in 14.6% of cases [33]. The principle of radiofrequency ablation (RFA) is that a needle inserted percutaneously or openly into the tumor creates local hyperthermia. Modern RFA can destroy a tumor 2–5 cm in size [34]. Some publications [35, 36] have demonstrated good results. RFA for kidney tumors. Multicenter studies of RFA complications showed their low frequency (7.4%). Complications were associated mainly with pain or paresthesia at the site of introduction of probes [33].

As an ablative technique, microwave thermotherapy was first used by Kigure T. [37] on VX-2 tumor models in rabbits. Recently Iinuma M. et al. [38] published their own data on the use of microwave ablation in the treatment of kidney tumors in 13 patients. Preliminary results show that all patients destruction of the tumor was noted after the procedure. Moreover, when compared with the control group, which performed an open nephrectomy, it turned out that after microwave ablation, significantly fewer complications were recorded. Terai A. et al. [39] performed laparoscopic resection of the kidney using microwave ablation in 19 patients. Postoperative complications include the formation of a urinary fistula, arteriovenous fistula, and wrinkling of the operated organ. 19 months after surgery CT scan showed no relapse or distant metastases. Similar data were presented by other researchers [40, 41]. Microwave thermotherapy has many advantages. Many clinics are equipped with microwave thermotherapy devices used for liver surgery, but they can be adapted for ablation of tumors of other organs, including kidney. Chemoablation is achieved by injecting chemicals into the tumor tissue. For this, various substances can be used. Percutaneous administration of ethanol into a tumor is more often used to destroy liver neoplasms [42]. In urology this method has been applied in prostate cancer [43]. Its use in kidney tumors is being studied. Naitoh Y. et al. [44] injected ethanol into a neoplasm of the kidney in white rats and showed that none the tumor that underwent this procedure did not enlarge. After the 3rd injection, tumor growth was significantly suppressed, and after the 5th tumor, almost completely destroyed. Histologically detected degenerative necrosis. Rehman J. et al. [45] for the purpose of ablation injected into the kidneys of pigs acetoacetic acid. At the sites of acid injection, tissue necrosis was noted. The authors propose in the future to use this method in combination with other minimally invasive kidney tumor treatment options, for example cryodestruction or radiofrequency ablation.

Kohrmann K.U. et al. [46] report the possibility of using high-intensity focused ultrasound (High Intensity Focused Ultrasound - HIFU). Wu F. et al. [47] used HIFU for late-stage kidney tumors in 13 patients and noted that the blood supply of all neoplasms either decreased or was absent and the tumors themselves were significantly reduced.

Other methods of minimally invasive surgery of kidney tumors have also appeared. Prapavat V. et al. [48] suggested using laser-induced thermotherapy (LITT). Dick E.A. et al. [49] used it in 9 patients with an inoperable tumor kidney and have shown that the method is safe and reduces tumor volume by an average of 45%.

Solomon S.B. et al. [50] on the kidneys of dogs showed the possibility of using ablation by γ -radiation (Interstitial Photon Radiation Ablation) on a par with other minimally invasive techniques. David Y. et al. [51] note that this method is effective with ablation of hyper vascularized tissues of interest is the Hydro-Jet technique, the principle of which is to use a directed jet water that acts like a sharp knife. Generator Hydro-Jet is mainly used for resection of highly vascularized liver tissue. Shekarri H. et al. [52] first used this method with laparoscopic resection of the kidney in animals. It has been noted that the Hydro-Jet preferentially cuts off the

renal parenchyma, leaving the intrarenal vessels and the renal pelvis system intact. Large vessels were then clipped and dissected. Minimal bleeding was easily stopped by coagulation.

The introduction of new technologies made it possible to revise the algorithm for examining patients with kidney tumors, as well as expand the possibilities of their treatment. In the future, an even earlier than when using ultrasound, tumor diagnosis kidneys; the existing screening method will be replaced by research for a tumor marker of kidney cancer. Of course, there are observations when the identity of the neoplasm remains unclear (parenchyma or pyelocaliceal system, tumor of the upper segment of the kidney with invasion of the adrenal gland or primary neoplasm of the adrenal gland with invasion into kidney, etc.). In these cases, the definition of a tumor marker would be extremely useful.

When planning the volume of lymphadenectomy and to substantiate the feasibility of removing the adrenal gland, an isotope diagnostic method is required, when the radiopharmaceutical is associated with a monoclonal antibody to kidney cancer antigens (according to analogies with prostasynth). Such a "renascent" will make it possible to visualize not only the tumor in the kidney, but also metastases in lymph nodes, adrenal gland, distant micro metastases. In order to improve the results of treatment, to suppress micro metastases, new "tools" of immunotherapy are needed. Thus, modern technologies open up new perspectives both in the diagnosis and treatment of kidney cancer.

REFLECTION AND PROBLEMS OF LINGVOCOGNITOLOGICAL AND COGNITIVE ASPECTS IN TRANSLATION

Azamova Gulasal Sodiq qizi*

*English Teacher,
Department of Foreign Languages in Humanities,
Fergana State University
UZBEKISTAN

ABSTRACT

There are different approaches to translation at the current stage of development of translation studies. One of them is the understanding of the translation process and quality, which is particular interest to researchers and scholars. This can be seen in a number of research articles devoted to discussing the cognitive aspects of translation around the world. This article shows critically examine the existing knowledge approaches and trends in translation proposed by translators. As well as it informs about the reflection and problems of lingvocognitological and cognitive aspects in translation.

KEYWORDS: *Translation studies, Cognitive aspects, Linguists, Language comprehension, Translation problems.*

INTRODUCTION

Many linguists and translators today are turning their attention to the study of knowledge, which they describe as a “cognitological aspect”. Cognition in general comprehension includes mental processes such as cognition, attention, memory and judgment, evaluation and reflection, problem solving and decision making, language comprehension and production. However, on the basis of cognitive linguistics and cognitive research, it is necessary to focus primarily on the processes of meaning creation and meaning interpretation. Finding the most suitable alternative is very important in translation, in this area

The contribution of linguistic theory is invaluable. The translator usually tries to adapt the closest alternative in the original language to the language being translated. Translation should be the object of scientific and theoretical study. Should focus on what is needed and what is needed to achieve the goal. Although the meaning of the pronouns often depends on the context, it is also

important to refer to the dictionary. It is not possible to approximate the meaning of words in a translation. The translator must know the word and its translations well or find them in the dictionary. Otherwise, the translator will inevitably fall into the trap of "fake friends of the translator." As for the shortcomings of the translations, it seems that some translators seem to see literary translation as a necessity, not a creation. For example, in recent years, the translation of some works of art into Uzbek has accelerated, with the contribution of Uzbek translators. However, it is difficult to say the same about the translation of Uzbek literature translated by other translators into the language of that country.

It seems that the world's translators have given priority to the quality of translations and the preservation of national identity in their translations, with the main goal of acquainting their readers with the works of Uzbek writers. The main reason for this is that translators do not know the subtleties of the meaning of words in the original language, the culture of the people, national identity, and customs. Therefore, the purpose of this article is to focus on this issue. Its relevance is that it helps to search for a doctoral dissertation by first identifying research trajectories in the field.

Moreover, as a new trend within the anthropocentric paradigm, the cognitive aspects of translation have not been sufficiently developed and studied, and therefore the problem is undoubtedly of interest to modern post-linguistic translation studies.

As for the cognitive scientific approach to translation, translators try to understand and explain the product of the mind:

How do translators and other scholars involved in translation create meaning in situations and texts that they manage?

How do they achieve their strategies and choices?

How do their cultural and linguistic foundations affect their thinking and understanding?

How do they develop translation powers?

In addition, research shows that there are commonalities and differences in how Western and Eastern translators study the problem in reflecting the cognitive aspect of translation. Indeed, more than 25 research papers, including books, scholarly articles, and works on various issues related to translation, are clear evidence of this.

A review of the literature, translations, and the essence of the content of words in another language helped to analyze and contextualize by brief comparison of previous research related to the disclosure of cognitive approaches in the field of translation. In addition, the application of this method has helped to reveal the interdisciplinary interaction of cognitive science and translation, as there are many disciplines that have a strong influence on their mutual development. For example, linguistics, psychology, psycholinguistics, cognitive linguistics, linguacultural studies, neurology, sociology, and some other fields have had a major impact on the growth of cognitive translatology.

TRANSLATION AS AN ACTIVITY

The cognitive aspect at the center of translations is the interpretation of the translation process by the interpreter of the interaction of cognitive and linguistic structures that the translator performs in the broadest context of his or her psychological and semi logical characteristics.

The concept of cognitive aspect includes knowledge, consciousness, reasoning, thinking, presentation, creativity, development of plans and strategies, reflection, symbolism, logical inference, problem solving, visualization, classification, cross-linking. It involves a wide range of mental activities such as cognition, imagination and dreams, and is determined by processes such as movement, cognition, mental imagery, memory, cognition, and attention organization. This is why cognition plays a key role in the translation process, as the translator is a pragmatic function based on cognitive activity, saving the semantic component of the text as well as its communicative and its own national color. it is necessary to take into account the mental processes involved in the performance of the task, as well as the required capabilities.

The role of lingvocognitological and cognitive aspects in the translation process is the interpretation of information as indicators of the cognitive process in translation. The wide range of published research on cognitive trends in translation quickly reveals another. Two key concepts - intercultural communication and translation - play an important leading role in understanding the commonality that lies at the heart of the interrelationship. As Komissarov points out, "Translation is a complex and multifaceted human activity that involves not only the process of conveying information from one language to another, but also the cultural aspects of the text in the source language, because culture is the sum of this material and the meaning of society. Are their achievements"

Culture encompasses all aspects of life and consciousness, including language. Therefore, many factors are crucial in the translation process and they need to be reviewed and explained regularly to better explain the translation process.

In short, the above-mentioned views will contribute to the identification of problems in the field, the theory and practice of translation, the efforts of scholars, researchers, translators and all creators of translation criticism, to increase the effectiveness of our cooperation. Given the limited scope of the article, more in-depth and detailed research is needed on how to apply cognitive aspects in translation studies.

PECULIARITIES OF THE USE OF INFORMATION AND COMMUNICATION TECHNOLOGIES IN THE TEACHING OF SPECIAL SUBJECTS IN HIGHER EDUCATION

Umarova Fotima Abdurakhimovna*

*Doctoral Student,
Tashkent State Pedagogical University named after Nizami,
UZBEKISTAN
Email id: umarova-fotima@mail.ru

ABSTRACT

This article is an analysis of the introduction and use of information and communication technologies in the disciplines of higher education, increase the effectiveness of education, increase students' knowledge and skills through the use of modern information and communication technologies in the training of designers, issues of interest in the learning process and the development of skills to apply their knowledge in practice are discussed. The focus is on developing appropriate strategies for the new educational role and in addition, the need to increase the role of students in the introduction of information and communication technologies in the educational process. The role and perspectives of teachers are very important and they are highlighted as key participants in the process. The results of the study show that the use of information and communication technologies in the educational process helps to increase the effectiveness of education and the organization of the educational process. In particular, it shows that the contribution of information and communication technologies to the improvement of the educational process in educational institutions, where information and communication technologies are an innovative factor. Achieving this high level means that the educational institution must not only modernize the technological tools, but also change the teaching models.

KEYWORDS: *Modern Information And Communication Technologies, Multimedia, Computer Programs, Textiles And Fashion, Software.*

INTRODUCTION

In the Address of the President of the Republic of Uzbekistan Shavkat Mirziyoyev to the Oliy Majlis, as the wise men of the East said, "The greatest wealth is intelligence and knowledge, the greatest heritage is a good upbringing, the greatest poverty is ignorance!"

Therefore, the acquisition of modern knowledge, true enlightenment and high culture should become a vital need for all of us. Therefore, the active transition to the digital economy will be one of our priorities for the next 5 years said he. "The present and future of our country are in the hands of our highly spiritual and enlightened youth. [1]

Today's process of rapid development and globalization places a number of demands on higher education. It is important not only to equip students with knowledge, but also to develop their professional skills and abilities, to use the opportunities of modern information technology, to teach them to apply in the educational process, in the field of specialization. The prospective professional must be able to think critically, analyze social problems, develop solutions, and be socially responsible. The training of specialists who meet such requirements requires the use of non-traditional teaching methods in the higher education system and the development of new effective teaching methods.

It is no secret that in today's market economy, the development of our society requires new technologies, including new information and communication technologies. In particular, the widespread introduction of multimedia and web technologies, the intensive study of computer-generated graphics, animation and video technologies require computer literacy. In recent years, Uzbekistan has taken a number of measures to develop computerization and information and communication technologies. [3]

The advanced countries and regions, which are working effectively to introduce digital technologies in education and create a digital learning environment, are showing high quality results in education. Therefore, Uzbekistan continues to study the best practices of foreign countries and move forward on its path of development. In particular, the Presidential Decree No. PF-5847 noted that the introduction of digital technologies in the educational process is one of the priorities in the development of the higher education system. It requires us to master digital knowledge and modern information technology to make progress, and it allows us to take the shortest path to growth. After all, IT is penetrating deep into all areas of the world today. [2]

A number of studies and reports in recent years have highlighted the potential and benefits of information and communication technology (ICT) in improving the quality of education. ICT is seen as a "key tool for building a knowledge society" and, in particular, as a mechanism for reviewing and changing education systems and processes, leading to an increase in the quality of education for all. [12]

The current stage of social development is increasingly being described as a period of formation of the information society. Informatization of education plays an important role in informing society. The problems of effective use of computer technology for teaching in the educational process are already widely covered in educational sciences and practice. The first attempts to develop a coherent system of computer training were made abroad by A.Bork, R.Williams, J.Merred, B.Hunter.

The use of computer technology in the training of specialists in the field of sewing production L.Vedmich, E.Zaroshchina, E.Koblyakova, V.Petrova, V.Romanova and E. Considered in the works of Tikhonova. [5].

In our Republic conducted researches on implementing ICT in education process by A.Abduqodirov, A.Abdullaev, M.Aripov, B.Begalov, U.Begimqulov, F.Zakirova, Q.Olimov, N.Taylakov, L.Shibarshova, S.Gulomov, U.Yuldashev. According to V.Blinov, achieving high efficiency in educational work requires the assignment of differentiated tasks, taking into account the individual abilities and capacity of students.

Improvements in information technology are focused on solving more intellectual, scientific problems. Data visualization, image processing, and the creation of a virtual environment enable a person to achieve a goal through innovative approaches to solving complex problems, making it easier to prepare and make management decisions. [4]

A number of studies and reports in recent years have highlighted the opportunities and benefits of information and communication technologies (ICT) in improving the quality of education. ICTs have become an integral part of modern society, especially in the field of education. Multimedia combines text, graphics, audio and video information, animation, allows the use of different ways of presenting information and can contribute to the formation of interest in knowledge, which in turn affects the activation and involvement of students in the learning process.

As Irina Bokova noted, “technologies can serve as a powerful learning tool only if they are used correctly and competently in the learning process, as well as in combination with new learning models”. [6]

The need to develop the skills of future professionals to work with information technology, first of all, the introduction of new intellectual educational resources in the educational process in the system of vocational education, secondly, the ability of teachers to teach using them and independently develop e-learning resources in specific subjects, third, it is closely related to the full realization of the opportunities to increase the effectiveness of the teacher's professional activity.

The use of ICT allows the teacher to optimize the learning process. This is because technical support of lessons creates a more favorable psychological environment, removes psychological barriers, strengthens its role in choosing methods, forms and rates of learning different topics of the curriculum, improves the quality of education due to an individual approach to education. Selevko G.K. considers information and educational technologies as educational technologies that use special technical media (computer, audio, film, video) to achieve pedagogical goals. Zaxarova I.G. takes into account the need to understand information technology as the application of information technology in order to create new opportunities for information transmission (teaching activities), knowledge perception (student activities) and the complex development of students' personalities in the learning process.

Many researchers argue that educational media resources are human brain friendly and using them in teaching and learning process helps people to learn efficiently. [10] Media resources create a multi-sensory learning environment. Involvement of all senses leads to an exceptional increase in the degree of assimilation of the material in comparison with traditional methods.

Enriching the information with various examples such as infographics and animation will make it easier for the user to assimilate the information and gain interest. [11]

The use of information technology in the teaching of special subjects not only increases the effectiveness of education, but also allows students to develop knowledge, skills, abilities and professional competence; helps students to think independently and develop creative activities. [6]

The use of ICT at all stages of the educational process allows to instill in future specialists the skills of collective work within the framework of electronic network structures, to teach the promotion of their own knowledge and skills in the market of highly qualified personnel through the electronic space. [13]

For quality self-education, it is necessary to create appropriate conditions, and above all, accessible educational material and technical base, electronic libraries, accessible Internet, electronic and printed educational and scientific literature, audio, video visual materials, infographics and much more. In educational process the wide usage of such as various resources i.e. media resources lead to interactive formation of education. [9]

Multimedia technology is based on the complex representation of any type of data. Such technology allows symbols, texts, graphics, images, documents, sounds, and dots to be processed together. The image can be transmitted to the screen along with the text and audio. Multimedia technologies are effectively used in education systems. The main reason for this is that when the user is active in a multimedia environment, he remembers 75% of the information he sees and only 25% when he hears. [4] As Benjamin Franklin said, "Tell me and I forget, teach me and I may remember, involve me and I will understand".

The use of multimedia is especially relevant in the training of professionals in the field of clothing design, because in the learning process, the future designer-model must join the real creative process of creating new competitive developments and creating conditions for its implementation.

In order to develop students' design and modeling competence, higher education institutions have divided the software products that graduates need to master in order to form a competent bachelor's degree in ICT into two groups:

- 1) software products required to master basic user skills.
- 2) professional (or specialized) software products.

Thus, after graduation, if the university's curriculum is designed taking into account the capabilities of modern ICT tools, the bachelor's degree in vocational education will become a competitive force in the labor market.

The development of technical progress, the introduction of computer technology and new information technologies in all spheres of life and production determines the demand for specialists who meet the level of development of the information society, including design. Costume designers, like all designers, need to be familiar with computer technology and analytical processing methods of information, which will help the specialist to adapt to active creativity and a changing environment. Computer technology in clothing design is a universal tool at all stages of project activities, from the creation of artistic and technical sketches, from the

construction of a model structure to the development of corporate brands and brand advertising.[8]

Based on the analysis of the work and qualification requirements of scientists conducting research, the results of our research and observations have shown that by adding competence in the use of information and communication technologies in the qualification requirements for vocational education teachers, we can train professionals who can meet modern requirements.

In short, Vocational Education Costume design achieves educational effectiveness by enhancing students' creative thinking skills, independent decision-making and teamwork skills through the use of modern information and communication technologies in developing students' competencies in designing and modeling clothing.

LINGUISTIC REPRESENTATION OF IMAGES OF TWO GENDERS IN FOLKLORE

Xakimboyeva Ozoda Kalandarovna*

*Teacher,
Uzbek State World Languages University,
UZBEKISTAN

ABSTRACT

In archaic times, the main form of transmission of the common people the experience of knowledge from generation to generation was folklore. Literally translated as "folk wisdom", "folk knowledge", the term denotes poetic creativity, reflecting the experience of millennia. Folklore existed in the context of folk culture and had, first of all, practical function, as well as informational and religious; the aesthetic function was secondary. Folklore works served the various needs of the ancient society; bearers of archaic traditions were people from the social bottom - peasants, poor townspeople, which led to the design of the oral verbal form of certain genres folklore. The relevance of the work is determined by two factors: first, the question the relationship of the sexes has always worried about a person, he remains open and in present tense; secondly, the problem of characterizing a person by his gender identity in Russian folklore is practically not studied, about as evidenced by the analysis of scientific linguistic research on gender. The scientific novelty of the research lies in the analysis of works Russian folklore from the position of reflecting gender inequality in them. The object of research is the works of Russian folklore, containing the characteristics of a person by gender. Research subject - semantic and grammatical features of lexemes used to describe the images of a man and women in folklore.

KEYWORDS: *Enticement, paternal inheritance, masculine, feminine, ditties, peasants, substantial part ditties, mental disability, humanitarian branches of knowledge, sphere of interest, behavioral patterns of men and women.*

INTRODUCTION

The ditties were originally designed as a "youth" genre, narrating about what took young people, boy and girl, from adolescence before marriage, so most of the ditties tell about the relationship of young people, convey their emotional experiences: dreams of love, first timid dates, courtship, "Enticement", suffering, parting. The guy in ditties appears frivolous and loyal, windy and loving:

I cried on one mountain,
On the other - he grieved:
I married one girl,
And he sent another letter.

More often, falling in love ends in disappointment, which is the reason serve the disapproval of parents, inequality of young people in the material, social issue, the discovered dissimilarity of characters, betrayal of one of parties, gossip and slander:

Oh you, my dear,
You are worth dear:
Has given me hope -
You marry another.

It is noteworthy that the young man also needed parental permission, blessing to marry, wedding was only possible with the consent of the father and mother to accept the chosen one of the son into their family:

I didn't paint the accordion myself,
I didn't use the varnish myself.
I didn't woo the cutie myself,
Father and mother went.

Depicting for the most part the life of a village man, a ditty contains details of peasant life, features of life a person tied to the land, living at the expense of a personal economy. Of ditties we learn that the man was engaged in agriculture, kept cattle, was responsible for paying taxes:

Well, time, well, yes, -
The peasant is in trouble:
There is no bread, no land,
And they came for the taxes.

In any family, a man was the main worker and bread-winner. That is why economic, businesslike husbands and sons were so valued. The household, as a rule, passed from father to son or sons. At the same time the main requirement for the groom, the bride's parents put forward the presence of he has his own property, economy. Hence, in Russian ditties appears the motive of the brother rivalry for the paternal inheritance, shared between brothers as they marry:

I fell in love, and even repent,

That there are many brothers:

Not only for you, dear, home -

Do not get the doors.

Darling, get married - don't get married

They won't give me up:

You have four brothers -

They will give a small share.

Ditties about work, presented in the number of three, refer to a later time, specifically to the Soviet period, about which evidenced, first of all, by the vocabulary: words such as "Miner", "locksmith", "factory", which arose in Russian in connection with the emergence of new and transformation of existing professions.

Ditties were created by peasants who moved to the city to work. Such ditties preserved the literary tradition, but acquired new ones. Features and details of factory and urban life:

Broken electricity

In a steam car:

Locksmiths have a lot of work -

Will not come home sweetheart.

The war for the recruit meant an alarming future, a difficult soldier service with its hardships and dangers, separation from mother, wife, bride. But guys 17-18 years old went to war and tsarist service, even after by the standards of a villager, this is a very young age, the very beginning of life. This is what the recruit sings about, falling into inconsolable melancholy. Substantial part ditties is a recruit's appeal to comrades, family, farewell to loved ones. The service also meant "separation" from native land, leaving the family without a breadwinner and worker:

Will be taken to the soldiers

From mother's illness.

From mother's illness

I don't want to be a soldier.

We will be hijacked - buried

Not fathers, not mothers,

Buried in an open field

Enemies are enemies.

Characteristics of a man by his appearance and character traits carried out on behalf of a girl, beloved or rejected. In basically, in ditties, the heroine criticizes those personal qualities of the guy, the presence which is considered undesirable and may even serve as a reason for parting of lovers. This is insecurity, frivolity, stupidity, infidelity, talkativeness, arrogance:

If only, dear, not you,
Bots would buy me.
And you with a long tongue -
I remained barefoot.
Thick light brown curls
At my dear.
Wrong words, empty -
I want to forget him.

The motive of a youthful, dashing lifestyle is widespread of a young man in the village. The guy brags about his bravery prowess, violent disposition; to be a bully, a criminal for him pride and honor. The narration is more often in the first person:

I'm a desperate little head
I don't value anything:
If the head is cut off,
I'll tie the korchaga.
Our field with your side,
The only difference is the boundary.
Who loves my sweetheart
He will try the knife.

A distinctive feature of ditties about human relations is a predominantly pessimistic representation of reality, therefore, ditties telling about happy love are practically not meet. Happiness in Russian ditties is the goal to which they strive heroes and performers, which often remains unreached. From here the appearance of ditties about the marriage of a girl in love to an unloved one a man at the behest of his parents:

You are ruinous parents
Destroyer mother!
Who did you want to marry,
They failed to give their daughter away, about the severity of parents who forbid seeing their beloved, do not approving the chosen one of the daughter:
Don't stand, dear, at the window,
Do not call for the evening:
I sit at home, crying with grief -
They don't want to let them go for a walk.

The general pessimistic mood persists in the ditties about family life. Plots about grave orphans' lives:

The orphan has so much grief -
What to do with bitterness?
I will carry it out into the open field:
Go, bitterly, for a walk,
about the unenviable, despised position of a widowed man:
I will not go to that end
Neither calves nor sheep.
Chilled me, girl -
The widower got involved.

Another common conflict is irreconcilable differences a young wife with her husband's family members, namely, the father-in-law and mother-in-law, sister-in-law:

I was grazing cows
She sang about her sister-in-law:
Horned cows
The sister-in-law is toothed!

Marriage meant living according to the rules of the spouse's family; often the husband's parents used the dependent position of the daughter-in-law and saw in her only a new housekeeper. Hence the motive of the girl's complaint to their parents for a hard life in someone else's house:

At his own dear mother
Eat and lie down
At a stranger's at the hostess
You will run without eating.

The theme also fits into the general elegiac mood of the Russian ditty. If in other genres of folklore wedding is a cherished desire any girl, a long-awaited, fateful event, then in a ditty the heroine appears disillusioned with youthful hopes and dreams. In relations, the first quarrels, quarrels, mutual reproaches arise, doubt and suffering. Married women grieve about girlhood gone about the former freedom, suffer from the mistake of choice, their own or parental:

My little head is cheerful
I want to sing songs,
Have fun while in girls
And there you will roar.

Ditties testify mainly to the fact that the girl in the family was entrusted with numerous household duties (caring for cattle, work on the ground, haymaking, cooking, cleaning), often overwhelming, so the heroine pours out her suffering, complaining about the strictness of her parents:

They say I'm thin
And I was not in a hefty one, -
Freaks are not in bliss:
The whole job is mine.

Thus, the analysis of ditties indicates more thematic groups of linguistic units, in which the image of a woman is presented: in comparison with the proverb genre, a woman in Russian ditty is also considered in the aspect of its involvement in professional activity, which is explained by a later time creation of ditties, namely in the Soviet period of national history, when the process of women's emancipation in social, labor and family life, which implies the empowerment of women with the right to equality in labor and wages. But at the same time, the image of a woman is still most fully revealed through the categories of family and gender relationships and personality characteristics. The image of a man in a ditty is considered in fewer numbers. Thematic groups (again in comparison with the proverb genre) that due to the specifics of the genre. From 8 thematic groups selected by us only 6 stands out here, there are no sections "church" and "social differences": since the main functions of the ditty are recreational and aesthetic, then the above aspects of public life are not included in "Sphere of interest" of the genre in question. The main characteristic men are also in a relationship with the opposite sex before marriage, the second most important is the personal characteristic. This is because those ditties from these thematic sections were composed by girls, and therefore, they reflect the girls' vision of relationships with guys and idea of the ideal features of appearance and character traits potential chosen one.

THE TIGER OF TURAN- JALOLIDDIN MANGUBERDI

Boboyev Mirodillo*; Umurzakova Bonukhon Azizovna**

*Student,
Fergana State University,
UZBEKISTAN

**Lecturer,
Ferghana State University,
UZBEKISTAN

ABSTRACT

This article provides information about the life and victorious march of Sultan Jaloliddin Manguberdi and his efforts for the peace of the motherland. In addition, the article also deals with the events that took place in the land of Turan in XII century. At that time, Chingiz Khan was coming to Khorasan with a huge army. Before reaching Ghazna, Jalaliddin met with Amin Malik, the governor of Herat and his father-in-law, and together they marched on the Mongols fortress of Kandahar.

KEYWORDS: Chingiz Khan, Mongols, Jaloliddinmanguberdi, Movorounnahr, Khorasan, Merv, Sultan, Khorezmshah, Temur Malik, Army, Uzlakshah, Akshah.

INTRODUCTION

One of the greatest figures in our history was Jaloliddin Manguberdi, who fought valiantly against the Mongol invaders and sacrificed his life for the freedom of the Motherland. Al-Nasawi, a medieval Muslim author, including his minister and mirza, called him "Manburni" (meaning man sign, meaning spot, spotted nose).

At a difficult time, Jalal al-Din Movarounnahr was plunged into war, much of the country was invaded by the Mongols, the imperial army was destroyed, some of the emirs went on the path of treason, and the rest on the path of saving their lives and property. Such kind of difficult time when the sultan had left the country to its own devices, ruled by mutual confusion and danger he appeared on the stage of history. In such a difficult situation, Jaloliddin fought for the freedom of the homeland and the people and fought against the Mongols for 11 years. He rode 14 times

against the Mongols, winning 13 of them. On the eve of the Mongol invasion, Jaloliddin, although the eldest son, was overthrown by his grandmother Turkon-Khotun and instead of him throne was taken by another prince of Qutbiddin Uzlokshah and was proclaimed zlakshahvaliahd.

The lands bordering Ghazni, Bamiyan, al-Gur, Bost, Takinabad, Zamin-Davara, and India were given to Jalaliddin. Although Jalaliddin was expelled from the center because of his grandmother, the sultan treated him with special love, appreciated his courage and wished him not to turn away from him. That is why Shams-al Mulk, a well-known state official, appointed Shahobiddin Alp al-Haravi as his minister, and Kuzbar Malik, his commander-in-chief, as his deputy. Muhammad Khorezmshah suffered from pleurisy and died in exile in the late 1220s (617 AH) on the island of Ashuradi in the Caspian Sea. Before his death, the sultan declared Jalaliddin the heir to the throne and gave him some of the sultan's ranks. After burying his father with his brothers Uzlokshah and Oqshah, Jalaliddin came straight to Urgench with 70 people. He will soon be joined by Khojand Governor Temur Malik and other amateurs. The people greet JalaliddinManguberdi with joy and great hope

However, when he learned that his brother Uzlokshah and his supporters were plotting against him, Jalaliddin secretly left Khorezm with 300 men, realizing that it was impossible to fight the Mongols. Recent research suggests that Jalaliddin's first encounter with the Mongols was in the Irgiz steppe of Jand province. Jaloliddin arrived in 16 days from Khorezm around the Nisa fortress in Khorasan. When Chingiz Khan learned that the sultan's sons had returned to Khorezm, he ambushed his army everywhere in Khorasan in order to oppose them if they wanted to retreat to Khorasan. Jalaliddin defeated the Mongol army of 700 men with 300 soldiers near Nisa. The Mongols are completely defeated.

At that time, Jalaliddin's brothers Uzloqshah and Oqshah became confused and did not know what to do, so they followed Jalaliddin to Khurasan. They defeated a small group of Mongols and paid a lot of attention to this victory. After that, they were captured and executed in another battle against the Mongols near the city of Habushan in Khorasan. The Mongols carried the heads of the slain princes in Khorasan for some time in protest. Another Jalaliddin's brothers, RukniddinGursanji (described by sources as "unparalleled in intelligence and splendor"), fought valiantly for six months against the Mongols in the Iranian fortress of Ustunavand. Jalaliddin arrives in Nishapur at this time. For a month, in order to fight the Mongols, all the emirs appealed to the commanders to gather troops. When he knew that the Mongols learned of his activities, they set up camp at al-Cairo in the Zawzan district (between Nishapur and Herat). Unfortunately, at this time, the local deputy governors are unable to unite around him. Jalaliddin, who was not strong enough yet, realized that it was dangerous to stay in the fort for a long time and headed for Ghazna.

At that time, Chingiz Khan was coming to Khorasan with a huge army. Before reaching Ghazna, Jalaliddin met with Amin Malik, the governor of Herat and his father-in-law, and together they marched on the Mongols fortress of Kandahar. In this struggle, for the first time in the history of military science, Jalaliddin pits the "infantry" against the Mongol cavalry. The British later praised the military method and used it in their famous battles near Cress. After three days of fighting, the Mongols were defeated and Jalaliddin was victorious, leaving for Ghazni

He entered the Ghazna in February 1221. According to sources, the people welcome Jalaliddin with great solemnity. The city is full of joy, just like the Feast of Hayit. In the Ghazna, Jalaliddin will be joined by Sayfiddin Ograk al-Khalaj, Balkh governor Azam Malik, Afghan tribal leader Muzaffar Malik and Qarluq leader al-Hasan Qarluq. According to historians, the total number of troops was about 90-130 thousand people. Chingiz Khan, angered by Jalaliddin's growing power and the Mongols' attack on him in Kandahar and sent an army led by Noyon Shiki Hutuhu. He approached the lands of Jalaliddin in the autumn of 1221. At this time, a progressive group of Mongols, led by Tekechuk and Molgor, began to besiege the Fortress of Valiyon, north of Chorikor.

Jalaliddin manages to defeat the Mongols in one attack. More than 1,000 Mongols were killed in this battle. Many historians, including Ibn al-'Asir, Juwayni, and Rashid al-Din, praised the battle. One of Jalaliddin's most important battles against the Mongols took place in the autumn of 1221 near the Parwanasteppe on the Lagar River in northern Afghanistan. The united army is led by Jalaliddin himself, with Amin Malik on the right and Sayfiddin Ograk on the left. The Mongols fought hard. At the behest of Shiki Hutuhu, every Mongol soldier was pushed behind him in order to endanger Jalaliddin's army. The battle of Parwana ended in the absolute defeat of the Mongols, and Shiki Hutuhu managed to escape to Chingiz Khan with the rest of his army.

The battle near Parwan had great importance to the people of Movarounnahr and Khorasan. So far, rumors and myths about the Mongols' divine, invincible power have been dispelled. Jalaliddin's victory lifted the spirits of the peoples of Movarounnahr and Khorasan, and led to popular uprisings against the Mongols in Sarakhs, Merv, Herat, and other Khurasan cities. The rebels in Bukhara drove the Mongols out of the city. Chingiz Khan was well aware of the dangers of Jalaliddin's rise to power and popular support for the Mongol-occupied lands. For this reason, he himself hurriedly led a large army to the south in order to defeat Jalaliddin at any cost.

Jalaliddin's army had taken a large booty after the Battle of Parwana. During the distribution of the booty, two of Jalaliddin's commanders, Amin Malik and Sayfiddin Ograk, clashed. As a result of the conflict, Sayfiddin Ograk and later others withdrew from the army. Jalaliddin's army was reduced, and he was left in a very difficult situation. Jalaliddin's appeal to the commanders who had left him to re-form an alliance and fight together against the enemy was in vain. While Jalaliddin was suffering from intestinal pain, he learned that a group of advanced Mongols had settled in Gardez (a town 50 km east of Ghazni). Despite his illness, Jalaliddin suddenly defeated the Mongols in Gardez and defeated them. Realizing that he could not fight a minority army against Chingiz Khan, he decided to retreat to the Indus River.

Chingiz Khan, who wanted to defeat Jalaliddin and capture him, pursued him. The Mongols, who were pursuing Jalaliddin, were particularly opposed by the fortress of Bamiyan. During the siege of Bamiyan, Mutulk, the son of Chigatay and the beloved grandson of Genghis Khan, was killed. Angered by this, Genghis Khan ordered the destruction of all the inhabitants of the fortress, without taking any booty or captives. The former fortress of Bamiyan, which was destroyed, was later renamed by the Mongols as Mobalik (i.e. a stupid city).

Finally, on Thursday, November 25, 1221 (the eighth day of the month of Shawwal, 618 AH), a decisive battle broke out on the banks of the Indus River that lasted for three days. A number of medieval Muslim historians claim that such a bloody, fierce, and terrible battle has never taken place in history. Jalaliddin and his army showed unparalleled courage and bravery. Only on the

third day did Genghis Khan's army begin to gain the upper hand. Jalaliddin's son, about 7-8 years old, was captured by Genghis Khan's army and killed. Amin Malik and many other commanders and navkars who fought valiantly in the battle were killed. In any case, Genghis Khan ordered to capture Jalaliddin alive. Jalaliddin, with his personal bravery, managed to break through the siege of the Mongol army, which was trying to capture him, and reach the banks of the Sind River. His mother, Oychechak, and other women in the harem were waiting for him by the river. However, they appealed to Jalaliddin, who was mentally and physically oppressed by the battle, to "... kill us and save us from the terrible captivity." Jalaliddin has no choice but to order all the harem women to be baptized. He jumps into the water on his horse and sails across the river to India

ChingizKhan also acknowledges Jalaliddin's courage and bravery not losing himself in any situation. According to historians Juwayni, Rashiddin, and others, Chingiz Khan admired Jalaliddin's courage and said to his sons, "A father should have only such a son. Whether he escaped from the battlefield and came to the brink of salvation from the whirlwind of destruction, great deeds and great revolts will come from him!" For three months after the battle of the Indus, Chingiz Khan captured and destroyed the strongholds of the generals who had separated from Jalaliddin's army.

According to Rashiddin, Jalaliddin will meet about 120 survivors from the river on the Indian coast. Both Jalaliddin and the survivors were in a difficult situation, both spiritually and physically crushed by the heavy fighting. At that time, one of the local Indian Rajas in Shatra arrived with an army of 40,000 men to exterminate the Khorezmians who had sailed to this side of the river. It was only because of Jalaliddin's unparalleled bravery and heroic deeds that Roja was killed and the army retreated. The battle lifted the spirits of the Khorezmian soldiers, and soon Jaloliddin was able to gather around him 3,000 men. Without losing his temper in difficult situations, the unbending commander crossed into India and began to occupy the lands along the Indus River. Jalaliddin's rule was soon recognized by the Sultan of Delhi, ShamsiddinEltutmish (1211-1236), and by NosiriddinQubacha (1205-1227), the ruler of Sind, Uchcha, Molton, Lahore and Peshawar

Jalaliddin stayed in India until the end of 1223, when he set out to conquer Iraq and Iran, the ancient possessions of the Khorezm kings. He will be replaced by Jahan Polvon Uzbek, a well-known commander. The world wrestler ruled India until 1229, then went to Jalaliddin to Iraq and served as an accomplice in his military campaigns. In early 1224, Jalaliddin came to Kerman and received an army of 4,000 men to help his brother Giyosiddin, the sultan of Kerman. He says his main goal is to fight the Mongol invaders and restore the independence. His visit to Sheroz and Isfahan will be greeted with great solemnity by the people.

Jalaliddin appealed to his brother GhiyasiddinPirshah, the caliphs of Baghdad az-Zahir (1225-1226), then al-Muntansir (1226-1242), Queen Rusudana of Georgia and others to fight together against the Mongols. . But many Muslim rulers, fearing retaliation from the Mongols and the rise of Jalaliddin, do not want to ally with him. The Caliphate of Baghdad and the Ismaili ruler Muhammad III (1221-1255) decided to get closer to the Mongols and openly fight against Jalaliddin. Princess Rusudanani and her minister, Avak, marched on Georgia in February 1226 after their proposals for an alliance were thwarted. Georgia is under heavy fighting, with many bloody and tragic events. After the second conquest of Georgia in 1228, the lands were plundered.

At the same time, Jalaliddin Manguberdi will have to fight the traitor Barak Hajib, who rebelled against him in Kerman, as well as the Ismailis. Also important is the fortress of Khilat, located at the foot of the Ararat Mountains, which has long resisted Jalaliddin. In late 1227, Jalaliddin, realizing that the Mongols intended to invade Iran, prepared to wage a fierce battle against them. The 2,000 Mongol vanguards sent in that year were crushed, 400 of whom were demonstratively executed in Isfahan. On August 25, 1228, a decisive battle took place near Isfahan with the Mongol invaders led by TaynalNoyon, who had come to conquer Iran. Although his brother Giyosiddin betrayed him during the battle and retreated to Luristan with his army, Jalaliddin resolutely ignored the situation. According to sources, even the Mongol noyon himself confessed to his courage, saying, "You really are a man of your time." Jalaliddin wins the battle. For eight days, he pursued the Mongols in Iran and drove them out of the country.

When he arrived in Isfahan on Friday morning as a victorious commander, the people greeted him with joy as the victorious sultan. The news of Jalaliddin's victory spread throughout the Islamic world. In the same year, Ogedei, the great Mongol khan, sent a letter through Honsultan, the first Mongol emperor, stating his intention to make peace with him. Jalaliddin abandons the diplomatic agreement and leaves the letter unanswered.

Jalaliddin lived in a complex and controversial period. He was, of course, a man of his day. He turned a blind eye to the looting and violence of his troops during many military campaigns, and became involved in destructive activities. This has led to an increase in negative public opinion and protests in Iran, Azerbaijan, Iraq and Georgia. But in any case, JalaliddinManguberdi remembered that his main goal was to fight the Mongol invaders. In this struggle, he hoped for the support of the surrounding Muslim rulers. But in many cases, his inability to find common ground with them was a sign of his weak foreign policy. At one time, Turkish, Arab, and Muslim rulers feared that his rule would grow stronger in the Middle East, and did not want to form an alliance with him. Some of them even openly supported rapprochement with the Mongols. In particular, the capture of the fortress of Khilat by Jalaliddin had earned the respect of the rulers who claimed it. Although Jalaliddin was aware of the alliance against him, he was mistaken in saying that at least he would be supported by the Turkish rulers.

On August 10, 1230, a joint alliance of the Sultan of Konya, the Governor of Khims, the Governor of Aleppo, the Governor of Mayafiriqin, and the Governors of Baynas defeated Jalaliddin. The Ismailis, on the other hand, betrayed and sent a secret letter to the Mongols about the defeat of Jalaliddin. Taking advantage of Jalaliddin's defeat, the Mongols launched a surprise attack on his military bases in Mughan and Shirkabut, Azerbaijan. In the spring of 1231, he came to Ganja, forgot all his grievances, and again appealed to the Muslim rulers to form an alliance against the Mongols. But his offer went unanswered. The governor of the Syrian fortress of Amida summons him. He wants to go to Iraq and recruit again.

Near Amida Road, she was suddenly attacked by the Mongols (early August 1231). He was followed by 15 Mongol army. Jalaliddin separated from his companions and came to the village of Ayn-ad-dar near Mayafariqin (now Silvan Province, Turkey). In this mountain village, it falls into the hands of the Kurds. After introducing himself as a sultan, the Kurds do not intend to kill him. Promises a reward for delivering it to the right place. But the Kurdish leader killed Jalal al-Din, who was in his house, in exchange for the blood of his dead brother. This event took place about 17-20 August 1231. The next day, when the sultan informed al-Malik al-Muzaffar, the ruler of Mayafariq, about a Kurd selling goods, he sent his commander, Shahabuddin Ghazi, to

the village. Shahobiddin Ghazi took the body of the sultan, killed all the men of the village and set fire to the village. Muarrikh al-Nasawi heard this and came to Mayafariq in person. Jalaliddin's uncle, Minister Oturkhan, recognized his body and was devastated. Jalaliddin Manguberdi's body will be buried in Mayafariqin and the grave will be leveled so that the Mongols do not insult them when they enter.

When his arch-enemy, the governor of Damascus, al-Malik al-Ashraf, was informed of the sultan's demise and asked for joy, he was saddened and said, "Do you want to congratulate me on his death? But you get the taste of it. I swear by Allah that his destruction means the Mongol invasion of the Islamic world. There is no one like Khorezmshah, who is now a wall between us and Gog and Magog. " Ibn Wasil described it as "a stronghold between the Mongols and the Muslims." After Jalaliddin's death, his glorious name soon became a national epic. Rumors that Jalaliddin was alive and that Jalaliddin was returning had long threatened the Mongols. Various individuals who called themselves "I am Jalaliddin" often led revolts and uprisings against the Mongols (for example, the uprising in the Ustundori of Iran in 1236, in 1255). Events along the Amudarya, etc

Muslim historians have always described him as a brave and courageous commander. Al-Nasavi, who knew JalaliddinManguberdi personally, described him as such. "He was a Turk, a middle-aged man with a black face and a black spot on his nose. He was fluent in Persian. He was unparalleled in bravery, a lion among lions, the bravest of horsemen ... he was modest, never laugh, just smile. He loved justice, but time has forced him to change. He tried to alleviate the suffering of his citizens, but he also resorted to violence because it was a time of decline. He did not want them to glorify themselves. He did not like the inappropriate descriptions and only asked them to refer to him as the sultan. The only word in his decrees is: "Help is only from Allah!" was the motto. "

Al-Muzaffar Sayfiddin Kutuz, the ruler of Egypt, a descendant of the Khorezmshahs, continued the glorious path of the ancestors' struggle, and in 1260 defeated the Mongols near Ain Jalut in the Middle East, preventing them from entering Syria and Egypt.

In November 1999, the 800th anniversary of the birth of JaloliddinManguberdi was widely celebrated, and a monumental statue was erected to him in his native Khorezm. Our national hero, who perished as a motherland, has become a symbol of respect, love and sacred memory of our ancestors.

In order to perpetuate the memory of JaloliddinManguberdi (Mankburni) and to establish historical justice, the Cabinet of Ministers of the Republic of Uzbekistan adopted a special resolution No. 408 on September 24, 1998. According to the decision, the birthday of the great commander will be celebrated on a large scale. On the occasion of the jubilee, a huge memorial to the commander was erected in Urgench, many pamphlets were published by specialists of the Institute of History and Oriental Studies of the Academy of Sciences of the Republic of Uzbekistan, KhorezmMamun Academy, a number of universities and various foundations. Artist T. Kuryozov created a portrait of the commander, held an international scientific conference "JaloliddinManguberdi - Defender of the Motherland" and, most importantly, a huge theatrical performance with the participation of members of the government and parliament headed by President Islam Karimov, foreign guests was held.

ETHNIC RELATIONS IN A MULTINATIONAL COUNTRY (UZBEKISTAN)

Holikulov Pirnafa*

*Candidate of Historical Sciences,
Karshi Engineering and Economic Institute,
UZBEKISTAN

ABSTRACT

The article covers the issues of preserving the language, customs, traditions and cultures, unique values over the years of independence, the further development of interethnic relations of more than 130 nations and peoples living in a multinational Uzbekistan. The reasons for the arrival of people of other nationalities, hospitality and tolerance of the Uzbek people were revealed to the Uzbekistan. The article also notes that equal conditions have been created in Uzbekistan to preserve the national identity of nationalities - for this there are 138 national cultural centers in the country, coordinated by the State Organization - the International National Center, classes in the Schools of the Republic are conducted in 8 languages, the media are published in 12 languages. All this is explained by the fact that in Uzbekistan, there is a mutual understanding in the interethnic relations, all nations and peoples living in the republic live in peace and harmony on the basis of the idea of "Uzbekistan - our common house".

KEYWORDS: *State Policy In The Field Of Interethnic Relationships, Concept, Migration, Ethnic Group, Interethnic Tolerance, Interethnic Consent, International National Center, National-Cultural Centers, National Identity.*

INTRODUCTION

Uzbek land has long been populated by people of different civilizations, cultural layers, different religions and worldviews. People who live here are not people who migrated from other places and settled here. This land is ancient and sacred land where our ancestors lived. Uzbekistan, located at the intersection of the Great Silk Road, where the ancient past and great future are found, in the heart of Central Asia, is one of the most ancient centers of human thought, science and culture. It was on this basis that the roots of the world of civilization were formed that the

world was formed, the religious and philosophical traditions of the most ancient periods of human history were formed. It is worth noting that the desire for the inherent nobility, humanity and interethnic agreement is one of the highest qualities of our civilization. These traditions are transmitted from generation to generation.

Uzbekistan is a multinational state, its multinational roots go into the depths of centuries. Multiple migration of peoples living in our country at different stages of historical development, devastating wars, the battles of different rulers - all this affected the demographic processes.

Resettlement here for centuries, Iranian rulers, Alexander Macedonian, Arab invasion, the looting of Genghis Khan, the colonial invasions of Tsarist Russia, the arrival of people of different nationalities and races, permanent residence of some artisans from different cities and countries during the reign of Amir Temur the Great led to a sharp Changes in the national composition of the population.

Main part

Our country is located at the crossroads of the Great Silk Road, has fertile lands, favorable natural climatic conditions, hospitality of indigenous people, breadwinning.

In addition, after the colonization of Turkestan, the Russian Empire from Russia began to relocate landless and unclosed peasants. For example, in 1889-1891, 28,911 families or more than 100,000 people were resettled in Turkestan. There are those who emigrated from Russia arbitrarily. By 1896, their number amounted to 178,400 people [1].

In the period of industrialization conducted by the former Soviet authorities in Uzbekistan in the late 1920s - early 1930s, 300 weaves were sent to Uzbekistan. In 1930, 15,000 skilled workers were resettled from Russia to Uzbekistan. In 1933, 3062 workers were sent, in 1934 - 3500, in 1935 - 300 people. In 1933-1938, 650 thousand workers were resettled to Uzbekistan for permanent job, including 94.3 thousand workers from Russia.

On the eve of the Second World War and in recent years, the national composition of the population of Uzbekistan has changed dramatically due to deported peoples. In October and November 1937, 16,307 families or 74,500 Koreans were deported from the Far East to Uzbekistan [2].

By 1944, Crimean Tatars, Meskhetian Turks, Kalmyks, Greeks, Poles and representatives of other nationalities were deported to Uzbekistan. As of July 1, 1951, 184,122 people were deported to Uzbekistan. As of April 1, 1953 there were 188,689 people [3].

After the Nazi invasion of the USSR, about 100 factories with the workers from the first days of war were evacuated from the center to Uzbekistan. After the end of the war, some workers who came to the factories remained in Uzbekistan for permanent residence.

In the 60-70s of the last century, foreign labor was brought to Uzbekistan for the construction and operation of chemical enterprises and the development of specially protected lands. In 1961-1975, about 400 thousand qualified workers were resettled from abroad.

Many forces to assist profits from Moscow, Leningrad and the Union republics of the former Soviet Union to cope with the consequences of the earthquake on April 26, 1966 in Tashkent. Among them were Russian, Ukrainians, Belarusians, Armenians, Azerbaijanis, Georgians,

Moldovans and representatives of the fraternal republics of Central Asia. When Tashkent rebuilt anew, some of them settled here forever.

The period of colonization of Uzbekistan, which lasted almost 150 years, had a significant impact on demographic processes in the country, including the ethnic composition of the population. It is known that complete information on the population, its total number, distribution by regions, age, sex, social and national composition, natural growth, migration is obtained by conducting a census. Population census in Uzbekistan was held 8 times in the last 100 years (in 1897, 1920, 1926, 1939, 1959, 1970, 1979 and 1989).

According to the 1989 census, the absolute number of Uzbeks has increased significantly over the past decade. Over the same period, it increased by 3,6 million and reached 14,1 million. As a result, the number of indigenous Uzbeks in 1989 amounted to 71,4% of the total population.

During the same period, the number of Russians remained at the same level - 1.7 million, their number in the national population of Uzbekistan decreased from 10.8% to 8.3%. The number of Tajiks has increased significantly from 594.6 thousand to 933.6 thousand, and the number of Kazakhs from 620.1 thousand to 808.2 thousand [4].

After finding Uzbekistan independence not only for the indigenous population of the country of the Uzbek people, special attention was paid to creating equal conditions and opportunities for people of different nationalities and ethnic groups living in the republic to preserve their language, culture, values and traditions as a nation.

The leadership of the country took steps to resolve the issue of law. In this regard, our country proceeded, above all, from the requirements of the Constitution.

The attention of all segments of the population and representatives of different nationalities focused on ensuring peace, calm and interethnic consent, strengthening the most important value facing the country - independence. Equality before the law was provided. It strengthened in the hearts of each citizen a sense of responsibility for a single land, a single place, a single homeland, which serves the idea of "Uzbekistan is our common house".

Article 4 of the Constitution of the Republic of Uzbekistan says that "the Republic of Uzbekistan provides respect for languages, customs and traditions of all nations and peoples living in its territory, and creates conditions for their development". Article 8 states that "the people of Uzbekistan, regardless of nationality, is a citizen of the Republic of Uzbekistan". This norm defines the concept of the "people of Uzbekistan". Everyone who was born lives and works in Uzbekistan, regardless of nationality, race or religion, is an equal citizen of our country. Citizens of Uzbekistan, regardless of their origin, race, social origin and other circumstances, constitute the people of Uzbekistan. Article 18 states that "in the Republic of Uzbekistan, all citizens have the same rights and freedoms and are equal to the law, regardless of gender, race, nationality, language, religion, social origin, belief, personal and social status" [5]. The principle of national equality of the people of Uzbekistan, enshrined in these articles, fully complies with the requirements of all international human rights treaties, including the Paris Charter for the New Europe, to which the Republic of Uzbekistan joined [6].

