bliss”, “joy”, “prosperity”, “the highest degree of happiness”, “fun”. Against the general background, in the lexical and semantic field of the concepts of “счастье” and “happiness”, in both languages there is a coincidence in such concepts as satisfaction, joy, fate, fun, bliss. In the course of the lexical and semantic analysis of this concept, the unity of the kernels of the words “happiness” in English and “счастье” in Russian was revealed. In them, “happiness” is expressed in a sense of joy and satisfaction.

In Russian, “счастье” is included in the lexical-semantic field “fate”, is its important component. In the popular mind, “happiness”, along with other personified incarnations of fate (share), acts as a mythological creature. The answer to the question about the source of happiness leads to the combination in the consciousness of a personal sensation of happiness and a mythological creature as the source of this sensation.

CONCLUSION

According to etymological dictionaries, it has been established that the concept of “happiness” is formed from the Central English hap in the meaning of chance or luck. Adjective happy - happy and noun happiness - happiness formed suffix way. You can also see the remnants of the hap prefix in such words as perhaps (balki), happen (yuzbermoq), happy (xursand), happily (baxtiga), hapless (bebaxt), unhappy (baxtsiz), mishap (mufaqqiyatsizlik), happiness (saodat) and happenstance (hodisa). This origin of the word “happiness” indicates that often in the meaning assigned to it there is some element of chance. Later, at the end of the 14th century, the feeling of very glad (very joyful) was displaced by the Old English words eadig (from EAD wealth) and gesxlig. In the 1520s, the old English word blide (happy) survives as happy. From Greek to Irish, in most European languages the meaning of “lucky” (lucky, successful) has been invested in the concept of “happy” from the very beginning. An exception is Welsh, where the word was used primarily as wise (dono).

The Uzbek word is “happiness”, a related Russian, Turkish, Azer “happy”, explain from Indo-European roots. According to I.A. Baudouin de Courtenay, the prefixed (as, for example, in the word death) is associated with the Sanskrit su-, which meant both “own, native” and “good”. The meaning of the second root is “part” or “share”. Happiness in the Slavic languages originally

meant “a good share” or “a good inheritance”, although it could be understood as “joint participation” - an etymology, undoubted for the late Church Slavonic, “participial”.

ABSTRACT

The article describes the role and functions of fantastic terms used in the works of world famous science fiction writers Ray Bradbury and Isaac Asimov. In it, in a comparative aspect, the Uzbek variants and meanings of English terms are revealed on the example of artistic fragments. The work in this direction is based on the image of innovations and discoveries in science and technology. Science fiction writers have always been ahead of the times in which they lived. Because they anticipate the future; they devote enough space to scientific hypotheses in their work. And these hypotheses come true over time, becoming reality. Hence, the difference between works of art and others is essentially the same. Moreover, the vocabulary of such works is unique.

KEYWORDS: *Science fiction, Scientific term, Lexico-semantic, Phrase, Telekinesis, Telepathy, Field, Evtaenathy, Smell, Stilistic devices, Space.*

INTRODUCTION

The fantastic trend in world literature has its own characteristics of centuries-old development. Such writers as J. Verne, G. Waels, A. Belyaev, A. Azimov, S. King, R. Bradbury made a worthy contribution to the development of this direction. The work in this direction is based on the image of innovations and discoveries in science and technology. Science fiction writers have

always been ahead of the times in which they lived. Because they anticipate the future, they devote enough space to scientific hypotheses in their work. And these hypotheses come true over time, becoming reality. Hence, the difference between works of art and others is essentially the same. Moreover, the vocabulary of such works is unique. The structure of this lexicon is composed primarily of science fiction terms that reflect advances in science and technology. Science fiction terms have universal meanings. Because they arise on the basis of the achievements and achievements of world science and, over time, are absorbed by general consumption. We will try to substantiate these views on the example of some works of the great figures of world fiction, Ray Bradbury and Isaac Asimov. Science fiction terms are lexical units that reflect the innovations of science in the works of these writers, explain the events taking place in the global world, the content of scientific discoveries. In this sense, such words also fulfill a methodological function in a fictional play.

It is known that the works of R. Bradbury and A. Azimov have been translated into Uzbek. The first factor that strikes a balance between originality and translation has to do with the use of science fiction terms. Since most of the brand terms are international, they are not translated, in any case go to the translation option. This is in line with the formal principle of linguistics. It is true that "the ability of a translator to translate from an intermediate language is also limited because he did not work with the original. Sometimes some passages in the original may be omitted or changes may be made to the translation process to make them meaningful"[1,56]. But in fiction there are practically no such boundaries. This is because the nature of science fiction doesn't allow it. However, having explained their essence in the Uzbek language, it will be possible to understand the content of the work. In addition, scientific quantitative terms are being updated, absorbed into the vocabulary of modern vocabulary. Consequently, science fiction terms have a firm place in the neologism system of the language. There are even terms that are now used as medical terms (euthanasia, hallucinations ...). This shows that the scope of science fiction terms is expanding.

LITERARY REVIEW

This term, according to L.V. Shcherba, refers to science and a certain field and is a "word or phrase expressing a certain concept" [2265]. The intensity of the process of learning traditional and stable terms in the language ensures that they form a whole terminological series and play an important role in the development of vocabulary. According to the lexical feature, the terms are mostly monosyllabic, but the language also has several meanings, usually seen in fiction. According to S.V. Grinev, the term "is a special lexical unit of a certain language that gives a name to individual concepts" [3, 309]. Science fiction terms, on the other hand, are an international lexical unit that names concepts for multiple languages, not just one specific language.

ANALYSIS

It is well known that in the era of radical changes and innovations in world literature, it was in the second half of the twentieth century that the fantastic genre in American and English literature developed very rapidly. In it, along with works in the realistic and modernist directions, fantastic stories, stories and novels are created and are being created. The leading genre of American literature in the second half of the twentieth century is the science fiction novel, the greatest representatives of which are undoubtedly Ray Bradbury and Isaac Asimov.

Today, many of the novels, short stories, and short stories authored by Ray Bradbury, a prominent figure in American literature of the twentieth century, have become the golden fund of world fiction. His works have been translated into 33 languages and published in 35 countries around the world. It was on this basis that he gained popularity in science fiction. The language of Ray Bradbury's writing is unique in that it uses a lot of science fiction terms. In the writer's stories, fantastic terms are unusual events taking place in the life of a person and society; sacred and exalted feelings in human nature; it includes simple everyday events that are hidden in man, nature and society, and which can break out of time and change the environment beyond recognition. In his works, Ray Bradbury uses fantasy and science fiction, elements of novels that frighten the heart of the reader. Usually, elements of different genres are mixed in the works of Ray Bradbury. It is these features that provide the uniqueness of Ray Bradbury's work and their unique recognition by readers. Although the author tells the story of vampires, ruthless killers, pyramids, ghosts, telekinesis, telepathy, he scientifically raises the most pressing problems of the time, such as man and his place in society, the struggle between good and evil. Currently, the most pressing issues are the translation of scientific and technical terms from English into Uzbek, since it has not yet been studied theoretically. Some specific terms are difficult to translate into scientific and technical texts. To translate such terms, the translator needs to look for alternative words in the Uzbek language. Or he will have to accept and explain exactly the words that are used in the languages of the world. Sci-fi terms in Ray Bradbury's *Martian Chronicles* reflect the processes of world civilization. It is known that the play uses the teleportation method typical of the fantasy direction, which allows people to travel in time to another space and to a different distance. For example: "At the cosmodrome, where pink flames and coals were smoking like coals, the rocket was high. On a frosty winter morning, the rocket carried with powerful fiery breath. The rocket creates the weather, and for some time summer has reigned on the square ..." [6,4]

In the process of lifting the rocket from Earth into space, the writer so skillfully used the terms "rocket" and "cosmodrome" that the animation of the rocket in the form of "goose bumps" demonstrates its enormous power. Or used against him "summer" and "weather" compounds also demonstrate the power of the rocket. This discovery of science is a product of human scientific activity to conquer the universe.

At the same time, the mood, fantasy, way of thinking and behavior of the main characters of the play are convincingly expressed through psychological terms: telepathy, teleportation, euthanasia, hallucinations, hallucinations, illusions. For example: "... - Uh. Then he did not speak our language. But I figured it out in one fell swoop. In my mind. This, of course, is telepathy" [6,8]. The author also uses travel in the novel figuratively through fiction. Those who ruined life there - the killers of nature - have already hit the head of the transparent Mars mentioned in the play, and these "knowledgeable" and "healthy" Martians became ill:

"... They are paranoid, and none of them are healthy!" But how we were greeted! ... It was shouts, songs, speeches ... In the end, it was great ... " [6,44] In this passage, R. Bradbury regrets that men even appreciated Mars and all the properties associated with it. The writer places the true illness manifested in humanity in his heroes, and in the heroic heroes he sees their decline:

"Treating patients in a mental hospital that you see is much more difficult ... But I can tell you that the work is very poor, including primary, secondary auditory, olfactory and gustatory frenzy like yours, as well as the visual sense." euthanasia. [6, 48]

The author considers the state of "euthanasia" in the play as the diagnosis and decision of the Martians, that is, the readiness of a person suffering from severe and incurable pain to commit suicide voluntarily.

The science fiction terms used in the play served as a means of describing a real journey based on advances in science and technology, not an imaginary one. The process of comparing scientific terms used in *Attack on Mars* in three languages, namely English, Russian and Uzbek, revealed the potential of each language. In particular, the Uzbek language has ample opportunities in terms of defining terms with their synonyms. At the same time, the advantage of the English language is that the idea can be conveyed succinctly, concisely and simply. That is, there are grammatical and lexical conveniences.

DISCUSSION

The terms used in a fantasy work define not only the nature of the work, but also its appearance, as well as identifiable features. One or another component in terminological combinations can have both general and special features at the same time, i.e. may be present in other terminological combinations. This feature creates a unique terminology hub that represents a series of terms in the industry.

For example, a Martian psychiatrist assesses the mental state of the "sick hero" as follows: "... our other patients ... focus on visual hallucinations ... and then move on to auditory hallucinations. If you ... treat chapter, the same way. ... Your madness ... our miracle is perfect.

This state is actually a state of non-perception, a state of perceiving an event as a strip. The author regrets that not accepting anything as a bar is the beginning of a recession. In the novel, R. Bradbury effectively used psychological terms in the image of the main characters, their worldview, thinking, and conclusions.

Ray Bradbury's fantasy novels contain elements of prophecy and warning. The danger threatening the future of man is also relevant in other works. A striking example of this is his one-act plays, staged in one of the theaters in Los Angeles in 1964. The most impressive of these is the *Veld* story. In this story, the author also reveals the idea of the work, widely using scientific terms. The plot of the work is as follows:

An American family hit by an attention-grabbing advertisement will buy a fully automated home for \$ 30,000. The children's room, in particular, had a strange character. The company that built such a house also named the house "For Happiness". A sophisticated system of designed devices and various devices, corresponding to the latest technologies of the future, can instantly transform a room into any corner of the Earth according to the wishes of children, creating the desired look in a vivid image.

Fairy gardens do not attract the imagination of children. In an environment devoid of human qualities, their hearts hardened like a text, and they became cruel due to lack of kindness and warmth. This house, which has made a person lazy, even washes the teeth of children and him, tying his shoelaces. Even her parents sleep in rocking beds, and cooking is the responsibility of the automated kitchen. At this level, the mechanism is so advanced that children can do their homework and brush their hair. In this age of technology, a person has no work left, and parental attachment is also a mechanism. A mechanized house is a father and a mother of children, their pipe. There is no room for human emotion in mechanized life.

Lately, parents have been hearing terrible screams from the children's room. By order of the children, the room was turned into a dry African desert - Veld, burning from the scorching sun. Hungry lions roamed in it, as if alive. Outraged by this situation, the parent decides to turn off the room; the mechanism of the house as whole Children doesn't want to leave their room. Because this room is as dear to them as their parents. They lock their parents in this terrible room and turn them into victims of hungry lions. Only then will the parents realize that the screams they have heard before are actually their own. One can only imagine how tragic the scene of the heart-shaking tragedy is. "By forgetting what is necessary for the happiness of your children, you are pushing them into the abyss of cruelty and cruelty," he said.

The play shows that the tragedy of not using human intelligence and engineering skills for the right purpose ends in such a tragedy. This story raises the issue of education and spirituality of the younger generation, which has become a global problem.

The story "Veld" was translated from Russian by NozimKamil. The spirit of originality was preserved in the translation, but the omission of some words, as well as the possibilities of the language, were especially evident when using scientific terms. The translation of scientific terms is preserved in their original form. This, in turn, ensures that there is no alternative to scientific terms and that translation into other languages remains the same.

ORIGINAL

"Walls, Lydia remember; crystal walls, that's all they are. Oh, I have to admit they look real - Africa in your living room - but they are all super-reactive, ultra-sensitive color film and mental film behind glass screens. This is all scent acoustics and acoustics, Lydia "[8.68]

"Odorophonic (science - fiction term) - a device producing smell and sound consists of two units - " odour ", " phone " which means " smell " and " sound ".

Elsewhere it would be better to say "color embossing, stereoscopic image" than "color comedy". Because neither English nor Russian texts contain the word "comic".

Russian translation: "- But all this is only a heightened impact of a color volumetric film and psycho-recording projected onto a glass screen, odorons and stereo sound." Apparently, scientific terms hardly need translation. Only their equivalents in other languages can be specified. If there is no equivalent, it will be possible to fully understand the essence of the fictional text by interpreting the term. Isaac Asimov, one of the leaders of the field of science fiction in American literature, in his work "The Stream of the Universe" also pays great attention to scientific terms. The writer turns more to terms related to the science of astronomy; in the process of analyzing scientific terms, it is also necessary to pay attention to the analysis of semantic components. Semantic components (semantics) of scientific terms in A. Asimov's novel are the units of the elements of the meaning of this term. In modern fiction, the meaning of a word in these units can be fragmented. The sema in a scientific term is a unit of meaning and is inextricably linked with meaning. The semantic component includes, of course, vocabulary). In this dictionary, each word is compared with the specific content that corresponds to it. Yu.N. Karaulov reads: "Semantic components, their complexes and interpretations should not be deduced from the level of intermediate linguistic representation, otherwise the interpretation will be useless".[4, 183]

One of the important features of the semantic component in the structure of scientific terms is its high degree of abstraction. It is this feature that determines the flexibility and relative stability of the semantic components. One component is included in the meaning of different words, which indicates that the semantic component cannot be individual. The semantic component used in a play must have a certain degree of "precision", "its own meaning," but in a fantasy play it is also used to express a figurative meaning or scientific environment. This helps to assimilate various words in the work as an additional element to the meanings. "I'm just looking for your benefit," he said. Black poop appeared in his hand. Erlik's voice was muffled: "This is a mental study." He tried to get up but couldn't. » [7, 11]

In the play, terms such as "black sternum", "psychic probe" play a key role in revealing the mental state of the protagonist. They are interconnected both spiritually and functionally. Both terms meant that the main character, Rick, was losing his normal mental state. The point of both is an automatic device, one end of which touches certain points of the skull, and as a result the client loses his normal state of mind.

In addition, the author often uses astronomical terms in naming conventions, often when naming geographic names. For example: "... The world was beautiful. ... said there were large burning signs in the Upper City a few miles away:

"Florina is the most beautiful planet in the entire galaxy" [7, 19]

Florina is the writer's fictional planet, and it is through this fiction that humanity is encouraged to save the globe. In the play, Erlik, a cosmonaut-researcher, warns of the imminent danger of the planet Florina, the highest grade of cotton.

CONCLUSION

Science fiction is a branch of science fiction, and its basis accepts the logical assumption that extraordinary things happen because of extraordinary development of technical and scientific thought. One of the most popular genres today.[11, 9246]

Each of the fantasy novels by Ray Bradbury and Isaac Asimov contains unique prophetic and warning elements. Both authors have effectively used psychological, physical and astronomical terms to express fantasy images.

The real hero of science fiction by R. Bradbury and A. Asimov is not the role of science and technology that changes the world, but a person living in a world that is slowly changing. They write with a sense of a happy or disturbing miracle taking place in a person's life. They say that a person, whether on Earth, in the Universe or on the rocks of Mars, should not forget himself, he should understand that he is the master of the soul.

In general, the science fiction terms used in the writings of Ray Bradbury and Isaac Asimov serve as follows:

Firstly, it determines the nature of the piece.

Secondly, it reflects the achievements of modern science.

Thirdly, it reveals the psyche of the hero.

Fourthly, it serves to enrich the vocabulary with new words.

ABSTRACT

Literary translation is one of the main means of increasing the cultural wealth of our people, further strengthening the bonds of friendship between the peoples of the world. The role of translators in acquainting our people with the rare works of world literature is enormous. The article discusses theoretical issues of literary translation that need to be analyzed more seriously.

KEYWORDS: *Literature, World Literature, Literary Translation, Translation Studies, Literary Character, The Problem Of Translation*

INTRODUCTION

Today the Uzbek reader tends to read works of world literature classics such as Bronte, M. Twain, I. Turgenev, A. Chekhov, R. Tagore, V. Shakespeare, G. Mopassan in his native language. These works have become an integral part of our literary wealth. However, our previous successes cannot satisfy our people, whose level and aesthetic taste are growing and their cultural needs are expanding day by day. Our people are waiting for the translation of hitherto untranslated examples of world literature. In order to fulfill this honorable and responsible task at a high level, we must first clearly define our positive traditions in the field of literary translation, and analyze our shortcomings in principle. In other words, the theoretical issues of literary translation need to be addressed more seriously.

Translation is a form of ideological and artistic expression of the original. It should be able to give the reader as much complete and in-depth knowledge of the original as possible. Let the reader read the translation and get a historically correct idea of the original. It is not enough to

translate the general content of the work and "in general" the art. The translator must be able to convey the originality of the work being translated, as well as the individual style of the author. For example, when translating Dickens's, if the translation does not preserve the deep ideological content of the works, the unique individuality of the characters, their artistic impact, the Dicken's style imbued with expressive phrases, such a translation will be difficult for the Uzbek reader and he cannot reveal the true character of this author. The reader does not see the writer's artistic skills and is not affected by the work. The main task of the translator is to preserve and convey to the reader the ideological richness of the original, the power of artistic influence and its unique features.

RESULTS AND DISCUSSION: Any artistic monument not only affects our minds, but also our senses and imagination. The translator must recreate his poetic tones for us in the process of translating the work of art. "The translator of classical works must be a poet himself," wrote Dobrolyubov [3, 122].

The distinctive features of the author's style are connected with the writer's way of thinking, literary aesthetic views. Adherence to these signs helps to convey the artistic and ideological content of the translation. The understanding of the author's individual style as an instrument of the artistic system is expressed in his worldview, which is necessary to maintain the unity of the work during the artistic translation. At this time, the task of the translator is not to recreate words in literary translation, but to recreate ideas and characters; not intonation, tone, in other words, stylistic forms and ways of another language, but in this stylistic category to expresse spiritual and poetic content [4, 40].

As a representative of a nation, a person has a certain character and specific psychological characteristics. Manifestations of national character, which embody the individual features that create the artistic image, are reflected in the psychological characters, his attitude to the environment, his actions, deeds, feelings, and so on. National character, like everything else in life, is created on a certain material basis and is a reflection of certain living conditions. Therefore, the national character of the hero can be correctly understood by studying the life, national history, identity, national, cultural and literary traditions of the nation.

The role of the translator in the recreating character is as follows:

- study the history, social and literary conditions of the nation in which the character was created;
- identify the main features of the character, the purpose for which it was created;
- analysis of the means and stylistic ways of the language in which the character is to be created;
- find the necessary means of expressing this character in the native language.

Just as there are no people in life who are completely different from each other, there are no people who speak only in the same pattern, express their thoughts in the same tone of voice, speak in the same style of speech. Even an actor who has mastered the art of imitating other people's style of speech very often does not notice that he utters words only in his own individual style. In fiction, in which the object of description is the human being, writers skillfully use this feature of human beings. Therefore, one of the most important issues in the creation of the

character is to determine their specific speech features. In the works of word artists, each character speaks in its own "language". In many cases a doctor can be distinguished from an engineer, and an engineer from a teacher, depending only on their speech characteristics. A book would not be a work of art if all the people, young and old, men and women, people of different professions, faiths and worldviews, described in the book spoke the same "language" and style. Some of our works of art are so boring and dry that the characters depicted in them, like trained parrots, speak in the same tone, on the same theme, chewing words. It is natural that people do not like such a fake language, because they do not speak such a "language" in real life [5, 212].

Each writer has his own individual way of defining the language of characters. Determining this is also important in studying the unique style of each writer. Defining the linguistic individuality of characters is an important issue not only in fiction but also in fiction translation literature. After all, the translator, who interprets the examples of classical literature, has to reflect the vocabulary and pronunciation norms of the language of the characters of the time.

The works of art depict people belonging to different social groups and strata within a particular nation. Although all of these are characters of children of the same nation, their speech differs significantly in style. Every farmer, landowner, soldier, nobleman, etc. speaks in his own "language". Some of them express their thoughts in an exaggerated way, some of them repeat soda, and some of them repeat rude or silent words. Undoubtedly, all this has to be reflected in the translation [5, 212].

In the works of world writers, the following methods are often used to determine the linguistic individuality of characters:

1. To attribute something in the language of heroes, to bring out their individual linguistic features by combining semantically incompatible words.
2. Distorting some foreign words that are difficult to pronounce in the language of the characters.
3. Create a special grammatical structure and tone feature for each character's speech.
4. Characters' speech in their own dialect.
5. Officials and aristocrats sometimes speak in a foreign language or use foreign words in their speech.
6. Use of any physical defect (for example, holding or stuttering) mentioned in the character, and giving examples from the speech of speakers who deliberately distort the language.
7. Pay attention to the lexicon of the language of heroes: wide use of professional terms, obsolete words and vulgarisms in their speech, taking into account their age, occupation, behavior and profession.
8. Reading and using some words and phrases in the language of characters.
9. The use of lexical tools specific to the age and gender of characters.

It is necessary to dwell on some of the methods, means and features of the creation of linguistic individuality of the characters observed in the practice of translation. Depending on whether the character is described as positive or negative, the writer chooses the appropriate words and phrases in his language. Accordingly, it is not from the lengthy descriptions and comments in

the language of the writer, but from the words used in the languages of the characters and characters he describes that they can be identified [7,124].

One of the most difficult issues in translation theory is to convey dealictisms in translation and to reflect the distortions of a particular language by people of other nationalities described in the literary work. In order to create a local color in the work, to create the linguistic individuality of the characters, to increase the artistic effect of the work, to ensure the authenticity of the details and to achieve simplicity and fluency of style, the "language" of his heros uses words and phrases typical of district dialects [5, 216].

The individualization of the "language" of characters, depending on their gender and age, is also an important issue. Of course, men do not speak another language, women do not speak another language, and children do not speak the whole language with the elderly. The fact is that their speech differs only lexically and, in some cases, grammatically. For example, words and phrases that are used more often in women's language are not used by children, or words that are specific to children's language are not used by adults, and so on. This feature of language is also widely used in fiction, so it is important to reflect this feature in translation [6, 1647].

In our opinion, the most appropriate is the term "national color". Each nation has its own national characteristics: language, culture, customs, religion, clothing, food, etc. Proverbs, idioms, word games, similes, allegories and other artistic styles of the writer have their own national character. These features complicate the work of the translator [1, 42].

According to professor A.V. Fyodorov [2, 181-182], words denoting the concepts of peoples' life are interpreted in three different ways in other languages:

- 1) by transliteration;
- 2) creation of a new word based on the richness of the translated language;
- 3) by the choice of means close to the original in the language of translation .

The problem of interpretation of words that mean the concepts of life of peoples in translation should always be analyzed in a practical way in the existing scientific and critical work. A skilled translator is often concerned with restoring the function of words used in certain contexts to represent the concepts of people's life. In this case, the translator should not confuse the original nationality - the nationality of another people with another concept that belongs to the language of translation. The national spirit that is originally given - say, if it is a word about the way of life of the American people - should not be given in terms of the culture of the Asian peoples - that is, the original should not be nationalized.

In the process of translating words that express the way of life of peoples, it is necessary to choose in the language of translation the means that are most suitable for them, as well as the means of digesting the norms and culture of this language. Such notions can be reflected in the thinking of a number of peoples in the same way. For example, many peoples, culturally and economically close to each other, such as Uzbeks and Tajiks, Russians-Ukrainians-Belarusians, Germans-British-Dutch or Caucasian peoples. They have many words, concepts, views, dreams which are similar. There is a harmony of hopes, joys and worries. The combination of national colors in the translations from these languages is of particular interest to the translator.

Also, many of the words used to express national concepts can give the same meaning to another language. In particular, many of the words and concepts in the national spirit used by the American people are becoming nationwide as a result of the globalization of the peoples of the world. These words and phrases already have a strong place in the dictionary of the peoples of the world. The role of television, radio, cinema and the press in popularizing the way of life is invaluable. These circumstances naturally give the translator a number of reliefs.

In addition, the meanings and functions of many words and phrases that express the national concepts of a nation are the result of various cultural, political, economic, and trade relations between countries, as well as to a number of peoples, including translators. Translators do not have to search for words in their own language for such words and actions - they also transliterate them [10,215].

Transliteration is the most effective way of interpreting words that reflect the concepts of life of peoples, and in a compact way restores the national color of the original, that is, the historical situation and the social environment of the characters. That is why translators use this method effectively in their work. [8,8162] **Conclusion:** In short, the problems of literary translation in Uzbekistan have been and are being studied in depth in the historical, theoretical and critical areas. Many educational materials on the theory of translation have been created, in which opinions on various areas of translation studies are expressed. In particular, the specificity of the language of characters is deeply considered. Defining the linguistic individuality of characters is one of the important issues not only in fiction but also in fiction translation literature. The translator, who translates the examples of classical literature, is forced to reflect the norms of the language and pronunciation of the language of the characters and characters of his time. Both moving away from and approaching the original should be aimed at only one goal - to fully preserve the richness of the original. After all, the translator, who translates the samples of classical literature, is forced to reflect the norms of the language and pronunciation of the characters of the time. Each nation creates its own national image based on its historical development and national character. The character of another nation must be accepted as it is and expressed in the language of translation.

ABSTRACT

In modern linguistics, Linguopoetics is the study of speech sounds, the additional meanings they express, the expressive-emotional properties of sounds. In world linguistics, the denotative meaning of language units has been studied extensively and comprehensively. However, there is not enough scientific research on the connotative meaning of language units and its occurrence in speech. The connotative meaning, the realization of its ingerent and adgerent forms in the speech process, has different character and properties in different phonetic means. In particular, the methodological features related to sound change in phonetic means, the function of sound repetition, the omission of sounds, the duplication of sounds, as well as super segmental phonetic means: intonation, pause and accents in the example of two languages analysis and research is one of the unresolved problems in linguistics. When analyzing the meanings of sounds and stylistic phenomena, phonetic figures of speech serve as an important phonostylistic tool. We have paid attention to the use of phonostylistic figures in English language, their stylistic peculiarities in poetic and prose texts, extralinguistic aspects of functional limitations, and collected examples from the literature. The results of the analysis show that phonostylistics contains intonation, alliteration, assonance, stress, rhythm, stylistic inversion, euphony, cacophony and others. In this article the stylistic figures and supersegment phonetic means have been analysed.

KEYWORDS: *Phonostylistics, Phonostylistic Devices, Euphony, Cacophony, Extralinguistic Factors, Intonation, Alliteration, Assonance, Stress, Rhythm, Stylistic Inversion, Melodyphonostylistic Means, Rhythm, Rhyme, Stylistic Figures, Intonation, Melody, Melody, Poetic Speech, Periodicity, Alliteration.*

INTRODUCTION

The study of the connotative meanings of the linguistic units in which phonetic changes occur in linguistic units and their various manifestations is also one of the current problems of linguistics today. Textbooks and manuals use terms such as "phonetic structure of the word", "some phonetic processes: combinatorial and positional changes", "changes in speech sounds". Regardless of the name of the event, the main idea is that the sounds from the word undergo different changes during the speech process: one is adapted by the other, some sounds are formed and dropped differently, sometimes a new sound appears in the word. Such phenomena are called by a number of terms: assimilation, desimilation, reduction, prosthesis, metathesis, ellipsis, appocopa, syncope, epithelium, ciparmanesis.

The nature and causes of these phenomena in different forms are different, they are mainly the pursuit of conciseness in speech, the emphasis on reading in the syllable or its absence, the hasty pronunciation, the influence of dialect, etc. difficulties in pronunciation of words learned from foreign languages cause this [6,216]

Analysis:

A prosthesis is a sound at the beginning of a word for certain phonetic reasons. In a prosthesis, a vowel is added at the beginning of a word.

Appacopa - the phenomenon of the sound at the end of a word or the fall of sounds also plays an important phonostylistic role in the artistic image to make a realistic representation of live speech.

Such phenomena as speech-saving, individualization of character speech, demand for poetic rhyme, reduction of volume, increase of volume, interchangeability, shortening of syllables play an important phonostylistic function in creating emotional impact on the listener [7,1649]. The importance of sound repetition in performing such a phonostylistic task is enormous. The repetition of sounds that are the same or close to each other is a phonetic repetition.

The term sound repetition was originally introduced by O. Brick and was used only for consonant sounds. Repetition is characteristic not only of speech sounds, but also of other forms of language structural elements. Sound repetition is especially used to draw the attention of the listener or reader to the object of the image. The main task of repetition is to make the speech effective, to clarify the idea and to draw the listener's attention to it. Professor A. Mamajon thinks about repetition and its stylistic function, showing that it has phonetic, lexical, morphological, syntactic forms [5,353]. Some literary and linguistic sources also emphasize the importance of alliteration based on sound repetition.

Alliteration is a phonetic, stylistic device that has a melodic effect in speech. Basically, words in a sequence are repetitions of certain consonant sounds at the beginning [4,93].

For example: The possessive instinct never stands still (S)

Secret and self – contained and solitary (S)

as an oyster. (Ch. D)

Alliteration creates methodological fluency, the tone of words. Alliteration does not have an independent meaning, its function is to influence the sound. Alliteration comes at the beginning of a poem and creates a harmony of sounds.

To lend our hearts and spirits wholly,
To the music of mild minded melancholy,
(Tennyson).

Alliteration also serves as an important phonostylistic tool in folk proverbs and oral discourse.

For example: Tit for tat; blind as a bat;

Betwixt and between; to rob Peter to pay Paul;

Sense and sensibility; school for Scandal.

In alliteration, the connotative meaning, which is formed when the sounds of speech are repeated in a certain place, in a certain situation, affects the basic meaning. The sound and the additional meanings in it always form a dialectical unit. The connotative meaning formed as a result of this dialectical unity is used to express the emotional state of the speaker during speech. Alliteration sound repetition creates an additional layer of meaning on top of the lexical meaning of the word. In addition to amethyr based on sound repetition, epiphora, anaphora, assonane, consonance, pleonasm, taftalogy, and nakorat have been interpreted as various forms of artistic repetition.

Anaphora. A piece of speech structured in parallel is a stylistic figure consisting of the repetition of exactly one element at the beginning. This stylistic figure was used to create forms of speech in which emotion is expressed with a high spirit.

For example: For want of a shoe, the horse was lost,
For want of a horse, the ruder was lost,
For want of a rider, the battle was los

The anaphoras in the English poem are based on repetition and serve as a means of expression that evokes various emotions in the reader and listener.

Epiphora: An epiphora is a repetition of some vowel or consonant sound in a poem to reinforce the expression at the end of a word or verse.

When I go to the lank
I get rattled.
The clerk rattle me
He ivckets rattle me
The sights of money rattles me

DISCUSSION: Phonostylistic devices which have been mentioned above have different functions. Authors can use them:

- To create logical and semantic unity. When words with different meanings are united in speech they may acquire some semantic similarity. As Roman Jakobson said, equivalence in form leads to equivalence in meaning.
- To emphasize the most important elements in utterance.
- To make the speech more beautiful, to create musical effect.
- To create stylistic convergence, in combination with tropes or syntactical repetitions.
- To reproduce the individual features of speech.
- **Euphony** is a harmony of form and contents, an arrangement of sound combinations, producing a pleasant effect. An author can create euphony in many different ways, such as using pleasant vowel and consonants, or by employing other literary devices, such as rhythm, rhyme, consonance, and assonance to create an overall harmonious sound to a work of literature. Euphony - is a sense of ease and comfort in pronouncing or hearing: "The moan of doves in immemorial elms, and murmuring of innumerable bees." (Tennyson. Euphony in the *Iliad*)
- In these lines from Book XII of Lattimore's translation of Homer's "Iliad" euphony helps reinforce the lulling effect of the winds dying down. Pay particular attention to the use of assonance and consonance to make the words euphonic.
- "When Zeus... stills the winds asleep in the solid drift..." (Euphony in the *Romeo and Juliet*)
- This example from lines 5-6 of the Prologue of Shakespeare's "Romeo and Juliet" creates euphony with two sets of alliteration, one with "F" sounds and one with "L" sounds (both of which are consonants often used to create euphony).
- Below we try to explain the next phonostylistic device which can be considered the opposite of euphony – Cacophony.
- **Cacophony** is a disharmony of form and contents, an arrangement of sounds, producing an unpleasant effect. Cacophony is a sense of strain and discomfort in pronouncing or hearing:
- "Nor soul helps flesh now, more than flesh helps soul" (R.Browning).
- Cacophony in Lewis Carroll's "The Jabberwocky":
- This famous poem by Lewis Carroll uses lots of made-up words to create a jumble of cacophonous sounds. When read aloud, the poem might feel like a tongue-twister, or like you have marbles in your mouth. That's often one of the effects of cacophony. In this case, it helps create a feeling of distortion and disorientation—almost as if the reader has entered another world (which is fitting because the poem itself is about a mythical monster and takes place in a fantastical world).

Tw'as brillig, and the slithy toves
 Did gyre and gimble in the wabe:
 All mimsy were the borogoves,
 And the mome raths outgrabe.

Cacophony in Shakespeare's Macbeth:

In this famous passage from Macbeth, Lady Macbeth's speech becomes cacophonous in a moment of panicked hallucination. Her guilt over the murder for which she is partly responsible comes to the surface not only through what she says, but through the discordant way she says it. Out, damned spot! Out, I say! - One, two. Why, then, 'tis time to do 't. Hell is murky!

Rhythm is the repetitive purposeful placement of a point in linguistics in order to create periodicity, the purpose of which is to create a certain periodicity. Rhythm is a factor that creates periodicity in speech in a certain order. Rhythm is used not only in poetry to correct rhyme, but also in prose.

In the works of the famous English writer Charles Dickens, we can see the following situation: In particular, we see that he used prose rhythm at the beginning of "A Tale of Two Cities".

It was the best of times,
 It was the worst of times.
 It was the age of wisdom,
 It was the age of foolishness.
 It was the epoch of belief,
 It was the epoch of incredulity.
 It was the season of light,
 It was the season of darkness.
 It was spring of hope,
 It was winter of despair.
 We had everything before us,
 We had nothing before us.
 We were all going direct to heaven,

We were all going the other way.

If the following passage in English is read aloud, it can be seen that it is formed on the basis of rhythm:

"The high-stopping roof of a fine sooty pink was almost Danish and two ducky little windows looked out of it, giving impression that very tall servants lived up there"(J.Galsworthy).

If we analyze the above passage, we can see that such phrases as "high-stopping", "fine sooty", "ducky little" are formed on the basis of rhythm.

Rhythm is very important, especially in poetry. It serves as an important phonostylistic tool in connecting verses and creating harmony in words. Rhythm-based poetry does not bore the reader, it gives him pleasure.

In a poem based on alliteration, rhythm creates a certain periodicity as a result of the repetition of speech:

Susan Simpson.
Sudden swallows swiftly skinning,
Sunsets slowly spreading shade.
Silvery songsters sweetly singing,
Summers soothing serade.
Susan Simpson strolled sedately,
Sleeping sobs, suppressing sighs.
Seeing Stephen slocum, stately
She stopped, showing some surprise.(B.Franklin)

The repeated use of the "s" sound in the above verse is an alliterative situation, expressing rhythmic periodicity and ensuring that the poem is read in a melodic manner. Poetry, read on the basis of rhythmic periodicity, delights the reader, showing the appropriate use of those words.

Rhyme. It is the ending of a compound sound of the same or similar type. There are rhymes such as full, empty, vowel, and consonant rhyme. Rhyme plays an important role in poetry, it shapes the poem, distinguishes it from prose, and at the same time provides melody. In order to express the main idea of the poem, he sometimes rhymes the words that form the basis of the poem.

It was many and many years ago,
In a kingdom by the sea.
That a maiden there lived when you may know.
By the name of Annabel Lee;
And this maiden she lived with no other thought
Than no love and be loved by me. (E.A.Poe)

The importance of rhyme is important in ensuring the melody of a poem. For this reason, rhyme is a means of expressing the idea of a poem. Many popular proverbs and sayings are based on rhyme.

Better late, than never.

It is never too late, to know.

In addition to proverbs, rhymes are often found in folk epics.

The following English poem shows a combination of rhyme and rhythm:

From "Sea Dreams"

What does little birdie say,
 In her nest at peep of day,
 Let me fly, says little birdie
 Mother, let me fly away. (A.Tennyson)

Intonation (Lat. Intonare - I pronounce loudly). The rhythmic-melodic aspect of speech, which serves to express syntactic meanings and expressive-emotional colors, pitch, tone.

The increase or decrease of the tone of speech during speech, the emphasis of the sentence, the tempo of the speech, the timbre of the voice help to form the components of the connotative meaning expressed in the intonation [9,8163].

Intonation is the main and characteristic feature of any sentence. It participates in the construction of speech as a separate unit. Therefore, intonation performs two functions: to form an emotional sentence from non-emotional sentences, as well as to express the feelings of the speaker. Reading any poem based on rhyme without intonation makes it ineffective, because the intonation not only makes the poetic speech effective, but also delights the reader and the melody is the main thing [8,124]. In the following poem of the poet Hamid Olimjon, in order to further strengthen the pictorial power of the melody, he gives a series of syllables that are semantically close to each other:

Sweet and low,
 Sweet and low
 Wind of the western sea.
 Low, low, breath and blow,
 Wind of the western sea
 Over the rolling waters go (A.Tennyson)

CONCLUSION:

Thus, the combination of rhyme, rhythm and melody serves as an important phonostylistic tool in ensuring the melody of the poem, to express the main idea of the poem. The poem, based on all three stylistic figures, such as rhythm, rhyme, and intonation, does not bore the reader, makes it easy to remember and retains in his memory for a long time.

In short, reading works based on sound repetition does not bore the reader. From the phonostylistic point of view, it is important that in speech a certain plot is created on the basis of the sound content of the language. Thus, the various forms of phonetic repetition used in place are a linopoetic phenomenon in artistic imagery and colloquial speech, providing musicality, rhythm, and melody.

METHODS OF USING INFORMATION AND ADVANCED PEDAGOGICAL TECHNOLOGIES IN PRIMARY EDUCATION

Khadicha Jabborovna Sattorova*

*Associate Professor,
Tashkent State Pedagogical University named after Nizami,
UZBEKISTAN

ABSTRACT

Today, the teacher has a responsibility to bring up a harmoniously developed generation, to set tasks aimed at improving the content of education, to keep pace with the times, to introduce modern educational technologies in primary education. Achieving positive results in education is determined, first of all, by the effective organization of educational work on the thorough teaching of the basics of scientific knowledge to the younger generation, the expansion of their worldview and thinking, the formation of spiritual and moral qualities. In this regard, many changes are being made in the educational process, new approaches are being introduced. One of them is to use information and communication technologies to increase the effectiveness of teaching in primary education.

KEYWORDS: *Primary education, Modern educational technologies, Methods of use, Primary school teachers, Programs, Motivation, Learning.*

INTRODUCTION

The emergence of the concept of "pedagogical technology" is associated with the emergence of the first organizational and methodological forms of education. Individual education is the oldest organizational form of the educational process, which originated in ancient Greece. The teacher worked with one student and directly organized, directed and supervised the education. The teacher read the texts or taught them to the children. By memorizing the rules and definitions, performing physical exercises, playing music on musical instruments, children have acquired knowledge about life, art, speech, physical culture. Later, individual education was replaced by group teaching. By the Middle Ages, memorizing rules, doing the same type of exercises, oral questions and answers, and at the higher levels, lectures and discussions became the leading methods of teaching. This situation gradually led to the emergence of new technologies, leading

to a class-lesson system. In the late 19th and early 20th centuries, many pedagogical theories emerged in foreign countries. Some of them were aimed at improving the education system and increasing student participation. It was during this period that the pedagogical movement "New Schools" emerged, founded by the French pedagogue E. Demolen. Such schools have opened in many countries, including the United Kingdom, the United States, France, Belgium, and Switzerland. The International Association of New Schools was set up in Geneva, setting out the requirements for new schools. These schools are private and only teach the children of those who can afford it. The new schools are well-organized, have well-equipped classrooms and laboratories, and use "free and active" methods. The students had self-governing bodies. Schools are a practical pedagogical laboratory that seeks to educate children by generalizing their thinking skills, rather than by filling their brains with memorized knowledge. Students were taught how to observe, find hypotheses, and test their hypotheses. Teaching in such schools was based on facts and experience, fostering children's initiative and independence. In Germany in the late 19th century, the educator Wilhelm August Lay (1862-1926) founded the "pedagogy of action." His ideas also had their own positive aspects and innovations. Lay attached great importance to expression and description in the pedagogical process, because in his opinion, in the process of such expression or description, students have the opportunity to show their activity, to act. According to him, all kinds of depiction: drawing, making clay and plasticine objects, modeling various objects, drawing, dramatization, singing, music, dancing, as well as experiments on the care of plants and animals, oral and written work, etc. are the means of "expression" in the educational process. According to Lay, all lessons should be based on these rules. Achieve mastery of the topic by all students; to improve students' fluency and accuracy, conscious and expressive reading; Encourage active student participation; motivate and motivate them to learn, identify ways to motivate students, and achieve the goal; Search for and improve ways to master pedagogical technologies and their application in primary education, work on themselves; Work to develop reading motivation in primary school students; Link the lesson to real-life experiences. And as a result, the student learns to read correctly, consciously and expressively, and improves reading skills through a variety of exercises. The notion of the Motherland expands, love for the Motherland is formed, and pride in the Motherland, that is, national pride, is formed. Learn to work independently with text. Learn to express yourself freely; teach fairy tales, proverbs, sayings, sayings based on what has been learned and agreeing with peers or learning to say new things. However, the introduction of information and communication technologies in the educational process is one of the modern requirements of today. One of the important tasks of today's pedagogy is to increase students' interest in science, to develop their intellectual and creative thinking, intellectual abilities, to provide interdisciplinary connections. The priority is to organize lessons on the basis of advanced pedagogical technologies, to teach students to work independently, to use information technology wisely and to improve the quality of teaching the subject.

MATERIALS AND METHODS

There are many different methods used in primary education. One of them is the use of modern information technology. The rapid development of modern information technologies and their rapid penetration into the field of education, which are becoming increasingly important in our lives, require the formation of our knowledge and skills in this area. Therefore, it is recommended to use computers in primary school. One of the most important achievements of

the course was the development of software tools that allow the use of computer technology components. These software tools are especially important in the organization of the learning process. E-books are created using software tools such as Macromedia Flash, GIF Animation, Microsoft Front Page, Adobe Photoshop, 3D Max, and Microsoft Power Point. They allow you to create moving, colorful, sound images. This will help primary school students to better understand the topic and improve the quality of learning.

E-textbooks, manuals and presentations for primary school students are widely used in the educational process. In the teaching of reading, mother tongue, mathematics and natural sciences, various visual slides can be used in the teaching process with the help of information technology. For example: reading and mother tongue science, reading letters and words together on the big screen, then reading small fairy tales and stories, writing letters correctly and beautifully; solve problems with the help of slides using simple operations in mathematics, organize various calculation games; it is possible to give insights from natural science using simple slides about phenomena in nature. The use of these methods will stimulate the development of oral speech, verbal arithmetic, creativity, research and thinking skills of young and knowledgeable students.

Using e-presentations as demonstrations and visual aids in the classroom can be a great help to the teacher. The presentation of educational material in the form of animations in the electronic presentation facilitates the understanding of the topic and increases the visibility. Demonstration slides can also be given to students as handouts. An example of this is the electronic presentation on "Agreements" created for use in 4th grade mother tongue lessons. The e-textbook can be used for independent learning and effective mastering of educational materials. In the e-textbook, science teaching materials are used in an interactive way, using psychological and pedagogical aspects, and modern information technologies, audio and video animations. There are many electronic textbooks for almost all subjects for students in grades 1-4. Most of them do not offer texts in audio forms. It is advisable to provide e-textbooks in the form of text and audio, in the form of slide shows. The combined use of audio and video information dramatically increases the effectiveness of teaching.

Electronic programs were created for primary school students, such as "Let's learn to count", "Alphabet lessons", "Algebra", "5x5", are interesting, age-appropriate, easy to use, intellectual capacity building is important as it encourages logical observation.

Learning to Count is an e-learning tool for elementary school math students. Through the development of this e-learning course, elementary school students will be able to perform 4 tasks, as well as the ability to use a computer "mouse" device.

Alphabet Lessons is an Alphabet Learning program for first graders. The advantage of the program is that it helps students to develop oral and written speech (pronouncing and writing a letter, learning the names of things that start with that letter). Also, after the letters are studied, a picture is given to reinforce it. The given cell is filled with the name of the object in the picture. Here students' computer skills are developed and they are taught to work with tests.

Algebra is a Grade 1 math program. Through the program, students learn to number, sort, add and subtract in 10, and compare. The program allows the student to automatically master the solution of oral examples. It also helps develop independent work skills.

5x5 is a multiplication table program designed for use in 2nd grade math classes. In the repetition part of the program, the computer itself teaches tables from 2 to 9 in order. In the exam section, the student develops the schedule independently. It is important to note that not moving from one room to another forces the student to work on himself. The program is a real help to the teacher. This is because 30-40% of the students in the class have difficulty learning the multiple tables. The program guarantees that students will learn the multiplication table automatically.

Today's teacher needs to be able to use information technology in the classroom, to teach students to use computers, to master modern knowledge, to become spiritually mature.

In the teaching of primary school students, it is important to choose the right methods, tools and forms of pedagogical technologies and use them in order to broaden the worldview of students, to broaden and facilitate the acquisition of knowledge. Many pedagogical techniques are used in the organization of reading lessons. The early stages of school play an important role in a child's life after kindergarten. Therefore, primary education is the most responsible period in the educational process. At this time, as the child becomes literate, his worldview is formed, the ability to think develops. During this time, every activity aimed at developing the child's mind has a great impact on the structure and development of the child's mind. Therefore, in this period, first of all, it is necessary to pay attention to the organization of the educational process in an interesting and effective way, to motivate and develop it. This period is characterized by the child's transition from play to mental activity to learning.

The use of various games is very important in the development of a child's learning. Through play, children improve their knowledge and master it deeply. From this point of view, the role of didactic games used in the educational process is invaluable. Didactic games increase the efficiency of the educational process, develop students' activity and learning motivation in the educational process. Learning motives also play an important role in organizing the educational process on the basis of pedagogical technologies.

Didactic games also help to effectively manage the learning process of students in the primary school, that is, theoretical knowledge is easily acquired through didactic games, students' interest in learning increases. Didactic games can be a great impetus not only in the primary grades, but also in the later stages of education to develop students' interest in knowledge. Such games are especially effective in increasing the cognitive abilities of students with learning difficulties. Nowadays, a lot of attention is paid to the organization of education based on pedagogical technologies. Since pedagogical technology is the ability to select and develop the most appropriate way and method to achieve the desired result for the implementation of forms of education, taking into account the abilities, capabilities and needs of students, it really increases the productivity of the educational process; forms the process of independent thinking of students, increases the passion and interest in knowledge in students, develops the skills and abilities to master knowledge, their free use in practice. That is why the technological approach to education is so important.

Technological approaches in education:

- Clear definition of the purpose of the educational process;
- Divide the teaching and learning process into interrelated stages, phases, actions;

- Coordinating, sequential, step-by-step actions to achieve the desired result in the educational process;
- Project work, which means that all your actions are performed in the same way.

In pedagogical technology, it is important to define the purpose of the educational process, which should guarantee the planned results. That's why teachers need to pay special attention to goal setting. Each teacher must first clearly define the subject he or she is teaching and the purpose of each lesson. It should be noted that a clear project of the didactic process, based on the set goal, will be easier to implement. Motives play an important role in the effective didactic process. Teachers should strive to create and nurture the child's reading motivation. Motives help students easily acquire knowledge, skills and competencies. Motive arouses a child's desire and interest in learning. It is useful for teachers to use this skillfully and to develop a system of independent work for students. It is a good idea for primary school teachers to use a variety of didactic games to organize each lesson. As the school period is a very difficult period in the lives of children aged 6-7, and children face a serious test. The child enters a new life - school life. Now he has to feel like a member of a new team, to be disciplined, to adapt to the new regime. Even though the child is young, he still has a lot of work to do, such as going to school, doing homework, and studying complex materials. Importantly, the transition from play to school, to daily forced and continuous labor, is a turning point in a child's life. Even for children from preschool, this is not easy. It's even harder for kids coming home from school. Especially sitting in a classroom for 40-45 minutes, listening and doing homework, long mental work quickly tires the child. The child may miss school or school. Teachers should try to make children's school life interesting, create motivation and try to develop it. The motive does not form spontaneously. It can be created through didactic games and independent work appropriate to the age and psychological characteristics of children. Involvement of students in lessons is especially effective in primary education as a result of making lessons fun using pedagogical technologies. In such classes, children are fully engaged and have a good memory. Motives help students deepen their knowledge. Therefore, primary school teachers should pay attention to the organization of the educational process on the basis of interesting motives.

CONCLUSION

In conclusion, as the teacher has a responsibility to bring up a harmoniously developed generation, to set tasks aimed at improving the content of education, and to introduce modern educational technologies in primary education. Achieving positive results in education, teachers should consider the effective organization of educational work on the thorough teaching of the basics of scientific knowledge to the younger generation, the expansion of their worldview and thinking, the formation of spiritual and moral qualities.

SOCIO-ECONOMIC DEVELOPMENT OF SURKHANDARYA REGION DURING THE YEARS OF INDEPENDENCE

Bohodir Saidmusaevich Rahimov*

*Associate Professor,
Candidate of Historical Sciences, Department of World History,
Termez State University
UZBEKISTAN

ABSTRACT

This article provides a scientific analysis of the large-scale reforms in the socio-economic sphere in the Surkhandarya oasis during the years of independence and their social significance. Also, in today's era of globalization, the integration of the world economy and, on this basis, the expansion of cooperation in the economic sphere, reforms and changes in the socio-economic sphere have been scientifically analyzed.

KEYWORDS: *Socio-economic development, Industrial enterprises, Sherabad, Jarkurgan cement processing enterprises, Shurchi grain products enterprise, Shargun-Boysun coal deposits, socio-demographic development.*

INTRODUCTION

During the years of independence, large-scale reforms have been carried out in our country in all socio-economic spheres. The main goal of the democratic reforms implemented in the new Uzbekistan on the basis of the Strategy of Action is to take measures from the developed countries of the world in the social, economic and cultural spheres and to make our country one of the most developed countries in all spheres. In this regard, of course, the most important criterion of our reforms is the implementation of areas that are in line with local capabilities. Surkhandarya region, which is the southern pearl of our country, occupies one of the leading positions in the country in terms of socio-economic potential, and the oasis has a worthy place in the development of our country.

MATERIALS AND METHODS

Surkhandarya has long been known for its nature, subterranean natural resources, various natural resources and mineral resources. In this regard, the President of the Republic of Uzbekistan Sh.M. Mirziyev expressed the following views; Surkhandarya region, with its economic potential, important geographical location and natural resources, is of special importance for the development of our country, "he said [1: 302]. During the years of independence, Surkhandarya region has made great strides in the socio-economic and cultural spheres. In particular, the bulk of oil, gas and coal deposits, as well as the majority of other valuable minerals, fall within the socio-economic potential of the oasis. The Shargun and Baysun coal deposits, which are the largest reserves of the coal industry in Uzbekistan, are located in the Surkhandarya oasis. Thanks to the development of joint ventures, small and medium-sized businesses, iodine, carbide, salt mining, agricultural processing enterprises have appeared in the oasis [2:35]. Large enterprises such as cement production in Jarkurgan district and gas production in Baysun district have been launched [3: 1], creating opportunities for large-scale development.

In the Surkhandarya oasis, the issues of social cooperation in the economic, social and cultural spheres, which have been implemented in the first place, have become important. In particular, since the early days of independence, the establishment of new industrial enterprises in the region, the further improvement of production, the emphasis on attracting foreign investment, the further development of the economy have been identified as important issues. Structural changes in the economy of Surkhandarya region, as in the whole republic, in two ways, that is, first, the technical re-equipment of existing enterprises; secondly, it was implemented through the construction of new enterprises. The establishment of new enterprises, the re-equipment of existing enterprises is aimed at the production of many consumer goods that are necessary for our people. In the early years of independence of the Republic of Uzbekistan, positive changes began to take place in the industry of Surkhandarya region. Surkhandarya region, which was the least developed in the Soviet Union, was one of the least developed in the country in 1990 [4:56]. Therefore, the initial reforms were identified as one of the most important issues, including attention to the socio-demographic situation in the oasis, further improving the socio-economic living standards of the population [5: 409].

In 1990, there were a total of 23 industrial enterprises in Surkhandarya, which produced industrial products worth 1,345 million soums, and supplied the population with industrial products worth 1,011.63 soums per capita. The production of industrial goods decreased by 1.4 million soums, and the production of consumer goods decreased by 2.1 million soums. Eleven enterprises in the region have sharply reduced the level of production of consumer goods. In particular, the Termez meat-packing plant did not produce products worth 6.4 million soums, the Denov oil refinery 1.6 million soums, the Denov winery 1.8 million soums, the regional grain association 1.2 million soums and 11.5 million soums [6: 1]. Specific measures have been taken in the region to address the problems in the industrial sector. Light industry enterprises were equipped with modern machinery and technology, and important work was done in the field of ginning industry [7:42]. In the early years of independence, when communications in the former Soviet Union were severed, supplies were disrupted, and many ginneries suffered from a shortage of spare parts, tools, and equipment. The internal capacity of enterprises was used to solve these problems in a positive way. In 1990, there were 11 ginneries in the region, which produced 143.5 thousand tons of cotton fiber [8:55]. In 1991, this figure was 145.4 thousand

tons. In 1992, the region's light industry enterprises produced 1,247,000 meters of silk fabric, garments worth 99.5 million soums, 20.1 thousand pairs of shoes, 19.2 thousand pieces of knitwear, 5.2 thousand pieces of socks, 2.3 tons of yarn were prepared [9:62]. The free movement of industrial enterprises and the liberalization of prices have depended on the fate of enterprises, the entrepreneurship and business acumen of their leaders and engineers. As a result of the reforms, significant changes in the field of property will be required in the field of industry, as well as economic protection of state-owned enterprises, strengthening their material and technical base, as well as the introduction of state-of-the-art equipment.

RESULTS AND DISCUSSIONS

Along with the state-owned 11 ginneries in the region, special attention was paid to their re-equipment on a modern basis. The work on equipping cotton gins, one of the leading branches of light industry in Surkhandarya, with new technologies has been accelerated. The volume of fiber production increased by 3.7% compared to 1993, the volume of wool production increased by 108% and 237 thousand tons of cotton fiber was produced. Particular attention was paid to the quality of fiber produced at ginneries. For example, in 1993, 82.5 percent of the tolls met the quality mark requirement, while in 1994 the figure was 94.2 percent [10:15]. It is also important to provide the population of the region with food. In this regard, the largest flour mills, established in 1980 in Shurchi district, play an important role. In 1991, in cooperation with the Russian government, the plant was modernized, and in 1994 the company produced more than 133,000 tons of flour [11:35]. The production of fodder has reached 5,459 tons. The volume of macaroni production increased by one and a half times compared to 1993, and in 1998, under the license of the Swiss company "Buller", new Russian-made machinery and equipment were imported, and the company's six-storey mill was the first in the country to be fully repaired. Equipped with new technologies, the mills, which process 600 tons of grain a day, began to operate automatically. 280 million soums were spent from the public reserve for the repair work [12:82].

In 2003, the joint-stock company "Shurchidon products", which employs about eight hundred employees, engineers and technicians, in 2003 produced more than 3 billion 302.4 million soums. In addition, a total of 9,000 tons of fodder was studied, and more than 6,500 tons of bran products were produced [13:25]. The company has the opportunity to sell its products on the world market, and in May 2003 began to export quality flour products to the neighboring Islamic Republic of Afghanistan. As of August 2003, the company had earned \$ 1 million 21,370 by exporting 8,772 tons of flour. Adapting to the market economy, the company has the opportunity to make a net profit of 110 million soums by producing products in various fields, such as pasta, confectionery, bakery products, garments [14: 302].

CONCLUSION

In conclusion, it should be noted that during the years of independence, the introduction of technical innovations in light industry enterprises in the region, the expansion of economic ties with foreign partners play an important role in further enhancing the economic potential of the region. In particular, due to the large-scale reforms launched by the President in recent years to develop the industry and the economy of the Surkhandarya oasis, the living standards of the population of the oasis are very important.

THE ANALYSIS OF METAPHORS THAT HAVE LINGUACULTURAL IMPORTANCE

Nafosat Otabekkizi Ziyatova*

*Student of Navoi State Pedagogical Institute,
(Based on Utkir Hoshimov's works),
UZBEKISTAN

ABSTRACT

Figurative word metaphors that are used only by certain nations have their linguacultural importance. Metaphors are normally used to add emotional color to the idea being expressed. These types of metaphors are typical occurrences in the Uzbek linguaculture and they are considered to be national and cultural treasures of the nation. The article analyses and deals with the national-cultural aspects of metaphors in the works of Utkir Hoshimov.

KEYWORDS: *Metaphors, linguaculturology, National-cultural aspect, literary importance, national mindset.*

INTRODUCTION

Figurative word metaphors that are used by certain nations and unique to particular cultures usually have linguacultural significance. These metaphors are also typical of Uzbek linguaculture, and they are considered to be national and cultural treasure of the nation.

A metaphor is the use of the name of an object in relation to a person or other object on the basis of similarity. Some animal, plant, and object names are used to refer to a person or, conversely, to an object, and are used to describe various characteristics of a person or object. This increases the emotional colour of the thought being expressed. [Usmanova Sh. Lingvokulturologiya.T.: 2019.p. 102]

MATERIALS AND METHODS

The national features of the Uzbek people are deeply reflected in the works of UtkirHoshimov. Therefore, below we analyze the metaphors that can be the object of linguaculturology. Only the figurative metaphors used by these people have linguocultural significance.

For example: *Qulog'imga shumtaka bolalarning qiy-chuvi kirgandek bo'ldi. ...Orif oqsoqol bunaqa adabsiz "taka"larni tarbiyalagan ota-onasi bilan shunaqa gaplashib, shunaqangi tanobini tortib qo'ydi, endi ashula aytishmaydi.* (It seemed as if **mischievous** [shumtaka] children were making a loud noise).

... Elder Arif talked to their parents, who raised such disrespectful “**goats**” [taka], and reproached so tight that they can no longer sing).

In colloquial language, shumtaka is used to describe a child who is extremely playful and rebellious. [1]. this compound word is derived from the words “shum” and “taka” (meaning “male goat”), meaning “very naughty, riotous.” The metaphor in the second sentence, “taka”, is also used to convey the same meaning. The words *shumtaka* and *taka* are used metaphorically in Uzbek linguaculture to refer to a very naughty young child or children (usually boy).

- *Qo'rqmang, xola! - dedim baqirib. Ammo jo'raboshi bilagimdan mahkam tutib, kerosin hidi anqib turgan kafti bilan og'zimni to'sdi. Ko'nglim aynib ketdi.*

- *Qo'yvor, eshak! - dedim bo'g'ilib. - Baribir aytib beraman!*

(“Don't worry, aunt!” I shouted. But bridegroom's best man gripped my wrist tightly and covered my mouth with his palm that smelled of kerosene. I felt like I would throw up.

Hands off, you animal [donkey]!-I choked. - I will tell anyway!)

A donkey is a small domestic animal smaller than a horse that belongs to the ungulates. [O'TIL. 2008. 5. p. 63] it is also used in the metaphorical sense when talking about “an ignorant, uninterested person” and it insults someone who is referred to.

...*Qani, popuklar, -deydi qandaydir tantanavor ohangda. -Dasturxonga marhamat. Uyalminglar, tasadduqlar!* (... Well *darlings* [popuklar], - she said in an elated tone. – Welcome to the table. Help yourselves dears!) [3. p. 68].

Popuk basically means “a bundle of fibers, feathers, thread, etc., which is attached to things for decoration.” [O'TIL.3.2008. p. 295]. This metaphor is used for pampering girls. Fiber, feathers, yarn, etc. have a seme of “softness”. The seme conveys the meaning of “gentleness” and “tenderness”. When this is used to refer to a person the seme “beauty, grace, attractiveness” in the seme “decoration” is reinforced and the seme “object” is abandoned thereby exaggerating the seme of “gentleness” and “tenderness”. As a result, it is widely used as a word that describes a positive attitude towards young girls.

–*Shaftoli yeysanmi?*– *U qo'lidagi kattakon zarg'aldoq shaftolini uzatdi.* (“Would you like a peach?” He held out a large **orange** [zarg'aldoq] peach) [2. p. 32]

Zarg'aldoq, in the main sense, is a yellow songbird in the family of sparrow with dark wings. Based on a relative comparison to this color, this word is sometimes used instead of a color that is similar to orange: an orange flower, an orange peach. Such usage is a national-cultural semantic feature of the word.

Chol kaftini karnay qilib har baqirganida derazalar zirillab ketadi.

- *Hushtakning bulbuli o'zimizda! Saqich deganlar kelaversin!*

(The windows rattled every time the old man shouted using his palm to make his voice louder. Our whistle is like a nightingale [bulbuli]! If you want a chewing gum, come and get!)

In literature, zoonym nightingale is used figuratively. The sound of the whistle has its own musicality. The goal here is to increase the price of this item on the basis of a relative comparison to this sound. There is also a sema that is typical of colloquial language.

*Mendan oldingi o'rindiqa **quralay** ko'zlari katta-katta, qisqa kesilgan sochi tiniq yuziga xo'p yarashgan ko'hlik juvon o'tirar, yonidagi ro'mol o'ragan o'rta yashar xotin bilan gaplashardi.*

(In the seat in front of me sat a cheerful doe-eyed [quralayko'zli] young woman with short-cut hair and a clear face, talking to a middle-aged woman wearing a scarf.) [O'. Hoshimov. Sevgiqissalari. 2013. p. 203]

The meaning of **quralay** is “an offspring of a deer or gazelle”. [O'TIL.5. 2008. 379-b.] In the fusion of “quralayko'z” there is a metaphor which means “the eye resembling the eye of a deer”

CONCLUSION

Such metaphors are unique to this language and are considered to be the national and cultural wealth of the nation. The use of metaphors is of great importance in the perception of the world. In particular, fixed metaphors are introduced into speech as ready-made units of a language. Every linguaculture has metaphors that reflect the mentality of the people, their specific national and cultural characteristics. The metaphors used in the process of communication also reflect unique aspects of the national and spiritual characteristics, social life and worldview, beliefs, traditions and customs of the speakers who use the language.

ON SOME ISSUES OF YOUTH HISTORICAL AND POLITICAL CONSCIOUSNESS

Ravshan Ruziev*

*Independent Researcher,
The Scientific and Enlightenment Memorial Complex named after,
First President of the Republic of Uzbekistan Islam Karimov,
UZBEKISTAN

ABSTRACT

This article attempts to identify the relationship between the basic concepts of modern political science discourse-the concepts of historical consciousness and political consciousness. Some aspects of the formation of historical and political consciousness in the context of the transformation of socio-political relations are considered. To replace the old worldview stereotypes, it is necessary to develop historical, political and ideological concepts that are adequate to the new conditions and contribute to the formation of modern public consciousness. Consequently, some features of the manifestation of political consciousness in the socio-political life of society and the participation of young people in general are analyzed.

KEYWORDS: *Consciousness, Political consciousness, Modern society, Public consciousness, Political activity.*

INTRODUCTION

At the turn of the XX-XXI centuries, against the background of the ongoing fundamental changes in the general civilizational sense, the problem of the formation of public consciousness is one of the most ambiguous. The modern information society as a global system demonstrates not only the integration achievements of people's activities in all spheres of social life, but also reveals many civilizational problems.

It is the philosophical understanding that helps to understand not only the fundamental historical laws, but also to seek answers to questions related to the human mental world, one of the main aspects of which is the problem of the essence of consciousness.

The multiplicity and extreme complexity of the study of this issue make it the subject of research in many sciences. It is one of the basic concepts of political science, sociology, and philosophy, denoting the highest level of political activity of a person. "The problem of consciousness goes back to the times of Antiquity. It is the most complex and global problem in modern science. Metaphorically illustrating the degree of this complexity, A. Schopenhauer once called consciousness "the snag of the Universe" [1]. Consciousness as one of the basic concepts of philosophy, psychology, sociology and political science denotes the human ability to perfectly reproduce reality in thinking. In the scientific community, consciousness is considered as the highest function of the brain, peculiar only to humans and related to speech, consisting in a generalized and purposeful reflection of reality, in the mental construction of activity and the anticipation of its results, in the reasonable regulation and self-control of human behavior." [2]

MATERIALS AND METHODS

The interpretation of consciousness and its relation to being is a philosophical problem that is significant for all human cognitive activity. This problem is of considerable interest for political science, especially in its part, where we are talking about the essence and formation of political consciousness, its connection with politics, various other types of consciousness. A separate problem is to reveal the correlation and interaction of political consciousness and political culture [3].

The study of political consciousness as a phenomenon allows us to clarify some ideas about it itself, and at the same time about politics, which serves as an object of cognitive interest for it and does not include this consciousness in its sphere at all, as is sometimes assumed. Let us consider the essence and manifestations of political consciousness. The essence and manifestations of political consciousness and the essence of any kind of consciousness is hidden in the peculiarities of its formation. Political consciousness is conditioned by the interaction, on the one hand, of politics, which is a special social phenomenon, and, on the other, of people who, by virtue of their natural organization, are able to perceive the world around them, including politics, and express their perception of the world in the appropriate knowledge. It is obvious that political perception is a means of reflecting political existence and therefore a source of political knowledge and, as a result, a factor in the formation of political consciousness. It can be concluded that political consciousness is the result of political perception and a form of reflection of politics, the content of which (form) is political knowledge. In turn, political knowledge serves as a way of existence of political consciousness. Political consciousness is contained in political knowledge, is manifested and embodied in it, is formed and revealed through this knowledge.

This means that political knowledge forms the natural basis of existence and the most important characteristic of political consciousness, and thus serves as an indicator of its state. The more developed political knowledge is, the more developed the political consciousness is. In its most developed state, political consciousness is represented by theoretical political knowledge, which is the highest level of knowledge and has a conceptual and systematic character. It follows that the direct carrier of political knowledge is the concepts by which this knowledge is reflected, consolidated and transmitted. Such concepts are called political science categories.

Political knowledge is concentrated in them and is inseparable from them in its existence. As a result, these concepts are the most important means of forming political consciousness. By

studying and revealing these concepts, we acquire political knowledge, and as a result, a political consciousness is formed. The more precisely the content of these concepts is established, the more developed the political knowledge is, the more developed the political consciousness itself is. Thus, political consciousness is directly revealed and formed with the help of concepts that are carriers of political knowledge. As a result, we can offer the following definition: political consciousness is a form of reflection of politics in concepts that are carriers of political knowledge. These concepts are the essence of political consciousness. In the political science literature, the question of political consciousness is revealed in different ways. Without claiming to analyze all approaches to this phenomenon, we note two fundamental problems in its interpretation, in our opinion. One of them, and perhaps the most difficult, is that political consciousness is confused with ideological consciousness, that is, with a consciousness that reflects a particular social idea and contains a political assessment corresponding to this idea. This consciousness is directed towards politics, but unlike political consciousness, it is not a reflection of political content [4]. The historical consciousness and the factor influencing it are connected with the historical thinking of each person, the understanding of human identity. Human self-consciousness is inextricably linked with historicity, historical consciousness, historical memory, historical thinking, national ideas and ideologies. The idea of national independence serves as the main force in the formation of historical consciousness, the awakening of historical memory, the beacon of self-consciousness, the expression of the aspirations of our nation and encourages members of society to act together. Awareness of the identity of a nation is an event that is inextricably linked with the awakening of historical memory, as a result of which the historical consciousness is established and raised in the members of society.

Life itself proves the prevailing opinion in society that "the true meaning of the new ideology is to cultivate people independent of the old beliefs, independent and innovative." Today's socio-political processes require "a struggle against the idea only of the idea, against the thought only of the thought, against ignorance only with enlightenment."

It is impossible to understand or explain the development of society without taking into account the internal contradictions of the development of spiritual maturity of a person, the ideas and ideologies that affect them. For this reason, wise geniuses at all times paid great attention to the study of the ideological and ideological foundations of public life, trying to create advanced ideas that would open up new opportunities for development. The collapse of the Soviet totalitarian regime also gave the young independent states the task of creating new ideas and ideologies that would become the basis for their development. This was also an important condition for the spiritual maturity of the society.

We believe that national spiritual values are the main spiritual factor that unites people, a nation, gives goals and direction to activities, and harmonizes it. "I believe that the national ideal, national pride," stressed the first President of the Republic of Uzbekistan, Islam Karimov, "will strengthen our spirit and strengthen our back in our daily hard work and creative activities, give us strength and energy, building a truly great state of the future."

In his speech at the first session of the OliyMajlis of the second convocation, Islam Karimov singled out the formation of the national idea and national ideology to a new level, increasing its effectiveness among the most important tasks facing our country and people. To solve this problem, first of all, it is necessary to restore and develop the national consciousness, which is on

the verge of extinction under the totalitarian regime: "This ideology is the essence of our society. It is a system of ideas that is constantly evolving and improving, based on its own path of development, lifestyle, and fundamental interests." Filling the gap created by the rejection of the old ideology with a new national idea, the ideology of independence, means that everyone should be more aware, know their place in society, and understand their dignity. Therefore, the national idea and ideology of independence should become the spiritual heritage of all people living in our country, form the basis of their worldview and immerse themselves in national pride [5].

History arises through man and becomes eternity through man. It becomes valuable as a phenomenon occurring in the human mind and thinking, heart and emotions. From this point of view, the human mind, its level of thinking, its philosophy of life, its efforts to develop society determine the mentality of the entire nation, the entire society. It is this mentality that is the essence of progress or decline, depending on the general cultural and spiritual level of the nation or people, the degree of their intelligence and the field of thought. History becomes a memory through this very complex, very contradictory and at the same time extremely powerful spirit, through activity. The history of mankind has never been smooth. This is a continuous process that occurs at different times, in different situations. In the layers of ancient history, along with the periods of high civilization and the peak of development, various tragedies and fundamental changes occur. In short, a universal story is a collection of ideas and goals that negate each other, prove their contradiction, and fight for supremacy. Today, the subjective side of political life is reflected in the political consciousness. The role of political consciousness in the life of society is difficult to overestimate. After all, it is not just a passive reflection of political existence. Political consciousness is able to outstrip practice, predict the development of socio-political processes. Consequently, it can have a significant impact on political life, on the dynamics of the political culture of society. In addition, the level of political consciousness largely determines the political behavior, the nature of political activity, both individuals and their socio-political associations.

Political consciousness is a special form of social consciousness in which political reality (political relations, institutions, activities) is reproduced in an ideal plan, as well as its interpretation and evaluation are carried out.

Political consciousness includes theories, ideas, feelings, ideas, values, expectations, moods, etc., formed by various social groups and individuals on the basis of their inclusion in the system of political relations and participation in the processes of exercising political power.

1) The structure of political consciousness

The structure of political consciousness is quite complex. It has many different dimensions. And in order not to get confused in them, highlighting the structural elements of political consciousness, it is necessary to clearly understand each time on what basis this selection is made. And there are many such reasons.

Subjects of Political Consciousness: To begin with, we emphasize that political consciousness is a form of social consciousness, therefore, it arises and is formed as a group, corporate consciousness. And since there are many social groups in society, it is quite legitimate to distinguish the features of political consciousness depending on its carrier, subject, i.e. any social community. Such subjects of political consciousness can be classes, estates, nations, age groups (youth political consciousness, for example), territorial, etc. The same criterion (carrier of

consciousness) underlies the distinction between mass political consciousness and elite consciousness.

Levels of Political Consciousness: Another leading basis for identifying the structural elements of political consciousness is the depth and adequacy of its comprehension of political reality. According to this criterion, the following levels can be distinguished.

State Consciousness: At this level, political relations are regulated through the development of various draft laws, programs, constitutions, etc., as well as the existing political orders and principles of governance are justified.

Theoretical Consciousness: At this level, various concepts, ideas, and views of a political nature are developed. Understanding politics at the theoretical level allows you to:

Set and solve the most important political goals and objectives - both fundamental (strategic) and current (tactical);

Determine the means and methods of solving political problems;

Determine the directions and ways of organizational and political support in the course of solving urgent problems;

Develop conceptual approaches to social monitoring of the implementation of political decisions and targeted programs;

Adjust the policy based on practical experience.

Empirical Consciousness: This level of political consciousness is based on direct practice, participation in the political process of various social communities and reflects the political reality in the form of sensations, illusions, experiences, ideas.

Everyday Consciousness: This level is closely related to the empirical level, but at the same time has a number of differences. In comparison with the empirical level, which generalizes the practical experience of the subject, the ordinary level characterizes the totality of ideas, views of a social class, social stratum or group of people that arise directly from everyday life. The ordinary level of political consciousness differs from the empirical level in that it has ideological and theoretical elements. This level is characterized by pronounced socio-psychological traits (moods, feelings, emotions), which gives it a special dynamism, the ability to respond sensitively to changes in the political situation.

Functions of Political Consciousness: Political consciousness is interconnected and interacts with other forms of social consciousness: economic views, legal theories and norms, philosophical teachings, moral concepts, aesthetic values, and artistic views.

The following functions of political consciousness can be distinguished.

Regulatory Function: Political consciousness regulates the social behavior of people on the basis of the perception of reality, as well as on the basis of the totality of political ideas, norms, ideas and beliefs developed by them.

Cognitive-Informational Function: The mechanism of modern life is such that people are constantly forced to make choices, including political ones. All this pushes them to learn about the world of politics, to get political information. Political consciousness is designed to help

people assimilate political knowledge and information, determine their place in public and political life and correctly navigate it.

Evaluation function. It is on the basis of an assessment of political reality that people formulate their political views, beliefs, and positions.

Mobilizing function. Through this function, political consciousness encourages people to engage in politically oriented behavior, to participate in public life in order to defend their socio-political interests.

2) Political ideologies

Political ideology is an important element of public consciousness. Acting as the core structure of the entire ideological system, it plays a significant role in the political life of society.

It is worth noting that the essence and functions of political ideology. The term "ideology" was introduced into scientific circulation in the XVIII century by the French scientist A. de Tracy, one of the last representatives of the enlightenment generation. He sought to find in the worldview the logical and psychological foundations of politics.

The study of political consciousness and the comparison of its content with the theoretical scientific schemes of philosophy, political science, sociology, economics and other sciences is extremely important for the correct assessment of the state of modern society, making administrative decisions at all levels of government, regulating society in order to avoid conflicts on political and social grounds. The study of the evolution of political consciousness in the period of social transformations, when it is undergoing a phase of revaluation of values, contributes to a deeper understanding and clarification of the basic concepts of the philosophical sciences.

Modern Uzbek society is undergoing a stage of systemic transformation, so crisis trends are objectively inherent in it. The evolution of political consciousness expresses these social shifts. Transformation processes have engulfed the post-industrial society, which is the most important component of the transformational potential of any modern society. That is why the correlation of evolutionary transformations in the Uzbek society, political and public consciousness is obvious.

Historical and political consciousness, as one of the main forms of social consciousness, has its own specific object of reflection. As such, political existence, political activity, and the behavior of social subjects are considered. The main subjects of political activity are classes. It is from the moment of their historical origin that political activity as such appears. It involves the creation of special institutions through which classes interact, realize their specific interests, fight for power, political domination, ownership of resources, territories, etc. The dominant classes in society regulate the production and distribution of the spiritual, ideological and moral values of their time; and this means that their ideas and value orientations dominate the public consciousness. This applies to all forms of social consciousness, including political consciousness [6].

RESULTS AND DISCUSSIONS

The concept of "historical and political consciousness" is one of the main forms of public consciousness, it arises together with the emergence of statehood, political power. This is the most general category that characterizes politics. In its content, it covers the sensory and

theoretical, value and normative representations of citizens, mediating their relations with the institutions of power.

Historical and political consciousness in a post-industrial society is able to outstrip practice, predict the development of political processes, and determine the nature of the activities in the sphere of power of both individuals and their public associations. Therefore, the content and nature of the political process, the goals and means of the regime of government directly depend on the political consciousness.

The essence of political consciousness is that it is the result and at the same time the process of reflecting and mastering political reality, taking into account the interests of people. Consequently, we consider political consciousness as the core of the national system of self-consciousness. It is political goals and objectives that have the potential and mechanisms for rapid impact on the systems of society, the consciousness of people. The importance of political consciousness, of the subjects and institutions that form it, is especially increasing when society moves from one stage to another, when dogmas in people's minds change and other paradigms are solved. Without political thinking in general, humanity does not know what society, the state is, in the society of the individual, political consciousness, political self-consciousness is formed with the emergence of ideas about the division of labor, institutions of government, "my" and "yours". Hence the political self-consciousness, at least in the form of an attitude towards private property. From this point of view, a person who belongs to each class can be considered as a subject of political processes, an expression of their own political consciousness [7]. But political self-awareness should not be seen as a simple attitude at this level. It manifests itself in an institutional form at different stages. For example, it is possible to study the relations of the individual and the state, the people and the political party, the state, non-governmental organizations and state institutions in the form of such steps. Of course, this place comes from the goal that every researcher sets for themselves in their heuristic research. However, it should put socio-political relations at the center of the study [8].

Political relations are an integral part of social relations in society, and they act as managers, regulators, and determine the nature of these relations. Consequently, the integral nature of politics presupposes participation in all spheres of "political relations", being their core. Therefore, political reality (political consciousness, political relations, political culture, political self-consciousness, etc. When studying political reality, it is necessary to proceed from its integral nature, since "research in which there is no concept of an integral leads to a fragmentary, descriptive analysis of political reality and deductive, metaphysical reasoning." [9]

The basis of political relations, political consciousness, and political self-consciousness is connected with politics. True, there are different, contradictory opinions and definitions about the concept of "politics", but sometimes he notes that all politics is a conscious type of activity aimed at establishing interpersonal relations. "If the theory reveals the nature of the conditions in which the activities of individuals are carried out, then politics is called upon to determine, on the basis of theory, how to use these objective conditions in the interests of certain social groups." So, in politics, theory and practice are harmoniously combined, their orientation to specific interests with ideas about conditions. Therefore, politics is a specific (heuristic) form of perception of political existence, and its subject is a type of activity (empirical) related to the establishment and management of relations between individuals in society. Political self-

consciousness is based on this law, which has a general methodological, universal significance, on the harmonious coincidence of the heuristic and empirical sides in politics.

The main current law of politics is the reliance on rationality and awareness. Political consciousness also considers it its main law, but the subjects of political consciousness are diverse, broad, that is, the entire people, the nation act as subjects of government.

Rationality stems from the need for management. As you know, society is a unity consisting of a complex integration of various institutions, hierarchical relations, connections between the individual and society, the state, individuals, organizations, groups and parties that have their own interests. These connections and relationships were not always realized, and they were guided by the goals of social progress. First, hypocrisy in the person himself, According to N. A. Berdyaev, there are "divine and animal qualities", "he is both a king and a slave. While he has an unsurpassed desire to live free, he loves slavery, a life of abundance." [10] A person who lives in spite of someone, the external environment, the regime, not only manifests himself, he becomes ready to commit any acts, inhumane acts against himself, society, existential existence, under external pressure or influence. At this point, you can recall the "Trinity" of the times of Stalinism, the social revolutionaries of the time of Hitlerism, or the terrorists of our time. Secondly, society is a unity that includes complex relationships, sometimes conflicting interests, and unequal (synergistic) cases of rejection of flat progress, egoistic aspirations, and inevitably arising conflicts between them. Egoism is both a natural phenomenon for a person, and a natural phenomenon for a group, party, organization, or strata. Human society, in order to preserve its unity and integrity, has long been forced to manage and establish these circumstances. Third, there are patterns of social development that individual individuals and institutions cannot comprehend. Naturally, even when these laws are realized by individuals, institutions, they do not know the ways to objectify them, to translate them into real existence, or do not have such opportunities. Only special political institutions (for example, the State) can carry out this activity. Consequently, the establishment and management of a complex social life is an objective necessity, which can be fully and on a large scale implemented by a major power-state. This imposes a governing function on the state and makes it the main subject of political relations and political life. Political self-consciousness actually begins with the realization of this socio-historical necessity, the recognition of the state as the main subject, the organizer of national development.

Thus, the relations of historical and political and social consciousness should be analyzed not only at the abstract-categorical level of concepts. Critical studies of the ideological, cultural, and socio-anthropological foundations of social consciousness in modern society are required.

In fact, political science, as well as political science in general, does not include in its composition historical, sociological, as well as philosophical, psychological, etc. knowledge that belongs to other areas of cognitive activity, although it can rely on them. Each of these areas has its own object of research which "physically" does not coincide with the object of political science.

CONCLUSION

In conclusion, we emphasize the subjective nature of historical and political consciousness. It is determined by the peculiarities of the formation of this consciousness, due to both the source of political knowledge and the ideological consciousness that grows on the basis of this

knowledge. Such features include, first, the ability of a person to perceive and reflect historical and political existence, while offering his own interpretation, his own understanding of this existence.

Secondly, such features should include the ability of a person to evaluate historical and political existence from an ideological standpoint, adapting the existing political knowledge to their expectations and claims about politics. These two factors determine the natural subjectivity of a person in political research.

As a result, historical and political consciousness inevitably bears the "seal" of subjectivity, while at the same time confirming that all consciousness is subjective. However, political science, which focuses on the knowledge of political laws, creates conditions for improving political consciousness, for clarifying its content.

By revealing the historical and political laws and thus the logic of political existence, political science brings political consciousness ever closer to objective truth and thus gives it a truly scientific character.

ABSTRACT

It is said in this article about a kind of foster poetry of Karakalpak nation as facetious sayings. The reasons of facetious sayings are opened as a genre of originality and difference from other genres. On the basis of it we determine the importance of sayings in the formation of children's speech, improving mother wit, extemporization, eloquence. Sayings are based on the question-answer foundation is considered to be Turkish nations ancient traditional genre.

KEYWORDS: Karakalpak, Traditional Value, Children's Folklore, Verbal Games, Nursery Rhyme.

INTRODUCTION

Karakalpak foster poetry is rich in various genres of children's creativity. Among them, a special place is occupied by the genre "aytpyshlar" (jokes), which plays a significant role in the development of thinking, enriching the vocabulary of children, and their psychological preparation in the process of perceiving objective reality. By its content and form, it corresponds to Russian "pribautka" or "perevertishka" [2, p. 304, 306], Uzbek "ağdarmachiq" or "qaytarmachiq" [12, p. 16; 13, p. 179-181; 18], in Kazakh "suramaqtar" [10; 17, p. 76-78].

The joke genre (*айтпышлар : aitpyshlar*) originated in the Karakalpak children's folklore in the form of song and play activities between adults and children, and is an integral part of the national tradition of the Karakalpaks in raising children. The well-known researcher of Karakalpak folklore N. Davkaraev examines samples of this genre as part of "children's poetry" [5, p. 137]. The founder of the theoretical study of Karakalpak folklore K. Aimbetov refers it to children's games [1, p. 49]. Another researcher who separately studied the specifics of the Karakalpak children's literature I. Kurbanbaev, adding additions to the existing classification,

includes this genre in the group of “children's song and play folklore” [9, p. 14]. According to the researcher, the genre combines both forms of children's folklore activity.

The most popular among the examples of the joke genre (*aytpysh or taulamash*) is "Tulkishek". Among the Karakalpaks there is still a stable phrase "Men sagan tulkishek aytyp otyrman ba?" or "Men sagan aytpysh aytyp otyrman ba?", "Men sagan tawlamash aytyp otyrman ba?", which means "What, am I telling you jokes?" [11, p. 68-69]. A person who is inclined to speak is exaggeratedly called "tawlamashi", that is, "a changeling" [16, p. 209]. The word "tawlamash" in its lexical meaning is synonymous with the words "tawlaw", "buraw" and "shyiraw" and means "to twist, to shape" [7, p. 288].

Jokes are not just communication between adults and children, its aesthetic function includes: the development of imaginative thinking, knowledge of the world around, speech, which occupy an important place in the adult life of every child.

As an example, one of the examples of this genre, which still exists among the Karakalpaks, is known as "Bala, bala - balpak", the Russian analogue: "Малыш, малыш – ходунок". Almost all variants of a given sample begin above the indicated traditional and stable beginning, which we have chosen as the name of the sample.

- *Kid, kid - walker,*

Why is your head flat?

- *I wore an iron helmet for a long time,*

Apparently the helmet crushed her.

As can be seen from the composition of the sample, like all the others, it is built according to the traditional “question-answer” scheme. Especially of great interest is the content of the text of the sample, which brings to light many essential facts from the historical past of the Karakalpaks. As is known from the various existing sources, like other nomadic and semi-nomadic peoples of Central Asia, the Karakalpaks, up to the full consolidation of the Karakalpaks as a nation, were forced to live on alert. This was facilitated by unstable political relations and civil strife with neighboring peoples. “Temir kalpak” (duwlyga), that is, “military helmet” as a military attribute mentioned in the sample, quite clearly characterizes the picture of the events of those times.

Another version of the sample already testifies to the wandering life of the Karakalpaks after military defeats or enemy raids.

- *Kid, kid - walker,*

Why is your head flat?

- *I wore an iron helmet for a long time,*

Apparently the helmet crushed her.

All questions asked by adults to children in song form are extremely simple in content and are taken from everyday life, from their environment. For example, in the joke group with the traditional beginning "Bala, bala - balpak" («Малыш, малыш – ходунок») there are various questions concerning the physiological characteristics of children. They are often found in the form "Why are you snub-nosed?" Or "Why are your teeth rare" or "Why are you dark?" etc.

Similarly, adults test the mental development of a growing little person. If the baby is not yet ready for such a "test", then adults help him and explain the meaning of the answer prepared by the elders. Thus, the baby's horizons expand.

The older the child becomes, the thematic circle of the genre also expands, that is, the questions asked to him acquire a more complex form. The process of expanding the thematic circle of the genre is also facilitated by the inherent interest of children in learning about the world around them. As you know, the satisfaction of their interests is usually carried out in the form of questions asked by elders. Apparently, on this basis, many "questions and answers" took shape in the genre of jokes. The most popular of these among children is the following pattern:

- Thick-thick iron,

Who made him thin?

- Thick-thick iron,

The blacksmith made it thin.

- Rows of powerful camels,

Who brought them together?

- Rows of powerful camels,

They were joined by a coal miner.

From the content of the above text, you can determine the age of the child who should answer the question. Here we are talking about two of the rarest professions among the Karakalpaks. The question asked, apparently, requires observation and vigilance from the respondent. In samples similar on the subject in a poetic form, questions are asked about many professions and sectors of the economy of the then Karakalpaks. In a similar way, in folk pedagogy, the ancestors of the modern Karakalpaks formed a positive attitude to work in the minds of the young generation, instilled the ability to feed their families and, most importantly, knowledge of the environment. In parallel, the process of performing texts contributed to the development of children's speech, the ability to express their thoughts.

Some kind of joke genre has a somewhat expanded form. Among them, the so-called type "Sonar, sonar - Kansonar" is widespread. The word "sonar" is used by the Karakalpaks to call ancient traditional types of hunting [7, p. 214] This type of hunting was usually carried out during the period of a thick layer of snow, when the game left noticeable traces in the snow cover. Sonar was the most widespread type of hunting, and all the inhabitants of the auls used sonar. According to the testimony of informants, taking part in such a spectacle was the favorite pastime of Karakalpak children. Having learned about the place and time of the hunt from adults, they gathered in groups and went to the places where the sonar was carried out. As one of the entertaining spectacles for children, sonar left its mark on their oral poetry, as evidenced by the multivariate examples of the joke genre associated with sonar.

- Sonar, sonar - cansonar,

Who's shouting cansonar?

- The hunter reports about him.

- *Who says "hunter informs"?*
- *The cattleman speaks about it,*
- *Who says "said the cattleman"?*
- *The herald speaks about it.*

The text of the sample is expanded by adding to it the name of a particular type of economy, which the Karakalpaks have been engaged in for many centuries. The species associated with sonar in the Karakalpak children's folklore differs from other species in its multivariance. In our opinion, this is due to its unfolding nature.

The most perfect in content and form in comparison with other types of the joke genre is the thematic cycle, conventionally called "communication with nature." The main artistic technique for the design of a poetic text was personification. The main characters of the creation are mainly natural phenomena, living creatures from the environment. Personified by childhood fantasy, they enter into dialogue with each other. The most common pattern among the Karakalpaks is the following text:

- *Ice, ice, what made you strong?*
- *If I were strong, the rain would not hit me.*
- *Rain, rain, what made you strong?*
- *If I were strong, the earth would not suck me.*
- *Mother earth, mother earth, what made you strong?*
- *If I were strong, the greens would not break through my body. *
- *Greenery, green tea, what made you strong?*
- *If I were strong, the sheep would not tear me down.*
- *Sheep, sheep, what made you strong?*
- *"If I were strong, the wolf wouldn't eat me.*
- *Wolf, wolf, what made you strong?*
- *"If I were strong, a man would not have removed my skin.*
- *Man, man, what made you strong?*
- *If I were strong, the ant would not make me prey.*
- *Ant, ant, what made you strong?*
- *Who can be stronger than me?*
- *I carry sixty batman millet on my back,*
- *I carry seventy batman on my shoulder*
- *That's how strong I am, I am a special strong man!*

As you can see from the text, each logically interconnected line of text requires from the performer special training in memorizing the text, special resourcefulness and a sufficiently high level of logical thinking for the younger generation. In a number of centuries, for the ancestors of modern Karakalpaks, similar poetic creations served as the main means of people's education. With their help, from early childhood, they taught their children to learn about the life around them.

The classic example of the joke genre is undoubtedly "Tulkishek". It is still especially popular among modern Karakalpak children and serves as a special decoration for their games. According to the Karakalpak folklorists, it first emerged as a song genre. Later, a game function was added to it, and it became the accompanying text of the children's game of the same name. For this reason, N. Davkaraev considered him in a number of children's songs, and K. Aimbetov included in a number of children's games [5, p. 137; 1, p. 49-52]. All researchers of the Karakalpak folklore associate the design of the sample as a genre with the historical events of the 18th century, which left a deep mark in the history of the Karakalpaks [6, p. 65-67; 11, p. 68-69]. These events have left noticeable traces in the Karakalpak children's folklore.

The language of the classic example "Tulkishek" is rather simplified and easy to memorize. Apparently, this was the reason for his particular popularity among the Karakalpak children. All variants of "Tulkishek" usually begin with the following traditional beginning for all of its variants:

*- Hey, Tulkishek, Tulkishek,
Where are you going for the night looking?
- I'm going home to my grandmother.
- What will your grandmother treat you?
- She will feed the goat milk.
- The goat has no milk,
The kid has no legs.*

Each variant after the traditional beginning is updated with new texts in the form of "question-answer". The range of questions and answers includes new information from everyday life, echoes of historical events of the past, etc.

Traditional examples of "Tulkichek" are found in Kazakh and Uzbek children's folklore [10; 12, p. 75-78]. All available data on the joke genre testifies to the presence of this genre in folklore among almost many Turkic-speaking peoples. But over time, it fell into oblivion and ceased to function. Making it in the form of "Tulkichek" contributed to the revival of new designs. Proof of this is the fact that all types and samples of the joke genre (aitpyshlar) are popularly called "Tulkichek".

For many centuries, jokes (aitpyshlar) played an important role in the aesthetic education of Karakalpak children, and it is undoubtedly one of the most striking monuments of the Karakalpak national children's folklore. A comprehensive study of the genre contributes to the identification of many significant facts from the history, ethnography and folklore of the Karakalpak people.

DESIGNING LESSONS AIMED AT TEACHING STUDENTS TO CRITICALLY EVALUATE THE PERSONALITY OF THE HEROES OF THE WORK OF FICTION

Anadjan Tadjibayevna Baltayeva*

*Associate Professor,
Department of “Uzbek (Russian) Language”,
Tashkent State Transport University,
UZBEKISTAN

ABSTRACT

This article examines the conceivable outcomes of designing lessons aimed at teaching students to fundamentally evaluate the personalities of the protagonists of a fiction, at the side the formation of critical thinking and critical thinking skills of the heroes, the examination and translation of literary texts, as well as numerous positive qualities.

KEYWORDS: *Critical Thinking, Critical Evaluation, Heroes Of The Fictionage, Methods And Techniques, Analysis, Fiction.*

INTRODUCTION

Under the concept of critical evaluation is understood a free, elective, well-thought-out point of view. As a result of forming such an attitude in students, the quality and effectiveness of literature instruction will increment essentially. Because such a point of see is a point of view with conscious, analytical power, it serves to develop understudies 'ability to communicate with the heroes of a fiction.

Students with basic thinking skills will pick up experience in independently interpreting and analyzing data, evidence, and knowledge. They can easily distinguish the opposite-minded characters in a specific work. Such students think coherently and articulate their sees clearly. They also clearly understand the suppositions of their questioners and later individuals of the community, assess them, draw the necessary conclusions, and find the right path in social situations.

THE MAIN FINDINGS AND RESULTS

In literature classes, a critical assessment of the personality of the heroes of a fiction starts with the study of the work itself, the actions performed by the heroes, and their character traits. This process requires a comprehensive investigation of the work of craftsmanship that needs to be studied. Only then will we start to select the evidence described within the events of the fiction and to analyze the diverse alternatives for considering. At the end of the process, the students' attention is drawn to the evidence that shapes the premise for a critical assessment of the heroes of the fiction. Students compare the distinguished prove and the judgments made. Hence, a set of thoughts is formed, which is the basis for a basic assessment of the identity of the heroes. In this case, the teacher must clearly define the purpose of the lesson.

The teacher should arrange in advance which work to teach students and which characters to basically evaluate. This process must be clearly outlined by the teacher. In order to educate students to basically assess the heroes of a work of craftsmanship, the teacher must design a lesson on the subject; clearly define the questions and assignments to be given to the understudies, before presenting a particular work to their attention. These questions and assignments ought to serve to identify the character and personality traits of the protagonists of the work being studied. For example, the differences between the protagonists of the work, the contradictory aspects of their character, the similarities ought to be revealed using the same questions.

Of particular importance is the intentional design of lessons aimed at teaching students to fundamentally evaluate the personalities of the heroes of the fiction.

Areas to be considered within the pre-class period. In doing so, the teacher ought to consider: what the essence of the lesson is; to what extent it is related to what students have learned within the lesson and what they need to learn; to what degree this lesson can instruct students to fundamentally evaluate the personalities of the heroes of a work of craftsmanship; the degree to which this course is related to other subjects; the significance of the lesson subject to the skills procured by the understudies; the degree to which the lessons are connected to individual encounters and interests, and the data that the lesson materials contain; the lesson ought to be organized in such a way that it gives students with a natural interest in critically evaluating the personalities of the heroes of the fiction.

Not all materials in the textbook always allow fully achieving the goal set for the lesson. Therefore, in order to achieve the set goal, teachers are required to enrich them at the expense of various scientific sources, materials from journals, in addition to the materials in the textbook.

The teacher should design the solution of the following tasks in the lesson: such as, What knowledge and skills should students acquire in order to critically evaluate the heroes of a fiction in the lesson? To what extent can students apply their knowledge to critically evaluate the personalities of the protagonists?

To activate students' thinking processes, they can be asked the following questions:

- Find a work that is close to the topic of the work covered in the lesson?
- What is the reality of the work that corresponds to the reality of the work covered in the lesson?
- Compare the peculiarities of the two heroes whose character traits match each other?

- Justify your opinion about the heroes of the fiction?
- Defend your point of view during the debate?
- Express the same idea differently?
- What else do you need to know about this work?

The teacher ought to continuously answer the question of what else they need to know and be able to do in order to benefit the learning process during the lesson plan handle. The question of how to assess students' mastery levels in a lesson ought to moreover be cross-referenced to the teacher amid the plan handle. The teacher has to have a great understanding of what his or her grade indicates. In this case: a) students have a profound understanding of the substance of the fiction in the classroom; b) the degree to which students have gained experience in critically evaluating each of the protagonists of a fiction.

When designing a lesson, the teacher should think profoundly approximately assessing students' ability to critically evaluate the heroes of a work. Such an assessment should be made throughout the process, not at the end of the lesson. The instructor is required to write on the board a measure of the students' assessment of the activities of critical evaluation of the heroes of the fiction. In this case, the teacher ought to act as follows:

Students will receive a grade of "5" ("4", "3"):

- 1) Express a natural opinion about the heroes of the work;
- 2) Be able to clearly prove their point;
- 3) Pay attention to the evidence to the contrary;
- 4) Be able to express a planned, consistent opinion;
- 5) Be able to express their written opinions without spelling and methodological errors. Written texts should be created in the size specified by the teacher.

The teacher should also be able to accurately determine the amount of time spent at each stage of the lesson when designing it.

Lesson.

1. Motivation phase. In the process, students need to understand why the author chose such a theme for the work and what it serves to reveal.

The methods used at this stage are:

- to tell, to give brief information;
- questions that arouse students' interest in the work being studied;
- to take into account certain aspects of the studied work for students;
- classification and grouping of students' opinions about the work;
- listen to students' opinions on how to divide the work into parts and how the events will continue;
- clearly identify the key words and phrases described in the play;

- ensuring that each group of participants works according to the plan in the process of group work;

- to write creative texts and essays in order to find out what students think about the work and what information they have before starting to study the work.

2. The stage of thinking almost the fiction being studied. Students effectively read and analyze the fiction being examined based on the goal they have set for themselves. It is imperative how students understand the text of the fiction and how they control their understanding.

The methodological methods used at this stage are:

- I.N.Z.E.R.T. method;
- way of thinking while reading;
- daily method;
- question-answer method;
- method of joint education;
- co-educational group;
- method of presentation and discussion;
- auxiliary manuals, etc.

3. The stage of analysis of a fiction. In the first normal reading of a fiction, one detail requires another. As it were at the conclusion of the method will the text have its claim scale? The evidence made up of words takes on a holistic appearance. The text, which consists of many parts, reflects its main idea and substance. Understudies have the opportunity to lock in in a discussion and try to compare this work with other works they have read. In doing so, they go beyond the scope of the work and start to think of a few works that have similar aspects to each other. On this basis, students explore the construction of a work. Colorful methods can be used in this process. In choosing them, it is prudent for the teacher to rely on time and the level of mastery of the students.

For example:

- ask questions within the work;
- discussion based on joint research;
- the last word to me;
- attractive discussion;
- class discussion;
- writing a 10-minute essay;
- I know - like I want to know and learn.

4. The concluding part of the lesson.

What conclusions did you draw at the conclusion of the lesson? Should the lesson issue have a total solution in each way? How should a lesson aimed at teaching students to critically evaluate

the personalities of the protagonists of a fiction end? What is important for this work? Based on the consider of this work, what principles and situations did the understudies get a handle on? What else do students got to learn in order to give a genuinely critical assessment of the heroes of a fiction? What information and aptitudes do students have to discover solutions to this issue?, the educator ought to ask himself and find answers to these questions in the next stages of his activity.

The use of the Internet in teaching students to critically evaluate the heroes of a fiction is a unique technology that can be used in this process. As a promising tool, it allows you to create new opportunities in the field, to establish specific forms of cooperation and communication with students. However, in this process, working with the Internet should be consistent. Only then can we think about the effectiveness of this technology in teaching students to critically evaluate the heroes of a fiction.

One of the tasks in ensuring the effectiveness of the use of information technology is the methodological development of educational technologies. In the handle of teaching students to basically evaluate the heroes of fiction, it is vital to study the methods of using data technology. Approaches in this range are at the level of starting proposals. In connection with the proactive approach, teaching literature lessons in writing to educate students to basically evaluate the heroes of a fiction and to prepare them for the method isn't through the transmission of information. It should be done on the premise of activities pointed at studying the content of the fiction.

The teacher can present the knowledge in them only when the students accept it. To do this, students need to perform a specific activity. In order for students to actively participate in the process of critical evaluation of the protagonists of the work, they are required to direct and monitor their own activities in this process. The educational process aimed at engaging students in cognitive activities is based on their inclinations. Only then this process allows students to learn independently, to acquire knowledge independently, to organize their activities independently.

In the educational process aimed at teaching students to critically evaluate the heroes of the fiction, the stratification of their activities makes great opportunities and conveniences. In this process, the organization of group and person shapes of work of students via the Internet features special didactic value. In the process of learning new materials on the Web with an individual approach to students, it is advisable to organize the following exercises:

- explain the materials by the teacher to all students in the class;
- divide students into groups based on their abilities;
- give creative tasks to group members;
- selection of leading methods and ways of activity for each member of the group;
- summarizing the results on the basis of tasks and final work;
- evaluation of the results of the group members on the basis of the analysis.

The use of information technology in the work experience of literature teachers includes:

- The use of information technology to tell a story about themselves, to give others the opportunity to self-assess;
- striving for originality;
- Satisfaction of curiosity;
- to be demanding of oneself.

The certification of one's own opinion by others creates a favorable environment for teachers to express themselves. It ought to be noted that data technology and mixed media give a unique opportunity to teach students to critically evaluate the heroes of fiction amid practical experiments.

CONCLUSION

In brief, designing lessons in the over way is of great importance in teaching students to be competent young people who are able to give accurate and objective assessments to members of the community, increasing their critical assessment capacity.

MEMORIAL WORKS – AS HISTORICAL FACTS (ON THE EXAMPLE OF S. KAMALOV'S MEMORIAL "FROM THE LESSONS OF MY LIFE")

Bahamdulla Nurabullayev*

*Karakalpak State University named after Berdakh,
Nukus, UZBEKISTAN
Email id: Nukus-uz@mail.ru

ABSTRACT

The article discusses the historical significance of the memoir written by a historian. The author pays attention to the scientific and historical basis of the events and information chosen by the historian for the architect. The historian identifies the genre differences of memoirs written by scholars as a "special memoir complex". The memoir tells about the peculiarities of the description of historical information in the literary text.

KEYWORDS: *Memoir, Historian, Document, Epoch, Politics, Reality.*

INTRODUCTION

Memoirs are an interesting and complex genre, and in their study it is necessary to take into account the peculiarities of the genre. For example, A.G.Tartakovsky points out two different methods of studying memoirs from a historical and documentary point of view:

- 1) Historical and cultural; In this case, the memoirs are used as a reference for the study of the period.
- 2) Typological; In this way, the memoir is studied from the point of view of his history [1].

Main part

Many scholars use the historical and cultural method in the study of the memoir, using the information in it as an illustration to fully reveal a topic. In particular, the memoirs written by socio-political, cultural and scientific figures are of great importance in creating the historical reality of the era, the picture of socio-cultural life of the people.

Well-known public figures in Karakalpak literature are the memoirs of K. Kamalov "In the service of the country", K. Uteniyazov "Thoughts relevant to my life", S. Kaniyazov "Altyn Zhagys", A. Kunnazarov "Seven centuries", the socio-political past of our people. It is worth

noting that the memoir "From the lessons of my life..." (2019) by a prominent public figure, historian, academician S. Kamalov, which is valuable for its valuable information on economic, historical and cultural life, deserves special attention.

It is noteworthy that the memoirs written by historians are considered "scientific research that illuminates the truth", that is, the historical event is a highly analytical interpretation of the historical memoir by a modern memoirist [2]. S.V. Pavlovskaya, a researcher of the text of memoirs written by a historian in Russia in 1920-1930, came to the following conclusion: they give a special type of testimony, that is, they provide special information that has been scientifically discussed and scientifically absorbed"[2]. From this point of view, memoirs written by historians require special attention as a "special memoir complex".

The memoirs, written by a historian and scientist, are important in that they combine the features of historiography and historical sources in a literary text, and the memoir has artistic features. After all, the main purpose of the events and ideas in the autobiographical story of the memoir is to convey them to the reader. Sometimes the main task and idea of the work is reflected in its title. For example, the memoir of the Russian historian A.Ya. Guryevich is called "History of the historian" [3], which discusses the formation of a professional historian. The memoir of the Kazan historian AL Litvin is entitled "Life is like survival: recollection and discussion of the past" [4], which reveals the obvious truths of the scholar's life experience.

Usually, the initial phrases of a work mean a lot about its idea and content. Let's say that A.Ya. Gurievich's recollection begins with a conversation about how he was transferred from the external department of Moscow State University in 1944 to the full-time department, while A.L. Litvin's memoir begins with the night of March 1941, the day his father was captured.

The memory of the well-known historian, academician S. Kamalov begins with the memory of who his ancestors were, how his ancestry as a religious scholar "cut" his life in the path of science. This means that the historian has been "feeling the emphasis of history in his daily life" [5] since his childhood.

The plot and semantic content of historians' memoirs is similar to the content of their profession. They are also important in providing valuable information about professional development, academic degrees, relationships with colleagues, and the communicative practices of the research center.

For example, in S. Kamalov's memoir "Lessons of my life..." in the section "My teachers" there are recollections of such people as S.P. Tolstov and professors T.A. Zhdanko, N. Daukarayev, Y. Gulyamov, who guided and cared for science. It reflects not only the care and mentorship of these great people, but also the selfless service to the history, science and culture of the whole of Karakalpakstan. For example, S. Kamalov, who spoke as a graduate student at a meeting to discuss an article in the memoir "Communist", did not ignore the opinion of his student, and his actions to correct the shortcomings were a sign of future success.

"The next day S.P. Tolstov held a meeting at the institute, to which he invited us. If there are small problems in the process, you go to your superiors, and if there are big problems, you come to me. Are you dissatisfied now? "Asked S.P. Tolstov. "Thank you, thank you" we were walking out the door, T.A. Zhdanko said, "Be patient, don't leave, he's waiting for me." After leaving the meeting, Tatiana Alexandrovna Zhdanko gave me a week's assignment. "You will report next

week on the completion of these tasks. It will continue to be so from now on”she said. By working in this order, I was able to do six months and a year of work that I had not wanted before. ... You would not have achieved such a result today if you had not remained silent in the same meeting. You did a good job of telling us what you wanted to do, and you set us in motion, so be active all the time, and I congratulate you on writing your dissertation, ”he said. [6, p. 43]. In this case, we can say that at that time he headed the Moscow State Institute of Ethnography and Oriental Studies and the Department of Ethnography at the University. Along with his character, we see his respect and love for Karakalpakstan. A full part of the memoir is devoted to the desired research work of SP Tolstov on the history of Karakalpakstan, in which the author describes the scientific and moral views of the Russian scientist on Karakalpakstan as a scientist and a human being in a comprehensible and attractive language.

In addition, the historian has notes on the activities of heads of state or other celebrities in our country to train local researchers, to strengthen the scientific and technical base of the research institution. These memories beautifully reveal their character and portraits of statesmen and public figures. In the creation of portraits "scientific analysis, scientific data is absorbed."

For example: "In 1958, the President of the Academy of Sciences of Uzbekistan H.M. Abdullayev brought to Karakalpakstan Andropov, who Minister of Geology of the USSR then. He gave a 45-minute lecture on "Prospects for Karakalpakstan" to party activists in Nukus. "Karakalpakstan, which is now an agrarian republic, may soon become an industrial republic," he said. After all, the land of your republic, especially its Ustyurt, is rich in oil and gas. Geological research confirms this. Ustyurt of Karakalpakstan is an oil and gas boiler. Oil and gas from Turkmenistan and Kazakhstan come from your Ustyurt, that is, from the outskirts of October, and the middle of October is yours. To this end, the leaders of your republic should pay special attention to the study of the Ustyurt. Karakalpakstan will be the richest country through the Ustyurt, ”he said [6, p. 81]. Such examples in the memoir increase its value as a scientific and historical fact, and some data also show the artistic features of the memoir.

For example, the "My Thoughts on Representation" section of the memoir highlights the shortcomings of the Soviet-era socio-political system and the system of personnel of that period. In this section, the author synthesizes historical and artistic facts in the text of the memoir, using popular anecdotes, funny stories in the memoir to reveal the realities of the time, the bitter truth of the time. Researcher T.M. Kolyadich, who studied the memoirs of writers, writes:

"Anecdotes are often found in episodes as part of a memoir. In it, serves as an introduction to the event, an introductory story. Its inclusion in the text, rather than in the form of an impartial address, is its lack of address. Therefore, the anecdote is included in the main description at the level of an auto document. Often, the authors of memoirs use anecdotes to express their views on political events "[7].

In fact, S. Kamalov in the sections of the memoir "The first representation", "Anecdotes about representation", "Representation stories" expresses the author's position on the influence and expresses scientific, historical and artistic views. Such information is of great importance for the reader in correctly understanding and using the differences between the information in the memoirs as historical and artistic information.

CONCLUSION

In short, analyzing this memoir from the point of view of a historian-scientist from a historical and cultural point of view, we come to the following conclusion:

- The story chosen for the plot of the memoir and the historical significance of the actions of the protagonists are described in detail;
- Facts that are not included in the documents on certain historical events, aspects of the character of state businessmen, public figures are revealed;
- The reader will have the opportunity to learn historical facts about the politics of the time, the realities of the times, the realities of life through the literary text.

ETHNIC COMPOSITION OF THE STATE OF KARLUK-KARAKHANS

Bekhzod Khamidovich Makhmudov*

*PhD., Senior Lecturer,
Almalyk branch of Tashkent State Polytechnics University,
UZBEKISTAN

ABSTRACT

The given article is devoted to providing a brief history of the Turkic states 'ethnic composition and characteristic features of their occurrence. It presents the fact about the establishment of the state of Karluk-Karakhans based on the Turkish dynasty and the unification of the Turkic tribes within the Turkish state. As well, it is discussed the socio-political activities of the Turkic tribes in the periods of unification.

KEYWORDS: *Turkish Right, The Turkish State, Tribe Union, Dulu, Nushibi, Az, Uz, Oguz, Karluk, Chigil, Yagmo, Argi, Tokhsi, Nomadic And Noble Population.*

INTRODUCTION

The tribes are used to have great importance in the history of society and the state. The level of unification has ensured the prosperity of tribes and their political, socio-economic life and cultural development. Therefore, it is also important to pay the attention to the history of each tribe in their formation for a deep analysis of the history of the Turkic state. As every tribe had its place in the political, socio-economic life of the state, dynasties could not carry out their political activities without their help on the ruling.

Each tribe experienced its unique historical events in the ethnic history of the Turkic tribes. When some large tribes united and formed a state, the army divided them into tribes and even changed their ethnic name. In some cases, under the influence of the Timurids' political events, a single tribe was divided into several groups, and some events spread to different regions. This caused them to change their name even though they were originally from one tribe.

It should be indicated that research on the history of the formation of each Turkic tribe and ethnic group is a much more complex issue and there is not enough information about them.

Both states of the Turkish dynasty and the Turkash state, and later formed Karluk-Karakhans state exploited Turkic tribes of these countries regularly as for uniting them in one state.

In the organization of the state, when the Turkic tribes were the main foundation, its further development was in all respects related to the more active indigenous population of Movarounnahr. In the Karluk-Karakhan state, not only nomadic or semi-nomadic Turkic tribes, but also representatives of the Otrok people formed the majority. Especially after the state of Karakhans was divided into Western and Eastern Khanate in 1040 year, the Western Khanate consisted of Movarounnahr. Movarounnahr was a territory of Turkic and Persian people who lived permanently in the location. The famous cities of Bukhara, Samarkand, Tashkent, and Termez of the East in this region were the richest cities of the country as an economic and Cultural Center. Therefore, the Western Khanate was more civilized than the Eastern Khanate, which was the result of people's endeavors in the area.

Based on the above information, we will express our views on the issue of which tribe was considered the main ethnic layer in the formation and management of the Khanate.

It is known that the territory of the Karluk-Karakhan state consisted of Yettisu, Isfijab, Shosh regions, the western part of Eastern Turkistan, and Fergana Valley. There were Turkic tribes from ancient times in these areas. Especially, these territories were the homeland for Dulu, Nushibi, Uz, Uz and other tribes in VI-VIII centuries, Oguz, qarluq, chigil, Khalach, Yag'mo tribes in VIII-X centuries; and later kipchaks were located in X-XI centuries. [1. p.37]. Consequently, the union of these tribes formed the Karluk-Karakhans state. Definitely, many Turkic tribes who were used to live in these regions had established their states based on their mutual union several times. For instance the Turkash Khanate was formed from the unification of Turkic khanate and its some parts. The state of Karluk-Karakhans also emerged on the basis of such processes, which consistently continued the system of Turkish statehood by uniting the tribes that were part of the previous insults and dispersed into a new union. Since the state of Karluk-Karakhans consists of a mutual union of tribes; the traditions of statehood in it were not new for the Turkic tribes in its unification. This state was an inalienable continuation of the previous Turkic states, which provided for the evolutionary development of rich experiences in the field of statehood.

The role of the tribes in this state varied and their participation in the political management of the state in a certain sense was also related to this. Inevitably, the historical processes did not go the same. In the early period, tribes with influential power, by the subsequent periods, had lost the status of self-cult or mixed with other tribes, the phenomena occurred as a natural process. As the result, the influence power of tribes in the life of the state has been changed to some extent. It should be said that since the state of Karluk-Karakhans had its long historical period (766-1212), it is necessary to pay special attention to all tribes within the state to objectively study its history. Due to the unification of different tribes, it is not common to study the history of Khanate completely. Therefore, every tribe in its composition had its place in the activities of the state, regardless of its size.

The researchers have determined the position of the tribes in different ways within the state of Karluk-Karakhans and their participation in the political processes of the country. Some scientists have recognized that the contribution of the elderly to the organization of this state is great (V.V. Grigoriev, O. Prisak, K.Sh. Shoniyozov), their thoughts are remarkable [2. S.189-250; S. 209-228; S. 17-68; B.192; B.426]. In their researches work including, K.Sh., Shoniyozov's works he studied some issues related to the history of Karakhanids and tried to find a solution to them. In this regard, the researcher stated that the contribution of the Karluk tribe to

the emergence of the state of Karakhanids was high and also gave extensive information about the tribes in the state, their origin, ethnic composition, role in the life of the state, and the relationship between the tribes. It is especially noteworthy that the date of its founding of the state of Karakhanids is not 940 years or the last quarter of the X century, but the designation of a century civilized period, that is, 840 year. But we K.Sh. we cannot correctly say some of the comments that are presented in the works of Shoniyozov, of course. In particular, according to the scientist, the state of Karakhanids, which has been operating for almost four centuries, was – "the state of Karluk", therefore it offers the name of the state to be called "the state of Karluk" [3.B. 192]. In our opinion, taking into account the centuries-old history of the Karakhanid state (766-1212) and its specific periodic stages of development, it is not right to call this large state the name of a single tribe. Because Hakanlik was formed from the Union of many Turkic tribes in its composition. Each of them had its place and importance in the activities of the state. Besides, it is beyond doubt that the unity of the state, its strength, and its ability to defend itself from external aggression depend in all respects on the extent to which mutual relations in the Union of these tribes will pass. By the way, during a long historical period, ethnic processes in the state have not been smoothed out. The relations between the Turkic tribes in the state and the ethno medical ones continued to develop continuously, as a result of which the generalization of their customs and traditional worldviews became more widespread. It is possible that at the initial stage of the state there was a strong influence of tribal customs in the field of management, but it was also recognized as a natural process that when the state reached a certain level of governance, rules that generalized acceptable to all Turkic tribes were also formed in the management of the state.

There are quite a few researchers who have expressed their views on this issue (V. V. Bartal, A. K. Koraev) [4. P. 315; P. 86]. Studying their works, we were convinced of this situation in order to understand that the law was played by representatives of the dynasty from which the tribe originated, who also played a key role in the emergence of the state of this tribe. In particular, A. K. Koraev points to the existence of a state based on the celandine tribe.

Based on this, he noted the term "Lion" in the names of the HokiTotemi tribe, which is used as a glorious title in the names of the Hoki tribe. [5. pp. 64, 86, 197-257]. But this does not fully confirm that the Hakan dynasty originates from the Chigil tribe. Since the pigs are one of the Karluk tribes, the fact of their great power and influence in the socio-political life of the state largely coincides with the X-XI centuries. And this period is characterized as a period much later than the formation of the Karakhanid state (the second half of the VIII century), that is, its developed period.

Of the tribes mentioned above, the number and prestige of the leaders of the cliches, garlands, and yagmas is not in doubt. In particular, in the process of the initial formation of the state, if old age was of great importance in the management of the country, then, thanks to the ability to fight in war, the yagmas could reach a large stage. And the gulls, as always a relatively large number of Turkic tribes, were the main socio-economic force of the state. For this reason, the term "Lion", which is also considered the totem of their tribe, was used as a title in the names of the Khakans. But if we think about the scale of domination, the ethnic composition of the state consisted in the generalization of both nomadic and semi-nomadic and post-religious morals.

This means that there was no participation of one or two tribes in the formation of such a large state as the Karluk-Karakhans, and in its activities. If initially this state was at the level of a

Tribal Union, then after joining this union of many tribes, such as az, uz, dulu, Oguz, Argh, Tohsi, along with the Yagma, Chigil tribes, the number and prestige of the Tribal Union increased, and the state of Karluk-Karakhon was restored. Therefore, if we paid attention to the stages of development of the Turkish states and their peculiarities, we would understand and understand this issue more deeply. Unfortunately, some researchers have expressed their own opinions without taking this aspect of the question into account. As a result, some problems related to the history of the state have become even more complicated.

Instead of a conclusion, we can say that the Karluk-Karakhan state was formed on the basis of a mutual Union-a Union of tribes. It is not true that we understand and interpret the occurrence of this condition as belonging to only one tribe. Of course, some tribes in the state were in a great position, but the ability and power to inhabit the state in all respects depended on the agreement between all the tribes of one state and on the strength of their union.

Since this state was originally formed on the basis of the Union of the Karluk tribes (in 766), the Union of these tribes was subsequently established and, uniting all the tribes in the territory, rose to the level of a large state. Also, as a result of the increase in the number and prestige of the tribes in its composition, as well as ethno-cultural and economic ties with the stagnant population of Movarunnahr, there is a process of intervention between them. And these processes have also caused certain political developments and reforms in public administration, that is, public administration now expresses not only the interests of the tribes, but also the interests of all nomadic and deposed residents living in the territory.

This means that the Karluk-Karakhan state under the leadership of Karluk-rights, formed from the Union of many tribes, united the peoples of East Turkestan, Ettisuv and Movarunnahr with a nomadic and noble way of life within a single territory. Although some Hakan tribes participated in strong ethno-cultural processes and were absorbed by the local population and forgot their ethnic names, it had its place and significance in the development of the country on the political, socio-economic and cultural fronts.

Including A.K. Koraev points out the existence of the state based on the tribe of celandine. Based on this, he noted the term "Lion" in the names of the Hoki tribe totemi, which is used as a glorious title in the names of the Hoki. [5.S. 64, 86, 197-257]. But this does not fully confirm that the Hakan dynasty is from the tribe of chigil. Because the Hogs are one of the tribes of qarluq, the fact that they have great power and influence in the socio-political life of the state largely coincides with the X-XI centuries. And this period is characterized as a period much later than the establishment of the Karakhanid state (the second half of the VIII century), that is, its developed period.

Of the tribes mentioned above, the number and prestige of the leaders of the clichés, garlands and Yag'mos is beyond doubt. In particular, in the process of the initial establishment of the state, if old age was of great importance in the management of the country, then, due to the ability of military combat, the Yagmos could have reached a large stage. And the Seagulls, as always a relatively large number of Turkic tribes, were the main socio-economic power of the state. For this reason, the term "Lion", which is also considered a totem of their tribe, was used as a title in the names of Hakan. But if we think at the scale of the rule, the ethnic composition of the state consisted in the generalization of both nomadic and semi-nomadic and post-religious morality.

It means that there was no participation of one or two tribes in the formation of a large state as Qarluq-Karakhans and in its activities. If this state was originally at the level of the Union of tribes, then after the annexation of many tribes such as az, uz, dulu, Oghuz, argh, tokhsi, along with yagma, chigil tribes to this union, the number and prestige of the Tribal Union increased, and the state of Qarluq-Karakhon was restored. Therefore, if we pay attention to the stages of the development of Turkish States and its peculiarities, we would have understood and understood this issue more deeply. Unfortunately, some researchers expressed their own opinion without taking into account this aspect of the issue. As a result, some problems related to the history of the state have become more confused.

In place of the conclusion, we can say that the state of Karluk-Karakhans was formed on the basis of a mutual Union-Union of tribes. It is not true that we understand and interpret the occurrence of this state as belonging to only one tribe. Of course, some tribes in the state were in a great position, but the ability and power to inhabit the state was in all respects dependent on the agreement between all tribes of the same state and the strength of their union.

Since this state was originally formed on the basis of the Union of the qarluq tribes (in 766 year), the Union of these tribes was subsequently established and, after uniting all the tribes in the territory, rose to the level of a large state. Also, as a result of the increase in the number and prestige of the tribes in its composition, as well as ethnic-cultural and economic ties with the stagnant population of Movarounnahr, there is a process of intervention between them. And these processes have also caused certain political events and reforms in the state administration, that is, in the state administration, not only the interests of tribes now but also the interests of all the nomadic and overthrown inhabitants living on the territory are expressed.

All in all the Karluk-Karakhan state, under the leadership of the Karluk rights, formed from the Union of many tribes, united the peoples of East Turkestan, Ettisuv, and Movarounnahr with a nomadic and noble way of life within the framework of a single territory. Although some tribes in the Hakan tribe participated in strong ethnic-cultural processes and were absorbed by the local population and forgot their ethnic names, it had its place and significance in the development of the country on the political, socio-economic, and cultural fronts.

ABSTRACT

The purpose of teaching using interactive methods in teaching physics is to form the knowledge, skills and abilities of students by deeply preparing them for mental knowledge by increasing their mental performance by creating problem situations. The article presents the results of using the problem-based method of teaching physics for independent thinking of students, finding solutions to problem issues through logical, rapid and theoretical in-depth thinking. When teaching physics in general education schools, creating problematic situations when performing laboratory work and solving issues related to the educational topic, students knowledge is consolidated, and skills in the practical application of laws are formed.

KEYWORDS: *Interactive Method, Problem-Based Learning, Creativity, Independent Thinking, Logical, Operational, Psychological State, Problem Situation, Innovative, Creative, Theoretical.*

INTRODUCTION

Methods of activity aimed at achieving learning goals, used in the joint and interrelated work of the teacher and students, are called teaching methods.

In physics lessons, teaching methods are used in various forms: story, explanation, vocabulary, demonstration, problem solving, independent work of students with a textbook, the use of movies and TV shows, student questionnaires, written test papers, etc. M. N. Skatkin and I. Ya. Lerner divide all teaching methods into five groups (according to the nature of cognitive activity): descriptive (illustrative) method of explanation, reproductive (reproducing memorized) method, method of problem presentation, question-and-answer (heuristic) method and research method. Babansky divides all teaching methods into three groups:

- Methods of organizing and implementing educational and cognitive activities;
- Methods of stimulating and motivating educational and cognitive activity;
- Methods of monitoring the effectiveness of educational cognitive activity.

When grouping teaching methods in the practice of teaching physics, we proceed from the following three characteristics: 1) the source from which students receive knowledge, 2) the nature of the teacher's activities, 3) the nature of the student's activities.

All teaching methods based on these characteristics are divided into three large groups: verbal, visual and practical methods.

In the verbal method, the teacher gives knowledge to the students, mainly through experience and demonstration through the word. This method includes a story, a lecture, an explanation, a conversation, a TV game, a telemause, and working with a book. In the verbal method, the main source of knowledge is the word[3].

In the visual method, the main thing is that the teacher shows phenomena and objects. Here the word takes on a different meaning. With the help of the word, the teacher correctly directs the logical thinking and observations of students, interprets individual aspects of phenomena. The visual method includes experiments, a diagram, a filmstrip, a drawing, a drawing, and a movie show.

The practical method is laboratory work, physical practice, extracurricular observations and experiments, working with handouts, problem solving, etc. In the process of applying this method, students, along with gaining new knowledge, acquire the skills of experimentation, measurement, search, problem solving and application of theoretical knowledge.

The whole group of methods involves the active participation of students in the lesson process. The use of these techniques serves to develop students' thinking skills, to educate them in such qualities as curiosity, desire, attention, and hard work.

No method is universal or interesting for solving all learning tasks. The condition for the effectiveness of educational work is the use of various methods in accordance with the purpose of physics lessons, taking into account the age characteristics of students. An oral statement is made in connection with experiments and exhibitions, and the solution of the question is connected with an explanation, drawings and drawings.

Each one is performed using methodical methods. The methodical method is an integral part of the teaching method, the actions that the teacher and students perform in the learning process separately. For example, laboratory work: 1) first the teacher explains, and then the students perform; 2) learn the method of execution from the instructions, and then perform; 3) the teacher sets a task, the students make a plan for its implementation, select tools, then perform the work; the students repeat the theoretical material, make a plan for the work and perform it.

Methodological techniques are divided into three general groups: logical, organizational and technical.

Logical methods consist of identifying various signs of phenomena and objects, comparing their similarities and differences, describing conclusions, generalizations, setting tasks, etc.

With the help of organizational methods, students' attention is directed to understanding and working. For example: 1. After the ones given on the blackboard are written down, all the students solve the same problem. 2. Students solve various tasks on the cards. 3. Students monitor the results obtained during the exercises using an automatic device.

In the technical method, special handouts are used. For example, with the help of didactic cards, the solution of problems is brought to an individual state; devices for frontal experiments are distributed.

Methods such as methods are also used in combination with each other.

In the learning process, logical thinking techniques are widely used. Methods of logical thinking consist of induction and deduction, abstraction and generalization; analysis and synthesis, analogy (analogy), modeling.

"Inductive inference-inference, as a result of which, based on the knowledge of individual objects of a certain class, general conclusions are formed about the knowledge of all objects of the class."

Using the inductive method of explanation, the teacher leads students to gain new knowledge based on the display and analysis of the results of the experiment. For example, when explaining the balance condition of the lever, the educator introduces the concept of "force shoulder", and then shows an experience in which the impact of the load can be balanced by applying various forces to the lever (in this case, a large force will have a small shoulder, and a small force-a large shoulder). Writing down the results of the experiment (forces and their shoulders), the teacher, based on the analysis of experimental data, formulates the condition of the balance of the lever (inductive). As a result of changing the strength and shoulders, again, forming the balance position, it is possible to show the correctness of the above results. The main type of logical inference in theoretical research is deduction. "Deduction is a form of thinking in which a new thought is deduced in a purely logical way (i.e., according to the rule of logic) from some information of judgments"

The teacher uses deduction in physics lessons not only when it is possible to deduce a particular case from general cases (for example, from the main cases of molecular-kinetic theory to deduce its main equation, etc.), but also in all cases when new knowledge is revealed at the theoretical level. Whether the phenomenon or the principle of operation of the device is explained from the point of view of a particular law, whether new connections are created based on the replacement

of formulas, whether a theoretical description of new phenomena and patterns is carried out-in all these cases, deductive reasoning is used.

To teach students to analyze the results of experiments and observations, to be able to determine the general and the general, to form on the basis of this inductive generalizations-a necessary condition for the development of their physical thinking.

In the process of studying physics, in order to expand theoretical, abstract thinking, it is important to familiarize students with abstraction, idealization, and analogies.

A simplified study of complex natural phenomena without taking into account the secondary, non-essential properties of the phenomenon is an abstraction. As a result of abstraction, the signs of non-essential aspects and phenomena are simplified. It is considered in its "pure" form. The school studies "straight-line" and "straight-line-accelerated" movement. In nature, the movement of various bodies (cars, planes, ships) can be attributed to one of the actions in an abstract form only with some approximation. All empirically established laws are extraction laws.

In physics lessons, a different kind of abstraction is used in the theoretical disclosure of the material — idealization, that is, a model of a real object. Only imaginary models, not concrete objects, are the objects of theoretical tests. In physics, models of the atom, molecule, atomic nucleus, gas, absolute solid, and chaos are used.

The transfer of a model property to a real object is based on the analogy method. the acquired knowledge about an object (model) is transferred by analogy to another, less studied object. This movement is carried out on the basis of the similarity of the studied objects in their essential features. If the objects studied by analogy are in relations of mutual isomorphism (for example, phenomena are expressed by the same formulas), then the conclusion by analogy becomes not probabilistic, but real.

Oral utterance in physics lessons is carried out in an indissoluble connection with the experiment, the construction and analysis of graphs, tables and figures, the solution of the problem.

A conversation is about bringing new material to the students 'minds through questions and answers based on the students' knowledge and skills.

The conversation plan should reflect, for example,:

- 1) a group of logically consistent questions corresponding to each stage of the conversation is compiled.;
- 2) a list of the experiments and exhibitions shown and the place of their display;
- 3) specify those that are written on the blackboard and in the students ' notebooks.

Through the interview, you can solve the following questions:

- explanation of the laws of physics based on frontal experiments;
- disclosure of the nature of physical phenomena;
- disclosure of the essence of physical concepts based on experiments and exhibitions;
- repetition and replenishment of knowledge;

- determination of ways to solve the problem;
- testing students ' knowledge.

A story is a consistent figurative presentation of the material.

The story method is effective in solving the following tasks:

- 1) introduce the history of the discovery of various inventions and laws, the life of scientists;
- 2) introduction to the achievements of science and technology;
- 3) familiarization of the studied with its application in science and technology;
- 4) description of phenomena observed in nature and technical devices.

The story should be clear, logically consistent, imaginative, the intensity (pace) is selected depending on the reader's perception and the complexity of the material. The story is supplemented by experiments and exhibitions.

Explanation-consists of a consistent logical presentation of heavy objects through experiments and exhibitions. This method is used when going through these topics that require proof, explanation, and justification.:

- 1) when teaching the structure and operation of physical devices and machines;
- 2) when revealing the essence (nature) of phenomena based on theories;
- 3) in the disclosure of the interrelationships of phenomena;
- 4) when explaining the properties of bodies on the basis of atomic-molecular and electronic theories;
- 5) when explaining technological processes based on physical laws.

When the explanation is accompanied by a conversation, the activity of students increases.

Lecture-one of the methods of presentation, which requires from a scientific point of view, a longer time than the story and explanation. This method is more applicable in high school. Because it's basically designed for a full lesson. The lecture requires the student to think abstractly, to be able to listen long and carefully, to be able to take notes, to describe laws and conclusions.

All the techniques of oral narration are supplemented by experiments and exhibitions. The teacher performs the role of both a speaker and a demonstrator of experience in the lesson. Its language should be clear and firm, and its intensity should ensure the reception of students.

In problem-based learning, the physics teacher systematically formulates problem situations when explaining complex concepts and organizes students ' cognitive activity in such a way that they independently analyze facts, observe phenomena, draw conclusions and generalizations, describe concepts and laws, apply their knowledge to new problem situations, solve problems, and perform laboratory work.

Problem-based learning begins with the formation of a problem situation, which activates the students ' thinking abilities. Its next stages are: identifying the problem, identifying ways to solve it, solving the problem, describing and concluding the conclusion[10].

Let the complexity of the problem situation be sufficient for the students to solve it and be able to arouse their interest in overcoming this difficulty. For example, unforeseen problem situations can be formulated as follows: by evaporating the ether in a warm room, we freeze the water (the phenomenon of evaporation), while in a strong storm, the roof of the house separates and rises up (Bernoulli's law). How can this be explained from the point of view of physics?

Problem-based learning can be of several types.

1. The teacher either sets a task and solves it himself, or shows how it is done in science (problem statement).
2. The teacher forms a problem situation, involving students in its solution (heuristic conversation).
3. The teacher describes the problem and recommends its solution to the students themselves (in the form of an experimental task, homework, and observation).
4. The teacher encourages students to set themselves a problem and find ways to solve it.

Now let's look at ways to form problem situations.

Formation of a problem situation by revealing the significance of the studied phenomenon in science, technology and life. Speaking about the technique and the application of the material studied in life in many topics, it is very possible to activate the thinking of students, since physics is the basis of technology. It should also be said that readers can use TV series, popular movies and literature, radio, etc. they get a lot of information from. Therefore, it is necessary to draw the attention of students to it, telling them that the essence of the technology they have heard and other achievements can be learned and revealed through the phenomenon being studied. Let's look at this with an example.

1. Having said that the main question of mechanics is to determine the position of a moving body at an arbitrary moment in time, mechanics solves it, we will focus on the significance of this in technology. Speaking of the fact that the main issue is the need to calculate the trajectories of projectiles, ballistic missiles, unmanned aerial vehicles, satellites, in this method, with great accuracy, the satellites of the Earth fly along accurate trajectories ("Venus", "Mars"), spaceships are precisely docked to each other and to the stations, we read about how great the value of li is.
2. When studying the electric current in liquids, the importance of solving an important technical issue, i.e., obtaining pure copper and other metals, in coating works is noted.
3. Moving on to the photo effect, television, recording and transmitting sound to tape, the importance of the photo effect in solar panels, it is mentioned that solar panels are installed on Earth satellites, they must be light to provide the device with electricity for 1 year.
4. Lets focus on the value in the operation of engines, accelerators during the passage of Ampere and Lorentz forces.

These methods are of great importance and it makes sense to present them in a narrative style. For example: readers don't know the harm of friction, they don't know the benefit. In the story about its benefits, it is said that a person can not walk on the ground if there is no friction, he can not lift a cotton cloth on conveyors, a violin, make sounds from buzzing, etc.

These methods connect the subjects studied with life, indicate their significance. After passing the topic, the readers' attention is drawn to it by another emphasis on revealing its essence in technology.

The use of a physical experiment in the formulation of an educational problem. The experiment is a manual of cognition, a method of physical research, a criterion of cognition of the surrounding world. The experiment is also used when setting a learning problem, because it attracts the attention of students. Observation of new unforeseen effects awakens the cognitive activity of students, forms the desire to learn the essence of the phenomenon. Therefore, in some cases, it is suggested to carefully observe the phenomenon, in others-to predict the results of the experiment. Let's look at some examples:

1) Children have seen a lot and know the use of a solid body in water. But those who have not thought about its essence, that is, how to apply it. To arouse interest in the knowledge of the cause of this phenomenon, you can show the following experience. We tilt the glass plate to the spring, touching its lower surface to the surface of the water in the vessel, and invite readers to observe what happens if we continue to lower the water into the vessel. Their attention is directed to the fact that the plate does not come off the water immediately, and the spring is stretched. How to explain it? The initial experience stops here. A problem situation was formed. This situation is analyzed: readers are invited to express their hypotheses in order to understand this situation. They come to the correct conclusion about the nature of the observed phenomenon based on the fact that they know the interaction of molecules from the previous lesson. After that, the subject is given and the experiment continues. We lower the container with water until the glass plate does not come off from the surface of the water. Students see that the detached glass plate is wet, and attach importance to it. Based on this, the issue of wetting will be considered[5,6].

They are wrong when they are asked to predict what the pressure will be if the liquid is poured into containers of different shapes, but with the same height of the faces of the bases, that is, since there is a lot of liquid in a large vessel, its pressure will be large. During the experiment, the pressure will be the same for everyone (even in a small vessel), which they will find inexplicable. A problem situation was formed.

Having shown Oersted's experience in the study of electromagnetic phenomena, we will formulate a problem situation, raising the question of how to explain this behavior of the magnetic needle. Students activate their knowledge of the magnetic effects of current. The teacher solves the problem by introducing the concept of a magnetic field.

Setting a problem with prior experience is also important in high school. For example, by inserting a large one from a small solenoid into it, we will pass a current through them in the same direction. Then, if we change the direction of the current in one, the small solenoid will pop out of the large one, turn (180°), and re-enter the large solenoid. There was a problem situation. Although the knowledge of the magnetic field of the current obtained by students in the lower grades is not enough to explain this, they understand that it is necessary to analyze the situation and study the interaction of magnets in more depth.

After familiarizing students with fluctuations and forced fluctuations, before moving on to autotebrenia, we formulate the problem situation as follows. To the tripod, we hang a stone weighing 1 kg with the help of a spring. Under it, we put on the coil of a universal transformer

with a core (220 V). It will be 1-2 cm lower than the stone. Having fixed a steel bar on the second tripod, we touch it to the stone. When we plug the device into an outlet, the stone creates autotebrillity. Its oscillation period is 1,2 s. The light shows (blinks) that the energy is supplied to the oscillatory system. The amplitude of the oscillations depends on the current strength, which is changed by the rheostat. When students are asked what this oscillatory motion is, they cannot compare it with either free oscillatory motion or compulsion. There was a problem situation. Students determine the difference between auto-vibrations and free and involuntary vibrations. This analysis of the problem leads to the introduction of the concept of autotebration and the study of its properties.

A learning problem that is solved by students after several lessons can also be pre-set by an experiment. For example: during the study of the electric field, you can set a task by showing the following experience.

We put two plates vertically, leaving 8-10 cm between them. Between them, we lower the ping-pong ball, suspended on a string. When the plates are charged, the ball is attracted to the nearest plate. If we paint a sphere with graphite (pencils), it will vibrate between the plates. It is solved by conductors and dielectrics after passing their objects in an electric field.

With the help of the experiment, you can give many more examples of setting problems. the statement of the educational problem should be carried out, guided by the psychological laws of the choice of the experiment.

If a new experience is laid in connection with the previous one, the students interest is aroused. Readers are not interested in well-known or incomprehensible experiences. When selective experiences in the lower grades have a strong impact on students and make them extremely agitated, students may not pay attention to them. At this time, it becomes much more difficult to draw their attention to the analysis of the experience. For example: when passing atmospheric pressure, the lesson should not start with the experiment with the Magdeburg hemisphere. It is advisable to show it at the end of the lesson and offer an explanation[3].

Some preliminary experiments arouse only partial interest among readers. For example: the rotation of thunder on a kerosene lamp (before the passage of convection). The electrification of bodies, while Oersteds experiments arouse readers interest in knowing their essence. Also of great importance in increasing the activity of students is the offer to explain the experience during the study of new material or after studying it.

Solving problems in physics is a means of setting an educational task. Drawing readers attention to a new problem and its description can also be achieved by first solving the problem. Let's look at some examples:

When introducing the concept of speed in class 6, it is advisable to consider the following question: Can a car overtake a cyclist if the cyclist has traveled 200 meters in 8 seconds, and the car has traveled 120 meters in 1 minute? Readers will be interested in finding the answer and start searching. They feel that it is possible to find the right answer by comparing speeds, because they know the concept of speed from life and mathematics. By solving this problem, they not only pose the problem, but also begin to study it. Before passing the topic of the capacitor (when passing the capacitance), students are given the task to calculate the capacitance

of the globe (as isolated). It is easy to calculate (the electrical capacitance of a spherical conductor is equal to its radius, in CM):

$$s = 6400 \text{ km} = 6.4 * 10^9 \text{ cm} \approx 7.1 * 10^4 \text{ F} = 710 \text{ UF.}$$

After that, the teacher shows a capacitor with a capacity of 1000 UF and asks: "How can a small body create a capacity equal to the capacity of the globe?" this raises a question. Based on the students' knowledge that the isolated conducting capacity will be influenced by the surrounding body, the educational task is set: is it possible to form a system of high-capacity conductors that do not depend on the surrounding?

Before proceeding to the dependence of the resistance of the conductor on the temperature, it is proposed to calculate the resistance of the light bulb on the demonstration table. The lamp is designed for 100 W and 220 V, respectively. When calculated using the same data, $R = U^2 / P = 484 \text{ ohms}$. When it is calculated according to the Ohms law (measured by a voltmeter, ammeter) (at a voltage of less than 220 V), the output is 300 ohms, when measured by an ohmmeter in the cold state-35 ohms. How to explain such contradictory answers? There is a problem situation, the analysis of which consists in comparing the measurement conditions. Students find out that the temperature of the lamp fiber is different in each case. Accordingly, the task is set: to determine the nature of the temperature dependence of the resistance and the nature of this phenomenon.

Solving the question concerning the calculation of the cross-section surface of a copper wire, which must be prepared so that during the transmission of electricity (when transmitting over long distances), the losses are minimal, we show that a lot of copper is required (a wire with a cross-section of 2 m), such wires can not be prepared at all, and then we set the problem: how is the transmission of energy through the wires?

Setting a problem by solving it not only increases the interest of students, but also connects their previously acquired knowledge with new ones. Just selecting a question may take some time[11,12].

We can also use questions when posing a problem. They help (encourage) students to increase their cognitive activity. Let's look at some examples.

Before studying the humidity of the air, we put the question:

Why do you have to wipe your glasses when you enter the house from the cold?

Before studying the pressure of liquids and gases, the question arises why is the depth of immersion in submarines limited? These problems are of interest when studying a new topic. Students are encouraged to find answers to the questions posed after studying it. This increases the activity of learning[2].

When a question is used to pose a problem, let them show that their knowledge is not enough. You should not ask a question that the reader can decide on the basis of their previous knowledge. These questions should be more relevant to the students' life experience, and also be somewhat difficult to explain. Too complex questions can also dampen the readers' interest. The teacher should pay great attention to this.