From world experience, it is known that in multinational countries, protecting the rights and freedoms, national and cultural interests of their citizens is one of the most important areas of state policy. This requires the creation of the necessary conditions so that the peoples living

outside their historic homeland can satisfy their national needs. This requirement is especially important for peoples without a nationally territorial device.

In the post-Soviet time, the National Policy was considered one-way. The national question was not resolved in any of the Union republics. Such a policy has had a negative impact on the socio-economic development of the Union republics, including Uzbekistan.

Although the Constitution of the former Soviet Union enshrined the national question, the constitutional provisions on the development of national cultures, in practice, the policy of Russification was carried out, the formation of a unified nation, which lost its national identity on the basis of rapprochement of all nations, and the peoples were "Soviet people".

From the first years of independence, flaws in interethnic relations began to gradually be eliminated. A multinational country adopted measures to ensure the world of peoples.

The creation of national cultural centers in the country has opened a wide path for the development of the national language, culture and other unique values and traditions of the country's non-indented population. Even before independence, in 1989, inter-ethnic cultural centers were created under the ministry of culture. Initially, these centers included 12 cultural centers, including Kazakh, Korean, Armenian, Azerbaijani and Tajik. Over time, the number of such centers has increased. By 1995, their number increased to more than 80. The increase in the number of centers required the coordination of their activities. To this end, on January 13, 1992, a republican International Cultural Center was established. Its main task is the implementation of a unified state policy in the field of interethnic relations, including ministries, departments, the Council of Ministers of the Republic of Karakalpakstan, regional, city and district khokimiyats, as well as public organizations, in particular:

- providing practical and methodical assistance to national cultural centers and coordinate their activities;
- assistance in the restoration and development of national traditions, customs and rites of peoples, comprehensive development of culture and spiritual values of peoples and national groups living in the territory of the republic;
- establishment and development of relations and cooperation with national centers of foreign countries;
- promoting the international integration of nations and peoples living in the Republic of Uzbekistan, the harmonization of interethnic relations [7].

In 2017, the 25th anniversary of the creation of the Republican International Cultural Center was widely noted. In his speech at a meeting dedicated to the 25 th anniversary of the Republican International Cultural Center, President Shavkat Mirziyev, assessing the activities of the Center, said: "It is noteworthy that the Republican International Cultural Center coordinates the activities of national cultural centers, provides practical and methodological assistance.

Based on bright events conducted in all regions of the country, the Center enriches our cultural and social life with a deeper meaning, strengthens the bonds of friendship and tolerance between people of different nationalities and ethnic groups living in Uzbekistan. It is noteworthy that among the countries of the Commonwealth of Independent States (CIS) only in Uzbekistan such a structure was created " [8].

To date, there are 138 national-cultural centers in the country, which effectively act as non-state non-commercial organizations. Azerbaijanis in Uzbekistan respect and keep the traditions and customs of the people. The Azerbaijan National Cultural Center in Uzbekistan - "Gardasylik" ("Brotherhood") was one of the first, founded in 1989 in Tashkent. Later, Azerbaijani national cultural centers were created in Samarkand and Bukhara. In 2003, the Republican Association of National Cultural Centers of Azerbaijan was established.

The center offers courses of Azerbaijani, clubs of Azerbaijani dance and national embroidery, as well as computer literacy lessons for everyone, regardless of nationality. It was a tradition to hold exhibitions of applied art and national cuisine, during which the Azerbaijan Gizlarri ensemble (Azerbaijani girls) under the control of the Honored Artist of Azerbaijan Cocaba Aliyeva (Tashkent) glorifies Azerbaijani folk songs and dances. In addition, on mass events in Tashkent and other cities of the country, the creative teams "Gardashlik", the "hearth" are allocated by their unique performances. Azerbaijani artists regularly take part in events dedicated to National Holidays of Uzbekistan - Independence Day and Navruz. Concerts of Azerbaijani artists are organized in collaboration with the Azerbaijani Embassy [9].

The activists of the center, seeking to strengthen and develop interethnic relations, make a worthy contribution to the exchange and enrichment of the Uzbek and Azerbaijani cultures, the further strengthening of ultrasound of friendship between nations.

The exhibits of the Museum of Uzbek-Azerbaijani Friendship in the center of the Center tell the story of friendly relations between the two peoples since ancient times. One of the exhibits of the museum is a stone amulet in the form of two kite of the II millennium BC, found in the Fergana Valley, is very similar to Amulet discovered in Azerbaijan, which confirms the proximity of our peoples. Today, the center and its branches in Bukhara, Navoi, Samarkand, Syrdarya, the Tashkent region and the city of Tashkent are effectively working to achieve a common goal.

An important activity of the International National Center is to actively participate in the preparation and holding of national holidays. In particular, in the traditional holidays "Independence Day" and "Navruz", celebrated in the country, along with Uzbeks, the people of all nationalities living in the country are actively involved.

Another direction of the work of the International National Center for the years of independence is the Film Art Festival, which has been held every two years since 1994. In particular, our people with great interest meets the speeches of professional and amateur artists of Armenian, Azerbaijani, Tajik, Kazakh, Tatar, German and Korean peoples, which are actively involved in this festival. Festivals of each National Cultural Center are to truly note the national holiday, show the bright future of this people, to strengthen the sense of responsibility for the destiny of the country in which they live. The final performances of national cultural centers are running on the eve of Independence Day on August 20 at the Palace of Friendship of Peoples and on the Day of the Holiday - September 1.

It was the tradition of the annual celebration of the Russian national and cultural center together with the Russian Embassy in Uzbekistan of the Day of the Great Russian Poets A. S. Pushkin and S. Ya. Yesenin, which strengthens our fraternal relations with the Russian people. It is also worth noting such cultural events as the anniversary of the Great Kazakh Poet Abay with our brothers and sisters-Kazakhs living in Uzbekistan, the celebration of the 1000th anniversary of the Kyrgyz National Epos "Manas" with our Kirgiz Brothers.

Another positive aspect of the development of interethnic relations in the country is the creation of a system of education corresponding to the national composition of the population. Note that today in 845 schools in the country, training is conducted in Russian, 491 - in Kazakh, 259 - in Tajik, 52 - on Turkmen, 40 - in Kyrgyz and 7 - on Korean.

In addition to Uzbek, teachers of pedagogical institutions under the Ministry of Public Education are preparing teachers for schools with Russian, Tajik, Turkmen, Kazakh and Karakalpak language learning languages. In addition to Uzbek, teachers of pedagogical institutions under the Ministry of Public Education are preparing teachers for schools with Russian, Tajik, Turkmen, Kazakh and Karakalpak language learning languages.

The media serving the diverse needs of the national composition of the country are published in 8 languages: Uzbek, Karakalpak, Russian, Kazakh, Tajik, Turkmen, English and Korean. Television and radio broadcast in 12 languages (Uzbek, Karakalpak, Kazakh, Kyrgyz, Tajik, Azerbaijani, Russian, Tatar, Bashkir, Korean, Uigur). Obviously, the inter-ethnic state policy of Uzbekistan is based on humanity and democracy [10].

In Uzbekistan, a unique experience of establishing an interethnic relationship has been accumulated. It adheres to the principle not only an understanding of the national identity, education of the sense of national pride, the preservation of the language, culture and traditions of nations, but also to achieving the overall unity of all nations in the country.

We should not forget that where the importance of the idea of interethnic consent is not recognized, various contradictions and problems that threaten peace and stability arise in society. This is evidenced by national conflicts that occur today in some countries of the world.

In order to consistently implement and further improve the state policy of the Republic of Uzbekistan in the field of further development of interethnic relations, the main directions of the concept of state policy of the Republic of Uzbekistan in the field of interethnic relations are developed in accordance with the Strategy of Action 2017-2021:

- improving the mechanisms of interaction between state bodies and organizations, local executive bodies with civil society institutions, including media, in the implementation of state policy of the Republic of Uzbekistan in the field of interethnic relations;
- the establishment of additional socio-economic conditions in the country for the further development of interethnic relations, the effective implementation of the state policy of the Republic of Uzbekistan in the field of conservation and development of the language, culture, traditions and customs of different nationalities and living ethnic groups;
- ensuring in the country. In society, the feelings of a large multinational family to prevent the discrimination of their constitutional rights and freedoms;
- strengthening of interethnic relations, the protection of freedoms and legitimate interests of citizens inside and outside the country;
- improving the organizational and legal framework of interethnic relations, taking into account the priorities of the Republic of Uzbekistan in the development of the state and society, an advanced foreign experience [11].

The concept of state policy in the field of interethnic relationships and the roadmap for its implementation for 2019-2021 has been approved. The Committee on Ethnic Relations and Friendship with Foreign Countries under the Cabinet of Ministers of the Republic of Uzbekistan is entrusted with coordination and monitoring of the implementation of the Concept and Road Card. The Committee has created a center for scientific and practical research of interethnic relations for scientific and social research in the field of interethnic relations, the preparation and publication of scientific articles, books, research materials, information and analytical reviews [12].

FINDINGS

During the years of independence, one of the priorities of state policy was the provision of interethnic consent in society, strengthening the atmosphere of friendship and a multinational family, the upbringing of young people in the spirit of love and devotion to Fatherland, respect for national and universal value. The provisions of the Constitution of the Republic of Uzbekistan on the equality of all citizens are being implemented.

Today, representatives of more than 130 nationalities and ethnic groups living in the country, using equal rights and capabilities enshrined in the Constitution and Laws of the Republic of Uzbekistan, work effectively in various sectors of the economy and social sphere, science and culture. They make a worthy contribution to the prosperity of the country and strengthening its independence.

Analysis of conducted large-scale democratic reforms, further liberalization of political, economic, social and cultural spheres and considerable creative work in other areas of society's life, shows the association of representatives of all nationalities and ethnic groups living in Uzbekistan, for the sake of a common goal, such as building a bright future for the new Uzbekistan.

THEORETICAL AND METHODOLOGICAL BASIS OF ORGANIZATION STUDENT'S SELF-LEARNING IN EDUCATIONAL MEDIA ENVIRONMENT

Zakhro Umarova*

*Doctoral student,
Tashkent state Pedagogical University named after Nizami,
UZBEKISTAN

Email id: umarova.zakhro@gmail.com

ABSTRACT

In this article highlighted actuality of using media resources in self-education and proved effectiveness of organizing self-learning in educational media environment. By the thoughts of author, their use helps to increase the efficiency of students' self-learning process, increases students' motivation to learn. It can be concluded that media resources must be used in the self-education process in order to improve the quality of knowledge and skills. Besides that, due to the media resources self-learning process which is conducted in educational media environment will more productive and fascinating.

KEYWORDS: *Self-Learning, Self-Education, Media Resources, Motivation, Educational Media Environment.*

INTRODUCTION

It is all known that, investment in education is the most effective and targeted today. Therefore, each person should invest daily in self-education itself. This is the actual requirement of the 21st century. [1] That's why self-learning is listed as a key component of the 21st century skills. It is also intricately linked to lifelong learning, which has been listed as a demand for modern society by international organizations such as UNESCO and OECD. [2]

Unfortunately, today for most students the world of self-learning can be a little daunting. One of the causes of this is absence of motivation to self-learning. When your motivation to self-learning is intrinsic, it ceases to be a chore. It's about your personal desire to gain more knowledge and to make progress towards 'WHY' you're learning. [8] The philosophical gurus behind the creation of the so-called managerial psychology were Ivan Pavlov and, later, Berres

Frederick Skinner, who were convinced that if they correctly find an incentive and influence people with its help, they will do whatever is required of them.[4] That "correctly found incentive" is the motivation.

Methods

Based on this, during our research we set the goal improving the methodology of organizing self-education of students in order to make self-learning fun, motivate students and interest them.

To achieve this, as E. Potulickal said that university professors should only help students to develop themselves, make them capable of continuous learning and self-education. If student has strong motivation, enough created conditions to learn making experiments and doing it is possible to acquire knowledge on your own, and the entire process will more engagement and productive. A. Eisenberg noted that self-education can develop if two cardinal conditions are met: the presence of a need for self-education, the dominant reason for self-assimilation of knowledge and a certain condition for its satisfaction.

An analysis of the pedagogical experience of domestic and foreign studies has shown that the problem of self-education is brought to the fore by scientists and is becoming more and more urgent. Self-education process is considered in the works of A. Usova, A. Eisenberg, V. Belikova, K. Levitan, L. Klinberg, R. Simpson, M. Kuzmina and others.

M. Kuzmina notes that self-education is an independent, purposeful, motivated by internal motives, cognitive activity, carried out without taking a course in a stationary educational institution for the purpose of mental development and personal self-improvement [5] Self - education is an integral part of the student education and training system, aimed at the free choice and mastering of additional education programs by students. [3] Findings published, in the International Review of Research in Open and Distance Learning, state that "the amount learned from the online classroom is somewhat greater than in the traditional lecture-based courses." [8]

Today, there is a big question in modern pedagogy that, how we should organize students' self-education to make it more effective and productive?

To answer this question, we should begin answering with how modern students learn actually. Because, learning how to learn begins with learning how we learn. [9]

So let's first define what is more interesting for many students. Of course, today, with ordinary textbooks in printed version, we cannot surprise our modern students, besides that, we can't explain something in more detail. Most students prefer pictures than text, and videos than pictures. We can continue this as much as we like, infographics, presentations, animations, caption videos (videos with subtitles), the possibilities of virtual reality, and augmented reality etc.

All of these are various means of visualization of information and they form digital media resources. They are so helpful in explaining difficult situations and things. Using media resources in educational process means combining and implementing words, pictures, graphics, charts, illustrations, infographics, audio, video and others to maximize teaching and learning effectiveness.[1] Because, media creates a multi-sensory learning environment.

Involvement of all senses leads to an exceptional increase in the degree of assimilation of the material in comparison with traditional methods. [1] Information of different modality (sound, text, graphics, video etc.) i.e. media resources creates a universal teaching and learning environment for almost any branch of knowledge and human activity.

Gaining knowledge works as eating food. To digest knowledge well, one must absorb it with appetite. [4] According to a study from the University of California, the researchers state that curiosity makes our brains more receptive for learning. When you learn to satisfy a level of curiosity, it makes the learning journey more enjoyable. [8] The media is fun and engaging for modern youth, the use of media resources for educational purposes in the educational process is one of the best solutions to increase students' learning motivation. [7]

RESULT AND DISCUSSION

According to the all above mentioned, we propose, to organize self - education of students on the facilities of media resources in educational media environment.

The organization of self-learning processes on the basis of media resources in modern socio-cultural conditions provides educational and developmental opportunities for students.

Organizing students' self-education in educational media environment gives the chance to students moving from a passive learner to an active learner and makes students' learning experiences more meaningful to them. This methodology, especially this process, learning by doing can increase student motivation and engage them active self-learning process.[1]

Making a habit of creating something new from what students have learned, is the most important rule of our methodology of organizing students' self-learning in educational media environment. In this way, new information is remembered for a long time, new knowledge gained is well strengthened and students gain new skills easier.

The organization of project activities on the basis of media materials allows students to become active participants in the learning process, as well as makes a huge contribution to the development of creative, critical thinking skills.[6]

CONCLUSION

The experience of organization students' self-learning process in educational media environment allows us to conclude that the most effective in the educational process is media resources. Media resources that are presented as educational resources of educational content makes self-learning process more fun and interesting for modern students. Consequently, increases students' motivation and improves quality of self-education process.

All in all, we can say that, organization students' self - learning process in educational media environment is one of the effective way and media resources can be the best facilities in it.

MECHANISMS FOR IMPLEMENTING AN EFFECTIVE TOURISM POLICY BASED ON THE EXPERIENCE OF DEVELOPED COUNTRIES

Shahodat Mirzaliyeva*

*Researcher,
Uzbek State University of World Languages,
UZBEKISTAN

ABSTRACT

This article focuses on certain aspects of the mechanisms of effective tourism policy based on the experience of developed countries. In particular, within the framework of the topic, the experiments conducted in the field of tourism in developed countries, such as the United States, Japan, Switzerland, France, Russia, Brazil, China, and India, have been analyzed and interpreted. Developed countries, as well as industrialized countries, have national and general aspects in their international tourism policy, as well as their own characteristics of the development of world international tourism, image, international tourism is the main source of foreign currency acquisition for them. Based on the author's conclusions, it is concluded that countries with different levels of development need both joint projects and interregional cooperation programs that allow developing countries to introduce new technologies to increase the competitiveness of a tourist product and increase its compliance with consumer requirements, and improve tourism policy in general.

KEYWORDS: *International tourism, Tourism policy, World economy, Developed and developing countries, Interregional cooperation.*

I. INTRODUCTION AND RELEVANCE

International tourism business is one of the most important industrial sectors of the world economy. In the world of international political and economic relations an important role is played by international tourism. It is not evaluated as a typical form of export because the tourist is not delivered a tourist product, and he himself arrives at the same place to consume the tourist product. Under the tourism product refers to the set of services included in the tourist tours. This suggests that international tourism is different from other types of exports [1.175].

First, the tourist takes care of the transportation costs. Secondly, the purchase of various souvenirs and items by foreign tourists can be considered as the implementation of profitable foreign trade operations.

A number of industries in different countries work "for domestic export". For example, in Japan, tourists buy radios of domestic production, in Switzerland-watches, in France-perfumes [2.9].

Tourist visa (from Latin) - a sign of the consent of a particular state to visit, an official mark in the passport on the permission of tourists to travel abroad. There are many types of tourist visa: one-time, long-term, visa only to certain countries. Visa-free countries are among the countries that adhere to the "Open door" tourism policy and attract a large number of tourists.

In developed countries, tourism will develop in a harmonious state. There is a balance of domestic and inbound tourism. Domestic tourism contributes to the efficient use of national tourism resources and the development of the tourism industry and infrastructure[3.234].

II. METHOD

In covering the topic on the basis of system analysis, it is noted that "Mechanisms for implementing an effective tourism policy based on the experience of developed countries "is not only to ensure the stability and well-being of the country, but also to ensure youth employment, as well as to implement the state program on youth policy based on a broad statistical and system analysis, survey, comparative analysis, and the logic of scientific research.

III. DISCUSSION

However, in practice, not all countries agree with this. Of course, it is followed only by those countries whose economy is connected with tourism. Some countries, under the pretext of internal state structure, restrict the travel of their citizens abroad or introduce measures of state control over tourist activities. That is, without the permission of the state, it becomes difficult to withdraw from the EPR, and tourism management passes into the hands of the state.

According to CIPA statistics, every Hungarian citizen, not counting infants and pensioners, goes to the tourist Mecca abroad twice a year. This figure is only 2% of the population of Russia.

International tourism-refers to the arrival of tourists from one state to another or several, while in some states only the arrival of tourists is taken into account, and in others-the arrival and departure of residents. International tourists are tourists who benefit the state. Tourists are measured by the number of trips from one state to another, while residents differ from travelers within the state. For example, the number of tourists participating in international tourism is equal to the number of tourists who left our country for another country. The better international tourism develops the more foreign exchange earnings will flow into the country [4.204].

International tourists-according to the recommendation of the World Tourism Society, the number of international tourists in Cyprus should be determined by adding to the tourists from other countries their own resident tourists visiting other countries. But most countries are determined only by the number of tourists from other countries. This is certainly true, because tourists who bring income are tourists from other countries [5.84]. Indicators of the development of international tourism in recent years indicate that this industry is becoming a leading sector of the economy of various countries. Developing countries, in particular, attach particular

importance to international tourism as a priority industry in developing their economic policies [6].

Therefore, it is advisable to study trends in the development of international tourism around the world on the basis of data from the UN World Trade Organization.

International tourist visits reached 846 million in 2006, an increase of 5.4 percent over the previous year. The tourism sector is characterized by the fact that its growth rate is higher than the global average. A distinctive feature of 2006 is that positive growth rates were observed in all regions. Consequently, of the 846 million international visits made in 2005, 43 million additional visits, including 22 million international visits to Europe, 12 million to Asia and the Pacific, and more than 3 million to other regions (America, Africa and the Middle East). Africa leads the way with a rate of +9%, almost twice the average growth rate in 2006. At the same time, sub-Saharan Africa finished the year at 10 per cent, and North Africa at 7 per cent, higher than the global average.

The Asia-Pacific region achieved 8 per cent growth, with 39 positive indicators, despite losses caused by the December 2004 tsunami typhoons in Thailand and the Maldives. While Europe saw growth of 5 percent, in the Middle East, despite the geopolitical situation there, namely the Israeli-Lebanese crisis, the growth rate reached 9 percent.

The region with the lowest growth rate is the Americas, which achieved 2 percent growth. While visits to Canada and Mexico stagnant growth is eroding high rates in Central America and the Caribbean, as well as in South America. (Table 1)

TABLE 1¹ TRENDS IN THE DEVELOPMENT OF INTERNATIONAL TOURISM

	International tourist visits (in million us\$.)					Market share (%)	Changing (%)		Annual average growth (%)
	1990	1995	2000	2005	2006*	2006*	05/04	06*/05	00-06*

Middle East	9,6	13,7	24,5	38,3	41,8	4,9	5,9	8,9	9,3

In 2006, more than half of international tourist visits were made for recreation and sightseeing (51%), and the total number was 430 million people. Business visits accounted for 16 percent (131 million), while other purposes, such as visiting relatives and friends, for religious reasons, restoring health, etc., accounted for 27 percent (225 million). The goal of the remaining 6 percent of visits remains unknown.

While travel by air (46%) and land was by road (43%) and rail (4%), travel by water was 7%. Over the past 3 years, the number of trips by air transport has been growing at a higher rate than by other modes of transport.

Worldwide, international tourism generated \$ 57 billion more in 2006 than a year earlier. For many visitors, the costs of accommodation, food, local transport, entertainment and other expenses are significant with the development of the economic system and the creation of new jobs. About 75 countries of the world earned more than \$ 1 billion in international tourism in 2006.

According to the UN BST, 733 billion (584 billion euros) of international tourism revenue was generated in 2006. This resulted in \$ 57 billion (40 billion euros) more revenue in 2006 than the year before, in absolute terms. In this regard, Spain, which is considered the second largest tourist center in the world, or the countries of the Middle East and Africa, stood out.

Asia and the Pacific achieved total revenues of US \$ 18 billion, achieving growth of US \$ 153 billion, while the Americas achieved growth of US \$ 9 billion, achieving total revenues of US \$

154 billion. In 2002, the Asia-Pacific region became the second most visited region in the world after Europe, surpassing America in terms of international tourist traffic.

Although international tourism in 2006 had a higher growth rate in the Asia-Pacific region than in the Americas, it still allows Europe to take the first place in absolute volumes, and Europe received an additional income of \$ 26 billion, reaching a figure of \$ 374 billion or 298 billion euros (51% of global income). Africa increased revenue by \$ 3 billion with an additional increase of \$ 43 billion to \$ 24 billion. And the Middle East, with an increase of \$ 1 billion, brought the total revenue to \$ 27 billion. While all regions achieved growth in overall terms, in terms of local prices last year, as a result of currency exchange and inflation, an increase of 3.2 percent was achieved, in 2006, the world received 4.3 percent more revenue from international tourism. For comparison, we see that in 2006, international tourist visits increased by 5.5% compared to the previous year. Among the regions, the Middle East, although it achieved growth in general indicators, failed to reach the level of inflation, observing a comparative decline in prices (-1.4%). In 2006, more than half of international tourist trips were made for recreation and sightseeing (51%), and the total number was 430 million people. Business visits accounted for 16 percent (131 million), while other purposes, such as visiting relatives and friends, for religious reasons, restoring health, etc., accounted for 27 percent (225 million). The goal of the remaining 6 percent of visits remains unknown.

While travel by air (46%) and land was carried out by road (43%) and rail (4%), travel by water was 7%. Over the past 3 years, the number of trips by air transport has been growing at a higher rate than by other modes of transport.

Worldwide, international tourism generated \$ 57 billion more in 2006 than a year earlier. For many visitors, the costs of accommodation, food, local transport, entertainment and other expenses are significant with the development of the economic system and the creation of new jobs. About 75 countries of the world earned more than \$ 1 billion in international tourism in 2006[7.154].

According to the UN BST, 733 billion (584 billion euros) of international tourism revenue was generated in 2006. This resulted in \$ 57 billion (40 billion euros) more revenue in 2006 than the year before, in absolute terms. In this regard, Spain, which is considered the second largest tourist center in the world, or the countries of the Middle East and Africa, stood out.

Asia and the Pacific achieved total revenues of US \$ 18 billion, achieving growth of US \$ 153 billion, while the Americas achieved growth of US \$ 9 billion, achieving total revenues of US \$ 154 billion. In 2002, the Asia-Pacific region became the second most visited region in the world after Europe, surpassing America in terms of international tourist traffic.

Although international tourism in 2006 had a higher growth rate in the Asia-Pacific region than in the Americas, it still allows Europe to take the first place in absolute volumes, and Europe received an additional income of \$ 26 billion, reaching a figure of \$ 374 billion or 298 billion euros (51% of global income). Africa increased revenue by \$ 3 billion with an additional increase of \$ 43 billion to \$ 24 billion. And the Middle East, with an increase of \$ 1 billion, brought the total revenue to \$ 27 billion. While all regions achieved growth in overall terms, in terms of local prices last year, as a result of currency exchange and inflation, an increase of 3.2 percent was achieved, in 2006, the world received 4.3 percent more revenue from international tourism. For comparison, we see that in 2006, international tourist visits increased by 5.5%

compared to the previous year. Among the regions, the Middle East, although it achieved growth in general indicators, failed to reach the level of inflation, observing a comparative decline in prices (-1.4%). Comparative price growth was observed in the regions of North Africa (+17%), South Asia (+14%), North-East Asia (+11%), Central America and South - East Asia (+10% each)[8.120].

For some countries, international tourism revenue is estimated as export revenue and is generated by daily visitors and overnight stays. However, income from international passenger traffic is not included in it and is accounted for as a separate category. The value of international passenger transport exports in terms of international tourism revenues has been 17 per cent in recent years and amounted to US \$ 148 billion in 2006. Total revenues from international tourism and international passenger transportation in 2006 amounted to 880 billion US dollars. In other words, this means that \$ 2.4 billion is earned from international tourism every day.

From the links to CIPA leading tourist countries of the world, we can see that there are differences in the types of tourism in OPAC. We can also see this in 8 of the 10 countries with the best CIPA scores according to the UN, BST. The United States is characterized by large expenditures of tourists on tourism revenues. European tourists like to travel to their regions because of the distance from Cook. China is ranked 4th, the UK and Germany are 6th and 7th, and Austria is 9th. According to these indicators, Germany has caught up with Mecca. The main reason for this is that FIFA is hosting the World Cup. Austria and Russia moved up to 9th place, moving up one place. In contrast, Turkey dropped two places below its place in 2005.

The top ten countries generate half of the world's gross tourism revenue. Their share in total revenues from international tourism decreased compared to the previous year and amounted to 47 % [9.158].

Tourism regions of the world and their development indicators are different. European tourism was developed in 2006 thanks to a number of events, namely the Winter Olympics in Turin, the World Cup in Germany and a number of other cultural events: the 400th anniversary of Rembrandt, the 250th anniversary of Mozart, the 125th anniversary of Picasso. Thanks to lower prices, it was possible to stimulate demand in the regions.

The 2 percent increase in 2008 is due to the fact that the growth rate in the first six months of last year was higher, the risk of losing control over the environment amid the financial crisis, and it was in 2008 that sad signals were expected that the development of the global stock market and its impact on the economy slowed down.

The UN BLS insists that the economic situation and the instability of the securities market in 2008 may affect the demand for tourism. The level of exposure is also increasing and is a concern for people with high levels of debt. The decline in the US dollar also had a negative impact.

Global visitor growth of 5 percent was observed between January and June, and a 1 percent decline in the second half is the result of 59 contractions in the economy. In addition, the reduction in aircraft capacity as a result of rising fuel and transport prices led to a decrease in growth rates.

The 1 percent decline was driven by a 3 percent drop in visits to Europe and a 3 percent drop in visitors from Asia and the Pacific. At the same time, the decline in Asia and the Pacific was

lower than in Europe, with an 11 percent increase in 2007 and a 6 percent increase in the 1st half of 2008. In contrast to America 1 percent, Africa 4 percent and the Middle East 5 percent) shows a sharp slowdown in visitor arrivals in the first half of 2008, although in July-December it was positive [10.158].

In 2008, the financial and economic crisis became the focus of the global economic situation and became the main factor influencing tourism trends (credit crisis, high fuel costs, instability of the commodity and currency markets). Several positive and negative effects for example: For various reasons, the Summer Olympic Games in Beijing also failed to stimulate an increase in China's attendance.

Terrorist attacks (Mumbai became very scary), health and safety threats continued, while floods (in China, Myanmar, Brazil, Mecca), forest fires, hurricanes and cyclones (in and around the Caribbean), volcanic eruptions (in Chile) and earthquakes (in China's Sichuan Province in May) continued. 2.7. – drawing.

However, the impact of various phenomena was limited and prevented. Despite the negative consequences, conferences in the field of sports were held in 2008. For example: some countries showed very good positive results: Honduras, Nicaragua, Panama, Uruguay, Republic of Korea, Marko (China), Indonesia, Egypt, Lebanon, Jordan, Morocco and Turkey. In 2009, the above cases are expected to be good.

While the air transport industry suffered globally in 2008, international rail transport has benefited in some regions, especially in Europe. Eurostar managed to increase ticket sales and passenger numbers by 10%. The international assembly market had a downward trend in 2008, and the situation worsened in 2009.

Corporate meetings and travel incentives have a huge negative impact, with many companies reducing travel and meetings around the world to a minimum. Small corporate meetings were partially affected due to the holding of teleconferences [11.103].

During the year, all regions except Europe saw an increase in visits. The best indicators belong to the regions of the Middle East (+11%), Africa (+5), America (+4%). Negative results in Europe were influenced by negative results in Northern and Western Europe. In 2008 (11% 2007), Asia and the Pacific region achieved 2 percent growth. Southeastern Asia (+4 percent), Southern Asia (+4 percent), Northeastern Asia (+0.4 percent) and Oceania (-1.5 percent) achieved the figures.

The America continent saw growth in the United States (North America +3%) and increased tourist traffic in both Central and South America. The Caribbean is the only region in the world where support has grown since 2007 (1% in 2007, 1.2 percent in 2008).

The Middle East is growing rapidly, reaching 11 percent growth in 2008. Africa has also achieved 5 per cent growth, which is a good result, even if it is half of last year's result. Despite the decline in growth compared to last year, good results were achieved in Honduras, Panama, Uruguay, the Republic of Korea, Macau (China), Indonesia, Egypt, Lebanon, Jordan, Morocco and Turkey[12.238].

According to the Air Transport Association, CIPA has also declined. Although passenger traffic increased by 2.2 percent in November (+7.4 percent in 2007), the year-end performance worsened. Despite a 3.9 percent increase in cargo capacity, demand for cargo transportation

declined by 76 percent (77 percent in 2007). It is noted that for 11 months of 2008 there was also a decrease in the employment of hotels. The decline was observed in all regions except the Middle East (+2foiz) and central and Southern America (+6 percent). In the above-mentioned regions, NOC receipts also doubled.

Taking into account the BST's forecasts for tourism development prospects up to 2020, it is projected to grow by 4.2 percent per year from 1995, in line with quantitative forecasts spanning 25 years. By 2020, international visits are projected to reach 1.6 billion people. It is estimated that 1.2 billion of them are in the region, and 378 million are on long-distance trips. By 2020, the top three regions with total tourist traffic are expected to be: Europe (717 million people), East Asia and the Pacific (397 million people), and the Americas (282 million people). East Asia and the Pacific, South Asia, the Middle East and Africa are expected to have growth of more than 5 percent per year, while Europe and the Americas are expected to have lower average growth rates.

Long-distance travel will continue to grow at an increasing rate, and the ratio between intraregional and long-distance travel in 1995 is estimated to be 82: 18 by 2020 and 76: 24.

In the report on the results of 2008, prepared by UN BTT experts, the development of tourism at the international level in 2009 was as follows:

- The economic downturn, market instability, and falling demand continued.
- In 2009, depression even decreased by 1-2 percent.
- Along with America, Europe also experienced a decline. In Oceania and the Pacific, the growth rate will be positive, even if it slows down. The same can be said about Africa and the Middle East.
- Companies carefully centralize their costs and try to maintain competitive advantages.
- In this case, the public and private sectors should act together.

It is known from history that crises, in addition to negative consequences, also generate positive opportunities, i.e., lead to a complete reform of the production structure. In this regard, the United Nations will support the tourism sector by providing it with the necessary support [13].

The UN draws attention to three interconnected BTT carriers: share strong market data and best practices through the newly established tourism committee; inclusion of tourism priority in the structure of economic measures; it is necessary to insist that tourism is the most elastic way, and it will lead to reducing poverty by ensuring economic growth.

As economic and administrative mechanisms to support the development of tourism in a number of foreign countries are: tax incentives, subsidies and subsidies; national legislation and regulations supporting the development of tourism and the protection of the rights of consumers of tourist services; reduction of passport and visa restrictions on entry and exit from the country; promotion of non-traditional tourism by reducing prices and providing various other benefits; development and support of social tourism; stricter requirements for the safety of travelers; strengthening measures to protect the environment, preserve cultural and historical heritage and other measures taken by the state.

A number of countries, including Spain and Greece, provide investors with incentives to pay taxes, depreciation and turnover taxes. In some countries, in the first years of operation of enterprises, the practice of exempting them from income tax, as well as providing benefits for the payment of value added tax is applied. In addition, there are benefits (up to full exemption) for customs duties when importing equipment for hotels and vehicles for travel [14.148].

The countries of the European Union have a policy aimed at equalizing the value added tax (VAT), which is between 6 and 25 percent for tourism and hotel activities. The average VAT rate in Germany and Luxembourg is set at 15 percent, while the maximum VAT rate in Denmark and Sweden is 25 percent. In Spain, VAT is on average 7 percent and can vary depending on the level of the hotel, while VAT on food (restaurant services), car rental reaches 16 percent. VAT on accommodation and meals in Greece is 8%, and the government has developed a system of benefits for businesses that provide tourist services outside of working hours

In France, the VAT for tourist activities is on average 10%, including for accommodation-6%, for catering services-hood! It is% percent.

VAT on accommodation and meals in Austria are set at 10 percent. But in accordance with the Federal Law on Tourist Tax, all tourist enterprises pay a local fee for the accommodation of each traveler (in the territory of the community - to the community, in resorts - to the resort fund). The amount of payment may vary depending on the season when hospital patients (children under 6 years of age, schoolchildren and students) are exempt from these payments.

In some European countries, tourism organizations use preferential tariffs for utilities. In most cases, tourist companies are exempt from the income tax of up to 20% of foreign currency earnings.

The state also encourages the construction of new turistic facilities by selling land at low prices and renting it out for a certain period of time (in Cyprus up to 99 years, in Israel and Turkey up to 49 years), while the lease term can be extended for another same number of years.

Due to the rapidly increasing pollution of the environment, state assistance in the field of tourism is more focused on environmental protection. In a number of countries, there are special boards that also control the planning of environmental protection in tourism (Great Britain, France, the Scandinavian countries)[15.224].

In 1992, in Rio de Janeiro, the World Tourism Organization adopted a programme of work for the twenty-first century, which was joined by 182 States. The authorities for the implementation of this program are assigned to state tourism institutions. The program highlights three main tools that can be used to create long-term applications:

- Development of new guidelines aimed at protecting people and the environment, as well as strengthening existing measures;
- Using price as a pressure mechanism;
- Creation of production processes in the tourism industry and programs designed to ensure the purity of the product.

In developing countries, the tourism sector can be financed by other international agencies. Different types of incentives are common in different countries. For example, in Greece and

Portugal, concessional loans are used, while in Austria, concessional loans account for half of all investments and are provided for 20 years with a 5% commission. Special attention is paid to subsidies in France, Italy and the United Kingdom, while in Spain low value-added taxes are imposed on the purchase of imported goods. International investment in tourism is provided by international organizations and the private sector 79. The main foreign lender is the World Bank (International Bank for Development and Reconstruction). Its activities in developing countries long-term infrastructure financing of these countries is aimed at helping jpgam to ensure a normal lifestyle.

Although direct investment in tourism activities is not a priority for this bank, it finances joint projects using export credits. The Bank encourages credit insurance institutions in potential supplier countries and provides guarantees to competitive suppliers selected at the tender. Unlike the World Bank, the International Development Association provides short-term loans, while the International Financial Society participates in equity projects.

European Community The European Regional Development Fund (EFRD), established in 1975 and providing financial support to low-development regions, invests in tourism in öpgam. When issuing EDF grants, preference is given to current tourism directions - projects that develop rural tourism and widely promote the cultural and historical heritage of the region. EFRD grants are granted on special terms for 40 years at rates of 1 % per year for the first decade [15.200].

Other organizations involved in financing the development of tourism in Europe include the European Investment Bank. This organization subsidizes the payment of the difference between interest rates from resources obtained at favorable interest rates on international credit markets, and thus provides intermediary services. For example, this bank financed the construction of a tunnel under the English Channel, the construction of Disneyland in Paris, the airports of Frankfurt, Munich and Hamburg in Germany, the expansion of Stansed airport in the UK. One of the main sources of risk of investing in tourism is the huge capital intensity compared to operating costs. This is explained by the high cost of construction and equipment. Capital accumulates gradually over a long period, while the return on investment occurs gradually. Therefore, reducing the cost of capital is a priority. Due to the complex nature of the tourist product, it is impossible to fulfill all the tasks facing the tourist industry of the economy. The Government is actively involved in supporting the private sector in the country's economy. However, studies of government intervention in various countries show that in countries with underdeveloped market economies, such interventions create difficulties for the market, not for its regulation.

The development of tourism, in addition to the economic one, is supported by the social policy implemented by the state. These include working hours, vacations, and professional training. For example, in France, the introduction of five weeks of paid work leave has had a significant impact on the development of tourism in the country. There is a significant difference in tourism development opportunities between industrialized and developing countries. Most industrialized countries have high unemployment rates, and tourism is a priority for creating a large number of jobs. In this regard, in these countries, much attention is paid to the renewal of the existing tourist product and the search for new resources for tourism, land development, environmental protection, etc. However, a special place in the development of tourism in these countries is occupied by the promotion of a tourist product abroad and, thus, justifying the large investments that they make in the development of tourism[16.15].

Unlike developed countries, developing countries do not have sufficient funds to promote their products. Because of this, they can not invite foreign tourists in the required number and, therefore, do not have sufficient funds for the development of tourist infrastructure. The industrialized countries of North America and the European Community occupy the main (70%) place in international tourism and have a common characteristic. They are the main generating and receptor countries. In these countries (with the exception of some countries such as Spain), the international tourism economy is a secondary sector compared to other UN sectors and mainly covers the private sector.

The tourism potential of the member states of the European Community is aimed at coordinating the development of tourism in the member states. The Council identified the following priority areas for joint solutions to the problems of ensuring the growth of tourism in these countries:

- * protection of tourists and their free movement: simplification of police and customs control at the borders; ensuring the safety of tourists and protecting them from inappropriate advertising; harmonization of insurance of tourists and their vehicles; informing them about their social rights;

- * harmonization of the rules of activity in the field of tourism: harmonization of tax legislation in different countries; recognition of diplomas of professional skill and qualification level; allocation of vacation periods in order to ease the pressure on the tourism industry in the hottest season;

- * regional tourism development with the aim of developing tourism in regions that are not developed, but have tourist potential.

However, since the European Community coordinates tourism activities, it does not interfere with national ones adapted to the specific conditions of the participating countries[17]. Tourism policy in the UK is coordinated by the British Tourism Authority, established in 1969, which is responsible for promoting British tourism products abroad. The administration consists of 400 people, of whom 22 people work in representative offices abroad. These offices are managed by three CEOs located in North America, Europe and the Asia - Pacific region. The Administration's budget is financed by State subsidies and the private sector. In 1993, its budget was about 47 million pounds, of which 32.7 million-F. the state assumes subsidiary responsibility. In recent years, more than 40% of the budget is spent on advertising and marketing, and a quarter on administrative expenses[18.150].

In order to achieve its main objectives, namely, to maximize tourism revenues and to expand the UK's tourist centers to new markets, the British Tourism Administration carries out: placing a large number of advertisements; conducting promotional events abroad through offices and with the help of mass media, television, radio and agents; organizing 88 conferences with the participation of foreign tourism specialists and British specialists; organizing excursions for foreign journalists to demonstrate the country's tourist product; evaluation of research and achievements.

The international tourism policy of France is coordinated, in addition to the Ministry of Tourism of the country, by the organization "Maison de la France". It consists of 850 private, state and public organizations that pay membership fees. The organization is headquartered in Paris and employs 200 people in its 38 offices in 29 countries.

In order to create an image of the tourist product of France, Maison de la France distributes information, guides and brochures on all French tourist products through its foreign offices. The success of "Maison de la France" is due to the constant verification and application of various policies to promote products in different markets based on the information received. In the 1990s, the dominant markets for France in terms of size and potential were Japan, the United States, Germany and the United Kingdom. Revenues from these countries accounted for half of international tourism revenues. Other European countries are Italy, Spain and the Scandinavian countries, and recently Russia is also among the growing markets for France[19.150].

A striking example of its efficiency improvement is the case of the Maison de la France, in which the use of public investment with the use of private sector investment can also be realized.

In Spain, the policy of promoting a tourist product to foreign markets is implemented by the Institute of Tourism, which is subordinate to the Department of Industry, Trade and Tourism of Spain. Its main goal is to strengthen Spain's position in the global tourism market. Spain ranks first in the world in terms of the annual budget allocated for the implementation of the possibility of moving a tourist product abroad. In 1993, these funds amounted to \$ 77.7 million, of which 70% were provided by the Government of the country. Cooperation with the private sector is carried out by introducing it into the organization and taking into account the initiatives it offers, especially with regard to the promotion of specific and environmentally friendly products[20.150].

IV.CONCLUSION

Developing countries, like industrialized countries, share common features in international tourism policy. They are the main receptor centers in the world, and international tourism serves as their main source of foreign currency. Tourist arrivals account for a quarter of the world's tourist flow, and tourism revenues account for a tenth of export revenues. Most developing countries are lagging behind in the adoption of new technologies, investment and training of personnel. The way out of this situation lies with the state, as the private sector is not well developed, which can also lead to the fact that the state will be in a debt hole[21.216]. Developing countries, having common features, differ in the level of tourism development and, accordingly, in international tourism policy. For example, in international tourism, the role of Southeast Asian countries and Mexico is noticeable, and among developing countries, only India and China receive foreign tourists. Moving a tourist product to large tourist-rich countries in the European Community, as well as to the United States and Japan, requires certain financial resources. For developing countries, this amount will be even higher. Therefore, they are obliged to implement the possibility of regional cooperation to ensure measures to promote and sell their tourism product. However, in order to ensure that the joint movement of products does not lead to the loss of their image and uniqueness, tourism movement activities based on regional cooperation should expand each tourist center individually. One prime example of this is RATA, which includes Eastern and Southeastern Asia, as well as numerous tourist centers in the Pacific region. Today, the countries of the Indian Ocean intend to create their regional associations on the example of RATA. The association is expected to include Australia, India, Pakistan, Malaysia and Singapore. Such cooperation allows jpgamu to carry out activities to promote its products around the world in addition to its traditional markets.

Small groups of developing countries located in the same geographical areas also establish regional cooperatives. For example, the Indian Ocean Islands have established the Indian Ocean Commission to jointly participate in exhibitions and fairs. Developing in one region, Mamacita, combined, create a mixed tourist product, while maintaining its specificity. Projects between the Indian Ocean and the countries of East Africa, Mexico and the countries of Central America are also known. However, this type of tourism, which combines various tourist centers, is not so cheap due to the high transport costs between these centers and, therefore, is mainly intended for wealthy clients[21.270].

Countries with different levels of development are also developing joint projects. An example of such agreements is the cooperation between the European Community and the countries of Africa, the Caribbean and the Pacific. EFRD also helps developing countries by providing financial assistance to sell their tourism products in European countries. Interregional cooperation programmes between countries with different levels of development allow developing countries to introduce new technologies to improve the competitiveness of tourism products and ensure that they meet the requirements of consumers. To this end, the World Tourism Organization has developed specific international programs, such as Interreg and Regus[22.176].

In view of the above, it is necessary that tourism potential in developing countries be directed towards reducing the risk of economic dependence that may arise from the uncontrolled growth of international tourism.

ABSTRACT

The article dedicated to the concept of time. The linguists' and scientists' as A.V. Westphalian, I. Newton, Leibniz, D.S. Likhacheva, Z.D. Popova, A. M. Peshkovsky, A. A. Shakhmatov, V. V. Vinogradov, A. Kh. Vostokov and others point of views and ideas about the concept of time analyzed. Verbalization of the concept of "time" in English adages and aphorisms also investigated. The question of the connection between language and intellection is one of the main problems of theoretical linguistics. Despite the fact that the exact mechanisms of their interaction have not yet been identified, it is generally recognized that the conceptual and linguistic picture of the world are closely interconnected, which means that the language reflects the experience of its speakers. Inside the linguistic picture of the world, the phraseological, based on paremias, is highlighted as one of the most significant.

KEYWORDS: Adages, Paremias, Concept, Linguistic Projection, Lexical Units, Syntactic Concepts, Temporality.

INTRODUCTION

The question of the connection between language and intellection is one of the main problem of theoretical linguistics. Despite the fact that the exact mechanisms of their interaction have not yet been identified, it is generally recognized that the conceptual and linguistic picture of the world are closely interconnected, which means that the language reflects the experience of its speakers.

Inside the linguistic picture of the world, the phraseological, based on paremias, is highlighted as one of the most significant.

Adages and aphorisms, as types of paremias, reflect the experience of a nation's social, historical and spiritual meanings and ideas that are important for a given nation. Due to the close connection with the life of the people and events from its history, paremias are often evaluative and have connotations that arise depending on the people's experience. According to A.V. Westphalian: "A positive or negative evaluative element is a defining component of the connotation and is due not only to the centuries-old system of moral culture of each nation, but the political and ideological platform of a particular state at a certain stage of its development" [1, p. one]. All this makes proverbs and sayings a good material for analyzing the verbalization of concepts and complex concepts in a language.

Time is an abstract concept and phenomenon underlying both linguistic and scientific pictures of the world. Many scientists and philosophers tried to study this phenomenon in order to answer questions such as: what is the nature of time, its properties, does time exist at all, why does it move in only one direction, etc. As early as in antiquity appeared two opposite points of view. The first was held by Plato; the philosopher understood time as an image of a moving eternity that exists independently of material bodies and processes. Aristotle believed that the existence of time is possible only thanks to consciousness [2]. These two points of view are reflected in physics and natural science: I. Newton argued that time is an independent stream flowing from the past to the future, while Leibniz wrote in his writings that time is a subjective way of perceiving the surrounding reality [2]. In modern physics, since the 20th century, a complex concept of time as a phenomenon dependent on the material conditions of a closed system and having certain metric properties. The passage of time can be slowed down or accelerated depending on the conditions [2]. The complexity of the phenomenon of time and its significant role in the picture of the world has caused the emergence of many of its interpretations in other sciences. These essentially unrelated concepts are based in part on the physical properties of time. So, for example, the course of time and its properties, studied in physics, are reflected in the language of man. Linguistic time is "a linguistic projection of a complex of existing human knowledge about this phenomenon, from everyday to scientific" [2, p. 2]. Linguistic time participates in the transformation of the surrounding reality into a linguistic picture of the world and expresses the connection between language, human activity and objective reality.

As we can see, time is a very complex phenomenon, all facets of which, one way or another, are reflected in the language in the form of linguistic time. In order to adequately describe the content side of such complex linguistic signs, the term "concept" is used. This can be traced in the definition of the concept by D.S. Likhacheva: the concept is "the result of the collision of the dictionary meaning of a word with the personal and national experience of a person" [4, p. 3]. Specifically, the concept of "time" is a basic and universal concept, one of the most important components of the conceptual picture of the world. It is important that the phenomenon of time is present in the consciousness and language of the people not only as a way of temporal orientation, but also as a series of "stopped moments" [6, p. 112]. In Russian studies, first of all, aspects and issues of time as a grammatical category were studied. These traditions are laid down in the works of A. M. Peshkovsky, A. A. Shakhmatov, V. V. Vinogradov, A. Kh. Vostokov and others. However, any concept can be verbalized lexically.

The problem of concept verbalization is considered in detail by Z.D.Popova and I.A.Sternin in "Essays on Cognitive Linguistics" [5]. Linguistic means are necessary only for the expression of the concept, but not for its existence. In addition, only the most significant concepts have linguistic means of expression, most of the concepts exist only in the human mind, their transition to the verbal form is optional [5]. There are the following means of verbalizing a concept in a language: ready-made lexical units and stable expressions of the lexical-phraseological system of the language (however, words do not convey the concept in full, they express a set of individual concept features necessary to convey a specific message); free phrases, sentence schemes (or syntactic concepts); as well as texts or collections of texts (for complex, abstract or individual-author's concepts) [5].

The vocabulary expressing temporality is varied in nature. These are any lexical units associated with the passage of time or a specific moment in time: minute, year, week, yesterday, Friday. Also, adverbs of time and adverbs of place with the meaning of temporality (eg, long, far). Time can be expressed with the help of lexical units, initially related to space in semantics, and vice versa: "Where did he rent a room? "Ten minutes from my house" or "Do we still have a long drive? "A couple of kilometers." In addition to the cases described, temporality is verbalized by words associated with certain historical epochs or events: mammoth, Spanish boot, Babylon, Leonardo da Vinci. Since a concept is, first of all, a body of knowledge, experience and ideas, a person who has the necessary information has associations with the necessary period of history.

Investigating the verbalization of the concept of "time" in English using the example of proverbs and sayings, we limited ourselves to nouns and prepositions. We analyzed 17 paremias from 4 dictionaries: "The Oxford Dictionary of Proverbs" (5th and 6th editions), bilingual dictionary by M. I. Dubrovin "English and Russian proverbs and sayings in illustrations" and online dictionaries "Cambridge Academic Content Dictionary "and" Cambridge Advanced Learner's Dictionary & Thesaurus ".

The lexical unit time is the basis and core of the concept of time in the English language. Other lexical units that verbalize the concept are used to name and measure time intervals: minute, day, week, year, era, tonight, moment, month names - January, February, March, etc., days of the week - Monday, Tuesday, Wednesday, etc., time of day - morning, day, evening, etc. Also these are groups of words used to denote the past, present and future (yesterday, today, tomorrow and past, present, future), space-time prepositions (before, after) and words related to historical periods and eras. The connection with time, its properties, especially metric, can be traced in the definitions of these words. For example, hour is defined as "the twenty-fourth part of the day and night, 60 minutes" and "time of day, moment in time" in the Oxford English Dictionary [11]. In the same place, year is "the time it takes the Earth to complete one revolution around the sun, equal to 365 days, 5 hours, 48 minutes and 46 seconds" [11]. Months in the Cambridge English Dictionary are described as a period of time between the previous and the following month, which has a certain position in the time measurement system: December - "the twelfth and last month of the year, after November and before January", August - "the eighth month of the year, after July and until September "[9]. There is also a connection with human observations of how time affects the world around: one of the definitions of the noun time is "this process and its influence on people and things" [11].

In the process of analyzing proverbs and sayings with lexical units that verbalize temporality, we have identified the following semantic groups.

1. Paremias, which describe the influence of time on a person and the world around him, including the hope that changes for the better will occur.

This semantic group is the most numerous, it makes up about half of the entire study material (14 examples out of 27): "Time and tide wait for no man", "Other days, other ways", "Tomorrow is another day", etc.

The proverb "Time and tide wait for no man" has the following meaning: natural processes occur without human participation, therefore, if an opportunity is missed, it may not appear again for a long time [3]. This pair reflects, firstly, the fact that time moves, due to an indirect comparison of time with the ebb and flow - natural processes constantly replacing each other. Secondly, it is shown that a person cannot influence the course of time in any way, just as he cannot change the process of ebb and flow.

The phrase "Time is a great healer" echoes the ancient idea that time heals. More often it concerns feelings and emotions of a person, rather than his physical condition [12]. In this example, we see a reflection of the observation and experience of man from ancient times. People must have paid attention to the fact that feelings and emotions subside over time, which was subsequently consolidated in the form of this phrase.

Similar in semantics and syntax, the pairs "Other times, other manners", "Other times, other customs", "Other days, other ways" are found in different languages [12]. Consequently, the ideas expressed in them can be considered universal, that is, common to people of different cultures. In the first two cases, time is plural. This is due to the fact that this word means a certain historical period, and not time as an abstract concept. In the last example, the noun times is replaced by the word days, which acts as a contextual synonym and means "a period of the past or present" [11]. The proverb has the following meaning: along with the passage of time, the customs, traditions and rules of society change, as the very way of life of society changes.

Knowing that time can affect the world around them and the person himself, people reflected in the saying "Time will tell" the hope that time will put everything in its place, and that later it will be possible to understand whether this or that decision was correct or no [7].

Separately, in the first semantic group, a subgroup of paremias can be distinguished, which reflect a person's hope for the best: "The darkest hour is that before the dawn" and "Tomorrow is another day". In the first proverb of the subgroup, the word hour is described by the adjective dark in a superlative degree: on the one hand, it has the metaphorical meaning of a difficult time, and on the other hand, it is a consequence of human observation of nature and the cycles of changing the time of day. The word hour it is used in the meaning of "a short indefinite period of time" [11]. Also, temporality is expressed by the preposition before in the temporal meaning and the noun dawn, which together create a dynamic picture and convey the movement of time. Their combined use also indicates the passage of time (if there is tomorrow, then there is also today and yesterday), which also creates a dynamic picture. Moving time in both examples is a reference to the property of this phenomenon to change the surrounding reality, which allows expressing the main idea of both proverbs - sooner or later things should get better.

2. Paremias about a careful attitude to time, the danger of procrastination and the need to be punctual, otherwise you can miss out on the benefits and present yourself in an unfavorable light.

The second largest group (7 of 27) of proverbs and sayings selected for research is dedicated to punctuality, which is especially important for English culture: "Punctuality is the soul of business", "Punctuality is the politeness of princes", "Delays are dangerous", "Time is money", "Procrastination is the thief of time", etc.

As described in the Oxford guide to British and American culture English vocabulary: "Most Americans and Britons agree that being punctual is good manners. <...>. Arriving on time for formal events such as business meetings or interviews is considered very important. <...>even in less formal situations, people are usually expected to think about those they meet and not keep them waiting. <...> Many people do not like to feel that their time is wasted and made to wait for no good reason" [10]. As you can see from the passage above, it is very important for Western representatives of the English-speaking linguistic culture to arrive at the meeting on time, regardless of whether it is a summit, an international conference or a meeting with friends.

The first proverb emphasizes the need to respect time for business success. In the second example, to emphasize the importance of this habit, punctuality is described as a sign of royal blood: "Punctuality is the courtesy of princes." The third phrase literally translates as "Delays are dangerous." The noun delay is used here, one of the meanings of which is "when someone or something should wait", which also refers to time [11]. The same can be said for the rest of the examples. All the considered paremias serve as a reminder that time must not be wasted or treated carelessly, because a person could benefit from doing business. The last proverb also connects the theft of time with possible psychological problems of the individual, once again emphasizing the importance of time in the historical experience of the people. The constant postponement of various matters, even urgent and important ones (procrastination), is qualified by modern psychology as an unhealthy addiction that can lead to problems in life and, accordingly, to painful psychological effects.

3. Paremias, in which lexical units with the meaning of temporality make it possible to more clearly and clearly illustrate other life realities or situations.

For example, the proverb "The rich man has his ice in the summer and the poor man gets his in the winter" reflects the facts noticed by people while observing the weather features of the seasons: when winter comes, ice appears, in summer it is not ... Time is presented in the form of two static, opposed segments: winter and summer. With the help of these facts, the poor and the rich are opposed, the latter of who, thanks to money, is able to receive even that which is contrary to the laws of nature. This serves as a kind of reinforcement.

The proverb "The calm before the storm", in turn, speaks of calmness in the face of great difficulties, problems or disputes. Here, the preposition before is used in a temporal meaning - the calm before the storm comes, which allegorically means a particularly responsible and difficult moment in life.

4. Paremias, which communicate significant information about the world around in a specific period of time and, sometimes, also about the ability of a given period to influence future events.

For example, the proverbs "February fill dyke, be it black or be it white" and "If in February there be no rain, 'tis nether good for hay nor grain" are dedicated to one month, February, and appeared as a result of human observation of nature, climatic and weather features of native lands.

In England, February is usually the month of rain and snow. Because of this, in the case of the first proverb, the ground is black due to mud or white due to snow [13]. And in any case, the ditches will be full of water either due to melting snow or due to rain. The second proverb is based on the same observations, but is related to agriculture and farming: a lack of rain in late winter negatively affects the harvest [13].

With the help of these proverbs, people passed on information to new generations about the climatic features of a particular month and also that weather conditions can affect the harvest, and, accordingly, the likely income and the chances of surviving the next winter. The difference between the second proverb and the first is only in the fact that February is presented in it not statically, as an independent separate part of the year, but as a period of time that has an impact on events in the future. But, as in the first group, a person is not able to influence how much precipitation will fall per month.

Among all the analyzed paremias, as we have already noted, the most numerous were examples of groups 1 and 2. From this we can infer what native English speakers consider to be particularly important. On the one hand, it is of great importance for them to understand the fact that time affects a person and the world around him, changing them, and people cannot influence this process in any way. However, changes are not always bad, because time can heal or simply change reality and things, transforming them into something else, so a person can hope for a successful outcome of events. On the other hand, for representatives of the English linguistic culture, it is equally important to manage time correctly and treat it with attention, not to waste on useless classes. Otherwise, a person will not be successful in life, will not be able to perform his duties properly, and others will have nothing to respect him for.

It is quite obvious that time is a complex and multifaceted phenomenon, which is why its nature has always been controversial for the natural sciences and philosophy. All these contradictory and complex ideas about time have found a significant reflection in the conceptual and linguistic (especially, phraseological) pictures of the world, which was confirmed by the study. As a basic concept, the concept of "time" is widely and variedly represented in the proverbs and sayings of the English language. Folk aphorisms reflect both the physical properties of time and the results of centuries of observation of a person over him, as well as national traits, as well as the mentality of native speakers. In addition, the temporal concept in paremias conveys vital information from ancestors to descendants and helps to describe the realities of the surrounding world more simply and clearly.

ABSTRACT

The article analyzes the changes observed in the modern media environment, their specific features, achievements and shortcuts, and especially, during the pandemic. It discusses the role of mass media in an ongoing emergency around the world. In the modern information society, any socially important processes that also affect the safety and health of citizens are accompanied by a flow of false information. The more participants in the process and the more complex the subject area, the wider the space for manipulation and dissemination of disinformation. Such misinformation can be more dangerous than the phenomenon that generated the threat.

KEYWORDS: *Pandemic, Mass media, Fakes, Fact-checking, Social media.*

INTRODUCTION

In the modern information society, any socially important processes that also affect the safety and health of citizens are accompanied by a flow of false information. The more participants in the process and the more complex the subject area, the wider the space for manipulation and dissemination of disinformation. Such misinformation can be more dangerous than the phenomenon that generated the threat.

MAIN PART

The global emergency in 2020 changed the way people react to information. First of all, the global news space was quickly occupied by "pandemic" content. In the analysis provided by Facebook Analytics alone, we can clearly see that these percentages have risen by 50% in one week¹. It has become difficult to find non-pandemic news on websites, social networks, and print media. However, it is safe to say that the pandemic has somewhat changed the values of information in Uzbekistan:

1. First of all, the process of mediation in society is significantly advanced. Since the announcement of the pandemic, the number of Internet and social network users has grown steadily. The telegram channels of well-known news sites were able to gather an audience in just two months that they had not been able to gather for years. The audience's need for information has simply shifted from a "need" to a "civic duty." That is, each person has a responsibility to be aware of the latest changes, first to himself, then to his family, and then to society. This has led to the formation of a serious attitude of citizens to the exchange of information in society.

2. The Uzbek authorities are beginning to realize the importance of fair and uninterrupted transmission of information in an emergency, and how to actually work with information. The purpose of accelerating communication with the public, the uninterrupted delivery of information has naturally improved the work of press services. That is, officials who once viewed disclosure as a "headache" have now realized that it is beneficial and responsible, and have taken responsibility. (For example, the Namangan governor's revelation about a woman buried without any relatives did not provoke public outcry, but served as a good incentive to stay at home. 'resonated with Uzbekistan.)

3. The state of emergency has drawn a clear line between professional journalism and blogging: Journalism has bravely taken on its social responsibility and risked its life to "take to the streets", informing the audience as much as possible about developments, explained, propagated, warned, taught. Live broadcasts (all news programs, "International Press Club", "Relationships", etc.) did not stop, they were engaged in informing the population, propaganda of safety from Covid-19. Television, of course, technically can't create content with 3-4 people, and it took a lot of heroism from the anchors to the lighting masters. The content on the sites has not been interrupted, the print media has not stopped, and some of them have been revived.

Blogging, on the other hand, was mainly about promoting official statements

relied solely on citizen journalism. The bots shared (mostly video) material coming from different people. The role of professional journalism has become even more prominent: telegram channels with an audience of 20-50 thousand people and more provided the information without facts, without checking them, in the pursuit of sensations, disseminated misinformation, misrepresented. At the same time, journalism served as a filter for information.

In short, journalism and the media have benefited from this situation. The media literacy of the population has also increased, partly infoetics has been formed, pragmatism, skepticism about any information has increased, and this process is still going on.

However, all this is due to the growth of organized lies or incompetences, misinformation, manipulation, fakes, propaganda, artificial hype in Uzbekistan, as observed in the global media.

The fight against the infiltration of the Internet, which is based on clickbytes, also requires serious attention from the state.

A small example is the Kazakhstani website www.tengrinews.kz, where Central Asian news outlets, particularly Uzbek online publications, often refer for translation, say, "A new deadly threat. For the first time in China, deaths due to xantavirus have been reported" (the title was later changed)², the news was also spread on the most visited information sites in Uzbekistan³, and the news was sent 473 thousand times in a single telegram channel. seen. Xantavirus has been known to science for 70 years, and there is even a vaccine against it, and although the deaths have not occurred for the first time in human history, the editor publishes an article under that headline. The choice of words and the way of conveying the facts in such a mysterious disease message have influenced the feelings of the audience, which has already become sensitive to the information on the background of the coronavirus pandemic, causing discussions on social networks and messengers. First of all, it aroused strong protests against the Chinese people and culture, not only in Uzbekistan, but also in Central Asia, and secondly, it caused inappropriate panic. There are many such examples.

RESULTS AND DISCUSSIONS

Public consciousness is a product of conscious understanding by people of the the same social conditions, their social life and assimilation and conception of information and knowledge obtained from the media information and social, political communication. It is proved that in modern society, with the active influence of the mass media on the development of the humanitarian component of the information society, the rapid formation of the information sphere, a new type of social relations is being formed - information and a specific type of public consciousness "informational" that is adequate to them. Its formation is accompanied by the processes of transformation, deformation, modernization of the structure of public consciousness, the emergence of new dominant levels⁴.

"Misinformation costs lives. Without the appropriate trust and correct information, diagnostic tests go unused, immunization campaigns (or campaigns to promote effective vaccines) will not meet their targets, and the virus will continue to thrive", said in a statement issued on pandemic that was discussed by the participants in the meeting, which was attended by representatives of various UN agencies and the International Federation of the Red Cross and Red Crescent. They urged states, civil society, the media and other "players" to stop the dissemination of false information.⁵

"As soon as the virus spread across the globe, inaccurate and even dangerous messages proliferated wildly over social media, leaving people confused, misled and ill-advised"⁶, UN Secretary-General Antonio Guterres said in a video message to the meeting participants, and the head of WHO Dr. Tedros Ghebreyesus said that "erroneous or deliberately distorted information threatens the health and lives of people and undermines the credibility of science, government institutions and health authorities."

They also recalled that the UN launched the "Verified" campaign aimed at opposing rumors and disinformation with scientifically substantiated facts and verified and reliable information, which he called "an antidote to" infodemic". This step really show the very need to the fact-checking strategies, as this problem is becoming more acute as the world moves closer to the development of a vaccine for COVID-19.

As it is clear from all these, for journalists, the most attractive in rumors is the relevance, which presupposes a keen interest of the audience to this topic, relative anonymity or lack of verification of information, which deontologically predetermine the professional intervention of a journalist, visual verification of events. In addition, working with rumors is an effective way to accentuate content, attract attention, and establish contact with the audience. E. V. Osetrova attributes the following to the media functions of rumors: “sensationalism allows satisfying the informational interest of the audience; relevance leads to the satisfaction of information needs; lack of verification of information makes it necessary to assess its reliability; anonymity allows the editorial board to relieve itself of responsibility for the disseminated information and to disguise its source”⁷.

Civil journalism is an event closely linked to the news community. Today's democracies of the world, which have reached the level of development based on a post-industrial society, are currently aiming to build an information society and create global information infrastructure in this area. Information technology, in particular, digital technologies and Internet technologies, is a decisive factor in this. Naturally, this society has its own political, economic, social and cultural problems. Issues of international media regulation and national information security, free flow of information, its priorities and contradictions, which are specific to our topic, are on the agenda. These peculiarities are characterized by the economic, political and other conditions and opportunities of the state society.

The people who make the most noise on the air today and bombard the Internet with false claims about Covid-19 (offering fake treatments, downplaying the effects of the disease, and ignoring those most affected by the virus) are reminiscent of the beginning of the AIDS epidemic. This epidemic taught us a lesson: disinformation is lethal. But it also showed us how strong the medical and scientific community can be when it stands as a united front and demands attention and action to overcome a crisis.

CONCLUSION

In conclusion, if in peacetime the ethics of journalism and the neglect of social responsibility have not led to much negative consequences, human life in emergencies will literally depend on the information being disseminated. There are two ways to prevent such a serious threat: to keep the information process under constant control, and to increase public media literacy.

THE DEVELOPMENT CYCLES OF NUT APHID GENERATION UPPER LEAVES IN THE CENTRAL AND MOUNTAIN SURROUNDING PLAINS OF FERGANA VALLEY

Shoxistakhon Qobiljonovna Yuldasheva*

*Associate Professor,
Department of "Biology", Candidate of Biological Sciences,
Fergana State University, UZBEKISTAN

ABSTRACT

In this article it is given information about development cycles of nut aphid generation upper leaves in the central and mountain surrounding plains of Fergana valley. From wintering eggs of nut aphids hatching of initiator individual larua depends on the temperature and relative dampness of spring. The amount of wintering eggs depends on the age and rising of nut trees and amount of one year's branches. The hot temperature of spring, coarsening of nut trees and other factors cause the depression of nut aphids upper leaves in central plains and mountain surrounding zones.

KEYWORDS: *Vermin, Linear Colony, Founder, Amount Consistence, Winged Alive Female, Larua, Aphid Generation, Depression.*

INTRODUCTION

There are two types of nectar in the walnut plant. Leaf upper walnut sap - *Panaphis juglandis* forms linear colonies on the upper side of walnut leaves, around the central root of the leaf. Walnut sap (*Chromaphis juglandicola*) lives by absorbing tissue fluid from the underside of the walnut tree leaves [2]. The underside of the walnut leaves protects this juice from sunlight and precipitation.

Walnut sap lives on the leaves of this tree and feeds on tissue fluid. In many cases, these insects multiply in young shoots, causing them to dry out, shedding young leaves due to absorption of tissue fluid. Therefore, the study of the biology and ecology of walnut sap such as *Panaphis juglandis* (Goeze) and *Chromaphis juglandicola* (Kalt.) Will undoubtedly serve to form the ecological basis of measures to protect walnut trees from their effects.

THE MAIN FINDINGS AND RESULTS

The emergence of larvae of the founding individuals from wintering eggs depends on the spring air temperature and relative humidity. Therefore, their emergence from wintering eggs in the central lowlands occurs earlier, in the foothills and later in the lower mountain regions [1].

Object of research. Walnut sap lives in walnut trees during spring, summer, and fall. These species spend the winter in the form of eggs. The amount of wintering eggs depends on the age and development of the walnut tree and the number of more or less annual branches [2].

When the walnut sap on the top of the leaf has multiplied in large numbers, the live-bearing females begin to fly to other walnut trees. Their larvae move along the leaf axils, branches, and begin to form colonies on new leaves [3].

The contribution of ants in the spread of walnut sap along the branches is large. They help the sap from dense colonies migrate to the young leaves [4]. At the time of mass multiplication, walnut sap completely occupies the young seedling leaves.

Early emergence of wintering eggs of the founders of *Panaphis juglandis* (1st generation) - walnut sap on the leaves is recorded on March 25–26. Their late appearance is observed on April 10–14 (1998).

In the foothills of the Fergana Valley, the emergence of larvae of the founding individuals of *Panaphis juglandis* on walnut trees occurs in late March - early April (28.03–1.04). In the central lowlands, their development begins 2–3 days earlier than in the foothills (26.03–28.03) [4].

1st generation larvae develop and mature in 16–20 days. During this period, they shed their skin 4 times and become winged founding individuals (13–18.04).

Founding individuals reproduce parthenogenetically and larvae begin to reproduce. The larvae of the live-born female individuals (2nd joint) that develop from them place their larvae around the central vein at the top of the leaves. The larvae of these winged live-born female individuals are born on April 13, and the late emergence period is in late April (26.04). Among the larvae of the 2nd joint can be found the larvae of the founders, which appeared later than the egg, as well as the larvae with delayed development.

Humidity is strongly influenced by the growth and development of walnut sap. At the level of light and heat, when the humidity is high, the sap begins to multiply actively. Reproduction of this species is observed from mid-spring [130].

The maturation of the 2nd joint larvae is accelerated by a slight entrapment of air. They can develop in 12–14 days (16–30.04, Fergana city; 18.04–2.05, Fergana district). Larvae of mature winged live-bearing females, in turn, begin to give birth to larvae after 1 day.

The average birth time of 3rd generation larvae occurs in late April - early May (30.04–2.05). In walnut trees, the onset of proliferation of winged live-bearing females occurs at the expense of 2–3 joints.

The maturation of the 3rd joint larvae occurs in mid-May (10.05–14.05). At this time, the leaf-top walnut sap colonies often consist of 1–2 mature winged live-bearing female individuals and 15–20 larvae.

The 4th generation larvae of live-breeding females begin to give birth in the 2nd decade of May (11.05-15.05). The period of birth in the foothills in 2008 coincided with the end of this month (26.05-27.05). The birth of 4-joint larvae causes an increase in the quantitative density of this species in walnut trees.

As the air temperature rises, the maturation period of walnut juices shortens. When the average air temperature is + 22.0S degrees, relative humidity is 73%, atmospheric pressure is 712 mm, the number of juices actively increases. They form sparse colonies on large leaves and thick colonies on small leaves [133].

It takes 9-10 days (11.05-22.05) for *Panaphis juglandis* 4th generation larvae to develop and mature.

5th generation larvae begin to give birth in late May - early June. The larvae of this joint develop and mature in 9-10 days. Their maturation occurs in early June. The mature forms of the 5th joint are recorded in the central lowlands and in equal periods in the foothills (3.06).

The birth of the 6th joint larvae occurs in early summer (3.06-6.06). The development and maturation of the 6th joint larvae and the beginning of larval birth occurs in mid-June (14.06-16.06).

The first individuals of the 7th generation larvae of this species are born on June 13 in the central lowlands, while the later emergence in the foothills occurs on June 27. The birth dates of these joint larvae are recorded in mid-June (13.06-16.06).

The birth rate of the 7th joint larvae is lower than that of the previous joints. Their development and maturation coincide with the beginning of the summer dormancy period of the walnut sap on the leaves. At the same time, their development and maturation are protracted. This opens up a wide range of possibilities for the species to survive in adverse conditions. The summer dormancy period can be seen as an example of the pre-preparation of leaf top walnut juice for adverse conditions.

In walnut trees growing in different conditions, regions and reliefs, the summer dormancy period in the life of leaf sap may or may not manifest itself. In nuts in the cool shade of thickly planted trees, low temperatures, precipitation and high humidity in the first months of summer prevent depression in the life of leaf sap and have a positive effect on the biology of leaf sap.

The birth of the 8th joint larvae occurs in the third decade of June (26.06-28.06).

The hot summer temperatures, the roughness of the walnut leaves, and other factors lead to a depression of the walnut sap in the central lowlands and in the foothills. However, *Panaphis juglandis* does not disappear completely in walnut trees, and a small number of its individuals are preserved throughout the summer [3].

The onset and duration of the depression depend on the arrival of hot summer temperatures, where nuts grow in the open and among trees.

In a walnut tree growing in a cool place, the amount of *Panaphis juglandis* continues to grow without depression. In mid-June (14-15.06, First, Vodil), *Panaphis juglandis* individuals continue to develop normally even in the walnut groves of the lower mountain regions [3].

In the foothills, early departure from the summer break is observed on August 5, and late departure - on August 20. Release from depression occurs in mid-August (15.08-18.08).

The birth of the 9th joint larvae is observed in the 1st decade of July (7.07-8.07). At this time their number decreases (7 larvae were found on the three leaves of a 10 cm long branch on the east side of a walnut tree, 3 larvae on the leaves of a 10 cm long branch on the south side. They were not found at all on the leaves of branches on the north and west sides).

In the foothills, the development of the 9th joint larvae occurs in the 3rd decade of July (21.07-23.07).

In trees where depression has been observed, the 11th joint larvae go through a developmental period and become the genus that gives birth to the genital joint. Birth of Polonos larvae occurs on the 1st decade of October (6.10-10.10).

The 12th joint is composed of polonoscae that form the genitalia; the larvae that give birth develop in the central lowlands for 16 days (10.10-26.10) and in the foothills for 18 days (05.10-23.10) and form the genitalia.

Egg-laying female walnut sap from representatives of the 13th (amphibian) joint is found in walnut trees until early November (5.11-6.11. Fergana district; Fergana).

The 14th-generation larvae, which begin to emerge in early September, are composed of polonosca-forming. The maturation period of these articular larvae is 18–20 days (3.09–21.09) and the female, which gives birth to the genital joint larvae, turns into a live-born female polonoska leaf sap. At this time, the amount of walnut sap on the top of the leaf decreases in walnut trees [4].

The larvae, which give birth to the leaf sap (polonoska) that forms the genital joint, develop in 20-22 days and develop into adult winged male and wingless egg-laying female saplings (13.10-16.10). After 3–4 days of feeding, the egg-laying females begin to lay their eggs on the three young branches of the walnut, between the leaves and flower buds.

The first eggs are laid in the foothills and central plains in early October (3.10–5.10).

CONCLUSION

The occurrence of sexual joints in walnut trees takes place in different years, depending on the early or late arrival of autumn. After the eggs of the walnut sap on the top of the leaf have overwintered, the following year the founding larvae emerge, initiating their next joints.

Panaphis juglandis are mountainous in spring, summer and autumn, and in the central lowlands form a different number of joints according to the different conditions of the environment, the early or late arrival of the seasons.

Life cycle of *Panaphis juglandis* juice.

Here: o - eggs; f - founder; v_{2,3} ... - joints of live offspring; O - egg-laying females.

ABSTRACT

William Butler Yeats is widely considered to be one of the greatest poets of the XX century. He was one of the modern poets, who influenced his contemporaries as well as successors. A traditionalist, constantly ahead of his contemporaries, Yeats is rightfully considered one of the major poets of XX century world literature. In this article we are intended to learn and form early background of the author's individual poetic career. Sense of moral wholeness and humanity of the prominent poet is discussed. Through analysis of his poems creative way, peculiarities of his style, and interpretation of symbols, their connection with the author's intellectual condition have been studied. While commenting on his poetry we have tried to realize his early individual poetic style and the evolutionary path to its formation.

KEYWORDS: *Early poetry, Poetic sensibility, Tradition, Individuality, Symbolism, Mysticism, Mythology, Individual style, Poetry analyses, Interpretation of poetic images.*

INTRODUCTION

The early period of the creative career of the Irish poet, playwright, and essayist William Butler Yeats passed under the sign of symbolism and myth-making. It is difficult to overestimate the importance of Yeats poetry to Irish and European culture in the late XIX and early XX centuries. Yeats' works raised the importance of Irish literature in English as both national and universal literature. The merit of Yeats was a kind of "creative translation" of the culture that has survived in the folk environment of Ireland into the common European language. Yeats strove to make Irish culture a part of the global process, and he succeeded.

A figure like Yeats was impossible to replace. He could be worshiped or he could be resisted, but not indifferent in any way. The poet's death was responded to by Auden, a modernist who belonged to the "other camp" - a camp in which Yeats was considered an old-fashioned

eccentric, who in the "age of steam and electricity" seriously believed in mysticism and magic and continued to write "traditional" poetry.

Nevertheless, many critics underestimate the first period of Yeats's work, the period that most contain the poet's interest in symbol and myth. In most Western works, early collections are only mentioned to show how the foundations of mature creativity were laid. The fact that Yeats in 1903 (the beginning of the second period) defiantly proclaimed the abandonment of the early manner of writing, allowed many researchers not to attach much importance to those motifs in the works of the first period, which remained key for Yeats throughout his life.

MAIN PART

The poet's family resided permanently in London, but as a child, he often spent the summer at the estate where his mother, Susan Mary Pollexfen, was born, in Sligo, a small town in the northwest of Ireland. In the future, in his works, the poet will repeatedly return to the beloved beauties of County Sligo, and his early works will be imbued with motives of Celtic folklore.

Yeats was one of the founders of the Irish National Theater (along with John Millington Synge and Lady Gregory). In Irish poetry, after Yeats, a whole school of followers was created (the most prominent can be considered Austin Clark and John Montague). Joyce's early lyrics are also influenced by Yeats. The poet and eminent literary critic of the late XIX century, Arthur Symonds, called Yeats the first Symbolist to write in English rather than French.

We would like to show the independent significance of the early creative system of the poet, which is of separate interest. Rich symbolism borrowed from various areas of human experience (mythologies of different cultures, occultism, and other philosophical systems), the atmosphere of Celtic twilight with its own unique flavor - all this is woven into a harmonious unity, which is, in the highest sense, a poetic unity.

DISCUSSION

As a teenager, Yeats began writing poetry in imitation of P.B. Shelley and Edmund Spenser. The poet believed that it was Shelley's aesthetic position that determines the state of his contemporary poetry. Yeats' early interest in Shelley is traced, for example, in the motif of the lake island in the poem "The Lake Isle of Innisfree". Allusions to Shelley's lines in Yeats's early poems are very numerous; among them: "I hear in the very depths of my heart" ("heart's core" - Innisfree Lake Island) from Shelley's Adonais; refer to "Alastor" swans in love one after another ("over by lover").

The imitation of Shelley and Spenser was quite deliberate. Following the traditions of Romanticism, Yeats matched the knowledge gained with his own ideas. So, he correlated Shelley's concept of "intellectual beauty" with the Rosicrucian "Divine Rose". Despite the fact that the poetics of the great romantic eventually ceased to fit into Yeats' aesthetic program, Shelley remained his favorite poet forever.

Of the other English poets who had the greatest influence on William Butler Yeats, William Blake should be noted. Yeats knew Blake's poems from childhood, then, in his youth, together with Edwin Ellis, the closest follower of the Pre-Raphaelites, he created the work "The Works of William Blake, Poetic, Symbolic and Critical", 1893) in three volumes, commentaries on which are almost entirely Yeats's. In an essay accompanying Blake's edition, Yeats put forward Blake's

notion of "mood" as the basis of the entire symbolic system. In the same year that Blake was published, Yeats published the poem "Moods", which was included in the collection "The Wind in the Reeds" (1899). Then, in a small essay "Moods" (1895) proclaimed the artist's purpose - "to discover immortal moods in mortal desires", thus accepting this conceptual concept of symbolism. Yeats was close to Blake's vision, a combination of poetry and painting in his work. From the work of the great poet, Yeats brought out the idea of the inseparability of the material and spiritual worlds, the indivisibility of the soul and body of a person.

ANALYSIS

In his first collection of poetry, the poet constantly turns to the natural world. Influenced by folklore traditions, as well as the poetry of the Pre-Raphaelites, Yeats animates nature. The lyrical hero, turning his prayers to nature, never finds response and understanding. The mysterious and otherworldly world of fairies ("The Stolen Child"), the world of his youthful dreams and memories ("The Lake Isle of Innisfree") can be contrasted with the reality surrounding the poet.

A characteristic feature of Yeats's early poetry is the appeal to the sagas of the Celtic pagan cycles. The main characters of his works are Eire (the goddess who gave the name to Ireland), Aengus (god of love), CúChulainn (brave warrior), Emer (wife of CúChulainn, a symbol of devotion and selfless love), Fergus (legendary wanderer king, burdened).

The fascination with Irish mythology was promoted by his acquaintance with Maud Gonne. Love for the beautiful Gonne became another motif of the poetry of W.B. Yeats. In the collection "The Rose" she appears before us in the form of a beautiful flower, a symbol of eternal beauty. Subsequently, the poet associates Gonne not only with the ideals of beauty but also with Ireland itself, for whose independence she fought.

Considering the subject basis of the poetic image, we note that the early period is characterized by the use of the symbol of the rose. The aesthetic role of the symbol consists in replacing a phenomenon or object in poetic speech allegorically, its conventional designation, something reminiscent of this life phenomenon [2; 88]. It was the rose in the early works that became the subject of various figurative associations. The poet creates a whole poetic cycle dedicated to the rose: "The Rose of the World", "The Rose of Peace", "The Rose of Battle", "To the Rose upon the Rood of Time". Rose in Yeats's works is the embodiment of the very essence of Beauty. True, spiritual beauty is like an eternity, it carries peace and wisdom. Thus, in the poem "To the Rose upon the Rood of Time", a number of images typical of the early period are created with the help of the rose symbol.

Rose is the poet's muse (Ah, leave those still / A little space for the rose-breath to fill). Her appearance is associated in the lyrical hero with the mythological past of Ireland (Cuchulainn battling with the bitter tide; / The Druid, gray, wood-nurtured, quiet-eyed, / who cast round Fergus dreams, and ruin untold). The rose in the poet's mind is the embodiment of eternal beauty wandering on her way, the unquenchable power of reason (But seek alone to hear the strange things said by God to the bright hearts of those long dead).

CONCLUSION

Throughout his creative career, Yeats was engaged in creating his own author's mythology. A significant role in the poet's work was played by his homeland, Ireland, with its mysterious, long-suffering history, shrouded in ancient legends and traditions. Changing, Yates did not disown the past but inscribed it in his mythology. In life, as in his work, Yates did not allow himself to forget about the past and in everything, he strove for certain aesthetic completeness. In his later poetry, one can hear an echo not only of his own early images and motives but along with them the images of his predecessors, which accompany him to the end.

Early Yeats was considered an incomparable lyricist. In that era, the poet was the creator of the poetry of essences: small in form, rhythmically tense poems often expressed one single, extremely intense emotion. "Victorian" by birth, Yates was implacable "anti-Victorian" in education and his own literary tastes. His criticism of Victorian poets was also based on the fact that their "famous poetic lines were usually excerpts from long poems, often very long and full of thoughts that could be expressed in prose" [1; 157]. In the 1920s he himself writes long poems as well, that remain "the poetry of essences", but express more than one "mood" (the concept of the early period), and contrasting feelings of regret and hopes, doubts and despair, conveyed by the complex rhythmic variations.

While concluding on the significance of the early creative system of the poet rich symbolism borrowed from various areas of human experience, the atmosphere of Celtic twilight with its own harmonious unity should be considered in the highest sense. Moreover, the Irish literary renaissance found its beginning precisely in these early works of Yeats, thanks to which for the first time interest in ancient Celtic legends and Irish literature, in general, was raised to the world level.

IN UZBEK PROSE THE HOSPITAL AS A LITERARY VENUE

Sohiba Baxadirovna Karimova*

*Basic Doctoral Researcher,
Tashkent State University of Uzbek language and literature named after Alisher Navoi,
UZBEKISTAN

ABSTRACT

The article analyzes the hospital as a literary space. The problem posed in the article was studied by the example of Shukur Kholmirezayev's works "Almond blossomed in winter", Askad Mukhtar's works, Khurshid Dostmuhammad's "Road to quite room". The function of the hospital in the work of art was studied. The article focuses mainly on the fact that writers chose the hospital as a literary venue. The article is enriched with necessary literature. In Uzbek literary science, new methods, which are a tradition in the world literature science, are approached with specific serious theories in later periods. In particular, some scientific research was carried out on the role of events in the artistic work, the time period or long-short period that covered those events. In such studies, the "chronotope" occupation is used very much and reasonably. The same concept Russian writer M.Bakhten said: "The theory of happiness, in particular, its "modern and chronotope forms in the novel. They rely on the work" Essays from historical poetics".

KEYWORDS: *Prose, Story, Chronotope, Image, hospital, literary genre, Image.*

INTRODUCTION

In Uzbek literary science, new methods, which are a tradition in the world literature science, are approached with specific serious theories in later periods. In particular, some scientific research was carried out on the role of events in the artistic work, the time period or long-short period that covered those events. In such studies, the "chronotope" occupation is used very much and reasonably. The same concept Russian writer M.Bakhten said: "The theory of happiness, in particular, its "modern and chronotope forms in the novel. They rely on the work" Essays from historical poetics".

"The maximum convergence of literary studies towards the phenomenon of artistic literature and the human moving in it is M. Bakhten said, we would not exaggerate if we say that the theory of happiness chronotope has been realized on the basis of. This scientific term, formed by combining the Greek words Chronos (modern) and topos (space), was previously used in the same form in such areas as Mathematics, Physics, Chemistry, and Biology. As soon as Bakhtin introduces the concept of chronotope directly into the literature of the 30-ies of the XX century, he takes into account the fact that the genre, composition, plot, artistic text on the basis of his artistic work covers important parts of the plot, poetics of images, harmoniously reflects the artistic space and time. Because the work of art, as long as every poetic part in it is not studied in the chronotope system, the interpretation of a particular work as an independent artistic phenomenon is complicated.

THE MAIN PART

There are many types of space where literary events take place in the artistic literature. In particular, such spaces as "road", "hotel", "Korgan" are considered the most convenient types of chronotopes for literary events. Russian writers "dead souls "(Gogol), "travel from Petersburg to Moscow" (Nekrasov), "hero of our time" (No, it's not events in such works as Lermontov) are distinguished by the fact that the "road" was built on the basis of the chronotope. It is worth noting that the events in Uzbek classical literature and some travel books in the genre of jadid literature are also built on the basis of the chronotope "road". For example, on the journey of the Steppe "memory of the road", the author also watches and evaluates various events without going on the road. "As we said before, we can only call" road memorization" as a travelogue in conditional clarity. After all, he has a serious difference from his usual travelogues: a passionate trip along the narrow streets of the heart of the masculine spirit is taken into the pen – the real path and the real destination does not concretize them even as the writer does not matter in the performance of artistic intent. There are not even aspects that give grounds to say that the work belongs to the genre of travel: the presence of the image of the "road", although not concretized, the standing of the image of the tourist-author in its center". In the creation of the steppe, indeed, the "road" occupies a special place as a chronotope.

As for the direct subject, it is possible to observe that in some of the events in the works of art on the attitude to literature and medicine, the hospital performs the function of a literary Chronicle. In this respect, it can be said that the hospital is also of particular importance as a chronotope. In life, a person who does not go to the hospital is rarely found. The writer sometimes finds the hospital acceptable in order to reflect events. Because it is also possible to bring the desired image to the hospital and at the same time "heal" the images that have fulfilled their task, to withdraw from it. A. Chekhov's story "The Sixth chamber", the patient chooses one special room – the sixth chamber. From the mutual treatment-attitude, feedback of the heroes in it, describes the generalization conclusions that belong to the social environment of Russia.

Directly in Uzbek prose, "almond blossomed in winter" by Askad Mukhtar's "The Ninth chamber", Shukur Kholmirzaev, X. Dustmuhammed in a series of works of such as "the road to A Quiet Room", Shodman Solomon's "the third chamber", the hospital is selected as the venue where the events are described. We presented some of their analysis in the last chapter The story of Sh.Kholmirzaev in the story " Almond blossomed in winter " is exactly what happens in the hospital. The protagonist of the story Nasirjon falls into the hospital with a liver diagnosis, and the events associated with it begin here. The writer himself takes a place in this chamber for

direct observation of events. When Nasirjon comes to the hospital, he makes friends with the people of different professions around him, and as a result of the jokes of his palatadins, he falls in love with Khubbijamol. Shukur Kholmiraev in this story very well reveals exactly the psychology of a sick person. Nasirjon begins to recover very quickly due to the sweet words of Hubbijamol. And khubbijamol goes to pass his exams. At the end of the story, all the palatadins recover and leave one room after another. But Nasirjon even though he is cured, he himself falls ill, does not want to recover, waiting for the Hubbijamol to come again. Even in medicine, if the patient himself does not really want to, his recovery will be very difficult. As they say that each victim has his own reward, as a result of severe irritability, Nasirjon's lost memory in the 5th grade is restored-he begins to study. The fact that the fate of man at the end of the writer's story is inalienable, her artificially insists that it can not be broken. In fact, Nasirjon fell into the hospital with one dart and became free from two troubles.

Shukur Kholmiraev very well, clearly describes in the story all the signs of liver sick – hepatitis. The fact that the eyes of the patient who fell into the hospital were yellow, the heart was compressed in bed, the end of the sentence to speak, the pain of swallowing zond, the hanging steroids taken for blood washing – all these are the tools that make the story more vivid and real. In the process of reading the story, the reader also takes a place from the same chamber, grinning at the jokes of Polina and Hubbijamol, suffering along with Nasirjon. The writer claims that in the story “every appearance of life gives its result”. That is, no event in life happens on its own. In a symbolic sense, we can say that the flowering tree is the untimely pastime of the Nasirjon. And the fate of the tree, which blossomed in vain, is known – it strikes cold. Shukur Kholmiraev would not be surprised if he also wanted the event to be at a time when the winter of the year would come into spring, plucked his feet to describe exactly the same situation.

Literature is associated with many sciences from time immemorial. Because no matter what science is, theoretical information about it reaches from ancestors to generations in writing. Sometimes we also meet terms related to another science in artistic works. Artistry is a wide field. To him it is possible to accommodate almost all events in life. So if only desire and talent. The writer, of course, will not be able to choose the story he encountered for his work, the place he encountered, the hero he encountered. Creativity is such a process that requires the use of the mind to achieve the intended goal. First of all, the idea is chosen, and the rest of the items are adapted accordingly. It is appropriate to pay attention to the story of the talented writer Askad Mukhtar from the attention of the topic "The Ninth Chamber". The name of the story is A.Chekhov's story "The Sixth Chamber" reminds of the name. Why the writer chose the number “nine”, but only because it came from six, seven and eight. Maybe, after reading A.Chekhov's story, the writer is disappointed to write this story. In any case, both stories reflected a socially significant problem. The events in the "The Ninth Chamber" take place in the new hospital of the construction town in the foothills of the mountain: "the new hospital of the construction town has fallen into a very comfortable place – the foothills of the mountain, one side of the young Popular, far from the big road. In the summer days, the patients open the windows sluggish and absorb the mountain air. Why did the writer choose the hospital exactly as a chronotope? Because when another place is chosen, the artistic idea that he thought would be left behind the shadow. Patients treated in the "The Ninth chamber" are sixty-seven-year-old Bahromov and Dad Haji, both of whom entered the eighty. And people with these two different worldviews can only talk to this chamber “in prison” heartily. Although patients with the same disease were

different. Character of the heroes in the story are different. Of course, what gives the soul to the story is this – conflict. We can say that Bahromov is a positive image: he wants to continue to heal and care for the future generation, even if his children died early. And the pilgrim grandmother is not interested in people at all, when she heals, only in the hope of living well. The writer Dad Haji describes his grandmother's condition very vividly: “ Sloppy suffered from obesity, and suffered from suicide (Bahromov's), if they ate food. As soon as it recovers and goes out.”

In the story, Bahromov dies, his death shakes everyone. It was not entirely possible to get up to Bahromov, he did not get up for a month and a half. But seeing that the Jackal, who made a skirt-pocket to the end, was going to the electric cable, which remained open, could not stand, the condition arose. No, first The Pilgrim asked the grandmother to take the child from there. And Dad Haji, with indifference, ran to Bahromov until got up and picked up Alisher from the side of the Horseshoe wire. For the same reason, his condition worsened. In the morning, the mother of the child brought a bouquet of roses to Bahromov. But the patient had no chance to see flowers. The writer described the second hero so much that sometimes confidence disappears.

Next to Bahromov's body, Dad Haji calmly said, “...put his hand into liquid food, something was clutching... Alisher came to the pleasure of the burning apples, tikilib was fed, Haji buva immediately gathered with a porous hand”” But this expression further clarifies the conclusion, we can say. The conclusion is that if a person is sick than a person-let him not be sick with a heart, language, temperament. Because only doctors are able to cure the body, no more. And the treatment of the heart is carried out only by the person himself.

If we observe the works, which most often serve as a hospital chronotope, then they are depicted mainly on the heads or the last days of the winter season. This thing can be attributed to the fact that the diseases are at the same autumn end and in the spring. The writer also pays serious attention to the seasons of the year in it, in order to ensure the truthfulness of the story.

For example, in the story of Abdulla Qahhar “A Thousand and one Souls”: “The Last Days of March. A piece of cloud floating in the blue face makes the sun shine one of away. Every time the sun comes out under the cloud, it seems that the spring is still lying on the ground, not aware of the arrival, the grass-grass-grass, the worms are awakened, more light than before, more hot than before,” the image in the style of which gives the impression that the hero of the work is pointing to a later recovery. Or in the story of Shukur Kholmiraev “almond blossomed in winter "comes such an image:" Nightly the wind did winter, although the wind of Capricorn. Towards the evening began to snow. Our snow window will crackle into the eyes. Our room is warm”” In such an image, there is some kind of relationship between the temperature in the weather and the events. Another example; A. In the story of Mukhtar's "The Ninth chamber“, such an image is given: " today the night covered the sky with clouds, and before it rained, it was very dim. Then from where the unstable wind blew and at midnight the tawny dove stood. The trees are like the sea the noise is from where the window pallets that are left open are slamming, they would be freckles, popular branches fall into crumbs, a crow”. This image adapts the reader to the phenomenon that occurs later in the story reality.

The story of Shodman Solomon's “The Third chamber” begins like this:“...Today, the first snowfall. The innocent Breath of winter also invaded the spacious rooms, the hospital, where heavy silence, like the disappointment of patients in the corridors of the orasta. Even so, the

nurses, wearing snow-white clothes, rustle around the hospital windows and pamper each other. Their mood also moved to patients. Who wrote a draft to the chief physician and asked permission for a day to go home-to come, which passed sweet words instead of bitter medicines from nurses... Only in the third chamber, where the poet lies, vitality is not felt. The beginning of this tale with the image of the First Snow Maiden is very important for the poet to symbolize homoony in the lying chamber. "The poet came to the hospital and realized one truth: it was a dwelling where not only the grief of his body, but also the grief of his heart combined. Perhaps the world itself is built on this logic-he, the poet, understands this now, when the sufferers gather together? Although the hospital is also a classroom...". Sh. Solomon directly from the attention of the subject pays special attention to the soul with the body. The fact is that some people, especially those who have fallen ill in the hospital, "combine not only the skin of his body, but also the skin of his soul".

"The hospital has also its own legitimacy of life, in a way. Although he had not yet five days to arrive, he felt appreciated by his roommates. As long as the value of a person in loneliness is known, as if five days have entered into his life with meaning. To whom has the meaning entered into his life? Far from so many things according to the meaning of his name, the life of Shoir, who is dividing, will also be as if the meaning has entered. Because he friend comes to the circle of people who live in his own dannyos.

"The hospital makes a man a believer-Cain. Here you will have a lot of opportunity to sum up your life by looking at the ceiling. Mullah also thought a lot. The conclusion came to the conclusion that" ten people here deserve punishment, one is me, and if one person is worthy, then the same is me." A debilitated person will look at the path of his past life, sum up his life if he stayed closer to that side than to this world. Tolerates thinking. The hospital is also considered a very convenient place for any image to look at his life, to reflect on his rewards and sins. The image of a specific space acquires naturalness and reliability, in particular, evasion of tiny items of the image of housing. In the science of literature, the term "interior" is used for the image of housing. "Interior (fr.interieur-interior) - architectural and artistically decorated interior part of residential, public and industrial buildings and structures".

In Khurshid Dostmuhammad's story "The road to silence", the same hospital was taken as a chronotope. "The quiet road "is written in the style of Dino Butsatti's story" seven floors". It is attended by two heroes of the two writers: Dino Korte of the West and Zahid of the East. In the story, two cultures are compared. The difference in the spirituality of these people from the two edges of the world is obvious. The writer brings two heroes to the hospital in a natural way. And the hospital is the detective of "not a hospital, but a hotel". Dino Korte is placed on the seventh floor of the hospital: quot;...The Lady of the humble nurse began her from the seventh floor. Yop-the light went into the chamber, the room was so tidy that the walls, the appliances, the bed linen-it was white, as if rinsing into the light with as like until the window curtains!" Such cleanliness in the hospital is considered a natural necessity. Just like that same X.Dostmuhammad and while the hero in the story of is close to Zahid is located on the first floor, the image of the housing in it is presented like this: "all the equipment in the room, the wall-it was white in stripes. Zohid watched around as he swung over the bed on a nearby white sheet-a feather pillow, a bed under which his member was so fond of his body!.."

After the story rises to the seventh floor near Zahid, while Dino Korte falls to the first floor. This story gives the impression that we are impregnated with thoughts close to mysticism. That is, the

hospital floors are stages of mysticism (demand, fano, surprise...), as they rise from them, man rises spiritually. And in the end they will reach the truth. One of the patients in the story, that is, Zahid, whose name is also understood, reminds us of a tax on the demand for a fee in a close sense. His hospital, in a figurative sense, is described in such a way that he is taken to the seventh floor, passing through the stages of mysticism:

“ It's light as a bird... - said the middle-aged man on the right.

– It's also light, ukparday-a! - approves his saying that the left-hand side. – Quite an innocent, angelic man, quite poor.

– If there was no angel, would they rise to this place?!. to the seventh floor ya!..”

Although in the story the human body is carried away from the floors, in fact, the ascension in his psyche is implied.

In Uzbek literature, the discussion of topics related to medicine, such as patients, doctors, hospitals, is rarely addressed (addressed). That is, these topics are among the relatively be “cool” topics. But nevertheless, in modern Uzbek prose there are works that harmoniously describe literature and medicine. Such works, first of all, if they follow the scale of the discussion of artistic literature, and secondly, serve to explain the author's artistic idea in a cold-blooded, plausible state. In Uzbek literature, the artistic interpretation of the medical topic is observed in stories written by a number of writers such as Abdulla Kahhor, Shukur Kholmiraev, Askad Mukhtar, Khurshid Dostmuhammad, Khayriddin Sultan. In them, the elements of Medicine are manifested in the form of a literary space or artistic image.

The story of the talented writer Khayriddin Sultan “Chollar palatasi ” is one of the works rich in such medical elements. In the story there is a clear and clear picture of the image of many patients. The writer introduces how every patient breathes, until he falls into the hospital for some reason. The reality is explained by the language of Muhammad, the youngest among all chemists. Muhammad comes to this space from the cause of an old sick – bronchitis attack. “The lungs are not anointed looking like a chariot, he should not stand without five to ten days” “ Yes, and the heart is compressed from the fact that the hero is sick exactly at the peak of the work, but there is some wisdom in everything.

As they say, there is no value in the water that flows before; a person knows the value of health when he is sick. In the story, this thing is mentioned again and again. This aspect is taken into account, especially when describing the reasons for the hospitalization of the old man in the work. Someone ignored, someone else fell into the hospital as a result of severe concussion, unable to withstand life tests. With this, the writer knows that it is necessary to appreciate every blessing in life.

The theme of the story is simply not chosen for the pastime. This story, which has a miraculous conclusion about the life of a person and its end, seems simple at first glance; if serious reasoning is made, then a deeper philosophical meaning is understood from it. By analogy, the life span of a person is one day, that is, youth is the dawn, and middle age is the sun, which begins at noon and old age. How much life in the “old man’s chamber” is described skillfully by the fact that there is a man today, there is no tomorrow. The writer places the young man Muhammad in the Chamber of the Kings; in the absence of his equals in the young man begins zerika in this welling. “The only a sick person in the hospital” " It is natural for any person who

is bored lying down to rub with TV. It will appear in the hospital image before the eyes of the pupil in the comfort... Muhammad in chamber feels very uncomfortable for the fact that the old men criticize the modern youth without a grudge. Slightly, the embarrassment to the sick begins to weigh. But in this short opportunity he takes the lesson he needs for his life in the same chamber. This story is very good for young people. At the same time, the inexhaustible treasure of the elderly is a storytelling, which means that it is a living history.

CONCLUSION

One of the eternal themes in literature is the life of Man, The Life of IBA. The idea that a person can get rid of the anxieties of this world only by leaving this world is the basis of the story. If you do not have the same concerns, Life is also meaningless, of course. There is a man today, there is no tomorrow. The elderly is a treasure trove. You must live take a lesson from them. The follow in the story is a small event from the language of the mustache strongly affects Muhammad. The arrival of such a story reminds us of the art of molding in classical prose.

It is known that in the artistic literature, the space after the events and the times are called chronotope. The hospital serves as a chronotope in the creativity of many writers. In particular, the choir palatasi is a very successfully chosen venue. At the same time, the hospital can sometimes also be the last address of a person's life. Attention is also given to this point in the game. Either out of the hospital is healed, or with the help of someone else, with legs stretched, like a follow-up mustache, closing the sheets on the face. The phenomenon of death serves to increase the philosophical burden of the story. Death is once again reminded of the presence in the head of each person.

Again in this story there is a characteristic character of Uzbek nationality. That is, both at the wedding of Uzbeks are always together. He will not leave one to be alone. For the same reason, Muhammad, who had long been from the old man, also did not move to another room. His face could not stand it, his upbringing did not allow. Yes, if the stone comes to bite, if the water comes to the bagel has in his blood.

In modern Uzbek prose, the choice of the hospital as a venue and time of events reminds the corresponding literary events in the world literature. Proceeding from the above comments, it is possible to describe some generalizations on this chapter.

First of all, in Uzbek literary studies, the issue of literature chronotope became an object of research only in the years of independence. Uzbek scientists also achieved certain successes in this area.

Secondly, in modern Uzbek prose three forms of chronotope are different, such as road, Hotel, City, Village, mountain. Among them, it is desirable to interpret as a very convenient and necessary literary space, in which the Heroes Act artistically, even if the hospital chronotope does not occupy a large place.

Therefore, as the Uzbek writers impress their heroes in their stories in the hospital environment, these images also harmonize with the description of the state of housing, as well as the nature.

ON THE ROLE OF PROFESSIONAL COMPETENCE IN THE FORMATION OF PROFESSIONAL RESPONSIBILITY

Turakhanov A.E.*

*Senior Teacher,
Public Education of Surkhandarya Region,
Retraining and Advanced Training Regional Center,
UZBEKISTAN

ABSTRACT

The article is devoted to the role of professional responsibility in the formation of professional responsibility. In addition, the article discusses scientific psychological approaches to such issues as the psychological qualities of successful students, professional competencies that contribute to the achievement of results in pedagogical activity, psychological characteristics of self-development of students, psychological conditions that ensure the formation of professional education. competence.

KEYWORDS: *Student, Profession, Professional Activity, Professional Responsibility, Altruism, Successful Student, Education, Upbringing, Values, Social Activity, Self-Development, Professional Responsibility, Organization, Communication.*

INTRODUCTION

It is known that the phenomenon of responsibility is one of the psychological factors that develop and stimulate the professional activity of students. Therefore, before analyzing the essence of these concepts, it is important to dwell on the essence of the phenomenon of professional responsibility, which is considered very important for the practical activities of students. At the same time, this concept is also characterized by a set of motivational actions of the student in his field.