ABSTRACT

Nuclear Disarmament has become a vital concern of all nations. It is essential not only for humanitarian and moral but also for economic and military reasons. India has made significant contribution to disarmament in the United Nations (UN) in terms of ideas, resolutions, amendments and action plan. India is the only nuclear weapon state willing to accept total disarmament within the time framework and the one to provide an unconditional, unqualified and unlimited no-first-use pledge. This presented study entitled "India and Nuclear Disarmament" divided into four sections. The first section, being introduction, gives a brief outline of the study, relating the issues of disarmament and nuclear policy both national and international arenas. The second section concept and history explores various adverse situation and reaction of nuclear disarmament. The third chapter entitled India's nuclear disarmament initiative after 1998 elaborates with pertinent issues relating to nuclear proliferation with special reference to India. In addition, it focuses on the comprehensive initiatives taken by India for universal nuclear disarmament. The fourth section being a conclusion sums up of the study and summarizes the observations. Based on the study, it suggests twelve important steps to be considered for shaping up India's nuclear disarmament policy in a better way and for attaining nuclear weapons free world.

KEYWORDS: *Comprehensive, Disarmament, Nation, Nuclear, Policy, Weapons*

INTRODUCTION

Nuclear Disarmament has become a vital concern of all nations. It is essential, not only for humanitarian and moral but also for economic and military reasons. India has made significant contribution to disarmament in the United Nations (UN) in terms of ideas, resolutions,

amendments and action plan. India is the only nuclear weapons state willing to accept total disarmament within a time-table and the one to provide an unconditional, unqualified and unlimited no-first-use pledge. Since India received cool response with regard to nuclear disarmament, it deviated from the original stands. As a matter of policy, it is committed to disarmament and has actively been associated with efforts for nuclear free world at different times. Its stands for peace, considers reduction of weapons as essential tent for avoidance of war by ensuring security. It fully believes in total abolition of nuclear weapons; and does not favour Comprehensive Test Ban Treaty (CTBT) that permits existing nuclear powers to retain their weapons and prohibits other form of testing and acquiring such weapons in the future.

India is, therefore, a country that looks for attaining relatively quick action on global nuclear disarmament and support the Conference on Disarmament (CD), the world's only multilateral forum for nuclear disarmament negotiations. However, since the mid-1990s, the Nuclear Weapon States (NWS) and Non-Nuclear Weapon States (NNWS) in the CD have been unable to resolve some major conflicts on priorities and linkage. Lacking an agreed "program of work", the CD has been unable to convene an ad-hoc committee to negotiate a multilateral treaty for nuclear arms reductions. India supports for negotiating a multilateral nuclear disarmament treaty to be arrived at CD. In the mid-1990s, it linked its acceptance of negotiations on conventional arms limitations, the CTBT and progress on general nuclear disarmament. However, in 1998, India stopped requiring progress on the Comprehensive Test Ban Treaty (CTBT), and Fissile Material Cut-Off Treaty (FMCT), as a condition for nuclear disarmament talks. More recently India has called for early negotiations on a nuclear weapon convention to deal with the issue of nuclear weapons in a "global nondiscriminatory framework." In the United Nations General Assembly (UNGA), India has regularly sponsored a resolution on reducing nuclear danger, addressing de-alerting options for nuclear weapons. Its initiatives can be stated as follow:

- Prohibition of the further use of fissionable material for military purposes [which would have amounted to a freeze on production of fissile materials for military use and a freeze on production of nuclear weapons];
- Prohibition of the transfer of fissionable material from civilian to military stocks;
- Non-export or conveying of nuclear weapons to other countries by those manufacturing such weapons.

Historical Background:

Since, Independence, India has been consistently pursuing the objective of global disarmament based on the principles of universality, non-discrimination and effective compliance. It always believes that the world free of nuclear weapons would enhance both global and national security. Thus, India has always advocated that the highest priority should be given to nuclear disarmament policy leading towards general and complete disarmament. As early as 1948, India called for limiting the use of atomic energy only for peaceful purposes and the elimination of atomic weapons from national armaments. The Indian Prime Minister Jawaharlal Nehru called for immediate suspension of all nuclear weapon tests in parliament on April 2, 1954. Jawaharlal Nehru was the first states- man to draw the attention of the world to the problem. All concerned people warmly welcomed the proposal. Responding favourably to Prime Minister Nehru's call for a 'standstill' agreement on nuclear weapon testing, the USSR on 10 May, 1954 came up with a proposal for a nuclear test ban as the initial step toward nuclear disarmament. But the US was

not amenable to the proposal. Therefore, again on July 12, 1956, India placed before the UN Disarmament Commission another proposal for 'Cessation of All Explosions of Nuclear and Other Weapons of Mass Destruction'.

Due to growing pressure from peace movements, especially from those in the US and Europe, US leaders were forced to begin test ban negotiations with their counterparts in the USSR. It may be recalled that after the failure of the UN General Assembly during 1946-49 to ban atomic weapons, in 1952, the UN set up a 11-member Disarmament Commission to prepare proposals for the regulation, limitation, and balanced reduction of all armaments, including nuclear weapons. The Commission was also to propose a system of international control of atomic energy so that it would be used only for peaceful purposes. When this Commission too did not make much headway, the UN in 1962 set up an 18-Nation Disarmament Committee to tackle the whole issue of general and complete disarmament. Unlike the US, India had been one of its most active members trying to promote the aims and objectives for which the Committee was set up. As it has been already mentioned, India was among the first countries to propose a treaty for a comprehensive test ban. It was also the first nation to propose a nuclear non-proliferation treaty. But when the treaties took their final form, crucial clauses that India had proposed had been deleted from them India was left with no option but to consistently oppose these treaties in their present form. The following section deal with major landmarks of agreements and treaties in the sphere of disarmament.

India's Nuclear Disarmament Initiative After 1998

Disarmament and promotion of world peace have persistently been the primary aims of India's foreign policy. The biggest threat that the world is confronted presently is the fear of the nuclear war. Disarmament, more specially, Nuclear Disarmament has consistently been an issues of anxiety to India. The very entity of nuclear arms and the maintenance of weapons race challenge the survival of mankind. Nuclear weapons neither can be granted to be weapons of war, nor should they be invested with a halo of peace process. India has always upheld that the proper orientation supervision and doctrine emanating from internationally harmonized goals and priorities in the field of disarmament ought to be rigidly obeyed or else the comity of nations would fail to accomplish the goal of disarmament.

India has the world's largest secular democracy. The preservation of its social, political, and economic wellbeing constitutes the primary focus of efforts of the government of India. To secure their well-being India must be able to seek resources and generate wealth on global scale to meet their needs. A global environment that is dominated by nuclear powers vying for controlling critical resources is not conducive to produce the peace and stability which is essentials for India's growth as a nation. It stands with the reason that verifiable, non-discriminatory, global nuclear disarmament is a natural goal of India's policy. This was the most dominated theme for India's government thinking and utterances on nuclear security issue.

International initiatives over the past fifty years have failed to end the global nuclear double standard. Not only a global nuclear disarmament a distant dream, the effects of rampant nuclear proliferation activities in past three decades simply alarming. Such factors create a difficult environment making on over political choice on the issues of nuclear weapons. The complicated nature of these choices was the driving force behind India's strident utterances on global nuclear disarmament. India has been at the forefront of the International efforts to get the nuclear

weapons banned and eliminated. As the Former Prime Minister Vajpayee observed in the parliament on 27 May 1998, from the early years of Independence, “our leaders..... realized that a Nuclear Weapon Free World (NWFV) would enhance not only India’s security but also the security of all nations. That is why disarmament was and still continues to be a major plank in our foreign policy”.

The Former Prime minister of India Mr. Atal Bihari Vajpayee has reiterated, after the nuclear tests of May 1998, India’s commitment to nuclear disarmament. He also said that India is keen on constructive dialogue for global nuclear disarmament. He has expressed readiness to discuss agreement on no-first-use with Pakistan, as with other countries, bilaterally or in a multilateral forum. India has declared a moratorium on her tests (so has Pakistan) and has expressed her willingness to explore ways and means for the de-jure formalization of this moratorium. India has also announced her readiness to adhere to some of the undertakings of CTBT but has pointed out that such adherence cannot be in vacuum. India has also offered to join negotiations on fissile material cut-off. The NWSs have yet to react positively to this unilateral declaration of India.

India’s Initiative after 1998

India has taken large number of initiatives aimed at nuclear disarmament over the last fifty years. These have been ignored or spurned by the five nuclear weapon states. Summarized these efforts, we delineate the dismal global environment in relation to the elimination nuclear weapons, as also the deteriorating nuclear security environment in India’s neighborhood. India remains a firm and consistent proponent of general and complete disarmament and attaches the highest priority to global nuclear disarmament. India’s policy on disarmament also takes into account changes that have taken place in the world, especially in the 1990s. The nuclear tests of May 1998 do not dilute India’s commitment to this long-held objective. As a nuclear weapon State, India is even more conscious of its responsibility in this regard and, as in the past, continues to take initiatives in pursuit of global nuclear disarmament both individually and collectively. The steps that were announced after the tests and the initiatives that India has taken since, strengthen this commitment.

Towards a National Consensus

One of the drawbacks of the earlier national consensus was that it did not exert sufficient pressure to necessitate the building up of a strong and broad-based peace movement within the country. Consensus on all issues relating to nuclear disarmament was taken for granted. In the absence of a powerful peace movement it became relatively easy to break the prevailing consensus as it has happened with Pokhran-II. Yet the general sentiment in favour of global nuclear disarmament is still very high. Therefore, it is time that this vital issue is again brought into focus. The unilateral declaration of a moratorium on further nuclear weapon tests by the government of India is a welcome step. In fact the government of India has already announced its willingness to convert such an undertaking into a de-jure obligation. But, it has given the doubtful motives for doing so, it has to go further and continue to oppose the CTBT in its present form until the concerns expressed by India all this while are adequately addressed by the US and other nations supporting the present CTBT. One of the most appropriate ways of doing that would be to bring it up before the Indian parliament.

The parliament could pass a unanimous resolution regarding India's commitment to cease all further nuclear weapon tests and also reaffirm India's unflinching support to the goal of global

nuclear disarmament in a time-bound framework. These goals, which India has time and again supported in the past, have also been reiterated by the present Indian government. Intervening in the general debate in the First Committee of the UN on October 15, 1999, India's ambassador and permanent representative to the UN Savitri Kunadi stated that:

"...there is no dilution of India's commitment to the goal of global nuclear disarmament. India...believes that its security would be enhanced in a nuclear weapons free-world and thus continues to press for negotiations on a Nuclear Weapons Convention that will prohibit forever the development. Production, stockpiling use and threat of use of nuclear weapons and provide for the elimination of all existing weapons under international verification".

No First-Use Pledge

The very first step by nuclear weapon states towards the goal of global nuclear disarmament has to begin with a no-use (of nuclear weapons) pledge against non- nuclear weapon states and a no-first-use (of nuclear weapons) pledge against other nuclear weapon powers. A no-first-use pledge, at the very least, is just a hypothetical guarantee - merely an expression of good faith. It does not involve verification, dismantling or freezing of nuclear weapons stockpile. But still it is the key element in advancing the cause of nuclear disarmament because it significantly contributes to de-freezing all rigid and inflexible mental attitudes regarding the issue. It also helps a great deal in adopting a saner approach towards the problem. All previous governments in India have staunchly supported this proposal. The BJP government too has reiterated the unilateral pledge. Making a statement before the lower house of the Indian parliament on 4 August, 1998, the then prime minister Atal Bihari Vajpayee said:

"We have stated that we will not be the first to use nuclear weapons. We are also willing to strengthen this by entering into bilateral agreements on no-first use or multilateral negotiations on a global no-first-use. Having stated that we shall not be the first to use nuclear weapons, there remains no basis for their use against countries which do not have nuclear weapons".

India has been one of the consistent champions of the abolition of nuclear weapons since the 1950s. For India, nuclear disarmament was almost a matter of national faith. As part of that campaign India has been strongly supportive of the idea of no-first-use and non-use of nuclear weapons as valuable milestones on the way towards the longer term goal of total nuclear disarmament. India has the only one among the states in possession of nuclear weapons to adopt a nuclear strategy is based on no-first-use of nuclear weapons. Unlike some of the five NPT nuclear weapon powers that have declared supported to the concept of no-first-use, for India it is an integral part of its doctrine. This is rooted in a variety of considerations, including survivability, safety and the costs of managing its nuclear arsenal. India has also strongly supported international efforts to reduced reliance on nuclear weapons as well as the institution of a norm among the nuclear weapon powers in favour of a collective understanding on no-first-use, which in effect would also become a non-use pledge against non-nuclear weapon states. Yet, paradoxically, despite this record in favour of nuclear abolition and no-first-use, there are strong indications that India's political enthusiasm for these ideas is beginning to wane.

India has a declared nuclear no-first-use policy and is in the process of developing a nuclear doctrine based on "credible minimum deterrence." In August 1999, the Indian government released a draft of doctrine which asserts that nuclear weapons are solely for deterrence and that India will pursue a policy of "retaliation" only. The document also maintains that India "will not

be the first to initiate a nuclear strike, but will respond with punitive retaliation should deterrence fail" and that decisions to authorize the use of nuclear weapons would be made by the Prime Minister or his 'designated successor.

The importance of a no-first-use pledge also lies in the fact that once all the nuclear weapon states have given a similar pledge, it automatically attains the form of a no-use pledge. This would in turn help the adoption of measures for the prohibition of use of nuclear weapons and for the prevention of nuclear war. Once this stage is reached, progress towards nuclear disarmament would proceed at a rapid pace. Precisely because of its inherent potential to advance the cause of nuclear disarmament, the proposal for a no-first-use pledge is inflexibly resisted by the US. While Russia, Great Britain, France, Israel and Pakistan have chosen to follow the US lead, China's position on the issue is very similar to that of India. A no-use pledge by the US way back in 1946 could have, in all probability, averted the nuclear arms race, but it was its obstinacy that thwarted such a possibility. It is its obsession with the policy of first-use of nuclear weapons that has forced the world to witness a costly and mindless nuclear arms race. It may seem shocking that the US has not formally given a no-first-use pledge even to its nuclear allies - Great Britain and France. Such a policy is becoming unpalatable to some of the closest allies of the US. For example, at the NATO Foreign Ministers' Meeting in Brussels on December 8, 1998, Germany and Canada questioned the NATO policy of first-use¹. However, the differences within NATO over this issue for the time being at least have been brushed under the carpet. Despite this latest development, India has been reticent in its criticism of the US policy. All that it has stated regarding the policy of first-use and the decision of the US to continue to station nuclear weapons abroad is the following:

Doctrines of first use of nuclear weapons have been revalidated even though the threat perceptions that originally gave rise to those doctrines which have long disappeared. The only remaining military alliance with transcontinental dimensions continues to assign nuclear weapons the highest priority, with several of its member's ostensibly non-nuclear weapon states, permitting peace-time deployment of nuclear weapons on their territories and given war-time access to those very weapons, in violation of treaty obligations undertaken by them.

India has to forthrightly condemn this adamant stand of the US. If, as per its professed policy, the Indian government is genuinely committed to achieving the goal of global nuclear disarmament, and also if it is seriously concerned about preventing nuclear war, and if it firmly stands by its no-first-use pledge, it has to demonstrate its commitment by actively campaigning for that cause. To begin with, India has to insist that all other nuclear weapon powers too have to give a no-first-use pledge forthwith. By giving a no-first-use pledge the other nuclear weapon powers stand to lose nothing materially, all they would have to sacrifice is their aggressive intentions. Now it is appropriate time for India to make its move. It has to assert that India's acceptance of the CTBT shall be linked to a decision by all nuclear weapon states to give a no-first-use pledge as an initial step towards prevention of nuclear war and a time-bound global nuclear disarmament programme. Once this condition is accepted, the problems with the present CTBT can be sorted out without much difficulty. Until and unless the nuclear weapon powers lower their aggressive posturing, the threat of nuclear war will remain ever imminent. If it is not possible for them to take the very first step towards nuclear disarmament, how will they ever take the next one? So, if at all India makes any move to accede to the CTBT without this simple and least difficult

condition being conceded, it would be to a betrayal of India's own vital security interests and the cause of global nuclear disarmament and peace.

Thus, a no-first-use pledge can no longer remain a cover for building a so-called second-strike capability. Adherence to a no-use pledge would also necessarily lead to adoption of steps for prevention of nuclear war. India had not only supported a no-first-use pledge but it had also vociferously pleaded for taking all steps for prevention of nuclear war. India's stand was that: "The use of nuclear weapons will be violation of the Charter of the United Nations and a crime against humanity; the use of nuclear weapons should therefore be prohibited pending nuclear disarmament. In addition, India was of the view that the member-states of the UN should "solemnly undertake not to use or threaten nuclear weapons under any circumstances. Even the present Indian government has not been found in upholding this stand.

When as early as 1973 there was a bilateral agreement between the US and the USSR to prevent nuclear war, it is incomprehensible, why no progress has been achieved till date in broadening that agreement into a multilateral one. The past attempts by India and several other countries to do so have met with little success so far. At the General Debate in the First Committee of the UN on October 15, 1999, India has again placed its views before the Committee on this issue. While doing so India's representative said:

India has viewed the Convention on the Prohibition of the Use of Nuclear Weapons as the bedrock of Negative Security Assurances (NSA) which is comprehensive, legally binding and irreversible step towards delegitimising nuclear weapons. India along with several co-sponsors, who extended invaluable support as in previous years, intends to table a resolution on this subject.

According to the National Research Development Corporation (NRDC) despite the escalation of tensions between India and Pakistan in 2001-2002, India remains committed to its nuclear no-first-use policy. But an Indian foreign ministry official told Defense News in 2000 that a "no-first-strike" policy does not mean India will not have a first-strike capability."

Conventional Nuclear Disarmament and Peace (CNDP)

November 11, 2000, the 600-plus delegates to India's first ever National Convention for Nuclear Disarmament in Peace held in New Delhi. Comprised, as former chief of naval staff L Ramdas put it, "a veritable peace fest..... and an altogether exciting historic landmark". The convention was the culmination of one-year-long process of meeting and consultations involving nearly 120 groups and organizations, as well as individual peace activists, in more than 10 Indian cities, it was also the beginning of new phase in India broad based movement for nuclear weapons abolition. The convention offered Indian peace activists the first national-level opportunities to debate a range of theoretical and political issues, exchange experiences, and achieve a degree of clarity on aims and methods. It established India's first-ever Coalition for Nuclear Disarmament and Peace (CNDP), a network with a 50-members coordination on committee.

The coalition gives India's peace movement an organized national presence and profile. This fills a major void. Since the 1998 nuclear tests, there have been sustained-and growing-protests in more than 40 cities against weapons of mass destruction and India's nuclear policy volte-face. These tended to be discrete, and unconnected to a coalition structure with a national (International) presence, profile and perspective. Matters change with networking among

different groups early in 2000 and the holding of preparatory meetings in Nagpur and Delhi. Three fourths of the convention delegates came from outside Delhi. There were 50 delegates from Pakistan, 15 for the rest of South Asia, and about 20 peace activists from Australia, North-East and South-East Asia, Africa, Europe and America. They include experienced campaigners from the British Campaign for Nuclear Disarmament (CND), representatives of the abolition 2000 network, and Japanese activists besides the Pakistan peace coalition.

The plenary established a Coalition for Nuclear Disarmament for Peace (CNDP) based on the principle contained in the draft chapter and plan of action. The Coalition for Nuclear Disarmament and Peace has undertaken the implemented over the coming year ending December 31, 2001, the following programme:

- Establish a central clearing house for information to help individuals and group wishing to get necessary materials to generate popular awareness about nuclear weapons and lack of safety and transparency of the nuclear power sector.
- Coordinate ongoing efforts towards regional and national convention of anti nuclear weapon activists. Such regional meeting in the north, south, east, west and central India to be convened over the next six months. There will be separate conventions for trade unions Scientists, doctors, journalist, artists, lawyers, musicians.
- Will press for institutionalization of “Nuclear Disarmament and Peace Week” during August 4-11 every year in as many schools and colleges as possible.
- Will actively engage in dialogue at an official level with all political parties and mass organizations as well as with professional associations of all kinds, including industry, religious bodies.
- Undertaken to support organization in Jharkhand fighting the cause of victims of nuclear radiation in whatever way possible to highlight their plight including official dialogue with the new state government of Jharkhand.
- Will support of efforts of concerned people in Rajasthan regarding secretive government nuclear-related activity including possible dumping of radioactive wastes in their areas.
- Liaise with the Pakistan Peace Coalition (PPC) to bring out with in a few months a report on joint Indo-Pakistan civil society initiatives that should be carried out to highlight the dangers posed by nuclearisation of South Asia.
- Help to set up within one year a national federation of radiation victims.
- Work with the PPC to identify 10 schools and 10 colleges in India and Pakistan which will be termed as “sister schools and sister colleges”.
- Work fraternally with all other genuine nuclear disarmament groups and individuals globally as well as establishing links of mutual support with the Indian and South Asian Diaspora in Europe, North America and elsewhere

In this first convention for nuclear disarmament and peace in New Delhi, US President Bill Clinton has warned India that Indo-US relations cannot reach their full potential without progress on non-proliferation and regional concerns. In a letter addressed to the house speaker, covering US policies in various regions and dealing with nuclear and missile issues, mainly relating to

India and Pakistan, President Clinton said Washington feels that there are no encouraging signs of resumption of talks between India and Pakistan soon.

Towards Nuclear-Weapon-Free and Non-Violent World Order:

India is now a Nuclear Weapon State (NWS). Further, it has affirmed its intention to maintain a credible minimum nuclear deterrent. How does it affect the Action Plan for a Nuclear-Weapon-Free and Non-Violence World Order submitted by the Prime Minister Rajiv Gandhi to the third special Session on Disarmament of the United General Assembly at New York on 19 June 1988? Soon after the nuclear weapons test Pokharan-II in May 1998, the Indian National Congress affirmed that the Rajiv Gandhi Action Plan remained the “sheet anchor” of the external dimension of the party’s nuclear weapon policy. The party then undertook an exercise to update and present in treaty language a draft convention incorporating the Rajiv Gandhi Action Plan. This draft was formally submitted to the Secretary General of the United Nations by the congress president in 2001.

Prime Minister Dr. Manmohan Singh in his statement on 29 July 2005, said that “our committed to work for nuclear disarmament, so passionately espoused by Prime Minister Rajiv Gandhi, in the long run remain our core concern”. August 17, 2005, Prime Minister Dr. Manmohan Singh subsequently, replying to a debate in the Rajya Sabha (upper house) said that “our commitment towards non-discriminatory global nuclear disarmament remain unwavering in line in the Rajiv Gandhi Action Plan. There is no dilution on this count. We do not accept proposals put forward from time to time for regional non-proliferation or regional disarmament. Pending nuclear disarmament, there is no question of India joining the NPT and non-nuclear weapons state, or accepting full scope safeguards as a requirement for nuclear supplies to India, now or in the future”. He further added:

“Our support for global nuclear disarmament remains unwavering. Prime Minister Rajiv Gandhi had put forward an Action Plan in the 1988 United Nation General Assembly (UNGA) Special Session on Disarmament. We remain committed to the central goal of this Action Plan that is complete elimination of nuclear weapons leading to global nuclear disarmament in the time-bound frame work”.

Minister of External Affairs, Shri Pranab Mukherjee, in an interview to the Hindu, 21st November 2006, said that we were committed to non-proliferation and disarmament. What Rajiv Gandhi said that special session on disarmament of the United Nations (9 June 1988) is the guiding principle of our foreign policy. He told that we would not graduate ourselves from the threshold level-that was our position then before 1998. We want that those who have nuclear weapons should stop proliferation-vertically, horizontally-reduce stockpiles and a time-bound action plan (for disarmament). In between, of course, we have gone for the (May 1998 nuclear) explosions. There have been development and that can’t be erased. It has already taken place-but even in that context we are serious and we are engaging ourselves. In this United Nations Session, we are going to move a resolution to this effect (for time-bound disarmament)”. He also said that it will thus be seen for Sixty Years, India has been consistent is pleading for universal disarmament. This is the sought for the 27 years between 1947 to 1974 when India had not undertaken nuclear tests. It remains so after the first serious test at Pokhran in 1974 which established India as a threshold NWS. And it has remained so since India became an NWS in 1998.

Nuclear Disarmament and Peace: The Recent Initiatives:

The Third National Convention of the Coalition for Nuclear Disarmament and Peace (CNDP), India was held from 1st to 3rd February 2008 in Nagpur, which has a glorious tradition of mobilising for peace and justice. In a landmark declaration, India as a nuclear weapons state formally proposed two multilateral agreements and two global conventions in a detailed framework for nuclear disarmament at the Conference on Disarmament in February 2008. India's seven point's agenda for disarmament was delineated as the following:

- ❖ Reduction of the salience of nuclear weapons in security doctrines
- ❖ Negotiation of an agreement on no-first use of nuclear weapons among nuclear weapon states
- ❖ Negotiation of a universal and legally binding agreement on non-use of nuclear weapons against non-nuclear weapon states
- ❖ Negotiation of a convention on the complete prohibition of the use or threat of use of nuclear weapons
- ❖ Negotiation of a nuclear convention prohibiting development, stockpiling and production of nuclear weapons, moving towards a global, non-discriminatory and verifiable elimination of these weapons.
- ❖ Unequivocal commitment of all nuclear weapon states to reduce risks and dangers arising from possibility of accidental use of these weapons.
- ❖ Adoption of additional measures by nuclear states to reduce risks and dangers arising from possibility of accidental use of these weapons.

Towards a World Free of Nuclear Weapons

Indian Council of World Affairs and the Centre for Strategic and International Studies were jointly organized an International conference on "Towards a World Free of Nuclear Weapons" at New Delhi, on 9-10 June 2008. It commemorated the 20th anniversary of the presentation by Indian Prime Minister Rajiv Gandhi of a proposal on "A world Free of nuclear weapons" at the United Nations General Assembly, New York, on 9 June 1998. It took place against the backdrop of heartening development that after twenty long years of Indian's presentation of an Action Plan towards a nuclear weapons free world; strategic thinkers from the U.S.A. and other have revived the debate on nuclear weapons and are willing to envisage a nuclear weapons free world. The conference was inaugurated by Prime minister of India Dr. Manomohan Singh who in his inaugural address spoke that disarmament, in particular nuclear disarmament, was essential to usher in a safe and non-violent world. He said that Rajiv Gandhi Action Plan was a comprehensive exposition of India's approach towards global nuclear disarmament and continuity in India's thinking since 1954 when India pioneered the call for a complete ban on nuclear testing. He emphasized that the essential feature of the Action Plan continued to be valid even today and India as a nuclear weapon state now it fully committed to the nuclear disarmament that is global, universal and non-discriminatory in nature. The pursuit of this goal will enhance not only India's security but the security of all other countries. He cautioned that this objective can't be achieved through partial method and approaches and it is not possible to

“regionalize” nuclear disarmament. He drew attention to the working paper on Nuclear Disarmament proposals submitted to the conference Disarmament in Geneva.

In the International conference Prime Minister Dr. Manomohan Singh delivered the inaugural speech and said that we take great pride in hosting this International conference on a subject that touches upon the very survival of humankind. Twenty years ago, on this day, our former Prime Minister, Shri Rajiv Gandhi addressed the third special session on Disarmament of the UN General Assembly. He is speaking on the theme of “A World Free of Nuclear Weapons”, he introduced an Action Plan calling on the International community to negotiate a binding agreement on general and complete disarmament. As the heart of the Action Plan was a commitment to eliminate all nuclear weapons in three stages by 2010. Rajiv Gandhi believed that disarmament, in particular nuclear disarmament, was essential to usher in a safe and Non-Violent world. He had the deep insight in to the nature of the evolution of technology; it is potential for advancing human welfare as also for unleashing destruction. In this context he was actively aware of the power of the atom. He wished that it should again never be used for destructive purposes.

The keynote address of the conference was delivered by H.E. Sergio Duarte, High Representative for Disarmament Affairs, United Nations. He shared the view of Rajiv Gandhi Action Plan which deserves to be remembered both for its wisdom and for the abiding relevance of its powerful vision of a path towards a safer and more peaceful world. He reminded the audience that this year also marks the youth anniversary of the signing of the NPT which included a legal commitment “to pursue negotiations in good faith on effective measures relating to cessation of the nuclear arms race at an early date and to nuclear disarmament and on a Treaty on general and complete disarmament under strict and effective International control”.

He expressed the view that disarmament was not just a dream, but a practical means to achieve security—one that is more reliable than its alternatives including deterrence, the balance of power or self help. He added that nuclear disarmament unites what is right with what works and that is why and it is “strategic necessity of our times” and stated in the initiation letter by the organizers of the conference. He concludes that there was need to reshape human perception on the inherent dangers in possessing nuclear weapons and perception of the concrete security benefits that would flow from their global elimination. He called upon the participants to recommit and to achieve the great and historical goal of nuclear disarmament.

The vice president of India Dr. Mohammad H. Ansari delivering his valedictory address he referred to General Omar Bradley’s view that “the only way to win an atomic war is to make it never starts”. He said that Rajiv Gandhi sought “not a marginal adjustment in the machinery of nuclear conformation, nor a partial or temporary scaling down of the arm race “but “a world which is aid of nuclear weapons”. He expressed the regret that the argument for outlawing chemical weapons under the universal and non-discriminatory chemical weapons convention has not been extended to nuclear weapons. Alluding to the change in the nuclear matters which the world has witnessed over the past decades and a half, he mentioned of UN General Assembly resolutions which reaffirm that use of nuclear weapons is a crime against humanity and proliferation of nuclear weapons is a threat against International peace and security. However, it was ironic that the production, possession and threat to use nuclear weapons have so far not been perceived to constitute a threat to International peace and security. He conclude that hither to nuclear disarmament has become almost synonymous with nuclear non-proliferation and the

transform the vision of nuclear disarmament in to reality, a plan and a timely approach on the Rajiv Gandhi plan would be essential.

CONCLUSION:

The destructiveness of nuclear weapons is immense. Any use would be catastrophic. However, the more recent events indicate that nuclear weapons are being endowed with strategic-rational roles. Considering the peace of major global development, the coming decade of the new millennium would be really indecisive with regards to Nuclear Disarmament. International relations would be stratified on power and force. National interest will continue to override international interests. Whether are likes it or not, WMD capabilities will remain the essence of military power. Unless and until, the military utility and the political role of nuclear weapons get diminished, nothing would be achieved and the question of realizing of NFWF does not arise.

Recent developments are a wake-up call to the world on nuclear disarmament. India still can play meaningful role in the movement for nuclear disarmament. It is being suggested that the need of hour is to revise the version of 1988 Action Plan for ushering in a nuclear-weapon-free and non-violent world order and then table it before the UNGA. The Rajiv Gandhi Action Plan needs to be updated, time table needs to be updated and the technical aspect to be worked out in greater detail². It is now strongly believed among analysis and researchers that a revised action plan may finally help in creating a nuclear-weapon-free and non-violent planet.

Historically, India's nuclear narrative has moved back and forth between Nehru's idealistic world view and the realistic-driven international system. New Delhi has been unable to resist the temptation to assert its states as a nuclear weapon power, while campaigning the case of global disarmament. Hence, India has positioned itself as a "reluctant nuclear power". The process of developing an ideology is part of the evolutionary process of a nation state; hence there is nothing wrong with India's struggle to locate itself within Nehru's idealism or the West's realism. The problem, however, is that by claiming to be a reluctant nuclear power, India cannot become a global power. Does this mean India should unequivocally clarify its position? There are two ways possible. The classic response would be for India to give up its call for disarmament and commit to it in real terms rather than follow a dual policy. Another way to consider is that perhaps in India's rhetoric lies it's real politic.

In Post-1998, however, there has not been any serious domestic political debate on disarmament. The debate countered largely around the CTBT. While there was strong consensus before the 1998 tests against joining the CTBT, after pokhran this debate has fragmented. Now, one thing is clear that India should sign the CTBT provided by the US and China ratifies the treaty. A variant is that India should oppose the CTBT because it aims at non-proliferation rather than disarmament, while providing a technological edge to the P-5 states especially the United States.

It is in keeping with this view that India has recently submitted a working paper on nuclear disarmament to the UN General Assembly, containing concrete initiatives on nuclear disarmament. India hopes to stimulate a debate and promote consensus on the way forward. These proposals were also submitted before the Conference in Disarmament in Geneva. They are a set of practical measures for working towards the goal of a nuclear weapons free world. Hence, based on this study, the following suggestions may be made for attaining nuclear weapon free world:

1. All people in India must come together and spread knowledge relating to the process of nuclearization process either for peaceful purpose or for defense;
2. It should be our primary goal to know in details about the hazardous effects of nuclear power plants, the plan for the disposal of nuclear waste, the effects of nuclear tests on the lives of the people of the region;
3. Formulation of a time bound program not exceeding a decade for gradual reduction of the stockpile with a view to achieving total elimination of all nuclear weapons;
4. There is an urgent need for all of us to learn from the experiences of other countries, e.g. the downfall of Russian economy due to nuclear arm-race during the cold war;
5. Reaffirmation of the unequivocal commitments of all nuclear weapons states to the goals of complete elimination of nuclear weapons;
6. Reduction nuclear weapons to reduce nuclear danger, including the risk of accidental use of nuclear weapons;
7. Adoptions of measures by nuclear weapons states to reduce nuclear danger, including the risk of accidental use of nuclear weapons;
8. Negotiation on a global agreement among nuclear weapon states and on 'no-first-use' of nuclear weapons;
9. Negotiation of a universal and a legally-binding agreement on non-use of nuclear weapons against non-nuclear weapons states;
10. Negotiations for a convention on the complete prohibition of the use or threat of use of nuclear weapons;
11. Negotiation for a nuclear weapons convention to prohibit the development, production, stockpiling and use of nuclear weapons leading to the global, non-discriminatory and verifiable elimination of nuclear weapons with in a specified timeframe; and
12. The last but not the least if at all India needs to match the West, it should do so in the field of medical research, social awareness, and education and it should not let its people victims of the same mistakes community during the cold war period of former superpowers.

ABSTRACT

What should a modern teacher look like? Today's global changes, the daily development of science and technology and information and communication technologies require a teacher of the XXI century pedagogical skills, sharp will, pedagogical and psychological knowledge, in-depth knowledge of their subject and high thinking, political literacy and reasoning. Educating a person at the level of a well-rounded person is a very complex process, and from time immemorial, mature people of the society have been involved in this activity, especially Abu Nasr Farobi, Yusuf Khas Hajib, Saadi Sherazi, Abu Rayhan Beruni, Abu Ali ibn Sino, Alisher Navoi, In their works, Hussein Wazir Kashifi, Abdullah Avloni and others provided valuable information about the teaching profession, its hardships, as well as the qualities that need to be reflected in the personality of a teacher. Therefore, this article provides information on teaching activities from ancient times to the XII century AD.

KEYWORDS: Teacher, Educator, Pedagogical skills, Education, Upbringing, Personal qualities, Avesto, Etiquette.

INTRODUCTION

When we study the history of education and upbringing, we see that its development, its formation over the years, depends on the activities of teachers and students. From the earliest times, teachers began to look for effective ways of teaching and educating. As a result, the demand for teachers to achieve educational effectiveness has increased since prehistoric times. Various ideas, theories and recommendations for improving the skills of teachers began to emerge.

In the VII-VI centuries BC, with the growth of productive forces in Central Asia, there were also positive changes in social life. Mutual cultural ties have developed between the Turkic and Persian-speaking peoples. Unique methods and tools, forms of education and upbringing, which have been used for centuries to prepare the younger generation for independent life and in accordance with the specific customs and traditions of the local people, began to emerge. The wisdom and methods of the members of the tribe in the fields of diligence, decency, delicacy, friendship, kindness, and humanity, even before school and pedagogical thought, were refined and perfected over the years as the noble fruit of that period. it's our time [1].

By the seventh century, the development of science and culture in Central Asia was marked by the active work of direct educators and the great variety and diversity of requirements for them. From the earliest times of primitive society and slavery, the scribes and teachers responsible for the education and upbringing of children used methods such as admonishing, explaining, encouraging, praising, setting an example, reprimanding, forbidding, coercing, threatening, intimidating. However, the teachers themselves had to have perfect practical and theoretical knowledge in order to educate the child. For this reason, the teachers were selected from among the educated madrassa students and trained for some time [2].

The Avesto, the most ancient and sacred book of Zoroastrianism, "... one of the strongest religions of the past," formed in the land of Khorezm in Central Asia, contains interesting information about the education of children. The Avesto emphasizes that knowledge and education are the most important pillars of life. It is necessary to bring up every young man in such a way that he must first acquire knowledge on the basis of learning to write, and then rise to the highest level with morality. The priestly teachers were selected by the Council of Elders and taught and educated the youth according to strict rules. The rules of teaching and educating children in Avesto are recommended in the following order:

- a) religious and moral education;
- b) physical education;
- c) teaching to read and write [1].

Specially trained teachers enrolled children in schools based on religious education from the age of seven.

After the ceremony of wearing the "holy green dress" in schools, the priestly teachers worshiped the goddess of goodness and kindness, glorifying the supporting forces mentioned in the Avesto. The prayers began with the words: "I promise to remain faithful to Zoroastrianism, **I believe in good thoughts, good words, good deeds** ..." [3]. After the ceremony, teachers handed out gifts to the children. In the course of the lessons, the teachers taught the children to believe in their religion more than corporal punishment, to worship the divine Ahuramazda, the creator of all good and goodness in the world, and to hate Ahriman, who showers evil and wickedness.

As the children grew up healthy and energetic, the priestly teachers were responsible for the complete observance of all the rites of their religion, for a thorough knowledge of the subjects studied, for moral purity, and for possessing such qualities as industriousness, honesty, and generosity. In the Avesto, land, water, and air were declared sacred, and anyone who polluted the environment and violated the rules of conservation was punished with 400 lashes. Preserving and beautifying nature has been ingrained in their minds since their youth [1].

The set of universal values promoted in the teachings of Zoroastrianism had a tremendous pedagogical influence with its ideas of good and evil, ignorance and knowledge, education and upbringing.

At the same time, it is necessary to emphasize the commitment of educators to their profession.

In their works, our great scholars highlighted the subtlety, responsibility and complexity of the teaching profession, as well as its honor, and expressed their views on the skills of the teacher, the requirements for them, views on their qualities, communication skills with students. The creative heritage of the mature representatives of the Renaissance Abu Nasr Farabi, Sheikh Saadi Sherazi, Al Khorezmi, Abu Rayhan Beruni, Abu Ali Ibn Sino, Alisher Navoi, Abdurahman Jami, Davani is an important source for future coaches in the formation of pedagogical thinking [2]. They have been passed down from generation to generation, generalizing and enriching the experience of training teachers and educators who have not lost their value. Indeed, the great thinkers deeply felt that the future of mankind and the prosperity of the kurrai land depended only on education and upbringing. Therefore, educating the harmoniously developed generation with the strength and enthusiasm of teachers has always been their brightest dream. Scientists who lived in our great land called Uzbekistan have a place and respect in this regard. We can cite many examples from the creative heritage of our scholars about the role of the teacher in the upbringing of a harmoniously developed generation.

Abu Nasr al-Farabi (873-930) was a scholar who made a great contribution to the development of the culture of the peoples of Central Asia. Farabi was the first to classify science in the Middle Ages. He called arithmetic, geometry, astronomy and music important educational sciences. The teacher of these subjects emphasizes that the teacher must have perfect knowledge and experience in all aspects. For example, in his works, "... the teacher should not be cruel to his students, nor should he be overly enthusiastic. Because excessive oppression arouses hatred in the heart of the student, and if the teacher is too soft-spoken, the student will ignore him and cool off from the knowledge he is imparting. That's why a teacher can use "hard" or "soft" methods of education, depending on the behavior of the children. In this case, the teacher sets the following requirements for the teacher:

- If students are eager to read and learn, soft methods are used in the educational process;
- If the pupils are arbitrary, disobedient, strict methods are used [1].

Unsurul Maoli Kaikovus's "Nightmare" was the first to describe the history of the development of oratory schools in the East and to provide information about the speakers of that period. This work plays an important role in the spiritual development of man in the current era of global change.

This unique work has been translated into many eastern and western languages.

In the play, Kaikovus says that life experience plays an important role in the mental, moral, and physical education of every age. He described his ways and means that only a good teacher can bring up children by connecting them with life. The book provides a theory of education in the following areas, which should be mastered by young men:

1. Kaikovus on knowledge.
2. About professions and various professions.

3. About marriage and rules of conduct.

4. About physical maturity.

Kaikovus sees teachers as the first sign of morality in his eloquence, and says, "The best of all abilities is the ability to speak." Sukhandon emphasizes to the students that they need to tell the truth in their speeches. There are four types of words:

The first is unknown and unspoken, the second is said and known, the third is both known and unspoken, there is no need to know, but it can be said. The fourth is that he knows and is not told unless necessary. The best is the fourth, that is, the one who knows and the one who does not say. Emphasizes the etiquette of being thoughtful when speaking, not being cold-spoken, humble, not boasting, listening carefully to someone's word. There are also four types of people: the first kind of people know a lot and the more knowledge comes. He says that these are scholars and nobles and that they should be obeyed. The second is trying to know what they don't know, they are capable people and such people need to be taught and educated. The third, unaware of what he knows, needs to be woken up as if he were asleep. Fourth, he does not know and does not even admit that he does not know [1]. He says that these are ignorant people and it is useless to teach them and they should be avoided.

Sheikh Muslihiddin Saadi Sherazi is a great poet and thinker who lived and worked in Iran in the 13th century. He was an experienced coach as well as a philosopher-poet. In "Gulistan" the poet divides the teachers of his time into different categories and describes them. Strict teachers are called "... hard-working, poisonous, bad-tempered, offensive, beggarly nature, greedy, and when they see it, their students are in a bad mood." Another category of teachers is "... a simple, good and gentle volunteer. He would not speak in vain, and words that offended the children would not come out of his mouth. Seeing his angelic morality and kindness, the children ignored the coach. Knowing that he was a gentle nature, they did not even study science. Sheikh Muslihiddin Saadi Shirazi is a great poet and thinker who lived and worked in Iran in the 13th century. He was an experienced coach as well as a philosopher-poet. In "Gulistan" the poet divides the teachers of his time into different categories and describes them. Strict teachers are called "... hard-working, poisonous, bad-tempered, offensive, beggarly nature, greedy, and when they see it, their students are in a bad mood." Another category of teachers is "... a simple, good and gentle volunteer. He would not speak in vain, and words that offended the children would not come out of his mouth. Seeing his angelic morality and kindness, the children ignored the coach. Knowing that he was a gentle nature, they did not even study science. Alkissa wasted no time in games and riots. "

Byte: If the teacher is polite,

The boy plays rock in the market [1].

Sheikh Sa'di gives two different descriptions of this situation. First, both in Saadi's time and in later periods, students were taught harshly in school. Secondly, Sheikh Sa'di saw this with his own eyes and did not object to a harsh teacher, preferring to be strict in teaching and learning:

Abu Ali ibn Sina (980-1037) emphasized in his works that three things play an important role in human development - heredity, environment, upbringing, in which teachers play a responsible role in educating children, approaching these three situations with a sense of responsibility and teachers are the key to success. gives the following recommendations:

- 1) Be calm and serious in dealing with children.
- 2) Focus on the acquisition of knowledge by students.
- 3) The use of different forms and methods in education.
- 4) Control of the student's memory, ability to acquire knowledge, personal characteristics.
- 5) To get children interested in science.
- 6) To be able to distinguish the most important of the given knowledge.
- 7) Carrying knowledge in accordance with the age and mental level of students.
- 8) Achieving that every word is at the level of arousing children's emotions [2].

The great mashayik of the 4th century, Abu Nasir Tusi, in his book *On the Education of Teachers*, wrote: A coach's speech can never be poisonous, rude, and harsh. His inability to behave during the lesson spoils the lesson. "

The great thinker Abdurahman Jami's book "Alexander's Excerpt" states the following about teachers: A coach who behaves inappropriately will never be able to educate children. " The poet describes the role of the teacher in life in the following verse:

If the world were without a teacher,
The world would be black with ignorance.

In the works of Alisher Navoi (1441-1501) special attention is paid to teachers. According to him, everyone should respect and honor his teacher, who has taught and nurtured him, for a lifetime. The work of a teacher cannot be measured by any treasure:

Who in the way of truth has taught you a letter of suffering,
It is an inescapable reward, with a real treasure [1].

Alisher Navoi puts high demands on the teacher, saying that the upbringing of the younger generation can not be entrusted to any random coach. To raise and educate a child, to develop his abilities, it is necessary to be an extremely literate teacher and a skilled educator. Alisher Navoi emphasizes that science and etiquette go hand in hand, that the two processes are inseparable, that a teacher should not only be a teacher, an educator, but also a skilled educator.

Kamoliddin Husayn Waz Kashifi (1440-1505) in his work focused on the teacher-student relationship. He appreciates every teaching that teachers give to their students, and in his work he points out 8 virtues of discipleship:

- greet first;
- speak less in front of the teacher;
- tilt the head forward;
- do not roll your eyes in all directions;
- If you want to talk, first ask permission from the teacher;
- not to object to the teacher's answer;

- not to gossip in front of the teacher;
- Respect while sitting [1].

Speaking about the special role of school and teacher in the upbringing of a child, Kashifi believes that teachers should be wise, educated, sweet-spoken, fair. In his book Akhlaqi Muhsini, the scholar writes about coaches: “A coach must follow the rules of grace and etiquette when instructing and teaching a child. It is not good to give him a reason in public, but it is necessary to talk to a child in a secluded place. If (the coach) knows that the time has come to give advice, he should approach him politely, because in our time it is expedient to be polite and kind. ”

Az Zamakhshari says: “A coach can only be a coach if he works on himself, If he stops studying, then coaching dies.”

It is advisable for all teachers to follow this wise idea, regardless of age, pedagogical skills, or how they teach.

Based on the above information, the following can be concluded:

1. In the upbringing of children it is necessary to use wisely the spiritual heritage left by our great scholars.
2. In the process of education, along with softness, calmness, sweetness, and rigor when appropriate, also ensures the effectiveness of education.
3. It is not in vain that it is said that upbringing begins with the family, upbringing should begin with everyone.
4. The rich creative heritage of the mature representatives of the Renaissance will serve as an important source in the future development of professional and methodological skills of teachers.

ARTILLERY INTELLIGENCE IN THE ARMY OF THE XXI CENTURY

Toxtanazarov Bakhrom Sotimovich*

*Student,
Academy of the Armed Forces,
Republic of UZBEKISTAN

ABSTRACT

The experience of modern military conflicts shows that artillery intelligence plays an important role in the reliable and effective destruction of enemy targets. To do this, a number of requirements are placed on artillery intelligence. Therefore, this article presents the modern means of artillery intelligence, the requirements for them and relevant suggestions for its improvement in the interests of casualties. Modern military conflicts are characterized by speed, rapid change of the situation and the need to make non-standard decisions. By meeting such requirements, the battle can be won. This will require the correct application of the methods and techniques of effective use of means of loss transmission.

KEYWORDS: *Intelligence, Artillery intelligence, Radar station, Unmanned aerial vehicles, Casualties, Data area, Automated fire control system.*

INTRODUCTION

In modern military conflicts in recent decades, artillery has evolved to the point where it has the ability to inflict casualties on the enemy from a long distance in a short period of time. As a result, new concepts such as "Long-range firefight", "Long-distance casualties" have emerged[1].

Direct artillery intelligence plays a key role in the acquisition of such a feature of artillery.

The experience of armed conflict and the analysis of the capabilities of artillery intelligence tools place a number of demands on artillery intelligence in modern combat, in particular:

Reconnaissance capabilities currently cannot detect 35-40% of enemy objects that are primarily to be destroyed at long distances, can not correct firing, so it is necessary to increase the reconnaissance distance;

Increase the accuracy of finding the coordinates of targets in order to reduce the amount of ammunition used to inflict casualties on the enemy. In this case, the error should not exceed 10-30 m for mortar and barrel artillery, 50-60 m for jet artillery;

It is necessary to reduce the transmission time of detected intelligence by 2-3 times [2].

The average range of artillery damage to the enemy is 10-25 km. At such depths, unmanned aerial vehicles can detect enemy objects, obtain reliable information about them and transmit them in a short time (Figure 1).

During the hostilities in the Syrian Arab Republic, the parties made extensive use of unmanned aerial vehicles to obtain information about the location and nature of the target. Unmanned aerial vehicles performed a number of tasks [3].

In particular, it performed tasks such as searching for and identifying enemy objects on the routes of movement, in the area of concentration, in combat mode, determining their coordinates in familiar and high accuracy, transmitting intelligence to state and supporting artillery casualties.

We can also see in the example of Nagorno-Karabakh the use of unmanned aerial vehicles in the interests of casualties. From the videos posted by the parties on the Internet, we can see that the means that led to a radical turn in the tactics of combat were unmanned aerial vehicles.

One of the most effective means of conducting intelligence in the interests of inflicting casualties on the enemy is radar reconnaissance. In recent years, a number of developed countries have been arming their armies with modern radar reconnaissance [1, 4].

The army of the Russian Federation currently has radar systems 1L261, 1L271 and 1L277 (Figures 2,3,4), which have a number of capabilities for reconnaissance of enemy objects, in particular:

Detection and tracking of flying tactical missiles, jet and artillery shells;

High-precision marking of projectile take-off and landing points;

Determine the caliber and category of artillery in the enemy firing position;

Figure 1. Modern artillery reconnaissance vehicle, unmanned aerial vehicle (UAV)

Figure 2. Modern artillery reconnaissance vehicle, 1L261 radar station (RS)

Simultaneous intelligence and surveillance;

To operate even in the conditions of passive exposure of enemy radios;

Capable of detecting, locating and performing other tasks against radar missiles;

Figure 3. Modern artillery reconnaissance vehicle, 1L271 radar station (RS)

The station detects the enemy's firing position in "Intelligence" mode, and in "service" mode determines the point of landing of the shells fired by our artillery vehicles [5].

Equipped with special software, these radar stations were able to operate in an automatic system. These radar stations can monitor twelve to thirty-six targets at a time.

Another advantage of this type of radar stations is that they are light and convenient to carry. For example, the 1L271, 1L277 radar stations have the ability to reconnoiter the firing positions of enemy mortars and other artillery weapons, even immobile targets. Radar stations of this type are currently the only ones.

Modern military conflicts are characterized by speed, rapid change of the situation and the need to make non-standard decisions. By meeting such requirements, the battle can be won. This will require the correct application of the methods and techniques of effective use of means of loss transmission.

Modern military conflicts are characterized by speed, rapid change of the situation and the need to make non-standard decisions. By meeting such requirements, the battle can be won. This will require the correct application of the methods and techniques of effective use of means of loss transmission [4, 5].

Figure 4. Modern artillery reconnaissance vehicle, 1L277 radar station (RS)

It is a complex process to transfer the found intelligence to the relevant authorities, and the decision of the commanders (chiefs) to inflict casualties on the received intelligence is a complex process.

During this time, in most cases, the identified signs have time to change their location. The only way to solve this problem is to have a program that performs

the tasks of creating a data field and deciding on the loss.

Based on the generalization of the above information, the analysis of the experience of organizing and conducting artillery intelligence in armed conflicts, the following can be concluded:

1. Artillery reconnaissance vehicles must be able to detect enemy objects at the depth of impact of the means of destruction.
2. It is necessary to use a complex of types of artillery intelligence (air, optical, radar, sound), as they complement each other.
3. It is necessary to create a software program that offers options for the collection, processing and decision-making of intelligence.
4. Through this proposed program it is possible to gain the advantage of intelligence and firing on the enemy.

ABSTRACT

The history of irrigated agriculture in the Surkhan-Sherabad oasis goes back a long way. Extensive scientific research in the oasis, as well as material sources found during archeological excavations provide the necessary information. The role of the Southern Surkhan Reservoir is especially significant in the prosperity of the Surkhan-Sherabad oasis. This article deals with the history of the formation and saturation of the Southern Surkhan Reservoir (Topolangdarya, Karatogdarya, Sangardakdarya, Khojaipokdarya), which has been operating for half a century.

KEYWORDS: *Massif, "Sherabad JSC", agro-industrial complex, water resources, Surkhan-Sherabad oasis, South Surkhan reservoir, water saturation.*

INTRODUCTION

"Every drop of water is worth it, and life itself requires the development of effective technologies for the efficient use of water resources."

The history of irrigation farming in the Surkhan-Sherabad oasis goes back a long way. In geographical sources, the territory of our region is called Surkhan-Sherabad oasis. This is because both rivers have been the main source of irrigation in the area. This means that the issue of water supply to the Sherabad desert is not on the agenda today. The territory of Surkhandarya region, as well as the south of the Sherabad oasis, had a very perfect irrigation network four thousand years ago. Archaeological excavations in Jarqotan show that the region was highly developed, science and culture flourished, our ancestors were engaged in agriculture, animal husbandry, blacksmithing, as well as jewelry, pottery and handicrafts, at that time people weaved

various fabrics from silk, today the remains of wheat grains. Surprising pottery and the discovery of the remains of well-finished water pipes show that the Surkhan-Sherabad oasis is one of the most developed areas in ancient times.

According to available sources, the Kayron-Angor massif (now the Mustaqillik farm and Angor village in Termez district) was a flourishing oasis of orchards, and crops in the south of the region were irrigated by a canal from the Sangardak spring. The Macedonian (Iskandar) bridge, which runs between the Surkhandarya and Komsomol 30th Anniversary areas (now the BeshKahramon farm), was built as a culvert for the Bandikhan River and was used for this purpose only.

According to the testimony of Arab writers and geographers, the water of the Surkhan River (then called Chaganrud) was used in such a way that it did not reach the Amudarya at all times of the year. Spanish and Chinese tourists and traders say farming is booming in the oasis.

In the V-VIII centuries the water of Sherabad, Topalang, Sangardak, Karatag, Xonaqa, Khojaipok rivers was widely used for irrigation of oasis lands. However, by the 13th century, after the Mongol invasion, the oasis's irrigation system was completely destroyed. Droughts and droughts often affected the lives of the population. Deforestation in the Gissar and Boysun Mountains has led to a decrease in river water. The main occupation of the people of the oasis, who suffered from drought, was cattle breeding and sowing of grain on arable lands.

As a result of the invasion of Central Asia by Tsarist Russia, life in the Emirate of Bukhara changed dramatically. On the instructions of the leaders of the Russian government and with the consent of the Emir of Bukhara Abdul Ahadkhan, a military engineer, Captain B. Kastalsky, in 1898 developed his own project for the extraction of water in the territory of Termez. In 1905, the canal was dug and put into operation. The waterworks were taken from the upper part of the village of Salavot, allowing the city of Termez, its environs, and 40,000 acres of arable land to be irrigated.

In 1909-1911, another Russian military engineer, AG Ananov, developed a project to develop the Surkhan-Sherabad desert. With the consent of the Emir of Bukhara Amir Alimkhan, on February 23, 1912, an agreement was signed between AG Ananov and the Emir of Bukhara MirzoNasrullobov. According to him, 72,000 decares of land in the Sherabad desert were approved for 99 years to draw water from the Surkhan River. 1,200 acres of land around Karakamar, 30,000 acres around Beshkotan, 30,000 acres around Angor, and 6,000 acres around Yangiarik were included in the agreement. Engineer AG Ananov will pay 100,000 soums to the Emirate of Bukhara in December every year for water.

Not only the Russians but also the British were interested in the desire to make a profit by pumping water to fertile lands. So they ask the Tsarist government to lease East Bukhara (as our region is called). This culminated in the formation of the Sherabad Joint Stock Company by the Russians and the British. The main task of the society is to study the subsoil and natural resources of the region. But the war of plunder that has begun will force these things to stop.

As a result of the commissioning of the Zang Canal in 1910-1911, by 1915, the cotton area in the entire Sherabad oasis had reached 4,400 hectares. The area of irrigated lands is about 20,000 hectares, including 1,200 hectares of irrigated land in the Sherabad desert and 850 hectares of cotton fields.

Interest and efforts to study the Surkhan-Sherabad oasis continued after the October Revolution. In 1922, leading scientists from the Central Asian State University (SAGU) conducted research on 300,000 hectares. As a result, in 1927, under the editorship of Professor N.A. Dimo, his book "Soils of the Sherabad oasis, the right bank of the Qizirikdara and Surkhandarya rivers" was published. In carrying out this scientific work, it was used in the design and organization of the state farm "Kumkurgan" (now these areas are transformed into farms "Surkhan" and "BeshKahramon"). During the former Soviet era, more attention was paid to the development of the Surkhan-Sherabad oasis. Hazarbog (1927), Kakaydi(1931), Kumkurgan (1932) canals were dug. The aim was to get the necessary benefits from the fertile lands of the Surkhan-Sherabad oasis, especially the large-scale cultivation of raw cotton, which is valuable in agriculture. Over time, until the independence of our country, the agrarian policy pursued by the former Soviet government has borne fruit, and agricultural crops grown in our oasis have always had to provide the center.

It is thirty years since our native land, Uzbekistan, went down in history as an independent state. In this short period of time, our country has become widespread in the world. It is no exaggeration to say that today there is no nation left on earth that does not know our country, its President and its people.

The reforms being carried out in our country in all spheres are bearing fruit, and today our free and prosperous Motherland is rapidly advancing along the path of its development, as a result of which the Uzbek people are taking their rightful place in the world community with their prestige and high spirituality. Undoubtedly, the basis of these achievements lies in the devotion, kindness, love and, most importantly, diligence of each of our compatriots.

This can be seen in the words of President ShavkatMirziyoyev at the pre-election meeting with the workers of the Surkhandarya oasis: "It is known that Surkhandarya region has a special role in the development of our country with its economic potential, important geographical location and natural resources. It is well known that the Surkhandarya oasis has long been famous for its fertile soil, hard-working farmers who harvest two or three times a year. Personally, I consider the people living in the Surkhandarya oasis to be courageous people who are not afraid of any trials and problems, who believe in themselves, in their own strength, who keep their word. Such a noble, tolerant nation is, without a doubt, able to create its own destiny, its own happiness with its own hands. You have always proved this truth in your recent and distant history, and you are proving it today. " Indeed, if we turn to historical sources, the Surkhandarya oasis is a major material and spiritual center of Uzbekistan and Central Asia at all stages of socio-economic life, the convenience of artificial irrigation is due to the fact that such rivers as the Amudarya, Surkhandarya and Sherabaddarya always bring important minerals to the country. The early and rapid development of agriculture, animal husbandry and handicrafts brought new achievements not only to the oasis, but also to the development of our country, especially due to the thirst for labor, creativity and ingenuity of the local population, as well as the socio-economic, material and cultural development of the country. We will witness. Of course, the role of water, which is considered a generous resource of nature, in achieving such great achievements is incomparable. In this regard, the great philosopher and scientist, one of the seven sages, Fales was right a thousand times when he said, "The beginning of all things is water," "The earth floats on water."

Indeed, water occupies a special place among natural resources. Because the main source of life for all living things is water. There can be no life without water. Our ancestors paid special

attention to keeping water clean and using it wisely. That is why they say, "Where the water runs out, the ground runs out. It is not for nothing that they say, "The struggle for water is the struggle for life." It is said that in Arabia, which is considered to be a hot country, a person who is going on a journey is asked for clear water in the form of a white wish. The hosts were very upset to see that the travelers, who were visiting one of the tribes in the Sahara Desert, were bathing excessively in water. Because they instantly ran out of water that would last the whole tribe a few days. This shows that in countries that need water, the need and respect of the population for water is very high. All their lives they dreamed of bringing water to the deserts and turning all sides into gardens. Indeed, water is the epitome of life. The beloved Uzbek national poet ErkinVahidov writes about this in his poem:

"If you go, there's life in the wide oasis."

So be on the lips of the country, there is novvot,

You are cotton, apple, pomegranate and nursery,

You are proud to drive for Uzbek,

You drop yourself on the ground - drop by drop,

You are the symbol of the people, not the river.

Keep flowing, don't dry up Mother!

Indeed, in our land, the centuries-old dream of our ancestors for water began to be realized by his descendants. They are supplying water to the new lands of our oasis, turning the deserts into gardens and orchards, and contributing unceasingly to the further development of agriculture. In this regard, the South Surkhan Reservoir, which is a dam in the very center of our region, in the Surkhandarya River, has innumerable services.

The construction of this reservoir plays an important role not only in our oasis, but also in the development of Kumkurgan district. It has been 50 years, or half a century, since the dam was built and put into operation last year, saving the necessary water.

It is known that Surkhandarya region is located in the south of the country, the central part of which is the Surkhandarya oasis. The oasis is the main agricultural area in the region. The oasis is bordered on the northwest by the Gissar mountain range and on the east by the Babatag mountain range. Between the Gissar and Babatag mountain ranges are the oases of the Surkhan and Sherabad rivers. Surkhandarya natural-geographical region is rich in water resources. The main rivers of this country are Surkhandarya and Sherabaddarya. The upper reaches of the rivers in the Surkhandarya region flow rapidly in a narrow stream. When it reaches the plain, the core expands and the flow rate slows down. The rivers in the Surkhandarya oasis are mainly fed by melting snow and glaciers and groundwater. The most important river in the country is Surkhandarya.

Surkhandarya is named after the confluence of the Karatag and Topalang rivers (in the Uzun district). The length of the river is about 200 kilometers and the catchment area is 13,610 square kilometers. The Surkhan oasis is located on the right bank of the Surkhandarya River, and its left bank is adjacent to the foothills of the ancient Babatag peaks. The South Surkhan Reservoir was built on the Surkhandarya River. Surkhandarya used to irrigate the Surkhandarya oasis, and the

Sherabad River irrigated the Sherabad oasis. However, during the years of mass desertification, the water of the Sherabad River could not meet the demand. In the village of Darband, which belongs to the Boysun district, located in the upper reaches of the Sherabad River, the project to build the Darband Reservoir has not been implemented. As a result, the water of Surkhandarya was transported through the Sherabad main canal and was widely used in the development of the Sherabad oasis. Thus, the Surkhandarya River reached the lower reaches of the Sherabad River and provided water to the newly developed lands.

The South Surkhandarya reservoir, built in the 1960s and with a design capacity of 800 million cubic meters, is fed by the following rivers:

The Topalang River is a wet and fast-flowing river that forms the Surkhandarya River and is the right tributary of the Surkhandarya River. The length of the river is 124 kilometers, the basin is 5217 square kilometers, and the catchment area is 2200 square kilometers. The Topalangdarya begins with snow and glaciers in the Hazrat Sultan massif, located at an altitude of 3800 meters above sea level in the Gissar Mountains. It is saturated with snow (65 percent of total water), rain (3 percent), ice (6 percent), and groundwater (26 percent). The accumulation increases the volume of water at the expense of dozens of rivers, streams, springs along its flow. The oasis in the mountainous zone of the river is very narrow, inconspicuously small (5-10 and sometimes 20-30 meters). Starting from the village of Zarchob, the river is clearly visible, and its oasis is 150-200 meters, and when it reaches the plain - the village of Sariosiyo, the oasis is up to 2 kilometers. The water consumption of the Topalang River varies depending on its saturation nature. Its water consumption increases from early spring to summer, after which the river's water consumption gradually decreases. In January, the river's water consumption is 11.5 cubic meters per second, in February - 13.8, in March - 28.8, in April - 78.4, in May - 136 cubic meters, in June - in the peak period of the river water consumption reaches 144 cubic meters per second. . The average annual water consumption of the river is 52.5 cubic meters per second. Even before the construction of the Topalang Reservoir on the river, it was an important water resource for the agro-industrial complex of the oasis. The water from the riverbed joins the Karatag River below and turns into the Surkhandarya River, which flows into the South Surkhandarya Reservoir and makes a significant contribution to the southern zone.

The Karatag River is the left tributary of the Surkhandarya River, with a length of 95 kilometers, a basin of 2,424 square kilometers, and a catchment area of 684 square kilometers. The Karatag River begins with an unnamed glacier on the southern slope of Mount Gissar, 4,688 meters above sea level. It is saturated with snow, rain, ice and groundwater. The river increases its water from small rivers in the high mountains, springs in streams and ravines, snow, ice, and its width increases from 60 meters to 300 meters along the stream. Its largest constituent rivers are Sarbin (13 km), Shirkent (65 km), Jalsin (13 km), Payron (23 km) and Saburgan (24 km) on the left.

The Sangardak River is one of the largest right tributaries of the Surkhandarya River, with a length of 114 kilometers and a catchment area of 948 square kilometers. The river begins with groundwater in the Chor-Aigul Mountains at an altitude of 3800 meters above sea level, which is the ridge of the Gissar Mountains. Later along the stream it is joined by many rivers and streams, streams and springs from the right and left streams. The beginning of the Sangardak River from the high mountains ensures that it generates a lot of energy at great speed from the narrow gorges. The river oasis widens to 470 meters near the mountain village of Sangardak. Then the oasis narrows again and widens to 350 meters in the village of Yangakli, and its exit from the

mountain to 500 meters in the village of Kenguzar. Its right tributaries are the Kyzylsay, the Shurab, the Molan-Gur, the Khanjiza, and others. The Sangardak River takes the name of Kizilsuv in the territory of Denau district and flows into Surkhandarya under the same name. The river is wet, fast. It is of great importance in irrigation work. Several canals are dug to get water from it.

The Khojaipok River is the second largest tributary on the right bank of the Surkhandarya River. The length of the river is 97 kilometers. The catchment area is 765 square kilometers, located at an altitude of 3,500 meters above sea level. The starting point of the Khojaipok River is Khoja Bozbarak Mountain. It is saturated with snow, rain and groundwater. The river flows between mountainous and wavy relief forms. To it is added the healing sulfur water from the Khojaipok cave. The Khojaipok River widens its oasis between Khojaipok Cave and the village of Qorliq from 150 meters to 1,000 meters. Starting from the territory of Qorliq village, Yangiariq and Ovchiaryk canals were passed through it. After passing through this village, the river is called the Golden River. The water regime of the Khojaipok River is suitable for mountain rivers. Its annual water consumption varies from 1.82 cubic meters per second to 22.7 cubic meters. The Surkhandarya, formed by the confluence of the above-mentioned rivers and streams, passed through the center of the oasis without any resistance for almost half a century and flowed into the Amudarya. The desire to subdue the flowing water to the human footsteps, to turn it into a barren desert in search of water and life, overwhelmed the people.

During the transition to peaceful post-war construction, Uzbekistan has ample opportunities for the development of cotton, melons, horticulture and animal husbandry in the country through the development of agriculture, efficient use of water resources, accelerated construction of reservoirs and canals. Shortly afterwards, on February 11, 1954, the USSR Council of Ministers adopted a special resolution "On further development of cotton growing in the Uzbek SSR, including the expansion of arable land in Surkhandarya region, especially to increase the area of fine-fiber cotton to 70,000 hectares." On the basis of this decision, on April 12, 1954 in Moscow, the heads of the Department of the Ministry of Agriculture and Water Resources of the USSR A. N. Askochenskiy, V. V. At the meeting, chaired by Poslovsky, the issue of construction and design of the South Surkhandarya reservoir in the south of the Uzbek SSR will be on the agenda.

According to the decision № 22 adopted on the same day, the scientific staff of the Sredazgiprovodkhlopok Design Institute will be responsible for the implementation of this project. The technical design of the South Surkhandarya reservoir is made by the technical control department of water management of the Ministry of Agriculture of the USSR on March 8, 1956 by the order № 29 and on March 30, 1956 by the decision № 2 by the USSR Ministry of Agriculture under the signature of AN Askochensky confirmed.

According to the instructions of the government, the staff of the Institute "Sredazgiprovodkhlopok" will carry out exploration and design work in the upper part of the present-day city of Kumkurgan, on the right bank of the Surkhandarya River, where it is advisable to build a reservoir. During the study of archival sources, it became clear that the project plan had previously included the possibility of building this reservoir in the upper part of Shurchi district and in the area of the current hydropower plant in Jarkurgan district. Of course, people may be interested in why the construction of the reservoir in question was chosen from the Kumkurgan region. This is due, firstly, to the ease of water supply from the territory of Kumkurgan district to the Surkhan-Sherabad deserts through the Bandikhan deserts, and

secondly, to the fact that the reservoir area used to consist of deep ravines, which allows to collect more water in a timely manner. - the creation of conditions is taken into account.

Indeed, water is the soul and blood of all living beings in the world. Where there is water, there is life, there is fruit, and there is blessing. But mastering, landscaping and gardening is not an easy task. How much work is required for this. Probably for this reason, our people have wise sayings such as "One person digs a ditch, a thousand people drink water", "When you drink water, do not forget to dig a ditch", "The water that flows in front of you is worthless".

This reservoir, which for half a century has changed the Surkhan-Sherabad oasis beyond recognition, today has its own achievements and a number of problems. There is no need to hide this fact, of course. What is the problem?

- First of all, it should be noted that at the time of construction and commissioning of the reservoir, it held 800 million cubic meters of water, but today this figure is slightly higher than 350 million cubic meters. This is due to the fact that rain, floods and flood waters, which occur in the spring of each year, flow into the reservoir basin, causing mud and sand to flow along the road. As a result, the reservoir basin has so far lost the capacity to hold almost 450 million cubic meters of water;

- Therefore, secondly, to compensate for the lost water, it is necessary to re-dig the reservoir in order to clear it of mud, or to raise the dam dam?

- and thirdly, settlements, organizations and enterprises located near the riverbed, as well as the discharge of various wastes and garbage into the water by farms, lead to unpredictable pollution of the dam basin. If this process continues, it will be difficult to imagine the condition of this dam in the next hundred years. According to experts, once the Topalang Reservoir, located in Sariosiya district and capable of holding 500 million cubic meters of water, is fully operational, it is likely to release enough water into the South Surkhan Reservoir and turn it into a flowing river like the Jarkurgan hydropower plant. Is this the future of the reservoir, which has been providing invaluable services to the development of our oasis for almost half a century? Therefore, this issue should be resolved not only by the Ministry of Water and Agriculture, but also by the general public with positive results, so that in the end this work will bear fruit. Today, in addition to this reservoir, there are four other reservoirs in the oasis (Topalang, UchqizilOktepa, Namuna-Degrez), but the role and services of the South Surkhan reservoir in the development of the Sherabad oasis should not be forgotten. For example, if at the time of construction and commissioning of this reservoir it was planned to supply water to 122 thousand hectares of arid and arid lands of the oasis, including 45 thousand hectares of newly developed lands, this figure was 142 thousand 448 hectares in 1986, 325 thousand hectares in 1995. to date, it has surpassed about 330,000 hectares. In this regard, we must not forget about the services of the canals that receive water through the Amudarya in our oasis.

It should be noted that today it is expedient to strengthen control over the technical condition of all reservoirs operating in the country and, if necessary, to carry out repair work. The cause of negligence and the consequences of unforeseen events can be seen in the recent floods in the Sardoba reservoir in the Syrdarya region.

In conclusion, we can say that the history of irrigated agriculture in our oasis has its own substantive path, which goes back a long way. Today, knowing and studying the past and history testifies to the love, respect and attention of each of our compatriots to their Motherland.

THE ISSUE OF PUBLIC ADMINISTRATION IN NIZAMULMULK'S "POLICY"

Davlatova Shoiri Shodavlatovna*; **Yuldasheva Zubayda Hamidovna****

*Lecturer,
Termez State University,
UZBEKISTAN

ABSTRACT

This article reflects the ideas of the Eastern thinker Nizamulmulk on the issues of public administration in his work "Politics". Politics is one of the main sources in the history of socio-political thought in the Middle East. This work was recognized by political scientists as a political program of the Seljuk state. In this work, the thinker gave a detailed analysis of the role of the ruler in building a just society. Although it was difficult to draw the line between the state and society during the time of the Nizamulmulk, the wise man was able to distinguish society from the kingdom.

KEYWORDS: *Nizamulmulk - an Eastern thinker who lived in the XI century; "Siyar ul-muluk" or "Life of kings" - another name for the work "Politics"; "Elite" is a French term meaning select, selected; ummol-zakatchi; consensus agreement.*

INTRODUCTION

Abu Ali Hasan ibn Ali Tusi Nizamulmulk is one of the Eastern thinkers who made a great contribution to the development of the elements of the political system of society. He served the Seljuk kings for 30 years. During this period, he fought for a strong centralized state and, compiling and summarizing his observations in this regard, created the world-famous work "Siyasatnoma" ("Siyar ul-muluk") as a guide for many emirs, statesmen and politicians. This work was written in 1091. During his reign, Malikshah Seljuk wrote a treatise on the rules, procedures and methods of governing the state to the nobles and scholars of the palace, instructing them to cite examples from the history and life experience of past kings. This pamphlet emphasizes that it must first and foremost serve as a program in public administration. This work, which is still a program for the heads of state, was written by Nizamulmulk on the orders of Malikshah Seljuk. The first chapter of the work is entitled "On the situation of modern people and the praise of the sultan, the just, the great king, the king." It is in this chapter that the

thinker concludes: "The Lord, in order to test the servants of the king and to know their intellect and knowledge by the pattern of the situation, commanded me to tell them about the virtues and virtues that kings need, the rules that are not obligatory now, and the good and bad deeds. Write a book, and I wrote it, remembering what I saw, what I knew, what I heard, and what I read." He calls this book *Siyar ul-Muluk* (The Life of Kings). The book originally consisted of 39 chapters, was presented to the king, and was pleasing to the king. Nizamulmulk copied it in 1092 and handed it over to the special secretary of the palace, Muhammad Maghribi an-Nasih, to give it to Sultan Malikshah, and set out on his own journey to Baghdad. After Malikshah's death, a struggle for the throne began among his descendants, and Nizamulmulk was removed from the ministry in the presence of the king's wife, Turkonkhotun. Nizamulmulk, who resigned from the ministry, was killed on October 14, 1092, by a hired assassin named Abu Tahir on his way to Baghdad. Muhammad Maghribi managed to publish Nizamulmulk in 1105, during the reign of Ghiyas ud-din Muhammad bini Malikshah.

Politics is one of the main sources in the history of socio-political thought in the Middle East. This work was recognized by political scientists as a political program of the Seljuk state. In this work, the thinker gave a detailed analysis of the role of the ruler in building a just society. Although it was difficult to draw the line between the state and society during the time of the Nizamulmulk, the wise man was able to distinguish society from the kingdom. He knew that the justice of the society depended on the political elite — the ruler, the palace officials, the governors. Because in the medieval monarchy based on feudal relations, where the thinker lived, the task of organizing the activities of society was mainly in the hands of state power. The "Policy" contains information on the management of the state, society, purity of religion and belief, protection of the integrity and inviolability of the country, protection of the rights and peace of citizens for all periods.

In this work, Nizamulmulk discusses the origin of the state, the goals of state-building. First of all, he tries to prove by various rules that one of its main tasks is to establish a just society, in addition to revealing the divine aspects of the origin of the state. In his political and legal views, first, the theocratic approach; second, consensus, that is, adherence to an agreement; third, it focuses on the distribution of responsibilities to everyone according to their abilities.

The thinker considers the existence of the state and its governance as a social necessity. According to him, "Allah subhanahu wa ta'ala raises a man from the people to the throne in every age and era, gives him crafts and pleasant virtues, gives him world peace and tranquility, closes the door through him, and his signature and luxury are the hearts of the people. and spreads it in their eyes, so that people may take refuge in the shadow of his justice, see a day of peace, and wish his kingdom to last forever in peace." The rule of the Nizamulmulk people and the state is also a gift of Allah to the kings, it shows the power of one of the people and gives the state and iqbal. The king, on the other hand, treats the people of his country with knowledge and wisdom, gives them careers, separates his servants from the people, provides them with the necessity and importance of religion and the world, protects the people, and wishes the people to live forever if kings rule the country with justice. he thinks. If one of the servants or mahrams behaves unworthily and realizes his mistake, he should be reinstated, and if he does not change his ways, he should be replaced by another worthy person. He said that if a person does not know the value of blessings, peace and tranquility, he should be betrayed, betrayed, betrayed, exaggerated, put to death, punished accordingly, and abandoned.

In his work "Politics" the thinker said: "Another requirement of governing the state is to dig a sewer and bring water from abroad, to dig large canals for the beautification of villages and fields, to build castles, to build cities, to build beautiful buildings, wide streets and rabots." It is also necessary to open madrassas for Taliban scholars, because in this case the name of the king will remain forever and peace and tranquility will be established in his property. By the power of Allah, these days will remain in the past and will decorate the lives of the previous queens, and will give the people a blessing that no one else has yet received. "

In this way, the king will carry out large-scale creative work in the country, focusing on landscaping, landscaping, construction and education, so that the name of the king and the country he rules will be engraved in the annals of history.

Malikshah's name has gone down in history because of the wise and just rule of the Nizamulmulk. At that time, he built madrassas called "Nizamiya" in Baghdad, Basra and Isfahan. Muhammad Ghazzali taught at the world-famous Nizamiya Madrasa, built by Nizamulmulk in 1067. Well-known astronomer Umar Khayyam was sponsored by Nizamulmulk. Umar Khayyam was invited in 1074 to lead a group formed by the Sassanids to reform the solar calendar. Umar Khayyam did this work and was invited to the scientific and public affairs of the devon. Although Umar Khayyam rejected the offer, Nizamulmulk paid him 1,200 districts a year and created conditions for his scientific and literary activities.

The second chapter of the work is entitled "On the appreciation of the blessings of God by kings." In this chapter, the thinker says: "If the prayers of the people are combined with goodness, the property will become stronger and stronger day by day, and this property will enjoy its state and peace, which will give it a good name in the world and mercy in the world."

Through these thoughts, the author notes that if kings do justice, give alms to the people, do good deeds, receive the blessing of the people, both the property and the state will be peaceful, so that he will make a good name and receive mercy.

The third chapter is entitled "On the King's Acceptance of the Oppressed, His Righteousness and Goodwill." It begins: "The king must receive the oppressed two days a week, punish the oppressors, and listen directly to the words of the people. It must accept and respond to important applications. "

This attitude, expressed by Nizamulmulk in the 11th century, has not lost its significance today, in the 21st century. According to him, if the news spreads in the country that the king will summon the complainants and listen to them twice a week and punish the oppressors, then the oppressors will not be afraid to think about the consequences of their actions. In this chapter, the thinker gives exemplary stories. For example, according to a story, when the Ajam kings built a shop, loaded it on a horse and took it to the desert, its purpose was to go to places to find out the condition of the people, to see the oppressed and to hear their complaints. The story goes that if the king sits in one place, there will be a corridor, a corridor, a door and a curtain. Selfish people and oppressors take advantage of this and do not put the oppressors before the king.

In one of the stories in Nizamulmulk's "Policy", he cites the tradition of the Eastern Muslim states and peoples. It says that the Ajam kings established a procedure for the king to receive the people on the days of Mehrjan and Navruz, which no one opposed. The king made a jar and summoned to him the people who had their affairs, appeals, and complaints. In those days,

people finished their work by agreeing with their statements, evidence if necessary, and witnesses. One day the herald announced to the people another additional decree of the king. The decree said: "Whoever blocks the way of the needy, the king will shed his blood." This means that the king pursued a just policy to ensure social stability in the country at that time, listened to the problems of the people, and had an equal right to appeal to all strata.

According to another story, a more deaf king thought, "Those who translate do not convey the words of the oppressed to me correctly, and I may give orders that do not suit their deeds, without knowing their condition." Let those who see it wear red, and let no one else wear it, so that I may recognize it. " The king himself, sitting on an elephant, wandered in the desert, summoned the red-robed men to his presence, heard their sorrows, and set out to solve the problems of the people by this means. Through this, every citizen who has seen oppression and injustice from thoughtful officials should have the opportunity to file a direct complaint with the governor, the minister, and even the king himself.

The fourth chapter is entitled "On the Status of Officials, Ministers, and Munshis." This chapter deals with the king's knowledge of the condition of officials, ministers, and monks, his control, and his observance of certain procedures in the collection of taxes and levies. The king said, "When giving a deed to the Ummah (zakat), they guide him to live well with the people, to treat them well, and not to ask for taxes other than rent. He should also demand the tribute in such a way that it does not harm the people. "If the tax is taken too early, the people will suffer. They will be forced to sell their property at half price, leave their homes, and become destitute and destitute." Nizamulmulk warns against the destruction of the people through taxes, and the destruction of the people, and for this the king inspects the work of his officials, dismissing them if they fail to perform their duties properly, and therefore entrusts the work to worthy and worthy people. He stressed that if the goods were forcibly confiscated from the citizen, they must be returned to their owners. If an official forcibly confiscates property from a citizen, his wealth should be confiscated and handed over to the treasury, and such an official should be punished so that others do not see the situation and oppress the people, and such an official is not given another job.

In addition, the rulers of the kingdom said, "Ministers and proxies secretly check their condition and how they are doing, because the peace and harmony of the kingdom and the country, as well as their corruption, depend on those ministers. "If the minister is good, if his intentions are not good, the country will be damaged, there will be no way to fix it, and the king will always be upset, upset and distressed." In this way, the Nizamulmulk must pay attention to the activities of the king's ministers in governing the state, and monitor their activities from time to time from the outside, indicating that the king could suffer greatly from such a minister if the minister does not justify the king's trust.

There are several stories from this chapter, one of which states that the king should not forgive the sins of the following four categories of people:

The first is those who committed suicide in his country;

The second is those who look at its harem;

The third is those who revealed his secrets;

The fourth was that they were strangers to the king and secretly plotted against the king with their enemies.

Nizamulmulk, therefore, the king must be vigilant, so that nothing is out of his control.

The fifth chapter of the "Policy" deals with "the question of the owners of iqta (property) and the state of the people." It reads: "The muqattas who have iqta (muqatti-iqta-chek, the owner of property) should know that they have the right to receive the reward from the people only for good, and that people must be safe with their bodies, children and equipment. If people want to come to the palace and report their situation, then they should not resist, and if any muqatta does so, he should cut off his hand, withdraw his iqta, punish himself, and set an example for others." Thus, the thinker emphasizes the need to prevent property owners from harming the public, to ensure their safety in all respects, not to prevent citizens from informing palace officials of their situation, and to take action against property owners if they violate the rules. In his view, property owners should understand that both property and citizenship belong to the sultan. Righteous kings must always care for the weak and inspect the affairs of the property owners every two or three years for the necessity of the country, so that the property owners do not look down on the rights of the subjects. Then the region will be prosperous and administrative.

The sixth chapter of the work is entitled "On the relationship between judges, preachers and muhtasibs and the development of their work." It explains that the king should be fully aware of the situation of the judges of the country, who of them are scholars, ascetics, poor, but humble, should be educated and dealt with. If they do not meet these requirements, they should be fired and replaced by other deserving people, paid to each of them at the required level, and not allowed to betray them. If a ruler rules with anger and oppression, they should be removed from office and punished.

The play even states that provincial governors are obliged to follow the rules of the judge and the Sharia, that those invited to their meetings must attend, that no one should renounce their judgment, so that justice can be done and the state can prosper. It is said in this regard: "The governors of the provinces should follow the rulings of the judge and the Shari'ah, and they should gather such scholars in the palace and not harm their orders and decisions. If a person does not want to go to the meeting of the Shariah governor, he is forcibly brought so that the truth becomes clear and no one refuses the verdict. Since the time of Adam (peace be upon him), there have been many cases in the world where justice has been done in every nation and property, and justice has been done. That is why their property and state have been prosperous for many years."

"Policy" is a work that serves as an example for various aspects of society. It also contains information about the various strata, the duties in the field of religion, or the duties to be performed by the king in matters of religion, sharia. The seventh chapter deals with the study and practice of religion, the Shari'ah, and the like. It is said in this regard: "It is obligatory for the king to study the work of religion, to perform the sunnah of the Messenger, to give his share from the treasury, and to honor and respect the zahid and dervishes." Nizamulmulk also advised the kings to summon the clerics once or twice a week and listen to their interpretations of the Qur'an and the hadiths. One of the stories in this chapter says that the best virtues of kings are piety, and according to another narration, the best sultan is the one who sits with the clergy, and the worst of the scholars is the one who sits with the sultan. He hopes that a just approach will be

formed in the king, who is aware of this religion, and on this basis he believes that any misconduct or actions contrary to the norms of society will not take place.

In his work, Nizamulmulk emphasized moral concepts such as justice, fairness, correctness and honesty, interpreted the political phenomenon in relation to real life, and firmly defended the idea of a centralized state. He put forward the idea that the king should be brave, wise, enterprising and determined. The thinker states that if the centralized government (executive power) is strong in the state, then peace and justice will be stable, the people will achieve their goal, the society will live in peace and justice, mercy.

From the views of the state on public administration in relation to the organization of the political system of society, it can be concluded that knowledge of all aspects of politics and public administration, as well as human life and understanding of their relationship does not belong only to the official or ruler. They apply to all members of society. Therefore, it is possible to ensure the stability of the whole society and to establish justice and build a prosperous life only by making political and administrative decisions on the basis of councils and consultations with experienced, wise and noble people. The main ideas of the work call on kings and governors to justice, peace and kindness, to establish strict rules and regulations in governing the state and society, to honest and faithful officials in various positions, to ensure the prosperity of the country, peace and harmony of the people.

UZBEKISTAN

ABSTRACT

*The scientific article contains theoretical and practical views on the issue of ensuring the ideological and ideological security of the Uzbek people in the transition from national revival to the national upsurge. Concepts are given a philosophical definition and their current development trends are shown. The ideas of ancient philosophers on a systematic understanding of the issue of interest helped to create a unique philosophical paradigm about the "Benefit" of the philosophers of the XVIII century. For example, the French philosopher Paul Henri Golbach, in his book *On the System of Nature or the Laws of the Material and Spiritual Worlds*, said: "Interest is the idea of one's own happiness according to one's character and ideas; are things that one of us thinks are necessary for our happiness."*

KEYWORDS: *Security, Moral security, National ideological and security, Public interest, State interest.*

INTRODUCTION

Over the past 30 years, the people of Uzbekistan have come a long way, consisting of endless struggles and hard work. This path, by its very nature and content, is: the attainment of independence, the struggle to preserve it, and the longing for dependence by some; maintaining peace and igniting the flames of civil war by enemies; justice and injustice; democracy and bureaucracy; finding a bite of honesty and amassing wealth with dishonesty; to think of the fate of the ordinary working man and to dishonestly pursue them in their own interests; adoption of laws and non-enforcement; disobedience to the people's grievances and increased aspiration for power; the rise of corruption in all spheres and the failure to combat it; the destruction of the people's trust in the government by their actions; lack of unity between word and deed; limited access to higher education for gifted ordinary children in higher education as a result of growing corruption in the education system; rising unemployment from year to year; the rise of ignorance

of reality, arrogance, laziness, and bigotry, especially "god-making" of leaders; the deterioration of good neighborliness and, finally, the launch of comprehensive reforms to radically change the economic, political and spiritual situation in the country in the interests of the people (Kuzmina, 2018; Song & Lin, 2010; Survey & 2008, n.d.).

Because if such conflicts are not prevented, the independence of our country will be lost. Because the effective use of such a country with rich natural resources (underground and aboveground), favorable weather conditions, skilled cheap labor, hardworking, educated children is in the interests of the most developed countries in the world.

METHODOLOGY

Therefore, countries such as Russia, China, the United States, Germany, Britain, and France are trying to attract Uzbekistan to their interests by any means, means and methods.

So, what is the benefit? A number of philosophers who lived in Ancient Rome were among the first to answer this question and tried to understand and explain the role of interests in the life of society and the state. As a result, in ancient times, ideas were formed that understood the existence of interests and needs of people working in various spheres of life in relation to social institutions and norms, the decisive role of their satisfaction. For example, Aristotle "believes that the highest goal of human life is prosperity, and that it is achieved by satisfying one's own interests is the result of the need and emerging interests in society through causes" [1.371]. Thus, although ancient scholars did not define the concept of "interest" as a philosophical category, they also had an idea of its origin and formation, its role in social life (Bendini, 2013; Hench, 1998; Schools, 2010).

Thus, the ideas of ancient philosophers on a systematic understanding of the issue of interest helped to create a unique philosophical paradigm about the "Benefit" of the philosophers of the XVIII century. For example, the French philosopher Paul Henri Golbach, in his book *On the System of Nature or the Laws of the Material and Spiritual Worlds*, said: "Interest is the idea of one's own happiness according to one's character and ideas; are things that one of us thinks are necessary for our happiness. So the conclusion that follows from this is that no human being is completely deprived of his or her interests. For example, the interest of the trader is to accumulate wealth. Thus, the object that binds everyone to the idea of their happiness is called interest" [2.311], and another French philosopher, Claude Adrian Helvetius, in his book *On Man, His Mental Ability and Upbringing*: "Interest is the basis of all our thoughts and views." [3.346.], - described and described. It is clear from this that they tried to solve the problem of the object and subject of interest in terms of the human factor living in the existing reality.

MAIN PART

Thus P. Golbach, R. Diderot, K. Helvetius and others saw in the interest the real foundations of morality, politics, social order. In our view, it is not surprising that when they understood the nature of interests as a leading activity, they suddenly came to the correct conclusion that "interests change people's lives".

The famous Uzbek poet and thinker Alisher Navoi (1441-1501), thinking about the driving forces of history, believed that material interests and reason are the main factors determining the actions of people. In doing so, he argues, the first factor prevails, with some rare exceptions. Thus, he said, people's actions are determined by material gain, not spirituality concluded. In one of his

works, Navoi says: "People do not act unless they feel the need. People act out of self-interest, striving for something that benefits. Know that a person does not do what is the result. " Although he was not an economist, Navoi was well aware that material gain was a decisive factor in the actions of not only individual people but of society as a whole. He said: "Satisfaction of the people is a blessing that solves any other complex problems. According to him, it is possible to conquer the whole world" [4.26.].

Many such examples can be cited from the history of social philosophy. However, today we are talking about ensuring the national interests of the people of independent Uzbekistan, the protection of their ideological and ideological security, prepared by a group of Uzbek scholars in the book "National interests and management responsibilities. Principles of Awareness and Vigilance": "Interest is aimed at changing the objects of existence, bringing them closer to the needs of the social subject, that is, it acts as an active force that encourages people to consciously work to change beings. That is why interest acts as the motive of human activity.....interests arise in the process of practical activity of people and under its influence act as a necessary link in the transition of objective and subjective things. Both the reflection and change of social existence in the mind always takes place through interests" [5.12.], In the book "Legitimacy of Reforms" by H.F. Khaydarov: "By interest we mean the subject's satisfaction with the conditions, that is, his various needs we understand the set of attitudes and activities. " [6.49.], although they are correct in terms of the rational essence of these ideas, but they do not clearly define it as a philosophical category.

To clarify the matter, it is first necessary to know what the lexical meaning of the word means. In this regard, the "Explanatory Dictionary of the Uzbek language" states: "Manfaat [Arabic - profit, income] - means material, spiritual, physical and other (visible) benefit, naf" [7.540.]. Based on this word, the concepts of "Beneficiary - has an interest in something, who is interested", "Beneficial - has an interest, has a benefit; useful", "Beneficial - a pursuit of personal interests", "Uninterested - an interest, useless, useless, useless" They are deeply rooted in the language and way of thinking of the Uzbek people in their daily lives. Of course, this lexical concept does not claim a philosophical definition. However, based on the meaning of the word, it can be philosophically defined as follows. Benefit is a system of activities carried out by an individual, person, people, nation, people, state and society for the benefit of any material, spiritual, physical and other benefits, based on the requirements of the necessary objective and subjective factors in reality (Fangel, 1984).

Interests can be divided into several types depending on the object and subject, place in space and time, mode of operation, satisfaction of needs, moral content, and place in politics, social structure of society and other aspects. Among them is the issue of national interest. Because as long as there is a social group, association, organization, national statehood, which represents their legal unity, the national interest also exists as a system of activities of individuals, communities, states, which have their own ontological and epistemological nature.

Finding an answer to the question of what the national interests of the Uzbek people are reflected in the transition from national revival to national uplift is one of the most pressing issues. In this regard, the President of the Republic of Uzbekistan Sh.M.Mirziyov said: "By national progress, we mean the development of our country, raising the living standards and quality of life of our people to a higher level in all respects. No matter what reforms, what changes, what new projects we are implementing today, they are all aimed at a single, great goal. And it is to please our hard-

working, hard-working, noble people, to justify the trust of our compatriots, who are courageously overcoming all the trials of life, to alleviate their burdens." [8.] Based on the rational essence of these views, the concept of "national interests of the Uzbek people" can be philosophically defined as follows.

The national interest of the people of Uzbekistan is a system of activities carried out in order to gain some material and spiritual benefits, based on the requirements of the necessary objective and subjective factors arising in the existing reality in accordance with their national and universal characteristics. At the heart of this are a number of moral and spiritual qualities of the Uzbek people, such as diligence, honesty, gratitude, sharing and justice. When the national interest is not based on the high moral and spiritual qualities of the nation and universal moral norms, it loses its moral basis and leads to a weakening of the implementation of the principles of legitimacy in domestic and foreign policy. This, in turn, ends up disrupting the system of national interests.

In the context of globalization, efforts are being made to ensure the national interests of the people of Uzbekistan, firstly, in the broadest human interest, and secondly, in the relatively narrow sense, the interests of the state, by ensuring their ideological and ideological security (BOBUR et al., 2015).

As the head of our state Sh.M.Mirziyoev said: "Today, the main goal of our life, embodied in our Constitution, is to ensure the full protection of human interests. In order to ensure the interests of the people, first of all, it is necessary to communicate with the people, to know their concerns, aspirations, problems and needs. " [9.114] based on this idea, in order to know the interests and needs of the people, the President Extensive dialogue with the people has been established at the initiative of the people." People's receptions" have been established in all districts and regions. In the past three years, from March 2017 to 2020, the virtual reception of the President received 3644701 applications from citizens. Mutual compassion 3592502 considered [10].

GOVERNMENTAL STRUCTURE

The first direction in ensuring the comprehensive ideological and ideological security of the interests of the people of Uzbekistan is to establish open dialogue with the people. The basis of ideological and ideological security in this area is that the communicating official does not lie, does not promise impossible things, acts at the level of authority given to him. It is clear from life experience that the official's "filling the sheep of the people with false promises" has always led to ideological confusion and paved the way for the formation of ideological consciousness, such as a confident view of state power.

The second direction in ensuring the comprehensive ideological and ideological security of the interests of the people of Uzbekistan is to protect their interests in housing, food, clothing, etc., which are necessary for their vital needs. Thousands of houses are being built in this area, and significant work is being done to meet their needs for food and clothing. For example, in 2019 alone, 17,100 houses were built in rural areas, 17,600 in cities, and a total of 34,700 cheap and comfortable houses [11.]. Ensuring ideological security in this area is primarily seen in the organization of work to provide housing to needy, low-income families, lonely disabled elderly people. Bordiu, who actually owns several houses and fraudulently bought a cheap house in order to profit from the sale of the house, is also one of the ideological perverts. Because they are first and foremost ordinary people, and then "self-interested people" who put their personal

interests above the national interests of the state. Such people are "secular-materialist" who ideologically strikes at the roots of the response of our internal national interests.

The third direction in ensuring the comprehensive ideological and ideological security of the interests of the people of Uzbekistan is to ensure the interests of people in entrepreneurial activities in accordance with the requirements of a socially oriented market economy. As the head of our state Sh.M.Mirziyoev noted: "Entrepreneur feeds not only himself and his family, but also the people and the state. Obstruction of business development is considered to be an obstacle to the state policy, the policy of the President"[12.148.]. So, it is an objective necessity to fully protect the interests of entrepreneurs, who are the "driver" of the development of our country, to ideologically and ideologically protect the policy pursued by the state in this regard. After all, today a lot of work is being done to protect the legitimate interests of entrepreneurs. Among the arsenals of ideological protection of the entrepreneur from the attacks of the "hidden economy" are the values passed down from ancestors to generations as a spiritual heritage. For example, not to overestimate the value of the goods, not to weigh, not to engage in usury, to fulfill the contract on time, to help the widows from the proceeds, and so on.

The fourth direction in ensuring the comprehensive ideological and ideological security of the interests of the people of Uzbekistan is to bring up children who are committed to the noble idea that "the interests of man are paramount." Because, "...our children will either bring us anxiety or benefit tomorrow"[13.91.]

It is well known that in today's world, the conflict of interests for the possession of material and spiritual resources is becoming more and more dangerous. At the same time, the main focus is on the ideological struggle to capture the minds and hearts of more than 2 billion young people in the world. Young people are becoming victims of conflicts of interest. That is why international organizations with great financial resources are trying to attract the youth of Uzbekistan, who make up about 60% of the population, to various conflicts of interest in the world under various pretexts (training abroad, employment, etc.).

The fifth direction in ensuring the comprehensive ideological and ideological security of the interests of the people of Uzbekistan is to ensure the ideological and ideological security of anti-corruption work, which is a hidden force that prevents the full realization of human interests. In this regard, President Sh.M.Mirziyoev said: "Unless all segments of the population, the best specialists are involved in the fight against corruption, all members of our society will not be able to achieve our goals without being vaccinated with the "honesty vaccine". We must move to early prevention of corruption before dealing with its consequences. " [14] This is the worst ideological violation in the implementation of work in this area, which is the fact that in its past and present activities, officials directly or indirectly involved in corruption in large-scale meetings and gatherings on the fight against corruption.

CONCLUSIONS

In conclusion, it can be said that the main national interest of the people of Uzbekistan is to live a free and prosperous life in an independent, free and prosperous homeland. The common national interests of our country today and the commonality of national ideas and ideologies as a matter

of law; "Most importantly, everyone living in our country, every family must feel the effects of our reforms in their lives today. To do this, leaders at all levels must work to ensure the vital interests of every citizen, without chasing interest, numbers, paper. Then our enlightened elders, honorable fathers and mothers, honorable women, dear children, great-grandchildren, and all our multinational people will be pleased with us." [15]

ABSTRACT

Expand the religious, scientific, legal, philosophical worldview in the education of the younger generation by explaining the essence of the works of Imam Termiziy, SunaniTermiziy”, Upbringing a morally mature person by developing an aspiration to national values, National spirituality, the study of the material spiritual heritage of ancestors.

KEYWORDS: *Man, spirituality, Islam, religion, sect, purpose, life, child, upbringing, morality, Hadith, perfection. The study of Imam Termisiy Hadiths should start from the school period”*

INTRODUCTION

A person lives by setting Great Goals for himself in his life. Thoughtful intellect requires patience from man, to strive towards the goal in the owners. In the hearts of ambitious young people aspiring to science, there is an increasing interest in studying the works of great scientists, scholars of Hadith, as a result of the scientific study of the works of Imam Termizi, hadiths recognized by the world, the worldview of the younger generation is growing, the culture of circulation, the culture of speech, moral qualities are of. Describing the books of Abdullah Holidi's Imam at-Termizi, Jome ' as - Sahih, they say that whoever has this book in his house will be as the Prophet is speaking at the House of them.” The president of the Republic of Uzbekistan ShavkatMirziyoyev has initiated creative work with the aim of restoring Imam Termizi's spiritual heritage. On February 14, 2017, Imam Termizi made a decision to open the International Research Center.

METHODS AND METHODS

Philosophical, legal, scientific methods adopted for the article, historical, scientific, impartial and consistent principles are reflected in it, which is an important source in the study of the works of the great Hadith scholar Imam Termizi from the national values of the Uzbek people, in the formation of moral qualities in the field of education. The order of writing hadiths came into being in Iraq in the VIII century of Islam.

In a nutshell, the world of hadiths forms the basis of human rights, spiritual and educational. In it, scientists from various fields of Medicine, biologists, chemists, or literary scientists will undoubtedly discover the field of their field of study. After the Republic of Uzbekistan gained independence, our national values were restored. In the National spirituality, a wide way was opened to study the rich experience of the treasure of ancestors. We began to understand ourselves. In the science of Imam Termizi of compatriot because Sunan is one of the scholars who founded the direction of

“Al Jami-Al sahih” is called, Sunan” Termizi of a convincing collection. The Prophet (S.A.V):” One faqih is better than a thousand ignorant monuments,” those who have been blessed. Because when a person is a faqih, nothing distracts him, he does not hit himself with any currents and groups. On the contrary, he becomes a fixed man in his own way. The greatest of fiqh is healthy. The founder of hanafiya described the science of Imam Khazratiam (rahmatillahialayh) as “fiqhi Akbar”. On Earth, the main majority of Muslims follow the Imam A’zham. In the book” SunanTermiziy, “ these aspects are taken into account (1.6) In the education of Islam Karimov, the first president of the Republic of Uzbekistan, we educate our children on the basis of secular knowledge, as well as the hadiths of Imam Bukhari, the teachings of Naqshbandiya, the termiziyO’gith, the wisdom of Yassawi.” (2. 2 p) „Authentic hadiths, narrated by those who are right and intelligent people, those who are right and intelligent people, are intensive without interruption from beginning to end (without interruption and defect) is a Musnad Hadith.

And Musnad Hadith is just a hadith raised from the Prophet Akram himself. Types of authentic Hadith: An authentic hadith narrated from a church that cannot be reconciled mentally and usually on something false, a church that has the same quality at the beginning, between and at the end of the ticker. Various anti-religious views have been put forward regarding the setting of this church's census. Ahad the news of every single one of such hadiths is called Vahid. , habariVahid “the hadith narrated by one person in the literal sense means the hadith narrated by one person. The famous Sikha (trustworthy) is a hadith narrated by the congregation (more than two) from one imam in common. The Hadith scholars up to Imam Termizi divided the hadiths into two parts. The order of dividing the hadiths into three parts was initiated by Imam Termiziy. Authentic, Khasan, divided into weak species.” 3. (.33)

Alloma Tashkent Prince Jesus has presented several works in the field of at-Termis science of Hadith. His This „ Al Jami'assahih ' (The Book of Sune) has assessed that the most numerous of the benefits among these works, the most compact of the order, is the least work of repetition.

Research results:

Once the Republic of Uzbekistan achieved independence, our national values were restored. The national spirituality opened a wide range of studying the ancestral treasury experience. The understanding of our identity began. Our great compatriot Imam al-Tirmidhi founded the

direction of hadith, Sunan Since they are from muddids, the trustworthy collection is called SunanTermezi. Our Prophet (saas): It is blessed, "It's a one favner better than a thousand Obeds." Because if man is favih, nothing can distract him, he does not hit himself any current and groups. On the contrary, it will be steadfast in its honor. The greatest of jurisprudence is a healthy genuine. Hanafi's founder, Azam (thanks for thanks), described the science of honor, Fiqihi Akbar. On earth, the main Muslims apply to ImamiaAzam. In the book of SunanTermezi, these aspects are taken into account (1 page 6) About the First President of the Republic of Uzbekistan Islam Karimov, we are among our children along with worldly knowledge Hadiths collected by Imam Bukhari, Naqshband teaching, Termez' sities, wisdom of Yassaviya. "(2.2 page), Sahih hadiths narrated that intelligent and intelligent person is narrated from the intelligent and intelligent person, and the council was constantly and is not convenient to the end, a sho (unavailable and without moths) is a muscular hadith. The parn'ad hadith is a hadith as a result of Messenger.

TYPES OF AUTHENTIC HADITH

An Authentic hadith narrated on a church that cannot be allegedly, in the midst and in the end, which cannot be allegedly in the middle and in the end of the circumstances of the false lies. This is a variety of views on how to mark the number of the church. Each of such hadiths of Ahad is called messenger vahid. According to the message of the news, hadith narrated by one person. It is a hadith narrated from one imam in common church (more than two people). "The hadithsters to Imam al-Tarzidi divided the hadiths in two parts. The hadiths were divided into three parts order of the sahih, Hassan, weak. "3. (. 33)

Profounder Tashkent offers a number of works in the field of al-Toshki, which is the best of these works, and the order is the most chorter, the most cheat. The Imam Termizi made special attention to gathering himself of self-interest in the field of hadith science. He endured any difficulties in this regard. After examining the hadiths that read or heard that he recorded them on separate papers. Thus sacrificial hadiths are sahih and dubious hadiths to classes. Hasan. Weak. Divided into adjectives and kinds such as stranger. Imam al-Termizi was powerful to memorize Termizi. Used to meet with the hadithistMuhaddid to Makkah, during communication and conversations. He asks the scholars to learn from hadith. Paper if not a scientist. Take a pen by his brother, Jesus will not be able to find a pencil. Scientist tells the hadiths close to the sixmicTermiziyy is as described as writing on the papers. Behasan involves the scholar to the actions of the Imam Termizi. The scholar purers to seeing that nothing is written on the paper and what you want to take me my time and wanna waste. Imam Termezi said, calming, "Shall I forget the hadiths you spoke" Teacher, on the other hand, holds on the cross to the sense of at-Tiribus by acknowledging the strength of the memory. Imam al-Termizi created in the ninitary century AD during the III century AD during the gold of the hadithology. The first match between Imam Bukhari and Imam Termezi was held in Nalipur, and we will talk about the unparalleled friendship of teacher disciple. Because this attitude and friendship is a great enlightenment, Islam has given great fruit to the world of hadith. Sahih. Two scientists discuss the mostaditions of Hasan hadiths. Imam Bukhari accurately accepts criticism of the Imam Termizi's criticisms and appreciates his knowledge of his knowledge and appreciates it with the following thoughts. , humbly you are me. I enjoyed me more than you, even though you enjoyed. " (3. Page 125) Our samples of Imam al-Termizi Hadiths provide a person who knows man „Search to grave to grave from crowns " „if a person is a man with knowledge”, „May Allah be

cursed to the fatherly weeping "paradise under the legs of mothers" Parent is to respect mother, divinity, and patience, and child upbringing, honesty, straightness, courage, loyalty, courage, loyalty, Orphans - being merciful to Esdays, humility, generous play an important role in the development of the qualities. By explaining the content of hadiths, moral is formed human qualities on the basis of religious - scientific knowledge. Children also study the discipline of Islamic discipline as well as a sense of respect for national values. He embodies oriental qualities. After all, the person who has forgotten his self-spirituality is steadfast in the faith. The independence of the Republic of Uzbekistan has created the opportunity to study national and religious values for our people. The renewal of Islam, which formed in the former Soviet era in our country, has allowed the grantity of religious freedom as a national value as a national value, publishing the works of spiritualitudes in Islam. From the Treasure of Legal Heritage the SunnaiTermizi book of Termizi guides the Muslims to Muslims in the conduct of Islam. Using the cause of the work, one of the reasons for this name is that fiqh, the rules, the hadiths of the rules of the rules. Along with, we are not commenting to say that there is a lot of advice, geniifts, the qualities of such a commentary, and the qualities of this levels, not in the work of the author. The work is divided into several chapters. It performs ablution, salmon, prayer, zakat, fast, and sanction, consent, consent, and consent, jihad, vows, faith, biography, jihad, clothing, clothing. Foods, Beverages, Charms Goods, and Mosts, Tongler, Fardors. Cuts.Hayrihi, and satellite Abranches, prophecies, testimon, permission, and etiquette, etiquette, etc. The qualities of the Qur'an have brought recitation, demursing, prayers, evils, "(4. 53page)

CONCLUSION

In conclusion, it is appropriate to focus on the following. 413 manuscripts of Imam Termezi and Termezi are being studied in libraries around the world and in international research centers. We have 43 manuscripts of Termez scholars in various libraries of Uzbekistan, which are scientific sources in the field of medicine, philosophy, jurisprudence. These sources are currently studied in more than 34 international research centers in foreign countries. President of the Republic of Uzbekistan Sh. Mirziyoyev noted that young scientists and researchers should be brought to the Imam Termizi International Research Center in Surkhandarya to study the heritage of scholars. History teachers, ATM teachers, Imam Khatibs advised to be a primary school in hadith studies, which educates the younger generation. The President instructed the scholars to study history and build a school for religious education near the center.

The Imam Bukhari School of Hadith Studies in Bukhara is intended to be a basic primary school. The hadiths written by our ancestors are of great importance in terms of education, and if they are inculcated in the minds of young people, they will be brought up as mature people with a broad spiritual worldview.

RECOMMENDATIONS

The order of dividing the hadiths into three parts was initiated by Imam al-Termizi, Sahih, Hasan, and Zaif. Species. " 3. (. 33) The scholar Tashkopirzoda Isa at-Termizi has presented a number of works in the field of hadith science, and this "Al-Jami 'as-Sahih" (Book of Sunan) is the most useful, the most concise, and the least repetitive. He assessed. Imam al-Termizi paid special attention to the collection of hadiths that interested him from a young age in the field of hadith science. Imam Termezi and Imam Bukhari have established sincere friendly relations. They describe the books of Imam al-Termizi, Jame 'al-Sahih, and say, "Whoever has this book in

his house, it will be as if the Prophet was speaking in his house." It is necessary to have Termizi's works in every family, to teach children about Imam Termizi and his hadiths, and to inculcate their educational significance in accordance with the child's mind. Man lives life with great goals in mind. It required a person with deep intellect to strive for a goal, to act, to be patient, to seek faith. There is a growing interest in the study of the works of great scholars, hadith scholars in the hearts of young people aspiring to science. As a result of studying the works of Imam Termezi, a world-renowned hadith scholar, the scientific and religious context of his hadiths, the worldview of the younger generation expands and grows, the culture of behavior, speech culture, moral qualities, beautiful meaning in life. A person leaves a good name, a successor of his life during his lifetime, righteous, righteous, throughout the life of his children. There is a similar proverb among our people. It is not for nothing that it is said, "A good man leaves a stain on a garden." The Uzbek people have their own vital roots, spiritual and scientific heritage, material and spiritual resources. Ancestor blood flows in our veins. Our people are knowledgeable, hospitable, tolerant, generous, noble, virtuous, who find themselves with a cocktail of honest bread and share it with their friends. The transmission of such habits from generation to generation relies on the ancestral heritage as spiritual and material food. The content of the works of Imam Termezi is one of the greatest sources of education in human life. Sunan Termezi is an invaluable source in the legal heritage treasury. Every family should love books in order to use the spiritual heritage of their ancestors in the upbringing of their children. If the parents are readers, the children will follow suit. In this regard, Abu Ali Mansur ibn Abdullah al-Khalidi described the books of Imam al-Tirmidhi, Jame 'al-Sahih, and said, "Whoever has this book in his house, it will be as if the Prophet was speaking in his house." It is necessary to have Termizi's works in every family, to teach children about Imam Termizi and his hadiths, and to inculcate their educational significance in accordance with the child's mind. In the child's mind is formed a sense of attention to the spiritual resources left by our ancestors. He strives to be a perfect person to follow the example of great people. A person who is perfect to follow the example of great people. Compare a child to a sapling. Family upbringing, spiritual outlook, moral qualities in relationships, conscientiousness, diligence, entrepreneurship, honesty, integrity are important factors in the upbringing of a child. According to the hadiths, if you feed your child honestly in the process of raising a child, he will grow up to be a pure body, strong in spirit, a believer, a gentle heart, a person who values his parents, a grateful person, and a patient, hardworking and thrifty person. Explaining to the child the moral, religious, philosophical, and legal aspects of the benefits of the hadiths in our way of life as spiritual nourishment, he will grow up to be a perfect human being and develop mentally. The order of writing hadiths in Islam originated in Iraq in the 8th century. In essence, the world of hadith is the basis of jurisprudence, human rights, spirituality and enlightenment. In it, scientists of various fields, such as medicine, biology, chemistry, or literature, will undoubtedly discover the horizons of their fields. After the independence of the Republic of Uzbekistan, our national values were restored. In the national spirituality, a wide way was opened to study the rich experience of the ancestral treasury. We began to understand ourselves. Our great compatriot Imam Termezi founded the Sunan School of hadith. Being a hadith scholar, the convincing collection of Al-Jami 'al-Sahih is called Sunan al-Tirmidhi. The Prophet (peace and blessings of Allaah be upon him) said: "One faqih is better than a thousand ignorant monuments." The Prophet (peace and blessings of Allaah be upon him) said: "If a person is a faqih, nothing can distract him, he will not strike himself into any sects or groups. One faqih is better." On the contrary, he is steadfast in his beliefs. The greatest of

jurisprudence is sound faith. The founder of the Hanafi faith, Imam A'zam (May God bless him and grant him peace), described the science of faith as "great jurisprudence." The vast majority of Muslims in the world follow the school of Imam Azam. These aspects are taken into account in the book Sunan al-Tirmidhi (p. 1.). On education, the first President of the Republic of Uzbekistan Islam Karimov said, "We bring up our children along with secular knowledge on the basis of the hadiths collected by Imam Bukhari, the teachings of Naqshbandi, the teachings of Termez, the wisdom of Yassavia." (p2: 2-) The authentic hadiths are narrated by a person who is correct and intelligent, narrated by people from a person who is correct and intelligent, who is constantly informed from the beginning to the end of the hadith, and who is a shawl and a mulal (uninterrupted and perfect). The Musnad hadith is a hadith that was narrated only by the Noble Messenger himself. Types of authentic hadith: A consensus is a congregation, which cannot be united on the basis of reason and what is usually false. It is a saheeh hadeeth narrated from a congregation of the same quality at the beginning, middle, and end. Ahad Each of these hadiths is called a single message. According to the lexical meaning of "Khabari Wahid", a hadith narrated by one person means a hadith narrated by one person. It is a hadith narrated jointly by a congregation (more than two people) from a well-known imam. Hadith scholars before Imam al-Tirmidhi divided the hadiths into two parts. The order of dividing the hadiths into three parts was initiated by Imam al-Tirmidhi. Sahih, Hassan, Zaif. Species. " 3. (. 33) AllomaTashkopirzoda Isa at-Tirmidhi presented a number of works in the field of hadith. He considered this "Al-Jami 'as-Sahih" (the Book of Sunan) to be the most useful, the most concise, and the least repetitive. Imam al-Tirmidhi paid special attention to the collection of hadiths that interested him from a young age in the field of hadith science. He endured any hardships in this regard. After checking the hadiths he had read or heard from the book and making sure that they were correct, he recorded them on separate papers. Thus the hadiths are sahih and the doubtful hadiths are saheeh. Hasan. Weak. Divided into qualities and varieties like a stranger. Imam Termezi's memory was strong. ,, On his way to Mecca for Hajj, the hadith scholar will meet and talk with the hadith scholars. He asks one of the scholars to teach him a hadith. If you don't have a scientist, take a pen and paper. On the contrary, Jesus will not be able to find the pen. The scholar narrates about sixty hadiths. Termizi moves his hand as if writing on paper. Unexpectedly, the scholar's actions caught the eye of the scholar. The scientist gets upset when he sees that nothing is written on the paper and scolds me as to what you want to take my time and waste.

Imam al-Tirmidhi said calmly, "Shall I recite the hadiths you have narrated from memory?" and has just heard from a scientist. Narrates all the hadiths one by one. The master-scholar, on the other hand, recognizes the strength of At-Termizi's memory and holds his collar. Imam al-Tirmidhi wrote in the third century AH, in the ninth century AD, in the golden age of hadith studies. The first meeting between Imam Bukhari and Imam Termezi took place in Nishapur. We will focus on the unique friendships of teacher discipleship. Because this relationship and friendship has had a great impact on the world of science, enlightenment, Islam and hadith. Sahih. The two scholars discuss the hadiths of hasan a lot. Imam Bukhari correctly accepts the criticisms of Imam Termezi, acknowledges the breadth of his knowledge, and appreciates him with the following thoughts. "With humility, you are from me." I have enjoyed you more than you have enjoyed me. " (3. 125) here are some examples from the hadiths of Imam al-Tirmidhi."From the cradle to the grave - seek knowledge""A man of knowledge will not be humiliated""May God curse the one who cried for his parents." "Paradise under the feet of mothers" diligence, honesty, truthfulness, courage, loyalty, kindness to orphans, humility,

generosity play an important role in the upbringing of children by promoting respect for parents, knowledge, patience, gratitude, family, character. By explaining the content of the hadiths, moral and educational human qualities are formed on the basis of religious and scientific knowledge. Children also learn Islamic discipline and develop a sense of respect for national values. It embodies Eastern qualities. For a person who has not forgotten his spiritual identity is steadfast in faith. The independence of the Republic of Uzbekistan has created an opportunity for our people to study national and religious values. The revival of Islam, which was violated in the former Soviet Union, has given freedom of religion as a national value as a result of independence, and the spiritual heritage of Islam has allowed the publication of works by hadith scholars. Imam al-Tirmidhi's book, *Sunan al-Tirmidhi*, from the Treasury of Legal Heritage, shows Muslims the right path to follow in performing the deeds of Islam. One of the reasons why the work is called by this name is that it contains a lot of rulings and hadiths on the subject of fiqh. It is not an exaggeration to say that there are many hadiths in the play about discipline, morality, and good manners, which are not found in any other author's work. The work is structurally divided into several chapters. It includes ablution, salawat, prayer, zakat, fasting, pilgrimage, funeral, marriage, breastfeeding, divorce, trade, compensation, norm, sayd, sacrifice, vow, faith, verses, jihad, clothing, food, drink, charity, and generosity, medicine, benevolence, and the onslaught of destiny, conspiracies, prophecies, testimony, and the attributes of heaven, the attributes of hell, faith, knowledge, permission, and manners. The virtues of the Qur'an are recited, commentary, supplications, manaqibs, and vices are mentioned. (4. 53p)

The Sunnah is narrated from the Messenger of Allaah (peace and blessings of Allaah be upon him) in explaining the rules of prayer in *al-Tirmidhi*, in the chapters on ablution, and in imparting religious knowledge. "Prayer and almsgiving from unclean money are not accepted from an unclean person." and teaches people to be clean. He states that the key to prayer is ablution, and the analysis of takbeer is salaam.

The five daily prayers and righteous deeds are taught. Jalaliddin Suyuti narrates in his *Qut al-Mughthazi*: Imam al-Tirmidhi's *Sunan* is divided into chapters. This is also a science. Fiqh and jurisprudence are also a science. It is also a science to say the ilal that separates the sahih and the sagim. Mentioning the types of hadith between them is also a science. The names and nicknames of the narrators are also a separate science. Jarh and modification. Determining the narrators who found the Messenger of Allah and those who did not find him is an isnad narration. The names of those who quoted it are all forms of social science. But the details are too many. So the benefits of this work are many. "It is obvious that the works of Imam Termez paid great attention. Because it contains the benefits and qualities that should convey to Muslims. It is no secret that there are important new problems in the eyes of modern people. Among them has a problem that remains available to all nations in centuries. He is also the foundation of this life and strengthening peaceful peace, the guarantee. Peace is one of the most important assignments of God's. For no one can save life and creatures that are the main duty without Him. Imam al-Termizi's work, and *Sunan*, is the same ummahs to live in peace, to be a mutual love, oppression, fighting, boo, rebellion, envy, encouraging such qualities as far as. The Messenger is full of blessed hadiths. I want to bring samples from the wikmathom's hadith of the Prophet (peace and blessings of Allaah be upon him, So that the believing Muslims, who fear God, listen carefully to the hope of the Hereafter, narrate these hadiths of the Messenger of Allah. And I will obey in the name of Allah that you will not enter Paradise until you are believers. You cannot be

believers until you have granted love. The way to form love is to introduce the path of greeting in your middle. They considered the habit of greeting the Messenger of Allah, may Allah bless him and grant him peace, Fortunity to mutual love, on the other hand, interpreted as a guarantee of all deeds and prayers. Another hadith narrated by Imam Thirmazi, our Prophet (saas) blesses, it is also charity to feed the brother's face with a smile. AmbingAmruuMa'ruf, Nahalah Marking is also a charity. It is also charity that the lost person is right. Removing the stone or thorn lying on the ground, they say that your brothers in your chelagen is also under the verdict". President of the Republic of Uzbekistan Sh. Mirziyoyev. Learn the precious heritage of the great scholar who has made a huge contribution to the development of Islam, The Committee on Religious Affairs in the heart of the Middleist of Our Holy Religious values in the spirit of noble ideas of our holy saints in the spirit of good ideas of the Republic of Uzbekistan in order to further develop the younger generation in his heart Muslim Board Surkhandarya Region Khokimiyat In Surkhandarya region, Uzbekistan is in the founder of Muslims, The Imam Termizi is the spirituality of his inheritance He began his creative work for the development of development. On February 14, 2017, he decided to open an international research center of the Imam Termizi. The main tasks of the International City Center of the Imam Termizi include: Textbooks for use in the work of religious education, scientific spiritual education of Islamic education, and religious values in the system of the sources of religious education, and the sources of religious values of Islamic studies, to study the scientific spiritual framework of the sources of religious education, and the religion of the sources of religious values of Islam in the essence of the sources of religious values. Training guides, popular publications, scientific affairs, training, training of scientific affairs, training of scientific affairs, training of scientific practices, development of ancestors, in the spirit of national values in the spirit of loyalty to national values.

The study of the rich spiritual heritage of Imam Termizi should be held in the study of international conferences, mints, exhibitions, trainings, seminars, scientific papers, competitions. (5. PQ 2774. February 14, 2017 y) it is found that the Termez have more than a hundred Termisits. Learning the spiritual heritage of Islam Manuscripts The manuscripts, stony works are studied on the basis of literature. 413 works by German Termizi and 413 Termizis are being studied in the Centers of the World Countries in the Centers of Scientific Publishing. We have 43 manuscripts in various sciences of Termez in various science libraries in Uzbekistan, and the teachings of various sciences are scientific sources in terms of teachings, phisyophies, objective areas, These sources are also studied at the centers of international scientific schooling centers today. President of the Republic of Uzbekistan Sh. Mirziyoyev said the young scientists at the Imam Termizshi Imam Termezi in Surkhandarya needed to study the inheritance. History advised the teachers of history, university teachers, teaching aids in educating the younger generation in educating the younger generation. Scholars gave history of history, presentation on our presentation on the organization of religious education. The school of 'Imam Bukhari School of Hadith in Bukhorum is meant to be a basic school. Hadiths written by our ancestors Education is of great importance and is broken into the mind of young people, and the worldview is raised as a mature, a perfect man.

ABSTRACT

This article examines the development of various branches of science in Bukhara during the reign of Amir Temur and the Timurids, the contribution of MirzoUlugbek to the development of science in Bukhara, as well as the development of the history of culture and art in the Timurid period. During the reign of Amir Temur and the Timurids, Bukhara became one of the cultural and scientific centers of Movarounnahr. Scholars, poets, and artists who grew up in Bukhara contributed to the second renaissance in Central Asia during the Timurid period.

KEYWORDS: Science, Metalworking, Glazed pottery, Darwishism, Madrasa, infrastructure, library, foundation, Poet, Devon, Creation, Even a traveling troupe.

INTRODUCTION

As a result of the transformation of Movarounnahr into a centralized kingdom by Amir Temur, special attention was paid to the development of the central cities of the region. Samarkand, Bukhara, Shakhrisabz and others, which were the central cities of Transoxiana, were to be the centers of economic, political, cultural and scientific development of the kingdom and to be the mainstay of the kingdom. First of all, it was necessary to pay attention to the development of secular knowledge. Amir Temur as an educated man, valued scientific scholars and those who possessed them, and invited educated people from all over the world to his country. Bukhara was the second largest city of Transoxiana during the reign of Amir Temur and the Timurids. In the historical literature, during the reign of Amir Temur, Muhammad ibn Ali ibn Mubarakshah

Bukhari (1340) and Ibrahim ibn al-Mahbubi al-Bukhari on the role of Bukhara in the development of science and culture during the reign of Amir Temur and the Timurids.

MATERIALS AND METHODS

During the reign of Amir Temur and the Timurids, innovations were invented in a number of fields of science. This is especially true of paints and their use. Archaeological excavations in Bukhara have uncovered many types of pottery typical of the Timurid period. When painting the surface of the vessels of the Timurid period, the color of the earlier periods was abandoned, and in a new direction, that is, painting on a bright background of the vessel in blue (cobalt), or painting on a vessel painted in black, began to paint [2, 167]. Due to this color of the vessels of Amir Temur and the Timurids can be easily distinguished from other vessels of the period. This was a sign of the development of chemistry in the period we are witnessing. During the reign of Amir Temur, Bukhara became one of the centers of metal processing. The development of bronze vessels and various metal products is often noted in the historical literature. We can also see that historical sources state that Bukhara was the most advanced in the Movarounnahr in terms of gold extraction and quality [3, 177].

His grandson MirzoUlugbek, who imitated Amir Temur in the field of state and public administration, is distinguished by his significant contribution to the development of science in Movarounnahr. During the Timurid period, Naqshbandiyya (Darwishism) gained political power and took root among the broad strata of society. Under such circumstances, it was natural for religious fanatics to oppose the rule of MirzoUlugbek. Dervishism spread widely in Bukhara. MirzoUlugbek even built a madrasah in Bukhara before the capital, Samarkand, and paid great attention to the promotion of secular knowledge in Bukhara. Because in the time of Ulugbek, madrassas mainly promoted literary subjects. Darwishism, on the other hand, did not recognize anything other than religious books. In particular, he did not recognize the biblical sciences [5, 100]. MirzoUlugbek is well aware that this will lead to a one-sided development in the society and eventually to the collapse. Therefore, it can be concluded that the purpose of building a madrasah in Bukhara was to promote and develop secular sciences.

With the above considerations, we are far from calling MirzoUlugbek against religious knowledge. There are many historical facts and evidences that he mastered religious sciences, including jurisprudence. This made Ulugbek famous among the general public for his education and justice. His knowledge of jurisprudence amazed the scholars of his time in this field. For example, Alouddin al-Bukhari (850/1447) narrated that Abu Hanifa an-Nu'man b. Sabit b. We consider it sufficient to cite the opinion of Zuga (150/767) that Sharhala al-fiqh, al-Akbar is a commentary on the great jurisprudence dedicated to Ulugbek [14, 44].

Ulugbek tried to turn the cities of Movarounnahr, such as Samarkand and Bukhara, into centers of knowledge and enlightenment. By his order he built madrassas in Bukhara in 1417, in Samarkand in 1420, and in Gijduvan in 1433. In madrassas, along with religious sciences, great attention was paid to the teaching of secular (biblical) subjects. We can see that the main subjects taught in madrassas during the Ulugbek period were mathematics (mathematics), geometry (geometry), astronomy (scientific board), medicine (medicine), history, geography, science, Arabic language [2, 83]. MirzoUlugbek paid special attention to the construction of madrassas, where he tried not only to develop science, but also to form a number of infrastructures and solve some problems of the population. For example, the construction of Bukhara madrassahs in

Bukhara in 1417 and Gijduvan madrassas in 1432-33 was one of the measures to form the infrastructure organized by the state and was to serve the beautification of towns and villages [1, 6]. There is some information in the historical literature about the library of Khoja Muhammad Porso, which existed in Bukhara during the Timurid period. The library of Hodja Muhammad Porso was a library built during the Timurid period, which included the Harun, Dunkak, Lake Jafar sites in the Mirabad district; Lands in Kharkash village of Shafirkan district and Uris village in Khutfar have been waqfed. The fact that the foundation document was approved by the Bukhara judge in 810 / 1407-1408 has been preserved in the historical literature [8, 119].

The fact that a number of poets emerged from Bukhara in the field of literature during the reign of Amir Temur and the Temurids can be seen in historical sources and literature. A. Vamberi also provided information about the poetic activity of Hodja Ismat Bukhari and mainly in the palace of Khalil Sultan [7, 268]. Sh.D. According to Mahkamov, Khuja Ismat Bukhari lived in the palace of Khalil Mirzo Temuridzoda and taught him literature. Commenting on his death, he noted that the sources indicate that he was born in 1425 and 1436 [9, 91]. The poems of Hodja Ismat Bukhari (1365-1426) were popularly read even during the reign of the Timurid ruler Shahrukh Mirzo, but when Mirzo Ulugbek came to power, Hodja Ismat did not write a poem, even calling himself a lion by the name of Mirzo Ulugbek. It can be seen that he did not write a poem and later even gave information that he did not write a poem [14, 46]. However, the information in the historical literature is not always consistent. There is every reason to say that ordinary people are satisfied with the state and administration of Ulugbek Mirzo, as well as the beautification activities carried out in the country. The fact that there was no armed uprising against the central government during the reign of Mirzo Ulugbek is the basis for such a conclusion. For this reason, taking into account the fact that the mature poets of his time, the people lived with pain, we can say that Hodja Ismat Bukhari also wrote Mirzo Ulugbek in an honorable poem. He was the scholar who studied Uzbek poetry in the first half of the 15th century. The fact that Rustamov quoted the statement that Ulugbek was also praised by Ismatullo Bukhari, citing the information of Davlatshah Samarkand, serves as a basis for our conclusion [12, 66].

Undoubtedly, Hodja Ismat Bukhari was one of the most mature poets of his time. And for mature people, there are always a lot of people who want to become students. In the historical literature, it is mentioned in the historical literature that the disciples of Hodja Ismat Bukhari, Mavlon Khayoli and Mavlon Kavsari, worked in Bukhara. Babur and Hondamir also report on Saifi Bukhari. He composed a divan of ghazals dedicated to various fields of handicrafts. It is also known that the problem is popular in the genre [12, 19]. The poet Saifi Bukhari, who was a student of Khoja Ismat, is also mentioned by Zahiriddin Muhammad Babur in "Boburnoma" [16, 69]. Babur Saifi gives information about Bukhari and states that he had two divans consisting of ghazals, but he was not engaged in Masnavi writing [12, 48]. Another student of Hodja Ismat Bukhari mentions Qori-Niazi Khayoli Bukhari (d. 1449) as one of the poets who lived and worked during the reign of Ulugbek Mirzo [14, 25]. However, so far we have not found any information about the direction in which he created, the Devon or any of his works. Information about the imaginary Bukhari was provided by B.J. Eshov and A.A. We can see that the Adilovs also mentioned it in general [13, 465]. Mavlon Tohir Bukhari is one of the poets who lived in the 15th century and was born in Bukhara. His real name was Sheikhzoda Tohir and he lived in Herat, the capital of Khorasan, during the reign of Abulqasim Babur, a Timurid. Mavlon Tahir

Bukhari became one of the most famous poets of his time as a result of his poems being read by the people [4, 77].

During the reign of Amir Temur and the Timurids, Bukhara rightly became one of the centers of science in Movarounnahr. In Bukhara, many scientific works were written, copied and donated to libraries. The services of calligraphers in Bukhara are invaluable in carrying out this work. We can see in historical sources and literature that the activities of the calligraphers who grew up in Bukhara are discussed. One of them is the Bukhara calligrapher (even the Nizam). According to his contemporaries, Nizam was unique in seven ways of writing, and his contemporaries even wrote that he could write with his finger more beautifully than a pen [11, 15]. Mir Ali Hirawi is also considered to be one of the most unique contemporaries of his time. In the historical literature about Mir Ali Hiravi, he first served at the court of HusaynMirza in Herat, and later, when Herat became a battleground between the Safavids and the Shaybanis of Iran, he served ShaibaniAbdulaziz Khan in Bukhara and it can be seen that related data have been preserved [16, 44].

The last calligrapher we meet in the historical literature of the time of Amir Temur and the Timurids was Mawlana Mir Ali Kotib, who was born in Bukhara in 1476 and was an incomparable man of his time, as is the case with Nazm. In addition, the death of Mawlana Mir Ali Kotib dates back to 1546 [8, 123]. The art of music reached its stage of development in Bukhara, as it was in all corners of the kingdom during the reign of both Amir Temur and the Timurids. Speaking about the development of music in Bukhara, it can be concluded that during the reign of Amir Temur and the Timurids in all corners of the kingdom, music developed in a unique general direction. The development of music can be considered as a stage of development since the 70s of the XIV century [10, 7]. There was no doubt that the art of music flourished in Bukhara, one of the largest cities in the centralized country. In addition, we believe that there is no doubt that military music, ceremonies, feasts and receptions are different. There is no doubt that one of the tasks of the state is to educate such musicians and their performers. In the historical literature, Bukhara is mentioned as one of the centers of music development during the reign of Amir Temur and the Timurids [2, 187]. There is every reason to say that during the reign of Amir Temur and the Timurids there were groups of traveling artists. They toured towns and villages. Historical literature preserves that a traveling troupe of 9 people led by MaksudaliMirjon Hafiz set out from Herat and performed in Termez, Shahrisabz, Samarkand and Bukhara [2, 195].

CONCLUSION

It can be concluded that the traveling troupes, which make a living through theatrical performances, often come to Bukhara as well as other cities, and on the contrary, the traveling troupes organized in Bukhara enjoy the art of the people of other cities with their crafts. In conclusion, during the reign of Amir Temur and the Timurids, Bukhara became one of the cultural and scientific centers of Movarounnahr. Scholars, poets, and artists who grew up in Bukhara contributed to the second renaissance in Central Asia during the Timurid period.

THE ROLE OF THE BAKSHI ART IN OUR NATIONAL SPIRITUAL VALUES

Gulchehra Uskinovna Akhmedova*

*PhD Student

Department of World History,
Termez State University, Namangan
UZBEKISTAN

ABSTRACT

This article deals with discussing the role and importance of the art of bakshi in further strengthening and developing the centuries-old national spiritual values of the Uzbek people. Also, a scientific analysis of the importance of large-scale reforms in the country since the early days of independence to further develop the art of bakshi, which is the most unique form of folk art.

KEYWORDS: *Folklore, Bakshi art, Alpomish, Gorogly, National values, Spiritual maturity, Heroic Epics, Education.*

INTRODUCTION

Today, one of the important issues in our country is the formation of a generation of national pride, honor and dignity to comprehensively protect the interests of the nation, people and the state. Only a country that embraces and shares such universal values as humanity, goodness, and integrity can be close and understandable to the peoples of the world and be accepted by the world community. Human freedom, his glory and dignity are the highest values of our society, and these high values are enshrined as the most important aspects in our basic encyclopedia [1.8]. Sh. Mirziyoyev, President of the Republic of Uzbekistan paid special attention to the role of folklore, which is our ancient national values, culture and unique art, in the spiritual development of a harmoniously developed generation. "If we do not work together today to preserve this unique art, tomorrow, unfortunately, it will be too late, future generations, history will not forgive us." [2].

In particular, we are very pleased that today in our press, radio and television, literature, cinema and theater, in general, the immortal history of our ancestors, who made a great contribution to

human development, is widely covered, and on this basis a sense of pride in their spiritual heritage. And it should be noted with pride that the centuries-old examples of folklore (the art of bakshi) have a special place in the education of the younger generation and the further strengthening of our spiritual values [4.2].

MATERIALS AND METHODS

When we talk about the creation and importance of Uzbek national folklore (folklore, bakshichilik), it is worth noting the views on the creation of this art form and its branches. Folklore - (English) -folklore, folk-folk, lore-knowledge, science, i.e. folk art [5; 47] and includes works created by the people and common among the people (fairy tales, epics, songs, lapar, parables, proverbs, parables, riddles, etc.). When we say folklore, we mean the oldest works of art that are equal to humanity and grew with it, and they have certainly played an important role in the national and spiritual education of the Uzbek people for centuries. Examples of folklore have a special place in the development of patriotic ideas. We have always been accompanied by the heroic people of such a great country as Alpomish, Tomaris, Shirak, Jaloliddin Manguberdi, Temur Malik, who are considered to be the great heroic epics of the Uzbek people. [6; 47] It has also found expression in the history and national customs of our people, in proverbs, songs, fairy tales, epics and other genres. It was customary for the people to call their oral creativity national values. Folklore is called folklore in science. The term was coined in 1846 by the English scientist William Thoms, meaning "folk wisdom" [7; 147]. In fact, folklore means all works of art created by the people.

RESULTS AND DISCUSSIONS

The art of bakshi also has a special role in the oral art of the Uzbek people. The special significance of this type of art is that the role of representatives of folklore (bakhshis and schools of bakshi art) in the transmission of such a spiritual heritage from generation to generation is great. Through their efforts, our invaluable spiritual heritage has survived to this day, and the younger generation is enjoying it. In particular, if we talk about the history of the Alpomish epic, the role of the Bakhchisarai art in the transmission of the thousand-year-old epic from generation to generation as an example of oral creation (written in 1932 by linguist Khodi Zaripov) is invaluable. Bakhshi and epic words, in essence, are twin words, and just as they are inseparable from each other, these words also complement each other in content. The word bakshi (bakshi) is a Turkish word in dictionaries, meaning coach and teacher, and in general, such interpretations as educator, leader, guide are also embodied in it [8; 69]. The term epic is broad, a voluminous work composed of poetry and prose with a specific semantic system, with a series of protagonists, attention to detail, and coherence of events. This means that the terms bakhshi and doston, or bakhshi and dostonchilik, have a predominant status in the world of applause in the form of bakshi, which interprets the meanings of the bakhshi and reaches the heart of the people.

We should note that the leading bakhshis and the schools they created played an important role in the good development of the art of bakshi in the Surkhandarya oasis. In particular, in the early twentieth century, schools of bakshichi, such as Sherabad, Boysun, became famous for their style of performance. The fact that the bakshi poets who studied in these schools amazed many listeners with their works testifies to the importance of these bakshi schools [9, 14]. Boysun-Sherabad bakshi school is located in Surkhandarya region: Sherabad, Boysun, Jarkurgan and

Denau districts, Guzar, Dehkanabad districts of Kashkadarya region, Chorshangi district of Turkmenistan, Qabadion and Shartuz districts of Tajikistan. [10; 124] These were Bakhshi Shernazar Berdinazar, popularly known as Sherka bakhshi (1855-1915), who in turn was educated by Kosimkor bakhshi (who lived in the second half of the 19th century), and Kasimkur bakhshi is a student of the poet Bobo bakhshi. Bobo Bakhshi lived and created in the first half of the XIX century. Students of Shernazar Bakhshi: Mardonakul Avliyokul oğlu, Ahmad captain, Saodat centurion, Chori centurion, Normurad Shernazar oğlu, Jora Eshmirzo oğlu, Khudoykul Laqay, Eson Shomurod oğlu and others. Khaliyar Abdunazar Karim oğlu, a student of the centurion, was born in 1897 in the village of Padang.

The folklorist Hodi Zarif visited Boysun and wrote the epic "Amir fled" from Abdunazar Bakhshi and several other poems in 1929. Umar, the son of the poet Safar, one of the founders of the Boysun-Sherabad school of bakshi, recited about 20 epics and hundreds of poems. The current Sherabad-Boysun bakshi school teachers are the successors of Sherka bakshi, Kholyor bakshi and Umur bakshi. Abdunazar Poyonovs from Munchok village and Shoberdi Bakhshi Boltaev from Khamkon village are among them. Their students Shodmon Egamberdi, Ural Rakhimov, Yuldash Suvonov, Bakhtigul Boboeva [11; 124] also contribute to the development of the art of bakshi. The history of generosity and epic poetry we are talking about, its spiritual foundations, as well as its place in our national values and its historical significance is closely related. Only a country that embraces and shares such universal values as humanity, goodness, and integrity can be close and understandable to the peoples of the world and be accepted by the world community. Only equal, mutually beneficial relations can be established with them. "A person's perception of what nation he or she belongs to is not just an idea, but an emotion. This feeling is embodied in a person in the form of understanding, feeling the history, psyche, current state and characteristics of the nation. If a person does not have national consciousness and pride, it is difficult to imagine that he will understand his national values unless he/she feels that he/she belongs to any nation. As long as nations, national ideologies exist, national relations, national feelings and national values will be preserved [12.59]. Attempting to deprive a nation of national values is the greatest crime before history and humanity.

Values are the wealth of our society, our national pride, and respect for national values is the key to a nation's self-respect. Our national values, formed over thousands of years, together with the cultural and spiritual riches created in the present, accelerate our development and help to ensure ideological and spiritual purification. Therefore, the careful preservation, protection and promotion of values is of great importance both in the life of the individual and in the development of society.

CONCLUSION

In conclusion we can say that above, we have focused only on the main types of values. Values are not limited. Most importantly, one of the most important tasks is to convey the role and important educational value of our national spiritual values in the upbringing of the younger generation.

Department of Primary Education Methodology,
Fergana State University,
UZBEKISTAN

ABSTRACT

Tradition is a material and spiritual value that is inherited from the past to the future, passed down from generation to generation, and manifested in various spheres of society. There are national, cultural, domestic, socio-political, religious and other traditions. This article deals with the overview of the national values, especially about morality in upbringing young people over centuries and based on the views in the history of pedagogical education.

KEYWORDS: *National values, Traditions, Material value, Spiritual value, History, Pedagogical education.*

INTRODUCTION

Tradition is a material and spiritual value that is inherited from the past to the future, passed down from generation to generation, and manifested in various spheres of society. There are national, cultural, domestic, socio-political, religious and other traditions. Values are formed in the process of historical development of nations. People's lifestyles and material conditions affect the formation of various values. Certain social rules, morals, customs, rituals, etc. are manifested as values: a) socio-historical phenomenon; b) an integral part of the processes of public life; c) criteria for determining the lives and activities of people; g) can be described as one of the spiritual factors in the management of society and people. National values are also a means of educating the young, teaching them the experiences of the older generation. Each epoch has its own values, which change over time, become richer in content, some disappear, and new ones emerge. Also, the A.s of one time may not correspond to the second time. National values that do not meet the requirements of the period are forgotten. The national values of each nation also reflect the way of life, level of cultural maturity, national consciousness and image of that nation. It is wrong to approach the national values of one region or people from different ideological and

partisan points of view, to evaluate them from the point of view of another region or people. The Uzbek people have ancient national values, which are still widely used today. These include respect for the elderly, kinship, closeness to the community, loyalty to the people, hashar, hospitality, respect for bread, and more. In Uzbekistan, Navruz, Independence Day, Constitution Day, Eid al-Fitr, Eid Ramadan and other national holidays have become popular.

MATERIALS AND METHODS

A Spanish philosopher has devoted his entire life to the study of the customs, values and morals of the peoples of the world. He visited our country and visited Tashkent, Samarkand, Bukhara. When he returned to his homeland, he said, "I have agreed to exchange all the work I have studied so far for the etiquette, material and spiritual values, and courtesy of a fifteen-year-old Uzbek girl who gets up and puts her hand on her chest." His impressions identify that we should be proud of the fact that we are the children of such a high moral, civilized nation. Indeed, our people have always been rich in moral qualities and values. When raising our children, our ancestors paid great attention to their behavior, speech, how to behave in front of people, what to think about, and how to explain their goals in words. They did not allow their children to be rude, to interfere in the conversations of adults, to do anything wrong. These things were considered the most important aspect of child rearing. In our recent history, we have abandoned the thousand-year experience of oriental upbringing and morality as a "legacy of antiquity", forgetting our own permission. A "new morality" based on immorality, shamelessness, drunkenness, hatred of our ancient heritage was forcibly promoted. Today we all see the results of this "European etiquette", the tragedies that befell our people, the damage they did to our spirituality.

Types of values:

1. Values related to the material environment in which a person lives.
2. Morality reflected in traditions, customs and ceremonies Values.
3. Labor formed on the basis of human intellect and practical activity

Skills and abilities, knowledge and experience, abilities and talents

Values.

4. Community, cooperation, goodwill, solidarity between people values that are reflected in the relationship.
5. Related to people's age, occupation, and sex and race values.

Values can be studied in different forms and types:

1. Universal values.
2. Regional values.
3. National values.
4. Religious values.

It is known from history that the Eastern etiquette has been formed and perfected for thousands of years on the basis of the rules of Islamic education. For example, the content of the verses of

the Qur'an, the hadiths of the Prophet Muhammad, the books of oriental scholars and philosophers have served as the source of our education. Islamic education covers all aspects of Muslim life, even the smallest details. It covers everything from breastfeeding babies to how they dress, to how they eat, to how they behave on the streets, in the presence of adults. Most importantly, Islamic etiquette stipulates that children should be brought up in the spirit of honesty, purity, diligence, knowledge, and respect for adults, especially parents. The hadiths of the Messenger of Allah, (may Allah bless him and grant him peace), says: "In addition to honoring your children, improve their morals." It is no coincidence that another hadith states: "The best of what is given to a believer is good behavior." Our ancestors have always strived to bring up a well-rounded human personality and to educate their children, the youth of the neighborhood and the whole society. In raising young people, they were not divided into "my child" and "your child". Discipline was seen as a conscientious duty of all. Mankind was born, always looking for the perfect emblem, striving for perfection; seeks the path of spiritual salvation. As a result of this aspiration, incomparable sacrifices have been made in the field of spirituality.

The idea of the perfect person implies the Uzbek people pay great attention to the development of people who are perfect in their culture and spirituality. As a result, such perfect people as Al-Zamahshari, Abu RayhanBeruni and Al-Farabi, Abu Ali ibn Sino and Al-Khwarizmi, Amir Timur and Ulugbek, AlisherNavoi and Babur, Ogahi, who had intelligence, encyclopedic knowledge and ability for centuries, emerged and known to the world. As our people lived proudly, worked, constantly strived for freedom and liberty. We know that Abu Ali ibn Sina as a great encyclopedic scientist in medicine, mathematics, astronomy, physics, chemistry, biology, pharmacy, psychology, physiology, philology, was a mature scholar of many disciplines such as philosophy, ethics, aesthetics and physical education. His intellect and the works he created are the greatest not only in Central Asia, but also in the countries of Eastern and Western Europe. In the face of his perfection, the mind marvels, because man thinks deeply about the truth. In order to embark on the path of perfection, he seeks the identity recognizes the world. When AlisherNavoi called for "perfection of my profession", he meant many qualities necessary for perfection. If a person does not purify himself from such inclinations as greed, lust, ignorance, ignorance, he will never be perfect. AlisherNavoi wanted man to rise to the status of a world child. Hudtsi considered this position to be the highest peak of perfection. Navoi in his time called perfect people "people of meaning". "All meaningful" are these like-minded people. There is no depth of meaning in the minds of thoughtless people. To think is to understand the truth. By "all meaning" we mean those who are wise and prudent, humble and noble, truthful and selfless. People with such qualities will be broad-minded. For in them the intellect is not developed from ordinary words and concepts, but from the gifts of religion, justice, fairness, faith, and love. According to AlisherNavoi, the meaning of the covenant, that is, meaningful people, are spiritually mature individuals. The epic "Hayratulabor" describes the qualities of a mature person in the spirituality, such as goodness, generosity, purity, modesty, kindness, kindness, modesty, humility, loyalty, contentment, honesty, generosity, and the ways of spiritual maturity. According to Navoi, bringing up the younger generation meant that cultivating them as people-oriented and educated people with the best qualities. Upbringing plays a leading role in this, but Navoi says that just as there are gifted children who are influenced by upbringing, there are also children with bad behavior who can be corrected. The child repeatedly emphasizes the superiority of upbringing in the development of the individual.

People strive for perfection - perfection, with beautiful qualities, good qualities, and pure hopes like light. By tasting all the bitterness, pleasure and pain, hard work and hardship of life, they acquire the ability to live and create, to learn from them; man has embarked on an enlightened path, drawing conclusions from all the experiences he has experienced over thousands of years. The gift of intellect bestowed on man in the world is such a powerful force that he can educate himself in any way he wants, overcoming and solving any suffering, any evil, even the most complex problems with the gift of intellect. Spiritual perfection creates a lofty abode of goodness in the human heart. The perfection of the intellect is achieved through reading, studying, analyzing, comprehending, believing, and gaining life experience. Just as the transformation of a young sapling into a prosperous tree depends on its care, so that the human child can grow into a perfect human being, care must be taken to bring him up from the ground. Our country is on the path of development with steady steps. This path is a path of national characteristics, of values, restoration, preservation, development, awakening of our national pride, perfection on the basis of ideology based on patriotism and universal values. There is an urgent task to shape the personal qualities of the younger generation such qualities as national etiquette, national beliefs, faith, which could not be studied in the former Soviet theory of education. Thus a new pedagogical direction was born, which included the formation of the above qualities. Indeed, national education is a pedagogical goal and condition of national independence of Uzbekistan. National upbringing serves to strengthen and bring up children who are ready to implement the state independence of Uzbekistan. There are specific theoretical problems of the work to achieve this goal. "What qualities should children who are ready to realize and strengthen the independence of Uzbekistan have?" is a matter of obtaining clear, experience-based answers to the question. All this creates the need for scientific substantiation of the criteria of education of national independence in schools of Uzbekistan. Criteria for the national upbringing of students in schools of Uzbekistan are determined on the basis of the principle of inculcating qualities that are directly related to the nationality of the person, which has become more relevant due to independence. In defining the criteria of national education, it is necessary to develop the ideological qualities of independent Uzbekistan: national pride, patriotism, values, culture of interethnic communication, national etiquette, conscience, faith, ideological consciousness of national independence. Negative qualities that reflect them: national indifference, patriotism, treachery, nationalism, localism, unscrupulousness, ideology, etc., should be aroused only. The integration of these activities should be taken as a special criterion by the teacher-educator. In determining the criteria of national education, the young, intellectual abilities of young people are taken into account. Understanding the natural, spiritual, geographical and national characteristics of Uzbekistan; gaining an understanding of the country's past, present and future; Knowledge of the services of the heroic children of Uzbekistan, the Uzbek people; Knowledge of the state symbols of Uzbekistan. Understanding one's ethnicity; To understand the cultural essence of the concept of "Uzbek people", to understand themselves as children of their own nation, to understand their national duties and values; endless love of the mother tongue, speaking and thinking correctly in that language. First greet, then start the speech; to know the patterns of behavior of the Uzbek people, which are considered "good" and "bad" to "everyone", to respect the elders and the younger ones, to know the duties of friendship; respect for teachers, to understand the differences between good behavior and bad behavior, to express a positive attitude to good behavior, a negative attitude to bad behavior, to learn to speak openly in the heart.

CONCLUSION

In conclusion, one of the inherited traditions of our ancestors is a material and spiritual values passed down from generation to generation, and manifested in various spheres of society from the past to the future. There are national, cultural, domestic, socio-political, religious and other traditions such as the national values, especially about morality in upbringing young people over centuries and based on the views in the history of pedagogical education.

UZBEKISTAN AS A LEADING INITIATOR IN CENTRAL ASIA

Durdona Iskandarovna Madaminova*

*Senior Lecturer,
Department of International Affairs,
Candidate of Political Science,
Tashkent State University of Oriental Studies,
UZBEKISTAN

ABSTRACT

This article provides a detailed analysis of the projects and initiatives implemented in the foreign policy of the Republic of Uzbekistan, as well as the expected plans. It is proved by important facts that Uzbekistan is one of the leading countries in the Central Asian region as a country with an important geostrategic position. At present, the achievements of Uzbekistan as one of the key players in international relations and its work in establishing cooperation within the region are highlighted. In addition, the initiatives of the President of the Republic of Uzbekistan in the process of consolidating peace in the Islamic Republic of Afghanistan and the new stages of cooperation between the two countries were covered in detail.

KEYWORDS: “Nowruz Summit”, Integration Processes, Economic And Humanitarian Cooperation, Transport Infrastructure, Regional Security, Potential Investors, “Road Map”, “Mazar-I-Sharif-Kabul-Peshawar”.

INTRODUCTION

Located in the heart of Central Asia, Uzbekistan is an important link between all countries in the region and a major catalyst for regional cooperation. As a result of the dialogue that has taken place in recent years, a completely new climate of trust has been created in Central Asia, and relations based on friendship and good neighborliness are strengthening. Since 2017, our country has been pursuing an open foreign policy in all areas in order to ensure mutually beneficial cooperation and security in the region.

First of all, the arrival of ShavkatMirziyoyev as President of Uzbekistan had a positive impact on the environment in Central Asia. In other words, there has been a revival in relations between the countries of the region, which has not left out the attention of other major countries and organizations but has increased their interest in the region.

As a state in Central Asia, Uzbekistan has put forward major initiatives of regional significance, which have been warmly welcomed by neighboring countries. First of all, we have made great strides in resolving the border issues that have accumulated over the years with our neighbors Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Tajikistan. It has also radically changed the environment in the region and strengthened good neighborly relations. It is no exaggeration to say that this, in turn, will serve as a basis for Uzbekistan's initiatives in the region.

First, Uzbekistan has resumed integration processes in Central Asia that were stalled many years ago. President of Uzbekistan ShavkatMirziyoyev proposed to hold regular consultative meetings of Central Asian leaders in November 2017 as an important mechanism for strengthening regional cooperation and mutual trust, as well as for the timely resolution of existing problems, and this initiative was supported by the countries of the region. In particular, the first summit of Central Asian leaders was held on March 15, 2018, in Astana (now Nur-Sultan). The heads of state called the conference a consultative meeting. However, Turkmen President Gurbanguly Berdimuhamedow was unable to attend the meeting due to his visit to Qatar. In fact, it was a protest against Tajik President EmomaliRahmon, who refused to participate in the Turkmenistan-Afghanistan-Tajikistan railway project. The date of the second consultative meeting dubbed the “*Nowruz Summit*”, has been delayed due to similar disputes¹. The summit discussed issues of expanding political, trade, economic and humanitarian cooperation, joint fight against terrorism, extremism, drug trafficking, and arms smuggling, strengthening security and stability. It was recognized that Central Asia is not only a geographical and geopolitical, but also a unique cultural and civilizational space.

One of the important practical steps in the implementation of the initiatives put forward by the President of the Republic of Uzbekistan ShavkatMirziyoyev from the rostrum of the 72nd session of the UN General Assembly is the International Conference “*Central Asia: one past and a common future, cooperation for sustainable development and mutual prosperity*” in Samarkand on November 10-11, 2017. It was attended by delegations led by Central Asian foreign ministers, high-ranking official delegations from the CIS, Europe, Asia, and the Americas, heads of more than 10 international organizations, as well as more than 100 foreign experts and media representatives. At the conference, the President of Uzbekistan proposed the establishment of associations of governors and business circles of the Central Asian border areas. This initiative is currently reflected in the development of interregional cooperation in border areas.

On June 22, 2018, the UN General Assembly adopted a resolution “*Strengthening regional and international cooperation to ensure peace, stability, and sustainable development in the Central Asian Region*” initiated by President ShavkatMirziyoyev. The document was co-authored by 55 countries in Europe, the Americas, Asia, and Africa, and the resolution was unanimously supported by all UN member states.

The resolution recognizes the important role of the Central Asian states in ensuring peace and sustainable development in the region, as well as in strengthening regional and international cooperation.

The document states that the General Assembly will support the efforts and initiatives of the Central Asian states to strengthen stability and economic cooperation in the region.

On November 29, 2019, the Second Consultative Meeting of Central Asian Leaders was held in Tashkent. An important aspect of the meeting was the participation of the leaders of all countries in the region. This will play a special role in addressing the various issues between these countries and finding effective solutions. The Presidents of Central Asian countries discussed issues of transboundary water use, development of transport infrastructure, border regulation, and regional security. During the talks of the Second Summit of the Heads of State of the region, the President of Uzbekistan also put forward an initiative to hold an international tourism conference and create a single tourism brand in Central Asia.

The consultative meeting in Tashkent demonstrated that Uzbekistan continues to pursue the path of renewal and regional cooperation. The next meeting of the region's leaders is scheduled for Bishkek, Kyrgyzstan. However, due to the coronavirus pandemic and the political crisis in Kyrgyzstan, the date is being extended.

Second, to ensure security and stability in Central Asia, Uzbekistan is actively involved in resolving the conflict in neighboring Afghanistan, calling on other countries in the region to cooperate. Significant agreements on mutually beneficial cooperation have been signed with this country, and practical work on new economic projects is underway. Pacific Afghanistan gives Central Asian countries access to ports in the Indian Ocean and the Persian Gulf, and connects Central and South Asia with European markets in a cheaper and more convenient way.

To stabilize the situation in Afghanistan, a high-level Tashkent international conference on "*Peace Process, Security Cooperation, and Regional Partnership*" was held on March 27, 2018, at the initiative of President ShavkatMirziyoyev. The conference was attended by President of the Islamic Republic of Afghanistan Muhammad Ashraf Ghani, UN Special Representative for Afghanistan Tadamichi Yamamoto, as well as the United States, Britain, Germany, Italy, France, Turkey, Russia, China, India, Iran, Pakistan, Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, Saudi Arabia, and heads of Foreign Ministers of the United Arab Emirates and representatives of 25 countries and International organizations.

Following the conference, the Tashkent Declaration was signed. This document embodies the noble goals of ensuring peace and security in the region, strengthening cooperation in all areas, and further expanding good neighborly relations.

Uzbekistan will continue to develop relations with Afghanistan and will continue to take an active part in international efforts to resolve the situation in this country peacefully. The Uzbek side supports the recovery of the Afghan economy and the development of its transport, manufacturing, energy, and social infrastructure. Indeed, a stable and prosperous Afghanistan is one of the key factors of regional security and stability in Central Asia.

As the coronavirus pandemic, which is now a global issue, began to enter the region, in mid-March 2020, President ShavkatMirziyoyev spoke by telephone with leaders of neighboring countries. He called for cooperation and close assistance to neighboring Afghanistan².

Third, Uzbekistan is offering new markets to its neighbors. In other words, new opportunities are being sought to connect Central Asia directly with South Asia through transport and communication projects. In this regard, Uzbekistan is scheduled to hold a conference in Tashkent on 15-16 July this year on "*Central and South Asia: Regional Interdependence. Threats and*

Opportunities” was initiated by a high-level international conference. It provides a strong impetus to discuss all issues and put them into practice.

February this year has been rich in high-level meetings on the implementation of the above issues. On February 2, President of the Republic of Uzbekistan Shavkat Mirziyoyev received a delegation of the Islamic Republic of Afghanistan - Minister of Foreign Affairs Muhammad Hanif Atmar and Head of the Presidential Administration Mohammad Shaker Kargar. The parties stressed the importance of speeding up the preparation and implementation of the project, the active involvement of foreign partners and potential investors on the basis of the adopted “road map”³. On the same day, President of Uzbekistan Shavkat Mirziyoyev received Adviser to the Prime Minister of the Islamic Republic of Pakistan Abdul Razak Dawood on 2 February. The Adviser’s initiative to build a railway project that would connect Central and South Asia via Afghanistan as the shortest route, provide access to Pakistan’s seaports and ensure the efficient operation of their infrastructure is evaluated and supported in Pakistan⁴.

After that, the Uzbek Foreign Minister began working trips to Central Asia. On February 17, 2021, the Minister of Foreign Affairs of the Republic of Uzbekistan Abdulaziz Kamilov met with the Deputy Chairman of the Cabinet of Ministers of Turkmenistan, Minister of Foreign Affairs Rashid Meredov. On February 18, the Minister of Foreign Affairs of Uzbekistan was received by the President of the Republic of Kazakhstan Kassym-Jomart Tokayev and met with the Deputy Prime Minister - Minister of Foreign Affairs of Kazakhstan Mukhtar Tileuberdi. On the same day, the Minister was received by the President of Tajikistan Emomali Rahmon⁵. The three-day visit of the Uzbek Foreign Minister to Central Asia has ended in Tajikistan. During the talks with the heads of state, in addition to the bilateral agenda, the issues of developing economic ties with Afghanistan and South Asia were discussed.

The talks in Ashgabat, Nur-Sultan, and Dushanbe focused on the prospects for the development of multilateral cooperation in Central Asia, the implementation of infrastructure and transport, and communication projects to enter new regional markets. This is important for Tashkent, which is developing its products. In addition, it was agreed to launch a new project in the Republic to build a railway from Afghanistan to Pakistan – “Mazar-i-Sharif-Kabul-Peshawar”.

The Minister of Foreign Affairs of the Republic of Uzbekistan Abdulaziz Kamilov, who arrived in Kabul on a working visit on February 23, 2021, was received by the President of the Islamic Republic of Afghanistan Ashraf Ghani and met with the Minister of Foreign Affairs Hanif Atmar. On February 25, in New Delhi, the Minister of Foreign Affairs of Uzbekistan met with the Minister of Foreign Affairs of India Subrahmanyam Jaishankar. On February 27, he held talks with Kyrgyz President Sadyr Japarov and Foreign Minister Ruslan Kazakbayev⁶. The main topic of the meetings was the new opportunities for transport corridors connecting Central and South Asia. This is in the interests not only of Uzbekistan but also of the two neighboring countries, which will increase the diversity of foreign economic relations.

The new trans-Afghan railway will provide access to Pakistan’s seaports of Karachi, Qasim, and Gwadar and connect the South Asian railway system with the Central Asian and Eurasian railway systems. This will help increase Central Asia’s transit capacity, attract significant freight flows, and restore the region’s historic role as a bridge connecting Europe and Asia by the shortest land route.

In short, the initiatives put forward by Uzbekistan serve the interests of all Central Asian states. They also play an important role in the peaceful, mutually beneficial, and long-term development of the region.

CHINGIZ AITMATOV'S PEDAGOGICAL CONCEPT IN THE DEVELOPMENT OF PEDAGOGICAL AND PUBLICISTIC THOUGHT

Elyor Abdolvokhidov*

*Lecturer,
Namangan State University,
UZBEKISTAN

ABSTRACT

The article will focus on the prerequisites for the formation of the pedagogical thought of ChingizAitmatov, on the influence on the process of creativity and views of the great thinkers of the East. The study of the pedagogical ideas of Ch. Aitmatov showed that he was greatly influenced by the great humanists of the East Abu Nasr Farabi, AlisherNavoi, Abdulla Avloni, IbraiAltynsaryn, ChokanValikhanov, Abai. Also, the Kyrgyz writer himself in his publicistic articles and works more than once referred to the epic "Manas", which also testifies to the closeness of his views to folk pedagogy.

KEYWORDS: *Pedagogical Concept, Folk Pedagogy, Morality, Spiritual Education, Education, Folk Wisdom, Continuity Of Generations, Culture, Sense Of Duty, Harmony, Socially Positive Behavior, Generosity, Humanity.*

INTRODUCTION

The study of the pedagogical views of Ch. Aitmatov, we believe, should begin with the socio-political life of Kyrgyzstan, the formation and development of culture and art in the country. First of all, we note that until the twentieth century, the Kyrgyz almost did not use writing, although it is known from history that they had runic writing on the Sogdian-Aramaic basis from the early Middle Ages. This was in the 7th - 10th centuries. Then the letter was influenced by Arabic, Farsi and Chagatai. But as we have already noted, the letter has not received wide application for displaying literature. Therefore, the pinnacle of folk art, the encyclopedia of the life of the Kyrgyz "Manas", to which Ch.Aitmatov refers and refers more than once, has an oral basis. Only by 1856 ChokanValikhanov began to write down the epic, which, against a broad socio-historical background, reflects the pages of the centuries-old history, the rich original spiritual life of the Kirghiz.

THE MAIN FINDINGS AND RESULTS

K. Nosirov in his article “Manas and Aitmatov” writes: “Manas” is the embodiment of the mighty national spirit ... saturated with universal human moral experience. A deep sense of duty, a high concept of honor, decency, conscientiousness, devotion in love and friendship, disinterestedness - this is what characterizes the heroes of the epic” [1, p. 7]. The author of the article, referring to the essay by Ch. Aitmatov “Snows on Manas-Ata”, notes with confidence that the heroes of “Manas” could be the prototypes of the AitmatovDuishen, Tanabaa, Edygei, Boston, “which with good reason can be called the spiritual descendants of Manas the Great” [1, p.8]. And the title of his book – “Manas and Aitmatov” K. Nosirov emphasizes the idea of continuity. Regular reference to myths and legends, the definition of the experience of the past as the spiritual support of youth - all this indicates the close connection of Ch. Aitmatov's work with the great epic. In “Manas”, as in “Avesto” and “Alpomys”, the foundations of the pedagogical thought of the countries of Central Asia were reflected.

Folk song, akynsky songwriting and instrumental music, equestrian games - all this, to one degree or another, is reflected in the works of the Kyrgyz writer.

Also, in his publicistic speeches, Ch. Aitmatov repeatedly noted his sympathy for SayakbaiKaralaev (1894 - 1971), a Kyrgyz storyteller who kept in his memory more than half a million lines of the Manas epic and other folk legends and legends. The full version of “Manas” was recorded from his legends. But one epic is not enough to fulfill the main task of education - to bring into harmony various mental movements, to achieve a proper balance between the bodily and mental sides of a human being. It is also necessary to manage socially positive human behavior with the help of a scientifically organized pedagogical process, that is, education.

Like writing, education in Kyrgyzstan developed relatively late: only by 1932 was the first pedagogical institute organized. The fact that Ch. Aitmatov “sends” his heroes to study in Tashkent (for example, Altynai from the story “The First Teacher”, Kazangap from the novel “And the day lasts longer than a century”) suggests that the Kyrgyz had a rather strong craving for higher education. Perhaps that is why every work of the Kyrgyz writer in one way or another touches on the problem of education and upbringing, which was also noticed by prominent researchers of his work.

G. Gachev philosophically defined the prerequisites and purpose of Aitmatov's work: “The feat of creating a new life was accomplished by the fathers ... The feat of war fell on the shoulders of the elder brothers. He also inherited from being an ascetic labor of understanding the past, the present and the future, equal to these great deeds ”[2, p.8]. The deep philosophical nature of the writer's works is explained by the fact that he and his heroes constantly have to think, decide and care about the future.

That is, in fact, Ch. Aitmatov himself also acts as the “first teacher” for readers, especially compatriots, the Kyrgyz people, who in their development jumped from the ancient stage of feudalism to the modern, without a transitional period. G. Gachev described the process most expressively: “Only from the shroud of a sleepy patriarchal state, in which he froze for a millennium, he was plunged into the whirlpool of world history in the twentieth century” [2, p. eleven]. Thus, the history of the people has undergone a sharp leap and left behind the path that European history has traveled for two or three millennia. Were the people ready for these socio-economic changes spiritually? This is what gave rise to many problems related to and

concerning, first of all, upbringing and education. The Kyrgyz enlightenment in its development under these conditions follows the dialectical path tested by history - it begins to absorb the best experience of other peoples. We observe this in the formation of the pedagogical thought of Ch. Aitmatov.

Studying the journalism and literary works of the Kyrgyz writer, it is safe to assume that his pedagogical views were ripened under the influence of the great thinkers of the East.

Thus, the pedagogical ideas of Farabi and Alisher Navoi regarding the requirements for the pedagogical process were reflected in the early journalism and stories about children for adults by Ch. Aitmatov. If Farabi and A. Navoi in their works touched upon the problems of education, the philosophical, physiological and psychological foundations of acquiring knowledge, moral and labor education, then Ch. Aitmatov, developing these thoughts, tries to find their solution in the light of modern conditions, against the background of comprehensive globalization. Farabi and A. Navoi emphasized a number of spiritual and moral requirements for the personality of a teacher, his professional level. The same thoughts find their continuation and development in the works of Ch. Aitmatov, but already regarding the modern requirements for the competence of teachers.

Pedagogical methods that give positive results have been analyzed in detail and allegorically presented in the works of art by Farabi and A. Navoi, which the Kyrgyz writer does not bypass in his works. Farabi notes the love of knowledge, phenomenal memory, logic, eloquence, virtue and justice with the main virtues of the teacher. A. Navoi in his work "Mahbub-ul-Kulub" ("Beloved of Hearts") also calls on the teacher to be generous and humane, to reveal the child's talent, to constantly work on him. At the same time, he exalts the title of teacher, noting that no one can compare with him in spiritual achievement.

Ch. Aitmatov in his works was able not only to synthesize these ideas, but also to show them on life examples. We can observe this in the actions and experiences, the characters of such heroes as Duishen, Tanabai, Boston, Abdutalip, Edigei, Avdiy, etc. Developing A. Navoi's idea that one should not punish the child, but show him the righteous path, Kyrgyz writer noted: "Young people should not be punished. The first thing we are trying to do is to somehow punish, isolate, I don't know, judge, and so on. Apparently, these strict measures are also needed. But what about next? Whether they return from prison re-persuaded and re-educated is a very big question. Therefore, I think that literature has been doing this and will be doing it, the writer said at a meeting in the Ostankino studio. It is about improving pedagogical theory and practice. The writer talks about a social problem, about pedagogical omissions and ill-considered actions in relation to young people. A specific problem is put at the forefront - to punish or educate. Before choosing from two, the writer requires a thorough analysis, namely pedagogical, because punishment does not always mean education. This is one of the most important concepts in the system of pedagogical views of Ch. Aitmatov.

The fact that Ch. Aitmatov is an effective successor of the ideas of the great thinkers of the East was first noted by the famous academician Rustan Rakhmanaliyev: "The Turkic world, almost 500 years after Alisher Navoi, shows the world literary Olympus Chingiz Aitmatov" [4, p. 9].

We will add that the Kyrgyz writer has absorbed the advanced ideas of leading thinkers, generalized and implemented them, put into the lips of his heroes the statements of philosophers

and scientists of the East, thereby serving to revive and “adapt” these ideas to the requirements of modern times.

This choice is due to the fact that each historical period, along with other phenomena, is also marked by the renewal of spiritual principles. In the context of globalization, they acquire special acuteness against the background of the formation of new political, moral and ethical norms, principles and approaches to solving the most pressing issues of life. Modernizing moral and ethical values, thinkers fix the moral pulse of society; give an objective assessment of its spiritual appearance, noting the positive and negative qualities prevailing in the mores of society in a certain period of history.

As we were convinced in the course of the research, the thoughts of great writers - A. Kunanbaev, Ch. Valikhanov, I. Altynsaryn, also had a considerable influence on the formation of the pedagogical views of Ch. Aitmatov. The content of the moral credo of the enlightened enlighteners is a set of ethical norms, which are a moral code and a kind of encyclopedia of pedagogical knowledge.

According to Ibrai Altynsaryn, the main means of moral formation for children are the work and example of parents, and the basis of morality is education and upbringing. The philosophy and pedagogical thoughts of I. Altynsaryn are permeated with reflections on the essence of morality, the meaning of human existence and happiness, moral motives of behavior and relationships, and the upbringing of a highly moral person. In the pedagogical works of I. Altynsaryn, the ideas of nationality, humanism, love for the motherland are clearly traced. Through them, he showed the great importance of work and approved the goal of education - respect for work.

On the way of promoting diligence, I. Altynsarin widely used fiction. In his stories “Kipchak Seytkul”, “The son of a rich and the son of a poor man”, “The harm of lies”, “Ignorance”, “Yurt and a wooden house” [5] and others, important problems of public life are posed: the harm of ignorance, social inequality, the advantage of a sedentary lifestyle, the benefits of knowledge and science. In these stories, industriousness is glorified, it is argued that it is labor that brings up a real person who is able to overcome any obstacles in life, and idleness is the root of vices.

We meet the same motives in almost all the stories and novels of Ch. Aitmatov, who, like I. Altynsarin, by the actions and aspirations of his artistic images shows how important work occupies in the spiritual and moral formation of a person.

I. Altynsaryn and Ch. Aitmatov were connected not only by the line of artistic images, but also by active educational practice. The first of them was the textbook “An initial guide to teaching the Russian language to the Kirghiz” (1879). Thus, I. Altynsaryn made a huge contribution to the formation and development of the educational system of his country. And Ch. Aitmatov in the very first articles analyzes the state of modern textbooks.

I. Altynsaryn's views on upbringing and education make him similar to Ch. Valikhanov, whose works are imbued with the idea that only knowledge and education give person strength and are a great tool in the struggle for enlightenment and well-being of the people. Only enlightenment can lead the people to the path of free and moral perfection. The moral and ethical positions of Ch. Valikhanov are a theoretical and methodological source for the development of the theory of moral education of youth. Considering pedagogical problems from an educational standpoint, he

wrote: “For the normal growth and development of a people, freedom and knowledge are essential first of all. It turns out that first of all it is necessary to teach”[6].

Along with other educators-democrats, he laid down the basic provisions on the laws, principles, goals, objectives, content, forms, methods and means of forming the moral character of a person. In his views on the moral education of young people, he relied on the principles of humanism, democracy, patriotism, optimism, education in work. Valikhanov considered the environment and upbringing to be the main factors in the moral education of the personality. Adhering to the opinion about the defining significance of the experience of the past, Ch. Valikhanov collected materials on history, ethnography, oral folk art of Kazakhs, their life and culture in general. As a result, he wrote a number of articles and notes of scientific and practical value (which, in fact, we observe in the works of Ch. Aitmatov). In them, the enlightener emphasizes the importance of the role of genealogical legends for understanding ethno-genesis, the role of monuments of folk literature for ethnography and historical science, typological similarities in the epics and legends of various peoples. Proceeding from this, the guidelines of the pedagogical thoughts of Ch. Valikhanov are traced, which affirm the principle of the nationality of upbringing, which begins in early childhood and is based on the process of mastering the native speech. He believed that only a folk school with a wide general educational cycle and popular science literature could provide moral food for the Kazakh people. Therefore, along with the works of Russian writers and teachers, it is necessary to include in textbooks samples of Kazakh oral creativity (fairy tales, proverbs, epics).

Among the works written by the Kazakh scientist, one can distinguish “Legends and legends of the great Kirghiz-Kaisak horde”, “Tengri (God)” - about the ancient beliefs of the Kazakhs, “Sample lamentations”, “Song about Abai”, “About the forms of Kazakh folk poetry”, “Kyrgyz genealogy”, “Historical legends about the batyrs of the 18th century”, “Diary of a trip to Issyk-Kul”, “Note about the Kirghiz”.

Ch. Valikhanov collected invaluable material about the life of the Kyrgyz people, wrote down and for the first time translated into Russian a cycle of legends from the pearl of the Kyrgyz oral poem “Manas”. He emphasized that “the assimilation of European, universal human enlightenment and the energetic struggle against obstacles that hinder the achievement of this goal should be the ultimate goal for every people capable of development and culture” [6]. With all this, he called for relying on the past and possessing high self-awareness.

We meet similar motives in another educator AbaiKunanbayev, who, like I. Altynsaryn and Ch. Valikhanov, considered work as one of the main means of education. He emphasized the importance of mastering the knowledge that the spiritual improvement of the individual largely depends on enlightenment. Abai's merit was that he looked for ways to renew a person, tried to raise his spirituality, improve his moral qualities. His call for the affirmation of the ideals of universal human justice “*Adam bol!*” (“Become Human!”) Has become a leading pedagogical idea. Abai attached particular importance to the acquisition of positive moral qualities of people and emphasized the special role of the personal interest of each individual individual in achieving the level of “perfect man”. The path to it lies through knowledge, through moral and spiritual improvement.

As a result of many years of thought, excitement and noble spiritual impulses of the great poet-enlightener are his “Words of edification” [7].

Ch. Aitmatov, whom we have the right to consider the successor of the great enlighteners, is also occupied with thoughts about education, upbringing of civic, moral qualities, patriotism, constant striving for knowledge of the world of his fellow tribesmen. Through all his work, the thought “*Imanduuadambulgun!*” [8, p. 41] - “Be a godly person”, which was the leading idea of his pedagogical system. Remaining faithful to the principles of humanism, he strove to find qualities worthy of imitation among other peoples, and urged the Kyrgyz to adopt them, to study the cultures and languages of other peoples. “Knowledge of a foreign language and culture makes a person equal with this people, he feels at ease, and if the care and struggle of this people are in his heart, then he can never stay on the sidelines. This is the nature of man” [7]. These instructions of Abai imbued all the creativity of Ch. Aitmatov, who did not stop referring to Ch. Valikhanov's “Manas” and was guided by the teachings of I. Altynsaryn about mastering the Russian language.

Ch. Aitmatov's pedagogical views are also close to the ideas of Jadism. This is substantiated by many factors, including the attitude towards education, moral and spiritual education, and the knowledge of modern sciences. A detailed analysis of a number of textbooks, characteristic of the works of the Kyrgyz writer, is also characteristic of the Jadids, who critically evaluated every means of education, were engaged in printing and creating libraries.

Let's refer to specific examples. One of the most prominent representatives of Jadidism, Abdullah Avloni, noted that the levels of education and upbringing of the individual should grow synchronously. The fruitfulness and effective effect of the knowledge gained depends on this. Ch. Aitmatov continued this thought in his journalism: “Now, when our life is becoming more and more complicated, when we must nevertheless come to the fact that the integrity of the perception of the world should become such a planetary principle for us, we must perceive the world in integrity, in its relationship, in its interaction. Such a person is needed now. And if this person is the predominant type of the population, then this is one of the factors that a global catastrophe will not happen. If, on the contrary, we cultivate the consciousness of our exclusivity, separateness, oppose ourselves to others. We will not survive then” [3]. We also hear about the need for high morality in obtaining education from the lips of the heroes of his works of art, such as Tanabai, Abdutalip, Edigey.

CONCLUSION

As you can see, today, when education is a leading social phenomenon that ensures social, cultural, scientific progress, an appeal to the heritage of Ch. Aitmatov, who considered education to be the highest value for a person and society, a deep and thoughtful analysis of his work allows us to comprehend the phenomenon of his pedagogical system. The idea that every writer carries in him a fraction of all the phenomena of life (and pedagogy is nothing but the most important phenomenon of life) sounded from the lips of the Kyrgyz writer himself: “... in the work of every artist of genius there is everything, because it is a whole and whole world, life in its entirety. It's another matter if from a great writer we take some one side or one idea of his work” [9, p.375]. Based on this idea, we decided to investigate the publicistic and artistic works of Ch. Aitmatov for his pedagogical concept.

Thus, we come to the conclusion that the formation of the pedagogical thought of Ch. Aitmatov was influenced by the works of the great enlighteners of the East and the worldviews of Western thinkers. Following his predecessors, the Kyrgyz writer responded to pressing social problems

(including pedagogical), not only stated and determined their nature, but also deeply analyzed, looked for ways to solve them in a dialogue with the public through his journalistic and artistic creativity. This will be discussed in the following sections.

Samarkand Economy and Service Institute,
UZBEKISTAN

ABSTRACT

This article discusses the role of tax potential and methods for determining the revenue base of the local budget, unique scientific approaches of scientists to the concept of tax potential, developed scientific proposals to further increase the role of tax potential in determining the revenue base of the local budget.

KEYWORDS: *Public Finance, Tax, Budget, Local Budget, Revenues, Tax Base, Tax Potential, Taxpayer, Investment Project, Sustainability.*

INTRODUCTION

Special attention has been paid to the reform of the public finance management system aimed at increasing the efficiency of the public finance management process and ensuring the stability of the local budget, ensuring fiscal transparency, the formation of local budget funds. In this regard, the adoption of the Resolution of the President of the Republic of Uzbekistan dated August 22, 2018 No PP-3917 "On measures to ensure transparency of budget information and active participation of citizens in the budget process" [1] was an important step in this direction.

Therefore, today it is important to take measures to ensure the sustainability of local budget revenues, taking a systematic approach to the issue through the widespread use of science-based proposals and recommendations. The concept of tax potential is widely used in foreign countries in determining the revenue base of the local budget. It is essential to note that there is no single scientific approach among scientists on the concept of this tax potential. In the experience of foreign countries, the tax potential refers to the state budget revenues per capita collected by public authorities during the fiscal year, using the conditions of uniform taxation in the regions of the country [2]. It is important to state that opinions on the nature of the tax potential category are one of the current issues at the center of scientific discussion.

LITERATURE REVIEW

The role of tax potential in determining the revenue base of the local budget is important to reveal the essence of the content of the tax potential of the country. Local budgets consist of the tax potential of major, large taxpayers, which serves to shape the tax revenues that make up the revenue base.

In foreign literature and scientific researches, this concept is defined in accordance with the current tax legislation and taking into account the total amount of taxable resources, taking into account the macroeconomic indicators that reflect the level of development.

Tabaeva T.V. and others suggested that the tax potential of a region should be determined by applying the average tax rate to the tax base of taxable income in a particular region of the country [3].

The concept of tax potential is equated with financial potential in most developed countries, where the model of budgetary federalism is widely used [2]. In the foreign literature, the basis of this category is often understood as the tax base, which generates income in the form of tax revenues of a particular region.

Local economists have also commented on the tax potential, some approaches. In particular, F.M Mirzaev in his research proposed a method of assessing the level of tax collection on the basis of the tax potential of the regions [4].

In the research, Z.A Abdullayev used correction factors to assess the tax potential, such as the level of socio-economic development of the regions, including the structure of regional GDP, tax base and taxpayers, transfers between budgets at different levels, depending on the level of tax potential. Its approach to the introduction of the practice of determining the optimal amount is expressed [5].

RESEARCH METHODOLOGY

Comparative analysis as well as induction and deduction assessment methods are used in this manuscript. Using the comparative method, the analysis of data on the tax potential in determining the revenue base of the local budget was carried out and scientific conclusions were given.

Analysis and discussion of results

Important areas of socio-economic development through the effective organization of the revenue base of the local budget are:

- Increasing the capacity of the district in determining the local budget base, collection of taxes in a timely manner;
- Formation of the procedure for the analysis of the structure of the local budget revenues to the district and its definition in relation to the state budget revenues;
- forecasting tax revenues to determine the production capacity of goods and services, new jobs and project value as a result of investment projects;
- Differentiation of taxable income based on the activities of taxpayers of different levels;
- Establishment and analysis of the mechanism of distribution of net profit of taxpayers;

- Determination of budget revenues in terms of tax revenues based on newly created jobs.

The main results to be achieved:

- Implementation of investment projects is provided;
- Increase in production capacity of goods and services;
- new jobs will be created to ensure employment;
- Additional tax payments to the budget will be provided.

The development of measures to ensure the sustainability of growth of local budget revenues, as well as the development of a quarterly network schedule can provide an opportunity to apply proposals and recommendations for the effective organization of budget revenues on a scientific basis.

In determining the revenue base of the local budget, it is important to establish a systemic approach to tax potential and its assessment:

- Tax potential and its assessment;
- Clarification of budget forecasts by studying the internal and external factors influencing the formation of local budget revenues;
- Regulation of mechanisms for distribution of tax revenues between budgets of different levels;
- If the local population operates without registration in other districts (cities), then the centralized transfer of them to the mandatory tax payments, the district tax infection in which they are registered.
- Ensuring that taxes are collected from which enterprise (organization) and their transfer to the budget of the district (income tax, VAT, excise tax) distribution of taxes between the Republican and local budgets based on the budget potential.

The main results to be achieved:

The development of effective recommendations and proposals by analyzing the budget situation in the second month of each quarter will ensure a 0.3-0.4 percent increase in budget revenues. This will increase the amount of budget revenues left to the local budget by 0.12%. Regulates the allocation of funds from the upper budget to the local budget in terms of types of taxes.

As a result of these measures, budgetary discipline will be strengthened through the establishment of effective public control, strategically correct allocation of available resources and quality delivery of public services will be achieved.

In general, the tax potential of a country consists of the sum of the tax potential of local governments; the tax potential of local governments is interpreted as the potential of taxpayers to pay taxes and levies, depending on the status of legal entities and individuals.

The tax potential takes into account macroeconomic indicators, as well as the choice of the taxpayer on the taxation procedure. This, in turn, allows determining the indicators of the effectiveness of tax policy and the effectiveness of tax administration in the country.

CONCLUSIONS AND SUGGESTIONS

In conclusion, it can be said that the views expressed on the tax potential in determining the revenue base of the local budget, summarizing the approaches, can be further expanded based on the classification criteria of the forms, types of tax potential.

In our opinion, it is expedient to attach the income tax from individuals and corporate income tax entirely for local budgets at the local level, and to distribute the value added tax among the different levels of the budget. In the future, Uzbekistan should create a mechanism to ensure inter-budgetary balance, expand the tax base by increasing industrial production to increase local budget revenues, calculate the tax potential of each region by introducing the concept of regional tax potential in the tax legislation.

ABSTRACT

This article is devoted to the study of the location of the population and ethnic composition in the late XIX and early XX centuries in the Surkhan oasis. As well as some issues were analyzed as the count, national composition of the population in the "beklik" of the oasis, its origin, statistics provided by the Russian Empire military, the cities of the oasis and the proportion of its population. The article provides information about the count of population in Eastern Bukhara and their economy in the second half of the XIX century, as well as about the tribes living in the oasis of Uzbek Chigataids, Tajiks, Kungirats, Hughes (Juzes), Turks, Turkic Karluks, Turkic-Kaltataids, Turkic-Barlas, Durmans. In addition, the article explores the settlement of Russians in the territory of the Bukhara emirate as in other parts of Central Asia after the conquest of the Russian Empire, as well as the arrival of the border troops of the Russian Empire in the region.

KEYWORDS: Surkhan Oasis, Bukhara, Russia, Boysun, Termez, Yurchi, Denau, Sherabad, Sarijoy, Sariosiya, City, Village, Chigatoys, Tajiks, Kungrad, Hundreds, Turks, Turkish Snowmen, Turk-Kaltatoyi, Turkish Barlos, Dormon.

INTRODUCTION

We can blindly say that the population of the Surkhandarya oasis in the late 19th and early 20th centuries was composed of different ethnic groups and ethnic groups with a more complex ethnic composition. Although the settled population of the oasis formed a common ethnic unity of tribes and peoples who migrated in different historical periods, they differed from each other in that they preserved their origins, customs, and some national traditions.

At the end of XIX-XX century, no complete information about the number of people living in the Emirate of Bukhara. In 1926 a registration form being According to the data, which, at the end of XIX-XX centuries Surkhandarya 264863 people, including 13110 people, or 5 per cent in urban areas and the remaining 95 percent of the 251753 people that live in rural areas. 7 largest cities, they Baysun development, YurchiDenov, Sherobod, Sarijo'y, to equip cities [□]. The population of the oasis is 74.5% Uzbeks, 20.2% Tajiks, 3.8% Turkmen and the rest of other nationalities. The population of Sariosia was 38,085, of whom 1,527 lived in cities and the rest in villages. The structure of the population of 55.7 percent, 44.3 percent Tajik Uzbeks [□].

RESULTS AND DISCUSSIONS

42856 people lived in Boysun district, including 3598 people in Boysun and Darband cities, which is 8% of the total population. Uzbeks accounted for 44.1 percent of the population and Tajiks for 55.2 percent. There are 69,932 people registered in Denau district, of which 3,000 live in Denau and 1,101 in Yurchi. The ethnic composition of the population is 83.9% Uzbeks and 16.1% Tajiks. The population of Sherabad district is 64,471 people, of which 2,500 live in Sherabad, 97.8% of the population are Uzbeks and 2.2% are Arabs.

28859 people lived in Jarkurgan estate. The ethnic composition of the population was 97.8% Uzbeks, 2.1% Arabs and 01% Turkmen.

In Pattakesar (Termez and its environs) 20,651 people lived, including 4,284 in Termez. The ethnic composition of the population was 41.1% Uzbeks, 51.2% Turkmen, and 7.7% other nationalities (Jews, Afghans, etc.) [3].

The statistics provided by the military of the Russian Empire describe the location of the population in the principalities of Gissar, Denau and Sarijoi, and their farms. Captain Stetkevich visited the Gissar oasis in the 1980s to provide information on the lifestyle and ethnic persecution of the people living in the Karatag basin.

According to him, the Regar, Sarijoi and Sariosiya estates of the Gissar principality have 6,809 houses, each with 5 people in each yard and more in the cities, with a total population of 35,400 people. There were 1,452 houses in Karatag, 452 of which were inhabited by Uzbeks, 1,000 by Tajiks, and more than 300 by nomads. Of the 1,788 courtyards owned by Regar, 428 were inhabited by Tajiks and 1,360 by Uzbeks.

Sarijo'yamlokligida 315 1545 1230 out of the yard Tajiks, Uzbeks, 1424, to equip amlokligida 140 are Tajiks, Uzbeks in 1284 out of the yard, in the areas Uzbeks and Tajiks who lived more than 1,000 immigrants were [□].

According to Captain Pokotilo, before the annexation of the Gissar principality to Bukhara, its population was estimated at about 180,000 [5]. Captain Liliental, who had studied the territories of the Gissar and Qabodiyon principalities, wrote in his report that the population of the Gissar

principality was much smaller than that of Captain Pokotilo. In the Gissar principality, Uzbeks and Tajiks cover the majority of the population. Barlos, Musabozor, Lakay, and Yuz of Uzbek descent made up a large part of the population.

There are a total of 3,940 courtyards in the Denau principality, of which 2,500 are inhabited by Uzbeks and 1,440 by Tajik families. The Uzbeks of Denau were inhabited by bells, Dormons, Turkmen Juzs, Qarluqs, Kenagas and other tribes. Russian troops gave their information and reports information about the people living in the East Bukhara. In Qabodiyon 20-25 thousand people, which is the seed of the Emirates English Uzbek horse, Tajiks, Turkmens, Arabs and other ethnic groups lived [6].

According to researchers, there were almost no large villages in Eastern Bukhara. On average, there were 30-35 yards in each village. For example, there were about 150 villages in Faizabad, with 15 courtyards in each village. In the last quarter of the XIX century the total population of Kurgantepa principality was 18 thousand people. It was also determined that there were 1,700 migrants. The Emirates Uzbeks, Tajiks, Kyrgyz Khazars, Arabs, Turkmens living [□].

By the second half of the 19th century, the Bukhara principality was reported to be the second most populous in Eastern Bukhara after the Gissar principality. Based on his research in the Baljuvan principality, GA Arandarenko writes that the population of the Kulob principality was much larger than the population of Baljuvan. Kolob (city) itself has 406 yards, with 5 people per yard, while Kulyab itself has a population of more than 2,300 [8].

Topographer V.A. Varygin says that during the First World War the population of the Kulyab principality decreased significantly. In general, the Russian military's research on the population of the Kulob principality does not provide accurate and complete information. The majority of the population of this principality were Uzbeks, Tajiks, Turkmens, Afghans and other nationalities. D. Logofet Kulyab located in the important trade routes expanded in Samarkand on the one hand, on the other hand conducted trade operations with Afghanistan recognizes the main commercial center [9].

In the Emirate of Bukhara, a large part of the population lived in oases. 300-350 thousand people lived in Zarafshan oasis, 500 thousand in Kashkadarya oasis, 200 thousand in Surkhan oasis, 500 thousand in Eastern Bukhara. According to B.X. Karmysheva, at the beginning of the nineteenth century fortress 137 677, in Kulyab 131 869 units, in Kurgan 15, 450, in Sherobod 53, in Denov 54 390 362 in Baysun 26 685 people registered [10].

As in the Central Asian states, the Bukhara Emirate did not have a population census until the early twentieth century. In 1914, under pressure from the Russian government, only certain calculations were made on the area of arable land, settlements and livestock in the Eastern Bukhara principalities.

Sherobod the lower reaches of the river valley and Sherobod Uzbek **Chigatay** three books in a number of areas, as well as the lower reaches of the Surkhandarya: Manguzar, Selliobod and the UAE village. In the villages of Manguzar and Selliobod, Chigatoy Uzbeks coexisted with Uzbek-speaking masters.

In addition to the southern part of the oasis, Uzbek chigatoy seeds are widespread in the northern regions. They are also known to have been in the villages of Big and Small Vakhshuvor. In the Great Vakhsh they coexisted with the Takhchi ethnic group (B. Karmisheva describes the Takhchi ethnic group as mountaineers. Some of them called themselves repressors). Uzbek Chigatoys also lived in the villages of Gazarak and Dashnabad on the banks of the Kulob and Obizarang rivers. In addition to these places, Uzbek chigatoys lived in Shoqqishloq, Ermon and other foothills together with barlos, engaged in farming and handicrafts [11]. According to the data, 1627 people live in Sherabad oasis, 1000 people in Poshhurd, 2160 people in Termez district of the lower Surkhandarya and Amudarya valleys, 9490 people in the upper part of Surkhandarya and 3420 people in the middle part.

The **Tajiks** living in the mountainous parts of the Sariosiya and Denau districts belong to two groups, the former being the ancient Kohistani (taqchi), who consider themselves indigenous, and the second group includes the region or hisori from different places. The first group of ko'hisoniy Tajiks small mountain pride, Shotrut, Qarsh, Tamshush, Chach, nilu, Zebah and other villages, while the second group of regional or hisorilarXufar, testing, training, equip, Yurchi, Dehqalandar and other villages [12].

There are 1,755 people on the eastern slopes of Mount Kohitang, 3,718 in the Sherabad River basin, 4,000 in the Boysun River basin, and 9,490 in the upper Surkhandarya.

Kungrats are the largest Uzbek tribe living in the Surkhandarya oasis. In the early 19th century, they lived in large areas up to the slopes of the Guzar, Termez and Babatag ridges. According to

the data, the calls amounted to 31,148 people. Boysundaryo 3525, 1838 Sheroboddaryo basin, the basin development environment and the Amu Darya River Valley in 3525, 9375 people lived in the valley of Surkhandarya [13].

In addition to the Sherabad oasis, Kungrad seeds are scattered throughout the Surkhandarya oasis. There are 13,140 bells in the Karatagdarya basin, 9375 bells in the upper Surkhandarya oasis and 9375 in the Bobotag part. They came to Sariosiya and Denau districts 170-180 years ago from Dehkanabad. The bells were mixed with the Tajiks in the upper part of the Surkhandarya oasis, in the mountainous areas of Sangardak, Changlak, Baghcha, and other villages. Sariosiyodenov, Dashnobod, Sarijo'y, Yurchida they lived in rural areas [14].

Representatives of the **Hundred** (Juz) clan lived in the villages of Kholchayon, Boqati, Khursand, Chimildiq, Bibichakka, Fayzova and others of Sariosiya and Denau districts. According to the data, the faces came from Samarkand to Shurchi 250-300 years ago. Later, they began to move to Denau and Sariosiya districts. Hundreds are also known to have lived in Altynsay and Sherabad districts [15]. According to B.X. Karmysheva, the Juzs lived in the Surkhandarya oasis in the Denau, Shurchi, Altynsay and Sherabad districts. The faces living in the oasis are divided into two parts, Vakhtamgali and Jilantamgali. They are divided into 8 parts in their place: Vakhtamgali Qazoyakli, kuztamgali, kazak, jarikbash, kesauli, hammer, alonli and batash. The lilac is divided into childish, kosa, patas, torga, yas, combed and saddles.

One of the Uzbek people living in the oasis of **the Turks**, for they, in turn, three sons, qarluq Turks, divided Barlas Turks and the Turks kaltatoyi [16]. A large group of Turks can be found in various parts of the Boysun principality and the Sherabad oasis. The number of Turks in the southern districts of Uzbekistan was 23,212. There are Surxon 3641, Qoratog' upper reaches of the river basin 12003 people registered [17]. The Turks lived in and around the town of Boysun, in the villages of Saraytosh and Turk, as well as in the village of Yukori Machay in the Inqabad, Omonkhana, and Machay river basins. Research Sherobod oasis near the city of SherobodGegirdak and Navubog' lived in the villages of Afghan and Uzbek-language chig'atoylar mixed data on common [18].

Turkish Qarluqs Denov, equip, Sho'rchi districts Tog'chion, Dashnobod Some other villages lived [19]. Snowflakes are more common in Tagchion, one of the mountain villages. The Qarluqs came to the Shurchi and Sariosiya regions in the middle of the 18th century. Some studies say that there are more than 500 snow families in [□ □ □ □ □ □ □ □]. 20

The Qarluqs are one of the tribes that have lived in Eastern Bukhara since ancient times. Most of the Qarluqs lived on the southern slopes of the Gissar Mountains and were called Turkish Qarluqs. Turkish snowmen are divided into several groups depending on their habitat. The snowmen living in the upper reaches of the present-day Kofirnihon River were called Ramiti. The snowmen living on the right bank of the Vorzab River called themselves Vorzabi. The snowmen living in the territory of Regar district are called kalluk-regari. The snowmen living on the banks of the Vakhsh, Javan, and Nurek rivers were called Hisori snowballs.

In the Surkhandarya oasis, the Qarluqs living in the Shargun and Topalangdarya basins are called Togchiyon Qarluqs. It is acknowledged that the mountain gorges are divided into Lolaki, Mozorchopti, Sultan Muhammad, Karayasak, Karabuyun, Pirmahmud and Adjirgani.

The Turkic-Kaltatoyi tribe formed the majority in the **Kenagas** guzar in the Denau district. The population of the Kaltatoy clan also lived in the Sarijoi and Yurchi principalities. In addition, kaltatoySherabadAkkurgan village and Sangardak and Obizarang the lower reaches of the rivers, Chontosh, Satan, Jonbaxti, Jarqishloq, looking Telpakchinor and the charred remains of the villages (the main part of this village has long lived in the district) [21].

Turk-barlos made up the majority of the population in the present - day village of Namuna in Uzun district. The Barlos also lived in the village of Dashnabad, mixed with the Chigatoys, in the villages of Shonsoy and Sangardak near the Hazarbog Canal in the west, and in the village of Chimtepa in the east. The arrival of barlas in the Sariosiya and Uzun districts of the present-day Surkhandarya region in the early 16th century can be attributed to the mass migration of Uzbek tribes to Central Asia, led by Muhammad Shaibanikhan. In addition to the village of Dashnabad in Sariosiyo, they also lived in the villages of Kudukli, Karabandi, and Shoqqishloq. The fact that the Barlos came to Denau, Uzun, and Sariosia 350-400 years ago has been singled out in later studies [22].

Dormon seeds can also be observed to be spread over a much wider area in the oasis. In the Sherabad oasis, on the right bank of the Sherabad River, the majority of the population of the village of Hojigi were Dormons. In the Gissar and Surkhandarya oases there are 7979 people from Dormons, and in Qabodiyon and its environs there are 2400 people. They are divided into two groups depending on their habitat — hisori and kabodiyon. In addition, they Kofirnihon oasis in the middle and lower reaches of the Bobotog lived in many villages in the northern part of [23]. Part of the Dormon seed is also distributed in Sariosia and Denau. Their graceful, energetic, Fayzov villages and mountainous Jiydabuloq, Anorbuloq and Pistamozor villages were found [24].

After the conquest of the Bukhara Emirate by the Russian Empire, Russian citizens began to settle in the Bukhara Emirate, as in other parts of Central Asia. They were originally formed by the military, businessmen and merchants. By the end of the 19th century, the number of Russians had grown significantly as a result of the development of trade relations between Russia and Bukhara, on the one hand, and the infiltration of Russian border troops, on the other. For example, in 1883 the 14th Turkestan Battalion arrived in the city of Karki, and in 1886 a part of the reinforced Russian army arrived. That same year, Chorjoy Russian troops were placed [25].

According to the Russian-Bukhara treaty of January 15, 1883, the Pattakesar and Salihabad territories around Termez were given to the Russians. After that, Russian military units from the 7th Border District began to be stationed here as well. According to the data, by 1900, 8,052 men and 2,069 women lived in Termez (Pattakesar), where the Russians lived. The bulk of this population was made up of the Russian military [26]. Armenians, Tatars and other nationalities also lived here.

CONCLUSION

At the beginning of the XIX-XX centuries, the population of the Surkhandarya oasis had a complex ethnic composition, among which there were seeds that did not interfere with the settled

population, and maintained their own genealogical order. They have also preserved their unique lifestyle, customs, culture and some ethnic characteristics. The history of the Uzbek tribes, which still live in the region and constitute the main majority, is mainly connected with the arrival of Muhammad Shaibanikhan in Central Asia in the early 16th century. They are widespread not only in isolated areas, but also in villages, guzars, where in many cases local (formerly inhabited) tribes live.

THEORETICAL, PRACTICAL AND DEMOGRAPHIC ASPECTS OF LABOR MARKET DEVELOPMENT IN UZBEKISTAN

Gavkhar Umarovna Radjabova*

*Senior Teacher,
Kokand State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

The article reveals the main aspects of the labor market in Uzbekistan in the context of the transition of the economy from the industrial to the informational stage. Used statistical data. When studying the labor market in Uzbekistan, factors influencing it have been identified and the influence of these factors has been theoretically substantiated. Shows their manifestation in practice from the point of view of demographic processes on the labor market. General conclusions are made and theoretical and practical recommendations are developed. The problem of annual employment of about 300 thousand young citizens entering the labor market for the first time and 100-120 thousand labor migrants returning to their homeland is especially urgent.

KEYWORDS: Republic of Uzbekistan, labor market, labor resources, demographic situation, formal and informal employment, labor migration, active and passive employment policy, monitoring of the social and labor sphere.

INTRODUCTION

Recently, among the numerous problems observed in the economy, the issue of the effective functioning of the labor market is highly relevant. Its successful solution is directly related to a deep understanding of the objective laws of its development.

The labor market is one of the developing systems where there is a priority of external factors, for example, technical progress. Changes in the conditions of social development, in accordance with technical progress, is reflected in the mechanisms and organizational structures of social regulation of the labor market. This situation was observed in the 1920s and 1930s during the technical revolution and is observed to this day. The progress of science and technology in the 70s and 80s of the last century led not only to a change in the technical and technological

structure, but also to the transition from the industrial to the informational stage of the development of human society. It is based on the ability to harmonize scientific potential, knowledge and information. The "intellectual economy" has turned humanity into the main productive force of society, and its creative potential into capital. The formation of such new qualities in a modern person requires a revision of not only the structures and mechanisms of the labor market, but also labor relations in general.

At present, Uzbekistan has reached such a level when one can speak of a country with an average level of development. The creation of decent and sustainable jobs, the elimination of forced and child labor have become relevant. The problem of annual employment of about 300 thousand young citizens entering the labor market for the first time and 100-120 thousand labor migrants returning to their homeland is especially urgent. In addition, the issues of ensuring the growth of economic activity of women and the reduction of informal employment also need to be addressed.

In conditions when at least 2 million people need employment, and the annual growth of the labor force is 350-370 thousand people, it is necessary to accelerate the creation of sustainable and productive new jobs. However, the development and implementation of programs for creating new jobs for many years has not solved the problem of expanding sustainable and highly productive employment. About three quarters of jobs are created due to the accelerated development of small business, private and individual entrepreneurship without the formation of a legal entity, the development of all forms of home work and self-employment.

Those employed in the informal sector, including informal labor migrants, are not covered by quality protection and decent working conditions, social insurance and risk falling into the category of low-income strata of the population, both at present and in old age. In addition to them, young people and women employed in the economy are also at risk of becoming unemployed.

Thus, the overwhelming part of employment (those employed in the informal sector, labor migrants working informally, youth and women employed in the economy) is unstable, that is, it temporarily provides the worker with income, but does not guarantee the sustainability of their receipt in the future, the preservation of a job and decent working conditions, growth of labor productivity, career growth, self-realization of the employed.

However, in modern conditions, when the country sets itself the ambitious goal of a quick transition to the group of countries with an upper middle income level, the problem of reducing informal employment becomes extremely urgent, since without ensuring inclusive growth in labor productivity and real incomes of the population, as well as without expanding the middle class, it is impossible to achieve this goal.

After Sh. Mirziyoyev was elected President of the Republic of Uzbekistan, Uzbekistan began to take decisive steps to achieve this goal. Thus, the most important area of development of the social sphere within the framework of the Action Strategy for five priority areas of development of the Republic of Uzbekistan in 2017-2021. is to increase the level of employment of the population through the creation of new sustainable jobs. At the same time, the creation of sustainable and decent jobs for such categories of the population as women and youth is of particular importance. The system of public administration of employment in the Republic of Uzbekistan is undergoing significant changes. The administrative reform of this system is aimed

at horizontal and vertical optimization of the functions of the Ministry of Employment and Labor Relations, which is responsible for state employment policy.

Currently, not only the organizational structure of labor bodies, the legal framework for state regulation of employment, methodological support of labor statistics are being improved, but also the entire system of public service.

State regulation of employment in Uzbekistan is carried out through the state employment policy through a network of special state institutions in order to maintain an acceptable level of employment, increase labor mobility, and create new jobs. State employment policy is a set of measures of direct and indirect impact on the socio-economic development of society in general and each of its members in particular.

State regulation of employment of the population is based on the following principles:

- ensuring social partnership of subjects of the labor market;
- promoting effective employment, preventing the growth of unemployment, creating new jobs, ensuring the voluntary choice of the sphere and place of activity;
- Compliance with the complexity of measures to regulate the employment of the population;
- Support for able-bodied citizens of working age who need social protection;
- Provision of preventive measures to regulate employment and reproduction of jobs;
- Availability of a guarantee of preservation of jobs and professions, income generation, etc.

Depending on the state of the economy and the labor market, there are two main options for implementing employment policy: active and passive. An active employment policy is a combination of legal, organizational and economic measures taken by the state in order to reduce the unemployment rate. It provides for measures to prevent dismissal, training and advanced training, active search and selection of jobs, financing the creation of new jobs. The passive employment policy provides for the payment of unemployment benefits and the provision of simple job search services through the public employment service. Such a policy can justify itself only with a high flexibility of the labor market as a whole [10, 1-2].

One of the important tools for developing a sound and effective state social policy is monitoring the social and labor sphere. Its main tasks are constant monitoring of the actual state of affairs in the sphere of social and labor relations, a systematic analysis of the processes that take place in it, prevention of negative trends that could lead to social tension and an increase in the unemployment rate to a critical one, as well as a short-term forecast of possible changes in this domain. Monitoring of the social and labor sphere is a comprehensive state system of continuous monitoring of the actual state of affairs in this area. The result of monitoring should be proposals for further reforming the economy, solving the problems of employment and unemployment, strengthening social protection of the population.

Monitoring is based on the solution of three main groups of problems: methodological, scientific and informational. Methodological monitoring tasks are the development of scientific foundations, structure and system of monitoring indicators, sampling methods and tools that allow obtaining reliable research results. Scientific tasks - tracking and analyzing specific shifts in the social and labor sphere (studying labor relations, the state of employment and

unemployment, the level of education, qualifications and living standards of the population, assessments, attitudes and behavior of people, changes in the social structure of society, the development of forecasts, etc.). Information tasks - providing reliable and objective information, the consumers of which are the appropriate circle of scientists and leaders of all levels.

Monitoring allows you to assess the completeness and effectiveness of the implementation of legislative acts on social and labor policy, to facilitate the adoption of optimal decisions at various levels of government. International documents formulate the main goals of statistics and collection of information on the labor activity of the population: measuring human and labor resources in order to carry out macroeconomic analysis and planning the development of these resources, as well as measuring employment, income and other aspects of labor activity for the development and implementation of programs in the field of social policy, improvement of mechanisms of state regulation of the labor market.

The correct distribution of human resources in the labor market serves the interests not only of its individual participants, but also of society as a whole. Through the labor market, our main national wealth - human resources - are used in various spheres of the national economy.

The essence of labor economics, first of all, boils down to the relationship between employers and employees regarding the conditions of compensation for labor, the cost of labor, material and non-material aspects of employment [1,377-384]. The listed elements of the relationship between labor market participants motivate or limit their individual choice. In this regard, the following questions are of research interest:

- Population growth in the Republic of Uzbekistan and employment problems;
- Ways of influence of supply and demand in the labor market on the process of making decisions by individuals on the choice of a particular type of employment;
- The role of education and training;
- Non-traditional employment and migration problems.

Ways of the influence of supply and demand in the labor market on the process of making decisions by individuals about choosing a particular type of employment. In this regard, the conditions under which employers and workers enter into employment contracts are at the heart of the labor market. First, this is due to the fact that recruitment agencies act as intermediaries between “sellers” and “buyers” of labor services. Secondly, after establishing the first contact with each other, the parties exchange information about the cost and quality of the desired work. Usually this process takes place during the interview of the candidate or is described in detail on the questionnaire. Third, when the parties have reached an agreement, we can talk about the emergence of a formal or informal labor agreement. It contains information about wages and working conditions, including the rights and obligations of the parties and the length of working hours. As a result, transactions between the employer and the employee contribute to the distribution of the labor force at the level of wages that corresponds to the degree of qualifications and knowledge of the employee [10, 1-2].

Let's look at a specific example. Suppose that under resource constraints, workers prefer high-paying jobs over low-paying jobs if all other job characteristics are the same for every task. Thus, they will leave low-paid jobs in order to get more profitable ones if they believe that

sufficient improvement is likely to be [2,30-32]. This principle does not mean that workers only care about wages or that everyone can equally leave. Workers obviously care about a number of employment characteristics, and improving any of them in their current job makes turnover less likely.

Understanding the nature of the labor market in terms of normative economics begins with the realization that there are two types of economic transactions. The essence of the first type of economic transactions in the labor market is that all parties to the transaction make a profit. For example, if a specialist is ready to create drawings for 10 thousand UZS per hour, and the customer is ready to pay for such work up to 15 thousand UZS per hour, then both parties to the transaction will be in an advantageous position when they can agree on the hourly cost of work in the amount of from 10 thousand to 15 thousand soums Such a deal is mutually beneficial. The role of the labor market is to facilitate these voluntary, mutually beneficial deals. If the labor market is successful in promoting all possible mutually beneficial transactions, we can talk about achieving Pareto efficiency [3]. If Pareto efficiency were actually fully achieved, then no more transactions in the labor market would be carried out voluntarily, because they would not be mutually beneficial.

In the second type of transaction, one or more parties of the employment contract lose. These transactions often involve redistribution of income, of which some benefit at the expense of others. The increase in the number of such transactions shows the ineffective functioning of the labor market. When employers and job seekers enter into negotiations, they usually weigh the costs and benefits only for themselves - and, of course, decide to close the deal if the benefits outweigh the costs. If all transaction costs and benefits fall on the decision-makers, then society can be confident that the transaction represents a step towards Pareto efficiency. However, sometimes jobseekers are not on an equal footing with the employer and therefore are not able to influence the decision on hiring. This happens when the demand for labor is much less than the supply.

A similar imbalance in the labor market is pushing states to intervene in employment processes taking into account the demographic aspects of the labor market. Government policies affecting the labor market are often based on a widespread, but not generally recognized, value orientation, according to which the distribution of income among the population should be more equal [4,6-13]. To this end, the state implements social security programs, adopts laws on minimum wages and imposes restrictions on migration. The essence of such a policy is that vulnerable groups of the population should not expose themselves or their families to the risk of physical or financial harm due to negative fluctuations in the labor market.

So, normative economics emphasize the efficiency of the labor market over considerations of social justice. For a transaction to be mutually beneficial, all it takes is for each party to a labor transaction to be in a relatively win-win condition. From a scientific point of view, the study of voluntary transactions of labor market participants is useful when considering economic efficiency [5,77-87]. However, considerations of equity are always linked to the comparison of a lack of well-being. For making political decisions based on considerations of justice, vulnerable populations usually turn to the leadership of the political system, not to the markets.

ABSTRACT

This article is dedicated to the first Uzbek national lithography, which was launched in 1874 in the Khiva Khanate during the reign of Muhammad Rakhimkhan Feruz (1864-1910). It provides new information about who worked in national lithography, what books, and how many copies were published. The sources have new information about Ibrahim Sultan, the chief editor and technician who worked in Khiva lithography. This lithography played an important role for its time and its work reflects the history of culture, literature and science of the Uzbek people. The article is based on primary written sources about them.

KEYWORDS: *Lithography, Typography, Manuscript, Printing, Book, Palace, Iran, Khiva, Calligrapher, Divan, Poet.*

INTRODUCTION

Until the second half of 19th century, there was no national printing company in all of Central Asia. The establishment of a national printing press in this region was first entrusted to the Khan of Khiva Muhammad Rahimkhan II (reign 1864-1910). True, at that time in Tashkent there was a printing house of the Turkestan military district. Although this Printing House has been operating since July 14, 1867, it has only published its leaflets, pamphlets, notebooks and letterheads in the previous decade. The Turkestan Military District Printing House did not accept orders from other organizations, and did not publish national books, pamphlets, newspapers and magazines [15, 117].

At the direct initiative of Muhammad Rahimkhan Feruz, lithography was brought to Khiva from Iran, where printing was very developed, in order to publish rare manuscripts and collections of local poets in the palace library. A. Yazberdiev, a Turkmen bibliographer, also said that the

lithographic equipment was brought to the khan from Geneva (Switzerland) [21, 58]. However, it is difficult to agree with him as no clear source has been cited to support this view.

It was clear that the country was occupied, its spiritual and cultural riches were plundered, and that the troubled khan Feruz would not bring printing equipment from Russia and Kazan. The equipment was far from being imported from Turkey, India and Egypt.

Simultaneous development of manuscripts, printed and lithographic books is a characteristic feature of book development in colonial Turkestan, especially in Khorezm. Non-typed (lithography) - a method of copying the text, which was previously written on a sheet of paper and inverted into a stone form, was used, and in general, this method is widespread in Central Asian cities.

One of the main reasons for the choice of this method of printing in the Khiva khanate and its strong place in the printing of national books is that this method is based on the use of calligraphy as an integral part of the book publishing process. This did not stop the thousand-year traditions of manuscript. On top of that, it is to use the knowledge of calligraphers who have continued their services in increasing the wealth of books as before. It would help to choose from centuries-old manuscripts to reprint their texts, which were full of text and quality. It opened up new possibilities for making full use of the skills and abilities of calligraphers. For this reason, the method of lithographic printing in Khiva was added to the tradition of book publishing without much resistance.

Another reason was that the lithographic printing method, unlike the typing method (typography), did not require a lot of laborious work related to the work of typewriters, editors, proofreaders. Typing and printing machines also saved money on expensive and rare Arabic typefaces. The most important thing was that even in the conditions of private business, the method of printing lithographs was much cheaper than the method of typing.

In addition to the above, one of the important factors in the development of the Uzbek national book is the method of moving books by hand could not meet the growing needs of the people for books, although there were various schools of calligraphy, a large number of cover workshops, and skilled calligraphers who could copy any manuscript for an average fee.

Thus, in addition to the study of books published in lithography, the study of the activities, methods, and book art of the calligraphers who worked on it will undoubtedly provide important information in our work.

The first scientist to give information about the lithographic printing equipment of the Khiva palace was A.N.Samoilovich. He was in the Khiva khanate from May 17 to July 2, 1908 and saw the stonework and its activities with his own eyes [18, 70]. His work entitled "Khiva Palace Book Preserve and Lithography" describes lithography and its activities [16, 82]. When Samoilovich saw the lithographic printing equipment, he was operating south of the chordara awning in the khan's garden called Tozabog.

The lithographic printing equipment was installed in 1874 in the khan's palace by Ibrahim Sultan, a printing specialist specially invited from Iran (on a contract basis). It is clear from the sources that this person was summoned from Iran to set up the lithographic printing equipment. Therefore, books published in Khiva are similar in appearance to Iranian publications. In fact, in

the pages of the history of this period of the Khiva khanate there are three names of Ibrahim Sultan.

After the conquest of Khorezm by Tsarist Russia in 1873, at the suggestion of von Kaufmann, the Iranian captives in Khorezm were released. Some of the freed Iranians stubbornly revolted:

“The captives were set free, and many slandered and persecuted their masters. One of them was led by Ibrahim Basmachi, who received the nickname Sultan. That is why he was called Ibrahim Sultan. All the captives rebelled, revolted, and plundered the population. Residents came and complained to Kaufman. At Kaufman’s signal, the khan, hearing their complaints, hanged two of the Iranians. Then the conspiracy was suppressed” [12, 57].

Another was Ibrahim Sultan, who worked as a runner in the khan’s palace. He was one of the close aides of the prime minister of the Khiva khanate Matmurad devonbegi. “Ibrahim Sultan was a beautiful writer”, writes the historian Bayani [12, 73-74].

The third Ibrahim Sultan is the one who brought the lithography that is our subject. However, our guess is that these three Ibrahim Sultan are one person. Ibrahim Sultan was originally a slave brought from Iran. He was later released with the arrival of the Russians. It is not surprising that Ibrahim Sultan joined the evil conspirators during his first liberation. Considering that he was enlightened, educated and a mature poet. For this reason, the enlightened khan offered him a job in the palace. Later, as a result of his knowledge and breadth of worldview, he became the closest person to the prime minister. Seeing the need and demand for books in Khorezm, because of his hunger for novelty, and finally, with the permission of the khan, he brought a lithographic printing equipment from his native Iran. This our opinion is supported by R.M. Mahmudova that “Ibrahim Sultan was one of the Iranians living in Khiva” [7, 44]. This opinion is confirmed by Bekchon Rahmon oglu, one of the enlightened Jadids who knew Ibrahim Sultan well, in his work “Ozodnoma” dedicated to the life of Khiva slaves:

“It was at this time that the slaves in Khiva, taking advantage of the Russian occupation of Khiva, stole the property of their masters and made all sorts of slanders, harassing many people and revolting. The leader of this uprising was the famous Ibrahim Basmachi, who first organized the printing business in Khiva. For this reason, he was nicknamed “Sultan” in those days and was also called Ibrahim Sultan” [4, 15].

The fact that the works published in the Khiva lithograph include examples of Ibrahim Sultan’s poetic verses and historical continents confirms that he was, as Bayani put it, “a good poet”. In the preface to “Divani Fuzuli”, published in 1882, he writes:

“Not to be hidden from the wise, this sinful man Ibrahim Sultan came to Khorezm by the will of fate. It was the digital age of Sayyid Muhammad Rahim Bahadur Khan. I came to his palace. I applauded him and lived a peaceful life”.

It is stated in these sentences that Ibrahim Sultan came to Khorezm from Iran voluntarily (captured) by the will of fate, and later he was highly valued in the palace of Muhammad Rahimkhan. Upon his arrival at the palace, Ibrahim Sultan made no secret of the fact that his life was spent in peace and tranquility.

Thus, the establishment of the lithographic printing equipment in Khiva took place under the influence of Iran, with the help of Ibrahim Sultan. The lithography was commissioned in 1874 by

the typist Ibrahim Sultan. He is said to have moved to Ashgabat, where he spent several years publishing several leaflets and pamphlets, teaching local students. G.N. Chabrov mentions that he will return to his homeland after working in the lithographic printing for 5 years [17, 318].

In fact, the name of Ibrahim Sultan is also found in the books published in 1301 AH (1884 AD). So even if he left, he would be gone after 1884. One of his students was Otajon Abdalov (1856-1939). Otajon Abdalov took over the printing business after Ibrahim Sultan left (it is not clear how long he worked with Ibrahim Sultan) and became popularly known by the nickname Otajon Basma. It should be noted that his name appears in books published by the lithographic printing in the early twentieth century. When writing about the Khiva lithographic printing, A.N. Samoilovich for some reason did not mention his name.

It should be noted that while the lithographic printing continued in Khiva, the method of typography was introduced a little later. This was reported in the newspaper "Tarjumon" in July 1896. According to the article "Khan of Khiva", Sayyid Muhammad Rahim Bahodirkhan visited the city of Nizhny Novgorod. It became known through "Pochta" newspaper that the khan paid attention to the printing presses, took the necessary number of letters from one of them and delivered it to Khiva. This machine will be donated to one of the Khiva madrassas and students will be taught the science of printing books. If this is done, as the newspaper's editor, the famous Ismailbek Gasprensky, wrote: "If so, the Khan will have done the greatest service, the most necessary work for his dear homeland!" [23, 105].

It is closer to the truth that special letters were brought to Khiva. Because, Mominjon Muhammadjon oglu noted in his memoirs that he saw that machine [10, 332].

The transformation of lithography (Khiva lithography) into a typo-lithography was announced on the first page of the book "Gulshani roz" published in 1912 by A. Bobokhonov in his monograph "From the history of Uzbek printing" [5, 114].

The author of "Tazkirai Qayyumi" writes about one of the leading poets of Khorezm Abdurazzaq Faqiri, in particular, he says: he collected his works with his pen and wrote a bayoz (poet) called "Gulshani ishq". He published it in 1916 [13, 598].

It is known that in 1910, due to the death of Muhammad Rahimkhan Feruz, the publication of books in lithography stopped. In particular, E. Akhunjanov is of the same opinion. He said: "In 1910, Khiva khan Muhammad Rahimkhan II died. His son and successor, Isfandiyarkhan, stopped publishing. Therefore, it can be noted that the lithography of the Palace in Khiva lasted from 1874 to 1910" [3, 101]. He explains his opinion by the lack of books published in the Khiva lithograph after 1910 in the fund of the Institute of Oriental Studies of the Academy of Sciences of the Republic of Uzbekistan.

It is closer to the truth that Isfandiyarkhan also continued to publish books in lithography. Indeed, during his time, the national revival was revived, the telegraph, hospitals, several madrasas were built, and the number of Russian-style schools increased under the influence of the Jadids.

It is closer to the truth that Isfandiyarkhan also continued to publish books in lithography. In his time, even in the oasis, a second printing press was launched. Indeed, during his time, the work national awakening was revived, the telegraph, hospitals, several madrasas were built, and the number of "Russ-tuzem" schools increased under the influence of the Jadids. Of course,

Isfandiyarkhan could not stop publishing books in Toshbosma. In his time, even in the oasis, a second printing press was launched. This was the K.V.Novikov printing house in Petro-Alexandrovsk (now Turtkul). Anyway, we have to do research on this. Anyway, it has to do research on this.

The Khiva lithography was launched in 1874, and it was determined that the first published work was Munis Khorezmi's "Divani Munis". A. Vamberi (1832-1913) has an article entitled "Two poets of modern Central Asia – Munis and Amir", published in 1892 in the "Journal of Oriental Studies in Vienna". Speaking about "Divani Munis", the title page states that the work was published in Khiva in 1292 AH (1874 AD) [21, 56]. It is known that A.N. Samoylovich got acquainted with the activity of the Khiva lithography through this information. However, he was not able to obtain this edition of "Divani Munis", but received the next 1880 edition from the Khiva. In general, the first edition of "Divani Munis" – 1874 – was not found in the libraries of the former Soviet Union.

However, it should be noted that the copy of the title page, which Almaz Yazberdiev Vambery used as the first copy of "Divani Munis", was not published in 1292 AH (1874 AD) [19, 315].

The opinion of A. Yazberdiev was noted by Uzbek bibliographers E. Akhunjanov and A. Mirzarahimov [3, 100; 8, 40]. Exactly six copies of Divani Munis, which they presented as the first book published in Khiva lithography, are kept in the lithographic book fund of the Institute of Oriental Studies of the Russian Academy of Sciences. It was published in 1297, not 1292. The fact is that at the top of the date, that is, next to the number 9 of the year, 2 of the number 26 of the month is written, and the number 7 of the year is slightly to the right of the text. Then A. Yazberdiev states that it was published by Otajon Abdalov. However, it does not mention the name of Otajon Abdalov. Then at that time, Ibrahim Sultan was still working on the Khiva lithography.

In this edition of the book, which we have used, the expert who used it before us has written the number of 1879 AD under the date 1297, which is given at the end of the preface. Therefore, on the title page of this publication, there is a sentence: "May Allah protect us from the child of grass and the plague of water. The book was published in the capital's Khiva printing house, which shines like the sun, on the 26th of Shawwal, 1297".

A.N. Samoilovich donated 5 books published in Khiva to the Asian Museum. K.G. Zaleman listed them as follows:

- 1) Divani Pahlavon Niyaz Mirzoboshi al-mutahallis bil-Kamil. Khiva, 1298.
- 2) Divani Ogahiy. Khiva, 1323.
- 3) Majmuai Davvoviyn. Khiva, 1324.
- 4) Divani Munis. Khiva, 1297.
- 5) Majmuai shuari Feruzshohiy. Khiva, 1324 [20, 22; 21, 57].

When A.N. Samaylovich came to Khiva in 1908, he knew "Divani Munis" quoted by Vamberi was known from the 1292/1874 edition. It is also strange that he won not this edition, but the next edition of the divan. Because he knew through Vamberi's article about "Divani Munis" that there was a lithography in Khiva, and he saw it with his own eyes and had a conversation with

one of the experts, Ahmadjan Tabibi. Hence, this fact once again raises doubts about the existence of the 1874 edition of “Divani Munis”.

It should be noted that at the end of the work “Divani Bedil”, published in 1301, the following two verses are written under the title “Qita’i tarix”:

کلام معجز نظام بیدل چو طبع گشته به طرز دل کش
که تاب هر حرف رشک مهرش کرد ربوده ز ید بیضا.
سنین سوری و معنویش هم از سر شوق گفت به قلم،
که گشت مطبوع در هزار دو صد نود و کلام زیبا.

It should be noted that the line given by this byte as history is indicated by the year 1301. Hence, the number 1290 in the text must have belonged to its first edition. This is confirmed by the authors of the pamphlet “Musical History of Khorezm” Muhammad Yusuf Devonzoda and Mulla Bekchon Rahmon oglu. They wrote: “In the years 1290-1296 AH, a lithographic printing equipment was brought from Iran and ordered by a man named Ibrahim Sultan, and several books were published” [9, 46].

The publisher was the main person in the preparation process of the manuscript for publication. He was not only an editor or proofreader, but was also the main person responsible for the quality of the manuscripts intended for publication, the artistic and scientific level of newly written and published, as well as reprinted books. In some cases, the text of the works prepared for publication was copied by the publishers themselves. In all these processes, highly qualified, experienced calligraphers with a deep understanding of centuries-old manuscripts in Turkish, Persian, and Arabic could be their assistants and advisors. The publisher personally negotiated with the khan, signed contracts with authors and calligraphers. Again he chose texts for rewriting, determined the character of the artistic decoration of the books, their size and format, the interior and exterior. He took a copy of the finished book and showed it to the khan.

These ready-made books were in demand by the publishers themselves, the courtiers, book authors, booksellers, ordinary individuals, citizens, literary lovers and book lovers. Books published during the first period of the lithography’s activity were not sold, but were given only to scholars, fuzalas, and madrasas [1, 97].

A.N. Samoilovich reports that lithographic products are not sold [16, 82].

However, research has confirmed that although lithographic editions have not been released to the public, some editions have been sold among readers. In particular, on the first page of the book “Fiqhi Kaydani” published in the lithograph, there is a note that “the book was bought by Mullah Muhammad Karim from Muazzin Eshan Babajan Mutawalli for 4 gold on the 16th of Rabi ‘al-Awwal, on Saturday” [6].

On the first page of “Divani haft shuaro”: “The book is from the library of Bekchon Rahmon oglu. №389, №418. Mullo Bekchon Rahmon oglu: I received it on February 22, 1925” [22].

It is known that the names of the publishers of lithographs were mentioned in the title page or in the preface of the work. In the course of researching literary, artistic and educational publications of Uzbekistan, R.Mahmudova, a researcher of Uzbek lithographs identified the names of more than 80 publishers, customers and sponsors of the book, who undertook the preparation and

funding of a separate publication, mostly manuscripts. Among the publishers responsible for the books published in the Khiva lithography, we should mention the names of such intellectuals as Kamil Khorezmi, Muhammad Rasul Mirzo, Muhammad Yusuf Bayani, Ahmadjon Tabibi and Muhammad Murad Devonbegi. However, their names do not appear in the title pages of books published in the Khiva lithography. Perhaps their names can be found in the foreword of the publisher who wrote for publication at the beginning of each book published here.

Otajon Basmachi, like Ibrahim Sultan, was the chief technical officer overseeing the publishing process. E.K. Betger notes that a person named Zevari also worked in the work “Khamsa” published here. This man was an assistant to Otajon basma, that is, a person responsible for the quality of the paint and paper. The title page of the “Office of the Seven Princes” published here also contains the name of Adai. This person was apparently responsible for the book’s artistic embellishments as well as the cover process. In the title page of Ahmadjan Tabibi’s book “Majmuai Shuaro” is mentioned the name of Otajon Basmachi ibn Abdalniyaz Khivaqi.

To date, about 40 books have been published in the Khiva lithography. Many of them are works of art and literature. These are mainly the works of Alisher Navoi, Munis Khorezmi, Roji, Ogahi, Kamil Khorezmi, Tabibi and Khorezmian poets who lived in the late 19th early 20th centuries.

In 1879, Munis Khorezmi’s divan “Munis ul-ushshaq” was republished. It consists of 669 pages, and at the beginning of the divan is a 14 page preface written by Munis. In 1880, Alisher Navoi’s epic “Hayrat ul-abror” from “Khamsa” was published. Alisher Navoi’s works are highly valued in Khorezm as well, and it was a favorite profession of Khiva poets to attach nazirs and muhammas to his ghazals. Navoi’s works were also taught in Khiva madrassas. In particular, Muhammad Rahimkhan Feruz highly valued Navoi. The first edition of Alisher Navoi’s “Khamsa” in Central Asia was prepared for publication by Kamil Khorezmi on behalf of Muhammad Rahimkhan II [2, 5].

In early 1881, Yaqubhoji ibn Ibrahim’s “Divani Khalis” was published in the Khiva lithography. The literature states that its preface was written by Kamil Khorezmi. In general, it should be noted that many of the works published in lithography were written by Kamil Khorezmi or his son Muhammad Rasul Mirzo.

In some of the editions of 1297/1880 we find the name of Muhammad Rasul Mirzoboshi, the son of Kamil Khorezmi, not Kamil Khorezmi, as a publisher. In particular, Feruz’s books “Divani Feruz” (1880), “Divani Roji” (1880), “Chahor Kitab” (1881) can be shown. However, E. Akhunjanov, A. Bobokhonov and others believe that these books were published under the preface of Kamil Khorezmi [3, 102; 5, 11].

Later, Navoi’s work “Khazayn ul-Maoniyy” (1882) was published in Khiva. This was the first edition of Navoi’s divans in Central Asia. According to B. Kasimkhanov, this book, published in 1300 AH, was prepared for publication by Kamil Khorezmi [2, 6]. However, in fact, it was not Kamil Khorezmi, but his son Muhammad Rasul who prepared it for publication and wrote the foreword. After the preface of the work, two rubais written by the editor to Muhammad Rahimkhan are also attached (p. 5). Another important aspect of this edition is that the last page of the book (p. 399) states that the book was published in 1296 AH by the order and with the help of Khiva khan Muhammad Rahimkhan Bahodirkhan II. The reason for the difference between this date and the date in the preface is that the date at the end of the book does not indicate the time of its publication, but the time when the preparation for publication was ordered

and the work began. This is probably the reason why we come across two dates of the same type in the many books published in the Khiva lithograph. It should be noted that in some publications this may be the opposite. That is, the title page may indicate the time of preparation for publication, and the date of publication at the end of the book. We find this in “Divani Bedil”.

In the Khiva lithograph, Ogahi’s 530-page “Tawiz ul-Ashiqiyn” (1882) was first published with an 18-page preface. It was also published by Muhammad Rasul, the son of Kamil Khorezmi, and included a 3-page preface.

In 1883, Fuzuli’s first work in Central Asia, “Divani Fuzuli Baghdadi”, was published. It was 184 pages and 21x19 in size. This divan of Fuzuli and Mirza Abdulkadir Bedil’s “Kulliyat” are published by Ibrahim Sultan Irani on behalf of Matmurod devonbegi. At the time of Fuzuli’s publication, Muhammad Rahimkhan Feruz had gone to St. Petersburg. On the occasion of the khan’s long journey, “Divani Fuzuli” was published: “With the intention of making the khan’s health and travels safe, the history of the Khivaq printing house was completed on the twenty-fourth of the month of Rajab in the year one thousand three hundred AH (June 2, 1883)”. These words were written on the title page of the work.

The foreword to the book states that Muhammad Rahimkhan Feruz went on a trip to St. Petersburg, and a book is being published in this regard.

The significance of this preface is that, first, it contains information about the identity of Ibrahim Sultan. The poems written in the preface confirm that he was a poet. It also shows that G.N. Chabrov’s statement that Ibrahim Sultan left after working in Khorezm for 5 years is not true. The second is the information that the khan of Khiva was on a visit to St. Petersburg in June and July 1300 AH. Fuzuli’s divan, as mentioned above, was prepared as “to’yana” (gift) on the occasion of khan’s return from the journey. In the month of Rajab 1300, the publication of the book began. Less than a month later, in the month of Sha’ban, the book was published in 100 copies. At this time the khan appears to have returned from a journey or entered the country.

The famous historian Muhammad Yusuf Bayani writes that the khan of Khiva was on a trip to St. Petersburg for three months in 1299 AH, not in 1300 AH [12, 76].

It should also be noted that in 1300 AH, In 1300 AH, Abdulkadir Bedil’s “kulliyat” (divan, masnavi, rubai, “Muhiti Azam”, “Isharat”, “Nukot”) was published again with the efforts of Ibrahim Sultan and with the direct help of Muhammad Murad devonbegi. The title page of the book lists the reasons for its publication. Inside the rhombus-shaped frame in the middle is 1300 as the name of the book and the date of publication.

Hence, it is known that during this period khan’s journey Matmurad devonbegi was the head of the Khiva lithography. Needless to say, two baytes are given as history at the end of the book. At the bottom of the history line is the year 1301. The 1300 dates in it indicate the time of preparation for publication, not the publication date of the book. This means that the title page of the book does not always indicate the date of its publication.

Works of Kamil Khorezmi, Muhammad Yusuf Raji, Ahmadjon Tabibi, Muhammad Rasul Mirzo and other Khorezm poets were published in Khiva lithography. Some works have been published several times. In particular, the “Divan of the Seven Princes” was published four times from 1906 to 1909. Kamil Khorezmi’s divan has been published four times. Kamil Khorezmi’s divan,

published by Mirzo, with a 3-page preface at the beginning of each, was published in 1880, 1881, 1895 and 1909 [3, 102].

In 1905, Ogahi's famous divan was reprinted on 434 pages (including a 13-page preface). In 1909-1910, Ahmadjon Tabibi's five divans in Uzbek and Persian, "Hayrat ul-ushshaq", "Munis ul-ushshaq", "Mir'at ul-ishq", "Tuhfat us-sultan" and "Mazhar ul-ishtiyoq" were also published.

The lithograph also published works translated from other languages. The Uzbek translation of Fuzuli's "Soqiynoma" (translated by Muhammad Rasul Mirzo) was published three times in 1907, 1908 and 1909.

In addition, the publication of religious literature in lithography is also planned. "Chahor Kitab" was published in 1298 AH and is a 242-page Persian work. Originally called "Muhimmot al-Muslimin", this work was taught to children in schools, some parts of which were memorized. The demand for the book was huge, of course. Therefore, Ibrahim Sultan copied it in his own hands and published. The book was published by Kamil Khorezmi's son Muhammad Rasul and written with a foreword.

"Tarjimai Fiqhi Kaydani", also known as "Targhib ul-Musalliyn", is one of the religious works. M. Rustamov writes that "a book called "Fiqh" was published in Khiva" [14, 38].

In fact, it was a translation of "Fiqh Kaydani" by Khorezm scholars. The work was published in 1309/1891 by Kamil Khorezmi.

An Arabic-Uzbek dictionary, Muhammad Riza Khivaqi's "Muntahab ul-lug'at", was also published. Abu Nasr al-Farahi's "Nisab as-Sibyan" is also a dictionary of Arabic and Persian, written in verse for children to memorize. This work was in great demand because it was taught in Khiva madrassas.

In general, the works published in the Khiva lithography should be linguistically divided into Turkish-Uzbek and Persian works. In terms of themes, they can be divided into divans, bayozs, religious and jurisprudential works, linguistic and moral works.

The titles of the first works published in lithography did not mention that they appeared in Khiva lithography. For example, the title of "Nisab us-sibyan", published in 1876, contains two Persian baytes and the name of the book in the middle, while the title page of Roji's divan, published in 1880, contains only the words "Divani Roji". Navoi's "Khamsa", published in 1880, stands out among the works published in Khiva lithography.

The Office of the Seven Princes was published in Khiva in 1324 AH (1906). This was the first publication of the work. It contains the divans of seven princes from the children and relatives of the Khiva khan. They were: Shahzoda Turamurod Tora (Murodi), Shahzoda Isfandiyorjon Tora (Farukh), Shahzoda Sayyid Nosirjon Tora (Sultani), Shahzoda Sayyid Sadullahjon Tora (Saadi), Shahzoda Hasankuli Tora (Sadiq), Muhammad Yusufbek (Bayoniy) and Husanmurodbek (Aqil). The title page of this book is uniquely designed. The title contains the words "Amali Ado (or Adoiy)". From this we know that a man nicknamed Ado also worked in the lithography.

The lithography is associated with the unique art of calligraphy, and thanks to their efforts, both the artistic level of the printed books and the art of writing have gained a new spirit. Among the calligraphers who wrote for the lithography are the names of them such as Ibrahim Sultan, Domla Muhammad Yusuf Khorezmi ibn Berdimurod Sufi, Mullo Ibrahim bin Domla Qalandar

Haji, Mullo Bekmuhammad bin Kutlugmurod Sufi. We would like to mention the name of Mullo Ibrahim bin Domla Qalandar Haji, the most talented calligrapher for the Khiva lithography.

The books published by Otajon basma (for example, “Majmuai shuaro”, “Divani haft shuaro”) differ from the works published by Ibrahim Sultan in their decoration and order of placement of texts. Ibrahim Sultan paid very little attention to the decoration of books. There are no patterns on the title pages, in the headlines. In Otajon Abdolov’s publications we see that national patterns are used a lot.

As mentioned above, the publisher was responsible for the level of the book, the accuracy of the text, the beautiful appearance of the book. In the margins of some books, we see that the publisher has corrected the word texts or pointed out the missing words. At the end of “Divani Feruz” there is a table with a sheet of paper showing the correctness of the words. It shows the wrong page, line, wrong word and its correct reading, as well as the place of missing words.

In the first edition of the Khiva lithography, not even the pages were numbered, and later the pages of the work were numbered. There is no content at all in lithographic publications. The number of copies of the books is not specified. For example, the title pages of publications in Tashkent, India and Turkey indicate the number of copies of the book. A.A. Semenov, an orientalist who was one of the first to study the history of Central Asian lithography, and who in 1912 compiled a catalog of lithographic books kept in the Turkestan Public Library, concluded that the books published in Khiva lithography were rare.

In general, it should be noted that scholars believe that the number of copies of books published in lithography did not exceed 150-200. Bibliographer E.Okhunjanov writes that they were published in 200-300 copies [3, 101].

In the title of the book “Kanz al-ibad”, published in Kazan in 1908, it is written that the publisher is Qari Ali Akbar bin Abdullah Nogaev from Khiva. Also, Kamil Khorezmi’s divan was published in Tashkent in 1327 AH (1909) in many copies. This information shows that Khorezm traders, booksellers and some enlightened people were not only satisfied with the books published in the Khiva lithography, but also that some of them were publishers in printing houses in other cities.

Because the years when “Kanz al-Ibad” was published in Kazan and Kamil Khorezmi’s divan was published in Tashkent were the most prosperous, developed and active periods of the Khiva lithography. However, the fact that the works of Khorezmians are published in other places means that our conclusions are correct. Nevertheless, we can know how many copies of the two works published in the Khiva lithography. These were “Divani Fuzuli” and “Divani Munis”. Earlier, the publisher’s preface stated that the books were published in 100 copies (in the book they were called “yuz mujallad”).

Concluding our article on this Khiva lithography, in a word, in the late nineteenth and early twentieth centuries, literature and art were formed in Khiva and developed in an unprecedented way compared to their time. The emergence of printing in Khiva in 1874, the introduction of lithographic printing, increased the opportunities for madrasa students and readers, and the social status of literature changed for the better. In the art of lithography, which developed in harmony with the art of calligraphy, there were also prominent calligraphers. Publishers would carefully review each book prepared for publication and allow it to be published. True, the

appearance of the first editions of the lithography resembled Persian books under the influence of Iran, but later traces of national art began to appear. It is also noticeable that as the repertoire of books published in lithography grows, so does their appearance, as well as the art of bookbinding. Speaking of lithography activities, we would like to point out that there are a number of issues that remain unresolved. One of them is the question of determining the exact time of the launch and the first edition.

In general, the launch of lithography in Khiva paved the way for innovations in book art and calligraphy. The lithography itself shows that the Khorezmian culture rose faster than the neighboring khanates.

A DEMOCRATIC SOCIETY IS THE SPOKESMAN FOR THE PEOPLE'S, NATIONAL WILL

Seitova Zukhrakhon Pirjanovna*

*Associate Professor,
Nukus State Pedagogical Institute named after Ajiniyaz,
UZBEKISTAN

ABSTRACT

The article talks about a democratic society in Uzbekistan, which is based on eastern traditions, the spiritual sources of the Uzbek people. For the prosperity of the Motherland, first of all, spiritual and moral reforms must be carried out. Democracy is the fairest and most desirable kind of society that a people and a person can achieve in their struggle. In such a society, a person's spiritual perfection should be high. That is, comprehensively developed and spiritually rich people, uniting, can build a democratic society. This is how the great thinkers and philosophers of the past represented a just society.

KEYWORDS: *Democracy, Traditions, Uzbek society, Spirituality, Spiritual and Moral education.*

INTRODUCTION

Democracy is the fairest and most desirable kind of society that a people and a person can achieve in their struggle. In such a society, a person's spiritual perfection should be high. That is, comprehensively developed and spiritually rich people, uniting, can build a democratic society. This is how the great thinkers and philosophers of the past represented a just society. In particular, in the 10th century, Abu Nasr Farobi dedicated his "Treatise on the views of the inhabitants of a virtuous city", in which he emphasizes that as far as people forming a society will be virtuous, moral, as far as their faith will be strong, the society will be strong, governance will be easy, the power will not be seized by random people [1].

Democracy, in its fundamental meaning, is a free civil society. A person enjoys the rights and freedoms enshrined in the Law, his activities are aimed at improving his life, meeting his needs, he has the right to do everything that is necessary for his perfection and the perfection of his children. However, democracy, like any other kind of society, presupposes the preservation of

law and order, social stability, and power management. That is, in such a society there is subordination, submission to the Law and to the government elected by the will of the majority.

Thus, power in a democratic society turns into an exponent of the people's, national will. As far as the people, the nation will be enlightened, culturally developed, so this will be life-affirming, effective. This means that the spiritual perfection of the people and the nation is the main factor for building a democratic society. The people of Uzbekistan in building a democratic society relies on eastern traditions, the spiritual sources of the Uzbek people. The wisdom of the East, traditions, rituals and customs of the Uzbek people, Islamic teachings are the first foundation of a democratic society under construction in Uzbekistan. As you know, relying only on traditions and not paying attention to world experience, one cannot achieve the goal. Therefore, eastern national traditions must be combined with democratic ideas. Consequently, universal human ideas and values are the second basis for building a democratic society. Strengthening independence and the transition to market relations set the task of creating a "comfortable and free homeland." The solution of this task is entrusted to the people who love their Motherland and are ready to do everything in the name of its prosperity. In this sense, patriotism and dedication of the people can be considered the third basis for building a democratic society. Fidelity to national traditions, the idea of self-awareness, the idea of combining it with universal human values should strengthen and strengthen the feeling of patriotism. A free person is a person who loves his homeland, ready to give, if necessary, his life for his country, for his people. Our freedom is closely linked with the freedom of the Motherland. As far as Uzbekistan is strong and powerful, so every citizen will be free and strong, multiply his opportunities.

Spiritual and moral education is an important condition for the creation of a democratic society in Uzbekistan. Only when people are bound by the bonds of spirituality can they become a people, a nation. Because spirituality is such a powerful inner force that calls a person to spiritual purification and perfection, enriches the inner world of a person, strengthens his faith and conviction, and awakens his conscience. The connection between the democratic transformations taking place in Uzbekistan and the spiritual renewal of society is the common wealth of all peoples living in Uzbekistan. At a time when we set our goal to build a civil society in the country, the tasks of mastering democratic principles, increasing the social and political activity of citizens, realizing individual freedom in practice, improving the multi-party system based on democratic principles, the gradual transfer of certain powers of government bodies to public organizations and self-government bodies, are connected with spirituality, which has embodied universal human values.

Only when the basic values of a democratic and civil society formed in the developed countries of the world, such as the power of the people, a policy aimed at protecting the interests of citizens, reliance on the will of the majority in decision-making, respect for minority rights, guaranteed observance of human rights, the introduction of a system of free and fair elections, equality of all before the law, public control over the activities of the authorities, will turn into an organic and inseparable part of the political culture of every citizen, only then the building of a democratic society will turn into reality. For the prosperity of the Motherland, first of all, spiritual and moral reforms must be carried out. This task can be performed by a leader with moral qualities. Consequently, for the implementation of democratic transformations in society, spirituality must become the main pillar of politics.

A democratic society is a society of glasnost; it is a healthy environment where a variety of opinions prevails. At the same time, the owners of high spirituality play an important role, since if the spirituality, morality and thinking of the masses are not high, it will be impossible to distinguish who is right and who is wrong, to distinguish truth from lies. Spirituality and national values form the foundation of the national ideology. National spirituality, like language, has a peculiarity to unite and organize people. From the first years of independence, Uzbekistan was faced with the task of not "forcibly introducing democracy", but of reviving democratic values among the people, forming a legal and political culture in them. At the same time, the revival of national and spiritual values played a big role. Since, as a result of the restoration of spiritual values, ensuring national harmony, rethinking history, the Uzbek language and the religion of Islam acquired their status, the heritage of their ancestors began to be widely studied. The people of Uzbekistan are proud that in a short period of reforming the economy and society, our country is recognized by the world community, in which it takes its rightful place. Today Uzbekistan is a multinational and multi-confessional state. All nation and nationalities, representatives of all religious confessions live in one space, therefore, national and religious tolerance is one of the important facets of the policy of our state.

Democracy is a society in which justice prevails, not only social justice, but also justice in the spiritual sphere. Although the value of a spiritual wealthy person is always high, we must not forget that spiritual wealth can be turned into a commodity. Democracy is the fruit of spiritual development. These two concepts always support each other. Spirituality is the pillar of a democratic state []. "Democracy is not only a theory and a political process, at the same time, it is a way of life of the people, a feature of its psychology, traditions, culture" [, 185].

Today we can say that in recent years the Republic of Uzbekistan has achieved huge and irreversible changes in the economic, political, social, spiritual, legal directions, entered a new stage of reforming and democratizing our society. This conclusion made by the First President of the country I.A.Karimov in his Concept of further deepening democratic reforms and the formation of civil society, on the one hand, convincingly proved the correctness of the chosen model of evolutionary, phased development of our state. On the other hand, he stressed the need to strengthen the dynamic development of the processes of democratization and liberalization in order to achieve the great goal - to become one of the modern developed, democratic states, the need to provide people with decent living conditions [3]. At the same time, in all key reforms being implemented, Uzbekistan was guided by such principles as the fullest consideration of the mentality of the people, its historical and national characteristics, traditions, customs, as a guarantee of the successful implementation of the modernization of society, and also relied on the openness of the state to the world, the desire to take deeper into account global processes, to join the achievements of modern civilization, the vast experience of democratic construction, market economy accumulated by developed countries.

SOME ISSUES OF CONDUCTING AND TREATMENT OF PREGNANT WOMEN WITH CHRONIC TONSILLITIS

Kasimova Sh.A*; Karimov A.Kh; Bakieva Sh.Kh*****

*Department of Obstetrics and Gynecology,
Andijan State Medical Institute,
Tashkent Medical Academy, Otorhinolaryngology and Dentistry,
UZBEKISTAN

ABSTRACT

The was an analysis carried out for examination of complications among females during a gestation period and during the act of delivery with pathology of the upper respiratory airways. Chronic Tonsillitis is one of the most frequently encountered malfunctions among grvida. Chronic pathological process which gets localized primarily on the palatine tonsils become the focus of permanent pathological impulsing. The evaluation of general condition of functionality of a fetoplacental complex among these groups of patients is the most topical issue at present.

KEYWORDS: *Pregnancy, endogenous Intoxication, chronic Tonsillitis, Lizobact, index, hepilor.*

INTRODUCTION

The issues of chronic tonsillitis still remain an urgent problem in otorhinolaryngology, since, according to different authors, its share among the adult population is 4-6% of cases, and among children - about 8-10% (3,4,5 , 7). Recently, the authors have reported an increase in the incidence of a combination of chronic tonsillitis and pregnancy. Chronic tonsillitis is an unpleasant and dangerous disease for the period of pregnancy, which can cause many problems (5, 7, 8, 12)... During pregnancy, a woman's organism undergoes hormonal changes and against this background, immunity may decrease (1, 2, 7, 10) ...In such cases, chronic tonsillitis worsens, causing not only the expectant mother, but also various complications for the fetus. Such as intrauterine infection of the fetus and provoke premature birth or miscarriages in early pregnancy. In addition, a constant chronic focus of infection can cause developmental disorders in a child and a tendency to various allergic and autoimmune diseases.

Despite all this, until now there are no fundamental works in which a large number of studies would have established the peculiarity of the course of pregnancy in patients with chronic tonsillitis, rational methods of therapy have not been developed (3,4,9).

Objective of the Study:

To determine the effect of chronic tonsillitis on the course of pregnancy and to develop the most rational methods of treatment.

MATERIAL AND METHODS OF RESEARCH

Under our supervision there were 69 pregnant women diagnosed with chronic tonsillitis. Of 69 pregnant women, 50 were diagnosed with a compensated form and 19 with a decompensated form of chronic tonsillitis. All pregnant women underwent clinical, laboratory tests, and also pharyngoscopy. To determine the degree of endogenous intoxication (EI), the most common method is the leukocyte intoxication index (LII), which is determined by the formula of Ya.Ya. Kalf-Kalifa (1941). To calculate the leukocyte index of intoxication (LII), we used the formula of V.K. Ostrovsky (1983).

RESEARCH RESULTS

All the symptoms of the underlying disease, such as sore throat, general weakness and fatigue were observed in all patients. Sometimes in the evening there was a slight increase in body temperature within 37-37.5 degrees. The presence of a painful dry cough and a feeling of a foreign body in the throat were observed in 78% of pregnant women. In mesopharyngoscopy - marked redness, swelling of the anterior arches and tonsils, the presence of purulent plugs in the lacunae. Tonsils are cicatricially welded to the arches. The submandibular and cervical lymph nodes are enlarged and painful on palpation.

The main complaints and objective data characteristic of chronic tonsillitis are sharply expressed in all 19 pregnant women with decompensated form of the disease. A similar manifestation of the disease was observed in 68% of pregnant women with a compensated form of tonsillitis. In the course of observations, out of 50 women with a compensated form of chronic tonsillitis before pregnancy, exacerbations of chronic tonsillitis were observed once a year in 14, among 19 women with a decompensated form of the disease, exacerbations of the process were observed 2 or more times a year in 9. After the onset of pregnancy among 50 women with a compensated form of chronic tonsillitis within 6 months, exacerbations of the disease were observed in 32, and among 19 women with a decompensated form in 15. All this confirms that it is during pregnancy that women often suffer from dangerous diseases. And all because it is during pregnancy that the body of women weakens, immunity is not sufficient to protect not only the mother, but also the child. The proof of the above is the results obtained in the pregnant women we observed. At the initial stage of pregnancy, 36 women showed slight fatigue and a state of discomfort. After exacerbation of chronic tonsillitis, 32 women showed signs of toxicosis, nausea, general weakness, and pain in the abdomen. Increasing shortness of breath during exertion was observed in 28 women; by the end of the first trimester, they had dyspnea even at rest. During the period of exacerbation of chronic tonsillitis, 14 pregnant women showed signs of a threat of spontaneous abortion and premature birth. In one woman 6 months pregnant, exacerbation of chronic tonsillitis provoked a miscarriage. All manifestations of secondary intoxication of chronic tonsillitis in women are associated with the onset of pregnancy. One of the global

problems in obstetrics is the issue of endogenous intoxication in pregnant women (6,8,11). In order to identify the significance of the EI coefficient in pregnant women, women were divided into the following groups. In the first group, 39 pregnant women with chronic tonsillitis of the compensated form, in the second group, 10 pregnant women with the decompensated form, and in the third group, and 20 pregnant women (11 with the compensated form and 9 with the decompensated form of tonsillitis) were assigned to a separate group, since they had an exacerbation of chronic tonsillitis. LII data in pregnant women with chronic tonsillitis are shown in Table 1.

TABLE 1

Forms of the disease	Number of patients	Average LII value	
		According to the formula of V.K. Ostrovsky (1983)	(after treatment)
Chronic tonsillitis (compensated form)	39	2,51	1,83
Chronic tonsillitis (decompensate form)	10	3,04	1,95
Chronic tonsillitis (in the acute stage)	20	4,04	2,02
Control group	15	1,81	

The results obtained by us from the LII data indicate a significant degree of intoxication in the body of pregnant women with chronic tonsillitis. With the compensated form of the disease, not sharply expressed phenomena of intoxication were noted - 2.51, as for the decompensated form of tonsillitis, the phenomena of intoxication are more noticeable - 3.04. During the period of exacerbation of chronic tonsillitis there were significant changes in the body of pregnant women. LII was 4.04. LII within 3-4 indicates a significant bacterial effect on the body of pregnant women. We observed the highest degree of endogenous intoxication in pregnant women during exacerbation of chronic tonsillitis. These data indicate the need to quickly eliminate the process of intoxication in order to avoid secondary complications from the mother and child. Our data confirm that the levels of endogenous intoxication on the pregnant body depend on the severity of the infectious process.

The peculiarity and complexity of the treatment of tonsillitis during pregnancy lies in the fact that it is difficult to find the right drugs as many of them are prohibited for use. Many pregnant women, after being diagnosed with chronic tonsillitis, very often engage in improper self-medication, as a result, conditions are created for the transition of tonsillitis from compensated to decompensated form and the presence of various complications.

All pregnant women with chronic tonsillitis in both remission and exacerbation stages underwent sanitizing treatment. In the stage of remission for pregnant women, we recommended a local antiseptic Lizobact. A medicinal product of natural origin, the active ingredients of Lizabact are

lysozyme, which acts as an antiseptic and regulates local immunity. And also pyridoxine, which has a regenerating effect on the oral mucosa and tonsil tissue. Lizobakt was prescribed two tablets three times a day for ten days. In order to increase the effectiveness, the tablets were recommended to be sucked whenever possible.

At the same time, as an antibacterial and analgesic agent, we used Hepilor, a drug recommended for the local therapy of infectious and inflammatory diseases of the oral cavity and tonsils, to wash out the lacunae of the tonsils. In the beginning, for the purpose of mechanical removal of pathological contents, tonsil lacunae were washed with 50 ml. saline solution. After that, washing was carried out with 20.0 ml of Hepilor's solution (for washing with 10 ml, the drug was dissolved in 50 ml of warm water), that is, each tonsil was washed with 10.0 ml. Hepilor's solution. The treatment was carried out once a day, the course of treatment consisted of 6-8 procedures.

During the treatment according to this method, pregnant women after 4-5 procedures noted an improvement in their general condition, a decrease in subjective sensations, and objective data also changed in a positive way. In general, as a result of the course of treatment, out of 49 (39 compensated and 10 decompensated forms of tonsillitis) pregnant women, 35 showed a significant improvement in their condition. In 31 of the compensated and 4 in the decompensated form, the improvement was achieved in 11 (7 in the compensated form and 4 in the decompensated form), that is, fatigue disappeared, sore throat, tingling and foreign body sensations disappeared. Regional lymph nodes decreased and became painless, body temperature returned to normal. Treatment was ineffective in 3 (1 compensated and 2 decompensated form), although after treatment an improvement was achieved, but exacerbations of tonsillitis continued. These pregnant women underwent a regular course of treatment; they were recommended tonsillectomy after childbirth.

Treatment of 20 pregnant women in whom an exacerbation of chronic tonsillitis occurred during the observation period was somewhat different from those in whom chronic tonsillitis was in remission. They were also prescribed Lizobact 2 tablets 4 times a day, and were recommended to suck until completely dissolved. Hepilor was used to gargle. For this, 2 teaspoons of the preparation was dissolved in ¼ glass of warm water. Rinsing was carried out 4-5 times a day for 6-8 days. Clinical improvement in the condition was achieved in all pregnant women already on the 4th-5th day of treatment: subjective sensations decreased - symptoms of intoxication, weakness, fatigue disappeared, sleep and appetite improved, body temperature returned to normal. The pharyngoscopic picture has changed - the plaques on the tonsils have disappeared, and the tonsils themselves have decreased in volume, edema and hyperemia have decreased.

In all pregnant women with chronic tonsillitis in remission and during an exacerbation, after the treatment, the symptoms of the threat of spontaneous abortion and premature birth disappeared. On the tenth day after treatment, repeated studies were performed to determine the degree of EI. As our studies have shown, the EI index returned to normal in pregnant women with a compensated form of chronic tonsillitis. And in pregnant women with decompensated form and chronic tonsillitis in the stage of exacerbation, the EI index approached the norm.

CONCLUSIONS

1. In the body of pregnant women with chronic tonsillitis, the phenomena of endogenous intoxication are observed to a large extent.
2. A high degree of EI index is observed in pregnant women in whom chronic tonsillitis was in the acutest age.
3. Carrying out preventive sanitizing treatment of chronic tonsillitis leads to an improvement in the state of endogenous intoxication and prevents the threat of spontaneous abortion and premature birth.
4. Lizobact and Hepilor in the treatment of chronic tonsillitis are effective drugs and do not give complications for both the mother and the child.

Faculty of Construction Management,
UZBEKISTAN

ABSTRACT

This article is about improving the tools of state regulation of investment and construction activities and their importance, which provides a scientific basis for what investment is and what it is a process. Investment activities are regulated by the state. Public investment improving the legal framework for taxpayers and taxpayers stratifying taxable items, tax rates and related benefits application of the tax system, setting norms, rules, standards, monopoly counter measures, credit policy and other policies determination of conditions of ownership and use of natural resources, establishment of mechanisms for examination of investment projects, etc. in a number of ways

KEYWORDS: *Economy, Construction activities, Investment, Increase, Technologies.*

INTRODUCTION

Improving the country's economy, modern equipment and technologies for the construction and reconstruction of new enterprises equipped with how crucial it is to attract foreign investment. This first and foremost, most like the increase in employment, its wages and incomes provides an opportunity to solve important social problems. That's why economic development of enterprises attracting foreign investment to our country one of the most important issues is to encourage and create the necessary conditions is calculated.

Without attracting foreign investment, especially in leading industries abroad structural changes in the economy without expanding investment participation implementation and modernization. Enterprises with modern equipment re-equipment and production of competitive products not allowed. Attracting foreign investment to the country's economy is its domestic in all areas,

accelerating the expansion of economic opportunities utilization of opportunities and reserves, export of new equipment and technologies by mastering the goods, by setting up their production plays an important role in ensuring the economic power of our state.

Investment activities are regulated by the state. Public investment improving the legal framework for taxpayers and tax payers are stratifying taxable items, tax rates and related benefits application of the tax system, setting norms, rules, standards, monopoly countermeasures, credit policy and pricing policy, etc.

Determining the conditions of ownership and use of natural resources and performs such activities in other ways. From investing the main goal is to earn income and achieve a positive social effect. When investing, first of all: the subjects of investment activities independence and initiative; investment in material goods granting status; carrying out investment activities prescribed by law opportunity. The object of investment activity is the production of material and intangible benefits are the objects of extraction. Market relations in our country the emergence and development of existing funds for the development of entrepreneurship requires voluntary investment. That's the investment including the legal regulation of foreign investment, primarily national by legislation, and secondly, by international agreements.

Government Regulation of Investment Activity Uzbekistan The investment activity of the Republic is mainly based on the "Foreign on foreign investment " Guarantees of the rights of foreign investors and on measures to protect them, adopted on December 24, 1998 The Law on Investment Activity also regulates this area regulated by other civil legislation aimed at taxation[1].

Investment activities are regulated by the state. Public investment improving the legal framework for taxpayers and taxpayers stratifying taxable items, tax rates and related benefits application of the tax system, setting norms, rules, standards, monopoly countermeasures, credit policy and other policies determination of conditions of ownership and use of natural resources, establishment of mechanisms for examination of investment projects, etc. in a number of ways. From the years of independence of our country to the market economy. The transition is on its own path of economic development the importance of investment policy is enormous. Because investments in the economy structural changes, technical and technological upgrades, restructuring of enterprises encourages the implementation of repair work, the country's exports and allows increasing the import potential. In this regard, the State of Uzbekistan pursues its own structural investment policy [2].

The country is taking measures to introduce modern market mechanisms to support businesses, to give greater freedom to private business, to strengthen the guarantees of their rights and legitimate interests, to attract foreign investment and modern technologies. At the same time, the study of the state of affairs in the construction sector has shown that there are problems that hinder the rapid implementation of reforms in this area and the development of a healthy competitive environment.

Construction activity in Uzbekistan is an investment one of the most attractive directions of introduction and is an important sector of the economy In January-November of the current year Uzbekistan Construction totaling 39,315.8 billion soums in the country. The growth rate was the same as last year compared to the corresponding period of 106.6%. Larger contract than total construction volume 11548.8 billion soums of construction by organizations share of the total

construction work performed 29.4%, and for the same period last year compared to 103.3%. Total contribution of small enterprises and micro-firms construction works 41.5% of the volume of construction works or 16315.5 billion soums and amounted to 115.6% compared to the same period last year, the share of the informal sector was 29.1% or 11451.5 billion soums and 98.4% compared to the same period last year. Large in the structure of construction work on the construction of buildings and structures the share of the volume of construction work performed by construction organizations 26.6% to 0.6 percentage points compared to the previous year increased. Accordingly, the share of small organizations and micro-firms was 36.2% (2.2%) and the share of the informal sector by 37.2% (2.8%) decrease).

In the construction industry, with the transition to market relations centralized management is abolished and most trusts are relatively simple hierarchical characterized by a variety of private (with or without public participation) divided into firms. They are based on the Construction Department (QB) does. This, in turn, will increase the number of workers and the former He was involved in the planning of the Union's economy the apparatus will be reduced due to the abolition of branch offices. The geometry of the characteristics of its organization with the increase in the volume of construction a sharp complication on the basis of progression has also been noted, as well information processing is increasing, and the engineering and technical related to this situation and the number of employees involved in management activities increase is observed. Despite the growth of the administration, management. The level of quality demand lags far behind. One of the main reasons for this situation is the work in the field of management due to lagging productivity. Design and management computerization of technologies efficiency of management work recognized to increase.

Economics of investment projects in the context of market relations efficiency is of primary importance. Efficiency evaluation is primarily a means and tool for innovative projects spending is carried out from the position of private property owners - investors. The last case is that innovative projects are science and technology (as well as in the organization of production, management, social spheres) determines the implementation of achievements in the field. The contractor is the evaluator for the builder in the execution of the order serves to determine the values of cost-effectiveness of its activities.

The cost-effectiveness of the estimated costs and results of a single project during the analysis or by comparing project options determined by analysis. Evaluate the effectiveness of current investment projects current guidelines * in line with worldwide practice and the economic situation in the CIS during the transition period some corrections were made based on the relationship.

In conclusion, more than 300 major investments in 2007 under the investment program The project has been completed, more than 700 new ones with foreign investment The enterprise was established. Joint ventures are primarily about high technology based industries - light, food, electrical, chemical and petrochemical, machinery, building materials industry, telecommunications and information It is noteworthy that it is organized in the field of technology.

ABSTRACT

This article describes the investments in entrepreneurship, their role in the country's economy, the opportunities created, the stages of development of investment policy, the existing problems. The ongoing economic reforms in our country are directly related to the institutional changes taking place in all sectors of the economy. 2019 has been declared the Year of Active Investment and Social Development in our country. In this regard, the State Program was adopted, which created ample opportunities for the development of small business and private entrepreneurship.

KEYWORDS: *Entrepreneurship, Economics, Investment, Private Property, Government Agencies, Capital, Stages Of Development, Investor, And Investment Policy.*

INTRODUCTION

The ongoing economic reforms in our country are directly related to the institutional changes taking place in all sectors of the economy. 2019 has been declared the Year of Active Investment and Social Development in our country. In this regard, the State Program was adopted, which created ample opportunities for the development of small business and private entrepreneurship. Today, in the context of global integration and globalization, the development of active entrepreneurship in the country requires the organization of small business on the basis of innovative and modern approaches, advanced technology and management methods.

As the President of the Republic of Uzbekistan Sh.M.Mirziyoev stated in his Address to the OliyMajlis: Our first task should be to expand the ranks of such entrepreneurs, including the creation of favorable conditions for the import and introduction of high technology, machinery and equipment based on the latest scientific achievements in our country.” they pointed out. The main directions of comprehensive support for small business and private entrepreneurship, the elimination of some negative barriers to the rapid and sustainable development of business entities are being developed. We will achieve rapid development of our economy only through the active attraction of investments, the launch of new production facilities. Positive results in the economy provide an opportunity to systematically address the problems that have accumulated in the social sphere.

“World experience shows that a country that pursues an active investment policy has achieved sustainable economic growth. That is why it is no exaggeration to say that investment is the driver of the economy, in Uzbek, the heart of the economy. Along with investment, new technologies, advanced experience, highly qualified specialists will enter various industries and regions, and entrepreneurship will develop rapidly.”

It should be noted that the ongoing reforms in Uzbekistan and their results are recognized by the world's leading international rating agencies. For example, the world's leading rating agencies Fitch Ratings and Standard & Poor's have for the first time set an international sovereign credit rating for our country. These ratings have a "stable" outlook, which means that this figure is unlikely to decline in the next 12-18 months. It should be noted that such ratings obtained by Uzbekistan are higher than in many developing countries.

REVIEW OF THE LITERATURE ON THE SUBJECT

Ways to develop entrepreneurship and increase the efficiency of attracting investment in the industry have been studied in detail by foreign and European economists. In particular, K. from foreign scholars. Makonnell, S. Brew, A. Marshall, Y. Shumpeter, J.B. Sey, A. Smith, D. Ricardo, Dj.S. Milya, V.M. Yakovlev, Yu.I. Ivanov, F.M. Rusinov, M. Veber, V. Zombart, P. Druker, V. Shepelev, D.V. Busigin, V.D. Kamaev, I.N. Gerchikova, F. Nayt, I.X. Tyunen, R. Kantilon, K. Bodo, I.X. Tunen, Naytear, D. Gelbreyt, E.V. Glushenko, E.V. Mixaylova, Class Eklund, A.I. Kaptsov, Yu.V. The Tikhonravovs and others made significant contributions to the development of entrepreneurial activity by studying certain aspects of their types and forms.

S.S. Gulomov, one of the leading economists of the republic, A. Vahobov, A. Abdukarimov, H. Abulqosimov, H.O. Rahmonov, Yo. Abdullaev, F. Karimov, E. Akramov, Sh.N. Zayniddinov, B.T. Salimov, T. Shodiev, Sh. Toshmatov, A.B. specific aspects have been studied to some extent.

Investment is a monetary form of expenditure on the restoration and increase of fixed and working capital, the expansion of production capacity. It is done in the form of cash, bank loans, stocks and other securities. "Investing" is "separating money today to make a profit in the future and believing that it is possible to invest in real or financial assets."

According to Swedish economist Klas Eklund, "investment is what is left for tomorrow in order to have more consumption conditions in the future.

Russian economist E. V. Mikhailova argues that "investment is defined as the burning of capital in any form for the sake of future income or social benefits." This definition is explained in a general and simple way, interpreted in the interests of a market economy.

Uzbek economists D.F. Gozibekov and T.M. Koralievs describe investment as all kinds of property and intellectual wealth that bring income (profit) or social benefits and are involved (spent) in entrepreneurship, business activities not prohibited by the state. Effective property and intellectual resources, ie investments, can take the following forms:

- cash, trust funds in banks, shares, stocks and other securities;
- Movable and immovable property (buildings, structures, equipment);
- Copyright, property rights consisting of the right to use inventions (know-how), other intellectual property;
- Land use and property rights and property rights;
- Other assets.

ANALYSIS AND RESULTS

Investment policy is one of the main directions of economic development of any country and the expansion of production in it. Therefore, the comprehensive development of the national economy requires an active investment policy. This, in turn, will ensure the implementation of profound structural changes in the republic. Activation of the flow of foreign and domestic investments in the sectors of the national economy is a key factor in launching a new stage of economic growth.

That is why the First President of the Republic of Uzbekistan I.A. As Karimov said: “The future of our country, its role in the system of world economic relations depends on investment. Accordingly, the active development of the economy requires large-scale investment. So, since investment is the driving force of any economy and its development, we must do everything possible to increase the volume of investment in our economy.”

Investments play an important role in the economy of our country and in the development of entrepreneurship. In 2019, about 138 trillion soums, or 16% more than in 2018, were disbursed from all sources. In this regard, the volume of foreign direct investment has increased almost 1.5 times compared to 2019, reaching \$ 4.2 billion. Accordingly, it was planned to launch 142 modern enterprises.

In such a rapid development of all forms of entrepreneurship in our country, first of all, the tax incentives for this sector and the attraction of investment play a sufficiently stimulating role. In particular, in 2018, 18 interstate official visits were made and agreements were reached on 1,080 projects worth \$ 52 billion. The volume of joint investments with the World Bank, the European Bank for Reconstruction and Development, the Islamic and Asian Development Banks, and other international financial institutions amounted to \$ 8.5 billion.

Today, 456 projects worth \$ 23 billion are being implemented in our country at the expense of foreign investments.

As noted by President Sh.M.Mirziyoev: “For the first time in our country, the institution of Ombudsman for the protection of the rights of entrepreneurs has been introduced. Taxes in the business sector have been significantly reduced, and access to credit has been expanded. New free economic zones have been created, which provide a wide range of benefits to investors”.

In the future, we must do a lot to create a more favorable environment for entrepreneurship, business, create new jobs, increase incomes, and improve pensions.

The Law of the Republic of Uzbekistan "On Investment Activity" of December 24, 1998 is of great importance. Therefore, before talking about investment activities, we need to clarify the meaning of some terms related to this area (investment, capital investment, foreign investment). For example, in the years of the former Soviet Union, the concepts of "investment" and "capital investment" were interpreted in the same sense. In such cases, capital investment was understood as the creation and reproduction of fixed assets, investment in the repair and expansion of existing facilities. This is not true because funds are invested in both current assets and certain types of intangible assets, as well as various financial instruments.

Until now, the concept of "investment" has been interpreted differently by economists. Some economists define it as "all kinds of wealth mobilized for the purpose of making a profit from entrepreneurial activity", while others describe it as the same as "capital investment" because the exact translation of the Latin word means "investment."

Investment institutions include financial brokers, investment companies (dealers), investment advisers, investment funds, which are engaged in investment intermediation, the issuance of securities, guarantees for their placement in favor of third parties, the issuance of shares

The development of investment policy in Uzbekistan includes the following stages:

Phase 1 - 1991-1994.

Phase 2 - 1995-2003.

Phase 3 - 2003 - current period.

Step 1:

- Investment process for the creation of various forms of ownership (decentralization measures have been taken);
- Budget funding for socially important facilities that do not have private sources of financing has been retained;
- Measures were taken to introduce private property;

Step 2:

- Legislative base regulating investment activities has been created;
- Transition to competitive project financing;
- Measures to attract foreign investment are being implemented;
- Investment in the real sector of the economy has been strengthened;
- Different sources of financing have been used in the implementation of investment projects.

Step 3:

- Currency relations and operations are being liberalized;
- Important documents on protection of the rights and interests of foreign investors are being adopted;

- Technical equipment of enterprises is being strengthened;
- Priority is given to financing projects specializing in the production of export-oriented and import-substituting products.

On December 9, 2019, the Law of the Republic of Uzbekistan "On Investments and Investment Activities" was adopted. The purpose of this Law is to regulate the relations in the field of investments and investment activities carried out by foreign and domestic investors.

In the field of business promotion - to provide practical assistance to businesses in organizing, conducting and further development of business, to create opportunities and conditions for access to the services of government agencies and market infrastructure, through the provision of consulting and information support, to create business incubators for start-ups; Expert in the organization and preparation of business plans, obtaining the necessary information related to the implementation of entrepreneurial activities and solving practical problems, legal and advisory assistance, assistance to entrepreneurs in acquiring practical skills in the organization of investment and production processes, obtaining the necessary information related to the implementation of business activities, legal assistance to businesses in conducting business activities, inspections of their activities, financial and commodity resources, engineering and communication networks, technological machines and devices, to provide practical assistance in the use of production facilities, as well as land, to establish community-based committees, business and coordination councils with the participation of members and partners of the Chamber of Commerce and Industry, to introduce innovative entrepreneurship, startup projects, youth, especially higher and secondary special, active assistance to graduates of vocational education institutions in organizing and running their own business, as well as the rapid development of small, private and family entrepreneurship, various forms of home-based work, which will ensure the rapid growth of employment and income.

In the field of cooperation with government agencies- introduction of an effective system of cooperation and new forms of work with all branches of government - the legislature, the judiciary and the executive, as well as the flexibility and effectiveness of cooperation with banking and financial institutions and other market infrastructure entities; to promote the effective organization of interaction between government agencies, as well as local authorities at all levels, to create a practical and effective mechanism of cooperation on the principle of "direct and feedback", receiving and processing applications of business entities, submitting them to the competent authorities for consideration, as well as monitoring and analysis of their implementation, organization of the activities of Entrepreneurship Support Centers in regional centers, districts and cities, their competent state bodies and organizations, as well as interaction with economic management bodies providing public services.

In the field of education and training of business entities - Radical improvement of the quality of the system of training and retraining for business structures, improvement of curricula in areas and specialties, taking into account the needs of the economy, the organization of regular training and retraining courses in each district and city by the following methods, The State Committee for Privatization and Development of Competition of the Republic of Uzbekistan and the Republican Center for Basic Entrepreneurship Training and its regional branches, including on the basis of professional colleges, organize cooperation in their spare time, international financial institutions, foreign donors and Establishing close cooperation with alternative centers for

training entrepreneurs in foreign countries, the basics of doing business for entrepreneurs, drawing up business plans, development and conducting of training courses for business entities on the development of draft legislation in the field of entrepreneurship, organization of training in management, financial management and other necessary disciplines, assistance to entrepreneurs in the selection and training of staff, continuous professional development, qualified personnel in regions and entrepreneurship Participate in the formation of state orders for the training of specialists in secondary special, vocational and higher education institutions, teachers of higher education institutions, professional colleges for the organization of education, depending on the needs, the task of attracting practitioners, high-achieving entrepreneurs and foreign experts will be performed.

In the Field of Foreign Economic Activity and Investment Attraction- integration of business entities of the republic into the international business community, ensuring the export of domestic products to foreign markets, active promotion of national brands abroad, attraction of local and foreign investments, as well as modern technologies, organization of business forums, exhibitions and fairs. Participation.

Conclusions and Suggestions

The objective need for investment in the country's economy and the development of entrepreneurship is particularly noteworthy. But there are some problems in the recruitment process.

Problems in Attracting Domestic Investment:

- Insufficient collateral for loans for financing investment projects, the complexity of the loan application process;
- Lack of in-depth marketing research on the investment project and the negative impact of this project on the stability of future cash flows and the reliability of the source of loan repayment;
- One of the main problems faced by the initiators of investment projects is the poor use of non-credit methods of financing (leasing, factoring, franchising, etc.);
- Fulfillment of non-specific functions of commercial banks by credit and financial institutions. In many cases, banks act as supervisory and supervisory bodies, which negatively affects the relationship of the initiators of investment projects with the banking system.
- In some cases, the assessment of the creditworthiness of the initiators of investment projects is not conducted objectively;
- Poor preparation of feasibility studies for investment projects.

In conclusion, we can say that in any case, we must create all the conveniences and conditions for investors.

ABSTRACT

This article provides information on the formation of polymer systems, dispersion of cellulose, the effect of stabilizers on the stability of polymer systems and polymer stabilizers. Polymer systems obtained with the help of stabilizers and their fields of application are considered. The stability of polymeric materials is related to their susceptibility to chemical exchange. Of the natural polymers, cellulose is one of the polymers used for many purposes in many industries. Of the synthetic polymers, polyvinyl chloride is one of the most widely used.

KEYWORDS: *Polymer, Cellulose, Destruction, Exploitation, Stabilizer, Photo stabilizer, intermission stabilizers, Heat stabilizers, Lubricants, Induction time.*

INTRODUCTION

The stability of polymeric materials is related to their susceptibility to chemical exchange. Of the natural polymers, cellulose is one of the polymers used for many purposes in many industries. Of the synthetic polymers, polyvinyl chloride is one of the most widely used. The instability of polyvinyl chloride is complicated by its decomposition under the action of HCl and decomposition of polyvinyl chloride due to the destruction of the polymer, which is reflected in bonds in single and linked double C = C bonds in macromolecules.

At present, in the field of cellulose chemistry, the creation of scientific foundations for dispersing cellulose and obtaining powder and microcrystalline modifications is and remains an urgent problem. These questions are solved by researching new methods for modifying cellulose and its derivatives [1].

In recent years, aqueous gels of microcrystalline cellulose have been widely used in the pharmaceutical, cosmetic and food industries to obtain creams and suspensions [2].

The instability of polymer products manifests itself in a counter process, which is observed as a result of a number of chemical and physical processes that eventually lead to irreversible changes in the characteristics of one or several polymers [3]. As a result, the physicochemical characteristics and color of the polymer composition change (yellow, carrot, brown and even black).

Technically, the weakening of the color is more important than the reduction of the dehydrochlorination of the polymer.

Stabilization is a set of measures aimed at preventing and reducing polymer degradation. Substances that are added to improve the stability of the polymer, i.e. to increase the resistance of its properties to various physicochemical and biochemical influences, they are called stabilizers [4].

Polyvinyl chloride ($-\text{CH}_2-\text{CH}-\text{Cl}-$)_n is one of the most widely produced polymeric materials in the world. It ranks second after polyethylene in terms of productivity. In everyday life and in the national economy, various materials are obtained from it and used for various purposes.

To increase the stability of the polymer, chemical stabilizers are used that increase the physicochemical and biological resistance of the polymer composition to chemical influences.

To increase the stability of a macromolecule, stabilizers must meet the following requirements:

1. Stop dehydrochlorination and oxidation reactions.
2. Prevent cross linking of macromolecules and stop chain breakage.
3. Loss of the carbonallyl group.
4. Eliminate or reduce the effect of chemical agents (O_2 ; HCl ; MeClp).

To improve the processing of the polymer composition, the stabilizer should have the following properties:

1. Must mix well with polymer and other components at processing temperature and working conditions.
2. The viscosity of the mixture must be optimal.
3. Reduce mechanical destruction of macromolecules and

Must have lubricating properties to reduce the adhesion of the composition to turbulence;

4. Must not smell.

From the point of view of using the obtained material, the stabilizer should impart the following properties to the polymer:

1. Resistance to atmospheric and thermal influences.
2. Resistance to physical effects (UV, X, R and other rays).
3. Resistance to bacteria and aggressive environments.

4. Do not change color.

In addition, the stabilizer must be inexpensive and non-toxic. It is very difficult for one chemical substance to combine all the complex properties of the complex. However, when a substance with a multifunctional group is processed, it is very difficult to give more than one property. Therefore, in practice, energy stabilizing stabilizers are used. If stabilizers are not chosen correctly, synergy can be replaced by anthropogenesis.

Currently, stabilizers are divided into two main classes. Metallic and organic stabilizers. They, in turn, depending on their chemical structure and protection, are divided into the following groups:

1. Chemical Stabilizers - Reduce oxidation degradation by heat.
2. Photostabilizers - prevent the decomposition of PVC under the influence of light.
3. Antarctic stabilizers - protect the polymer from degradation by X-rays.
4. Mechanochemical stabilizers - prevent degradation of the polymer by mechanical force.
5. Biochemical stabilizers - prevent polymer degradation under the influence of living organisms.

Metallic Chemical Stabilizers: Chemical compounds of this group are complex stabilizers that mainly bind low molecular weight compounds released from the polymer during degradation. Mainly bind low molecular weight compounds released from the polymer during degradation. For example, they bind HCl, which is mainly formed during the decomposition of polyvinyl chloride. When processing PVC, at least one of the metal-containing chemical stabilizers must be used.

The first representative of metal-containing chemical stabilizers is lead-containing compounds. Lead compounds are relatively inexpensive and retain good HCl, which is used in the manufacture of insulation materials, due to the formation of insoluble chlorides. Without the presence of compounds containing lead, the secretion of HCl is increased from the very beginning. When lead compounds are added as stabilizers, they retain HCl primarily at the expense of lead oxide. The anionic part of these compounds serves to increase their stabilizing properties: for example, if we use lead phosphide, it also traps HCl and increases its resistance to weather and light. Phthalate plasticizer mixes well with PVC. Steroids are lubricated.

Lead stabilizers are rarely used due to their toxicity. In order to reduce the toxicity of lead-containing steroids during processing of PVC, attempts are made to granulate them and treat the top with fatty acids and their salts. Another disadvantage of lead stabilizers is the formation of black spots in the presence of sulfur-containing compounds.

Lead stabilizers are divided into three groups:

1. Simple stabilizers.
2. Stabilizers with a lubricating effect.
3. Complex stabilizers.
6. Lead Silicate - Reacts well with tribasic lead sulfate.

Simple stabilizers:

1. Quadruple - a good (heat stabilizing) stabilizer that does not have a lubricating effect.

2. Tri-base - also a good heat stabilizer without lubricating effect.
3. Dibasic 2RO - PbHSO₄ - heat stabilizer does not possess antioxidant and light stabilizing properties.
4. Dibasic phthalate - mixes well with PVC. Most phthalate plasticizers are used in PVC.
5. Basic (white lead) - has weak stabilizing properties.
6. Lead Silicate - Reacts well with tribasic lead sulfate.

Lubricating Stabilizers:

Lead Steriate Pb(OOC₁₇H₃₅)₂- this heat stabilizer has lubricating properties.

Complex Stabilizers:

Lead and Calcium Steriate: Pb (OOC₁₇H₃₅)₂ and Ca (OOC₁₇H₃₅)₂

The stabilization mechanism influencing the stability of polymers is as follows: the effectiveness of lead salts under statistical conditions with a stabilizer amount of 3-5% is as follows: lead stearate - dibasic; lead phthalate is dibasic, lead sulfate is dibasic, lead phosphide is three basic. The performance of a lead stabilizer under dynamic conditions is slightly different than under statistical conditions.

The main reason for the difference in dynamic and statistical conditions is that lead stabilizers not only trap HCl, but also stabilize the anion. Another reason the stabilizer is more effective under dynamic conditions is that it can react with stearic acid to lubricate PVC during processing to form lead stearate:

Therefore, RO is more effective under dynamic conditions; another reason for the effective stabilization of lead stearate is that lead stearate interacts with the labile group of polyvinyl chloride to increase the stability of macromolecules.

In addition to increasing the efficiency of the stabilizers used to determine the thermostatics of polyvinyl chloride, it also provides high thermal stability of the resulting polymer composition. The thermal stability of polyvinyl chloride is determined by the induction period. The induction period is the time from the start of heating of the system to the start of hot compression. During this time, the stabilizer installed in the system is fully used to trap the HCl released as a result of the destruction of the polymer composition.

Several methods can be used to determine the thermal stability of polyvinyl chloride:

1. The induction period can be determined using the "Cango-red" indicator.
2. Determination of thermal and thermal oxidizing dehydrochloramine.

This method involves determining the amount of HCl evolved in a nitrogen-oxygen stream or in a vacuum.

CONCLUSION

In conclusion, we can say that stabilizers are chemicals used to increase the stability of the polymer and increase the resistance of the system to physical, mechanical, biological and chemical influences. This requires the correct selection of stabilizers in accordance with the purpose. The influence of the selected stabilizer on the composition and concentration of the polymer is developed individually for each system.

EXPLORING INSTRUCTIONAL LEADERSHIP PRACTICES IN THE INSTITUTIONAL SCHOOL OF KATHMANDU: A NARRATIVE INQUIRY

Subash Shrestha*

*Principal,
New Leera High School,
NEPAL

Email id: subash@kusoed.edu.np

ABSTRACT

Principals of the schools are more focused on managerial works rather than supporting teaching and learning in the school. As a result, they spend most of their time behind the desk and in to the files. Principals of the schools are guided by the principles of making good grades in the examinations. As a result, they are more focused on rote learning than knowledge and skill based learning that add value in the life of students. However, the instructional leadership advocates that the principal should able to create school culture that support students' achievement. So, the main aim of the paper is to explore perception and practices of principals on their instructional leadership in addressing the 21st century skills. I applied narrative research approach in order to explore the perceptions and practices. For this, I interviewed two principals of two different schools of Kathmandu valley. The finding of the study reveals that setting direction, focusing in curriculum and monitoring the learners' progress are the perception and practices on instructional leadership.

KEYWORDS: *Instructional leadership, 21st century skills*

INTRODUCTION

It was in the year 1984 when my father, a non-academician, established a small school upon request from some of his friends who were teachers. The school did well and was quite popular in its area in terms of students' enrollment and their achievements. After 5 years, his friends demanded their share in the institution which my father refused. As a consequence, his friends left the school and established another school of their own. In the initial phase, their departure

didn't matter much but slowly their absence was felt as the school's management and academic achievements gradually started declining. However, he continued to run the school without giving up. Just to provide him a moral support, I would spend some time in the school every day after taking my college class. I was inspired by my college's ECA activities and tried to incorporate ECA activities in my father's school too. I was involved in the school as a part-time teacher of an English subject. But it was in the year 2000 AD that my father decided to handover the leadership role to me and declared me to be the new principal of the school. This reminds me of what Bush (2006) stated that the principal in developing countries are appointed based on a successful record as teachers with the assumption that this provides a sufficient starting point for school leadership. This was shocking for me as I was just a 23-year old lad who had recently completed his Bachelor's degree, and who hardly knew anything about teaching and learning. I was new in the school without any clear vision, professional skills, attributes and knowledge (Bush, 2006).