According to the researcher, AN Novikov, educating students with the features of professional responsibility is characterized by the following [1,165]

- Ability to communicate freely with others;
- Skills to effectively use modern information technologies;

- Have a database of the industry;
- Awareness of economic and industry news;
- Awareness of the content of laws, decrees and orders and documents of the relevant ministries on education;
- Excellent knowledge of one of the foreign languages;
- Psychological preparation for change, etc.

In addition, it was noted that the criteria of responsibility in professional activities cover two aspects of voluntary activity.

Researcher PI Muchinskaya points out that there are three psychological aspects that explain the criteria of professional competence of students [2,45]:

1. General scientific or fundamental aspect - this aspect implies the knowledge of students in the natural sciences and humanities, professional experience in working with computers;
2. Socio-personal and communicative - this aspect is explained by the ability to criticize, tolerance, ability to work in a team, which are important for students;
3. Organizational and managerial features are the ability to plan and perform the work of students, the ability to apply theoretical and practical knowledge and skills in practice, the ability to analyze data from various scientific literature, the ability to adapt quickly to changing conditions. described. So, for a responsible student, professional dedication and its psychological components are very important.

In contrast, according to FM Yusupov, in pedagogical activity can be divided into two blocks that define professional dedication [3, 36]:

1. Basic general professional knowledge and task block;
2. Block of professional knowledge in the field of specialization.

Without these two block data, it is impossible to carry out professional activities and conduct effective activities. To do this, everyone must study in educational institutions focused on their field. The formation of criteria for professional responsibility in future students is inextricably linked with the many complex situations encountered in the learning process, as well as the ability to perform problematic tasks independently, the ability to work effectively.

According to NI Meshkov, the only way to improve the professional responsibility of higher education students is to develop their skills, knowledge, innovation, personality. [4, 19]:

In our view, the goal of all universities aimed at improving the skills of students is to act as a dynamic system that improves professional competence.

According to TA Popov, programs specializing in the training of students should be based on two important principles. That is, these principles are divided into general and special types, which in their content aims to: 5, 22]:

1. The principle of dynamism - it means constant change and updating of educational programs;

2. The principle of perspective - it characterizes the students' deep understanding of the system of different educational opportunities;
3. The principle of versatility - this includes a high level of interest of students and the qualifications of students;
4. The principle of interaction is characterized by the relationship between students and students, as well as the process of communication between student and teacher.

According to the author, the ability to interact is one of the important factors in a teacher's quick acceptance by students.

According to VA Isaev, according to the content of approaches based on professional competence, the development of a sense of professional responsibility in future students is carried out not only through teaching, but also through methodological and new pedagogical technologies. To do this, first of all, it is important to create psychological and pedagogical conditions in the learning environment. These conditions include [6, 82]:

1. Changing the role of the teacher in the classroom - in this case, the teacher initially plays the role of conveying knowledge, explaining theoretical information to students or acting as an actor who contributes to the personal development of students;
2. Introduction of innovative methods that stimulate the professional activity of students. This is explained through skills such as the teacher's accumulation and sharing of experiences, overcoming challenges at work, and creative design;
3. The use of teaching methods that improve the many elements of students' professional competencies and their individual characteristics. Such methods include: positive error method, creative-problem-solving, game-shaped methods, technique of learning role adaptations, ideas demonstration and project methods, etc.;
4. To pay attention to the different professional and living conditions of students, to make a connection between the educational goals and the situations that can be applied in the labor market;
5. To be able to use rapid assessment operations, etc., which correspond to the specific features of the experience gained in the learning process and provide the characteristics of individual development specific to a particular person. Thus, we can observe that the development of professional competencies acts as a goal-setting component and is carried out in the formation of specific psychological and pedagogical conditions.

It should be noted that the professional suitability of students has been studied by many authors and can be considered from different perspectives. According to G.V. Igonina, it is also possible to analyze the psychological aspects of the student's professional competence in a valuable, technological and personal-creative way [7, 39]. The system of student values is first and foremost one of the study subjects of philosophy. It explores all kinds of questions about the content of the concept of values. Essentially, values determine the direction and motivation of human life and activities. Each student has their own value system, which in some may be incomprehensible and in others it is understandable and understandable. What is valuable to a person is something that is of special importance or even benefit to him. It can act effectively

with healthy values in any field: it can be an object or object, a situation or event, an action or a word, an emotion, an emotion, and even a person himself.

According to researcher I.O. Mezentseva, there are the following psychological components that explain the phenomenon of professional responsibility [8,42]:

- Morale responsibility;
- Sacrifice;
- Independence;
- Impartiality in relationships;
- Creativity, initiative and inviolability in the performance of official duties, etc.

So, professionalism is explained by the readiness of future professionals to work effectively in the educational environment. This quality ensures the guaranteed and effective performance of tasks in the life of the individual. According to the Russian psychologist LM Mitina, the following general psychological features that define responsibility are distinguished [9,76]:

- Analytical and constructive thinking;
- Emotional and voluntary stability;
- Resistance to stress and rapid adaptation to extreme conditions;
- Compassion and tolerance;
- Psychophysiological features.

All of the above psychological qualities are the psychological factors that ensure the effectiveness of future activities for future professionals, without which no success in practice can be achieved.

In conclusion, we can say that an active student who has passed all the requirements and is able to competently build the psychological and pedagogical processes, can be considered an expert in his field. Such students will always be “exemplary students” for their colleagues. In order to achieve high results, it is necessary for students to be able to see themselves in their professional activities and to acquire the necessary knowledge in this field, in particular, to improve their practical and theoretical competencies.

PHRASEOLOGIES WITH COMPONENT «KÓZ» (EYE) IN THE KARAKALPAK LANGUAGE

Ulbosin Konakbaevna Keulimjaeva*

*Student,

Karakalpak State University

UZBEKISTAN

Email id: ulboskeulimjaeva17@gmail.com

ABSTRACT

In the given article are proved the meanings of synonymous phraseological units using features with the component «ko'z (eye) » on the basis of the examples taken from literary works. In the literary works were investigated the use of synonymous phraseological units in forming the character, in giving the lingual characteristics to the character, the external portrait of the character, his world of internal life, his behavior, in describing his worldview. Phraseologisms with words related to human body organs have a special place in the work of semantic types of phraseology in the Karakalpak language. Such words serve as a source of phraseology in the structure of phraseology.

KEYWORDS: *Phraseological Units, Synonym, Synonymous Phraseologism, Somatic Phraseologism, Component.*

INTRODUCTION

Phraseologisms with words related to human body organs have a special place in the work of semantic types of phraseology in the Karakalpak language. Such words serve as a source of phraseology in the structure of phraseology. For example, tongue, heart, eyes, mouth, hands, teeth, feet, etc. words are among the key words «[1]. In this regard, E. Berdimuratov said: «We see that most groups of phraseological units in the Karakalpak language originated in the circle of the closest objects and phenomena that have a certain significance in human history.» The words face, head, nose, ears, lungs are found in the composition of phraseological units [2]. Such somatic phraseologies are a phenomenon common to all languages of the world.

Because the names of the parts of the human body are so ambiguous, they create new words, and the fact that there are many phrases can be seen in the phraseology itself, which is formed by a single word «eye».

MAIN PART

The vast majority of phraseologies in the language, the word «köz» (eye) is associated with a certain form of the verb, which led to the formation of several verb phraseology. «Köz» component phraseologies are the most numerous two-component, then three-component, the least multi-component phraseology.

1. Two-component phraseology: *köz ayırmadı* «stared», *köz alarttı* «hated, disliked», *köz ashtırmadı* «did not rest», *köz jumdı* «died; looked indifferent; took a risk», *köz juwırttı* «saw, looked», *köz jiberdi* «looked, saw», *köz boyadı* «deceived, deceived; bewitched», *közi toymadı* «not satisfied», *közi ashıldı* «came to his senses, woke up, understood, knew», *közi jaynadı* «was happy», *közi jetti* «clearly believed, understood, knew», *közi qıymadı* «did not want to give», *közi shaldı* «saw», *közın joydı* «killed, destroyed», *közın qadadı* «stared», *közge ilmedi* «was arrogant», *közge kórındı* «was famous», *közine bastı* «confessed his guilt», *közdi aladı* «nice amazing, beautiful», *közden ótkerdi* «examined one by one», *köziñe qara* «be careful» and so on. Examples: Endi Gúlhásen Nurımnıń anıq kele almaytuǵına *közi jetkennen* keyin, qıspaqlı tar jollardan qansha tayǵanasa da jıǵılmawǵa háreket etti (G.Esemuratova). Bálent ırashtıń basınan pástegi páskeltek putalıqlardıń ústinen dárya tamangá *köz jiberdi* (Sh.Seytov). Orazgúl jeńgey *közi ilinip* baratırsa da maǵan «arı jat, beti jat» dep bir awız sóz aytpaytuǵın edi (J.Aymurzaev). Ol meni *közi qıymay*, ózinen qaldırmay alıp ketip te júrdi (J.Aymurzaev). Ol otırǵanlarǵa qaray *köz juwırtıp*, bir qarap aldı (J.Seytnazarov). Durdıyar ústinen moynın ǵazday sozıp, aldındaǵı shanaqtay-shanaqtay at izlerinen *közın úzbey* kiyatır (Sh.Seytov). Múmkin, bul ádette qalanıń eski qurılıs belgileriniń kóbirek *közge taslanatuǵınlıǵınan* shıǵar (I.Yusupov). Atası Labaqbay jalǵız qızı bar, Xan menen patshanı *közge ilmegen* («Máspatsha»). Dala tısır etse, urı kelip qalǵan sekilli, yamasa baspaq bas jibin úzip oynaqlap shıǵıp baratırǵan sekilli aqshamı menen *közi ilinbedi* (T.Qayıpbergenov).

2. Three-component phraseology: *köz aldına keldi* «imagined; dreamed», *köz qıyǵın saldı* «looked at; took care of», *közden ǵayıp boldı* «disappeared», *közdiń jasın tókti* «cried, grieved», *közi alaqańday boldı* «scared», *köziniń eti ósken* «arrogant», *köz-qulaq boldı* «cared for; guarded», *janın közine kórsetti* «tortured; threatened» and so on. For example: Aramızda neler bolǵanın *köz aldına keltirip* otırman (T.Qayıpbergenov). Quwǵınshılar *közden ǵayıp bolǵan* soń ǵana adamlar birte-birte úylerine tarqastı (K.Sultanov). – Bári bos sóz! Ayırım adamlar basshılıq lawazımǵa kóterilse, *közlerine may pitip* aljasadı, jáne birewler basshılıq lawazımında sál kúshke ushırasa, *közlerine jas keltirip* aljasadı (T.Qayıpbergenov). Ol sonda ǵana bizdi tabadı. Házir *köziniń eti ósip* júr (T.Qayıpbergenov). Óz buyırǵı boyınsha pitken axidnamaǵa pikir aytpay, nemquraydı otırǵan Ǵayıp xannıń *közleri álle-pálle bolıp* ketti (T.Qayıpbergenov). Tóresh anasınan keyinirek qalsa, joldıń eki boyındaǵı qarabaraqlardıń arasınan bir nárse táp beretuǵınday, eki *közi alaqlap*, bir qolı menen beldemesin kóterip, apasına jetip keldi (N.Dáwqaraev).

3. Multi-component phraseology: *köziniń astı menen qaradı* «did not like», *köz jasın kól qıldı* «cried; tormented, grieved», *eki közi tórt boldı* «waited a long time; missed», *ay dese awızı bar, kún dese közi bar* «very breathable, pleasant», *eki közi jep baratır* «stared, fell in love» and so

on. Examples: Meniń *eki kózim tórt bolıp*, mollanıń keliwin kútip otırdım (J.Aymurzaev). Hámmeniń sońında *kóz jası kól bolıp*, qálpe túrgeldi (Á.Shamuratov). Pıshaqtı kórgende onıń júzinde qan qalmay, bózdey dóndi, *eki kózi uyasınan shıǵıp kete jazlap* dawısıńıń barǵanınsha baqırdı (T.Qayıpbergenov).

As can be seen from the examples, we can see that in the Karakalpak language there are many phraseologies used with the word «eye». The words that are part of the above phraseology are used as a single unit. Such idioms are constantly intertwined with each other. They should not be separated from each other, that is, the words in such a fixed sequence should not be replaced by another word, the order of the fixed place should not be changed. For example, the word «*murın*» (nose) should not be used instead of the word «*kóz*» (eye) in the phraseology *qas penen kózdiń arasında*, because in the Karakalpak language the phraseology *qas penen murın arasında* is not used. Also, if we say *kózdi ashıp jumdı* instead of *kózdi ashıp jumǵansha*, the latter permanently destroys the property of being a phrase.

Phraseological phrases in karakalpak language are divided into four groups depending on the meaning of the whole, the ratio of the individual components of their composition to the meaning: phraseological complications, phraseological units, phraseological combination and phraseological words. In the Karakalpak language, phraseology with a «*kóz*» («eye») component is often used in four groups.

Phraseological complications are components of words that have almost lost their lexical meaning. Therefore, their meaning is completely different from the meaning of the words used in their work: *kóz benen qastıń arasında* (suddenly, immediately), *kózge shóp salıw* (insults), *eki kózi tórt bolıw* (long-awaited), *eki kózinen asılıw* (inability to get up due to severe pain), *kózi tas tóbesine shıǵıw*, *kózi uyasınan shıǵıw* (severe fear, shock), etc. Examples:

Suwdıń ór jaǵınan anası paqırdıń *eki kózi tórt bolıp*, sınsıp, tıpırshılap, hesh jerde turalmay júr (Á. Shamuratov). Bul xabardı esitkende Ámettiń kózi uyasınan shıǵıp kete jazladı (T. Qayıpbergenov). *Kózi tas tóbesine shıqtı*. Hawlıqqn kóz janarı laplap, solǵın janarı qatıwlanı qaldı (K. Sultanov).

Aqıllı adam sóz ertpeydi izine,

Shóp salmas yarınıń hárgiz *kózine* (Berdaq).

In phraseological units, the individual components come close to the whole meaning, their individual meanings are collected, and the underlying form of the word sequence forms the second meaning. In Karakalpak language, the component «*kóz*» («eye») is used more effectively in phraseological units than in phraseological complications: *kóz tigiw* «staring», *kózi jetiw* «close proximity, belief, knowledge», *kóz ilindiriw* «sleeping», *kóz ushına sihiw* «to go to an inaccessible place», *kózdi ashıp- jumǵansha* «quickly, suddenly, instantly», *kóz jumıw* «to die», *bir kózde kóriw* «to see everything equally», *eki kózin almaw* «stare at someone or something for a long time», *istiń kózin biliw* «experienced, capable» and so on. Examples:

Shaǵırayısqan juldızlarǵa uzaq waqt *kóz tikken* qız óz-ózinen gúbirlenedi (T. Qayıpbergenov). «Xosh bol aǵa, Qıdırbay!»-degendey máni ańlatıp, qolın bir bılǵadı da *kóz ushına sihip* ketti (J. Seytnazarov). Ol qansha oylaǵan menen Aytjańǵa pıshaq urǵan adamdı tabıwdıń qıyın ekenine *kózi jetti* (T. Qayıpbergenov). Kóbirek jasaytuǵınıńa kóziń jete me? (X. Seytov). Biraq tın

jarpısına deyin qorqıp otırıp tań aldında *kózi ilinip* ketedi (Q. Ayımbetov). Jolǵa usı gilemge minip ushsań, *kózdi ashıp-jumǵansha* alıp baradı («QQ. x. e»).

Phraseological units such as «*kóz tikken, kózi jetti*» in the examples are synonymous and do not deviate from the meaning of any of their individual components. For example, the phrase «*kóziń jete me?*» means something related to the eye (the concept of seeing or knowing). Without completely deviating from the meanings of the words in the phraseological units, its meaning is close to the meaning of the words in the same dictionary or the word before or after.

Individual words in phraseological units are collected and explain a single meaning, which can not be divided into separate parts, and in contrast to phraseological transitions and phraseological units, the meaning here is directly related to the lexical meanings of individual components. For example, the individual meaning of each word in the phrase «*kózi tınıw, kózi qamasıw*» is directly related to the whole meaning, but can not be separated from each other. We can see that the component «*kóz*» («eye») is often used in phraseological units: *kózi masaladay janıw, kózi qamasıw* «the eye can not see, the eye is blurred, not seeing», *kózi tınıw* «blindness» and etc.

For example:

Men *kóz-qulaq* bolayın,-dep Jámiyla awırılıqtı ózi algısı keledi (K. Sultanov).

Eń kemi mın bolsın *kóz kórgen* tanıs («Berdaq»)

Ol otırǵanlarǵa qaray *kóz juwırtıp* bir qarap aldı (J. Seytnazarov).

Phraseological words. In our language, a unique group of proverbs, which are found in everyday life in a ready form, is close to the groups of phraseological units in terms of their grammatical connection, lexical unity, inseparability. Proverbs also do not require changes, such as replacement of words, abbreviations, inappropriate wording. In proverbs and sayings in our language we see the occurrence of the component *kóz* «eye», their use in the literal sense, in the figurative sense. For example:

Kóz qorqaq, qol batır.

Kóz kózge túsedı,

Mıyrim shápáát júzge túesdi.

Atalar sózi-aqıldın *kózi*.

Ǵarǵa-ǵarǵanın *kózin* shoqımaydı.

Tilge tis qala,

Kózge qas qala.

Mańlay *kózi* kórmeydi,

Kewil *kózi* kóredi.

Kóz jumbay suw keshiw joq.

Mıynetin *kózin* tapqan,

Baqıttın ózin tabadı.

Qas qondıraman dep *kóz* oyıp alma.

Kózi shaldırístıń sózi shaldırıs.

Kózi toymaǵannıń ózi toymaydı.

Ayawlı *kózge* shóp tiygish hám. t. b.

CONCLUSION

Therefore, in our language, the semantic types of somatism phraseologies related to the names of human body parts are different. The study of this type of phraseology as a topic is of practical and theoretical importance for the phraseology of modern Karakalpak language.

FACTOR IN THE OF TRANSBOUNDARY WATER RESOURCES IN CENTRAL ASIA

Buriyev Soatmumin Donayevish*;

* PhD Senior Lecturer,
Department of Civil Society,
TerSU, Termez, UZBEKISTAN

ABSTRACT

This article provides information on an invairable ponds, basins and networks. There is also information about the water networks flowing across the borders of the world and the purposes and issues of international agreements, treaties, mutual agreements on its. In addition, there is a talk of a positive development of relations between the Central Asian states on this issue.

KEYWORDS: *Water codex, Water resources, transboundary water resources, water artery, convention, hudrometeorology, limit, reconstruction, modernization, exploitation, investment.*

INTRODUCTION

I'm sure the water problem the region of the settlement country-and the interests of their peoples other than equal consideration is reasonable there is no way.

Water is the source of life. Life without water has never been and never will be. If we look at the history of events related to water scarcity, we can see that it mainly covers two periods. The first is the period up to the middle of the twentieth century, when the demand for available water resources was low, with a population of 2.5 billion people and an underdeveloped economy. , an inexhaustible natural resource, it is a gift from God to human beings, it can be used as much as it wants, it will not run out, the use of river water will not affect its quantity, the quality of water will not change, because if it is rolled seven times, it will be clean again the wrong idea or concept was ingrained in people's minds. The second stage in the history of water relations is characterized by the beginning of peaceful life in the middle of the twentieth century, i.e. after the Second World War, the development of large areas, industrial development, and a sharp increase in demand for water resources. The existing water resources have been almost fully utilized, and now the question of which water resources will be provided for the future is on the agenda.

Today, water problems in our region, including the new economic, social, political and environmental realities, show that water resources play a crucial role in the sustainable development of the region and its countries. So, future development depends in many ways on the available water resources, their quantity and condition, water requirements, the level of water use and, in general, our attitude to water, water use. Currently, the average perennial water flow of the Amudarya and Syrdarya, which have the status of transboundary water bodies, varies widely.

When it comes to transboundary waters, it makes sense to first focus on the meaning of the term. Hence, transboundary waters are any surface and groundwater that cross the borders of two or more states or are located within such boundaries. It should be noted that local water bodies are any surface and groundwater bodies located in the territory of a country, the zones of formation, distribution or flow and consumption of water resources.

According to official UN data, there are currently 276 transboundary watersheds (rivers and lakes) in the world, of which 68 are in Europe, 64 in Africa, 60 in Asia, 46 in Central and North America, and 38 in South America. Located. About 276 watersheds that cross the border of two or more states are home to 40 percent of the world's population. Transboundary watersheds cover about half of the globe, or 46 percent. Of the 276 transboundary watersheds, two-thirds, or 185, cross at least two states, 256, or 92.7 percent, cross 2-4 states, and 20, or 7.2 percent, cross more than 5 states. Of the existing reservoirs, 13 flow through 5-8 countries, 5 (Congo, Niger, Rhine, Nile and Zambezi) - 9-11 countries, and one (Danube River) - flows through about 19 countries. The number of large and small rivers in the world is several hundred. There are 175 rivers with a length of more than 1000 km. The number of rivers flowing through the territory of several states is 261, of which 71 - in Europe, 53 - in Asia, 39 - in Central and North America, 38 is located in South America. International watersheds partially cross the territory of 148 states and completely cross the territory of 21 states.

Cross-border organizations play a key role in solving international problems in the management of transboundary water resources. Such organizations may have different management styles according to the political environment, water issues, and the cultural characteristics of the area. They are often based on voluntary agreements between sovereign states, but may also include international and local water authorities and commissions.

International organizations are traditionally established to address specific problems. For example, issues such as water transport or flood relief. Their mandate is ongoing and will provide comprehensive assistance in resolving problems in the basin. It may be useful to establish an advisory body to expand the range of stakeholders, as the ministers of each country are interested in making the full decisions that are acceptable to them. The activities of such organizations are based on agreements, memoranda and international agreements. The effective functioning of transnational organizations requires a reliable financial basis, the political will of governments and the fulfillment of cooperation obligations between them.

Transboundary, interstate and local water bodies account for, allocate and use water resources on the basis of various normative documents adopted around the world. To date, many normative documents on accounting, distribution and use of water resources in such water bodies have been adopted worldwide, and work is being carried out on their basis. Examples are the International Convention on the Use and Protection of Basins and Transboundary Arteries, adopted in

Helsinki on 17 March 1992, and the Declaration on the Development of the Environment in 1998 in Rio de Janeiro. can be cited.

Today, there is a need to increase the reliability of the database to increase the capacity of joint management of transboundary water. Creating an environment of trust between intermediaries and negotiators in achieving the terms of the agreement requires certain funds and resources, certain time and effort. In this situation, donor assistance from international organizations such as the UN and the World Bank can yield positive results.

Coordination of national water policy by cross-border interagency organizations should be supported by partner organizations. Pressure from citizens, the media, and NGOs often has a positive effect on issues such as mitigating environmental issues related to water use. Once the transboundary water management is established, the work will not stop there, it will be necessary to implement special control measures, strengthen communication and data collection, as well as develop funding mechanisms to strengthen it. Experience shows that technical skills play a very important role in this regard.

Serious problems in the management of transboundary water bodies include the sharing of transboundary rivers, the lack of a single interstate system for monitoring the use of water resources, and the lack of reliable data on cross-border water resources and emergencies.

As there is no legal or methodological basis for regulating the joint use of natural resources, it is necessary to coordinate the assessment and rehabilitation of transboundary environmental damage.

Attempts to solve the problem of transboundary pollution bilaterally have not led to practical results in reducing the level of transboundary river pollution. The growth of water supply, industry and environmental sustainability of the country has led to the aggravation of cross-border problems in line with the formation of water resources and the increase in water pollution.

It should be noted that there are no national mechanisms for fulfilling obligations under international conventions. The problem is the lack of methods and methodologies for planning intersectoral activities that take into account the obligations of countries under conventions and treaties.

When it comes to the use of water from transboundary rivers, it would be useful to focus on how the work is being done between the Central Asian countries. The results of the joint solution of the problems of interstate water relations in the basin are positively recognized by the Central Asian countries. The measures taken by the countries to regulate the joint management of common water resources include: 1) The Agreement on Cooperation in the Management and Protection of Transboundary Water Resources between Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan and the Republic of Uzbekistan was signed on February 18, 1992 in Almaty and on March 26, 1993 in the Red Horde. In this agreement, the parties agreed to establish the Interstate Coordinating Water Commission (ICC) and its executive bodies, the Amudarya Water Basin Association (SBU) and the Syrdarya SB; At three consecutive meetings of Central Asian leaders: in March 1993 in the Red Horde, in January 1994 in Nukus and in March 1995 in Tashauz, it was agreed to establish the International Fund for Saving the Aral Sea; 2) On January 11, 1994 in Nukus, specific actions were taken to improve the environmental situation in the Aral Sea basin for the next 3-5 years, as well as to approve the basic provisions of

the Concept of solving the problems of the Aral Sea and the Aral Sea Basin the resolution of the Central Asian leaders on the approval of the program was approved; 3) On September 20, 1995, the Central Asian leaders signed the Nukus Declaration of Central Asian States and International Organizations on Sustainable Development in the Aral Sea Basin. At its signing, the Central Asian leaders reaffirmed the recognition of previously signed agreements, treaties and legal documents regulating water relations in the Aral Sea Basin and ensuring their sustainable operation; 4) On March 17, 1998, an agreement was signed between the governments of the Republic of Kazakhstan, the Kyrgyz Republic and the Republic of Uzbekistan on the use of water and energy resources in the Syrdarya basin. It was later joined by the Republic of Tajikistan; 5) In 1999, an agreement was signed on the exchange of hydrometeorological data, as well as on the parallel operation of energy systems in Central Asia; 6) On October 6, 2002, the Heads of State approved the "Program of concrete actions to improve the environmental and socio-economic situation in the Aral Sea basin for the period 2003-2010." It is known that before the independence of the Central Asian states, water legislation in the republics and water relations in accordance with them were regulated by the former "Fundamentals of Water Legislation of the USSR." According to the data, surface water produced in Uzbekistan makes up 10% of the total volume in the Aral Sea basin. The available water volumes between the Central Asian states are distributed according to the "Amudarya and Syrdarya basin schemes" developed in 1983-1984. According to this distribution, Uzbekistan will receive 71.69 billion soums. cubic meters of water. Including: 58.6 billion from rivers. cubic meters (81.7 percent), of which 11.47 billion cubic meters from inland rivers. cubic meters (19.6 percent), 10.07 billion cubic meters of groundwater. cubic meters (14.0 percent), 3.02 billion cubic meters of sewage. cubic meters (4.3 percent). Amudarya waters were distributed on the basis of the Protocol adopted in 1986 (Protocol No. 566 of September 10, 1987 of the Scientific and Technical Council of the Ministry of Land Reclamation and Water Resources of the former Union). According to this document, Amudarya water: 9.5 billion cubic meters to Tajikistan. cubic meters (15.5 percent); 22.0 bln. cubic meters (35.8 percent); Uzbekistan receives 29.6 billion soums cubic meters (48.1 percent). After the independence of the states, there was a need to revise the legal framework governing water relations at the national and international levels.

In 1993, the Water Code was adopted in the Republics of Kazakhstan and Tajikistan. In 1994, the Law of the Kyrgyz Republic "On Water" and in 1993, the Law of the Republic of Uzbekistan "On Water and Water Use" were adopted. The Water Code of Turkmenistan, adopted in 1973, remained in force until November 11, 2004. In the Central Asian region, since 2000, new efforts have been made to develop the legal framework in the field of water management. Currently, the Water Codes of the Republic of Kazakhstan (2003), Kyrgyzstan (2005) and Tajikistan (2000), the Water Code of Turkmenistan (2003) and the Law of the Republic of Uzbekistan "On Water and Water Use" (1993) in the field of water relations in Central Asia. They can be summarized under the name of National Laws (NSCs) and they are regulated by existing interstate water relations agreements.

It should be noted that in the general water situation in the Aral Sea Basin (ODH), Afghanistan, Tajikistan and Kyrgyzstan are the countries that form the main water resources in the region. Kazakhstan, Turkmenistan and Uzbekistan are the main water consumers. According to various estimates, in the north of Afghanistan (upper Amudarya) 8-10 to 16-18 cubic km per year. In Kyrgyzstan, 25 percent of the ODH, 80 percent of the Amudarya River in Tajikistan, and almost

all of the transboundary Zarafshan River are formed. The situation is further complicated by the diversified structure of interstate water infrastructure facilities. Thus, the water supply of South Kazakhstan and the Lower Syrdarya is connected with the Toktogul (Kyrgyzstan), Kayrakkum (Tajikistan), Charvak (Uzbekistan) reservoirs and interstate canals passing through Uzbekistan. The water supply of the Keles region depends on the management of the flow of the Chirchik River. More than half of the Tuyamoyin hydroelectric power station, which supplies water to Karakalpakstan and Khorezm regions, the Amu-Bukhara Machine Canal (ABMK), and the Karshi Main Canal (KMK) main water intake facility and other infrastructure, is located in Turkmenistan. Bukhara in Uzbekistan

According to many experts and analysts, there are many conflict situations in the use of Central Asian transboundary water resources (TSR), which in the future could cause serious problems in the region. The political situation in the region related to water problems may be a factor in the consolidation of Central Asian states or, conversely, in the escalation of conflicts between them.

The principles of International Water Law (IWR) are based on the generally recognized special environmental principles of international law:

- a) Cooperation and equality of the littoral states, fair and rational use of the TSR, taking into account the existing practice;
- b) the sovereignty of the states belonging to it on the transboundary river bank;
- (c) The use of international rivers, while respecting the common interests of all littoral states and the particular interests of each;
- d) not to harm cross-border procedures;
- d) Compensation for damage ("the person paying the damage").

These and generally accepted principles and IAS norms can serve as a basis for the development of a draft agreement on the management of TSR in Central Asia.

Uzbekistan's position on transboundary water use is as follows:

- 1) The unilateral construction of large reservoirs and hydropower plants on transboundary rivers without environmental, socio-economic expertise, their feasibility study (TIA) and construction projects without agreement with neighboring countries should be legally considered as interference in the internal affairs of other countries;
- 2) Examination of the construction of such facilities, especially in the preparation of their TIA and construction projects, should strengthen the legal rights of the downstream states to water and their interests;
- 3) It is necessary to develop a draft Agreement defining the principles of management of water flows of transboundary rivers and compensation for damage to states located in the lower reaches of rivers in case of non-compliance with the agreed regime.

It should be noted that only 20% of the water resources used in our region are formed in our territory, and the remaining 80% come from neighboring countries. Addressing the Oliy Majlis, President of Uzbekistan Shavkat Mirziyoyev said: "The main way to meet the growing demand for water in the near future is to improve the management of water resources, rationalize their use and find internal resources, achieve water conservation."

Institutional, legal, economic and social reforms are being carried out in Uzbekistan to address the problem of ensuring the efficient use of limited water resources within the country, which has a deep understanding of the attitude and economic and social significance of our country for its rapidly growing economy and population. We can see it in the following directions:

1. Development of the water use base in accordance with the legislation, a number of amendments and additions to the Law of the Republic of Uzbekistan "On water and water use". Legitimacy and legal documents have been developed. In particular, the Resolution of the Cabinet of Ministers of March 19, 2013 No. 82 "On approval of the Regulation on water use and water consumption in the Republic of Uzbekistan", June 14, 2013 No. 171 "On approval of the Regulation on the procedure for issuing permits for special water use or special water consumption" -numbered decisions were made;
2. Transition from the administrative-territorial principle in the management of water resources to the hydrographic basin principle. This major event has yielded a number of positive results in drastically reducing water wastage of an organizational nature, which is allowed in the context of the administrative-territorial principle in the management of water resources;
3. Transfer of part of the powers and responsibilities of the state on water resources management to public organizations at the lower level of irrigation systems (Water Consumers' Associations). This measure has led to an increase in the sense of involvement of water consumers in improving the efficiency of water use, which has increased dramatically as a result of reforms. Today, there are 1,503 associations of water consumers in the country, formed taking into account the wishes of water consumers. At present, water consumers' associations are the main organization responsible for the efficient use of water resources at the grassroots level. Their effective activity in many respects determines the level of economical and targeted use of water resources in agriculture;
4. Diversification of agricultural crops. In irrigated agriculture, reducing the share of water-demanding crops in large quantities and even in times of water scarcity, and increasing the share of crops growing in low-water, non-water-scarce periods, can significantly alleviate water shortages. At the same time, water-intensive cotton fields were reduced from 2 million to 1.2 million hectares, and rice from 180,000 to 40,000 hectares, and low-water crops such as grain, vegetables, melons, orchards and vineyards were increased;
5. Increasing the efficiency of water facilities. Over the past years, 1,500 kilometers of canals, 211 kilometers of tray networks, 400 large hydraulic structures, more than 200 pumping stations have been reconstructed and modernized. Every year, an average of 5,000 kilometers of canals, more than 100,000 kilometers of internal irrigation networks, about 10,000 hydraulic structures, 3,000 pumping units, irrigation wells are being repaired. As a result of these measures, the efficiency of the channels through which the projects are implemented has increased by 20%;
6. Water accounting. Equipping each consumer's water intake with water metering devices and facilities, maintaining and enforcing the contract between the water recipient and the supplier within the allocated limit has significantly increased the efficiency of water use;
7. Organize the introduction of water-saving equipment and technologies, including:
 - Introduction of modern irrigation technologies;

- Organization of wide use of existing traditional irrigation technologies;
- Promotion of non-traditional new irrigation technologies;
- Organization of agro-technologies on the basis of water saving requirements.

8. Implementation of investments aimed at ensuring the reliable operation of water facilities. It should be noted that about 500 billion soums a year are allocated for the development of the water sector at the expense of state capital, as well as 1.7 trillion soums for maintenance costs, which has increased fivefold over the past 10 years. In addition, due to the importance of the industry, the state pays special attention to attracting investment. Currently, major financial institutions such as the World Bank, Asian Development Bank, Islamic Development Bank, Saudi Development Fund, OPEC Fund, Kuwait Fund, Eximbank of the People's Republic of China, as well as donor investments from international cooperation organizations and agencies in Japan, Switzerland, Germany and other countries. Large-scale projects are being implemented with the participation of Over the past 10 years, the sector has attracted about \$ 1.5 billion in investment.

As a result of effective water management measures, the total annual volume of water used in the country has been reduced from 64 billion cubic kilometers in the pre-independence period to an average of 51 billion cubic kilometers or 20%. The relative annual water consumption from the source for irrigation of each hectare of land has been reduced from 18,000 cubic meters to 10,500 cubic meters compared to the 1990s. Such an intensity of work in the field of water management and the level of investment is not observed in any country in the region.

Thanks to the prudent state policy in the field of water management, the irrigation potential has not only been preserved during the years of independence, but has also been successfully modernized. During the years of independence, radical changes have taken place in water management. Integrated water resources management is being introduced on a large scale. According to the World Bank, the Asian Development Bank and other funds, Uzbekistan is a recognized leader in the region. In conclusion, it can be said that water saving is an important source of sustainable water supply. Therefore, all the people living in the region would appreciate their invaluable water and use it efficiently without wasting a single drop of it.

ON THE ANALYSIS OF NORMATIVE-LEGAL DOCUMENTS IN THE REGULATION OF THE ACTIVITIES OF CRIME PREVENTION SERVICES OF THE MINISTRY OF INTERNAL AFFAIRS OF THE REPUBLIC OF UZBEKISTAN

A. A. Amanov*

*Associate Professor,
Doctoral Researcher, Faculty of Postgraduate Education,
Doctor of Philosophy (PhD) in law,
Academy of the MIA of the Republic of UZBEKISTAN

ABSTRACT

This article concentrates on the analysis of normative-legal documents in the regulation of the activities of crime prevention services of the Ministry of internal affairs of the Republic of Uzbekistan, as well as depicts the normative and legal documents regulating this sphere and proposals and recommendations for the improvement of the activity of this area are developed.

KEYWORDS: *Internal affairs organs, Crime prevention services, Law, Decree, Resolution*

INTRODUCTION

The unique legal system for crime prevention and protection of the rights, freedoms and legitimate interests of citizens, property of individuals and legal entities, the constitutional order, public order, the rule of law, security of the individual, society and the state has been created in the Republic of Uzbekistan, and crime prevention services of internal affairs organs play the significant role in this system.

It should be mentioned that the crime prevention services of the Ministry of internal affairs also have its own legal status just as each participant, namely the subject of the administrative-legal relations involved in the social life of the society has its own legal status. Legal status is the set of a state of the subject, its rights and obligations defined by legal norms¹. It is possible to include not only its rights and obligations, but also its main functions when talking over the legal status of the legal entity².

According to the Law of the Republic of Uzbekistan “On internal affairs”³, the Minister of internal affairs of the Republic of Uzbekistan is a member of the Cabinet of Ministers of the Republic of Uzbekistan. The Ministry of internal affairs of the Republic of Uzbekistan reports directly to the President of the Republic of Uzbekistan and to the Cabinet of Ministers of the Republic of Uzbekistan on some issues.

The organs of internal affairs maintain its activity within the scope of their powers, including protection of the rights, freedoms and legitimate interests of citizens, the maintenance of public order and public safety, the fight against criminality and terrorism, human trafficking, crime prevention, prevention, identification and elimination of their causes and conditions, identification of persons prone to commit offenses in advance, participation in the work on raising legal awareness and legal culture in the society, and other crucial areas.

It can be highlighted that the large-scale works have been carried out to improve the system of internal affairs during the years of independence, and consistent works in this direction are still ongoing in an effort to ensure peace and tranquility, public order and security in our country.

Particularly, it is no exaggeration to say that the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated on April 12, 1999, №170/40 “On the concept of maintaining public order and security in Tashkent”⁴ was the beginning of reforms in this field. The reason is that these initiated reforms cover the entire system of internal affairs and are focused on all important areas of activity. The structure of the General Directorate of internal affairs of Tashkent city was reorganized, the activities of patrolling service and traffic safety service were launched on the completely new basis, and the institution of crime prevention inspectors was established on the basis of police station inspectors within the scope of this decision⁵.

Moreover, bases of internal affairs organs were established in all 444 makhallas (people’s community) of Tashkent, where the activities of about 1,200 crime prevention inspectors were established on the basis of this decision. As a result, it has allowed radically reconsidering and strengthening the work on crime prevention, identification and elimination of the causes and conditions of crime, as well as has significantly improved the criminal situation in our country⁶.

Decree of the President of the Republic of Uzbekistan dated on March 27, 2001, № PD-2822 “On measures to improve the activities of internal affairs organs of the Republic of Uzbekistan”⁷ defined the organizational structure and main tasks of the Ministry of internal affairs of the Republic of Uzbekistan, and in order to ensure the execution of this decree the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated on June 6, 2001, №247/41 “On measures to strengthen the role of the prevention service in the fight against crime”⁷ has been adopted and both legal documents play an essential role in determining the legal status of crime prevention services of the ministry.

The bases which are the lowest level of crime prevention services have been established in all makhallas (residential area) of the country, where the activities of crime prevention inspectors have been established and cooperation with citizens’ self-government bodies has been further strengthened in the course of these reforms.

The resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated on May 16, 2002, №162 “On measures to improve the infrastructure of police bases”⁸, and the Decree of the President of the Republic of Uzbekistan dated on July 19, 2004, № 3264 “On measures to further

improve the activities of internal affairs organs of the Republic of Uzbekistan”⁹, the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated on September 23, 2004, № 442/69 “On measures to improve the training of specialists for internal affairs organs at the Academy of the Ministry of internal affairs of the Republic of Uzbekistan”¹⁰ have had a positive impact on the effectiveness of reforms in this sector.

These normative-legal acts effectively influenced the formation of the absolutely new system of crime prevention services of internal affairs organs, the further strengthening of their activities, the further enhancing of the legal framework and legal status, the improvement of material and technical base and the training, retraining and advanced training of highly qualified personnel in the educational institutions of the internal affairs organs for this service, the newly established structural units in the system of crime prevention services of the internal affairs organs, namely, the establishment of bases of internal affairs organs to comprehensively combat crime, their sectoral services of internal affairs organs and mechanisms of cooperation with law enforcement bodies and other government agencies, citizens` self-government bodies and public structures as well as other civil society institutions.

The law of the Republic of Uzbekistan “On crime prevention”¹¹ dated on May 14, 2014, served to determine the powers of the organs and institutions directly involved and participate in crime prevention, as well as the formation of coordinating councils served to increase the efficiency of work in this area and raise it to the qualitatively new level.

The adoption of the Law of the Republic of Uzbekistan “On Internal Affairs”¹² has also played vital role in comprehension the legal status and current circumstance of crime prevention services of internal affairs, and in determination of the goals and functions.

In particular, the Article 4 of the law states that one of the main activities of internal affairs organs is the prevention of offenses, identification and elimination of their causes and conditions that lead them to occur, the identification of persons desire to commit offenses.

It is stipulated that, One of the main structures of crime prevention services of the internal affairs organs is the base of the internal affairs organs, that ensures the cooperation of districts and cities internal affairs organs departments with the public, is considered the key subordinate link that directly ensures the safety of citizens, public order, crime prevention, the fight against crime in accordance with the Article 15 of the law.

Furthermore, it was also stipulated that the bases of the internal affairs organs carry out their activities in the composition of senior inspectors of crime prevention, inspectors and their assistants for maintaining public order, and approval of the position of crime prevention inspectors by the decision of the district (city) Council of People`s deputies and their submission of reports to the citizens` self-government bodies in accordance with the established procedure; other divisional units of internal affairs organs, and also members of public structures of “Makhallaposboni” (residential area`s security guard) can be involved in the organization of work of bases of internal affairs organs.

The adoption of the Decree of the President of the Republic of Uzbekistan dated on March 14, 2017, №2833 “On measures to further improve the system of crime prevention and fight against crime”¹³ has also served to improve the cooperation of crime prevention subjects and the creation of the efficient system for crime and delinquency prevention.

The Strategy of actions¹⁴ for the five priority areas of development of the Republic of Uzbekistan in 2017-2021 also pays special attention to the system of crime prevention, radical improvement of the activity of internal affairs organs in the fight against criminality and maintenance of public order.

The Decree of the President of the Republic of Uzbekistan dated on April 10, 2017, № 5005 “On measures to radically increase the efficiency of internal affairs organs, strengthening their responsibility for ensuring public order, reliable protection of the rights, freedoms and legitimate interests of citizens”¹⁵ has also defined the importance of crime prevention in current social life.

Specifically, the following statements are stipulated according to the Decree: the report of the Minister of internal affairs to the Senate of the OliyMajlis of the Republic of Uzbekistan on the state of crime prevention twice a year in our country; quarterly reports of the Minister of internal affairs of the Republic of Karakalpakstan, the Heads of the General Directorate of internal affairs of Tashkent city and the Heads of regional departments of internal affairs, respectively to the Supreme Council of the Republic of Karakalpakstan, Tashkent city and regional Councils of People’s deputies, and quarterly reports of the Chiefs of district (city) departments of internal affairs to the district (city) Councils of People’s Deputies; and the order in which the reports of their deputies on youth issues – the chiefs of crime prevention departments (divisions) are heard on a monthly basis; discussing critically the measures taken and the results of their work, assessment of the effectiveness of their work, as well as to make recommendations on the suitability or unworthiness of their positions during the hearings of the officials of internal affairs organs are clearly indicated.

The position of deputy head of the district (city) department of internal affairs (division) on youth issues – the Head of the department of crime prevention (division) was introduced by this decree, and they will be responsible for the effective organization and coordination of the work of crime prevention inspectors, primarily for the prevention of minors and juvenile delinquency.

The adoption of the Decree of the President of the Republic of Uzbekistan dated on №2896 “On measures to radically improve the activities of crime prevention units of internal affairs organs”¹⁵ also served to further improve and legally strengthen the legal status, composition and current conditions, activities and management of crime prevention services of law enforcement agencies. The regulations “On the General directorate of crime prevention of the Ministry of internal affairs of the Republic of Uzbekistan” and “On the base of internal affairs organs” were approved within the scope of this decree.

As a result of the Strategy of actions for the five priority areas of development of the Republic of Uzbekistan in 2017-2021 and during the reform process, as well as the above-mentioned decrees and resolutions, effective affairs have been done in the field of crime prevention of internal affairs organs.

In particular, additional 175 city departments (divisions) of internal affairs organs and 824 bases of internal affairs organs were established in order to ensure the proximity of internal affairs organs to the population and to create convenience for citizens in settlements far from the internal affairs departments (directorates)¹⁶. The number of crime prevention inspectors working at the lowest levels of crime prevention has been increased from 5,867 to 6,969¹⁷.

To summarize, today the crime prevention services of the organs of internal affairs of the Republic of Uzbekistan provide public order and security in residential areas, crime prevention and raising the legal awareness and culture of the population, carry out effective services in creating the way of life that fully meets the lifestyle standard, spirituality, values and mentality of our people. However, it should be stated that offences are evolving, complicating and improving just as society is always in progress.

Therefore, it is necessary to improve our national legislation in order to constantly implement crime prevention and effective fight against crime, as well as to implement the best international experiences on the basis of constant analysis of normative-legal acts regulating the activities of the subjects engaged in this activity in our national legislation. Moreover, it is of paramount importance to bring the activity and efficiency of crime prevention services of internal affairs organs to a new level and improve their work for further implementation of crime prevention and ensuring legal liability of committed offences.

In addition, it is expedient for crime prevention services of internal affairs organs to exercise their powers effectively by streamlining the forms and methods of activity and services based on laws and normative-legal regulations, in maintaining public order and ensuring the safety of citizens, prevention of delinquencies, elimination of the causes and conditions of offenses.

THE TECHNOLOGY OF PRONUNCIATION AND SPEECH DEVELOPMENT OF PRIMARY SCHOOL STUDENTS BY MEANS OF FOLK ORAL CREATIVITY

Olimova Nilufar Qosimjon qizi*

*Lecturer

Department of Primary Education Methodology of Fergana State University,
UZBEKISTAN

ABSTRACT

Increasing the efficiency of using speech technologies in the conditions of preschool educational organizations and elementary schools, the search for new, innovative forms and methods of interaction with children are the most important problems of modern education. In the course of the study, theoretical methods were used: analysis and synthesis, generalization, systematization, classification, forecasting. The specifics of the study are the author's vision of the features of interaction in classes on the development of speech in the conditions of senior, preparatory groups of kindergarten and during lessons in elementary school. The conclusion is drawn about the role and specifics of introducing various innovative technologies into the educational process of speech development of preschool children and primary school children. The prospect of the study is to develop new speech development technologies for preschoolers and primary schoolchildren using knowledge of the existing classification and modern development directions.

KEYWORDS: *Analysis and synthesis, Generalization, systematization, Classification, Forecasting.*

INTRODUCTION

Speaking is "the process of building and sharing meaning through the use of verbal and non-verbal symbols, in a variety of contexts". Speaking is a crucial part of second language learning and teaching. Despite its importance, for many years, teaching speaking has been undervalued and English language teachers have continued to teach speaking just as a repetition of drills or memorization of dialogues. However, today's world requires that the goal of teaching speaking

should improve students' communicative skills, because, only in that way, students can express themselves and learn how to follow the social and cultural rules appropriate in each communicative circumstance. In order to teach second language learners how to speak in the best way possible, some speaking activities are provided below, that can be applied to ESL and EFL classroom settings, together with suggestions for teachers who teach oral language.

MATERIALS AND METHODS

The law of the Republic of Uzbekistan on education is widely introduced into practice. Thanks to independence, our country was given a wide opportunity to conduct independent deep reforms in the system of public education. One such reform is aimed at improving the culture of speech of students. The correct formation of the child's speech is mainly traced in primary school, and when he or she goes to secondary school, the scan is improved. Speech is the kind of activity of a person, the functioning of his thinking on the basis of language tools. Speech acts as a function of interaction and communication, expressing one's own thoughts with emotion and influencing others. Well-developed speech is one of the important tools of an individual's active activity in society, and for a student, speech is a weapon of successful education in school. The child should be taught to speak fluent language from a psychic age. In order for the students' speech to be developed, it will be necessary to use the methods and methods that will help the teachers in their active possession of the pronunciation, vocabulary, syntactic construction and connecting speech of the learner. To teach the child from a young age to speak fluent language, to freely express the thought, using beautiful words in his speech. In the primary classes, along with the acquisition of theoretical and practical knowledge during all classes, students develop oral speech skills through correct formulation of sentences, rules of interaction, statement of thought, re-creative storytelling, and poem memorization. Speech cannot be distinguished from contemplation; speech develops on the basis of contemplation. Mother tongue lessons effectively help to enrich the children's dictionary, teach how to compose a speech. The reading lesson and the exercise conducted in connection with it will give the students' knowledge about the phenomena of nature, the life and labor of people. This lesson provides a wide range of opportunities for the reader's speech, its formation and cultivation. In other lessons in the elementary class, the students' speech is enriched with a variety of words. In the lessons of mathematics, children enrich their speech with new imagination and concepts, a lot of words and Terms, think logically. Students group their subjects that they see in the lessons of Natural Science and at the time of the exorcism with the help of the teacher, compare and say that they find different sides. These, in turn, allow us to clearly understand some concepts about nature, develop thinking, speech. In the lessons of Labor, fine arts, physical education, music, in addition to classes, classes also allow the reader to cultivate his speech and thinking. First of all, it is necessary that the teacher himself has an expressive impactful speech, while adhering to the norms of the literary language. The teacher himself needs to be an example for the child. Because, imitation in children is extremely strong. If in the primary classes the planned Organization of the growth of the pupils' speech is carried out regularly, then, as soon as the activities in this field are carried out, it becomes important in the smooth articulation of speech, affecting the whole body of the student, his emotions, imagination, will and character, finally, thinking activities and abilities. In this way, through the development of speech skills, the potential for correct speech and a clear, logical expression of thoughts is formed in them. Develops their creative activities and talents. In order for the teacher to grow the verbal skills of the students, it is necessary to strengthen their

vocabulary in all lessons by teaching them to actively use words in speech, according to a clear goal-oriented plan. Students cannot think clearly and fluently without having enough vocabulary. Each new word taught increases the vocabulary reserve of readers, the possibilities of expression of thought. Therefore, it is necessary to carry out continuous work with both students on mastering the word and its meanings. In this case, it is of particular importance to constantly evolutively integrate synonyms into the speech of the reader. Face Green compact round aft bluish small circle blue skinny teacher should not forget that the words are necessary elements of the text, absorbing the reader. From a series of special works specific to general speech on the preparation of students for oral statement, the right organized practical exercises should help the reader to improve his oral speech in the should especially be mastered by students. If it is difficult for them to understand the meaning of words, it is very important to use synonyms. The task of the teachers is to determine the number of statements and essays in the planning of speech development for academic quarters, as well as to determine the nature of oral and written works and their place in the system of writing sessions are intended to dressing skills in the field of written speech on the basis of the development of oral speech. When children perform oral exercises, the teacher gives instructions on the content, appearance of the statement (essay), helps to eliminate the inadmissible shortcomings technical means to the live speech of the teacher in modern school come to the aid.

After a content-based lesson, a discussion can be held for various reasons. The students may aim to arrive at a conclusion, share ideas about an event, or find solutions in their discussion groups. Before the discussion, it is essential that the purpose of the discussion activity is set by the teacher. In this way, the discussion points are relevant to this purpose, so that students do not spend their time chatting with each other about irrelevant things. For example, students can become involved in agree/disagree discussions. In this type of discussions, the teacher can form groups of students, preferably 4 or 5 in each group, and provide controversial sentences like “people learn best when they read vs. people learn best when they travel”. Then each group works on their topic for a given time period, and presents their opinions to the class. It is essential that the speaking should be equally divided among group members. At the end, the class decides on the winning group who defended the idea in the best way. This activity fosters critical thinking and quick decision making, and students learn how to express and justify themselves in polite ways while disagreeing with the others. For efficient group discussions, it is always better not to form large groups, because quiet students may avoid contributing in large groups. The group members can be either assigned by the teacher or the students may determine it by themselves, but groups should be rearranged in every discussion activity so that students can work with various people and learn to be open to different ideas. Lastly, in class or group discussions, whatever the aim is, the students should always be encouraged to ask questions, paraphrase ideas, express support, check for clarification, and so on.

ROLE PLAY

One other way of getting students to speak is role-playing. Students pretend they are in various social contexts and have a variety of social roles. In role-play activities, the teacher gives information to the learners such as who they are and what they think or feel.