Consequently, I followed my father's footsteps and started running the school just the way he did. I was more involved in the traditional structure of teaching and learning. As a school's success was determined by its SLC results during that time, I also believed that the success of my school lay in scoring high SLC/SEE marks. Moreover, I was also grown up studying in one of the reputed schools which gave utmost priority to SLC scores. The school where I studied was indeed the only school to score the top ten rank in the SLC examination almost every year and to continue its legacy of being in the top ten rank, the school would only focus on obtaining excellent SLC results. As obvious, I set the strategy the school focusing more on mark-oriented culture for almost 12 years on which Huber (2004) argued that

The school cannot any longer be regarded as simply imparting traditional knowledge within a fixed frame. Rather it is becoming an organisation which needs to renew itself continuously in order to take present and future needs into account.

Having worked as a principal of one of the institutional school for almost fifteen years, I have always kept myself busy as an administrator who struggled for the sustainability of my school and it is still continued even after its 23rd SEE batches and its history of three-decade. I didn't involve myself in teaching and learning. I was always behind the chair and into the files or financial statement. Over a period of time, I felt I haven't grown personally and professionally. In a mean time, my decision to join M.Ed. Leadership and Management Program of Kathmandu University has become an eye-opener for me as it has made me realize failure often correlates with inadequate school leadership (Leithood et.al, 2006). In the same line Harris (2009) said effective school leadership determine school improvement. According to Bush (2007), there has been a great interest in educational leadership during the early part of the 21st century because of the widespread belief that the quality of leadership makes a significant difference to school and student outcomes. In many parts of the world, there is recognition that schools require effective leaders and managers if they are to provide the best possible education for their leadership (Bush, 2007). Much of the available literature on school leadership effectiveness indicates that school leaders play an important role by exerting their influence over several factors, including, most importantly, teachers (Hallinger & Heck, 1998; Leithwood, Louis, Anderson, & Wahlstrom, 2004). Effective school leadership directly affects teacher capacity, motivation, and commitment and working conditions, all of which directly affects teaching practices linked to student learning and achievement (Leithwood et al. 2008). According to Louis et al. (2010), school leaders

influence student learning mainly through establishing appropriate school conditions by setting goals, influencing culture, setting parameters for classroom conditions through designing and managing curricular planning and resource allocations, and also by directly influencing teachers. The review of literature conducted by Hallinger and Heck (1998) on instructional leadership literature published between 1980 and 1995 suggests that school principals who employ an instructional leadership had an indirect effect on student reading achievement and direct effects on school climate changing in elementary schools. Additionally, Spiro (2013) affirms that instructional leaders establish clear goals, provide educators with direction and sense of mission. Furthermore, they motivate educators to enhance their performance. Teacher motivation was also highlighted as having a drive that leads to improved educational outcomes. This knowledge and awareness on leadership practices finally has given me the background of the study on issues like 'How do school principals practice and perceive instructional leadership in their schools?' So, my research attempt to throw some light upon the instructional leadership practices in institutional school of Kathmandu.

Instructional leadership is not a new concept. Salo, Nylund and Stjernstrom (2014) said that the origin of instructional leadership is Anglo-American, developed intensely in the early 1980s mainly by school effective movement. However, Critics argued that instructional leadership as outdated and authoritative position of the principal (Sebastian & Allenswoth, 2012). In the same line Hallinger (2003) had a view that principals could not have capabilities of being curriculum experts in all the learning areas so they might be ineffective. However, Hallinger (2011) observed that instructional leadership has been reawakened as leadership for learning that aimed to achieve school goals. Adjectives such as collective, shared, transformational, and distributed are used with instructional leadership (Louis & Wahlstrom, 2012). Thus, I find this issue needs to explore in institutional schools where the principals are teacher, administrator and leader as well (Bush, 2006).

Since this study focuses on leadership practices of institutional school, I will be taking McEwan model "7 steps to effective instructional leadership" as my theoretical lens. In step-1, instructional leader should aware of what is taught? And why it is taught? They are ultimately responsible for incorporating the designated state and district standards into the development and implementation of the local school's instructional programs, ensures that school wide and individual classroom instructional activities are consistent with state, district, and school standards and are articulated and coordinated with one another. Uses multiple sources of data, both qualitative and quantitative, to evaluate progress and plan for continuous improvement.

In step-II McEwan says effective instructional leader should discuss instruction and learning. Effective instructional leaders do all these things and more by utilizing the four Cs—collaboration, collegiality, cooperation, and creative problem solving. Effective instructional leaders are eager learners. They read a variety of publications, attend all kinds of workshops, go to national conferences, present staff development programs to their teachers, and are constantly on the lookout for potential resources for their buildings. Works with teachers to improve instructional programs in their classrooms consistent with student needs. Facilitates instructional program development based on trustworthy research and proven instructional practices. Uses appropriate formative-assessment procedures and informal data-collection methods for evaluating the effectiveness of instructional programs in achieving state, district, and local standards.

In step-3 instructional leader should establish high expectations for student achievement that are directly communicated to students, teachers, and parents. They should establish clear standards, communicates expectations for the use of time allocated to instruction, and monitors the effective use of classroom time. Moreover, they should implement, and evaluate procedures and codes for handling and correcting behavior problems.

In step-4, instructional leaders should provide for systematic two-way communication with staff regarding the achievement standards and the improvement goals of the school. They should establish, support, and implement activities that communicate the value and meaning of learning to students. And finally develop and uses communication channels with parents to set forth school objectives.

In step-5, instructional leader should able to assist teachers yearly in setting and reaching personal and professional goals related to the improvement of instruction, student achievement, and professional development. They should make regular classroom observations in all classrooms, both informal (drop-in visits of varying length with no written or verbal feedback to teacher) and formal (visits where observation data are recorded and communicated to teacher) They must engage in planning of classroom observations, post observation conferences that focus on the improvement of instruction. Provides thorough, defensible, and insightful evaluations, making recommendations for personal- and professional-growth goals according to individual needs.

In step-6, instructional leaders should schedule, plans, or facilitates regular meetings of all types (planning, problem solving, decision making, or in-service and training) with and among teachers to address instructional issues. They should able to provides opportunities for, and training in, collaboration, shared decision making, coaching, mentoring, curriculum development, and presentations. Moreover, they should provide motivation and resources for faculty members to engage in professional growth activities

In step-7, instructional leader should serve as an advocate for students and communicates with them regarding their school life. They should encourage open communication among staff members and maintains respect for differences of opinion. Demonstrates concern and openness in the consideration of teacher, parent, and student problems and participates in the resolution of such problems where appropriate. Models appropriate human relations skills. Develops and maintains high morale. Systematically collects and responds to staff, parent, and student concerns. Acknowledges appropriately the meaningful accomplishments of others.

METHODOLOGY

Since the study tries to explore the practice and perception of instructional leadership in institutional school, I have employed qualitative approach to explore the personal experiences of principal. Principals' personal experience is of a central focus in this research. Therefore, I have used narrative inquiry as my research methodology that offers practical and specific insights for researches looking for personal experiences (Creswell & Poth, 2012). Clandinin & Connelly, (2004) also viewed that experience happens narratively, and therefore, educational experience should be studied narratively. I have purposefully chosen two participants from two different institutional school. As stated by Punch (2005), purposive sampling involves the existence of some purpose in mind. This enabled the researcher to go directly to the point. I have taken in-depth interview with the 2 principals who have been working in the school for more than 10

years from the selected school. I interviewed each participant for second round. The first interview focused on knowing the participants of my study and understanding their view on instructional leadership. The second was a follow-up interview for further probing into the issues they shared previously. I have recorded the interview and also use field notes as a method of recollecting information. I have interpreted such information with generation of information. Coding was made in the diaries for some of the information obtained from interview and digital record was prepared for the interview. I adopted an elaborative process of coding, categorizing, and thematized (Creswell, 2007). Then the experiences shared by the participants were then analyzed through a theoretical lens.

Findings

During this research conduction, both two participants found to understand the instructional leadership very differently. Principal-1 limited his understanding to management skills whereas principal-2 emphasis in improving teaching and learning of the students along with management skills.

Perception and practice on instructional leadership

Setting direction

Upon asking them about instructional goal, principal-1 stated the vision of the school “*Creating an appropriate environment where all the stakeholders can excel the skills to adjust themselves in everyday world*”. He said teachers integrate the element of child friendly activities based on the vision statement. He gave an example of teaching solar system in grade 2. He said teacher would bring the students out from the classroom and draw the solar system on the ground and name each one them according to the name of existing planets and let them revolve around the sun. It reminded me what Robinson (2011) said instructional leaders direct the work of teachers to develop clear and common goals. The Wallace Foundation (2013) also found that effective principals shape a vision of academic success for all students.

Whereas upon asking the vision of the school, principal-2 said, “*I haven’t developed yet. I think our vision is reflected in our bulky report card since our school is mark oriented school and we emphasize in taking exams*”. She expressed her pride to associate the marks oriented culture of teaching and learning as their value. She strongly asserted that parents admit their children because they want their children to score good marks. Our parents want more number of exams because they think that keep children occupy at home and same time helps to bring good marks in the examination as well. In this case he sets direction to achieve marks which is indeed traditional. But according to him parents want their children grow with marks. This reminded me what Leithwood, Louis, Anderson and Wahlstrom (2004) identified setting directions as one of the three critical components of school leaders. Setting directions in this case includes incorporating daily lesson plan and activities with the vision statement of the both schools. In the school of principal-1 teachers are encouraged to include child friendly activities to enhance learning whereas in the case of principal-2 teachers are encouraged to achieve marks. And he claimed that it is because of such instruction they have been able to achieve successful grades in SEE result for more than a decade and awarded the best school by the ministry of education in 2067 B.S. This reminded me what OECD research (2009) supports the view that successful instructional leaders are actively involved in ensuring that schools’ goals are achieved.

Focusing on curriculum

On questioning about curriculum, principal-1 said, although they followed national curriculum, they had a provision of sequential planning and teacher stayed after school for lesson plan and our supervisors and department heads support to maintain quality. He said, they had a sharing session and focused on team work. The supervisors would go to the classes with the teachers. They would see how it is operating and provided regular coaching and mentoring sessions. Based on the feedback teachers would work again. Sim (2011) had a similar view that the principals motivate and inspire the educators to plan and engage in classroom teaching in a way that is aligned with school vision. Mulford and Silins (2011) also said that successful principals involve others in the leadership process to increase and build capacity.

Whereas Principal-2 also viewed that they do follow national curriculum but they do not let teacher prepare daily plan. Rather she mentioned the learning objectives of the book should be covered and success of any students depend on score they get in the examinations. Upon asking why teachers are only limited to prescribed books? She said,

“We have teachers who have been working for 20 years and above. It is very difficult to change them as we have three level of teachers. They are same level, growing level and old- aged teachers in the institution. Same level means such types of teachers who works at same level for many years. For example, the teachers of primary section or pre-primary who does not want to initiate the change. The old aged teachers have very few years in their service and very stubborn to accept change to improving teaching learning and there are few such growing level teacher who have helped sustain the quality of school”.

So, she viewed despite of professional development practice in the school, they are reluctant to adopt new teaching and learning process. She referred the attitude of teachers with the famous quote. *“A dog tail will not be straight no matter how hard you try”*. In the case of Principal-2, she is found to be ineffective in making firm decisions regarding managing curriculum whereas principal-1 found to be exercising collaborative and collegial environment to enhance effective curriculum. In the same line, the literature on effective schools also shows that effective principals are more powerful over making decisions regarding curriculum and instruction than those in ineffective schools (Robinson, 2011).

Monitoring learners' progress

Regarding assessment, principal-1 said, they have formative evaluation system. Teacher is the final implementer. In the real practice if a teacher sees any new activity, he includes in remarks. There is a sharing. Book is just a supplement or a tool. What the student requires is given more emphasis. He gave an examples of the exam-

During the exams teachers set the indicators that students are supposed to learn in each grade. If students participate in activity based learning, can play the game of solar system and identify the different planets, we consider them that they got knowledge on the chapter solar system. Basically we focus on what all students must learn rather than they should learn.

He agreed that they also focused on core subjects like English, Nepali, math, social, science and computer. However, they emphasized teachers to focus on improving motor skills and 21st century skills.

Whereas principal-2 said

There are a lot of examinations and the teachers are always correcting copies and filling in their report cards. There is not time for teachers to go to training, develop their professional skill.

Upon asking why she has kept such a busy schedule to the teachers. She replied that keeping teachers busy help occupy their mind and they don't have time to think against school management. She strongly affirmed that school is known for achieving good grades and parents admits their children because they appreciate the value created by the school. That is the reason we have six exams annually and parents are satisfied as well.

Whether it is formative or summative the data indicate that both the school had organized practice to help the parents understand how their children are performing (Kruger, 2003). In the same line Katterfeld (2011) viewed instructional leaders focus on students' work and build systems for teacher accountability to ensure that the all the learners are progressing.

DISCUSSIONS

The above data revealed that both the principal does not seem have in-depth knowledge of instructional leadership. However, they found to ensure the effective learning and teaching by setting direction, setting expectation in curriculum and monitoring learners' progress. The theme "setting direction" is aligned with step-4 of McEwan's "7 steps to effective instructional leadership". In the step-4, according to McEwan (2003) instructional leader should able to communicate vision and mission of the school. He must have a clear vision for what the school should be and can become at some time in the future. In the case of principal-1, he has a well-defined vision and seem to encourage teachers to align lesson plan based on the vision of the school. It is aligned with what Harris et al (2008) claimed that goal setting is considered one of the key dimensions of success for a successful school leader This shows he is following the step-4 as McEwan claims the instructional leader should do. Whereas principal-2 found to be chameleon leader who has no vision, no definition, no limits and no parameters (McEwan, 2003). She is not clear about the vision of the school. She is so sure that the parents admit the children because they expect good grades in the exam and the school has been satisfying both the parents and students by helping them achieve good grades.

Similarly, the theme "focusing on curriculum" align with step-5 that emphasizes the instructional leader should able to set high expectation to the staff and oneself. According to McEwan (2003) principal should engage in planning of classroom observations, post observation conferences that focus on the improvement of instruction. In the case of principal-1 he is found to be supporting and mentoring teachers in designing daily lesson plans and providing constructive feedback to make sure every lesson plans incorporate the activities that help achieve the vision of the school. But in the case of principal-2. she expresses her negative experiences with existing teachers. Teachers' negative attitude on her effort to check students' copies and conflicting meeting among teachers show that there is a resistance to change in the school. Since there is no vision in the school of principal-2, the whole effort is to secure good grades in the examination.

The theme "monitoring the learners progress" align with step-7 that strongly advocates the instructional leader should show their concern and prioritized the development of students at first. Effective instructional leaders don't just talk about how much they care about students. They show how much they care by their actions. On a daily basis, they work to change practices

in the areas of discipline and grading. With this reference in the case of principal-1, he is found to be practicing formative assessment. Teachers are given full responsibility and the progress of the students are being measured in terms of acquiring skills. Whereas in the case of principal-2, he is found to be practicing summative assessment and students' progress are being measured in terms of obtaining grades.

CONCLUSIONS

From the above data and discussion, it is concluded both the principals are perceiving and practicing instructional leadership as setting direction, focusing on curriculum and monitoring learners' progress. Principal-1 has a vision to engage students so he seems to be focusing every activities and progress of the students to achieve the set goals. Whereas in the case of principal-2 every activity is directed to achieve good grades. It gives me insight that they are aware of few steps of effective instructional leadership as claimed by McEwan. However, they seem to be missing knowledge and skills in developing teacher leader, be an instructional source, create a school culture and most importantly establishing and maintaining positive relation with students and parents.

This study had several limitations including the limited time and resource. As only two head teacher was selected as a participant, the conclusion of this study can hardly be generalized. Another limitation is that this study was carried out selecting only two secondary school head teacher of Kathmandu district, so similar studies need to be carried out covering wide area and more number of such schools so that the results of studies could be generalized. The third limitation is that this study is carried out only to explore the perception and practice of instructional leadership of principal but not of other teachers, non-teaching staffs, students, parents and school management committee members. If such study includes them, the findings again may vary. Finally, I also realize that it would be better to follow multimethod to collect the data from informants and to triangulate the data for reliability and validity of the data. In this connection, use of other methods such as observation, focus group discussion, collection of artifacts, etc. would be further relevant. Multiple interviews as well as multimethod data collection procedure would have been ideal for the saturation of the research themes. However, I realize that the data provided by both the principal and my analysis of them provided a strong foundation for more indepth examination of the existing practices of instructional leadership.

SPECIFIC FEATURES OF INTERDISCIPLINARY INTEGRATION IN TEACHING NATURAL SUBJECTS

Narbutaev Hushbak Babanazarovich*

*Candidate of Pedagogical Sciences,
Termez State University,
UZBEKISTAN

ABSTRACT

This article discusses the issues of mastering knowledge in biology of interdisciplinary learning, also due to the fact that the object and subject of research in the academic subjects of biology, chemistry, physics are close to each other, the knowledge of the whole essence of nature in interdisciplinary communication, content, changes, occurring in processes and events, a unified presentation of general and particular concepts available in these academic subjects, which provide for the formation in interdisciplinary communication when using skills and abilities and their introduction in practice. In addition, to develop the ecological thinking of pupils in the synchronous and asynchronous communication of biology teaching, modern teaching methods were used.

KEYWORDS: *Interdisciplinary Connections, Natural Subjects, Biology, Pupils, Lesson, Means, Ecological Thinking, Synchronous And Asynchronous Learning, Environment, Integration.*

INTRODUCTION

Integrated subjects, which form the basis for the development of knowledge about nature and society in the world, are included in the curricula of many countries. This suggests that integrated subjects, especially those with a focus on the natural subjects are a key tool in shaping environmental responsibility in pupils in the global community. Therefore, the issues of harmonization of nature-society relations, establishment of serious relations with the environment in interdisciplinary relations are of great importance in the curricula and programs of secondary schools of the country. In particular, the ecological culture of pupils, their worldview, behavior, environmental protection in the teaching of biology, chemistry and physics, the development of the content, forms, teaching methods, ways, opportunities and tools

of interdisciplinary communication is one of the important issues in education and also it is considered.

A detailed study of environmental problems by pupils, the development of independent and critical thinking, an increase in environmental culture, a sense of the beauty of the environment, responsibility for the protection of nature, the correct formation of a person's worldview, the ability to distinguish and awareness of the laws of nature, have an idea of the relationship between man and nature, increase knowledge about ecological balance and others contribute to the implementation of the planned goals on the topic of ecology among pupils [16].

In the education system of the republic some stable and huge reforms are being carried out. In particular, in improving the content and quality of education in secondary schools, didactic and methodical scientists, psychologists, teachers need to pay attention to the problems of interdisciplinary communication. This is due to the fact that the rapid development of science and technology has made it an urgent problem to develop in pupils a belief based on high spirituality, free and independent thinking, ideological and political maturity, scientific outlook. Interdisciplinary communication has great potential in the development of these qualities in pupils.

International experience shows that integrated subjects, which form the basis for the development of knowledge about nature and society are included in the curricula of many countries. This suggests that integrated subjects with a focus on the natural subjects are a key tool in shaping environmental responsibility in pupils in the global community.

The natural subjects in school education reveal to pupils the current scientific landscape of the world. Therefore, the natural subjects form the natural-scientific basis of the pupil's worldview. Interdisciplinary connections should be aimed at developing pupils' generalized scientific understanding. The integration of knowledge requires a unique approach to education.

Two objective features in the development of science - differentiation (branching) and integration (joining, merging), ultimately play an invaluable role in the creation of a holistic, general scientific picture of the universe. In this context, the problems of regulating the impact of man on the biosphere, achieving a balance in the relationship between man and nature are becoming increasingly relevant.

Improving the system of environmental education in secondary schools. The implementation of interdisciplinary links in the curriculum of all subjects, including natural subjects play an important role in ensuring the integrity of this system [1].

It has no sense to understand integration without differentiation, they are inseparable categories that define each other from a dialectical point of view. According to academician I.D. Zverev "Integration is the process of creating organic connection, integrity. In teaching, it can be considered as a result of a single synthesizing course based on the combination of elements of different disciplines "[12].

Teaching biology synchronously and asynchronously with chemistry and physics provides a systematic approach to the process of developing pupils' environmental thinking. So, all forms of interdisciplinary teaching of biology: lessons, extracurricular activities, chemistry and physics, necessitated the identification of opportunities for the development of ecological thinking in pupils through environmental education. In this way, it prepares the ground for the direct

application of the theoretical knowledge acquired by pupils in the teaching of biology in connection with the subjects of chemistry and physics.

In exchange for the integration of subjects, the unique achievements of civilization are being achieved. Differentiation in the subjects is becoming a powerful tool for learning about the universe and changing it. For instance, molecular biology has disrupted many traditions of classical biology and radically changed their views on life processes. Physical electronics revolutionized the smallest subunits of the material world [18].

An analysis of the work experience of master teachers showed that the combination of forms and methods of environmental education in teaching biology to chemistry and physics in combination with didactic requirements gives good results.

In improving environmental education, it is necessary to pay attention to the protection of the environment, nature, man, the correct and rational use of natural resources, cleanliness. These issues should be included in the curriculum, educational programs, optional classes, the content of work plans [2].

Experience has shown that creating methods and questions or assignments to organize pupils' independent work after selecting methods in accordance with the content of new material during the lesson, and using them in class and in extracurricular activities, serves to improve teaching. An important factor in the development of the educational process is to pay attention to the fact that the selected issues and questions are relevant to the content of the topic, they can engage pupils in independent thinking.

Since environmental education for pupils is a comprehensive problem, it cannot be implemented in the process of teaching a single subject. To do this, in the process of teaching each subject, it is necessary to provide interdisciplinary links, to equip pupils with a system of environmental knowledge and to combine it with environmental education.

I.T.Suravegina has learnt the activation of the process of teaching biology through the use of interdisciplinary links in biology lessons, increasing pupils' interest in biology and other natural subjects. From a scientist's point of view, it's hard to imagine teaching biology without linking it to the natural subjects. He argues that the establishment of interdisciplinary links and their skillful use serve to form a system of pupils' knowledge of nature [20].

A.N. Zakhlebny [13] develops an integrated system of nature-oriented education in secondary schools, the main focus is on the content of general skills and competencies that need to be formed in pupils within this education. He noted that the theoretical environmental knowledge generated by pupils in the field of environmental protection is divided into 3 types. They are:

1. Skills and competencies aimed at activating knowledge about the interrelationships between nature, society, man, technology and the solution of nature protection problems between them.
2. Skills and competencies to analyze and critically evaluate the results of the interaction of man, society, technology and nature, or knowledge of the nature of the contradictions in the process of organized action in each case and the ability to understand the causes of their occurrence.
3. Claims the ability to prove their views on specific opportunities and needs for solving nature protection problems, to see ways to solve them.

Today, the balance between man and the biosphere is disturbed, and unexpected threats to human life (countries, regions, societies, the integrity of the universe, the environment) arise. They pose a reasonable threat to human living conditions [10].

Hence, the research work carried out in the CIS today claims the need to ensure environmental safety and the effective use of modern forms, methods and tools in their implementation, the development of environmental protection on the basis of modern economic strategies, its application in the educational process. According to academic N.N. Moiseev, man is stable

for its development it became necessary to take into account the influence of environmental conditions on it, not on itself. If the term "ecology" until recently focused mainly on environmental degradation, the damage caused by man in this process, then in "sustainable development" - to ensure the sustainability of human life, because human development today is in the biosphere and man is an element of it. taken into account [15].

In the research work of P.A. Gulyukina, a bright sample of ecological thinking, ecological culture and interdisciplinary integration through a foreign language, that is, by teaching a subject included in the curriculum, it is impossible to form them fully, effectively and consistently. The implementation of these processes is associated with a more complex psychological - pedagogical, human behavior and actions, thinking about perfection, consistency, continuity and its dialectically interconnected content [9].

According to L.S. Astafeva's research, the process of formation of ecological thinking is organized spontaneously, which is a very detrimental factor for the ecological balance today and in the future [3].

The relevance of the choice of topic in the research work of L.R. Azizova is explained by the lack of scientifically proven mechanisms for the formation of ecological thinking and the fact that the education system is suitable for all segments. The solution of this problem requires the participation of not only educators, but also ecologists, biologists, chemists, physicists and those responsible for environmental protection [4].

According to P.I. Agalarova, the purpose of ecology is not only the knowledge, skills and abilities related to ecology, but also the formation of ecological thinking, consciousness, culture, behavior, ethics in pupils [5].

O.F. Vichkanova claims proposals on additional education in the formation of environmental culture through the organization of environmental activities. According to him, the structure of educational institutions includes extracurricular activities, clubs, centers that allow adolescents to directly participate in the environmental situation [11].

As A.O. Lagut points out, "culture is a factor of social development. The spiritual and socio-cultural qualities of nations can have a significant impact on all of humanity. In this sense, environmental thinking is an integral part of generations' understanding and perception of the world. Ecological education and ecological upbringing bring service of or this thinking" [14].

Also, the issues of environmental protection are studied in the context of practical ecology in foreign Western countries. Environmental protection means, first of all, measures to prevent the negative and extreme negative impact of human activities on nature.

Since the 1970s, various environmental social movements have been developing in the United States. According to social demand, environmental education is included in all stages of the education system. The process of training environmental education specialists will be established. In 1990, the US Congress passed a new version of the National Environmental Education Act. Extracurricular activities based on the Open Door method are widely used throughout the country [6].

In the United States, there are educational centers dedicated to various environmental issues, and dozens of books are published each year. Among them are U. Solomon (The Three Most Important Areas of Environmental Ethics, Environmental Law, and Environmental Education) [21], M. Gray (Problems of Ecodiversion) [8], and A. Blackman (Can Environmental Action Be Protected in Developing Countries?) [7] is one of them.

It can be seen that the pedagogical aspects of environmental thinking and culture have been studied to some extent. However, research on the pedagogical aspects of the development of pupils' ecological thinking in the teaching of biology in secondary schools in synchronous and asynchronous connection with the natural subjects is not comprehensive.

Therefore, the implementation of interdisciplinary links in the teaching process should be considered as the interaction of different disciplines studying the material and spiritual world as a natural process of their development and a factor in developing pupils' scientific outlook and thinking.

CONCLUSION

The use of appropriate teaching methods in the development of pupils' environmental thinking in the interdisciplinary teaching of biology serves to increase the effectiveness of the educational process. Biology teachers cannot imagine the possibilities of this process because they do not have enough theoretical knowledge, skills, and competencies to make interdisciplinary connections in teaching biology. Therefore, there is a need to define environmental thinking, its components and principles of development.

Today, a biology teacher requires modern approaches, not only in the country where he lives, but also in the problems that arise in teaching biology all over the world and how important biology is for human life. To do this, first of all, as mentioned above, the importance of interdisciplinary teaching of biology increases.

TECHNOLOGY OF INTERDISCIPLINARY INTEGRATION OF PRIMARY EDUCATION

Salohitdinova Navruza Murodulla kizi*

*Teacher of the Department of "Primary Education",
Termez State University,
UZBEKISTAN

ABSTRACT

The article, using modern educational technologies, highlights the need to integrate primary education, interdisciplinary links in the educational process, implementation of pupils' knowledge, skills and abilities in interdisciplinary communication, strengthening the structural connection between the disciplines through integration technology, their generalization, further enrichment of pupils' holistic perceptions of nature and society as well as the content of the integration of primary education.

KEYWORDS: *Integration, Education, Interdisciplinary Connection, Subjects, System, Integrative Approach, Teaching, Integration, Primary Class, Technology.*

INTRODUCTION

One of the global challenges in the education system is the integration and stratification of disciplines. The solution to the problem of integration is directly related to the effective use of modern educational technologies in the educational process of educational institutions. Proper organization of this process not only increases the effectiveness of teaching, but also provides the basis for a project-based creative model of teaching.

Consequently, the problems of integration of teaching and education in primary schools are theoretically and practically very important from a modern point of view and become more relevant on the basis of new social requirements. Today, due to the development of science and huge changes in production, the demands are putting new challenges on school education. The modern system of education is aimed at establishing the foundations of science at a high level, developing thinking, understanding and imagining the world as a whole, correctly understanding the events around us, educating young people who understand their essence.

The continuously increasing volume of information leads to an increase in the amount of knowledge shared with pupils, an increase in the number of subjects and courses offered by educational establishments. This, in turn, leads to psychological stress on pupils, a decrease in their interest in these subjects and lower motivation, as well as contributes to a decrease in the level of knowledge acquisition.

Based on the goals and objectives of the educational institution, the study of internal and external relations of a particular subject, its application to other disciplines not only expands the scope of knowledge, but also allows the pupil to have a fuller knowledge of the environment, the formation of worldviews, as well as apply existing knowledge in practice.

In pedagogical dictionaries, the concept of "interdisciplinary relations" is defined as the interdependence of curricula [3]. Interdisciplinary connection in the educational process activates pupils' learning activities. In doing so, the learner mobilizes his or her activity to search for existing unknown relationships or to form new concepts based on clearly established interdisciplinary relationships. Interdisciplinary connection in the educational process activates pupils' learning activities. In doing so, the pupil mobilizes his or her activity to search for existing unfamiliar relationships or to form new concepts based on clearly established interdisciplinary relationships. There is an active pursuit of knowledge acquired as a result of experience in mastering interdisciplinary relationships. Interdisciplinary relevance can be divided into relationships between knowledge and skills specific to each subject and between relationships between knowledge, skills, and competencies that are common to different disciplines.

Interdisciplinary links should be established in the field of knowledge and skills, and also in the formation of emotionally-valuable attitudes to creative activity and assimilated objects in existence. Interdisciplinary connection serves to unite all the components of the educational process (content, form, methods and tools) into a single system. In addition, it is an important factor in ensuring the quality and effectiveness of education. Ways to implement interdisciplinary links are as follows:

- the sequence of study of different disciplines should be chosen in such a way that the study of one of them facilitates the study of the other;
- ensuring a common approach to the formation of general understanding, skills and competencies;
- ensuring the uniformity of requirements for the acquisition of knowledge and the acquisition of skills and competencies;
- extensive use of knowledge, skills and competencies in one discipline in the study of knowledge, skills and competencies in other disciplines [12].

The implementation of interdisciplinary communication in educational institutions also requires the use of computer and information technology. The reason is that pedagogical software tools for teaching, modeling, demonstration and control allow pupils to generalize and synthesize knowledge, master generalized methods of knowledge and problem solving [10].

The development of the theory of the application of integration in the teaching process is important for the development of scientific and pedagogical concepts. Integration is inextricably

linked to differentiation. This coherence is evident in the fact that pupils build a system of aspirations to understand what they are learning.

Integration is the convergence and interdependence of sciences during the differential process [6]. The process of integration is a new, high-quality interconnection between the sciences, which manifests itself in a high way. It should be noted that the foundations of the integration process are based on folk pedagogy and scientific pedagogy of the distant past.

Integration is considered to be an interdisciplinary connection. The foundations of interdisciplinary coherence arose from the need to show and explain nature in its entirety in textbooks. Opinions of great educators in the study of the integration process.

As the great didactic Jan Amos Comenius put it, "Everything that is connected to each other must be studied in the same way".

The idea of interdisciplinary connection was later approached by many educators, who contributed to its development and generalization.

According to D.Lock: "One subject must be supplemented by elements and facts of other disciplines in determining the content of education".

Commenting extensively on the issue of interdependence in textbooks, I.V.Pestalossi says, "Understand that interdependent sciences are in a state of organic connection in nature". Pestalossi argues that the state of one subject being studied apart from another is even dangerous.

Researches in recent years have focused on integrated education. In particular, I.D.Zverev explains that integration is a single synthesis process based on the organic connection, the creation of integrity, the combination of elements of different educational disciplines. [4]

A.N.Zakhlebniy and M.V.Reshkov emphasize that the integration of disciplines should be carried out in the context of individual subjects in the school, taking into account the links in the curriculum and textbooks. Thus, the desire to integrate teaching materials is inevitably natural and characterized as leading in both the world and our national pedagogy. [5].

I.T.Suravegina has studied the activation of the process of teaching biology through the use of interdisciplinary links in biology lessons, increasing pupils' interest in science. From a scientist's point of view, it's hard to imagine teaching biology without linking it to other academic disciplines. Emphasizes that the establishment of interdisciplinary links and their skillful use serve to form a system of pupils' knowledge of nature [9].

R.A.Mavlonova divided integrative education in the educational process into the following classes. In particular, the integration of many disciplines can also be called universal or general, replacing several basic system courses. For example, combining reading, mother tongue, science, art lessons into one common lesson [7].

In Turdikulov's research work the problem of integrated teaching of natural sciences was developed, which in his research work he considered the universe as a whole conception, in a holistic view. In addition, it was noted that the integration of education is a high level of interdisciplinary communication, a tool that allows you to create an integrated knowledge. [11].

Interdisciplinary connection in teaching biology by A.T.Gafurov, interdisciplinary connection in teaching the basics of genetics and selection by S.S.Fayzullaev, and also one of the most

important problems of education - the integration and stratification of knowledge - has been studied in the research work of R.H.Juraev. In particular, according to the scientist, integration serves to establish structural connections between different systems of knowledge, to generalize them, to form a holistic view of nature and society of pupils.

N.M.Ahmedova today describes the phenomenon of integration as a leading position of innovation in education. Scientific and pedagogical research is being conducted, which allows to adapt the general scientific category to didactic realizations [2].

According to H.B.Norbotaev, through the organization of integrated lessons it is possible to discuss with pupils, to organize group competitions and quizzes. The main purpose of the use of such modern types of lessons is to activate pupils in the learning process, to achieve a high level of mastery of educational material. Such technology teaches pupils to imagine the world differently, to connect practice with life, not to memorize theoretical rules verbatim, to understand the harmony of the individual and society, to achieve diversity of ideas, as well as to understand ways of self-development. [8].

Typically, the authors of such courses combine the materials of the natural sciences, bring them into a specific system, and call their courses integrative or general. It is clear that the correct sequence in the delivery of natural science materials in the primary education system can be achieved only by maintaining the structure of the lessons. Some scholars point out that this is also being addressed in traditional schools through the sequential study of the natural sciences. A number of scholars believe that the tradition of separate teaching in primary education is also widespread.

The integration of subjects in the primary grades increases the effectiveness of the lesson, leads to the efficient use of time, helps to master the lesson in depth, increases leisure time and enables pupils to be involved in clubs.

The following should be taken into account when teaching through the integration of disciplines:

- Each lesson should be goal-oriented;
- The selected additional material on interdisciplinary relevance must be related to the topic to be covered;
- Ways to work with pupils in the classroom can be identified in order to increase their activity;
- The course should be not only educational but also aimed at shaping and developing positive aspects of humanism on pupils;
- should be aimed at the formation of scientific knowledge, beliefs and convictions about nature, society, human thinking, development, depending on the content of the topic;

In general, the integration lesson should be consistent.

The problems of integration of teaching and education in primary schools are theoretically and practically very important from a modern point of view and become more relevant in the light of new social requirements. Today, due to the development of science and huge changes in production, the demands are putting new challenges on school education. The modern education system is aimed at laying the foundations of science at a high level, developing thinking,

understanding and imagining the world as a whole, correctly understanding the events around us, educating young people who understand their essence.

The foundation of a positive attitude towards the environment is taught in the primary grades. Therefore, new psychological-pedagogical research related to the outcome of economic education in the first stage of school education allows us to consider the notion that the cognitive activities of young schoolchildren are limited. This lays the foundation for mastering and updating all components of economic education in the primary grades.

The key to such an update is to identify a goal that meets the age characteristics of the primary school pupils and meets the course requirements.

A number of works are devoted to interdisciplinary and intra-subject relations in primary education. These problems are the immediate development zone of the transition to the integration of academic disciplines.

The process of mastering the content of these areas of education and the acquisition of interrelated knowledge, skills, abilities, practical application has not been studied theoretically and practically.

The integration relationships of primary school subjects are poorly explored and the concepts are contradictory. There is a lot of controversy among scholars about the nature of these relationships.

There are two concepts in this regard:

1. A system is a concept that expresses the state of interdependence of individual stratified parts and functions of the organism and the process that leads to this state.
2. The process of convergence of disciplines, which is carried out in conjunction with stratification processes.

Integration of educational content is a world tradition (idea, thought, aspiration). The integrative approach reflects the objective integrity of systemic relations at different levels (nature - society - man). Integration involves combining previously divided parts into one whole. It leads to an increase in the level of integrity and coherence of system elements.

During integration, the interdependence increases and becomes more organized, the operation of the parts of this system and the object of its study are regulated. How can these general rules be applied in school education? According to modern didactics and methodology, the success of teaching and educating students depends on the formation of their understanding of world unity, the need to conduct their activities on the basis of common laws of nature, to solve interdisciplinary and intradisciplinary links in science. Integration in education is considered through a systematic approach to the design of the content of academic disciplines.

The simplest of the connections that make up the simplest knowledge of nature or science is a local imagination bounded by a particular place or concept. [1]. This connection is separate from other knowledge and therefore provides the simplest mental activity. This is typical of a small school age. The imagination that belongs to a system is the simplest structural imagination. It is formed on the basis of the study of a particular subject, science, or phenomenon.

Knowledge of any science is achieved by recognizing new facts and concepts by comparing them with knowledge related to any certain field. The simplest generalization of knowledge takes place, but it would be useful if the knowledge gained were linked to knowledge that was close to it all. [13].

This results in students' analytical and generalization activities. Imaginations within the system ensures that students know the whole system of sciences, there is a wide use of knowledge within the studied discipline. The imaginations within the system reflect time, environment, and numerical relationships. Interdisciplinary perceptions are considered the highest stage of mental activity. They combine different systems of knowledge, allowing us to know the diversity of an event or process. Based on this knowledge, general concepts emerge. The formation of intersystem imaginations allows them to use knowledge, to subordinate them to each other, to identify gaps in the boundaries of knowledge.

CONCLUSION

The integration of the primary education process will increase the efficiency of learning subjects, the development of the quality of education on the basis of a single goal. Because the teaching of one subject in different interdisciplinary relationships can be the basis for increasing the activity and interest of students in the classroom.

ABSTRACT

In this article, the author analyzes William Golding's creative works in which he draws attention to Human Nature. Golding was a contemporary English writer of the 20th century, who through his literary works tried to express his thoughts and ideas that were clearly acknowledged by critics as philosophical,. He wrote a lot of significant works, particularly novels, which contain extravagant philosophical concerns about human's true essence. The purpose of the article is to analyze Golding's literary works which highlight philosophical problems such as human nature, evil essence, existence, and the meaning of the life. In the article, the author presents several famous novels written by Golding, and shows his philosophical inclination by thoroughly analyzing them.

KEYWORDS: *Philosophy, Human nature, Evilness, Goodness, Existence, Egoism, Absurdity.*

INTRODUCTION

In the 18th century philosophers and writers thought that a person was born good and virtuous and it was the ugly environment that could sometimes spoil him/her. Yet they believed in the ability of man's reason to defeat Evil. The complicated atmosphere of the 20th century, the two world wars, the moral crisis of society, violence, and crime characteristic of the modern world

led some people, Golding among them, to see the cause of evil in man's nature. The experience of Golding in World War II had a deep impact on his understanding of society and the horrors it was capable of. Golding continued teaching after the war and began to write novels. "Lord of the Flies" (1954) was his first novel, and the work immediately brought him fame when it finally was published after several rejections. The benefits got by Golding after the novel being sold, enabled him to stop teaching. Then he was able to concentrate his attention fully on writing. Golding was productive; he wrote notable novels that contain philosophical views about searching for the true essence of human nature. But still, he is mostly remembered for his novel "Lord of the Flies" which contains allegorical dark irony.

MAIN PART

William Golding was born in Cornwall, England, on September 19, 1911. Beginning with the age twelve, he wanted to be a writer, but his parents encouraged him to practice natural sciences. Even though he agreed to study natural sciences, he turned his attention to English literature when he was a second-year student at the Oxford University. He took a job as a theater, actor and producer after graduating from Oxford and then finally became a schoolteacher. Golding joined the Royal Navy in 1940, where he served in command of a rocket-launcher and fought in the Normandy invasion. Almost all associations with existentialism were rejected by William Golding, but his views are related to that philosophy. His works are dynamic and full of involvement. Modernist elements go next to each other with realistic elements, in which realistic images contrast with allegorical images. His works were called fables by Golding himself, hence emphasizing their didactic essence. His experience in the World War II pushed him to focus on human nature. As he became the witness of the horrors of the war, he came to conclusion that a human being is an evil and cruel creature who collapses anything on his way.

William Golding began writing in the middle of the twenties, and immediately chose "human nature" as the key question of all his works, a question which he answered pessimistically. He asked himself what a man could hope for, and came to the conclusion that a man can really only hope for God's grace, nothing else. Even though Golding's views can be referred as theological, most of his works have another tradition – modernism. Golding himself may not acknowledge this fact as he refused to call his books philosophical. Thus, William Golding makes no claims to be a leading modernist and denies having any connections with the modernists, and yet they regard the principles underlying his works very favorably.

"The Lord of the Flies" considered to be his most famous work, and ideas shown in this book furnished the key to understanding all of his novels, or at least their philosophical basis. William Golding took an idea to write this renowned book while he was giving a lecture at the University of California, USA (1962).¹ Golding terms all his books "fables" or "myths" thus stressing their didactic function. Everything that William Golding created so far are philosophical and at the same time, allegorical "fables". Nevertheless, they differ from each other by style and theme. Golding wrote in his article: "It is a thankless task, to be a fabulist. Why this is so is clear enough. The fabulist is a moralist. He cannot make a story without a human lesson tucked away in it.... By the nature of his craft then, the fabulist is didactic, desires to inculcate a moral lesson."²

William Golding showed the moral idea of his famous work "The Lord of the Flies" in his article "The Fable". He confidently states that a man produces evil as a bee produces honey, and if

people after witnessing the catastrophes of wars including fascist savagery don't realize that, they are absolutely blind or wrong in the head. He believed that his task as a writer is to explain people the true nature of humankind. He speaks of man's innate greed, cruelty, and egoism. Also, he declared that a man was sick and not exceptional man, but average man. Golding wrote: "To many of you, this will seem trite, obvious and familiar in theological terms. Man is a fallen being. He is gripped by original sin. His nature is sinful and his state perilous. I accept the theology and admit the triteness; but what is trite is true".³

"Lord of the Flies" tells of a group of civilized boys who find themselves shipwrecked on a deserted island in the middle of the ocean, and of their return to an animal state. These schoolboys try to construct a civilization on the island, but it falls apart because the boys are "suffering from the terrible disease of being human". In the same article, Golding attempts to persuade the reader that the basic thesis of "Lord of the Flies" may be applied to all events of human history. If one takes this into consideration, there can be no doubt about the nature of his philosophical conception of the world. The naturalism of the characters in his first novel only underlines his biological conception of man which in no way contradicts the theological concept of original sin. Man is therefore by nature an animal, and the human predicament is very grave. The only thing man can hope for is God's mercy. On the other hand, we can't state that William Golding's philosophical approach is totally pessimistic, because he alleged that the main task of the writer is to warn people about their nature, prevent the evil they produce.

The novel's title can be traced back to the Jewish legend of evil presence, where the devil Beelzebub is named 'Lord of the Flies'. The central representative of the phony supernatural beings should be him. The title is most suitable because Golding tries to express morals such as – the world is not the best place to be bound to, authority distorts anything and humanity must bear the life surrounding with cruelty.

We can comprehend when the civilization and order fades away, and evil "Lord of the Flies" takes control over us, then the wars begin, people start fighting each other, killing and exterminate each other, innocent children who by fate find themselves on the island begin to quarrel, and slowly turn to animals who worship the Lord of the Flies. Once the Beast becomes a reality for youngsters, Jack Merridew, by penance, tries pacifying him. He left the head of the pig which he had cut as a sacrifice to a beast. He believes that the Beast doesn't touch them in this case. This was the tradition of ancient savages who, by religious offerings, come up with their idols. Jack establishes a new system where murder and torture are practiced. Simon and Piggy are killed, and children hunt down Ralph. The Lord of the Flies takes control over the youth souls. Only Simon remains free from the enchanting power of the Beast. When Jack slaughtered the sow and offered its head to the Beast, Simon sickened. The sow's head became the Lord of the Flies, comes to life and makes a conversation with weak Simon. It reveals that the true evil can't be vanished, because it is in the soul of men. Thus, the Best is the children themselves, generally all the humankind.

Jack reflects a profoundly ingrained, primal aspect of human nature in "The Lord of the Flies". His acts illustrate how quickly a logical person can revert to animalistic behavior. His earliest entry in the book appears with his greed and lust for power. The leadership that Ralph gains over him in the early election makes him envious. With an appeasement from Ralph to let Jack manage the hunters, his impulses are only somewhat minimized. Darwinism may clarify Jack's eagerness to become the boys' leader, the principle of sustainability and competitiveness is Jack's

driving force. The origins we depend on to live millions of years ago are now deceased, and we are now special. "Lord of the Flies" is an undertaking to follow the deformations of society back to the blemish of human nature". As the tale unfurls all to viciousness on the friendly island of the half-educated English students, the peruses observe the tales of the human condition, in which the light still can be seen by a few shielding hopes.

"The Lord of the Flies" is like a horrible nightmare. As the reader slowly prepared to acknowledge that things could end up that way and there are not many moves from civilization to tribal savagery and decline. Golding faces the philosophical questions. Golding faces the existential challenges of his storyline openly and boldly with romantic creativity, and "Lord of the Flies" becomes an allegory of regression, which leaves anxiety, cruelty, and destruction as it falls. It's a novel with tragic intensity and overwhelming moral influence. In the novel "Lord of the Flies" Golding wanted to show that evil is present in every human and everywhere. William Golding desperately believes that human being is evil, without civilization and order, they will return to their initial animalistic form. Golding roots our evilness to selfishness and ignorance. In the Second World War, as we mentioned above, Golding served in the navy army, and saw all terrible things that people did with each other, he rethinks his ideas and puts a question in his book, how can people be so evil when they call themselves civilized, but act even worse than animals? (None of an animal kills its own kind on purpose). The beast presence in every child in "Lord of the Flies", except Christ-like Simon. Simon becomes a chance of humanity, that goodness still can exist, but unfortunately, he is killed which symbolizes that the last goodness in people disappears.

Golding during his lifetime wrote six novels (from 1954 to 1967), and all of them are dimensional. Golding's second novel, "The Inheritors" (1955) is the most philosophical among the others. Again, William Golding tried to proof that nature of a human being is initially dark. By using parody, he compared civilized people to Neanderthal men. New people appeared on the Earth, which until then had been inhabited by primitive Neanderthal people. The new arrivals are cunning, greedy, and evil. The primitive creatures that had lived a simple and innocent life, making use of nature's gift, are superseded by these new beings that learn to subjugate nature to their own needs, bloodthirstily killing animals and their own kind. These more highly perfected specimens of mankind represent a step forward in human civilization. In Golding's interpretation, they are in fact, a step toward evil. The new men mercilessly clear their path of everything and everyone that stands in their way, and receive cruel satisfaction from blood and murder.

In this novel Golding wanted to highlight the "absurdity" of the existence and how the human nature shows its authentic state, so Golding conclude that it raises step by step and eventually shows itself. William Golding portrayed this situation presenting men's evolution. Dark image of a human being and the primitive portrait of Neanderthals are brilliantly created.

Golding denies the presence of any philosophical coating, exactly existentialism in his works. However, this trend influenced his next work, "Free Fall" (1959). From the very beginning, the novel develops an inner argument about the limitations to man's freedom of choice and this argument acquires most force in the episodes that take place in the Nazi concentration camp when Sam Mountjoy gives way under torture and is ready to betray everyone, even telling his tormentors about "facts" which have been his entire invention. William Golding presents his novel in a unique way – either they are isolated individuals or a group of people surrounded by

challenges and struggles, which reveals their inner identity. The main hero of the novel “Free Fall”, Mountjoy analyzes his whole life and comes to conclusion that moral decadence he experienced is the result of the wrong “choices” he had made.

“The Spire” (1964) is the fifth novel written by William Golding. The characters of the novel are accepted as highly symbolic, at the same time interpreted by critics in different ways. Jocelyn, the main hero of the novel suffers from the fixed idea to construct the high spire above the church. To embody his ambitious, he sacrifices people and even his own life. Valentina Ivasheva, a literary critic, explained the symbolic meaning of this character and wrote: “How can be Jocelyn’s crime comprehended: this building “on the sand” which cost so dearly in human life? It can be seen as a manifestation of man’s genius and labor that withstood all despite the human sacrifices it required and the natural condition that the “madman” Jocelyn ignores. The building of the spire is called “Jocelyn’s Folly”, but Jocelyn himself, a religious fanatic and dreamer, calls it “God’s Folly”: God pushes a man to do “mad” things in his praise. This is how Jocelyn understands his task in building the spire, against the wishes of the builders and clergy, and despite the obvious absurdity of the task.”⁴ The insane actions of Jocelyne remind the myth of Sisyphus and show the absolute absurdity of the life.

“Darkness Visible” William Golding’s 1979’s novel about terrorism, multiculturalism, and spirituality It is set in present Britain, and characters which are portrayed in this novel are not so pleasant. Golding portrayed psychopaths, maniacs and thieves. The protagonist of the novel is Matti, who saw the bombing of London by Nazi army. Matti is a man of honor, but at the same time he is very lonely. His face is burnt and became ugly, and most people scare him because of his appearance. Matti departs for Australia in grief. A far bigger tragedy hits him there, and he goes half-crazy. He returns to England believing that he is a prophet now. Matti dies rescuing a child from fire, but still he can’t be considered as a fully good character. He commits a crime with an old man whose intentions are not good. The bad side of the essence of a man will quickly prevail over the virtuous one, Golding emphasizes. On the contrary, we can see in the life of Matti – the portrait of English social life. It is characterized by economic instability, moral depravity, abuse, and terror. The novel was called by critics "a picture of England in the dark surrounding darkness".

Golding's major work of the last period is the “Sea Trilogy” which consists of “Rites of Passage” (1980), “Close Quarters” (1987) and “Fire down below” (1989) set on an old ship bound for Australia during the Napoleonic wars. Like his other works the trilogy combines elements of several genres: a sea novel, a historical and a psychological one. At the same time, it is a profound philosophical fable dealing with such problems as a man versus society and the contradictory prospects of human progress. For his contribution to world literature William Golding was awarded the Nobel Prize in 1983.

Golding announced that his task is to reveal the dark essence of the human nature, to warn people about their inner substance which is made of evil, admonish them to fight it in order to make their life better.

ON THE STUDY OF MANUSCRIPTS OF ALISHER NAVOI'S "KHAMSA" (ON THE EXAMPLE OF PORSO SHAMSIYEV)

Giyosiddin Nafasovich Shodmonov*

*PhD Student,

Karshi State University Karshi, UZBEKISTAN

Email id: shodmonov786@gmail.com

ABSTRACT

The article is devoted to the research of textual scientist Porso Shamsiyev's scientific laboratory. It mainly describes the manuscript sources and their significance, which are the basis for the scientific and critical texts of Alisher Navoi's "Khamisa" epics compiled by the scientist. The textologist has introduced many unique copies of Alisher Navoi's works to us, to Kazan and St. Petersburg. Two manuscripts of Alisher Navoi's works in the Kazan collection attract the scientist's attention. One of them is Navoi's perfect work, the "Khamisa" manuscript, which does not indicate who copied it, when or where.

KEYWORDS: "Khamisa", epic, text, scientific-critical text, textologist, secretary, calligrapher, manuscript, source, publication, lithograph.

INTRODUCTION

Currently, the world's manuscript collections contain a number of ancient manuscripts of Navoi's works. Examples are the funds of the Saltikov-Shedrin State Public Library in St. Petersburg and the Institute of Oriental Studies of the Uzbek Academy of Sciences. In addition, some of Alisher Navoi's works can be found not only in various manuscript collections around the world, but also in the personal libraries of some fans of science and literature. Therefore, it is important to study the unknown manuscripts of the poet's works and determine their scientific value.

In the 50s and 60s of the last century, a great deal of work was done to study and publish the works of the great artist Alisher Navoi. It is worth noting that our textual scholars were active in this process. One of such great scholars, Honored Scientist of Uzbekistan, Doctor of Philology Porso Shamsiyev, as a textologist, also conducted serious research on the manuscripts of Navoi's Works.

It is well known that the study of examples of our classical literature, including the works of Navoi, is a serious error in the texts copied by calligraphers of different levels over a long period of time, overcoming confusion required a thorough knowledge, a keen intellect, and a great deal of responsibility. Porso Shamsiyev's unique talent and deep knowledge were most evident during this time - in the process of textual research.

The textologist has introduced many unique copies of Alisher Navoi's works to us, to Kazan and St. Petersburg. Two manuscripts of Alisher Navoi's works in the Kazan collection attract the scientist's attention. One of them is Navoi's perfect work, the "Khamsa" manuscript, which does not indicate who copied it, when or where. All five epics in the manuscript are perfect. Porso Shamsiyev examines it, examines the paper, the style of writing, the ways of decoration, identifies it as belonging to the XVI century, and creates a detailed description and presents it to the fund. This source will later be included in the list of 6 authoritative copies involved in the preparation of the scientific-critical text of "Khamsa".

THE MAIN FINDINGS AND RESULTS

It turns out that until the first half of the XX century, among the many manuscripts of Navoi's legacy in the compilation and publication of scientific and critical texts of "Khamsa" epics, only "Khamsa" copied by the great calligrapher of the XV century Abduljamil relied only on the manuscript. This manuscript was acquired in 1930 and is currently stored at the Institute of Oriental Studies named after Beruni of the Uzbek Academy of Sciences under number 5018[3]. This copy is based on scientific texts and publications because it is scientifically reliable.

P. Shamsiyev accepts the above-mentioned Abduljamil's manuscript from 6 sources as the main reference for compiling the scientific-critical text of Navoi's "Khamsa". The scientist found that the letter of the manuscript was written in a small and beautiful text, the paper was slightly damaged, and in some places the pages were lost. Elsewhere, it appears that the pages were restored in a different letter and by a different person. The textual critic points out that the manuscript, despite its shortcomings, is the most remarkable of all the manuscripts. In addition, Abduljamil's contemporaries with Navoi and the fact that he copied the work with him add to the credibility of the manuscript.

The second source selected for the scientific-critical text of the Hamsa is a manuscript belonging to Sultan Ali Mashhadi, which is kept under the number 560 in the fund of the St. Petersburg Fundamental Library named after Saltikov-Shedrin [4]. The manuscript says that it was written in 898 (1492/93) by Sultan Ali, a servant of God. This manuscript is also beautifully copied and consists of 325 pages. But there are also places where the leaves are lost. 11 pages from Epic 3, 8 pages from 4, 19 pages in total.

It is known that Sultan Ali Mashhadi was a permanent calligrapher of Alisher Navoi. In this regard, P. Shamsiyev says that there is accurate information about the secretary in the 7th volume of Khandamir's "Habibu-us-siyar" and Mirkhand's "Ravzatu-s-safo". The scholar Zahiriddin Muhammad Babur also gives the following example of how close he was to Sultan Ali and Navoi: "Although there are many calligraphers in the palace of Sultan Hussein Mirza, Sultan Ali Mashhadi is their leader in Nasta'liq. He wrote a lot for Mirzo and Alisherbek: every day he wrote thirty poems for Mirzo and twenty poems for Alisherbek". Alisher Navoi himself speaks about the talent and skillful calligraphy of this secretary in his work "Majolis-un-nafois": Mawlana Sultan Ali is a martyr. This day is the qiblalu-l-kuttab in Khorasan and in most parts of

the world in the Nasta'liq script, and the territory of the Kitab is the only pen. There is no one who is morally upright and virtuous, the language of the sharhid is weak and there is no minister of good manners, and it is a good thing [1:387].

Apparently, Sultan Ali Mashhadi was one of the greatest secretaries of his time. Thus, P. Shamsiyev accepts this manuscript as the second auxiliary copy after Abduljamil's, which was involved in compiling the critical text of "Khamsa".

The third manuscript is a non-colophony copy No. 7554 from the fund of the Beruni Institute of Oriental Studies of the Uzbek Academy of Sciences [5]. The order of the epics in this "Khamsa" manuscript is as follows:

1. "Khayrat-ul-Abror";
2. "Farkhad and Shirin";
3. "Sab'ai Sayyar";
4. "Layli and Majnun";
5. "Saddi Iskandariy".

The scholar suggests that the alternation of the epics Sab'ai Sayyar and Layli and Majnun in the manuscript may be due to the cover-up process. This copy is complete. Despite the absence of the Colophon, the scholar identifies the antiquity of the manuscript on the basis of the following two important features: second, there is a note on the first page of the manuscript stating that it was donated. Half the record is gone. It was gifted to some sort of Muhammad Bek, a servant of Sultan Boyazid. In addition, the history of the inscription indicates its antiquity: در تاریخ روز پنجشنبه ۱۴ محرم الحرام ۹۷۹ (The date of the narrow date is Thursday, the 14th of Muharram al-Haram 979), i.e. July 8, 1517 AD. It is clear that the manuscript was copied in the late XV and early XVI centuries. The text of the copy is also very well written.

The manuscript "Khamsa" in Navoi "Kulliyot", number 55, which is kept in the fund of the St. Petersburg State Library named after Saltikov-Shedrin, is the fourth among the sources involved in the scientific-critical text compiled by the textologist. In this "Kulliyot" 13 works of the poet are presented in a chaotic manner. At the end of the first epic there is a colophon, which gives a clear history - 1258 (1842). There is another story. It is quoted in one of the four devons of the "Khazayn-ul-maoniyy", the "Gharoyib-us-sig'ar". It states that the Garoyibu-s-sigar was completed on the twenty-second of Dhul-Hijjah, 904 AH. This history is considered to apply to all works in the Kulliyot. According to Shamsiyev, the Kulliyot (*Khayrat-ul-Abror*) was copied in the XVI century [2:30]. The textual scholar finds that there are a number of corrections to the Hamsa text in Kulliyot, that is, there are spaces added by the secretary's hand and by someone else instead of some omitted bytes.

The fifth source selected for the scientific-critical text is kept in the collection of the St. Petersburg State Library named after Saltikov-Shedrin under number 559. It contains all the epics except the fifth epic of Khamsa, Saddi Iskandari. There are 23 miniatures in the manuscript. The letter is beautifully written. Colophony not shown. According to the size, spelling, format (32x32) and other features of the manuscript, the manuscript was copied in Bukhara in the XVI century.

The last-sixth source involved in the compilation of the scientific-critical text of “Khamsa” is kept in the Fund of Oriental Studies of Kazan University (inv.15334). The textual scholar examines the manuscript from beginning to end. The beginning of the epics in the copy is decorated with a gold border, the text is taken in a simple border line. The letter is the same as before - a small, beautiful nasta. The paper of Hirat, each page is divided into four columns and consists of 21 lines. The paper format is 23x16 and the text is 17x11.5. According to the scientist, the cover of the manuscript was reworked by the Russians.

The placement of the epics is in the following order:

1. “Khayrat-ul-Abror”;
2. “Farkhad and Shirin”;
3. “Sab'ai Sayyar”;
4. “Layli and Majnun”;
5. “Saddi Iskandariy”.

The manuscript does not indicate the name of the secretary or the date of copying. Inspections show that the manuscript was copied in the first half of the XVI century. In addition to these six manuscripts, P. Shamsiyev refers to 3 lithographic copies of “Khamsa”: Khiva edition, 1880. Two Tashkent editions from 1904–1905.

As mentioned above, the textual scholar relies entirely on Abduljamil’s copy in compiling his scientific-critical text. Try to keep its features as much as possible. Compares each byte in the manuscript with the next five. Differences in meaning are noted in the scientific apparatus of the text.

The scholar describes the symbols of a scientific-critical text as follows:

Manuscript - 5018, Abduljamil

Manuscript - 560, Copied by Sultan Ali - BQo‘lyozma – 7554, Toshkent nusxa– B

3. Manuscript - 55, LGPB - G

4. Manuscript - 559, LGPB - D

5. Manuscript - 15334, Kazan University – E

The following differences are shown when comparing the texts of each copy:

Major spiritual differences;

Spelling differences;

Secretary's error;

Missing keywords, bytes

CONCLUSION

In short, the use of ancient manuscripts of Alisher Navoi’s works by Porso Shamsiyev in science is significant in the following ways:

First: It helps to uncover aspects of the poet's work that are not yet known to science, and lays the groundwork for new research;

Secondly: These ancient findings served as a necessary source for the further development of the unique scientific-critical texts of Navoi's works, in particular, the epic poems of the great poet "Khamasa", which are the product of high artistic thinking. Evidence of this can be seen in the work of scientists;

Thirdly: Some of the confusion associated with Navoi's textology (mainly in the writing of critical texts) had a positive effect on the elimination of confusions.

TURKIC LEXEMES IN THE HISTORICAL WORKS OF ALISHER NAVOI

Dilnoza Akramovna Abduvaliyeva*

* Lecturer,

Doctor of Philosophy in Philology PhD

Department of Methods of Teaching the Uzbek Language,
Jizzakh State Pedagogical Institute named after A. Qodiriy
UZBEKISTAN

ABSTRACT

The article presents the thorough analysis of the turkish lexis which we often encounter in the historical works of Alisher Navoi and their influence to the old Turkish language and modern Uzbek literary language. The period of the ancient Turkic language is characterized by a full-fledged expression of the specific properties of the Turkic languages in relation to the stage of general development. In the studies of the language of this period, general properties of the phonetic, lexical, and grammatical development of the Turkic languages are observed.

KEYWORDS: *Lexicology, Lexeme, Lexical unit, Old Turkic Language, Old Uzbek language, Old Uzbek literary language, Semantic change, Narrowing of meaning, Expansion of meaning, archaism.*

INTRODUCTION

The period of the ancient Turkic language is characterized by a full-fledged expression of the specific properties of the Turkic languages in relation to the stage of general development. In the studies of the language of this period, general properties of the phonetic, lexical, and grammatical development of the Turkic languages are observed.

The sources highlight the expression of the specific features of the ancient Turkic language in modern Turkic languages. Most of those used in the era of the Türkic domination are in the speech circulation of the modern Türkic languages [1]. E. Begmatov, based on the ancient Turkic dictionary, confirms the use of over 2500 lexemes related to the ancient Turkic language in the modern Uzbek literary language. These lexemes are the expression of concepts of different directions and belong to twenty lexico-semantic groups [2. 65-73].

The historical works of Alisher Navoi "Tarihi muluki Ajam"[3], "Tarihi anbiyo va hukamo" [4] also reflect common Turkic lexemes that were used in the ancient Turkic language.

1) Lexemes in the Old Uzbek literary language used in the meanings of the period of the Old Turkic language. The main part is made up of lexemes with the meaning of action-state, activity. For example, ёвмок – "to come closer, come closer" [5], [6]; yugurtmoq– "to come closer, come closer"; qovmoq (TMA, 208) "drive, drive away"

The derived verb *oyullan-* in the ancient Türkic language with the meaning "to adopt" (DTS, 364) retained in the TMA texts the meaning "to adopt, to take up" (ANATIL, III, 602) in the phonetic form *oyulčila*.

MAIN PART

The main part of the names of objects and phenomena is used without semantic changes: *yumurtqa* - "egg" (ANATIL, III, 584); *Iskandar javáb berdikim, ul yumurtqalarni qoyar quş uči* ... (TMA 733a8); *künäs* - "sun" (ANATIL, II, 138); (DTS, 327): *Anda oy xamini yetkürüb, künäsgä saldurdü* (TMA 737a13^14); *iyä* - "owner" (ANATIL, II, 14); (DTS, 205): *Tegirmän iyäsi ... anı öltürüb, jihatın egällädi* (TMA 742b7); *bürünčäk* - "silk curtain for the face" (ANATIL, I, 338); "Women's headdress - a light veil" (ДТС, 133): *...aqa bürünčäk va čarx yibardikim, qilyan işiğya bu läyiqdur* (TMA 740b4).

Also, the lexeme *yamyur*, denoting a phenomenon of nature, in the ancient Türkic language is used in phonetic variants *yaımur* // *yamyur*. In the texts of "Tarihi anbiyo va hukamo" this word is expressed as follows: ... *haq taála yetti yıldın söñräkim yamyur berdi*. This derivative is formed by attaching the ending *-mur* to the verb *yay-*, which in the ancient Turkic language means "to fall from the sky as a precipitate" (MK, III, 68; DTS, 223)

2) Lexemes used with semantic changes. In the semantic structure of a number of lexemes of the ancient Turkic language, there was a narrowing of meaning. Semantic peculiarity, differentiation, narrowing, that is, the process of getting out of use of certain lexemes can be found in the texts of these historical works. The lexeme *tangri* in the ancient Turkic language is used in the following meanings: 1) "sky; 2) god, deity, lord, lord; "4) "ruler, master" (ДТС, 544). In the works of Navoi, only the meaning of "God, Lord, Lord" of this word is observed (ANATIL, III, 180): *Chun tangri taolo amridin bun to'lg'odi* ... (TAH, 100). This means that there was a narrowing of meaning in the semantic structure of the word.

In the semantic composition of some words of the ancient Türkic language, new meanings were formed; this process took place on the basis of the development of dictionary meaning. When observing changes in the semantic structure, it is not the disappearance of the lexical meaning that is of great theoretical and practical importance, but the formation of a new lexical meaning and the concretization of issues related to this. Based on this point of view, in the texts of these works one can observe the expansion of the meaning of some lexemes of the ancient Turkic language. For example, the verb *bolalamok* in the ancient Türkic language meant "reproduction of birds and game" (ДТС, 80). This word in the ancient Turkic language is formed by attaching the word-forming ending *-la* to a noun pronounced in the form of *ba:la*, and the word *bala* expressed the meaning of "chick" in "Divan" Mahmud Koshgari (MK, III, 250). And in the works of Navoi, this verbal lexeme is used not only in relation to birds, but also to the

reproduction of other animals: ... anīḡ zamānida pil Hindistāndin özgä yerdä balaladī va ul ham yarib amr erdi (TMA 741a12).

The Turkic verbal layer of the language of the historical works of Alisher Navoi is divided according to the degree of use in the modern Uzbek literary language into Turkic words used in the modern Uzbek literary language and Turkic words not used in the modern Uzbek literary language.

Turkic words used in the modern Uzbek literary language are classified as follows:

1) Lexemes, used without semantic changes, express meanings in relation to the Old Uzbek literary language. These are: denoting action-state: ber= (TMA 729a13), ye= (TMA 734b2), de= (TMA 729a2), kel= (TMA 730a28), atlan= (TMA 741a16), sev= (TMA 730a13); denoting a feature-property: oq (TMA 741a13), kök (TMA 731a24), yaxši (TMA 731b9), yaman (TMA 737b9); denoting the names of objects-things: ip (TMA 737a12), ipäk (TMA 737b6), otun (TMA 740a19), egär (TMA 729a18), taray (TAX 726b16); denoting the names of some persons: temürçi (TMA 730a5), elçi (TMA 733a1), oquyuçi (TMA 734a11), qaraqçi (TMA 733a26), qoyçi (TAX 726a15), balıyçi (TAX 722b9), suvçi (TAX 711a27); animal names: it (TMA 735b1), yılan (TMA 735b25), at (TMA 735b25), tevä (TMA 729a18), kiyik (TAX 723a26), böri (TAX 711a7).

2) Lexemes, in the semantic structure of which there have been changes. In the vocabulary of Navoi's historical works, the main part of the Turkic words is used independently, in a dictionary meaning. But certain meanings in the semantic data structure of tokens have fallen out of use. The functional-semantic analysis of the TMA vocabulary shows that the words of the Turkic lexical layer had a wide semantic circle in the Old Uzbek language. In later periods, a narrowing of this semantic circle is observed. Certain meanings of a number of Turkic words are not observed in the modern Uzbek literary language.

The vocabulary of Alisher Navoi's historical works can be generalized according to the degree of use in the modern literary language and semantic properties:

a) Words that have preserved their basic meanings, but some meanings have fallen out of use. For example, the verb *yasa-* in the works of Navoi is used in several meanings (ANATIL, IV, 596). This lexeme in TMA texts is used in eight meanings. The following meanings of this word are not observed in the modern Uzbek literary language: 1) "build, create, erect, construct": *Va Sus bilä Bābil šahrini Hušang yasadi* (TMA 729a23).; this lexeme in modern literary language is not used in the meaning of creating three-dimensional objects (for example, a city, building, etc.), but is used in relation to objects (tool, thing) used in work-activity, play, etc. (ATYL, 5, 121); 2) "to depict, draw": ... *anīḡ suratin yasab, anīḡ bilä xursand bolur edi* (TMA 729b2); 3. "Draw up" (order, rule, decree, decree, program, etc.): *Rašitannikim, Dārāb dasturi bilä dastur yasab erdi, Bayri atlıy inisi siáyati bilä tilädikim, azl qılyay* (TMA 733a6); 4. "Manage, lead, and lead": *Azarmidox came to power, did not appoint a minister, and decided to make the property his own business and opinion.* (TMA) 5. 742a; do together ": *Ardašer šādmán bolub buyurdı, anı anīḡ yaši atfāl bilä yasab, anīḡ qaşıya keltürdilär, bir-bir ötkärib, ul yetkäč, atalıy mehri harakatgä kelib ...* (TMA 735b11^12). 6. "Put in order the army, army, form a line, line": *Humáy Erán čerikini yasab, Rum fathigä yıbaradur erdi* (TMA 732b10).

The word *el*, meaning “people, population, people of one locality; in general, a lot of people, a lot, everything”, is used in the modern Uzbek literary language in three meanings (ATIL, 5, 29). But among them there is no meaning “army, army” that was in the works of Navoi (ANATIL, III, 562): *Va pádšáh neča qatla qalín el yībarīb daf ’qīla almadī* (TMA 738b4). The word *kon* in the modern Uzbek literary language is used in four meanings (ATIL, 5, 328), but among them the meaning of “blood feud, vengeance” is not observed, which is available in the works of “*Tarikhhi muluki Ajam*” and “*Tarihi anbiyo wa hukamo*”: After this command, I invaded the Persian mulukidin Hurvis the cavalryman of the Children of Israel, who killed them in exchange for the blood of the two prophets. . (TAX, 175); ... Salm and Turdin killed Jaddi for their blood (TMA, 202).

b) Lexical units with an extended lexical environment in the modern Uzbek literary language.

The word *yol* with the meaning “a long, continuous part, a roadway formed after the disappearance of traces on the surface of the earth due to the passage of people, animals and other objects” (ATIL, 2, 276) in the ancient Türkic language is also used in this meaning. This polysemantic noun was pronounced in the form of *yo*: 1. subsequently, the sign of the longitude of the vowel *o*: disappeared (DTS, 270; Devon I, 197). This lexical unit in the ancient Türkic language meant: 1) “road, way”; 2) “event, exit, measure, method”; 3) “the way of the living animate” (ДТС, 270). In the Old Uzbek literary language it meant 1) “road, way”; 2) “event, exit, measure, method, reception”; 3) “sect, direction, faction, group, conviction, faith, path in life” (ANATIL, II, 82). In the texts, TMA is used in the following meanings: 1) “road, way gard they sprinkled water on the road in the neighborhood (TMA 741a16); 2) “Way out, way, method”: ... property and sipáhiya found a halal way ... caught him and killed him (TMA 730a28); 3) “Specially designated direction for the passage of ships”: Noširaván sent aid to the river to Yemen ... (TMA 740a5^6). The use of this word in modern literary language in sixteen meanings speaks of the expansion of the lexical content of the word.

The historical and etymological analysis of the historical works of Alisher Navoi reflects the lexical properties of the Uzbek language of the period of the Old Turkic language, the Old Uzbek literary language and the modern Uzbek literary language, used in the vocabulary of “*Tarikhhi muluki Azham*” and “*Tarikhhi anbiyo va hukamo*”.

DRIP IRRIGATION TECHNOLOGY AND ITS IMPACT ON THE ENVIRONMENT

Hurmatoy Abdumutalipova*; Artikbay Botirov**

^{1,2}Department of "Agriculture and Forest Reclamation",
Andijan Institute of Agriculture and Agro-technology,
UZBEKISTAN

ABSTRACT

Article describes new modern and innovative methods irrigation, help which is achieved the possibility of continuous supply of water plants, while inaccessibility and batteries. Dispensing water during the irrigation period, allow you to create the necessary moisture regime will increase crop efficiency.

KEYWORDS: Mineral Fertilizers, Irrigation Technology, Hydro-Module Areas, Ground Water, Saline Groundwater, Soil And Soil Composition, Groundwater, Melioration, Sub-Irrigation, Drip Irrigation, Sprinkler Irrigation, Irrigation Through A Flexible Hose.

INTRODUCTION

Today, drip irrigation has gained widespread acceptance. Scientists and farmers alike consider it to be the best and most efficient irrigation method, most likely because it provides plants with water and fertilizer where it is needed, at the right time and in the right amount. The use of drip irrigation over large areas in many countries has met the expectations of farmers in terms of higher yields, as well as savings in labor, water and energy resources.

It is known that drip irrigation has been widely used in the state of Israel since the 60s of the last century and with its high sama is recognized as one of the most interesting new technologies of all agricultural workers. Due to the positive results of the new technology, in a short period of time, this technology spread all over the world and began to bear fruit. The fact that this method is useful in the cultivation and increase of productivity of many agricultural products has begun to interest many experts and scientists.

MAIN PART

Uzbekistan is beginning to introduce the practice of drip irrigation of agricultural crops.

In this regard, a special government decree has been developed, which provides for the introduction of drip irrigation in the first place in the steppes, orchards and vineyards, which are subject to irrigation erosion. This method is a very costly method, but it is one of the most cost-effective options for saving water in water-scarce countries.

It is now known that in the state of Israel, using this method of irrigation, fruits and vegetables are grown and increased by 60-70 percent. Uzbekistan's water resources come from neighboring countries, such as Tajikistan and Kyrgyzstan. They are busy building dams on big rivers. It is obvious that time and situation demand that this technology is necessary for Uzbekistan and that it is the most convenient way to irrigate all agricultural crops in the future.

Experiments show that this method of irrigation is extremely convenient with another key feature. This is evidenced by the fact that the soil of our country is suitable for climatic conditions. In drip irrigation, water mainly enters the root part of the crop through the soil and moistens the root sufficiently and satisfies the crop's demand for water sufficiently. Drip driers are selected depending on the mechanical composition of the soil, crop type and soil conditions.

Saving water in the future is very important for the future state of Uzbekistan, because the rapid population growth in the country will dramatically increase the demand for water and food, which will lead to the development of new technologies in agriculture and their efficient use of every inch of land, gives birth. When irrigated in this way, the soil is moistened evenly, if the slope of the soil is correct. If the plane is incorrect, then an expert is able to correct it. The development of the root system of the plant shows that it is much higher than other methods of irrigation. The fact that the drip irrigation method can be carried out at any time without choosing a time shows that this method is much superior.

The use of this method without disturbing the soil structure also guarantees that agricultural machinery will not be disturbed. The fact that this method of irrigation can be easily used even in soils where irrigation erosion sometimes occurs shows that it is more convenient than other methods.

Use of drip irrigation water:

- Low water consumption for high yields per unit of crop yield;
 - Low water wastage for irrigation evaporation compared to irrigation and other irrigation methods (low surface moisture);
 - No effect of wind on water distribution or moisture evaporation;
 - Water distribution does not cause inconvenience even in difficult topographic conditions;
 - Uniform distribution of moisture;
 - No effect of pressure;
 - Possibility of quality irrigation for 24 hours, without exposure to wind, external influences and evaporation;
 - No waste of water;
- sudden reduction of weeds in the irrigated area indicates that this method of irrigation is more convenient and reduces labor costs.

The air exchange in the soil layers remains virtually unchanged as it is irrigated by drip irrigation.

Good air exchange and moisture levels in the soil are significantly increased and ensure that the moisture capacity in the soil is sufficient, except for the area where water is spilled near the humidifier. Irrigation in this way creates the following conditions for reorganization:

- reduce the likelihood of disease spread in plants and prevent pest infestation;
- determination of leaves is observed;
- drip irrigation reduces the spread of various diseases and weeds;
- improves aerobic (soil gas exchange) conditions in the soil;
- reduces energy and labor costs and increases economic efficiency.

CONCLUSION

Drip irrigation requires less labor and saves energy, while the slow passage of water saves energy. With the right irrigation scheme and schedule, there is no need for a special drainage system. The crop absorbs 95% of the water that enters the field. This really has a positive impact on the environment.

ABSTRACT

The centuries-old vast and inexhaustible treasure trove of Uzbek literature has served as a basis for the emergence of the artistic potential of countless famous prose writers, playwrights and poets. In this article, the relationship of inheritance and tradition in fiction, the role of national and world literary experience in the development of Uzbek literature, traditions and innovations, literary communication and literary influence, creative use of traditions in the development of national literature, literary imitation and the artistic and aesthetic laws that apply in the process of renewal are revealed in the work of Abdulla Qahhor. The article is intended for philologists dealing with various issues of fiction and a wide range of readers interested in art.

KEYWORDS: Fiction, Nationality, Succession, Tradition, Literary Tradition, Development, Literary Imitation, Artistic-Aesthetic Legitimacy, Abdulla Qahhor, Skill, Talent, Stories.

INTRODUCTION

The term tradition is still widely and somewhat abstractly interpreted in literature. From the 1960s to the 21st century, a number of problems of literary tradition in Uzbek literature were studied, and many scientific articles and monographs were published. But today it is clear that in most of them the problem of literary traditions is studied in a very abstract way. Today's socio-historical development requires a historical-literary approach to the study of literary traditions, which is the main driving force of the process of artistic and aesthetic thinking.

THE MAIN FINDINGS AND RESULTS

Before classifying literary traditions, it is necessary to clearly define their essence. Because the experience of the literary-historical process shows that some traditions, while providing succession, may not serve the ideological and artistic development of literature. For example, in the Uzbek poetry of the XV-XVI centuries, genres such as ghazal, rubai, tuyuk raised the existing traditions of ghazal writing, rubai writing and tuyuk writing to a certain level of ideological and artistic height. However, the ideological and artistic position of these lyrical genres in the twentieth century did not reach the level of perfection of national literature. Because the demands of the social period had changed to such an extent that they differed sharply from the ideological and artistic potential of the above lyrical genres. Nevertheless, the formal features of these genres were preserved, but they did not rise to a new level in terms of ideological and artistic development. This suggests that literary traditions only served to ensure succession. Some literary traditions, in addition to ensuring succession, also serve to raise the national literature to a new level of perfection. For example, as early as the 1920s, Uzbek literature made a leap in literary progress by adopting a genre of realistic novels that was completely absent from the national literary experience. This literary-aesthetic leap was due to the use of the experience of novel-type epic works in the literature of other peoples, applying them to the novel genre as inheritors of national classics and folk epic traditions.

In the twentieth century Uzbek literature, the pursuit of the unique internal traditions of the national literature, the assimilation of the advanced principles that have existed in them for a long time, and thus the desire to ensure the development of today's national literature has significantly increased. It is unanimously acknowledged in literary criticism that A. Kadyri creatively used the advanced traditions of Eastern realist prose, on the one hand, and Western realist prose, on the other, in creating unique examples of national realist novels. Not only did the author use the existing traditions, but he was able to raise the world novel to a new level by enriching these experiences with his new, truly national news.

Later, this realistic style was successfully continued in the works of such great writers and poets as Cholpon, GafurGulam, Hamid Olimjon, Abdulla Qahhor, Oybek. In the works of these writers, Islamic themes, through traditional images, moved away from biblical figurative images to reflect the life of the people, their psyche and feelings on secular topics, through secular images in simple colloquial language. Thus, a realistic trend has emerged in Uzbek literature, and in recent years it has been a regular leader in the field of art.

The history of foreign traditions, which played an important role in the development of Uzbek literature, is also very ancient, and its first roots cannot be traced back to a specific period or literary monument. But one or two facts can be used to give a clear idea of the fact that foreign traditions have been used in our literature for a long time. For example, Yusuf Khos Hajib's "QutadguBilig" shows that the tradition of creating a large didactic work in Uzbek literature in the form of *masnavi* with the size of *aruz* poetry dates back to the 11th century.

If AlisherNavoi's work is examined in terms of the succession of foreign traditions, it should be noted that the great thinker himself admitted in one of the continents that he was a teacher of Persian poets: Hafiz Sherozi, KhisravDehlavi and Abdurahman Jami. In Hamsanavism, he repeatedly mentions that the great Azerbaijani poet NizamiGanjavi, who wrote in Persian, the

Turkish poet KhisravDehlavi from India, and Abdurahman Jami from Herat was his predecessors.

It is obvious that AlisherNavoi, creatively using the literary form, noble ideas and traditions of creating immortal literary types in the literature of other nations, was able to reach the peak of the development of ghazal poetry in Uzbek literature, as well as the basis of national solidarity. This means that the use of foreign literary traditions can also serve as an important creative factor in the development of a particular national literature in due course.

AbdullaQahhor, a well-known Uzbek writer of the 20th century, follows the traditions of A.P.Chekhov, a great representative of Russian literature, a brilliant realist writer, and O. Henry, an unparalleled American comedian; he skillfully used the imagery methods of these creators, their word-use skills, their approaches to life topics. It should be noted that Qahhor creatively used the tradition of creating an image in the story “Chameleon” by A.P. Chekhov, written between 1883 and 1885, in creating the types of chameleons in the story “Nationalists”, written in 1937. Because in the images of MirzoBahrom and Tavhidiy in the story of A. Qahhor there are lines that are very similar in character to the image of Ochumelov in the story of Chekhov. But Qahhor does not remain in the stage of imitation in this story. He is able to skillfully use the literary techniques used by teachers to portray the psyche of other personalities in a completely different context in a different national context. The Uzbek writer manages to portray his comic heroes in a unique way on the national soil, in the embrace of national spirits.

It is no secret that A. Qahhor's 1937 novel The Teacher of Literature was influenced by Chekhov's “Uchitelslovesnosti”, written between 1893 and 1895. Because the protagonists of these stories, such as superficial, amateur teachers like Nikitin and BakijonBakaev, were created in similar ways and methods. While he is embarrassed that he has not read Nikitin Lessing's “Hamburg Dramaturgy”, which he considers to be very knowledgeable, BakijonBakaev tries to get rid of his sister-in-law, who is a college student, by not being able to answer his questions about literature, and shows that he is a very helpless person, both as an expert and as a person. They are able to show the unique flaws of their nature in a unique way while depicting the national psyche of living people in the new era and in a different space.

The literary types in both stories attract the reader's attention with their vitality and authenticity. Because A. Qahhor was able to create completely new artistic characters using the method of drawing the artistic landscape in the stories of A. Chekhov. The reality of the Uzbek writer's story “Teacher of Literature” is that if there was no *chalamulla* (illiteracy of saint) in our national life, who tried to present himself as knowledgeable, and AbdullaQahhor would not describe them as very vital; external tradition, influence could not be a factor in the creation of such an immortal work. This shows that when referring to foreign literary traditions as heirs, it is necessary to pay close attention to whether there are conditions and opportunities for the application of these traditions in the national literary soil. This is because in the creative assimilation of an external tradition, there is a vital connection between the national reality and the tradition being assimilated, and the circumstances that appear in the tradition can be confirmed in the national context.

A.P. Chekhov's story “Disaster” has some aspects that are similar to AbdullaQahhor's “Pomegranate”. The similarity in these works is not in the subject matter, nor in the expression,

nor in the use of visual aids, but in the literary problem, that is, in the writers' conception of the meaning of man and his life.

The story is about the bloodless tragedy of a man who lived together for forty years and did not know or think about not only his wife, but also the life he lived, his life was spent drinking vodka and beating his wife. The play depicts the life of a man in ignorance without light, and his inner world, which is darker than his past life. The writer does not dwell on these aspects of the blacksmith's life, nor does he fantasize about the protagonist. It would be unnatural and unbelievable for someone who has lived a life of suffering and ignorance to think like that. The master's life is illustrated by the rumbling of a blacksmith driving a car. Only the mosaic of those ringing murmurs full of sorrow tells the thoughtful reader that ignorance and ignorance are the main reasons why so many lives of two people are so tragic.

In the story "Pomegranate" A. Qahhor does not exaggerate the fate of a person who did not give meaning to his or his wife's life. The similarities between these stories can be seen only in similar external aspects. In "Disaster" the blacksmith's wife died when he realized that he had lived a life of drunkenness and beating his wife, and began to think of living like a man. Turobjon in "Pomegranate" reflects the fate of a young man who is in a tragic situation, unable to fulfill a natural wish of his wife. On the surface, the two stories are similar. However, these works differ significantly in the nature of the national color and expression expressed in the inscriptions.

Chekhov's protagonist, who spent his life drinking and beating his wife, thinks about his past. The lifestyle that led to his sadness and resentment is more typical of Russian life. Turobjon in "Pomegranate" is a completely different type. He does not live a wrong life, nor does he oppress anyone, knowingly or unknowingly, willingly or unwillingly. He is an Uzbek guy who is looking forward to his day. A. Qahhor's achievement is that he was able to show the nature, spiritual world and intellectual potential of the Uzbek young man in the most convincing examples of life.

AbdullaQahhor focuses on portraying the protagonist in "Pomegranate" with small details that seem insignificant. The writer is able to focus every detail of the work on the factors that led to Turobjon's tragedy. The author does not interfere in the development of the plot. It follows a completely neutral path. The more the writer refrains from intervening, the more the image becomes influential. The story begins in the form of "***As Turobjon rushes in the door, his pen is hung on the sleeve of his jacket and torn to the elbow***". The author does not mention Turobjon's poverty in the story. It does not allow artificiality anywhere in the story to achieve its artistic purpose. It simply tells the true story of a young man who believes that he is doing something that will please his loved one. The second detail in the story is as relevant to the first as the ring itself. Seeing Turobjon's haste, it is natural and vital for the bride, who is burning with pomegranate pain, to stop feeling the corn and run to the future of her son-in-law. At the same time, there is not the slightest bit of violence in the image of "***the bridegroom is spinning and the half-grown corn is falling to the ground***". ***The image of a lame cat walking in the yard biting the spilled corn, which he did not seem to like, and our complaint to Turobjon, "mau", is a painful logical continuation of the previous scenes.***

These details in the story serve to show the roots and scale of the tragedy in the lives of Turobjon and his bride. The writer does not say or comment on the characters and their spiritual world, their actions, but only shows them in action. The reader seeks to make sense of every detail used

by the writer, to find more meaning in the image than in the image itself. Although it is not mentioned anywhere, the student knows that Turobjon is poor because he could not give the pomegranate to his wife. That's why he sees the beginning of the tragedy in the tearing of the not-so-old side to the elbow. The sheer amount of corn on the cob, especially the smell of it coming from the cat, adds to the frustration. Because in the Uzbek family, any animal's food is considered unclean. Which means it's about to be the most delusional time of the year, as well. This can be a source of frustration and frustration.

The writer is deeply aware of the nature of the characters being portrayed. Turobjon sees his wife protesting and rebelling when he sews his torn shirt and his daughter-in-law "takes the yacht and puts it aside". An Uzbek man does not stand up to his wife's rebellion, he is ashamed of it. That's why Turobjon speaks harsh words to his wife.

Abdulla Qahhor also adds to the chain of images in the story the details of the muscles being fired at the cradle wedding in MullajonQazi's garden. The skill of the writer is to make every detail of the story convincing and true. Unable to afford a pomegranate for his wife due to his poverty, Turobjon began to calculate how much money would be spent on useless muscles and how much pomegranate he could get for the money. Because of this muscle, the bride thinks: ***"..he imagined a garden: not a garden, but a pomegranate ... In the pomegranate trees hung pomegranates, pebbles, teapots"*** is something else.

As academician M. Kushjanov said: ***"The talent of A.P.Chekhov, a great artist and writer, who realistically portrayed the tragic events, dramatic situations of his time, in particular, the comic events of a simple working relationship with the ruling class, tends to see these aspects of life"*** [1, p. 30]. Knowing that he had the same tendency, AbdullaQahhor realized that looking at the past of the Uzbek people through the eyes of AP Chekhov would have a greater artistic and aesthetic effect. In fact, the teacher was not deceived by the writer's mind and emotions.

Abdulla Qahhor is determined to portray the people's past with absolute objectivity, without painting, without violently raising it, and at the same time without hitting the ground. Because the writer's talent tends to see tragedy and comedy in harmony, he portrays scenes from the past in such a way that human dignity and smallness go hand in hand. At the same time, his works vividly reflect the extent to which humanity has changed in recent times, the way of life has been completely renewed, and this is reflected in the way of thinking and spiritual climates of people.

It seems that a real talent can use the existing literary experience to achieve a completely original artistic and aesthetic result, using the literary tradition and creating new traditions from it. Indeed, the depiction of the psyche of the heroes of Abdulla Qahhor's works, the scale of their tragedies, and the clarity of the image are in many respects more weighty, influential, and weighty than the social-life meaning derived from the depiction of characters in the works of his teacher A.P. Chekhov. The example of Abdulla Qahhor's work shows that being able to use existing literary experiences wisely can turn external traditions into a factor in creating internal traditions.

Creative use of foreign literary traditions is very important. It is well known that the application of best practices from the history of literature does not always lead to positive results. Uzbek writers such as A. Qodiriy, Cholpon, A. Qahhor, Oybek, P. Qodirov, O. Yakubov, Said Ahmad, Sh. Kholmiraev, O. Hoshimov, first of all, national literary experiments, then Cervantes, Dante, Bokachcho, Balzac, Flaubert, Mopassan, N.V.Gogol, L.N.Tolstoy, I.S.Turgenev,

F.M.Dostoevsky and other famous writers. Sh.Butaev, I.Sultan, S.Vafo, T.Rustamov, Proust, Kafka, Marquez, Ch.Aitmatov, Borges, Faulkner, M.Frith, etc., have written good works using the traditions of modern world writers. There are also artists who follow the traditions of avant-garde, impressionism, abstractionism, Dadaism, chauvinism, modernist trends in Western literature, and works created in the flow of consciousness, experimenting and creating in a variety of ways.

CONCLUSION

In general, the adoption of the literary and artistic tradition being mastered in order to achieve true succession through the creative assimilation of foreign literary traditions and their application to the national literary process; there must be a national-literary basis for its implementation and development. It seems that external and internal literary and artistic traditions and practices are the most effective means of ensuring the continuity and continuity of literary succession.

ABSTRACT

The article deals with the folklore of Uzbek folk ethnonyms and examples of their appearance in the written literature. In particular, the historical roots of the bell seed and samples from the epic "Alpomish" were studied. It should also be noted here that in many medieval historical sources the emergence of a particular tribe or tribe is explained in relation to the lives and activities of epic individuals taken separately.

KEYWORDS: *Ethnonymic Legend, Folk Art Thinking, Genesis, Folklore, Historical Figure, Genre, Epic Reality, Historical Truth, Written Literature.*

INTRODUCTION

Uzbeks are a people with a complex ethnic composition. Because it contains a lot of seeds in its composition. Each tribe that is part of the Uzbek ethnos has a name and a history associated with that name. It turns out that ethnonymic legends consist of semi-historical, semi-epic stories about the origin of these seeds.

Uzbek ethnonymic legends have not yet been fully collected and studied. Nevertheless, some historical sources have preserved legends about the origin of many tribes and clans. One of such sources is the work "Tavorixi guzida – Nusratnoma" by an unknown author.

It explains the history of the formation of many tribes and clans in connection with the marches of the legendary Oguzkhan and Genghis Khan. For example, it explains the history of the formation of Kipchak seeds as follows:

In the battle with Itbarakhan, Oguzkhan was defeated. It is during these military operations that a woman is seen in a tree hollow. The child is called a kipchak, meaning he was born in a tree hollow. When the boy grows up, he becomes the closest person to Oguzkhan and holds one of the most responsible positions in his army. The descendants of this person named Kipchak form the Kipchak tribe [5, p. 96].

THE MAIN FINDINGS AND RESULTS

It is evident that in this source, too, the history of the historically real seed, in keeping with the traditions of medieval historiography, is interpreted in a mythical way. It should also be noted here that in many medieval historical sources the emergence of a particular tribe or tribe is explained in relation to the lives and activities of epic individuals taken separately. Therefore, the same tradition is fully observed in the “Tavorihi guzida – Nusratnoma”. For example, the history of the formation of the blood seed in it is explained in this way. The people who loaded the booty captured during the battles of Oguzkhan on chariots were called *kangli*. Those who dispersed from them formed a bloody seed. Because bloody Turkish means chariot [5, p. 9].

The seed of Qalach is narrated in the following narration. On his way back from Isfahan after his march to Khorasan, Oguzkhan came across a woman with a nursing baby. The mother's milk was gone, and the baby was screaming with hunger. Oguzkhan wants to take the child into his care and raise him to be a good warrior. But the woman refuses the offer. Angry Oguzkhan shouted “*Stay hungry!*” he continues on his way screaming. The offspring from this baby form the kalach seed [5, pp. 9-10].

It should be noted that, as in many other cases, the folk etymology lies in the interpretation of this epic term. Because it seems that the word side of the ethnic term, especially its phonetic structure, is a combination of the Qalach-Uzbek words “*qol ach*”. Such a lexical association led to the creation of a peculiar epic ‘history’ that directly explains the origin of the *kalach* seed. But it should also be noted that there are no historical facts that confirm or deny how close these types of myths and legends are to historical truth. That is why we are unable to study their exact history. The most important thing for us is the existence of legends that explain the origin of this or that ethnic term.

The “Nusratnama”, like many other tribes and clans, explains the history of the formation of the Qarluqs. Snowdrops are one of the oldest seeds common in Central Asia and Turkestan. For this reason, the Snow dialect is one of the leading dialects of modern Uzbek. In this source, the history of snowfields, the etymology of the term snowball is explained on the basis of a specific small legend. It says heavy snow falls when Oguzkhan returns home from a trip to Georgia. His entire army remains in dire straits. Many die from the cold. Some leave the army behind. Oguzkhan calls this place snow. After that, the people who stayed in the city and their descendants became known as snowmen [5, pp. 9-10].

Thus, Uzbek ethnonymic legends are significant in that they allow the history of the emergence of various tribes and clans to be to some extent imaginative about the clans and tribes that make up the ethnic composition of the people, even if they do not have an epic, real historical basis.

Some of the Uzbek ethnonymic legends have attracted the attention of historians and ethnographers with different relationships. For example, the khan of Khiva, the famous historian Abulgazi Bahodirkhan, explains the origin of the Turkmen ethnonym in his “Shajarai Tarokima”

as follows: “The Tajiks who came to Mowarounnahr used to be called Turks by the Tajiks. After five or six steps, he fell to the ground, his temples were narrow and his eyes were big, his face was small and his nose was big. The Turkmen captives and traders came to Mowarounnahr from the settled lands. When they saw them, the Tajiks said they were Turks. The former Turks were given a Turkmen name. Its meaning would be a Turkish-like *temak*. Black people do not say Turkmen, they say Turkmen” [6, p. 42].

This information of Abulgazi correctly explains the origin of Turkmen ethnonymy. This is because in oral speech, it is legal for a word to be shortened, especially for certain parts of speech in other languages. Furthermore, we accept the above narrations explaining the Turkmen ethnonym as the only interpretation.

Most ethnonymic narrations are based on the interpretation of the name of a tribe, clan, or people in relation to the proximity or correspondence of one or more words to the sound side. Ch. The legends about the Kyrgyz ethnonym cited by Valikhanov originated in a similar way. According to the scientist, the Kyrgyz term came to its present form due to the combination of the words forty-girl and phonetic changes. One of the narrations he cites explains the origin of the Kyrgyz as follows: A dervish named Mansur is accused of spreading various wounds and diseases among the people. So they want to kill him. Mansur then begs them to burn his corpse and throw it into the lake. When Mansur's ash is thrown into the lake, white foam appears at the edge of the water. Curiously, the princess and her maids also drink from these foams. As a result, they all become pregnant. The king drove his daughter and concubines to the other side of the Chu River, that is, to the north. The descendants of the princess and her concubines, and of the children, constitute the Kyrkkiz-Kyrgyz people.

Although the plot is completely different, a second narration explaining the connection of the Kyrgyz term with the words forty and girl is also given by Ch. Valikhanov. It is said that the daughter of a tribal khan was traveling with forty maids. One day when he returned from such a journey, the enemy killed all the people of the village and destroyed everything. Only one red dog survived in the village. The princess and the maids communicate with the dog. From them children are born. From these children came the Kyrgyz, that is, the Kyrgyz people [1, pp. 281-290].

Both legends are interesting, the first of which is dominated by magic (magic), fiction and supernatural imagery. In our opinion, it has an image effect typical of fairy tales. In the second legend, the influence of the dog totem is felt, because the red dog totem, which is in contact with the khan's daughter and his concubines, consists of the image of the ancestor himself.

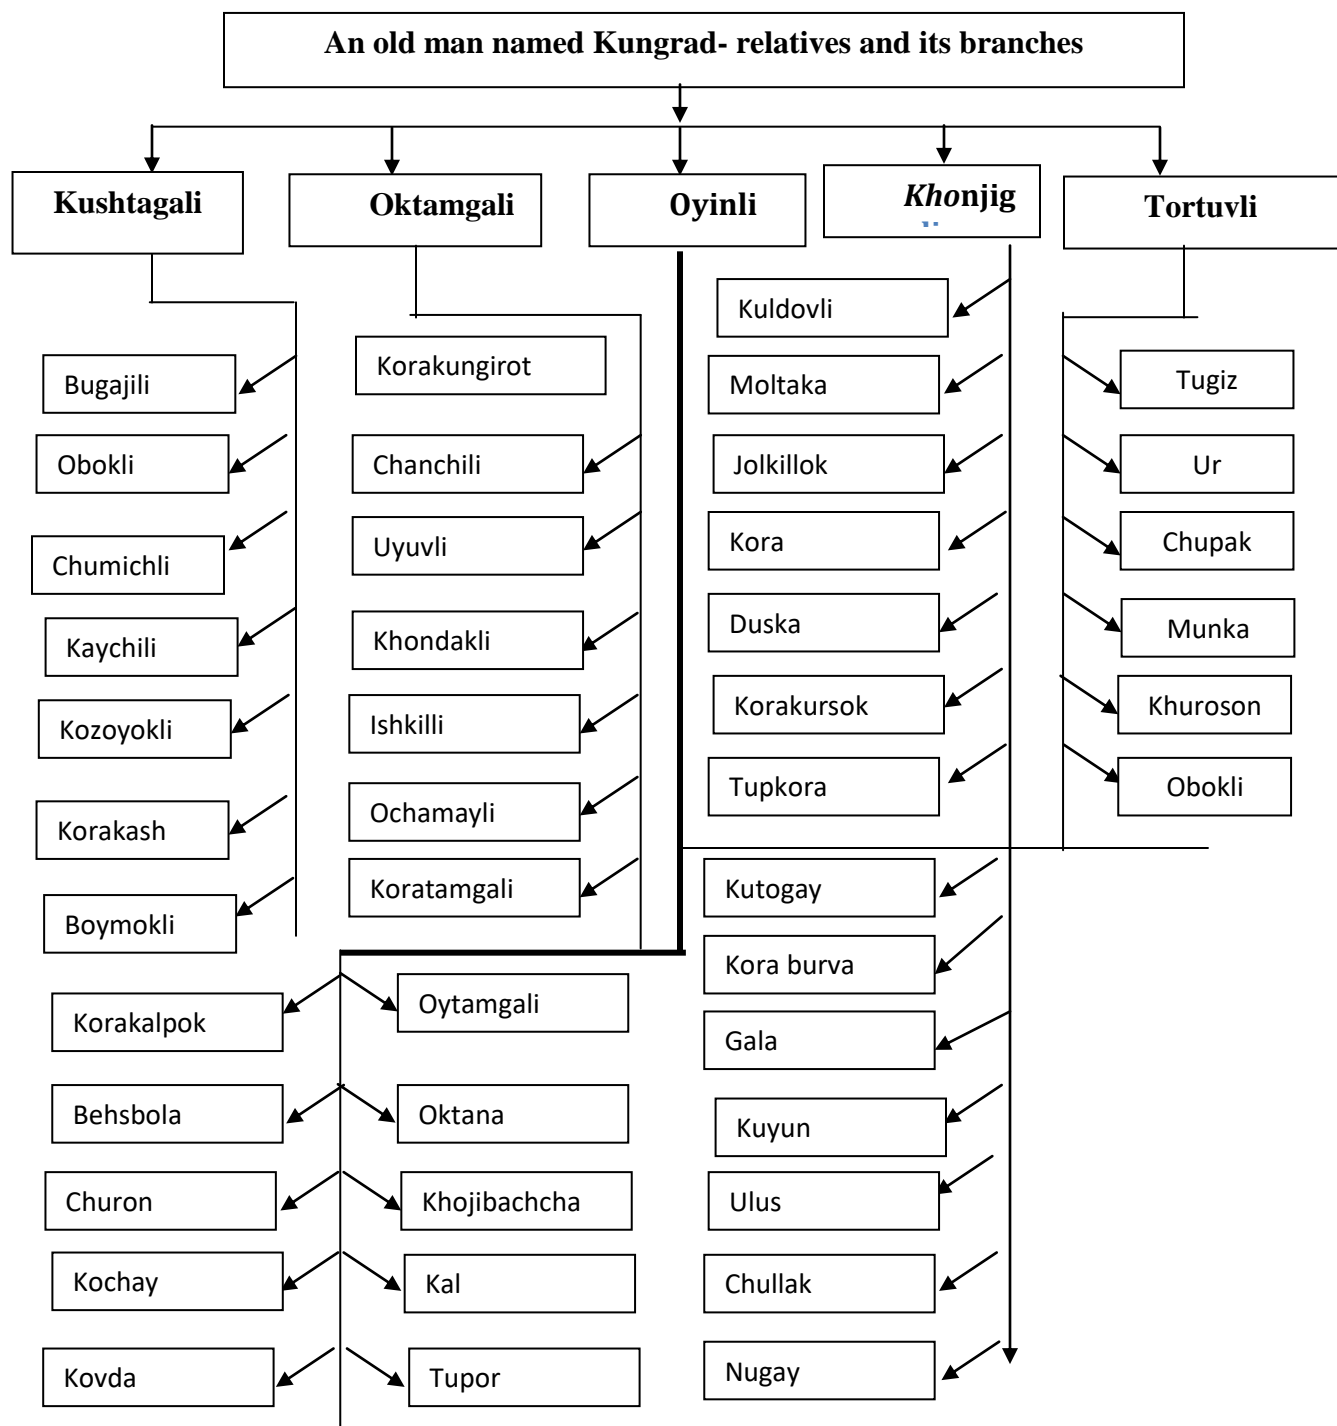

One of the largest Uzbek tribes is Kungrad, and one of the legends explaining the origin of this tribe and the appearance of the provinces within it is given by L.P. Potapov. It is said that an old horseman was looking for his *jong* (three-year-old camel) in the desert. At one point he encounters forty horsemen. They ask the old man if he has seen a state bird. They say there is a king and his state bird. The king commanded that if I die; let the state bird fly, and whoever the bird lands on should be chosen as king. When their kings died, they flew a state bird in search of that bird.

The old man says he has not seen a state bird, but under a hill lays a seemingly very happy young man. The riders ask the old man to show them the place. The old man agrees and leads them there. Then they saw the state bird spreading its wings and casting a shadow over the sleeping

young man. They immediately woke the young man, explained the whole story, and told them that he would be king, and the young man agreed. The young man was given a horse. As the young man mounted the horse, the horse fell, unable to lift it. So he rode on the horses of forty horsemen one by one, and this happened every time. Then the young man tells the old man that he will give his horse, only his horse can lift himself. In return, he says he will reward the old man when he is elected king. The old man gets used to it and gives his brown horse to the young man. They leave. Soon he hears that the young man has been elected king. The old man immediately goes to the king to receive his reward.

The old man approached the palace and shouted, “The owner of the brown horse has come.” When the young man heard this, he called the old man to him so that he could choose the reward he needed. The old man asks for a desert gift to take care of his herd. The king obeys his request and tells the old man to ask for something else. The old man looks around and sees many women and asks one of them to marry him. The king fulfills this request as well. The old man returns home with his wife on his horse. He had four sons named *Koshtamgali*, *Vakhtamgali*, *Kantigali* and *Aynli*. The old man gave each of them his inheritance, took his share, and moved with his young wife to another place - to the foothills of Mount Boysun. From then on the old man and his wife were called bells. It was here that his fifth son was born. The child was named *Tortuvli*, meaning gifted [4, p. 38].

The only source written and published by the famous ethnographer L.P.Patonov at the beginning of the last century is the Kungrad seed and its five branches, and various variants of the legend explaining the information about the regions within them are also widespread among the creative people. We even see that in the folk epics sung by some bakhshi-poets, detailed information about the Kungrad tribe and its branches is given. For example, the famous Bakhshi Umir from Surkhandarya is the son and student of the poet Safar oglu - Kara Bakhshi Umir oglu from our folklore scholars' prof. The epic “Alpomish” written and prepared for publication by M.M. Murodov and associate professor Abduolim Ergashev also contains information about the Kungrad seed and its branches [3, p. 565].

The epic part of the legend and epic, which explains the origin of the bell seed and its five regions, consists of a plot based on a fictional life, in which the regions of the bell are closely related; bloodline, and therefore they should live in peace, that is, the patronymic idea. That is why the first source cited in one of them is valued as a beautiful example of ethnonymic narration. The second source is the small epic fragments from the epic “Alpomish”, which are the best examples of vital information about the Kungrad seed and its branches.

CONCLUSION

In short, Uzbek ethnonymic legends serve to explain all the tribes that make up the Uzbek people and their origins. But most of them are now forgotten because they were not recorded. The plot of the legends belonging to this group has no real historical basis. For this reason, their historicity is evident in the real existence of a particular tribe or clan living under a name.

ATMOSPHERIC DUST AND ITS EFFECTS ON HUMAN HEALTH

Karshieva D.R*; Nazarova F.A; Tolibova Z.H*****

*Teachers,

Department of Ecology and Geography of Bukhara State University,
UZBEKIDTAN

ABSTRACT

This article provides information on the effects of dust in atmospheric air on human health, types and sizes of dust in industry and production, the impact of dust on the upper respiratory tract. The amount of dust trapped in the body increases when you breathe deeply, for example when working hard, as well as when the amount of dust in the air increases. Silicosis usually develops over many years in very dusty conditions, often during strenuous physical activity. Such dusts can include the formation of eroded layers of sand and soil under the influence of wind and severe storms, dust from flora and fauna, volcanic eruptions, meteorites from space exposed to the Earth's atmosphere from space, and dust from other space objects.

KEYWORDS: *Erosion, Meteorite, Dispersion, Amorphous, Pneumoconiosis, Silicosis, Silicosis.*

INTRODUCTION

Dust generation and decomposition are observed in almost all work performed in industry, vehicle operation, and agriculture. In general, the types of powders are considered as natural and artificial powders, taking into account their sources of origin. It is known that the dusty air environment has haunted mankind since ancient times.

Natural powders include powders that are formed in nature without human intervention. Such dusts can include the formation of eroded layers of sand and soil under the influence of wind and severe storms, dust from flora and fauna, volcanic eruptions, meteorites from space exposed to the Earth's atmosphere from space, and dust from other space objects. The amount of natural dust in the atmosphere depends on the natural conditions, weather conditions, seasons and in which region the zone is located. For example, the amount of dust in the atmosphere is known to be higher in the southern regions than in the northern regions, in the desert zones than in the forest zones, as well as in the summer months compared to the winter months [1].

Artificial dust includes dust generated as a result of direct or indirect human exposure in industrial plants and constructions. In some industries, such as the chemical industry, hazardous industrial dusts are released in such a way that their removal without cleaning would create catastrophic situations.

According to the origin of the dust, it is defined as organic, mineral and mixed powders. The description of the harmful effects of dust depends mainly on its chemical composition. The harmful effects of industrial dust on the health of workers depend on many factors. These include, first of all, the physical and chemical properties of dust particles, their size and shape, the amount of dust in the air, the duration of exposure during the shift and the simultaneous exposure to other factors such as occupational period, environment and labor activity. For example, when the outside temperature rises or when a person is engaged in physical labor, the level of dust entering the body increases as a result of frequent breathing. At the same time, the presence of radioactive aerosols in the dust and the effects of other gases in the air increase the harmful effects of dust on the body. There will be individual differences in the body's exposure to dust exposure, which depends on the filtering properties of the airways, biological resistance, and so on. In addition to the hygienic effect of dust separation, there are other disadvantages: it accelerates the decomposition of technological equipment, causing economic damage by disposing of valuable materials. It also worsens the overall sanitary condition of the production environment, including reducing light due to contamination of windows and lighting fixtures. Some types of dust, such as coal and wood dust, can cause fires and explosions.

The chemical composition and solubility of powders, the size (dispersion) of powders, the shape of particles, the structure of their hardness (crystalline, amorphous), the properties of electric charge are important in influencing the organism. The chemical composition of dust determines the effect of dust on the body in many forms. The main effect of dust occurs primarily when inhaled. Inhalation of dusty air can lead to the development of mainly respiratory damage: bronchitis, pneumoconiosis or general damage (poisoning, allergies). Some powders have the property of causing additional diseases. This non-primary effect of dust is observed in diseases of the upper respiratory tract, mucous membranes of the eyes, skin. The entry of dust into the lung tract can lead to the development of pneumonia, tuberculosis, lung cancer. Silicon (II) oxide (especially its crystalline type), silicates (salts of silicic acid), coal, powders of some metals (aluminum, etc.) and mixtures of various powders, such as mineral-metal powders, according to their chemical composition in the development of pneumoconiosis. will be dangerous. These dusts are practically insoluble and are trapped in the deeper parts of the respiratory system when inhaled and cause disease, leading to the development of connective tissue in the lungs. From this point of view, free crystalline silicon (II) oxide, i.e. quartz dust and its other types, is the most dangerous dust. The danger of additional pathogenic powders cannot be directly proportional to their solubility. For example, amorphous silicon has a higher solubility than quartz, but quartz has a higher risk of additional disease.

When inhaled with dusty air, much larger dust particles are trapped in the upper respiratory tract, mainly dust particles that are 5 μm and smaller fall into the deeper sections of the airways. The amount of dust trapped in the body increases when you breathe deeply, for example when working hard, as well as when the amount of dust in the air increases. Silicosis usually develops over many years in very dusty conditions, often during strenuous physical activity. This disease is an occupational disease of mining workers and has long been known. Silicosis begins with

shortness of breath, cough, chest pain. In the earlier stages, these symptoms are less noticeable, with shortness of breath occurring only when doing physical work. Shortness of breath and wheezing occur during the period of exacerbation of the disease when performing normal activities and even in a calm state. Dust in production not only causes pneumoconiosis, but also other diseases of the respiratory tract, skin and mucous membranes. These include migration of skin cells, various rashes, eczema, dermatitis.

The following measures are taken to prevent dust diseases:

- 1) Legislative measures
- 2) Measures against the formation and spread of dust
- 3) Personal protection measures.

According to the Labor Code of the Republic of Uzbekistan, a medical examination is carried out before starting work, which may be exposed to industrial dust. People suffering from pulmonary tuberculosis and its extra pulmonary forms, diseases of the upper respiratory tract and bronchi, organic diseases of the cardiovascular system, etc. are not admitted to dusty work. Individuals under the age of 20 should not be placed in dusty jobs because pneumoconiosis develops faster in young people and is more severe than in adults. In general, there are documents that set the maximum permissible level of dust in the air of industrial enterprises, rooms and shops, which do not endanger the health of those working in these areas. Technological measures will be most effective in combating the formation and spread of dust. At the same time, manual work will be transferred to automatic methods, the tightness of the equipment will be increased, and a remote control system will be introduced.

In the mechanical engineering industry, replacing the cleaning of castings with a stream of sand by mixing it with a water spray or by cleaning it with water, cleaning with acids completely eliminates the risk of silicosis. In the refractory products industry, the possibility of silicosis is reduced due to the replacement of quartz and dinas materials with magnesium. In some industries, the production of products in the form of granules and pastes instead of powders dramatically reduces or eliminates powder separation processes.

Personal protective equipment-respirators, special helmets and suits for fresh air are used in cases where it is not possible to reduce the dust in the air in the workplace with the most basic general measures of technological and other characteristics. The Lepestok respirator is the most common, in which the inhaled air is filtered through a woven layer of special synthetic fibers. It is very effective (98 to 99.9% depending on the type of fabric used in the respirator), has almost no resistance to breathing (2-3 mm water column), is lightweight and easy to use. In other respirators, only the inhaled air passes through the filter, the exhaled air exits through a special valve. The best of these respirators is the FPP, which also serves as a filter cloth in the Astra-2. In some jobs, such as sandblasting, cleaners are used to send fresh air to workers' breathing areas. Fresh air is sent to the bottom of the helmet via special hoses, the hoses are connected to the belt and have a valve to control the amount of air supplied.

It is important to determine the amount of dust in the air in industrial production zones. When familiarizing with the production process, it is necessary to determine the sources of dust and the causes of dust formation, hygienic assessment, taking into account the quality composition and quantity of dust in a certain volume of air. Based on this, the importance of the dust factor is

assessed, information on the health of workers is collected when necessary, and dust control measures are determined on the basis of this evidence. The study of dust factors present in an industrial enterprise begins with the study of the technological process, equipment, raw materials, methods of its transportation and processing. At this stage, it is usually possible to determine the chemical composition of the powder. However, the dust that is released when the raw material is processed in different ways may be different from the raw material dust. In such cases, it will be necessary to further identify dust types that are more harmful to health, such as silicon (II) oxide.

The pursuit of a goal that is important for one's life, not to hesitate in difficult situations and not to lose the goal, to be able to organize one's activities properly, leads to high elevation and good health. After all, striving for a goal is the primary force that drives a person and ensures his health. A person can live happily only if he has good health. After all, only if everyone deeply understands that the preservation of such a valuable asset as health is a guarantee of a peaceful life, it is possible to prevent the occurrence of disease and related problems. Therefore, everyone should be primarily responsible for the health of himself, his family and loved ones. It should be borne in mind that prevention is easier and more effective than treatment of any disease [2].

ARTISTIC AND AESTHETIC FUNCTION OF CHRONOTOPS IN THE STRUCTURE OF THE NOVEL

Khamro Dauletbaevich Abdullaev*

*Associate Professor,
Candidate of Philological Sciences,
Karakalpak State University, Nukus, UZBEKISTAN

ABSTRACT

The article deals with the artistic analysis of the novel "Ming birqiyofa - A Thousand and One Images" by the famous Uzbek writer OmonMukhtor. Basically, the chronotope, which is the main attribute that creates the plot of the novel, was chosen as the object of analysis. The chronotope used in the novel is identified and their artistic and aesthetic function in the work is described.

KEYWORDS: *Novel, Composition, Plot, Chronotope, Space And Time, Retrospective, Literature, Style, Speech, Monologue, Dialogue.*

INTRODUCTION

There are many logical ideas in world literature about the concepts of space and time and its functions in a work of art. The well-known Russian literary critic M. Bakhtin, analyzing the samples of different stages of the development of the novel genre, defines the concept of chronotope as follows: The term is used in mathematics based on Einstein's theory of relativity. The term has nothing to do with us as a special concept used in mathematics. We take it as a metaphor for literature (albeit not literally). What is important here is that the term refers to time and space in a harmonious way" [1. pp. 234-235].

In today's Uzbek literature, the chronotope of the novel genre and its peculiarities in our national novelism are discussed by prof. U.Jurakulov conducted extensive research. The chronotope system of the novel is one of the most important and novelty aspects of the novel for the world of the novel by the founder of the Uzbek novel A. Kadiri. We cannot fully comprehend the nature, plot, and imagery of any literary genre without this theoretical understanding [2, p. 200].

THE MAIN FINDINGS AND RESULTS

Well-known Uzbek writer Omon Mukhtor's novel "A Thousand and One Images", which we have studied, also has a system of chronotope, which ensures the logic of the events of the work as a whole. The novel follows the following chronotope system: a driverless bus, a three-story building made of red brick, a cave, a nine-story building, a city, a desert, and so on.

The "driverless bus" chronotope in the novel is metaphorical in its meaning and was the basis for subsequent events. The protagonist, Abdullah Hakim, gets on the bus in the middle of the night drunk.

"The driver was not visible in the car, he sighed", the bus left the city behind and went out on a rough country road, sometimes swaying, sometimes calming down and moving forward. He is apparently surprised by the madness of a sticky car driven from somewhere else... The bus finally enters a dark wooded sidewalk on both sides of a country road. After a short walk, a three-story white-and-red building in the shape of a horseshoe appeared in the distance." (O.Mukhtor, "Four Sides Qibla (side to Mecca)"pp. 12-13). The process by which the protagonist gets drunk, gets on a driverless bus (or rather, the bus itself appears) leaves the city, crosses the steppe, and arrives at a three-story red brick building somewhere and connects times. If we think of the "driverless bus" as a thing of the past, we can understand, according to the writer's imagination, the tragic situation of our people during the former regime without a "head", that is, without a master. The protagonist, who does not know who is going on the ship, sings a poem to his once-beloved daughter with sweet dreams, realizes that he is leaving his place and going to another place involuntarily, and begins to think calmly and consciously. The protagonist of the novel, Abdullah Hakim, begins to feel that he got drunk and got lost in a strange "bus" only when he came to the red building across the steppe. The gestures in the mind of the hero on the bus seem to summarize the history of the fate of our people in the former regime in a specific time and place.

Although the flow of consciousness is depicted for a short time before Abdullah Hakim boarded a driverless bus and went to a red-brick building, it seems to reflect the historical process of the nation's character. According to the requirements of art, the images in the work have a generalized character. In the image of Abdullah Hakim, that is, his drunken state, in which case he gets on a bus without a driver, gives in to sweet dreams on the bus, suddenly wakes up, expresses the dreams of our people in the early twentieth century, the psychological state, the raw aspirations of the "dream" ship. We can imagine historical, socio-political relations, such as the opening of the original image of the dictatorial regime in the 80s of the century. Through this chronotope and the image of the heroic stream of consciousness, the writer connects the events of the past with the present and the future. This chronotope represents a metaphorical view of a traditional "road" chronotope, depending on the writer's position or artistic intent. That is the 70-year-old destiny of our people under the former regime. Through this chronotope, the writer connects the past with the present in a specific place and time. "He was apparently amazed at the madness of a sticky car driven from somewhere else" (p. 13 of the same book), which suggests that the author is referring to some recent history and encouraging the reader to think retrospectively. The writer does not reveal his artistic intentions and position, but embodies them in the minds of the protagonist.

The second chronotope in the novel (a three-story building with white and red bricks) is connected to the system of events in the first chronotope, forming the main node of the plot. The reason why the protagonist was in such a state, the reason for bringing him to the red-brick building, the elevator guys in black suits and pants, the dwarfs - all this was a mystery to him. It can be seen from these images that the writer does not create the times and places associated with a particular historical period, but creates images of time and place specific to some abstraction. However, the "typical" reader of the novel may come to certain conclusions based on his socio-political, spiritual and cultural level. There are various interpretations in the scientific literature of a "building made of red brick" - meaning "the reign of the former Red Empire" or "the era of the Red Empire". If we follow the sequence of events experienced by the protagonist in the chronotope, we will understand the essence of the building and how true the above interpretations are.

In both the first chronotope and the second chronotope mentioned above, the protagonist thinks of his beloved daughter in his youth and reads the poems he wrote to her in a whisper. The repetition of this retrospective thinking of the protagonist in 2 chronotope seems to fall short of the writer's description of the space and time he uses.

The depiction of the events related to the protagonist on the first, second and third floors of the building reveals the essence of the chronotope of the "three-story red brick building". Or the events that took place in this building correspond to the essence of the symbol of the "red brick building". It is only in this chronotope that Abdullah Hakim's dreams, fantasies, hallucinations, etc. about his lover have become more and more exaggerated. For example, on pages 24-28 of the novel, Abdullah Hakim's conversation with his beloved daughter Halima, locked in a dark room, is retrospectively portrayed in a dream or hallucination, and does not seem to fit into the chain of consciousness. In addition, the image is much longer, and the number of coincidences exceeds the law.

The Red Brick Building will test Abdullah Hakim's qualities of humanity and loyalty to his friend. The people in the building wearing headscarves said, "We are not asking you for anything. No need. Also, if you live in a public house, we will give you a nice garden. You've been sweating around for ten years, and you haven't gotten a car like that. Say the name of the car you want, the bastard who hasn't handed you the key yet. The money is yours, not yours, but your grandchildren's. theqibla is on all four sides, and you will get out of here and go on your way. Minba'd you us, we do not know you." (P. 21)

The fact that the event took place in a red-and-white building, rather than elsewhere, ensured the unity of space and time. Upon hearing these offers, Abdullah Hakim lost his temper and tried to act like a thief. However, he did not contradict the human qualities in his God-given heart. He did not sell his friend Shukur Burhan, he remained faithful. He would rather die.

The events are linked to the chronotope of the "grave" after the novel's hero is killed. This chronotope is depicted in the third scene of the novel's first story, The Torment of the Grave. After the death of the protagonist, the spirit of Abdullah Hakim becomes the protagonist. Events or streams of consciousness are narrated by the spirit. This is a unique style of the writer, which expands the possibilities of artistic thinking and description. In image and expression, the author moves from the real world to the abstract space and time. The flow of events continues through the language of the spirit that enters the tomb with its body. The spirit now interrogates the

angels in the tomb with munkar-nakir. The soul, which feels that it is a rebellious slave before the angels, confesses its destiny. The spirit comes out of the grave and observes the mortal world in which he lives. There is no communication with living people in the grave. The fact that the spirit and the angels communicate with the munkar-nakir (*According to the Islamic imagination, the angels who first interrogate the dead in the grave as to who is their Lord, what is their religion, and who is their prophet, and punish them for their sins.*) is in line with the essence of the “grave” chronotope. The image and flow of events in the tomb take on a monologue character from the language of the soul. From the depiction of this “grave” chronotope, the novel's synthesis of secular and religious thought comes to the fore. The images of the evil angels mentioned in this chronotope have their roots in the Holy Qur'an, religious narrations and myths. Through the image of the grave and the spirit in the grave, one can feel that man is not only a product of social relations, but also a miracle related to the essence of the divine creation. We also understand from the language of the soul that the benomus of his servant, "wrapped in the whirlpool of life", forgets his loved ones. Just as man lives in the mortal world, so he longs for paradise in the eternal world. However, in this world called life, man makes many erroneous mistakes, and a person who is not determined by his faith or religious imagination cannot think religiously. At the heart of the events in this chronotope is the state of mind of a sinner who, in the course of his life experiences, does not know what sin is and what is good, and does not even understand himself. The spiritual world of the individual today is shaped by both religious and enlightenment as a result of objective secular activity and thought. Factors influencing people by traditional religious beliefs are mainly reflected in the socio-ethical life of human activity. As long as a person thinks both secularly and religiously, he is always alert and progressive.

Abdullah Hakim remained faithful to his friend in the grave. He did not lose his humanity. Munkar-nakirga did not say that I am ShukurBurhon. Apparently, the writer's protagonist is portrayed as a loyal friend who has not lost his human qualities in social relations, even if he has not married, had children, lived as a human being, or has not performed actions required by religious beliefs. The original image of the human person is manifested in the conditions of intention-social relations, in the conditions of tension and intensity of relations.

The sequence of chronotopes in the novel makes sense for the sequence of events. Each chronotope does not have a single image or event that does not match it. Initially, the driverless bus chronotope was a homeless people; where does it lead? – “red brick building” (second chronotope) under the Red Empire (oppression, mangling); Corollary: The third chronotope is the “grave,” which leads to the destruction of society and death.

The third story in the novel is called "The Lord's Childhood" and uses the chronotope "Desert" and "Palace". In the "desert" chronotope, all the animals and insects lived unchanged for many years. Everyone is busy with their own lives. One day a donkey, a stranger to the desert people, appears. The main events in the desert are conversations between animals. The desert is also a symbolic chronotope, not a simple technical one. This can also be felt in the speech of the animals. For example, a dialogue between a donkey and a fox:

- Ahmoqekansan-ku, - dediungatulki. – *“You're a fool,” said the fox.*
- Seningeshshakekanligingnio'zimiz ham ko'ribturibmiz. Biz sendan, masalan, oldinlarboshqabirovbo'lganmisan, kimningruhisani, deb so'rayapmiz. - *“We can see you're a*

donkey." We ask you, for example, if you have been someone else before, whose spirit you are.

- Mana, deylik, toshbaqabirpaytlararbobbo'lgan. Men qozibo'lganman. Ilonvazir, arslonshoh...sen ham shunaqabirovmidingyokiavvaldaneshshakmisan?....Ayiql. - *"Let's say the tortoise was once a man." I was a judge. Snake was a Minister, Lion was a King... Are you like that or are you a donkey before? Bear.*
- Men oldinlarmirshabedim. Haligachao'shakunlarnieslabyuraman. - *"I used to be a policeman." I still remember those days.*

The writer's style seems to create a story within a story.

Kultepa Palace - Kultepa used to have many horns, and now there is a horn named Rahimbek. The palace is inhabited by representatives of the political system, such as Rahimbek Shah, Rahimbek II (son of the horn), Prime Minister, ministers, officials, and brothers of the horn. "Oppression is better than justice, hypocrisy is better than truth, and corruption is better than truth." [3, p. 206] Decrees on the fate of the country and the people are read there. Indeed, the selfless prime minister will be sentenced to death from here. Rahim II (the king) locks his brothers in the palace. He doesn't meet anyone, he doesn't communicate. Does not communicate with outsiders. In governing the country and the people, he relies on the advice of foxes like Ghulam. The spread of all false myths about the "justice" and "generosity" of the king also rules the palace. Tullak Ghulam finds a mysterious death. All this fits into the essence of the palace chronotope. The name of the palace is Kultepa, which is given in the chronotope of time.

The main thing that distinguishes fiction from other forms of art is that it has a figurative speech and is one of the central elements of a work of art. Because a writer's intention and idea cannot be realized without the means of speech. Hence, emblems and images, portraits, landscapes, expositions, artistic details, dialogues, and monologues are important literary units that create plot and plot directions that move the writer in the realization of his artistic intent.

Literary theoretical sources state, "Symbolic images are the generalization of social phenomena through objects, plants, objects, animals, and colors. For example, the dove is a symbol of peace... and so on. Another type of symbolic imagery is called allegorical imagery. Allegorical images are characterized by the fact that birds, animals, and insects are portrayed as having human characteristics, that is, they are humanized, and thus ridicule the shortcomings of some people in life [4, p. 58].

The third story in the novel A Thousand and One Images is called The Lord's Childhood. In addition to the images of the lord, King Rahimbek, there are images of donkeys, foxes, turtles, snakes, lions and bears in the story, and the author summarizes the social shortcomings of a particular place and period by entering them into a dialogue. It is also through this image and depiction of events that the writer's position on contemporary realities is understood. When the donkey heard that its owner (Efendi) was going to serve in the royal palace, he ran away to the desert. an unseen white donkey appeared out of nowhere all the animals in the desert — those insects — were curious and surrounded the donkey. They stared at him.

- Sen kimsan? – debso'rashdiulareshakdan. - *Who are you? They asked the donkey.*
- Men eshshakman – dedieshshak. - *"I'm a donkey," said the donkey.*

- Ahmoqekansan-ku, – dediungatulki -". Seningeshshakekanligingnio'zimiz ham ko'ribturibmiz. Biz sendan, masalan, oldinlarboshqabirovbo'lganmisan, kimningruhisani, deb so'rayapmiz. - *"You're a fool," said the fox. We see that you are a donkey. We ask you, for example, if you have been someone else before, whose spirit you are.*
- Qanaqaruh? – ajablandieshak. - "What spirit?" The donkey wondered.
- Mana, deylik, toshbaqabirpaytlararbobbo'lgan, men qozibo'lganman. Ilonvazir, arslonshoh...sen ham shunaqabirovmiding, yokiavvaldaneshshakmisan? – *"Let's say the tortoise was once a man, and I was a judge." Snake was a Minister, Lion was a King... Are you like that, or are you a donkey before?*
- Men avvaldanfaqateshshakman, - tan oldieshak. - "I'm just a donkey before," said the donkey.
- Harkimningqismati! Bu gaplardanzig'irchaozorchekmay – dedieshak. - *"Everyone's destiny!" Don't worry about it, 'said the donkey.*
- Men avvaldanshunaqayaratilganman. Odamningxizmatiniqilibkelaman. Zodagonlar – kattakonlargaishimtushmagan. Ko'pinchaoddiy, faqr, rag'ibkishilarningkunigayarayman. Nasriddindagan bola bor. Hoziro'shaningeshagiman. – *"That's how I was created before." I have been doing the service of man. Nobles are nobles. Most of the time, I'm good for the simple, the poor, the poor. There is a boy named Nasriddin. I'm his door now.*
- Xo'p, bunisimayli, - dedivishillabilon. – Biz odamdanqo'rqamiz. Birgabo'lishimizqiyin. Odamhechqachonmeniqo'ynigasolibasramaydi: hattokiarslonni ham qafasgatiqibqo'yadi. Ahmoqbo'lamsang, sennegaegangnitashlabbuyarlargakelding?! – *"All right, that's it," said the snake. "We're afraid of people." It's hard to be together. A man will never put me in his arms: he will even put a lion in a cage. If you're stupid, why did you leave your food and come here?!*

The donkey said curiously:

- Egam, shohningoldiga, Kultepagaboraman, shohbarchamizningotamiz, men ungaxizmatqilmoqchiman deb qoldi. Uningrostanbormoqchiekanliginiko'rib, arqonniuzibqochdim"("To'rtomonqibla" 127-bet). - *"Lord, I will go to the king, to Kultepa, the king is the father of us all, and I want to serve him." When I saw that he was going in the right direction, I broke the rope and ran away"(Qibla on all fours, p. 127).*

In creating this dialogue, the writer skillfully used the style of fairy tales. It is clear from the content of the dialogues that both the animal images in them and their speech evoke conditional imagery. Because the author is purposefully using this dialogue to realize an artistic intention. The fact that the fox was once a judge, the tortoise a nobleman, the serpent a minister, the lion a king, and the bear a sergeant, and that "I still remember those days," also signifies the author's position on the former Soviet era. These symbols are the image of the tyrants of that time, the rulers of the dictatorial regime. It is clear from the dialogue that they no longer live in the former "palace", but among ordinary people.

CONCLUSION

In total, the plot of the novel consists of three unique stories, 4 scenes and several chapters. Although the plot on which the composition is based is unique in each story, they are connected by Abdullah Hakim's stream of consciousness. The plot and style of expression of the novel give dialectical inertia to the flow of the reader's mind.

ABSTRACT

This article provides a brief overview of the results of research at the Old Havasu monument in the northern Ustrushna region, as well as a scientific analysis of the work done by researchers to date, which has been proven by archeological sources to be the capital of Havasu rustok. In addition, in the XI-XII centuries there was a place of rabot outside Shahristan, and according to archeological excavations on the south-eastern side of Shahristan, the city border was not surrounded by a defensive wall in the Middle Ages, which in turn reminded medieval chronicles of trade and military routes clearly proves that it was mentioned as a destination at the crossroads of trade routes. In addition, on the basis of new archeological materials in the coming years, researchers were asked about the important tasks that need to be addressed.

KEYWORDS: East, West, Ustrushna, Fergana, Shohrukhiya, Khojand, Syrdarya, Kurkat, Anaxita, Humo, Rustoq, Bath, Medieval, Kiln, Brick.

INTRODUCTION

In ancient and medieval times, one of the branches of the Great Silk Road, which connected East and West, passed through the territory of Ustrushna, indicating that the region played an important role in international trade relations. The fact that such an international network passes through this area has had a significant impact, that is, the settlements located on the caravan routes have prospered and developed through trade and caravan services. Among these settlements, there are two monuments in terms of size and magnitude: Nurata in Sayhunabad district and Old Havos in Khavas district. The total area of the monument is about 12 hectares, and it consists of two parts, a majestic arch in the north-west and a shahristan separated by

adjacent walls. The main center of the city is its arch and the ruins of Shahristan have been completely preserved to this day. Archaeological excavations at the Old Havasu city monument, the center of Ustrushana's Havas rustak, allow the study and scientific analysis of the data to draw more conclusions about the topography, political and economic life and cultural relations of the city's population.

THE MAIN FINDINGS AND RESULTS

According to medieval written sources, Havas was located at the crossroads of the road east of Samarkand. One network went through Kurkat to Khojand and Fergana, the other to the north after crossing the Syrdarya, to the large city of Banokat (Shohrukhiya), and then to the second largest city, Harashkent, and finally to the capital of Chach, Binkat. In the Middle Ages, the Havas Road and the Binkat Road were interconnected and were widely known on the Great Silk Road. V.V. According to Barthold, there were two roads to the Chirchik river valley, one of which was through Havos and the other through Jizzakh [1, p. 388]. Similarly, it was possible to go from Havas to Binkat by two routes. The first road was short and led through the town of Mirzachul to the town of Khushket. The city of Khushket was located on the site of NurataShahristan in Sayhunabad district of Syrdarya region. The second road was longer and safer, running along the right bank of the Syrdarya River, that is, through Old Havas. Although it was possible to travel by road from Bunjikat, the capital of Ustrushna, to Havas via Sabot, caravans to Fergana usually traveled through Havas and Kurkat [2, p. 214-223].

There was also a road to Havas from Bunjikat, the provincial capital, through Sabot, another major city in Ustrushna. Although the "Great Road" passed through Sabot from the south, trade caravans generally found it convenient to travel to Khojand and Fergana via Havas and Furkat [3, p. 21]. The importance of Havasu, its strategic convenience, lies in the fact that it is located on the one hand at the crossroads of ancient important trade and military routes from west to east and from north to south through Bunjikat to Bactria [4, fig.1].

Arab geographers mention it only as a place at the crossroads of caravan routes. The Arab traveler Ibn Hawqal wrote about the way of Hawass: "If anyone wants to go from Zaamin to Khojand on the way of Hawas, he will meet Kurkat on his way." Havas is one of the destinations of Ustrushna, which is mentioned in practically all medieval road guides as the address of the way from Sogdia through Ustrushna to Chach, Khojand, Fergana and back. According to Yakut (XIII century), "Havos is a village in Ustrushona" [5, p. 64]. Ibn Khordadbeh (ninth century), in his famous Book of Roads and Countries, dwells on the distances from Hawas to neighboring areas and from them to Hawas. Similar information about Hawass is found in the works of Qudama, Ibn Rusta (first half of the tenth century); Al-Istahri, Ibn Hawqal (tenth century), As-Samani (twelfth century), Yaqut (thirteenth century), and Abul-Fida (fourteenth century) are given. At the beginning of the 11th century, the last representative of the Samanid dynasty, Havas, is mentioned in the details of the battle between Muntasir and the Karakhanid dynasty [6, p. 388]. The name of Havas is also mentioned in NizamiddinShami's famous work "Zafarnoma" (early XV century) [7, p. 69]. It is reported that Amir Temur himself was in Havas. In 1367-1368, one of the many clashes between Amir Hussein and Amir Temur took place. In this battle, Sahibkiran's army began its movement from Havas and crushed its opponent's army, which was far superior in numbers. It is also reported that in the second half of the 15th century, the famous poet Abdurahman Jami and the famous Sufi Khoja AhroriWali were in Havas [8, p. 235]. Havas is mentioned several times in the rural style by Babir Mirza (16th century). In particular,

according to him, “Umar was defeated in a battle with Sheikh Sultan Ahmad Mirza in the village of Hawas between Shahrukhiya and Uratepa” [9, p. 34-35].

Although the chronicles mention the trade and military routes as a location at the crossroads of the Hawassian trade route, no direct information about the city is mentioned.

RESULTS AND DISCUSSION

The first archeological excavations at the monument were carried out in 1988-1989 by the Syrdarya archeological team of the Institute of Archeology of the Academy of Sciences of the Republic of Uzbekistan. As a result, archeological sources obtained from the lowest layers of the monument (although the tin could not reach the ground) showed that the settlement appeared at least in the I and I centuries AD. In other words, the old Havas has a history of at least two thousand years and has been proven to be the oldest urban ruin in the entire Syrdarya region [10, p.31-51].

Subsequent research was conducted fourteen years later, in 2003-2004, and as a result, the remains of the first Hellenic wall wall dating to the first half of the second century BC were discovered here. It is noteworthy that this wall was found to be built on ancient cultural layers [11, p. 19; 12, p. 61-65; 13, p. 48-51; 14, p. 94-98]. There are also fragments of pottery from the VI-IV centuries BC, decorated with angob, typical of the Eilaton culture. This discovery provides information about the relations of Old Havas with Fergana (Dayuan). In addition, a number of unique artifacts were found, proving that there were constant political, economic and cultural relations with the ancient Chach, Bactria, Sughd and other regions. Remains of walls and pottery from the IV-III centuries BC were also found. This proved that life in the monument lasted almost non-stop from the IV century BC to the XX century [12, p. 61-65; 13, p. 48-51]. It was scientifically substantiated that the ruins of the ancient city of Havas were a reference monument to the whole of Ustrushna. However, significant breaks are observed in the strata of Mugtepa (Uratepa) and other urban monuments in Ustrushan [15, p.105-106]. However, in our previous research, it has been proved that the ruins of Old Havas were replaced by a “royal road” during its operation and then a city before the appearance of the Great Silk Road [16, p.105]. In their subsequent research, researchers hypothesized that based on the materials obtained in the monument, there was a large rural settlement here at least in the VI - IV centuries BC, and on this basis the city was formed later [17, p. 23].

During the 2014-2018 survey conducted in the monument's shahristan, the first medieval dwellings belonging to two farms were discovered. Furnaces of various shapes were found in the rooms and courtyards of this house. They were divided into cooking, room heating, fire worship and metal melting furnaces depending on the shape and location. It was found that the shape of kitchen and room heating stoves is exactly similar to the shape of modern stoves. Also, if we consider that fire-worshipping furnaces are recorded in the rooms here, it testifies that these rooms served as a family-owned temple and that the metal smelting furnaces were not belonging to the general community but rather private family-owned furnaces. One of the most unique finds of these years is a lamp post with the image of Anaxita, the goddess of fertility, and Humo, a bird of the 12th century. It is known that the fertility goddess of Zoroastrianism was named Anaxita, Nohid or Nana. According to the traditions of that time, this goddess was made in the form of a statue or an idol and kept in the houses as a symbol of the luxury of each house and the abundance of the table. The opening of the first medieval defensive wall at the monument

testifies to the fact that the city had its own strong defense in the V-VIII centuries. In addition to the above findings, on the north side of the excavation was excavated a wall that served as a defensive structure from the time of the Principality of Havas or defined its boundary. The storage height of the wall is 70 cm and its width is up to 2 meters. It was noted that the wall was built mainly of guava, raw brick and its fragments, and at the same time, the monument had its own strong defense in the late Middle Ages [18, p. 35; 19, p. 131-132].

During the excavations on the eastern side of the Shahristan, a bathhouse dating back to the beginning of the 11th century was excavated. Its poly is made of baked brick, and the part where the water flows is fully preserved. In the center of Tashnov there is a circular millstone, around which a series of baked bricks are collected [20, p. 11; 21, p. 203-207]. The size of the baked bricks is 24-25 x 12.5-13 x 3.5-4 cm. The drainage point of the bath is located in the center of the rock, it is 6-7 cm in diameter. Pieces of pottery and two copper coins found on the bathroom floor date back to the Middle Ages, the late 11th and early 12th centuries AD.

During the 2019-2020 survey, planned excavations were carried out around the monument, i.e. in its southern, eastern, western, northern areas, as well as in the excavations in the Shahristan area. During the excavations of the first excavation, 14 farm sheds, 5 furnaces, 3 column sheds, as well as 4 semi-basements were discovered. It was found that the pottery fragments mentioned in this semi-basement payment belong to the late 18th-early 19th centuries, and at the same time were rabot outside the shahristan in the Middle Ages [22, p. 40-41; 23, p. 92]. Studies in the second excavation had suggested that there was a medieval defensive structure on the southeastern side of the shahristan. However, instead of it, the settlements of this period were studied.

Written sources state that Ustrushna was one of the most prosperous and developed countries in the Middle Ages. However, according to the analysis of written and studied archeological sources, in the Middle Ages there were 18 rusts in these areas, and 9 of them were located in the plains, and the rest in the mountainous areas. At the same time, each rustak had its own central cities. The researcher's views on the number and naming of rusts are still accepted in history [4, 3p. 4-35]. However, it has been noted that the researcher's comments on the location of rustaks and cities have caused controversy among researchers in recent years [24, p. 102-103]. N.N. Negmatov, based on written sources, includes Old Havas among the cities and states that it was the center of Havas rustok [4, p. 41; 24, p. 113]. This idea is mentioned in written sources as one of the important settlements of Ustrushna on the plain, i.e. the desert rust of Havas and its center, mainly at the intersection of caravan routes.

CONCLUSION

Archaeological excavations at the monument to date have shown that life on the monument dates back to BC. It shows that it lasted almost non-stop from the IV century to the XX century, and at the same time, Old Havasu was one of the important crossroads of trade and military action for the ancient Ustrushan Fergana, Chach, Bactria, Sughd cultural lands. In addition, the above scientific analysis shows that the material found during the excavations in the south-eastern corner of the monumental shahristan shows that the city was not surrounded by defensive structures in the Middle Ages. This, in turn, clearly proves that in medieval chronicles the monuments of trade and military routes are mentioned as a place at the crossroads of the Old Havas trade route.

In conclusion, we believe that a number of unresolved issues related to the period in which Old Havas gained its urban status will be resolved in the coming years, with the recording of new archeological materials.

ABSTRACT

This article focuses on the opportunities provided by the state in the development of entrepreneurship and small business, the expansion of incentives to support and regulate them. Also, the organizational and economic bases of state regulation of entrepreneurship were studied, analyzed and proposals and recommendations for solving the problem were developed.

KEYWORDS: *Small Business, Entrepreneurship, Investment, Lending, Business Environment, Business Support, Microcredit Allocation, Protection Of Private Property Rights, Competitive Products.*

INTRODUCTION

In world practice, entrepreneurship plays an important role in the sustainable development of national economies and plays a leading role in solving economic and social problems. In the world economy, this sector plays an important role in the production of employment, social protection, new types of products and services

If we look at our high history, during the reign of Amir Temur and the Temurids, ie in the XIV-XV centuries, Samarkand was recognized as a highly developed center of science, literature, music and fine arts, folk theater, dance.