Simulations are very similar to role-plays but what makes simulations different than role plays is that they are more elaborate. In simulations, students can bring items to the class to create a realistic environment. For instance, if a student is acting as a singer, she brings a microphone to

sing and so on. Role plays and simulations have many advantages. First, since they are entertaining, they motivate the students. Suggests, they increase the self-confidence of hesitant students, because in role play and simulation activities, they will have a different role and do not have to speak for themselves, which means they do not have to take the same responsibility.

ASYMMETRY OF FORM AND CONTENT OF A LEXEME IN UZBEK LANGUAGE

Isakova Yulduzhon Zokirovna*

*Teacher of the Chair of Primary Education,
Kokand State Pedagogical Institute
UZBEKISTAN

ABSTRACT

In this article, the different effects of a lexeme on a person, the information that people receive through the content of a lexeme, and the fact that the shape of some words in speech and their equality to several words (homonymous, polysemic–polysemous) or vice versa – several words are synonymous (synonymous), variant words, doublet words) are thought of various phenomena in linguistics.

KEYWORDS: *Lexeme, Semema, nomema, phrase, form, meaning, pragmatic meaning, homonym, synonym, polysemy, variant, doublet, neutral word, significant, denotation, subject, mind, word, thing.*

INTRODUCTION

It is difficult to give a concrete answer to the question of when linguistics developed as an independent subject. However, experts guess the early roots of linguistics to the 4th century BC. Despite the fact that linguistics as an independent science, is found in written sources in the X century BC, but it was fact that linguistics was founded by the Indian linguist Panini[1]. From the moment of the appearance of linguistics to the present day, the word is the most ancient and central, the most contradictory and rational and at the same time it is in the center of attention of linguists in the world.

The word, the essence of the word, the discovery of its semantic content continues in the views of modern linguists, starting with Aristotle's Poetics. In particular, the meaning of the word and its study in Uzbek linguistics has been conducted for a long time – Abu Nasr Farobi, Abu RaikhanBeruni, Abu Ali ibn Sino, Mahmud Kashgari, AlisherNavoi– although this study is an integral part and the direction of Uzbek linguistics was formed in the middle of the century [2].

With the advent of systemic-structural linguistics, it became necessary to approach the language as a whole system and to determine the status of its components – level units, as well as to define the lexeme as a unit of the lexical level. Lexeme (Greek Lexis-phrase, speech revolution) – a unit specific to the vocabulary of the language; lexical and semantic element of the linguistic structure [3]. Lexeme (glossema) and lexeme 1 A word, a structural element of a language, a type of word that differs from a part of speech or a unit of speech, manifests itself in the process of speech); analogy is ema. 2. A phrase is a whole. 3. Lexical morpheme [4].

A lexeme is a type of morpheme, ready for members of society, general, obligatory, consisting of a stable combination of form and content, forming something, a sign, a sign and a relationship in reality and including grammatical morphemes in speech and vocabulary [5].

A word is the smallest basic part of language (speech), used in various grammatical meanings and functions, which has its own sound shell, which can express the concept of objective things-events, the relationship between them or the relationship to them. A word is a basic element as a sound form in Phonetics; in lexicology as a lexical unit (lexeme); in morphology it can be the expression of different grammatical meanings and possession of forms expressing these meanings; in syntax word can be an object of study, since it serves as a material basis for constructing words and sentences. Lexical word, semantic word, morphological word [6]...

The definition of the essence of words and lexemes, their definition by their status attracted the attention of many linguists – A.Khodzhiev, M.Mirtozhiev, Sh.Rakhmatullaev, Sh.Shoabdurakhmanov, A.Nurmonov, Kh.Nematov, R.Rasulov and R.Safarov [7].

A lexeme is the basic unit of a language. It serves to denote the elements of the universe that surround us. A lexeme is not only a function of naming, but also a function of transferring our knowledge about the world to future generations (cumulative task), understanding (perceptual) and influencing the listener (expressive). This shows how adaptable the lexeme is.

It should also be noted that although the lexeme and the concept are in a dialectical relationship with each other, not every new concept can be expressed in a separate word. If we continued to apply a new word to each concept, the language would lose its communicative function, leading to some level of waste. A characteristic feature of the language is that it has the ability to express an infinite number of concepts using a series of units that can be stored in memory. Consequently, new concepts are mainly expressed using existing units based on that language model [8].

The terms word and lexeme have often been used interchangeably. But they are different. A lexeme is a whole, consisting of the relationship of a sememe and a nomeme, and their semantic content consists of the relationship of nouns, expressions and functional semaphores. Any lexeme definitely uses a "call" sememe from these semaphores. Therefore, this seme is the central seme of the lexeme, and the remaining seme is the boundary semaphore.

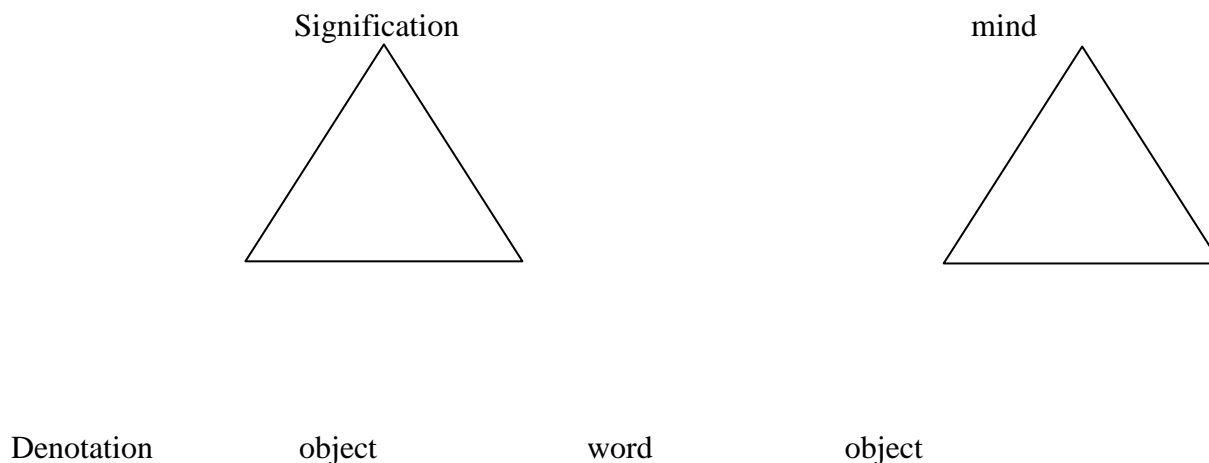

The word term also includes units other than lexemes, that is, units that do not have noun semantics. For example, it is true, for a word, not a lexeme. Because they don't have a semaphore. It only has grammatical meaning. Therefore, the word includes lexemes with grammatical meaning and units with auxiliary, prepositional, modal nouns.

A word is a sound or a set of sounds based on the expression of an existing or non-existent object, event, phenomenon, entity in objective world.

A word is an object of objective world, a unit of a lexical level according to the noun expression of an event; an object of objective being is a unit of a morphological level according to the grammatical meaning of an event. For example, the book source of the dictionary indicates its unit of the lexical level by the expression of the read, this indicates that this is a noun, a simple unit, a consonant, that is, the lexical meaning of a word is its unit of the lexical level, indicating the grammatical (morphological) meaning.

The grammatical meaning of a word is expressed using formal indicators. Lexical meaning (thing, event) is a direct or indirect perception in human consciousness and is associated with the general cognitive abilities of a person, mentality, culture, volume of thinking. Both formally and materially, the general meaning of the word is a product of personal thinking and it cannot exist in the language [9]. The issue of the "common meaning of a word" has been the subject of much debate and different discussions. The general meaning of the word is divided into denotative, connotative and pragmatic. Denotative meaning is a direct reflection of an objective being in a person's consciousness.

Figure 1

An objective being (the world around a person) is reflected in a person's consciousness with the help of certain signs (words). If there is no trace (code) of this sign in the mind of a person, it will not be possible to perceive it. For example, if the speaker speaks complete, the acoustic image (signification) reaches the listener's consciousness (signification), but the listener cannot return it to the object, because there is no trace (code) of the sign "completeness" in his mind. (In fact, this is a large pile that stumbles in the middle of a threshing floor for grinding whole grains, and a horse, donkey, or bull tied it in a circle, separating the crushed grain from the stem.) That's why A.Potebnya said that speaker gives not his opinion to the listener, he hints listener's opinion in his mind. Therefore, when the speaker says tulip, the listener understands tulip in his mind, not the speaker's tulip. Of course, there will be community in the thinking of the same nation.

Denotative meaning is out of any emotional expressiveness. The connotative meaning is the extra meaning and has an emotionally expressive color; the emotionally expressive color can be positive or negative. The connotative meaning is used as an extra function of the denotative meaning, which is its next level.

The face is the name of the parts of head where the eyebrows, eyes, nose, mouth, or the front of the head, or the place from the right ear to the left ear are located, the place where the hair extends from the chin is denotation. The synonymous forms of this designation are *reyuz*, *jamol*, *orazdiy dorturq*, *bashara*, *shikhtin* in Uzbek language. They are considered as a connotative meaning.

Pragmatic meaning is a social, practical meaning, a practical meaning invented by a nation to express gaps, unsatisfied aspects that have not been used for centuries, designations or connotations, socio-political, spiritual-cultural, geographical, religious-ethnographic, historical-literary and other aspects.

Facial mark forms such as *istara*, *farishta(li)*, *azroil (tukibor)* have a pragmatic meaning in Uzbek. The pragmatic form of a particular character in one nation may or may not be accepted in another nation.

For example, the pragmatic view of the Siberian peoples associated with snow may not exist among the Arab peoples. The pragmatic view of the Arab people about camels or deserts, the pragmatic view of the Japanese and Chinese people's about snakes and dragons, a pragmatic view of our cotton as national pride may not exist in other countries. This means that not all words may have a pragmatic meaning. Language is a sacred gift given to man by God.

Professor N. Makhmudov boldly declares that "man has been given a language for understanding man, the world, and God". Language is expressed in words. Man's mastery of the word, its use increases his ability to cognize the world. The simplification of the human way of life, the development of the first simple way of life (few number of objects and things) will undoubtedly be characterized by new words. On the other hand, the appearance of words lies in the goodness of the dialectic of form and meaning. As there is no sense without form, so there is no sense without form.

Form

Meaning

A form requires a meaning that is more consistent with a person's simple lifestyle in most cases, and this issue has caused a lot of controversy and controversy in the history of linguistics [10].

The development of world civilization required emotional changes at all levels of the language, including the lexical simplification of the dialectical integrity of the original form and meaning of a word in ancient times. Roman linguistics – $f \text{ (form)} = m \text{ (meaning)}$; $f < m$; $f > m$; $f \leftrightarrow m$; $f \leftrightarrow f$; $m \leftrightarrow m$ – this process has been the focus of linguists' attention since ancient times, and each period expressed its attitude to this linguistic phenomenon.

In studying the types of words in Uzbek linguistics according to the form and meaning, a number of linguists conducted serious research such as Ya.D. Pinkhasov, F. Kamol, A. Khodzhiev, M. Mirtozhiev, B. Isabekov, E. Begmatov, Sh. Rakhmatullaev, R. Shukurov, H. Nematov, R. Safarova, I. Kochkartoev and so on.

The primary aspect of the lexical meaning is the semantic aspect, the second aspect is the structural and functional aspect. While the semantic aspect focuses on the reflection of the universe, the second aspect involves the intra-systemic relationship of the lexeme. Some authors

use the terms *nomeme* for the form side and *sememe* for the content side, taking into account the unity of form and content in the *lexeme* [11].

When analyzing the semantic content of a word, O. Espersen states that the form is the primary aspect, then in the *onomosiological* method, the meaning is primary, *semasiological* method, the *onomosiological* aspect goes to $f-m$, and the *semizological* aspect goes to $m-f$ [12].

Words in the language are divided into synonyms, homonyms, antonyms, poronyms, variants, doublet words in accordance with the dialectic of form and meaning.

Summarizing the opinions of experts in this field, words that combine into a common meaning, distinguished by the subtlety of meaning, can be called synonyms.

Kulmoq, jilmaymoq, tabassumqilmoq, iljaymoq, tirjaymoq... (laugh, smile, beam, grin, smirk, *simper*) based on a common meaning expressing joy, words expressing sadness such *asyig'amoq, ingramoq, sixtamoq, bo'kirmoq, dodlamoq...* (Crying, moaning, squeezing, roaring, screaming) are a group of synonyms united by a common meaning and they differ in semantic brilliance. The central element of the group is the main word dominant, a neutral or moderate word which is out of emotional and expressive coloring.

Figure 2

A word in a synonymous group is divided into two: positive and negative emotional-expressive series according to their emotional-expressive features.

The owners of the speech situation – the speaker and the listener – basically choose the speaking word, emotionally expressive positive or negative for the purpose of the speech situation, and the speech goal is achieved.

The level of emotional expressiveness of a word depends on the abilities of the speaker. Emotionally expressive, mainly synonyms, polysemantic words (variants), variants, phonetic (lengthening, shortening, pairing, exchange of sounds), lexical (choice of words), morphemic (replacement of additional variants), syntactic (replacement of parts of speech) in the presence of doublets) method;

Emotional expressiveness is realized through synonyms, essentially synonyms of words, grammatical and situational synonyms. Word synonymous are like *yuz*, *bet*, *aft*, *bashara* or *chol*, *qariya*, *keksa*, *oqsoqol* grammatical synonyms are phonetic – *dedi*, *deydi* (*e-ei*), *tamosho*–*tomosha* (*o-a*), *ikki*–*ekki* (*i-e*), *morpheme*–*beaql*–*aqlsiz* (*be-*, *-siz*), *puldor*–*serpul* (*-dor*, *ser-*) and others. Even in the mentality, customs, rituals, taboos and euphemisms of a particular people, the speaker's emotionally expressive attitude to the idea expressed by him (died, bitten, fell asleep, died, enslaved, disappeared, flew away ...) is presented.

Morphological – a synonym for contracts with auxiliary organizations: *qalambilanyozdi*, *qalamdayozdi*; *ukasigaoldi*, *ukasiuchunoldi* and so on. The syntactical–*kattalarningbittasi*, *kattalardanbittasi*; *bo'shvaqtlarkitobo'qirdi*, *bo'shvaqtlardakitobo'qirdi*; *mehmonlarkeldi*, *mehmonlarkelyapti*; *bushubhasiz*, (*so'zsiz*, *tabiiy*) *bizningyutug'imiz* or asparadigm of speech [13] and so on.

Semantics is the expression of such meanings as affirmation-negation, positive-negative: *Khandalagitushmagur*, *Khandalagitushgur*, *bo'yiyetganyigitlarbordemaysizmi?* *Yaxshigapirdi* (in the sense of bad speech) – *Yomongapirdi* (in the sense of good speech), *Dahshatgapirdi* (in the sense of good speech) – *yaxshiginagapirdi* (in the sense of negative speech); *Hazillashyapsiz!*, *Hazillashyapsizmi?* (Past tense, present tense, future tense) and so on;

The difference between two words belonging to the same language in meaning and style is called a variant (variant word). For example, *kabutar* – *kaptar*, *nabira*–*nevara* [14].

Variant words are the norm of the literary language regardless of their style and their positive or negative meaning. One variant of variant units of a word, variant of a morpheme (allomorph - *dek*, *-day*, *-gi*, *-ki*, *-qi*), variant of stem, and so on;

Doublet (<fr. Doublet <double – binary) words are two words or two units belonging to two languages with the same semantic structure. *Talaba*– *student*, *lingvist* – *tilchi*, *tilchi* – *tilshunos* and others. Doublet words can vary depending on their mutual use. Novelty, scientific character, differs in originality and can express the speaker's individual attitude – value [15].

So, when we evaluate a lexeme as a unit of language, we see that it has a certain form and aspect of content. But in lexemes, form and content do not always coincide.

In many cases, as it is shown above, one form itself can have multiple meanings, or, conversely, one content can be represented by multiple forms. The following examples and events can be considered as examples of the following opinions of our linguists: “The reason for the disparity of form and content in a language is that the essence of linguistic symbols (units) is not simply associated with the combination of form and content” [16].

MODERN UZBEK POEMS.

Azimova Dildora Bahridinovna*

Doctor of Philosophy (PhD) Philological Sciences,
National University of UZBEKISTAN

ABSTRACT

The article is about the modern Uzbek poem is a completely new phenomenon that has absorbed the features of the epic, classical written dastan and poems mastered from European literature, and as a novel is an "emerging genre". In the poem, in addition to the plastic depiction of reality, non-plastic elements, such as the author's emotional attitude to reality, his reflections, acquire special significance. The phenomenon of "romanization" taking place in modern poems proves that this genre continues to form. Evaluation of the poem from the point of view of the poetics of artistic modality, taking into account the state of decanonization of the genre shows how great its possibilities as a genre are. The process of romanization, taking place in the structure of the poems, shows that in them the hero has lost his status as an epic hero, and instead of him a person, a personality, has come to the center of the image.

KEYWORDS: *Modern uzbek poem, Composition, structure, Evaluation of the poem, elements of the topic, Folktales, Aesthetic ideal, the idea of freedom.*

INTRODUCTION

The term poem in uzbek literature is used to refer to the concepts of epic, classical written dastan and poem in modern form. This can be expressed as follows:

As you can see, the new Uzbek poem is a completely new phenomenon that incorporates the features of all three types of poems, and, like a novel, a "forming" (M. Bakhtin) genre. And this proves that the poem has great potential as a genre. This paragraph also expresses the attitude

towards the ideas that the poem belongs to the lyric-epic genus, which have been established in our literary criticism for many years. We relied on scientific statements that, due to its genre features, the poem can belong to the lyric, epic, dramatic and lyro-epic genus.¹ It is pointed out that the best way to determine the genre of a poem is to trace which element in its structure is the leading one. It is also noted in this paragraph that the reality (object) reflected in the poem is depicted by the lyrical subject (poet), that in the poem, along with the depiction of reality, the artist also has the opportunity to express his own attitude towards it, that the author's point of view and his attitude to reality is manifested through his emotional experiences that the poem provides very great opportunities for lyrical reflection.

It is commented on why the method of epic depiction in modern poems differs from that in the epic and written dastans. The question of whether the transformation of an epic image by a lyrical subject into an object of lyrical reflection can limit the method of representation has been comprehensively investigated.

It is known that along with the string of experiences of the lyrical character, meaningful pictures of reality entered our poetry. The phenomena of social reality, full of meaning, began to live in close connection with the experiences of the lyric hero ... the synthesis of elements of lyric expression and epic images were aimed at the poetic development of specific manifestations of the processes of reality". This circumstance expanded the pictorial possibilities of literature, including poems. Realistic elements began to appear in the structure of the poem, in reflecting the complexities of the inner spiritual world of the heroes, in highlighting social problems important for the era and personality. The social assessment of society and human life in poems has increased the capabilities of this genre to a new level.

In Aybek's poem "Davrimjarohati" (The wound of my time), a deep perception of reality, the poet's transformation into his own pain, ensured the success of the poem. The experiences and reflections of the lyrical subject-hero born as a result of the tragedy constitute the basis of the work. The deep lyricism of the poem nowhere turns into a dry presentation. And in the poems of E. Vakhidov "RuhlarIsyoni" (Rebel of the spirits) and A. Aripov "The Road to Paradise", in addition to expressing sympathy for the hero, the author has a need for self-expression, a need to express his word about time and man. The story of the Bengali poet Nazrul Islam ("Rebel of the spirits") was for the poet also a means of reflecting his spiritual world, his experiences, a means of reflecting the surrounding reality. As a result, the poem "Rebel of the spirits" was created in the form and sound we know. Since E. Vakhidov felt the need to convey to the reader the truth he was aware of that reality does not correspond to the high ideals that the existing system and the ruling party had introduced into the minds of people.

The tragedy of Nazrul Islam gave the poet the opportunity to interpret the state of the society in which he himself lived. In the image of Nazrul, the high aspirations of a creative personality were expressed.

Despite the fact that the event depicted in the poem is the experience of Nazrul Islam, the perceived reality is completely different. Nazrul Islam served as an object of artistic reflection for the poet.

May my body be a prison cell?

In my soul – freedom;
 I am not a slave from birth;
 Slavery is alien to my soul;
 The will to freedom with milk;
 Was absorbed into my blood;

In the poem, in some places, a realistic interpretation is expressed in close connection with artistic conventions. For example, in the poem “Rebel of the spirits”, parallel to the depiction of reality, rivayats (narratives) and legends are given that contribute to the expression of the poet's artistic intention, and the author translates pictures into them that cannot be contained in reality. And in A. Aripov's poem “Jannatgayo‘l” (“The Road to Paradise”), the events are spatially transferred to another world, but the problems are directly related to the real state of society.

Fraudsters, scoundrels, scammers, schemers are realistic types of the place and time in which the poet lives. This conditional element, used by the author, helped him to reveal the main concept of the work.

In Mirmemir's poem “Surat” (Portrait), which reflected the truth of life, aspirations and aspirations of the hero of the time, his tragedy, the subtle features of his spiritual world, the possibilities of realism were even more widely manifested. In the work, an incredibly strong psychologism, the spiritual image of the hero is conveyed through internal monologues and lyrical digressions. Toshlon at the same time loves Oysuluv with all his being and hates her. The hyperbolized manifestation of this property of ambivalence in the spiritual structure of the hero makes it possible to assert the tragic nature of the hero's state and at the same time ensures his vitality.

The novelization of the poem includes such concepts as the decanonization of the genre (non-canonical genres), proseization, and the transition of poetry to prose (poemin prose). For the first time it was used by the Russian literary critic M. Bakhtin in his work “Epos and Novel”. Other sources also draw attention to this problem.

In the era of the poetics of artistic modality³, the genre system underwent significant changes. Several characteristics characteristic of genres are noticeable in them. This was not “genre atrophy”, but rather a blurring of genre boundaries. Genres that were previously created on the basis of well-known canons, today gave the author freedom of creativity. Since in the poetics of artistic modality, artistic integrity is determined in relation not to the genre, but to the work Artists now stopped thinking in terms of the genre, and began to strive for a broader and deeper depiction of life. The process of romanization in the poem shows that our artistic thinking is going through a kind of renewal process. We must not forget that one of the theoretical misunderstandings arising from ignoring the breaking of genre canons is the opinion that the poem belongs to the lyric-epic genre, which has been entrenched in our literary criticism for many years. According to Bakhtin, the romanization of other genres provides them with a freer and more flexible expression. Signs of romanization can be traced in the following situations:

1. Latent manifestation of epic coverage in lyric poems and the transformation of the lyric “I” into the main character of the poem. In Zulfiya's poem “Xotiramsiniqlari” (Fragments of memory), the lyrical subject - the author (in this poem, these two concepts coincide), using the

example of the tragedy that befell her family, depicts the true face of the totalitarian system that ruled for more than seventy years, its tragedy.

2. The romanization of a lyroepic poem is usually associated with the fact that its hero loses his epic-heroic status and becomes a private person. Undoubtedly, this is due to the fact that the literature of that time was sociologized. In this regard, Nazrullslom, the protagonist of ErkinVakhidov's poem "RuhlarIsyoni" ("Rebel of the spirits"), is a private person, a person. Heroes of the folk epic or classical written dastans, even in the most severe moments, demonstrate examples of courage and bravery. In modern poems, a hero who has turned into a person should not have this.

Firstly, this is hindered by a realistic interpretation, and secondly, the person who replaced the epic hero as a result of the novelization of the poem and who took the central place in the work differs from the person who was the product of artistic thinking, aspirations and aspirations of the people of the past hero, who can easily overcome any obstacles, and do not burn in the fire, and do not drown in water. This is a person who is just beginning to realize himself in public life (or cannot realize himself), is just beginning to realize himself as a person and in relations with the external environment and people is experiencing various dramatic and tragic states.

Together with its strengths, its weaknesses, as well as states of spiritual crisis, can serve as an object for today's poems. In addition, if epic heroes on the way to achieve their goal receive strength from the outside, then in modern poems, the personality extracts strength for understanding oneself and the world from within itself. The hero of a modern poem remembers his heroic past, since the poem retains its epic foundations. This state coincides with the opinion that the genre "always remembers his past" (M. Bakhtin). This is considered on the example of motives characteristic of the folk epic and found in new Uzbek poems.

In modern poems, there is a hierarchy of author and hero. Here the compatibility of the spiritual state of the author and the hero is manifested. A similar compatibility is observed in Toshlon and Mirtemir in the poem "Surat" ("Portrait"), in the young man of the poet from "Jannatgayul" (The Road to Paradise) and Abdulla Aripov, in Nazrullslom from "Rebel of the spirits" and ErkinVakhidov.

ABSTRACT

The choice of this paper was based on the fact that prior to establishment of economic recovery and growth plan which was considered as a panacea to Nigeria economic problems, several development plans have been implemented by the federal government in the past to stabilize the economy. Based on the Keynesian Economic Stimulus theory, the paper matched acclaimed achievements of government Economic Recovery and Growth Plan with the 2020 budget as basis for considering the possibility of achieving targeted terminal objectives of the development plan. The paper discovered that increase in megawatts generation from the power sector is not sustainable. Huge amount in the 2020 budget was to be borrowed and more for debt services while meager mount was earmarked for infrastructure which cannot be translated into welfare provision. It was further discovered that there was intended increase in tax which will stiffen business operations and cause infant businesses to close shops. The paper suggested that there should be continuity in project execution by successive governments to avoid a break in on-going developmental projects and recorded achievements. Every development plan should be based on home environment because of existing culture and climate rather than being initiated by World Bank. Certain key sectors of the economy should be favored in budgetary allocations to encourage diversification of the nation's productive base and revenue generation other than crude oil.

KEYWORDS: *Economic Growth, Recovery Plan, Contemporary Issue.*

INTRODUCTION

The negative signs of macroeconomic indices arising from Nigeria's deep recession in 2016 and the need to restore economic growth through the development of median term plan led to the creation of recovery and Growth plan 2017–2020. It has a robust framework of galvanizing the economy towards ensuring steady growth of Gross Domestic Product (GDP) growth. The strategic economic recovery and growth plans were built on the past development rolling plans to achieved set economic blue-print in 2020. The action of government was based on the fact that the economy was in real danger. While the activities of banks as the custodian of people's future to secure available funds were no longer promising, the private sector operators were also not capturing the reality of government mandates to banks concerning sustained food supply.

Nigeria Economic Recovery and Growth Plan (ERGP) focused on core priority sectors of the economy routed in agriculture, manufacturing, solid mineral, services, construction and real estate, oil and gas, industry and trade policy, and power to achieve its objectives. These priority sectors are possible focus areas. The strategy is to achieve predetermined objectives. The focus on agriculture is to institute bold agricultural business to enhance productivity and encourage private sector investment through access to finance with a view to increasing the agricultural earnings to N21.0trn by 2020 under an annual growth rate of 6.92 per cent from 2017 to 2020 (Uwaleke 2017).

Manufacturing is another focus of Nigeria ERGP. Improving the performance of the manufacturing sector is intended to project Nigeria into competing with other countries such as Morocco, South Africa, Mexico, Indonesia and others. Revitalizing the manufacturing sector is further intended to remove Nigeria from being a dumping ground for goods. The idea is to build on existing Nigeria Industrial Revolution Plan (NIRP) in accelerating manufacturing capacity of Nigeria through agricultural business and agro-allied, metal and solid mineral, oil and gas related industries and construction, light manufacturing, increase Research and Development (R&D), enhance capacity of Nigerians, increase employment and foreign exchange earnings. According to Ukah (2017), solid mineral was projected to grow at an annual average rate of 8.55 per cent to facilitate coal production and integrate the miners into an artisanal formal sector at the same time encourage mineral processing. The essence is to strengthen the forward and backward linkages. Under the services, GDP is expected to growth through telecommunication, financial services, tourism and creative industry. Telecommunication and Information Communication Technology (ICT) penetrate the global economy. The service sector was to further focus on increasing film production, intellectual property improvement and encourages patronage of local agriculture. The growth of domestic product in the construction and real estate was to be actualized through strategic planning targeted at financing the construction industry and vocational and technical craft trainings such as carpenters, mason, electricians and others, using the local industry.

Cursory look at oil and gas industry revealed that activities in the upstream sector have to be increased to enable GDP growth in that sector. This is achievable by improving the business environment that drives investment in downstream, midstream and upstream. Pertinent to actualization of ERGP objectives would also require revisiting the existing policy regulation in the oil and gas sector, ensure increase in the production capacity of the local refineries and initiate transparency in management performance (Oseni & Oseni, 2015). Another major strategy

is a focus on the industrial and trade policy which has to be reviewed with a view to redefining government roles in promoting trade relations and at the same time enforce export expansion grants. The gain of the expansion is to encourage fair competitions and discourage unfair business collusions and encourage fairness in the export sector, domestic sourcing, incentive funding of exports and others. The power sector in this regard is to facilitate access to electricity, restore viable financial market, encourage private sector participation in the power generation investment and remove power infrastructure and gas sabotage.

STATEMENT OF PROBLEM

Prior to the establishment of Economic Recovery Growth Plan in 2017, the economy was said to have experienced high rate of inflation, such that the GDP growth rate was negative at -0.36% and further deepened to -1.5% the same year. Production of oil fell from 1.86mb/d to 1.47mb/d between 2015 and 2016 with the inflation rate raised from 10.86% to 18.55% in 2016. Inflation remained at 15.2% in 2017 despite all federal government efforts (FGN, 2017 cited in Kyarem & Ogwuche 2017). Fluctuation in the power sector showed that Nigerians were sleeping in darkness with huge amounts spent in running small and medium scale industries even when power generation was said to have increased from 3000MWs to 5000MWs (MBMP 2019). Following these recounted scenarios, a four year economic recovery and growth plan was established in 2017 with increased budgetary allocation to various sectors of the economy to reduce the upsurge in unemployment, unrealizable GDP growth targets, increase output of goods and services and foreign exchange earnings. Questions raised are; “is economic recovery and growth plan 2017-2020 achievable under the above situations”. Without increase in the production of goods and services, how realizable is Nigeria’s economic recovery and growth plan? It is in the light of the foregoing that this paper will assess how realizable are the targeted objective of Nigeria economic recovery and growth plan 2017 to 2020.

Considering the fact that performance of Nigeria ERGP is evaluated annually, the aim of this paper is to assess Nigeria’s four year economic recovery and growth plan from 2017 to 2020. Specifically, the paper seeks to; identify the nature of Nigeria recovery and growth plan, and assess the extent of achievements of the recovery and growth plan.

The paper is organized in sections; the first section introduced the work, followed by the second section which took a look at the various concepts that aid better understanding of the work. The third section presented the theory guiding the work and a cursory look at related scholarly studies relating to the issue been discussed. Achievements of the ERGP and criticism of the achievements were presented. This was followed by the position of this paper on acclaimed achievements. The final section concluded the work and made recommendations.

LITERATURE REVIEW

Conceptual Clarification

Economic Recovery and Growth Plan (ERGP):

This is a four year plan explained thought budget projections as a development plan in areas that border on economic progress with a view to getting the economy out of recession and driving it to sustained growth. The essence was also to return the economy back from negative indices reflected in all the economic sectors. Though a medium term development plan, it is likened to previous development plans. Its projections using the budget make it clearer to understand.

According to Deloitte (2018), Economic Recovery and Growth Plan (ERGP) is a growth restoring agent aimed at investing in the people towards building an economy that will be globally competitive. Assessment of its performance began the following year since it was designed to annually turn in results based on the objectives. The cardinal objectives focused on; stabilization of the macro environment, sustained agricultural and food productivity, improving transportation infrastructure, petroleum product and energy sufficiency in power, industrialization drive based on Small and Medium Enterprises (SMEs).

Economic Growth:

This is a sustainable increase in goods and services production over a specified period. It increases profit for producers causing increase in prices of stock which in turn creates need for more labor employment and consequent investment. The creation of more jobs results to rise in income while consumers part with more money in the purchase of goods and services; In return, higher purchases result to economic growth. Economic growth can be measured through certain indicators not limited to increase in interest rate, wage rise, stable inflation, increased productivity and others (Oseni & Oseni 2015).

Contemporary Issue:

Contemporary issue could be seen as any idea, opinion, event, title or relevant topic of discussion on matters of interest. Contemporary issues are found in current live activities or subject of interest. Current contemporary issues shape the society and act as a unifying factor especially when it involves people with like mind or culture. It shapes intellectual ability in suggestions on societal issues.

Brief Review of Nigeria's Past Development Rolling Plans:

The idea of economic development plan was first conceived in 1946 by the colonial masters in 1946 under the welfare Act. This plan which lasted till 1956 (ten years), focused on infrastructural provisions and industrial development. Agricultural inclusiveness of the plan was limited to cocoa, palm produce, groundnut, timber log and cotton. Since after the independence, Nigeria had adopted various long and short term development plans in addition to other ad hoc measures to better her economy. According to Uche (2019), few years after the independence, the issue of development plan began with the "First National Development Plan (1962 - 1968); the Second National Development Plan (1970 - 1974); the Third National Development Plan (1975 - 1980) and the Fourth National Development Plan (1981 - 1985), the Fifth National Development plan did not see the light of the day before it was replaced by the newly adopted method of planning – the perspective plans, the Structural Adjustment Program (1986 - 1990)". All these economic curative approaches have given way to one another due to failure to achieve targeted objectives.

After the first development plan, there was a switch to seven year national post-independence plan, 1962 in June which projected N2,132m for total investment expenditure, of which private investment expenditure gulped N780m representing 4 per cent of the amount ear-marked for investment. By the end of the plan period, there was an annual growth rate of 5% achievement.

The economy was devastated immediately after the war which prompted the kick starting of the 2nd development plan in 1970 to last till 1974. It was targeted at socio-economic development. General objective of the 2nd development plan was to build; a self-reliant, strong and united

nation and just society, a society with full and equal opportunities for her citizens and a democratic society. The set target was based on investment sector budgetary allocation of N4.00bn for capital investment with N3.3bn earmarked for private sector investment. In the end, average growth rate of 11 per cent per annum was indicated.

The period 1975 – 1980 was for 3rd national development plan. The public sector budget was N43.3bn showing a tremendous increase when compared to 2nd nation plan budget for capital investment while the private sector investment budget gulped N24bn. The five specific objectives were holistically modified to; reduce unemployment, balance development, indigenize economic activities, increase income per capita, expand high level manpower supply and diversify the economy

The elected democratic government in 1980 designed the 4th development plan which ran from 1981 to 1985. Budgetary allocation for capital expenditures was N83bn with more than seven objectives. Though bogus, the specific objectives similar to the 3rd plan program targeted at; development of technology, greater output of goods and services, greater self-reliance, development of good attitude to work with national orientation and discipline; Oil market collapse frustrated achievement of the plan target due to drop in production from estimated 2.3m b/d to 1.3m b/d. Oil price fell from \$30 per barrel contrary to estimated \$40 p/b. These challenges led to abandonment of infrastructural projects nationwide.

Following the biting economic recession, development plans were abandoned for Structural Adjustment Program (SAP) designed to cover 1986 to 1988 which was later extended to 1990. Adverse economic situations that prompted the creation of SAP include; increasing external debt service as a result of huge indebtedness, repetitive fiscal deficit, balance of payment account deficit and too many uncompleted projects. The impossibility of realizing these set objectives of each plan has created the need to change the plan periods to 10 year development plan. The situation was aggravated as a result huge drop in oil revenue receipt (Ukah 2017). It is pertinent to state that this economic diversification program is yet to achieve its objective as the economy is now in what can be termed chronic recession.

THEORETICAL FRAMEWORK

This paper is predicated on Keynesian economic stimulus theory which conceptualized that total influence on total spending or aggregate demand results to an equivalent influence on total output of the economy more especially during recession. The fact is that in state of prolonged macro-economic recession, intervention of the government would result to economic growth, increase aggregate demand, employment and correct all negative macro-economic indicators in the economy (Kyarem & Ogwuche 2017).

The stimulating factors that are expected to put economy back to equilibrium is known as Keynesian Stimulus. This is as a result of government deliberate policies capable of boosting the output of goods and services, income and employment to increase aggregate demand thereby moving the economy out of recession. This theory explains recession in the economy to mean when the economy is in a comatose state with increasing unemployment and low output. This situation could be likened to the period 2015 to 2016 when Nigeria economy witnessed its worst form of recession with sustained negative growth rate. All the economic sectors in Nigeria experienced retarded growth with job losses (NBS, 2017).

Adopting Keynesian Economic Stimulus, government increasing expenditure, tax reduction can be used to boost investment and production of goods and services which invariably will result to higher production of goods and services, increase in income per capita through reduction in taxes, increased borrowing and spending, reduce unemployment, control inflation and generate increase in aggregate demand. Negative indices experienced in Nigeria economy makes Keynesian stimulus relevant to recover the economy from recession and increase growth.

EMPIRICAL REVIEW

Several studies have been conducted on Nigeria economic recovery and growth plan (Oseni & Oseni 2015: Kyarem & Ogwuche, 2017: Adekunle & Alokpa 2018). The work of Ukah (2017) opened more discussions on this in his study on national rolling plan performance appraisal using content analysis based on publications related to short and medium term development plans of the federal government. The paper crosschecked the performances of various federal government development plans in the 90s to find their impact on the economy especially the financial sector and discovered that there was little positive impact in the economy despite the oil sector instability. The paper further found that there were challenges of transforming the plan projections to reality and suggested that release of capital should be timely to ensure that plans are matched with targets.

Kyarem and Ogwuche (2017), worked on tackling the down risk of Nigeria macro economy through the economic recovery plan. Standing on the Keynesian stimulus theory, they adopted retrospective and retrospective diary design fused in deductive and inductive approach to find how the recovery and growth plan accelerated economy repositioning. The study observed that political problems, militancy confrontations in the Niger Delta, inconsistency in government policies were instrumental to non-realization of recovery and growth plan objectives for the period. It was suggested that agriculture should be one of the focus of the economic restructuring if over-reliance on oil must be over looked. There must be periodic appraisal of the economic and growth plans to understand the possibility or how non achievable it would be.

In another study, Uche (2019) identified alternatives to impediments bedeviling the development policies and plans in Nigeria since her independence. Utilizing sources, identified militancy in both Niger Delta and North-East, inconsistency and summersaults in government policies, absence of implementation will external interferences and corruption as constraints. The paper suggested for continuity in government projects rather than duplication. Projects must be designed based on home environment and not based on external initiatives.

Economic Recovery and Growth Plan 2017 to 2020 was appraisal by Adekunle & Alokpa (2018), following non achievement of past plans. Content analysis was adopted in the study to identify areas of achievement such as growth restoration, positioning the economy towards competitively global economy and people oriented investment. It suggested for enactment of an Act to guide the implementation of ERGP and speedy passage of the Petroleum Industry bill to enforce reduction of importation of petroleum products.

Kyarem and Abdulsalam (2018), worked on risk optimization through economic recovery and growth plan, adopting “qualitative optimization” research design to minimize the downside risk; militancy in the oil producing Niger Delta and maximize the upside risks; oil price fluctuation and restoration of peace in the regions. The paper recommended for legalization of ERGP

evaluation and monitoring committee and Directorate for the implementation of ERGP should comprise of government executive arm.

A matter arising on nation building, economic recovery and growth plan was studied by Inoykwe (2018). Deductive inferences were adopted in analyzing the primary and secondary variables. The study revealed that realization of the ERGP objective is a function of government's good will to holistically implement the plan in the midst of mass corruption in the country. It was further discovered that there is the possibility that interest of political class may undermine the achievements of Nigeria Economic Recovery and Growth Plan. It was recommended that government should provide a checklist to assess progress made by the development plan.

Inusa, Daniel, Dayagal and Chiya (2018) studied Nigeria's adoption of agriculture as a means for achieving economic growth plan. Ordinary Least Square regression was utilized for the data analysis. The study revealed that GDP components, total savings, exchange rate, loan and advances and agricultural output are positively related. It was suggested that the application of monetary policy and moral suasion should be applied and that there is the need for government to provide improved agricultural seedlings.

STUDY METHODOLOGY

Methodology adopted for this study is the introspective and retrospective diary design as used by Kyarem & Ogwuche (2017). This design reflects on an individual's feelings, thoughts motives and reasoning processes with intention to ascertain how these processes and statements influence the way issues are decided. Introspect and retrospective reasoning was complimented in this approach. According to Prague, (2005), studies involving diary highlights normally hidden issues that largely are inaccessible in retrospect, hence the application of both deductive and inductive diary to arrive at conclusion. Relating the forgoing to the topic under discussion, Economic Recovery and Growth Plan (ERGP) express government thought about the economy hence its suitability for this study.

Achievements of Economic Recovery and Growth Plan for the Past Three Years:

There have been claims of positive signs of economic improvements as stated by Nigerian Bureau of Statistics (2017) since the Economic Recovery and Growth Plan was launched. It was stated that the economy showed an annual growth rate of 0.83% which was higher by 2.42% when compared to 2016. The 2017 record showed that the achievement was driven by the non-oil sector contribution which showed annual contribution of 89.96%. According to Dipeolu (2018) cited in Adekunle (2018), GDP figures showed 4.23% as consolidated growth in industry and agriculture which accounted for 25% GDP growth recorded for the year.

Another sign of positive record is the inflation rate measured by the consumer price index which dropped from its original figure of 15.37 per cent in January 2018 to 15.13 per cent, representing 0.24% drop in December, 2018.

Sectorial contribution in revenue through VAT was N250.56b in the fourth quarter as against N254.10b in the first quarter of 2017, indicating a difference of 3.54%. The custom's import service generated N53.57bn out of a total revenue of N1.01trn. The assumption is that such a trend from all revenue generating sectors would help the ERGP to meet its set target by 2020. In inflation, as recorded by NBS, 2017, a little progress was observed with steady drop.

Arguments Against the achievements of Economic Recovery and Growth Plan (ERGP) 2017 – 2020;

Based on the performance and execution principles of ERGP as portrayed by Deloitte, this paper makes the following arguments;

1. Stabilization of the macro environment:

The efficiency in the tax system cannot be achieved with the proposed increase in tax to 2.5 per cent as proposed in the 2020 budget.

It is wrong for the government to target increase in revenue through taxation, mostly in an environment where social welfare is zero.

The fall of naira value between N360 to N365 as at the time of Deloitte assessment portends bleak future for importers as no business venture sells below cost price. The higher the exchange rate, the higher will the price of the goods be in the domestic market.

Sustaining stable economy is only possible where there is steady drop in the rate of inflation and interest rate. There are no facts to show that inflation maintained a steady drop in 2018 for 4 consecutive quarters.

Deloitte's reliance on 4 consecutive months negate the economic principle and against the targeted execution principles of ERGP.

2. Achieve Agriculture and Food Security:

Using rice farmers to represent agricultural funding is not holistic as rice is not the only farm produce Nigerians plant. More contradiction is observed on the contributions of agriculture as non-oil revenue.

Agricultural contribution should have been said to involve only earnings from rice production.

Out of N118.98 billion budgeted for agriculture in 2018, only N55b was disbursed and 80 per cent of the disbursed amount went to rice farmers.

It raises the question of "which sector was the balance of N63.98b budget disbursed to?"

3. Ensure Energy Sufficiency in Power and Petroleum Products:

Crude oil production was 1.7m bpd in 2017, 1.8m bpd in 2018. But was lower with 2.3m bpd in 2019 The 2020 crude oil production figure was mere pegging for budget purposes therefore may not be realistic as previous years did not show significant confirmation of estimations.

The power sector was said to have increased from 3000MW to 5,222.3MW and 5,000 MW while targeting 9000 megawatts in 2020.

Why do Nigerians still sleep in darkness with huge amounts being spent on fuel and diesel to run small and medium scale industries?

4. Improve Transportation Infrastructure:

There was improvement in infrastructural provisions with good road networks.

Transportation infrastructure is in a dire bad shape ranging from air ports, road network. Infrastructural provision has not shown improvement. The rail road's and the water ways are not good enough for express and fast delivering of goods and services.

5. Industrialization derive, focusing on SMEs:

Industrialization is driving by available credit financing, power, infrastructure and government policies. Enabling business environment ensures return on investment. The difficulties in industrial sector is attributed to steady power supply, low interest rate, good road network, available and low priced raw materials and others.

These are opposite to what can be found as motivating factor to industrialization of small and medium enterprises and averse to accomplishing ERGP objective by 2020.

POSITION OF THE PAPER

In considering the possibility of achieving the Economic Recovery and Growth Plan 2017 – 2020 set target, one would first resolve the following questions; what has happened to poverty, inequality, inflation, unemployment, foreign exchange rate, food prices and power generation? How far has federal government resolved these burning issues through ERGP?

Again, looking at salient loopholes in the 2020 budget revealed that over N2.3trn is to be borrowed, over N2.4trn is for debt servicing. Only N3.0tr was provided for infrastructural provision. This explains that in the 2020 budget of N11trn, about N4.5trn does not exist neither is it revenue. And about N2.5 per cent as proposed increase in tax (from 5 per cent to 7.5 per cent Value Added Tax (VAT) effective from 1st of March 2020)

The power sector was said to have increased from 3000Mw to 5,000 MW but Nigerians still sleep in darkness with huge amounts spent on gasoline in running small and medium scale industries

The issue of federal government achieving her targeted policy objective of stabilizing the macro environment, sustaining agricultural and food productivity, improving transportation infrastructure, petroleum product and energy sufficiency in power, industrialization drive based on Small and Medium Enterprises (SMEs) as provided in the ERGP 2017 – 2020 framework remains unresolved. It is therefore, obvious that Nigeria Economic Recovery and Growth Plan 2019 - 2020 cannot achieve its projected objectives.

CONCLUSION AND RECOMMENDATIONS

Establishment of Economic Recovery and Growth Plan as a result of recession that plagued Nigeria economy was a good effort by the federal government. This paper used the assessment of ERGP performance in 2018, 2019 and 2020 budget in predicting the possibility of achieving ERGP targeted objectives in 2020. Its components of achievement were usually showcased in budgetary allocations. Recorded achievements revealed impacts so far made through which this paper based its arguments. From heralded shortfalls of ERGP and existing loopholes in the 2020 budget, this paper concludes that ERGP targets are not achievable by the year 2020 hence the following suggestions; There should be continuity in project execution by successive governments to avoid a break in on-going projects and achievable objectives. Every development

plan should be based on home environment rather than being adopted from World Bank initiated program. The reason is that not every project is realizable due to our climate and culture. Every development plan must not be initiated by World Bank. More budgetary allocations should favour key sectors and areas of the economy such as agriculture, industries, and infrastructure to encourage diversification of the economy and revenue sources.

ABSTRACT

Currently almost all non-english speaking countries are opt for learning and teaching the English language not solely primary schools but also higher education in order to keep in harmony with the outside world as this language has been dominant in virtually the whole globe for many years. Therefore, teaching English in Uzbekistan has been experiencing various changes in the last few decades. That's why most educational institutions need certain approaches and methods to teach English normally throughout the world. Having said that, it is not a secret that some kind of these institutions have been coming across some difficulties in either choosing the correct approaches or how to implement them during the lessons. This article will cover why these challenges may occur while teaching in EFL classes. To gather enough data, multi-methodological approach of quantitative survey and qualitative interview are used and some challenges are revealed that rural EFL teachers have encountered when implementing CLT in their classrooms. These include students' lack of cognitive resources, the rural setting because of geographical and socio-economic constraints and lack of skilled teachers.

KEYWORDS: *Communicative Language Teaching (CLT), Multi-Methodological Approach, Communicative Competence, Implementation, Survey, Qualitative Interview, Challenges.*

INTRODUCTION

It's not a secret that throughout centuries almost all countries have been using a wide variety of approaches to learn or to teach a particular language for certain purposes. In fact, humankind tried to use some methods like direct, audio-lingual, grammar-translation, cognitive, reading and communicative approach at some stages of life. At first, communicative language teaching approach seems to help learners use a language for meaningful communication, connect people together, love other nations and cultures with a good use of reading, writing, listening and speaking skills in authentic materials or role-playing since it first emerged in the second half of the twentieth century. "To catch up with the fast growing global economy, and increase in the number of effective English-communication learners, including many Asian countries, with the recognition of the English language as an international communication tool, have reformed their English education within the past two decades" (Littlewood, 2007). To implement this approach effectively also, in our country, there have been demand for enough skilled teachers: "Admittedly, while learning a foreign language, teachers physical existence plays an important role to make sure that students are learning properly" (R. Ne'matov, 2020, 76p).

In spite of these attempts, it's known that there's a major problem with lack of skilled teachers in Uzbekistan. New English teaching techniques aiming at "teaching English for effective and appropriate communication" have been adopted by the government. Since then, the English language has been used as a foreign language at schools and communicative approach has been used as the main technique of teaching which is led by non-native English teachers. Actually, the CLT movement started here at the beginning of twenty first century, educational movements highlighting 'practical English' were generated to increase learners' oral communication ability in order to help students feel themselves the functional users rather than knowledge accumulators of English. But still, there are some challenges that are waiting for being overcome: the most visible problem is lack of experienced teachers, as mentioned above and less interest in language by pupils. This is partly due to geographical and socio-economic confinement because as can be clearly seen that state-of-the-art equipments aren't readily available for introducing CLT to the lessons in remote rural areas.

METHODOLOGY

As my ultimate goal is to carry out a clear research concerning teachers' difficulties in both implementing and practicing CLT while teaching English, the study makes good use of a mixed-method approach because a quantitative approach generally provides us with a wide vivid view that controls statistically the bias and external factors of the phenomena studied. By contrast, various sources that were gathered through qualitative approach allows us to know closely about a deeper understanding. In fact, "the hybrid use of quantitative and qualitative approaches increases validity and gives more insights" (Shu-Hsiu Huang, 2016). A questionnaire entitled "Teachers' challenges in using CLT in the classrooms" adapted from me at a public school in Khatyrchi district, Navoi, Uzbekistan. It was divided into two major parts. Finding one contained questions relevant to the subject's background information, including age, education degree, years of teaching, grade level teaching. Finding two was statements about difficulties rural teachers encountered for their CLT implementation.

The Interview method. “Interviews are the best way of learning about people’s interior experiences and how they perceive and interpret their perceptions, affected by their thoughts and feelings about a particular event” (Weiss, 1994). Vivid description of interview and narrating process explained in a detailed way by the subjects are well transferred to this article (rural CLT practice in this study) for much more authentic scientific explanations in order to grab the whole meaning of the phenomena described. In this research, the interviews were conducted in Uzbek language as as to give an access to have adequate freedom for interviewed teachers to feel themselves free and speak fluently to the questions prepared. Each interview lasted 15 to maximum 20 minutes. The whole process was recorded in order that I could sort out the data collected. The interview process was translated into English later on and sent to supervisor for analysis purpose. The interview questions mainly focus on the open face-to-face interview questions. They are about descriptive scenarios on teachers’ general views on CLT, the development of students’ capabilities and understanding of CLT and actual classroom teaching tools, and the difficulties resulted from their CLT practice.

Results

The research was conducted at school N24, located in Navoi region. There was no selection process for interview since at this school only eight teachers teach English and they are qualified for other languages, some of whose major aren't English at all. The research greatly paid attention to the teachers' perception about practising CLT, challenges encountered during the lessons. This interview could assist to reveal the real condition of current CLT usage in EFL classes and this can lead us to know about the weakness of the approach and potential solutions, as well. All of the interviewed teachers claimed that the cultivation of students’ communication skills is really crucial. All of them admitted that CLT has a distinctive power in terms of teaching English and teachers practise CLT activities when there is enough time to fulfill CLT, most of the teachers (6 out of 7 interviewees) are opt for conducting a semi-traditional teaching approach – a mixture of two main teaching approaches, Communicative Language Teaching (CLT) and Grammar Translation Methods (GTM)

Finding 1 reveals participants’ background information, including age, education degree, years of teaching, grade level teaching:

	Participants' name	Age	Teaching experience	Teaching grades	Qualification (according to diploma)
1	Khaydarova Lobar	39	15	9-11 grades	French
2	KholikulovaDilafruz	38	16	7-11 grades	Spain
3	KuchqorovaKhurriyat	37	13	7-10 grades	French
4	UmrzokovaMakhfuza	33	9	1-4 grades	English
5	BozorovaSurayyo	32	7	1-4 grades	English
6	RakhmonovaShakhzoda	27	4	5-6 grades	English
7	ErgashevaEzoza	25	3	5-6 grades	English

Finding 2 is about how these rural teachers practise CLT and difficulties they encountered for their CLT implementation.