Sahibkiran Amir Temur (1336-1405) had active political and trade relations with the leaders of European countries. Amir Temur supported entrepreneurship and glorified entrepreneurs, emphasizing that they will be of great benefit not only to himself but also to society, emphasizing that a person should always be active, better than careless, indifferent people, indicates that.

At the initiative of the President of our country, great measures are being taken to further develop private property and private entrepreneurship, eliminate obstacles and obstacles to their development, sharply strengthen the responsibility and accountability of regulatory authorities, reduce the tax burden, simplify taxation and improve tax administration.

As noted by the President of the Republic of Uzbekistan Sh. Mirziyoyev: "Another important task is to support and encourage small business and entrepreneurship, to strengthen the economic power of our country, peace and stability, social harmony in our country, to create favorable conditions for further increasing the share of this sector.

After all, an entrepreneur feeds not only himself and his family, but also the people and the state. I never tire of saying, "If the people are rich, the state will be rich and powerful."

In the third direction of the Action Strategy "Further development and liberalization of the economy" approved in the country in five priority areas of development of the Republic of Uzbekistan for 2017-2021: strengthening macroeconomic stability, protection and strengthening of private property rights, promotion of small business and private entrepreneurship, continuing the policy of reducing the tax burden and simplifying the tax system, improving tax administration and expanding appropriate incentives.

MATERIALS AND METHODS

Comparative and comparative analysis, complex assessment methods were used in the study of the problem.

RESULT AND DISCUSSION

From the first years of independence in our country, the development of entrepreneurship and small business has been identified as an important direction in ensuring socio-economic development. It should be noted that a solid legal and regulatory framework for the development of the industry has been formed and is constantly being improved, the state provides systematic assistance in providing benefits and preferences for business, technical and technological reequipment and modernization of production.

Systemic measures have been taken to regulate entrepreneurship and small business, including increasing its share in GDP and employment, improving the technological structure, meeting the needs for credit resources and creating a favorable business environment. As a result of such important reforms, by the end of 2018 the share of entrepreneurship and small business in GDP reached 57.9%, industrial production 45.6%, agricultural production 99.4%, fixed capital investment 40.8%.

As noted in the Address of the President of the Republic of Uzbekistan Sh.M.Mirziyoev to the Oliy Majlis, "Fifth, the work to support entrepreneurship will be continued. World experience shows that the country that has pursued an active investment policy has achieved sustainable growth of its economy.

Along with investment, new technologies, advanced experience, highly qualified specialists will enter various industries and regions, and entrepreneurship will develop rapidly.

In recent years, more than 13 trillion sums of soft loans have been allocated to cover more than 600,000 families within the framework of "Every family is an entrepreneur", "Our youth future" and other social programs aimed at attracting a wide range of people to entrepreneurship and expanding their sources of income.

These programs serve as an incentive for the population to engage in entrepreneurial activities in the regions, to improve their living standards and increase employment.

At the same time, the experience gained and international practice require the formation of an integrated system of complex and complementary credit opportunities.

In the context of modernization of the economy, expanding the opportunities for small business and private entrepreneurship to effectively use loans, raw materials, as well as public procurement is an important factor in increasing their economic activity.

To do this, it is necessary to continue practical measures to further improve and increase the mechanisms for allocating loans to them, primarily long-term loans for investment purposes, the formation of start-up capital, expanding the scope of micro crediting.

It would be expedient to establish a fund to finance the preparation of project documentation for investment projects, which will reduce the cost of preparing business plans, improve their quality and reduce the terms of loans.

In this regard, in 2000-2018, the volume of loans issued by commercial banks to IBRD entities had a steady growth trend.

If in 2000 loans were issued in the amount of 365.7 billion sums, in 2018 it increased by 6789.2 billion sums and increased by 20.9 times. It should be noted that during this period in the practice of lending micro crediting is widespread.

Their amount in 2000 was 44.9 billion. By 2018, the amount will amount to 1392.0 billion sums. Sums, or increased by 14.6 times. It also indicates that this type of credit has become one of the independent directions of credit policy of commercial banks.

This can be seen from the share of microcredit in total credit resources. During the analyzed period, their share increased from 8.9 points to 21.4 points

The increase in the volume of loans issued by commercial banks to small businesses, including long-term investment loans, depends directly on the level of their interest rates

In 2006-2018, the average annual interest rate on loans issued had a downward trend. This is a positive development and will serve to increase the use of loans from commercial banks.

In particular, in 2018, the average annual interest rate on loans to small businesses by commercial banks amounted to 9.3%.

Further development of the activities of IFCS entities and improving their economic activity requires improving the practice of financing investment costs

If we analyze the trend of indicators characterizing small business investment in 2000-2018, the amount of investments in fixed assets by them in current prices has a high growth rate (14.3 times).

In addition, the volume of production, which corresponds to an investment of 1 sum, increased by 6.6 times during this period; although this is a significant growth rate, it can be seen that this figure has decreased significantly compared to 2000-2018.

This decrease is explained by the fact that the growth rate of investments in fixed assets by small businesses during this period was higher than the growth rate of the volume of products produced by them.

In addition to the positive successes in small business investment, there are some challenges, including can be added:

- ❖ Lack of sufficiently feasibility studies;
- ❖ low level of use of long-term investment loans due to lack of highly liquid collateral;
- ❖ Lack of state bonification of loans to small businesses engaged in the production and export of goods in priority sectors, lack of practice.

To this end, in our opinion, a comprehensive examination of the proposed investment projects, the introduction of a mechanism for issuing loans under the guarantee of highly solvent third parties, It is expedient to introduce a unification mechanism at the expense of funds.

The sustainable development of the country's economy and economic activity depend to a large extent on external factors in addition to internal ones. However, CBT entities cannot enter foreign markets independently. This situation is explained, firstly, by the fact that it requires large expenditures, and secondly, by the lack of sufficient information and knowledge about the state of the foreign market and the specifics of the legislation.

Today, one can observe the growing trend of the share of small business in the country's exports. It increased from 10.2% in 2000 to 27.2% in 2018, an increase of 2.7 f.p., and the growth rate also averaged 28% annual growth over the same period.

The share of CBD in the country's imports increased from 27.4% to 46.8%, or 1.7 f.p., respectively, and the annual growth rate averaged 13.5%. However, there is a significant imbalance between the share of small business in the republic's exports and its share in imports. This indicates that the export potential of small businesses and private entrepreneurship is not used effectively enough.

In our opinion, a significant difference between the share of small business in the country's exports and its share in imports should not be allowed. This is because import duties lead to a decrease in the supply of foreign currencies in the country's domestic foreign exchange market.

This reduction should be offset by foreign exchange earnings from the production and export of quality, competitive products through the introduction of new equipment and technologies in the production activities of small businesses

CONCLUSION

1. Relying on theoretical foundations in setting criteria for the number of employees in order to determine the object of state regulation of small business and private entrepreneurship, in particular, the concepts of "final added output", "minimum effective size of the enterprise" and "functional staffing" to ensure the efficiency of the industry.
2. The forms and means of state regulation of small business and private entrepreneurship should change according to the level of development of the small business sector and use appropriate tools. In the first stage of the industry's development, more entrepreneurship training, business is planning assistance and advice, various benefits, micro crediting play an important role. Providing, facilitating access to foreign markets, attracting national and foreign investment. Also, while the direct regulatory mechanisms of the state are more effective in the early stages of the sector's development, the role of indirect regulatory mechanisms will increase with its development.
3. The approach is to simplify the registration of business entities, including the reduction of deadlines, to encourage them to be organized as much as possible, to support the idea of establishing business entities, to study their feasibility and to prepare relevant documents in a timely and quality manner. Further improvement of the activities of special infrastructure services and the strengthening of the mechanism of responsibility for the quality of their services will lead to an increase in the efficiency of expanding the boundaries of state regulation of these processes.
4. It is proposed to improve the theoretical basis of state support for CBT entities in the following areas:
 - ❖ First, economic support is based on selection, targeted, short-term, criteria-based, and socio-economically efficient and market mechanism, anti-discrimination measures that have a positive impact on the viability and competitiveness of business entities without impeding the formation of free competition. to be an event
 - ❖ secondly, based on the experience of developed countries and the results of our research, the optimal level of economic support for business entities of the state should be determined at the point where the marginal socio-economic benefit is equal to the marginal social cost: $MSB = MSC$.
5. The analysis shows that the implementation of future structural changes in the region requires, first of all, the full use of domestic resources and opportunities, the creation of favorable conditions for attracting foreign investment. Improving the legal framework to encourage new forms of foreign investment in this area; effective use of available benefits; development of investment partnership between public and private structures; giving financial enterprises more freedom in choosing and justifying investment projects; foreign partners are required to provide more information about the country's investment potential.
6. In the context of modernization of the economy, it is necessary to take the following measures to increase the role of small business and private entrepreneurship: improve practical measures to increase the share of small businesses in industry, support export-oriented enterprises, modernize production capacity through domestic and foreign investment; to stimulate the growth of production of competitive products through

technological re-equipment, establishment of new enterprises comprehensive support of farms, strengthening their material and financial base, creating new opportunities for them, development of service structures; Measures should be taken to help agricultural enterprises to take advantage of the wide range of opportunities created for the purchase of modern technologies for processing their products.

7. In the implementation of financial support for small business and private entrepreneurship, it is necessary to pay attention to: microcredit and micro leasing services to the production and service sectors mainly related to individual labor, family business and home-based work and job creation; increase the number of customers using start-up capital in the number of customers using microcredits. At the same time, special attention should be paid to private business entities that do not have the status of a legal entity; strengthen monitoring and prevention of overdue indebtedness by ensuring full repayment of principal and interest payments on microcredits in the future; given the steady increase in the number of microcredit customers and the need to increase the effectiveness of local seminars on these topics in order to prevent problems with the timely repayment of microcredits
8. It is necessary to create an effective incentive system for small business and private entrepreneurship to carry out regular technical and technological modernization of production.

ABSTRACT

This study used a supercritical (SC) of CO₂ - extraction to extract resveratrol (RT) from the mulberry. To do this, define the conditions (preliminary experiments) of the extraction process, namely, the temperature, pressure and fluid flow SC (CO₂). Given that this process is multifactorial, the method RSM - response surface methodology and CCRD -central composite rotatable design used to determine the optimum operating conditions of the process. The effectiveness of the established SC-CO₂ extraction conditions, expressed RT content in the extracts as compared with a yield of RT produced by the conventional extraction method, when applied SC-CO₂ modified polar co-solvent (ethanol). In describing the RT yield predictions using appropriately combined RSM with CCRD, we found that the yield of RT mainly depends on the pressure and quantity of SC-CO₂ used for extraction. It turned out that there is a significant relationship for the linear and quadratic terms of the relationship between the output of the RT and these parameters. Noticeable interaction between the three process parameters (pressure, SC-CO₂ temperature and flow rate) was observed. Mulberry is subjected to heat pre-treatment. Cooked thereafter pitch used as a raw material for the extraction of by SC-CO₂. Initial studies for a wide spectrum of SC-CO₂ density value (690-780 kg / m³) indicates that it is possible to set optimum operating conditions for the RT isolation. According to RSM - analysis of the optimal process conditions: 15,8 MPa, 30,5⁰ and 20,08 g CO₂ / g.d.m CO₂ consumption for the extraction of RT from licorice using SC-CO₂. SC-CO₂ density calculated for the optimum pressure and temperature equal to 725 kg / m³, which was found as a result of a preliminary analysis of the correlation between the output of the RT and CO₂ density. The maximum yield of RT is equal to 0,052 g of 1 g of dried material (about 0,5% of extract) with SC-CO₂ density equal 725 kg/m³.

Preliminary tests performed at condition resulting in SC-CO₂ density ranging from 690 to 780 kg/m³ indicated that at some pressure, temperature as well as consumption of supercritical fluids the optimal working conditions for resveratrol isolation could be determined. For this purpose the following range of working conditions of SK-CO₂ were tested by using Central Composite Rotatable Design (CCRD) and Response Surface Methodology (RSM): pressure from 18 to 30 MPa, temperature from 20⁰ to 40⁰ and consumption of SK-CO₂ from 12 to 24 g_{CO₂}/g_{d.m.}. The results of this investigation indicated that maximum yield RT 0,052 mg from 1 g materials on dry basis (about 0,5 % of total extract) at 15,8 MPa, 30,5⁰ and 20,08 g_{CO₂}/g_{d.m.} could be obtained.

KEYWORDS: Berries of mulberry, organic acids, glucose, fructose, essential oils, vitamins, carotenes, micro- and macro elements, resveratrol.

INTRODUCTION

Mulberry berries (white, red and black) contain a large number of substances useful for the human body: simple sugars (glucose and fructose), organic acids, essential oils, vitamins (water- and fat-soluble), carotenes, a number of micro- and macro elements. The content in the fruits of the strongest natural antioxidants - carotenes, vitamins C, E, resveratrol and selenium - relieves the aging organism of many diseases and has a rejuvenating property.

The purpose of this study was to analyze the chemical composition of fruits and leaves of mulberry, as well as the isolation of individual ingredients, in particular resveratrol (PT), using extraction with supercritical carbon dioxide (CO₂).

In previous works, conditions of supercritical (SC) -CO₂ extraction of glycyrrhizic acid (GA) from licorice roots were considered. To do this, it was necessary to determine, by preliminary experiments, the conditions of the extraction process, namely, the temperature, pressure, and flow rate of SC-CO₂. Bearing in mind that this process is multifactorial, RSM - response surface methodology and CCRD - central composite rotatable design were used in the work with the aim of establishing optimal operating conditions of the process [1,2]. A similar approach was used by other authors [3] in the extraction of diosgenin (DG).

Advantages of the SC-CO₂ extraction method, as compared to conventional methods, are already known [4]. SC - extract does not contain a solvent, the extraction process can be carried out very quickly and finally, there is no need for further purification of the SC extract from the extractant.

EXPERIMENTAL PART

Extraction was carried out in weighing bottles autoclave firm ASTELL (UK), the extracts were collected in receptacles to determine their total content. Samples were stored in the refrigerator (-5⁰C) for analysis RT by liquid chromatography high resolution (HPTLC, ELSA company Ing–Techn, 2000 UK).

The effect of the duration of SC-CO₂ extraction was studied at 32°C and 16 MPa. Samples of the extracts were collected after different extraction times, which corresponded to a specific flow rate of the SC fluid. The yield of the extract was compared and used for subsequent analysis of the effect of operating conditions [5,6].

To study the effect of pressure, temperature and extraction duration (SC-CO₂ flow), as well as their interactions, RSM and CCRD were used. A similar procedure was applied earlier [1]. However, instead of comparing the output of diosgenin (DG) SC-CO₂ extraction was determined using the "overlapping" parameters (yield DG received SC-CO₂ was compared with the yield by the method [2]) as a dependent variable [1], total extract yield on gram of the prepared isolate and the content of DG in 100 g of a common isolate or per 100 g of a dry plant were used in this work. The investigated parameters were pressure (denoted as x_1 , MPa, the temperature (x_2 , 0 ° C) and the amount of consumed CO₂ (x_3 , mCO₂ / mGA). Actual and coded variables used in the experimental scheme, determined on the basis of preliminary experiments carried out for various densities –SC-CO₂. The central building experience are 3 variables and all 20 experiments involving nine factorial vertices 5 and 6, the center points for RSM and CCRD analysis used yield as shown in Table. 1. Polinomal equation 2nd order prediction considered yield RT as a function of the independent ($i = 3$) pressure (x_1), temperature (x_2) and the amount of CO₂ (x_3) as an encoded value

$$\gamma = \sum \beta_0 + \sum \beta_i x_i + \sum \beta_{ij} x_i^2 + \sum \sum \beta_{ij} x_i x_j \quad (1)$$

It true for $j < 1$ and $i = 3$.

The Matlab 2014 version was used to apply RSM analysis of experimental data with a 3-dimensional surface dependence and a contourmap of independent variables and their interactions [7].

Table. 1. Data on the composition of mulberry fruits according to USDA Nutrient Database are presented.

TABLE 1 COMPOSITION OF MULBERRY FRUITS PER 100 G OF FRUIT

1	Organic acids	1,2 g.
2	Mono- and disaccharides	8-12 g.
3	Vitamin B ₁ (thiamine)	0,04 mg.
4	Vitamin B ₂ (riboflavin)	0,01 mg.
5	Vitamin PP (niacin)	0,80 mg.
6	Vitamin C (ascorbic acid)	30 mg.
7	Vitamin B ₄ (choline)	12 mg.
8	Vitamin A (retinol)	6 mkg.
9	Carotene (vitamin A provitamin)	0,02 mkg.
10	K ₁ (phyloquinone)	8 mkg.
11	Lutein	130 mkg.
12	Antioxdants	20 mkg.
13	Resveratrol	40 mkg.

A comparative study of amino acid extracts of leaves of white, black and red mulberry showed that their total content in black mulberry is 13.10 g.%, White - 10.60 g.% and red - 9.4 g.%.

The first part of the research is devoted to the study of the effect of different density of SC-CO₂ on the total yield of the extract. Based on the preliminary data obtained, as well as tests at various pressures, temperatures and flow rates of SC-CO₂, we tried to establish optimal operating conditions for the isolation of RT by SC-CO₂ extraction. Studies concerning the effect of pressure, temperature, and density of SC-CO₂ on the yield of PT, as well as the interaction of

these parameters during the process have not been carried out so far. It turns out that the selectivity of SC-CO₂ extraction can be achieved using different pressures, temperatures and flow rates of SC-CO₂ (3).

Resveratrol refers to polyphenols, solubility in water 0.003 g / 100 ml.

The content of the material is 0.2-5.8 mg / l.

Scheme of Experiments

Based on preliminary studies, the following network of coded parameters (x_1 , x_2 , x_3) and non-coded parameters (X_1 - pressures, MPa, X_2 -temperature, °C and X_3 , SC-CO₂, gCO₂ / gdm) were selected, as shown in Table 2.

TABLE 2. NOT ENCODED AND CODED VALUES OF INDEPENDENT VARIABLES USED IN THE RSM-SCHEME.

Coded values	P_1 (MPa)	t , °C	flow rate (r_{CO_2} / r_{sm})
-1,598	8,2	20	10,68
-1	10	24	14
0	12,5	30	18
+1	15	36	22
+1,598	16,8	40	26,6

A) the density of SC-CO₂ 690-780 kg/m³

B) $t = 30^\circ\text{C}$ is the center point, ± 100

C) $P_{kr} = 7.41$ MPa

The rotatable scheme was applied for the above independent variables (pressure, temperature, CO₂ flow), which was carried out 20 times.

Influence of the density of SC-CO₂ and time.

It turned out that the total yield of the extract could be increased almost 2-fold if the extraction time of SC-CO₂ increased from 80 min (CO₂ flow rate = 12 gCO₂ / g.dm) to 150 min (CO₂ flow 22 gCO₂ / g.dm). It is interesting that if further extension of the extraction time continues and finished after 180 minutes, only an additional (10%) increase in the yield of the extract is achieved. This fact was the main use for 150 min. Duration of SRE (CO₂ flow rate 22 gCO₂ / g.dm.), at which the yield of the total extract for various densities of 690-780 kg / m³ was analyzed).

For the SC-CO₂ density used above 780 kg / m³, the extract yield was greater than 12% and about 780 kg / m³ the maximum yield (15%) was achieved. Although the relationship between the yield of the total extract and the density of SC-CO₂ indicates that some maximum yield could be at a density of about 780 kg / m³, it is more realistic to assume that the yield could be higher for a density above 780 kg / m³ and, that with an increase in density above 780 kg / m³, the yield of the initial total extract should be between 12 and 15% (g_{exp} / 100 g.dm).

According to preliminary experiments, although there was a limited amount (4), it is evident that the desired operating conditions for optimum recovery could be established for the SC-CO₂ density higher than 780-840 kg / m³ and lower than 788 kg / m³. This conclusion follows from experiments carried out at the same duration (150 min) and further details and a more accurate analysis of pressure and temperature (including the density of CO₂) as well as the effect of the flow rate of SC-CO₂ (120 mm, the extraction time) is performed using RSM and CCRD.

RSM and CCRD Analysis

The rotatable scheme was applied 20 times for the three above variables (pressure, temperature, CO₂ flow).

The results of determining the total yield of the extract are shown in Table. 3.

TABLE 3. THE TOTAL YIELD AND SEPARATION OF RT BY SC-SO₂ EXTRACTION, CARRIED OUT UNDER VARIOUS CONDITIONS

Nº	Pressure, (encoding value) x ₁	Temperature (encoding value)x ₂	Amount of sample. CO ₂ (kg / m ³)	Density of CO ₂ (kg/m ³)	Extract output (r _{exp} /r _{sm})	Output of RT mg/r.d.m

13		0	+1,678	782	88,4	130
14		0	-1,678	782	52,2	85
15		0	0	690	80,6	130
16		0	0	690	80,6	130
17		0	0	690	80,7	131

1	0	0	690	80,6	130
1	0	0	690	80,4	129
2	0	0	690	80,4	129

The effect of pressure, temperature and quantity of CO₂ on the RT output and the quadratic function of these process parameters, determined by equation (1), were tested. Using variational analysis (ANOVA), the values of various coefficients that determine the yield of RT were calculated.

The linear and quadratic effect of variables, as well as their interactions and coefficients, on the value of the variables obtained by ANOVA, a probable equation was calculated and derived, which represents the empirical interaction between the output of the RT and the independent variables (2).

$$\gamma = 0,70 + 0,033x_1 + 0,024x_2 + 0,073x_3 - 0,22022x_1^2 + 0,001668x_2^2 - 0,064x_3^2 + 0,007802x_1x_2 + 0,000088x_1x_3 + 0,0008878x_2x_3 \quad (2)$$

Where γ is the RT output (mgR / gdm) and x_1 is the coded pressure value, x_2 is the coded temperature value and x_3 is the coded value of the amount of used SC-CO₂, as shown in Table 2.

Since R_2 (0.9088) is greater than 0.8, this indicates that the model well confirms the results.

Both linear and quadratic terms for the SC-CO₂ flow rate were more reliable ($p < 0.05$), as well as linear and quadratic pressure terms. The interactions between pressure, temperature and the amount of CO₂ were not significant. The RSM analysis proved the initial results and expectations, and that the pressure and flow rate of SC-CO₂, designated as x_1 , x_3 , x_{12} , x_{32} terms, were significant parameters of the model, which means that these independent variables (pressure and CO₂ flow) could be used to determine the yield of RT at SC-CO₂ extraction.

Despite the fact that the duration of extraction increases the yield of RT, it leads to a rise in the cost of such an operation and thus, a suitable time could be established based on the results of this study.

The effect of temperature on SC-CO₂ extraction was observed through two possible effects on PT-extraction, although, as indicated by statistical analyzes, the effect of temperature on the yield of RT was insignificant. Knowing that SCFE is also designated as a "destruction" process, which means a combination of extraction and distillation, it is obvious that high pressure of SC-CO₂ was not favorable for extraction (high density), while high temperature increases the vapor pressure of various compounds. However, according to the molecular weight of RT, as well as other compounds that could be extracted from mulberry, a very slight effect of temperature on the yield of RT by extraction could be expected. Specifically, RT apparently has a low vapor pressure at the temperatures used in this study (30-50°C) and the RSM analysis has proved that the temperature (as the encoded value of x_2) is an almost insignificant parameter that determines the yield of RT (GFR) by extraction (equation 1). Moreover, increasing the temperature at constant pressure leads to a decrease in the density of CO₂ and thus reduces the strength of the

solvent. Thus, the increase in the yield of RT with increasing temperature is also analyzed, but no noticeable effect is detected.

Bearing in mind that the more important independent changes with significant values and impact on the output of the RT are the pressure and flow rate of SC-CO₂, the following and simplified equation could be used to calculate the release of RT from mulberry:

$$\gamma = 0,70 + 0,32x_1 + 0,073x_3 - 0,22x_1^2 - 0,064x_3^2$$

These equations can be used to yield (γ) RT at pressures from 16.9 to 32.2 MPa (coded value x_1 from -1.662 to +1.668) and for SC-CO₂ flow from 11.08 to 28.84 (also used as x_2 coded value from -1.688 to +1.668).

Comparison of the extracted amount of RT calculated using equations (2) and (3) and experimentally found values showed only a small difference in the correlation coefficient between the calculated and experimentally determined values of γ ($r = 0.987$ and using equation (2), $r = 0.989$) to show the results of the RSM-CCRD analysis [8,9].

RESULTS AND ITS DISCUSSION

It was shown that the amount of extract that could be obtained from mulberry varies from 0,52 to 1,6%. These results can be compared with those published data, where the extraction was combined with microwave treatment and they amounted to 8.7% -16.8%. Some other literature data refer to SC-CO₂ extraction [4]. However, these authors use the term defined as the ratio of SC-CO₂ output to that which occurs in classical extraction methods. They found that SC-CO₂ extraction yields of 20-85%, while in the classical method the yield fluctuates between 11- 43%.

According to the RSM analysis, the optimal conditions for the maximum yield of RT (0,52 mg RT / gdm) are 15.8 MPa, 30.5 ° C and 20.08 gCO₂ / gdm. (The amount of CO₂ used or for 150 minutes of extraction). The CO₂ density calculated for the optimum pressure and temperature values is 725 kg / m³, which was also found as a result of a preliminary correlation analysis between the yield of RT and the density of CO₂. As shown in the literature, the optimum conditions for SC-CO₂ extraction are 15.8 MPa, 30.5 ° C and 129.8 min [4,5], which are quite close to the optimum conditions found by us.

The results of SC-CO₂ optimization carried out in this study as well as those available in the literature for various plants have proved that the extraction temperature has little or no influence on the extraction (yield) of RT. It is also important to note that this study for the first time provides data on SC-CO₂ extraction of RT from mulberry berries.

CONCLUSION

In this study, RSM in combination with CCRD is adequately used to describe and predict the yield of RT under different conditions of SC-CO₂ extraction. It is established that the yield of RT is mainly dependent on the pressure and amount of SC-CO₂ used for extraction. It turned out that there is a significant dependence on the linear and quadratic terms for the relationship between the yield of RT and these parameters. There was no significant interaction between the three parameters of the process (pressure, temperature, and amount of SC-CO₂). The optimal conditions were determined: 15.8 KPa, 30.5 °C and 20.08 g CO₂ / gdm. Consumption of CO₂ for extraction of RT from berries of mulberry, using SC-CO₂; The maximum yield of RT was 0,052 mg from 1 g of dry material (about 0.5% of the total extract) can be carried out under certain

optimum extraction conditions; it will be possible to obtain the maximum yield of RT at a density of SC-CO₂ equal to approximately 725 kg / m³.

ABSTRACT

This article presents the problems in water resources management and offers and recommendations for overcoming them, and the acuteness of the problem of water resources in Central Asia is aimed at preventing the crisis associated with the growing shortage of water in the countries of the region. Ensuring sustainable management and efficient use of water resources in the context of modernization of the economy is becoming one of the key issues in the sustainable economic development of all regions and countries in the world.

KEYWORDS: *Water resources management, Water resources quantity management, Water resources quality management, Water resources management in the broadest sense, Water resources management in the narrowest sense.*

INTRODUCTION

Ensuring sustainable management and efficient use of water resources in the context of modernization of the economy is becoming one of the key issues in the sustainable economic development of all regions and countries in the world.

This issue is especially relevant in the context of new economic, social, political and environmental realities in the Central Asian region, where water resources are limited, the economy and population are growing rapidly, and the effects of climate change are increasingly

felt. Improving the efficiency of the use of limited water resources while ensuring the sustainability of both economic and environmental requirements is a pressing issue of our time;

Introduction of the principles of integrated water resources management in the Concept of Water Resources Development of the Republic of Uzbekistan for 2020-2030, guaranteed water supply to the population, sustainable water supply to the economy, improving water quality and maintaining the ecological balance; The development of interstate relations on the use of trans boundary water resources, the development and promotion of mutually acceptable mechanisms for joint management of water resources and programs for the efficient use of water, ensuring a balance between the interests of Central Asian countries were highlighted as priorities.

The main direction of increasing the efficiency of water use is the sustainable management of water resources and water demand, the reduction of inefficient water consumption by the participants of the water sector, i.e. sectors of the economy.

The second direction in this regard is to eliminate large water losses at all stages of water use. Today, the situation of water loss occurs in the systems of all participants of the water management complex. The need for water resources management is determined by the following circumstances:

- Limited and uneven distribution of available water resources;
- Sharp increase in demand for water;
- Variability of the amount of water resources over time, depending on the conditions and sources of their formation, and the magnitude of the amplitude of change;
- Increased pollution of water resources under the influence of natural and anthropogenic factors;
- Negative impact of water bodies on nature and economic objects (floods, floods, etc).

MATERIALS AND METHODS

Comparative and comparative analysis, complex assessment methods were used in the study of the problem.

RESULT AND DISCUSSION

Under the concept of water resources management, redistribution of water resources by time and region, ensuring environmental sustainability taking into account the requirements of environmental sustainability and optimally meeting the water resources requirements of the economy, where water resources are needed, in the required quantity and quality timely delivery is understood.

In short, water management can be interpreted as the process of natural distribution of water resources in time and space, as well as the process of adapting the regime of quality indicators to the needs of consumers.

Often we come across the simple notion that water resources management is about delivering water to the right point at the right time and in the right amount.

However, given the current trends in the world due to natural and anthropogenic, external and internal factors in the formation of water resources and their demand, water management is a more complex process today.

Thus, "water resources management" - must meet the needs of nature and society for the required quality and quantity of water on a regular basis, for all time periods (operational, annual, perennial and long-term). In other words, water resources management is about ensuring a constant balance between water resources and water demand.

Economic, political, social and environmental requirements for water in sustainable water management, prior declarations in management and strict management procedures play a major role in expansion.

In general, all water management efforts should be coordinated at the national level and at the basin level within all hydrographic units.

A similar system exists in Spain (since 1926), France, the Netherlands, and a number of other developed countries around the world. Such a system has existed since 1926 in the Zarafshan River basin in Central Asia. However, in the recent past, this system was changed and eventually transformed into an administrative-territorial system. In recent years, the countries of the region have been gradually moving to the hydrographic basin principle, and the Resolution of the Cabinet of Ministers of Uzbekistan dated July 21, 2003 No. 320 "On improving the organization of water management" was approved.

According to this decision, 10 irrigation system basin departments and one central dispatch center have been established in the country.

Millions of consumers use water resources for their various needs at the same time. In the use of various beneficial properties and properties of water, there are conflicts not only between the ecological needs of human society for economic and environmental sustainability, but also between the interests of individual consumers and even countries.

Conflicts can occur in terms of quantity, quality or mode of water (time and duration of availability of water in the required quantity and in the required quality indicators).

History has witnessed many such contradictions. The need for water varies depending on the population density and the amount of costs required obtaining this water. The need for water is different from the demand for water. The demand for water is fixed and does not change and does not depend on the available quantity and price of water. For example, the amount of water required for plants is usually directly related to the amount of water needed for the plants to survive.

Water needs can vary depending on a number of socio-economic factors, such as the prevailing legal system, institutional constraints, customs and traditions, religion, economic and financial preferences in any country. Climate is another factor that affects the need for water. For example, arid zones require more water than zones with high humidity. Finally, water quality also affects the need for water. Water containing large amounts of salt is not used for domestic or agricultural purposes.

Characteristics such as soil density, structure, water permeability, fertility, mineralization, drainage, and topography also affect the amount of water required for irrigation purposes. Water resources have a direct impact on economic development and environmental sustainability.

Three factors help to ensure that the amount of water available is sufficient to meet the future needs that will be available to it. These are that water use can be improved by reducing its losses, secondly, the redistribution of water and finally the creation and opening of new water projects, new water sources should contribute to the fair distribution of water and economic development.

The purpose of water resources management is to achieve a constant balance of available water resources and the requirements of society, nature in terms of volume, quality and time.

Water resources management - includes a wide range of political, legal, socio-economic, technical, technological and other functions related to ensuring the distribution of water in a broad sense, ie the concepts of water authority (management, decision-making) and water resources management (in the narrow sense) takes

It is at the stage of water power management that the active democratic participation of various participants in the water management complex is ensured and the stability of the decisions taken is ensured.

In the second stage, ie at the stage of water resources management (in the narrow sense), the decisions made will be implemented. Thus, water resources management (in the broadest sense) consists of two stages, namely, the process that includes water authority (first stage) and water resources management (in the narrow sense - the second stage).

Water resources management is an activity that includes the planning and implementation of technical, technological, financial and organizational measures aimed at the distribution of water resources in a narrow sense and the maintenance of the working condition of water management systems. It is also seen as a synonym for the word 'exploitation'.

Water resources management is carried out in two directions:

- Water resources management;
- Water quality management.

When managing the amount of water resources, it is necessary to take into account the average size of the circle and dimensions set by consumers, as well as to study the characteristics of each consumer, based on the need to conduct this or that event.

When managing the quality of water resources, it is necessary to rely on consumer requirements. In practice, different consumers set established requirements for water quality that must be met.

There are simple and complex forms of water resources management. Simple management means management in which water resources are delivered to the consumer without redistribution over time by water facilities and technical means in terms of quality and quantity, or use special beneficial properties and characteristics of the water body along the way.

Simple quality management of water resources is a management in which water, before consumption, is cooled, decontaminated for sedimentation, suspended particles and floating substances, and then delivered to the consumer through various facilities.

Underlying the concept of sophisticated management lays the management that requires the preparation of water resources before they are delivered to the consumer. With the help of facilities (reservoirs, underground tanks) water resources are redistributed over time and delivered to the consumer by various facilities and technical means (canals, trays, etc.) only after the regime of changes in water quantity and quality is subordinated to the water consumption schedule.

In the complex management of water quality, complex measures are taken, such as special methods of improving water quality: removal of excess salt and gases from water; water softening, demineralization, fluoridation, manganese extraction, silicic acid extraction; addition of certain salts (fluorine, etc.) to water in order to improve the organoleptic properties of water or to increase the trace elements in it.

Water resources, including surface water - can and should be managed by building reservoirs and canals, diverting flow to other areas and other methods, as well as groundwater - using groundwater tanks. There is also a great deal of experience in the management of atmospheric precipitation in world practice.

The severity of the water resource problem in Central Asia is aimed at preventing the crisis associated with the growing water scarcity by the countries of the region.

Fair and sustainable water use management requires a strategic approach. Water is a common resource in Central Asia. Irrigation infrastructure in the irrigation, hydropower, water supply and sanitation sectors will change depending on specific policies in the areas of institutional, financial and management systems of water use.

Unappreciated water resources are often uncertainly distributed, inefficiently managed, and lost. An unjustified program of capital investment and irrational management of the sector can lead to disproportionate use of scarce resources.

One-sided views on water resources at the national and sectoral levels and the growing scarcity of water resources are increasingly complex challenges today. In particular, social and political disputes are a problem that poses economic challenges for countries located in different parts of the river basins. All Central Asian states have common water management problems, including:

- Lack of legal and managerial norms, as well as institutions that are economical, socially oriented and have a sustainable approach to environmental protection and are able to manage water resources sustainably;
- Insufficient participation of real participants of water use in the process and responsibility of water resources management;
- Deterioration of the water system, low operational efficiency, rapid increase in infrastructure and water distribution costs due to the fact that a large part of the infrastructure has reached its economic and spiritual obsolescence;
- Cases of disproportionate management of water resources leading to losses and water shortages;
- Interstate and intersect oral conflicts in the lower and upper reaches of rivers;

- Uncertainties in water resources data (meteorology, groundwater reserves, hydrological forecasting).

CONCLUSION

In order to address the above problems, the concept of development of water resources of the Republic of Uzbekistan for 2020-2030 has been developed in our country.

This concept envisages sustainable water supply of the population and all sectors of the economy in the Republic of Uzbekistan in 2020-2030, improvement of reclamation of irrigated lands, widespread introduction of market principles and mechanisms and digital technologies in water management, ensuring reliable operation of water facilities and land and water resources. The following main tasks have been identified in order to increase:

Improving the system of forecasting, accounting and database formation of water resources and ensuring transparency;

- Modernization and development of water facilities (except for drinking and sewage systems), automation of management of large water facilities on the basis of digital technologies, widespread introduction of modern technologies that save electricity and other resources, attract foreign investment and targeted and ensure efficient use;
- Ensuring the safety and reliable operation of reservoirs, flood reservoirs and other water facilities;
- Improvement of water resources management system, introduction of “Smart Water” and similar digital technologies in water use and water consumption accounting;
- Further expansion and encouragement by the state of the introduction of water-saving irrigation technologies in the cultivation of agricultural crops, attraction of foreign investments and grants in this area;
- Improving the reclamation and sustainability of irrigated lands, helping to increase soil fertility, reducing soil salinity and applying effective technologies to prevent it;
- Introduction of the principles of market economy in water management, including the system of gradual reimbursement of part of the cost of water supply by water consumers, timely and quality repair of water facilities, the introduction of digital technologies and effective management;
- Introduction of public-private partnership and outsourcing in water management, allocation of separate water facilities for use by farmers, clusters and other organizations, and directing the saved funds to the modernization of water facilities and remuneration and incentives for staff;
- Introduction of the principles of integrated water resources management, guaranteed water supply to the population, sustainable supply of water to the economy, improving water quality and maintaining the ecological balance of the environment;
- Development of interstate relations on the use of transboundary water resources, development and promotion of mutually acceptable mechanisms for joint management of

water resources and programs for the efficient use of water, ensuring a balance between the interests of Central Asian countries;

- Training of qualified personnel for the water sector, improvement of the system of staff training, development of cooperation between education, science and industry, as well as the introduction of scientific achievements and know-how into production;

ABSTRACT

Subcutaneous (SCIT) and sublingual (SLIT) immunotherapy methods are more commonly used to deliver the allergen to the patient. Both methods are able to alter the natural course of the disease and prevent the emergence of new sensitivities [6]. The use of ASIT leads to a reduction in the symptoms of the disease, a decrease in the need for treatment, and in addition has a long-term clinical effect by preventing the development of allergies and its symptoms. Treatment affects the underlying immunological mechanisms responsible for the development of clinical symptoms.

KEYWORDS: Allergic rhinitis, Pediatric, Immunotherapy, Unsatisfactory.

INTRODUCTION

ACADEMICIA: An International Multidisciplinary Research Journal
<https://saarj.com>

Among the current issues of modern allergology, the problem of allergic rhinitis (AR) in children occupies a special place [2, 4, and 5]. Allergic rhinitis is one of the most common allergic diseases in childhood [1, 3]. This disease is a worldwide problem because it has a high specific gravity (60–70%) in the composition of allergic pathology and is common in the pediatric population (10–15%), emphasizing its importance [6].

Given the impossibility of eradicating an allergen of significant importance and the short-term effects of pharmacotherapeutic effects, allergen-specific immunotherapy (ASIT) is the most effective treatment for AR and is important [1].

Subcutaneous (SCIT) and sublingual (SLIT) immunotherapy methods are more commonly used to deliver the allergen to the patient. Both methods are able to alter the natural course of the disease and prevent the emergence of new sensitivities [6]. The use of ASIT leads to a reduction in the symptoms of the disease, a decrease in the need for treatment, and in addition have a long-term clinical effect by preventing the development of allergies and its symptoms. Treatment affects the underlying immunological mechanisms responsible for the development of clinical symptoms.

MATERIALS AND RESEARCH METHODS

The study was conducted in the pediatric allergology department of the Tashkent Medical Academy Multidisciplinary Clinic and examined 79 sick children with a diagnosis of AR. The age of the patients diagnosed with allergic rhinitis was 6 to 12 years, and the mean age of the patients was 9.1 ± 0.31 .

All patients were interviewed prior to admission to the clinic to diagnose or confirm “Allergic Rhinitis”. The survey was developed and adapted by the international ARIA program. The questionnaire consists of 2 main questions and 10 sub-items. Small items have “yes” or “no” answers.

The diagnosis was made according to the international classification of ARIA. During the study, all 40 patients were diagnosed with AR interstitial course and 39 patients were diagnosed with AR persistent. The skin irritation method was tested in all patients, where sensitivity to different groups of allergens was determined. ASIT was performed in 35 patients with hypersensitivity: SCIT in 40 patients with AR for 3 years and SLIT in 16 patients. The effectiveness of allergen-specific immunotherapy was evaluated on a 4-point scale:

"4 points" - a very good result (complete absence of symptoms after a course of treatment);

"3 points" - a good result (significantly improves nasal breathing, restores olfactory function, rhinorrhea and sneezing are only in great contact with allergens);

"2 points" - a satisfactory result (the main symptoms are less noticeable than before treatment, the need for drug treatment is reduced);

"1 point" - unsatisfactory result (no effect from treatment).

The data obtained were processed using the SPSS statistical software.

RESULTS AND DISCUSSIONS

According to the results of Key Question 1, the following questions were answered during a survey of 79 patients. Aqueous discharge from the nose was detected in 40 patients (100%), and in 20 children (17.8%) - a small amount of mucous discharge. Sneezing and nasal congestion were observed in all children in the study (100%). Difficulty breathing through the nose was observed from mild to non-nasal breathing at all. Itching of the nose was confirmed by all patients, persistent itching was noted in 32 patients (28.5%), moderate itching - in 45 patients (40%).

In answering question 2, all patients denied unilateral nasal symptoms, and nasal congestion was observed without other symptoms, confirming the presence of an allergic process. Thick discharge from the nose to the throat was observed in 16 (20.3%) patients and mucosal-purulent discharge in 7 (8.8%) patients, indicating the presence of other otolaryngological pathology. Recurrent nosebleeds, watery rhinorrhea, and forced nasal congestion occur in 45 (40%) patients. In 70 patients (88.3%), odor insensitivity was identified as an additional symptom of AR.

Thus, the survey identified allergic rhinitis in all children, as well as pathology of the otolaryngological organs, which required further detailed definitive diagnosis.

Next, we analyzed the age at which the first symptoms of AR were observed. The first symptoms of AR were recorded at 5.9 years of age. The mean age for referral to AR and clinical diagnosis was 9.1 years. It should be noted that 3 years elapsed from the onset of the average AR symptoms until diagnosis. The non-parametric analysis method identified the formation and late diagnosis in 74 patients (95.5%) and noted timely referral in 5 (4.5%) patients. Thus, the above study confirmed global data on delayed referral to specialists. The distribution according to the severity of patients with AR showed the following: in patients with intermittent AR, the severity was observed in 32.5% (13), moderate (42.5% (17) and mild - 25% (10) cases.

Mild persistent AR was not observed, the mean level was recorded in 22 patients (43.6%), and the severe level was recorded in 17 patients (43.6%), $r < 0.05$. It should be noted that children with a mild level of AR are excluded from the scope of medical examination, parents do not correctly interpret the symptoms of AR in children, and only consult a doctor when the level of AR worsens.

In group 1 patients with intermittent AR, an exacerbation of the disease was observed mainly from June to mid-July. In the group of pollen allergens, sensitivity to cereals was most often detected - in 40 (74.1%) patients. Sensitivity to weeds from the group of pollen allergens was observed mainly in wormwood pollen - 35 (54.9%), sensitivity to tree dust - 7 (13%) and poplar in 5 (11.1%) patients. Epidermal sensitivity was noted in 3 individuals (7.5%). Children in the examined patient group were found to be hypersensitive to household products.

Patients in group 2 with persistent AR showed high sensitivity to pollen and household allergens. Skin sensitivity to weed allergy was predominant in 56 (96.6%) patients. In 49 patients (84.5%), sensitivity to grass and cereal dust was found to be unusual. Among pollen allergens, sensitivity to tree dust was lowest in 6 patients (10.3%). Sensitivity of the skin to household allergens was detected in almost half of patients with persistent AR - 25 (43.1%). The following were identified from the spectrum of aeroallergens: *Dermatophagoideus farinae* - 13 (22.4%), *Dermatophagoideus pteronissinus* - 16 (27.5%), library dust - 6 (10.4%) patients. Epidermal allergens were also identified: dog hair - 3 (5.1%), cat hair - 8 (13.8%) and pillow feathers - were observed in 10 patients (17.2%) who were in constant contact with the allergen.

In this study, patients underwent ASIT based on data obtained after skin scar analysis. Subcutaneous immunotherapy was performed in 19 patients from group 1 (47.5%) and 21 patients from group 2 (52.5%) with intermittent AR in 40 patients. After 1 course of subcutaneous immunotherapy, good results were observed in 6 (31.6%) patients with intermittent AR in group 1 and in 5 (23.8%) children with persistent AR in group 2, only during the disease season and in contact with allergens. The result was satisfactory in 10.5% of cases due to the exacerbation of AR symptoms.

Subcutaneous ASIT significantly improves the effectiveness of treatment in both groups of patients, taking into account the dose of allergens delivered each year. In all patients in group 1 with intermittent AR, treatment results were found to be positive (89.5%) within 3 years after receiving ASIT, but were satisfactory in 10.5% because the disease was seasonal and contact with allergens led to an increase in AR symptoms. In 31.6% of cases, the treatment outcome of patients was good, which was explained by significant contact with allergens and cross-sensitization in the use of binding allergens i.e. observation of episodic recurrence of AR symptoms. In 57.9% of patients, very good results were obtained after the completion of the entire course of treatment, in this category of patients neither the use of binding allergens nor significant contact with allergens showed AR symptoms. Positive results were observed in 66.7% of children with persistent AR in group 2 after 3 years of treatment. In this group of patients, good and satisfactory results after treatment were 33.3% and 42.9%, respectively. After 3 courses of ASIT, the efficacy of the subcutaneous treatment method in group 2 with persistent AR was statistically confirmed ($r < 0.05$).

To assess the effectiveness of the received therapy, skin scarification tests were repeated in all groups after ASIT by subcutaneous method, taking into account the sensitization spectrum after 1-2-3 years. In the 1st group of patients with intermittent AR after the course of treatment, a positive trend was observed in 18 (94.7%) children after 1-2-3 years, a strong, direct correlation between treatment efficacy and skin scarification test results was $r = 0.512$. statistically confirmed ($r < 0.05$).

After ASIT treatment in group 2 of children with persistent AR, only after the 2nd and 3rd courses of treatment, positive dynamics was noted in 12 (57.1%) patients, which was confirmed by the results of a skin examination - showed a direct and strong correlation $r = 0.537$, $p < 0.05$.

The sublingual ASIT method was performed in 31 patients with AR. All patients were divided into two groups: 16 (51.6%) children with intermittent AR in group 1, 15 (48.4%) patients with persistent AR in group 2 underwent 3 courses of treatment, and at the end of each course to assess the effectiveness of ASIT skin tests were performed.

After ASIT sublingual treatment, a positive result was observed in 14 (87.5%) patients in group 1 with intermittent AR and in 13 (86.6%) patients in group 2 with persistent AR ($r < 0.05$).

Exacerbation of seasonal AR symptoms was observed only in 4 (25%) children in group 1 with intermittent AR and in 2 patients (13.3%) in 2 groups with AR after 3 courses of sublingual ASIT.

Complete clinical remission of the disease was confirmed with positive dynamics after 2 and 3 courses of ASIT in 100% of patients in group 1 with intermittent AR; a very strong relationship was found $-r = 0.946$, $r < 0.01$. No complete clinical remission of the disease was detected in

group 2 patients with persistent AR, but a positive trend (partial clinical remission) was observed after ASIT in 11 (73.3%) patients. In this group of patients, disease progression was observed, and during ASIT, patients may not always follow a hypoallergenic regimen and diet, i.e., are more likely to interact with allergens [6].

CONCLUSION

1. It is recommended that the questionnaire proposed by the ARIA program be implemented at the primary care level. It is recommended to use the questionnaire method for pre-clinical diagnosis and diagnosis of otolaryngological pathology in children with suspected AR, as well as AR, and timely consultation with specialists.
2. The data obtained are a priority in the development of a strategy of preventive measures aimed at preventing the development of AR and lead to early detection of AR in children.

ABSTRACT

The article provides information on the aim of our work is to study the biological features of the species of the genus hawthorn, in connection with their introduction in the conditions of the Southern Aral Sea region. Introduction of new plant species is an important issue for the Republic of Karakalpakstan, characterized by severe soil and climatic conditions. Hawthorn was first introduced in England in 1750. Already in the XVIII and XIX centuries, hawthorns appeared in Holland, France, Denmark, and Sweden, but only up to 40 species were used in landscaping. In many botanical gardens of the former USSR in the 1930s-1940s, work began on the introduction of hawthorns into culture.

KEYWORDS: Hawthorn, *Crataegus L.*, introduction, flowers bloom, vitamins, flora, Botanical Gardens, Southern Aral Sea region.

INTRODUCTION

The generic name of the hawthorn *Crataegus* comes from the Greek word «cratanos», meaning strong, sturdy. This name was given to hawthorn for its outstanding durability (up to 400 years), resistance to adverse conditions, and for its strong, solid wood. Sharp thorns - that is what people noticed when they first met this plant [2, p. 272].

Hawthorn was first introduced in England in 1750. Already in the XVIII and XIX centuries, hawthorns appeared in Holland, France, Denmark, and Sweden, but only up to 40 species were used in landscaping. In many botanical gardens of the former USSR in the 1930s-1940s, work began on the introduction of hawthorns into culture [1, p. 222].

A number of research papers are dedicated to the study of hawthorn. A. Raeder points out that more than 1000 species of hawthorn naturally grow in North America. According to the scientist, the genus has 1250 species worldwide, of which 1125 species grow in America [8, p. 514-577].

In the Botanical Gardens of Central Asia, work on the introduction began in the post-war years. In Central Asia, the introduction and study of the biology and ecology of hawthorn was first carried out in the central botanical garden of the Republic of Turkmenistan [10, p.10-15].

Especially widely in Central Asia, work was carried out in Uzbekistan, the collection of hawthorns was considered the largest in the post - war years, it numbered 120-130 species [1, p.222].

The introduction of new plant species is an important issue for the Republic of Karakalpakstan, characterized by severe soil and climatic conditions.

Taking this into account, along with local breeds, it is necessary and possible to introduce new breeds from the flora of other zones in order to create a rich and diverse planting material of fast-growing, long-lasting ornamental trees and shrubs for the early implementation of landscaping in the populated areas of the Republic of Karakalpakstan.

Among the many plants introduced by the Karakalpak branch of Academies of sciences of Republic of Uzbekistan of Botanical Garden, species of the hawthorn genus *Crataegus* L. from the Rosaceae family are of great interest.

Plants of the genus Hawthorn (*Crataegus* L.) according to the traditional classification and the structure of the flower and fruit belong to the family of Rosaceae (*Rosaceae* Juss.), the subfamily of Apple trees (*Maloideae*) [11, p.611]. The scientific name of the genus comes from the Greek words *crata* (strong, strong) and *agein* (lead, act).

Hawthorn - *Crataegus* L. belongs to the Rosaceae family. These are trees or large shrubs, in the best growing conditions it reaches a height of 10-15 m, most species have a height of 5-8 m. The maximum trunk diameter of 40-50 cm is noted in some species of American hawthorns. Deciduous, rarely semi-evergreen trees 3-5 m., sometimes up to 10-12 m in height, often multi-stemmed or growing or fractured, in some species exfoliating with small plates [5, pp. 57-62,].

The flowers bloom in spring or early summer later than the leaves – a period when the latter have not yet reached normal size; protogenic, honey-bearing, but have an unpleasant smell and are pollinated mainly by various flies, as well as beetles and bees; at the end of flowering, when the stamens are fully developed, self-pollination is also possible [8, p.514-577]. Inflorescences are

corymbose or umbellate, in a few species the flowers are single or two or three, a corolla of five petals, columns from one to five, stamens from 5 to 20, their color is diverse. The fruits are apple-shaped, spherical, ellipsoidal or pear-shaped, yellow-orange, red or black [3, p. 154-155].

Many species of the genus of hawthorns, for example, Altai hawthorn – *Crataegus altaica*, blood-red hawthorn – *C. sanguinea*, Almaati hawthorn – *C. almaatensis*, Songarsk hawthorn – *C. songarica*, Korolkov's hawthorn – *C. korolkovii* – ornamental, fruit, medicinal, vitamin plants, at the same time they are resistant to adverse conditions of our republic, well tolerate salinity and dryness of the soil. All species can tolerate shading, but in open areas they develop well and bloom profusely.

PURPOSE AND OBJECTIVES OF THE STUDY

The aim of our work is to study the biological features of the species of the genus hawthorn, in connection with their introduction in the conditions of the Southern Aral Sea region. Introduction of new plant species is an important issue for the Republic of Karakalpakstan, characterized by severe soil and climatic conditions.

Taking this into account, along with local breeds, it is possible and necessary to introduce new breeds from the flora of other zones in order to create a rich and diverse planting material of fast-growing, long-lasting ornamental trees and shrubs for the early implementation of landscaping in populated areas of the Republic of Karakalpakstan.

In the conditions of the city of Nukus, in 1989, several scientists studied the appearance of vegetative and reproductive organs on the buds of some species of the genus hawthorn [5, p. 57-62, 4, p. 145-147].

RESULTS AND DISCUSSION

In the Botanical Garden of Karakalpak branch of Academies of sciences of Republic of Uzbekistan, it grows from March 25 to October 30. The growth of shoots is observed from April 9 to May 20, with an annual increase of more than 25 cm. In the conditions of the garden, the pinnately cut hawthorn grows well, does not suffer from dry air, it is quite winter and frost-resistant. It is of great interest as an ornamental plant. Suitable for creating hedges. Because of beautiful flowers, it is bred in gardens and streets for decorative purposes. It grows in a variety of soil and climatic conditions, both in mountainous areas and on plains with forest and steppe vegetation, and has very broad adaptive properties, which greatly facilitates its introduction in new conditions.

Introduced hawthorn species in the conditions of Karakalpakstan grow intensively in April-May, when the relative humidity is quite high and the temperature is relatively low. During these months, most hawthorn species show the greatest growth compared to other months. During this period, plants are provided with up to 80-90%, and in some cases the entire annual growth. The nature of the growth varies within a single plant and depends on their position on the shoot, age status, environmental conditions (light intensity, temperature, relative humidity of the air and soil).

Hawthorn is especially valued for its fruits. The fruits of many species are large, fleshy and edible. Fresh hawthorn berries can be eaten, used for making jam, marmalade, jelly [4, p. 8-10; 9, p. 25; 6, p. 145-147; 12, p. 860-863].

Ripe fruits in fresh form are soft, mealy and delicious, with little medicinal value inferior to rosehip. The sugar content ranges from 4 to 11 %, it mainly consists of fructose, so that they can be consumed in diabetes, as well as a complex of biologically active compounds — tri terpenic acids (oleic, ursolic and krategic), choline and acetylcholine, quercetin, tannins, phyto sterols, tartaric and citric acid, vitamins A, C, P. The acid content is small and ranges from 0.26 to 0.93%. The vitamin content reaches: vitamin C-31-108 mg/% (in American species up to 257.3 mg/%), vitamin P-330-680 mg/%, carotene 2-4 mg/% (in American species up to 75 mg/%). Fruits contain quite a lot of pectin, which not only forms jelly during processing, but also removes heavy metal salts and other harmful compounds from the body [7, p.287].

The use of hawthorn in medicine has been known for a very long time. Dioscorides wrote about this plant: "It is a tree covered with thorns... It has small fruits, similar to apples, but smaller. They are red, sweet, and each fruit has three grains." Later Avicenna wrote: "The fruit of this tree is round and edible, tart to the taste. Hawthorn binds more strongly than rowan, suppressing bile and locking up the flow more strongly than any other fruit" [2, p. 272].

In ethno science, hawthorn was used for palpitations, insomnia. The fruits were widely eaten fresh, as well as in the form of flour made from dried ground fruits. Sweetbread was baked from this flour. Hawthorns are great honey plants. Honey collected from their flowers is famous for its wonderful aroma and healing properties.

The hawthorn tree serves to protect nature, protects the soil from wind and water erosion. In the practice of green construction, for landscaping squares, parks, alleys, hawthorns are planted both in groups and alone. They make very beautiful hedges.

ABSTRACT

The article deals with the issues of the species structure of fish living in rice fields and their formation, the intensification of fish farming in the modern conditions of the water regime in the southern Aral Sea, the rational use of young fish in rice fields for further breeding.

KEYWORDS: *Fish Fauna, Fish, Southern Aral Sea Region, Rice Fields, Reservoir, Rational Use.*

INTRODUCTION

Currently, rice fields with internal irrigation channels, collector and drainage systems in the southern Aral Sea region occupy a huge water mirror, and it has a great impact on both the life and distribution of fish. In this regard, the problem of rational use of these valuable fish is very important. Therefore, it is necessary to use different types of reservoirs of the agricultural zone of the Republic for fish farming with the greatest efficiency. Fish enter rice systems annually during the irrigation period from the Amu Darya riverbed (including the Karakum canal systems) and the fish fauna of rice, collector and drainage systems of the lower reaches of the Amu Darya is formed by these. In our discharges of rice systems, almost all the main commercial fish species that live in the Amu Darya riverbed, the Karakum canal and their reservoirs (Tuyamuyun, Kurtlin, Kopetdag, and Sauskhan) are noted [1, 1218-1221; 2, pp. 227-229; 6, pp. 75-76].

Material and methodology

Materials were collected from rice fields and reservoirs during the summer periods of 2017-2020. The fishing gear is a 15.0 m long fry drag with a cell size of 0.2 mm, a 20.0-meter long dragnet (2.0 m high, 1.5 m long ball bag, 0.6 mm cell size) sheathed with gauze inside. The captured young fish were fixed with 4-6% formalin solution, then the species composition was measured, weighed and determined in the laboratory. [3, pp. 107.]

Purpose and objectives of the study

The aim of the study is to determine the species composition of fish and to develop ways of rational use of bio resources in the southern Aral Sea region. They can serve for the development of fisheries in these reservoirs, along with local farms to provide the population with fresh fish products and preserve them in changing habitat conditions.

RESULTS AND DISCUSSION

The rice fields and the KS-1 reservoir are home to 19 species belonging to seven families. Of these, 9 species are representatives of native fish fauna, 10 species are acclimatizers. The largest number of species, as in natural reservoirs, belong to the cyprinidae family (13 species, *Rutilus rutilus aralensis* Berg, *Aspius aspius iblioides* Kessler, *Ctenopharingodon idella* (Valenciennes), *Pseudorasbora parva* (Temminik & Schlegel), *Chalcalburnus chalcoides aralensis* Berg, *Alburnoides taenitus* Kessler, *Abramis brama orientalis* Berg, *Parabramis pekinensis* (Basilewsky), *Hemiculter leucisculus* (Basilewsky), *Carassius auratus gibelio* (Bloch.), *Cyprinus carpio* Linnaeus, *Hypophthalmichthys molitrix* (Valenciennes), *Aristichthys nobilis* (Richardson.), and the rest of the family – Siluridae, Ophiocephalidae, Percidae, Adrianichthyidae, Poeciliidae, Gobiidae contain only one species (Table 1).

TABLE – 1 SPECIES COMPOSITION OF FISH IN RICE FIELDS AND RESERVOIRS IN THE SOUTHERN ARAL SEA REGION

The data about the fish fauna of rice fields and reservoirs given below is mainly related to the Kizketken canal, feeding from the Amu Darya river, often rolling larvae from the Tuyamuyun reservoir end up in irrigation channels.

In rice fields, there are mainly larvae, fingerlings and yearlings, and even mature ones are also found in reservoirs, and they are unevenly distributed in terms of species and quantitative composition.

The most numerous species both in the reservoir and in the rice fields is the white silver carp and it makes up more than 60% of the total catch. The abundance of white carp in rice and collector-drainage systems persists until the end of the growing season. The size of fingerlings in rice fields by the end of the growing season ranged from 6.5 to 9 cm, and in the KS-1 reservoir near checks ranged from 7.8 to 47 cm. In deep water places far from the checks there are large sizes of white carp (from 20 to 70cm). It should be noted that in the rice fields, as a rule, there are more flickering white young silver carp than in the main reservoir.

This is probably due to the fact that the larger young white carp, getting to the rice fields, still comes out when discharged to the collector, while the younger part of the population, which does not have the strength to overcome the obstacles encountered in significant numbers, remains in the fields until the end of the growing season.

During the water discharge from the fields, some numbers of young fish go out into the discharge channels and fall into the main collectors, and in the main collectors the depth reaches 1.5-2 m and in such places they winter until the next year, when all the checks after the growing season dry out. The white amur in the rice fields of the lower reaches of the Amu Darya river was 18.6%, and this is the second largest indicator after the white carp. The size of the white amur caught in rice fields ranged from 7 to 10.1 cm, and in the collector of the KS-1 near the checks ranged from 12.8 to 40.1 cm. In deep-water areas, there are large sizes, both white carp and white amur. Crucian carp in rice fields and reservoirs is one of the most common species. In our catches, they occupy the third place in number, and make up 15% of the total catch. The size of crucian carp in rice fields ranged from 5 to 13.1 cm. At the end of the growing season, compared to the total catch in July, there is a slight increase in the number of crucian carp in rice fields, apparently due to its ecological plasticity. The size of common carp in rice fields and reservoirs ranged from 6 to 30.6 cm. in terms of the number of total catch, they occupy the fourth place, and is about 10%. At the beginning of the growing season, feeding on rice fields, without leaving the outlet furrows, they are kept in the checks themselves. At the end of the growing season, when water is discharged from the checks, young carp gradually leaves them in the outlet furrows, through it to the collector, and most of them remain in the rice fields. Roach, amur bream, eastern bream and gobies are less numerous than the above-mentioned representatives of rice fields and reservoirs, but they are common. In the rice fields fastfish, asp, amur chebachok, catfish, bighead carp and snakehead are found in single copies. Other types of chalcid, hemiculter, pike perch, mosquito fish, and copper fish in rice fields are not noted, and in the KS-1 all collector other 19 species are found everywhere. When compare these data obtained with the literature, about the stingray of young fish and larvae in irrigation channels, you can see a sharp change in the species composition and quantitative ratio of fish living in rice fields and the KS-1 collector.

In the Amu Darya river, larvae mostly rolled up to 80% of fish representatives of the Aral-Amu Darya fish fauna, while the Amur-Chinese complexes accounted for less than 1% [4, p. 47-57; 5, p.36-41]. Currently, the Amur-Chinese complexes account for up to 60% of the total catch. This indicator is not only typical for rice checks and reservoirs, but can also be seen in the Amu Darya riverbed and irrigation channels [2, p. 227-229]. Thus, the species structure of fish living in irrigation channels, rice fields and reservoirs continues to degrade regarding the whole Republic.

In the Republic of Karakalpakstan, rice checks cover 36,116 ha, and collector and drainage networks cover 20,454.7 km, which allows only 50% of checks and main collectors to grow 100-

150 kg/ha of fish annually. The use of rice checks for fish farming allows to get a double harvest of rice and fish from one area.

Rice checks fully meet the basic requirements for reservoirs that are intended for growing fish. The water temperature in the receipts did not exceed 35⁰. The content of dissolved oxygen throughout the entire period remained within the limits of fisheries standards (6.2 mg / l-10.7 mg/l), the pH of water changed from 6.2-9.3 [1, p.1218-1221].

Checks should be arranged so that the sprinklers and discharges are parallel to the slope. Before filling with water along the perimeter of each check, fish-breeding grooves should be made in which the fish would find shelter in low water, and secondly, during fishing, the grooves will serve to collect fish. Fish collecting ditches, in the third place, will play the role of drainage ditches, contributing to the rapid drainage of checks, which is very important when harvesting rice.

The existing checks and checks currently under construction are not suitable for fish breeding, and therefore every year in rice checks, the young of valuable fish that have been fed die irrevocably at the end of the growing season.

For effective application of the biological method in large permanent reservoirs of the southern Aral Sea region, it is necessary to stock herbivorous fish of two or three years of age, and for small reservoirs, it is necessary to launch fingerlings and yearlings of the white amur and silver carp. Preliminary preparation of an overgrown and silted reservoir, or drains for the application of the biological method, consists in sinking strictly in the center with the obligatory leaving on both sides of the passage a narrow, reed-covered coastal strip of 50-60 cm. With this preparation, almost all categories of reservoirs are made suitable for fish to live in, especially for the white amur fish, which controls the development of aquatic vegetation and provides shelter in low water.

Therefore, in order to make rational use of water resources and resilient young fish in Karakalpakstan, where the pond economy is not widely developed, the potential reserve for obtaining fresh fish or planting material without high costs is rice fields and reservoirs.

ABSTRACT

The article deals with the issues of soil salinization in the arid territories of the Southern Aral Sea region. In irrigated soils, there is a fairly even distribution of nitrates along the soil profile. The development of secondary salinization in the region can be considered as one of the existing problems that arose as a result of the widespread development of irrigation, which determined the transfer of automorphic soils. This issue requires some elaboration of new approaches to the development of irrigation in the region.

KEYWORDS: *Southern Aral Sea Region, Soil Salinization, Monitoring, Soil Physical Condition, Irrigation, Fertility.*

INTRODUCTION

Relevance of the topic

Saline soils are an indispensable component of both natural and anthropogenic landscapes of arid territories. Soil salinity is one of the main genetic indicators of arid soils, as well as a property that limits its fertility. The issues of classification, origin and agro melioration of the soils of arid territories cannot be resolved without painstaking research of saline soils, detailed monitoring of their distribution and forecast development. In connection with the growth of anthropogenic pressure, soil degradation is one of the most urgent problems of today that call for an immediate

intercession. Taking into account the actual occurrence and the natural and economic significance of the consequences, soil salinization is considered as one of the most significant types of soil degradation. One of the main environmental problems of the region is secondary salinization of land, which occurs due to increased salinity of groundwater. The Southern Aral Sea region is officially recognized as an ecological disaster zone due to existing environmental problems, such as water scarcity, soil salinization, water pollution, poor supply of high-quality drinking water to the population, degradation of pastures and arable land, and the death of tugai and saxaul forests [4, 6]. The main criterion for assessing the physical condition of the soil is the correspondence of the complex of soil properties to the nature of the functions performed by the soil in a particular landscape. In this context, the most relevant issues are the quantitative assessment of saline soils. This means that, first of all, it is necessary to establish how, and to what extent, the amount of salts affects the performance of the soil of its ecological functions through changes in physical properties.

Salinization of soils leads to the physical degradation of land and its further loss from agricultural use [1]. In turn, the physical degradation of soils serves as a trigger for a large number of natural destabilized processes. The widespread increase in the area of saline soils and the resulting reduction in arable land makes it necessary to assess the ecological status of saline soils [2, 3]. From this point of view, the protection of soil fertility and its increase is one of the main environmental problems. When using the soil, some anthropogenic processes that affect it contribute to a decrease in its fertility, and therefore it is necessary to carry out measures aimed at eliminating them.

MATERIALS AND METHODS

The research was carried out in the arid zone of the Southern Aral Sea region (Republic of Karakalpakstan), occupied by irrigated soils in shirkat farms of the central zone of the republic (Chimbay, Nukus, Kegeyli, Khodjeyli districts). The climate of the territory is sharply continental with dry and hot summers. Soil samples for determining the degree of salinity were taken by the envelope method from each site from the upper 0-30 cm layer. The content of water-soluble salts was determined in the soil samples selected and prepared for chemical analysis. The degree of soil salinity and the salinity of ground water were estimated by the content of water-soluble salts (ions) according to the method of V. Pankov [4].

DISCUSSION OF THE RESULTS

The process of soil salinization is one of the leading degradation processes in the irrigated lands of the Southern Aral Sea region. The current state of the soils in the Aral Sea region is critical. The humus content has decreased by 30-40% over the past 40-50 years, and about 60% of the cultivated areas contain less than 1% of humus. In this regard, the primary problem of agriculture in the Aral Sea region is the reclamation of saline soils and their return to agricultural circulation. The complex of environmental hazards and problems plays an important role in determining the main strategic directions for ensuring environmental safety, preventing and eliminating environmental threats [5].

Saline soils include soils containing easily soluble salts in toxic amounts for agricultural plants. They have a direct negative effect on plants as a result of an increase in the osmotic pressure of soil solutions and the toxic effect of individual ions, as well as an indirect effect through changes in physico-chemical, biological and other properties under their influence [5, 6]. Soda, then

chloride, then sodium and magnesium bicarbonates, and then sodium and magnesium sulfates show the greatest toxic effect. Gypsum, as well as calcium carbonate (unlike toxic magnesium carbonate), is not toxic, however, its presence in large quantities (gypsum bark) leads to a decrease in soil fertility [2, 3].

In irrigated soils, there is a fairly even distribution of nitrates along the soil profile, the maximum limits of their content in virgin soils are 16.4-75.2 mg/kg in the upper 30-cm layer, and at a depth of 70-100 cm – they vary within 6.3-19.2 mg/kg of soil. In soils with a low content of nitrate nitrogen compounds in virgin conditions, there is a sharp reduction in their concentration in the layer of 50-70 cm. In the low-lying layers of the soil, the reduction is no longer observed. With a high content of nitrates in virgin conditions, there is a consistently high amount of nitrates in the entire meter thickness with an accumulation in the layer of 0-30 cm and with a tendency to accumulate in the layer of 50-70 cm. In irrigated soils, there is a very gradual decrease in the distribution of nitrates along the soil profile; only in old-irrigated soils, there is a slight increase in their content in the layer of 70-100 cm.

According to researchers [9], in virgin automorphic soils, an increased amount of mineral nitrogen is observed only in the upper, 0-50 cm layer, with a sharp decrease in its content down the profile. The presence of high amounts of nitrates in the lower horizons of the soil profile is an anthropogenic factor [9, 10].

According to the depth of the upper boundary of the salt horizon, saline soils are divided into saline – salts in the layer of 0-30 cm, saline – 30-80 cm, deep saline – 80-100 cm and deep saline – deeper than 150 cm. The salt content is expressed in % and in mg-eq per 100 g of soil. In the first approximation, saline soils are considered to contain water-soluble salts of more than 0.25% of the soil weight, and salt marshes-more than 1, 2, 3%, depending on the type of salinity. A more accurate ecological assessment of soil salinity takes into account the nature of salinity (the predominant chemical composition of cations and anions), and an even more detailed assessment takes into account the amount of toxic salts [3, 4].

The analysis of the irrigated lands of the Southern Aral Sea region by soil-reclamation areas showed that the main share of soils is gray-brown soils – 55.6%, followed by desert-sandy soils – 15.7%, the smallest share is swamp-meadow, which amounted to only 0.10%. (figure 1).

The analysis of water extraction of soils (in %) showed that the main type of salinization in the studied areas is chloride-sulfate. Samples were taken at 3 main points in 5 horizons. The analysis showed that at the sampling site №2, the sulfate-chloride type of salinity was recorded in the 20-30 cm horizon, and at the sample site №3, the transition from the salinity type to the sulfate-chloride type was observed in the 10-20 cm horizon.

According to the authors, the irrigated soils of the northern cotton-growing areas in the Southern Aral Sea region were able to yield raw cotton at the level of 13-15 c/ha due to natural fertility. The content of total nitrogen is gradually reduced until 0.042 % loss of total nitrogen in recent years was 31.8% [8] there is also a significant reduction in the amount of phosphorus and potassium, but for typical stabilization of humus content in soils and its deficiency does not exceed 162-199 kg/ha.

Fig.1. Distribution of irrigated lands in the Southern Aral Sea region by land reclamation areas

It is the stable preservation of the humus content in the soils that shows a stable yield of raw cotton at the level of 13-15 c / ha [8]. The stability of the humus content is also explained by the natural ability of soils to preserve their ecological function, fertility and ensure the yield of cultivated plants, which is achieved due to the activity of soil micro flora, root residues, leaf litter, irrigation water, as well as atmospheric precipitation [7]. With an unfavorable background, the natural processes of transformation, consumption and replenishment of soil reserves with nutrients prevail in the soil [7].

Consequently, on irrigated lands, the salts contained in the deep horizons of the soil-forming and underlying rocks enter into circulation. Depending on the hydrogeological conditions, depth, and distance between drains, the volume of salts discharged from deep horizons can be from 20 to 60% of the total volume of salts entering the drainage runoff. The development of secondary salinization in the region can be attributed to the existing problems that arose as a result of the widespread development of irrigation, which determined the transfer of automorphic soils to this issue requires the development of new approaches to the development of irrigation in the region. First of all, it is necessary to conduct an inventory of irrigated land based on modern methods of remote sensing and modeling of salinization processes for individual irrigation massifs in order to determine the direction and intensity of the salt accumulation process. Already on the basis of these data, the most promising lands for irrigation should be identified and new irrigation methods, in particular, drip irrigation, should be introduced on these massifs.

ABSTRACT

The article is devoted to the study of the bio-morphological features of the Richter's saltwort (salsola richteri kar.) in the conditions of culture. Good growth of cherkez on bare sands, high seed productivity, the ability to reproduce by seeds and cuttings and tolerate significant salinity, powerful growth of the root system contributed to its promotion as a promising plant when fixing the sands.

KEYWORDS: *Root System, Vertical Direction, Horizontal Direction, Seed Productivity, Ability To Reproduce By Seeds And Cuttings, Fodder Plant, Growth And Development, Experimental Plot, Lateral Roots, Branching, Aboveground And Underground Parts, Germination And Germination Of Seeds, Cotyledons, Flowering And Fruiting, Drought Resistance.*

INTRODUCTION

Richter's saltwort (local name: Akcherkez) belongs to the Marev family - Chenopodiaceae this species is an example of complex use in phytomeliorative practice. Good growth of Cherkez on bare sands, high seed productivity, the ability to multiply by seeds and cuttings and tolerate significant salinity, powerful growth of the root system contributed to its promotion as a promising plant when fixing sands [3]. Formation and long-term preservation of large organic matter with economical water consumption, the relatively high protein content characterizes Richter's hodgepodge as a valuable forage plant for the creation of autumn-winter pastures [2,4]. In addition, Richter's hodgepodge is included in the State Pharmacopoeia. Fruits and shoots

contain alkaloid solsolidine and solsoline of Orekhov [2], which are used for hypertension and complex nervous diseases.

Based on the listed economically valuable properties of Richter's hodgepodge, scientists recommended its introduction into culture. Sokolov V.S., Petrov, Nechaeva, Prikhodko, Zaprometova [3], [4].

Despite the practical value of this species and the great attention on the part of researchers, the growth and development of Richter's saltwort, taking into account the influence of the environmental conditions of the Karakalpak part of the Kyzylkum desert.

MATERIAL AND METHODOLOGY

Richter's saltwort is one of the main food plants of The Kizil Kum. In our conditions, the culture of Richter's hodgepodge has been poorly studied. Therefore, we set ourselves the task of studying the dynamics of growth and development of the vegetative organs of Richter's hodgepodge, conducting phenological observations of the studied plants, and introducing it into culture.

The sowing soil was prepared by strip plowing. Sowing in the experimental plot was carried out in autumn and early spring.

The study of germination and germination of seeds in laboratory conditions was carried out according to the methodological instructions of MK Firsova [12], M.G. Nikolaeva and others [5]. The study of soil germination was carried out under the conditions of two experimental plots, depending on different sowing dates and the depth of seeding. Phenological observations of the rhythm and development of plants were carried out according to the method of I.N. Beideman [2]. The root system was studied using the trench method. Taranovskaya [2]. The flowering biology and seed productivity were investigated by the method of AN Ponomarev [7], IV Vainagy [6]. Morphological descriptions of vegetative and generative organs are made according to the methodology of IG Serebryakov [9], A.A. Fedorov and others [10], [11]. When studying ontogenesis, we used the scheme of age states proposed by T.A. Rabotnov [8], I.G. Serebryakov [9].

Study results

Laboratory germination. To determine the germination rate of Richter's saltwort seeds in laboratory conditions, we used seeds collected in the fall in 2015 from pure Cherkez, associations in the vicinity of the city of Nukus (near the bypass road on the sands). The experiments were carried out in Petri dishes, 100 seeds in triplicate at room temperature 18-23°C, seed germination exceeded by 30%. The absolute weight of Richter's hodgepodge seeds is 9, 25 gr.

Soil germination. With the autumn sowing of the collected seeds in 2015, the field germination rate was 16%, with the spring sowing 18%. Determination of soil germination of seeds is of great practical importance for determining their seeding rates, obtaining a certain number of seedlings per unit area. We studied the effect of storage time on the germination of Richter's hodgepodge seeds in February 2018 for various storage periods. With a long shelf life of Richter's hodgepodge seeds, their germination rate decreases after 28 months of collection and was 9.6%, and after 16 months it was 11%, after 4 months it was 32.3% (Table-1).

TABLE 1 INFLUENCE OF SHELF LIFE ON LABORATORY GERMINATION OF RICHTER'S SALTWORT SEEDS

Place of collection	Array	Date of delivery of the experiment	Duration of storage period	Date of collection, year	Germination rate
North-western The Kizil Kum	Bypass road	2.02.2018.	28	2015	9,6
		2.02.2018.	16	2016	11,0
		2.02.2018.	4	2017	32,3

Seedlings appear in March, early April. There are frequent cases of seed germination in winter. Seedling cotyledons are linear-filamentous, juicy, light green, 20-30 mm long and 1 mm thick. Hypocotyls reach 50-60mm in length. A root that penetrates 30-40 mm deep into the soil, i.e. at this stage, the development of the aboveground part dominates over the root [2].

Cotyledons are characterized by a period of 1.5-2 months, they die off at the end of May. The height of the aboveground part of the Richter's saltwort plant (at the beginning of June) is 22 cm, the length of the main root is 15 cm, the length of the lateral roots is 3-5 cm. During this period, the plants have 5-6 shoots of the first order. At the end of July, the height of Richter's saltwort reaches 113 cm, the number of internodes is 120 (Table-2).

In our experiments, in Richter's saltwort, the flowering and fruiting phase was observed in the first years of life, the beginning of flowering in July, fruiting in mid-August.

TABLE 2 GROWTH DYNAMICS OF THE MAIN SHOOT OF RICHTER'S SALTWORT

Plant name	Observation dates						
	March	April	May	June	July	August	Sept.
Richter's saltwort	4 sm	7,3 sm	19 sm	43 sm	113 sm	143 sm	146 sm

At the end of the growing season, the plant height reached 146 cm (Table 2), the number of internodes on the main shoot was 120, the plant had shoots of I-III orders. The maximum shoot length is I-order 84 cm, on some specimens the number of fruits is up to 700 pieces [3] (table-3).

TABLE-3 SOME MORPHOLOGICAL INDICATORS OF THE VEGETATIVE ORGANS OF RICHTER'S SALTWORT AT THE END OF THE GROWING SEASON

Plant name	Number of I-order shoots	Length of shoots	Number of II-order shoots	Length of shoots	Number of internodes on the main shoot	Number of fruits
Richter's Saltwort	36	84	99	41	120	13-700

It should be noted that the emergence of seedlings in the studied species was observed earlier at high air temperature and atmospheric precipitation.

In the two-year-old Richter's saltwort, the regrowth of young shoots began in the first ten days of April, simultaneously from the lateral branches and from the main shoot. The appearance of leaves begins from the lower part of the main shoot, the number of leaves is 10, the length of the

leaves is 6 cm, new shoots appear at the base of the dried shoots, they are shiny, reddish black, the trunk diameter is 1.7 cm, the bark is white. life in the first decade of May, buds appear in the leaf axils in the upper part of the fourth order shoot. The number of buds in one generative shoot ranges from 6 to 14 pieces.

The results of studies on the study of flowering and fruiting of Richter's saltwort showed that in the Karakalpak part of the The Kizil Kum, under culture conditions, it begins to bear fruit in the first year of life. Richter's saltwort blooms simultaneously from the third decade of May-June to September. Mass flowering was noted from June 1-20.

Fruiting is highly dependent on the age of the bushes. According to N.S. Zapremetova [3], in the conditions of The Kizil Kum, Richter's saltwort bushes with a stock of seeds of up to 2 kg, on average, 200 grams, are rare. We, in the North-West of The Kizil Kum, under the conditions of culture of individual bushes of Richter's saltwort in the second year of life, gave 300-600 seeds.

The root system of the three-year-old Richter's saltwort on gray-brown soils and on sandy soils form numerous shoots of the first and second orders, and shoots of the third order are formed.

On gray-brown soil, the length of the roots reaches 130 cm, and on sandy soil, 152 cm. Their lateral roots reach 119-136 cm, the diameter of the main root is 1.2-1.7 cm, and the lateral roots are 0.6-1.2 cm. The number of lateral roots of the first order is 20-25 cm [3].

The concentration of the root system of Richter Saltwort in the soil layer, i.e. their penetration depth and volume depend on the age of the plant and on the type of soil.

The study of the dynamics of the underground part of Saltwort Richter shows i.e. gives the basis to consider that the formation of roots continues and there is no inhibition of growth in the fifth year of the growing season [3].

CONCLUSION

As a result, it was revealed that the underground part of the Richter Saltwort, deepening significantly in the first year of life, continues to develop intensively in subsequent years. Thanks to the powerfully developed root system, a large volume of soil is cooled and provides itself with moisture.

It should be noted that, under the conditions of culture, Richter's saltwort begins to grow in early April, bloom in June. In mid-September, lionfish appear on the fruits, in the second half of October the first ripe fruits appear, in early November they fully ripen, which means that this species develops normally, goes through the entire development cycle, self-seeding is annual, surviving without agrotechnical care.

ABSTRACT

This article describes family law, the basic principles, functions, system, rules of family law. In particular, opinions and conclusions in this area are given. Even in today's rapidly changing globalization, Uzbekistan believes that its future is in the development and respect of the family, which is one of the priorities of state policy to build a modern, exemplary and prosperous family, enriching our traditional values. In practice, all of this implies an obligation by the state to establish and maintain kindergartens, maternity homes, including hospitals, and to provide benefits and benefits to low-income families or single mothers.

KEYWORDS: *Family, Family Law, Principles, Monogamy, System, Convention, Declaration, Marriage.*

INTRODUCTION

The family is described as a stronghold, a sacred place, a place of love. After all, the family is a small homeland within the homeland, the blood vessels of the homeland. If it is strong and loving, the country will prosper. Our enlightened ancestor Abdurauf Fitrat said: "The happiness and glory of any nation, of course, depends on the internal discipline and harmony of this nation. Peace and harmony, on the other hand, rely on the discipline of families of this nation. The stronger the discipline of the family, the stronger and more powerful the country and the nation," he wrote.

The family is the most important pillar of society and the state, leading in social development. It is well known that the family is important in the life of any person, society and country. For man, the family has always supported all spiritual and economic activities, the essence of life, not only the state, but the whole world order. Even in today's rapidly changing globalization, Uzbekistan believes that its future is in the development and respect of the family, which is one of the priorities of state policy to build a modern, exemplary and prosperous family, enriching our traditional values. In turn, on the basis of the analysis of universal and national family values, a comprehensive priority is given to the definition of modern, exemplary family criteria and the promotion and inculcation of the constitutional principle of "Family in the protection of society and the state."

Family law is a set of rules governing non-interrelated relations arising from the adoption of citizens for marriage, adoption, guardianship and custody of minors, family, upbringing of children. Family law is an independent branch of law that regulates relations arising from forms of marriage, consanguinity, pedigree of the child, placement of children deprived of parental care. Family law is a set of legal norms governing the family, an individual relationship of a material nature formed as a result of marriage between people, adoption for the upbringing of children, and mutual relations. Levushkin considers it necessary to understand the range of persons involved in mutual rights and obligations in the field of personal property and non-property relations, arising on the basis of kinship, marriage, custody and other legal evidence on the basis of family relations.

Family relations are a basic principle in the field of family law. Family relationships occur in the following legal situations.

1. Marriage
2. Dissolution of marriage
3. Relationships between spouses
4. The relationship between parents and children
5. Family relations
6. Child support
7. Deprivation of parental rights
8. Child custody
9. Covers relationships such as inheritance.

The priority of family law is to build and strengthen the family, to establish relationships in the family. Family law includes mutual consent, monogamy, equal rights in family relations, proper upbringing of children, concern for their health, education, development, including parental care. Consists of principles that incorporate them. One of the first principles of family law is state support and protection of the family. In practice, all of this implies an obligation by the state to establish and maintain kindergartens, maternity homes, including hospitals, and to provide benefits and benefits to low-income families or single mothers. Another important principle of family law is that the state only recognizes marriages registered with the marriage registration office.

The principle of voluntariness of family law, based on the principle of equality of husband and wife, prohibits any unreasonable restrictions on family rights. In family relations, all citizens, regardless of nationality, language, gender and religion, all family problems, disagreements and other elements of family law are resolved only by mutual consent of husband and wife. The voluntary feature of a marital relationship between a husband and wife is a free voluntary union of a man and a woman based on marriage, monogamy, or monogamy. The spouse is also not bound by the will or consent of other persons to marry. Family law regulates relationships that require regulation by the country. These include the relationship between the couple, the relationship between the children, the relationship between the parents and the children, other members of the family, which are related to the termination and annulment of the marriage, the registration of civil status acts. The basic principles of family law are equality between husband and wife, equality of other spouses in all family matters, equality in marriage, protection of motherhood, upbringing of minors, regardless of nationality, race, religion and gender. 'care, monogamy, freedom of divorce, mutual cultural and spiritual support of the participants of family relations and care for each other are among the principles. The basic rules of the family are that their norms are binding on all because they are included in the sources of family law. These include strengthening the family, mutual respect and love in the family, the fact that all family members live on the basis of responsibility and mutual assistance to the family, not to allow anyone to interfere in family affairs without the consent of family members, to exercise their rights. covers rules such as unimpeded implementation. Articles 12, 16, and 25 of the 1948 Universal Declaration of Human Rights cover the area of family protection. Article 16 of the Declaration states that "The family is the natural and fundamental group unit of society and is entitled to protection by society and the State." Indeed, society is interested in a strong, spiritually and morally healthy family. Therefore, the society pursues a policy of strengthening the family, helping it to perform its social functions, raising children and improving the living conditions of families.

Article 8 of the Convention for the Protection of Human Rights and Fundamental Freedoms provides for the strengthening of the right to respect for family life. Respect for family relationships is, of course, one of the elements of law enforcement. Indeed, we can see that in the life of every society, special attention is paid to family relationships.

The 1989 Convention on the Rights of the Child is an important document in the field of family rights. The family, as the basic unit of society and the natural environment in which all members, especially children, develop and mature as individuals, must be provided with the necessary protection and assistance to carry out the tasks assigned to them. .

The system of family law is its structure, the structure of the institutions of individual norms in a particular direction. The system of family law is objective, it reflects the specific features of social relations that form the subject of family law and the unity of the separation of interrelated institutions.

In short, the family is a free association of people on the basis of voluntariness and the most rights, distinguished by commonality, social, moral, economic and other conditions and interests. The family carries out the most important social tasks, such as raising children, their physical and spiritual development, living in a family environment, mutual assistance, ensuring the economic and social development of society.

ABSTRACT

The article reflects the views of our great scholars on pedagogical education and the art of education and their activities. An experienced educator says that first of all, each student should take into account his feelings and direct him to the goal.

KEYWORDS: Education, Upbringing, Art Of Upbringing, Inspiring Art, Compulsory Method, Ethics, Social Environment, Heredity, Biological Factor, Activity, Activity, Psychological Mechanisms, Perspective, Mnemonic, Figurative Activity, Level Of Education.

INTRODUCTION

The development of society, national well-being has always been associated with the education of the younger generation, new personnel with deep knowledge of modern knowledge, their high qualifications. It is the responsibility of the youth to build on the achievements of the older generation and the experience they have gained, to further enhance the scientific, economic, cultural and educational potential of the country.

"The art of education is familiar and understandable to almost everyone, and to some it may even seem easy, the clearer and easier it seems, the less theoretically and practically it is known to that person," said KDUshinsky. Education is mainly provided by: demonstration and explanation; encouragement and punishment; assignment and demand; verification and correction, persuasion and analysis. In this way, adults create and direct children's cognitive and practical activities, and these activities are monitored, corrected, and developed.

There are two types of pedagogy. The first method is for those who are interested in (inspiring) art. The second method (coercion) is the method used to educate foster children. An example of this is the way teachers use students or teachers. For example, the government or the state will be the teacher and educator of the people living in that country. A parent is a teacher who uses a variety of methods to bring up children. It is clear that the government and the teacher are both teachers and educators who give to children or workers in their own way. One of them raises children with kindness and kind words, and the other raises them compulsorily.

Educational work is also carried out as an ideology that expresses the ideas of Naqshband. In addition to teaching children to believe in Islam, the scholar teaches them to love work, to be moral, to help people, to get an education, to learn a trade, and other virtues. In mosques and madrassas, the right and effective way to be close to God in the minds of students is to live for the happiness of society, not creativity, but to value creativity and hard work, and to acquire knowledge and knowledge. In order to achieve perfect morality, in short, the ideology that embodies the character, the effort, which requires active participation in the life of society, has been gradually absorbed.

An experienced educator, first of all, takes into account the feelings of each student and directs him to the goal. Creates the conditions to manage them.

According to Ibn Sina, man feels the need for things beyond the nature and natural phenomena that surround him, he creates things only by labor, but he cannot do these things only by his own labor, in order to create them others must also participate or the team should help. To do this, team members need to have a good relationship with each other. This relationship is formed through language, meaningful sounds. Man acts consciously and knows the result of this action, that is, he thinks about the future. Acting with a clear purpose protects a person and a team from bad deeds, directs them to do good deeds, and creates a sense of confidence in them. According to Ibn Sina, life, the life force, comes in three forms. Manifested in the form of plants, animals and humans. Man has these three vital forces and the mental power that is unique to man. The highest expression of the nafs is the intellect, which is unique to man.

Pedagogical conditions of personal development in the process of vocational education. The role of social environment in the formation of personality is invaluable. There are many examples of how the development of hereditary traits depends on a person living in a social environment. If a human being falls into another environment, say, an animal environment, rather than a social one, some biological manifestations of hereditary traits will be preserved, but there will be no human thought, activity, behavior (in 1920, Dr. Singh of India, a wolf near Midnapur) the lives of the girls Kamola and Amola, who found it in their nest, are an example of this).

Hereditary traits are among the objective factors in shaping a person. Humans inherit the anatomical structure of the body, physiological movement, nerve type, basic unconditioned reflexes. Behaviorism, pragmatism, and biogenetic currents, which highly value the role of biological factors in human personality and behavior and link the individual to the offspring, are some of the representatives of which say that the human child acquires all the characteristics of the future. and mental ability is also passed down from generation to generation, he says. Some even link a child's mental development to heredity.

Educational work is also carried out as an ideology that expresses the ideas of Naqshband. In addition to teaching children to believe in Islam, the scholar teaches them to love work, to be

moral, to help people, to get an education, to learn a trade, and other virtues. In mosques and madrassas, the right and effective way to be close to God in the minds of students is to live for the happiness of society, not creativity, but to value creativity and hard work, and to acquire knowledge and knowledge. In order to achieve perfect morality, in short, the ideology that embodies the character, the effort, which requires active participation in the life of society, has been gradually absorbed.

An experienced educator, first of all, takes into account the feelings of each student and directs him to the goal. Creates the conditions to manage them.

According to Ibn Sina, man feels the need for things beyond the nature and natural phenomena that surround him, he creates things only by labor, but he cannot do these things only by his own labor, in order to create them others must also participate or the team should help. To do this, team members need to have a good relationship with each other. This relationship is formed through language, meaningful sounds. Man acts consciously and knows the result of this action, that is, he thinks about the future. Acting with a clear purpose protects a person and a team from bad deeds, directs them to do good deeds, and creates a sense of confidence in them. According to Ibn Sina, life, the life force, comes in three forms. Manifested in the form of plants, animals and humans. Man has these three vital forces and the mental power that is unique to man. The highest expression of the nafs is the intellect, which is unique to man.

Pedagogical conditions of personal development in the process of vocational education. The role of social environment in the formation of personality is invaluable. There are many examples of how the development of hereditary traits depends on a person living in a social environment. If a human being falls into another environment, say, an animal environment, rather than a social one, some biological manifestations of hereditary traits will be preserved, but there will be no human thought, activity, behavior (in 1920, Dr. Singh of India, a wolf near Midnapur) the lives of the girls Kamola and Amola, who found it in their nest, are an example of this).

Hereditary traits are among the objective factors in shaping a person. Humans inherit the anatomical structure of the body, physiological movement, nerve type, basic unconditioned reflexes. Behaviorism, pragmatism, and biogenetic currents, which highly value the role of biological factors in human personality and behavior and link the individual to the offspring, are some of the representatives of which say that the human child acquires all the characteristics of the future. and mental ability is also passed down from generation to generation, he says. Some even link a child's mental development to heredity.

The role of biological factors in human formation is important and unique, the importance of heredity is undeniable, human characteristics - mental and physical ability to work, thinking and speech can also be innate, but these innate possibilities for development, the human child must have a human environment, live among people, interact with people, participate in social life, and follow certain rules of etiquette.

The role of the social environment in the formation of great people is important, of course, Alisher Navoi - a poet, Einstein - a physicist, Ulugbek - an astronomer, Ibn Sino - a doctor, of course. The social environment and education played an important role in the development of their talent buds. The role of the environment in the formation of personality is also reflected in the policy of our state on the education of harmoniously developed people

Education plays a leading role in the formation of a person. Education is the acquisition of reading, writing, labor, skills and abilities that are not spontaneously affected by heredity and the environment, and even congenital defects are changed in a certain direction (deaf, blind, training the dumb) can also eliminate negative deficiencies caused by environmental influences.

It is no coincidence that today in our country attention is paid to gifted, talented and gifted children, and these young people are said to be the future of Uzbekistan. The introduction of the Nihol Prize, the Zulfiya Prize, Abu Ali Ibn Sino, Abu Rayhan Beruni and Presidential Scholarships is also a manifestation of the attention paid to young people.

The role of the concepts of "activity" and "activity" in the development of the individual is invaluable. Great people have worked hard to achieve great things in their fields. One can achieve great heights with one's aspiration and activity, and one must work on oneself in order to realize one's abilities and talents.

"Human activity is closely related to the concepts of 'Action', 'Activity' and 'Behavior' and is concerned with the individual and his consciousness." It is through various activities that a child is formed and expresses himself

This means that student activity is not a passive process, but an active process that is consciously controlled. That is, activity is a specific form of activity that is guided by the mind and thinking of the student, arises from the needs of the various districts in it, and is aimed at changing and improving the external world and self. It is an activity in which the student learns the essence of real objects in the classroom through a specific solution within his imagination, to discover new discoveries.

If in the process of teaching there is a transition to mental processes based on external activities, such a process is called internalization in psychology, and vice versa, the transfer of ideas formed in the mind directly to external actions or external activities is called externalization.

Activities also vary according to the degree of direct involvement of the mind. At the beginning of some actions, each element needs to be taken seriously, individually, and all the attention - the attention, the direction of the mind. But over time, that is likely to change, and more parts will be automated.

The great scientist, thinker Abu Nasr al-Farabi, emphasizing the important role of activity in the development of the individual, divides its types into several stages and describes the methods of implementation, time and space, physiological mechanisms. puts forward the idea.

One of the most important elements of professional pedagogical training is the acquisition and application of at least a simple method of determining the personal and character traits of students. Teachers of higher and secondary special educational institutions often focus on the study of the mental abilities of students - young people, but the continuing education of the problems of correcting their levels of education (in the broadest sense) and behavioral disabilities do not try to interpret it in terms of a single membership and integrity in the system, to find its solutions. The intellectual development of pupils and students depends to a large extent on independent thinking and general level of education. One of the most important requirements of our time is to diagnose the level of their upbringing, to study the features of their spiritual and enlightenment development, and, if necessary, to eliminate their moral defects.

Upbringing and education Understanding the pedagogical culture of the past is useful not only for teachers, educators, future educators, but also for everyone, parents. After all, everyone, the parent, is the educator of their child and the other children are the educators of the self-disciplined teenagers who interact with them.

ABSTRACT

Work is an integral part of everyday life, as it is our livelihood or career or business. On an average we spent twelve hours daily life and it is the one third of our entire life. Research on quality of work life is considered to be more important at the individual and organization level. Quality of work life is considered for both the employees and organization and it is involved with job satisfaction, productivity, job involvement, job enrichment etc. The success of any organization is highly dependent on how it attracts recruits, motivates, and retains its workforce. Today's organizations need to be more flexible so that they are equipped to develop their workforce and enjoy their commitment. This study is made attempt to analyses the "Quality of work life". In order to improve quality of work life, various coping techniques have been suggested to upgrade the employee's attitude towards their job and the working environment in the organization

KEYWORDS: *Quality, Business, Work Life, Productivity, Job, Environment*

INTRODUCTION

Quality of work life Movement initially a loosely organized network of a few dozen academics in the early 1970's, the QWL Movement had grown by the 1980's into an international grouping of trade union officials, personal managers and social scientist generally. QWL will have direct and indirect relationship with the economic and social well - being of large portion of population

which lies beyond the domain of Industry. Improved QWL naturally helps to improve the family life of the employees and world also improves the performance of the Industry/ enterprises. This article reviews the meaning of QWL, various definition of QWL and determinant of QWL based on the reviews. Improving the Quality of Work Life, barriers and Issues of QWL described. However, there is positive and significant relationship between QWL and employees' job satisfaction. QWL practice involves acquiring, training developing, motivating and appraising for the best performance of the employees as per Organizational objectives. QWL provides for the balanced relationship among work, non -work and family aspects of life. We therefore, have undertaken this study influence of workers QWL

II) STATEMENT OF THE PROBLEM

Employees at the grass root level experience a sense of frustration because of low level of wages, poor working conditions unfavourable Terms of employment, by their superiors And the like where as managerial personnel feel frustrated because Of alienation over their conditions of employment, inter personnel Conflicts, role Conflicts, job pressures, lack of freedom in work, Absence of challenging work etc....

Job discontent and job pressures have their substantial effect on employees health in the form of reduction in general happiness increase in smoking drinking and putting on excess body weight etc....Frustration weight also be due to absence of recognition , tedious work, unsound relations. This can be improved by better quality of work life.

III) DEFINITION

QWL improvements are defined as "any activity, which take place at every level of and organization, which seeks great organizational effectiveness through enhancement of human degree and growth... a process through which stake holders in the organization – management ,unions and employees learn how to work together better....to determine for themselves what actions ,changes and improvements are desirable and workable in order to achieve the twin and simultaneously goal both the company and the unions".

According to Richard E.Walton, 'QWL is a process by which an organization responds to employee needs for developing mechanisms to allow them to share fully in making the decisions that design their lives at work.

Quality of work life (QWL) concerns about employee commitment morale and skills during a period of downsizing, organization full bought and rapid technologies change recognizing the achievement of missions and goals require high performing employees to address work force issues balancing personal & professional life is a challenge that we must meet balance, in my view, makes us more successful in all aspects of our lives.

Human resource departments are involved with efforts to improve productivity through changes in employee relations. QWL means having good supervision, good working conditions, good pay and benefits and an interesting, challenging and rewarding job. High QWL is sought through an employee relations philosophy that encourages the use of QWL efforts, which are systematic attempts by an organisation to give workers greater opportunities to affect their jobs and their contributions to the organisation's overall effectiveness. That is, a proactive human resource department finds ways to empower employees so that they draw on their "brains and wits," usually by getting the employees more involved in the decision-making process.

IV) QWL PROGRAM HAVE BEEN FOUND TO

- Improve work place morale
- Encourage employee commitment
- Support recruitment
- Encourage retention
- Enhance productivity
- Reduce absenteeism and
- Maximize staff resources.

Criteria for Measuring Quality of work life :

Richards E. Walton explains QWL in terms of right broad conditions of employment that constitute desirable QWL. The proposed sense criteria for measuring QWL. There criteria/conditions include:

- Adequate and fair compensation
- Safe and health working conditions
- Opportunity to use and develop human capacities

Opportunity for Career Growth

Opportunities for promotion are limited in case of all categories of employees either give to educational barriers or limited openings at higher level QWL provides opportunities, knowledge and Qualification.

Social Integration in the Work Force

This can be established by creating freedom from prejudice, supporting primary work groups, a sense of community inter personal openness, egalitarianism and upward mobility

Constitutionals in Work Organization

QWL provides constitutional protection to the employees only to the level of disability on such matters as privacy, free speed, equity and due process.

V) SPECIFIC ISSUES IN QWL

Trade unions claim that they are responsible for the improvement in various facilities to the workers where as management takes credit from improved salaries benefits and facilities.

Pay and Stability in Employment

Good pay still dominates most of the other factors in employee satisfaction. Various alternative means for providing wages should be developed in view of increase in cost of living index, increase in levels and rates of income tax and profession tax. Enhancing the faculties for human resources development can provide stability to a great extent.

Occupational Stress

Stress is a condition of strain on one's emotions, thought process and physical condition .it is determined by the nature of work, working conditions, working hours pause in the work schedule.

Worker's abilities and nature and match with the job requirements. Stress is caused due to instability, hypes excitation or depression, unstable behaviour, fatigue stuttering, trembling psychosomatic pains, heavy smoking and drug abuse stress adversely effects employee's productivity. The hr manager, in order to minimize the stress, has to identity, prevent, and tackle .the problem. He may arrange for the treatment of the problem with the health unit of the company.

Organizational Health Programs

Effective implementation of health programs result in reduction in absenteeism, hospitalization disability, excessive job turnover and premature death. They should also cover relaxation, physical exercise, diet control etc

Alternative Work Schedule

Alternative work schedules including work at home, flexible working hours. Staggered hours, reduced work week, part time employment that may be introduced for the convenience and comfort of the workers.

Participative Management and Control

Workers feel that they have control over their work, use their skills and make a real contribution to the job if they are allowed to participate in creative and decision making process.

Recognition

Recognizing employee as a human being rather than as a labour increases the QWL. Participate management award and reward system, congratulating the employee for their achievement, job enrichment, offering prestigious designation to the jobs , providing well furnished and decent work place offering membership in clubs or associations , providing vehicles or some of the means to recognize the employees.

Congenial Superior and subordinate relationships

Harmonious supervisor worker relations give the workers sense of social association a sense of belongings; we should not ignore the impact of social relations at the work place the productivity resulting from this.

Grievance Procedure

Workers have a sense of fair treatment' when the company gives them the opportunity to ventilate their grievances and represent their case succinctly rather than settling the problems arbitrarily.

Adequacy of Resources

Resources should match with st4ted objectives; otherwise, employees will not be able to attain the Objectives. This results in employee dissatisfaction and lower QWL

Seniority and Merit in Promotions

Seniority is generally taken as the basis for promotion in case of operating employees. Merit is considered as the basis for advancement for managerial people whereas the promotional policies and activities should be fair and just in order to ensure higher QWL.

VI) METHODS TO IMPROVE QWL

Flex time the employees are given freedom to choose their own work schedules, the quality and productivity of their work increases.

Flexi place

Flexi place gives an employee the freedom to select the location of work. This kind of arrangement requires a formal commitment between the employer and the employee.

Alternative work schedule

This helps employees work for a certain number of hours every day, though the schedules differ from the traditional work schedule.

Part time employment

This option has fixed days hours each week or flexible schedule. Part time employees work for less than 35 hour per week.

Compressed work week

CWW helps employees the week from five to two, three or four days depending on the work number of hours they do the work. CWW results in lower turnover, increased satisfaction and employee morale, decreased overtime.

Job enrichment

The program redesigns employee jobs to give freedom and responsibility in achieving their work goals.

Job enlargement

This program aims at making an employee's job more challenging and rewarding by adding more duties and tasks to the existing ones. This increases the employee's self esteem and satisfaction.

VII) STRATEGIES TO IMPROVE QWL**Self managed work teams**

These are also called as autonomous work groups or integrated work teams, they are formed with 10 to 20 employees who plan co-ordinate and control the activities of the team with the help of a team leader who is one among them.

Job redesign and enrichment

Jobs can be redesigned to later the changing needs and thereby help employees in increasing their worth. Jobs redesigned enrich and satisfy the higher order human needs.

Effective leadership and supervisory behaviour

Organization should aim at adapting the most effective, style of the leadership and a congenial leadership between both the managers and supervisors is essential.

Career development

Provision for career planning, communicating and counselling the employees about the career opportunities, career path, education and development and for second career should be made.

Alternative work schedules

This provides for flexibility in working hours and part time jobs. This will also helps working couples and students security. This is one of the most important motivating factors and tops the employee's priority list and needs to be adequately taken care off.

Participative management

This creates sense of pride and responsibility among the employees organization adopt various strategies in this regard "Quality Circles" being the most popular among them.

CONCLUSION:

Organization should focus on the benefit that are aimed to words self improvement of the employees. Organization need to maintain the appropriate balance of work. Opportunity for career growth should improve. Benefits provided by the organization are very good to satisfy the employee personal needs. Teamwork in the organization is very good. Organization should focus on the training sessions in order to motivate the employees. Organization need to provide scope for the employee development. There is no discrimination at work place. The relationship with superior at workplace is good. On the whole the quality of work life good.

THE ROLE OF PROGRAMMING AND USE OF PROGRAMMING PRODUCTS IN PEDAGOGICAL ACTIVITY

Ulasheva Shakhlo Tagaevna*

*Lecturer Teacher,
TATU karshi Branch, UZBEKISTAN

ABSTRACT

In today's age of technology, information technology and their products, such as programming and programming products, have entered every field. As these industries merge with each other, development and modernization are taking place. The results of the analysis show that the use of such technologies and their products in pedagogical organizations increases the efficiency by a minimum of 30% to 45%. In this study, the results of the observation and analytical work are described and summarized.

KEYWORDS: *Information technology (IT), Multimedia, Computer, Pedagogue.*

INTRODUCTION

Multimedia is a rapidly evolving modern information technology. Its distinguishing features include the following:

- Different types of information: traditional (text, tables, ornaments, and others), original (speech music, video clips, TV shots, animation, etc.) in one software product. In day various devices for recording and displaying integrated information: microphone, audio systems, optical CDs, television, VCR, video camera, computer using electronic musical instruments performed under management;
- Work at a given time, text that is static by nature, and unlike graphics, audio and video signals are only known for time will be considered in the interval. Computer processing of video and audio data and the rapid mobility of the centre processor to display data signal | the bus has high bandwidth, RAM and video memory capacity external memory (mass memory), volume and computer input-output channels the exchange rate will need to be doubled;
- A new level of "human-computer" interactive communication, in which In the process of communication the user receives a much wider and more comprehensive information to improve

the conditions of study, work or leisure allows. Teaching and staffing students through multimedia retraining is a topical issue today.

MAIN PART

In developed countries, this method of teaching is the current form of education applied in the field. In fact, every family is multimedia without tools. Multimedia tools 1981 the annual turnover is 4 billion. USD, and in 1994 it was 16 billion USD and now everyone is selling you can't imagine a computer without multimedia. Of computers the loss of jobs in the field of education in the 70's, primarily due to their extremely low productivity. Practice shows that teaching students through multimedia is twofold is equally productive and time consuming. Knowledge based on multimedia tools You can save up to 30% on learning, and the knowledge gained is stored in memory will last a long time. View student submissions (video), the retention of information increases by 25-30%. In addition, the training materials are in the form of audio, video and graphics given in aggregate, the memory retention of materials increases by 75%. This is another aspect of our multimedia learning process made sure there are.

Innovative technologies in the science of programming technologies Ways to increase the effectiveness of education through Knowledge, experience and interactive methods of pedagogical technology and pedagogical skills ensure that students acquire knowledge and advanced skills. In this section, we will talk in detail about innovative technologies.

A modern teacher must be able to use and implement innovative methods in the educational process.

Requirements for the teacher in this process:

- know the concept of innovative technology, the essence of its content;
- know the role and place of innovative technologies in the implementation of educational goals;
- Principles of application of innovative technologies in science to know;
- Knowledge of educational and business games;
- Knowledge of problem-based developmental teaching methods; Innovation is an English word meaning "to innovate" means.

To improve the quality of innovative socio-cultural objects is a system of action of focused social actors and is expected forms a system of news that leads to results.

- Organize and provide independent student activities know the ways;
- Improving students' ability to work independently mastery of methods;
- know and master the methods of visual teaching;
- Exemplary teaching using advanced pedagogical technologies take classes;
- know and master the methods of activating education.
- Mostly full of interactive methods in its implementation used.

Initially, distance learning is far from geographical schools and academic education. However, development of modern information and telecommunication technologies allowing the natural

educational process to take place over long distances gave. As a result, distance learning is becoming more and more popular widely used in schools, businesses and manufacturing enterprises and was another impetus for the use of new teaching methods. Distant Analysis by the International Council on Teaching Based on the Methodology Today, more than 10 million students around the world are taught in this way are taking. A new course of study in the United States based on this method centers are being built. Thus, they are the modern requirement of national cadres Progress is being made in training and retraining.

Fig.1. the effectiveness of programming and the use of its products in pedagogy

CONCLUSION

The hierarchical decomposition of the software product is as follows directions. Software product design from top to bottom. — Software product design is one of the main stages in its organization. A well-designed program can be written poorly. But a poorly designed program cannot be written well. Van Tassil. The initial goal is that detection errors will require major changes not only to the software, but also to it. Accordingly, software projects can be divided into 3 groups.

In short, no matter how advanced the capabilities of a personal computer, if they cannot connect to each other, their rich potential cannot be fully exploited. For example, Tashkent State Technical University has about a thousand personal computers, almost all of which are actively involved in the educational process. If they weren't connected, about a thousand people would be running around the building with floppy disks. If it is a matter of collecting students' test results, then it is possible to collect the results on floppy disks, although it is more inconvenient. However, if we sell tickets to the plane in this way, then it is safe to buy several tickets in one place. That's why computers need to be connected to each other. The challenges of creating multimedia teaching aids and their future performance are further complicated by the variety of technical tools and instruments. This creates certain difficulties, and often it is not possible to use different training programs in a single course. These courses are designed in a single scheme and the courses are placed on the floors of this scheme. The incompatibility of the computer fragments of the course is not an easy problem to solve, either in terms of the technique of

organizing a dialogue with the student and the logic of construction, which arises in the absence of this single scheme. Even the different use of the control keys and buttons and their placement on the screen can cause inconvenience and lead to a loss of teaching efficiency as the student moves from one course to another.

THE RELATION BETWEEN NAMES AND LANGUAGE

Ismatova Nodirakhon Makhmudovna*

*Teacher,

Kokand state Pedagogical Institute,

UZBEKISTAN

Email id: nodiraismatova1981@gmail.com

ABSTRACT

The reason for the spreading of elements of dialects is the influence of natural factors, the diversity of people's migration to regions their interregional connection and many other causes can be mentioned. The specificity of geographical names lies in the fact that along with naming and identifying objects they reflect, capture and retain social and historical facts in the development of the society, bringing ideological messages from the past to our daily lives. An important constituent of grammar is the syntax, determining the way words should be connected together into larger semantic conglomerates. Most names start their existence as such a semantic conglomerate.

KEYWORDS: *Interregional, Conglomerates*

INTRODUCTION

Various differences of language units in different regions, dialect of the region depend on a number of ethno linguistic factors. The reason for the spreading of elements of dialects is the influence of natural factors, the diversity of people's migration to regions their interregional connection and many other causes can be mentioned. As a consequence, firstly we need the naming of the area and origins of the place. As the geographical names, toponyms are the great scientific and practical importance, they play a great role in socio-educational, scientific function. So toponyms are studied for different purposes as they are learned in a number of spheres of life, for instance: geography, social sciences and philology.

A researcher of Central Asia's geographical names E. M. Mirzayev introduces seven ways of learning purposes of toponymy:

- What type the name or the geographical object belongs to;

- The origin of the geographic name;
- What language does it belong to?;
- Meaning and etymology;
- Compliance with grammatical rules and etymology;
- How to translate to other languages;
- Habitat and migration.

Toponyms are considered to be the product of a definite period and have become the property of the people. In the past, the people were nomadic or semi-sedentary, as a result they were scattered in different regions.

Scientists semantically divide toponyms into different types or several groups:

1. Names denoting a sign of a natural condition which they consist of a few words without an element. Some of them which are connected with the names forest-vegetation relief, names with land, water, soil etc. can be examples of some toponyms of Uzbekistan: Qiziltepa, Yakkatut, Beshtarak, Uzunsoy, Kaltaqul, Yemanjir etc.
2. Names related to socio-economic events, ethnic composition of population, furthermore, some names related to labor skills, transportation, well-being of the population. For example: Dehqonobod, Qozoqqishloq, Charmgar, Kashtachi, to'qimachi, So'zangaron etc.
3. Location, number, type of geographical component of geographical object denoting names – Avstriya, Severo, Morsk city, southern Chinese sea, Ushkani Islands etc.¹

Currently, a name is given to an object or a place, the language of the name-giver provides both the elements needed and the structure to join them together. The elements consist of semantic and morphologic units – units of meaning and form - called *words* and *morphemes*. The formers are the smallest units that can occur independently, even more smaller particles as suffixes and affixes forming part of them. The structure can be given in the form of a set of rules called *grammar* that defines the way the language can be used to understand and communicate the meaning. An important constituent of grammar is the *syntax*, determining the way words should be connected together into larger semantic conglomerates. Most names start their existence as such a semantic conglomerate. Moreover, most of the names are given according to the people or nations who survive there.

From a global point of view, obviously not all language families are as important, as far as numbers measure importance. More than 75% of all languages belong to only 10 of the 100 recognized families, while judged by the numbers of speakers; two-thirds of the world population speak languages belonging to only two families (Indo-European and Sino-Tibetan). To the topographic-cartographic toponymist, however, other numbers may be even more relevant: after all, the number of geographic names to be dealt with is not so much dependent on current numbers of speakers, as it is on the geographic extent of the area to be surveyed and the scale of mapping the survey is carried out for. Topographic map series of a certain scale use to cover a complete country, irrespective of differences in population density.

Just like in the context of toponymy numbers of speakers do have another weight than they have from a general linguistic point of view, the question whether or not a language is being officially recognized as such also has less importance in a toponymic sense. This so-called question of linguistic status – is a specific system of common speech to be considered a real “independent”

language or alternatively, “just a dialect” of a “real” language? – can be answered differently depending on the considerations of who is asked. Political considerations in this may prove to be dominant above any linguistic criteria.

In conclusion, there are a great number of place names in every language, all of them have their own importance and actuality in the nations. The specificity of geographical names lies in the fact that along with naming and identifying objects they reflect, capture and retain social and historical facts in the development of the society, bringing ideological messages from the past to our daily lives. Toponyms are regarded as a result of human cognitive activity, establishing relations between different entities in the world and expressing this relationship in the created name. Onomastic units represent the world the way we live in, the way it is seen, learnt, comprehended and reflected.

PEDAGOGICS OF FORMATION OF FUTURE TEACHERS ' SOCIAL OUTLOOK IN THE CONDITIONS OF INFORMATIZATION OF EDUCATION

Sidikova Zulfyaxon Murodjon qizi*

*Lecturer,

Department of primary education methodology of Fergana State University,
UZBEKISTAN

ABSTRACT

In the article the organizational and pedagogical conditions of readiness of future teachers for the project activity in conditions of digitalization of education are analyzed. The structure of readiness is defined, which includes the following components: motivational-value, content procedural, organizational-managerial, reflex-appraisal. The motivation-value component is aimed at stimulating the motivational attitude of the students to the project activity, understanding its significance for future pedagogical activity. The content-procedural component is aimed at the phased development of the project activities, including the entire life cycle of the project: research, planning, development, deployment and quality assessment. The organizational and management component is aimed at the organization of interaction between teachers, students, administration of the university, developing strategic goals, predicting the result of project activities, performing diagnostics and control in project management. The impact-assessment component is aimed at the formation of a reflective readiness for the project activity. Materials and methods: When writing the article, the following methods were used: theoretical and methodological analysis and synthesis of existing special domestic and foreign scientific and methodological literature, a conceptual analysis of scientific articles and publications. An interdisciplinary scientific and theoretical analysis of the problem was conducted on the subject of the research, as a result of which the conclusion was made that the organizational and pedagogical conditions for the readiness of future teachers for the project activity are to be developed. Results: The set of organizational and pedagogical conditions necessary and sufficient for the successful formation of the project activity of future teachers in conditions of digitalization of education is justified. The program of experimental and

experimental research of the readiness of future teachers for the project activity on motivational-value, substantive-procedural, organizational and managerial, reflective-evaluative components is implemented, ensuring objectivity, complexity, consistency of monitoring and evaluation of the results of project activities. Discussion and Conclusions: The willingness and ability of future teachers to carry out project activities in the digital environment will effectively organize the educational process in the digital age

INTRODUCTION

Informatization of education can be identified as one of the most significant trends today. Currently, there are a wide variety of initiatives that support the informatization of education, from state initiatives to individual higher education institutions and specific projects implemented within the framework of certain training programs.

At the same time, the informatization of education faces some obstacles. Currently, government initiatives are overcoming the classic problem of logistics for educational institutions, but a much more significant problem is the resistance of the participants in the process itself.

The problem of resistance to innovation of participants is sufficiently thoroughly considered in the works of a number of authors. In particular, articles by V. Lykova and I. Marakushina are devoted to this problem.

The experience of participation in the implementation of projects related to the informatization of education at any level allows the author to say that most often it is school teachers and higher school teachers who assess informatization as a significant threat to the current state of affairs and established pedagogical practices.

There are often two lines of resistance here. The first line of resistance is that any actions related to the informatization of education are evaluated by teachers and teachers as an additional burden that is not related to the educational process, unpaid and therefore not worth attention. Separately, we note that the objectives of this work do not include consideration of the qualitative characteristics of teachers' motivation, we can only fix such an objection and state its comparative prevalence.

Interestingly, this "extra workload" is very rarely perceived by teachers at school and teachers at the university as a way to optimize their daily work. In the vast majority of cases, teachers do not use the opportunities implemented within the framework of informatization projects to reduce the current workload or redistribute it. In particular, the use of ICT in higher education allows to significantly optimize the process of preparing teachers for classes, significantly simplifies the control of individual work of students and – in some cases – the assessment of students' knowledge.

The second objection is that the use of ICT significantly impoverishes the process of communication between both the teacher and the student, and students among themselves. In contrast to the first objection, which can be corrected if appropriate information support is provided for projects on informatization of secondary and higher education, the second objection

cannot be compensated within the framework of an information campaign and requires a meaningful scientific analysis, partially undertaken in the work of V. A. Lykova.

For our work, it is essential to fix this objection: the use of ICT in the educational process significantly reduces the communication potential of the educational situation and therefore critically negatively affects educational results. A full and detailed inventory of this objection goes far beyond the scope of our work. However, the argument itself certainly deserves attention: the learning process is really built on the communication of the student and the teacher, and therefore changes in communication may well have an impact on the results of the learning process.

MATERIALS AND METHODS

We are faced with the need to answer an additional question: what kind of learning outcomes are we talking about and, accordingly, what kind of educational outcomes should we pay attention to in the framework of our research.

To answer this question, let us turn to the recently established division of soft skills and hard skills in training. Usually, this division can be simply interpreted as the division of professional skills and skills related to interaction and coordination of joint work.

Obviously, within the framework of our analysis, it does not make sense to discuss professional skills and their formation on several grounds. First, different skills are formed in different training programs, and the significance of the communication situation for such skills may vary.

Secondly, the subject of our analysis is not the formation of professional skills. Professional skills or, in other words, the direction of training of students can serve as a variable by which groups are combined and compared.

Information technology individualizes the student. The purpose of ICTs in training is precisely to promote an individual approach. At the same time, for a number of specialties (especially for the specialties "human — human"), social competence is no less important than professional competence. That is why it can be assumed that the work in this regard is more significant for the specialties of the class "person – person", including pedagogical ones.

The key contradiction that is important for our work is the following: on the one hand, various forms are introduced into training that individualize the student, thereby excluding him from group interaction and thereby making it difficult to form social competence. On the other hand, the requirements for the skills of cooperation, group interaction and teamwork are currently as high as possible.

The above considerations allowed us to formulate the hypothesis of the work: we assume that in the case of active use of ICT in the teaching of a student group, the communication potential of the educational situation decreases, and such a group will differ in a relatively low level of development of social competence.

In a statistical sense, the basic hypothesis is formulated as follows: there are statistically significant differences in the level of social competence between a group in which information and communication technologies are actively used in the educational process, and a group in which these technologies are used with significantly less intensity.

CONTENT OF SOCIO-MORAL QUALITIES OF CHILDREN THROUGH TV SHOWS

Ortikova Zulfiya Nurmaxamatovna*

*Lecturer,

Department of Primary Education Methodology of Fergana State University,
UZBEKISTAN

ABSTRACT

This article deals with issues relating to the social and moral education and development of preschool children. The theoretical understanding of the current state of this field is reflected in the modern normative documents "On education in the Uzbekistan", the state educational standards. The analysis of theoretical and practice-oriented research in this area shows that the phrase "moral education" today is gradually being replaced by "social and moral education" and "social and moral development preschool children that many relevant diagnostic methods are aimed at: to explain the actions of children and their relationships with each other and adults and to assess these actions (i.e., to correlate the situation with the moral norm). The analysis of the results showed that children of senior preschool age willingly include themselves in the retelling of the actions described in situations but find it difficult to assess what is happening from a moral point of view. It is obvious that psychological and pedagogical work is necessary in this direction, taking into account the age characteristics of the children, as well as the social and moral guidelines relevant to the current situation in regard to the development of society.

KEYWORDS: *Social and moral development preschool, Moral guidelines relevant, Relevant diagnostic methods.*

INTRODUCTION

Television is an important part of every child's life. From witnessing the magic of superheroes to tuning into horror weekends, children go through an immersive experience through television and live in the bubble of their own world. Sometimes, this bubble becomes a cause for concern, depending on the types of shows being watched. Television builds character and personality and

even has the power to change attitudes and perspectives towards life. Taking extra care will ensure that your child enjoys TV shows without being exposed to the ill-effects of watching TV.

MATERIALS AND METHODS

Formation of moral qualities in primary schoolchildren, perfection as a comprehensively mature, beautiful, kind person is one of the important tasks of the present day. Because this comes from the issue of increasing the effectiveness of education and training in the process of restoring national value and spirituality. In the study of this problem, it is necessary to take into account the individual characteristics of the students in order to properly conduct primary education on a scientific basis in the successful implementation of the task facing psychologists. It is known that in order to establish an exemplary activity for the formation of the personality of the reader, it is necessary to first determine the level of purposeful content of their character traits and personality traits. After determining each student morally, there is an opportunity to be in an individual relationship with the subject obtained separately. The personal qualities of 8-10 Senior Primary School students are unstable; the simple, quick-giving to external manifestations. As noted by the great scientists, the character of a person is more formed in the initial knowledge of his than anyone else, and the quality of in these qualities is greatly strengthened and becomes the second nature of the child. In the second nature of the child, all responsibility for the content of positive emotions, personality qualities, the formation of high moral qualities in them falls on the responsibility of primary schoolchildren. At this age of the student, every question that the teacher says, every behavior, manner of interaction, passes the role of a criterion of truth for him. Thus, the personality of the child is a very complex psychological category, which is gradually formed under the influence of certain concrete factors during the individual of the individual. According to scientific sources, the human personality is contained in the influence of three syllables. The first of them is the influence of the external social environment in which a person is born, the second is the influence of social education – upbringing, which is systematically given to a person for a long period of time, and finally, the third is the influence of hereditary factors, which are given to a person by procreation.

In the development of the psyche of Man and the content of his personal qualities

The role of external, social environment and upbringing has a decisive role. But man

The content of his person, as we have already mentioned above, only to these two

Not only is the third Factor connected. These are some of the ways of factor degeneration

It is the influence of anatomical and biological features. For example, the structure of the body,

The color of the hair and eyes, the voice, the manner of speaking, some characteristically

Can be given. But it should never be forgotten that a person will never his psychic characteristics, that is, his attributes related to the mental side off spring cannot be given by the way. Finally, in rare cases, some disadvantage, for example,

Musical, mathematical abilities can be given in a genealogical way.

In order for such opportunities to be realized, that is, to be able to starve, of course

There must be certain conditions. At present, it has grown among our people

Talented scientists, engineers, inventors and poets, the state and the public by genealogy to figures, talented artists, artists and other people any conditions for the entry of all the given opportunities into the field roof of arrival.

Where there is no spirituality, neither progress, nor happiness, nor the future will be. It is known that in every society the fate of the future is as if in the hands of successive generations, the level of spiritual and cultural perfection of each nation is primarily the upbringing of individuals it seems. What is the spirituality and culture of any person who thinks about the prospect takes care about the formation.

Tasks set before the organization of spiritual and moral work

It consists of:

Formation of moral qualities in Primary School Students Society

To reveal its role in development and the importance of absorbing it into the minds of individuals;

Spiritual with the adoption of the national program of Personnel Training

To show further improvement of moral work and what has been done in this matter generalization of works;

Spirituality, Enlightenment, ideology in the organization of spiritual moral work deny the interconnectedness, relativity of their concepts, the second of which the use of them generalized in the educational process of not doing possible explanation, etc.

Spiritual-enlightenment and ideological propaganda work is never the same as now it has not become an actual vase.

MODERN TECHNOLOGIES OF INCREASING THE WEALTH OF STUDENTS IN NATIVE LANGUAGE EDUCATION AND WORKING WITH DICTIONARIES

Buvajonova Mohiraxon Usmonali qizi*

*Lecturer,

Department of Primary Education Methodology of Fergana State University,
UZBEKISTAN

ABSTRACT

This paper aims to investigate and implement various uses of technologies in language education in the 21st century. Research explored in this paper show that there are a wide variety of technology to choose from, either offline or online media. Teachers and students who are digital immigrants can benefit from integrating technology in their learning and teaching. If only these teachers and students understood the importance of and practiced Network-based language teaching and e-learning skills.

KEYWORDS: *Wide variety of technology, Implement various uses of technologies, Digital immigrants.*

INTRODUCTION

Education is a collaborative activity of the teacher and students, in the process of which the development of the individual, his / her knowledge and upbringing are also carried out. In the lessons, the teacher achieves his knowledge, skills and skills to the students through training, while the students will have the ability to use it as a result of their assimilation. In the process of learning, students use different forms of assimilation, that is, they rely on specific discrepancies in the perception, processing and application of the assimilated information. In the educational process, issues of education and training in the form of interaction of teachers and students at the time of classes, independent performance of students, extracurricular work are solved.

The purpose of education is formed in accordance with the need of society. Therefore, the purpose of education should be appropriate and proportionate. It was noted that the purpose of education in the scientific literature is to create the right, accurate, appropriate use of the opportunities, skills and skills, develop logical and creative thinking, increase communicative

literacy, integrate the National idea, form shakana education, the expression of spiritual enrichment of a person. On the basis of educational purpose, the culture of their communication is improved by independent thinking, increasing oral and written literacy, developing logical thinking. On the basis of educational purpose, spiritual, ideological, spiritual education is provided. In the process of language learning, it becomes possible to approach the cultural and moral values of the people.

One of the great wise. "...As long as you live with the anxiety of the future, give your children good knowledge, read". It would not be a mistake if we say that the reforms carried out in the educational system of our country in the real sense were not a work aimed at achieving efficiency in a two-year or short period, but a change in the real sense for several hundred years. This shows that the wise policy lies at the time of the idea that all the children of our country – my children, they should be stronger, educated and of course happy than us, worrying about the future of our president, our future generation.

MATERIALS AND METHODS

It is known that the introduction of advanced pedagogical and new information technologies in education not only increases the effectiveness of training, but also plays an important role in the upbringing of an independent and logical thinking, comprehensively high spiritual person by applying the achievements of Science in practice.

Currently, interest in the application of interactive methods and information technologies in the educational process is increasing day by day. One of the reasons why this happens is that by this time, in traditional education, students are taught to acquire only ready-made knowledge, while the use of modern technologies teaches them to search for the knowledge they possess, independently study and think, analyze, and even draw the final conclusions themselves. The teacher in this process creates conditions for the development, formation, acquisition and education of the individual and at the same time performs the function of management, directing. Today in education, modern technologies such as "smart attack", "Mind attack", "networks" method, "Sinkveyn", "BBB", "fifth plus", "6x6x6", "discussion", "role play", FSMU, "work in small groups", "rounded snow", "Zigzag", "let me say The Last Word" are used.

It will give a positive result if it is used in the lessons of repetition or strengthening of the game-tasks during the lessons. The choice of what kind of a game task should depend on the type of lesson, the level at which students are taught to perform the game tasks, their level of knowledge, the possibilities of independent creative work, the ability to quickly restore the learned in memory, the extent to which creativity is also formed.

In education, attention is paid to the issue of thinking the personality of the reader, understanding the thoughts of other people and teaching this idea to make literate statements in oral and written form, the main role is played by the perfection of an independent thinking, speech culture developed literate person. The lifestyle, cultural creativity of the nation is studied on the basis of its rich historical heritage.

ACKNOWLEDGEMENT AND RESULTS

Today, the teacher requires the use of advanced pedagogical and new information technologies in the educational process. Proceeding from the above, based on our experience, we will describe our thoughts on the ways of teaching and learning through the use of interactive techniques in the

lessons. We think that it will provide practical assistance to our colleagues in increasing the effectiveness of training. It also becomes one of their close assistants in the performance of a responsible task, such as the selection of students for their direction and the formation of skills in preparation for an independent life. Below we give recommendations on the application of modern methods of teaching on the basis of some topics in the cross-section of classes. You use it with a creative approach, and in response to the thoughts of our first president: "let's look for answers to the question of what we are doing today, in order to arouse pride and pride in our children, a sense of loyalty to our sacred Mother Earth", we hope that you will add your own sense of achievement.

The law on education says a lot about the search for and introduction of new ways of teaching in the national program of Personnel Training. Teaching children in primary classes the formation of elements of national and universal education in them should be expressed in the process of modern primary education. In the process of Primary Education, various methods are used. But there is a method, which provides a close relationship between the teacher and the pupil, this very process of the lesson is called "Play".

In this, almost all students take part and act. In the process, students learn something. All moves, both excellent and high school students and general students pull briskly. Because the children who are sitting in the classroom have recently come from the world of games. If the teacher makes it interesting to think about educational games, the child will wake up with a feeling of "surprise", this process of Education will not be forgotten by the students, and the goal envisaged in the game will go to the formation. Games are of two different importance, they are educational and educational.

Educational significance is that the knowledge, skills, skills that are given by the teacher in children is mastered through play. Through knowledge, skills and skills, which are integrated with children, such attributes as morality, labor, and patriotism are formed and become of educational importance. There are several types of educational games. They are grammatical, didactic puzzles, problematic games.

Currently, aspiring and experienced teachers achieve effective results by combining the educational process with didactic play in accelerating cognitive performance. Didactic game application can be used in the process of explaining a new topic, strengthening it, testing and evaluation of children's knowledge. The teacher should prepare the students for the individual, and then group games, after they have successfully come out, conduct mass play lessons. Because, students must have acquired the necessary knowledge, skills and skills to participate in didactic game lessons. It is better for the child to work than to sit dumbly, repeating what the teacher said, thinking in any case.

The cognitive activity of the child begins at a young age. Only in that period will Knowledge activity be built on the basis of games. School life differs from family or kindergarten conditions in external and internal aspects. A child who comes to the first class feels school, but cannot adapt to this process. That is why it is necessary to carry out the transfer of knowledge to the child through the game. To teach children only a serious lesson, to give superimposed theoretical knowledge, to arm them with the rules, will cause them to be bored and will remain ragged. A child who is tired of mental strain is illiterate. For this reason, we must encourage children to

think tirelessly with the help of games, to travel to the world of fantasy, to educate themselves in ways that they want without mental strain.

In the process of working in primary classes, one must be able to think, look for new educational tools, and be creative. Attractive names of games attract children's attention, do not get tired of them, creative emotions in relation to the lesson. They can also be entered in the middle, end or beginning of the lesson, the subject should be chosen taking into account the purpose and character of the game.

POETICS OF SHORT STORY TITLE

Komiljon Ulmasovich Khamraev*

*Senior Lecturer,
Doctor of Philosophy in Philology,
Tashkent State University of Uzbek Language and Literature named after Alisher Navoi,
UZBEKISTAN
Email id: k.hamrayev@gmail.ru

ABSTRACT

The article is about title of a literary work. It involves peculiar and distinctive aspects of title stylistics in Uzbek short stories and studies its edges, which reveal literary notion of the author. However, we can see the opposite of this statement in short stories with sarcastic title. For example, one may not perceive the reason for naming short story "The thief" until reading the literary work itself, consequently, we are not able to understand the inner meaning of it. "Strong fall wind, that is not letting to open the eyes for about two weeks is whistling over the top of lonely trees, it is buzzing; hustling over the veins, going straight forward windows and doors and sighing".

KEYWORDS: Title, Composition, Plot Line, Literary Mode, Literary Detail, Literary Concept, Figurative Meaning, Sarcasm, Genre Of Short Story.

INTRODUCTION

Title – the most important part of a literary work. It reveals the true essence of the life. With this feature title is considered as a notable component of literary work composition. "Exactness and laconism are the initial advantages of the prose. It demands thinking. Without it, a beautiful, sophisticated short story serves to nonsense. The title of the literary work must be laid in couple of words, should preciousely contain the concept, which is discussed over hundreds of pages, must attract reader from the first sight. It is quite complicated and pleasant at the same time. [1]

Some of writers choose the title coming out of their literary aims, while majority of literary works are titled after the completion, being the result of thought and choice made by author.

Placing the means of the text into one word or any quote creator hides the key from the literary work caste into the definite title. Title is a tiny literary work in the content of huge one that focuses literary aim, concept of the work and all of components into one point.

So, where can be observed the stylistic feature of the title and its importance in revealing literary aim? What sort of obligations and responsibilities are laid upon the title as the component of a literary work? Basing on which stem and methods do the authors choose certain title?

Title stays in connection with the meaning layers of the literary work. For that reason title might be comprehended only after reading and perceiving the literary work itself. Summarizing above cited notions the main charges of the title can be described as follows:

- Title comes along as a tool of literary work composition;
- Title involves literary aim of the author;
- Title informs about main idea of literary work;
- Title takes the responsibility of heading reader to the meaning of literary work, serves as a navigating star

Title is a poetic piece that drags attention of the reader to the literary work. Consequently, every literary work contains title whether it belongs to epic, lyric or dramatic genre. This fact evidences the differences of title selecting stylistics. For this reason, the shortest epic genre – short story title was discussed below.

After the second half of XX century, we can observe that Uzbek short stories had many changes from the composition point, plot, the issues and from the new point of declaring style.

Notably, coming up to 60-80 years the image of person was observed from different recourses, strengthened the stream of upbringing new heroes and characters to the literary area. While, the literature of independence period can be distinguished as a literature that illustrates changes in the human spirit and coherence with philosophical manner, along with nature delineation and emulation to the world literary trends. It brought Uzbek short story genre onto a new level, a higher stage. To prove our point we address to the shortest piece of the story – title.

Contingently it would be proper to classify titles of Uzbek short stories in the following order:

The title occurring out of short story composition:

- a) Detailed title;
- b) Title of image;
- c) Title of plot;
 - 1. Figurative title:
 - a) Sarcastic title;
 - b) Title involving elements of *tazod* (putting together opposite concepts)
 - c) Philosophical title
 - 2. Spiritual-emotional title.
 - 3. Chronotopic title.

1. The title occurring out of short story composition is a detail compounding events in the literary work, connected to the literary aim of the writer and it is selected based on plot line or image.
2. **Detailed title is a main factor typifying life.** Even the whole story might be build over one detail. [2] Such short stories as «Pomegranate» by Abdulla Qahhor, «Oqtosh» by ShukurKholmiraev, «Stopper» by A.A'zam, «Spate» and «Inscription» by Nazar Eshonqul, «A piece of tear» by A. Ibodova may be considered as detail based. Literary details in those kind of short stories usually have great deal meaning. A phrase or word titling the story definitely included in its text. «The tear awaiting deep in the eyes of Ma'suma finally came out, that it dropped to her atlas dress leaving traces over her face darkened on the sun. Not being penetrated to it, tear fell down to Earth.»[3] Or «Oqtosh is still staying in my room, in the row of my different swimming awards».[4]
 - The detail in title of story obtains general unity at some points.
 - A tool that joins the parts of the story.
 - It may serve as a cause for intense relationships between characters.
 - Component that reveals behavior of characters.
 - The literary factor commits and accomplishes aim of the writer.

6) Title of image. These kinds of stories arise the character as a title. To be more certain, the main character or any image of the story takes their place from above and refers to the story as the central point of discussion. [5] Such stories as «Baker girl» by Cho'lpon, «Lantern man», «Gulnoropa» by Oybek, «Shiroq» by MirkarimOsim, «Grandfather with his grandson» by Tog'ayMurod, «Writer», «Master» and «Unknown person» by ShukurKholmiraev illustrate main character at the center of literary work and with this feature often remind novelette. As it is seen in such short stories the names of heroes and their professions, nicknames or their distinctive features become a title and consider following meanings:

- All the elements in the content of short story serves to demonstrate and enlighten the inner world, personality of a character.
- The noblest characteristic features of the author goes into the portrait of short story's main hero.
- The literary aim of the writer and destiny of main hero become consistent and maintains concept of literary work. To sum up creator puts the main hero to the center of literary work.

c) Title of plot. Above there were stated two main methods of choosing title to short stories. The first is a title that was given according to the initial literary aim of the author, the second is the title that came out later. Title of plot is definitely may be claimed as a second type of title, when the true master of word selects title according to the plot line. Writer informs of the plot actually in the title. Consequently, author views the title as a factor informing about the short story plot.

The title, which is selected in this way covers the whole meaning of the world. «On the horse», «Feast of gins» by A. Qodiriy, «Under the Zov», «Navruz» by Sh. Kholmiraev, «Fishing» by Q.Kenja, «The bus» by A.Azam are the light pattern of a prove to our opinion. In this case literary idea of the author comes along with the plot. The impact of unexpected drastic plot line

to the behavior of characters, using point of view of characters to define events are the most distinguished features of those short stories.

I. Figurative title is based on the different types of meaning shift. The words or phrases in the title begin to live their “second life”. This “second life” becomes consistent with the true meaning of short story coming along with it as a spirit with body. Such short stories as “The thief” by Abdulla Qahhor, “Almonds blossomed in winter” by Sh.Kholmiraev, “The man heading with ape” by N. Eshonqul along with containing elements of figurativeness in their titles, include didactical, philosophical, critical and contrasting means. Figurative titles are divided into three categories:

a) Sarcastic title – comes along as a statue serving to the literary aim of the writer. Such stories as “The ill”, “The thief”, “Thousand and one lives”, “The wife not eaten a raisins”, “Headless rider” by A. Qahhor contain bitter sarcasm. Those titles have following features:

- The title coming equal to whole meaning of short story – in this case literary aim and plot of the story becomes tiny title of a short story. Moreover, conclusion derived from the literary work becomes equal to the title.
- Polysemous of the title – in the following feature of sarcastic title meaning divides into external and internal. From the external point it may seem as ordinary word, but from the inner point it may be alike to the “unhemmed nut”. Writers as well create beautiful poetic piece hiding into it inner deep meaning of literary work.

Title with asocial value – in this case the event or situation laid by author often is linked with not only one person, but the whole society, problems and dilemmas are concerned with entire community. Instance for, A. Qahhor in his short story “The ill” claims the society as ill or sickened by indicating to its negative features. That element can be seen in such short stories as “The thief”, “Thousand and one life”, “The wife not eaten a raisins” and “Headless rider”.

Comprehending the title only after reading the short story. Specialists consider title as “a key” to the short story. However, we can see the opposite of this statement in short stories with sarcastic title. For example, one may not perceive the reason for naming short story “The thief” until reading the literary work itself, consequently, we are not able to understand the inner meaning of it. This circumstance proves that the entire short story may serve as a key for opening the meaning of the short story.

B) Title involving elements of *tazod* (putting together opposite concepts) – occurs as the opposite of two notions. Those kind of short stories often have parallel plot line. Natural landscape descriptions become the most important elements demonstrating the literary idea of the author. Valuable poetic invention of the author has asymbolic meaning and becomes the title. Such stories as “Tulip in the snow” by A. Cho’lpon, “Almonds blossomes in winter”, “Spring weather in fall”, “Moon hided under cloud” by Sh.Kholmiraev, “Tulip in the winter” by Q.Norqobilov falls into taht category.

C) Short stories with philosophical titles often discuss the relationships between person and the universe, relationships in social and universal levels. The title which is selected for short story is also a result of philosophical thinking. Those kind of titles do not serve to deliver writers initial idea, but they motivate to percieve the concept of wold and a person. Following stories as “Person”, “The Magnetism of universe” by Sh.Kholmiraev, “Hub in

the corner” and “Chilla” by N.Raufkhon, “Bakhovuddin’s dog”, “Wind is uncatchable” by N.Eshonqul flow to this category. Such stories obtain one common point and from this angle they deserve statement of “a new literary work”. These are: a) comprehending the situation, describing them in literary way and occurrence of metaphor towards them; b) The leadership of associative method in literary outline c) the structure of the plot and characters fully on metaphor. [6] From the first sight those titles may seem as an ordinary description. However, the assist reader to think philosophically in opening the true meaning of the story, understanding events cohesion.

Spiritual-emotional title

In short stories with such kind of titles there can be lightly seen leadership of spiritual description rather than ideological, critical character. With these features, spiritual emotional stories often remind dramas. For the reason of concerning one spiritual situation into the whole story these circumstance goes on the top of it. “Horror” by A.Qahhor, “Soul”, “Something has gone” by Sh.Kholmiraev, “The joy of falling apart” by Q.Norqobilov and “Tearing” by D.Saidova prove above mentioned opinion with their titles selected through that method. In the story “Horror” the author from very beginning comes along with description of horror landscape and heads reader towards the gates of terrifying darkness. “Strong fall wind, that is not letting to open the eyes for about two weeks is whistling over the top of lonely trees, it is buzzing; hustling over the veins, going straight forward windows and doors and sighing”. In those nights one becomes so slowed and wants to wait for something with struggle.[7] The story that begins with a little “horror” of a nature ends up with a dramatic death. The whole story goes along under this spirit and it turns into the title.