	How often they use CLT	Difficulties resulted from CLT practice
1	Actually, I used different teaching methods for different units and parts but in every lesson CLT should be used.	students' low first language cognitive resources; Disturbed environment of the class.
2	I don't just use a single method. Using CLT depends on the theme	Students' low English proficiency; Student's 'communication' problems
3	A CLT activity may be good for sentence practice and GTM works for reading, so I try to use both above.	Students' lack of learning motivation; Parents' attitude toward English learning and CLT
4	If the lesson includes interactive games, CLT is best way to use but sometimes we avoid it due to lack of resources.	Teachers' English proficiency and Lack of in-service training; Limited teaching resource
5	I start the lesson with CLT to improve communication among pupils as much as possible.	Classroom management problem; Class agenda problems
6	I cannot use it every time since the class consists of too many pupils owing to lack of English teachers. It may be too noisy if it's used regularly.	CLT textbooks and standardized paper-based tests; A large number of students in the classroom
7	I try to use it despite pupils' less interest and lack of modern tools as it's best method to use.	Students disturbed the class; Using other languages in the classrooms.

DISCUSSION

The data collected and the interview make it clear that all the participants who were involved in the investigation consider communicative approach of teaching as one of the most fruitful methods to improve communication among pupils in the classroom. That's why, almost all of them are willing to practise CLT in each lesson in spite of the fact that there is short of modern technologies and equipments. Yet, they confirmed that either financial constraints make using CLT somewhat impossible or pupils themselves have less interest in learning a language or disrupt the lesson in remote rural areas. Moreover, according to the interviewed teachers, there are a large number of pupils being taught during the lessons. This is mostly because schools in remote areas still need qualified EFL teachers. As they mentioned, it was difficult to implement CLT to the lessons that included too many pupils in one go as it would lead to unmanageable condition, noisy or mess. "Often", according to one of the interviewees "there is no definite texts or grammar rules are not presented, and classroom arrangement is nonstandard. Pupils are likely to interact primarily with each other during the lessons rather than with their teachers". Because of less communicative skills in target language, they are expected to use their mother tongue.

CONCLUSION

As far as I'm concerned, during the CLT practice, rural teachers in Uzbekistan encountered different difficulties resulted from themselves, pupils, parents or school system. From both observation and interview, this study reveals that all participants encountered various difficulties in teaching English with using speaking or communicative ability. The most common challenges faced by the teachers were pupils' less interest to the lesson and limited teaching resources and

also 'being afraid of making mistakes' is one of the reasons of problem which hindered them to speak. What's more, according to the findings on the challenges that were experienced in the use of CLT, the research uncovered that time and class agenda cause trouble to apply CLT. These, along with the large classes, curb the teachers' action and ability to involve learners in meaningful role-playing activities. I would suggest that other researchers who are keen to conduct a research on a similar topic should take into account classroom observation for the witness of rural teachers' actual CLT practice and data collection. There are numerous interesting researches concerning rural areas-related teaching process waiting for further investigation.

ABSTRACT

The article reviews the development of the notion «intertextuality» in linguistics and explores some modern classifications and theories dealing with intertextuality. It also analyzes the amount, types and functions of intertextual facts in the geological texts

KEYWORDS: *Intertextuality, Scientific Discourse, Quotation, Reference, Symbol System References, Reference Function*

INTRODUCTION

The term "intertextuality" is widespread in linguistics. During its existence, it has been used both in a very broad and in a very narrow sense. In the works of modern scholars, it is considered as one of the categories of discourse, and it is in this aspect that various types of intertextual connections are studied and classified.

The history of the emergence of the concept of "intertextuality" begins with the works of a Swedish linguist at the beginning of the 20th century. Ferdinand de Saussure, or rather, his work "Course of Modern Linguistics", which presents the theory of the differentiability of the linguistic sign. Directly the term "intertextuality" was introduced by Yu. Kristeva in 1967 in relation to the study of the dialogical concept of MM. Bakhtin, according to which all utterances are responses to previous utterances and are addressed to specific addressees. Thus, the text is formed from already existing discourses: authors do not so much create new texts as compile them from previously existing discourses. Bakhtin and Kristeva emphasize the dual, two-sided nature of the statement or text [3].

In addition to Bakhtin's works, the development of Kristeva's theory of intertextuality was influenced by the ideas of structural psychoanalysis. Developing the idea of duality, Y. Kristeva introduces two new concepts: phenotext, denoting the symbolic, rational part of the text associated with the communicative function of language, and genotext, the nature of which is the unconscious. The ratio of these types of text in specific texts is always different. So, in scientific or formatted texts traces of genotext can be almost imperceptible, while in fiction it manifests itself in full [3].

Great contribution to the development of the concept "Intertextuality" was introduced by the French poststructuralist J. Derrida, whose main idea was the relativity of all boundaries. It is about going beyond the text of human consciousness. His ideas became the basis for the development of a cultural-semiotic approach to literature, culture, society as an open boundless phenomenon [1]. Within the framework of this approach, intertextuality appears as a theory of an unlimited text. This concept is continued in various versions both in domestic (Yu.M. Lotman, I.P. Smirnov, B.M. Gasparov, P.Kh. Torop) and in foreign linguistics (R. Barth, M. Riffarter).

In modern linguistics, two main concepts of intertextuality can be distinguished: a radical (broad) concept and a narrow concept. Within the framework of the radical theory, the linguistic analysis of the text seems to be a difficult task, since "the undifferentiated universality proclaimed by this theory did not allow distinguishing intertextuality itself from non-intertextuality, firstly, and various historical and typological forms, in- the second "[1].

As for the narrow concept of intertextuality, it, as V.E. Chernyavskaya, duplicates some of the functions of literary criticism and philology. Currently, scientists have not come to a common definition of the concept of "intertextuality". However, in modern linguistics, a large number of works appear in which researchers combine two concepts and take into account such aspects as the interaction "text-recipient", "Text-text / group of texts", "text-genre" [J. Jeannette], [M. Pfister], and try to define the criteria for intertextuality [1].

In this regard, it is advisable to dwell on the work of E.V. Mikhailova, where she defines the criteria for the classification of intertextual links: the types of links, the degree and form of their expression in the text (marking) and their functions in the text. The material for her research was the articles of such scientific directions as economics, linguistics and physics. The purpose of this work is to determine the number, types and functions of intertextual relations (IS) in articles of the geological direction based on the material of the journal "Soviet Geology" of various years of publication.

According to the classification developed by E.V. Mikhailova, there are three main types of intertextual connections used in scientific articles:

1. Proper-textual types of intertextual links - primary and secondary quotations.
2. Paratext types of intertextual links (nominal, title, address, mixed / bibliographic links). In paratext borrowing, the function of intertextual links is performed not by fragments of the precedent text itself, but by elements of the paratext of the source, referring the recipient to any of the formal features of the latter, that is, links.
3. Combined type of intertextual connections, in which the named types are combined. For example, a quote combined with some type of link.

Indirect quotes, abbreviations, allusions are viewed as transformed intertextual connections, which are more integrated into the text carrier. 1

Considering the functions of intertextual links in a scientific article, E.V. Mikhailova proposes the following classification:

1. The referential (referential function) of intertextual connections is prototypical in scientific discourse. It has three varieties:

1) informative, serving for Collapsing a large amount of scientific knowledge required to understand a specific topic;

2) Explanatory, serving to clarify, clarify the author's idea;

3) Appellative, implemented in cases when the author of a scientific article establishes a connection with the original source of the borrowed information in order to rely on an authoritative opinion when developing his own solution to the problem.

2. The evaluation function has two types, depending on the attitude of the author to the borrowed source:

1) Critical, with a negative attitude;

2) Empathic, with a positive attitude.

3. The etiquette function is implemented in various ways: both as an expression of respect for the scientific community, and as a sign of compliance with a certain group of texts, and as a kind of password sign.

4. The decorative function is manifested only with the help of quotations, which are used to give an individual character and soften the strictly style of scientific presentation [2].

Particular attention is drawn to the article by P.F. Shvetsova "Physical Geology and Geotechnics", published in the journal "Soviet Geology" No. 9 1970. It is distinguished by a large number and variety of intertextual connections with a complete absence of symbolic connections. Perhaps this is due to the individual style of the author. However, in our opinion, a more important factor in the intertextual diversity of this article is its topic.

The analysis of ISs from the point of view of their functions showed that ISs are most often used in the reference function in its informative variety. As a rule, this function is performed by bibliographic references. Explanatory function, as already noted, is often expressed through symbolic connections. It is natural to expect the use of IP in scientific articles in the appellative function, since many scientific studies are based on authoritative sources. The rest of the IS functions in scientific articles of the geological direction are manifested to an insignificant extent.

Based on the analysis, it is possible to but draw the following conclusions: The number of IPs in scientific articles of the geological direction for the period 1970-1990. increased. In most of the analyzed articles, bibliographic references, symbolic links and references to authors or a group of authors prevail. The leading function of IP in these articles is abstract in all its variants. The rest of the types and functions are rare or not identified at all.

It is assumed that the number and variety of types of IP in texts is influenced not only by the nature of scientific discourse, but also by the topic of the article, as well as the individual style of the author. However, this assumption requires further research.

PEDAGOGICAL CONDITIONS FOR FORMING SPORTS MOTIVATION

Kadirov Abdurashid Abduganiyevich*

*National University of Uzbekistan named after MirzoUlugbek,
Tashkent, UZBEKISTAN
Email id: a.kadirov1987@mail.ru

ABSTRACT

The essence and content of sports motivation and the peculiarities of its relationship with the personality traits of athletes have been determined on the basis of a theoretical analysis of scientific and methodological literature. The pedagogical conditions of the formation of sports motivation of volleyball players of 15-16 years old were revealed.

KEYWORDS: *Motive, Sports Motivation, Sports Activity, Personality Traits, Level Of Aspirations.*

INTRODUCTION

Motivation occupies a leading place in the structure of the personality, permeating all its structural formations: personality orientation, character, emotions, abilities, mental processes. Motivation of behavior is impossible outside the emotional sphere [1]. Emotions orient a person, indicating the significance of the environment for a person, the degree of their importance, their modality. The degree of significance indicates the permissible level of material and functional-energy costs necessary for the implementation of the impulses.

In the psychological literature, it is proposed to distinguish between the concepts of motive and motivation. Motives are understood as: 1) subjective dynamic forces (tendencies) aimed at ridding a person of oppressive states of tension; 2) subjective images of objects that satisfy the corresponding needs, and give the activity directed at them a personal meaning; 3) special fixed installations that determine the readiness for activity in appropriate conditions and in a certain direction; 4) stable evaluative dispositions.

Motivation is considered as a mental state that is formed as a result of a person's correlation of his needs and capabilities with the specifics of a specific activity and serves as the basis for setting and implementing its goals.

The specificity of sports motivation is due to the qualitative originality of the subject of sports activity. R.A. Piloyan [1] defines sports motivation as "a special state of an athlete's personality, which is formed as a result of his / her correlation of his abilities and capabilities with the subject of sports activity, which serves as the basis for setting and implementing goals aimed at achieving the maximum possible sports result at the moment."

Sports activity is characterized by such psychological characteristics as an orientation towards the ultimate level of achievement and high emotional stress associated with the subjective significance of the results of activity, the severity of rivalry, and the publicity of performances in competitions. In the duration and effectiveness of sports, a significant role belongs to the motivational sphere of the individual [2].

The motives for playing sports of the highest achievements include, according to A.V. Rodionov [3], the need for extreme physical efforts, experiencing a state of strong mental tension, overcoming an opponent, testing one's own physical and mental capabilities.

The priority of motives, the peculiarities of the structure of motives are influenced by the specificity of the kind of sport, the level of sports achievements, age, gender, sports experience of an athlete, as well as self-assessment of their personal qualities [4].

Sports psychologists propose to distinguish between sports motives and sports motivation. In particular, V.K. Safonov identifies two levels of sports motivation:

1. General motivation. Its formation is the task of the entire educational process. A prerequisite for this is the setting and consolidation of a far-backed goal in the mind of an athlete.
2. The motivation of an athlete at a given training session, at a specific stage of training, which, refracted through general motivation, is actualized through the awareness of the tasks of this stage of training and self-assessment of his state, functional capabilities.

The development and functioning of sports motivation presupposes the need for a high level of development of a number of personality traits: 1) a positive attitude to sports and overcoming the difficulties of sports activity [5]; 2) emotional and volitional qualities - determination, decisiveness, perseverance, self-confidence, self-control, resourcefulness, emotional stability [6]; 3) a sense of collectivism and its manifestations [7].

Sports motivation is defined as the current state of the athlete's personality, which serves as the basis for setting and implementing goals aimed at achieving the maximum possible sports result at the moment. It was revealed that, on the one hand, motivation affects the nature of training activity and directly on the competitive result, on the other hand, an increase in the effectiveness of competitive activity enhances sports motivation.

E.G. Babushkin [7] proposes to distinguish training and competitive motivation in the structure of sports motivation. In turn, there are two components in competitive motivation: motivation to achieve success and motivation to avoid failure [8, 9].

Athletes with dominant motivation for achieving success are distinguished by the desire to win, the ability to "fight to the end", positive emotions, the tendency to dominate, the desire to take risks, insensitivity to threat, low anxiety, an attacking style of fighting, high intensity of effort and the effectiveness of behavior in extreme situations.

It was revealed that the motivation for achieving success affects the purpose and content of the action, the intensity of the effort and behavior in extreme situations. B.I.Stepansky [9] found that with the dominance of achievement motivation, the performance is determined by the current level of activity regulation, that is, by its psychophysiological characteristics. If the motivation for avoiding failure prevails at any level of activity regulation, its effectiveness will be low.

The manifestation of sports motivation depends on the characteristics of athletes' self-esteem of their personal qualities. According to the research results of A.V. Shaboltas, the significant parameters of self-esteem, regardless of the sport and gender of athletes, are self-confidence, satisfaction with sports results, authority, and health. In particular, it was revealed that self-confidence is closely related to sports achievements, the motive for achieving success and the emotionality of sports activity.

In a number of works, the ratio of motives and goals of sports activity was considered. G. D. Gorbunov writes that the process of subjective goal-setting and the motivational sphere of an athlete are closely related, and the decisive role in this is assigned to self-affirmation. The development of such a motive must be considered in connection with the formation of an athlete's value system, which should be based on a critical assessment of personal behavior and achievements. An athlete's critical attitude to his behavior is impossible without self-esteem and identification with generally accepted social and social norms.

The athlete's personal values determine his level of claims to himself and to his achievement.

An important prerequisite for the implementation of the regulatory function of the goal is its subjective acceptance by the athlete. The more clearly the athlete realizes the tasks facing him, the deeper he understands and experiences the importance and social significance of solving these problems, the more intense the urge to resolve them. The more difficult and serious the goal, the more efforts are made by athletes [10]. The difficulty of the goal chosen by the athlete characterizes the level of her aspirations in the field of sports activity. The level of an athlete's aspirations must correspond to his capabilities [11].

As stress increases, individuals with a strong nervous system overestimate the level of aspirations, while those with a weak nervous system underestimate it. E.P. Ilyin [12] gives signs of the behavior of athletes with high and low levels of claims. The former overestimate their capabilities, claim high marks from others and experience bad luck. Athletes with a low level of aspirations underestimate themselves, do not strive to rise above the achieved level, are reluctant to take on difficult tasks, and are afraid of failure. The athlete's level of aspirations can be influenced by past successes and failures, the ability to realistically assess the current situation, the ability to foresee the course and result of an action. The volitional activity of an athlete, his desire for the intended goal, the higher, the more important the motive and the higher the level of aspirations (the more difficult the goal).

In general, the research results indicate a close relationship between motivational attitudes, the level of aspirations, self-esteem, and personality traits.

Summarizing the research results of domestic and foreign researchers, we can conclude that they distinguish the following motives associated with the process of sports activity: the need for physical activity; aesthetic enjoyment; the desire for competition; active rest and entertainment; the need for extreme physical effort; striving for a state of stress and overcoming it.

Along with this, the authors highlight the motives associated with the results of sports activity: testing their own physical and mental capabilities; the desire to become healthy, strong, physically, to achieve a beautiful physique, to improve physical abilities; personality formation: the desire to temper the will, to become courageous and persistent; raising social status, social self-affirmation; achieving success in sports; orientation to the possible negative consequences of success; desire for contacts in a sports team; material needs, social conditions; preparation for professional activity; accumulation of special knowledge and skills, knowledge about their opponents; lack of pain and psychogenic influences; desire to visit competitions in other cities of the country and, especially abroad; desire to become a coach in the future; ethical motives: awareness of the importance of sports activities, the desire to glorify their country, the desire for sports improvement for a successful performance for a sports team.

The development of motivation for sports activity is conditioned by the interaction of internal and external factors that change their significance during sports activity. As internal factors for the development of motivation, the following are distinguished: age, the inclinations of motor abilities and a propensity for activities with a certain content. The role of external factors is played by the social environment, which reflects both the traditional social and moral norms inherent in society and the attitude towards the athlete's personality.

The development of internal and external factors is carried out through their interaction in the course of sports activities. As a result of the development of internal factors, the goals and objectives of sports are formed, which are adequate, on the one hand, to personally significant needs, on the other hand, to the possibilities and characteristics of the activity being performed. The development of external factors is manifested mainly in the improvement of the organization of the educational training process (training conditions, organization and methodology of training, high emotionality of training sessions) and competitive activity.

For the development of motivation, the high satisfaction of athletes with the results of sports activity, taking into account their compliance with its goals and objectives (as a result of the effective interaction of internal and external factors), is of decisive importance, information about which is promptly received by the athlete from the coach through the feedback channels.

The ultimate goal of psychological training is the formation and improvement of the sports motivation of the individual through the daily (in the process of each training session and competition) stabilization of the athlete's attitudes to the process and results of sports activities, to the coach and teammates, to himself. Psychological training aimed at the formation of sports motivation is carried out in unity with other types of sports training. Therefore, all physical exercises and rehabilitation measures performed by athletes should be considered in conjunction not only with their physical states, but also with the mental states of those involved in this being actualized.

In the literature, such questions as: the features of the competitive and training motivation of volleyball in adolescence have not been reflected; the relationship of sports motivation, self-assessment of sports capabilities and volitional qualities; management of the formation of sports motivation; the relationship of sports motivation with the personality traits of an athlete and the level of their sports readiness. This determined the relevance of our study.

Our long-term research on this problem with volleyball players 15-16 years old allowed us to come to the following conclusion.

Formation of the relationship underlying sports motivation is carried out through the psychological mechanisms "bottom up" and "top down".

The action of the mechanism "from the bottom up" is provided through the directed creation of special external conditions in the process of extra-training, educational-training and competitive activity (for example, situations of achieving success, the need to make a timely decision in a personally significant and uncertain situation, etc.), which objectively require athletes to actualize the formed motives and volitional qualities, and lead to an independent decision on the implementation of related actions.

Simultaneously with the setting in specially organized external conditions of sports activity, the trainer, through the use of methods of suggestion and persuasion, is brought to the consciousness and understanding of athletes, what kind of orientation and emotional coloring should be the attitude to these conditions, under which high efficiency of sports activity is achieved (the action of the mechanism "from top to bottom").

Theoretical analysis and generalization of literary data made it possible to single out a number of pedagogical conditions, the implementation of which in the process of sports training through psychological mechanisms "from bottom to top" and "from top to bottom" should ensure, according to our assumption, the emergence, functioning and development of volleyball players' attitudes towards the goal of sports, sports success, their capabilities, educational training and competitive activities, to the team and the coach.

Stabilization of these relations leads to the formation of the motives of going in for sports, volitional qualities, the ability to subjective control and self-government, which subsequently become the personal basis of internally organized sports motivation.

At the same time, in our opinion, it is necessary to observe the following pedagogical conditions that we have highlighted:

- Formation of favorable attitudes towards the goal of playing sports;
- Formation of favorable attitudes towards sporting success;
- The formation of favorable attitudes towards their capabilities;
- Formation of favorable attitudes towards training and competitive activities;
- Formation of favorable relations to the team and the coach.

Summarizing the results of the study, we can conclude that with the practical implementation of the pedagogical conditions we have identified in the educational and training process of volleyball players aged 15-16, the following is observed:

- 1) Accelerating the pace of development of volitional qualities of purposefulness, perseverance and perseverance;
- 2) Weakening the importance of the motive of emotional pleasure and increasing the importance of the motives for achieving success, social and physical self-affirmation;
- 3) Strengthening of sports motivation and competitive motivation;
- 4) Increasing the level of subjective control and the ability to self-govern communication, behavior and activities.

To manage the formation of sports motivation, it is necessary to create pedagogical conditions for the emergence, functioning and stabilization of these relations by means of psychological mechanisms “from bottom to top” and “from top to bottom”.

ABSTRACT

The article in higher education institutions contains a list of scientific and practical tasks for students to conduct independent research using the "PV lighthouse" program and the "PVlighthouse" program as a method of actively involving students in scientific research while ensuring the scientific and practical significance of the content of "Optics" (influence of plate thickness, effect material, surface effect, light return, absorption, transition control capabilities). In addition, a set of independent research topics for students, guides and guidelines to help develop skills in the PV lighthouse software system, an interactive presentation-based software product that builds the ability to use the PV lighthouse software system.

KEYWORDS: *PV Lighthouse Software Package, Optical Layer, Radiation Parameters, Plate Thickness Effect, Material Effect, Surface Effect, Light Return And Absorption.*

INTRODUCTION

Training of high-potential specialists who can meet the requirements of the times, taking into account the prospects of the Republic of Uzbekistan, qualified, competitive, highly educated, contributing to the development of science, culture, economy, social spheres of the country, independent thinking, high spirituality purpose. Science, culture, technology, modern achievements of the economy, the systematic improvement of training methods, taking into account the social prospects of the country's economy and culture, is one of the most pressing issues today [1].

Great attention should be paid to the scientific nature of science in the teaching of "General Physics" courses in higher educational institutions (HEIs) of Uzbekistan. One of the traditional ways to do this is to cite theoretical science-based concepts with experimental confirmations. But it is advisable to direct students directly to scientific research in order to educate them among those who want to connect their future with scientific research. If it is much easier to solve the problem in universities with appropriate scientific laboratories, how can universities without such material and technical base behave? In response to this question and in the process of teaching the "Optics" section, the main goal of this work is to develop and implement a realistic method of solving the problem.

The authors chose the software system "PV lighthouse" as a method of active involvement of students in scientific research, while ensuring the scientific and practical significance of the content of the section "Optics".

First of all, let's talk about the general information about the software system "PV lighthouse". The PV Lighthouse web application was launched in June 2011 and is currently being expanded by Keith MacIntosh, Malcolm Abbott, Ben Sudbury and several other photoelectronics professionals. The number of current users of the system is growing rapidly, and the number of calls to it exceeds 10,000 per month. The system works on an online basis and a lot of research can be done with the help of the program. In particular, it is possible to theoretically analyze the materials selected in the creation of solar elements by entering the parameters. To do this, select the "CALCULATORS" menu from the main window of this system. The resulting section is entered from the menu into the "WAFERS" section. This section contains the Wafer Dimensions and Wafer ray tracer commands, from which you can select Wafer ray tracer [2]. Using this section, the optical factors of the solar elements or the base material selected for them - absorption, return and transition parameters - are studied. The important thing is that several types of silicon and its different thicknesses can be selected as the base material [3].

The following initial parameters are also selected for the study: Illumination - radiation parameters: at the zenith - the vertical angle of the sun, the spectrum - the type (spectrum) of the light source, such as sunlight, absolute black matter, halogen or xenon lamp . Surface morphology: the frontal layer is selected - planar, optical layer or texture, and for the back layer - planar, optical layer or texture. Layer materials: where the type of optical layer material and its thickness are selected. It is possible to select single and multilayer optical layers and form them in different sequences [4].

As an example, let us analyze the dependence of the wavelength of light on the return, absorption and transmission of sunlight incident on the surface of a silicon crystal [5]. To do this, let us choose different thicknesses of the silicon wafer: $d = 200 \mu\text{m}$ in case 1, $d = 100 \mu\text{m}$ in case 2 and $d = 10 \mu\text{m}$ in case 3. Let us examine the initial calculations in which no optical layers are coated on the silicon surface and no textures are formed.

The amount of photogeneration or absorption current that can be generated in it is the amount of dependence of the light wavelength of IA, holding the silicon wafer under study under normal daylight, as usual, falling vertically from above (frontal surface). The calculation results can be obtained in tabular or graphical form. Based on similar calculations, it is possible to determine the return (IR) and transit (IT) of light from the silicon surface.

It can be seen in Figure -1 that the calculation results for the silicon wafer are graphically expressed as the dependence of the total return R (I), absorption A (I) and conduction T (I) on the light wavelength (I).

Graphical or tabular data are obtained for different thicknesses of silicon wafer as shown in Figure 1. Using them, it is possible to obtain secondary link graphs or tables that are convenient for physical analysis. Figure 2 shows a graph of the correlation of the light absorption index of a silicon wafer of different thickness ($1 - d = 200 \mu\text{m}$; $2 - d = 100 \mu\text{m}$; $1 - d = 10 \mu\text{m}$). Figure 3 also shows a graph of the correlation of the light transmittance of a silicon wafer of different thickness to the wavelength of light ($1 - d = 200 \mu\text{m}$; $2 - d = 100 \mu\text{m}$; $1 - d = 10 \mu\text{m}$) [6].

Figure-1. Spectral graph of light wavelength dependence of light reflection, absorption and conduction index for a crystalline silicon wafer with thickness $d = 200 \mu\text{m}$.

Analyzing such results, we can explain that the curves 1, 2 and 3 in Fig. 2 and Fig. 3 differ radically with increasing light wavelength due to the fact that the absorption indices of photons of different wavelengths in silicon have different values. The passage of the rest of the absorbed light through the silicon wafer is explained by the curves in Figure 3.

Figure-2. Graph of correlation of light absorption index of light absorption index of silicon wafers of different thicknesses: $1 - d = 200 \mu\text{m}$; $2 - d = 100 \mu\text{m}$; $1 - d = 10 \mu\text{m}$.

Thus, using this method, students learn to measure the optical factors of solar elements or the basic material selected for them - absorption, return and transition parameters, to determine the return (IR) and transit (IT) of light from the silicon surface, to work with tables and graphs. From the scientific point of view, the analysis of statistical data from a physical point of view, the fact that curves differ radically with increasing wavelength of light, the absorption of photons of different wavelengths in silicon have different values learns to do scientific observation.

Figure-3. Graph of correlation of light transmittance of a silicon wafer of different thickness to the wavelength of light: 1 – $d = 200 \mu\text{m}$; 2 – $d = 100 \mu\text{m}$; 3 – $d = 10 \mu\text{m}$.

A list of scientific and practical tasks (effect of plate thickness, material effect, surface effect, ability to control the return, absorption, passage of light) was developed for students to conduct independent research using the software system "PV lighthouse".

Using the learned software system, students and teachers can analyze the results obtained by performing research i.e. covering the surface with optical layers or forming regular textures to reflect light, absorb, change transmission parameters and determine optimal conditions.

Thus, the experimental research conducted in 2017-2020 on the application of the proposed new method of teaching "Optics" to undergraduate students in the field of "Physics" allowed to form the following important conclusions:

- Students have the skills to conduct independent research;
- A set of independent research topics was developed for students;
- Developed guidelines and recommendations to help students develop skills in working with the software system "PV lighthouse";
- Developed a computer product based on an interactive presentation that provides access to the software system "PV lighthouse" for students and researchers;
- Radical improvement of students' mastery of the department "Optics" with in-depth scientific and practical aspects.

Another important aspect of the proposed methodological development is that it is used in the teaching of "Molecular Physics and Thermodynamics", "Electromagnetism", "Atomic and Nuclear Physics" sections of "General Physics", as well as "Semiconductor Physics",

"Theoretical Physics", " It can also be actively used in the teaching of other disciplines, such as "condensed matter physics".

Thus, with the help of the software system "PV lighthouse" students and teachers can conduct independent experiments, analyze the results and graphs on the basis of physical laws, concepts, conduct independent research. This will contribute to the development of young people in Uzbekistan to contribute to the development of the country, independent thinking, creative approach, effective use of Internet materials, skills and competencies in research.

ABSTRACT

This article provides an analysis of the provision of autonomous electricity consumers with alternative energy sources. The technical parameters of the proposed wind energy source and the graphs of the power curves of these turbines are given.

KEYWORDS: *Microges, Autonomous, Air Speed, Power Supply, Power Curve, Panel, Wind Map, Technical Parameter.*

INTRODUCTION

Resolution of the President of the Republic of Uzbekistan No. PQ-4422 of August 22, 2019 put plans to increase the share of renewable energy sources to 25% by 2030. At present, this figure is 10%.

Providing quality and reliable energy to autonomous electricity consumers far from power grids remains a challenge even today. It is not cost-effective to supply consumers through power grids, so it is advisable to choose alternatives to supply this type of consumer. Currently, this type of consumers are offered to burn a diesel generator or other type of fuel.

In Uzbekistan, the use of solar energy is more efficient, as the country has an average of more than 300 sunny days a year, but the efficiency of solar panels is low (about 15%), and the surface of solar panels is covered with dust due to regional characteristics. causes a further decline. Cleaning and cooling the surface of solar panels is one of the challenges facing the industry.

It is not always possible to supply energy to such consumers through micro-hydroelectric power station, as given the fact that this category of consumers is usually located in hot regions or desert areas, the availability of these energy sources is low.

So, as can be seen from the above considerations, the use of wind energy resources has some advantages. The basic equation of wind energy answers the question of how much energy is in the wind (5). Power is the speed of energy over time. For example, we need to know how much energy a wind turbine can produce per unit of time. Wind energy depends on: [4]

- Amount of air,
- Air speed,
- Air mass.

Picture 1. Schematic of wind speed velocity flow. Represents the volume flowing in a unit of time passing through the area of the cylinder.

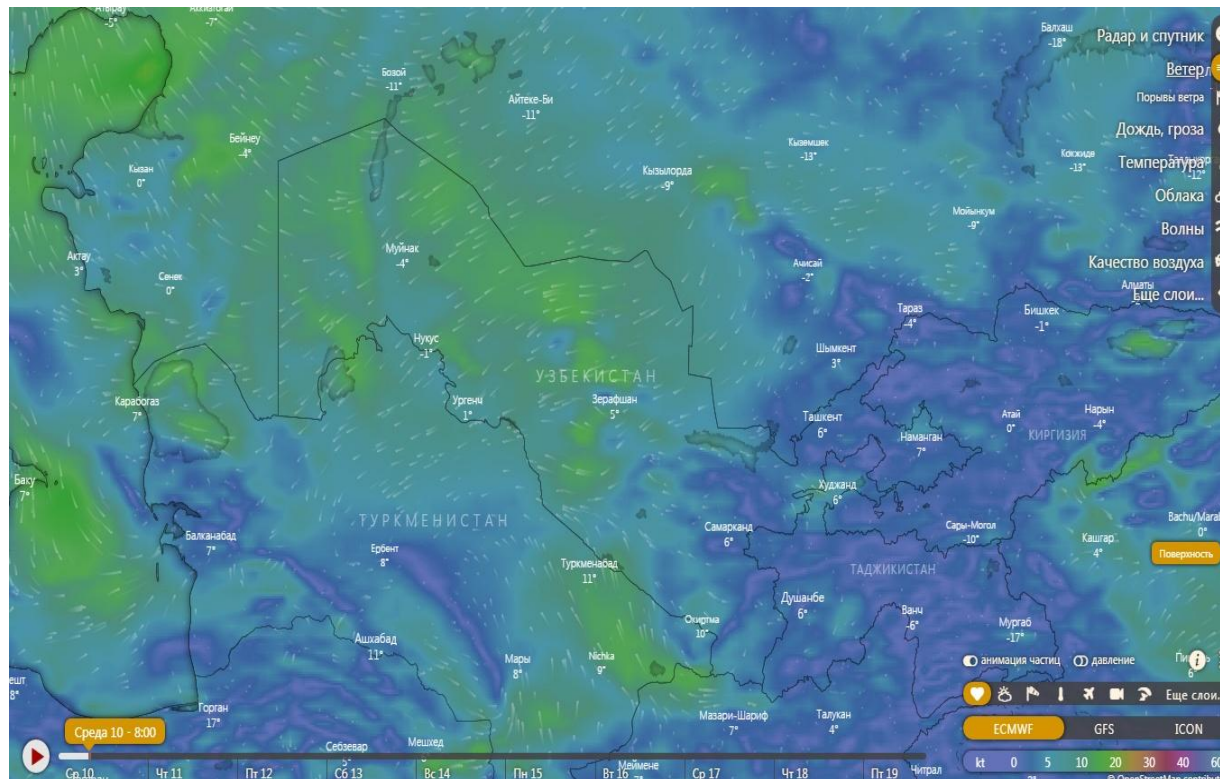

A cylinder with an area of influence S and a length $v \cdot dt$, i.e. a volume $S \cdot v \cdot dt$. Therefore, the flow rate of the volume is $S \cdot v$, and the flow rate is v . The flow rate is the product of the flow velocity v and the current density ρ .

$$\frac{dm}{dt} = \rho \cdot S \cdot v \quad (2)$$

Summarizing Picture 1 and formula (2), we obtain the following expression. $P = \frac{1}{2} \cdot \rho \cdot S \cdot v^3$
(3)

Expression 3 is the fundamental equation of wind power analysis. The cubic level of velocity in the formula shows the curvilinear dependence of wind power on velocity. A two-fold increase in wind speed results in an eight-fold increase in power, which means that speed is important (5). Wind strength is linearly related to air density and wind impact surface, so these magnitudes are of secondary importance.

Here comes another question: to what extent is the potential for wind energy in Uzbekistan, or if a wind farm is built, can the wind give the minimum speed at which we can get power from this station? Below we will try to answer this question with a wind map from wind.com:

Picture 2. Wind map of Uzbekistan.

типлишамолэлектргенераторинингтехникпараметрлариникелтирибўтамиз.

This map shows that in the north-western regions of the country: Karakalpakstan, Khorezm, Bukhara and Navoi regions, wind speed varies in the range of $5 < v < 20$. Hence, the use of wind energy sources in these areas gives the expected result

Taking into account the above points, we cite the technical parameters of wind turbines HW 77/1500 and HW 82/1500.

TABLE 1

Picture 3. Power curves of proposed wind turbines

It is important to normalize the area of influence of wind power flow. This leads to the definition of kinetic wind energy flow, called wind energy density (DEZ). As in the above definitions of flow and flow velocity, the flow of wind energy is the flow rate of wind energy per unit area.

$$DEZ = \frac{P}{S} = \frac{1}{2} \cdot \rho \cdot S \cdot v^3 \quad (4)$$

DEZ is used to compare wind sources independently of the size of the wind turbine and is the quantitative basis for the standard classification of wind. [2]

It is important to know the wind power classes to install the turbines proposed above.

Table 3 shows the wind energy classes measured at a height of 50 m above the ground according to the classification based on wind power density.

TABLE 3

Wind power classification			
Wind power classes	Resource potential	Wind power [W / m ²]	Wind power [W / m ²]
1	Strong wind	0-200	0-5,9
2	Extreme wind	200-300	5,9-6,7
3	Medium wind	300-400	6,7-7,4
4	Strong wind	500-600	7,4-7,9
5	Strong wind	500-600	7,9-8,4
6	Strong wind	800-600	8,4-9,3
7	Very strong	>200	>9,3

The wind speed corresponding to each class is the average wind speed based on the distribution of the average equivalent of wind power at 1500 meters above sea level.

Above we have considered the overall composition of the surrounding air flow and wind power. In fact, it is not possible to use all of these capacities. The efficiency in the use of wind energy is determined by the power factor (C_p), which is the ratio of the power output from the turbine

$C_p = P_T / P_{wind}$ to the total power of the wind resource.

The turbine power is as follows:

$$(5) P_T = \frac{1}{2} \cdot \rho \cdot S \cdot v^3 \cdot C_p$$

where the value of P_T is always less than the value of P_{wind} . In fact, there is a theoretically upper limit of the maximum removable power known according to Betz limit theory, and this value does not exceed 1. [3]

In summary, despite the disadvantages of using wind energy sources, there are a number of advantages, and these advantages increase the importance of using such sources.

- Consumers supplied with wind power will be independent of the power grid, so interruptions in the network will not affect autonomous consumers.

- Installing a wind turbine is cheaper than installing a mains supply.
- The use of wind energy provides resource savings across the region.

ABSTARCT

The Law of the Republic of Uzbekistan “On the names of geographical objects” adopted on October 12, 2011 plays an important role in the legal regulation of relations in this area, the restoration of centuries-old traditions of our people. For centuries, it has played an important role in the economic, social and cultural life of the oasis in the Lower Amudarya region. In the second half of the 16th century, after the Amudarya changed its course and began to flow into the Aral Sea, the city of Gurganch (now Old Urgench) was left without water. That is why, the mass media, exhibition and advertising officials, and the general public need to be active in promoting large-scale work on the regulation of place names.

KEYWORDS: *Restoration, Centuries-Old, Large-Scale*

INTRODUCTION

Based on the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan “On regulation of naming of administrative-territorial units, residential areas, the organizations and other toponymic objects in the Republic of Uzbekistan”(Legislation Collection of the Republic of Uzbekistan, 2004, No. 32, Article 363), great work has been done and is being done, during the years of independence in our country to realize national identity, revive our values, restore many ancient place names that were unjustifiably changed during the former communist regime [1].

The Law of the Republic of Uzbekistan “On the names of geographical objects” adopted on October 12, 2011 plays an important role in the legal regulation of relations in this area, the restoration of centuries-old traditions of our people. On October 16, 2012, the Cabinet of Ministers of the Republic of Uzbekistan adopted a resolution on the implementation of this law.[2]

According to the resolution, research was conducted in all regions of the country. Geographical research takes into account the specifics of each field, and then explores the possibilities of their use. For example, in the scientific study of the geographical names of each region, there is enough knowledge about all its branches, ie geographical location and surface structure, land resources, climatic conditions, water and labor resources, is required.

For this reason, the natural and geographical features that underlie it should be taken into the consideration in the process of the naming and renaming of residential areas of Urgench district.

First of all, everyone wants to know the name of their place, city, village, neighborhood, street, whatever, natural feature, what human name they are associated with. Why are they called Hindukush, Ajalvodiysi (Death Valley), Borsakelmas, Dashti Margoh, Dashti Lut, Ulikdengiz (Dead Sea)? If you translate some foreign names into Uzbek, you will see strange, sometimes absurd names. Krivoy rog-curved horn, Tbilisi-boiling spring, Vladivostok-occupy the east, Velikie lyuki-big bows, Los-Angeles- “our lord, the king of angels”

The place names have a deep scientific, political, practical and educational significance and have existed for centuries as an invaluable expression of the thinking of our wise people. It is well known that many geographical names in our country are closely connected with the natural climatic conditions of the region, the economic activity of the population, as well as historical events.

Urgench district occupies 7.2% of the region's territory. It borders the city of Urgench. The district has 11 citizens' assemblies, 76 residential areas, 58 mahallas. The population as of January 1, 2019 is 191,5 thousand people with a density of 436 people per 1 sq. km. It borders with Shavat, Yangibazar, Koshkopir, Khiva and Khanka districts, as well as with the Republic of Karakalpakstan in the north-east via the Amudarya. Depending on the geographical location of the district, it is located between latitudes 40° - 31° and 42° as well 60° - 62° east longitudes. The climate of the district is sharply continental and the difference between the maximum and minimum temperatures is 78°C . As of October 1, 2018, 1321 enterprises (excluding farms) are registered in the district, of which 5 are operating on the basis of foreign capital. Enterprises operating on the basis of foreign capital make up 7.6% of the total number of enterprises operating on the basis of foreign capital in the region.

Urgench is located in the lowlands on the left bank of the Amudarya. At an altitude of 98-100 m above sea level.

Urgench district is located around the ancient and ever-young city of Urgench in Khorezm. For centuries, it has played an important role in the economic, social and cultural life of the oasis in the Lower Amudarya region. The prosperity of the district is due to its geographical location, ie the proximity of the Great Silk Roads and the capital of Khorezm - Urgench, as well as talented and hardworking people.

TABLE 1 RESIDENTIAL AREAS OF URGENCH DISTRICT

№	Urban residential areas	№	Rural residential areas
1	Cholish	1	Begovot
2	Chandirkiyot	2	Koromon
3	Gardonlar	3	Gaybu
4	Kupalik	4	Cholish
5	Okoltin	5	Chandirkiyot
		6	Yukoribog
		7	Korovul
		8	Chatkopir
		9	Galaba
		10	Chakkasholikor
		11	Yukoridorman

(The data in the table is based on data from Khorezm regional statistics department)

On this basis, there was a discussion of the tasks to ensure the implementation of the resolution of the Khorezm regional commission “On naming and renaming of geographical objects” dated November 13, 2012, and Resolution No. 242 Q of October 20, 2012 of the governor of Khorezm region “On measures to regulate the work in the field of names of geographical objects, in accordance with the Law of the Republic of Uzbekistan, based on the regulation No 295 of the Cabinet of Ministers of the Republic of Uzbekistan “On the names of geographical objects”, dated October 16, 2012.

Based on the regulation, the issues of naming and renaming of geographical objects of Urgench district were also discussed.

Urgench is one of the oldest and great cities in the country. The ancient city of Urgench (Gurganch) is part of present-day Turkmenistan (Tashhovuz region) and is now called Old Urgench. The ancient city of Urgench has been founded for more than 2000 years. The city of Urgench in Uzbekistan was founded in 1646 by Khiva khan Abdulghazi Bahodirkhan. In the second half of the 16th century, after the Amudarya changed its course and began to flow into the Aral Sea, the city of Gurganch (now Old Urgench) was left without water. Abdulghazi Bahodirkhan resettled the scattered population in the fortresses of Gurganch, Wazir and its environs and settled them in the southern part of the Amu Darya. Then, he fortified the area around the settlement with a fortress wall and named it “TozaUrgench”, ie “New Urgench”. After that, the city of Gurganch was renamed Old Urgench.[3]

Map of rural residential areas of Urgench district. (Map created by the authors).

The ethnos formed in the lower reaches of the Amudarya were called Khorezmi people until the XII century. From the 11th to the 12th centuries, the Turks and Mongols treated the Tajik-Persians and Khorezmians living in Central Asia as traders and called them “sart”. According to the available information, the Turkicized Persian-Tajik population was called “sart”.

In Khorezm, a large part of the population living in the latitude from Urgench (Old Urgench) to Khozarsp was the Turkicized descendants of Khorezmians, who were also called “sart”.

In conclusion, “sart” is not an ethnos name, but a nickname, and the term “Khorezmi” is an ethnos name.

The term “sart” is originally derived from the Sanskrit (ancient Hindi) word “Sartkhalaha”, which means “merchant”, “leader of the caravan”.

In the early 16th century, the Shaybanids from Dashti Kipchak conquered Movarounnahr, calling the settlers “Sart” and calling themselves “Uzbeks.” Thus, the term “Sart” was first applied to traders and caravan leaders, then to traders and craftsmen, then to Uzbeks and Tajiks, and finally to Uzbeks living in cities and villages. These processes contributed to the formation of the Khorezm people and they established their first state.[4]

The toponymy of Urgench district is closely connected with the toponyms of Khorezm. Here is a general description of the toponyms of Urgench district.

Arbob-kishlok. (Arbob-village) Khorezm region. Arbob is an Arabic word that means the plural form of the word “master, possessor.” It means a well-known celebrity, chief, leader, village elder [5].

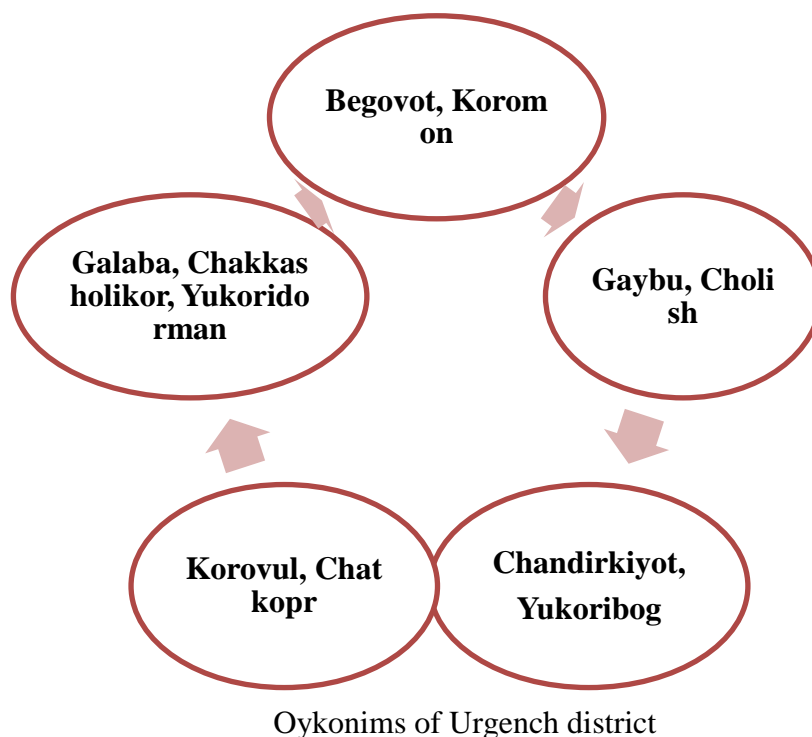

Baday-Tukay is situated in the Beruni district of the Republic of Karakalpakstan, on the right bank of the Amu Darya. Baday is a tribe of Uzbeks. They lived mainly in the lower reaches of the Amudarya in the Urgench district of the Khorezm region and were engaged in cattle breeding. They were distributed in the Surkhandarya valley in the early XIX century.

Dormon is a village name found in almost all regions of the republic and in Karakalpakstan. Dormon is the name of one of the Uzbek tribes, which lived scattered in Zarafshan, Surkhandarya, Tashkent oasis, partly in Khorezm, several parts of southern Tajikistan, as well as in northern Afghanistan. They migrated from DashtiKipchak in the 16th and 17th centuries. The villages where they lived were called Dormon, Dormoncha. The word Dormon (Mongolian: “dorba”) means “four”. [4]

Zargar-kishlok. (Jeweler village). This toponym was based on the name of the profession. A jeweler is a craftsman who makes jewelry and ornaments from metals such as gold and silver. This is the name of the village where the jewelers live. Toponyms such as Zargar, Zargarlik can be found in almost all regions of Uzbekistan.

Sevan- a city. The lake of the same name was the basis for this toponym. Sevan means “lake” in Armenian.

Chakkakishlok. (Chakka village) is in the Urgench district of Khorezm region. Chakka is found in many toponyms in Khorezm. For example, Chakkasholikor, Chakkali, Chakkalar, as well as people's nicknames: Yoldosh Chakka, Bibi Chakka. The word is interpreted by locals as “edge, outside, surface.” But the word chakka has another meaning. Chakka means something else. Chakka means “cheerful, humorous” in Persian [16].

Chandir-kishlok.(Chandir village). Toponyms with the word Chandir are found in the regions of Uzbekistan. Now Chandir ethnic groups exist in the Turkmen people as well. In Khorezm, chandir is used to mean “strong, powerful”.

Gurganj-is recorded as Gurganch in the Turkish language; as Jurjoniya in Arabic sources. Various legends about the origin of the name have been preserved among the people. Including: it was named Hurganj or Urganchj in honor of a girl named Hur and a boy named Ganj and their love. Or Hur means “sun” (or happiness) Ganj- means “treasure”, that is “Treasure of Happiness”.

Canal Shovot - The village is located on the Shovot district of Khorezm region. The canal also flows through the city of Urgench and the Urgench district. The village of Shovot is named after the canal.

“In Khorezm, large canals and the beginnings and wide sections of canals are called “arna”. The term literally means the river divides into tributaries. The reason why artificial canals are called by this term is that these canals are considered to be part of the river in terms of size. For example, Pakhtaarna, Shovotarna, Polvonarna are the same.

Toponymist Z. Dosimov published a separate article entitled “On the word Arna” and came to the conclusion that in Sanskrit “arnas” means “stream of water” [3].

Today, we are happy to see Uzbek names that fit the streets and alleys, squares, stations and buildings of our country,. We are full of national pride. The names of the places give us an idea of the place.

Naming or renaming geographic features is a delicate and responsible matter. In this process, it is necessary to have the important knowledge, intelligence and awareness of the historical, ethnic, socio-cultural characteristics of the people.

Another important point is that when renaming a street or other object, the change must be communicated to the public in the most convenient and easy way. That is why, the mass media, exhibition and advertising officials, and the general public need to be active in promoting large-scale work on the regulation of place names. It is necessary to analyze the toponymy of Urgench district, as well as other districts of the country.

ABSTRACT

The article discusses the creative work of Mahbudkhoja Behbudi, a mature representative of the national revival. The role of the critic in the promotion of education and culture, his devotion to the reform of education will be highlighted. During this period, the widespread promotion of science, education, schools, and the pursuit of change in various spheres of social life was on the agenda. At the forefront of the awakening movement in society stood the selfless enlighteners. Through their creative and practical activities, they helped the nation to understand its identity.

KEYWORDS: Nation, Jadid, Education, Mass-media, Theater, School, Upbringing.

INTRODUCTION

At the beginning of the twentieth century, in the history of Uzbek culture, intellectuals have stamped the names of jadids with the light of truth, justice and enlightenment. At a time when the preservation of the unique heritage, values, language, literature and art of the Uzbek nation has become a pressing issue, there was a great need for scholars. The resolute, steadfast people who undertook this honorable task in a precarious situation, said, were steadfast in their advice with their worldview and intellect.

THE MAIN FINDINGS AND RESULTS

During this period, the widespread promotion of science, education, schools, and the pursuit of change in various spheres of social life was on the agenda. At the forefront of the awakening movement in society stood the selfless enlighteners. Through their creative and practical activities, they helped the nation to understand its identity. Intellectuals, familiar with Eastern and Western cultures, began to make changes in various aspects of social life. Talented figures, whose main criterion was the morality and ideals of the people based on goodness, justice, took the lead in illuminating the psychology of the individual and society. Abdulhamid Cholpon's new

poetry, Abdullah Qadiri's rare prose, Abdurauf Fitrat's literary criticism, Mahmudhoja Behbudi's best examples of critical science strengthened his colleagues.

Mahmudhoja Behbudi's article "Right is taken, not given" defines the main criterion of human freedoms and opportunities in a just society. Emphasis is placed on strengthening the relations between the Turkic peoples in Turkestan, first of all, calling on the peoples with common religion, history and culture to unite for a common goal. As a religious and public figure, Behbudi always chooses the path of peace and tranquility, trying to explain to the simple, hardworking people the feeling of ownership of their homeland, their land, not to lose their freedom. He boldly raises the issue of establishing autonomy and encourages members of society to prioritize the application of human values, the creation of an independent and prosperous environment. The progressive critic, in his article "The Theater is Rare", sheds light on the role of the temple in human spirituality through an analytical approach. By enriching concepts such as theatrical stage, acting skills, speech culture, which are new to people, they enrich the world of imagination. Explains the principle of educating the audience's taste, consciousness and worldview of the dramatic work.

Mahmudhoja Behbudi in his article "We need four languages, not two" reminded that Arabic is necessary for religion, Russian is important for life and the world, and the study of Turkish and Persian is necessary for the further development of science. Necessary instructions are given in the chapter on preserving the purity of each language, correctly defining its potential, not discriminating against other languages, valuing the transparency of the mother tongue. It should be noted that the study of language is still relevant in terms of strengthening literary ties, reviving the dialogue with people of different nationalities and religions, changing the world of thinking. The scholar urges his comrades to carefully master religious and secular teachings and to establish universal values.

In "The Needs of the Nation", the critic's anxieties are expressed on the surface. He worries that a nation deprived of modern science will be trampled underfoot by other nations. The unique role of the school in the future of the nation, the thorough acquisition of secular, Islamic sciences in it, paves the way for the expansion of the network of branches in society.

Enlightener Ismailbek Gaspirali and Behbudi lived in pursuit of their worldview, noble intentions, and the highest goal of the country's development. They were united by the nation's pain and future. Behbudi followed the good deeds of the intellectual in the field of educational reform and worked hard to introduce a new school in Turkestan. The wise scholars are determined to inculcate in the human mind that only knowledge and enlightenment will put an end to ignorance. The influence of these on the intelligentsia of the nation, the ability to express public opinion, is pleasing to the people. They occur in the periodical press with effort. The press was a platform for enlightenment, a means of fully covering the environment of the period, thus serving to define its position in the development of literature and culture. Timely coverage of the situation in society, the study of cultural aspects of life, the expression of analytical thinking requires a critical response from the critic.

The publication of a number of Uzbek newspapers and magazines in Turkestan not only brought news to the social and cultural life, but also created a field of opinion on topical issues. Ismailbek Gaspirali, the founder of the Jadid movement, and the "Tarjumon" newspaper, which he founded, has played a significant role in the emergence of such newspapers as Taraqqiy,

Khurshid, Shuhrat, and SadoiTurkiston. MahmudkhojaBehbudi's cooperation with Gaspirali marked a turning point in the reform of science, enlightenment, art, school and education. Efforts have been intensified to raise awareness of the nation, which is devoid of modern science, and to encourage them to learn other languages.

Along with the development of national literature, the periodical press also became a platform for the development of Uzbek criticism. The periodicals began to give reviews of published works of art and translation on their pages; these reviews paved the way for the development of literary criticism. The fact that the reviews began to be published in the newspaper under the heading "Criticism" allowed for an objective study of the events of the literary process. Reviews and articles emerged as the first reaction to the idea of a poetic, prose, dramatic work, and compositional feature, artistic level, which was published at the same time, and played an important role in the development of thought.

MahmudkhojaBehbudi, Munavvarkori, Abdulla Avloni, SadriddinAini, Hamza HakimzodaNiyazi, MuhammadsharifSofizoda, SaidrasulAzizi made great changes in the field of school education. They opened schools, wrote textbooks themselves, sought to increase the knowledge of the children of the nation, to keep them informed of modern knowledge. Influenced by Turkish, Azerbaijani, Russian literature and art, the first examples of genres such as essays, feuilletons, short stories, novels, and dramas began to appear in Uzbek national literature. Hardworking writers began to work in many ways as publicists, poets, writers, journalists, critics and educators.

Enlightenment has become a leading principle of modern literature, and unique masterpieces of national Uzbek literature have been created. The idea of progress, science and freedom became the main principle in the works of artists of this period. Transparency and objectivity began to determine the direction of the Uzbek national literature. Realistically describing the existing social order of the time, giving it a deeper spirit, reflecting the will of the people has become a major theme in the literature.

During this period, a number of Uzbek newspapers began to be published in Turkestan. The influence of IsmailbekGaspirali, the founder of the Jadid movement, and the "Tarjumon" newspaper, which he founded, is invaluable in the emergence of such newspapers as "Taraqqiy", "Khurshid", "Shuhrat", and "SadoiTurkiston". In 1913, thanks to the efforts of MahmudkhojaBehbudi, the newspaper "Samarkand" was published. Behbudi reminded the newspaper that "articles and messages written in Turkish and Persian for the happiness and reform of the Islamic nation and the use of modern sciences by Muslims" will be given to the newspaper, emphasizing that good deeds have begun for the future of Islam. The newspaper is characterized by fans and experts, a review of the newly written work of art, its translation into Russian, a review of its role in cultural life. Founded in 1913 at the initiative of Behbudi, the magazine "Oyna – Mirror" has become a necessary platform for the Uzbek people to express their identity, rights and interests. As each society desires a word artist from a reality that embodies the ideal of the generation, a product of event expression, new original images emerge to be worthy of it. It is important for human happiness to follow the spiritual and moral precepts, not to harm the being, to keep the heart pure.

Behbudi created the first example of Uzbek drama and called it "Padarkush". The author fills the leading theme of universal literature, such as family, upbringing, morality, with a new event,

image. A wise man who deeply understands the painful point of this period will be able to show his spiritual poverty in a realistic way. Ignorance, indifference, and indifference, which are the root causes of the father-child relationship, create drama. Through the comparison of materiality and spirituality, a reference is made to the tragedy of a weak, vulnerable generation. Moral depravity is expressed in a series of events that first destroys the family and then society. This work is noteworthy for its profound enlightenment of the realities of life and its awareness of ignorance and evil.

Criticism of theatrical works and articles dedicated to the stage itself play an important role in the literary process. A new view of literary criticism is seen in the question of writing reviews of stage works in general. The periodicals also paid special attention to theater criticism in their pages. Cholpon's objective reviews of Fitrat's dramas, his views on World Theater and culture came to the attention of intellectuals. Fitrat's reviews also raised the issue of raising stage culture. The review of the drama "Padarkush" also noted the art, language and composition of the work. Importantly, the work on the promotion of national culture and art has intensified. The critics made valuable comments on the role of stage works in the development of literature, emphasizing the issue of real, effective coverage of everyday events. The author of the articles did not tell the plot of the drama, but focused on the characteristics of the genre, which is a new approach, which is aware of the impetus for evaluation. It is clear that the future development of fiction is directly dependent on the periodical press and literary criticism.

CONCLUSION

The activity of modern enlighteners played an important role in the Uzbek periodical press, the emergence, formation and further development of literary criticism. In literary criticism, it is clear that objectivity, honesty is achieved by showing the beauty of the work of art, its aesthetic appeal, its originality. MahmudhojaBehbudi's wise and just actions in promoting universal values will always be an example for generations. His great contribution to the enrichment of the spiritual treasury of our nation will forever be remembered.

THE QUALITY OF MODERN PEDAGOGICAL TEACHINGS AND ITS MAIN INDICATORS

Zohid Nazarovich Ernazarov*

*Independent Researcher,
Karshi State University, UZBEKISTAN

ABSTRACT

In this article, the quality of education and education in modern pedagogy, pedagogical principles of education, quality of education, quality education criteria, quality management criteria, quality management such as strategy. The interpretation of the quality and efficiency of the education system, as a social category characterizing the state of education, will inevitably impoverishment of the subjectivity of quality indicators inevitably the subjectivity. The needs of different social groups can vary, and this creates a contradiction between the hopes of education and their implementation

KEYWORDS: *Quality of education, Pedagogical principles of education, Quality management strategy, Modern pedagogy, Basic entities, Quality education criteria.*

INTRODUCTION

The generalization of the current interpretation of the understanding of the education leads to the following conclusion: this is the integral feature of the educational process and its consequences representing the measure of its compliance with ideas in society and what goals they should serve. The dependence of education includes the propagandics of the composition of the education: education systems, educational process, students, research and innovative activities and management systems. The quality of education this is a comprehensive indicator:

- Interesting of educational purposes and results;
- Ensuring the level of meeting the requirements of the educational process of the submitted educational services;
- Achieving certain knowledge, skills, competent and powers, mental, physical and moral development.

V.V. Kazakov, focusing on the development of the quality of education, focuses on the development of many metalistics: Educational standards, scientific organization, the most new technical textbooks and pedagogical technologies. In addition, the quality of education comes from external factors: Training and production base, marketing, social partnership, financing¹ [1, 56 p].

THE GOAL

The interpretation of the quality and efficiency of the education system, as a social category characterizing the state of education, will inevitably impoverishment of the subjectivity of quality indicators inevitably the subjectivity. The needs of different social groups can vary, and this creates a contradiction between the hopes of education and their implementation. When considering the quality of education in terms of state, society, employers, parents, teachers, students, receive a new quality, i.e., different sets of quality education. In addition, social dynamics inevitably leads to the evolution of ideas about it. We can say that as a social category, the concept of education and variationificationis given to the concept of education. This means that an Invasion is a feature of education that allows you to ensure life and professional success. Then those who are specific to the concepts of success in each specific historical period will be variability features.

At the same time, the concept of the quality of education, which is derived from the uncertainty of the quality philosophical category, does not exclude the need to object ideas on quality education. Such objectivity should be the result of social dialogue, a wide social partnership.

THE MAIN PART

The concept conducted in modern pedagogy is given the following indicators of quality education, summarizing different approaches:

- Conceptual degree that corresponds to the level of scientific and technological development;
- Interdisciplinary, competent and activity description;
- Individual orientation;
- Variable, alternative and problematic description of training;
- Creation of different cultural environment;
- Independent assessment of the level of development of the learner.

Based on the above, pedagogical principles of quality education are formed as follows:

RESULTS:

- Optional of the content of the educational content;
- Personal or development of educational programs and educational technologies;
- Interaction of subjects of the educational process in the interview process;
- Constant activism of students as an educational subject and the level of independence;
- understanding the students of education, specific changes in the educational process;

Advising the focus of quality education in the work of foreign scientists inviting:

- Healthy and well-eating learners ready to participate in the educational process with the support of family and community;
- Educational environment, which provides healthy, safe, protection, necessary resources, and favorable conditions;
- Content reflected in the relevant curricula and materials to develop key skills;
- the process of using approaches that teachers are prepared using the approaches to the first place; Training in specially equipped acadia and schools; Uses the ability assessment methods to encourage reading and minimize the differences in learning students;
- the results involving national goals and positive participation in the field of education, which includes knowledge, skills and personal positions, are related to the positive participation in the field of education.

The list includes a favorable environment for the Quality Indicator of Quality, the educational symptoms that ensure favorable conditions for human development.

Analysis analysis of the quality of education will allow it to highlight the following symptoms:

Quality in potentially result of the final result of education and achievement of this quality;

We have the results of educational education; quality of educational process, quality of educational content, education technology, and human quality;

Multiplicity of final results - the quality of professional school and general secondary school graduates;

Most of the quality of education, i.e. the quality of education, is carried out by many entities. Majbles: students and student graduates themselves, higher education institutions and doctoral education graduates of various additional curricula; their parents; employers in general society and government agencies; the education system itself; representatives of its various levels and stages; Researchers of the education system;

multine criteria - the quality of education is evaluated by a set of criteria;

High level of subjectivity in understanding the quality of education;

Invasion and variability - between all graduates of each specialization, their graduates, stands for each graduates of each study, each historical period.

Apparently, there are common grounds in the philosophical, economic and pedagogical definitions of quality. In addition, the idea of the quality of education is a reflection of the philosophical and practical approach. Thus, the quality is determined as an integral feature of modern education. In this sense, it does not have an appraisal characteristics, it includes the quality of alumni, the quality, structure and technology of the educational process, not bad, and is not good.

When using an economic approach, the quality of education will have the meaning of assessment. In this case, the results of educational services and the educational process can be assessed, the quality of graduates. As an economic category, education is determined by the sum of objective quality properties and characteristics.

Based on the general concept of education, the quality of higher education can be explained as follows:

- In a particular state standard, as well as compliance of the "products" and services established by other consumers of other consumers;
- Accurately and measurable variability, for example, the professionalism of students;
- The ratio of expenses and results obtained;
- Ability to meets the hidden needs of customers;
- The result of the interaction of the teacher and student.

Higher education also stands in internal goals. Indeed, the quality of requirements for high quality education must be provided, i.e. the quality of the conditions must be ensured. The quality of educational processes, which provides direct training of specialists, plays an important role in following these two aspects of quality. Thus, the quality of higher education is the general indicator, including:

Quality of Conditions:

- Standards, normative bases, quality of curricula (education content);
- The nature of the teaching, laboratory, material and technical base of higher education;
- Personnel potential;

Processes:

- Quality of education technology;
- the nature of the interaction in the "Teacher - Student" system;
- quality management of the educational process;

Results of the Activities of Higher Education Institutions:

- quality of training of graduates;
- The degree of development of their personal qualities, upbringing, professional culture;
- Professional self-democracy, the need for its need age in the labor market, the level of satisfaction.

However, it should be noted that the quality of the learning results cannot be considered separately the quality of the learning process and the conditions of its implementation. The opposite is also true: determination of the efficiency and the results of its implementation without evaluating the effectiveness and conditions of its implementation. Therefore, the quality of the education is the level of identification and identification of students, which meets and responds to the conditions of state and society, reflecting the conditions, reflecting the conditions that reflect the conditions that meet the needs of the state and society, reflecting the conditions that reflect the conditions that reflect students. It should be understood that there is no clearly uniformity between the conditions, organization and results of educational activities.

It should be noted that the quality of the training of graduates is the inner core of the system. The remaining qualities provide the necessary level of education systems, the results of the result.

Quality higher education must meet a number of requirements:

- Able to conduct fundamental and applied research, training of highly qualified personnel in all sectors of knowledge and the economy;
- Training of highly qualified specialists who are able to effectively solve standard and non-standard practical tasks in various fields of activity;
- Education of higher education, cultural, spiritual and physical developers.

When called quality education, it is usually as follows: the demand for high employment and young professionals; rational use of limited sources; Effectiveness and monitoring of educational services; Quality management strategy.

The composition of science quality is the composition of the quality of education - results, conditions, acceptance of the quality of the process, as it is to add another important, system component. Relying on philosophical traditions stronger: What is the substantive characteristics of the educational process (its quality)? The answer to this question seems very simple: the educational process without the learner and the learner without the education and education-treating relationship is impossible to do not interact. It is this attitude that forms the essence of the educational process, its essence. In the pedagogical education system, we operate something that the all components can't exist immecally, even when all components are in a good functional position.

CONCLUSION

The quality of relations between the main entities of the educational process should be considered as the results, conditions and an important component of the quality of education rather than the quality of education. In fact, the quality of the results depends on the quality of this relationship between the quality and quality of the educational process and the quality of its organization. At the same time, the reflection of the reflection is not exercised: the teacher cannot be fully covered by the rational organization of the learning process, or using additional technical means that the qualification of his motivation or not willing to work under new circumstances. Accordingly, in terms of management theory, the relationship between this "teachers - educated" should be the core of the quality management system.

ABSTRACT

Literature of each nation has its own way of development in the world literary process. The literature of the Arab countries has also taken its rightful place in the world and it has made a significant contribution to the development of world literature. It should be noted that today the Arab East consists of twenty-three states; however, the process of formation and development of new Arabic literature (the end of the 19th century-the beginning of the 20th century) in individual countries varies. In particular, Jordanian literature has its own way of development. Socio-cultural development of the country is associated with the movement of enlightenment – “an-Nahda” (the Awakening), covering a number of Arab States. But in Jordan, the movement “an-Nahda” arises later than in other countries, and it is formed in the 1920s-1940s. By this period, the short story (al-qissa al-qasira), a genre of short story, had become one of the leading genres of Jordanian literature. By the 1950s - 1960s, the withdrawal of Palestinians from their native lands, the defeat of the Arabs in the Arab-Israeli war in June 1967 led to an even greater appearance of works devoted to the events of the war. As a result, the political processes in the East in many Arab countries, including Jordan, the defeat of the Arabs in the Arab-Israeli war have led to the emergence of even more works revealing a gallery of events related to the war. This theme is considered to be one of the main themes of Arab literature, in particular, Jordanian literature. The political processes in the Middle East have created a new social and cultural environment in the Arab world, including Jordan. The study of short stories in Jordan in the early 60-80s of the 20th century shows that the problem of Palestine is one of the leading topics, received a deeper and more comprehensive coverage in their works. A characteristic side of the short story writers of Jordan 70-80s is that they take a biased anti-Israeli position. During

this period, the writers create the short story which possesses a new form and content. It should be noted that the anti-Israeli position is characteristic of the short stories of Ilias Farquh, where the writer's short story "Abo, illuminating the silence", discusses the theme of the Palestinians who have become refugees in their homeland.

KEYWORDS: "An-Nahda", Journalism, "Kissa Kasira" (Short Story), Realism, "Palestinian Theme", "Anti - Israeli" Position, Retrospective Plot, Symbolic Meaning, "Abo " - Outerwear.

INTRODUCTION

Jordanian literature is an integral part of universal literature, with a unique tradition dating back to the early Middle Ages. The development of literary processes in Jordan is in many ways similar to the literary processes in other Arab countries whose historical destinies are similar. Like other Arab states, the territory of present-day Jordan was a part of the Arab Caliphate from the 7th century, then part of the Ottoman Empire, and until the beginning of the 20th century, Syria, Jordan, Lebanon, Palestine formed a single geographical and cultural-historical region and named as Sham.

The emergence of the independent state of Jordan coincided with the beginning of the twentieth century, and in 1921, under the British mandate, the Emirate of Transjordan was formed. In 1946, the Emirate of Transjordan became known as the Hashemite Kingdom of Jordan (Jordan) and became an independent state led by King Abdullah.

Main Part

The socio-cultural development of the country was connected with the enlightenment movement - "an-Nahda" (Renaissance), which included a number of Arab states. Literary critic A.A. Dolinina, in a short sense, the word "an-nahda" means "cultural development, the restoration of ancient Arab heritage and the development of literature and art through its use for modern needs¹. But the al-Nahda movement in Jordan came later than in other countries, in the second quarter of the twentieth century (20-40s). However, this movement began in the middle of the XIX century in the relatively developed Arab states - Egypt, Syria, Lebanon. "Until the 1920s, there were no political, material or human resources for the an-Nahda process in the territories that were part of Jordan," writes Jordanian literary critic Samir Qitami².

Representatives from other Arab countries, especially Palestinians, took an active part in the rise of the socio-economic and cultural way of life in Jordan. Several members of the Jordanian government, even Amir Abdullah, were not originally Jordanian.

Amir Abdullah was not only a great politician, head of state, but also a poet. Many Jordanian writers, including Isa an-Nauri, Samir Qitami, and Abdurrahman Yaghi, considered him as the founder of literary movements in Jordan. "After the publication of his (Amir Abdullah's) collection of poems, literary movements began in Jordan; the Amir often competed with poets, words from Jordan, as well as poets from other countries³.

By this time, the traditions of classical Arabic literature did not fully meet the new requirements of the time, the needs of the reader. The development of Jordanian literature in the 20s and 40s of the twentieth century was characterized by the gradual abandonment of these traditions under the influence of relatively advanced literature, as well as the incorporation of traditions. Advanced

representatives of Arab society seeking to study European culture sought answers to the social problems of the time from the philosophical, socio-political, and aesthetic concepts of the West. The revival of the national ideology of the Palestinian and Jordanian peoples, the development of cultural and literary movements were played by the first Jordanian enlighteners of Palestinian origin, Halil Baydas, Khalil as-Sakkokini, Iskandar al-Huri al-Bitijali, Muhammad al-Shariki, Shukri Shaasha and others.

Journalism was widely developed in the works of enlighteners. The development of journalism paved the way for the enrichment of literary forms and internal content, the emergence of new genres, first of all, the genres of story, narrative, novel. If until the end of the XIX century the main form of literary creation in the Middle East was poetry, by the 20s and 30s of the XX century prose rose to the forefront. Being full of problems required a new way of thinking and a clear, realistic reflection of the "idea of the age." This situation accelerated the emergence of new forms, first of all, the "small" prose form - the story genre, making it one of the leading genres in the early years of Jordanian literature. The lack of material resources for writers to write and publish works in large prose form led to the development of the story in relation to the novel. Literary critic Samir Qitomi points out that "Jordan's 'little story' has historical roots, it has used the experience of Egyptian, Syrian, Lebanese and Mahjar⁴ storytelling⁵. "Daily and weekly newspapers, cultural collections and other periodicals played a major role in the spread of this art⁶.

As a result of the 1948 military conflict with Israel, thousands of Palestinians were forced to leave their homeland and move to Jordan. The migration of almost half of Palestine's population to Jordan has not only increased its population, but also changed its internal social structure. "Jordan's 400,000 backward population, made up of Fallahs and nomads, has been joined by nearly a million workers, artisans, farmers, intellectuals and local officials⁷". This was another impetus for the development of Jordanian literature. "Palestinian storytelling has influenced the development of the storytelling genre in Jordan. Palestinian writers were more advanced and skilled than Jordanian writers in the field of storytelling. This is the result of the people's desire to get acquainted with the culture of neighboring Arab countries, to know the essence of the story genre in life⁷".

By the 1950s, the exodus of Palestinians had become a major theme in the literature of many Arab states, including Jordan. It is safe to say that this period was a great revolutionary period in intellectual and cultural life. Political processes in the Middle East have created a new social and cultural environment in the Arab world, including Jordan. "After the tragedy of 1948, the children of the two banks of the Jordan River merged. This society has endured the oppression of the Israeli occupation, the disintegration of the Palestinian people, and difficulties in the health, social, economic, and political spheres. All of this was covered in the prose of the time⁸.

By the 1960s, the range of themes in Jordanian story had expanded and literary criticism had developed. "In the 1960s, the number of collections that published stories in Jordan increased to 11. "The New Horizon" magazine, published in 1961-1965, was instrumental in publishing the stories of Jordanian writers of the period. Literary critics discussed the works of writers through their research and translations. This laid the foundation for the entry of the younger generation into the field of culture, acquainting them with different literary trends and styles⁹.

The defeat of the Arabs in the Arab-Israeli war of June 1967 led to the emergence of more works devoted to the events of the war. According to literary critic Khalid al-Karki, "Arab writers believed in the power and place of the literary word¹⁰".

RESULTS AND DISCUSSION

In 1974, the Jordanian Writers' Society (رابطة الكتاب الاردنيين) was founded. The purpose of the society was to create a society, said Abdurrahman Yaghi, a critic who led the society from 1979-1981¹¹. From its earliest days, the Jordanian Writers' Society struggled to "strengthen its position, create a free cultural environment, and ensure that the works of young writers are available to students in every corner of the country¹²". Khalil as-Sawahiri, Ahmad Udo, Fahri Kaavar, Mahmud Shukeyr, Yusuf Zamra, Salim an-Nahas, Mufid Nahla, Ibrahim al-Khatib, Ibrahim al-Absi, Yusuf al-Hazw, Khalil Qindil, Ilyas Farkouh, Hashim Gharayiba, Mustafa Salih and other writers were members.

A study of the work of Jordanian storytellers in the early 1960s and 1980s shows that the Palestinian problem, one of the leading themes in their work, is described more deeply and comprehensively. A characteristic feature of the works of the Jordanian writers of the 70s and 80s, the Children of Disaster (ابناء الهزيمة), is that they are anti-Israel. "The Palestinian problem, which reflects the national identity of Jordanian literature, became especially serious in the 1970s and 1980s¹³". Each of the storytellers of this period had his own style and idea of authorship. This is reflected in the fact that each writer chooses one or another aspect of the Palestinian problem, the theme of his works and the diversity of his protagonists. For example, the stories of Yusuf Damra depict the lives of Palestinian refugees in Jordan in profoundly realistic images, while Khalil al-Sawahiri and Mahmoud Shukayr focus on the lives of different strata of Palestinian society in the Israeli-occupied territories. "The main, leading direction in the development of Jordan prose during this period was to further strengthen and enrich realistic principles¹⁴".

The Arab literary scholar Hussein Juma wrote in his article "The Palestinian Problem in Modern Jordanian Literature" that "the Palestinian question and the problem of displaced refugees were the main themes of modern Jordanian literature¹⁵".

During this period, Ibrahim al-Absi, Yusuf Damra, Ilyas Farkouh, Hashim Gharaiba, Khalil Qandil, Rijo Abu Ghazzala, Tariz Haddad, Zuhra Umar and other short story writers were effective. "Writers who created in the 70s brought a new form and new content to the story. It not only reflected the realities of the homeland or the Arab world, but also went beyond the Arab world¹⁶".

The desire to create the first short story in Jordanian and Palestinian literature is reflected in the work of Khalil Baydas (1875-1949). According to literary critic X. Yaghi, Halil Baydas can be considered as "the first great teacher of the story¹⁷".

In 1924, in Cairo, a collection of short stories by Halil Baydas, entitled Thoughts (مساريح الازدهان), was published. The collection included 32 "pieces" that could be called conditional stories that laid the foundation stone for the formation of Palestinian and Jordanian storytelling. Diverse in genre (apologies and parables, essays, etc.), these works indicated that the writer had long sought forms appropriate to the spirit of the times, beginning the first period in the development of new prose. Most of them had no plot and consisted of philosophical and ethical ideas, and sometimes the propaganda of direct enlightenment ideas.

The emergence and development of the story genre in Jordan is also associated with the name of another Palestinian writer, Mahmoud Sayfiddin al-Irani (1914-1974). He further developed the ethical issues raised by Halil Baydas in his works. Al-Irani criticized feudal traditions in his works, focusing on the role of women in society, unemployment, and other issues. We can see these issues in his works, such as "Human Life" (حياة الإنسان (1937)), "The Cloud Has Passed" (سحابة مرت (1937)), "Burning" (الاحتراق (1955)) and others. For example, the protagonist of the story "Burning" - a nurse working in a military hospital, looks at the wounded every day, confronts the dead and mourns the wounds of the war. However, she stays in the hospital even after learning that her boyfriend is dead and continues to look after the injured.

Sayfiddin al-Irani looked for a theme in his works from life. He writes in his book, "Our Culture is 50 Years Old", that storytellers need to take their heroes from the real being that surrounds them. Life itself is a source of inspiration for writers. That is why the writer's service to society is determined by his ability to reflect life objectively. The writer-realist must only look ahead and show the people in his works ways to get out of poverty, serve his people and connect his work with the fate of the oppressed¹⁸, he said.

Isa al-Nauri (1908-1985) was another writer who made a great contribution to the formation of the national literature of Jordan. Isa al-Nauri's literary work is extensive, and he is well known to readers as a storyteller, novelist, literary theorist, linguist, member of the Jordanian Arabic Academy, and translator. He entered the "small prose" in the 1940s, at a time when the national liberation movement of the Jordanian people was developing and the country's aspiration for cultural and political independence was growing. Al-Nauri also focused on one of the most painful problems of Arab society in his early stories - the problem of women. It is known that the issue of women is widely covered in the works of the great representatives of the new Arabic literature Jubran Khalil Jubran, Amin ar-Rayhani, Mikhail Nuayme, Mahmoud Teymur and others.

We also find various "painful" aspects of the Palestinian problem in the work of the famous Jordanian storyteller Yusuf Damra (1952). His first collection, "Wagons", published by the Jordanian Writers' Society, included 11 stories written between 1974 and 1978, reflecting the writer's creative maturity. The main protagonists of Yusuf Damra's stories are Palestinians. His stories, such as "The Warm Waters of the Gulf" (مياه الخليج الدافئ), "Steel Circle" (دائرة الفولاذ) and "Homeland and Lisa" (الوطن و ليزا) and others focus on war events.

In addition to the above-mentioned writers who are the masters of storytelling, we can meet many more storytellers in Jordanian literature. Among them were Halil Qindil (1951), Muhammad Tawfiq Hakim (1954), Mustafa Salih Mustafa (1947), Ahmad Udo (1945), Khalil as-Savahiri (1940), Ilyas Farkouh, Yusuf al-Hazw (1940), Mahmud Shukeyr (1941).) and others.

Jordanian writer Ilyas Farkouh (Ilyas George Basil Farkouh) was born in 1948 in Ammon. He studied at the University of Beirut, majoring in Philosophy and Psychology. From 1977 to 1979 he worked in the editorial office of the newspaper "Madaniyat" and magazines "Madaniyat Asri". From 1980 to 1991 he worked in the publishing house, and in 1992 he founded the publishing house "Dar azmina" (House of Times) and was the director of this publishing house. He is one of the founders of the Jordanian Publishers Association and a member of this association, as well as the Union of Arab Writers, the Jordanian Writers Association. His

collection of short stories "21 Shots for the Prophet" won the "Best Collection of the Year" in 1982, as well as the novel "Foam" in 1992, and in 1997 won state awards for his contribution to storytelling. Elijah Farkouh's "Pages" (1978), "The Birds of Ammon Fly Slowly" (1981), "21 Shots for the Prophet" (1982), "Who Drives the Sea?" (1986), "Secrets of the Hourglass" (1991), "Angel in the Open Sky" (1995), "Winter Under the Roof" (2002), and many other collections of stories. Ilyas Farkouh was also involved in translation. He was also educated in England. Independently dealt with filmmaking and fine arts. Probably for this reason, these are reflected in his artistic worldview, his desire for clarity in the depiction of events, and his ability to reflect them on facts.

As noted above, since the 1940s, the theme of Palestine and Palestinians became a leading theme in the work of Jordanian writers, an important national feature of Jordanian literature. This was due to socio-political changes in the Middle East, the Arab-Israeli wars of 1948 and 1967, the expulsion of thousands of Palestinians from their homeland, the difficult social life in the refugee colonies, unemployment and other problems.

Elijah Farkouh's story, "Eagles illuminating silence", was written in 1978 and published in al-Qaeda in Beirut. The author dedicates his work to Jihad Humuv who passed away and mentions this at the beginning of the story.

The protagonists of the story are women and townspeople. The woman's name is not mentioned in the play. The story is based on a retrospective plot and begins at the culmination:

(كان ملفعًا بكفن غير الذي درج عليه الناس. مخطط بالوان طويلة عريضة، وقصير لم يحط بجسده تماما اذ برزت صفحاتاً قديمة العاريتين كشيتين زائدين

He was wrapped in some kind of shroud with wide and long stripes that people were not wrapped in. The shortness of the shroud did not completely cover the body, and his legs protruded as if it were extra."

As you can see from the picture, at the beginning of the story there is a picture of an immigrant dying on the street.

The man was frustrated on the east side of town. None of the townspeople knew him. This is strange, because the people of this small town knew each other very well.

نعم، نحن نعرف صعايك بلدتنا و حثالها. نعرفهم واحدا واحدا. الحاقه منهم والعاطل. المتشرد ونزيل السجون الدائم. ونعرف أيضا الماجورين المافونين. نحن نعرف مستقبل الجنين وهو في بطن أمه نحن نعرف كل شيء.

"We know the townspeople and the inhumane," he said. We know them one by one. We know who hates them, who is unemployed. We know both the homeless and those who are constantly imprisoned. We know the idiots in the rent, and even the babies to be born in the mother's womb. We know everything.

Here the writer draws the reader's attention to a number of "painful" problems of society. The increase in Jordan's population due to refugees causing unemployment, homelessness problems in the society. The number of refugees growing. Thousands of people are forced to look for work in other areas to support their families. Some people die as a result of political conflicts, various disasters. The author notes this throughout the work.

The protagonist of the story is a woman, and the course of events continues in harmony with the woman's inner experiences and thoughts. Leaning against the door of her house, the woman stares at the wall on the east side of town. The woman, who saw cars passing by the barrier, did not give in to nightmares. The woman is the wife of a man who gave his life for Palestinian freedom. In this way, the author draws the reader's attention to the fact that political problems have not been solved for years, and the flow of refugees has not stopped. The protagonist of the story is also a representative of Arab women who are tired of political clashes, but still endure all the hardships. The woman is patient and resilient. She is a family person, trying to keep it a secret, even though she is tormented by the loss of her heart and the pain of waiting. The writer skillfully describes such mental states of the protagonist.

The dreamy woman remembers her husband's last words in anger.

وطَّنة على العطاءم بعد اليوم!!

"Patriotism is needed in great deeds from today !!"

These words of Iqab are a moving feeling in the hearts of Palestinians - love for the motherland, devotion to good deeds, a call to fight for freedom.

The woman has not seen her husband since. Such a tragedy was the tragedy not only of the protagonist of the work, but of all the women of the eastern city. It is known from history that in 1949, the eastern part of Jerusalem came under the control of Jordan and the western part under the control of Israel. But after the 1967 Six Day War, the Israeli government occupied the Eastern city. This will cause great protests of the Arab people. The problem of the eastern city is still unresolved.

Unemployment has dispersed the poor, middle-class population of the eastern city in search of work. They are even looking for work in areas belonging to Israel. Someone dies on those sides. However, there is no human value in those aspects. In some cases, even the dead are left on the streets. The writer expresses this tragedy of the nation through the following conversations of women gathered under the wall.

- الجنازة مصلوبة في الشمس منذ الصباح، هذا لا يجوز.

استغربت المرأة:

- ولماذا لا تتحرك؟ كرامة الميت في دفنه.

تتطحت أخرى: يقولون انهم منعوها.

- من منعها؟

قالت الأولى:

- ضابط المخفر

- "The corpse has been lying in the sun since morning, which is not good."

Another woman said in surprise:

- "Why don't they try?" After all, burying in time is good for the corpse.

Another woman said with conviction:

- They say they do not allow it.
- "Who doesn't?"

The first woman said:

- The guard at the post.

The woman did not succumb to all sorts of frightening fantasies. She sometimes thinks of her husband Iqab and sometimes of her son Hamadon. His son has not been seen since morning either. Suddenly the woman's imagination is shattered by the words of those gathered.

مات في الجنوب ويريدون دفنه هنا. انه غريب.

- *He died in the south, they want to bury him here. He is a stranger.*

- *"He's no stranger." He was born here, but that place is also his homeland.*

Although a number of Palestinian territories have been occupied by Israel, Palestinians also consider these lands as their homeland and will never give up hope of returning to their homeland. Ilyas Farkouh would like to emphasize this in the above conversation.

The fate of the dead will not be decided until late at night. In the middle of the night, while the guards are asleep, his (deceased's) friends come and steal without telling him. When darkness falls, a call is made for a funeral in the town.

Funeral details will be described throughout the work. These details remind the reader of a documentary.

أطل النعش من بعيد فدنت بندق البلدة منه.. كان صامتا ومكشوبا ويتقدم، وكانت البنادق تهتز متوفرة. العساكر يراقبون من بعيد، والنسوة جمعن اولادهن الى جنبهن. اشتعلت الجنازة بالشاعل وقاربت مدخل البلدة.

The coffin appeared in the distance and was approached by the town's rifles (armed men). The coffin shook quietly and approached in an open position. The rifles rose and rose, as if ready to open fire. The soldiers were watching from a distance, and the women were gathering their children around them... The funeral procession lit up under the torches and approached the city gates.

The funeral was held under military supervision. The number of people coming to the funeral was increasing, which sounded like a new clash with the soldiers. The woman comes to her senses as her son Hamadon holds her hands. Her husband did not return home that night either. The morning had also begun. Hamadon said, "Mom, look at the bats," and clung to his mother's lap.

- انها ليست وطاويط يا "حمدان" لا تخف.
- ثم تنهدت و أضافت:
- الوطاويط لا تجرو على الخروج إلا في الليل.
- فتساءل حمدان:
- وما هذا؟
- رفرفت عباءة سوداء في المقابل بفعل الريح.

- جيش من العقبان يا "حمدان". من العقبان.
- *"They're not bats, Hamadon, don't be afraid." Then he took a deep breath and added:*
- *Bats only go out at night. Hamadon asked again:*
- *"What's that?"*

On the opposite east side, a black wing fluttered in the wind.
- "Hamadon, these are an army of eagles." An army of eagles.

At this point, Ilyas Farkouh strives for symbolism. By eagles he means Palestinians striving for freedom. Eagles strive for freedom, for distant heights. The flock of eagles is proud, they will never be defeated.

The story is "Silence like a new grave" (سكون رتيب كالمقبرة الجديدة), "An ominous idea" (قلبها هاجس شؤم), "Torches flashing lightly like devils on houses" (المشاعل كشياطين), "Heavy day" (النهار الثقيل), "The passion of blood boiling like an ordinary cauldron" (تفور كمرجل بدتنى), "Hot tears" (العيون المحرورة الدامهة), "Hot blood passion" (شهية الدم الفائر) and the skillful use of various other analogies and expressions further enriched the content of the work.

As we can see, the realistic depiction of the events in the story demonstrates the writer's skill in artistic perception of reality, his artistic thinking, and the uniqueness of his style of expression.

CONCLUSION

In conclusion, a study of the work of Jordanian storytellers in the early 1960s and 1980s shows that the Palestinian problem, one of the leading themes in their work, is described more deeply and comprehensively. A characteristic feature of the works of Jordanian writers of the 70s and 80s is that they are anti-Israel. Writers who worked during this period brought a new form and a new content to the story.

Elijah Farkouh's story "Eagles illuminating the silence" also addresses the above issues. One of the unique features of the story is that it is built on a retrospective plot and begins at its culmination. In this way, the author manages to engage the reader and quickly draw his attention to the content of the story.

In the story, the author draws the reader's attention to a number of "painful" problems of society. The main theme of the work is the increase in the population of Jordan due to refugees, unemployment, homelessness in society, thousands of people forced to look for work in other areas to support their families, political conflicts, the death of innocent people as a result of various disasters. The story skillfully portrays the image of a woman who is tired of political conflicts, yet still endures all the hardships.

THE ROLE TO IMPROVE THE MECHANISMS OF STATE SUPPORT FOR THE AGRICULTURAL SECTOR IN UZBEKISTAN

Dilbar Suyunova*

*Independent Researcher,
National University of UZBEKISTAN

ABSTRACT

This article presents the features and factors that determine the attraction of investments into the agricultural sector of the country and the investment policy in the agricultural sector. Thus the main foreign partners on attraction of foreign investments into the sector and ways of development of investments into fixed capital for agriculture in Uzbekistan are allocated.

KEYWORDS: Strategy, Infrastructure, Agriculture, Agriculture, Credit, Agrarian, Project, Machinery.

INTRODUCTION

In order to achieve sustainable development of the agricultural sector, it is necessary to form the investment potential of farms, improve their support mechanisms.

To do this, it is necessary to develop an agricultural investment policy that includes a mechanism to develop the investment potential of the industry, increase the attractiveness of the investment environment, reduce risks.

The action strategy for the five priority areas of development of the Republic of Uzbekistan for 2017-2021 sets the task "... active attraction of foreign investments in the sectors and regions of the economy of the country through comprehensive and balanced socio-economic development of regions, districts and cities, improvement of the investment climate" [1].

THE MAIN FINDINGS AND RESULTS

Socio-economic, financial-organizational-legal and other factors in increasing investment activity should be directly related to the formation of a favorable investment climate for producers in this sector.

In order to increase investment activity in agriculture, the following tasks need to be addressed:

- Development of institutional market infrastructure that will attract investment in agriculture;
- Formation of investment markets in the regions, which are engaged in the organization and direction of capital investment in the production investment of the population, farmers and small businesses and private entrepreneurship;
- Development of the banking system serving agriculture and increasing their capitalization;
- Improving organizational forms of investment attraction;
- Improving the participation of the state and investors in the justification and adoption of investment projects in agriculture;
- Organization of information-consulting and marketing services of the investment process.

In attracting investment in the agricultural sector, the financial condition of agricultural entities, high risk, long-term coverage of the results and efficiency of their fixed assets requires the creation of a system of direct investment: a system of strong links between domestic and foreign investment sources and collateral reserves. reaches

The system of mutual guarantees between agricultural entities, suppliers of agricultural raw materials, technical equipment (logistics of the project), which are mainly used by investors, should be implemented by government agencies and commercial banks.

They must simultaneously guarantee loans and guarantee the risk of non-return on investment. In agriculture, the mechanism of investment in fixed assets will ensure the continuity and sustainability of their reproduction, as well as the effective use of investments in the agricultural sector.

The specific features and factors that determine investment policy in the agricultural sector require a direct transition from quantitative to qualitative indicators, that is, to attract investment in areas that are highly productive and priority.

In 2017, funds from international financial institutions were attracted for the development of agriculture:

-\$ 150.0 million from the Asian Development Bank for the project “Modernization of Agricultural Production”;

-\$ 150.0 million from the International Bank for Reconstruction and Development for the Livestock Sector Development Project;

-International Fund for Agricultural Development

23.8 mln. USD for the project “Expansion of dairy production and development of processing in Kashkadarya and Jizzakh regions”;

-\$ 14.0 million from the International Development Association for the project “Adaptation and mitigation of climate change in the Aral Sea region”.

In 2019, the volume of investments from all sources of financing reached 220.7 trillion soums, which is 2 times more than the approved forecast for the year. At the same time, the volume of investments in fixed assets amounted to 189.9 trillion soums, and the growth rate compared to 2018 was 1.3 times.

The share of fixed capital investment in GDP increased from 30% in 2018 to the current 36.2%, the share of total investment in GDP in 2019 amounted to 42.1% [2].

At present, 2.8 thousand social, infrastructure and production facilities have been commissioned. There are 145 large production facilities, 167 large regional projects, more than 2,500 social and infrastructure facilities.

Significant growth in investment activity is directly related to the inflow and disbursement of foreign investment of \$ 13.3 billion, including:

- Foreign direct investment and loans - \$ 9.3 billion (including fixed capital - \$ 6.6 billion;)
- State-guaranteed foreign investments and loans - \$ 4.0 billion (including fixed capital - \$ 3.2 billion).

At the same time, the share of disbursed foreign direct investment and loans in total investment reached 37%, while in 2018 this figure was 10.5%.

According to a report by the United Nations Conference on Trade and Development (UNCTAD), global foreign direct investment fell for the third year in a row, reaching its lowest level since the global financial crisis. As of January 1, 2019, this figure decreased by 19%, while in 2017 - by 16%.

At the same time, according to the UNCTAD report on developing countries, a positive growth in foreign direct investment was observed in Asia, its volume increased by 5%[3]. At the same time, the growth of foreign investment in Central Asia averaged 8-10%, while in the Republic of Uzbekistan this figure was \$ 2.9 billion for the same period in 2019, including \$ 1.6 billion in fixed assets, which is 3.2 times more than last year. \$ 9.3 billion, of which fixed capital increased by \$ 6.6 billion. This has ensured the leadership of Uzbekistan in terms of growth among Central Asian countries [4].

China, Russia and Germany can be recognized as the main foreign partners in attracting foreign investment to the republic. At the same time, the total number of countries investing in the economy of Uzbekistan has exceeded 50. As a result, the share of large investor countries in total foreign direct investment and loans decreased to 34%.

It should be noted that the active growth of foreign direct investment and lending compared to 2019 increased by 2.5 times in the textile industry, 2.1 times in leather and footwear.

The growth rate of foreign direct investment and credit flows has also strengthened in projects of regional significance, with a total volume of \$ 4.8 billion in 2019, including \$ 4.2 billion in fixed assets.

In 2020 and beyond, work is underway to diversify their areas by actively attracting foreign direct investment and credit, implementing them in priority areas, such as the production of finished products in agricultural and industrial enterprises.

The specific features and factors that determine investment policy in the agricultural sector require a direct transition from quantitative to qualitative indicators, that is, to attract investment in areas that are highly productive and priority.

The cost of investment projects for the construction of new enterprises for deep processing of agricultural products, reconstruction and modernization of existing ones in 2016-2020 [5].

TABLE 1

Investment projects	Total cost of projects	By sources of funding:		
		own funds	bank loans	foreign investment and loans
Total projects) (180)	595 886,3	242 916,7	189 461,6	163 508,0
Including				
New construction (141 projects)	463 267,3	169 714,7	144 324,6	149 228,0
Reconstruction and modernization (39 projects)	132 619,0	73 202,0	45 137,0	14 280,0

According to the above, in 2016-2020, 138 fruits and vegetables with a processing capacity of 99,100 tons, 46 meat processing plants with a capacity of 16,500 tons, 79 dairy products with a processing capacity of 34,850 tons and other food products will be produced. It is planned to launch 153 new food processing enterprises with a capacity of 26,840 tons.

In accordance with the Investment Program approved by the President of the Republic of Uzbekistan on January 9, 2020 No PD-4563, in 2020 it is planned to invest about 233.2 trillion soums in fixed assets from all sources of financing; including foreign direct investment and loans - \$ 7.1 billion; state-guaranteed foreign investments and loans - \$ 2.7 billion.

In January-March 2020, the development of investments in fixed assets by type of economic activity in the Republic of Uzbekistan: 3182.5 billion soums in agriculture, forestry and fisheries accounted for 9.5% of total investments.

In January-September 2020, investments in fixed assets by type of economic activity in agriculture, forestry and fisheries amounted to 260.9 billion soums, or 0.9% of the total.

The development strategy of the Republic of Uzbekistan until 2035 provides for the allocation of \$ 67.9-83.0 billion to agriculture [7].

This indicates that the volume of investments in the agricultural sector of Uzbekistan has increased.

CONCLUSION

In our opinion, in the context of deepening and liberalizing economic reforms in agriculture, it is possible to achieve sectoral stability by ensuring the priority development of farms, namely:

-Production of high quality products through the efficient use of land and water resources of agriculture, equipping the material and technical base with modern equipment, the widespread introduction of high-yield crops and productive livestock;

-By attracting foreign investment, which expands the export of agricultural products.

To do this, attracting foreign investment in agriculture and investment activity can be based on the following principles:

-Continuous improvement of legal, socio-economic, organizational and institutional conditions that ensure the broad attraction of foreign investment in agriculture;

-Development of mechanisms for the organization, support, granting and implementation of foreign economic activity of agricultural entities, including farms and *dehkan* farms;

-Consistent implementation of preferential and incentive policies for foreign investors;

-Directing foreign investors' funds to industries, regions and directly to agricultural entities that ensure the sustainable development of agriculture and have a wide range of opportunities for the production of competitive products;

-Improving the system of comprehensive practical assistance and promotion of priority projects of the subjects.

The implementation of these principles will be an important factor in attracting direct investment, including foreign investment in agriculture, increasing the investment activity of the industry and, ultimately, its sustainable development.

ABSTRACT

The article examines the structural and phase changes of surface diffusion nitride-oxide coatings obtained in the process of nitriding in a gas medium followed by oxidation in water vapor of ferrite-pearlite steels, as well as the effect of phase changes on corrosion properties. The combination of the process of gas nitriding in an ammonia medium followed by oxidation in water vapor (nitro-oxidation) consists in the fact that at the first stage of saturation, nitriding is carried out in a gas atmosphere, and at the second stage, the nitride layer is oxidized in superheated steam.

KEYWORDS: Ferrite, Pearlite, Nitriding, Oxidation, Diffusion Coating, Nitride Layer, Oxide Layer, Corrosion Resistance.

INTRODUCTION

During nitriding of metals and alloys, multiphase surface diffusion coatings are formed on the surface of the work piece, consisting of a nitride zone and an internal nitriding zone, which provides a wide range of physic mechanical and physicochemical characteristics of nitrided materials. In order to expand the field of application of nitriding, combinations of the process with other methods of surface hardening are used. At the same time, the intensification of the

process, regulation of the structure and structure, as well as modification of the phase composition of the surface nitride layer with the achievement of the required property, taking into account the specific operating conditions of the processed product [1-4], is achieved.

Although the combination of the nitriding process with other methods of chemical-thermal treatment is carried out in a parallel or sequential scheme, in all cases the formation of the surface nitride layer during nitriding depends on the potential of the saturating medium; compositions of nitriding gas and nitriding alloy. During nitriding, according to the “iron-nitrogen” phase diagram, a nitride layer is formed on the surface of the work-piece, consisting of ϵ -phase, $(\epsilon+\gamma')$ -phase and γ' -phase. Under the high-nitrogen ϵ -phase, there is a mixture, followed by a thin γ' -phase. The boundary advancement of the γ' -phase significantly increases the average nitrogen content in the zone of internal nitriding [5-6].

THE MAIN FINDINGS AND RESULTS

When the nitriding process is combined, of all known saturating media, the most dynamic are gaseous atmospheres, which make it possible to obtain any structural sets and a different range of depths of diffusion layers. To ensure the diffusion of nitrogen into the material, it is necessary that the nitrogen potential of the saturating medium be greater than the nitrogen content in the metal. At the initial stage of diffusion, the nitrogen concentration corresponds to the formation of a high-nitrogen nitride layer (ϵ -phase) with a change in the value of the nitrogen potential in the atmosphere; the phase composition of the nitride layer also changes. The final structures and phase components of the nitride layer are obtained after cooling the nitride layer [7-9].

The combination of the process of gas nitriding in an ammonia medium followed by oxidation in water vapor (nitro-oxidation) consists in the fact that at the first stage of saturation, nitriding is carried out in a gas atmosphere, and at the second stage, the nitride layer is oxidized in superheated steam. As a result of oxidation of the nitride layer, nitride, carbo-nitride, oxy-carbonitride layers and a zone of internal nitriding with an enriched γ' -phase are obtained, which are each responsible for certain corrosion or wear-resistant properties [10-12].

To improve the service characteristics of products made of low-carbon steels, the difference in the physicochemical properties of the structure - ferrite and pearlite in the steel matrix, especially in the surface zone, requires the need for chemical-thermal treatment to obtain diffusion coatings in terms of increasing their corrosion properties in atmospheric conditions and wear resistance under various conditions of friction. One of the ways to achieve this goal is to obtain an equilibrium structure of the diffusion nitride-oxide layer on low-carbon steel products.

Carrying out the process of gas nitriding in partially dissociated ammonia at temperatures closer to the eutectoid temperature for the “Fe-N” system accelerates the nitriding process and reduces the nitrogen content in the ϵ -phase due to its intense migration into the depth of the layer. In this case, the surface hardness slightly decreases, but the physical and mechanical properties of the surface layer itself do not decrease. The nitrogen concentration in the ϵ - and γ' -phases at a given temperature and the phase composition of the diffusion layer are determined by the nitrogen potential of the atmosphere [2].

By changing the parameters of the atmosphere, it is possible to regulate the structure and phase composition of the layer, by changing the ratio of nitride phases in the nitride zone and by forming an oxide film of Fe_3O_4 at the final stage of the process. The atmospheric potential is a

thermodynamic quantity and indicates the possibility of forming a layer of a given phase composition and a certain concentration of saturating elements. When carrying out the nitro-oxidation process in a production environment, it is very difficult to measure the partial pressure in the furnace. In this regard, the nitrogen potential is usually controlled by the change in the dissociation of ammonia in the furnace atmosphere [13-14].

By maintaining the nitrogen potential at the level of nitrogen solubility in one or another phase, a layer consisting of iron nitrides and alloying elements can be formed on the surface of metals and alloys, and it is also possible to form an γ' -phase (low nitride) or ε -phase with low nitrogen content.

METHODS

To develop a production controlled technology of the process and the theoretical foundations of the technology of the combined nitriding process followed by oxidation in water vapor for surface hardening of low-alloy steel, the dependences of the composition and structure of the nitrided and oxide layers on the chemical composition of steels and technological parameters of the process were studied. Investigated industrial steels 20, 45 and 40X after annealing with a ferrite - pearlite structure.

During nitrooxidation to obtain the required effective thickness of the diffusion surface nitride layer, nitriding is carried out at a temperature of 500-580⁰C with an exposure of 3-5 hours. Metallographic analysis of the treated steel samples was carried out on transverse sections using a Neophot-21 light microscope.

The qualitative phase X-ray diffraction analysis of the diffusion nitride and nitride-oxide layers was studied using a Dron-3 diffract meter using filtered cobalt $K\alpha$ - radiation. The general corrosion resistance of the treated samples was investigated in a 3% NaCl solution.

RESULTS AND DISCUSSIONS

During nitriding followed by oxidation, a combined diffusion layer is formed, consisting of a surface oxide zone, a carbo-nitride and oxy-carbonitride zone, followed by a diffusion sublayer - an internal nitriding zone (INZ). In all cases, at the first stage of saturation, predominant nitrogen diffusion occurs, and the structure and phase composition of the diffusion nitride layer is determined by the phase diagram for the "Fe-N" system.

Since during the interaction of ferrite and pearlite with the environment in separate phases, due to the difference in electrode potentials, anodic and cathodic reactions occur; which cause electrochemical corrosion, as well as the difference in plastic properties and hardness of the phases, sharply reduce the surface physical and mechanical properties during their operation.

From a theoretical point of view, on steels the main structures of which are grains of ferrite and pearlite, due to the difference in the rate of diffusion processes during nitriding, the formation of a nitride layer over the depth of the metal occurs unevenly. Therefore, in order to obtain a uniform controlled nitride layer during gas nitriding in an atmosphere of dissociated ammonia, subsequent oxidations of the nitride layer in water vapor were carried out to obtain a thin oxide layer.

During gas nitriding in dissociated ammonia at saturation above the eutectoid temperature (5910C) for the "iron-nitrogen" system, the resulting diffusion nitride layer, depending on the

cooling method, consists of a porous $\xi + \varepsilon$ -phase, $\varepsilon + \gamma'$ -phase, γ -phase and it is followed by a zone of internal nitriding (Figure 1, a). The high-nitrogen $\xi + \varepsilon$ -phase has a columnar structure and upon cooling it is easily oxidized by atmospheric oxygen and always forms a thin porous oxide film consisting of Fe_2O_3 on its surface.