Chronotopic title. Those titles are divided into two types, the first concerns time and periods. The second is title linked with the certain place. Second type of titles are often tiny in shape, nevertheless wide in meaning and initially they describe destiny of one person, even entire society. The title of short story obtains metaphor meaning and stays in poetic connection with literary aim of the author. “Jintepa” (“Hill of gins”), “Groom from city” by O’tkirHoshimov, “In wide, large fields”, “Returning to Galatepa” by Murod Muhammad Do’sit, “Guest” by LuqmonBo’rixon goes into those category.

Short stories titled chronologically often are linked with period, year, season and other notions, and the word in the title describes the period of happening events. “Life of the truthfull” by OdilYoqubov, “Price in fall” by Sh. Kholmiraev, “One day of a peasant” and “One night of a peasant” by O’tkirHoshimov, “Breath of winter”, “The life” by UchqunNazarov, “Where is my birthday” by Ne’matAminov can be light example of chronologic titled short stories.

To sum up, title is important element of literary work. Stylistic of choosing title in Uzbek short stories depends on changeability factors of the plot and derived from the literary coherence of the author. Consequently, poetic feature of Uzbek short stories can be seen in following circumstances: Initially, the style of the author, viewpoint, literary aim and ability of word usage; Secondly, in description of social life dilemmas; Thirdly, in the renewal level of short story genre; Finally, the options of short story genre can be seen in the way of description, the size, from the point of plot composition changes.

ABSTRACT

The twentieth century began with some success for the peoples living in the territory of the Russian Empire. This gave rise to the Turkestan national press. After Russia was defeated in the war with Japan, he was unable to withstand the pressure of internal and external forces. Political struggles within the empire intensified, and by the end of 1905 the emperor was forced to declare a freedom manifesto for all political forces and groups. One of the main points of the manifesto was freedom of speech. Different peoples and political strata took advantage of this opportunity to establish their own press. The above mentioned issues are more deeply discussed in this article.

KEYWORDS: *Jadid, Jadidism, Vaqt, Yulduz, Ottoman Turkey, Russian Empire, Turkestan Province Newspaper, Pilgrims, Bukhara Sharif, Tuijor, Tavallo, Oyina - Mirror, Anti-Governmental.*

INTRODUCTION

In the early twentieth century, in addition to the “Turkestan Province Newspaper”, newspapers published in Ottoman Turkey, Iran, India, Egypt, and some European countries were widespread among intellectuals. This situation was facilitated on the one hand by the postal system introduced by the Russian and local governments, and on the other hand by the fact that thousands of pilgrims, traders and other categories brought publications from different countries. Although censorship was an unchanging law for the Russian bureaucratic apparatus, it was unable to provide a complete barrier to all publications being brought into the region.

THE MAIN FINDINGS AND RESULTS

In the late 19th and early 20th centuries, Turkestan was colonized and the Russian Empire began to economically erode it. The colonialists tried in various ways to keep the indigenous people in

ignorance, illiteracy, poverty. Such a policy of the imperial administration gave rise to a national liberation movement of the local population. The revolutionary movements in Iran in 1905-1911, India in 1905-1908, and Turkey in 1908 in the early twentieth century increased the political activity of the Jadids in Turkestan [1, p. 26]. Therefore, the Jadid movement in Turkestan emerged for two main reasons. The first is the influence of political changes in the Muslim world on the spread of national intellectuals, progressive ideas in their homeland, and the second is the influence of Ismailbek Gasprinsky's ideas on Turkestan. Despite the censorship applied by the Tsarism, the Jadids in those years were constantly acquainted with the media in the eastern regions of the Russian Empire. For example, "Tarjuman" (Bakhchisaray), "Vaqt", "Yulduz" (Kazan), "Mulla Nasriddin" (Tbilisi), "Siroti Mustaqil" (Turkey), "Siroj ul-Akhbor" (Afghanistan), "Khabul Vatan" (India).

Also, in awakening the people from their slumber in Asia, the influence of progressive literature as a mass movement led to the publication and further development of the Jadid national media.

Thanks to the selfless work of Munavvar Qori Abdurashidkhonov, Mahmudkhuja Behbudi, Abdulla Avloni, Ubaydulla Khujaev, Nosirxantura, Ashurali Zohiri, Obidjon Mahmudov and others, it led to the spread of serious ideas among the urban population of the country. "Taraqqiy", "Khurshid", "Shuhrat", "Tujjor" and other national media outlets published by them played a significant role in strengthening the socio-political movements of the Jadids [2, p. 25]. The events of 1905 and the revolutionary movements in Turkey, Iran and India allowed the slogan of the struggle for a new school to be sharpened. As the number of readers of the "Tarjuman" newspaper increased, so did the Jadids' interest in the press. The governor-general allows the Jadids to publish a newspaper on the condition that he edits someone close to him. How does "Taraqqiy" see the world through this?

In general, this newspaper is significant in that it served to accelerate the struggle of the Jadid periodical press for a specific goal. Beginning in 1906, newspaper production began to intensify. "Khurshid", "Shuhrat" and "Osiyo" newspapers were published.

The first Samarkand Jadid newspaper, "Samarkand", was published in April 1913 under the editorship of Mahmudkhuja Behbudi. In April 1914, the newspaper "Sadoi Turkiston" was published in Tashkent. The editor was Ubaydulla Khujaev. For the first time in Fergana, the Uzbek-language newspaper "Sadoi Fergana" was published under the editorship of Obidjon Mahmudov. It was compiled and corrected by Ashurali Zahiri. Also in Samarkand "Oyina" (1913) and in Tashkent Abduramon Sodiq o'g'lu Sayyoh magazines "Al-Isloh" (1915) was published [3, pp. 53-55].

Mahmudkhuja Behbudi, Ismail Obidi, Munavvar Qori Abdurashidkhonov, Abdulla Avloni, Ashurali Zohiri, Obidjon Mahmudov, Abdurauf Fitrat, Mirmuhsin Shermuhamedov, Laziz Azizzoda, Islam Shoahmedov, Khoji Muin, Shukrullo, Mard Shokirjon Rakhimi, Akobir Shomansurov, Gazi Yunusov and others have done great work.

After the events of February 1917, the attitude to the press in Turkestan changed and grew rapidly. Unfortunately, these national publications did not fully escape the influence of the policies of the dictatorial Soviet regime.

According to the newspaper, Ismail Gasprinsky had a lively correspondence with Hasan Chonishev on the distribution of "Tarjuman" in Turkestan. Despite the fact that N. Ostroumov

wrote to his teacher Nikolai Ilminsky that he was very angry when he saw the first issue of “Tarjuman”, in the first years of his activity in “Turkistan Region Newspaper” he did not pay any attention to “Tarjuman” and did not express his views.

N. Ostroumov pointed out that despite the fact that he had previously corresponded with I. Gasprinsky and was closely acquainted with his works; in some cases he was not familiar with him. The announcements made after N. Ostroumov's appointment did not mention “Tarjuman” distributors in Turkestan. During the first two years, “Tarjuman” had about 200 subscribers all over Turkestan. According to reports from Bukhara in those years, the “Tarjuman” was read hand-in-hand.

The Russian administration of Turkestan focused only on the development of the intellectual development of the potential of the “Russian intelligentsia” and the implementation of specific measures in this regard. Analyzing the statistics of Russian periodicals in the Syrdarya region, Ivan Geyer [4] describes the group of people who read these publications as leaders of the country's spiritual development. Unfortunately, in such analyzes, the interests of the local people were not taken into account at all.

The Turkestan Regional Newspaper, the official publication of the Governor-General of Turkestan, was one of the first Turkish-language newspapers published in the Russian Empire. Apart from the two short periods in which the national press was published in Turkestan (1906–1908 and 1913–1917), the official newspaper was the only publication in Central Asia in the local language. This newspaper served as the main platform for Turkestan intellectuals who wanted to express their views on the state of the country in a global and imperial context.

However, despite the fact that the Turkistan Province newspaper played an important role in the lives of Muslims, it was extremely conservative and “hostile” to any form of Jadidism. For this reason, according to researchers, the Russian-edited Turkestan Province newspaper cannot be considered a true “Muslim” newspaper.

According to researchers, the role of the “Turkestan regional newspaper” [5, pp. 23-37] is based on hypocrisy and contradiction. The original purpose of the newspaper was to “inform the local population of all orders of the Governor-General” and “to report on commercial and various events in Tashkent and other cities”. Among the less interesting news were excerpts from “A Thousand and One Nights” and various reports from the Russian press.

From 1875, the newspaper began to publish letters from its readers, as well as “useful information” about the time. According to N.Ostroumov [6], the “useful information” included the geography of different countries and information about them, the use of hot air in balloons, railways and telegraphs, instructions on the cultivation of cotton and silkworms, and so on. The “Local News” section reported only criminal cases aimed at exposing the negative aspects of the local population.

Concerned that the local population was less interested in learning Russian, Kaufmann's successors sought to distance themselves from the policy of the late governor-general, and in 1883 N. Ostroumov's appointment as editor of the Turkestan Regional Newspaper was the first step in this change. One of the main directions of Russification policy was the deepening of the Russian language among the local population.

Under the leadership of the new editor, N. Ostroumov, the “Turkestan Regional Newspaper” was to emerge as a tool of the Russian government’s new policy of “enlightening the local people with caution and foresight”. To this end, the newspaper began to be published in both Uzbek and Russian at the same time. Officials in Turkestan’s Russian administration believed that Russian oriental studies could enlighten Asians and that it should do so in a way that the interests of “non-Russians” were in line with the interests of the dictatorial Tsarist Empire. To this end, the Turkestan regional newspaper has doubled the number of “useful information”. But the information was politically “safe”.

The first non-governmental local language newspaper was published in 1906 by Ivan Geyer. The main purpose of this newspaper was defined as to acquaint the local people with new political views and opinions. It should be noted that the private and independent press in the Russian society living in Turkestan was founded in 1890 in Samarkand. I. Geyer’s newspaper “Development - the lifeblood of Central Asia” reprinted, mainly translating reports from Russian newspapers.

Nonetheless, the newspaper provided an opportunity for the Russian administration to express its views to individuals who were unacceptable from the point of view, i.e., local intellectuals. In this way, Ivan Geyer's newspaper paved the way for local intellectuals to join the long-awaited goal of political dialogue. The newspaper was shut down due to financial problems after the 17th issue came out.

The Jadids of Turkestan accepted the newspaper primarily as a sign of progress and a source of knowledge. They interpreted the original essence and purpose of the newspaper differently. At one time, I. Gasprinsky stated that the main purpose of the newspaper was to serve the truth and enlightenment. At the beginning of their journalistic career, Turkestan enlighteners compared the newspaper to a doctor treating the “disease” of society. Shortly afterwards, the press began to regularly criticize the shortcomings of society and became a “true leader” of society.

The struggle of the Turkestan Jadids to achieve their goals, as declared by Ziya Said, “jihad” against conservative thought, began with the newspaper “Taraqqiy”, founded by Ismail Obidi after Ivan Geyer. I.Obidi wanted to rename the newspaper “Sharq”. I.Obidi's newspaper was closed by the court after the 19th issue on the charge of publishing inappropriate materials.

A few weeks after the closure of the “Taraqqiy” newspaper, Munavvarqori Abdurashidkhonov founded the “Khurshid” newspaper. This newspaper also became a follower of the “Taraqqiy” direction. However, unlike Ismail Obidi, Munavvarqori Abdurashidkhonov in his articles focused on political events in Russia and neighboring countries. Apparently, this direction of “Khurshid” corresponds to the political views of I. Gasprinsky.

Gasprinsky considered “Khurshid” to be a “pure national” newspaper and was proud of its “language”, which was very different from that of the Turkestan regional newspaper. According to Zaki Validi, Ostroumov tried to create a language in his newspaper that could be used to distinguish the “Sart language” from the Tatar and Kazakh languages. Gasprinsky, for his part, accused the new Tatar newspapers of spreading street language instead of literary language, and sharply criticized their “language”. The Turkestan Jadids, on the other hand, tried to use the “local central language” promoted by Gasprinsky.

For this reason, I. Gasprinsky republished the main article in the first issue of the newspaper “Khurshid” in “Tarjuman” in order to show the “language” of Turkestan newspapers as an example to others. Before the closure of the Khurshid newspaper, “Tarjuman” republished many news and articles from it that were in line with the editorial point of view. Munavvarqari's newspaper was published until November 13, 1906, and after its 10th issue, the government closed it down for publishing in the “anti-government line”.

Later, “Shuhrat” and its successor, Asia, founded on the joint initiative of Abdulla Avloni, Tatar Ahmadjon Bektemirov and Munavvarqori, were closed down on the same charges. The newspaper “Asia” was banned on May 21, 1908. At the same time, Saidkarimboy Saidzimbaev began to publish the newspaper “Tujjor”. Unlike other publications, the newspaper declared itself to be anti-government, pro-Russian, and non-religious. “Tujjor”, which has such a program, did not gain much popularity among students, and after the 36th issue was closed due to lack of subscribers. With the closure of “Tujjor” in May 1908, the independent national press in Turkestan ceased to exist.

Turkestan readers of “Tarjuman” blamed the Turkestan regional newspaper and N. Ostroumov for the destruction of the national press. N.Ostroumov told various government agencies that he had been involved in the case and had tried to ban the “Tarjuman” newspaper in the country.

He corresponded with the Russian political agency in Bukhara on the issue and tried hard to get a report from him about the “Tarjuman’s” harm to Russian interests in the region.

The four newspapers published between 1906 and 1908 quickly portrayed the Turkestan Jadids as a force on the path to national and religious self-realization.

Unlike Russian Turkestan, the first press in the Bukhara Emirate appeared almost half a century after the newspaper was first published in Central Asia. N.Ostroumov reported in the Turkistan Region newspaper that after I.Gasprinsky's meeting with the Emir of Bukhara, Abdullah Khan, during his 1893 trip to Turkestan, he agreed to I.Gasprinsky's offer to publish a newspaper in Bukhara. I.Gasprinsky immediately declared it a false message as soon as it appeared.

Of course, it is not difficult to see that such misinformation is aimed at depriving I.Gasprinsky of some of his “strongholds” in Turkestan. The Bukhara Jadids, later called the Young Bukhara People, became more active after 1910. They initially advocated reforms in some areas, particularly in the education system, and focused more on the establishment of new method schools in various cities of the emirate.

The Emir of Bukhara had no right to pursue any independent policy without the permission of the Russian political agency. All political issues in the emirate were, of course, discussed with a Russian political agent. Realizing this situation, progressives from Bukhara, such as Mirzo Muhiddin and Mirzo Siroj Hakim, with the help of a Jewish merchant Levi (Levin), were able to “persuade” a Russian political agent of the need to publish a newspaper in Bukhara. They tried to prove their desire to publish a newspaper with such facts as to acquaint the population of the country with the Russian Empire and to help them achieve high results in the cultivation of cotton for Russian factories.

Based on this program, they asked a Russian political agent to help them get permission from the Emir to publish a newspaper. Thus, the first press appeared in the Bukhara Emirate. This was the first Persian-language newspaper, “Bukhara Sharif” [7], published on March 11, 1912, in Kagan

(New Bukhara). This newspaper was to be published once a week until July 14, 1912, and then four times a week.

“Bukhara Sharif” was published under the editorship of Mirjalol Yusufzoda. Yusufzoda, who was invited to the post from Baku, taught religious studies at the Ittihad School and worked as an editor for the “Haqiqati Afkor” newspaper. However, the newspaper's main editor was Haydarkhoja Mirbadalov, a Tarjuman appointed by the Russian political agency.

In July 1912, the Uzbek (Turkish) newspaper “Turon” was published as an appendix to “Bukhara Sharif”. The newspaper was published twice a week and operated as an independent publication in September of that year. Giyas Usmanov, who studied in Turkey from 1906 to 1911 and was an active member of the Bukhara community in Istanbul, was appointed editor of “Turan”. Bukhara newspapers quickly became popular among the people. These two newspapers had a total of 2,600 subscribers (Bukhara Sharif - 800, Turon - 1,800).

In April 1913, the Samarkand newspaper, the first of the Samarkand Jadids, was founded in Samarkand by Mahmudhoja Behbudi, according to Ziya Said. Behbudi published the newspaper at his own expense and was forced to suspend it five months later due to financial difficulties. The newspaper did not re-appear after issue 45.

Reporting on the closure of the Samarkand newspaper, I. Gasprinsky wrote that he was very sorry for it. “Behbudi”, he writes, “started the newspaper with great enthusiasm, but there were not a thousand subscribers among Turkestans for the newspaper in their own language”. Tolagan Khojamyorov (Tavallo) declared the closing day of the Samarkand newspaper a “national day of mourning”.

In 1913, Turkestan intellectuals repeatedly appealed to the government for permission to publish a newspaper. In early 1913, Obidjon Mahmudov of Kokand applied to the military governor of the Fergana region to establish a newspaper in the local language. He soon received permission to publish a newspaper under the name “Jami’u-l-Akhbar” (Message Collection) and to open a reading room under the name Madora. In Namangan, Ishakhan Ibrat applied to the regional governor for permission to publish a newspaper called “At-tijarat An-Namangan” (Namangan commercial news) in his printing house. But the government did not allow the publication of this newspaper.

On June 15, 1915, with the publication of the 68th issue of “*Oyina* - Mirror”, the magazine ceased to exist. According to Fitrat, *Oyina*, like other similar magazines, “could not please” its readers. Readers of the magazine did not like his articles. But Fitrat points out that the case could have been rectified. To do this, all Turkestans had to take part in improving the program of the magazine. In turn, in response to the “accusations”, Behbudi published various letters from students about the language and program of the magazine in “*Oyina* – Mirror” in order to “justify” himself.

Two more Turkestan twin newspapers, which “fascinated” I. Gasprinsky with their “language” and style, were founded in April 1914. These are “Sadoyi Turkiston” and “Sadoyi” Fergana newspapers. Launched in Tashkent, “Sadoyi Turkiston” has become a mainstay of Tashkent's progressives. The newspaper claimed to be the translator of “Ona Turkiston ovozi”. In the first issue of “Sadoyi Turkiston” he said that he would convey to his readers “the words of the

motherland to the sons of Turks in the Turkish language” and confirmed that he would follow the path of I. Gasprinsky.

As you can see, the program and language of “Sadoyi Turkiston” are completely in line with the ideas of I. Gasprinsky. But Shura magazine likened Sadoyi Turkiston’s articles to a sermon by Sufis who annoyed people with their “language”.

Sadoyi Fergana, edited by Obidjon Mahmudov in Ferghana, became popular and received permission from the government to publish a Russian version of the newspaper, “Sadoyi Fergani”. According to the translator, the editors ordered Russian letters as soon as they received permission to publish them, and the newspaper will start publishing as soon as the letters arrive. However, for reasons unknown to us, the Russian version of “Sadoyi Fergana” was not published. “Sadoyi Fergana” itself was forced to suspend its activities after the 123rd issue due to financial reasons.

The fate of the Tashkent newspaper was as tragic as any of its predecessors. “Sadoyi Turkiston” stopped publishing after the 66th issue. The main reason is lack of funds. Tashkent-based developers have failed to support the newspaper’s financial position in a variety of ways.

In any case, the emergence of printing equipment in Turkestan has led to lifestyle changes in certain segments of the population. Although this process took longer than in other regions of the Russian Empire, until the October 1905 manifesto, I. Gasprinsky’s “Tarjuman” newspaper was the only pulpit for Russian Muslims. And, it is he who played a very large and important role in the emergence and development of the Muslim press in the Caucasus, inland Russia and Turkestan.

CONCLUSION

In our opinion, three factors hindered the formation of an independent national press in Turkestan. These are, firstly, economic backwardness, secondly, pressure from the official government, and thirdly, material shortages. Although a group of local intellectuals who began to carry out reforms in the social life of Turkestan was formed in the late nineteenth century, they managed to stand on their own two feet only in the first decade of the twentieth century.

If this situation is taken into account, perhaps this situation may be the main factor in the delay in the emergence of the national press in Turkestan. The people of Turkestan were radically different from other Muslim nations in the Russian Empire in their way of thinking and thinking. Due to the extreme conservative thinking of the population and their “loyalty” to traditions, newspapers were not so popular among the people. It is for these reasons that most of the national press that emerged in Turkestan in the 1920s was forced to close down.

ABSTRACT

This article describes the origins, peculiarities, language and, in part, the customs of the Qatagan (Khataki)s, one of the Turkic tribes. This article discusses the origin (ethnogenesis) of Qatagans (Khatakis), one of the Turkic tribes, scattered in different parts of the world, belonging to the Qarluq-Chigil-Uyghur dialect, belonging to the group of Uzbek dialects "a" and speaking the Uzbek dialect "y". specific features, language, and partial customs are covered.

KEYWORDS: Tribe, Qatagan, Khataki, Language, Peculiar, Huyya-Huy, Qarluq-Chigil Dialect, Peculiar Cuisine, Parent-Child Relations, Grandparent-Granddaughter Relations, Language, Originality

INTRODUCTION

Among the 92 tribes that make up the Uzbek nation, there is the Repression tribe. When two strangers meet in the Surkhon oasis, they will definitely ask for each other's seeds. Abulgazihan, Muhammad Salih, B.K.Karmisheva, N.G.Mallitsky, S.M. The Abramzons have stopped in their works [1].

Ahmad ZakiValidiTogon, who awakened the Turkic world in the 20th century, writes: "According to the tribal structure, the Uzbeks are called ninety-two boys everywhere. Boy means tribe. The table of Uzbeks in Afghan Turkestan, compiled by Mir Izzatullah of India in the early 19th century, is somewhat noteworthy. Accordingly, the tribes there are as follows. Ochamayli province of a thousand tribes in Saripul near Shiberghan; next to it in a place called Sayyad Ochamayli and Qaziogli, Ming, below it the Kipchak tribe, in Kunduz completely repressed. In the territory of Balkh live the descendants of Sarai and Moytan, in Badakhshan the districts of Eshkamish and Qatagans called Burga and Timish.

The seed of Qatagan is the three tribes: Five Boars, Saljovut, Four Fathers. Mir Izzatullah gives signs of the provinces of the descendants of Moytan and Qatagan.

Among the Uzbek tribes there are aristocrats nicknamed "Bekzod". They took an active part in the accession of the khans to the throne and in the management of the country. Among them are the tribes of Qiyat-bell, Yugur-Naiman, Kangli-Kipchak, Nukus-Mangit in Khiva, and in Bukhara in the time of the Shaybanids Koshchi, Naiman, Qorluq, Burak. In the time of the Mangits (according to Radlov), the seeds of Ming, Arlot, Borin, Batash were known. During the repressions, the Bekzods were elected.[2]

Abulgazi Bahodir Khan writes in Shajarai Turk that the seed of Qatagan originated from Nur. Alanquva's husband Dubunbayon died early, leaving her two sons. Alanquva's uncles and nephew came and wanted to collect. Alanquva refused. He said that he would be the head of the river himself until my sons grew up, and then I would hand them over to them. A few years passed. Then Nur came to Alanquva's bed at night. "He slept one night and woke up in the morning. A light came in from the night, and I saw in the light that a man in the form of a white-yellow man with wide eyes came into the house.", She becomes pregnant. As the fetus grows older, Alanquva gathers her relatives and tells the story. Some people were skeptical and said, "Am I lying to you when I am in power?" Then people lurked under his hole at night and saw a light enter the hole in his bed. We read in Shajarai Turk: "Alanquva Ucham gave birth to a son. The name of the former is Bugun Qatagan. All the oppressed will be his descendants." [3]

Hafiz Abro's "Zubdat at-Tavorix" states that Alan Quva's lineage is from sunlight.[4]

The famous Indian epic Mahabharata also contains the story of the birth of a child from the Divine Light.

In the 1920s, Jadid scholar Ghazi Olim Yunusov defended his dissertation on "Qatagan (khataki) and their language." Local intellectuals Shoniyoz Safarov, candidate of philological sciences Muhammadjon Azimov, historian Ikrom Umarov conducted scientific research on repressions, made speeches in the press and published books.

Qatagan is scattered all over the world. They live in the Surkhandarya, Samarkand, Kashkadarya, Jizzakh, Tashkent and Fergana valleys of Uzbekistan. There is a citizens' assembly "Qatagan" in Kasbi district of Kashkadarya region. There is Qatagan district in Kokand city of Fergana region. When Academician Aziz Qayumov published his father's Tazkirai Qayyumi's Tazkirai Qayyumi, we saw that when it comes to the biographies of many poets, he describes them as from the Qatagan district. It is also found in the Shartuz district of Tajikistan, the Uzbek-populated provinces of Afghanistan, India and Pakistan.

In some recent works, the name of the seed is not "qatagan", but "Kohitang errors". This name is derived from the name of the place. In order to differentiate themselves from the repressions scattered around the world, the repressions in Surkhandarya call themselves "mistakes." That is, at the foot of the Kohitang ridge there is a village called Khatak. From this village begins the "Surkhan State Reserve" with a very charming natural landscape. The first paintings of mankind "Zarautsoy" are also located in this village. The original meaning of the words *khatakin* ~ *khatagin* ~ *kataganis* "a strong, stable people." The village is named after the tribe. [5]

In this study, the author studied the meanings of the word Buryat, Yakut, and noted that in all of them the place means "strong fortress", and in the sense of the name - trustworthy people, strong people, guards. In order to confirm this opinion, we can say that there is a saying among the people: "Qatagan is also a hard hand, if there is not a hundred in the middle."

There is another aspect of distinguishing mistakes from qatagan. The Khatakis are originally from the village of Khatak in the foothills of the Kohitang Range in Sherabad District, and live in Sherabad, Muzrabad, Angor, Termez, Jarqurghon, Kumkurgan, Qizirik, Boysun districts and the city of Termez in the Surkhandarya region. The people of this tribe speak "ye". They are not "je" hunters.

From ancient times to the 70s of the last century, Khataki women wore hats called "lachak". The lachak is a circle in the shape of a head, wrapped in a thin layer of cotton and tied from the back down over the neck. It covers the neck, back, neck and hair. Women who washed their heads or went on long trips wore it to avoid catching a cold. Women who wore lachak did not have a headache at all, and their backs and necks did not sting.

The cuisine of the repressed population is also unique. For example, the "bulamok" dish, which does not exist in any seed, is cooked only by women belonging to this seed. To do this, the cooked milk cream of the cow is collected in a container for 7–10 days. In winter it is stored in the yard, in summer it is stored in the refrigerator. Put it in a pot and dig until it melts well. When the cream melts and becomes liquid, add a bowl of flour and knead until golden brown. When it turns the color of crimson bread, it is given a bowl of water. 4 cups of water are given 4 times a day. After each watering, a large amount of butter is released from it. If the cow is fat, up to 1.5 liters of pure butter is obtained. After straining this dish, butter will stick to the surface of the bowl. It is eaten sprinkled with sugar according to taste. It is an extremely hot food and people who cough and have a cold recover quickly. A person who eats porridge walks for two days.

Kirmich - when the milk is cooked, leave overnight to get sour cream. When the milk is emptied, the bottom of the bowl is scraped and eaten. Very sweet and delicious food.

Durda- burning of sour cream. The solid part is called durda and the liquid part is called butter. In the morning it is added to tea and drunk.

Ogiz (also called uvuz) - freshly milked cows, sheep, goats. As a result, colostrum is ready in about half an hour. The mouth is hard and the color is reddish. The milk of newborn animals changes color after another day or two. The dish made from it is called kelagai. Kelagai is whiter than milk and slightly thicker than milk. Kelagay is prepared just like the mouth. You can slice it and eat it. After 2–3 days after fertilization, the milk becomes white and liquid. Both of these foods are very rich in calcium, and children who do not have teeth will erode their teeth and appear whiter when they eat them.

There is a habit in this tribe that no other tribe has. That is, when the repressors release the yoghurt from the yoghurt bags sewn from gray or white surp, they put in it a plant called algae, which grows in the mountains of the Kohitang ridge. Alcohol is extremely fragrant and gives the yogurt a unique taste. In the heat of cancer, an alkaline yoghurt cake gives a special pleasure to the drinker.

In all the nations of the world, mothers say Allah. There is no doubt about it. But the repressive men living in Surkhandarya say goodbye to their grandchildren. Every baby born in an Uzbek family has a mother goddess before the call to prayer. This is natural for us. But there is a strange custom that has never been found anywhere in the land of Surkhandarya. We have grandparents take their grandson in their arms and shake him to a rhythm and say "huya-hui". A father cannot say alla to his son. His parents are still alive. The young father is ashamed to say alla in front of

them. God says grandfather, not father. To his grandson. As everyone gathers around the table, the grandfather takes his grandson in his arms and says, "Huy-ya-huy." It is a peculiar god of men. It is said only by men, that is, by ancestors.

Xuyya-huyya huyyang koni,
Bobong bergan tuyang koni
Huyya-huyya, huyyalar busin,
Shu bolam tezroq to'ylar-a busin
Huyya-huyya, huyyalar busin,
Shu bolam tezroq katta-yo busin.
Xuyya-huyya huyyang koni,
Bobong bergan tuyang koni
Huyya-huyya, huyyalar busin,
Shu bolam tezroq to'ylar-a busin.

Listening to such a beautiful song, the boy trembles in unison and falls asleep in his grandfather's arms. What country child listens to such a beautiful song from his grandfather.

Doctor of Philology, Professor Tora Mirzaev began his career in the Jarkurgan district of Surkhandarya region, and among the people he wrote "huya-huy" and introduced it to the scientific community. The famous scholar of the twentieth century Fitrat called this heritage of our people "folk literature".

Today, due to independence, such concepts as "Surkhancha", "Surkhancha method", "Surkhancha dance", "steppe songs" have been formed and recognized in our national art. For example, "Huya-huy", "Shamollar-Mirhaydar bobo" labor ceremonial songs, "Kadi" dance, "Chirak dance" are examples of art that are unique to the Surkhandarya region.

The peculiarity of Surkhandarya dances is that in the hands of the dancer there is definitely an element, a tool of labor, a household item or a child. Even if he has nothing in his hand, he takes his hairpin and turns it over. The peculiarity of Surkhandances is that not only girls or women, but also men dance in the circle. Take, for example, the song "Huya-huy". In it, a grandfather holding a young child in his arms says "Huya-huy," meaning "alla."

Yarashadi kiligi-yo, yu-huy, huya-huy,
Qoshlarningining piligi-yo, yu-huy, huya-huy.
Polvon bulsin khudoyim-a, yu-huy, huya-huy,
Tula bulsin iligi-yo, yu-huy, huya-huy.

There is also a peculiar folklore of the qatagans. For example:

There are also specific proverbs of this tribe. If the husband dies early and the wife does not cry, he uses the proverb, "He gathered the wheat and set fire to the straw." You gave birth to children, now what does the land mean. Phrases such as "Even if a donkey dies, its tissue will mourn for three days" are used.

Mothers-in-law often tell their daughters-in-law, who are hungry for food, "Kunniyam has hope from lunch." This means adding a cup of water to the food you are cooking, so that someone can come.

There are also specific words in the dictionary of this seed. For example, a cold day when the sun does not rise is used in the vernacular as a "bite day". Today has been a frustrating day. Jirindi is an abandoned, neglected place. For example, because of an infinite number of wives, the yard became a dungeon. When two vowels come together, the pronunciation changes dramatically. For example, the word "dua" is pronounced as "doga", which means "pray for me, boy".

The dictionaries of the population belonging to the repressive clan are also unique. For example, dehi-ordinary, juyruk-arbitrary, immodest, totu-crazy, a house for a young man who is going to get married (let him go on the grass), yashamol - is used for the elderly who have lived a long time. Tearing - if the deceased has lived a long time, everyone is stripped of a piece of material to tie a belt, and their grandchildren are given a garment to sew from that tear. Ichkinna, ichpinna - is used for the person who keeps the cake. Alang - hill. Angara is a foreign country. For example, an edge of a field. Under the mulberry plantations. The father used to look at his son: come in a turn, put in the hangar.

The word "bodi" is used in reference to a young man who walks barefoot even in the cold. For example, a mother scolds her son who has a cold: go naked in the cold, my child. The word "Ilachila" is used in the sense of sudden, immediate. For example, Ilachila whispered and spoke. The word "beautiful" is used for a mother-in-law who does not give her daughter-in-law a day off. Ikovi (the bride's mother-in-law) is used as a way to make a nice day for our neighbor's bride. Degurdi - is there a point; Tagop-mountains; Sug'ra-then; Ganda- unpleasant, ugly; Tulkhori is wrong; Togla-past period; Oyanda-next period; Tunogun-the day before nightfall; Qatalanqilmoq-to make hard is to make hard days; Zigirvonqilmoq-to make linen is to push it forward.

In this seed dialect, the words "lang" and "aying" are used as synonyms and mean epidemic. For example, if a young child suddenly gets hot, notes, and loses his taste, there is a "lang", which is said to be "bear".

In the dialect of qatagan, "a" is typical. For example: apple-apple. Choy-chay. In some places, instead of "b" there are cases of "v". For example, *yubordim-yuwardim*. For example, in the literary language, the plural form of "brothers" is used in this dialect as "akamala", the plural form of "sisters" as "opamala". When two people get along well with each other or have a good relationship, they are said to be in a "fight". A person who commits acts that are not appropriate for his age is reprimanded as "totu" (insane).

The tribe of qatagans is an extremely aristocratic people, and a separate house was built for the boy before he married him. If he is unable to build a separate house, the bride and father-in-law are made separate from those who enter from the other side of the door so that they cannot enter through one door.

When the qatagans send a wedding to the boy, they send the sheep with different colored scarves around their necks. A goat is also added to the sheep and it is called "shouluk". There is a saying, "Shoulouqelniki, tutganni." Whoever is the first from the village to get on the car and take the kid will be his. It's a habit. No one will oppose him. A dress material is placed on top of the bride's

dress and sarpas, and a rich, happy woman with children opens it and takes the material that stands on it.

In this tribe, from the day the son is married, the parents and the bride refer to him as "you" (for respect) No other tribe in the Surkhandarya oasis refers to a son or a daughter-in-law as "you." Grandparents, of course, address their grandchildren as "you". They tease Nevvara, saying, "Let me delighted from the God who gave you." That is why other tribes in Surkhandarya say that the language of repression is sweet.

"If the hand of qatagan had not been hypocritical, it could have become a savage," he said. "Tortuvli is as greedy as the qatagans."

CONCLUSION

In general, the Turkic tribes living in Central Asia underwent complex ethnic processes. The Khatakis are indigenous people of modern Uzbekistan and have lived for a long time. Although they have been called differently over the centuries, they have retained their names, ancestral customs, distinctive dialects, and anthropology. According to S. Tursunov, the appearance of khatakis is Europoid [6].

The Khatakis are a branch of the Turkic tribes of Central Asia, who speak in a snow-covered dialect. They belong to the group of "y" hunters, not "j" hunters, and because the "o" at the beginning of the word becomes the "a" sound, they have a "a" at the beginning of the word. It is a tribe that has a special place in the life of the Turkic peoples and has long been engaged in handicrafts, horticulture, agriculture, animal husbandry, metalworking and settled in the mountain villages of southern Uzbekistan.

ABSTRACT

The article developed and investigated a thermo-photoelectric device for the combined production of heat and electricity from a single receiving surface. The proposed energy device consists of a solar heat collector absorber, on top of which polycrystalline solar cells are placed. This unit is a combined helio profile that can be installed on the roofs of buildings and structures. constructions. The design is intended to improve the energy performance of solar energy converters.

KEYWORDS: Absorber, Photoelectric Converters, Thermo-Photoelectric Installation, Silicon Solar Cells, Helioprofiles, Thermo-Photoelectric Conversion Of Solar Energy.

INTRODUCTION

One of the problems of solar energy is that the energy potential of the falling solar radiation is insufficient and the efficiency of photoconverters and other solar devices. low.To improve the

efficiency of these systems, it is necessary to fully utilize the energy flow to the working surfaces of solar devices.

At this stage, photovoltaic modules are mainly used to generate electricity, while solar thermal collectors are used to heat the heating medium. However, with the development of modern science and technology, more and more solar devices have emerged that can produce both heat and electricity simultaneously through the same surface. These devices convert all solar radiation that simultaneously hits the surface into heat and electricity, that is, they simultaneously heat the coolant and serve as an alternating current generator[1].

LITERATURE REVIEW

Various studies have included research on solar photovoltaic and thermal devices. [2-5]. However, such scientific sources contain data on various combinations of hybrid photo thermal devices [3, 5].

The use of combined thermo-photovoltaic devices can significantly save on the consumption of materials per unit of power for their production, which is a common phenomenon of efficiency and increases the efficiency of use [1]. This is because absorbers of thermal heliosystems and solar panels receive and convert different wavelengths of the solar spectrum, so both heat and electricity can be obtained from a single working surface. The production of helio-photoelectric panels reduces the cost of materials required for expensive selective coating absorbers and photoelectric modular structures as a result of serial development by combining them into a single device [2].

The main problems of solar power plants are the small intensity of solar radiation, which is converted into electrical and thermal energy, efficiency is low, and as a result is the cost per unit of power. Due to the low potential of solar energy, high requirements are placed on the efficiency of the use of solar devices in the supply of heat and electricity, methods for determining the main parameters of efficiency, photovoltaic modules and heliocollector. A combination of a flat heat absorber and a photoelectric battery can create a design that allows efficient use of incident solar radiation and increases its conversion factor.

On a modern industrial scale, mono- and poly-silicon solar cells have a flat construction and an absorption coefficient of 95%, with an efficiency of 18-20%. In the conversion of radiation in solar cells, 80% of the energy is mainly used to heat the element, which negatively affects its quality. When solar cells are placed on the surface of the solar collector absorber, the efficiency of the device is significantly increased if ideal heat exchange takes place.

The removal of heat by the heat transfer fluid circulating along the contour of the solar system prevents the photovoltaics from overheating and, accordingly, the total amount of electricity produced increases. The high absorption coefficient of solar cells allows up to 80% of the absorbed solar energy to be used to heat the receiving surface of the heat absorber. For industrial-scale solar heaters, the conversion rate for most absorbers is as high as 80%.

MATERIALS AND RESEARCH METHODS

The article considers and studies the principle of operation of a combined thermo-photoelectric device, calculating its thermal and electrical performance.

The aim of the study is to theoretically and experimentally confirm the efficiency of the use of solar radiation incident on the surface of a thermo-photoelectric device and increase its conversion factor for the surface of the receiving unit.

All experiments were performed under natural conditions in the Namangan region, namely under constant sunlight during the experiment, with measuring instruments [6].

During the study, a method for directly measuring the current and voltage of a photovoltaic cell with a variable load resistance and a method for measuring the temperature of the heat carrier were used.

The experiments were performed in a wide range of natural conditions, in the open air, under natural sunlight. The experiments were performed in a wide range of natural conditions, in the open air, under natural sunlight.

The combined thermo-photovoltaic device (Fig. 1) is a full-size industrial helioprofile designed to directly cover the roofs of residential buildings. The helioprofile contains tubes for liquid heat transfer, air or heat-insulating material.

With such helioprofiles it is possible to cover an unlimited area of the roof up to 7 m in height and width. The receiving surface of the helioprofile has a chain of 36 solar cells connected in series. The photocells are attached to the receiving surface using a special heat-conducting paste with high ohmic resistance. The elements cover 1/3 to 1/2 of the surface of the lower part of the helioprofile (Fig. 1).

Figure 1. Thermo-photoelectric device

1 – falling sunlight; 2 – heat-absorbing surface; 3 – solar cells; 4 – walls of the helioprofile absorbing surface; 5 – air duct; 6 – water channel; 7 – electrical contacts of solar panels.

Due to the low temperature and circulation of the heat transfer fluid, the elements are cooled, which improves the quality of work. As silicon solar cells change parts of the spectrum other than those related to heat absorbers, an overall increase in energy production is observed.

Theoretical descriptions of the photovoltaic and absorber operation of a thermo-photoelectric device are represented by the following formulas (1-4) [7]:

The maximum capacity of a solar cell is expressed as follows:

$$P_{max} = F_{ff} I_{sc} U_{sp} = I_{max} U_{max} \quad (1)$$

Here, F_{ff} –filling factor, I_{sc} – short circuit current, U_{sp} – salt processing voltage, I_{max} – current at the operating point, U_{max} –operating point voltage.

It is known that the solar cell efficiency is calculated as follows:

$$\eta_{sc} = \frac{I_{max} U_{max}}{S_{us} E_0} = \frac{P_{max}}{S_{us} E_i} \quad (2)$$

Here, S_{us} – useful surface of solar cells (m^2), E_i –illumination of the working surface (W/m^2).

The calculation of the heat absorber is also done in a certain way. Useful energy from the collector per unit time Q_u (W) [13]:

$$Q_u = F_R A [I_P (\tau a) - U_L (T_i - T_a)] \quad (3)$$

Here, A – collector surface (m^2), F_R – collector heat dissipation coefficient; I_P – the total intensity of solar radiation in the collector plane, (taking into account the angle coefficient), W/m^2 ; τ – the light transmittance of transparent coatings against sunlight; a – the absorption capacity of the collector plate relative to sunlight; U_L – the total heat loss coefficient of the collector, $W/(m^2 grad)$; T_i – the temperature of the liquid entering the collector, $^{\circ}C$ (in nominal mode); T_a – ambient temperature, $^{\circ}C$.

A simplified version of this formula is more suitable for practical calculations:

$$Q_u = S_{SC} G C_P (T_{exit} - T_i) (W) \quad (4)$$

Where S_{SC} – is the collector surface (m^2).

Accordingly, the efficiency of a solar collector is determined by the following formula:

$$\eta_{sc} = \frac{Q_u}{S_{sc} E_i} \quad (5)$$

E_i – illumination for the combined device is the same as for the collector and photocell elements. The values of S_{sc} and S_{eq} – surfaces are equivalent, that is:

$$\eta_{sc} = \frac{P_{sc}}{S_{csd} E_i}, \eta_{sc} = \frac{P_{sc}}{S_{csd} E_i} \quad (6)$$

can be written as.

here (of the combined device) η_{sc} – solar collector, and η_{sc} – the efficiency of the solar cell; P_{sc} and P_{sc} – the power coming out of the collector and the solar cell, respectively, S_{csd} – it is the useful surface of a combined solar device filled with solar cells.

The total power of the combined device is equal to the sum of the powers of the thermal and photovoltaic parts of the device:

$$P_{csd} = P_{sc} + P_{sc} = S_{csd} E_i (\eta_{sc} + \eta_{sc}) = S_{csd} E_i \eta_{csd} \quad (7)$$

here η_{csd} general efficiency of the combined device.

Thus, with the increase in solar energy due to the photoelectric component, the overall efficiency of the device increases, while the area and illumination of the working surface remain constant.

If the receiving surface of the combined device is not completely covered with solar cells, formula (7) can be replaced by:

$$P_{csd} = S_{csd} E_i (\eta_{sc} + f_{QEK} \eta_{QB}) \quad (8)$$

here f_{ces} – the coefficient of filling of the receiving surface of the combined device with solar cells. In our case, it varies from 1/2 to 1/3.

As a result of heating, the efficiency of solar cells decreases according to formula (9):

$$\eta_{sc} = f_{ces} \eta_0 (1 - k(T_i - T_0)) \quad (9)$$

here η_0 – efficiency of the photocell at $T_0 = 25^\circ \text{C}$, T_i – the temperature of the heated photocell (we consider it to be equal to the temperature of the liquid at the entrance to the collector), the decrease in the efficiency of the solar cell depends on the k - depending on the temperature gradient and up to $0.3 \div 0.5\% / ^\circ \text{C}$ [5].

With this in mind, formula (8) looks like formula (10):

$$P_{scd} = S_{scd} E_i \frac{G C_p (T_{exit} - T_i)}{E_0} + S_{scd} E_i f_{ces} \eta_0 (1 - k(T_i - T_0)) \quad (10)$$

According to formulas (1-10), all the parameters and properties of the Combined Solar Device can be determined by taking into account the collector and photocell elements.

RESULTS AND THEIR ANALYSIS

For the experiments, we used two solar devices of equal size, located at the same angle to the sun with the same heat absorber (Fig 2). Solar cells are placed on the absorber surface of one device and the dimensions of the devices are 3x2 meters. The photoelectric part of the device consists of three photoelectric modules with the same power. Because the surfaces of the devices are equal, both devices receive the same amount of sunlight.

Figure 2. Solar heating (left) and thermo-photoelectric (right) devices

During the experiments, the heat energy produced by the two solar devices were compared as shown in the graph (Fig 3).

The data show that the temperature difference of the heat carriers at the output of the device in the simultaneous production of heat and electricity is only $1-2^\circ \text{C}$, and these devices have

almost no difference in heat production. Only here the combined thermo-photoelectric device also generates electricity. Due to the losses in the transfer of heat energy from the photocells to the absorber, differences of 1-2 ° C are recorded during heating. If the quality of the combined absorber is improved, the losses can be further reduced.

Figure 3. The outlet temperature of the heat transfer fluid

— thermalhelioprofile; — combined helioprofile.

Fig. 4 shows graphs of the specific heat capacity characteristics (W / m^2) of each solar device.

Figure 4. Specific heat capacity characteristics of devices

— thermalhelioprofile; — combined helioprofile.

Each of the three photovoltaic cells produces 48 W of power when the photovoltaic cells in the solar profile are in operation. In this case, 1/3 of the helioprofile surface is covered with photocells and the total power of the modules is 144 W. Table 1 shows the electrical characteristics of the thermo-photoelectric device output.

The results of the study show that the use of heat carriers and photocells with high temperatures under the influence of a heated surface due to solar infrared radiation significantly increases the overall conversion factor of the solar device. Thus, the combined helioprofile photovoltaic cells

each generate approximately 50 W of electricity (Table 1) and the thermal capacity of the two solar devices being compared remains approximately constant (Fig. 4).

Load performance data for individual helioprofiles.

$U(V)$ – experimental value	0	2	4	6	8	10	12	14	16	18	19
$P(W)$ – experimental value	0	7	14	21	26,4	32,5	38,4	44,8	48	39,6	0
Illumination of module characteristics 808 W/m^2 , Obtained at $T_{air}=30 \text{ }^{\circ}\text{C}$											

This is because the photocells convert radiation of a different wavelength that differs from the spectrum required (enough) to heat the collector heat transfer fluid [6]. When non-heat-conducting solar cells operate, the energy of the infrared component of solar radiation is used to heat the photocells, which can often cause them to overheat, reducing the efficiency of the photocells [7].

CONCLUSION

The results of the study showed that from the developed combined helioprofile surface can be obtained from 1 m² to 750 W of heat and up to 150 W of electricity.

From the results of the experiments, it can be concluded that the combined production of heat and electricity will be effective for solar-powered devices.

Theoretical calculations on increasing the coefficient of variation by comparing the experimental data obtained by comparing the operation of the heat collector and the combined device in practice were confirmed.

The total conversion factor of solar energy of the combined thermo-photoelectric device will be increased to 85%. In this case, the efficiency of the helioprofile is up to 70%, and the efficiency of solar cells is more than 15%.

The study also included the study of the results of complete coating of the collector surface with photocells, the redirection of the generated heat for energy purposes, and the efficient use of solar energy through the transmission of electricity directly to consumers. provided.

“HOTAMNOMA”–A STORY BASED ON FOLKLORE SUBJECTS

Nafisa Abdumajitkizi Abdumannatova*

*Master's Student,
Samarkand State University,
UZBEKISTAN

ABSTRACT

The article reflects on the plot structure of the “Hotamnoma”, the composition of motives, the nature of the images. The plot of the story has also been compared to that of Uzbek folk tales, proving that “Hotamnoma” is a folk tale based on folklore. To get rid of the suitors, she suggests seven difficult questions on the advice of the nurse, and announces that whoever answers these questions will get married accordingly. In order to save the life of a prince, he goes to the king of Herat in search of a cure for witchcraft. The king said, “Whoever saves my daughter from the dragon, I will give her medicine”.

KEYWORDS: “Hotamnoma”, Generosity, Folklore, Epic Plot, Test Motive, Adventure Motif, Talisman, Fairy Tale, Magic Objects.

INTRODUCTION

There are a number of traditional images in Eastern literature, such as Noshiravon, Jamshid, Qarun, Luqman, Hotam, each of which serves to express and promote a particular human quality. While the symbol of justice is Noshirawa with the image of justice, wisdom and high intellect, Luqman is mentioned as the ruler, while human qualities such as open-handedness, tolerance and generosity are associated with the name of Hotami Toy. In Oriental literature there is a work about the adventures of Hotam, which in Persian-Tajik literature is called “Seven Journeys of Hotam”, “Seven fair deeds of Hotam”, in Kazakh folklore “Hatimtayjomart” and in Uzbek folklore “Hotamnoma” or “Hotamnomyi Turkish”. “Hotamnoma” is a folklore work; the author and date of creation are unknown. The events in the work took place between slavery and feudalism. Although Hotam is said to belong to the Thai tribe in Yemen, his adventures take place not only in Arabia, but also in India, Iran, Central Asia, the Caucasus, and China.

THE MAIN FINDINGS AND RESULTS

“Hotamnoma” was translated into Turkish at the end of the XIX century. One of the first translations is kept in the manuscript fund of the Leningrad branch of the Institute of Oriental Studies of the USSR Academy of Sciences under the number s-172. This copy was translated from Persian in Aksu by Muhammad Hasan Alim and copied by Mirza Abdulkadir Axun in 1311 AH (1893-1894 AD). The manuscript consists of a total of 182 pages, of which about 10-12 pages are missing [1, p. 4]. In 1988, Akbar Matgoziyev published the book “Hotamnoma” based on this manuscript. He filled in the missing pages in a book published in Tashkent in 1900 by O.A. Porsev under the title “Hotamnima” Turkish”.

The “Hotamnoma” is one of the rare examples of folklore, which reflects the breadth of human thought, the beauty and infinity of dreams, goodness and incomparable love for life. Through the amazing adventures of Hotami Thai, a symbol of generosity, generosity and kindness, friendship and love, purity and loyalty are promoted. The work attracts the reader's attention with its richness of fantasy, logical observations, beautiful and picturesque images, optimistic attitude to life. The fact that the work is written in a puzzling way, like “Totinamo”, “Forty Ministers”, “Alif Layla” (A Thousand and One Nights), with a story in it, shows that the author has followed the traditional way of Eastern literature [2, pp. 32-34].

“Hotamnoma” is an adventure story. The composition of the work is in the form of a story within a story, using the traditional method of molding. It consists of seven independent stories. But within each single story, a number of small-scale stories are also given. In this sense, it is similar to the composition of such works as “A Thousand and One Nights”, “The Four Dervishes”, “Kalila and Dimna”. However, the composition of “Hotamnoma” differs from them in some respects, in the above works the main narrator is the protagonist of the story, but in “Hotamnoma” the protagonist is not the narrator, Hotam is an active participant in all events. Moreover, in many works of storytelling, there is no unity and integrity between the myths and stories told in the different chapters. The presence of the protagonist in all the stories and legends in “Hotamnoma”, as well as the connection between them, strengthens the compositional unity of the plot.

The “Hotamnoma” glorifies such noble ideas as generosity, honesty, love and devotion, friendship between people, kindness, peace and prosperity. Many of these ideas are also reflected in the terms given by Husnbonu. That is why in the play they are conditionally taken as the title of each chapter: 1st time “I saw a career, I want to see again”, 2nd time “Kiss, throw in the river”, 3 Journey “Do not do evil, if you do it, you will find evil”, 4th time “Truthfulness is always in front of pleasure”, 5th morning The 6th time is called “Looking for a pair of pearls like a duck egg”, the 7th time is called “The secret of the Bathroom Bodgard”.

The protagonist of the work is Hotam. He participates from the beginning to the end of the work. The preface of the work lists seven of his ancestors: Hotam bin Tay bin Qahlan bin Rasan bin Nahshab bin Qahtan bin Hud. It also mentions Hotam's mother, the daughter of Aden on horseback, the daughter of Thai's aunt [1, p. 9]. The preface is followed by “The Story of Husnbonu, the Daughter of Kurdonshah, King of Khorasan and BarzakhBazargan”.

It tells the story of a girl named Husnbonu, the main culprit in the chain of events, her father Barzakh, a merchant, and Kurdanshah, the king of Khorasan. When the girl was 12 years old, her father died on the journey, and Kurdonshah showed her kindness. Because of her beauty, many

princes began to marry her. To get rid of the suitors, she suggests seven difficult questions on the advice of the nurse, and announces that whoever answers these questions will get married accordingly. Many who are in love with Princess Husnbonu cannot answer her mysterious questions and return to their homeland in despair. One of them, Munirshah, the prince of Khorezm, went out into the desert after he could not answer Husnbonu's questions and complained and moaned around him. One day he goes to the borders of the state of Yemen and meets Prince Hotam of this country. She recounts her experience: Hotam makes a pact of friendship with her and goes to help the young man reunite with his lover. To this end, he and Munirshah left Yemen for Husnbonu. Then the main events of the story begin.

Several motives led to the activation of the subject of the work: heroic journey, adventure, conditional test, and dream. It is worthwhile to dwell on the concept of motive in folklore. The Russian-Uzbek Glossary of Literary Terms states that "motive" is one of the links in the subject. If the plot is a system of events that make up the content of the work, the motive is the main element that creates this reality. That is, the structure of an epic cannot be imagined without motives. Scholars differ on the subject and motive of epic works. However, most folklorists rely on the views of the Russian scientist A.N.Veselovsky. Emphasizing that motives are the main link that creates the plot, he says, "Motives come together to form a plot circle". He analyzes motives as the smallest integral part of the plot [3, p. 105]. It is well known that as long as the subject of an epic work really takes place in a space and time, this movement is undoubtedly accomplished through the movement of motives. The presence of several motives in the plot of the protocol also ensured the continuity of the whole plot.

The conditional test motive has a special significance in the subject of the work. There are two types of test motives in the plot: a) puzzle test; b) Plates in the form of hand-to-hand combat tests played a significant role. While the puzzle test serves to glorify the human mind by testing the hero's mental strength, the hand-to-hand race test serves to test the hero's physical strength and honor human physical perfection. Every epic creature has its own device. And the motive plays a key role in this device. Therefore, the analysis of folklore works should be done through the analysis of motives. Identifying motifs in epic works, analyzing the aspects of each motif in relation to other motives, internal movements and features, artistic and aesthetic functions is one of the important issues in folklore.

It is well known that as long as the subject of an epic work really takes place in a space and time, this movement is undoubtedly accomplished through the movement of motives. The presence of several motives in the plot of the protocol also ensured the continuity of the whole plot.

The conditional test motive has a special significance in the subject of the work. The beginning of the story, the answer to Husnbonu's 7 questions, is a test of the intellect and will of the protagonist, Hotam. There are also small stories within the story, most of which are based on a test motive. For example, when Hotam Yusuf came to Chin to fulfill the wishes of the bazaar, Bedod entered the city on horseback. The princess would ask three questions to test the intelligence of the strangers who came to the city, and whoever could not find the answer to this question would lose his head. The protagonist Hotam is also asked the following three questions:

Question 1. Which river is the river from which the creature emerges? Hotam answers: that river is the head of man; it is the drop of man that makes man appears.

Question 2. What kind of fruit is it, sweet, that it tastes so good that it can't be tasted by anyone? He replies that he is a child.

Question 3. What is it that no one needs and it will definitely come? It's death, says Hotam. So, because of his intelligence, he successfully passes the test and saves the princess from the spell.

During his adventures, Hotam uses a number of magical objects (a seal given by the daughter of a bear, a staff made by the king of snakes, Khurjun, which does not blind the poison, does not come close to the fire when caught, and a magician can destroy it [1, p. 102]. Their magical properties are manifested in the fact that the protagonist of the story is in a difficult situation: surviving in the belly of a fish, boiling oil, getting rid of snake venom in the woods, crossing a huge river, overcoming cancer in the river. However, it should be noted that in the full depiction of the image of Hotami Toy, these magical tools only play the role of auxiliary motives. Because even in the most difficult situations, Hotam acts mainly on his intelligence and courage (he finds the answer to the Queen's 3 questions) and achieves the triumph of justice.

The magical items mentioned in the story have a special character: a seal given by the bear's daughter, a staff and a seal given by King Khurjun, and a seal at the mouth of the morisurkh. For example, there is no drowning in the river that holds the seal; the venom of the serpent and the scorpion does not blind; does not burn in the fire, blindness is eliminated; whoever catches it wins the battle; all savagery will mute him; the mind will increase, the wealth will be fully accumulated [1, p. 112]. It should be noted that these magical items have a special significance in the story as a symbol of the centuries-old dreams and aspirations of the people. For example, it helps Hotam not to burn in fire, not to drown, to survive in the belly of a fish, and to heal the sick in the abode of giants. There is a special symbolism in the inclusion of these details in the subject of the story. They express the age-old dreams of the people: the availability of drugs to cure chronic diseases, the elimination of various natural disasters, and the simplification of people's lives through these magical objects.

It is noteworthy that the subject of the stories in the "Hotamnoma" can be found in Uzbek folk tales. Evidence of this can be seen in the preface. The plot of Husniyabonu, a collection of Uzbek folk tales called the "Golden Cradle" [5, 256], is almost identical to that of the story of Husbonu, the daughter of the Kurdish king of Khorasan and BarzakhBazargan, in the Hotamnoma. In the fairy tale Husnbonu is given as Husniyabonu, Kurdonshah - Gardonshah. It also depicts Husniyabonu as the grandson of Gardonshah. The story mentions 40 servants of a false sheikh who believed in Kurdonshah, while the tale mentions Eshan and 400 murids.

There is also another story about a hypocrite sheikh who was the spiritual teacher of the Kurdanshah and who robbed people with his disciples. As a result, the Kurdish king expelled Princess Husnbonu from the city. Husnbonu faced difficulties until the secrets of this fake sheikh were revealed. Although this story is educational in nature, it has nothing to do with the structure and overall plot of the work, so it can be concluded that it was later added by the narrator.

Hotam, a 16-17-year-old boy from a poor family, is featured in Volume 3 of the Uzbek Folk Tales Collection. The young man shows a series of heroism. In order to save the life of a prince, he goes to the king of Herat in search of a cure for witchcraft. The king said, "Whoever saves my daughter from the dragon, I will give her medicine". Then, out of pity for Hotam's young life, he tells her to take some medicine and go back. But Hotam kills the dragon and saves the country

and the king's daughter, saying, “Mard's job is to help the needy, to save the needy from hardship” [6, p.305].

A similar plot can be found in Chapter 3 of the People's Book, “Do Not Do Evil, If You Do It, and You Will Find Evil”. According to him, a seven-headed creature, one of which looks like the head of an elephant and six the head of a lion, inflicts damage on a village. “Hotam was trying his best, and I saw him, he knew that he was a hashtag, and he heard that if someone wanted to repel him, he would shoot a bullet in the eye, like an elephant's head. If he is blind, he will run away and never go to the welfare of the people” [7, p. 73]. So Hotam kills the creature and saves the villagers. In both sources, Hotam is portrayed as a brave, courageous hero who risked his life to save the nation from disaster.

CONCLUSION

In conclusion, it can be said that the “Hotamnoma” is a work that reflects the lofty thoughts and aspirations of the people. as well as the fact that a significant part of the subject of the work is similar to the subject of Uzbek folk tales, which means that it is a folk tale based on folklore subjects.

ABSTRACT

Ensuring interethnic harmony is one of the main directions of any state policy in the current era of globalization, which is characterized by geopolitical and ideological processes, as well as in the context of growing economic, political, national, religious and other conflicts in the world. One of the urgent problems of history is the large-scale reforms in the field of interethnic relations in the Republic of Uzbekistan, including the Republic of Karakalpakstan, the scientific study of the activities of national cultural centers. This article discusses the activities of national and cultural centers in the Republic of Karakalpakstan, the work carried out by the centers, the role of national cultural centers in preserving the ethnic identity of each nation.

KEYWORDS: Nation, Language, National Cultural Center, Ethnic Identity, Interethnic Harmony

INTRODUCTION

Interethnic harmony plays an important role in the political, socio-economic development of the Republic of Uzbekistan. In our multi-ethnic republic, the fate of each nation, the focus on their national characteristics, the creation of opportunities for their development has risen to the level of public policy.

In well-developed legal and civil countries, democratic processes divide society into three sectors: government, business, and non-governmental and non-profit organizations.

The public sector is engaged in solving political and war security, economic, social and other major problems at the state level, the business sector is engaged in solving all business problems in the country and serves to improve the living standards of the people.

Non-governmental and non-profit social organization contributes to improving the living standards of the people and accelerates the process of democratization in society, ensuring that many problems that are still lacking in the hands of the state can be solved without asking for funding from the state [1]. One of such non-governmental social organizations that contribute to the political, economic and social development of our country are national and cultural centers.

As a result of the national policy pursued in the Republic of Uzbekistan, there has been a process of ethnic and cultural unification among all nationalities living in Uzbekistan. The establishment of national-cultural centers paved the way for the development of national programs, cultures and other peculiarities of the peoples.

In 1989, social organizations of all nationalities and ethnic groups living in Uzbekistan - national and cultural centers - were established, and in that year their number reached 12. In 1989, the Republican Center for International Culture was established under the Ministry of Culture. In January 1992, the International Cultural Center was transformed into the Republican International Cultural Center. This process has developed rapidly due to the opportunities created during the years of independence. In 2002, there were 120 national cultural centers in the country [2, 187]. Currently, there are 147 national and cultural centers in the Republic of Uzbekistan.

In the Republic of Karakalpakstan, the organizational and legal framework for the activities of national and cultural centers has been created. On February 1, 2014, the Council of Ministers of the Republic of Karakalpakstan adopted a resolution approving the composition and the Charter of the Council for Coordination of National and Cultural Centers in the Republic of Karakalpakstan. According to the decision of the Council of Ministers, the Council for Coordination of National and Cultural Centers in the Republic of Karakalpakstan will be monitored on a regular basis and effectively to strengthen interethnic harmony and religious tolerance with the participation of local governmental and non-governmental organizations. Review of the action plan on the basis of proposals and recommendations to strengthen interethnic harmony in the country, improve the socio-spiritual environment, promote and implement the essence of the idea of national independence among representatives of different nationalities and ethnic groups, with representatives of national and cultural centers and religions Spirituality aimed at preventing international terrorism, religious extremism and missionary movements that undermine inter-ethnic harmony and inter-religious harmony the task of ensuring the regularity of reef activities was set [3].

The establishment of the Council has played a practical role in coordinating the activities of national and cultural centers in the country, providing practical assistance for the development of national and cultural centers, organizing and conducting events promoting interethnic harmony.

Currently, the Association of Koreans, the Russian Cultural Center, the Kazakh National Cultural Center, the Turkmen National Cultural Center, the Ukrainian National Cultural Center, the Kazakh National Cultural Center of Kungrad district operate in Karakalpakstan. The main purpose of these national-cultural centers is to strengthen friendly relations between the representatives of different nationalities living in the Republic of Karakalpakstan, to preserve and develop the national characteristics, historical values and traditions of each nation.

In 1990, the Association of Korean Cultural Centers of the Republic of Karakalpakstan was established. Over the years, the center has been contributing to the strengthening of friendly relations between the peoples of Korea and Uzbekistan.

The Association of Koreans of the Republic of Karakalpakstan was registered by the Ministry of Justice of the Republic of Karakalpakstan on August 11, 1993. The main goal of the Korean Association is to create ample opportunities for the development of any economic and cultural sphere of Koreans [4].

In 1937, the Koreans came to the Republic of Karakalpakstan, where at that time 1383 families, mainly fishermen, ie 6826 people settled in Moynak, Kungrad and Khojayli districts. They have made a significant contribution to the development of the region, especially in rice cultivation. Early ripening by breeders created Avangard, Nukus-2 varieties and produced a rich harvest. Experienced farmers have established rice cultivation schools in Kungrad district - Pak Guk, Kanlikul district - He Nam, Li Chun, Chimbay district - Kim Bon, Kim Moisey, Karaozyak district - Kim Victor rice cultivation [5]. At that time, in addition to agriculture, the Korean people made a great contribution to the development of science, education, medicine, construction and other sectors of the economy.

Currently, the center has language learning, dance and young artists' clubs. Every year 60-70 people attend the center to learn the language. There is a choir of older mothers called Ariran. The choir has 16 members, the oldest is 86 years old and the youngest is 69 years old. The ensemble actively participates in the annual festival "Uzbekistan - our common home" with concerts, exhibitions of our national culture, national cuisine [6].

The Karakalpak Association of Korean Cultural Centers regularly celebrates Korean folk holidays such as the New Year, Tano, and Chusok, which are celebrated according to the lunar calendar called Sol. The association is also holding a campaign of South Korean doctors to provide free medical care to the people of Karakalpakstan to further strengthen friendship between peoples.

It is difficult to call the Mugumhua Dance Ensemble of the Association of Korean Cultural Centers an ensemble composed exclusively of Koreans. The reason is that it includes Uzbeks, Karakalpaks, Tatars and Russians. They perform songs and dance in Spanish, Tsygan, and many other languages[7].

Among the national-cultural centers operating in the Republic of Karakalpakstan, the Russian Cultural Center has a special place. AN Efremov was elected its first chairman. In addition, its members I.A. Balakin, L.V. Kalacheva, N.V. Lyubimov N.V. made a great contribution. Today the chairman of the center is Zorkina Galina Alexandrovna, the members are Yu.I. Kulakov, K.A. Pirnazarova, T.L. Samolazova.

The Center of Russian Culture of the Republic of Karakalpakstan was registered by the Ministry of Justice of the Republic of Karakalpakstan on November 7, 1994. The main purpose of the Russian Cultural Center is to conduct educational work on the preservation of Russian culture, language, customs, in-depth study of Russian history and literature [8].

Today, there are more than 10,000 representatives of the Russian diaspora in the Republic of Karakalpakstan. All of them are actively involved in the construction of a sovereign republic.

The Center of Russian Culture of the Republic of Karakalpakstan works to preserve and develop the Russian language, culture, customs and traditions, develops cooperation with other national centers, creative associations and educational institutions [9].

The information received from the chairman of the Russian Cultural Center G. Zorkina during the research is noteworthy: "By the decision of the Cabinet of Ministers of the Republic of Karakalpakstan, we were given a building to carry out our activities on a regular basis. In 2019, our center celebrated its 25th anniversary. Over the past years, the main task of the center has been to preserve the language, culture, traditions and programs of the Russian people. The events held at the Russian House in cooperation with the faculty of NDPI named after Ajiniyaz, school teachers of Nukus, the Center for Education and Development "Progress" are aimed at the promotion of the Russian language and culture. Poetry evenings dedicated to the works of Maslennitsa, AS Pushkin and M.Yu. Lermontov, various competitions have become a tradition. Happily, our young people take an active part in such celebrations, the Russian language is heard on the stages of higher and secondary special educational institutions. The doors of our center are always open, our library has more than two thousand books, methodical manuals. Most of the literature on Russian language and literature was donated by secondary schools, colleges and lyceums information resource centers. The center has an exposition dedicated to the works of AS Pushkin, as well as the Museum of the East. A number of school children watched our exposition and expressed their gratitude.

In order to cover people of all ages, the center has a group "Znayka" for preschool children, and since 2011 a club for young people "Alye parusa". Of course, we do not forget about the elderly: they are guests of the Russian House and take part in organizing and conducting various events. We provide material and moral support to the elderly who are unable to participate in our events"[10].

One of the first national-cultural centers opened in Karakalpakstan is the Kazakh National-Cultural Center, which has been contributing to the development of interethnic relations since independence.

The Kazakh National Cultural Center is a social and non-governmental organization founded by representatives of the Kazakh nation in Karakalpakstan. The Republican Cultural Center, established as a result of long-term prudent policy in the field of interethnic relations in multi-ethnic Uzbekistan, has its own charter. The Kazakh National Cultural Center, together with other national cultural centers of the republic, serves peace and friendship, solidarity and unity among the peoples of our country. In general, according to the charter of the National Cultural Center, its main and responsible task is to restore the spiritual life of our peoples, promote the ancient cultural heritage, literature and folklore, customs and art of the Kazakh people, turn them into spiritual food, further development [11].

The Kazakh National Cultural Center of the Republic of Karakalpakstan was registered by the Ministry of Justice of the Republic of Karakalpakstan on July 3, 1996. The main purpose of the Kazakh National-Cultural Center is to meet the spiritual and cultural needs of the Kazakh people living in Karakalpakstan, to develop their language and traditions, thereby strengthening friendship between peoples [12].

The Kazakh National-Cultural Center is working effectively to meet the spiritual and cultural needs of the Kazakh people living in our country, to provide them with educational literature in their native language.

The Kazakh National-Cultural Center of Karakalpakstan has distributed more than 800 collections of art and literature books to Kazakh-language schools in the country.

Measures are being taken to further strengthen the cultural, humanitarian and friendly ties of national cultural centers operating in our country with national and cultural centers abroad. In particular, the Kazakh National Cultural Center organized a meeting of the youth of the institute with the editor-in-chief of the socio-political newspaper "Aktobe" of the Aktobe region of the Republic of Kazakhstan, poet Baurjanov Babajan oglu on February 27, 2020 at the Nukus State Pedagogical Institute [13].

Currently, Kungrad district is the second largest city in the Republic of Karakalpakstan after Nukus in terms of the number of Kazakhs (35,659 people). Therefore, the branch of the Kazakh National Cultural Center operates in Kungrad district.

In order to create the necessary conditions for the effective operation of the National Cultural Center, a separate room for the Kazakh National Cultural Center was allocated from the music school named after Esemurat Jirao' in the district and provided with the necessary equipment. In Kungrad district, where people of different nationalities live, every effort is being made to ensure the well-being of the population, to create decent working and living conditions for them [14].

Representatives of the Turkmen nation have a special place among the peoples living in our country. They work effectively in all spheres of the national economy, among them well-known scientists, painters, artists and other creators.

The Turkmen National-Cultural Center of the Republic of Karakalpakstan was registered by the Ministry of Justice of the Republic of Karakalpakstan on December 26, 1999. The main purpose of the Turkmen National Cultural Center is to preserve and develop the Turkmen culture, language, customs, literature, rituals, to strengthen and develop friendly relations between nations and peoples [15].

The center, which operates in the city of Turtkul in the Republic of Karakalpakstan, has been a member of the World Humanitarian Association of Turkmens since 2002. The center houses the editorial office of the Turkmen-language newspaper "Mekan" and a library with literature in Turkmen and other languages. Today, more than 20 schools in Turtkul teach in Turkmen. Textbooks in the Turkmen language in Uzbekistan are also being prepared by Karakalpak authors.

In this regard, it is worth mentioning the work of A. Kadyrov, G. Velbegov, G. Abdullaeva, who used their efforts in the creation of textbooks and other literary books in the Turkmen language [16].

The Turkmen National Cultural Center is headed by B.Sultanov, the holder of the Order of Friendship since 2002, and Muratbay Taganmuradov, an agricultural worker and holder of the Order of Friendship since 2004.

The Turkmen folk ensemble "Orzu" ("Dream") demonstrates its diverse repertoire and brings joy to the hearts of our multinational people. The ensemble's repertoire includes not only Turkmen national songs, but also works of art of other fraternal peoples. There is a class of Turkmen national musical instruments in the art school of the Turtkul district branch of the Republic of Karakalpakstan, where more than twenty Turkmen children study. Weddings have been opened in every densely populated village and mahalla of the Turkmen Diaspora, where all opportunities for cultural events have been created. Weddings, cultural events in a national tone, in a manner worthy of tradition

carried out.

The first information about the mass migration of Ukrainians to the Uzbek lands was recorded in the XIX century. Today, more than 71,000 ethnic Ukrainians live in Uzbekistan. The Republican Ukrainian Cultural Center "Slavutich", founded in 2001, and its cities of Nukus and Angren, as well as its branches in Tashkent region make a significant contribution to the preservation and development of the unique culture of Ukrainians [17].

The Slavutich Ukrainian National Cultural Center in Nukus was established in 2005 and works closely with other national centers, especially the Russian National Cultural Center, to strengthen and develop friendship between peoples. Currently, about a thousand Ukrainians live in the republic. All of them consider Uzbekistan as their homeland and are proud of it. This is because the friendship between Ukraine and Uzbekistan has a long history. It should be noted that the great Ukrainian poet and painter Taras Shevchenko was exiled by the tsar in the XVIII century to the shores of the Aral Sea for 10 years. In the Second World War of the last century, Uzbeks and Karakalpaks set an example of courage by participating in the liberation of the Ukrainian land from the German Nazis. Everyone knows that Ukrainian builders were active in dealing with the aftermath of the earthquake in Tashkent. Uzbek volunteers also took part in the liquidation of the Chernobyl accident.

As for the activities of the center, together with the Russian National Cultural Center, Navruz, Mustaqillik, Easter, Maslenitsa, New Year holidays will be held, and well-known war and labor heroes of the republic, writers and poets will be invited to it. Meetings and roundtables are held at educational institutions. They also have good relations with the Embassy of Ukraine in our country, where they donated the national costumes of the Ukrainian people. It is also helping young Ukrainians graduating from secondary schools to study at the expense of state scholarships by providing them with referrals to higher education institutions in Ukraine. Currently, four of our students are studying in Ukraine on the recommendation of the center. The center also provides holiday care to the elderly living in the country [18]. The Center has done a lot to provide comprehensive, both moral and material assistance to the Ukrainian people living in our country.

Currently, the Ukrainian national-cultural center "Slavutich" is headed by Olga Artemovna Mironets. His main profession is medicine, he works as a laboratory manager at the State Center for Sanitary and Epidemiological Surveillance of the Republic of Karakalpakstan. At the same time as working in his difficult profession, O. Mironets faithfully carries out his duties, uniting the representatives of the Ukrainian nation living in our republic for a common goal. He was awarded the Medal of Fame on the occasion of the 25th anniversary of the establishment of the International Cultural Center of the Republic of Uzbekistan in 2017 for his heroic deeds before the state.

In conclusion, it can be said that the national-cultural centers operating in the Republic of Karakalpakstan are taking bold steps to strengthen interethnic relations in our republic. Interaction between different cultural centers, cultural performances are important.

The national-cultural centers of the republic contribute to the strengthening of interethnic harmony in many areas. These are clearly seen in the events related to historical-ethnographic, cultural-enlightenment, musical, scientific-popular, scientific, informational and social-charitable.

National-cultural centers serve to reveal the unique features of each nation, to pass their traditions to the next generation, to further develop their native language.

ABSTRACT

The article covers the assessment technology and its ability to identify professional competencies. Based on the results of the study, five groups of the most important competencies necessary to achieve successful activity through behavioral models are described. Each behavioral model demonstrates the manifestation of a particular competency. With the help of the assessment technology, the general and specific features that are characteristic of management in the public service are identified.

KEYWORDS: *Personnel Management, Public Service, Civil Servants, Performance Evaluation, Professional Competence, Technology Assessment.*

INTRODUCTION

As you know, an important condition for the dynamic development of the Republic of Uzbekistan is the accelerated introduction of modern innovative technologies in the economy, social and other spheres with the widespread use of the achievements of science and technology. The rapidly developing all spheres of public and state life of the country require close support of ongoing reforms based on modern innovative ideas, developments and technologies that ensure a

quick and high-quality leap of the country into the ranks of the leaders of world civilization. The main goal of this Strategy is the development of human capital as the main factor that determines the level of the country's competitiveness in the world arena and its innovative progress.

According to the literature, to solve topical problems in the field of management, a radical reconstruction of personnel management mechanisms and the transition of personnel management to a fundamentally new level of development are required. The use of new, complex, unconventional technologies in personnel management based on a change in the approach to personnel as a key asset of the organization contributes to the company's transition to a different way of functioning. In order to build a personnel management system, it is necessary to revise the approaches to personnel assessment as the most important tool for personnel management [1].

The term "assessment" is firmly established in everyday life - it is used by financiers, lawyers, physicians, and developers of technical systems. In the broadest sense, assessment is synonymous with assessment. In a narrower sense, it means testing or assessment, the results of which are presented in quantitative terms, as well as an assessment carried out in the course of a certain meeting.

The procedure for assessing the competence of personnel using the assessment method is a useful but expensive tool. Personnel services use quite a variety of assessment methods, so when they talk about assessment, they most often mean the technology of the "assessment center". It was developed to assess the potential of a person and was initially applied at the stage of selecting candidates for senior positions. The main distinguishing features of this assessment technology are the following: several people are assessed simultaneously, the assessors themselves and there are also several assessment methods.

World experience testifies to the advantages of the "assessment center" technology for assessing and developing the competencies of managers in the public service. Assessment Centers or Assessment Centers provide more efficient selection and better audit and assessment of personnel than standard methods. To date, the Assessment Center can be called one of the most accurate methods for the comprehensive assessment of candidates for a vacant position, employee assessment for drawing up programs for the development of professional skills and business qualities, inclusion in the personnel reserve and promotion.

Naturally, the Assessment Center, like any other method, does not provide one hundred percent accuracy and has a number of limitations. At the same time, the practice of the last two decades shows that its use is more than justified. The use of the Assessment Center gives high accuracy of the results, thanks to the preliminary preparation of the scenario developed by psychologists and consultants on special technologies. Assessment scales, interview forms, business games are developed based on the characteristics of the activity and the requirements for a specific position [2].

Key features of the Assessment Center: concentration on behavior, reproduction in tasks of the main aspects of work. It is assumed that the performance of these simulated tasks, close to practice, predicts behavior in work situations. The use of interviews and tests in addition to group assignments increases the validity of the staff assessment. It is possible to review and evaluate the performance of the assignment in terms of the competence required to achieve the intended level of performance for a specific job or required at a specific place in the

organization. During the Assessment Center, there is a simultaneous assessment of several candidates or participants, which allows them to interact, disclose and apply their professional experience. When recruiting in this manner, it provides an opportunity to show the extent to which candidates fit into the culture of the organization, and the candidates themselves can better understand the organization and its values in order to decide for themselves if they fit. This is established by observing their behavior in various typical situations and using tests and structured interviews, and, of course, based on the developed competency model.

Having applied the assessment of government officials, we came to the conclusion that it is possible to single out general and specific features that are characteristic of government in the public service, in contrast to other spheres: production, business, politics, public organizations. Everything related to the purpose of management as a whole is related to common features. This is goal-setting, organization of technological solutions, controlled allocation of resources and motivation, inspiration, and training of employees.

As for the specific features, the following can be said. Civil service is a function of the state apparatus, implemented by specially created state bodies. The key question here is: "What social institution should a public service be?"

Management skills are more difficult to define and evaluate than technical skills or experience. On the example of behavioral models that people demonstrate to achieve the best result in work, one can observe the manifestation of professional competencies. The five groups of the most important competencies required to achieve successful performance are described below through behavioral models. Each behavioral model demonstrates the manifestation of one or another competence [5].

1. Values

It is believed that it is moral values that are the cultural basis of administrative ethics and an important condition for organizational effectiveness. The block of values usually includes honesty, responsibility, obedience to the law, competence, fairness, impartiality, political neutrality, "social sensitivity", efficiency. The new values include a propensity for innovation, the ability to "team" work and the quality of performance of official duties.

2. Managerial professionalism

The professional management activity of a civil servant involves the knowledge and use in practice of effective methods and means of analyzing the situation, making a decision, setting goals, organizing activities to achieve results, motivating subordinates and monitoring performance.

3. Systematic thinking

The ability to see the situation as a whole and its individual elements; ability to generalize information; the ability to identify significant relationships; the ability to highlight the main thing from the general; mastery of information gathering techniques and the ability to structure large amounts of information.

4. Leadership

Ability to take on the role of leader of a team or group. Ability to convince, influence or make a positive impression on the target audience in order to induce them to take actions aimed at achieving the result.

5. Adaptability

The ability to navigate in a changing situation, the ability to quickly adapt to new conditions and effectively solve new problems.

Among the diverse approaches to building a model, two can be distinguished. One of them is popular in business, the other in working with government officials.

The distinguishing features of the two models is that in the field of public administration, the main professional and managerial roles that are called upon to be played by a high-level civil servant are important. In systems management, the managed activity is analyzed in four main categories: activity processes, functional structures, resources, methods of activity. The interrelation of these elements and the organizational integrity of the systems of controlled activity are ensured by the systemic organization of the management itself and its role specialization [3].

The distinguishing features of the two models is that in the field of public administration, the main professional and managerial roles that are called upon to be played by a high-level civil servant are important. In systems management, the managed activity is analyzed in four main categories: activity processes, functional structures, resources, methods of activity. The interrelation of these elements and the organizational integrity of the systems of controlled activity are ensured by the systemic organization of the management itself and its role specialization. The assumption about role specialization is based on the idea of the relative independence of each of the named categories.

So, the processes of activity in the organization can be ensured by analyzing the situation, determining the goals that must be achieved, as well as by developing and implementing appropriate programs for the functioning and development. We conditionally "attributed" the responsibility for these types of activity to the performer of the role, which was called the Manager. Responsibility for the development of organizational structures and, in general, various forms of organization of personnel activities was "assigned" to the role of the Organizer. The role-playing picture of the person responsible for the distribution of the basic resources of the organization, as well as control over the implementation of activity plans, was named Administrator. And, finally, responsibility for the placement of performers, an accurate understanding of the tasks facing the organization, possession of effective methods and techniques of professional activity, as well as maintaining an optimal atmosphere in the team was seen in the role of the Leader. In reality, the boundaries between these roles are not so obvious. Sometimes the responsibility for a particular aspect of management is distributed among the members of the management team, but it is often possible to observe cases of universal managerial professionalization, when the entire repertoire of roles is performed by one person [4].

We proceed from the assumption that a person can have several roles in an actual state, and at least two roles from the proposed set, he can actively use and combine in his daily activities.

To identify the level of competence formation, an integrated approach is required. It includes the development, adaptation and use of assessment methods that imply the ability to work, including within the framework of remote procedures (see Table 1).

TABLE 1 "TYPOLOGY OF CANDIDATE ASSESSMENT METHODS"

	Full-time	Remote
Contactless	1. To use them, control subjects with sufficient qualifications for the methods used are required	2. To use them, controlling subjects without special skills and knowledge are required, since the instructions for the methods of this group are closed. The main task comes down to control over the participants' compliance with the conditions for filling out the methods.
Contact	4. For their implementation, specially trained personnel with experience in carrying out similar techniques are required.	3. To conduct them, people with computer skills are needed, who are able to use various technologies of working online.

Remote non-contact methods:

1. Personality - role questionnaires.
2. Intellectual tests.
3. Questionnaire of professional and managerial roles.
4. Professional test for knowledge of legislation, the basics of general and strategic management.
5. Questionnaire for the analysis of the life path (biographical data; "Life line").
6. Essays.
7. Recommendations.

Remote contact methods:

1. Participation in Internet conferences.
2. Participation in online forums (including Webinar technology).

Thus, we can conclude that the modern challenges facing the civil service make it possible to adequately understand its boundaries and perceive reality holistically, to focus on self-learning and transformation (a creative approach at all levels, functional links and spheres of life), to achieve an understanding of their goals and purposes (goal-setting, purposefulness, purposefulness and expediency), to increase the level of tolerance to uncertainty, to fix the set of internal moral values, rules and norms of civil service. Assessment as an appraisal procedure is designed to contribute to the formation of the staff of the Civil Service.

FACTORS INFLUENCING THE DESIGN OF ADOLESCENT UNIFORMS AND DETERMINING THEIR FUNCTIONS

Sharipova Saodat Islovovna*

ABSTRACT

Teenagers of school age spend a lot of time in school, and therefore, the clothes worn to school are the most popular and diverse. Based on the analysis and generalization of a priori information and consumer situations, a block diagram of the main functions of modern teenage uniforms is developed. It is established that teenage uniforms are a complex multifunctional object and the development of a wardrobe of uniforms should be approached from a position that primarily provides comfortable conditions for the student in various situations of consumption.

KEYWORDS: *Teen Clothes, The Time Budget Of The Student, The Functions Of The Uniform*

INTRODUCTION

The success of industrial enterprises is associated with a rapid response to consumer demand, expanding the range, clarifying the volume, improving the quality of products while ensuring sufficient profit and production efficiency. Therefore, marketing research plays a leading role in planning the manufactured range of clothing [1].

The process of designing teenage uniforms has its own specifics, due to increased consumer requirements for it due to the peculiarities of the morphology, physiology and psychology of the child during periods of growth and development.

The imbalance of the domestic economy, accompanied by frequent crises, revealed the imperfections and shortcomings of the methods used for conducting pre-project work and the composition of initial information based on marketing research.

Analysis and determination of the initial situation is carried out to establish targeted actions of pre-project research of the consumer market and the development of a rational assortment collection of the industrial level. Analysis of the initial situation in the design of a complex object

(assortment) or a separate assortment unit involves the synthesis and analysis of consumer situations.

The consumer situation is a mode of use of the product associated with the place of its consumption, characterized by stable standards of treatment of the product and placing special requirements on the operational and artistic and aesthetic properties of the product.

Under the conditions of consumption, we understand a set of environmental factors in which the child's activity takes place, and which have a certain influence on him at a certain time of day.

As you know, the daily time, from the point of view of physiology, is conditionally divided into active and passive. the passive time of day refers to the period when the child is in an inert state, active time is the time when the child's vital activity increases, accompanied by a separate amount of energy consumption of the body and therefore requires a special approach in choosing clothes.

When a child comes to school, his lifestyle changes: there are new responsibilities, daily routines, and classes according to the educational process. The circle of communication is expanding - with peers, teachers, with high school students, etc. younger students have a great need for joint activities: games, collective

Leisure, work and other activities of interest, for example, in circles - art drawing, modeling, sports, music, etc. in this regard, the child's wardrobe is not only expanding, but also significantly changing due to the appearance of new items of clothing necessary for study and occupation, corresponding to his age and type of activity.

Older children are more actively involved in various activities. In this regard, uniform clothing is becoming increasingly unified and expedient. There is a need for specialized clothing (for sports, the profile of work in training workshops, in clubs, etc.).

As was usually the case, the time allotted for recreation is often spent outdoors at any time of the year. clothing during walks protects the child's body from cold, wind, rain and solar radiation, and since children are most active at this time, it also protects them from various injuries. in this case, the main dominant function of adolescent uniforms is a protective function that protects the child's body from adverse external influences of the climatic environment, which is especially important for the clothes that the child wears every day (school and every day).

Children in technology lessons, early labor, when performing physical work at home, on the garden plot, wear various dressing gowns, aprons, and headscarves over their main clothes. In this case, the clothing, performing the function of protection, ensures the safety of the main clothing from objects of labor and industrial pollution. Such clothing for its intended purpose refers to technological clothing.

The child at recess enjoys spending time in sports games, which allows him to move a lot, clothing in these cases provides normal conditions for movement, a comfortable state of the microclimate of the clothing air and the nervous system, i.e. performs a physiological and hygienic function. Uniform clothing supports the external environment in a state favorable for the flow of life, expanding the interaction of the child with the environment, optimizing the conditions of his activity [3], which is especially important for the child's body, since uniforms and casual wear are among the most wearable.

The entire budget of children's time was divided into three components: sleep, study and leisure.

The time allotted for sleep refers to passive time, because the child's body is at rest. study and leisure, accompanied by a complex of different activities and requiring a certain physical activity-to active. Moreover, the main time, more than 70% of the time, according to research results, children spend at school, for example, the " working day " of a lyceum student, taking into account the preparation of homework and other activities, lasts 10-12 hours in primary classes and up to 15 hours in senior ones.

It is established that the main time of high school students more than half (51.3 %) of the daily time is allocated to study with the road there and back. The second place in the share of the daily time budget of schoolchildren is occupied by time for basic restorative rest - night sleep (26.7 %), the third place (10%) is time for personal hygiene, self-care, food, etc. The share of free time is 4.1%. Other activities take up 7.9 % of the daily time.

Figure 1. The time budget of a modern high school student.

Teenagers of school age spend time at school, and therefore, the clothes worn to school are the most popular and diverse. Based on the analysis and generalization of a priori information and consumer situations, a block diagram of the main functions of modern teenage uniforms is developed. It is established that teenage uniforms are a complex multifunctional object and the development of a wardrobe of uniforms should be approached from a position that primarily provides comfortable conditions for the student in various situations of consumption.

Classes at the school are arranged in such a way that in addition to general education subjects, physical training, labor training, music, etc. are included. Special attention is paid to the organization of children's leisure time after the main classes, because this time is a kind of way of conducting educational and familiarization work of teachers with children.

The whole complex of school activities is aimed at the development of mental abilities, the formation of moral and ethical norms of human behavior in society and the education of a sense of responsibility in various situations.

The activities of children in school are so diverse that in order to establish the requirements imposed on adolescent clothing when forming an assortment collection, it is advisable to consider their types and the functions of clothing used for these cases.

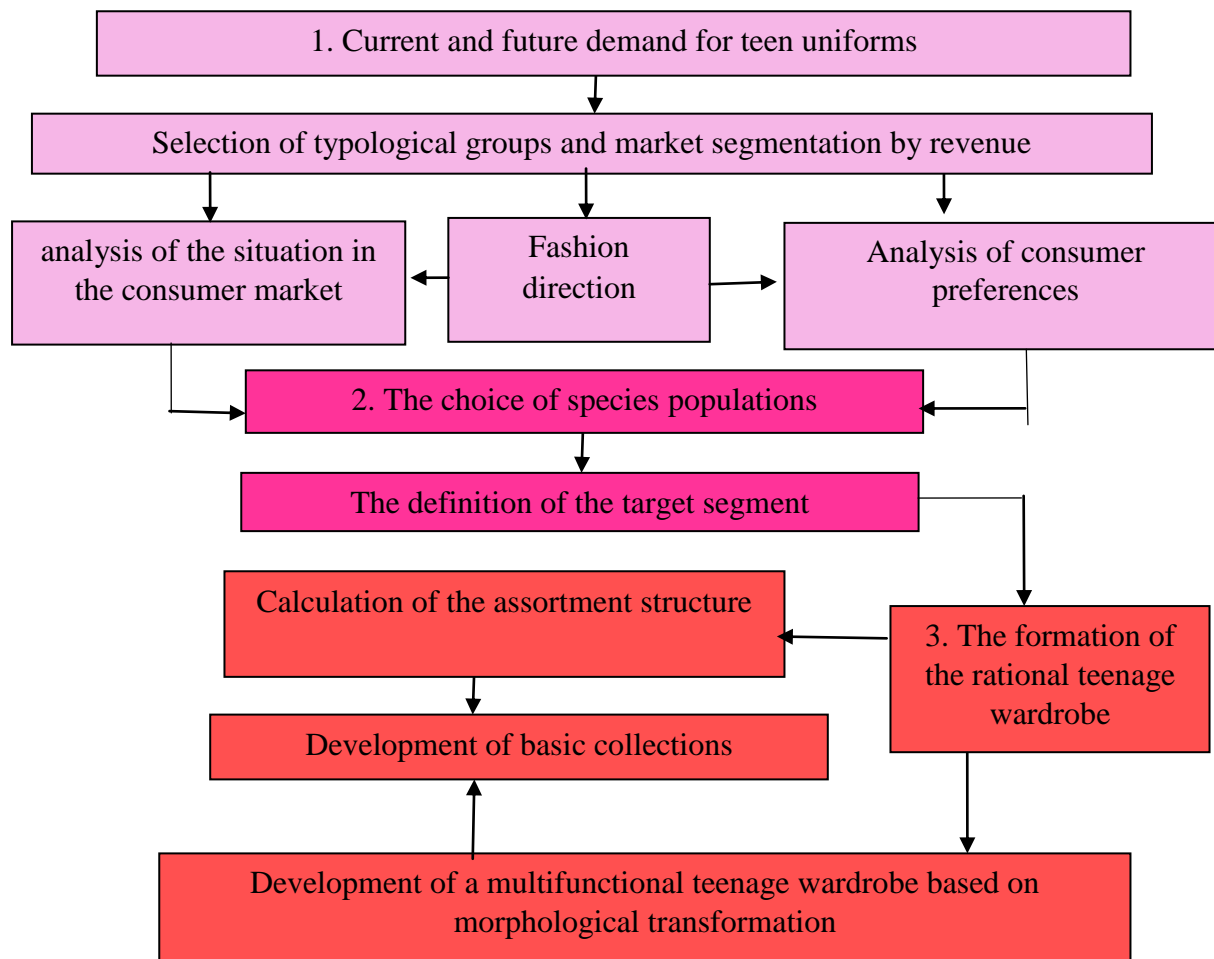

Figure-2. Generalized block diagram of the process of forming a rational assortment of adolescent uniforms of industrial level.

The function of clothing is understood as a characteristic that determines the actual performance of the product of its purpose, i.e. the implementation in the process of consumption of the properties of the product determined by the purpose and morphology.

The functions of the product are diverse, and in order to create a functional "portrait", it is necessary to type the functions and select the most dominant of them, i.e., bearing the dominant value.

In this regard, a block diagram of the main functions of modern teenage uniforms has been developed (Figure 2).

Teenagers of school age spend a lot of time in school, and therefore, the clothes worn to school are the most popular and diverse. Based on the analysis and generalization of a priori information

and consumer situations, a block diagram of the main functions of modern teenage uniforms is developed. It is established that teenage uniforms are a complex multifunctional object and the development of a wardrobe of uniforms should be approached from a position that primarily provides comfortable conditions for the student in various situations of consumption.

THE ABILITY OF BEHBUDIY IN THE SELECTION OF WORD

Avazov Normurod Hakimovich*

*Associate Professor,
Candidate of Philological Sciences,
Tashkent State Institute of Arts and Culture,
UZBEKISTAN
Email id: normurod.avazov.63@mail.ru

ABSTRACT

Behbudi's works were widely used in Turkestan at the beginning of the twentieth century as the leader of the Jadids in language and literature. In Behbudi's work, the problem of mastering the art of speech is one of the new aspects of his work. His drama "Padarkush" and artistic journalism play an important role in educating the Uzbek people in the spirit of enlightenment in Turkestan. Thus, we see that he skillfully used this word. Behbudi's eloquence, the use of popular words further helps to understand the same period.

KEYWORDS: Word, Vocabulary, Language Of The Nation, Nationality, Turkestan, Turkestan Region, Multilingualism, Reform, Freedom, Motherland, Freedom, Culture, Freedom, Power Of Speech.

INTRODUCTION

The influence of Behbudi's journalism is enormous. It is well known that at one time they reached the general public, especially the intelligentsia. Behbudi takes each article seriously, having a clear idea of who it was written for and for what purpose. At the same place, we are obliged to talk about the artistic skill and language of the writer.

How is this skill manifested? Let's try to answer this question first. Let's focus on choosing Behbudi headlines. Many articles by the author pay attention to the title. They clearly show the purpose and purpose of the writer's utterance. The name itself does not leave the reader indifferent. The most important aspects of the theme were stamped: "The right is taken, not given" ("Haq olinur, berilmas"), "The future of Bukhara is in the dark" ("Buxoroning istiqboli qorongulikda"), "Patriotism is needed" ("Vatanparvarlik kerak"), "Oh, the banks have ruined us" ("Oh, banklar bizni barbod etdi"), "Needs of the nation" ("Ehtiyoji millat"), "Who will reform

the nation” (“Millatni kim isloh etadi”), “Habits that ruin us” (“Bizni kemiruvchi odatlar”), “Our factor, or our goal” (“Omilimiz, yoyinki murodimiz”), “Criticism is sorting” (“Tanqid saralamoqdur”), “Assertion of truth” (“Bayoni haqiqat”), “We need an alliance” (“Ittifoq kerak”), “Grief and sorrow” (“Oh va hasrat”), “Duma and Turkestan” (“Duma va Turkiston”), “Wedding and waste” (“To‘y va isrof”), “Appeal to the nation” (“Millatga murojaat”).

Importantly, Behbudi’s personal attitude is clearly expressed in many of them. In the articles: “Patriotism is needed”, “Wedding and waste”, “Who will reform the nation”, “Needs of the nation” reflect the author's affirmative action, approval, consent, “Oh, the banks have ruined us”, “Habits that ruin us”, “Duma and Turkestan ”and “Appeal to the Nation” the author expresses a negative, contradictory point of view.

All this confirms from the title that the writer-publicist has a passionate attitude to the facts of reality, a violent rage of positive and negative emotions, a "call" to express a free passionate opinion about an event, a problem.

It is worth talking here about Behbudi's method for putting an issue on the agenda. The writer begins most of the work with an introduction. Thus, he prepares the interlocutor (journalist, reader) for the release, helps him to concentrate on the problem. At the same time, he creates conditions and an opportunity for others to understand and comprehend the most important aspects of the problem that he or she is trying to solve. Some articles show that this situation is clearly spelled out. For example, in the article “Students need help” we read: “We cannot tell the preface of each work.”

In practice, this idea has found its full effect. Let's take a look at a few examples. “Ahli xabarining ma’lumidirkim, eski hukumat zamonida har nimarsa amr va buyruq bila bo’lur edi. Xaloyiqning dini va milliy ishlarini isloh va rivoji to’g’risida qilaturgan harakatlarig’a yo’l berilmas edi. Hech nimarsa hukumatdan bejavob va izsiz qilina olmas edi”(1).

He added: “Hammaning ma’lumidirkim, eski hukumat zamonida har nimarsa oning amri va jabri ila bo’lurdi. U nimarsa bizning shariatimizga va yo maishat va millatimizga zarar keltirsada ko’milgan hukumat zoliman joriy qilurdi. Binobarin ellik sana muddatda biz shariat, maishat va axloq jihatidan ko’p tanazzul etdik va bizning taraqqiy va isloh yillarimizni eski hukumatning ruslashtiruvchi siyosat odamlari va mssionerlari butun bog’langan edi”(2).

The reason for writing these articles is indicated at the beginning of the article: “On the evening of September 18, I went to a meeting in the Orzok office of Samarkand region. It was about food, that is, life. The chairman of the Mejlis needed money to bring wheat from Russia, and for this money he turned to Russian and Muslim notables for help. Some said let the banks do it. Someone told the townspeople to give two soums per person for each food card. Some felt the need to appeal to the consciences of the rich. Some wanted to ask for help in the store and in the office” (3).

“Muhtaram birodarlar! Hozirgi qimmatchilik, qahatchilik va suvsizlik hammaga ma’lumdir. Allon yozda biroz meva mavjud, albatta yozning tirikligi qishnikidan osondur. Qimmatchilik va qahatchilikning eng qo’rqilaturgan vaqti oldimizdagi qish va kelar bahordur. Agarda suluh bo’lmasa va Rossiya temir yo’llari ochilmasa eng xufiyalik va ochlik hollar oldimizdadur. Russiyaning ba’zi viloyatlarida bug’doy ko’b va onda ushbu kunda bir puti uch yoki to’rt so’m

bo'lganda, Turkistonda puti Rossiya narxidan o'n da'fa ziyodadur. Endi Turkistong'a Russiyadan bo'g'doy keltirmoqdan boshqa iloj yo'qdur"(4).

Behbudi's influential word art is one of the brightest signs of a writer's skill. Each article is adorned with exactly this art. Not only the choice of words in the statement, the logical flow of thought, the consistency, but also the facts and arguments presented, and even the accuracy in the details of the events, the objectivity in the number of facts and arguments provide this confidence. Let's look at the article "On national affairs in Samarkand": "There is a lot of work, a little work, a little effort.

Through the twentieth issue of Hurriyet, two people from all communities of the city districts of Samarkand region were invited to form the Samarkand Regional Society to discuss the issues covered in the twentieth issue of Hurriyet. sent in several letters to the societies. Meetings will be held in Samarkand on July 11 and 12. Five to ten Russians came. Even two representatives from the Peasants' Society in Tashkent came twice. However, only one person from Jizzakh, Kattakurgan, Khojand and Uratapa in Samarkand region did not attend the meeting. However, at this meeting, vital issues for Turkestan were divided. Or in the article "Bukhara events" the details of the meeting with the amir, the situation and the landscape there, and even the details of the relationship between him and the amir are not in doubt (5) - on the contrary, the reader is under the influence of the narrator.

At this point, it seems appropriate to stop work on the volume of Behbudi's articles. Behbudi has no large-scale articles. The largest of them, at current sizes, is no more than 5-6 typewriters. Most of them are the size of two or three typewritten paper. This fact alone suggests that the power of Behbudi's writings is seen in his conciseness, conciseness and concise clarity of thought. His ingenuity and ability to use the word in its place is noteworthy.

Behbudi's journalistic articles have a character that is often overlooked. It is a repetition of a particular idea or fact. He follows exactly the same path in places that are considered important. But these repetitions should not be interpreted as a weakness of the author's style, but rather as a coherence, priority, consistency in the author's worldview and goals. Furthermore, whether the repetitions are related to facts or to the direction of thought, the author uses them to achieve his goal, that is, as a means of conveying them to his addressee. To prove our point, let's look at some examples:

"If we people of Turkestan spend the money we spend on weddings and condolences on the path of science and religion, we will develop almost like Europeans, and we will find prestige and prosperity in our religion," he said. No, if we remain in the present state, we will have nothing but delusions and pleasure for religion and the world. "

"Let's try to open schools and madrassas, establish public and corporate business. It is necessary to send students to Russia and Europe, Egypt and Istanbul. We, Muslims of Turkestan, will have no other fate"(6).

"Let's try to open schools and madrassas, create public and corporate enterprises, send students to Russia and Europe, Egypt and Istanbul. Muslims of Turkestan, brothers! Open your eyes, look at magazines and magazines and get to know the world" (7).

We know that with the money spent on weddings and celebrations, it is necessary to send children to the Caucasus, Crimea, Orenburg and Kazan to learn the educational method" (8).

As can be seen from the above examples, intellectual repetition is associated with criticism and ridicule of some of the vices that depend on our traditions to achieve a common and serious goal, and at the same time are fetters for the development of the nation. ...

In general, almost all repetitions are intended to emphasize and strengthen the author's opinion. Only in a few cases do the aspects of these repetitions related to the style of the writer come to the fore.

If we approach Behbudi's work from this point of view, then we can understand that his literary heritage also had a significant impact on the development of the Uzbek language at that time. Apparently, Behbudi always thinks about his reader when he writes each article. This does not exclude the student's career, worldview, level, level of knowledge. These circumstances serve to determine the criteria for the choice of a word by the writer. Therefore, it is easy to see that Behbudi chose different words in his articles, addressed to different strata of society.

When it comes to pre-existing reality, we see that the writer is content with the extremely brief and short expressions. Conversely, one can observe indomitable commentary when locals talk about an event or concept that is new or unfamiliar to the interviewer or reader. As an example, let us give an example: "The government, in the name of a private loan, within three days opens small banks in most districts of the Turkestan region, and a short procedure is a matter of business. Each constituency elects from three to four members, that is, from two to three districts of the Vulus. These members borrow more money from their families at a rate of twelve percent for a period of eight to nine months, or one hundred soum for a period of twelve sums" (9). Or: "In some parts of Turkestan, one tenth is four tanobs, and in other countries - six tanobs. But the real profit is calculated on the basis of desyatin, that is, six hundred sarjins for per tanob. The places with one tanob four hundred sarjin give one kilogram wheat. One desyatin is two thousand four hundred marhib sarjin" (10).

In the first article, Behbudi considers it necessary to comment on the fact that the term "Мелкий кредит" is not only Russian, but also new for the local population as an economic concept. This clarifies the content and essence of the concept. The same can be said for the following excerpt. Here he compares it with the size of the sarjin, which is understandable to everyone, given that the word tithe has different sizes in different muzaffari of Turkestan. We are not mistaken in saying that it is specific for all types of Behbudi's articles.

During the Behbudi period, opportunities for enriching the Uzbek language through the Russian language expanded. Behbudi also uses this opportunity. Behbudi's articles often contain Russian and Russian international words. In any case, they should be understood as a legitimate and true expression of the events of that historical period. Whether Behbudi wanted it or not, these words came true, began to be applied in practice along with their concepts and found their place. In Behbudi's articles, we see many Russian and Russian-international words related to various spheres of social, political and cultural life. In particular: economic: banking, credit, finance, commerce; related to politics: дума, parish, member, autonomy, contour; military: military organization, governor, missionary and other words.

The writer does not use these words on his own. Assuming they are unfamiliar, he explains this with another word or comment known to the Uzbek reader. For example: "Учредительная собрания" means "Majlisi muassison" (Haq olinur, berilmas), федерация-muhtoriyat (Haq olinur, berilmas), калония-mustamlaqot (Bayoni haqiqat), assembly of a military organization:

военной организация, Meeting of the soldiers and workers are совет солдатский, рабочий депутат (We need an alliance).

Of course, it is difficult to say that they are all understandable to ordinary people, the general public. It can be noted that Behbudi himself found it difficult to find alternative words, and sometimes such words were not found. For example, such words as “дума”, - “балдия” (about national affairs in Samarkand), “muboravatimiz” - “парламентизм” (Bayoni haqiqat). The interpretation of the word “Ультиматум” by Behbudi is limited with naming as “an official paper”.

While talking about Behbudi, it is impossible to avoid Arabic and Persian-Tajik words. Even entire Arabic sentences and phrases resigned in place. Many Arab, such as Afgor, amloq, basirat, darilqazo, jadida, jihat, jaft, maftun, mabuxosa, rafiq, manih, mufatish, manzerrat, masraf, mab'us, nahir, takfir, taziyin, tamasaxo'r, funun, favran, as well as the first, Tajik-Persian words as bomashvarat, digar, dohlan, sarbozxona, bachcha, olbolu, xazor are widespread. Not only do the behbudi language contain expressive structures typical of our classical traditions, as well as an episodic display of height. For example: "indolla and indannos", "fitammul" (We need an alliance), "kullollahu va lukvn marokh" (an objective appeal to the respected Samarkand people).

Obviously, Behbudi's skill is very evident in the use of a purely Uzbek word. He is well aware that this word has an extremely powerful effect. Therefore, in practice, he uses it very delicately. This is evidenced by the representatives of simple appeal themselves. “Oh, dear compatriots” (on national affairs in Samarkand), “Oy khazrat ulama and agniyo” (The right is taken, not given), “Dear friends” (We need an alliance).

Behbudi may try to find words that can touch the hearts of the people to whom this thought is addressed. These features are evident in our examples above. However, it will not be superfluous to cite the above example once again: “Bovurs! You should know that autonomy has been proclaimed for all the peoples of Turkestan, and you know that the right is taken, not given. ”

The use of the word "Bovurim" here can be regarded as an artistic invention. Such an appeal could only be found by a person who understood and appreciated the customs, national traditions and values of the people's spirit. Such a great person can be seen in the image of Behbudi.

The expressiveness of Behbudi's language is explained by its closeness to vernacular, more precisely, to the way it is spoken. Behbudi speaks the language of the people. Therefore, his articles often contain popular interpretations, articles, texts. It must have been the influence of that spirit. Behbudi's rises some phrases to the level of wisdom and proverbs. Folk proverbs included in the text of Behbudi's works stand out with a new color. It is known that the proverb “If the baby doesn't cry, the mother doesn't give milk” is often used in cases of high demand.

In the Behbudi language, this proverb is used to emphasize the degree of the socio-political needs of the nation. Not only that, in addition to stating the need, the spirit of active action prevails here. To clarify our point of view, we will quote the text to which this proverb belongs: “There is a need to cultural movement, we need to learn from others,” he said. This silence is a witness to our carelessness, guilt. There will not be given milk to a child who does not cry, we have elections to the city council and country council.”

Let's take a look at another article. The popular proverb “ko'rpanga qarab oyoq uzat”, (cut your coat according to your cloth) requires that you refrain from inappropriate actions or adhere to

socio-ethical standards in your actions. In Behbudi's article, he adds an additional tone: "For the sake of the bank, Jews, Armenians and others will become statesmen. We will lose the property and prestige of our state. For example, we do not cut our coat according to our cloth" (11).

As an expert in several languages, Behbudi also uses the subtleties, sayings and folk sayings of these languages: "The Caucasus and Tatarstan should learn from scholars and traders:

(A person is not given any effort if he does not make an effort "(12)).

Apparently, the proverb here is the same as the existing forms in Arabic and Persian. In general, Behbudi created a number of wise sayings as a result of the influence of such wise sayings and his personal observations. Examples of the type "The right is taken, not given", "The past is the scale of the future" can serve as a confirmation of our opinion. Behbudi's closeness to the language sometimes - though sometimes - also allows him to use dialectal materials. Maybe it will happen naturally. In any case, some elements of the Samarkand dialect are reflected in the proverbs: "Each city has societies?" or is called a "военный организация" "совет солдатский рабочий депутат" ("We need an alliance", "Hurriyet", 1917).

"When we will make a progress? If we spend tens of thousands of soums on weddings on our way to schools in order to prepare modern people, we will be a stepping stone in the development of that time, which is far away" ("Who hears", "Samarkand", April 26, 1913) ...

"We have a great task ahead of us. If we all unite, make Shurai Islam a political and authoritative society for ourselves, open branches in all cities and work together, our ancient Jadids will be inclined towards autonomous freedom" (Ulug Turkestan, 1917 June 12).

Examples show that Behbudi used the elements of Samarkand dialect effectively. This requests the question of whether Behbudi was naturally unable to escape the influence of the dialect. If one examines Behbudi's other works, there is no doubt that he mastered the literary language of that period. Hence, a different approach to the above dialect elements is required. At this point, Behbudi himself extended a helping hand to us, he wrote: "Xalq tili ilan vaz va pand aytmog joriydur".

This means that Behbudi consciously uses the same elements in his articles to say "xalq tili ilan".

The conclusion of Behbudi's articles is also exceptional. In this respect, too, we can speak of Behbudi's school of skill. In some articles, the purpose of the article is directly related to conclusion. The author pushes it to the end of the article so that he understands the purpose correctly and completely. In particular, the article "On national affairs in Samarkand" concludes: "Matlabimiz shahar dumalari va sahro zemstvolari vakili majlisi muassisoniga xaloyiqni hozirlamoq va ham Toshkentdagi markaziy shuromizga bir – ikki nafar kishi taylab doimo anda turib xalq nafaiga ishlamoqlari uchun yubortirmoq ham alarni va ham sho'roi markazimiz masorafini ta'min etdurmoq, tushuntirib, yaxshi hukumatga yordam bermoq lozimligini bayon etmoqdur"(13).

Some articles end with "additional evidence." This task can be accomplished by wise sayings, folk proverbs or exemplary opinions of celebrities. For example, "majlisi muassison bizga berilmaydur, balki o'zimiz olsak, azbaski haq olinur, berilmas"(14).

This excerpt is from the article "The right is taken, not given". Or in the article "Month of Education" we see the following conclusion: "The past is the scale of the future". Let everyone

know in terms of size”, and the article “We need an alliance” ends with poetic verses that are very consistent with the issues raised:

Davlat ha ma zi ittifoq xezad,

Badavlati az nifoq xezad.

(i.e.: Davlat ittifoqlik tufayli barqaror bo‘ladi,

Bedavlatlik dushmanlikdan kelib chiqadi).

There is another series of articles in which the shortcomings of the existing system, which are inherent in society, are severely criticized. Accordingly, the ending may also be embellished with sarcastic words. "Oh, are we rich enough to listen to these words?"

Obviously, the short size of the article sometimes does not allow to explain the end of the idea. At that point, Behbudi divides his thoughts into parts. And this signals the existence of a division. In particular, the article “Turkistan Autonomy” was published in the newspaper "Hurriyet" on September 19, 1917 and was marked as “there is an end” because it was not completed. Its sequel was published in the December 22 issue. But it is having continuance, it is said that “there will be a continuity.”

This may have been due to the availability of printing as well as newspapers and magazines. However, there are some articles in which Behbudi emphasizes that the issue has not been resolved or that the issue is very important. For example, in the article “Appeal to the youth”, (“Yoshlarga murojaat”), “zamoncha o‘qimoq tariqasidan boshqa maqolaga arz qilinur”.

Behbudi's journalism is a completely new and unique event in the history of Uzbek culture, especially Uzbek literature. His greatness, dedication and sensitivity are fully reflected in his writings. In terms of subject matter, they have not yet lost their relevance.

As an active participant in social, political and cultural life and a devoted son of his people, Behbudi at the beginning of this century tirelessly fought for the freedom of the people, the inviolability of the homeland, the prosperity of the nation, and the future. the happiness of their compatriots. Those inherited from the author of the article are living martyrs of this merciless struggle. This is their meaning for us. In addition, these articles reflect the extremely difficult fate and life of the Uzbek people, full of contradictions at the beginning of the twentieth century. They focus on politics, government, social order and state building, economic conditions in the country and in various segments of the population, as well as culture, education and the spiritual world of the nation. They are being discussed. Thus, the attention of compatriots, fellow citizen, colleagues will be riveted to these issues.

Putting Behbudi's issues has a special place and position not only in terms of putting issues on the agenda, but also by showing them specific solutions or initiating them to specific solutions.

Behbudi's journalism is primarily a socio-literary phenomenon. His practical work takes Uzbek journalism to a whole new level. For the same reason, it is safe to say that Uzbek journalism cannot be imagined without Behbudi's work. It's not just about Behbudi's journalism, it's about his artistic skills.

In Behbudi's journalism, the Uzbek language, the Uzbek word, fully reflects its beauty and freshness.

The impact of Behbudi's articles is closely linked to their structure, the author's proactive approach to the topic, and the skillful choice of relevant words in the coverage of each topic. For the same reason, his articles should not be read lightly or simply ignored. They are equally important, respected and cherished by their contemporaries and for today's generations.

ABSTRACT

The article identifies the main stages of the crisis, which include: a series of foreshocks that began in August 2007, followed by an economic downturn that lasted until August 2008, when the liquidity problems could not be solved by three large US financial institutions ; a serious financial shock in September 2008, in the last few months of 2008; end of financial shock and panic; early 2009 financial recovery and recovery period in the real sector of the economy. The article examines the main factors of the emergence of the crisis, which together reflect all the reasons and their interconnections, therefore, they can reveal the full picture.

KEYWORDS: *Financial Crisis, Economic Crisis, Financial Markets, Credit Bubbles, Mortgage Bonds, Financial Activity, Credit Risks.*

INTRODUCTION

There are several points of view about the cause of the 2008 financial crisis, but each of them is supported by one reason. Some economists believe that the cause was international capital flows or monetary policies [1], others that it was caused by housing policy [2], others that it was insufficient regulation of the banking sector, or the greed of those who functioned in the financial sector and had political influence in Washington [3]. In any case, these arguments, if used as the only explanation, are too simplistic and incomplete. While all of these factors are undoubtedly important causes of the crisis, each of them is insufficient as an autonomous explanation. The approach of most other experts who try to explain the crisis suffers from the opposite problem - it is too broad [4]. Not everything that went wrong during the financial crisis triggered the crisis,

and while some of the causes were significant, others had only minor impact. Not every change in the housing or financial system before the crisis was the cause of the crisis.

The hypothesis that the crisis was caused by insufficient regulation [5], and the opposite opinion that too strong regulation caused the crisis [6], is also oversimplified. The emergence of a crisis cannot be a measure for determining the effectiveness of regulation. Financial regulation is needed to address specific failures in the financial system. For example, high-risk nontraditional mortgage lending by non-bank lenders flourished in the 2000s, but with ineffective regulation caused enormous damage and led to a financial crisis [7]. Poorly designed government housing programs have distorted the market and contributed to the creation of unjustified mortgages. Irresponsible lending across the country and the massive losses of the American insurance corporation AIG in the face of the bankruptcy of Lehman Brothers were partly due to ineffective regulation and supervision. While the failures of mortgage agencies Fannie Mae and Freddie Mac were the result of government policy, they confused public goals with personal gain, which led to negative consequences [8].

Kondratyev's cycles (K-cycles or K-waves) are periodic cycles of alternating ups and downs of the modern world economy lasting 48-55 years, described in the 1920s by Nikolai Kondratyev. The concept has been actively researched and developed throughout its existence, however, a broad consensus in the community of economists about its practical applicability has not been achieved: many researchers (especially in Russia) widely use Kondratieff cycles in their research, but a significant part of economists do not consider them or explicitly denies the existence of such cycles. The characteristic period of the Kondratieff waves is 50 years with a possible deviation of 10 years (from 40 to 60 years); the cycles consist of alternating phases of relatively high and relatively low rates of economic growth. Kondratyev noted four empirical patterns in the development of large cycles. The first - before the start of the upward wave of each large cycle, and sometimes at the very beginning of it, significant changes are observed in the conditions of the economic life of society. Changes are expressed in technical inventions and discoveries, in changes in the conditions of monetary circulation, in the strengthening of the role of new countries in world economic life. These changes, to one degree or another, occur constantly, but, according to Kondratyev, they proceed unevenly and are most intensely expressed before the onset of upward waves of large cycles and at their beginning. The second - periods of upward waves of large cycles, as a rule, are much richer in large social upheavals and upheavals in the life of society (revolutions, wars) than periods of downward waves. Third, the downward waves of these large cycles are accompanied by a prolonged depression in agriculture. Fourth, large cycles of the economic situation are revealed in the same single process of the dynamics of economic development, in which medium cycles with their phases of boom, crisis and depression are also revealed.

For the period after the industrial revolution, the following Kondratieff waves are usually distinguished: 1st cycle - from 1803 to 1841-1843 (the moments of minimums of economic indicators of the world economy are marked); 2nd cycle - from 1844-1851 to 1890-1896; 3rd cycle - from 1891-1896 to 1945-1947;

4th cycle - from 1945-1947 to 1981-1983; 5th cycle - from 1981-1983 to ~ 2018; 6th cycle - from ~ 2018 to ~ 2060 (forecast). However, there are differences in the dating of the "post-Kondratieff" cycles, for example, the following boundaries of the beginning and end of the "post-Kondratieff" waves are also given: 3rd cycle: 1890-1896 - 1939-1950 4th cycle: 1939-1950 - 1984-1991; 5th cycle: 1984-1991

Most experts believe the crisis could have been avoided if only the United States had applied tighter regulation and supervision of financial activities. This finding largely ignores the global nature of the crisis. For example [9]: 1) The credit bubble appeared not only in the United States, but also in Europe. Therefore, explaining the causes of the credit bubble should focus on factors common to both regions. 2) The credit bubble has manifested itself not only in the housing market, but also in the commercial real estate market. There were soap bubbles in Britain, Spain, Australia, France and Ireland, with some even more pronounced than in the United States. This suggests that it would not be enough to simply increase regulation of the US housing market. 3) Many financial institutions in Iceland, Spain, Germany and the UK and elsewhere did not rely on the US housing market, and in most cases they were tightly regulated, yet they also faced financial setbacks similar to those seen in the United States. These facts suggest that US housing policy itself is a non-exhaustive explanation of the crisis. It is impossible to explain the financial and economic crisis solely by insufficient regulation and supervision in the United States, ignoring international parallels, since there will be no prioritization of causes and no sufficient justification of cause and effect. Before identifying the main causes of the crisis, let us describe its main stages.

The United States is still in a recession, triggered by the financial crisis that manifested itself in August 2007 and ended in early 2009. The main causes of the financial crisis were the financial shock in September 2008 and the accompanying financial panic. The financial shock and panic triggered a severe downturn in lending in the fourth quarter of 2008. Some economists describe the situation as a recession that began in December 2007 and lasted until June 2009 and is only now beginning to recover. Recent events in the US can be described in the following stages [10]:

- A series of foreshocks began in August 2007, followed by an economic downturn that lasted

until August 2008, when the liquidity problems were not solved by three large US financial institutions. - Serious financial shock in September 2008, in which ten large financial institutions changed their institutional structures. - Financial panic and the beginning of a large recession in the real sector of the economy in the last few months of 2008. - The end of the financial shock and panic - early 2009 - the starting point for financial recovery and a period of recovery in the real sector of the economy. At present, the economy of the United States is still in its last stage, its financial system is still recovering and restructuring, trying to return to stable and rapid economic growth [11]. The following external and internal factors can be named that are important for explaining the causes of the financial and economic crisis:

Credit bubble. Since the late 1990s. China and other large developing countries, as well as large oil-producing countries, created large capital surpluses that were invested in the financial markets of the United States and Europe, causing interest rates to fall. Credit spreads have narrowed, which means that the cost of borrowing to finance risky investments has decreased. A credit bubble has emerged in the United States and Europe, most notably an increase in investment in high-risk mortgages. US monetary policy may have contributed to the credit bubble, but it did not. There are three main possible explanations for a credit bubble: global capital flows, risk reassessment, and monetary policy.

Housing bubble. Since the late 1990s and in the early 2000s, a large and persistent US housing bubble formed. The bubble was characterized by large national increases in house prices and rapid regional boom-bust cycles in California, Nevada, Arizona, and Florida. Many factors contributed to the formation of the housing bubble, which, when it burst, caused huge losses for homeowners and investors. The relationship between short-term interest rates and home prices is very weak, so even if the Federal Reserve's (FRS) goal was to lower lending rates between banks, this cannot explain why thirty-year mortgage rates were too low [12].

Mortgage credit lending. There have been overly optimistic assumptions about US home prices, as well as problems in the primary and secondary mortgage markets. Trillion dollar risky mortgage loans were widely deployed through the financial system: mortgage-related securities were bundled together and then formed into other bundles and sold to investors around the world. When the bubble burst, losses of hundreds of billions of dollars shook the market, as well as financial institutions that had acquired significant amounts of these mortgages and used them as collateral to create a lot of debt. This happened not only in the United States but around the world. These losses were multiplied by financial derivatives such as synthetic securities [13].

Credit ratings and securitization. Errors in credit rating and securitization translate into bad mortgages, unreliable financial assets. Credit rating agencies erroneously rated mortgage-backed securities and their derivatives as safe investments. Securitization is an innovative form of financing that denotes a new technique for raising funds, it has gained widespread acceptance, first in the United States and then in Europe. This is a mechanism in which financial assets are written off the company's balance sheet, separated from the rest of the property and transferred to a specially created financial intermediary (SPV), and then refinanced in the money market or capital market. Refinancing is carried out either by issuing ABS (asset-backed securities), or by obtaining an Asset-Backed Loan (syndicated loan) [14].

When house prices fell and mortgage borrowers stopped making payments, mortgage standards began to decline. The Mortgage Securitization System supplied toxic mortgage loans from all

over America to investors around the world. Many mortgage lenders set the bar so low that they simply took any qualifications of borrowers on faith, often deliberately ignoring the level of the borrower's ability to pay. Nearly a quarter of all loans made in the first half of 2003 were interest-only loans, and 68% of floating rate, selectable mortgages made by US banks were formalized without paperwork or with limited paperwork [1H].

Financial institutions have purposefully increased risk. The executives of many large and medium-sized financial institutions in the United States have concentrated huge savings in highly risky financial instruments in the form of mortgage-backed bonds. Some have done this deliberately, betting on rising house prices, while others have paid little attention to the potential risk. This hastened the collapse of large financial institutions [16]. Severe corporate governance and risk management failures in many critical financial institutions were a key cause of the crisis. It was argued that the self-preservation instinct of the largest financial firms would protect them from fatally risky actions without the need for constant regulatory intervention, which firms argued would stifle innovation. Too many of these institutions have acted recklessly, taking on too much risk and with too little capital and too much dependence on short-term funding. In many ways, this reflected a fundamental change in these institutions, especially the large investment banks and bank holding companies, which increasingly focused on risky and profitable trading. They have made tremendous efforts to attract and support unreliable borrowers, as well as creating mortgage-related securities, collecting them in bundles, and then forming other packages and selling them for trillions of dollars, including synthetic financial products.

Financial institutions and rating agencies have enthusiastically used mathematical models as reliable risk prediction tools, in many cases substituting for common sense. Risk management has too often become an excuse for risky actions [17]. General shock. The short-term borrowing of huge amounts, combined with debt obligations that were not visible to other market participants, increased the chances of a rapid collapse of the system. The past thirty-odd years have seen the growth of a shadow banking system, opaque and overloaded with short-term loans, in size that rivaled the size of the traditional banking system. When the housing and mortgage markets collapsed, the lack of transparency, the extraordinary overload of debt, short-term lending, and risky assets all emerged and contributed. This caused panic.

One of the problems was the great loss of housing. This general shock meant that the problem was broader than one bankrupt bank - key large financial institutions were capitalized. Financial shock and panic. The bankruptcy of Lehman was unexpected, and the government tried too hard to save Lehman. In September 2008, the bankruptcy and restructuring of dozens of firms triggered a global financial panic. Confidence in the financial system began to wane with the collapse of large and medium-sized financial institutions in the United States and Europe. During the month, interbank lending rates rose, which indicates heightened fears that there was a threat of a complete freeze on lending. The panic was also caused by too short a time interval between the bankruptcies occurring.

The financial crisis is causing the economic crisis. The financial shock and panic were caused by large cuts in production and jobs in the real sector of the economy. The shock and panic ended in early 2009. Negative consequences for the real sector of the economy continue to this day [18]. Measures to be taken to overcome the consequences of the crisis To tackle the global financial crisis, governments need to adopt a mixed strategy of short-term and long-term responses. There

is also a need for concerted action around the world, based on similar policies (monetary expansion) pursued by national governments. These actions include the following [19]:

There is also a need to ease expectations of a subsequent recession, as they have a detrimental effect on consumer demand and investment spending. Increasing government spending or lowering taxes will not help restore confidence at this stage. Any financial incentive must be timely, temporary, and directed at those who are inclined to spend government-provided money. This is hardly possible given the current fear and distrust of financial markets. The need to rebuild financial systems and establish a banking union in the euro area, and develop and implement actionable mid-term fiscal adjustment and welfare reform plans in Japan and the United States, backed by concrete action. In addition, potential output needs to be increased, particularly in the euro area and Japan, including through reforms that level the playing field for existing and new labor market entrants and reduce barriers to entry into product and service markets. Another challenge is to prudently adjust the course of US monetary policy in response to changing growth prospects, inflation and financial stability.

Excessive tightening may be difficult to reverse later, and global growth may well be below and below medium-term growth and inflation forecasts. Measures should be taken to maintain financial stability, given the risks inherited from recent credit booms and the new risks posed by capital flows. Many countries need a new round of structural reforms, including investment in public infrastructure, removal of barriers to entry into markets for goods and services, and in the case of China, a reorientation of growth from investment to consumption. [21] The fact that financial markets are betting on a global economic recovery over the next two years is becoming increasingly evident. Investors refused to heed warnings that tech stocks were severely overvalued at the turn of the millennium. The head of the US Federal Reserve System Ben Bernanke has dispelled the idea that the US mortgage market was an accident and that the problem with American real estate could have global consequences. [22]

Suppose that the International Monetary Fund, the World Bank, and the financial markets are all wrong when they say that the US can achieve sustained growth over time, that Europe is on the mend, and that China can make the transition to a less centrally planned economy. At the same time, there is reason to think that the opinion is correct and that the outlook for several years is optimistic and there is an opportunity for sustainable growth (due to companies with a lot of cash, stimulating economic policy for more than half a decade, and having innovative products in abundance) ... But if this view is wrong, then the global economy remains subject to a seven-year rhythm of recurring financial crises. In these circumstances, three questions should be asked. First, where is the crisis most likely to occur? The economic situation in China is not always completely secure, as credit restrictions affect it.

Growth in the world's second largest economy is slowing down and probably slightly faster than official statistics show. Other emerging markets - India, Brazil, Turkey - look even more vulnerable, as they are more susceptible to the negative influence of US political moves. The rate at which the federal reserves decline and the government reduces the size of stimulus will depend on the situation in the US, not in the rest of the world. Capital outflows from countries with large current account deficits are a real threat [23]. The second question is, how will the government react if a second shock wave occurs long before the global economy recovers from the first shock? Traditionally, central banks and finance ministries have used booms to replenish their arsenals. They raise interest rates so that later in difficult times it will be possible to lower

them, and they also reduce the budget deficit so that demand can be supported through tax cuts or increased government spending.

The second question is, how will the government react if a second shock wave occurs long before the global economy recovers from the first shock? Traditionally, central banks and finance ministries have used booms to replenish their arsenals. They raise interest rates so that later in difficult times it will be possible to lower them, and they also reduce the budget deficit so that demand can be supported through tax cuts or increased government spending. A new round of the crisis could begin against the backdrop of low interest rates, high budget deficits, and a situation where central banks are filled with bonds that they bought under the program to mitigate the financial crisis. Opportunities for conventional monetary policy in these conditions are largely limited and coordinated fiscal expansion is not realistic, so the choice will be made towards an unconventional monetary policy in the form of quantitative easing (QE) [24].

And the final question: What kind of impact will the second wave have on the already shaken global job market? Unemployment is rising and not enough jobs are being created to cope with the demands of a growing global population. There is every reason for social unrest, so businesses need to be encouraged to use the rising profits for productive investment rather than share buybacks. Prospects for the development of the world economy

Analyzing the history of crises, one can notice that at the root of almost all crises, without exception, lies the problem of excessive cheap financing provided in order to support the falling incomes of investors and banks [26]. The proliferation of instruments whose prices are based on complex calculations could be limited. The funding provided to bond buyers could be limited so that they do not buy tens of times more than their own funds allow, thereby inflating demand. All this could be done if a fundamentally new control system with qualified and motivated auditors was introduced.

ABSTRACT

This article describes the role of economic efficiency in the activities of enterprises, the theoretical and methodological aspects of its increase. Concepts of the essence and criteria of economic and social efficiency and the factors influencing efficiency are given. In addition, production efficiency is the most important task of any enterprise. It represents the qualitative and quantitative indicators of management, as well as the relationship between packaged and live labor costs and the results obtained.

KEYWORDS: *Efficiency, Economic Efficiency, Social Efficiency, Criteria, Labor Costs, Labor Savings, Labor Productivity, Human Capital*

INTRODUCTION

It is known that industry provides the economy of our country with the means of production, tools and food products produced by industrial enterprises. The economic development of any country depends on the level of development of its industry.

Industry is the main branch of material production, the foundation of the economy. Only a large-scale mechanized industry capable of restructuring all sectors of the national economy can be the sole material basis of economic development.

As noted by the President of the Republic of Uzbekistan Sh.M.Mirziyoev, as a result of structural changes in the economy, the share of industry in GDP is expected to increase from 35% to 37% this year. However, in some cities and districts, this very important issue is not given enough attention.

As a result, the share of industry in 27 districts of the country is less than 1% of the regional average. Therefore, it is necessary to develop medium and long-term programs for the development of industry in each district and city.

It is known that the result of any economic activity is measured by the efficiency indicators achieved. In addition, production efficiency is the most important task of any enterprise. It represents the qualitative and quantitative indicators of management, as well as the relationship between packaged and live labor costs and the results obtained. Therefore, the sustainable operation of manufacturing enterprises in a market economy, ie in a competitive environment, of course, depends on efficiency indicators. This is because an inefficient enterprise will inevitably face a crisis. Thanks to efficiency and quality work, the company firstly ensures its economic stability and competitiveness in the market, secondly, improves its image and strengthens relations with partners, and thirdly, improves the economic and social situation of employees.

Unfortunately, in a market economy, the concept of “efficiency” is less than the concepts of price, profit, income, cost, although income, cost reduction, labor productivity growth, return on investment, profitability, etc. are consistent with the nature of efficiency and do not contradict the requirements of a market economy. used. Effective performance means, in essence, obtaining the intended (planned) profit, reducing non-production costs and losses, better use of production capacity and manpower, increasing labor efficiency, improving the quality of manufactured products.

Based on the above, it can be said that today and in the future one of the most pressing issues is to develop scientific recommendations and practical proposals to increase the social and economic efficiency of industrial enterprises, ensure their competitiveness and develop quality industrial products

Review of the literature on the subject

From foreign and European economists on ways to develop the activities of enterprises and increase efficiency M.I.Buxalkov, V.P.Gruzinov, T.A.Slepneva, E.V.Yarkin, V.K.Sklyarenko, V.M.Prudnikov, N.A.Vasileva, T.A.Mateush, M.G.Mironov, I.V.Sergeev, O.V.Baskakova, I.Babich, Druker, V.Shepelev, D.V.Busigin, V.D. Kamaev, I.N. Gerchikova, F.Nayt, I.X.Tyunen, R.Kantilon, K.Bodo, I.X. Tunen, Naytear, D.Gelbreyt, E.V. Glushenko, AI Kaptsov and others have made a significant contribution to the development of entrepreneurship, studying certain aspects of their types and forms.

One of the leading scientists of the republic A. Artikov, B.T.Abdukarimov. In the scientific activity of A.Abdukarimov, H.Abulkasimov, H.O.Rahmonov, Y.Abdullaev, F.Karimov E.Akramov, Sh.N.Zayniddinov, B.T.Salimov, T.Shodiev and others the development and

efficiency of industrial enterprises the specific aspects of the increase have been studied to some extent.

It is known that in the context of a developing market economy, the economic strategy of the state, in addition to setting long-term fundamental goals, also includes the means and ways to achieve these goals. Among them, the continuous improvement of production efficiency plays an important role.

Analysis and results

Strengthening the power of the state of Uzbekistan, fully satisfying the needs of the population in material and spiritual goods, and in the future - to create them in abundance, to be among the most developed countries in the economic and scientific-technical sphere - depends on increasing production efficiency.

It is known that in the development of production there are two different factors: quantity and quality, extensive and intensive, that is, expanding (prolonging) and compelling, strengthening factors. In other words, if the sphere of production is expanded, there will be extensively expanded reproduction; if more efficient means of production are used, intensively expanded reproduction will occur. As a result of the rational use of these two ways in the industry of Uzbekistan, the efficiency of production is gradually increasing.

The word efficiency is one of the most common general concepts and is widely used in various areas of economic and social development. For example, the efficiency of social production, the efficiency of labor, the effectiveness of teaching and learning, the effectiveness of treatment and treatment, the effectiveness of adopted laws and regulations and solutions, and so on. Efficiency a "mirror" of industrial production. In this "mirror" you can see all the results of production.

It is known that every industry, enterprise, as well as every person strives to get the maximum benefit from their production activities. It incurs certain costs for him. The difference between these benefits and costs is reflected in the efficiency, which is a "mirror" of the industry and the enterprise. The highest production efficiency is to keep production costs to a minimum.

In the context of market relations, efficiency has a special place. A market economy requires efficiency, profitability. In an orderly market economy, it is necessary to achieve a lot with minimal resources. There are 5 types of resource systems in operation in the production process: a) material resources, b) labor resources, c) financial resources, d) energy resources, d) information resources, ie information resources. It is possible to increase the efficiency of production by using these resources wisely. Such activities play an important role in increasing production efficiency.

Efficiency is usefulness, efficiency. It is well known that to get any result you have to work, work, produce a product or service and spend a certain amount of money.

To determine efficiency, the outcome should be compared with the costs or resources expended to achieve that outcome. Hence, Productivity is the ratio of the results of production activities to the labor, material and financial resources expended to achieve them.

Distinguish between economic and social efficiency of production. Dividing efficiency into economic and social types is a conditional division. It can be said that all the results that occur in

the process of material production and are related to labor costs are economic and, in a sense, socially beneficial.

It should be noted here that it is possible to argue about the artificial division of economic and social concepts. But just as the economy is not outside of social life, so is social life without economics. So they are inseparable. Because every work done brings both economic and social benefit

Economic efficiency reflects the economic result of production. For example, the result of production, management, introduction of new techniques and technologies, improving the quality of labor, and so on. Economic efficiency is characterized by the amount achieved due to saving material, labor, money and other resources, saving time, reducing construction time, saving labor costs, reducing labor wastage, accelerating turnover, increasing production, improving work quality and other results.

Social effectiveness refers to the effectiveness of the implementation of measures that help an individual to develop in all respects. It is reflected in the improvement of working and living conditions, staff training and is characterized by an increase in per capita consumption of basic foodstuffs, industrial goods, benefits and privileges from social consumption funds, and the cost of training.

Given that these effects occur in production itself and that the relationship between workers is defined as a result of joint labor, we can call them socio-economic effects.

The essence of economic efficiency is reflected in its criteria and system of indicators.

The question of criteria is the most important area of economic efficiency theory. In the philosophical sense, a criterion is a basic dimension, an important distinctive sign, a basic point of view. Only on this basis can we determine the objective truth, accuracy and reliability of our knowledge in this or that field, to distinguish the truth from misunderstandings.

To achieve the main goal of production, it is necessary to use all resources wisely, reduce the cost per unit of finished product. Thus, the criterion for measuring efficiency is the saving of total social labor, increasing its productivity.

Total (absolute) efficiency of production means the total amount of economic efficiency compared or compared with certain types of costs and resources.

The overall efficiency of production is used to determine and assess the level of use of certain types of costs and resources, and is calculated in general for the national economy, industries, enterprises, capital construction projects. Determining such efficiency is based on the calculation of differentiated indicators that reflect the level of cost and resource efficiency, the main components of efficiency. Such indicators include labor capacity, material capacity, stock capacity, capital capacity of production or products made in it.

Labor capacity describes the amount of expenditure per unit of output, expressed in national income, net, gross, branded product or in kind.

Productivity is an indicator of the amount of labor time spent on producing a particular type of product (e.g., a single tractor, suit, or shirt).

There will be three types of labor capacity: technological, full and national labor capacity. In terms of accounting for labor costs, it is further divided into three types: planned labor, normative labor and actual (actual) labor capacity.

There are many, many different factors and key areas for increasing production efficiency. All factors can be divided into groups based on three characteristics: by source, by key areas of production development and improvement, by the role of factors, and by the level of implementation.

Classification of factors according to the sources of increasing production efficiency helps to determine at what expense social labor savings can be achieved or have been achieved. In this regard, the main factors include: labor capacity of the product, material capacity, stock capacity and capital investment, reduction of demand, rational use of natural resources and time savings. But such a classification does not meet the requirement. To find answers to these questions, all the factors of increasing production efficiency should be grouped according to the main directions of development and improvement of production. They consist of a set of technical, organizational, economic and social measures aimed at saving social labor. These directions are very diverse. The most important are

- improvement of production structure;

- Accelerate the development of science and technology, increase the technical and economic level of production and products, reduce the time of introduction of scientific and technical achievements;

- increasing the level of specialization, cooperation, combination and territorial location of production;

- Improving the management structure, financing, evaluation and crediting and incentives;

- To increase the creative activity and initiative of workers on the basis of strengthening the human factor.

Liberalization of industrial production and deepening of reforms in this sector are the main directions of increasing efficiency. Another decisive way to increase the efficiency of production in industrial enterprises is to accelerate the development of science and technology. The technical and technological factor provides at least two-thirds of the increase in labor productivity.

The role of the human factor in raising the socio-economic efficiency of industrial production is invaluable. Human initiative, energy, lively creativity is the powerful force and the most important source of any development. This is why man is said to be the main productive force of society. He creates all innovations, including new, advanced techniques, rationally organizes production, makes scientific and practical discoveries. All means of production are driven by human labor, useful things are created. However, man is not only the main productive force, but also the subject of production and other social relations. Human activity takes place through these relationships. The direction and outcomes of this activity depend on what thoughts, perceptions, goals, life guidelines, aspirations, and psychological beliefs the employee adheres to in his or her work. Therefore, when analyzing the essence, significance and content of the human factor, it is necessary to speak not only about the person, but first of all about the social qualities,

motivating factors and interests determined by the whole system of social relations in which a person lives and works.

The socio-economic efficiency of production as an important category, in general, studies the efficiency of the production process, the relationship between the result achieved and live and packaged labor. The constant increase in the efficiency of industrial production is an objective necessity and allows for a sharp increase in national income.

In the general theory of efficiency, the problem of criteria, that is, the measure of evaluation, the question of the main point of view, has a special place. Saving total social labor, increasing its productivity is a measure of efficiency.

In the practice of economic computation and analysis, two different efficiencies are distinguished. The first is total (absolute) efficiency, the second is comparative efficiency.

The level of production efficiency in industrial enterprises is formed under the influence of various interrelated factors.

In order to introduce new techniques and technologies, it will be necessary to determine its economic and social effectiveness. Therefore, on the basis of the introduction of new techniques and technologies, it is necessary to determine which of the technical measures is useful to achieve high performance in industrial production.

The main groups of technical measures are:

- new and improved types and designs of machines and mechanisms, equipment and tools;
- New types of raw materials, fuels and energy;
- New and improved types of technological processes;
- Improving the chemical and physical properties, parameters and range of products;
- Mechanization and automation of technological processes;
- Equipment modernization;
- Creation of new types of buildings and structures;
- New and improved methods of labor organization and management;
- Inventive and rationalization proposals.

It is necessary to accelerate the development of science and technology in enterprises, industries and inter-sectoral complexes to accelerate the pace of production, increase the volume of production, improve its quality, increase the profitability of production. This work can be at the expense of the implementation of certain measures. Measures must be effective. Human capital plays an important role in the implementation of these measures.

CONCLUSIONS AND SUGGESTIONS

In order to increase the practical effectiveness of reforms, to promote new initiatives on the ground, we must make our people more active and more proactive.

For the first time, our country received an international credit rating and successfully placed \$ 1 billion in bonds in the global financial markets. The Organization for Economic Co-operation and Development's credit rating of Uzbekistan has improved for the first time in 10 years.

Deep structural reforms have begun in energy, oil and gas, geology, transport, road construction, agriculture and water management, drinking water and heat supply, and a number of other sectors.

Modernization and competitiveness programs are being implemented in 12 leading industries.

As a result, economic growth last year was 5.6 percent. The volume of industrial production increased by 6.6%, exports - by 28%. Our gold and foreign exchange reserves increased by \$ 2.2 billion in 2019 to \$ 28.6 billion

It is known that at different stages of economic development, the nature and content of technical development have their own characteristics. For example, as a result of the transition to a market economy, scientific and technological progress will focus not only on quantitative changes, but also on qualitative changes. In general, efficiency is related to qualitative changes in the economy, a requirement that is also fully implemented in the development of science and technology.

So, in conclusion, it can be said that the liberalization of industrial production and the deepening of reforms in this sector is the main direction of increasing efficiency. Another decisive way to increase the efficiency of industrial production is to accelerate the development of science and technology. The technical and technological factor provides at least two-thirds of the increase in labor productivity.

Samarkand, UZBEKISTAN

Email id: shahnozaumarova09051995@gmail.com

ABSTRACT

The article is devoted to the importance of improving national audit standards based on international standards on audit and to reveal the problems associated with this. The article specialized more in oil and gas companies which has significant role in the economy of the Republic of Uzbekistan. The article also analyses the differences between national and international standards on audit.

KEYWORDS: ISA-International Standards On Audit, NSA-National Standards On Audit, Oil And Gas Companies, Fair Valuation, Quality Control, Financial Statement, Audit, Accounting, Petroleum Products.

INTRODUCTION

The role of economic relationships among countries in the process of global integration is enormous. In order to simplify and facilitate economic relations between the countries, international standards of an advisory nature have been developed by international organizations in economic areas, including accounting and auditing. International standards play an important role in strengthening the economic and political position of countries, their integration into the world economy. Uzbekistan is also implementing international accounting and auditing standards in national practice in order to attract foreign investment and expand trade in the world market. As the trade in petroleum products is one of the main sectors in Uzbekistan, it is important to introduce international standards in this area. Giving reliable information about the financial situation is crucial to appeal investors from all over the world. One of the main forms of confirmation of the reliability of the financial reporting information provided by each

enterprise is audits. Adaptation of audits in this area to international requirements provides information users with reliable and understandable information.

Methods

Methods of comparison, scientific abstraction, logical thinking, observation and analysis were used in the research process.

RESULTS AND DISCUSSION

One of the most pressing issues in the economy of Uzbekistan is the production and timely supply of petroleum products to consumers. The role of oil companies in the supply of petroleum products to consumers is significant. Modernization of the network entities, digitization of procurement, storage and sales processes, as well as settlements with suppliers and customers on the basis of modern computer and information technology, on this basis, accounting for income, expenses, profit (loss), tax payments and Improving control is an important task.

In carrying out these tasks, the transfer of financial statements and reports to international standards, as well as audits on the basis of financial statements prepared in accordance with international standards, as in other industry enterprises, is very effective. The main reason for this is that it will be necessary to attract investors to all sectors of the economy and provide information to external partners in an understandable way to enter the international market.

Government gives considerable more attention to make effective efforts in Uzbekistan in order to implement international standards. For instance, the Ministry of Finance of the Republic of Uzbekistan held a meeting with representatives of the International Federation of Accountants (IFAC), the World Bank, the Chamber of Auditors of Uzbekistan, the National Association of Accountants and Auditors of Uzbekistan, on 30th January, 2020. **The main purpose of the meeting was a comprehensive discussion of the main audit and international financial reporting standards, as well as the training of specialists in this field.**

The results of the comparison of national and international auditing standards can be seen in the table below.

The differences between international and national standards on audit in Uzbekistan

International standards on Auditing	National standards on Auditing of Uzbekistan
ISA 200: Overall Objectives of the Independent Auditor and the Conduct of an Audit in Accordance with International Standards on Auditing	
ISA 210: Agreeing the Terms of Audit Engagements	
ISA 220: Quality Control for an Audit of Financial Statements	NSA 5: Quality Control for an Audit
ISA 230: Audit Documentation	NSA 6: Audit Documentation
ISA 240: The Auditor's Responsibilities Relating to Fraud in an Audit of Financial Statements	

ISA 250: Consideration of Laws and Regulations in an Audit of Financial Statements	NSA 25: Checking Compliance of Laws and Regulations in a Audit Process
ISA 260: <i>Communication with Those Charged with Governance</i>	
ISA 265: Communicating Deficiencies in Internal Control to Those Charged with Governance and Management	NSA 12: Evaluation of the Accounting and Internal Control System in the Process of Audits
ISA 300: Planning an Audit of Financial Statements	NSA 3: Planning an Audit
ISA 315: Identifying and Assessing the Risks of Material Misstatement through Understanding the Entity and Its Environment	NSA 9: Significance and audit risk
ISA 320: Materiality in Planning and Performing an Audit	
ISA 330: The Auditor's Responses to Assessed Risks	
ISA 402: Audit Considerations Relating to an Entity Using a Service Organization	
ISA 450: Evaluation of Misstatements Identified during the Audit	NSA 24: The Actions of the Audit Organization in the detection of Misstatements in the Financial Statements
ISA 500: Audit Evidence	NSA 50: Audit Evidence
ISA 501: Audit Evidence-Specific Considerations for Selected Items	
ISA 505: External Confirmations	
ISA 510: Initial Audit Engagements-Opening Balances	
ISA 520: Analytical Procedures	NSA 13: Analytical Activities
ISA 530: Audit Sampling	NSA 14: Audit Selection
ISA 540: Auditing Accounting Estimates, Including Fair Value Accounting Estimates, and Related Disclosures	
ISA 550: Related Parties	NSA 55: Getting audit evidence from related parties
ISA 560: <i>Subsequent Events</i>	NSA 56: Subsequent events after financial statement
ISA 570: Going Concern	
ISA 580: Written Representations	
ISA 600: Special Considerations-Audits of Group Financial Statements (Including the Work of Component Auditors)	NSA 60: Using Results of Other Audit's Work
ISA 610: Using the Work of Internal Auditors	
ISA 620: Using the Work of an Auditor's	NSA 16: Using the Work of Expert

Expert	
ISA 700: <i>Forming an Opinion and Reporting on Financial Statements</i>	NSA 70: Forming Audit Report and Conclusion about Financial Statement
ISA 705: Modifications to the Opinion in the Independent Auditor's Report	
ISA 706 Emphasis of Matter Paragraphs and Other Matter Paragraphs in the Independent Auditor's Report	
ISA 710: Comparative Information- Corresponding Figures and Comparative Financial Statements	
ISA 720: The Auditor's Responsibilities Relating to Other Information in Documents Containing Audited Financial Statements	NSA 10: Other Information in the Contents of Financial Statement
ISA 800: Special Considerations-Audits of Financial Statements Prepared in Accordance with Special Purpose Frameworks	NSA 80: Audit Report about Results of Special Question
ISA 805: Special Considerations-Audits of Single Financial Statements and Specific Elements, Accounts or Items of a Financial Statement	
ISA 810: Engagements to Report on Summary Financial Statements	
International Standard on Quality Control (ISQC) 1, Quality Controls for Firms that Perform Audits and Reviews of Financial Statements, and Other Assurance and Related Services Engagements	
	NSA 11: Audit in Computer Processing
	NSA 31: Acquaintance with Activity of the Company
	NSA 90: Professional Services of Audit Organizations

It is clear from the table that our national standards are incomplete compared to the international standards, even some very significant features are missed. A good example for this may be ISA 540: Auditing Accounting Estimates, Including Fair Value Accounting Estimates, and Related Disclosures Standard which is not mentioned in national standards. The differences between national and international standards on the audit differ not only in the names or substance of the items, but also in the checking of valuation of assets, liabilities, capital. In international practice, the assets of the enterprise and the sources of their formation are valued at fair value. In particular, commodity inventories, which make up a significant part of the assets of oil companies, should be valued at fair value by international standards. But this is not provided for in our national standards. Therefore, it is necessary to make recommendations on the fair value

of inventories during audits. Additionally, quality control is one of the most urgent factors of auditing, since it enhances confidence about results of audit. So that International Standard on Quality Control (ISQC) 1, Quality Controls for Firms that Perform Audits and Reviews of Financial Statements, and Other Assurance and Related Services Engagements have to be considered in the process of audit.

CONCLUSION AND RECOMMENDATIONS

It is obvious fact that revenues from oil and gas extraction can make up a large proportion of national and regional economy and taxes from this companies have a bulk percentage of total budget. For example, in Uzbekistan, 21% of total taxes collected were paid by oil and gas companies. It can prove that auditing according to international standards in these companies is vital.

Implemented successfully, the International Standards on Auditing is profitable not only for the economy of the country, but also can help auditors boost efficiency, improve documentation, provide better reporting to clients, and enhance audit quality. Thus, from the brief comments above, it is possible to draw conclusions below and make suggestions and recommendations.

- The transfer of financial accounts and reports to international standards, as well as audits of financial statements prepared in accordance with international standards, as in other industries, are an objective necessity and gives great results.
- Auditors should understand the requirements of International Standards on Auditing (ISAs) and specifically how they impact on the audit of oil and gas companies;
- The transition to the procedure of preparation of financial statements on the basis of international standards will prevent the transformation of national reporting forms, which are currently carried out in parallel, into financial statements based on international standards, spending a lot of time and money.
- In international practice, the assets of the enterprise and the sources of their formation are valued at fair value. In our country, the elements of financial reporting are not reflected in fair value. In order to ensure the reliability of reporting data on assets and liabilities of enterprises, it is expedient to include in audit plans and programs the inclusion of audit procedures in compliance with the procedures set out in IFRS 13 "Fair Valuation".
- To solve the increasing demand of the Uzbek economy entails greater capacity in the current providers of education and training in accountancy. This, in turn, requires for the introduction of new programs to update the skills of university professors in contemporary accounting and auditing techniques, which they can then transfer to their students.

REQUISITIVE TYPE OF EXCLAMATION CATEGORY: REQUEST, ENTREAT, PROPOSAL

Aziza Arslonovna Muminova*

*Doctor of Philosophy in Philology (PhD),
State University of World Languages,
UZBEKISTAN

ABSTRACT

In linguistics, research is being conducted in priority areas, such as the coverage of aspects of the category of exclamation, the analysis of their national and cultural characteristics. The article deals with the expression of requestive type of the exclamation category. Lexical, grammatical means serve as formal means of expression of exclamation. In standpoints of reflecting national culture, similarities and differences can be seen in the exclamation category. Their differences are reflected in the influence of the national culture. When using sentences, phrases in communication, it is important to pay attention to the semantical structure of the sentences. They are directed towards the intended goal and play an important role in the speaker's achievement of a positive or negative outcome in the communication process.

KEYWORDS: *Exclamation Category, Request, Proposal, Modality, Replica, Linguoculture.*

INTRODUCTION

Linguistic units representing exclamation are widely studied in modern linguistics. Exclamation is expressed as a semantic category in studies which devoted to this problem. The exclamations are very diverse according to the form and the nature of the expression, combining different meanings. Everyone sets a goal when wants to talk about a specific concept. In everyday life, it is natural to resort to the requisite type of direct exclamation to find solutions to problems based on desire and will. According to E.V.Lobanova, the requisite type of exclamation is a directed request of the addressee to do something [4].

Requestive type of exclamation includes request, proposal and offer. Many linguists view request as an independent type of exclamation. In fact, it has its own meaning, is functionally derived,

and is widely used in the communication process. The meaning of the word Request is defined in the "Explanatory Dictionary of the Uzbek language" as follows:

Request – entreat, asking, apology, forgiveness. 1. appeal, asking about satisfaction intention (purpose, desire). 2. Such a request is a form of application that records the claim [8].

The meaning of request correspond to each other, i.e. similar in the French and Russian languages, too. Request - represents the desire of the speaker to be directed to the fulfillment of something in particular by the listener, fulfillment or non-fulfillment depends on the listener's will.

The exclamation of the requisitive type of exclamation is synonymous with the request of the entreat. According to Ts. Sarantsatsral, entreat is a form of request exclamation [6]. Entreat - a strict request is also given in the "Explanatory Dictionary of the Uzbek language" [8]. There are two meanings of the word entreat. The first meaning is to implore with supplicating please, to beg. As for second meaning that request to ask forgiveness, remission.

When the addressee addresses the entreat exclamation, it is inevitable that he will hope, even if he knows that its execution or non-execution is at the discretion of the addressee. Hence, entreat is the presence of a day of this request exclamation, which is distinguished by the sensitivity of its power to the request.

The addressee sends a request or entreat exclamation to the addressee on the basis of his obligations, wishes, desires. Speech etiquette plays a special role in this. According to the scientist D.M.Teshabaeva, it is one of the most common types of request exclamation in the form of labels [7].

Although the addressee expressed his exclamation to the addressee as a plea, it is clear that there are doubts about its execution. Request and entreat exclamation are not as clear-cut as command exclamation. But how the addressee is able to direct the addressee is important. It should be noted that national communicative behaviors in the culture of speech serve as an important factor in the ability to direct the addressee. In language culture, it is important to adhere to the specifics of politeness and nationality in the expression of request exclamation. This allows the interlocutor to focus and succeed as a result of the speaking activity. Politeness and nationalism are expressed through the use of tone and speech etiquette in the expression of please exclamation.

It is possible to express several views of a request by tone. In this case, the choice of one or another means of expression of the request depends on the area of communication of the addressee. For example, a speaker's behavior during a formal conversation will be strictly ordered. Although the addressee has a wide range of language tools at his disposal during the conversation, he uses an expression that is appropriate to the situation in life and refers to the rules of etiquette in order to have his request answered.

Based on the classification of E.V. Boychuk [2], we compare the manifestations of request exclamation in the examples in French, Uzbek and Russian.

1. A request to perform an action is directed by the addressee to the addressee. For example: - Jevoudraisbienunpeu de café, s'ilteplaît, nounouCela me ferait du bien [16]. In the example, the

addressee's request to bring coffee to his nanny is expressed in French by the phrase *s'ilte plait*, which gives the speech a gentle and polite tone.

The market is full of grapes, peaches, ripe apples, plums and plums ... Aunt, give me a head of your grapes [12]. In this example, the request to give a head of grapes is given the color of caress with the affix *-jan*. In Uzbek, the affix *-jan* is used not only to refer to close relatives, but also to bring respect and courtesy to communication.

In general, in the process of analyzing the examples of the request to perform the action in Uzbek, we have seen that most of the exclamation of the request in these examples is characterized by respect and courtesy to the addressee. It brings a tone of softness to the exclamation and has a psychological effect on the addressee. This is done using different affixes. For example, the use of affixes in the request exclamation of a mother's speech to her adult daughter will inevitably lead to a positive outcome of the conversation:

Сипороқкийингин, вой, қизим,
Ибратбўлкелинга, ҳой, қизим,
Онангнитушингин, ойқизим,
Бировнингболасиуйимда [13].

In the above-mentioned, Сипороқкийингин, Онангнитушингин, the transmission of the request exclamation through the *-gin* affix ensured its stronger output. Here the peculiarity of the Uzbek mentality is obvious: when a mother addresses her daughter as "Сипороқкийин, войқиз, ибратбўлкелинга, ҳойқиза", a command would be sounded instead of request exclamation, and in this case the communication could end in vain. At the same time, the psychological approach of the mother in the poetic verse increases the likelihood that her request to her daughter will be successful.

Липа! – сердито окликнула её Марина Петровна. – Я прошу тебя, проснись, пожалуйста! – Или иди домой и бери больничный, если не можешь нормально работать! [14]. In this example, the request to perform the action together is given by the words *pojaylusta* and *proshu*. The *proshu* expression in the example has an exclamation color.

Hence, the request exclamation to perform an action in comparable languages is conveyed by the addressee to the addressee with politeness and courtesy.

2. A request to perform an action together is applied by the addressee to the addressee to perform any action together. For example: *Ne pleure plus, s'ilteplaît, nounou. Allons, ma vieille bonne pomme rouge* [16]. *S'ilteplaît* means please. It is possible to witness the expression of the request to perform the action together with the word *Allons*.

Омонпилдирабкелибоёғимгаёпишди, кўтариболдим.– Ака,
опамменгаукачатуғибберябдими? – шивирлабсўради у.
– Билмадим.

Ака, опамнинголдигакирайлик, укачаникўрайлик [12]. In this example, it is clear that in the Let's Let, let's see expression, a request is made to perform the action together. In this case, the request exclamation for joint action is reflected in the use of the affix *-lik*, which calls for joint action.

Пошли, Ваня, – велел Кузьминский. Мы спустились вниз и сели за стол [9]. In the Пошли expression, the definite tense of the verb request to perform an action together is given by the present tense plural suffix, and the request exclamation can be understood from the explanation of the word велел.

3. Request for permission - permission is obtained from the addressee by the addressee. The high position of the addressee is the basis for the request for permission of the Request exclamation. Phrases such as if you allow and permit in such requests give the request exclamation a formal character, further emphasizing the high level of the addressee.

Si vous me permettez de venir chez vous se soiret je seraisheireux [16].

– Ёшулли, адолаткилинг, – дедишупайтгачагапгааралашмаётганларданбири.– Дуруст, бизмилисагабормасмиз, буопажонгаҳамдаъвойимизйўқтур.Ижозатэтинг, юртимизгакетайлик [11].Permettez is given an expression in French if you will allow. Let us observe that in the expression "**Let's go to our country**" the request exclamation is accompanied by the permission exclamation. Here, the permit phrase, which is originally a marker of permission exclamation, has reinforced the entreat semaphore in request exclamation.

МожноМаргариту? – **попросила**девочка[9]. In the example, the word **можно** is requested for permission.

As can be seen from the analysis of examples in French, Uzbek and Russian, the addressee is often asked to perform the desired action, usually by expressing a request exclamation with the words allow and permit in important situations that give the addressee the right to perform or prohibit the actions highlighted by social status. , brings gentleness and kindness to the appeal. In this case, the position of the addressee is important. In the languages being compared, as discussed above, the expression request + permission includes politeness as well as mutual respect.

4. A regulatory request is a request made by a company to comply with established rules of procedure.

In French, a community-oriented request expression often involves politeness and courtesy. For example, when traveling with tourists, the phrase Attention à la tête s'ilvousplaît is used. Due to the low doors of some places in our historic cities, tourist guides warn Attention à la tête s'ilvousplaît, as well as a request to be careful with your head.

Please do not leave rubbish in the cemetery, take them to a designated place (administration).

This example can be found not only in camps, but also in many public places. The appeal was sent to the public through a request exclamation.

Убедительная просьба, дверью не хлопать. It can be seen that in the Russian example дверьюнехлопать therequestive exclamation is given in the form of a strict command. To soften this rigidity, the term is **убедительнаяпросьба** used. Such an expression of requestive exclamation requires a formal state of speech.

This means that each of the languages being compared has regulatory requestive exclamations, which are widely used in public places.

5. Corrective (about stopping or changing action) request. If the interactions of the interlocutors are of a formal nature, sentences containing conditional-type expressions are a more polite option. For example: Si ca ne vous derange pas, faitescommemoi. Faitesce que vousavez à faire. The fact that the request to stop or change the movement is given with the expression Si ca ne vous derange pas indicates that the request is valid. - Бунақагапларниқўйибтурунг, илтимос.Олдинтинчиболайлик, жиноятчиларбиланкейингаплашамиз [11]. Put a requisitive exclamation in this example, **қўйибтурунг, илтимос**, and the expression **жиноятчиларбиланкейингаплашамиз** is aimed at changing the action.

Не пойдешь к тому врачу. Пожалуйста, сходи к моему врачу, так как она хороший специалист [9]. In the example, requestive exclamation also refers to stopping an action and directing it to another action.

6. Particle (on partial performance of action or performance of other action) request:

Please, my daughter, my child, please don't hurt anyone. If you sin, God will punish you. (From the newspaper).

Sdelay hotya by odno uprajnenie ili ne moroch mne golovu svoim domashnim zadaniem [9].

Thus, in French, Uzbek, and Russian, a request to perform an action, a request to perform an action together, a request for permission, a regulatory request, a corrective request (to stop or change an action), a partisan request. on the implementation).

One of the requisitive types of exclamation is the offer exclamation, which is important for the addressee and the addressee.

Proposal - command, assignment, task; torture; duty 1. An opinion, issue, advice provided for discussion, implementation or adoption. 2. Visiting, stepping on, and so on. request, word, call about [8]. According to VE Iosifova, the proposal can be called one of the most obvious types of exclamation [3].

Using a wide range of requestive exclamations, it is possible to invite a person to a place or ask the addressee to do something. Whether or not to comply with this offer is at the discretion of the addressee. According to KS Neustroev, it is also an offer to request someone to come [5].

– **Venez voir** Ribabdi, c'est un ami de notre père [15].

Эри қамалганидан бери дам ярим тунда, дам эрта саҳарда келиб юргани учун эшикни очган келини бу ташрифдан ажабланмади. “**Келинг, опа**” деб сўрашди [10].

An offer exclamation is used to make an offer to encourage action to do something. Because of this, it is not easy to simply distinguish between request, entreat, and offer semaphores. These semaphores are realized only in context. Also, the advice can be given to the interlocutor, the request can be made by the speaker, and the offer can be made by both parties, i.e. the addressee and the addressee.

COMMUNICATIVE LANGUAGE TEACHING METHOD

Kholmurodova Olima Abdivalieva*

*PhD, Foreign Languages Department,
Jizzakh State Pedagogical Institute,
UZBEKISTAN

ABSTRACT

This article deals with Communicative Language Teaching method and Communicative competence. The authors of this article investigated the role of CLT in learners' communicative competence and the communicative activities as a great assist in preparing language learners to real life situations. This term is closely associated with CEFR. I would like to associate CLT with learning through practice, real-life situations, where each single element of the language is trialed. Exploring the world through speaking orally and explaining in a written form.

KEYWORDS: *Communication, Real Life Situations, Linguistic Competence, Sociolinguistic Competence, Discourse Competence, Strategic Competence, The Role Of The Teacher.*

INTRODUCTION

The origin of the word **communication** can be traced back to the Latin word *communio*, which is translated to mean “to join or unite,” “to connect,” “to participate in” or “to share with all.” This root word is the same one from which we get not only the word *communicate*, but also *common*, *commune*, *communion*, and *community*. Thus, we can define communication as a process by which we share ideas or information with other people. We commonly think of communication as talking, but it is much broader than just speech. Other characteristics of voice communicate messages, and we communicate, as well, with eyes, facial expressions, hand gestures, body position, and movement. The more you know about communication, the more choices you'll have available for your day-to-day interactions. It's like learning vocabulary. The more vocabulary you know, the more choices you have to express yourself.

The basic reason for learning foreign languages that all people have in common is communication - communication in any mode. It is a two-sided process, which requires the ability to understand each other, to be able to code a message that someone wants to convey to someone else in a way, which will be comprehensible to the receiver and also appropriate to a

concrete situation and status of all participants. Vice versa the person should be able to interpret a message that someone else is conveying to them. To acquire a good skill of communication in foreign language it is necessary to be familiar not only with vocabulary (single words and their meanings, collocations, phrases and phrasal verbs etc.) but also with language structures and above all with strategies for using them in right context according to concrete situations. Language is therefore a tool for real communication and not a thing to be studied. I think we should think about communicative competencies and how to better organize a class, in which a teacher enhances students 'four competencies simultaneously.

After the Presidential Decree "On measures to further improve of foreign language learning system"(2012 year) a lot of projects have been done as an implementation of this important document. In 2013, on the initiative of the Ministry of Higher and Secondary Specialized Education of the Republic of Uzbekistan the work on developing a set of learning materials for foreign languages meeting international requirements has been launched. The specialists prepared the new English books for elementary school students which are very up-to-date and very interesting for both teachers and students. It is important to prepare language learners to use their language skills in real life situations. The Common European Framework of Reference (CEFR) was implemented in Uzbekistan in 2012 as a framework for teaching, learning, and assessing languages. CLT is employed within CEFR and the approach is much different than the rule-based/grammar-translation method (GTM) to language teaching that language teachers are accustomed to in Uzbekistan(David L. U.Azizov, 2019: 25).

In the book "Reconceptualizing language teaching; an in-service teacher education course in Uzbekistan " (David L. U.Azizov, 2019: 28) an Uzbek university language teacher supported the CLT and shared the thoughts clearly about teaching communicative competencies from a CLT perspective: "In the last decade, in Uzbekistan, CLT has become popular. This term is closely associated with CEFR. I would like to associate CLT with learning through practice, real-life situations, where each single element of the language is trialed. Exploring the world through speaking orally and explaining in a written form. I think it is most important for us language teachers to not think of our language teaching as a content area of knowledge. I think we should enable our learners to be competent communicators. Language is therefore a tool for real communication and not a thing to be studied. I think we should think about communicative competencies and how to better organize a class, in which a teacher enhances students' four competencies simultaneously."

Communicative Language Teaching based on many modern linguistic theories is considered a good approach by many second language teachers around the world. It reflects a communicative view of second language teaching and learning. According to CLT, the learners must develop skills and strategies for using language to communicate meanings as effectively as possible in concrete situations. The learner must become aware of the social meaning of language forms. For many learners, this may not entail the ability to vary their own speech to suit different social circumstances. CLT makes use of real-life situations that necessitate communication. The teacher sets up a situation that students are likely to encounter in real life. Unlike the audio lingual method of language teaching, which relies on repetition and drills, the communicative approach can leave students in suspense as to the outcome of a class exercise, which will vary according to their reactions and responses. The real-life simulations change from day to day. Students' motivation to learn comes from their desire to communicate in meaningful ways about

meaningful topics. Scientists Canale and Swain (1983) propose communicative competence, which can be used to interpret and guide second language teaching. Canale and Swain (1980) state communicative competence is the ability to use the language correctly and appropriately to accomplish communication goals. The desired outcome of the language learning process is the ability to communicate competently, not the ability to use the language exactly as a native speaker does. Communicative competence is made up of four competence areas: linguistic, sociolinguistic, discourse, and strategic:

1. Linguistic competence means knowing how to use the grammar, syntax, and vocabulary of a language. Linguistic competence asks: What words do I use? How do I put them into phrases and sentences?

2. Sociolinguistic competence means knowing how to use and respond to language appropriately, given the setting, the topic, and the relationships among the people communicating. Sociolinguistic competence asks: Which words and phrases fit this setting and this topic? How can I express a specific attitude (courtesy, authority, friendliness, respect)? When I need to? How do I know what attitude another person is expressing?

3. Discourse competence means knowing how to interpret the larger context and how to construct longer stretches of language so that the parts make up a coherent whole. Discourse competence asks: How are words, phrases and sentences put together to create conversations, speeches, email messages, newspaper articles.

4. Strategic competence means knowing how to recognize and repair communication breakdowns, how to work around gaps in one's knowledge of the language, and how to learn more about the language and in the context. Strategic competence asks: How do I know when I've misunderstood or when someone has misunderstood me? What do I say then? How can I express my ideas if I don't know the name of something or the right verb form to use? (Canale and Swain, 1980:20) Finocchiaro and Brumfit present clear and detailed explanations of the features of CLT. According to them, in the communicative approach, language learning is seen primarily as 'learning to communicate', and the goal of the approach is the acquisition of communicative competence, which enables second language learners to use the target language for communication effectively and appropriately. This approach also argues that 'the target linguistic system will be learned best through the process of struggling to communicate' and learners are expected to learn the target language through interaction with other people (Finocchiaro and Brumfit 1983:91-93).

In CLT, the teacher has two main roles: the first is to facilitate the communication process between all participants in the classroom and between these participants and the various activities and texts. The second role is to act as an independent participant within the learning-teaching group. The latter role is closely related to the objectives of the first role and arises from it. These roles imply a set of secondary roles for the teacher: first, as an organizer of resources and as a resource himself, second, as a guide within the classroom procedures and activities. A third role for the teacher is that of researcher and learner, with much to contribute in terms of the nature of learning and organizational capacities (Breen and Candlin, 1980: 99)

The role of the teacher is not only that of a resource and lecturer but also a facilitator, an organizer, a guider and more important a creator of environment in which learners learn how

to learn. In the traditional Grammar-Translation Method teachers are dictators in class. Teachers deliver the contents of a textbook to students and students just copy the information into their notebooks. They passively receive the knowledge in the class. On the contrary, in CLT, learners play a central role in communication and interaction. They are advocated to participate in classroom activities actively. Learners have greater autonomy in communicative activities; autonomy is where students take responsibility for their learning and undertakes all of the management tasks concerned with it. Learners come up with a mutual solution by exchanging ideas and opinions with each other. They help each other and learn from each other. In 1980 Breen and Candlin describe the learner's role within CLT in the following terms:

The role of learner as negotiator – between the self, the learning process, and the object of learning – emerges from and interacts with the role of joint negotiator within the group and within the classroom procedures and activities which the group undertakes. The implication for the learner is that he should contribute as much as he gains, and thereby learn in an interdependent way (Breen and Candlin, 1980:110).

As a conclusion, we can say that CLT is very effective method of teaching and CLT promotes learners' communicative competence and stimulates their inner motivation since the communicative activities are close and relevant to their daily life. CLT makes great demands upon the professional skills and competence of teachers. CLT teachers need to have other abilities as well as the proficiency of target language, such as organizing ability, insight into learners. Therefore, it is recommended that second language teachers should enhance their standard in order to improve the effects in practical teaching. Teachers should work hard on their teaching and studying new methods in order to help their students to learn English language without difficulty.

THE ISSUE OF LINGUISTIC STUDY OF OYKODOMONYMS

Ruzmetova Mexriyo Nuraddinqizi*

UZBEKISTAN

ABSTRACT

In this article, the content of oykodomonym, the relevance of their linguistic study, is illustrated by the example of the names of buildings in the city of Urgench. Significant buildings have been linguistically analyzed in depth. The word "universal" is derived from the Latin word "universalias," which means "universal, multifaceted." It is so named because of the variety of products sold in this mall. Although the name appears on the entrance of the building, it is not called "Universal" due to the social nature of the language.

KEYWORDS: *Oykodomonym, Linguistic Research, Onomastics, Nickname, Microtoponym, Toponym, Urbanonym, Micro Scale.*

INTRODUCTION

Language is the valuable wealth, national pride and mirror of every nation and people. For this reason, the issue of preservation, development, enrichment and promotion of the national language in the world has always been important. One of the most pressing and important issues today is to preserve, enrich and eliminate the factors that threaten the purity of the state language.

Proper nouns have a unique place in the language. In fact, names are very common in our language. Since onomastics emerged as a separate branch of linguistics, much research has been done in this field. Although a number of names are widely studied in Uzbek onomastics, there are a majority of proper nouns which are not still investigated. Some types of onomastic units exist as proper nouns, and despite being known, they have almost never been analyzed. The examples can be: anoykononym, anemononym, artiononym, agiononym, venesuonym, glaciononym, gemerononym, geortononym, ginekononym, dignitoym, ideonym, insectonym, demononym, lithonym, nautonym, oykodomononym, ornithonym, poliononym, seleonym, stratonym, terronym, tautonym, fictiononym, choronym, the names of works published, the names of vehicles, proper nouns of scientific, literary and artistic works, etc. [E. Begmatov., 2013: 37]. So, one of the proper nouns that need to be studied is the oykodomononym. Oykodomonym is a microtoponym that falls within the scope of these toponyms. Basically, the names of individual buildings and structures in the

city area are combined under the term oykodomonym. Oykodomonym is described in the sources as a unit of micro-scale of onomastics, which is the part of urbanonyms: "Oykodomonim is a proper noun of a certain building, structure and architectural monument" [E. Begmatov., 2013: 47].

Linguistic study and analysis of these proper nouns is one of the current issues of the Uzbek language and will inevitably impact on the development of the language. This can be seen below in the linguistic analysis of some buildings and structures in Urgench.

Urgench trading house is a large shopping mall located in the center of Urgench. This word is the official name of the building. But in the vernacular it is called ЦУМ(TSUM) for short. A few years ago, the official name of this shopping center was in Russian - "Центральный универсальный магазин" ("Central Department Store"). TSUM, on the other hand, is an abbreviated form of the name, and was formerly called by that name. So far, the name has survived in the vernacular. Almost no one calls this place as Urgench Trade House. The problem is, most people do not know what Urgench trading house is. If you ask TSUM, they will know right away. Not many people even know where the name has come from or what it means. The influence of the Russian language is still preserved in such forms.

Darital is a shoe factory located in the center of Urgench. There are also small shops selling food, clothing and household goods in the area of the factory building. There are two commercial buildings. The name of the first building is Business center. The name of the second building is Universal. The official name of the factory is Darital shoes LLC. The factory is called "Darital" because it began its activity as a joint venture between Uzbekistan and Italy. That is why it is called by this word in Italian. This is understandable. The shops and malls in the area are also commonly referred to as "Darital". The business center building is also commonly referred to as "Darital" after the locals. Although these malls have their own names, they are all united under one name. That is, the official name is different from the spoken word. The word "universal" is derived from the Latin word "universalis," which means "universal, multifaceted." It is so named because of the variety of products sold in this mall. Although the name appears on the entrance of the building, it is not called "Universal" due to the social nature of the language. The business center has a similar feature. No one calls this complex a business center. Most people do not even understand the meaning. Business center means "business center" in English. However, this name cannot be given to the name of the building in which the trade takes place. Because in Business centers, mainly for the organization of entrepreneurial activities, projects are developed, offered to entrepreneurs. That is, the business center provides services to business people. The name of the business center also means this. This is the case in all other business centers. But only trade is practiced in the business center. On the second floor of the building there are sewing shops, beauty salons and barbershops. The second floor is for public service. As a result, the name of the building was chosen incorrectly. In addition, several buildings have a common name, although they have their own names. However, the experience of human communication and the history of language have shown that language cannot perform its function by thinking only in a generalized way, and that it is vital to name certain things and events in isolation i.e. separately. For this reason, from time immemorial, a species, a kind and a group of things are named in isolation [E. Begmatov., 2013: 32].

Khorezm Palace Hotel is one of the most popular hotels in the center of Urgench. The above name is the official name of the hotel. In the vernacular it was called "Khorezm palace". With

this name mentioned, everyone knows it is all about the hotel. Interestingly, the English word "palace" was added to the name of this hotel. Palace means "palace, tower" in English. So, in general, the name "XorazmSaroy" ("Khorezm Palace") is derived. As we strive to preserve the purity of our language and introduce it to the world, we have inappropriately added an English word to the name of the main building in the city where almost all foreign visitors come. The name of the building need to show the beauty of our language and using English names is not an appropriate choice in this term. If this is aimed at attracting foreign visitors, naming them in pure Uzbek names will increase the status of our language in the eyes of the world.

Karavan Hotel is one of the most popular new hotels in the center of Urgench. It is not clear why such a large and beautiful hotel is called such a Karavan. If the word "caravan" is in English, it has two meanings. First, the caravan means the van. For example, when we are talking about using a caravan for holidays we say go caravanning. The meaning of this sentence is clear. Second, caravan means caravan, caravanserai. But there is a spelling mistake. The word caravan is misspelled as "Karavan". If the word is a caravan in Russian, it also means a caravan. It is a big mistake to show a Russian word in Latin letters. It is known that a caravanserai was a palace where caravans stopped and spent the night. The cities of the Middle East, Central Asia, and the Caucasus were built on trade routes. If the hotel was named Caravan in this sense, it would be better to use the Uzbek form. There is also a welcome sign at the entrance to the hotel. This situation occurs in almost all such hotels. It may seem as simple situations, inadvertently using foreign words as an alternative, in fact this development slows down the development of the Uzbek language. Instead, it would be a good idea to use a beautiful Uzbek phrase "XushKelibsiz" ("Welcome").

Dashqinjon bobo shrine is one of the ancient monuments located in the center of Urgench. The above name is the official name of the shrine. Among the people it is called Doshqinjonbuva. In the Oghuz dialect, the word bobo is mainly used as buva. Due to this, this shrine is used among the people as Doshqinjonbuva. Dashqinjon Bobo Shrine is a religious monument of historical, architectural, aesthetic and socio-cultural value, built in 1646-1648 by the founder of New Urgench Abulgazi Bahodirkhan. Sa'dWaqqaq was one of the sheikhs such as Yusuf Hamadani, Sultan Vays, and Ismamutota, and the shrine was built in his name. The complex is so named because he was popularly known as Doshqinjon bobo. The name of this shrine has been preserved for many years. Such ancient names are a real historical treasure for our language, for our people.

Belissimo is the name of one of the largest cafes in Urgench. We come across this name in other places as well. The word is found mainly in music, theater and advertising. Belissimo is actually the name of a restaurant that Italians visit. Guests who taste the aromatic meat at an Italian restaurant exclaim, "Madonna mia! Belissimo! Perfetto!" praising the skill of the cook. So belissimo is an Italian word. There are restaurants, clubs, clothing stores, shoe and beauty salons all over the world. It literally means "good, luxurious." Judging the café's name in the city Belissimo, one can think that there is Italian food here. But we see the opposite. That is, the cafe has a lot of Uzbek and Turkish dishes. It turns out that this is not an Italian restaurant. The choice of this name is also problematic.

Above, we tried to find out the names of the most popular places in Urgench, which are often visited by locals and foreign visitors. Apparently, most of the oykodomonyms are foreign words. There are more examples of such oykodomonyms. For example, the names of grocery stores

(Arsenal, Flamingo, Spring), the names of study centers (Today, Teach me, Smart education, West Pro, A + Academy), the names of cafes, restaurants and nightclubs (Magnat, Karat, Billur, Jargonna, Donar Cafe, Je taime, Monaco, Cafe 101), the names of beauty salons and barbershops (Glamour, Kapriz, Sonya, Fortuna, Grand, Cleopatra, Jadi, Beauty, Bernara) are the names which are taken from foreign languages without understanding their meaning. And many more big stores that sell building materials are misnamed as Wallpapers, Wallpaper World, WallpaperGlobe. Such names are quite common in urban areas. Linguistic analysis of them is essential. Even the head of state commented on the study of the names of such buildings: "Unfortunately, toponymic signs, various signs and advertisements are often reflected in foreign languages in public places, in the streets, on the roofs of buildings most of which are in forms of being alien to our spirituality. This is a sign of indifference to the requirements of the state language, our national culture and values, the decline in general literacy "[Sh. Mirziyoyev., 2019].

Today, the transformation of the Uzbek language into a real state language, the preservation and further enrichment of the national language has risen to the level of state policy. Of course, every language has its own set of borrowing words. It is also important to learn and communicate in the languages of the world. However, due to the fact that the Uzbek language itself has an alternative as well as attractive words that those big buildings can be called after, naming them with words from foreign languages as modernity only reduces the status of the language. The following statement of our President is a proof of this: "Naming of social objects is not just a personal or private matter. It is a testament to the patriotism and spirituality of all of us. No one should ever forget this "[Sh. Mirziyoyev., 2019].

Therefore, the study of oikodomonyms, an in-depth linguistic analysis of the names of buildings and structures that serve the public, especially public buildings, is a necessary need for the development of modern Uzbek linguistics, Uzbek onomastics and the Uzbek language.

IMPACT OF COMMUNITY EDUCATION ON SOCIO-ECONOMIC TRANSFORMATION OF RURAL COMMUNITIES IN RIVERS STATE

Ephraim Wordu*

*PhD,

Department of Curriculum/Instructional Technology,
Ignatius Ajuru University of Education Rumuluomeni,
Port Harcourt, Rivers State NIGERIA

ABSTRACT

This study examines community education for socio-economic transformation among rural communities in Rivers State, Nigeria. The study adopted descriptive and exploratory research designs. Six research questions and one hypothesis guided the study. The population of the study consisted of 890 members of rural communities that participated in community education programmes. 700 respondents were selected as sample for the study using multi-stage sampling technique. Data were collected with the aid of a questionnaire titled "Community Education for Socio-economic transformation Questionnaire (QCESET)." The reliability value of the instrument was 0.76. Data obtained were analyzed using mean statistic and percentages. Findings indicate that food increases in food production. There is no significant improvement in the areas of employment, health, capital expenditure, literacy, self-discipline and respect for others rights and dignity. Except food production, findings indicate that community education did not have positive impact on socio-economic development in Rivers State. The study concluded that to address hunger, there is need to look beyond standardized classroom learning to embrace diverse learning opportunities that exist outside the classroom. It recommended that community education programmes be overhauled to reflect the problems/challenges encountered in rural communities. It also recommended that resources of the common people be controlled by them. In addition, it recommended decentralization for policy effectiveness and certificate to be awarded to completers of literacy programmes.

KEYWORDS: *Community Education, Socio-Economic Transformation, Socio-Economic Development.*

INTRODUCTION

A critical condition for socio-economic development is availability of resources on which people depend for their livelihoods such as farming, fishing, lumbering, hunting, small-scale business, etc. These livelihoods have been limited by inadequate or unavailability of resources. The root cause of this is the massive exploitation of the natural resources of local communities by government both federal and state. Government may allow or overlook foreign or national companies logging, fishing and mining without regard to the communities that primarily depend on these lands and resources for their livelihoods and way of life. Some of lands are designated as protected areas by government, thereby hindering communities that are served by these from using them (Todaro and Smith, 2009). This situation accounts for rising rate of incidence of poverty particularly in rural areas and in order to counter balance the effect of massive exploitation of the people's natural resources, government used empowerment.

In response to the socio-economic condition in rural areas both federal and state governments have employed numerous educational strategies including formal education, training of workers in their various departments, etc. These educational strategies failed to reach the masses in the society particularly those in rural areas which led to the adoption of community education strategy. Community education can promote socio-economic development in several ways of which one of them is improvement in the people's well-being. This is because community education assists individuals and communities to make the best use of their talents and ability to improve their lives through altering their knowledge skills, attitudes, values and beliefs in a positive direction and provision of resources.

Statement of the Problem

Community education is widely acknowledged as an instrument for socio-economic development both in urban and rural areas. The federal and Rivers State government spend huge sums of money to promote, support and co-ordinate its programmes. Community education is implemented in various local government areas as well as communities. These include youth entrepreneurship programmes, youth empowerment programmes, skills acquisition programmes, agricultural extension programmes, etc. Despite, the opportunities for learning offered to both individuals and communities through community education, data available show that people in rural areas still live in impoverished conditions. This calls to question, the extent to which community education has enhanced the socio-economic well-being of the rural masses of Rivers State. To establish how community education has transformed the socio-economic condition of the rural people of Rivers State is the problem of the study.

Aim and objectives of the Study

The aim of the study is to examine community education for socio-economic transformation in rural communities of Rivers State. The study specifically sought to:

1. Identify the socio-economic problems/challenges of rural people in Rivers State.
2. Identify the community education programmes implemented for socio-economic transformation of rural communities in Rivers State.
3. Determine the impact of community education on socio-economic development in Rivers State.

Research Questions

The research questions for the study are:

1. What are the socio-economic problems/challenges encountered in rural communities in Rivers State?
2. What are the community education programmes for socio-economic transformation of rural communities in Rivers State?
3. What is the impact of community education on socio-economic development of rural communities in Rivers State?

Scope of the Study

The study focused on impact of community education on socio-economic transformation of rural communities in Rivers State. The study was delimited to Andoni, Biara, Egi, Kpite, Akinima, Isaama, Omuagwa and Omuaturu communities in Andoni, Gokana Ogba/Egbema/Ndoni, Tai, Ahoda-West, Asari-Toru, Ikwerre and Etche Local Government Areas respectively. The study specifically focused on members of these communities who took part in community education programmes.

Literature Review

Socio-economic transformation

Socio-economic transformation is synonymous with improvement in basic necessities of life such as food, water, health, education and shelter. Wordu (2018) posits that socio-economic transformation pre-supposes socio-economic development. Socio-economic development as defined by the National Economic Commission and the United Nations Institute for social development is “an attempt to deal with the problem of uneven development and involve the total economy and society in the process of change. It is a departure from development based solely on economic growth, and concerned with the general style of development and the various components and their interactions such as participation, cross sectional spatial and distributional aspects (Ake, 1981). It requires improvement in areas such as agriculture, manufacturing, infrastructure, employment, participation, etc. It also involves women in development. The indices for measuring socio-economic development according to Wordu (2018) include:

- i) Improvement in food production
- ii) Improvement in incomes
- iii) Improvement in employment
- iv) Improvement in participation
- v) Improvement in participation\improvement in standard of living
- vi) Improvement in health
- vii) Improvement in education
- viii) Improved participation in decision-making
- ix) Increased involvement of women in the economy

Concept of Community Education

Community education involves teaching both children and adults to improve their lives and their communities (Aidcey and Voorhies, 1969 in Anyanwu, 2002). Anyanwu (2002) believes community education “is essentially locally based, non-formally education but not grounded in education theory, a new basic education for life, for adjustments and acquisition of new habits and values for social effectiveness in a fast changing world. This definition suggests that community education as a new form of non-formal education, not fully developed and understood.

ANONTAS (2000) cited in Wordu (2018:30) defines community education as:

A process of empowerment, social justice, change, challenge, respect and collective consciousness. It is within the community and of the community reflecting the developing needs of individuals and their locale. It builds the capacity of local communities to engage development responses to educational and structural disadvantage and take part in decision-making and policy formulation within the community. It is distinct from general adult education provision due both to its ethos and the methodologies it employs.

This definition focuses on adult only, but community education involves adults, youths and children.

Barikor (2005) sees community education as outreach programmes, multi-service non-formal education infrastructure extending educational services to the general public other than the regular students. Similarly, Wordu (2018) defines community education operationally, as outreach programmes an organization outside the organization’s premises to reach out to people elsewhere.

The Impacts of Community Education on Socio-Economic Development

The impacts of community education on socio-economic development include: knowledge gained, improvement in general well-being, attack on gender discrimination, change in taste and making socio-economic development popular. Well-being conceived broadly encompasses conditions that enable individuals to adequately provide for themselves and their families, such as income, educational attainment, agency and empowerment as well as subjective well-being.

Africa’s Affirmation on Food Production

Studies on Africa’s food production have been reported by Mulangu and Porto (2012). They indicate that yields have been growing by an average growth rate of 1%, 0%, 1% and 2% respectively. Yield decline is notable with fruit and oil crop while cereal yield had been consistently growing. Fishery production is said to be growing at an annual growth rate of 5% in Ghana, Kenya and Nigeria with respect to cereal fruit, oil crop and tuber root crops.

Empirical Studies

Galigan (2007) investigated the impact of community education in Donegal, using a sample size of 3,463. Data was collected using FGD and analyzed with simple percentages. The study shows that community education could improve the quality of peoples’ lives. It reveals that community education leads to both social and economic outcomes. Nnena (2014) examined community education as a tool for sustainable development using a sample of 11,211 drawn from a

population of 31,850 in Etche Local Government Area in Rivers State. Her study reveals that community education led to improvement in the peoples' standard of living. Patrick (2008) evaluated ABE and skills acquisition programmes of non-governmental agencies in Rivers and Lagos States. The study adopted descriptive survey design. The population and sample sizes were 11,360 and 1,400 respectively. Data was collected using a questionnaire and analysis carried out using simple percentages. Findings indicate positive impact in the area of employment, income, asset ownership and skills. Ladan (2016) focused on the beneficiaries of FADAMA II Project based on documentary analysis. He reported that, the project benefited farmers in such areas as improved food production, increased income and reduction of conflicts.

Methodology

This involves research design, the population of the study, sample and sampling technique, instrumentation, validity of the instrument, reliability of the instrument, method of data collection and method of data analysis.

Research Design

The study adopted the descriptive and explorative designs. Descriptive survey is applicable when a research wants to describe a particular situation. It involves both quantitative and qualitative techniques of data collection, such as questionnaire, test, interview schedule, observation etc.

Population of the Study

The population of this study consisted of 890 persons who participated in community education programmes in the study area. It was based on a list of community members who participated in community education for socio-economic transformation programmes in the rural communities selected for the study. This list was collected from the Local Government Areas of the respondents.

Sample and Sampling Technique

The sample of the study consisted of seven hundred and twelve (712) persons who participated in the community education programmes. This sample size represents 80 percent of the population of the study. This sample was selected through multi-stage sampling technique. In the first stage purpose sampling was used to select eight LGAs in rural areas for the study. Proportionate sampling technique was used to select 80 percent of participants in community education, programmes in the communities used for the study.

Instrumentation

Community education for socio-economic transformation questionnaire was the major instrument used to obtain data for the study.

Validity of the Instrument

The research instrument was validated by researcher's experts and three other persons who are experts in Community Development as well as Measurement and Evaluation.

Reliability of the Instrument

The reliability of the instrument was ascertained using test-retest method. The questionnaire was administered to the same respondents from Omuagwa and Kpite communities on two different

occasions. 20 copies of the questionnaire were administered twice to community education participants who were not part of the sample used for the study. The correlation of the two (2) sets of data collected was done using Pearson Product Moment Correlation (r). A reliability coefficient of 0.76 was obtained. The significance was tested at 0.05 levels. Consequently, with 0.76 reliability coefficient, the instrument was considered reliable.

Method of Data Collection

The researcher and eight assistants trained on how to administer the instrument to the respondents, administered the instrument on the respondents during a community gathering. The trained research assistants were all graduates in various disciplines and reside in the communities involved in this study. 712 copies of the instrument were administered. All the 712 copies were retrieved but 12 copies were found to be invalid. The remaining 700 copies representing 98.3 percent were correctly completed and were used for data analysis.

Method of Data Analysis

The researcher adopted descriptive statistics of simple percentages and mean statistics to analyse data on the six research questions. A criterion mean of 2.5 ($\frac{4+3+2+1}{3}$) was used in determining whether the respondents agree or disagree.

Research Question 1: What are the socio-economic problems and challenges encountered in rural communities in Rivers State?

TABLE 1: SOCIO-ECONOMIC PROBLEMS AND CHALLENGES ENCOUNTERED IN RURAL COMMUNITIES IN RIVERS STATE.

S/N	Statement	SA (4)	A (3)	D (2)	SA (1)	X	Remark
1.	Extreme poverty is a challenge facing rural communities.	309 (1,236)	204 (612)	119 (238)	68 (68)	3.1	Encountered
2.	Low income is a socio-economic problem of rural communities	175 (700)	204 (612)	184 (368)	137 (137)	2.6	Encountered
3.	Unemployment is a problem rural communities	306 (1,224)	205 (615)	123 (246)	66 (66)	3.1	Encountered
4.	Illiteracy is an obstacle to farmers and fishermen in rural communities	201 (804)	125 (375)	315 (630)	59 (59)	2.7	Encountered
5.	Hiv/aids and malaria attack is a challenge among rural dwellers	312 (2648)	241 (735)	124 (348)	23 (23)	2.5	Encountered
6.	Rural-urban immigration affects rural communities negatively	74 (296)	67 (201)	368 (736)	191 (191)	2.0	Not Encountered

Data in Table 1 indicate the problems and challenges encountered in rural communities in Rivers State. Data show that the majority of respondents agree on items one to five with a mean score of

3.1, 2.6, 3.1, 3.7, and respectively. Therefore, the problems/challenges encountered in rural communities in Rivers State were extreme poverty, low income, unemployment, illiteracy and Hiv/Aids and malaria. With a mean score of 2.0, respondents did not agree that rural-urban drift is a problem encountered by rural community dwellers in Rivers State.

Research Question 2: What are the community education programmes implemented for socio-economic transformation in rural communities in Rivers State?

TABLE 2: PROGRAMMES IMPLEMENTED FOR SOCIO-ECONOMIC TRANSFORMATION IN RURAL COMMUNITIES IN RIVERS STATE.

S/N	Statement	SA (4)	A (3)	D (2)	SA (1)	X	Remark
7.	Agricultural skills training is implemented	309 (1,236)	204 (612)	119 (238)	68 (68)	3.1	Implemented
8.	Mechanical skills training is carried out	306 (1,224)	205 (615)	110 (220)	79 (79)	3.1	Implemented
9.	Business/Entrepreneurial education programme is implemented	73 (292)	139 (417)	341 (682)	147 (147)	2.2	Not Implemented
10.	Health and nutrition education is part of the programmes implemented.	200 (800)	221 (663)	49 (98)	230 (230)	3.4	Implemented
11.	Social studies is regularly carried out	246 (984)	36 (108)	182 (364)	236 (236)	2.4	Not Implemented
12.	Civic education is part of the training and education in rural communities.	314 (1,256)	229 (687)	107 (214)	50 (50)	3.2	Implemented
13.	Literacy and numeracy programmes are carried out	273 (1,092)	227 (681)	127 (254)	72 (72)	3.0	Implemented
14.	C.R.K. is part of the training and education carried out in rural communities	254 (1,016)	237 (711)	147 (294)	62 (62)	3.0	Implemented
15.	Computer skills training is provided for rural dwellers	8 (1,524)	22 (66)	356 (712)	314 (314)	1.6	Not Implemented

Data in Table 2 show that majority of the respondents agree on items seven, eight, ten, twelve, thirteen, and fourteen with a mean score of 3.1, 3.1, 3.4, 3.2, 3.0 and 3.0 respectively. In effect, the community education programmes implemented for socio-economic transformation in Rivers State were agricultural skills training, mechanical skills training, health/nutrition education, literacy and numeracy, civic education and Christian religious knowledge. With a mean score of

2.2, 2.4, and 1.6, respondents show that community education programmes listed in items 9, 11 and 15 are not implemented for socio-economic transformation in Rivers State.

Research Question 3: What is the impact of community education on socio-economic transformation before and after the involvement of participants?

TABLE 3: IMPACT OF COMMUNITY EDUCATION ON SOCIO-ECONOMIC TRANSFORMATION IN RURAL COMMUNITIES IN RIVERS STATE.

S/N	Statement	Before participation				After participation			
		SA	A	D	SD	SA	A	D	SD
16.	I achieved self-employment through community education	5	1	388	300	113	102	280	205
	29.3		0.7	1.0	55.4	42.9	16.4	14.6	40.0
17.	I experience increased food production through community education	2	4	354	340	101	179	52	368
	52.6		0.3	0.6	50.6	48.6	14.4	25.6	7.4

	267								

achieved increased capital	0.7	1.0	46.3	50.7	13.3	22.9	25.7	38.1
expenditure								

Data in Table 3 reveal the impact of community education on socio-economic transformation. To determine the impact of community education two sets of data were used. These indicate impact before and after participating in community education. Data show that 12 (1.7%) of respondents agree that they were self-employed while 688 (98.3) disagree with this. Data has it that after participating in community education, the number that agree increased to 215 (30.2%) while the number that disagree reduced to 485 (69.3%). Based on the number that agrees before and after participation, it can be said community education had low impact on self-employment. Data also indicate that 120 (17.1%) of the respondents agree that they experienced increased food production while 580 (82.8%) had a contrary view. Data show that after participating in community education the number that agree increased to 420 (60%) while the number that disagree reduced to 280(40%). Based on the number that agrees before and after participating in community education, it can be said that community education had moderate impact on food production.

Data also show that 5 (0.7%) agree that their incomes increased before participating in community education. Respondents numbering 695 (99.3%) disagree with this view. Data indicate after participating in community education, the number of those that agree increased to 253 (36.2%) while the number that disagree reduced to 505 (72.2%). Looking at the number that agrees before and after participating in community education, it can be viewed that community education had very low impact on income. Data show 14 (2.0%) of respondents agree that they experienced improved health awareness before participating in community education while 686 (98.0%) do not consider this to be so. Data show that the number of those that agree increased to 236 (33.8%) while those that disagree decreased to 464 (66.2%) after participating in the community education. Looking at the number that agreed before and after participating in community education, education had very low impact in the area of health.

Data indicate that 12 (1.7%) of respondents agree that they read and write before participating in community education while 688 (98.3) had a contrary view. Data indicate that number that agree increased to 125 (17.9%) while the number that disagree fell to 575 (82.1%) after participating in community education. This shows that community education had extremely, low impact in the area of literacy and numeracy attainment among its participants. Data also indicate that 13 (1.9%) believe that they experienced increased self-discipline before participating in community education and that 687 (98.10%) disagree with this. The number that agreed increased to 134 (19.2%) while the number that disagreed reduced to 566 (80.8%) after participating in community education. Based on this area of community education had very low impact in the self-discipline.

Data indicate 13 (1.7%) agree that they experienced increased respect for others' rights and autonomy before participating in community education. While 687 (98.1%) disagree with this view. Data indicate that after participating in community education the number that agree increased to 178 (25.4%) while the number that disagree decreased to 522 (74.6%). Premised on the number that agrees before and after participating in community education, show that community education had very low impact in the area of respect for others' rights and autonomy.

Focusing on capital expenditure, 12 (1.7%) agree while 679 (97.0%) disagree that they achieved an increase before involving in community education. After participating in community education, the number that agree rose to 195 (27.8%) while the number that disagree decreased to 447 (63.8%). Look at the number that agrees before and after participating in community education, that community education had very low impact in the area of capital expenditure among its participants.

DISCUSSION OF FINDINGS

The following are the discussion of the findings:

Findings indicate that the socio-economic, challenges/problems confronted in rural areas include extreme poverty, low income, unemployment, illiteracy and Hiv/Aids and malaria. Todaro and Smith (2009) corroborate these findings expressing that poverty, illiteracy and malaria/Hiv/Aids are high in sub-Saharan Africa.

The findings to the second research question shows that the programmes implemented for socio-economic transformation were agricultural education and extension, mechanical skills, health/nutrition education, literacy and numeracy, civic education and religious education programmes Ban and Adesina (2006) and Oladapo (2006) corroborate these findings as their own findings show that programmes implemented in community education involve vocational and liberal aspects, such as literacy, religious education, agriculture and extension, civic education, etc.

Findings on the impact of community education reveal that 28% were self-employed, food production increase of 40%, while 26% and 35% improved their capital expenditure respectively. The study also reveals that 17% and 24% improved self discipline and respect for other rights and autonomy respectively. Studies confirming these findings include Patrick (2010), Ladan (2008) and Nnana (2014). Mulangu and Porto (2002) corroborate these findings. They showed that food production increased in African countries including Nigeria. Pointing out the cereals and root/tuber has been growth but fishery production grows faster than both in Nigeria. Ladan (2006) also corroborate this finding, noting that food production was one of the benefits of FADAMA project to the participants.

CONCLUSION

The study examined the impact of community education on socio-economic transformation of rural areas in Rivers State. Findings indicate that community education do not have significant impact on socio-economic transformation in Rivers State. However, a different conclusion can be made in respect of food production which recorded 60% increase, that to overcome hunger, we must look beyond the classroom. The study also shows that the programmes implemented are not closely related to the socio-economic challenges/problems faced by rural dwellers. This leads to the conclusion that community education in Rivers State needs overhauling. Based on the programme implementation challenges, which include poor governance, weak institution, lack of political will, corruption and inadequate funding it can be concluded, that progress in education depends on the larger society.

Policy Implications

The following policy implications are necessary:

- a) There is need for specific and concrete actions plans that address the needs of the learners to eliminate duplications
- b) Functional literacy. The issue of literacy has to be addressed because of its role in socio-economic develop of rural communities. It should be based on the socio-economic context of the participants.
- c) Evaluation. Period evaluation of impact of community education on socio-economic transformation is required.

Recommendation

The following are the recommendations of the study, which include:

1. Decentralization for policy effectiveness. There should be decentralization of the decision making process.
2. Institutions that promote local control of indigenous resources should be encouraged to enhance participation of rural dwellers in socio-economic development.
3. Local communities should be involved in leadership.
4. First School Leaving Certificate (FSLC) should be awarded at the completion of literacy programmes to enhance enrolment and completion of programme.

Activity of the Academy of the Ministry of Internal Affairs of the Republic of Uzbekistan.
Expert Psychologist of the Republican Center for
Forensic Examinations named after Kh. Sulaimanova
UZBEKISTAN

ABSTRACT

This article discusses the criteria of expert competence in conducting forensic psychological and forensic psychiatric research. The author pays special attention to the trends in the objective interpretation of expert opinions in the aspect of legal law. The history of our long-term practical activity in the field of forensic psychology reveals many prospects for a critical analysis of the provisions, which allows us to move "from the point of stagnation" and clarify objective directions, taking into account the methodological positions adopted both in the CIS countries and in foreign countries. The aspects of our review include questions related to the influence of emotional states on the behavior of a person in a legal status.

KEYWORDS: Transaction, Forensic psychological examination, Forensic psychological and psychiatric examination, mental state, Will, Expression of will, Delusion, Deception.

INTRODUCTION

Currently, the probability of solving problems related to forensic psychological research is particularly ripe, which requires explanations and provisions necessary for the qualitative interpretation of research findings in the work of judicial and investigative authorities. This statement is related to the fact that many mistakes and incidents were made, both in the parameters of law and in the parameters of the competence of conducting forensic psychological

research with a biased interpretation of conclusions that sometimes have a fateful significance in making decisions and sentences.

The decree of the President of the Republic of Uzbekistan "On measures for further improvement of forensic expert activity" dated 17.01.2019 places great responsibility on experts [1]. Despite the increasing demand for forensic psychological research and the increasing number of its appointments, the qualitative aspects of forensic psychological examinations expect much to be desired.

THE MAIN PART

The history of our long-term practical activity in the field of forensic psychology reveals many prospects for a critical analysis of the provisions, which allows us to move "from the point of stagnation" and clarify objective directions, taking into account the methodological positions adopted both in the CIS countries and in foreign countries. The aspects of our review include questions related to the influence of emotional states on the behavior of a person in a legal status. The legal status of a person is considered by us in the framework of criminal and civil processes, which determine the questions about the abilities of the subject of the study: either to control and predict their actions in a criminal incident, or to make the right decisions taking into account all the necessary conditions in the circumstances of a civil claim. Since the dominant motivation of human behavior is related to the state of the affective sphere, the parameters of the "emotional response" in the context of the deficit of the volitional complex are included in the basis of our research direction.

Our observations show that all forensic psychological studies related to civil proceedings are focused on identifying certain parameters and levels of emotional response of the legal entity. In this regard, it should be noted that regardless of the subject type of forensic psychological examination, all issues related to the factor of human nature are directly related to the diagnosis of a particular emotional state in which the subject was from the point of view of legal law. In the dissertation research of scientists of the Russian Federation, some provisions are presented that are relevant to the subject of our interest. Thus, L. V. Alekseeva (1996), considering the phenomenology of legally significant emotional states, made an attempt to explain the causal relationships between emotional states and the understanding of the subject of the study of the surrounding reality [2].

S. S. Shipshin in his scientific research on "Forensic psychological examination of the mental state of a driver in cases of road accidents" (1998) paid special attention to the complex of emotions, experiences and states that make up the "emotional spectrum" of extreme states and its parameters [3]. L. N. Yablokova (2005) in her research considers the features of assessing the emotional states of juvenile defendants during complex forensic psychological and psychiatric examinations [4]. Oselkov (2011), studying the psychological features of the influence of extremist materials on students of higher educational institutions, notes the role of emotions that are actualized in a negative way, disorienting the positive orientation in the youth environment [5].

In our experimental studies related to forensic psychological practice, professional inconsistencies are often identified due to the lack of complementarity (complementarity) research versions for a specific legal subject of the study. This position is determined by the fact that the version of the psychiatric report often contradicts the version of the psychological report,

which is associated with a contradictory interpretation of the subject of the study, which has a specific affiliation.

MATERIAL METHOD

In the last decade, as part of the socio-economic changes in the life of society, the development of market relations that affect the activity of citizens to dispose of their property rights, the number of civil law transactions has increased. Invalidation of a transaction is one of the ways to protect civil rights. As our forensic psychological practice shows, more than 90% of all civil cases considered per year by one judge in the court of first instance are initiated on claims for invalidation of transactions.

Unfortunately, the insufficient development of the theoretical and methodological basis for the subject types of forensic psychological examinations in the Republic leads to numerous disagreements among psychiatrists and psychologists, which causes the errors of the legislator. As T. V. Sakhnova rightly notes, "The subject of psychiatry is the human psyche in pathology, the subject of psychology is the healthy psyche" [6]. This explanation is sufficient to distinguish the subject of psychological expert research from the subject of psychiatric examination.

The behavioral characteristics of a pathological person (mentally deficient) differ from the behavior of a normal person (mentally full), who can get into unfavorable circumstances and react to them in an uncharacteristic way.

Considering the incidents of the psychological-psychiatric and purely psychological significance of the conclusions presented in civil proceedings, we note some examples that are relevant to this problem. So, in one example from our practical experience, there is a tendency to inconsistency in the interpretation of the behavior of the subject K. E. in the circumstances of a civil claim. According to the circumstances of the case, it is known that K. E., made a deal to buy and sell her apartment under the influence of unscrupulous buyers for a minimum amount that does not correspond to the real value of the disputed housing. According to the court definition, a forensic psychological examination was conducted, for the resolution of which questions were raised regarding the ability of K. E. to make the right decisions, taking into account her emotional state and the ability to comprehend all the necessary conditions of the circumstances of the transaction.

As a result of the forensic psychological study on the subject K. E., conclusions were drawn due to the fact that at the time of signing the contract of purchase and sale of the apartment K. E. was in a state of behavioral disorganization that arose under the influence of a number of psychotraumatic circumstances. A comparative analysis of medical documentation, civil case materials, and a clinical conversation with the subject showed that the requirements of the legal situation exceeded the psychophysical capabilities of K. E., who in the period of interest to the court perceived reality through the prism of super-valuable experiences of ideas of inferiority and feelings of guilt that arose on mentally defective grounds.

The violations revealed as a result of experimental psychological examination in the cognitive and personal spheres of the subject indicate: non-purposeful thinking, the tendency of the subject to symbolism and resonant constructions, against the background of defectiveness of volitional regulation with progressive autism and maladaptation in the social environment. These circumstances caused the increased suggestibility of K. E. and her pathological dependence on

external influences, which sharply reduced her intellectual potential in a mentally tense situation of circumstances of the period of interest to the court.

The plot of mental disorders found in K. E. was determined by a direct connection with psychotraumatic circumstances, which was the reason for the sharp restriction of critical capabilities in the subject who was not able to see the situation as a whole at the time of the period of interest to the court, make the right decisions and predict the consequences of her behavior, taking into account all the necessary conditions.

For a number of reasons of the everyday plan, K. E. again found herself in an expert situation on the passage of a psychological and psychiatric examination with the decision of the question of her legal capacity (incapacity). The clinical history of the life of the subject, including clinical observation and psychological examination, leads experts to the conclusion that K. E. reveals signs of disorders related to the nosology of the schizophrenic symptom complex. But at the same time, the subject K. E. is defined by experts-psychiatrists as "capable", i.e. "capable". Able to make the right decisions and be aware of their actions in the circumstances of a civil claim. The expert conclusions of the forensic psychological study were ignored by both psychiatrists and the court, which made a decision according to the conclusions of the psychiatric report.

This fact indicates the lack of information of the bailiff, on the one hand, in terms of psychological parameters that are equivalent to legal meaning (Article 122,123 of the Civil Code of the Russian Federation), which explains the cause-and-effect relationships of behavior (normative or non-normative) of a person in legally significant circumstances, and on the other hand, ignoring the significance of psychological knowledge, taking into account the authoritarianism of the psychiatric position.

This circumstance is explained by the insufficient development of the methodological base in the field of the use of forensic psychological knowledge in the judicial and investigative practice of the Republic of Uzbekistan, to which our research interests are directed.

According to the statistical indicators of our forensic psychological research experience-70% of the research is related to the circumstances in which it is necessary to conduct post-mortem forensic psychological examinations. A post-mortem forensic psychological examination in civil cases is appointed by the court in cases where the persons committing a disputed act are deceased and the court has questions that require psychological knowledge for their explanation.

It should be noted that in the Republic of Uzbekistan, until recently, only a forensic psychiatric examination was appointed in respect of disputed transactions (for "purchase and sale", "wills", "gift"), since the court usually had doubts about the mental worthiness of the testator or another person.

The experience of our practical activity (on the example of the analysis of materials of civil cases on judicial investigations in the Republic of Uzbekistan) allows us to assert that the adoption of a decision by a deceased person can be influenced by: the mental state, the psychological characteristics of the individual, and the emotional manifestations of the subject of the study at the time of actions related to the legal period. In this case, it is necessary to consider:

a) The nature of the stimulus affecting the personality, deforming the behavioral structure of a person who is not a mentally defective subject;

b) Various psychological reasons (loneliness, stress, death of loved ones) that cause mental states, the impact of which cannot be overestimated during the registration of legally significant acts.

There are civil law circumstances that do not allow a person to correctly assess and perform actions that at first glance seem to be a true manifestation of the will of a legal entity. In the presence of these circumstances, this will is vicious in its content. Since the "defects of will" for the recognition of a transaction as invalid are of a material nature, procedural actions are necessary to establish the presence of a "defect of will" in the transaction.

Will as a psychological reality is the conscious regulation of a person's behavior and activities related to the ability to overcome internal and external obstacles in the circumstances of achieving the goals set. When the marked abilities are violated, then the question arises about violations of volitional qualities, i.e., about the "vice of the will". Reasoning within the framework of psychological terminology, we mean both violations of the intellectual capabilities of a person, and violations of the volitional regulation of behavior at the time of making a legally significant transaction.

By implying a certain psychological regularity under the "vice of the will", we assume that in the above sense, the causes of the "vice of the will" (volitional deformation of behavior) are individual in each case, and this is due to different mechanisms for the formation of a particular error in the circumstances of the need to make a decision [7].

In our opinion, the psychological parameters of the deformed will include: the syndrome of emotional tension; the syndrome of volitional frustration (in a hysterically accentuated person); the syndrome of personal asthenization (mental weakness) as a result of a somatic disease that weakens the psychological compensatory mechanisms that affect adequate adaptation in the social environment. The concept of psychological "vice of the will" - as the basis for the invalidity of the transaction-also includes intellectual (cognitive) personality disorders, which can be caused by various reasons, both situational and chronic (non-curable).

In our opinion, the statement of the "vice of the will" is impossible without substantiating the mechanisms of the formation of this state. There are internal mechanisms that are related to the "emotional stress" syndrome. External reasons concerning the legal interpretation of events are also important. These reasons are due to the material and legal significance that differentiates the error as an essential element of the transaction declared invalid. In this case, the legal connotation is the careless fault of the counterparty. And here it is necessary to qualify the transaction as made under the influence of deception. It is necessary to take into account additional significant criteria due to the probability of the subject of the transaction being deceived.

One of the means of proving the "vice of the will" is the examination of the inability of a mentally capable subject to control his actions in the circumstances of a temporary period. A post-mortem forensic psychological examination of a person who has committed a legally significant act in the period preceding the death is appointed in absentia. In the last decade, in the Republic of Uzbekistan, a purely "psychiatric trend" is expressed in the fundamental disregard of the forensic psychological direction in the aspect of post-mortem forensic psychological examinations. This circumstance creates a scientific need in terms of introducing specifics and

clarity on the competence of the psychologist (as an expert) in civil proceedings, in connection with the giving of an opinion that may have evidentiary value.

CONCLUSION

Thus, according to the above, an objective study of the parameters of the "emotional response" in the aspects of the civil investigation of the Republic of Uzbekistan is of fundamental importance in the circumstances of both psychiatric and psychological examinations. Moreover, the research context in the diagnosis of the "human factor" for the types of forensic examinations under consideration is determined by the difference in the platforms of competence, the complementarity of which is not intended to introduce disagreements in situations of judicial decision-making, but to represent the scientifically based clarity of expert research, the conclusions from which can be fateful.

ABSTRACT

Communicative skills, including pronunciation are not easy to teach. Considering the importance of incorporating pronunciation in English classroom, this paper attempts to find out the ways to use tongue twisters as a teaching means to improve pronunciation. This paper highlights the significance of tongue twisters in teaching pronunciation among Uzbek students. Controlled class observation method was conveyed. Research results showed that tongue twisters make the classroom activities more engaging, motivational and fun. Moreover, tongue twisters have the capacity to make the pronunciation rules much stickier was also discovered. Researches also showed that teachers are being required to more creative when using the tongue twisters to teach pronunciation to relieve the monotony which comes with overly using the same technique. Innovative practical strategies and techniques to use tongue twisters are provided as research suggestions.

KEYWORDS: *Tongue twisters, teaching pronunciation, fun activities, innovative techniques and strategies, repetition technique.*

INTRODUCTION

Pronunciation is the way we pronounce sounds, and it is one of the key areas to improve communication skills of students. It is obvious that even if students have good grammar or vocabulary knowledge, without adequate pronunciation skills they are less likely to be understood by others. Good pronunciation shows the listeners the speaker has a good proficiency level even if there are slight errors with grammar and vocabulary in their speech. There are some factors that affect to the speakers' pronunciation abilities. They are listed by Brown and Lee as the following: In priority, native language, following 5 other factors "are age, exposure, innate

phonetic ability, identity, and agency, as well as motivation and concern for good pronunciation". (Journal, Arab and Muin, Fatchul and Amrina, Rosyi and Amelia, Rizky, 2017) Dewi (Astutik, 2017) believes that pronunciation is the most important factors to study and teach. As Ali Abdullah (Ghani, 2018) states that overall competence of students cannot be improved without raising the awareness and building mutual intelligibility in pronunciation of sounds. Nevertheless, most teachers just ignore applying pronunciation into their classroom. The reason behind is that attempts made to teach pronunciation are sometimes unsuccessful. Or else, teachers themselves have lack of knowledge to teach this in this sphere. Especially, in teaching English to the Uzbek students, pronunciation is substantially important. Since the phonology of English language and Uzbek language quite differs from each other. Some English phonological sounds do not exist in Uzbek language. Gulnigor presents those phonics which do not exist in her paper called "Common pronunciation mistakes of Uzbek learners in speaking English" (Gulnigor, 2018) dividing into two groups: vowels [u, ou, ai, ue] and consonants [ð, θ, r, w, f, v]. Those omitting sounds make Uzbek students to struggle to pronounce English sounds. Therefore, teaching pronunciation to the Uzbek students is considerably crucial. In addition to that, pronunciation is not necessarily to teach in a separate classroom as particular pronunciation rules can be incorporated into any classroom topics. For example, while teaching past simple tense, teacher can arouse the awareness of students how to pronounce -ed in two existing forms such as, /t/ and /d/. It depends on the creativity and competence of teacher.

Relying on my teaching experience and the works done previously in the field, tongue twisters are precious sources to improve pronunciation. Tongue twister is a word, phrase or sentence, sometimes rhymes which are made of complex structures, super close-sounded words to each other. They are really difficult to pronounce and the purpose of creating them is improving articulation or pronunciation skills of students. Wikipedia defines the tongue twisters as "A **tongue-twister** is a phrase that is designed to be difficult to [articulate](#) properly, and can be used as a type of spoken (or sung) [word game](#). Additionally, they can be used as exercises to improve pronunciation and fluency." (wikipedia, 2021) sometimes, they create warm and humorous sense when applied in the classroom. The faster the pupils articulate the tongue twister the better their speeches can be enhanced. They exist in any language and mostly used among younger ages. However, tongue twisters can be conveyed to learn a foreign language by adult language learner. Tongue twisters make the students more engaged into the classroom regardless of their behaviour. For example, some students are quite introvert to participate in the classroom activities where the tongue twisters give a hand. Teacher can make competitions among the students and these races accelerate the enthusiasm of students to engage. Furthermore, tongue twisters are not hard to get access not to mention their reasonable price. On the internet web pages, there is a wide scope of tongue twisters to apply in English classrooms.

LITERATURE REVIEW

1.1. Theories about the tongue twisters' characteristics to improve pronunciation:

- 1) Vivi (Aulia, 2020) states that mother language's interference leads to mispronouncing words among English learners since some English sounds do not exist in other languages. Moreover, students struggle to pronounce the phonics they have the similar sounds, such as /p/, /f/, /v/, /ð/, and /d/. Tongue twisters basically are made of similar sounds in a sentence. They clearly states how these sounds should be pronounced differently. In order to optimize the implementation of tongue twister in the classroom, the author considers YouTube videos

are extremely useful not to mention they require “maximal preparation” and special attention for each student by the teacher. (Aulia)

- 2) Dewi research states that English pronunciation is really challenging for language learners thanks to the different form of the language from spoken language. Another difficulty follows the similar sounded words, such as “to”, “two”, “too”. These three words have no difference in terms of their pronunciation. Obviously, identifying their difference while listening is hard for learner to comprehend it. The research highlights that main purpose of English learners is improving their communication skills owing to this, students tend to get silent concerning their pronunciation mistakes. Applying tongue twisters in the classroom is both fun and useful. Nevertheless, improvement in the students’ pronunciation skills comes with the amount of significant practice. The more students practice the tongue twisters; their ability to pronounce other English words gets better. As the learners feel the improvement in their skills, they get motivated to practice tongue twisters. (Dewi Lutfiani & Indri Astuti, 2017)
- 3) The research done by the group of UniversitasLambungMangkurat scientists (Journal, Arab and Muin, Fatchul and Amrina, Rosyi and Amelia, Rizky, 2017) compared the tongue twisters and repetition techniques among two types of learning styles, namely reflective and active. By the definition, students who chose the reflective learning styles are someone who is introvert, on the contrary, active learners learn by doing and engaging actively in classroom activities. Research claims that learning style of students do not significantly influence on the improvement of pronunciation skills. Two different teaching pronunciation techniques, repetition and tongue twisters also do not cause to distinguishably different results. Nevertheless, tongue twisters provide a meaningful practice environment for the students. So, students are more likely to feel engaged to tongue twister activities without feeling of obligation to learn the pronunciation. Moreover, tongue twisters encourage the students to be more active while learning.
- 4) Tongue twisters have been used in the classroom to improve pronunciation skills of students for centuries. Tongue twisters practice the muscles of the speech organs. Wells Smith Partners paper cited in this paper highlights the list of benefits which comes with using tongue twisters in the classroom. The researcher states that students got a positive effect using the tongue twisters to improve their pronunciation skills. The role of tongue twisters is substantially important especially in improving “in dental and palatoalveolar fricative consonants”. I provide those advantages as they were cited in (Asilfa paper (Wells-Smith 2012)):
 - a. Help to arouse the awareness of students their weaknesses in their pronunciation;
 - b. Help to correct their errors in their pronunciation quickly;
 - c. Help to enhance their muscles adaptability to pronounce unknown sounds by creating a muscle memory on the speech organs;
 - d. Enhances their listening comprehension skills;
 - e. Helps to make the classroom atmosphere more enjoyable by relieving the monotony;

- f. As students see that their peers and even teacher make mistake while practicing with tongue twisters, students' confidence will be boosted to practice without the fear of making mistakes. (Asilfa, 2019)

1.2. Activities to implement tongue twisters in the EFL classroom to improve pronunciation:

Tongue twisters are precious authentic materials to apply in the classroom. As long as the teacher is creative enough unlimited activities can be hold in the classroom to make the real English learning atmosphere. Kate Joyce, from British Council suggested a practical activity as a warm-up exercise in the following procedure:

- a. At the first stage, teacher writes down some famous tongue twisters on the board, or distributing the cards is also favourable;
- b. Students read the tongue twister loudly making interference to other to read;
- c. Students are encouraged to create their own tongue twisters as writing answers to the following questions in the type of gap filling activity;
- d. Write your first name; what did he/she do?; where; when; why; because
- e. Students will be divided into 5 groups and write down the answers by words starting the first letter of the name. Consequently, tongue twisters get back to the person who started.
- f. As in the example, following tongue twister can be created:

“Laura laughed in the laundrette at lunchtime because she lost her laundry”.(Joyce)

Warming-up activities, tongue twister game suggested by Nomor, follows the stages given below:

- a. Students choose a tongue twister from the website which is connected to the course of study;
- b. Ss try to read it out loud. As long as they make any mistakes, they are encouraged to correct their mistakes by looking up the dictionary or asking for help from the peers.

This activity helps to get improved any English teaching classroom as it helps to shift from teacher-centred approach to student-centred approach. in the classroom. Students do not get unmotivated as they work in a group with different tongue twisters. Another activity suggested by Moron is “whispering game”. It is really new concept for students to whisper the tongue twister in each other's ears in a small group. The game follows the two stages. First, teacher makes the students group of 6 people. Then, students whisper the tongue twister conducted by the teacher. At the end, the last student tells the tongue twister out loud. This game does not fulfil the expectations of a teacher. That is, the tongue twister will be misunderstood by its meaning and structure. The teacher should provide the correct tongue twister itself at the end, and make the students distinguish similar sounds in words. Practicing and drilling the accurate version of tongue twister five or more times is much more preferable. Even if those above-mentioned games are exciting and fun, they are both time-consuming. (Sitoresmi, 2015)

The following list of factors is suggested to take into consideration while teaching English pronunciation by the teacher:

- a. Helping the students perceive new categories of sounds which were unknown before;

- b. Giving feedbacks for the students' performance;
- c. Pointing out what is going on while explaining;
- d. Establishing a prior plans before starting the teaching;
- e. Devising activities;
- f. Assessing the students' progress to motivate them.

English teachers can make variations to the classroom using extra-curricular activities. Dialogue and role-play techniques are also preferable to apply using tongue twisters. This allows the students to express their personal opinions and let their potential revealed in enriching their skills. (Fatriana, 2017) Every language has tongue twisters and these are difficult to pronounce even for the native speakers themselves. The teacher explains the tongue twister by making students repeat after him. At the first part of the video, sounds are explained, and then repeating collaboratively with a tutor. At the end, independent practice is provided (Alex) Another effective method to practice tongue twisters is explain a particular sound by splitting the tongue twister in smaller units. After that making the students follow the teacher till the students' muscles are comfortable with pronouncing the sounds is also highly effective. For example, the teacher explains the difference between "ch" and "sh" sounds. Then, distributes the tongue twister cards "*If Stu chews shoes, should Stu choose the shoes he chews?*" The teacher reads and students repeat after her. (Gomez, 2021)

RESEARCH METHODOLOGY

3.1 Research Hypothesis and Questions:

The following null hypothesis and research questions were formulated to undertake this research:

Research Hypothesis:

- Tongue twisters are useful to improve the pronunciation of Uzbek students.

Research Questions:

- Do tongue twisters make the pronunciation rules stickier?
- Is learning English pronunciation through tongue twisters funnier?

3.2 Research Population and the Location:

The 45 students from the Samarkand regional branch of IT Park, which is Technological Park of Software and Information Technology, were chosen to a control group to teach the English language incorporating tongue twisters. Students were selected according to their age, and English proficiency level. All the students had the same level of English competence, that is, A2 according to the national CEFR standards. Students were aged from 16 to 20 years old with the same level of English proficiency. Some of the students had no competency to write in English alphabet. To check their proficiency level, they were tested by the help of this placement test. <https://www.centrolinguebenaco.com/wp-content/uploads/2018/10/test-inglese.pdf> The test contains 55 multiple-choice questions. Ss found around 15-18 correct answers which labelled their knowledge as A1/A2 elementary levelled students. Their pronunciation proficiency levels were checked by reciting the alphabet, spelling their names, and reading the given text out loud. They had the basic competence in terms of their pronunciation skills. They were divided into

three groups, two of them were aimed at being taught with tongue twisters, and the other group were taught with conventional repetition techniques.

3.3. Research Procedure and Methodology:

Controlled class observation method was chosen as the best strategy to conduct this research. The observation lasted 3 months. The research materials, such as textbooks, tongue twisters related to the proficiency level of students, classrooms were set beforehand. The grammar and pronunciation topics were selected according to the Navigate books' (Jane, 2016) content and enriched with tongue twisters. The researcher took notes during the observation about the changes in the student's ability to pronounce certain English sounds, engagement in the classroom activities. The tongue twisters were selected appropriate to the focused grammar or pronunciation topic. Such as, when the topic was the past simple tense with the simple state verbs, the following tongue twister was applied:

"Betty bought some butter, but the butter was bitter, so Betty bought some better butter to make the bitter butter better."

The two groups were continually introduced with a tongue twister once in two classes. Teacher introduced the tongue twister by splitting it several parts. For example, distributing the tongue twisters cards, explaining the focused pronunciation rules and translating the pronunciation all together, and lastly, the ss were given the tongue twister to learn by heart as a home task. Three classes in a week were held. The other one group taught with the repetition technique. The Navigate Oxford press A1 level books' course book(Dummett Paul, Hughes Jake. , 2016) And work book (Jane, 2016) were used including with their CDs and YouTube videos, reports for all groups. The teacher used repetition techniques to help students get aware of the pronunciation skills. While the two controlled groups got learning the tongue by heart as a home task, the third group learnt the dialogues by heart. By the end of the months, all of the students' pronunciation skills were tested through reading the text, and giving a presentation on the topic of my hobby. The spelling bee competition was held, and their pronunciation skills were tested (Lingua.com, 2018). During the competition, 5 basic levelled English words were pronounced by a teacher and the students got one mark for each correct spelling.

RESEARCH FINDINGS

Observations showed that tongue twisters and conventional drilling, repetitions techniques led to almost the same pronunciation results. Students from the controlled group could apply the pronunciation rules slightly better than the other group. However, teaching with pronunciation was more fun and more engaging. Even at the beginning of the learning procedure, students were reluctant to learn the tongue twisters by heart, as they practiced their muscles to pronounce those difficult words, learning the tongue twisters seemed as getting easier for them. Consequently, the student engagement rate was boosted. However, the results from those students were not considerable. Some students apply the pronunciation rules for only particular words which were taught by the teacher by repeating several times and did not apply this technique to other words. For example, teacher explained two /ee/ letters are pronounced as /i:/ sound as in the words "beef" /bi:f/, "week" /wi:k/ etc. However, when students come across such words in the context, they could not apply it for unknown words. Even they learnt it with the context of tongue twisters, it continued happening. When the tongue twister 'Peter Piper' was introduced,

“Peter Piper picked a peck of pickled peppers.

A peck of pickled peppers **Peter Piper** picked.”(Library, 2021)

Students were taught to pronounce -ed past tense suffix (picked, pickled) with /d/ after voiced letters (b, d, g, j, l, m, n, ng, r, sz, th, v, w, y, z), and when the -ed suffix comes after voiceless consonants (ch, f, k, p, s, sh, t, th) it is pronounced as /t/. (Beare, 2019) Piper is pronounced as /paɪ.pər/ with a /ai/ in it. Nearly all students failed to apply the latter pronunciation concept to other similar words, such as writer, bright. Surprisingly, they were good at conveying the -ed rule in their speech. In the meantime, quite opposite situation was also recorded. After learning the particular pronunciation rules, some students are reluctant to accept the exceptional phonological cases to those sounds. For instance, when the teacher explained the /ea/ vowels are pronounced as /i:/ as in the words “weak” /wi:k/, please /pli:z/, as well as /ea/ vowels are pronounced as /e/ short sound as in the words “head” /hed/, “spread” /spred/. Almost in any case, students get confused and made mistakes when they came across with these words in another context. Another finding is that mastering the pronunciation skills not only depend on the technique or materials used to teach, individual’s self-motivation was more important to be good at any target language skills including pronunciation. In both groups, students lost their motivations when they got any critical feedback. They kept silent after the correction. After that, teacher changed the style of teaching to the collaborative group work. In the group work, students practiced the tongue twister together rather than repeating it individually in front of the public. That reduced the affective filter and boosted their confidence to pronounce the certain words. Another notable feature to take into consideration was the second research question was accepted with affirmative results. That is, tongue twisters could make the pronunciation rules stickier. It is supposed that once the tongue twister is learnt by heart by making the right amount of efforts, students are never going to forget these rules.

RESEARCH SUGGESTIONS

1.3. Research showed that perfect preparation keeping the proper strategy in mind, is the best way to achieve the desired results from the students. The research suggests to the teachers to use the following strategy in applying the tongue twisters in the classes:

The first stage is prior to practicing. :

- a) **Selection:** Teacher should choose the proper tongue twister in terms of the students’ proficiency level, lexical resource and focused pronunciation concept. If the tongue twister is too hard to understand its meaning or to pronounce, students feel discouraged. On the contrary, if the tongue twister is too easy, students are less likely to take it seriously. Sometimes unless the teacher can find a suitable tongue twister to the classroom, creating the one is also preferable.
- b) **Preparation:** Teacher should have clear goals on her mind before the class. What is being expected by applying this into classroom? How many tongue twister cards are needed? Teacher should be ready for all unexpected situations such as; students can be bored with learning pronunciation, and no longer want to practice. Or else, students can overestimate their skills and do not do their homework (do not learn the tongue twister by heart). Therefore, teacher should be creative, and apply different techniques, methods (whispering, video modelling, and gaming) in the classroom.

- c) **Instruction:** Teacher should clearly state what students are going to do. How they will practice, and what they will learn should be clearly interpreted to the students. Otherwise, students can get lost in some many rules, and instructions.

The second stage happens during the practice.

- d) **Introduction:** New pronunciation topic should be clearly explained. How to pronounce the target sound should be taught with interactive repetition. For example, if the teacher is introducing schwa sound, first she should write down schwa sounds' mark on the black board. Then, teacher explains it with examples such as from, a, family, support etc. and write down their transcriptions if needed. Teacher should link the new topic to the previous pronunciation topics. It makes the classroom more meaningful and the materials easier to comprehend.
- e) **Explanation:** Straight going to the tongue twister itself, and splitting the tongue twister into the phonological parts, such as weak forms, or certain focused pronunciation rules.
- f) **Translation:** Teacher should encourage the students to translate it into their native language. Sometimes, tongue twisters do not make any sense, and make some humour among them. as long as students are aware of the meaning of tongue twister, they learn it faster. Along the way, they can learn new vocabulary.
- g) **Practice:** Initially, students repeat after the teacher chorus. Then, Teacher encourages the students to read 5 or 6 times individually. It makes the classroom really noisy. Students should be encouraged to interfere to each other while reading, and read loudly. It makes the learning process fascinating and encouraging.

The third stage is the final step where the students demonstrate their pronunciation skills.

- h) **Competition.** Dividing the students into 4 or 5 groups with 4 or 5 students in each and making a competition is also great technique. Students come to the blackboard and recite the tongue twister with their group. It makes the classroom more fun. This activity also strengthens their friendship bonds. They learn group working, as even a student fails to recite the tongue twister; it causes the whole group to fail. That is why, they teach each other, and it leads to better results
- i) **Evaluation:** Rather than getting feedback from the teacher, peer review is more preferable. Using evaluation cards with assessment rubrics on it is also useful. Students should be introduced with assessment rubrics, and evaluate each other's performance. Following rubrics can be used as a sample.
- How fast was the student? (Fast, moderate, slow)
 - How did the student pronounce the tongue twister? (students will mark the mispronounced word from the tongue twister)
 - How many times did the student pause while pronouncing? (0, 1,2,3,4...)
 - How many times could the student tell the tongue twister? (1,2,3,4,5...)

In evaluating, students should be encouraging as much as possible.

- j) **Rewarding:** Students should be rewarded in any case. If it does not happen, they easily lose their motivation. There are several ways to get this done. Announcing the winners and boasting them among the group boosts their motivation. Or, boasting them with just clapping is also highly recommended technique. Marking them with higher scores is another way. Teacher should take every student into consideration while rewarding. Even the least successful students should be motivated with some amount of warm words.

Using tongue twisters is time-consuming, and it can discourage students from engaging into activities. Explaining this situation beforehand is also crucial. One way doing this is bringing a tongue twister in the students' mother tongue, and having the students to practice it in initial stage. Eventually, Students understand that tongue twisters are hard to pronounce, and learn it by heart. Whenever they come across with challenges with learning the tongue twister, they are less likely feel discouraged.

TBL (Task Based Approach) Activities: Tongue twister technique can be blended with task based approach. By the definition TBL approach is “focuses on the use of authentic language and on asking students to do meaningful tasks using the target language.”(Wikipedia, 2021) Students can make their own tongue twisters based on the social situations. Using this approach is effective when it is used as a home task assignment. Students should create the tongue twisters from their real life first-hand experiences. This strategy can be used after making the students totally familiarized with the tongue twisters. That is, students will have enough experience to create one after learning the several tongue twisters by heart. This makes the tongue twister stickier. For example, teacher tells to the students to create a tongue twister based on the following rubrics as sample to create a tongue twister:

- 1) Events (Birthday, family dinner, working out, shopping, wedding, at the hospital.)
- 2) How many words were started with the same letter? (Students should be informed that they should start almost all the words with the same letter)
- 3) Names of characters (They should be chosen according to the focused pronunciation sound)
- 4) Places' names (They should be chosen according to the focused pronunciation sound)

For Example,

Brighton became bitter boy in his birthday, because his brother beat Brighton.

As long as the teacher is creative, only sky is the limit. There are enough situations and events to create a tongue twister. This technique boosts students' comprehension skills in general not just pronunciation skills. This encourages the students to be more creative, and use other language skills, such as writing, critical thinking etc. If the students make silly meaningless tongue twisters, that is normal. Because the nature of tongue twisters does not require to be a deeply meaningful from the tongue twisters' context.

Suggestions for further Researches: Realizing the significance of tongue twister in improving the pronunciation, conducting the research among larger population would be preferable since this research was conducted in a relatively short period of time, and among a smaller scope of students. Moreover, making the list of tongue twisters with appropriate grammar, and pronunciation topics in mind is also required in teaching. Because, using the tongue twisters in a meaningful context makes the learning procedure more effective. In addition to that conducting a

research about the importance of motivation in acquiring the pronunciation skills would be beneficial.

CONCLUSION

Pronunciation is one of the most important skills in enhancing the one's communication and comprehension skills. Student's native language causes obstacles in learning the second language. For example, some English sounds do not exist in the learners' native language. Teachers are integrating different methods to improve the students' overall competency including pronunciation skills. Songs, tongue twisters, rhymes and other authentic sources have been used to teach pronunciation. The importance of tongue twisters to use in teaching pronunciation has been recognized by many researchers and being conveyed to make the pronunciation classes funnier, and more effective. Although the benefits of tongue twisters do not outweigh the traditional repetition techniques' benefits, tongue twisters are more enjoyable and encouraging technique to use in the classroom. Pronunciation rules are more memorable when they absorbed by the help of tongue twisters. Teachers are required to be creative when they use the tongue twisters as students can be fed up with the same practice regularly. Using task based approach techniques, or following the three staged strategy to incorporate the tongue twisters into classroom is highly recommended.

ABSTRACT

This article is dedicated to explore iron deficiency during the pregnancy in an early stage. Moreover, the research presents a great deal of data concern about diagnosis and treatment of iron deficiency in early pregnancy. On the top of that main causes and effects of anemia at this rate, as well as prevention forms dealing with iron deficiency. The research outcomes are implemented in terms of facts, affairs and humans' affections.

KEYWORDS: *Anemia, Early pregnancy, Iron deficiency, Treatment, Prevention, diagnosis, woman, drugs.*

INTRODUCTION

One of the most common diseases among the population of the republic anemia and its various pathological conditions, in which the blood the amount of hemoglobin, and in most cases the number of erythrocytes decrease is noted. Anemia is a symptom of some disease manifests itself as, i.e., it is a secondary disease. Anemia is not only different at all stages of human life in diseases, but also in some physiological conditions (pregnancy time, during the growth and lactation periods of the organism). Especially since anemia in young children is of great social importance anemia at this age of physical development in the body and iron causes a disruption of the exchange. Development of anemia with adolescence and menopause, hormonal disorders,

nutrition character, digestive system, kidney disease, in the body disorders of the absorption process, autoimmune conditions and other factors may also be related to. The disease is often internal, infectious and oncological diseases were not associated with anything is also a symptom.

Iron deficiency anemia is a pathological syndrome characterized by a decrease in the number of red blood cells and blood hemoglobin. This condition causes major hypoxia of the tissues and organs, as a result of which less oxygen is delivered to the cells.

This condition is especially dangerous for the brain. Nerve cells die during hypoxia.

MAIN PART

In the early stages of the disease, a person feels constant fatigue and decreased performance. If a laboratory blood test is performed on these symptoms, it can detect a decrease in the level of hemoglobin and red blood cells. Iron deficiency anemia is a very common disease that occurs in adults and children. It can develop for several reasons and is a serious medical condition that needs to be treated. Otherwise, anemia can cause great harm to health.

Anemia (anemia) a condition characterized by a decrease in hemoglobin content per unit volume of blood, often while reducing the number of red blood cells [1, 44-45p]

Not only is it important for the body to consume the mineral with food (iron does not form spontaneously in the body), but it is also important for the proper process of assimilating and transporting it. A special protein (transferrin) is responsible for the absorption of iron molecules from the duodenum. It delivers iron to the bone marrow, where red blood cells are synthesized.

Excess minerals are excreted in the urine, feces, and sweat glands. Menstrual bleeding is still common in women from adolescence to menopause. Approximately 2 g of iron is excreted from the human body per day, which means that it is necessary to consume at least a small amount of iron with food to replace it. Maintaining the balance necessary for the tissues to breathe depends on the proper functioning of this mechanism.

Causes of iron deficiency

Iron deficiency can be caused by:

Chronic bleeding (daily blood loss 5-10 ml) - frequent nosebleeds; bleeding from the stomach and intestines; heavy menstruation; characteristic hematuria renal pathology.

Acute blood loss - trauma, severe burns; uncontrolled donation; pathological bleeding (e.g., uterine bleeding in oncopathology, etc.).

Low iron intake - diet and starvation; unbalanced diet; vegetarianism.

Disorders of iron absorption - gastrointestinal diseases, vomiting; old age and infancy.

Increased iron levels - active growth (1-2 years and adolescence); pregnancy, lactation (iron requirement doubled to 30 mg per day); formation of the menstrual cycle; physical education, sports; frequent inflammation (influenza, etc.).

Congenital anemia in children - early pregnancy; anemia in pregnant women.

Iron Deficiency Levels:

Mild - hemoglobin values range from 110 to 90 g / l;

Medium - hemoglobin level 90 to 70 g / l;

Severe - hemoglobin level below 70 g / l (2).

Symptoms of Iron Deficiency Anemia:

Symptoms depend on the stage of the disease. At the beginning of the disease the following symptoms appear:

Decreased concentration;

Fatigue;

Memory impairment;

Decreased appetite;

Dizziness;

Decreased performance;

Sluggishness;

Nervousness;

Brittle nails;

Dry skin.

As the anemia worsens, these symptoms become more pronounced.

In the latent stage, patients develop the following subjective symptoms:

- Dry mucous layer of the tongue;
- Pain in the tongue;
- Changes in taste - patients eat more salty, sour and spicy foods;
- Difficulty swallowing;

- Sensation of a foreign body in the throat when swallowing;
- Rapid heartbeat.

During the examination, the doctor also notes the first objective signs of anemia:

Atrophy of the tongue suckers;

In women with iron deficiency anemia, there is itching and burning in the vulva; cheilitis (whitening and cracking of the lips).

Body changes in iron deficiency:

Doctors note that the severity of symptoms depends not only on the degree of anemia, but also on the age of the patient and the duration of the disease. Symptoms increase over time. The following changes have been noted:

The skin changes. The skin becomes green and pale. Redness appears on the cheeks quickly, the skin loses its elasticity, wrinkles appear and cracks appear.

Hair changes. Hair becomes dry, brittle, and gray in color and loses its luster, becomes thin and quickly turns white.

Nails change. The nail plates become thin, lose their luster, become flat, and in more severe forms of anemia, the nails become concave.

The musculoskeletal system changes. Muscle weakness is a symptom of iron deficiency anemia.

The mucous membranes change. Membranes of the digestive tract, respiratory and genital atrophy.

Diagnosis of Iron Deficiency Anemia:

First of all, it is very important to correctly identify the type of anemia, because the symptoms are common to all types of anemia. This requires a complete laboratory diagnosis of the patient. It includes: blood tests (general and biochemical), bone marrow puncture. Women can also be referred to a gynecologist, as anemia is often caused by diseases of the uterus or its appendages. Men are referred to a urologist and proctologist because anemia in men can develop against the background of hemorrhoids or prostate disease. Only after the final diagnosis and the causes of anemia are identified, the doctor will develop an individual treatment regimen.

Treatment of Iron Deficiency Anemia:

Treatment of iron deficiency anemia is carried out only by long-term administration of iron supplements in moderate doses, and in contrast to the improvement of the general condition, the amount of hemoglobin increases only after 4-6 weeks. Prescribing and calculating the dose of medication depends on the attending physician. Therapeutic doses are prescribed until hemoglobin levels return to normal, after which the patient is switched to prophylactic doses.

Iron Deficiency Diet:

Patients with severe anemia should use a specialized diet in addition to the basic treatment. The basic principles of therapeutic nutrition for iron deficiency anemia are to drastically limit the consumption of fats from plant and animal sources, as well as to fortify them with foods high in

protein. Carbohydrates have been shown to have no effect on the absorption of iron by the body, so their consumption should not be limited.

Iron (liver, beef tongue, lean turkey, red sea fish, buckwheat and millet, berries and peaches) should be added to the patient's diet to replenish the amount of iron needed for normal blood formation. A large percentage of iron is also found in all types of greens, beef and eggs. Among the fruits, dates, quinces and apples should be preferred raw or ripe. It is recommended to completely eliminate dairy products and black tea from the diet of patients with iron deficiency anemia, as they contain substances that prevent the absorption of iron. In order to absorb iron-rich foods well, you should eat foods that contain vitamin C (oatmeal, currants, sauerkraut, freshly squeezed fruit juices and citrus juices).

Drugs Produced against Anemia:

Oral 2 and 3 valent iron preparations are mainly used. Recently, ferlatum (iron-protein complex) is widely used began. Iron for the uncomplicated treatment of anemia adding additional components that facilitate assimilation it is advisable, for example, cysteine (in irradiation preparation), ascorbic acid, acid (ferroplex, phenyuls, Ferro-folgamma), succinic acid (conferon), fumaric acid (xeferol), folic acid (ginotardiferon, Ferro-folgamma) can be cited as an example. However, it is worth noting that the above antianemic most of the drugs are considered to be foreign drugs, they are much more expensive in terms of cost, and for most patients it causes discomfort [1, 21p]

Prevention of Iron Deficiency:

The main rules of preventive measures aimed at reducing the prevalence of iron deficiency anemia are:

Eat foods fortified with easily digestible iron;

Use of iron-enhancing agents;

Treatment of chronic foci of infections [4, 22p].

In addition, the prevention of iron deficiency anemia is divided into primary, secondary and, accordingly, tertiary. The primary goal is to eliminate the main factor that leads to anemia, the secondary goal is the timely detection of symptoms, timely diagnosis and treatment of the disease. The goal of tertiary prevention is to minimize possible complications.

In most cases, iron deficiency anemia is successfully corrected, and the signs and symptoms of anemia are reduced. However, if left untreated, complications can develop and the disease can progress. If a person has a low hemoglobin level, a thorough clinical and laboratory examination should be performed to determine the cause of the anemia. Proper diagnosis is the key to successful treatment.

In addition, this condition affects more women than men and tends to reach its peak for women of childbearing age or pregnant women.

How does pregnancy affect iron deficiency anemia?

Pregnancy requires a lot of iron for normal development and growth, especially in the second half of pregnancy. According to Dr. Matthew Cantor of OB / GYN at New York-Presbyterian Hudson Valley Hospital, iron deficiency anemia develops during pregnancy for two reasons:

The amount of blood expands significantly and this weakens the amount of iron.

Women who develop iron deficiency anemia before pregnancy usually exacerbate the deficiency and require careful observation by a physician.

Importance of iron during the pregnancy

Adequate iron intake should be included in the diet or through supplements during pregnancy. Not only does your body need to produce extra blood to provide the placenta with all the nutrients it needs to grow, it also needs iron, which can also negatively affect you and your baby. Iron is needed to prevent leaching conditions.

CONCLUSION

In general, low iron intake is usually the cause of iron deficiency anemia. This can happen as a result of a lack of iron or supplements in your diet or through supplements, due to blood loss and certain health conditions that make it difficult for your body to absorb iron from food. The outcomes show that anemia in an early pregnancy is widely spread among population. The rate is being diminished by professors with the help of drugs and preparations.

ABSTRACT

The article discusses the figurative meanings of the concept "time" in English and Uzbek. It is revealed that the figurative meaning of the concept "time" in English correlates with the concepts: duration, past, time marks / points of reference, frequency, form of measurement, regularity, physical condition of a person. The fact was also determined that some English set expressions, along with the concept of time, convey socio-cultural information of native speakers of English and Uzbek.

KEYWORDS: *Concept, the concept of "time, Phraseological units, Interpretation.*

INTRODUCTION

The modern stage of the development of science is characterized by numerous attempts by scientists to rethink traditional concepts and phenomena. Language is no exception. This article is devoted to the study of one of the key cultural concepts - the concept of «time». The works of both foreign and domestic scientists are devoted to the problems of studying the nature of the concept: V. von Humboldt, E.Sepir, J.Lakoff, M.Minsky, A.A. Potebni, S.A. Askoldova, D.S. Likhachev, N.D. Arutyunova, Yu.S. Stepanov, E.S. Kubryakova, A.P. Grandma's, Z.D. Popova, I.A. Sternina, V.V. Kolesov, D.U.Ashurova, A.E.Mamatov, U.K.Yusupov, Sh.S.Safarov and many others etc. And yet the term concept, in view of its complexity and multifunctionality, still receives a very different interpretation in linguistics.

The relevance of the chosen topic is determined by the fact that this study is in line with the most popular areas of linguistics and socio-humanitarian knowledge. The focus of modern linguistics is on border topics related to concepts that have access to other sciences. Linguoculturology is one of the most actively developing branches of linguistics, which studies the relationship

between language and culture. Many theories and scientific schools recognize time as one of the basic cultural universals. The perception and reflection of time is carried out differently in different cultures and, accordingly, is displayed differently in the language system and in phraseology in particular.

The object of the study is the linguistic embodiment of the concept of “time” in English and Uzbek, and the subject of study is the identification of their national-cultural specifics in English and Uzbek linguistic cultures.

The goal is to describe the features of the expression of the concept of “time” by the linguistic means of English and Uzbek.

To achieve this goal in an article research, a number of tasks are solved:

To select and analyze phraseological units reflecting time in English and Uzbek;

To study the manifestation of universal and national features in the concept of “time” and its representations by phraseological means of English and Uzbek languages.

The concept of time is the key in our work, therefore, it is necessary first of all to identify the meaning of the term «concept» itself. There are several approaches to its definition. Y.S. Stepanov defines the concept of a concept as follows: “A concept is like a clot of culture in the human mind; that is, in the form of which culture enters the mental world of a person. And, on the other hand, a concept is that whereby a person is an ordinary, ordinary person, not a “creator of cultural values” - he himself enters into culture, and in some cases influences it.) [24,231].

Turning one of the first in world linguistics to the study of concepts S.A. Askoldov believed that the most essential function of concepts as cognitive means is the function of substitution. He considered the concept “a mental formation that replaces an indefinite number of objects of the same kind in the process of thought [10,267 – 279]. He further says that one should not think that a concept is always a substitute for real objects, it can be a substitute for various kinds: purely mental functions. D.S. Likhachev, continuing Askoldov’s reasoning, suggested that the concept be considered “an algebraic expression of meaning, because a person simply does not have time to capture the meaning in all its complexity, sometimes it cannot, and sometimes in its own way interprets it (depending on his education, personal experience, belonging to a certain environment, profession, etc.) [16,342].

G.G. Slyshkin and V.I. Karasik understand the concept as a “multidimensional mental unit with a dominant value element.” [11, 75]. The concept is grouped around a certain “strong” (i.e. value-accentuated) point of consciousness, from which associative vectors diverge. The associations that are most relevant for native speakers comprise the core of the concept, while less significant associations are the periphery. In their opinion, the concept does not have clear boundaries; as they move away from the nucleus, a gradual attenuation of associations occurs. Karasik V.I. and Slyshkin G.G. consider the linguocultural concept a conditional mental unit aimed at a comprehensive study of language, consciousness and culture.

Z.D. Popova and I.A. Sternin defines a concept as a complex mental unit that turns in different directions in the process of mental activity, actualizing its different signs and layers in the process of mental activity, while the corresponding signs or layers of a concept may not have a language designation in a person’s native language [19, 59]

The concept is represented in the language by ready-made lexemes and phrase combinations from the lexical and phraseological system of the language; free phrases; structural and positional diagrams of sentences bearing typical propositions (syntactic concepts); texts and sets of texts (if necessary, the explication or discussion of the content of complex, abstract or individual authors' concepts). Concepts can be stable - having the language means of verbalization assigned to them, and unstable - not having the means of verbalization assigned to them, unstable, still forming, deeply personal, rarely or practically not verbalized. The presence of a linguistic expression for a concept, its regular verbalization keep the concept in a stable, steady state, make it well known (since the meanings of the words with which it is transmitted are well known, they are interpreted by native speakers, reflected in dictionaries). The authors propose the following concept model: the core of the concept is a sensual basic image, acting as a coding image of a universal subject code. This image belongs to the existential layer of consciousness and, as some observations show, has an operational or objective character, based on the biodynamic and sensory tissue of consciousness. The basic image is surrounded by a cognitive layer that is specifically sensual in origin, reflecting the sensually perceived properties and attributes of the subject.

Time and space are fundamental attributes of our being, they are not subject to any objective external changes. But with all the stability of the extralinguistic category of time, the lexical and stylistic means of expressing the concept of time undergo significant changes associated with the subjective perception of man. The changes undergone by time models are all the more radical, the closer the concept of time is associated with a person's life, his worldview and the ongoing historical processes. Such reasons may be scientific progress and the corresponding expansion of knowledge about the world around us: a person's awareness of his strength as equal to God and the adoption of an active life position, the general acceleration of the rhythm of life in connection with technological achievements.

The first reasoning about time arose in the bowels of ancient philosophy. Already ancient Greek thinkers asked questions about the causes of time, its properties, direction, beginning and end. Since then, the philosophical interpretation of this category has undergone significant changes.

Due to its extreme abstractness, but also obvious evidence for any native speaker of time, time does not want to fit into the usual scheme of interpretation of meanings, therefore only metaphors can be used to describe the semantic structure of this concept. Metaphorical terms allow the researcher to comprehend the image of time through the study of the spheres of associations and personification of this concept.

In order to trace how the idea of how or what time was in the linguistic picture of the world of medieval man (XIV-XV centuries) and modern has changed, consider the English lexeme «time»

Time as an abstract concept cannot be felt, but a person can:

- 1) Mourn (wepe, weylle) –yig‘lashi
- 2) Curse (corse, banne) - koyishi
- 3) Hate (lothe) - yomonko‘rishi
- 4) lose (leese) - sarflashi
- 5) Spend (despende, passe) - o‘tkazishi

- 6) Extend (prolonge) – uzaytirishi,,to‘xtatibturishi
- 7) Wait (awaite, abyde) - kutishi
- 8) Pull, hold (tarie)
- 9) To glorify (blesse)
- 10) To suspect - taxmin qilishi
- 11) Have - egabo‘lishi
- 12) See (see his time) - ko‘rishi
- 13) Find (fynde his time) - topishi
- 14) You can regret it (birewe, rewe) - u uchunachinishimumkin

The semantics of most verbs implies a person's emotional state, his specific attitude to the time when an event occurred. Here is how it is embodied in the works of English poets:

Hir fader.

Cursed the day and tyme, that nature Schoop him to ben a lyves creature. (Chaucer)

Blessed be the tyme knyte that euer be borne (Mallory).

Wei can Senek and many philosopher Bywaylen time, more that gold in cofre (Chaucer).

A person can express his attitude to a certain period, pore, moment, flow of time, but cannot affect the course of time or its properties. The course and influence of time is not subject to man; the demiurge of time, which man cannot resist, is God. A medieval man patiently waits for his time, an auspicious occasion (I can do more whan I see my tyme (Mallory)), because, according to the dogmas of the church, each creature and everything under the sun has its own time.

The following verbs-actions of the time itself - in conjunction with the verbs-actions of a person over time, allow us to draw a conclusion about its properties. Time may:

- 1) Comekelishi (come)
- 2) Pass (passe / waste) - o‘tishi
- 3) Sneak (stele for us) - bildirmasdan o‘tib ketishi
- 4) Fly (flee) - uchishi
- 5) Sneak up (crepe in) - sezdirmaykelishi
- 6) Get closer (approche) - yaqinlashishi
- 7) Require - talab qilishi
- 8) Cannot wait (not a byde) - kuta olmaydi.

The compatibility data allows us to distinguish three conditional metaphorical blocks:

- 1) time-traveler: that which moves;
- 2) time-lord: that which demands, orders, does not wait;

3) time-property: what they possess.

The first metaphorical block indicates the most obvious fact - time lasts. G.P. Aksenov writes that "duration is such a clear and conspicuous property of time that it is most often identified with time. It is unconsciously implied that duration and time are one and the same, although time is a more multifaceted phenomenon than duration, and the latter is something structureless, unbroken, and spontaneous, with no beginning or end.

To describe the characteristics of duration, medieval writers resorted to metaphors for movement in space:

And soneaftirward he lay stoonstil

And deydewhantyme come (Chaucer).

Anchavaqto'tsa ham hamonyotardi

Vaqtsoatiyetgandavafotetadi.

It can go away slowly and imperceptibly:

Thetymepasseth night and day

And stelithfor us (Chaucer),

Vaqttunu-kun bizgasezdirmayo'tibketadi.

And can fly fast:

For though we slepe, or wake, or rome, or rude,

Ay fieth the tyme (Chaucer).

Biz uxlab, uyg'onib, uxlab, yoo'ynab, yojahllanguncha

Vaqtasayeldekuchishimumkin.

But it is certain that in the minds of medieval man this process is continuously and inexorably moving in one direction - from the present to the past.

Another property of time before which man is powerless is his irreversibility. The passage of time exists in only one direction and does not return from there. Irreversibility is the continuous formation of the present, its continuous renewal, inevitable renewal. Chaucer's time is compared to a stream that never returns:

The tymepasseth night and day.

As doth the streem, thot torneth never agayn. (Chaucer)

Kunu-tunvaqto'tar.

Qanchaqish-u bahorlaro'tsa ham ortgaqaytmaydi.

A study of the compatibility of time-subject and time-object in modern English has shown that time can:

1) Give – berish

2) Leave – tarketish

- 3) Spend - sarflash
- 4) Spend in vain (waste) - bekorgasarflash
- 5) Fill - to'ldirish
- 6) choose (chose) - tanlash
- 7) Take - tanlashshug'ullanish
- 8) buy (buy) - sotibolish
- 9) Have - egabo'lish
- 10) You need it (need) - ungamuhtojbo'lishingmumkin
- 11) Make move (make. Move) -harakatlanishgamajburlash
- 12) Take for granted (take for granted)
- 13) It is possible to navigate (discover oneself in time) – kimnidiro'zinivaqtidakashfetishi.

Time may:

- 1) Pass - otishi
- 2) Come - kelishi
- 3) Reach slowly (creep) -sekinharakatlanishi
- 4) Stay (be left) - qolibketishi
- 5) Be over - tugashi
- 6) Force someone to do something (make smb. Do) -kimnidirnimadirqilishgamajburlashi
- 7) Change your qualities (crumple) - o'zqiymatinio'zgartirishi
- 8) Show something (show) - nimanidirko'rsatishimumkin.

An analysis of the actions taken over time in modern English literature opens up a new person who takes an active position in relation to time, capable of influencing him in a certain way. A person, as well as circumstances, can give time, occupy, choose, fill, buy, leave, and even make him move, go.

- We had hoped that this moon-threat would stop the war for a few days, and give the World Security Council time to act (Wilson).

- Biz ushbuoydagitahdidiurushnibirnechakungato'xtatib, Jahonxavfsizlikkengashigaharakatqilishuchunvaqtberishigaumidqilganedik

- Nothing is indescribable in words if you take the time and the trouble (Wilson).

- Agar vaqtvamuammogaduchkelsangiz, hechnarsagatilingizaylanmaydi.

- Entirely without other occupation, she filled her time with household tasks and enjoyments (Murdoch).

- Hechqandaykasbniegallamayturib, o'ziniuy-ro'zg'orishlarivamashg'ulotlaribilan bandetdi.

Time, objectively possessing constant properties, in the perception of modern man is able to change his qualities. For example, the hero of the novel A. Murdoch's «Dream of Bruno» Michael, under the influence of tranquilizers, sees how time and space cringe:

His wide-open eyes see nothing, he Nigel, the all-seer, the priest, the slave of the god. Time and space crumple slowly. (Murdoch)

Uningkattako'zlarihechnarsaniko'rmasdi, u Nigel, hammako'radigan, ruhoni, xudoningquli. Vaqtvamakonasta-sekincho'kadi.

The development of natural science concepts and technological achievements of man of the XX century contributed to an unprecedented expansion of knowledge about the history of the Earth. The globalization of knowledge and the intellectualization of man himself made it possible for the mind to embrace millions of years of time periods and move in this “temporary space”. This naturally expanded the understanding of the time frame, which was reflected in the existence of the concept of time in modern languages and in its direct verbalization in stable combinations, in particular in sayings and phraseological units, both English and Uzbek.

In the modern existence of the concept of «time» significant differences from the medieval period are noticeable. Consider them in the framework of a holistic linguistic-temporal picture of the world.

The linguistic-temporal picture of the world combines the conceptual and linguistic levels: linguistic temporal semantics represents, on the one hand, the “shell” of the concept of “time,” and, on the other, the content in relation to the verbal level. The concept of «time» appears as a unit of the linguistic-temporal picture of the world. One of the ways to verbalize the concept of “time” is with phraseological units with the meaning of “time”. Temporary representations in the form of concrete, vivid, sensually tangible visual and auditory images are reflected in the internal form of phraseological units with a temporary meaning. It is in the phraseological units that make up the so-called phraseological picture of the world, artificially created by the people in the process of creativity, that the cultural concepts are most clearly reflected. Phraseologisms, as bright, figuratively emotional, expressive means of language, contribute to the creation of an aesthetically significant, linguistic picture of the world. The concept of a phraseological picture of the world implies a part of the linguistic picture of the world described by means of phraseology, in which each phraseological unit is an element of a strict system and performs certain functions in the description of the realities of the surrounding reality. From this it follows that the phraseological picture of the world is one of the universal ways of classifying phraseological units, the basis of which are both extralinguistic and linguistic features.

The lexeme “time” in Uzbek comes from “time”, which is related to the words “twirl”, “spindle”. Thus, in the Uzbek picture of the world, the idea of time is associated with the idea of repeatability, regularity, and cyclicity.

Thus, the Uzbek language reflects the time that moves in a circle, cyclically. Cyclically - this is «for May, » «for October». According to the English approach, time is linear, one-dimensional, unidirectional and irreversible. Time moves, and its movement is continuous. Every moment of it is unique. Time cannot be stopped, turned back.

Punctuality is one of the concepts genetically related to the English nation. Accuracy is an integral attribute of the British, they see it as a guarantee of reliability, and is perceived as ways

to counter unpredictability. In turn, the hypersensitive attitude to time in English culture does not correspond to Uzbek ideas about its effective use: wait and see; not yet evening.

For most Uzbeks, unlike the British, time is not a strict principle of their life. Therefore, the attitude towards him can often be called frivolous, which is reflected in all kinds of lateness, postponements of events, non-compliance with the schedules of buses, trains, etc.

The reflection of objects and phenomena of reality with the help of images presents us with a bright, colorful, sensually tangible, real or imagined world. The study of the representation of the concept of «time» was carried out on the basis of the opposition «reality - irreality». The surreal time, reflected in English and Uzbek, is, first of all, figurative time, directly related to various representations caused by fantasy, creative imagination of both peoples. The study showed that phraseological units expressing the meaning of surreal time are the most figurative, expressive, emotional, since their imagery has a dual nature: on the one hand, they are associated with extra-linguistic factors (the unreality of the situation, which gives room for unbridled imagination), and on the other, linguistic, manifested in the use for the formation of the figurative structure of alogisms, which serve as the most striking means of enhancing imagery, expressiveness, expressiveness, emotionality.

Phraseological expressions express the surreal time: when the cancer on the mountain whistles, after rain on Thursday, after Friday on Thursday, God knows when the hell knows when, at the carrot's conspiracy, to sit till the cock-crow.

Many phraseological units with the meaning of "time" have specific time periods "time", "hour", "century", "day", "minute" as components, however their content is not objective time, but their general temporal value - short-term and long-term segments (from minute to minute, in a jiffy, in a tick, («this moment»)).

Along with phraseologisms with the meaning of «surreal time», the object of our study was phraseologisms with the meaning of «real time», this is the present (at the moment, this moment, at this moment, in a trice), the future tense (on the nose, not far off, on the doorstep, sooner or later, the sooner the better, time to come («future times»)), past tense (in great-grandfathers, in old people, on a time, good old time), as well as the time presented in the lexical oppositions, figuratively represented in the semantics of phraseological units related to the parameters of time measurement - "fast - slow" (with lightning speed, I did not have time to blink, best part of an hour, flew like a bolt of lightning, on the spur of the moment, off the top of one's head), «early - late» (no light, no dawn, until late at night, long before dawn; a day before the fair, at the peep of day, with the lark (with the sun), at the first hint of day)

The abstract concept of «always», reflected in the phraseological units of the English and Uzbek languages, has a certain poetic elevation and has mainly a positive coloring in both languages. Typically, such phraseological units relate to the theme of friendship, love, gratitude and hatred (until the end of the century, forever and ever, forever, until the cows come home, to the grave, to the tomb). Phraseologisms with the concept of «never» in both Uzbek and English often have a negative connotation (until new brooms are forgotten, not for a moment, under any pretext, never for a moment, not for a minute, on no account, under the circumstances) Phraseologisms with the meaning of «never» are more often found in the English language and have a more vivid imagery due to the fact that the British are more categorical and principled than the Uzbeks.

In both cultures, there is a realization that everything is fleeting and everything has its own limit (how long is it before sin (trouble), nothing is forever under the moon, trouble is never far off, there is nothing permanent under the moon, the morning sun never lasts a day).

Phraseologisms with the meaning of “often - sometimes” in both Uzbek and English do not have significant differences, they generally have a negative rating, but also have a positive rating (every single day, every day, every blessed day, day in and day out, time and again). Relative to this topic, it is difficult to conduct a comparative analysis, since it is universal in all languages.

Based on the data obtained during the study, it can be concluded that in addition to universal features, the language embodiment of the “time” concept in both English and Uzbek linguocultures is based on national-specific features, which are caused by the difference in English and Uzbek social cultures that reflect the mentality and value systems of two national communities. As a rule, first of all, phraseological units, the internal form of which is built on alogism, have a national specificity, reflecting the peculiarities of time perception by the Uzbek and English peoples.

CONCLUSION

The concept of «time», being one of the key concepts, is an important part of the conceptual system, which is reflected differently in all languages, which allows us to talk about temporary perception, about ethnic temporal mentality, temporary universals, and in general about the temporary picture of the world. One of the most striking results of the verbalization of the concept of “time” are phraseological units with the meaning of “time”.

Our study was undertaken with the aim of a linguistic description of the features of the expression of time in phraseological units in Uzbek and English linguistic cultures. As a result of the study, the place of time in human life was identified and a comparative analysis of stable expressions reflecting time in Uzbek and English linguistic cultures was carried out in order to identify features, similar and distinctive features of the two nations studied.

The concept of time embodies the reflection of the era and activity, the interpretation of the existing culture, the rhythm of social time and the effectiveness of prognostic consciousness. All these points determine the historical «paradigm» of time.

In the course of a comparative analysis of phraseological units reflecting time in Uzbek and English, we found that the attitude towards time is heterogeneous and is more important in English culture, since English culture is monochronous (clear time planning), and Uzbek culture is polychronous (emphasized attention to communication with people, networking, family). In both cultures there is a realization that everything is fleeting and there is a limit to everything. Intemperance, excessive emotionality and haste are present in both cultures, but are more pronounced in Uzbeks. However, sometimes speed is needed when every second is expensive. Speed in business or in a specific situation is important in both languages, but in English it is expressed more strongly. Like the concept of “fast”, the concept of “slow” is also considered in two ways in both languages. In both Uzbek and English, often “slowly” means properly, carefully, wisely. However, the Uzbeks have such a trait as to postpone something for later, to wait for something.

Universal for both linguistic cultures is the structure of the concept of «time», namely its phraseological expression, which includes phraseological units with the meaning of real and

surreal time, as well as phraseological units based on auditory and visual associations. The basis of English and Uzbek phraseological units with the components «time», «hour», «century», «day», «minute» are not specific time periods, but their general time value. The national-cultural specificity of the content of the concept of “time” is manifested, firstly, in the associations that underlie phraseological images, and secondly, in the specifics of evaluative perception, manifested in the different behavior of Uzbeks and Germans in terms of temporal factor. Thirdly, the national-cultural layer of the concept of “time” is made up of knowledge oriented towards significant social, cultural and aesthetic values for each national-cultural community, which are reflected in phraseological units with the meaning of “time”.

To summarize the results of the study, it should be noted that due to the progressive development of the economy, social relations, ideas about time are changing. And interest in the study of the time of different peoples does not disappear, since this subject is very relevant today.

ABSTRACT

This article discusses the idea of a just society and a just king, put forward in the Nightmare by one of the Eastern thinkers, Kaikovus. The thinker said to the kings, "Always be truthful, speak little, and laugh a little, so that the little ones may not be arrogant to you, and be arrogant." does. In the eyes of Kaikovus, the king must be straightforward, talk less, laugh less, and not be rude. He believes that if the king exceeds these norms, he will be committing obscenity in front of the people.

KEYWORDS: *Kaikovus Is A Thinker Who Lived In Western Iran In The 11th Century; Fear; Safe, Secure; Dalir- Brave; Discount-Light; Porso-Godly, Pious; Abusive-Insulted; Depending On The Performance; Deputy Minister Of Propellers; Rude- Impolite.*

INTRODUCTION

Unsurulmaali Kaykovus ibn Iskandar, the grandson of Shamsulmaali Qaboos, the king of Western Iran, created the book "Nasihatnoma" dedicated to his son Gilanshah in 82-83 of the 11th century. However, Kaykovus named this work "Qobusnoma" in honor of his grandfather Shamsulmaoli Qobus, according to the tradition of that time. This work was first published in 1860 by the Uzbek poet and thinker Muhammad Rizo Ogahi, and in 1966 by the Honored Scientist of Uzbekistan Subutoy Dolimov. The work consists of 44 chapters, the 42nd of which is entitled "In the Remembrance of the Conditions and Pictures of the Kingdom." One of the main ideas of the views of the thinker Kaikovus, who had the encyclopedic knowledge of his time, was the question of a just king. Kaikovus, like many oriental thinkers, equates the justice of kings with the sun. He said, "Just as the sun shines equally on everyone and everywhere, so the king must shine equally on everyone." In his opinion, the king should show kindness to the people, treat all the people equally, so that his country would be prosperous, his house would be

peaceful, and his rule would last a long time. He said: "O my son, show the same kindness to the people, so that the country may be prosperous, because the king is like the sun, the sun casts a shadow on someone and does not turn away from anyone else. Never mind oppression, for the house of a righteous king will last for many years, and the house of an oppressor will soon be ruined and destroyed, because justice is a sign of prosperity and oppression is a sign of destruction. The rulers say that a just king is a flood of the ruins of the world.

In *The Nightmare*, Kaykovus states the following requirements that the king must follow: "O child, if you are a king, be pious and keep your eyes and hands away from the women and atfolidin of the people (atfolidin - women, wife and children). Be pure and secure, clean and secure is purity. The author emphasizes that, in accordance with the requirements of his time, the king should be pious, not look at other people's family members with immorality, and protect himself from impurity.

According to his views, the king must act wisely in carrying out every action, not go beyond the realm of reason, and obey the command of reason. He considers the mind to be the king's minister, that is, his closest aide, and says of it: "Whatever you do, do it with the command of the mind, and do not act foolishly, for the king's minister is the mind.

Kaikovus warns that the king should not be in a hurry, that is, he should not act in a hurry, he should know the scale of each task, think about its consequences, plan in advance what will be the result, and then carry it out.

The thinker said to the kings, "Always be truthful, speak little, and laugh a little, so that the little ones may not be arrogant to you, and be arrogant." does. In the eyes of Kaikovus, the king must be straightforward, talk less, laugh less, and not be rude. He believes that if the king exceeds these norms, he will be committing obscenity in front of the people.

In the play, the author adds another piece of advice to the rulers: "Whatever you give, make it mustahiq (mustahiq- worthy, rightful) and do not despise yourself in the eyes of the army and the people. Do not ask for anything from anyone and have mercy on the slaves, but do not have mercy on the cruel. Always get used to grace and cabbage, but be political. " According to Kaikovus, the king must choose what he wants to give to whom, treat himself with dignity, show himself helpless to the people and soldiers, never ask for anything from anyone, be merciful to the people, and ruthless to the cruel. Always be accustomed to sweetness and courtesy, the king should have his own policy.

King Kaikovus did not entrust all the affairs of the kingdom to the minister, and immediately agreed with the minister's views.

Not to report, to examine it first, to support his opinion after approval, to consider the pros and cons of any work he does. The source said: "Do not hand over the whole matter to the minister, do not always need his opinion. Listen to the minister say every word about everyone, but don't take it immediately. Tell the minister, "I think, if he agrees, I will order you to do it. Test it with forgiveness, so that when you know its benefits and harms, do whatever you can. "

According to the author, the king himself, whether young or old, should choose his minister from the elders. If both the king and his minister are young, the two can burn the country with the fire of youth. In this regard, he said: "If you are a king, whether you are old or young, make an old man a minister, and do not give a young man a ministry. If you are old and your minister is

young, it is an unworthy job. "If you are a young man and your minister is a young man, two young men will become one fire and burn the country."

He also says that the king should pay attention to his appearance when choosing a minister. He advises: "It is better for a minister to be happy and tall, to have a big belly, and to be old. If a person is short, short-tempered, short-tempered, then there is no greatness and splendor. A man with a long beard deserves the ministry better. "

Again, the king finds it expedient not to change ministers frequently, to work with them patiently and patiently for a long time.

In the play, Kaikovus emphasizes that the selection and placement of officials, that is, servants, in the light of modern times, is the most urgent task for the king. When the king distributes the duties according to the ability of the servants, he tries to explain to the king that he will be useful in every way. Ordering a fool who does not know the task assigned to him, who is incapable of doing it, emphasizes that this is a sign of the king's own ignorance. According to the source, the king should not withhold service from anyone, but should order everyone to do what is right for him, that is, what suits him and what he can do. If a person who is not able to do a job is given a job, he will not get results. In this regard: "... if you order a job for everyone, order a job worthy of you, do not order an inappropriate job, so do not order a person worthy of cleaning, do not order a person worthy of wine, do not make a treasurer. Alkissa, not everyone can be ordered to do everything. If you order a job from someone who doesn't know the job, unless that person says they don't know the job for their own benefit, that job is not fair and useful. So enjoin on him who knows the matter, that you may be successful. If you wish to make it great and magnificent by the grace of a quarter, you can make it luxurious and bountiful even without action. If you serve a fool, you will bear witness to your own ignorance. "

Kaikovus also states in the Nightmare that the king is aware of the condition of the people, and compares the king to a shepherd, the people to a flock of sheep, and believes that if the shepherd does not save the flock, the flock will soon perish. In his view, the king should be obedient, and the difference between a king and a citizen, that is, the people, should not be allowed to be in the obedience of the owner of the kingdom, to despise the king's decree. If the king's word is despised, and his decrees are not obeyed, the king himself will be despised. Enforcement of the decree depends on the policy of the king. The policy of the king is not to oppress the slaves, that is, the people, so that the people can accept his judgment, obey him, and carry it out. He expresses this in the play as follows: "O Sultan, if you are a king, let them accept your judgment, and let you always be steadfast on the throne of pleasure, so that the slaves will not be oppressed and punished. ... If the rule of every king does not follow, he is not a king, and the kingdom depends on the decree. (Depends on the execution)... It is a policy to issue a decree. So it's not good to make mistakes in politics. "

In the play, the thinker also gives advice on how the king should behave in military and civil relations. According to him, the king should not prefer the soldiers to the people, treat them both equally, treat them as he treats them, and make the people happy with the people, even if he subjugates them to the army. Should not be oppressed. He also said that the house of a tyrant would soon be ruined by oppression, and the house of a righteous king would last for many years.

In the source, the king receives the prayers of the oppressed, because the prayers of the oppressed are answered, the ruler does not behave in solitude, that is, he is with the army and the people, he is aware of their condition, and if the king stays away from the people, the people will go away. It is also thought that it should not be delayed in sight, and that if it is done so, the king will increase the number of enemies.

Kaikovus also wrote valuable advice to kings on how to keep an army. In particular, the play says: "... if you capture an army, do not capture the whole army from one tribe. If the king captures all the troops from one tribe, the army will be defeated, because they will always be in alliance with each other and it is impossible to have the same policy for all of them. If you take an army from every tribe, then one group will be afraid of the other, and they will not be able to disobey, and your order will be pleasing to your army. " In the play, Kaykovus also tells the kings that from time to time he should invite the nobles of his army to his meeting to eat bread, drink nabiz (nabiz- palm or grape wine), to be generous and kind to them, to please them with generosity, and to be generous to the king. That if he gives something, he will not give it in public, and that a little generosity can expose the lowliness of the king's generosity to the people, and that his reputation among the people will be diminished, and the people will be his enemies, even if he cannot be hostile. Emphasizes that it will never rise to great heights. The thinker writes about this in his own experience: "... I spent eight years in Ghazni with Sultan Mawdud (Sultan Mawdud - Shahobuddavla Mawdud (1041-1048), the tenth sultan of the Ghaznavid dynasty. Mas'ud's son, Mahmud's grandson).) I was. I never saw three things in it:

One would say that if the gift was less than two hundred gold coins, he would not give it to anyone in the crowd, but would order it to his propeller in private.

The second one never laughed as hard as his teeth would show.

Thirdly, no matter how much he was angry, he would never say anything else. This is a very good thing. I had heard that the custom of the Greek sultan was the same. So, my child, be generous and do not be lowly, otherwise do not show your generosity among many. "

King Kaikovus warns that within the limits of his authority, he should abide by the norms, and that the position, the throne, should not lead him into a whirlpool of pride. He advises him not to give up the following six qualities and to hold on to them: greatness, justice, generosity, protection, gentleness, and honesty. It is also said that if every king is far from one of these six qualities, if he is intoxicated with the wine of the kingdom, he can get rid of this intoxication after the loss of the kingdom, so the king must be careful and be aware of the condition of the kings of the world. Warns of the need to stay.

Again the king must supervise the affairs of the minister, not allowing him to drink wine. For the king must not forget that he has given his house, his wife, and his property to the minister.

Another piece of advice from the author to the king: "Even if you are outwardly friends with the kings around you, do not be friends inwardly, and if you are an enemy inwardly, do not reveal them outwardly." In this way, Kaikovus emphasizes that the heads of state must have relations with other rulers of the state, and in doing so must pursue a policy of comprehensive prudence, and must have their own internal secrets in the king's policy in public affairs.

According to Kaikovus, the king must be accustomed to great deeds, for he is greater than all men. His speech, conversation, deeds should be superior to others, he should speak exemplary, set an example to others in all areas.

As a final exhortation to the kings, the thinker said: “Glorify your judgment and do not judge every wrongdoer. If you judge something, do not disobey it, because it is bad for everyone, especially for the king. ” Through these views, Kaikovus emphasizes that the judgment of the ruler should be great, that he should not act contrary to the judgment he has rendered.

In short, the ideas of a just king put forward in Kaikovus's Nightmare are still relevant today. This work, created by Kaikovus as an encyclopedic thinker of his time, also serves as one of the political sources in the management of the kingdom in the world community, and the ideas about the statehood of that period and certain rules, norms and requirements of governing the state both have their own value.

ADMISSION TO THE CITIZENSHIP OF THE REPUBLIC OF UZBEKISTAN IN A SIMPLIFIED MANNER BASICS AND CONDITIONS

Yuldashev Jahangir Xayitovich*

*Associate Professor,
Doctoral Student ,
Doctor of philosophy in Legal Sciences,
Academy of Mia of the Republic of UZBEKISTAN

ABSTRACT

The article analyzes the basics, conditions and procedure for admission to citizenship in a simplified manner in the legislation of the Republic of Uzbekistan, reveals the existing collisions and legal gaps. On the basis of international standards and comparative-legal analysis of the legislation of the CIS countries, proposals and recommendations were made to eliminate them.

KEYWORDS: *Citizenship, Admission to citizenship, Simplified procedure, Admission to citizenship in a simplified manner, Basics, Procedure and conditions of naturalization in a simplified procedure.*

INTRODUCTION

Analysis of the norms of the law of the Republic of Uzbekistan "on citizenship of the Republic of Uzbekistan" № 610 of March 13, 2020 shows that there are three different procedures for admission to citizenship: 1) in general order; 2) in simplified order; 3) in separate order.

These procedures differ from each other in the peculiarities of carrying out work in this category. In them, admission to citizenship in a simplified procedure is of particular importance.

Admission to citizenship in a simplified procedure is a separate type of admission to citizenship and is used on the basis of certain specific conditions and procedures. This type of admission to citizenship is applied to individuals of a separate category, on the basis of certain specific conditions and procedures.

In this place, initially, there will be a need to clearly define in the legislation the category of persons who have the right to receive citizenship in a simplified procedure. According to the results of the study, these requirements reflect the preferential rules applicable to

"compatriots" who in most cases are foreign citizens or stateless persons abroad. O in this regard. E. Kutafin believes that "the civil Institute is connected with the Printing House of the continuity (linkage and order) of statehood, and since the Russian Federation is the legal successor of the Soviet Union, compatriots have the right to obtain citizenship in a simplified procedure".

In general, since the requirements for obtaining citizenship in this order are seriously different from the civil conditions that are issued on general grounds, it is worthwhile for the contingent of such a category to use the existing requirements in preference. However, the determination of the circle of persons of this category is an issue that is resolved by each state's own internal policy.

In the legislation of the CIS and the Baltic states, it is established that persons of the following categories have the right to obtain citizenship in a simplified procedure:

- 1) the legislation of Armenia stipulates the granting of citizenship in a simplified procedure to persons of Armenian nationality (without additional conditions) (Article 1 Part 2);
- 2) persons who have the status of repatriant (forced displaced) in Georgia will benefit from such privileges (Article 271 Part 2);
- 3) in Kyrgyzstan: a) if one of the parents of a person is a citizen of this state and lives permanently in the country; B) if a person was born in the USSR or Kyrgyz SSR and has the citizenship of the former Union has the right to obtain citizenship in a simplified manner (Part 1 of Article 14).
- 4) in Russia, however, in addition to the rules established in Kyrgyzstan, in addition to the following, such benefits are provided to: a) persons who have a capable (talented) son or daughter who have reached the age of eighteen and who have been in a legal marriage with a Russian citizen for 3 years; b) persons who themselves are disabled and who have reached; v) Persons whose parents, who are Russian citizens under custody, died by a court decision, are missing, are deprived of parental rights or have children who are citizens of the Russian Federation who are found to have such a right, are found to be unfit for circulation or limited in treatment; g) persons who have studied for 3 years before the date of applying for citizenship; D) persons engaged in entrepreneurial activities for three years before applying for citizenship by types of economic activity established by the government of the Russian Federation; e) persons recognized as "carriers" of the Russian language are also included in this list (Part 1 of Article 14);
- 5) as for the legislation of Tajikistan (Part 1 of Article 16), the following preferential circumstances are provided for: a) if a person has great achievements in the field of Science, Technology, Health and sports or has contributed to the social, economic and cultural development of Tajikistan; B) is a participant in the World War II, lives in the territory of Tajikistan and has; d) children and persons with disabilities who are in full state supply in educational, treatment or other social protection (such as orphanages of kindness) institutions; d) persons born in the Tajik SSR and who have Soviet citizenship, lived in countries that have entered the Union citizenship, but have not received the citizenship of these states and are under the status of a stateless person.

It is noteworthy that the legislation of Tajikistan stipulates that for persons of the above categories, the requirement for permanent residence and knowledge of the state language in the country should not be exhaustive. At the same time, some other (condition that the person was

not brought to criminal responsibility) requirements were preserved. In the legislation of this state there is also a category of preferential persons of the second group, with respect to which half of the condition related to the term of permanent residence is applied. In particular, a) persons without citizenship (except those listed above); b) a person whose parents are citizens of Tajikistan and who, on the basis of the fact of his birth, have obtained the citizenship of another state (if he applies within five years after the age of 18 years); g) a foreign citizen whose parents are citizens of Tajikistan; D) persons born in the Tajik SSR and who have the citizenship of the Soviet;

6) according to the Lithuanian legislation, a person whose ethnic origin is Lithuania (regardless of the place of residence) is granted citizenship in a simplified procedure (Part 1 of Article 10).

Apparently, in the laws of the CIS and the Baltic states, the scope of persons who have the right to obtain citizenship in a simplified procedure is relatively widely described. There are also categories within them that can not logically refuse the right to receive concessions.

In our opinion, in the legislation of the Republic of Uzbekistan, along with compatriots who are either foreign citizens or persons without citizenship, the following categories of persons shall be included in the category of persons who have the right to obtain citizenship in a simplified manner: 1) permanently residing in the territory of the Republic and possessing the citizenship of the former Union; 3) children and persons with disabilities who are in full state support in institutions of education, treatment or other social protection (such as orphanages, orphanages).

On the above-mentioned proposals, the opinions of specialists in the practice of applying the right are studied and asked, "Which of the following should be included in the category of persons entitled to obtain the citizenship of Uzbekistan in a simplified manner?" when addressed with the question " 75,1 percent of respondents – 24.5 percent of children and persons with disabilities who are in full state supply in educational, treatment or other social protection institutions (such as orphanages, orphanages), 4.2 percent of persons permanently residing in the territory of the Republic and possessing the citizenship of the former Union, 8.9 percent of persons who are under the guardianship or patronage of a citizen of the Republic The application of the above proposals to our national legislation further increases the level of ensuring the natural rights of a person to a citizen.

Taking into account the fact that the category under consideration has its own characteristics of performance of work, it is worthwhile to determine with what aspects they differ. This-firstly, serves to modernize our current legislation on the basis of modern requirements; secondly, this category serves to establish the specific rules of conduct.

Russian scientist D.V. According to Andrianov, the granting (obtaining) of citizenship in a simplified procedure is illustrated by the following distinctive features::

First, the person applies to the territorial competent migration authorities or consular institutions abroad, and not to the president with the application (these bodies decide to shorten the terms of consideration of the case);

Secondly, the applicant is not required to fulfill the strict conditions established by law (for example, in the law "on citizenship of the Russian Federation"(Article 4) the period of consideration of applications in a simplified procedure is established as up to 6 months).

Based on the results of the studies in this direction, it is possible to conclude that the legislation of the Republic of Uzbekistan does not suffice to accept citizens in a simplified manner. In particular, in articles 20, 38 of the law of the Republic of Uzbekistan "on citizenship of the Republic of Uzbekistan" dated March 13, 2020, there are no special privileges (for example, reduction of the terms of consideration of work, reduction of the requirements for admission to citizenship or the number of documents required in this process) that should be used in the consideration of

In the process of a sociological survey conducted among specialists, they were asked, "Do you think that the conditions (Omas) of admission to citizenship on the general basis of admission to citizenship in a simplified procedure in our legislation are sufficient?when addressed with the question " quot;, 78,5 percent of them answered – no.

Also, "in your opinion, what aspects of the conditions of admission to citizenship (Omas) in a simplified procedure should differ from the requirements for admission to citizenship on a general basis?when asked, it was stated that 75,1 percent of the respondents – with the shortness of terms of consideration of applications, 24,5 percent – with a low amount of required documents, 4,2 percent – with a low number of conditions for admission to citizenship, 0,9 percent – were distinguished by other issues.

As you know from the above, it is difficult to say that the conditions for obtaining citizenship (SES) established by law are simplified. Therefore, in the simplified procedure for admission to the citizenship of the Republic of Uzbekistan, it is desirable to provide for the above-mentioned conditions and legal norms.

ABSTRACT

This article is an article that gives complete information and skills about the methods for the formation of independent reading skills in elementary school students. The article gives full information about the types of reading skills for Primary School students and their application to the general public today.

KEYWORDS: *Complete Information, Replacement, Reflection.*

INTRODUCTION

Changes in the view of the overall concept of education are reflected in the approach to teaching. In recent decades, there is a shift from the traditional approach, which is characterized by the transmission of finished information, to a constructivist approach. According to Paper, traditional teaching methods are the methods when students perform certain instructions, work according to the model. Due to the development of science and ICT, since the end of the 20th century there has been a replacement of direct teaching methods with principle of knowledge constructing in specific increments. The purpose of education is not and cannot be the transmission of the truth only, as it is in the case of the so-called Trans missive pedagogy (its method is memorizing, transmission of non-problematic "facts" - knowledge into the consciousness of a pupil). A more substantial challenge facing education is to equip pupils with the ability to navigate in the vast sea of knowledge and learn to use them correctly.

MATERIALS AND METHODS

Constructivist pedagogy focuses on the way of how knowledge and understanding arise, on the process of how we use the ambiguous reality, how we construct instrumental truths - find useful solutions. At any time a person has a complete form of the world, i.e. finished structure, in their consciousness. New facts either fit in the structure or they are in conflict with this structure and cause its change. The aim of a teacher is to enable a student to examine these images (preconceptions), facilitate the integration of new information into existing mental structures and assist in reflection of not only new knowledge but also in the way it was achieved and how it was involved in the image of the world. Another feature of the constructivist education reform is the change in the status of a teacher, from the information provider to a facilitator and guide in acquiring them. Even teachers can sometime learn from their pupils. Great emphasis is placed on the inter-subject

Relationships and preparation for teamwork. As it can be seen, these requirements exactly coincide with the needs of sociologists-defined imminent information society as well as with the results of a wide range of disciplines. A constructivist teacher is seen as a guarantor of the method, as an assistant, study guide and ensures that every pupil can achieve the highest possible level of development. A pupil comes to school with certain knowledge and, therefore, to think about what they know and to develop their knowledge.

Modern pedagogy supports and promotes a teaching methodology that is both diversified and flexible, providing a very wide range of teaching-learning methods. The large number and the great diversity of teaching methods used in modern pedagogy provide opportunities for the enrichment and development of the teachers' teaching and educational expertise. A teaching method is an effective way of organizing and guiding learning, a common way of procedure that unites a teacher's and a students' efforts. A teacher's creativeness and personal development level determine how these teaching methods are used and combined.

Cognitive theories suggest that learning occurs with the result of information formation developing with dominant priorities. According to this, learning is based on that a learner processes the information that he configured with his own cognitive process and this process shapes new learning. The advances in this direction are related to what they learn and how they learn, not how much they learn. The main metaphor expected to be argued is, perhaps, students are active learners rather than they are passive receivers. The Teaching and Learning International Survey noted that "in the classroom, teachers in all countries put greater emphasis on ensuring that learning is well structured than on student-oriented activities which give them more autonomy. Both of these teaching practices are emphasized over enhanced learning activities such as project work. This pattern is true in every country".

RESULTS AND DISCUSSIONS

In the recent local and international methodological literature the teaching methods and practices have been given special attention, but when it comes to their understanding, defining and naming, a complete agreement has not been achieved yet. First of all, there are different terms in literature that make it difficult to communicate, so within teaching methods, authors also discuss the terms such as methods in the class, methods of teaching and learning, organizational types of the teaching and learning processes.

The criteria and indicators of the readiness of the future teacher of technology and entrepreneurship for the development of moral consciousness in schoolchildren are:

- value-oriented (orientation to the moral and semantic essence of labor and its entrepreneurial version, its production in future pedagogical activity; the need to acquire moral knowledge; internal motivation of readiness for the purposeful development of the moral consciousness of schoolchildren);

- Information and competence (knowledge of the morally developing capabilities of the academic subject, the moral and semantic resources of information technologies, the methodological foundations of the pedagogically directed process of developing the moral consciousness of schoolchildren);

- Activity-competence (the ability to direct schoolchildren to search for the moral meaning of various types of activity; organize training for schoolchildren in the elements of entrepreneurial activity; prepare them for moral choice in problematic situations of work, including entrepreneurial).

With that in mind, here is a comprehensive listing of the technology skills that every educator should have. Because as computer and associated technologies continue to change and evolve, educators must continue to strive for excellence in their work. Today that includes continued time and effort to maintain and improve their technology skills (as much as some educators do not want to admit).

Here are 20 basic technology skills that all educators should now have:

Word Processing Skills

Spreadsheets Skills

Database Skills

Electronic Presentation Skills

Web Navigation Skills

Web Site Design Skills

E-Mail Management Skills

Digital Cameras

Computer Network Knowledge Applicable to your School System

File Management & Windows Explorer Skills

Downloading Software from the Web (Knowledge including eBooks)

Installing Computer Software onto a Computer System

WebCT or Blackboard Teaching Skills

Videoconferencing skills

Computer-Related Storage Devices (Knowledge: disks, CDs, USB drives, zip disks, DVDs, etc.)

Scanner Knowledge

Knowledge of PDAs

Deep Web Knowledge

Educational Copyright Knowledge

Computer Security Knowledge

In order to be a great teacher, you must display enthusiasm, leadership, commitment, and compassion. By exhibiting these key factors, you will appeal to the schools at which you are applying as someone who will work to better the lives of their students in a variety of ways. Helping others succeed is a central component to teaching, thus trust, knowledge, and commitment are invaluable traits. Teachers must also maintain current professional development standards by taking regular refresher courses and test.

Technical Skills

EXPRESSION OF THE ANALOGY RELATION AT THE SYNTACTIC LEVEL

Shukhratova Yulduz Shakarbek qizi*

*Teacher

Department of Primary Education Methodology,
Faculty of Preschool and Primary Education of Fergana State University,
UZBEKISTAN

ABSTRACT

Syntaxes is a significant branch of linguistics which deals with relations between words and even sentences in general. The following article aims at exploring syntactic relations and the expression of analogy in particular. The study of syntactic relations has always occupied a significant place in the course of syntax. The concept of a syntactic connection is one of the basic, fundamental concepts of syntax. A syntactic connection is understood as "formal, line relations between the components of syntactic units, revealing semantic connections - syntactic relations - and expressed by means of language".

KEYWORDS: *Syntaxes, Attributive, Subordinate, Complex Sentence.*

INTRODUCTION

Most syntactic units are composed of several components. The components of syntactic units are in certain relations with each other, which are expressed by linguistic means - syntactic links.

The study of syntactic relations has always occupied a significant place in the course of syntax. The concept of a syntactic connection is one of the basic, fundamental concepts of syntax. A syntactic connection is understood as "formal, line relations between the components of syntactic units, revealing semantic connections - syntactic relations - and expressed by means of language".

In the modern syntactic system, two types of syntactic communication are distinguished: composition and submission. These types are opposed to each other on the basis of the presence / absence of relations between the determined and the determining, or the main and dependent components.

When subordinate, these relations exist, therefore the role of the component in creating a syntactic structure is different, and i.e. the components of a syntactic unit are multifunctional. The subordinate liaison organizes:

1. Phrase: sweet tea, tea with lemon.

2. Complex sentences: [The village (where Eugene was bored) was a lovely corner]. Traditionally, the types of subordinate communication are distinguished according to the ways of its morphological expression: coordination, management, adjoining.

It is customary to call agreement a subordinate relationship in which the main component requires that the dependent word be put in the same grammatical forms in which the main one appears. The agreement is grammatical: it is enough to know only the grammatical form of the main thing to name the form of the dependent, without knowing anything about its lexical content. The main component in agreement is always a noun, and the dependent is an adjective, ordinal, pronoun-adjective: sunny morning, something interesting, such a fate, third floor, an observed phenomenon. The agreement is complete (reproduction of the grammatical meanings of the gender, number and case of the subordinating word: frosty day) and incomplete: a woolen skirt and jacket - agreement in gender and case in the absence of agreement in the number; blue sunsets - agreement in number and case.

Management is usually defined as a type of subordinate relationship in which the main component of the combination requires a specific case from the dependent form without a preposition or with a preposition. The main word can be used in any of its inherent forms, and the choice of the form of the dependent is determined by the main word and those semantic relations that arise in the phrase. Control is observed when a noun (or any substantive word) is subordinated: to pass on to a friend, to leave a friend, to talk about a friend, to meet friends. Distinguish between strong weak management. With strong control, the presence of a dependent word form is predetermined by the properties of the subordinate word (a transitive verb requires a direct addition), while with weak control, the appearance of a dependent word form is not necessary: the beauty of the city, smile at a joke, and knock with a hammer.

A word combination is a non-predicative syntactic unit, the components of which are the forms of significant words, interconnected by a syntactic link. A sentence, on the contrary, is a predicative syntactic unit consisting of several forms of words interconnected by a syntactic link. A sentence is a grammatically formed combination of words that has semantic and intonational completeness and is a means of forming and formalizing thoughts.

Predictivity is the grammatical essence of a sentence, which consists of a complex of grammatical meanings correlated with the act of speech and always having a formal expression. Predictivity is thus a universal feature of sentences.

From a functional point of view, the concept of syntaxeme is distinguished - it is the minimum further indivisible semantic-syntactic unit of the Russian language, serving simultaneously as a carrier of elementary meaning and a constructive element of more complex constructions. For example, in the sentence winter everything turns white - we see a set of syntaxemes, that is, word forms that function in a given context.

Syntactic relations in a phrase are the relations between the main and dependent components of a phrase. The whole variety of syntactic relations can be reduced to the following main types:

Attributive, or attributive, relations are established in phrases if the dependent component indicates a feature, the quality of the subject and in most cases answers which questions? Whose?

The ability to ask a question is an additional way of defining syntactic relations, while the main way is to analyze the role of the dependent component.

Attributive relations arise during the semantic-grammatical interaction of nouns with:

- 1) Adjectives: beautiful girl, bear den, active participation;
- 2) Consistent pronouns: my book, some subject, each person;
- 3) Ordinal numbers: first year, sixth apartment;
- 4) Full participles: loving woman, written article, edited manuscript.
- 5) With prepositional and non-sentence forms of nouns: a letter from Voronezh, a habit from childhood, apple jam; hotel gates;
- 6) With adverbs: soft-boiled eggs, opposite house, barbecue in Caucasian style;
- 7) With an infinitive: the desire to learn, the need to rest.

Object relations arise in such phrases where the dependent component denotes the subject of the application of an action or a feature named by the main word, and answers questions of indirect cases, for example: reading a book, ready for an exam, inclined to be overweight. A dependent component can also denote an instrument of action, for example: eating with a spoon, sewing with a needle, knitting with bobbins. The main word in such phrases is usually expressed by verbs, participles and participles, adjectives, words of the category of state: gluing wallpaper, reading a book, accustomed to noise, glad to meet, everyone can. Less commonly, it is an adverb (across the machine) or nouns with the meaning of procedurality (treating a patient, reading a book, developing a disease, releasing products, and checking readiness). Such nouns, as a rule, can be replaced by verbs with the postfix -sya: the patient is being treated, the book is read, the products are released, the readiness is checked, etc. The position of the dependent word is usually occupied by a name, most often a noun, less often an infinitive: go to the mother, call him; asked (about what?) to repeat, serve lunch (serve lunch).

Subjective relationships are associated with a special type of verb sentences, as well as with passive phrases. Such phrases are based on the lexico-grammatical nature of passive verbs and passive participles. The dependent form of the noun in them (instrumental) denotes the producer of the action or the carrier of the state. For example: the arrival of guests, nice to friends, is being built by carpenters, read by me. In most cases, such phrases can be transformed into predicative units: guests have arrived, carpenters are building, I am reading.

By analogy with verbs, some substantive phrases with subject relations can be formed: release by a medical commission, discussion by the government. Subjective relationships are also characteristic of some phrases with a dependent word in the form of the genitive case, for example: the arrival of the father, the departure of the commander, the appearance of the car. In such cases, the relationship "action and actor or object" is also established.

Circumstantial relations are inherent in verbal phrases, since various adverbial meanings always accompany certain actions and states and are based on the lexical meaning of procedurality. The contingent relationship is concretized as:

- Definitive-adverbial: run quickly, speak excitedly;
- Temporary: arrive in the evening, return in a year;
- Spatial: walking in the forest, being nearby, living in a hotel;
- Causal: making a mistake out of ignorance, saying by mistake;
- Target: fall on purpose, joke, and come on a date.

A complementary (replenishing) relationship is a relationship in which the main word is informatively insufficient and requires the necessary explanation (replenishment) with a dependent word form. The main word is usually expressed by a pronoun, numeral, informatively insufficient verb, for example: several people, many times, two friends, becoming sad.

MAIN DIRECTIONS OF CHANGES IN THE EDUCATION AND TRAINING SYSTEM IN UZBEKISTAN

D.I. Vasieva*

Associate Professor,
Candidate of Historical Sciences,
Karshi Engineering Economics Institute,
UZBEKISTAN

ABSTRACT

The article describes the emergence of university education in Uzbekistan, that university education was one of the greatest dreams of the modern Turkestan intelligentsia in the late 19th - early 20th centuries, the creation of the Turkestan Muslim people Dorilfun, headed by Munavvar Kori Abdurashidkhonov. in the old city of Tashkent. It is called the Asian University; dozens of scientific and cultural institutions, the Academy of Sciences and universities have been established on its territory. In the former Soviet Union, education and training policies did not take into account the specificities and traditions of indigenous peoples.

KEYWORDS: *Independence, Education, Upbringing, Independence, Intelligentsia, University, Jadid, Scientists, Madrasah, Intellectual Potential, National University, Scientific Research, International, Sovereignty, National Culture, Intellectual Workers, Cultural Development, Technology, Intellectual Potential, Social - Economic Development, Idea, Society, Professional Sciences, Specialist.*

INTRODUCTION

The next historical stage in the formation of intellectual potential in Uzbekistan, in particular, the development of the education and training system, coincided with the years of communist ideology. The negative processes that took place during this period created the current problematic situation in the personnel sector on the eve of independence.

It is well known that the ideological approach that prevailed in all spheres of society in the former Soviet era and based on classism also led to the politicization of the education system. As a result, "this system has produced thousands of dumb people, mostly small workers, not selfless, independent, conscientious, responsible, inquisitive and innovative" [1], - says the First President

I.A. Karimov. This, in turn, had a negative impact on the formation of the national intelligentsia. The prevailing beliefs of the period emphasized that intellectuals should play a supportive, servicing role in relation to the leading and defining classes in society. In other words, the existence of the intellectual class as a relatively independent social unit would only be possible if it could meet the needs and interests of the working class or peasantry. At the same time, from the cultural and educational point of view, his leadership role was taken into account.

This dual approach to the intelligentsia arose as a result of the class approach, on the one hand, and a realistic assessment of the contribution of this stratum to the spirituality and culture of the people, on the other. According to these approaches and assessments, intellectuals belong to the ranks of politically and socially unstable groups that often change their worldview, moral and spiritual convictions.

Undoubtedly, the core of the intellectual potential is made up of intellectuals and qualified intellectual workers. Its composition, number and position have constantly changed over the course of a long historical development. Attitudes and assessments of one's place and role in society have changed in different periods, and the state policy influenced the formation of intellectuals. At the same time, it is necessary to recognize the importance of higher education and the role of universities, which play a special role in the formation of the intellectual potential of the republic. Speaking about the emergence of university education in Uzbekistan, it is necessary to emphasize the merits of the Jadids. In the late 19th and early 20th centuries, university education was one of the greatest dreams of the modern intelligentsia of Turkestan. A modern university was essential to reunite a nation that was once at the center of the global arena, with its potential driven by decadence and slander over the past three or four centuries.

It is true that in the East, including in Turkestan, there was a madrasah education system that operated for a thousand years and supplied the world with dozens of scientists. For example, in the 18th century there were 70 madrasahs in Samarkand and Bukhara, and in the 19th century only in Tashkent there were 18. In 1894, there were 6445 madrassas in Turkestan, and by 1913 their number increased to 7665. In this sense, madrassas have served as their own for centuries. kind of a university. Moreover, it is known that European universities, which began to be created in countries such as Italy, Spain and France in the XII century, imitated Muslim madrasahs of the X-XI centuries. However, the reason for the idea of modern intellectuals about the need for a modern educational institution is that in recent centuries the secular sciences taught in madrassas have sharply decreased and have been replaced by religious sciences.

Progressive Jadid intellectuals recognized this need before anyone else in the region and raised it to the level of a national idea. This idea was promoted by Jadid intellectuals in their own publications such as Tarjimon (1883-1918), Oyna (1913-1915), and Turon (1913-1918).

It is known from history that the Jadid intelligentsia talked with local investors about financial support for the university, which was planned to open in Turkestan, and after some preparation, they began practical work in 1918. On April 9, 1918, an organizing committee of nine people was formed in the house of Munavvar Kori Abdurashidkhonov. The Board meets nine times a month. They develop everything from the organizational structure of the future university to the faculties and departments of the studied disciplines. At the general meeting of the organizing committee on May 3, 1918, Munavvar Kori Abdurashidkhonov was elected chairman, Isa Tukhtaboev was the first deputy, MukhtorBakir was the chief secretary, and

AbdusamigoriZiyoboev was treasurer. On May 12, 1918, in the old part of Tashkent, Turkestan Muslim folk medicine, headed by Munavvar Kori Abdurashidkhonov, opened its doors to students.

Dorilfun had three stages (lower, middle, upper) and also included the five-year-old dorilmuallimine. In a short time, a team of Dorilfunun teachers was formed. Among the teachers were about 20 representatives of various fields, including famous poets and writers. In Dorilfun, the famous scientist Fitrat taught the native language and literature, Munavvar Kori Abdurashidkhonov - ethics, AbubakrDivaev - ethnography, KamolShamsi - mathematics, Burkhan Habib - political history, Ismail Hakki - the history of culture [4].

The fate of Turkestan Muslim University did not turn out the way its founders hoped. In September 1918, he was added to the People's University. In 1920 it was transformed into Turkestan State University. Nevertheless, he played an important role in the education of the nation, in the cultural development of the country.

A historical fact should be noted here. The creation of the Turkestan State University in Tashkent was associated with the name of the Soviet government and its leader Vladimir Lenin. The date of origin of university education in Uzbekistan was September 7, 1920. Thanks to independence, as in other spheres, the historical truth about the emergence of university education in Uzbekistan was restored. By the decree of the President of the Republic of Uzbekistan dated January 28, 2000, in recognition of the merits of the Jadid intelligentsia, who gave their lives for the development of the Motherland and the nation, the restoration of historical truth, the founders of Tashkent State University were Jadid intellectuals.

Tashkent State University, originally known as Turkestan University, and then the University of Central Asia, is the first higher educational institution and research center not only in the country, but also in the region, its high potential in science and education, its important role in the formation of the education system and Research in Central Asia In accordance with the specified Presidential Decree, Tashkent State University was assigned the status of a National University and transformed into the National University of Uzbekistan named after MirzoUlugbek. Thus, another historical fact was restored.

In recent years, dozens of scientific and cultural institutions, the Academy of Sciences, and universities have been built on the territory of the university. Without exaggeration, the history of all scientific, educational, cultural, educational and printing institutions operating today, not only in our country, but throughout Central Asia, is connected with this university. In our country, this science has played a decisive role in the formation of a modern system of science and education, as well as in the training of highly educated personnel [5].

It was on the basis of the Tashkent State University that in 1933 the country's second university was opened in Samarkand, and in 1976 - the third in Nukus. He also trained many specialists for the national economy, research institutes and universities in the country. Thus, prior to independence, three universities in the country, namely Tashkent State University, SamSU and Karakalpak State University, were leaders in the higher education system. Tashkent State University also played an important role in staffing 37 research institutes and 45 research centers operating in Uzbekistan in the 1930s [6]. Over the years, 170 graduate students of local nationalities studied here. This, in turn, had a positive impact on the formation of local staff.

The national intellectual potential, even from the point of view of quality growth, could not fill the long-standing gap in the personnel sphere, fill the gap in the culture and spirituality of the people and fail to fulfill its function. continuity.

Thus, national intellectuals are increasingly moving away from their past and losing touch with their historical past and ethnic roots. Sovereignty, the originality of the national culture, no one could say a word, anyone who "retreated" from the so-called international Soviet culture was immediately branded a nationalist, organizational and repressive conclusions were drawn about him. Only cultural figures were encouraged who invariably demonstrate their devotion to the center [7].

The approach of the great statehood to the development of national potential, the psychology of administrative management and imperialism was preserved and even intensified at some stages of the period of stagnation. This led to the backwardness and decline in the quality of national cadres - intellectual workers.

Stagnation sought to turn this potential into an obedient servant, which would ensure the dominance of the party and state elite both in theory and in practice in economic relations, in the management and planning of the national economy, in public consciousness, thinking and worldview, and in the distribution of material and spiritual good.

Every effort was made to support these ideological aspirations, to turn the intellectual potential into a tool, to one degree or another, for the formation of stereotypes among workers and to preserve the right to control the spiritual state of the people. At the same time, in order to raise the spiritual prestige of this potential, for example, ideas about the nationality and character of the intelligentsia were constantly formed through the media and educational media. To reinforce and support this idea, special quotas were established for the admission of students to universities, which would allow them to manage the class composition of students.

On the eve of gaining independence, the possibilities of the republic's intellectual potential to meet and satisfy the needs of the most promising sectors of the economy and social sphere were extremely limited. This can be observed in the case of engineering and technical personnel. That is, during this period it became clear that technical specialties do not enjoy such authority in the public opinion of the local population.

This is confirmed by the fact that on the eve of independence and in the first years of its existence, Uzbeks accounted for 37.8% of engineers and only 17.8% of designers [8]. In general, there were only nine engineers with higher education per 1000 people in the country, while engineers with higher engineering education accounted for 24% of all specialists [9].

At the same time, differences in the education and training system are visible from a regional point of view. The creation of redundant educational institutions in some regions of the country, especially higher educational institutions, without taking into account the interests of other regions in this regard, influenced the future socio-economic development of these regions. In particular, in the 1975-1976 academic year, there were 42 higher educational institutions in the country, in which 246.6 thousand students studied, of which 19 were in Tashkent, and 134.2 thousand students were there. In percentage terms, these indicators are 45 and 54 percent, respectively [10].

During this period, a characteristic feature of the development of the industry in our region was the slow pace of renewal of scientific personnel and their low level of qualifications. For example, according to statistics, by the end of the 1980s, the share of doctors of sciences in higher education in Uzbekistan was 2.6%, and in the system of the Academy of Sciences - 7.3%. By age, the proportion of doctors of sciences under the age of 50 was only 14% of the total [11]. It should be noted that the turnover of scientific personnel is also low. In particular, only 9% of graduate students studying in the system of the Academy of Sciences annually, and 14% in the system of the Ministry of Higher Education completed the defense of dissertations [12]. Technical support of labor in the Academy of Sciences of the Republic of Uzbekistan amounted to 18.8 thousand soums, and in prestigious research universities in the United States - 80-100 thousand dollars [13].

Analysis of the state and development of certain groups of intellectual potential showed that in the national environment there is a certain caution in the approach and choice of these professions, as well as insufficient understanding of the essence of intellectual work.

Therefore, in general, one can observe serious disparities and distortions in the distribution and use of the intellectual potential of personnel: there was not enough personnel for some professions and specialties, for others there were more of them than needed. Naturally, the emergence of such a situation in the republic is due to the fact that the real needs of the national economy do not correspond to the rigid system of planning higher education. For example, if in 1990 25 percent of university graduates worked in industry and construction, 13 percent in agriculture and about 50 percent in education [14].

Sociological surveys of young specialists in the late 80s show that only 10% of them were involved in the development of new technologies, the introduction of scientific achievements into production in the course of their practice. A 1992 study showed that 56% of the interviewed specialists experienced difficulties in finding a job, and 48% of them were dissatisfied with the level of training received at the universities of the republic [15].

The low level of intellectual abilities was explained not only by errors in the planning and management system, but also by the cost of training on the part of the state. This can be seen when comparing expenditures on education in the republic and the former USSR with expenditures in foreign countries. The cost per student in the United States was 5.4 times higher than in the former USSR, 4.6 times higher in Japan and 5.8 times higher in the UK. According to other estimates, in the United States, on average, from 7,000 to 23,000 dollars were spent on teaching young people in agronomy, engineering and medicine, while in our country, before independence, the state budget allocated 5-15 times less [16]. ... If in 1975 the annual cost per student in the republic was 820 rubles, then in 1989 - 1376 rubles. [17].

Similar differences were observed in the indicators of educational and technical provision of students in educational institutions. In the country's universities, the average cost of equipment per student was 2500 soums, in pedagogical universities - 800 soums, while in the United States this figure reached 10,000 dollars [18]. In terms of the level of modern equipment, Uzbekistan also lagged behind other regions of the USSR. Tashkent State University, one of the leading universities not only in the country but also in Central Asia, has 180-200 students in front of a computer desk and 300-400 students at Nukus University, compared with 20-25 students at the former university. Soviet Union.

Naturally, all this, to one degree or another, affected the quality of personnel. This problem has always been one of the most difficult and acute, since the growth of intellectual potential at the expense of highly skilled and unskilled workers aggravated the contradictions in the socio-economic development of the republic. Tests to determine the level of theoretical knowledge and practical skills of students at the end of "stagnation" and the beginning of "reconstruction" showed that there are gaps in the assimilation of materials by students in their areas. For example, according to a survey and written research conducted by six groups of the Tashkent Institute of Highways, 63% of the students surveyed were unable to solve algebra problems and 58% were unable to solve problems in school arithmetic. Similar control tasks were given to senior students of the TashPI named after Beruni. As a result, 90 percent of the final year students of the Faculty of Power Engineering were unable to solve school arithmetic problems. Every second student of the faculties of radio electronics and automation, mechanics and mechanical engineering did not cope with the control tasks in physics at school.

In general, the situation in the post-Soviet space did not go unnoticed in the choice of intellectual types and directions of work by the local population. The Uzbek people, despite their efforts to increase the level of intellectualization of their workforce, have not been able to balance the region's potential in the context of centralized management and employment planning.

In other words, over a long historical period, a stereotype has formed in the national consciousness that indigenous peoples are unable to assimilate modern forms of intellectual labor. Such distortions are deliberately and artificially rooted in the public consciousness. This is, on the one hand, to prove the unpreparedness and immaturity of the nation for the transition to higher forms of organization of its socio-economic life, and on the other hand, to show the prestige and status of "older brother". and the "little ones" in need of generosity were made for the purpose of persuasion.

In a word, in the policy of education and training in the post-Soviet space, approaches to the national republics did not take into account the specifics and traditions of indigenous peoples, proceeding only from the interests of the center.

In terms of education, the policy of the Soviet government to keep the national intellectual potential under constant control led to the politicization of the education system, the persecution of many intellectuals defending national interests, and, ultimately, to the monopoly of communist ideology.

Thus, studies show that the development of intellectual potential in any case ensures the completion of the process of the formation of a nation, its maturity and civilization, and at the same time the restoration of social unity. This proves that during the transition period, in the context of the multi-ethnic composition of the population and the predominance of the national factor in the intellectual potential, these processes can proceed along with contradictions and acute conflicts. At the same time, it was found that only through the formation of new qualitative characteristics and characteristics of the national intellectual potential can the mobilization of the entire nation, the level of activity, and its integration into the world economy and culture be increased.

IDEAS THAT LED TO THE EMERGENCE OF SOCIOLINGUISTICS AND INTERPRETATION OF THE STUDY

Nuritdinova Rayhona Numonovna*

*Teacher,
Department of the Uzbek Language and Literature,
Fergana State University,
UZBEKISTAN

ABSTRACT

This article is devoted to the emergence of ideas that led to the emergence of sociolinguistics, the importance of theories in them. In the first half of the twentieth century, such ideas arose that without them it is difficult to imagine modern sociolinguistics. Changes and updates in society are primarily reflected in the vocabulary of the language. In most of linguistics, the study of language as a systemic structural phenomenon has long dominated its interpretation as a largely orphaned structure. But over time, the approach to language has changed.

KEYWORDS: *Sociolinguistics, Slang, National Language, Dialect, Social Differentiation, Society, Social Context.*

INTRODUCTION

In the first half of the twentieth century, such ideas arose, without which it is difficult to imagine modern sociolinguistics: 1) the idea of social differentiation arising from the social status of the bearer of a particular national language in society. (I. A. Baudouin de Courtenay, E. D. Polivanov, L. P. Yakubinsky, V. M. Zhirmunsky, B. A. Larin, A. M. Selishchev, G. O. Vinokur, B. Gavranek, A. Mathesius); 2) the idea that all means of language are distributed in the process of communication, and the division of communication into processes is provided based on social conditions (S. Bally); 3) the idea of using methods of studying rural dialects in the study of the urban language (B.A. Larin); 4) the idea that the rate of evolution of a language depends on the rate of development of society and that changes in society lead to changes in the language. (E.D. Polivanov)[1];

Since the famous Russian scientist Polivanov expresses this idea, we see how close it is to reality. In particular, the linguist N. Makhmudov will also pass. "Changes and innovations in society are primarily reflected in the vocabulary of the language. For example, before independence, the word "rich" had a negative connotation. In the old dictionary, this is described as "the wealth obtained with the help of human power, the world was acquired by (man)." In nowadays ... in the full sense of the word ... he began to name what the world acquired through the hadith of his entrepreneurship [2]; 5) the idea of division into social dialects with territorial division into dialects (E.D Polivanov [3]); 6) the study of slang, argo and other spheres of manifestation of social language for understanding the system of the national language (B. A. Larin, V. M. Zhirmunsky, D. S. Likhachev, etc.).

By the second half of the twentieth century, the American descriptive school played an important role in translating theoretical ideas into reality. The uniqueness of American life has led to differences in speech. The structural structure of the language has undergone significant changes as a result of the migration to this state of people of different nationalities from all over the world and their interaction with each other and with local Indians. Scientists from the United States who studied these changes W. Labov, A. D. Grimshaw, G. Curry. As a result of Roger's continuous scientific work, this area has received full theoretical and practical confirmation.

One of the founders of modern sociolinguistics, American researcher William Labov, evaluates science as a field that studies "language in a social context." If we pay attention to this definition, we will see that sociologists pay attention to the language itself, to its internal structure and to the extent to which people who make up a particular society use this language. It takes into account all the factors influencing the language - from the specific characteristics of the speaker (age, gender, level of education and culture, type of profession, etc.) to the characteristics of a specific speech process.

At a scientific conference at the University of Pennsylvania on January 23, 1997, William Labov gave a lecture in which he described science as follows. "Sociolinguistics is a field of research based on new methods currently recognized in America, that is, on numbering (statistics) taking into account phonetic, morphological and lexical changes in words" [5])

For example, in 1966, W. Labov's research aimed at identifying differences in the language of white and black children. The term "ebony" is introduced (the language of all blacks, regardless of where they live). The African American dialect differed from other dialects of the English language in its lexical richness and grammatical structure.

In most of linguistics, the study of language as a systemic structural phenomenon has long dominated its interpretation as a largely orphaned structure. As experts rightly point out, "in the main directions of structural linguistics, the main attention is paid to the immanent (internal) features of the language system, the connection of this system with a person, society, thinking and other extralinguistic factors is completely ignored" [6];

Sociolinguistics, on the other hand, focuses on the laws of the use of language, that is, on the manifestations of speech. Therefore, researchers note the importance of creating a theory of the use of language as the main task of sociolinguistics, the formation of a general theory of the role of language in public life, the development of speech ethics, the rules of speech discipline [7];

If we talk about the role of sociolinguistics in linguistics, we see that it is closely related to all areas. In particular, functional styles of speech are forms associated with the use of language in society, its adaptation to various social spheres, social functions, so that all the flavor and rich lifestyle of the language manifests itself directly. This means that without sociolinguistics, it is impossible to develop laws for functional styles of speech. From this point of view, there are many points of intersection of sociolinguistics and stylistics, considering many other - many methodological - connotative features.

So, if we talk about the internal factor, then it includes: "community language + language tradition + language competence + speech practice (synchronous) + values + the initial state of the language + practical appearance of the language (speech)" [8];

It should be noted that the language undergoes changes as a result of a combination of external and internal factors. It is with this pure language that its appearance in various fields is used in different terms. For example, origin is defined as L1, function or L2. The language of representatives of a social group is slang, argo, barbaric words...

Thus, the sociological approach to language has the following characteristics:

- determines the degree of use of the speaker;
- takes the internal structure of the language;
- does not conduct special studies of the structural structure of the language, which is the object of generative linguistics;
- studies external factors affecting the language;
- classifies speech manifestations caused by external factors;
- studies the problems of bilingualism - diglossia, bilingualism and multilingualism;
- studies the origin and development of slang, slang in the language;

IMPORTANCE OF USING ADVANCED PEDAGOGICAL TECHNOLOGIES IN THE PROCESS OF TEACHING SPECIAL SUBJECTS IN THE TECHNICAL SCIENCES

Abdura khimovich Umarov*

*Lecturer at TSPU named after Nizami Khusan,
UZBEKISTAN

ABSTRACT

The article discusses the importance of a technological approach in teaching special subjects in the field of technical sciences based on advanced pedagogical technologies. Also analyzed the difference between pedagogical technologies and advanced pedagogical technologies. The use of test items in the classroom provides a good opportunity for the teacher to assess students quickly and fairly. Without looking at some of the shortcomings, today in pedagogy there is no better method than testing for a really quick assessment of students' knowledge.

KEYWORDS: *Pedagogical Technologies, Advanced Pedagogical Technologies, Educational Process, Teaching Special Subjects, Personnel Training.*

INTRODUCTION

The educational system of the Republic of Uzbekistan is gradually being reformed on a large scale based on the national training program. This, in turn, requires teachers, in order to increase the efficiency of the educational process, by analyzing foreign experience, to select and use advanced pedagogical technologies when teaching special subjects.

Pedagogical technology – is an educational process or project of "building" a lesson, the art of teaching, which should determine the general didactic goals of the subject and focus on its implementation, and it is recommended to divide it into two directions. - new and advanced pedagogical technologies.

Requirements for new pedagogical technologies:

1. Determination of the direction of interests of students;
2. Separation of the most basic teaching materials;

3. Clearly define the objectives of the training materials and organize them;
4. Determination of the scientific and technical orientation of production processes;
5. Motivation for learning;
6. Providing interdisciplinary communication of the educational process;
7. Programmatic teaching of educational material;
8. Control of students' knowledge using of a multilevel system.

Advanced pedagogical technology – is the effective use of teaching methods and forms to increase the activity of students in the process of teaching the basics of educational goals. This is a reasonable and effective use of the achievements of didactics today, the best practices of proactive, creative teachers, namely:

1. Realization of the educational goal through conversation, communication, cooperation;
2. Reproductive thinking;
3. Productive thinking;
4. Research - creative thinking, scientific cyclical scheme of research (object - model - hypothesis - experiment);
5. Non-standard activities: seminars, discussions, independent work on a textbook, organizing business games.

In both cases, a clear definition of learning goals, the revitalization of students' activities, a creative approach to the choice of methods and forms, is typical for each lesson. The lesson does not stay “in shape”, but its methods change throughout the lesson depending on the purpose, content and size of the lesson.

As a result, it is necessary to turn the teaching of special subjects in the field of technical sciences into a technological process in which the results were guaranteed, and thus the teacher was able to achieve high efficiency through the design of the educational process and the mastery of teaching, characterized by three different approaches.

1. Demonstration explanation of special subjects, that is, the translation of educational material to the student.
2. Construction of the educational process of teaching using pedagogical technologies, that is, a systematic approach to teaching materials. In this case, on the basis of the relationship "teacher => student => teacher" to assess whether he has fully mastered knowledge and skills.
3. Creative research thinking, that is, the creation of educational tasks that motivates students to research, problem solving. This approach includes interdisciplinary communication, integration of hypotheses and their testing in practice, collection and comparison of results, modeling.

On the basis of advanced pedagogical technology, the educational process is recommended to be structured as follows: Learning content and general didactic goal => lessons goal => organization of the educational process based on advanced pedagogical technologies => assessment. The

assessment determines the effectiveness of the training and the degree to which the set learning objectives are achieved.

The structure of pedagogical technology is as follows:

- a) Development of the goals and objectives of the subject;
- b) Creating tasks based on the above requirements in accordance with the learning objectives;
- c) Ways to achieve learning goals;
- g) Assessment of student progress.

Considering that the educational process is assessed through current control, then in the selected technologies of the teacher, it is possible to track certain degrees of the lesson, in which the goals of learning and the tasks developed on its basis are tracked. In developing the goals and objectives of the subject, you can specify the following:

- Concepts formulated by the student;
- Knowledge that students need to get;
- Ability to apply knowledge in specific situations.

It is clear that when setting a learning goal, what needs to be understood, what needs to be learned and what can be applied to specific situations? When setting a learning goal, the development of students' intellectual, emotional and personal abilities and other characteristics are taken into account.

In pedagogical technology, the goal of learning can be likened to a tree, i.e. If the tree exists, its core is the learning goal; the branches are the branches of science, and the leaves are the special goals of each of them. The realization of the learning goal refers to the teacher's activities (teach, teach, explain, narrate, demonstrate experience, etc.).

The result of the training is the implementation of the educational task: what has the student mastered or could not master what he did not know before, in other words, what did he need to know? It is a determining factor in qualities such as how much he has mastered and how much he has learned.

Teaching by systematizing knowledge in the learning process is an important method of the new pedagogical technology, which is a necessary condition for the depth and strength of knowledge. The use of systematization not only organizes the previously formed reserve knowledge about the educational material that the student should know, but also serves as a source of new knowledge.

The advantage of advanced pedagogical technologies is that they teach students to learn on their own, foster passion, a desire for success. In the process of teaching special subjects in the field of technical sciences, as in others, control and evaluation works play an important role in teaching, since they help determine the levels of achievement of the set goal and objectives. Depending on the complexity of the studied part of science in advanced pedagogical technologies, it is advisable to use such types of control as written work, oral interview, control and practical tasks and others.

A multilevel system for monitoring the student's knowledge of educational goals and objectives, as well as the criteria for assessing it, are an important component of pedagogical technology.

Since the multi-level system itself is a feature of pedagogical technology, it allows all students of the entire group to conduct a comprehensive assessment in a short time based on carefully studied teaching materials.

In addition to the above, do not forget about the tests. Since the test items have a special role, given the purpose and characteristics of control. The use of test items in the classroom provides a good opportunity for the teacher to assess students quickly and fairly. Without looking at some of the shortcomings, today in pedagogy there is no better method than testing for a really quick assessment of students' knowledge. The main requirement for test tasks is that tasks that meet the goals of the studied educational material should be reflected in the test tasks. This takes into account the goals, objectives of training, the volume and content of the training material.

In conclusion, we can say that in the process of teaching special disciplines in technical sciences, it can be highly effective if the educational process is organized on the basis of the correct pedagogical technologies and the methods of assessment are correctly selected.

CLINICAL SIGNIFICANCE OF ATRIOVENTRICULAR CONDUCTION DISORDERS IN CHILDREN

Kamola Nigmankizi Yakubova*; **AkidaValievna Muratkhodjaeva****

^{1,2}Department of Optional Pediatrics,
Tashkent Pediatric Medical Institute,
UZBEKISTAN

ABSTRACT

Violation of atrioventricular conduction is a pathological condition characterized by changes in the frequency, regularity of the heart rhythm, with impaired communication and sequence between the activation of the atria and ventricles, which is benign or with pronounced changes in hemodynamics. Heart rhythm and conduction disorders in children are currently one of the most socially significant problems. So, according to statistics, a systole in patients with bradyarrhythmias is the cause of unexpected circulatory arrest in 15-20% of cases, and in patients with acquired high-grade autoventricular block, it is one of the main causes of death.

KEYWORDS: *Cardiac Arrhythmias, Cardiac Conduction Disturbances, Atrioventricular Block, Children, Cardiomyopathy, Myocarditis, Electrocardiography, Echocardiography.*

INTRODDUCTION

Atrioventricular block or atrioventricular block denotes a violation of the conduction of excitation from the atria to the ventricles. Depending on the degree of damage to the atrioventricular junction, incomplete and complete atrioventricular blocks are distinguished [1,2, 7, 10].

Cardiac arrhythmias occur in children of all ages. Often the causes of rhythm and conduction disturbances are not only cardiac (myocarditis, cardiomyopathies, pericarditis, primary pathology of the cardiac conduction system), but also extracardiac (diseases of the kidneys, endocrine system organs, impaired autonomic regulation of the heart rate, psychopathy), including electrolyte disturbances, exposure to physical and climatic factors [2, 6, 7, 9].

The largest number of cardiovascular diseases are polygenic. Monogenic diseases associated with heart damage include a number of syndromes and diseases accompanied by malignant

cardiac arrhythmias and a high risk of sudden cardiac death. The cause of hereditary heart rhythm disturbances is considered to be anomalies of the following main classes of proteins: contractile and cytoskeletal; ion channels and intercellular contacts; transmembrane carriers, as well as their modulators [3, 5, 10, 12].

Various etiological factors, such as ischemic heart disease, myocarditis and cardiomyopathies, the use of drugs, endocrine or electrolyte disturbances, surgical and endovascular interventions, lead to the occurrence of cardiac conduction disorders. Often, conduction disturbances arise "primarily", in the absence of obvious etiological factors, and in some cases are congenital[3, 4,8, 15].

The most common congenital conduction disorders include grade I atrioventricular block, complete and incomplete right bundle branch block, and blockade of the anterior and posterior branches of the left bundle branch (cases of congenital left bundle branch block have not been described). In most cases, conduction disturbances are isolated, do not have clinical manifestations and are detected when an electrocardiogram is recorded during routine medical examinations. These forms of conduction disorders are characterized by a favorable prognosis; they usually do not progress and do not require treatment [13, 21].

Violation of atrioventricular conduction can be permanent or transient. In some cases, manifestations of the disease can be detected already at the stages of intrauterine development with auscultation of fetal heart sounds or planned ultrasound examination, as a rule, starting from the 18th week of pregnancy [17, 18, 24].

The most common cause, accounting for 60-90% of cases of congenital complete AV block, is intrauterine systemic lupus erythematosus, which occurs with autoimmune diseases of the mother. Penetrating through the placenta, these antibodies bind to the antigens of the cells of the atrioventricular node of the fetus, disrupting the functioning of their ion channels, activate apoptosis and potentiate the development of the inflammatory process, followed by the replacement of dead cells with connective tissue[3, 13,15, 26].

In addition to the violation of atrioventricular and intraventricular conduction in carriers of these mutations, sinus node dysfunction, sinoatrial blockade of various degrees and the syndrome of "silent" atrium (atrial standstill - complete absence of electrical activity and, accordingly, contractions of the atrial myocardium) are described. In rare cases, congenital sinus node dysfunction is the only clinical manifestation of the disease; atrioventricular and intraventricular conduction disorders may be completely absent or occur later [15, 18, 23, 25].

Violation of conductivity at various levels of localization and severity is often found in congenital structural heart disease. They can be caused both by a primary disorder in the development of the cardiac conduction system, and be the result of morphological and hemodynamic changes accompanying the congenital defect. Transcription factors are genes expressed in the early stages of embryogenesis, whose protein products determine the direction of further cell proliferation and differentiation. Mutations in these genes can disrupt the formation of entire organs and its individual components. It has been established that the proliferation and correct differentiation of cells of the cardiac conduction system are regulated by genes belonging to the Homeodomain and T-box families [2, 16, 20].

Progressive cardiac conduction disorders are characteristic of a number of neuromuscular diseases, being the main cause of sudden death and one of the leading causes of overall mortality in these patients[3, 11,19, 22].

With a number of hereditary diseases (the so-called laminopathies), in which heart damage is manifested by dilated cardiomyopathy, ventricular and arrhythmias and progressive conduction disorders, which can occur before the development of violations of myocardial contractility and the appearance of arrhythmias. A morphological study of patients who died sudden death at a young age revealed replacement of the atrioventricular node and the His – Purkinje system with adipose and connective tissues [13, 15, 24, 27].

Conduction disorders (high-grade atrioventricular block and intraventricular conduction disorders) are found in myotonic dystrophy. This disease with an autosomal dominant type of inheritance is characterized by damage to the muscular system (muscle weakness is caused by impaired relaxation of muscle fibers with their intact contractility), eyes (development and rapid progression of cataracts) and the heart (progression of heart failure, cardiac conduction disorders, fascicular ventricular tachycardia, sudden death). A pathomorphological examination of the hearts of patients with myotonic dystrophy who died suddenly showed that the sinoatrial and atrioventricular nodes were replaced by fibrous and adipose tissues [5, 10, 15, 23].

Since congenital atrioventricular block may be caused by genetic disorders, in the absence of a diagnosed systemic disease in the patient's mother, it is advisable to examine close relatives of the patient for the timely detection of possible conduction disturbances in them, even in the absence of clinical manifestations characteristic of the disease [8, 14, 17].

It is impossible to understand the electrophysiological processes occurring in the heart without understanding the anatomical and physiological characteristics of the conducting system[3, 5, 10].

Literature data indicate that the presence of focal myocardial fibrosis is a prerequisite for the occurrence of ventricular arrhythmias. At the same time, the activation of autoimmune mechanisms can serve as an additional triggering factor that activates the arrhythmogenic zone. Left bundle branch block is an electrocardiographic phenomenon caused by disturbance or complete cessation of the conduction of excitation along the left bundle branch[1, 9,16, 22].

A fairly large number of neuromuscular diseases, most often myodystrophies, and mitochondrial diseases (cytopathies) are accompanied by damage to the cardiovascular system, the most characteristic of which are dilated cardiomyopathy, myocardial hypertrophy, various forms of ventricular and supraventricular arrhythmias, as well as progressive conduction disorders [17, 25].

The term "progressive lesion of the cardiac conduction system" unites a group of diseases that have significant etiological and pathogenetic differences, common to which are hereditary character, progressive course, poor prognosis and potential threat to the patient's life in the absence of timely implantation[5,11, 14].

In most cases, the blockade is due to the replacement of the atrioventricular node with fibrous tissue or impaired conduction of the impulse from the atrial myocardium to the atrioventricular node [12, 22].

The most typical development is dilated cardiomyopathy with the occurrence of life-threatening ventricular arrhythmias, less often there is a progressive lesion of various parts of the cardiac conduction system, which is manifested by sinus bradycardia, atrioventricular blockade of various degrees, as well as blockade of the legs and branches of the His bundle [13, 25].

Violation of the formation and conduction of excitation impulses from the atria to the ventricles of the heart leads to significant changes in hemodynamics. The most significant changes are due to complete atrioventricular block. As a result, such compensatory mechanisms are activated as: lengthening diastole, increasing filling of the ventricles, increasing the rate of circular filling of myofibrils. Remember that arrhythmias can cause the appearance of symptoms of heart failure, the constant existence of heart rhythm pathology can aggravate its course [5, 7].

The degree of conduction disturbances determines the severity of the course and the prognosis of patients. The most characteristic is transient or permanent complete atrioventricular block with periods of prolonged asystole and syncope, which is the most common cause of death in patients. A progressive course of generalized lesion of the vascular system has been described, which begins with a distal bundle branch block, then spreading to the atrioventricular and sinus nodes, which leads to the development of complete atrioventricular block and the onset of sick sinus syndrome [9, 11].

It has now been proven that in children, atrioventricular blockade can persist for a long time, progress, having a negative effect on hemodynamics, leading to a delay in the pace of physical, psychomotor and intellectual development of the child, and significantly reduce the quality of life indicators. [18, 23].

The clinical manifestations of congenital complete atrioventricular blockade and the prognosis in patients are determined by the level of blockade, which, in turn, determines the localization of the substitute pacemaker and, accordingly, the frequency of its automatic activity. If the driver of the replacement rhythm is localized in the atrioventricular junction (below the conduction block) or in the proximal parts of the His – Purkinje system (common trunk of the His bundle) and QRS complexes have normal morphology, clinical manifestations of the disease are often absent. The prognosis in such patients is significantly better than in patients with acquired complete atrioventricular block [19, 20].

Patients with grade II atrioventricular block may be asymptomatic and prone to the development of conditions such as dizziness and fainting, which are more common in patients with grade III atrioventricular block. Complete atrioventricular block can be congenital, acquired, or hereditary. The most common causes of acquired grade III atrioventricular block are cardiac surgery and viral infection. Children with complete atrioventricular block, regardless of the genesis of the block, are threatened by the development of syncope and, consequently, by the development of sudden cardiac death due to life-threatening brady- and tachyarrhythmias, leading to the development of inadequate cardiac output and impaired cerebral circulation [9, 11].

The change in atrioventricular conduction may be in direct proportion to the rhythmic activity of the main pacemaker. The appearance of atrioventricular block of the 1st degree against the background of bradycardia may be associated with an increase in the parasympathetic division of the autonomic nervous system and clinically may manifest as vegetative-vascular dystonia of the vagotonic type. Tachy-dependent atrioventricular blockade of the 1st degree, which occurs with an increase in the heart rate, is obviously associated with a blockade of conduction along the fast

(β) channel of the atrioventricular node. This blockage may persist in the tilt position of the patient, but may resolve after subcutaneous administration of atropine. Such a response gives reason to believe that with tachydependent atrioventricular blockade of the 1st degree, the nature of the influence of autonomic regulation of atrioventricular conduction is not the main one. The reasons for the development of I degree atrioventricular block are idiopathic degenerative diseases of the conducting system (Lev's disease, Lenegra's disease); systemic lesions of the connective tissue (juvenile rheumatoid arthritis, systemic lupus erythematosus, systemic scleroderma, etc.); infectious diseases (infective endocarditis, diphtheria, acute rheumatic fever, Lyme disease, tuberculosis, etc.); infiltrative diseases (amyloidosis, sarcoidosis, etc.). Grade I atrioventricular block can also occur after undergoing cardiac surgery or as a result of catheterization of the right heart. Atrioventricular block II degree is observed in children after heart surgery; sometimes atrioventricular block of both I and II degrees can be a consequence of congenital heart disease. It should be borne in mind that atrioventricular blockade of the I degree, II degree of the 2nd type and variants of high degree blockade often transform into a complete atrioventricular block and occur in children with severe cardiac pathology [5, 18].

Diagnosis of the disease is based on the detection of complete atrioventricular blockade during ECG recording and can present a certain difficulty with a sufficiently high frequency of the replacement rhythm and normal QRS morphology (with the localization of the source of automatism in the atrioventricular node). Since conduction disturbances can be transient, long-term ECG recording using stationary monitoring stations, Holter monitors, and in some cases implantable recorders plays an important role. Currently, there are no clinical guidelines for molecular genetic studies in patients with congenital complete atrioventricular block due to the relative rarity of detecting mutations in patients of this category [8, 20].

Conduction disturbances are usually localized distally at the level of the His-Purkinje system. When monitoring the ECG of patients in dynamics, it is characteristic to detect a gradual increase in the duration of the PQ and QRS intervals [15, 27].

The use of continuous cardiac stimulation systems in patients with complete atrioventricular block can reduce the manifestations of heart failure and improve the quality of life [14, 26].

The lack of diagnostics of the nature of the lesion of the myocardial conduction system in infectious cardiomyopathy in children in the form of rhythm disturbances, myocardial conduction, repolarization of the ventricles of the heart leads to inadequate and untimely treatment, and as a consequence - the development of chronic forms of the disease, an increase in morbidity and mortality in older age groups [20, 25].

CONCLUSION

Thus, as can be seen from the presented literature data, the problems of rhythm and conduction disturbances in pediatric practice are very relevant and the study of the peculiarities of the course of rhythm and conduction disturbances in children is a poorly studied problem. Under these conditions, to develop prognostic criteria for the course of rhythm and conduction disturbances in children, research aimed at solving this problem is needed.

EFFECTIVE STRATEGIES AND TECHNIQUES OF TEACHING ENGLISH VOCABULARY

Kattaboeva Dilrabo*

*Senior teacher,
Uzbek State World Languages University,
UZBEKISTAN

ABSTRACT

This article dedicates effective strategies and tactics implemented in learning vocabulary of Modern English. This is because vocabulary is an important and essential element in language learning. In order to communicate well in a foreign language, students should acquire an adequate number of words and should know how to use them accurately.

KEYWORDS: Vocabulary, Strategies, Denote, Introduce, Identify, Memory, Understand, Dictionary.

"Without grammar very little can be conveyed, without vocabulary nothing can be conveyed."

(D. Wilkins)

INTRODUCTION

In learning a foreign language, vocabulary plays an important role. It is one element that links the four skills of speaking, listening, reading and writing all together. Before they master the four skills they have to know some vocabularies to support them in learning English. Students only think of vocabulary learning as knowing the primary meaning of new words from the teacher or check the meaning from dictionary. Up till now, there has not been only one but a wide variety of definitions of vocabulary. In order to find the best and most easy-to-understand definition is such an unfeasible task. Each linguist or scholar, in his specialized field, with his own set of criteria has found out for his own way to define vocabulary. However, in the most popular way, Cambridge Advanced Learner's Dictionary Online has applied a meaning for vocabulary as "all the words which exist in a particular language or subject." This definition covers vocabulary's meaning on the whole. Nevertheless, it does not show vocabulary in a deep understanding. More

precisely, Longman Dictionary of Contemporary English presents six meanings of the word “Vocabulary” as follow:

1. All the words that someone knows, learns or uses.
2. The words that are typically used when talking about a particular subject.
3. All the words in a particular language.
4. The word failure/ compromises, etc. is not in somebody’s vocabulary used to say that someone never thinks of accepting failures, etc.
5. A list of words with explanations of their meaning in a book for learning foreign languages.
6. A list of the codes or terms used in a computer system.

The analysis of the words within the foreign language allows us to distinguish the following groups of words: concrete, abstract and structural.

Words denoting concrete things, actions and qualities are easier to learn than words denoting abstract notions. Structural words are the most difficult for Russian-speaking learners. The teacher should bear this in mind when preparing for the vocabulary work during the lesson.

Introduce words in sentence patterns in different situations of intercourse.

Present the word as an element, i.e. in a sentence pattern first. Then fix it in the pupils’ memory through different exercises in sentence patterns and phrase patterns. In teaching pupils vocabulary to the ear and the organs of speech should take an active part in the assimilation of words. Learners should have ample practice in hearing words and pronouncing them not only as isolated units but in various sentences in which they occur.

While introducing a word pronounces it yourself in content, ask learners to pronounce it both individually and in unison in a context, too.

In teaching words it is necessary to establish a memory bond between a new word and those already covered.

Perhaps the most important factor in a successful vocabulary-building program is motivation. It will be very difficult for you to study words month after month without a strong feeling that it is worth doing, that a larger vocabulary will help on the job, and that it can well lead to a more exciting and fulfilling life.

We identify four basic steps to a better vocabulary:

1. Be Aware of Words
2. Read
3. Study and Review Regularly

While there are not any magic shortcuts to learning words, the larger your vocabulary becomes, the easier it will be to connect a new word with words you already know, and thus remember its meaning.

1. Be Aware of Words

Many people are surprised when they are told they have small vocabularies. "But I read all the time!" they protest. This shows that reading alone may not be enough to make you learn new words. When we read a novel, for instance, there is usually a strong urge to get on with the story and skip over unfamiliar or perhaps vaguely known words. But while it is obvious when a word is totally unknown to you, you have to be especially aware of words that seem familiar to you but whose precise meanings you may not really know. Instead of avoiding these words, you will need to take a closer look at them. First, try to guess at a word's meaning from its context - that is, the sense of the passage in which it appears; second, if you have a dictionary on hand, look up the word's meaning immediately. This may slow down your reading somewhat, but your improved understanding of each new word will eventually speed your learning of other words, making reading easier. Make a daily practice of noting words of interest to you for further study whenever you are reading, listening to the radio, talking to friends, or watching television.

2. Read

When you have become more aware of words, reading is the next important step to increasing your knowledge of words, because that is how you will find most of the words you should be learning. It is also the best way to check on words you have already learned. When you come across a word you have recently studied, and you understand it, that proves you have learned its meaning. What should you read? Whatever interests you - whatever make you want to read. If you like sports, read the sports page of the newspapers; read magazines like Sports Illustrated; read books about your favorite athletes. If you are interested in interior decorating, read a magazine like House Beautiful- read it, don't just look at the photographs. Often people with very low vocabularies don't enjoy reading at all. It's more of a chore for them than a pleasure because they don't understand many of the words. If this is the way you feel about reading, try reading easier things. Newspapers are usually easier than magazines; a magazine like Reader's Digest is easier to read than The Atlantic Monthly. There is no point in trying to read something you simply are not able to understand or are not interested in. The important idea is to find things to read you can enjoy, and to read as often and as much as possible with the idea of learning new words always in mind.

3. Study and Review Regularly

Once you have begun looking up words and you know which ones to study, vocabulary building is simply a matter of reviewing the words regularly until you fix them in your memory. This is best done by setting aside a specific amount of time each day for vocabulary study. During that time you can look up new words you have noted during the day and review old words you are in the process of learning. Set a goal for the number of words you would like to learn and by what date, and arrange your schedule accordingly. Fifteen minutes a day will bring better results than half an hour once a week or so. However, if half an hour a week is all the time you have to spare, start with that. You may find more time later on, and you will be moving in the right direction. Teaching a word does not cause its automatic learning by the students. That is one of the first things teachers realize when they start teaching. It would be wonderful if finishing a unit of the course book meant that the students master all the words in it. Unfortunately, a lot of work (recycling, vocabulary notebooks keeping, memory techniques ...) has to be done before students thoroughly know a word. The activities which follow have been tested on students and provide a practical suggestion for a systematic approach to vocabulary learning.

In conclusion, teachers should prepare themselves for the following strategies and tactics for teaching vocabulary of Modern English, because foreign language training will be more efficient.

ABSTRACT

The article provides basic practical recommendations for working with landscape composition, explains the characteristics of individual methods used in this area. In small-scale etudes, small pieces are ignored, mostly in large color relationships. When performing landscape etudes, less complex plots are chosen (for example, a part of the house and yard). It then moves on to depicting an open-air landscape, complicating the task. Students need to be able to see the unique beauties of nature and art, to understand and comprehend the processes involved in depicting the landscape in them by gaining their boundless love for their homeland and to become its active participants.

KEYWORDS: *Landscape, Color, Composition, Proportions, Composition, Laws Of Perspective, Color And Color Relationships, Constructive Construction, Color, Plein Air.*

INTRODUCTION

Nature is incredibly attractive and beautiful. Sunlight and the environment create an infinite variety of colors.

Landscape is one of the most emotional genres of fine art. Beautiful landscapes enrich a person spiritually with their subtle effects.

Being in the bosom of Mother Nature is a constant source of creative ideas and inspiration. If an artist depicts a place imaginatively without deeply studying and analyzing the environment, the

work will not be fake and will not attract the audience. Regular creativity teaches the artist to feel delicate and to fully convey the color and hue features of a particular state of nature. The so-called adaptation of the eye (increasing and decreasing sensitivity of the eye to light) nature (nature) can create different impressions in different lighting. For example, when the nature observed in the sunlight is suddenly covered with clouds, all the colors change and appear darker.

THE MAIN FINDINGS AND RESULTS

In the process of performing landscape studies, it is necessary to see nature as a whole when working with comparisons and comparisons, otherwise it is impossible to correctly determine the color and color relationships of nature and achieve an attractive appearance of the study. When working with small-sketch small-sketches in the open air (plein air), it is important to first find the basic color relationships. To do this, it is necessary to compare the contrasting (colored and colored) spots on the front view of nature with respect to the distant ones. In small-scale etudes, small pieces are ignored, mostly in large color relationships. When performing landscape etudes, less complex plots are chosen (for example, a part of the house and yard). It then moves on to depicting an open-air landscape, complicating the task. In such studies, the main focus should be on events in the air perspective, such as color vision and saturation in the landscape. This is achieved through a holistic perception by comparing all aspects of the landscape.

For example, the river bank in the front view is compared with the second and distant view, as well as with the reflection of the sky and its water at the same time (the study time can be 15-30-60 minutes).

“... It is necessary to describe the etude in such a way that suddenly it is necessary to understand the nature of the relationship between earth and water in relation to the sky”, - said the famous artist M. Nabiev to his students. He himself was a master at building basic color relationships in etudes.

The purpose of short-term studies can be different: in one case the study is performed before long-term work, which analyzes the color relationships in nature and determines the first impressions of its color, in another - its small parts (study of the human hand) for additional and more detailed study; some parts of the landscape) are determined. In order to thoroughly study some of the laws of painting, studies are performed in field practice: the general state of illumination, the integrity of color, and so on. When describing a landscape etude, the light always changes frequently. Even if the sun is behind the clouds, it has a direct effect on the landscape, as the light status in the landscape is always different at the beginning and end of the session.

“Look for commonalities, said I. Levitan, “Painting is not a decision, it represents nature in paintings”. Look for a common color in the play without being distracted by details and details” [1, p. 139].

It is very important to keep the overall hue and color state in the landscape painting. When describing a landscape etude, the most important thing is to choose the right color and color relationships, for example: earth, sky and water. If the overall hue and color status is not taken into account, the colors in the image may intensify in terms of hue strength and color. When the etude is running in cloudy weather, pure white and light saturated dyes are used. In winter,

before evening, for example, the snow is not so white, but in the eyes of an inexperienced artist it can be painted in white, lush green leaves or grass in any blue weather in summer. As a result of such an error, the most important thing in a landscape study is that the state of the environment does not exist. After all, this is what determines the effect of the scene on the mood and emotions.

The great “colorists” have always treated the relationship of dyes with the general state of nature and colors. Well-known artists O.Tansiqbaev, R.Akhmedov, A.Mirzaev, I.Levitan, N.Korovin skillfully depicted the grass, clouds and trees in the etude with the help of a single general paint, whose material originality, color and charm still amaze many. This is because the criteria for the general state of color illumination in their etudes were created with proper consideration.

It is important to look at landscape objects and objects as a whole during the painting process. During practical work, the first appearance should be done in bright colors, and the subsequent appearances should be blurred. Only a holistic view can accurately identify and describe the perspective dimensions of the landscape, their color relationships in different appearances.

When expressing the color relationships of nature, it is also necessary to take into account the unity of colors, which creates a spectral system of illumination. In the morning, nature is dominated by golden-pink colors, and in the evening - yellow-orange, and on a cloudy day - neutral silver colors. Warm green colors always prevail in the forest. On a moonlit night, gray-blue and green colors are observed.

In the process of working from nature, the artist must achieve the integrity of color and color harmony, without observing the proportions of color relationships, the balance of the overall color and hue state. Students need to be able to see the unique beauties of nature and art, to understand and comprehend the processes involved in depicting the landscape in them by gaining their boundless love for their homeland and to become its active participants. In the process of landscaping, students learn its simple laws (linear and aerial perspective, the laws of color, composition) both theoretically and practically. In this way, students gradually awaken a love for the nature of our country, its unique hills, gardens, wildlife and landscapes.

Landscape is a work of art that reflects the natural appearance of fine art. It depicts real, imaginary places, cityscapes, and so on. Landscape is one of the ancient genres of fine arts and plays an important role as a medium in both historical and everyday works [4.-444].

In particular, the landscape genre serves as a key tool in shaping students' professional interest in the fine arts. Initially, landscape as an independent genre played an important role in the medieval fine arts of ancient China. In Europe, the landscape genre was well developed in the XVI-XVII centuries, while in Russia the landscape genre developed in the XVIII century. In particular, the architectural monuments of Moscow and St. Petersburg were masterfully depicted by the artist F.E. Alekseev [2. -26].

In the second half of the 19th century, the genre of realistic landscape flourished. During this period, I.Shishkin, A.Savrasov, I.Levitan, V.Mashkov and other artists created significant works.

The landscape genre was highly represented in Central Asian miniature art, including Middle Eastern art. Especially in the short works of KamoliddinBehzod, the landscape is masterfully designed [5.-43].

The real development of the Uzbek landscape genre dates back to the twentieth century. During this period, rare specimens of the landscape were created in the art of the bench. During this period, P.Benkov, U.Tansiqbaev, N.Karakhan, A.Mirsoatov and other artists in their works of art, for example, U.Tansiqbaev's "Hot Lake", "Motherland", "Kayrakkum Reservoir", N.Karahon's "Nanay Way", "Spring in Sijjak", R.Temurov's Samarkand architectural landscapes, revealing the secrets of love for nature and beauty. Nowadays, many talented artists, including A.Nuriddinov, O.Kozakov, A.Muminov, paint charming landscapes glorifying nature [3. -27].

There are several types of landscape: urban (architecture), rural (mountains), and industrial (factory, factory memorial constructions) landscape genres. At the heart of each of these lies a unique content, an idea. For example, in the urban landscape, urban life, tall buildings, vehicles, parks, underground passages, rural landscapes, vast expanses, rocks, pastures, mountains, plants, gushing waters, bridges naturally attract students. In the lyrical landscape, the seasons of nature, such as "Early Morning", "Spring", "White Snow", "Golden Autumn", we imagine works that reflect the subtle, serene beauty of nature, its state of awakening, and bring joy to man. The image of reality and the view of nature surrounding the human being are reflected in the landscape. In this sense, the landscape acquires an emotional appearance and ideological content [1, p. 28].

Landscape genre plays a special role in shaping students' professional interest in fine arts. Because every student who goes out into the bosom of nature strives to portray nature as he knows it. The process of landscaping in the visual arts requires the following practical exercises:

- All the observations of students related to the process of drawing a landscape form their initial ideas;
- learns the laws of horizon, point of view, field of view, aerial perspective, image plane, light and shadow in landscape work.

At the same time they study the shapes of branches and trees in the object being depicted, the features of the anatomical structure of the animal world, the depiction of the appearance of mountains and rocks in realistic images. Drawing such themed images is done in different seasons of the year using different materials: album, colored paper, watercolor, simple black pencil, colored pencils, felt-tip pens, colored chalk.

In the visual arts, it is especially important to teach students to choose an extremely interesting plot space to draw a landscape in their spare time outside of class in order to convey the scene live. Distinguish the main points of the landscape first on paper, then the perspective horizon, point of view, work with colors, distinguish light and shadows, express the process of landscaping by choosing the right, place the landscape on paper, how light falls on trees and plants in the landscape and nature should be able to describe the clarity of its early morning colors. Perspective and choosing the right color in landscape work leads to the enrichment of students' creative thinking and imagination. Observations in the natural landscape show that attempts to reflect the beautiful nature that surrounds us serve to shape individual characteristics in students. For example, choosing the right horizon line, painting colors correctly, and so on.

Students need to choose the right size of the composition in order to increase the effectiveness of the composition in the image. It is especially important to choose the right perspective and

composition, as well as the right choice of color in the process of drawing a landscape. Working with paints is a complex process in landscape painting. To properly organize the work with paints, it is necessary to have the necessary methodological recommendations, the necessary knowledge, skills and qualifications. When painting a landscape, the brightness of the colors, the light-shade, is influenced by the light that falls on the colors. The farther away the light effect, the brighter the colors, and the closer they get the darker and brighter they appear.

Therefore, the student should not be exposed to light and make a mistake in choosing a color. Sometimes, he can get upset about his mistake and lose his self-confidence. In addition, the colors are light and dark depending on the seasons. Colors are also referred to as warm and cool shades in nature. For example, when describing a tree in nature, it is incorrect to paint it in a single green paint. Because the color of the tree changes under the influence of light, under the influence of shadows, under the influence of things around it. Therefore, it is necessary to teach the student to use a mixture of different colors when painting a tree.

CONCLUSION

Working in watercolor helps students develop their creative abilities, color perception, artistic taste, and imagination of size and spatial breadth. When teaching students to draw landscapes, they should be taken out into the yard or gardens. Drawing outdoors (plein air) is very different from drawing indoors. When out in nature, the student faces problems with depicting the landscape. As a result of this problem it is possible to observe the complexity of showing the perspective, that is, the air perspective in a correct, holistic depiction of the visible landscape, the choice of color, the ability to find interesting motifs and compositions.

Thus, in order to form the professional interest of student youth in the fine arts, the choice of the genre of landscape in the first place allows to achieve the intended goal faster. Its development and history are also important in imagining the genre of landscape. One can feel how much fun it is to teach students to describe the beauty of nature and its fascinating aspects.

In particular, it is advisable to carry out the process of landscaping during practical training. Students must master the laws of horizon line, point of view, field of view, weather perspective, image plane, light and shadow in landscape work. Therefore, it is important to convey the visual arts genres live to students. In particular, it is important to distinguish the most important things in the landscape, to place them on paper first, and to remember the sequence of subsequent processes. Developing the ability to see the landscape as a whole and compare all parts of nature equally is an important issue in painting education. If an amateur artist does not incorporate these issues into himself, he will not be able to achieve positive results in his future work. Being able to work with knowledge and relationships as a whole sets the most skilled artist apart from the amateur.

FORMATION OF ART AND AESTHETIC COMPETENCE IN FUTURE FINE ART TEACHERS

Nilufar Ibrohimovna Yuldasheva*

*Teacher,
The Department "Fine Arts and Methods of Teaching",
Tashkent State Pedagogical University named after Nizami,
UZBEKISTAN

ABSTRACT

The peculiarity of the training of future teachers of fine arts in the article is the formation of professional skills in working in the field of fine, decorative and applied arts in educational institutions and teaching fine arts. Because the quality of performance is important, if the evaluation of creative work and the criteria for it are clear, then the formation and evaluation of pedagogical competence is also a topical issue for the teacher of fine arts.

KEYWORDS: Competent, Innovative, Motivational, Strategic, Conceptual, Aesthetic, Communicative, Prognostic, Constructive, Didactic, Gnostic, Organizational, Expressive, Substructure, Emotional, Therapy, Image, Associative, Individual, Graphic, Epistemological, Cognitive, Reflexive, Composition, Element, Museum, Galleries, Architecture, Context, Synergetic, Productive.

INTRODUCTION

At present, one of the important conditions for improving the quality of education in the normative documents on education is the formation of ethical principles and standards for the purpose of spiritual upbringing of the individual; the need to make greater use of the moral potential of art as a means of development is often mentioned. This requirement is art pedagogical education, which forms the aesthetic culture of the younger generation; it is based on a strategic plan in the field of teacher training and is directly related to the purpose of the main professional education program in the field of training students in the field of fine arts: training of professionals capable of effective artistic and aesthetic activities in educational and cultural institutions.

Students of pedagogical higher education institutions in the field of fine arts methodology should have a spiritual and aesthetic orientation, which are clear criteria for assessing the beauty of art and the surrounding world. Prospective teachers of fine arts should not only master the basics of pedagogical skills, rather, they should also be promoters of aesthetic culture. Therefore, the concept of professional and aesthetic training of future teachers of fine arts today has its own content and structure, a special need to identify opportunities for its formation in the context of the higher education process.

THE MAIN FINDINGS AND RESULTS

Problems of professional preparation for pedagogical activity have been studied as the object of many researches. In particular, H.Abdukarimov - the education of the teacher in the process of continuous pedagogical education [1, p. 46], A.J.Ajibaeva - the introduction of a person-centered approach to the education of future teachers [2, p. 23], D.N.Arzikulov - the psychological features of professional development [3, p. 22], R.Kh.Djuraev - organizational and pedagogical bases of professional training [4, p. 43], Sh.N.Majitova - integrated development of the future teacher in the process of professional training [5, p. 172], Sh.K.Mardonov - training and professional development of teachers on the basis of educational values [6, p. 302], N.A. Muslimov - pedagogical bases of professional formation of the teacher [7, p. 315], B.H. Rakhimov - formation of professional and cultural relations in the future teacher [8, p. 160], M.B. Urazova - preparation of future teachers for project activity in the process of professional education [9, p. 287], N.M. Egamberdieva - personal and professional socialization of students [10, p. 332], F.R. Yuzlikaev - acceleration of didactic training of future teachers [11, p. 303], S.R. Zoxidova - improved the process of professional socialization of teachers [11, p. 303], and others have conducted research in this area.

A.S. Puni emphasizes that readiness for pedagogical activity is no different from any other activity, which means that an individual has confidence in his abilities, understands his motivation and all actions are aimed at achieving goals. This idea is certainly somewhat controversial, because in our view, training is a much more complex category than simple actions, and is a multi-stage, multi-faceted system, the essence of which is determined by the specific characteristics of the activity [12, pp. 123-128].

The versatility and complexity of teacher professional training compels researchers to explore the essence of the concept of teacher training. For example, K.K. Platonov considers professional training for pedagogical activity as an integral part of personality. He concluded that the beginning of its formation corresponds to the subtraction of experience, that is, it depends primarily on knowledge, skills and abilities [13, pp. 68–78]. M.T. Mirsolieva professional training, the ability of the professional to organize specific and team research; noted that it is possible to include qualities such as the ability to see an innovative future, self-organization and self-development [14, p. 225].

F.R. Yuzlikaev, N.M. Egamberdieva, Sh.R. Urakov and others interpreted the concept of “readiness” on the basis of emphasizing the multifaceted nature of pedagogical activity by functionally differentiating the tasks of the teacher's professional activity [15, p 303]. Thus, “readiness” is considered by scientists as a prerequisite for the success of any activity. It includes not only conscious relationships, but also equally important tasks, possible behavioral patterns;

determination of the optimal method of activity, involves assessing their own capabilities, as well as achieving a specific outcome.

V.A. Slastenin gives the most complete description of professional training for pedagogical activity, as well as shows its multifaceted nature. Preparatory criteria included: the ability to identify or perceive oneself with others; a psychological state that reflects the dynamism of the individual, the richness of the spiritual world, independence, entrepreneurship; emotional resilience; professional-pedagogical thinking based on the understanding of success and failure as the search for the necessary cause-and-effect relationship; ability to predict outcomes [16, p. 224].

Thus, the analysis of the scientific literature on this issue allows us to draw certain conclusions. In particular, vocational training is the result of activities by researchers; quality that establishes an attitude to the solution of problems related to the professional situation; conditions for targeted activities; included in the general direction of his actions and, despite some similarities in preparation and attitude, the configuration of the subject's activity was interpreted as the active state of the person arising from the type of activity with a complex structural basis.

The definition of preparation for pedagogical activity in the scientific literature is interpreted in terms of a research approach. Therefore, several types and forms of preparation for activities are distinguished: personal, professional, psychological, ethical, motivational and others.

Many scholars emphasize the importance of personal training in pedagogical activities, because "... a person's readiness implies an attitude to the profession, ideological maturity, broad and systematic professional-subjective competence, didactic needs" [17, p. 19].

Indeed, a teacher's professional readiness stems from the presence of personal qualities such as knowledge, goal setting, thinking, instinct, improvisation, observation, cheerfulness, intelligence, prediction, and reasoning. Note that preparation is dynamic in nature, and many personal qualities of a person can develop and replace existing ones with new ones. It should be remembered that training is a set of human qualities, the formation of which also depends on the acquired knowledge, so it should be based on modern knowledge and good practical training.

When studying the issue of preparation for pedagogical activity, many scholars emphasize that future educators should have a certain attitude towards mastering the knowledge and skills necessary for them to work as teachers. In our research, we understand attitude as a stable desire, a necessity for self-improvement. Therefore, in the preparation of a future teacher of fine arts, it is necessary to pay great attention to the satisfaction of pedagogical activity. This is done through the teacher's desire for self-improvement.

The views of scholars on the structure of this process are also important in the study of preparation for pedagogical activity. Sh.Urakov proposed the following structure on the components of professional training: motivational, operational and reflexive [18, p. 48].

The structure of the teacher's readiness for pedagogical activity is the ability to master teaching and learning technologies; development of pedagogical consciousness (I-concept, T-concept of upbringing, and F-concept of activity); mastering pedagogical techniques; communicative, cognitive, prognostic, constructive, didactic, gnostic, organizational, expressive pedagogical skills.

In summary, there are three components to a teacher's professional readiness:

Firstly, the creation of a foundation in the form of solid knowledge;

Secondly, the formation of personality qualities, abilities, priorities, which are reflected in the interaction with students, colleagues and the pedagogical process;

Thirdly, that there is a solid foundation for self-development.

It should be noted that the above considerations are not perfect for some specialties, for example, for teachers of fine arts, because the requirements for the training of teachers of fine arts should be determined by its area of activity.

According to its qualification description, the specialty of a teacher of fine arts is aimed at artistic and aesthetic education of students, which serves the socialization of the individual by allowing him to know the world of human civilization, as well as self-awareness and self-expression [19, p. 346].

A separate component of fine arts includes the works of art itself, elements of art criticism, the theory of fine arts, the study of applied drawing. The fine arts introduce students to a variety of disciplines such as painting, graphics, sculpture, architecture and art and crafts. The content of the subject "Fine Arts" is aimed at shaping the perception and study of works of fine art, the development of a creative approach to the surrounding reality and children's art. Fine arts classes are directly related to the surrounding realities: promoting aesthetic perception of the world; shaping the ability to observe beauty; distinguish between aesthetic phenomena in reality and works of art; to have an active aesthetic attitude to reality by the teacher-students by directing them to analysis and classification, teaches to apply artistic skills in practice in the process of study, work, social activity.

The main purpose of fine arts in school is not only to acquaint students with works of art; rather, it is to develop their spirituality, their ability to see and appreciate beauty in art and life. The effectiveness of fine arts in the aesthetic education of students will be high. Fine arts not only form an aesthetic ideal, but also develop the creativity of schoolchildren by combining the qualities of aesthetic taste, appreciation of beauty, understanding and creation, intensive influence on the intellectual, emotional and volitional sphere of the learner.

We have identified three components of a future fine arts teacher's artistic and aesthetic preparation for professional activity.

Artistic-aesthetic education includes students' conscious aesthetic attitude to reality and art, expressed in the generality of aesthetic ideas, theories, views, evaluation criteria. At the heart of aesthetic consciousness is the socially conditioned notion of perfect beauty in nature, society, man and art, the ability to evaluate various objects, events, life situations and works of art in terms of personal artistic and aesthetic taste - the aesthetic ideal.

Artistic-aesthetic education has a great impact on the inner world of the individual in educational activities, creates a diverse and complex experience. At the same time, aesthetic feelings, needs, and ideals stimulate socially useful activities, shape beliefs, and motivate people to fight against things that hinder their realization. This is the main educational function of art.

COCNCLUSION

Educational activity as a form of social artistic and aesthetic education is a source of bright and unique knowledge of both lifestyle and its spiritual content. The study of a number of disciplines of higher education through works of art is always carried out in a deep and thorough manner, as it activates the whole system of emotionally enriched clear-image thinking. It is through this that the cognitive and pedagogical functions of educational activity in artistic and aesthetic education are manifested. For example, in order to understand and comprehend the spiritual world that exists in works of art, it is necessary to have a great moral outlook, an emotional culture, a keen understanding. To do this, it is important to strive to develop students' aesthetic consciousness on the basis of outstanding masterpieces of local and world art in the educational process.

The purpose of art and aesthetic education of students of higher education is to form the moral and aesthetic humanistic ideal of all-round development, the achievement of which is to ensure the emergence of artistic and aesthetic development, artistic taste, productive figurative thinking. As a form of thinking, the artistic image gathers complete information about nature, society, social relations, and social consciousness. With the help of artistic images, a person thinks, comes to new generalizations and conclusions.

Based on the above, it should be noted that the process of formation of professional and aesthetic training of future teachers of fine arts should be carried out taking into account national characteristics, ethnic traditions, which are directly involved in the aesthetic and cultural activities of students.

RAUF PARFI AND WORLD LITERATURE

Olim Oltinbek*

*Associate Professor,
Candidate of Philological Sciences,
Tashkent State University of Uzbek Language and Literature named after Alisher Navoi,
UZBEKISTAN

ABSTRACT

The article is aimed to analyze the views of the Uzbek poet Rauf Parfi on the twentieth century world poetry and its representatives. In particular, analyzed his views on creativity of P.Neruda, R.Tagor and N.Hikmet. In addition, considered R.Parfi's translations from world poetry and draw appropriate conclusions.

KEYWORDS: Pir – Old Man Who Gives Advice, Arabic, Persian, Turkish, Petrarch Path, Sonnetism, Sonnetry, Santiago, Isla Negrada, Thakuriya, Kishpra, Muktibodhduosi

INTRODUCTION

Rauf Parfi's acquaintance with examples of world literature began very early. One of the reasons for this was his first teacher in literature - Abdurahmon Vodili. The poet's article "Oppression and Poetry" reveals his knowledge of the literature of classical and modern Muslim nations, as well as Arabic, Persian and Turkish languages: "At the end of Vadili's life, he translated Abdurahman Jami's treatise on mysticism from Persian; Muhammad Hadi's "Alvohiintiboh" in Azerbaijani; Abdurahman al-Kawkabi's book *Zulm* was translated from Arabic into Uzbek.

*I enjoyed reading the Russian edition of Abdurahman al-Kawkabi's *Zulm*. At that time (1963-64 - O. O.) I searched for and read the works of Evgeny Evtushenko, Andrei Voznesensky, Alexander Solzhenitsyn, Andrei Sakharov, Viktor Sosnora, Abdurahmon Avtarkhan and others" [1, pp. 187–188, 189]. It turns out that the poet became acquainted with some of the latest, and even banned, literature of that period during his student years. But the poet's acquaintance with world literature was not limited to these.*

THE MAIN FINDINGS AND RESULTS

One of the creators of the world that Rauf Parfi fell in love with was William Shakespeare. In 1965, the poet wrote a poem "Hamlet" consisting of three sonnets. The author of the poem: "My

contemporary, the tormented Hamlet, Oh, my friend, see the bloodthirsty in the world, this pen is weak, the imagination is weak” [2, pp. 15-16], sympathizes with the hero of Shakespeare. In the poem, the English classic poet says: *“Don't die! Have mercy on the world, zealous...”*

There are two paths in world sonnetry: one is the Petrarch path (classical sonnet), the other is the Shakespeare path (free sonnet). R. Parfi followed Shakespeare's path in sonnetry, in which he raised Uzbek sonnetism to the stage of maturity. For the rest of his life he remained an ardent fan of Shakespeare. He epigraphs the lines *“Eyajal, jonimnitezolg'ilfaqat, yolg'ongaqulemish, yorab, haqiqat - O death, take my soul quickly, only to be a slave to lies, O Lord, the truth”* to another poem. In the last years of his life (2003) Shakespeare translated the first sonnet in his book of sonnets. Since this sonnet, which is kept in the poet's own handwriting, has not yet been published, we have found it necessary to quote it here in full:

A garden of sophistication that will never die,
We expect fruit from the original vine,
When the buds open, the army is sad
The flower is a shed, and we will pass.
And you are fascinated by yourself,
He will renounce the exalted virtue from you.
If perfection leaves - you are disabled, you are happy,
You stab yourself, stab yourself.
You are the ambassador of spring, the transient,
You are a death; you decorate yourself only for this day,
Will he die without opening his face?
You were not out of jealousy.
Have pity on yourself, laugh out loud,
Let the buds open, let the flowers bloom.

Another poet who gave Rauf Parfi a great deal of pleasure and inspiration was George Byron. “Manfred”, a genius of English romantic poetry, was translated by R. Parfi. Literary critic N. Rahimjanov in one of his articles quotes from the conversation with the poet: *I really liked Manfred. You know everything — there's actually nothing. The spirit in him is very high and special. Close to my soul. It has such free thoughts that you will enjoy and freeze. Manfred is a terrible image. Manfred is a free man, submissive to nothing. And he does not recognize the appearance of any muteness...* [1, pp. 187–188, 189].

Rauf Parfi's spiritual closeness to Byron's personality and poetry is also evident in his poem “Byron's Last Journey” (5). This trip also attracted the attention of the world literary community in its time. W. Scott wrote his articles “Death of Lord Byron”, V. Hugo “About Lord Byron”, A. Pushkin's poem “To the Sea”, as well as poets such as V. Kuchelbeker, K. Rileev, D. Venevitinov. All this was written in 1824, when the poet died. 152 years later (1976), the Uzbek poet Rauf Parfi also addressed this issue.

In 1823, the national liberation movement had begun in Greece. Byron, an ardent fan of ancient Greek culture, considered it his human and creative duty to take part in this struggle. Before his death on April 19, 1824, he said: “*I gave him (Greece - O. O.) my time, my property, my health - can I do more than that? Now I will give him my life*”. The feeling that captivated Rauf Parfi's heart was Byron's participation in the national liberation movement.

Representatives of world literature, to whom Rauf Parfi refers, stand close to the poet in three respects: either with a sense of Freedom, or with the sorrow of the Homeland, or with aesthetic principles. Sometimes all three of them came together. The Chilean poet Pablo Neruda Rauf Parfi is associated with each of these ties. That is why our poet had great respect not only for his poetry, but also for his personality. His poem “On the Death of Pablo Neruda” is proof of this. In the poem, R. Parfi describes it as “the white dawn of Chile”, “the endless sky of freedom”, and even the sun of the sky of freedom. Sadly, he was killed: “*The black devil with a black torch was killed*”. Our writer AskadMukhtor wrote about this tragic event: “On the day Nazi planes shot down Santiago, he was in his studio in the seaside village of Isla Negra, a hundred miles from the capital. The junta, which was always afraid of the poet, got it that day, the village telephones and communication lines were immediately cut off ... Fascism is always afraid of poets. It has always been that way. Fascism fears the poet even after his death. Carabinieri were placed on the threshold of Neruda, who was lying on his deathbed. His friends, relatives, and even the innocent Matilda (his wife - O. O.) were not included with him. They were afraid that any words of the poet would burst into the world.

Severe illness and the tragedy of the country took the poet out of life in a week. That night, the Nazis invaded his home in both Santiago and Isla Negra, vowing to destroy all traces, creations, heritage and libraries of the fiery furnace to the last leaf, to the last word...

The next day the coffin of the great poet could not be left in the house: the rooms were filled with water. The coffin was placed on a few bricks in the street” [4, pp. 221–222].

The events of September 23-24, 1973, resonated in the heart of an Uzbek poet living millions of miles from Neruda. Rauf Parfi assesses the situation as follows:

The evil devil, with the black torch in his hands again,

Darkness is the white dawn of Chile.

They broke in pieces.

They took a bloody stab, Pablo.

They wanted to orphan the freedom, only.

They orphaned themselves again, Pablo.

Rauf Parfi had translated six poems by Pablo Neruda. A poet who has no commonality in nature and feelings cannot enter the literary world of another artist. Pablo Neruda in his Nobel speech:

“The duty of poetry commands me not only to be acquainted with beauty and harmony, wonderful love and boundless sorrow, but also to demand that human cruelty be a part of my poetry” [5, p. 68], which also applies to Rauf Parfi's literary and aesthetic views; it should be noted that it is not alien.

“Enough, I have three pirims”, says Rauf Parfi in an article, “Yassavipirim, Navoipirim, Thakur pirim” [6, p. 192]. The poet has never honored any of the representatives of world literature to such an extent. The Yassavi and Navoi are, without a doubt, the unchanging beacons of our national-spiritual path. Thakur, on the other hand, is a genius who illuminates the ways to free his nation from oppression. He is a mentor to Rauf Parfi not only for his love for his country and nation, but also for his courage in the cause of national liberation of this country.

In one of Robindranath Thakur’s poems: Oh. India, mother, my songs are for you, our heart is yours - what else do we have, - says Rauf Parfi: He wrote like this,

*Oh, mother Turkistan, I sing burning,
You gave me the courage of the world.
I now understand the Turkish World,
Behold, I am ready to die, -*

The great Indian poet: “I have never lied in my poems”, said the Uzbek poet. “Lying is the cousin of talent”, he said. The soul of a poet who writes a lie will die. So, Thakur is a teacher of Rauf Parfi to everything from patriotism to the principles of creation.

Our poet's first poem about Thakur was written in 1973. After this poem, entitled “The Rain of Thakur and Srabon”, he also wrote “Quotes to Thakur” (1993) and “The Last Poem of Thakur” (2003). At the end of his life, he announced that he was working on the series “Thakuriya”. All these were examples of Rauf Parfi's respect for the “great Indian”.

Another Indian poet is Muktibodh. Fans of Rauf Parfi know the name as the title of one of the poet’s poems. SharachandraMadhavMuktibodh (1921–1964) was one of the twentieth-century Indian writers. The collection of poems “Sign of New Days” (1949), a collection of short stories “Kishpra” (1954) and the novel “Border” (1962) were published. A nationalist writer who enriched Indian poetry with new forms. Rauf Parfi's poem “Muktibodhduosi” is associated with the name of this artist. The poet in the poem: If he had not uttered the words,

*When dawn breaks in my country,
When will the grief be over?!*

through the Muktibodh prayer, he would not have been able to utter them in his own language in 1981, when the Soviet knife was naked.

In general, Rauf Parfi used this method a lot. Most of them are associated with the name of a creator. Most importantly, there is emotion, destiny, and fellowship between that creator and the poet. In this way, Rauf Parfi both introduced the reader to his own pain and introduced him to a painter we do not know in world literature.

In 1913, the poet BerdiRahmat published a memoir about Rauf Parfi entitled “Holidays of Poetry”. In the article, the author dwells on the poems in the poet's book “Memory” and continues: “One of them is from the language of the twentieth-century Japanese classical poet Ishikawa Takuboku. Only five lines:

I'm sorry
 From liquid stones
 I want to build a dahma
 To myself
 Have your own body inside.

The reason for this poem is that I am interested in Japanese poetry. In general, it was Rauf Parfi who interested me and my peers in the work of world poets" [10, pp. 166–167]. Indeed, it is. But Rauf Parfi not only introduced us to world poets and their works, but also to the genres of world poetry.

There are such poetic genres in modern Uzbek lyric poetry that have entered the world literature, the legitimacy of which in the heart of our national poetry is directly related to the work of Rauf Parfi. These are rondo ("Goodbye ... Playing butterfly ..."), rondel ("It's a sad night"), tanka (fives), and hokku (threes). And the sonnet also reached the stage of maturity in Uzbek poetry through the pen of Rauf Parfi, and his unique classical samples were created. Also, a number of poetic methods and figures related to world poetry have been created in the poet's work - this is a separate research topic.

CONCLUSION

Rauf Parfi introduced the Uzbek reader to the representatives of world literature in two ways: first, by informing them (in poetry, articles and literary conversations), and second, by translating his works. The poet's translation includes one epic (N.Hikmat's "Landscapes of Man"), two epics (M.Hodi's "Sounds of Life", A.Tvardovsky's "Right to Memory"), one dramatic epic (Byron's "Manfred"), three plays (Ya. Solovich's "Silver Lion", G. Oster's "Greetings to the Monkey", U. Sarayan's "Who's There?"), Two stories (E. Gutsalo's "Meeting", T. Miura's "River of Patience"), as well as three world poems. It is known that there are about a hundred translations. (This list could be expanded). Some of them have not been published yet. These sources provide only an overview of Rauf Parfi and world literature. In fact, the coverage is much larger. In particular, the study of the poet's work and translation activities in connection with the literature of the Turkic peoples, Russian literature, and even the literature of the Baltic peoples is a separate research topic.

SOCIO-POLITICAL LIFE AND GHULAMZAFARI'S WORK IN TURKISTAN IN 10-20S OF THE XX CENTURY

Olim Usmonov*

*Associate Professor,
Candidate of Philological Sciences,
Tashkent State University of Uzbek Language and Literature named after Alisher Navoi,
UZBEKISTAN

ABSTRACT

The article tells about the literary environment in which Ghulam Zafari lived and tried to take a new look at the scientific, literary, socio-political life of our country in the 10th and 20th centuries. There are also different views on the study of literary and social life in this period. He realized that the only way to free him from this bondage was to ignite the fading feelings of patriotism, freedom and enlightenment in the hearts of the nation. This required progressive ideas that could lead the nation forward, and devotees who would spread and implement those ideas among the people. The authors of the Workers' World magazine were a group of patriotic Jadids who published works that mainly sang about the freedom and liberty of the Motherland, as well as supporting the Turkestan Autonomy.

KEYWORDS: *Jadidism, Literary Environment, Socio-Political Life, Enlightenment.*

INTRODUCTION

Ghulam Zafari began his literary and social career at a time when the Jadid movement was gaining momentum in Turkestan. Close acquaintance with the leading intellectuals of the time "Tarjumon" published in Bogchasaroy, "Vakt" newspapers published in Ufa; as well as his regular acquaintance with the enlightenment-revolutionary works in the newly emerging local publications in Turkestan, which aroused in him a feeling of love for the Nation and the Motherland, grief for its bitter fate, and struggle for it. He returned to Tashkent from Osh in late 1913 and continued his teaching career. During this period, more precisely, on January 15, 1914, a bright event took place in the cultural life of Turkestan. On the same day, Mahmudhoja Behbudi's play "Padarkush" was staged: a new European-style theater was born in Turkestan and began to develop rapidly. The desire to create a new Uzbek theater has long been in the minds of

many Jadids. The Tatar and Azerbaijani peoples have had such a theater for a long time, and they also went on tour to Turkestan. Ghulam Zafari later wrote: "From 1912, theater enthusiasts began to appear among the youth. These amateurs learned from the European-style theaters of our Russian, Tatar, and Azerbaijani brethren in our country" [1, p. 12].

THE MAIN FINDINGS AND RESULTS

Ghulam Zafari joined the Turon troupe in late 1913, founded by Abdullah Avloni [2, pp. 60–71]. From then on, his life and work were forever connected with the theater.

The troupe formed by Avloni was in close cooperation with the Tatar and Azerbaijani theaters. During the first years of the troupe's activity, it was assisted by representatives of the Tatar and Azerbaijani theaters. The troupe opened its first act with the play "Padarkush". The play was staged by Azerbaijani director Aliaskar Askarov. The troupe has since performed a number of enlightening works. These are mainly the works of Abdullah Avloni, N. Qudratulla, Hamza, Abdullah Qadiri and Tatar, Azerbaijani and foreign playwrights, in which Ghulam Zafari played various roles.

In the 10s of the last century, the Azerbaijani theater toured Turkestan several times. These works, which reflect the heart and soul of the Azeri people, whose language, religion and traditions are close, have become very popular among the Uzbek people. Musical dramas, in particular, have won the love of the people. Ghulam Zafari, who is naturally fond of music, also wanted to get acquainted with these works and work with Azerbaijani directors. Many of his later musical productions, including the famous Halima drama, have been influenced by performances by the Azerbaijani theater. The author himself wrote: "At the beginning of 1916, Sidki Ruhillo from Baku, Ahmadbek Kamarlensky and Yunus Narimonov came and showed our young theater enthusiasts how to play" [1, p. 12]. In the Azerbaijani theater's performances in Turkestan, such as "Layli and Majnun", "Husband and Wife", "Asli and Karim", "Mashodilbod", "Arshin Mololon", the struggle between old and new, ignorance hindering the development of the people, the issues of bigotry, the backwardness of the social system were raised, and the ideas of marriage based on love and the struggle for women's freedom were expressed. It can be said that Azerbaijani enlighteners, especially theatrical figures, have a worthy place in the development of the Jadid movement in Turkestan.

Participation in the Turon theater troupe was a school for Gulam Zafari. Here he not only learned the secrets of the theater, but also got acquainted with the ideas of Jadidism, and was in close creative contact with its leading representatives. Ghulam Zafari, who was well acquainted with Jadids such as Abdullah Avloni, Fitrat, Cholpon, Hamza, as well as Tatar and Azerbaijani enlighteners, was a creative collaborator and regularly followed the new press, was well acquainted with the policy of the tsarist government. He realized the subtleties of his policy towards the Muslim peoples, including the people of Turkestan. Through independent readings, creative interviews, and careful observation of life, his political knowledge and outlook grew, and he understood the reasons for the social backwardness and backwardness of his people. He believed that the main reason for this was the disease of the nation, which was left in the grip of ignorance and superstition. He realized that the only way to free him from this bondage was to ignite the fading feelings of patriotism, freedom and enlightenment in the hearts of the nation. This required progressive ideas that could lead the nation forward, and devotees who would spread and implement those ideas among the people. Ghulam Zafari devoted his entire life to this

noble idea, to the struggle to see his people free and happy. His poems and articles, published since 1914 in such publications as “Oyna”, “Sadoi Fergana”, “Al Islah”, once spread the light of enlightenment to the whole world, and in recent times the people of Turkestan have become a swamp of ignorance and superstition. It is in the spirit of encouraging the people to enlightenment that it is mainly enlightened and propagandistic. In his poem “O Science”, the poet addresses science directly and asks him to enlighten the people of Turkestan, who are in the darkness of ignorance:

O science, who has alienated you from us at this moment,
You were a Muslim in the past.
We are left in a house of ignorance, a roof of ignorance,
Now come and get rid of this ignorance.

Until 1918, the poet published his works under the signature of “Mullah Ghulam Zafari from Tashkent”. This indicates that he was a man of faith, a regular believer in the religious literature that had been published and was being published up to that time. This can be seen from the author's 1915 questions to “Al Islah”. Some of the problematic issues in his commentary on the Qur'an by one of the Tatar scholars, Muhammad Kamil Mutei, and his question to the editors about the confusion have led some to argue about the fate of non-believers and disbelievers in the Hereafter. The presence of I ask our scholars to answer these questions in the “Islah” magazine, because everyone is reading this commentary. If it is true, then it would not be good for people like us to see what they don't know and believe in it”, he wrote [4, p. 28].

The scholars who claimed to lead the people at that time were illiterate in modern secular sciences. However, the Shari'ah did not oppose the study of secular sciences, but instead called for “the study of science, even if it is true”. For some, it is common for people to be skeptical of any innovation, to hide behind their shells, and to study the language, culture, customs, and scientific achievements of other religions. it seemed to be an apostasy. This was in line with Tsarist Russia's policy, which the Tsarist government had always sought to keep the peoples of its colonies ignorant and unconscious. Jadid ideas were essentially a threat to Russian sovereignty, and tsarist rulers always prevented Jadidism from spreading. Nevertheless, the number of selfless nationalists in Turkestan increased day by day. Poets and writers began to write mainly socio-political and enlightening works. Literature began to serve as a weapon of war to awaken the people.

After the fall of the Tsarist government in 1917, the Jadids began to articulate their political goals. In particular, the proclamation of the Turkestan Autonomy filled the hearts of the Jadids with joy and pride, and gave them hope.

Although the Turkestan Autonomy was proclaimed in Kokand, the role of selfless enlighteners in Tashkent and other cities was significant in its implementation. Soviet historian P. Alekseyenkov writes: “The Tashkent national bourgeoisie, as well as the Russian bourgeoisie, played a very active role in the preparation and subsequent propaganda of the Kokand Autonomy. The idea of Turkestan Autonomy was born in Tashkent, and to implement it, prominent Tashkent counterrevolutionaries deliberately went to Kokand, while the rest continued to actively campaign for Kokand Autonomy and even tried to move from propaganda to action” [5, p. 60].

The “national bourgeoisie” and “counter-revolutionaries” are Jadids who care about the future of the country and have died in the process.

Achieving independence was the dream of progressive, nationalist people living in every town and village in the country. So they applauded the Autonomy and began to support it in every way.

Poems and articles written by Jadids such as MahmudhojaBehbudi, Fitrat, Cholpon, and Hamza in praise of the Autonomy at that time are examples of this. Ghulam Zafari was also active in politics during this period. His work for Workers' World is particularly noteworthy. The authors of the Workers' World magazine were a group of patriotic Jadids who published works that mainly sang about the freedom and liberty of the Motherland, as well as supporting the Turkestan Autonomy. During the Soviet era, the magazine was described as follows: “*IshchilarDunyosi* - Workers' World” was published on January 4, 1918 in Tashkent. The magazine, which is published every fifteen days, defended the ideas of the local bourgeoisie against the ideas of the anti-Soviet elements on behalf of the local workers, leaving a black mark in the history of the workers' press (six or seven issues were published).

The magazine called on the local workers to renounce the Soviet Union, pursue an Islamic policy in the country, expose the "accusations" of the Bolsheviks, and fight for private property.

He shouted, “Participatory sectarianism must be avoided”. There are no correspondents below. Close writers: Mulla Ghazi Yunus Muhammad oglu, Ghulam Zafari, Ishchi, LazizAzizzoda, Muhammad Yusuf Mahammadali (Yusuf Aliyev), MirmashriqMiryunosoglu (poet Elbek), Muslim o ' He was also the son of MirmullaShermuhammad”[6, p. 29]

Note that the views of non-national Alekseyenkov in 1931 are almost identical to those of Ziya Said in those years, and there is no difference in their views on the treatment of the descendants of Ghulam Zafari.

In his poems published in this magazine, Ghulam Zafari calls on everyone, young and old, to take up arms to protect the Autonomy and preserve independence like the apple of an eye:

Our wish was already there,
Our autonomy has been declared.
Service is waiting for us now
Jump on Salah, workers.

In many of his works, Ghulam Zafari recalls the glorious history of the Turkic peoples, compares them with his time, laments the state of the nation, and emphasizes that dependence on the Turkic peoples is unacceptable:

The Turks ruled the world,
The kings of the world were doomed.
No humiliation, someone rules us,
Enough condemnation for us, the workers.

In his poems glorifying freedom, full of high spirits, patriotism and love for the nation, published in the magazine “*IshchilarDunyosi – Workers’ World*”, GulamZafari called for the nation to understand itself, to embark on the great struggle for the motherland “Look at the history, who we were, let's be worthy children of our great ancestors like Amir Temur”, he shouted, calling for the time to achieve national liberation. In the article “Our strength is a soldier” published in the 2nd issue of “*IshchilarDunyosi – Workers’ World*” magazine in 1918, Ghulam Zafari writes:

“Caring Turkestans! We, the Turkish children of Turkestan, have declared Autonomy. Now, if we want our autonomy to be stable, we need strength. They are power soldiers. Let us look at the soldiers we have with all our heart, let us pay attention to them, let us never forget them, and let us understand our heroic soldier in spite of everything else, even if we are hungry and thirsty” [6, p. 29].

The newly proclaimed Autonomous Government did not yet have the power to defend its independence. So the government starts building its own army. However, the initial number of troops, according to P. Alekseyenkov, was only 60 [4, p. 28]. The task of the autonomous government was to immediately increase the number and quality of troops to a level where they could defend their independence. In doing so, he relied on the support of the people and the financial support of the local rich. In the article quoted above, Ghulam Zafari emphasizes that the homeland and the nation are in an exciting, but at the same time dangerous situation, and that a positive solution depends on the further actions of every Turkestan, and calls on everyone to help build a national army. However, the Autonomous Government did not manage to bring the national army to the level where it could defend its independence. Bolshevik troops, who came to the aid of their comrades from different cities, along with the Armenian Dashnaks, drowned the Turkestan Autonomy and its stronghold, Kokand. “The city was on fire for several days. The fire destroyed more than a thousand shops and stalls and killed 1,500 people. In 10 mahallas (neighborhoods) of the city (Kokand) no one was left slaughtered, and in a short time the pillows of 10,000 people dried up” [7, p. 167]

Ghulam Zafari describes these horrific events in his book, “A Picture from the National War”: “Everywhere there is the sound of corpses, the sound of cannons, the sound of gunfire, the sound of guns, and the words of testimony in a choked voice:” ... Oh ... Our holy homeland ruined, Oh, religion, nation ... Revenge, my soul ... Ohh, my child”, cried the wounded, groaning in all directions, terrifying the whole world was loose” [8, p. 73].

CONCLUSION

The various reasons for the collapse of the autonomy were, first of all, the lack of unity among the people, internal conflicts within the government, the lack of a well-armed regular army and other factors.

There is a lot of such information that shows the spiritual image of Ghulam Zafari.

Our observations of the socio-political situation in Turkestan at the beginning of the last century and some of the characteristic features of Ghulam Zafari's literary and social activity show that Ghulam Zafari was one of the most advanced intellectuals of his time. Throughout his life, he fought for national independence, dreamed of the prosperity of our culture, science, and contributed to this work as much as possible with his works.

INTERPRETATION OF NATIONAL VALUES IN THE WORK OF ABDULLA AVLONI

Ozodbek Imomaliogli Danabekov*

*Student,
Specialty of Uzbek Language and Literature,
Tashkent State Pedagogical University,
UZBEKISTAN

ABSTRACT

This article discusses the views of our enlightened writer Abdullah Avloni on education, which is one of the national values. The relevance of his works in any period does not lose its essence. On the contrary, the development of the country will continue to play an unparalleled programmatic role in the development of the youth. Thus, the national awakening and development movement has become a dream of our people. The scientific, educational, literary and artistic heritage of the Jadids, who sacrificed their lives for the freedom of our homeland and the happiness of our people, is of great importance to us today" [1].

KEYWORDS: Ancestral Heritage, Abdullah Avloni, National Values, Education, Morals, Behavior, Language, Homeland.

Understand with your mind the good and the bad,
Do not waste this precious time.
Strive, strive, and strive for knowledge,
Look at this world with wisdom.

Abdulla Avloni

INTRODUCTION

The President of the Republic of Uzbekistan ShavkatMirziyoev, in his speech at the solemn ceremony dedicated to the Day of Teachers and Coaches noted the importance of the Jadid movement in the history of our statehood. In particular, "Like many intellectuals, I always think with one wish: the Third Renaissance in our country could have been carried out by our enlightened modern ancestors in the twentieth century. After all, these selfless and dedicated people have devoted their entire lives to the idea of national awakening and mobilized all their

forces and capabilities to bring the country out of ignorance and backwardness, to save our nation from the swamp of ignorance. In the process, they also sacrificed their lives. They considered the hadith, "There is no salvation except knowledge, and there can be no salvation," to be a living belief. They believed that national independence, development and prosperity could be achieved, first of all, through enlightenment, secular and religious knowledge, and deep mastery of modern sciences. During this period, Abdulla Avloni, MahmudhojaBehbudi, Munavvarqori Abdurashidkhonov, UbaydullaKhojaev, AbduraufFitrat, Ibratdomla, Abdulhamid Cholpon, Abdulla Qodiri, AshuraliZahiri, Haji Muin and hundreds of other great people were in the forefront of the national awakening and nationalism. In addition to new methodological schools, they established newspapers, magazines, publishing houses, libraries, and theaters to change people's worldviews and lifestyles. Unfortunately, the current situation and the social system did not allow us to achieve the noble goals set by our modern ancestors. The devotees of enlightenment were slandered by various ignorant people of that time. First the Tsarist government, then the Soviet government, brutally persecuted and repressed them. Thus, the national awakening and development movement has become a dream of our people. The scientific, educational, literary and artistic heritage of the Jadids, who sacrificed their lives for the freedom of our homeland and the happiness of our people, is of great importance to us today" [1].

THE MAIN FINDINGS AND RESULTS

On October 8, 2020, the Decree of the President of the Republic of Uzbekistan "On additional measures to further study the heritage of the victims of repression and perpetuate their memory" was adopted. Undoubtedly, this document is of historical significance and, first of all, shows the high respect for the memory of our ancestors.

After all, perpetuating the names and memory of thousands of our compatriots, statesmen and public figures, representatives of science, culture and art, literature, ordinary people, repressed by the dictatorial regime, their courage and perseverance inspired the younger generation to love the Motherland and Nurturing in the spirit of devotion is an urgent task.

Under the leadership of President Sh. Mirziyoev, unprecedented work is being done to restore our national traditions and values, to study in depth the sacred religion, the rich heritage of our saints and scholars, to beautify their shrines, to preserve historical monuments.

In short, the scientific and spiritual works of our great scientists are a noble call to do good deeds and guide mankind to the right path. The relevance of his works in any period does not lose its essence. On the contrary, the development of the country will continue to play an unparalleled programmatic role in the development of the youth. Therefore, it is both a duty and an obligation for each of us to study these rare heritages, to study them deeply, to propagate them to the world community, to pass them on to future generations, and to do good deeds as worthy heirs to our great ancestors.

Abdullah Avloni, one of the above-mentioned nationalist and enlightened devotees, called upbringing "*Upbringing*" *pedagogy, that is, the science of child rearing. For a child to be healthy and happy, it is to bring him up well, to keep his body clean, to correct his profession from an early age, to teach him good manners, to protect him from bad manners*" [2, p. 12] According to him, upbringing begins from the day a child is born and lasts until the end of his life. Upbringing consists of two parts - family and school upbringing. Proper family-oriented

upbringing is the foundation for the next stage, and conversely, if there is no focus on family upbringing, this situation will slow down the educational work in the school. Abdullah Avloni gives a new interpretation of the relationship between parents and children.

He condemns punishment that offends the child's senses, harms the child's emotions, and oppresses him or her spiritually. He believes that it is necessary to love the child and to influence him skillfully, to express his duty through persuasion [2, p. 14]: *Who does Where is it made? The question arises. To this question, "the first home upbringing. This is the mother's duty. Secondary school and madrasa education. It is the duty of the father, the teacher, the teacher, and the government", and one person says, "Which mothers do you mean, ignorant mothers? Where do they get the education they don't have? That word hurts the heart, it burns the heart."*

At the same time, the author emphasizes that education and upbringing are a whole process: *"He studied from the cradle to the grave". The meaning of this hadith is a proof for us. "The happiness of every nation, the peace and prosperity of nations depend on the good upbringing of young people", said one judge.*

From his pedagogical point of view, Abdullah Avloni divides education into three types: physical education, mental education and moral education. He also emphasizes that they are inextricably linked. According to the author, in order to have a healthy mind, good morals, knowledge and enlightenment, it is necessary to train the body. *"Keeping your body healthy and strong is one of the most important things you can do. Because to read, to teach, to learn, to teach, you need a strong, disease-free body. Physical training also helps in mental training. The body and the soul are like the skin on the right side of a robe". If the body is not adorned with cleanliness, if it is not protected from bad habits, it is like putting on a robe and washing the lining, which always hits the dirt on it. You need a strong, healthy body to train your mind. That's why parents should not neglect their children when they are sick, but should see a doctor as soon as possible".*

It is a very important and sacred duty to develop children's thinking skills. That is why our great scholars paid special attention to intellectual education. Avloni, referring to the wisdom and affirmations, says the following about the education of thought: *"Thought makes a person virtuous and zealous. This education needs the help of teachers, and the strength, beauty and breadth of thought depends on the education of the teacher".*

Abdullah Avloni considers the mind to be *"the perfect, the only murshid of human beings". "The more, the cheaper, and the more valuable the mind in the shadow of science and experience,"* he said. According to the author, the mind is a quality that only a human being has, and the adornment of the world is intelligent people. That is why the author urges people to rely on reason and discussion in every work, to weigh every work and event on the scales of reason and to carry it out in its place and time. The mind, which is the key to human development, develops through knowledge and experience. It takes effort and perseverance to acquire knowledge. According to Avloni, *"science is like the core of an almond. To get it, you have to separate the core from the shell. Science is a very high and sacred quality for human beings. It pierces our minds like a sword. A man without knowledge is like a tree without fruit".*

The writer is well aware of the role of science in the development of society. That's why he urges young people to learn the secrets of science, to understand the essence of events. He especially

says that reading books is very useful, that there is a lot of wisdom in books, and that there is no better friend in the world than books.

Speaking about the practical significance of science, Abdullah Avloni said: *"The benefits of science are so great that it is impossible to describe it. He will save us from the darkness of ignorance. It brings us to the world of culture, humanity, enlightenment, turns us away from bad deeds and evil deeds, and makes us virtuous."* According to him, everyone should be able to apply science and profession in life, so that science can benefit society. He praises those who can put their knowledge into practice, calling them wise people. The author's idea of applying science in practice has not lost its relevance today. As a proof of this, I consider it appropriate to quote the following opinion of our esteemed President Sh.M. Mirziyoev: *"Based on my experience, my advice to you is: Appreciate science, strive for science! Don't waste a second! Youth is the most precious period of life. Never forget that science and knowledge are treasures that will not burn, will not sink, and will not be taken away from you!"* [3].

Abdullah Avloni's views on the national language in education are noteworthy: *"The mirror life of every nation in the world is language and literature"*. He stressed that everyone should know their native language perfectly and works hard for the development of the national literary language. *"Losing the national language is losing the spirit of the nation,"* he said. That is why he calls on young people to be worthy heirs to our rich cultural heritage and national values, which have a history of thousands of years.

O mother tongue, my dear,
Compliment my soul, my mercy,
You've been around since I was born,
Don't wake up, my dear.

You taught me science and manners,
I am a unique writer and teacher.
You lift the spirits of the nation
My most holy cabbage sultan.

Avloni pays special attention to the culture of communication and etiquette. He emphasizes the importance of the word in defining human dignity, emphasizing the meaning of the word, and says: *The wise know the thoughts and intentions of the heart, the knowledge and the power, the dignity and worth of what one speaks"*.

The writer encourages young people to think of every word, to use it in its proper place, to make the speech beautiful and meaningful, and to refrain from speaking when necessary. At the same time, the author advises to listen carefully to the words of others, to learn from their speech: *"If the word is in accordance with reason and wisdom and does not benefit himself or the hearer, then among the bees g A dry murmur like a squeaking squash is nothing more than a headache. Many of the hardships we face come from our soft tongues. That's why they say, "Think more, talk less." It is also said that the best of languages is the one who speaks fluently, and the best of words is the one who speaks knowingly and thoughtfully.*

When you speak, speak kind words,
Otherwise, it's best to keep quiet.

Good thoughts, good thoughts,
Otherwise, it's better to be dumb.
If you work, work well,
Otherwise, it's better to be idle.

In Abdullah Avloni's pedagogical views, the issue of morality is again at the forefront. He emphasizes the great role of moral education in human life and the need to educate children from an early age. According to the author, if the upbringing is not given in time, the child will not be affected by the upbringing once the worldview is formed:

If you take a young child of a bird,
Let's start with the upbringing,
Take a your mother,
No, if a person is always ready.
Necessary upbringing means from youth,
It must be great to eat,
Egur is a trouble-free man,
The knot is burning.

According to Abdullah Avloni, the social environment and family conditions play an important role in the formation of moral qualities in a child. Those who have established true human morality have a positive effect on the upbringing of young people to be compassionate, consequential, sincere and polite.

According to Abdullah Avloni, young people should not be limited to the acquisition of knowledge, but should adhere to the rules of ethics in life, in communication with people. One should always live with the desire to do well to others, to serve the interests of society and the people. If a person wants to have a good name in this world, he should always do good deeds, not hurt people, refrain from bad deeds, and follow the example of good people. While praising good, the writer considers evil to be the greatest defect of man, a defect that leads him astray.

Avloni considers humility as a sign of humanity, encourages young people to be humble in life, not to succumb to arrogance: *"Pride, arrogance degrades a person, disregards him among the people, even if he has knowledge and a state, a monetary value - It will not be worth it,"* he said.

In his pedagogical views, Abdullah Avloni also pays special attention to courage [4, p. 71]. He understands courage in a broad sense. Courage includes the qualities of courage, perseverance, endurance. The most important characteristic of a person is his conscience. Abdullah Avloni spoke about conscience, one of the most beautiful human qualities, and called on his contemporaries to be conscientious. He sees conscience as the true measure of the human mind and thought. The author's *"conscience is a clear mirror of everyone's actions and deeds, and the one who looks in the mirror is trying to correct his own faults and shortcomings, and will not have time to look for the faults and shortcomings of others"*, - he describes the conscience and emphasizes that everyone is accountable to their own conscience, which is a testament to Avloni's talented coaching.

Abdullah Avloni pays special attention to educating young people in the spirit of patriotism. According to her, the Motherland is as sacred as a mother. It is the child's duty to appreciate and respect him, to share his joys and sorrows, to share his sorrows.

Homeland, homeland, if my soul dies from my body,
Don't worry; I'll be home for generations to come.
I'm not worried about the dust, I'm scared,
I mean, I'm the ruler of my homeland.
I was born and raised in this country,
I don't care if he dies.

“It is well known that many of our pilgrims who sold their gardens and courtyards to Arabia, our most sacred place of worship, will return to their homeland,” he said. The reason is that the power that pulls them is the love of their homeland”.

CONCLUSION

To conclude, the enlightened writer Abdullah Avloni has a broad view of all important aspects of education. His views on this issue are closely linked with the psyche, lifestyle and national values of the Uzbek people, so that his rich literary and pedagogical heritage is a valuable source in the development of national pedagogy. In addition, as the President Sh.M.Mirziyoev said: the great literary heritage of our ancestors enriches the lives of young people in the spirit of patriotism, citizenship, tolerance, respect for the law, national and universal values, able to resist harmful influences and currents play an important role in nurturing strong beliefs and attitudes. The unique and unique scientific and spiritual heritage of our great ancestors should become a living program for us. This immortal legacy will always be with us and will always give us strength and inspiration. First of all, we need to irrigate the national education system in this spirit. To do this, our scientists and specialists, our esteemed scholars, must convey this spiritual treasure to today's generations in a simple and understandable, attractive form [1].

As Abdullah Avloni said: “Education is for us a matter of life or death, salvation or destruction, happiness or disaster”.

"COTTON QUESTION" IN THE MEMORIES OF THE KARAKALPAK PEOPLES

Pirniyazova T*

*Karakalpak Medical Institute,
UZBEKISTAN

ABSTRACT

The article emphasizes the role of memoirs of political leaders, representatives of science and culture in covering the history of the so-called "cotton business" in Karakalpakstan. Along with archival documents, memoirs, by right, occupy a leading place in the source corpus of the new history of the region. The studies of the memoirs of this time, undoubtedly, fills in the gaps in the «cotton business» and help an objective study of history.

KEYWORDS: A New History, Karakalpakstan, Repressions, "Cotton Business", Sharaf Rashidov, Kallibek Kamalov, Sultan Kaniyazov, Erezhep Aitmuratov, Memoirs, Analysis, The Meaning Of Memoirs.

INTRODUCTION

The political history of Karakalpakstan of modern times, perhaps to the greatest extent, turned out to be overflowing with a heap of dilapidated and shabby in recent year's ideas. Historians have not yet created a picture of the "cotton affairs" of the second half of the 1980s in Karakalpakstan. "Cotton case" is the collective name for a whole series of criminal cases related to corruption and registrations on the territory of the Uzbek SSR in the last years of the existence of the Soviet Union. The first secretary, Sharaf Rashidov, then led the Communist Party of Uzbekistan so the shadow fell directly on him. A natural reaction to this state of historical science was the appeal of the public to the literary version of the political events that took place [1, 76.]. Publicists and literary men were least of all concerned with the theoretical and methodological side of the matter in an effort to be in the spotlight.

The mistakes of the union government in carrying out economic reforms in the region were also aggravated by the campaigns that began in those years to defame the peoples of Uzbekistan and Karakalpakstan, which found eloquent expression in the so-called "cotton business". Only in Karakalpakstan 133, people were under investigation during these years [2, 154.].

At the beginning of April 1983, an investigation group of the USSR Prosecutor General's Office T.Kh. Gdlyan and N.V. Ivanov were created in accordance with the Resolution of the Politburo of the CPSU Central Committee on the investigation of abuse in cotton growing in Uzbekistan.

The sadistic methods of investigation were perfected. For example, someone was arrested for receiving or transferring bribes, and he denied his guilt, then he was reminded that because of his stubbornness, he was putting his family, the whole clan at risk. The arrested person continued to be silent, and then the threats were carried out. The closest relatives ended up in the cells. Children were sometimes placed in cells adjacent to their parents. They did it deliberately, played on parental, family feelings.

During the investigation, 8 innocent relatives of K. Kamalov, K. Nurumbetov, 15 - Khudaybergenov were arrested according to the decisions of the Gdlyanovsk investigators [3, 34; 4, 54]

Erezhep Aitmuratov: "I was arrested on August 20, 1987, in Tashkent. He was kept in remand prison for several days, and then transported to Moscow. From that moment on, regular interrogations began, led by Gdlyan and Ivanov. They explained to me for a long time about the significance of a frank confession, advised me to confess everything, threatening to make me a "steam locomotive" in the case otherwise, they threatened to sort out the postscripts in the republic, to which, allegedly, I, being the secretary of the Central Committee of the Communist Party of Uzbekistan, had a direct relationship. They declared that those who did not confess to them would be shot, and those who went with them would have almost nothing, and they could even release them from custody. They also intimidated that if I continue to be silent, they will arrest my wife, son, daughter, brother".

Kasym Nurumbetov: "Under the dictation of Gdlyan, I began to write a statement about whom and from whom I received bribes. It went something like this. Gdlyan asked me which of the higher leaders came to our area. Moreover, when I called them, he made them write that I had given them bribes. Then he ordered me to list all the chairs of collective farms, directors of state farms, and heads of trade and name them all among the bribe-givers. I wrote all this. After I wrote the list, again under the dictation of Gdlyan, I wrote the amount of money that I received from each person I named, and the amount of money that I transferred to the higher-ranking officials. Only after that, I had to come up with for each bribe giver and bribe taker when and for what the sums of money were transferred. That is, I gave credibility to my statements".

Sultamurat Kanyazov: "Ivanov entered the office and said in a stern tone: "Write a statement addressed to the Prosecutor General of the USSR, where you will indicate that you took bribes from 45-47 people from below for at least 500 thousand rubles, as well as at least 12-15 episodes you will show "up" so that there were Osetrov, Orlov, Abdullaeva, Ishkov and others".

Among those convicted in the so-called "cotton cases" were 430 state farm directors and collective farm chairmen, 1300 their deputies and chief specialists; 84 directors of cotton plants and 340 chief specialists of these plants; 150 workers in the light industry of Uzbekistan, the RSFSR, Ukraine, Kazakhstan and Azerbaijan; 69 party, Soviet workers, specialists from the Ministry of Internal Affairs and the prosecutor's office. 58 thousand officials were arrested, 800 criminal cases were opened, 4 thousand people were convicted [5, 322]. 172 workers who were included in the nomenclature of the Central Committee of the CPSU, 1813 were included in the nomenclature of the Central Committee of the KPS were removed from their posts.

On December 25, 1991 (that is, the day before the legal establishment of the termination of the existence of the USSR), the first President of Uzbekistan, I.A. Karimov, pardoned all those convicted in the Uzbek case who were serving their sentences on the territory of the republic. [6, 37]

In social and political life, the repressions of 1983-1988, which fell on Uzbekistan and Karakalpakstan, had a frightening effect on the population. In an effort to stop, the aspirations aimed at gaining real sovereignty, the allied leadership tried, as part of the overdue struggle against the corrupt nomenclature, to create a stir around the fabricated "cotton business". At the IV plenum of the Karakalpak regional party committee in June 1984, "more than 90% of the leadership of the regional party committee and 85% of the leaders of the city and district level were renewed. [2, 160]. In the cotton complex of Karakalpakstan, 27 cases were initiated, in which the following were convicted: in 1986 - 10; in 1986 - 56; in 1987 - 55; in 1988 - 24; in 1989 - 14, 159 people. [2, 160]

Speaking at the VI Plenum of the Karakalpak Regional Party Committee on November 30, 1989, I.A. Karimov stated, "The process that was started 5-6 years ago around the cotton business in Uzbekistan, including in the Karakalpak Autonomous Republic, continues to this day torment everyone". [2, 165]

The study of memoir literature shows that society is beginning to get tired of the continuous stream of exposures and discrediting of the Bolshevik regime, descriptions of the crimes of Stalin and his henchmen, which make up the lion's share of newspaper and magazine publications, but give little for understanding the deep essence of the processes leading to the crisis of the political system.

The genre of political biography, which has become widespread in response to the call to write history in faces and portraits, to overcome the schematic and dry academism inherent in official historiography, does not bring satisfaction. Any full-fledged research of this kind is hardly possible without recreating the proper historical background, a kind of portrait of the era. Only then, can you understand and explain the deeds, actions and thoughts of people of their time, when they had to live and act.

For the history of Karakalpakstan in 1950-1991, the analysis of the hidden mechanisms and springs, with the help of which the party organization and its nomenclature, actually exercised power and control, is especially important. The opening of archival funds has so far only allowed lifting the veil over these secrets. In the memoirs of N. Mukhitdinov, K. Kamalov, A. Kunnazarov, K. Uteniyazov hidden control mechanisms are shown.

When working with sources on the "Soviet history" of Karakalpakstan, we must take into account the known specifics. We have had to deal with a much larger volume of publications and archival documents than, for example, a 19th century historian. At the same time, it should be borne in mind that the system created under Stalin has developed a number of techniques and methods for manipulating public consciousness by dosing information, hiding the truth. The sources are in many ways saturated with distortions, default figures. The memoirs largely make up for these reservations.

Thus, the range of the identified problems of memoiristics, leading, in our opinion, to the creation of a truly scientific history of modern times, is quite wide and voluminous.

ABSTRACT

When studying the art history of a period or region, whether you like it or not, the main question begins with the study of the political and economic aspects of that period or region. The reason is that the development of art and the attitude to it depended on the attitude of political and even religious leaders of the period or region to art. In the study of the art of a certain period, the region, first of all, refers to political and economic relations. Once again, we will be sure to use any source and literature in the process of learning, to get acquainted with them. In the history of Western Europe, the sixteenth and seventeenth centuries became a new, very bright period, with a completely self-governing value, and at the same time it was partially mentioned as very important for its subsequent evolution.

KEYWORDS: Baroque, Clathism, Feudal, Renaissance, Domestic Genre, Plots, Still Life, Aesthetics, Sculpture, Bench, Decorative, Gothic, Batal, Realistic, Painting, Architecture, Mythology, Evolution.

INTRODUCTION

The seventeenth century is one of the most important stages in the development of European culture. During this period, the process of forming a system of capitalist relations on the basis of feudal society reached its final stage. The development of trade and the accumulation of trade capital attracted peasants and feudal farms to market relations [1, p. 9].

When you study the art history of a period or region, whether you like it or not, you start by studying the political and economic aspects of that period or region. The reason is the development of art and the attitude to it, as well as the attitude of political and even religious

leaders of the period or region to art. In the study of the art of a certain period, the region, you first have to turn to political and economic relations, and once again you will be convinced of this as soon as you begin to get acquainted with them, using any source and literature in the process of study. For example, by the end of the 16th century, the division of the Netherlands into two states: the Netherlands in the north (recognized independence) and the Spanish-occupied Flanders in the south had a profound effect on the development of art history not only between the two countries but throughout Western Europe. Because it was during this period and in this region that new types and criteria of art appeared (detailed information is given below).

THE MAIN FINDINGS AND RESULTS

The seventeenth century became a new, very bright period in the history of Western Europe, with a completely self-governing value, and at the same time became very important for its subsequent evolution. By this time, many national art schools in Italy, Flanders, Spain, France and the Netherlands flourished. Each of them, due to the peculiarities of the historical and cultural development of a particular country, has acquired a bright national identity, the vital character of society and the traditional artistic features [1, p. 11].

“During this period, European art developed on the basis of the traditions of the early Renaissance. In it, too, the main theme was the expression of man, his body, emotions, thoughts, dreams and desires. During this period, artists sought to portray the image of man more realistically, to highlight the complexities and new aspects of his mental state. A full interpretation of human life and way of life has become an important direction for the works of this period [2, p. 114].

This means that the genre, which we call “domestic” today, which reflects the scenes of life, appeared and formed in Western Europe as a separate form of fine art at this time. “Now the proportions between art forms and genres have also changed. New types and genres of it have emerged. Along with the existing traditional plots, works dedicated to life events began to enter the artistic life on a large scale. The genres of everyday life, landscape and still life have become independent arts [2, p. 114].

The domestic genre is a genre of fine art that reflects the daily life of society and the individual. In this genre, the artist (sculptor) describes the events and happenings of everyday life in his time, people's way of life, leisure, work and sports, in short, their daily activities are the content of this genre. Although the interest in depicting people's lives has existed for a long time, but its development and becoming an independent genre is associated with the rise of democratic principles in society since the XVII century, since then in the works of artists dedicated to the life of ordinary people. This genre was widely developed in the Netherlands. The genre was dominated by the works of Rembrandt the Great, Peter de Hoox, Terborh, Jan van Ostade and others.

As you study the history of Western European art, you will come across terms such as “Baroque” and “Clathism” in the seventeenth century, because these great styles penetrated all styles of art during this period and covered the whole of Europe with their principles. takes For this reason, it is possible to give information about these two terms, but due to the fact that the subject is different, a different aspect of the art of the region in this period is studied briefly.

The 17th century is also known as the “Baroque Age”. Because the ideological and aesthetic views of the time were more expressed in this style. Signs of the Baroque style, which was used in the history of art to describe the peculiarities of the architecture of the XVII century, and later began to be used in relation to the fine arts, first appeared in Italy. These principles are reflected in the architectural works of Vinola, Palladio, sculptures of Michelangelo, Correjo's benches and decorative paintings [2, p. 115]. Baroque spread throughout Western Europe, evolving in a unique national spirit under the influence of local art traditions. Luxurious in Spain and Portugal, Gothic in Germany, Flemish Baroque in Flanders, and Baroque in France under the influence of clathism, England, the Scandinavian countries, and later Russia.

Over time, genres can become stratified and independent. For example, in the historical genre of landscape navigation, the interior is separated from the genre of landscape.

Creativity in the domestic genre is more complex than in other genres, and in the process of its work, a person's worldview is very important.

The paintings can depict not only historical, heroic events and happenings, but also ordinary life.

Such paintings are works of the domestic genre, often referred to as works of genre painting. Basically, these events are depicted on paintings, but they can also be found in graphics and sculpture. The life stories created by the artists in different periods tell about the life of the people who lived in those times. This genre flourished in European national schools in the XV-XVII centuries. An example of this is P. Bruegel's “Cretian's Wedding”.

The picture depicts the beautiful and cheerful scenes of the national holiday. Flemish P. Rubens realistically depicts rural holidays in his works. Dutch painters G. Gerborch and Jan Vermer described the life of different strata of society with love. 18th century French artists A.Watto, F.Busche, J.B.Sharden, O.Fragonar also created works in the domestic genre. Later, artists began to try to reveal the essence of what was happening, without simply describing what was happening. A critical approach to public life is reflected in the work of French artists O. Dome, G. Courbet and traveling artists.

“Another great artistic style of the seventeenth century, clathism, appeared in France. Its representatives considered reason to be the only criterion for the right path to art. Reason is opposed to emotion. According to them, only a work of art created by the power of the mind is a true age of art” [2, p. 116].

“By this century, works of art were divided into large and small genres. Works on historical, mythological and religious themes are divided into large, comedy, satire and genres that reflect the life of the people. [2, pp. 116-117]

When we talk about Western European art in the seventeenth century, we are talking about Dutch independence, Baroque throughout Europe, Clathism in France, Rubens in Flanders, and Spain and Italy. It is better to stop. This is Joseph de Ribera (1591-1652).

Information about Spanish artists in Europe in the XV-XVI centuries is almost non-existent. Spanish artist Fernando in Leonardo da Vinci's studio is often mentioned. Juan de Juaregi, a Spanish portrait painter who studied portraiture in Rome, is also well known, but he is better known as a writer. One of the most prominent Spanish artists in Europe at this time was Josepe de Ribera.

Born in the town of Hatiba near Valencia, Ribera left his homeland at a young age and went to Italy, first to Rome and then to Naples. He lived and worked in Naples for almost 30 years and died there. In Rome he became a member of the Academy. The paintings under Ribera's hand show this, and the Academy is very proud of it. But at the same time, Ribera always (especially at a young age) emphasized that he was Spanish, and in his paintings he often indicated his place of birth [3. pp. 5-6]

Spanish art, which began to develop in the 18th century, is considered to be the most artistic period in Spanish history. Described as the "Golden Age" of Spanish art, this development lasted until the 18th century, during which "Time Theater" and literature flourished in Spain, along with the visual arts. However, although a number of well-known works have been developed in architecture and sculpture, these areas are also not considered by historians to be among the most advanced areas of Spanish art, such as theater, literature and painting.

As a result of the successful end of the bourgeois revolution, the Netherlands was divided into two countries at the end of the 16th century. In the north, an independent bourgeois republic with seven provinces (sometimes called the Netherlands) was formed, which was self-governing with the Dutch and consisted of seven provinces. South Flanders and the rest of the provinces remained under Spanish rule. In line with the division of the country, art also loses its former unity. In the seventeenth century, two separate schools emerged - the Dutch and the Flemish schools [4, p. 104]

It is natural to think of Rubens as the Flanders School of Fine Arts. In the third edition of the book "Art" with corrections and additions: Some simply say: "Antwerp", but many say: "Homeland of Rubens" [5/159]: Sometimes it is simply called Antwerp, but very nomadic people say that it is the land of Rubens.

In the Netherlands, there are many such representatives. As a result of their work, many famous works were published.

In addition, changes in the art took place here during this period. This is also due to the work of Dutch artists. "Still life became a new genre of painting" [6/5], that is, it was formed as a separate genre. This happened in the Netherlands in the seventeenth century, due to the work of Dutch artists. "Finally, the largest numbers of works in all genres were produced in the Netherlands" [6, p. 5]

In the 16th century, still life and genre paintings were inextricably linked. Peter Arsten from the Netherlands and his student Joachim Beykelaar began to work on still life on a par with the genre painting. The personality was at the center of European painting, and here the region was disappearing. He became simplistic and became one of the pieces of the artist's world. The type became more important than the individual: the peasant type, the soldier type, and later the small and large bourgeois types. Poor painters prefer the average person [6, p. 8].

CONCLUSION

To conclude, this period is an important period that determined the future of European art and gave it a very rich history. The sixteenth and seventeenth centuries are a period worthy of being described as the "highest frequency in European art from the point of view of Comerton. There is no doubt that this is the "Golden Age" that has left spiritual and cultural riches for all mankind. Therefore, we must first of all nourish, cherish and learn from these riches, because it is our duty

to pass them on to the next generation with accurate and appropriate scientific analysis. After all, everyone, regardless of nationality, religion, race, or social origin, has the right to enjoy these spiritual riches.

ABSTRACT

Renal cell carcinoma (RCC) diagnosis and management have undergone significant shifts in the recent past. MSCT makes it possible to assess not only the prevalence of the tumor process, but also the calyx-pelvic system and vessels; In the past 10 years, due to the technological advancements, laparoscopic nephrectomy has become the popular and effective method of the treatment and a less traumatic alternative to open radical nephrectomy. Laparoscopy may not be used only for removal of the neoplasm, but also for biopsy of the tumor. Over the past years, cryodestruction of neoplasms has become widespread since it is possible to carry out the procedure in real time under the control of ultrasound, CT or MRI. This review aims to highlight recent evidence that has emerged in the diagnosis and management of this complicated oncologic issue.

KEYWORDS: *Renal cell carcinoma, Multispiral computed tomography, Telomeres, laparoscopic approach, Microwave therapy, Chemo ablation.*

INTRODUCTION

Modern technology has greatly improved the diagnosis and treatment of kidney cancer. The algorithm for examining patients has changed: after detecting a neoplasm during ultrasound, multispiral computed tomography (MSCT) is performed, which allows us to abandon excretory

urography and complex vascular research. MSCT makes it possible to assess not only the prevalence of the tumor process, but also the calyx-pelvic system and vessels [1]. In planning an organ preserving surgery obtaining spatial three-dimensional position of the neoplasm, renal vessels and the calyx-pelvic system with modeling the of possible anatomical changes after removal of part of the organ might be significantly informative. Both MSCT and magnetic resonance imaging (MRI) allow us to consider the presence and extent of a tumor venous thrombus, and MRI with suppression of the signal from paranephrium- about invasion into the kidney fibrous capsule, which facilitates the differential diagnosis of the pT1a, b and pT3a stages of the disease.

Despite the enormous possibilities of tomography, in some cases (suspicion of a benign tumor, severe intercurrent condition, etc.) it is necessary to establish the morphological structure of the neoplasm before the operation. This allows perform only a biopsy, the informative value of which reaches 90%. In order to increase informativeness of a biopsy it is used the determination of telomerase activity [2]. The enzyme telomerase is a ribonucleoprotein complex that synthesizes the terminal DNA sequences - telomeres. Telomeres protect the ends of chromosomes from enzymatic destruction, prevent fusion of chromosomes with each other and are necessary for doubling of genetic material during division of cells. High activity of this enzyme is observed in embryonic, stem, germ cells of a person, as well as in macrophages and leukocytes; Although information about this enzyme is encoded in the DNA of all cells there is no telomerase activity in most somatic cells. In the process of malignant transformation of the cell, telomerase is activated, which provides the malignant cells to divide unlimitedly. Most malignant tumors are characterized by high telomerase activity. A kidney tumor is no exception.

In the past 10 years, due to the advancements in technology laparoscopic nephrectomy has become popular effective method of the treatment and a less traumatic alternative to open radical nephrectomy in a certain population of patients [3]. The first laparoscopic nephrectomy due to kidney cancer was performed in 1990 by Clayman R.V. [4]. Today, laparoscopic nephrectomy is widely used. Compared to open surgery, it reduces postoperative pain as well as the patient's stay in the hospital and the period his recovery after surgery [5].

Most authors perform laparoscopic radical nephrectomy in cases of small (<8 cm) local renal cell carcinomas without local invasion, renal vein thrombosis or lymphadenopathy. For laparoscopic kidney cancer surgery there are three approaches are used: transperitoneal, retroperitoneal and assisted.

Clayman R.V. was the first to use the transperitoneal laparoscopic approach [6]. Retroperitoneal access is an analogue of open lumbotomy nephrectomy, it makes possible to reach the renal vessels without opening the abdominal cavity. Assisted laparoscopic nephrectomy facilitates the training of surgeons in open surgery and serves as an alternative to the conversion of laparoscopic surgery to open surgery, and is also used for large tumors. It has been described [7] a modified assisted laparoscopic surgery with an additional gel port in the groin or on the border of the epi- and mesogastric region for manual manipulations in the wound. There are [8] the advantages of this technique: the use of the alternating manual and instrumental tissue dissection with laparoscopic assisted nephrectomy combines the possibilities of endosurgical and traditional approaches. Every of three access options for laparoscopic nephrectomy has its advantages and disadvantages and can be chosen by the surgeon depending on his/her preferences, but it is necessary to ensure compliance with oncological requirements. The results of 5-year survival of

patients' with kidney cancer that underwent laparoscopic surgery are comparable to those with open surgery (Table 1) [5, 9 - 15].

Tumors to be removed with laparoscopic radical nephrectomy (stage pT1), can be removed with open resection of the kidney [3, 16]. Modern technologies make it possible to carry out laparoscopic organ-preserving surgeries for kidney cancer [17].

Laparoscopic surgery for cancer is associated with the risk of dissemination of the neoplasm and the development of metastases. There are reports of cutaneous metastases and metastases at the sites of laparoscopic port placement after laparoscopic lymphadenectomy for prostate cancer [18] and bladder cancer [19]. The work [20] provides data on 1098 urological laparoscopic operations for malignant neoplasms, while there were 8 local recurrences and 2 cases of metastases in the ports. In kidney cancer, according to the authors, the frequency of local recurrence amounted to 2.2%; metastases in the places of installation of laparoscopic ports were not registered. Currently, only 3 cases of metastases in ports after laparoscopic radical nephrectomy have been described [21].

Traditionally, laparoscopic radical nephrectomy is performed for kidney cancer at T1-2N0M0. The maximum sizes of the neoplasm, subject to laparoscopic removal, are discussed, and the limitations are to a greater extent associated with the "comfort" of the surgeon, rather than with technical difficulties [3]. If initially laparoscopic surgery was carried out at clinical stage T1-2, then in the subsequent described [9, 15] successful laparoscopic removal of many neoplasms that

according to the data of morphological studies, they belonged to the pT3a stage. Moreover, laparoscopic the operation can be performed for advanced (pT3b) and metastatic (M1) kidney cancer.

So, Walther M.M. et al. [22] showed that patients with metastatic kidney cancer who performed laparoscopic cytoreductivenephrectomy, recovered faster after surgery, had less pronounced postoperative pain and shorter time to treatment with interleukin 2 compared to patients undergoing open nephrectomy. However, the author reports that in 5 out of 11 cases, laparoscopic the operation was transformed into an open one.

Performing laparoscopic nephrectomy with venous tumor invasion of renal cancer into the renal and inferior vena cava is limited due to the technical difficulties of laparoscopic thrombectomy. Nevertheless, here, too, there are technical innovations. Allowed to perform laparoscopic radical nephrectomy for renal cancer pT3b with renal thrombus level I [23], and during operations on animals - and with renal thrombus level II – IV [24]

Recently, there have been reports of authors [25, 26] about the use of a laparoscopic access for kidney tumors. There was used a laparoscopic approach, and not laparoscopic surgery, since the technique itself does not differ from the standard one when using the transperitoneal operative approach [3]. With laparoscopic surgery, as with open surgery, it is necessary to observe oncological requirements, such as lymphadenectomy [27].

Laparoscopy may not be used only for removal of the neoplasm, but also for biopsy of the tumor. There is a large number of works confirming the great diagnostic value of a kidney biopsy [28, 29]. Visualization of the organ is possible not only through ultrasound scanning, but also with laparoscopic and retroperitoneoscopic access. Limb J. et al. [30] used a laparoscopic approach to elucidation of the nature of 57 cystic neoplasms kidneys (28 patients had Bosniak II category and in 29 - III). In all observations, transperitoneal laparoscopic imaging of the neoplasm and aspiration of the contents cysts for cytological analysis followed by biopsy of the cyst wall. 11 (19%) patients were diagnosed with cystic kidney cancer. In none there was no recurrence of cancer or dissemination of cancer cells in the port or peritoneum.

If removal of the neoplasm of the kidney is impossible (severe intercurrent background, senile age, small size of the neoplasm or reluctance of the patient), then one of the options for minimally invasive surgery for kidney cancer can be chosen - cryodestruction, radiofrequency ablation, laser ablation, focused high-power ultrasound exposure, microwave thermal ablation, chemoablation with the introduction of ethanol and others into the tumor substances. The role of these methods is being studied; it is possible that that some of them will be at the forefront of the treatment of localized small kidney tumors.

Over the past years, cryodestruction of neoplasms has become wide spread since it is possible to carry out the procedure in real time under the control of ultrasound, CT or MRI. The use of this method is devoted to a large number of works, first used it Barone G.W. in 1988 [31]. In a recent publication, Cestari A. et al. [32] reported about cryodestruction of a kidney tumor in 37 patients. Depending on from the location of the neoplasm, the procedure was performed trans- or retroperitoneally. In average the operation took 194 minutes, and the blood loss was 165 ml. After the operation, the patients were under MRI control for 24 months or more, in addition, a biopsy was performed from the area of the tumor, which was subjected to cryodestruction, 6 months later. In none of observations did not detect cancer cells. Complications were registered