Oxidation of a nitride layer obtained at a higher eutectoid temperature always leads to its oxidation along the wall of columnar nitrides and, due to the porosity of the formed oxide layer, the rate of the denitro-genation process will always be higher than the rate of oxidation. When the nitride layer is oxidized in these temperature ranges, the total thickness of the nitride layer decreases due to the dissociation of the high-nitrogen nitride.

A mixture of the $\varepsilon + \gamma'$ -phase in the nitride layer is formed during the cooling period, due to the difference in nitrogen concentration along the depth of the layer (Figure 1, a). The formation of the γ -phase is characteristic of the nitride layer obtained at a higher eutectoid temperature. Especially, the formation of the γ -phase occurs with a decrease in the carbon content in the steel matrix, since the presence of carbon in the matrix participates in the formation of a nitride layer of a carbo-nitride nature and upon cooling, some part of the γ -phase closer to the internal nitriding zone transforms into carbo-nitride or γ' -phase in a mixture with the zone internal nitriding.

In low-carbon steels, the zone of internal nitriding formed in a mixture with the γ -phase, during saturation, practically does not have a significant effect on any properties of the processed material (Figure 1, a). By choosing certain methods of cooling in the zone of internal nitriding in the boundary of the pearlite part, it is possible to obtain martensite, bainite, or depleted retained austenite in the ferritic part.

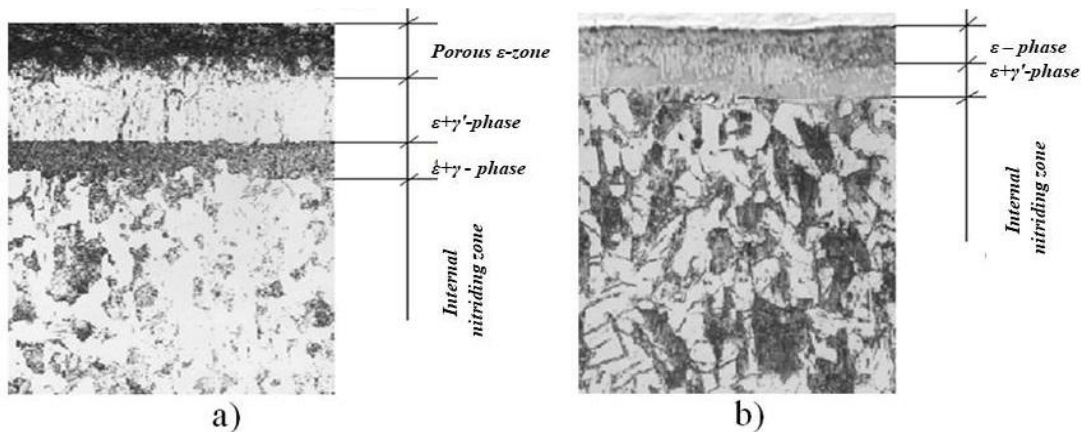

Figure 1. Microstructure of steel 20 after nitriding at a temperature of 620°C (a) and 580°C (b) in a dissociated atmosphere for 3 hours.

When nitriding below the eutectoid temperature (580°C), a denser structure is formed on the surface of steel 20 than the nitride layer obtained at a higher eutectoid temperature (Figure 1, b). The surface ε -phase has fewer pores, consists of a mixture of high-nitrogen nitride and carbo-nitride phases, and carbo-nitrides are formed by the diffusion of atomic nitrogen from the saturating medium and the simultaneous decarburization of the steel matrix in the zone of the nitride layer.

The mixture of $\varepsilon + \gamma'$ -phases forming behind the high-nitrogen ε -phase in the nitride layer, the forming during the cooling period has dispersed structures due to the uneven distribution of carbon in the steel matrix. Since the carbon content in ferrite is 0.02% C, and in pearlite 0.8% C. At saturation below the eutectoid temperature for the "iron-nitrogen" system, the γ -phase is not formed (Figure 1, b).

The composition of the zone of joints formed on low-carbon steels during processes of their saturation with nitrogen from the saturating atmosphere and carbon from the pearlite part due to its decarburization has a significant effect on the structure and phase composition of the nitride layer and on the performance characteristics of the hardened products. Determination of the composition of the nitride and carbonitride zones depending on the parameters of the saturating atmosphere in the range of certain temperatures is very difficult due to the different shapes and dimensions of ferrite and pearlite in the structure of the work-piece.

In the process of subsequent oxidation in water vapor of the nitride layer obtained at a lower eutectoid temperature (Figure 2, a), a thin oxide layer is formed on the surface of the nitride layer due to denitrogenation of the nitride layer (Figure 2, a and b).

A denser nitride layer for its further oxidation is obtained at a nitriding temperature below the eutectoid temperature with a stepwise change in the degree of dissociation of ammonia. Since at the beginning of the process it is desirable to withstand a low nitrogen potential due to the activity of the treated surface until the concentration of nitrogen in the diffusion layer is obtained within the formation of the ε -phase.

In the diffusion layer, after reaching the nitrogen concentration corresponding to the formation of a high-nitrogen nitride phase in an atmosphere of constant nitrogen potential, the process of decarburization of the matrix is accelerated in the opposite direction to the diffused atomic nitrogen, as a result of which the rate of nitrogen diffusion decreases. In this case, on the surface, the probability of the formation of molecular nitrogen and the accumulation of carbon from the matrix causes micro-porosity of the formed layer.

The subsequent increase in the nitrogen potential ensures a constant rate of nitrogen diffusion through the nitride layer. In this case, boundary diffusion of carbon from pearlite towards ferrite occurs due to the displacement of the atmosphere by nitrogen. The redistribution of nitrogen and carbon in the ferrite and pearlite zones favorably affects the formation of a carbonitride layer, both in the ferrite and pearlite parts of the formed surface nitride layer, giving them the same carbonitride character. As a result of such a change in the nitrogen potential of the saturating atmosphere during nitriding, it is possible to obtain a denser structure of a mixture of ε -phase nitride and ε' -phase carbonitride in the surface layer for its further oxidation (Figure 2, a).

After oxidation of the nitride layer in water vapor, an oxide layer forms on the surface of the nitride layer due to denitrogenation of the nitride layer, and at the same time diffusion of an oxygen atom into the interior of the nitride layer occurs.

When nitriding is combined with subsequent oxidation in water vapor during saturation of the nitride layer with carbon of the steel matrix, a carbonitride ε' -phase is formed, and then, due to the diffusion of oxygen in the carbonitride phase during oxidation, an oxycarbonitride ε'' -phase is formed [9, 12].

During oxidation with the achievement of the required density of the oxide layer counteracting denitrogenation and decarburization of the matrix under the oxide layer, depending on the concentration of nitrogen, carbon and oxygen, upon cooling of the nitride layer, mixtures of ϵ -, ϵ' - and ϵ'' -phases are formed, followed by $\epsilon'' + \gamma'$ -phases (Figure 2, b and c).

a - nitriding at a temperature of 5800C for 3 hours; b - nitriding at a temperature of 580⁰C for 3 hours; subsequent oxidation at a temperature of 5800C for 0.5 hour; c - nitriding at a temperature of 5800C for 3 hours; subsequent oxidation at a temperature of 5500C for 1.0 hour.

Figure 2. Microstructure of steel 20 after nitriding (a) and nitrooxidation (b and c).

The oxide film obtained on the nitride surface at a higher eutectoid temperature for the “iron-oxygen” system (570⁰C) has a micro-porous structure, and wustite (FeO) is also detected on X-ray diffraction patterns upon rapid cooling (Figure 3, a). With slow cooling, wustite is not detected on X-ray diffraction patterns, because when the processed sample is slowly cooled, most likely wustite decomposes according to the formula: $\text{FeO} \rightarrow \text{Fe}_3\text{O}_4 + \text{Fe}\alpha$.

The nitride layer located under the oxide layer has a heterogeneous structure due to a mixture of carbonitride and oxycarbonitride phases, due to the microporosity of the oxide layer. Since the denitrogenation process in a microporous oxide film remains long and with an increase in the thickness of the oxide film, the activity of carbon during decarburization will be greater than the diffusion of oxygen through the barreous oxide layer.

In order to avoid the formation of wustite and the formation of equiphase structures of nitride and magnetite monoxide (Fe_3O_4), the oxidation process must be carried out at a lower eutectoid temperature for the “iron-oxygen” system, in particular in the temperature range 500-550⁰C (Figure 2, c). In this case, the resulting oxide layer has a dense structure and consists of one oxide Fe_3O_4 , and the resulting oxide layer acts as a barre layer preventing denitrogenation, since due to the dissociation of the high-nitrogen ϵ -phase, a more uniform distribution of nitrogen, carbon and oxygen in the nitrided layer with uniform and constant the formation of the oxycarbonitride layer of the ϵ'' -phase at different durations of the oxidation process (Figure 2, b).

The study of the microstructure and X-ray diffraction analyzes of the nitrooxidation process on steels 45 and 40X also confirms the formation of a uniform oxide layer consisting of Fe_3O_4 monoxide and a mixture of a surface oxide film of a nitride layer in a mixture of an

oxycarbonitride ε'' -phase and γ' -nitride, it is possible to obtain a uniform nitride layer on the surface of ferrite and pearlite on annealed steels (Figure 3, a and b).

For surface hardening of parts operating in a corrosive environment, for wear at low contact loads, a nitrooxide layer is used; consisting of a developed nitride zone and a thin surface oxide zone, which provides better wearing-in of rubbing surfaces and corrosion resistance. Low-nitride layer consisting of ε' - , ε'' - and γ' -phases, therefore, for the formation of a carbonitride layer on the ferrite surface, it is necessary to set the oxidation time of the nitride layer based on the diffusion of carbon from the pearlite part to the ferrite part; to obtain a uniform carbonitride or oxycarbonitride layer under the oxide layer.

a) x500

b) x500

a - nitriding at a temperature of 580°C in an ammonia atmosphere with a degree of dissociation of ammonia $\alpha = 45\text{-}60\%$ and followed by oxidation at a temperature of 550°C for 0.5 hours. b - nitriding at a temperature of 580°C in a mixture of $0.75\% \text{ NH}_3 + 0.25\% \text{ H}_2$ for 3 hours and followed by oxidation at a temperature of 550°C for 0.5 hours.

Figure 1. Microstructure of steel 45 (a) and 40X (i) after nitrooxidation.

In the process of nitrooxidation, the formation and uniformity of the surface diffusion nitride layer is significantly influenced by the presence of carbon in the steel matrix. In this case, carbon is in a free form in the matrix during the decarburization of pearlite and directly affects the development of the nitride layer by the formation of carbonitride phases during the nitriding process and oxycarbonitride phases during the oxidation of the nitride and carbonitride layers.

For parts operating under fatigue conditions at elevated temperatures, a nitride layer is used - an oxide layer with a developed diffusion sublayer of the internal nitriding zone, and for tools operating under dynamic wear and shock loads on the surface, an internal nitriding zone is formed without a brittle surface nitride layer.

It is known that nitrides have a high affinity for oxygen and the thermodynamic assessment of the interaction of iron and its nitrides with oxygen proved that iron nitrides interact more actively with oxygen than iron.

The dependences of the time of appearance of the first foci of corrosion in a 3% aqueous solution of NaCl for samples with a nitride – oxide coating were studied. With an increase in the amount of γ' -phase in the nitride zone, the time until the first corrosion centers appear, reaching up to 450 hours. A further increase in the amount of γ' -phase is accompanied by a decrease in corrosion resistance. The presence of an oxide layer has a positive effect on the corrosion

properties of the layer. It should be noted that in the experiments carried out, the thickness of the oxide zone was 1-5 microns.

Subsequent oxidation of the 13-phase in water vapor at a temperature of 540-550 ° C for 0.5-1 hour on the surface can obtain a uniform oxide layer with a thickness of 1-3 microns. The obtained nitroxide layer possesses the best corrosion properties, the time of appearance of the first centers of corrosion on which is 1056 hours.

The most corrosive properties are possessed by a nitride layer consisting of a mixture of ϵ' -, ϵ'' - and γ' -phases with a surface oxide layer consisting of Fe_3O_4 . This asserts that during the oxidation of the nitride layer, it is important to grow the nitride sublayer with the formation of lower nitride ϵ' -, ϵ'' - and γ' -phases due to the high-nitrogen 16-phase obtained during nitriding at the first nitriding stage.

CONCLUSION

The research results show that:

- The required structure and phase composition of the nitride-oxide layer is achieved under optimal processing conditions, with the production of low-nitrogen ϵ' -, ϵ'' - and γ' -phases and a surface layer of Fe_3O_4 oxide with a thickness of 1-5 microns.
- nitrooxidation of annealed steels with a ferrite - pearlite structure, it is possible to obtain a uniform surface diffusion layer with the required ratios of nitrogenous phases in the nitride layer;
- corrosion resistance depends on the ratio of nitride phases, the oxide layer consisting of Fe_3O_4 has the best adhesion strength.

Each obtained phase or phase mixtures are responsible for certain conditions of the physico-mechanical and physicochemical properties of the processed products, therefore, taking into account the operating conditions of the parts and setting the technological parameters of nitro-oxidation, it is possible to increase their reliability and durability.

DOCUMENTARY FILM IS AN IMPORTANT TOOL FOR ADVOCACY ACTIVITIES OF PUBLIC ORGANIZATIONS.

Mahliyo Mirsoatova*

*Associate Professor,
Candidate of Philological Sciences,
National University of Uzbekistan named after Mirzo Ulugbek
UZBEKISTAN

ABSTRACT

This article discusses the fact that the documentary film is an important tool for advocacy activities of public organizations. In the article, the author analyzes the work being done in this area. A documentary is a television or film, cinematographic work, based on certain aspects, real events, connected with a single plot, filmed in a series, intended for display on the screen. Documentary films are widely used in the spiritual and educational activities of political parties, mass social movements, non-governmental organizations, public associations and foundations, the media, self-government bodies.

KEYWORDS: *Documentary, Public organizations, Advocacy, film, Screenplay, plot.*

INTRODUCTION

Under the leadership of President ShavkatMirziyoyev, a large-scale work is being carried out to further develop the national cinematography, to encourage filmmakers to create screen works that reflect our achievements during the years of independence and contribute to the upbringing of the younger generation. The meeting, chaired by the President of the Republic of Uzbekistan ShavkatMirziyoyev on December 29, 2017, focused on the analysis of the ongoing work on the development of the national cinematography and film industry and the solution of existing problems in this area. ShavkatMirziyoyev, President of the Republic of Uzbekistan, said that the struggle for different ideas and ideologies in the world, the competition between different forces to win the hearts and minds of people, especially young people, should make effective use of the unique potential of cinema. The priorities of modernization of the country, envisaged in the Action Strategy, require the improvement of cinema, as well as all industries and sectors, the

creation of new opportunities for the industry. To this end, the Resolution of the President of the Republic of Uzbekistan dated August 7 “On measures to further develop the national cinematography” serves as an important legal document on the consistent development of cinema and film industry in the country, strengthening its material and technical base, training highly qualified personnel. Documentaries made in recent years are a clear proof of this.

A documentary is a television or film, cinematographic work, based on certain aspects, real events, connected with a single plot, filmed in a series, intended for display on the screen. Documentary films are widely used in the spiritual and educational activities of political parties, mass social movements, non-governmental organizations, public associations and foundations, the media, self-government bodies.

At the same time, the ongoing processes of globalization, the priorities of modernization and renewal of our country require the improvement of cinematography, along with all other sectors and industries, the creation of new opportunities for the development of the industry. Rich history, national traditions, patriotism, life and ijodi; those who are actively involved in sponsorship in order to spread the ideas of charity; the brightest talented youth of our country. Documentary films about the rich national traditions of Uzbek families, especially about the devotion to the family, respect for parents (including the life and work of famous artists (Hamid Olimjon and Zulfiya, Said Ahmad and Saida Zunnunova, etc.)) 4 - civic institutions are an important means of advocacy.

The attention paid to the organization of the summer health season of our children at the level of modern requirements is bearing fruit. Spirituality and enlightenment, computer rooms, libraries, various clubs are organized in all camps. The most advanced pedagogical technologies and interactive methods are being introduced into the educational process. For this purpose, the Federation of Trade Unions of Uzbekistan distributes DVDs and banners of feature and documentary films on educational and enlightenment topics, such as “Youth is our future”, “Healthy life - the wealth of the nation” in all camps.

Public organizations will show films, television essays, social videos and reports about the sports of the National Television and Radio Company of Uzbekistan “Sport”, the state unitary enterprise “Uzbektelefilm”, the National Agency “Uzbekkino”, as well as non-governmental TV channels and film studios. The Federation of Sports Cinema and Television of Uzbekistan operates in our country.

Solving environmental problems in our country is an integral part of state policy. Non-governmental organizations are also actively involved in this process. In this regard, ecological cinemas are being established to provide the public with comprehensive information on environmental issues. New documentaries on measures to improve the environmental situation, combat desertification and drought are being shown in the Aral Sea region. The purpose of these ecological cinemas is to expand the ecological knowledge of the population. Such meetings with the participation of experts, non-governmental organizations and the media contribute to the development of the Environmental Movement in our country.

Along with a number of public organizations, the Forum of Culture and Arts of Uzbekistan Foundation makes a worthy contribution to the promotion of documentaries. This is evidenced by the fact that the Foundation traditionally conducts various projects, festivals, competitions, aimed at the further development of our national cinema. The Forum of Culture and Arts of

Uzbekistan regularly holds a traditional regional seminar for documentary filmmakers. The main purpose of the event, which is attended by filmmakers from Central Asia, is to exchange views and experiences of documentary filmmakers, to share innovations and achievements in the field, to acquaint film lovers with the current processes in the field. Within the framework of the seminar, along with the screening of new films made by filmmakers of our country and Central Asia, there will be conferences with the participation of artists, art critics, directors, creative dialogue.

It is obvious that the use of documentaries in the activities of civil society institutions is very effective. In the future, the task is to improve the quality of documentaries, to create a special film bank for these films, to open appropriate information and resource centers, to expand the film audience. All public organizations should be involved in these tasks.

In order to fully support the activities of local self-government bodies in Uzbekistan during the years of independence and strengthen the institution of the family, to inform the world community about the large-scale work carried out in 2013. It is planned to make a documentary about the history of the establishment and development of the mahalla institute, a feature film about the role of the mahalla in ensuring the unity and harmony of our people, peace and harmony in our society.

A regular seminar on "The role of the media in raising public awareness of environmental issues" is organized for editors of regional television and radio stations, members of the National Association of Electronic Mass Media of Uzbekistan. The main purpose of the seminar is to draw public attention to climate change, biodiversity, land degradation prevention, and to improve the professional skills of journalists covering this topic. The editors who participated in the seminar will talk in detail about the criteria for covering the environmental topic, the main principles in this area. Documentary films, broadcasts, social videos, films prepared by the participants of the seminar will be discussed in detail.

Advocates of spirituality - especially the advice of the chairmen of neighborhood assemblies on religious enlightenment and spiritual and moral education - taking into account the specifics of public policy in the social and legal protection of minors, the impact of information attacks on youth morale in the globalization process. they use documentaries about the tragic consequences of trafficking, missionary work, and alcoholism.

Under the leadership of President Islam Karimov, special attention is paid to honoring the memory of artists who have made an invaluable contribution to the development of our national culture, art and science, studying their activities and promoting their rich spiritual heritage among our people, especially youth. In particular, the film "Yunus Rajabi" tells the story of the artist's life, scientific and creative activity. The film "Inextinguishable Starlight" is about the famous scientist, pedagogue, scientist of Uzbekistan Tashmuhammad Qori-Niyazi. The film "Latif Fayziev" tells the story of the director's life, work and creativity, which made a worthy contribution to the development of our national cinema. The film "Every word was a melody" is dedicated to the work and activity of the People's Poet of Uzbekistan Turob Tola. The documentary "Book of Life" is dedicated to the life and work of Ozod Sharafiddinov.

In recent years, the creators of the film studio "Karakalpakfilm" have made many documentaries. For the past five years, renowned director B.J. Boymirzaev's "Berdaq" (tells about the exemplary life of the great poet, his rich creative heritage), "Kissaxonlik" (reflecting the rich oral art,

traditions and values of the Karakalpak people), directed by Z. Abdumurodov's films "Aykulash" (which reflects the social activity of the folklore and ethnographic community of the same name) were judged by the audience.

The inclusion of dozens of documentaries made by Uzbek cinematographers in the UNESCO World Heritage List testifies to the fact that the modern culture and art of our country are also highly valued at the international level.

ANALYSIS OF FORMATION OF FOREIGN EXPERIENCE OF A STRUCTURAL APPROACH TO COORDINATION OF NON-STATE HIGHER EDUCATIONAL INSTITUTIONS

Yuldashev Muxsinjon Akramjonovich*

*Trainee Researcher,
Namangan State University
Namangan, UZBEKISTAN

ABSTRACT

Currently, non-state higher education has become an important part of the general education system of Uzbekistan, leading the training of highly qualified personnel, which has a positive impact on its condition and development. The non-state sector in the higher education system has reached a certain level of development and has earned recognition.

KEYWORDS: *Coordination of higher educational institutions, Education, Non-state higher education, Highly qualified work, Theory of management of educational systems.*

INTRODUCTION

The development of a network of non-state educational institutions makes it possible to partially solve such problems of the country's higher education as: bringing educational services closer to the place of residence; expanding opportunities to meet the needs of the population in higher education; the possibility of implementing new copyright programs and technologies; the formation of new economic approaches to the management of educational institutions; attracting additional funds for the development of higher education [1].

It should be noted that the process of the formation of the non-state sector in the higher education system is clearly ahead of the process of its reflection. The quantitative description of this system, the ongoing debate around it, only confirms its real and problematic development, but does not satisfy either academic interest or those who practically build this system, and feels an urgent need for scientific substantiation and support of their own activities.

The non-governmental sector of education has filled a niche that has arisen in the market for supply and demand for highly qualified labor, new in structure and content, oriented towards international experience.

One of the fundamental steps in the reform of higher schools was the transition from state to state-public and public-state management systems with various forms of ownership, creating potential opportunities for students to move along their own path in the system of lifelong education, with the right to choose various educational institutions, including non-state [2].

A unified educational policy has been consolidated, which is implemented within the framework of a unified system, and provides, on the one hand, for the implementation of specific educational functions by state and public organizations, and on the other, for the implementation of certain functions of these organizations in their interaction. With this approach, it is possible not only to divide functions between the structural units of an educational institution, but also to combine them, subordination, which contributes to the achievement of educational goals in all their diversity.

The main goal of educational institutions, including non-state ones, is the transfer of ideas, methods and technologies for the development of natural social and industrial processes. However, the traditional educational strategy in universities is based on the subordination of all participants in the educational process to uniform external standards, which seriously impedes the introduction of progressive innovations, prompt response to changes in the social environment [3]. The main goal of modern education is the development of a person's needs, and the ability to go beyond what is being studied, the ability to self-actualize creative potential, self-development and self-education throughout life.

The cardinal changes that are currently taking place in all spheres of life in Russian society are accompanied by a rapid increase in the number of professions that require in-depth training and focus on a specific area of professional activity.

B.S. Gershunsky wrote that everything starts with an idea, which gradually turns into a constructive hypothesis, a theoretical concept, an expanded target program, into a concrete plan of practical action. He considers education itself as a value, system, process, result [4].

Thus, the readiness of an educational institution for high-quality professional training of specialists depends on three components: the goals of training, the content of training and the organization of the educational process.

An analysis of the theory and practice of the functioning of universities indicates that the educational process in modern higher education suffers from a number of shortcomings. Students in the learning process are not able to cover the complex of the studied problems in unity; when solving problems of practical activity, they do not always understand the interaction of various factors that influence these decisions.

Analyzing the practice of organizing the educational process in non-state universities, we noted some of its regularities:

- 1) the educational process is carried out better in those universities where it is based on serious analytical work;
- 2) more effective is the result of management activities in those universities where the level of its feasibility is higher;
- 3) the higher the level of continuity of management influences, the more significant the effectiveness of management results;

- 4) the more stable the rhythm of management of the educational process, the higher its organization and effectiveness of the results of activity;
- 5) the interconnected and coordinated functioning of the educational process is ensured by the observance of proportions in the activity and structure of the controlling and controlled systems;
- 6) the organization of the educational process can only be effective when the management system has the knowledge and skills necessary to carry out management activities.

Obviously, it is necessary to develop conceptual approaches to the system of training specialists, which would harmoniously combine the possibilities of solving the problems of professional activity and the development of the personality of a professional who is able to realize himself in practice [5]. We believe that the development of pedagogical conditions for organizing the educational process is such an approach, the implementation of which will successfully solve these problems.

The pedagogical process, the synonym of which is educational, consists of the learning process and the education process. An analysis of the practical activities of non-state universities allows us to conclude that they are in dire need of scientifically based recommendations, primarily on the organization of the educational process. Despite the fact that many non-state universities were created with the aim of obtaining special higher education, most of these institutions are represented by the mechanical transfer of pedagogical systems (educational process) from a state university [6]. Therefore, the problem of organizing the educational process in non-state universities acts as a condition for improving the quality of training.

The objective complexity of each profession determines the presence of high requirements for his personality and activity, his cognitive, emotional-volitional, moral, activity spheres. As a result, optimization of the process of training specialists in a non-state university is one of the priority tasks of reforming the educational system.

One of the ways of optimization is the control process, understood as an impact on an object (process), which is selected from a variety of possible impacts, taking into account the goal, the state of the object (process), its characteristics and leads to an improvement in the functioning or development of this object, i.e. approaching the target. The existing practical experience indicates that the organization of management in any field of activity does not take place spontaneously, thoughtful management actions are necessary, the definition of the subject and object of management, the identification of their relationship [7]. The analysis of the philosophical, psychological and pedagogical literature showed that the theoretical foundations of management are perceived as an independent substance in development. Management theory that solves the problem of ensuring the effectiveness of the educational process is considered in the works of A.G. Aganbegyan, A.I. Anshichkina, V.G. Afanasyeva, D.M. Gvishiani, I.I. Shamova, S.V. Shekshni, foreign scientists - M. Weber, D. Carnegie, V. Stevenson. The problems of organizing the pedagogical process in educational institutions became the object of research by Yu.V. Vasilyeva, V.I. Zvyagintseva, Yu.K. Konarzhevsky, O. V., Levgerova, A. N. Orlova, M.M. Potashnik, I.K. Shalaeva.

In recent studies, various aspects of the management problem have been considered, and the issues of management organization have been studied. A systematic vision of the pedagogical process is reflected in the research

S.I. Arkhangelsky, V.G. Afanasyeva, Yu.K. Babansky, V.P. Bepalko; conducted pedagogical research in the field of education management; studied the management of the pedagogical process of educational institutions; analyzed the current state and development trends of higher non-state educational institutions.

Despite some progress in the development of higher non-state educational institutions achieved in recent years, the training of a high-class specialist is still an object of the educational process. Today it is becoming more and more obvious that there are a number of contradictions in the organization of the pedagogical process of a higher non-state educational institution:

- Between the need of society for the professional training of a specialist and the objectively existing social and pedagogical conditions that complicate the implementation of this process;
- Between the large volume of required professional knowledge of a specialist and the rapid "aging" of the information received;
- Between the constantly changing requirements of society to the level of professional training of a future specialist and his readiness to quickly and effectively adapt to the conditions of labor activity;
- Between scientific and theoretical knowledge and experience of legal training of students and the lack of developed conceptual foundations for organizing the pedagogical process in higher non-state educational institutions. The need to resolve these contradictions predetermined the research problem, which consists in identifying organizational and pedagogical conditions and substantiating ways to increase the effectiveness of the educational process in a non-state higher educational institution [8].

The aforementioned contradictions and problems determined the choice of the topic of our research: "Features of the organization of the pedagogical process in a higher non-state educational institution."

Purpose of the study: to develop and implement a model of effective organization of the educational process in a non-state higher educational institution.

Object of research: the pedagogical process in a higher non-state educational institution.

Subject of research: organizational and pedagogical conditions for the functioning of the educational process in a higher non-state educational institution.

In accordance with the problem, purpose, object and subject of research, the following tasks were set:

1. Analyze, on the basis of comparison with a state university, a set of initial provisions that form the theoretical basis for the organization of the pedagogical process in a non-state higher educational institution.
2. Determine the essence and structure of the pedagogical process in a higher non-state educational institution.
3. To develop a model for the effective organization of the pedagogical process in the preparation of a specialist in a non-state university.

4. To determine the pedagogical conditions for the effective organization of the educational process in the preparation of a specialist in a higher non-state educational institution.

In the course of the study, a hypothesis was put forward that the effectiveness of the pedagogical process in a non-state university for training specialists will significantly increase if the conditions and pedagogical capabilities of a non-state higher educational institution are taken into account in the management and organization of the educational process, namely:

-Reliance is made on the psychological and pedagogical characteristics of students, their goals and values;

-As a technological basis for training, the means of new information technologies and mass communication are systematically and holistically used;

-Compulsory computer literacy of teachers and students is provided;

-The organization of independent work of students and various types of control of its results are optimally connected;

-Is formed and rationally used the subject environment in the educational complex, through the implementation of the pedagogical process in the courts, prosecutor's office, customs, tax police [9].

The methodological basis of the study was: the theory of personal and professional self-determination, the theory of management of educational systems, studies of the features of educational activity, the theory of personality development, studies on the adaptation of a young specialist to professional activities, special studies on the organization of the pedagogical process in universities.

Culturological, axiological, personal-creative and activity approaches served as the methodological basis of the research.

The special methodology was a systemic and holistic approach to the knowledge and transformation of professional activity, the concept of a humanistic orientation to the organization of vocational education, the principles of the unity of theory and practice in the educational process of a higher educational institution.

The work used the provisions of the UZM Law "On Education", the Law "On Higher and Postgraduate Professional Education", the Order of the Ministry of General and Vocational Education of UZM "On Measures to Promote the Improvement of Teaching, Methodological and Academic Work in Non-State Universities", regulatory documents of the Ministry of Education, scientific and methodological sources, psychological and pedagogical literature on the research problem.

To solve the set tasks and test the working hypothesis, a set of research methods was used, including:

-Theoretical analysis of philosophical, sociological, psychological and pedagogical literature on the problem, regulatory documents; observation, questioning, creation of various pedagogical situations; analysis of the productivity of professional management activities; pedagogical experiment; method of mathematical processing of experimental data.

Preparatory and organizational - characterized by the study of normative, instructional and methodological documents, scientific and methodological sources, scientific, psychological and pedagogical literature and foreign sources in order to determine the specific features of the organization of the activities of a higher non-state educational institution, the experience of organizing the training of specialists in higher non-state educational institutions of economic legal profile; development of approaches and research methods [10].

Theoretical and experimental - clarification and adjustment of the tasks of the dissertation research. Revealing a complex of pedagogical conditions for increasing the effectiveness of the educational process of a higher non-state educational institution.

Theoretical - generalizing - completion of pedagogical research, theoretical understanding of the results obtained, analysis and generalization of research materials, formulation of conclusions and introduction of a model of organization of the pedagogical process into the practical activities of higher non-state educational institutions. Literary design of the dissertation research.

The most significant results obtained personally by the applicant; their scientific novelty and theoretical significance:

- A model of the organization of the pedagogical process of a higher non-state educational institution has been developed and tested, contributing to the improvement of the quality of specialist training;

- Within the framework of the developed model, a set of pedagogical conditions has been determined that most effectively affect the organization of the educational process and the training of specialists in a non-state university of economic and legal profile;

- Proposed and substantiated diagnostic procedures that reveal the effectiveness of the organization of the educational process in higher non-state educational institutions;

- Formulated scientifically grounded methodological recommendations for the organization of the pedagogical process in a higher non-state educational institution.

In addition, the approbation and implementation of the results obtained make it possible to develop fundamentally new approaches to further improving the system of professional training of students in higher non-state educational institutions [11].

1. The pedagogical process of a higher non-state educational institution is an integral, special, educational, educational system designed to form both professional and personal qualities of a student capable of fulfilling his educational, social and labor duties.

2. The theoretical model of the organization of the pedagogical process is an integrative unity of goals, tasks, defining principles, methods, psychological and pedagogical conditions that ensure the effectiveness of students' educational activities, based on conscious motivation for the chosen profession.

3. Features that determine the organizational and pedagogical conditions of the activity of a higher non-state educational institution provide a program-targeted and professional orientation of the educational process, form students' cognitive independence and stimulate educational activity.

4. The effectiveness of the work of the educational administration, special departments and the dean's office in the process of planning, organization, regulation and control ensure the performing and educational disciplines;

5. The variety of forms of independent work of students, the interaction of teachers and students in the learning process, the development of democratic, collaborative, benevolent interpersonal relations maintain a comfortable psychological microclimate, and ensure the effectiveness and quality of the educational process.

EFFECTIVE METHODS OF TEACHING AND LEARNING ARCHITECTURE AND CONSTRUCTION TERMINOLOGY IN HIGHER EDUCATION

Khilola Zakirova Abduraxmanovna*

*Senior teacher

Tashkent Institute of Architecture and Civil Engineering,
UZBEKISTAN

ABSTRACT

This article explores the use of various innovative methods in the process of teaching architecture terms in English, to improve the communicative competencies and communication skills of students of non-linguistic faculties of the university. The article discusses improving the level of language competence and cognitive activity of students, improving the quality of language training of specialists and their needs in learning a foreign language.

KEYWORDS: *Architecture terms, Non-linguistic, Communication skills, Cognitive activity, language competence, and learners' needs.*

INTRODUCTION

More and more demands are placed on specialists in mastering professional competencies. This encourages the teacher to constantly look for new means, ways and methods to optimize and intensify the educational process. In recent years, students have preferred engineering fields and profiles. The most difficult for students from the point of view of mastering and understanding the professional language are the directions "Architecture" and "Construction". For a student, mastering the engineering profession is a complex process. In a short time, he must master many special disciplines in a foreign language, learn to communicate with teachers and students in a professional environment. The formation of students' professional communication is based on the relationship of competence-based and interdisciplinary approaches in teaching architectural terms in English.

In the process of work, students are offered a classification of architectural basic terms by spheres, objects and subjects of activity (urban planning zoning, earthworks, architect, designer); types of buildings, structures and structural elements (central dome system, architectural order,

balustrade, cornice, capital, portico); painting (palette, light filter, glazing, tone); architectural styles (Gothic, Baroque, Renaissance, Rococo); urban planning (restoration, overhaul, master plan), etc.

The productive activity of students is an independent study of individual topics of the course; preparation of messages, reports and presentations; implementation of term papers, projects and studies. Practice shows that the formation and development of the communicative competence of students in architectural and construction areas is closely related to their deep knowledge of terminology and the ability to use it in speech situations of the professional environment. In this regard, from the above-mentioned types of independent work, we pay special attention to the compilation of an individual thematic dictionary of terms. The compilation of a glossary can be both reproductive and creative. Working with new vocabulary, the student not only thinks over the terms, comprehends and remembers them, but also activates them in their speech practice. The compilation of the dictionary begins under the guidance of the teacher. The student completes this task in the lesson or on his own at home, replenishing the dictionary with new terms and concepts. He can write down the translation of the term into his native language, give his own comments and examples, and insert the necessary pictures, drawings, diagrams, speech patterns for the use of this term in a scientific text. Some students practice keeping electronic dictionaries in the table forms with definitions and translations into several languages, as well as their pictures as illustrations, which are proved to be one of the most productive techniques in memorizing terms. (See Table 1)

	Term and definition	Russian	Uzbek	Picture
1	Hollow brick- A brick that has holes through it which total at least 25% of its volume	пустотелый кирпич	ичи бўш ғишт	

Table 1. Self-study glossary

General English is bridge to develop ESP vocabulary, as it helps to comprehend the ESP context. Moreover, picture prompt is considered to be one of the efficient techniques to teach terminology. (See Table 2)

ESP term	General English	Picture prompt
Wood is combustible but concrete is non-combustible .	Wood can burn but concrete can't burn.	
Glass is transparent but wood or wall is opaque .	One can see through glass but can't through wood or wall.	

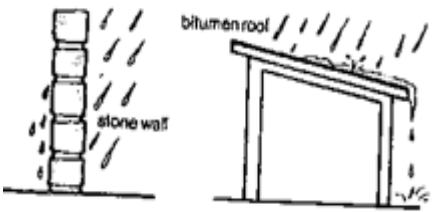

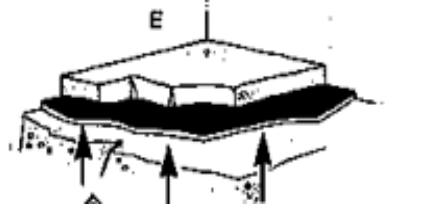

Stone is <i>permeable</i> but bitumen is <i>impermeable</i> .	Water vapor can pass through stone but not through bitumen.	
This means that polythene is <i>impermeable</i> .	The polythene membrane can prevent moisture from rising into the concrete floor.	
Rubber is <i>flexible</i> but concrete is <i>rigid</i> .	A man can bend a rubber tile but not a concrete tile.	

Table 2 Properties of materials

It's obvious that the general learner of English may not understand the section of a factory (Fig.1). However, the learner of construction specialty with background knowledge in L1 can easily give a description of this structure, its components and elements. This is a challenge for a language teacher to teach L2 for ESP learners without knowledge of that specialty.

**Fig.1 Structure of a factory**

The following type of self-study provides the learners to avoid misinterpreting the words as they can easily comprehend from the labels. (see Fig.2)

Fig.2 Parts of a house

“Engineering Drawing is an art interwoven with science.” Why drawing is so important?

A language composed of just written or oral words has some limitations that is the shape, size and other details of an object cannot be completely explained even by the use of most advanced word language. It can be effectively described by the “Language of Engineers”, so called engineering drawing, which, for engineers, is as important as grammar for an English teacher. To manufacture an object, if an individual has a group of skillful workers, all the latest machines, many precious tools, the raw material but there’s no sketch of what to manufacture, nothing can be done.

A designer prefers a picture to a written description of an object. The design team should make all the things clear. To design a Gear, one should define the type of gear, material, pitch, pressure angle, number of teeth, all dimensions including tolerances, outside diameter, details of mating gear and heat treatment specifications. The more the clues provided, the more accurate the gear quality and results will be. To be competent, the vision of the designer should be sharper than his pencil. (See Fig.3)

Fig.3 The interior of a house

Engineering drawing is the universal accent. It is spoken, read and written in a particular style. As in the case with any language, engineering drawing has also been devised according to certain

rules and has its own syntax; it has some definite rules and so can be easily understood across any piece of this universe. A complete drawing of a job is followed by giving an accurate shape to the raw materials, according to the sketch. If the engineer commits an error in the sketch, it is carried over to the practical work by others, resulting in the loss of time, material, labor and finally affects the production efficiency of the industry.

Vocabulary is of major importance for ESP learners, because knowledge of it and the ability to process certain vocabulary storage allow them to retrieve and properly comprehend information from professional texts after reading and/or listening, to express their thoughts both in oral and written forms when interacting and communicating with specialists (native and non-native speakers). The purpose of this article was to explore the use of various innovative methods in the process of teaching architecture terms in English, to improve the communicative competencies and communication skills of students of non-linguistic faculties of the university. The article discusses improving the level of language competence and cognitive activity of students, improving the quality of language training of specialists and their needs in learning a foreign language.

ANALYSIS OF THE FORMATION OF A FRIENDLY ATMOSPHERE WHEN USING EDUCATIONAL TECHNOLOGIES IN THE RUSSIAN LANGUAGE LESSONS FOR STUDENTS OF AGRARIAN UNIVERSITY

Alibekova Rano Khudaiberdievna*

*Tashkent State Agrarian University
UZBEKISTAN

ABSTRACT

The article discusses analysis of the formation of a friendly atmosphere when applying educational technologies in the lessons of Russian languages for students of agrarian universities. It reveals the essence of pedagogical methods as a pedagogical technology, and describes in detail the content of its components. The author extensively substantiates the relevance, expediency and effectiveness of the use of subject-language integrated learning in Russian classes, and summarizes the advantages and disadvantages of its use in teaching Russian at a university.

KEYWORDS: *Pedagogical methods and technologies, Technology, subject-language integrated learning, specialized training Russian, Agrarian universities.*

INTRODUCTION

English for specific purposes is considered as an approach to teaching and learning of English as a foreign language. However, in contrast to other pedagogical approaches, the entire course, its content and objectives are based on the specific needs of target learners. Especially, these facts called forth the need of a language for real communication, which conforms to the constructivist learning perspective supporting the idea that language learners should engage in activities fostering real life use of language rather than memorizing rules.

Russian is a world language; all people need to use there at an increasingly high level. A good knowledge of Russian is needed more than a choice. Globalization, science, technology, education make Russia proficiency in all branches of science. Teachers who deal with these spheres have to be prepared to come across with all these changes, challenges and difficulties in high educational establishments. Therefore, it is important to have a clear understanding of how

our universities are ready for the global demand and why our graduates are not reaching the appropriate level of the English language and ready to solve these kinds of problems.

The modern education system involves preparing students for the choice of professions while still in school, largely through specialized training in high school. The composition of high school students is differentiated in accordance with their interests, the area of subjects that they plan to study in depth, as well as the development of their professional orientation. While some have already chosen a future profession and a range of specialized subjects, others are still at the stage of selection, without a clear plan and definite interest in a specific subject and field of activity.

The general objective of our research includes analysis of the factors affecting the Russian language teaching and learning process. In our research, we are trying to determine the classroom conditions where the lesson procedure takes place and identifies characteristics of the lesson and behaviors of the students and surely, teachers' instructional competences with the help of pedagogical technologies. There are several factors that affect the Russian language teaching and learning process to establish how each of them affect the teaching process in our country. In done studies, it was mentioned that there are several factors, which affect the learning process of English as a foreign language.

Profile training allows you to organize the educational process of students in accordance with their individual abilities, to create a special educational trajectory that will allow each student to study a certain number of subjects in in-depth form.

There are many advantages of pedagogical methods and technology that have been connected with the use of integrated education, "Research indicates that using an interdisciplinary or integrated curriculum provides opportunities for more relevant, less fragmented, and more stimulating experiences for learners".

Other benefits that have been found are that it is student centered, improves higher level thinking skills and problem solving, and improves retention¹

More advantages that are specific focused on integrated pedagogical methods and technology in education. Several advantages in pedagogical methods and technology education include making students be active in their solution. It is required to be solvers, innovators, inventors, logical thinkers and critical thinkers, and technologically literate as Morrison mentioned. Studies done by many researchers have shown that integration of mathematics and science has a positive impact on student attitudes and interest in classes to motivate them to learn and to achieve results.

Integrated pedagogical methods and technology education often requires numerous materials and resources for students to investigate solutions to real world problems through designing, expressing, testing, and revising their ideas. Materials can include construction tools such as saws, measuring devices, and hammers; electronic materials such as computers, design programs, robotics kits, and calculators; and other materials used in design, which could include wood, Styrofoam, glue, cardboard, or construction paper. Through the use of these materials in design activities students can better understand technology. A broad definition of technology is anything that is human made that makes life easier. An engineers' job is to design technologies that can solve problems. For authentic learning to take place, students need to be given

opportunities to design processes or products concerning various types of mining engine technologies.

Integrated pedagogical methods and technologies in education is an effort to combine science, technology, engineering, and mathematics into one class that is based on connections between the subjects and real-world problems. However, in general, integrated pedagogical methods and technologies in education can involve multiple classes and teachers' do not have to always involve all four disciplines of pedagogical methods and technologies.

Pedagogical methods and technologies teachers need to develop not only to deep knowledge of the content that they teach but also to also specialized knowledge of how to teach pedagogical methods and technologies content to students, pedagogical knowledge. The training and support of teachers are essential to achieve the goal of quality pedagogical methods and technologies education. Paradoxically, many schoolteachers have limited background knowledge, beliefs, confidence, and efficacy in teaching pedagogical methods and technologies.

One of the urgent problems in specialized non-linguistic groups is the attitude of students to a foreign language and its place in the system of specialized training. Obviously, knowledge of a foreign language in modern market of competencies is a priority and in demand. It is not difficult to imagine that in-depth study of specialized subjects can push the English language into the background, significantly reduce the motivation of students to study it. One of the ways to increase it is to integrate it into the educational process of interdisciplinary communication with specialized subjects, where the language becomes no direct means of studying other subjects and mastering communicative competencies.

The specificity of the methodology lies in the fact that knowledge of the language becomes a tool for studying the content of the subject. At the same time, the language is integrated into the curriculum, and the need to immerse you in the language environment to be able to discuss thematic material significantly increases the motivation for using the language in the context of the studied topics.

After this comes the way out into speech, the stage at which the teacher can offer students a wide range of language exercises. Most often it is may be a problem statement that students must solve using their knowledge of the core subject, language skills and speech skills, as well as imagination, thinking outside the box. In addition, logical completion of this stage can be project activity, when students receive a new product through scientific methods in the course of research. At the same time, the work can be carried out both in groups and in pairs and individually.

This makes it possible to find similarities and differences, consider the problem from different positions, cultural, religious and ideological views. For example, in a socio-economic university, a subject-language integrated lesson of English can be considered topics such as political device in Uzbekistan and Great Britain or America and find similarities and differences in their legislative, executive and judicial branches. Such classes will undoubtedly broaden the horizons of students, immerse them in a natural language environment, and contribute to the formation of socio-cultural competence of mining students.

Thus, we consider the use of pedagogical technology in the Russian classroom in agrarian universities necessary and effective. This approach meets the requirements of Educational State

Standards of the Republic of Uzbekistan, forms integrated interdisciplinary communications is actively aimed at developing the skills and abilities of students, contributes to the formation of the necessary competencies. *Secondly*, subject-language integrated learning fits perfectly the educational process of mining students, where the main forces of students are focused on studying specialized subjects. Integrated classes become an additional source of knowledge and skills of students in a specialized subject. *Thirdly*, the development of all four language skills, the replenishment of the vocabulary with different layers of vocabulary, certain terminology, new language constructions, an abundance of language exercises and speaking contributes to a qualitative increase in the language level of mining students.

In addition, this technology is universal and suitable for use at any level, regardless of the profile, configuration and language level. It should also be noted that integrated classes are professionally oriented, especially for students who cannot decide on their core subjects and their future profession. Finally, interesting integrated classes will certainly increase the motivation of students to learn Russian, even despite the need for in-depth study of difficult subjects of the profile cycle.

In Conclusion, recent discussions have maintained that English and Russian offers opportunities to improve the process of language learning and language teaching. "Theoreticians and teachers claim that the learning environment created by increases the learner's general learning capacities, his/her motivation and interest". There is much discussion about the global spread of Russian as a medium of education. There have been major achievements over the last twenty years in how to teach Russian as a second/foreign language. Some approaches to subject teaching have developed radically, others less so. This is also the case with how teachers teach. The following suggestions should be taken into consideration in Polish bi-lingual education:

"DEVELOPMENT OF ORAL AND WRITTEN SPEECH IN THE STUDY OF THE RUSSIAN LANGUAGE IN AN AGRARIAN UNIVERSITY"

Ashirmatova Manzura Jumanbaevna*

*Teacher,

Department of Uzbek Language and Literature
Tashkent State Agrarian University
UZBEKISTAN

ABSTRACT

The article substantiates the conceptual "development of oral and written speech while studying Russian language in future agronomists, describes a semiotic-situational approach as the basis of research, reveals the pedagogical principles of the process under study. The teaching of oral and written speech in the methodology has long been called the development of coherent speech. At the same time, coherent speech is understood as a process, speech activity, and a certain result of an act of communication, i.e. detailed answer of the student on the material of the academic discipline, oral and written presentation of the text created by the student, abstract, article in the wall newspaper, description, reasoning, report. a certain speech work, text.

KEYWORDS: Russian, student, agrarian university, oral, written.

INTRODUCTION

In connection with the adoption by the Republic of Uzbekistan of the Law of September 24, 2020 "On Education in the Republic of Uzbekistan", the state authorities of the subject of the Republic of Uzbekistan in the field of education ensure state guarantees of the rights of citizens to receive public and general education.

On the one hand, teaching students with Russian as a non-native language is a special area of methodology, specific learning conditions are created for such students, on the other hand, and all students of the Republic of Uzbekistan must go through the system of state final certification, not differentiated depending on the knowledge of Russian as a non-native language.

The main task of the language teacher is to bring the lessons of Russian as a non-native language closer to the lessons of Russian as a native language, and not as a foreign one.

As part of the introduction of educational standards of the second generation, much attention is paid to the development of the speech of students, including those who study Russian as a non-native language.

The primary task of every language teacher is to educate a person who owns the art of verbal communication, the culture of oral and written speech.

Students master the Russian language through speech activity, through speech perception and speaking. That is why it is so important to create conditions for the speech activity of children.

The weakest link in the general system of teaching the native language is the work on the development of coherent speech of students.

The teaching of oral and written speech in the methodology has long been called the development of coherent speech. At the same time, coherent speech is understood as a process, speech activity, and a certain result of an act of communication, i.e. detailed answer of the student on the material of the academic discipline, oral and written presentation of the text created by the student, abstract, article in the wall newspaper, description, reasoning, report. a certain speech work, text. Each of the speech works indicated in the program acts both as a subject of instruction and as a means by which communicative skills are formed and developed. So, by teaching to build a text of the type of reasoning-proof, the teacher helps schoolchildren to realize the features of this type of text, to master certain skills, and at the same time, all this work serves as a means of developing communication skills, human communication skills. That is why a clear understanding of the content of work on the development of coherent speech, its sequence and the optimal selection of methods and means of teaching corresponding to the tasks are of great importance.

Three main directions of the development of students' speech can be distinguished: mastering the norms of the literary language, enriching the vocabulary and grammatical structure of students' speech, teaching various types of speech activity.

For successful work in these areas, you can use various productive pedagogical technologies: student-centered learning, the development of critical thinking through reading and writing, gaming technologies, information technology. Such training involves not only equipping schoolchildren with educational information, but also the development of their intelligence.

The main goal of teaching Russian as a non-native language is the development of students' communicative activities. Therefore, the formation of the skills and abilities of verbal communication or communications is put forward as the most important goal of training. This is formed in all types of education: reading, speaking, and writing. And above all, communicative target attitudes play an important role here, requiring students to be able to express agreement, support what was said, join what was said, complement the interlocutor (agree, continue what has been said). When studying any language of the world, a person tries to learn his communicative activity. In educational activities, great importance is attached to communication between students and teachers.

Mastering computer technologies allows you to really individualize the educational process, enhance the positive motivation for learning, intensify cognitive activity, and enhance the creative component of the work of both the student and the teacher.

Information and communication technology is both a delivery medium and a control medium. Computer lessons will help to improve the level of teaching, enhance the motivation for learning, and activate students' cognitive activity.

The development of interest in the subject is also associated with the development of the individual abilities of students. There are "strong" students in the class who strive to get a high percentage of knowledge, skills, abilities, having a high learning potential and "weak" students. Given these features, you can use the learning technology. The essence of the technology is that the student is given the time that corresponds to his personal abilities and capabilities, which allows him to assimilate the material. In addition, "strong" students are given tasks of increased difficulty, which contribute to the development of cognitive interests.

If there are goals and motives for communication, then the act of communication within the framework of a speech situation will take place. The best technique for activating oral and written speech is an interactive technique, which is translated from English as interaction, where the teacher and student work to achieve one goal. For example, this includes various situational tasks with dialogical and monologist speech and the ability to express one's thoughts in the form of texts, creative, research works.

Game technologies: Learning will be successful if knowledge, skills, and abilities are learned in strict sequence, when each new lesson is based on the previous ones. But in the learning process, it is important not only knowledge, but also the impressions with which the child leaves the lesson. Techniques for learning proverbs, sayings, and poems help students' master aspects of the language.

With the help of such game techniques, you can consolidate new language material, or you can cheerfully and easily repeat the material you have covered.

Thus, the basis of communicative activity is made up of communicative skills, formed on the basis of linguistic knowledge, skills, and skills, That is, work on communicative concepts gives good results.

In conclusion, I would like to say that the main thing in a teacher's work is striving for creative search. Such lessons allow students to see the benefits of learning a subject, resulting in an increased interest and quality of education in the subject being studied.

In the university, in the process of educational activity, all functional varieties of speech develop, but speech as a means of cognition, preservation and transmission of information, speech as a means of organizing collective actions, speech as a means of self-awareness and self-expression, influence on comrades and adults is of particular importance. At this time, along with interpersonal communication, group communication is intensively developing. It is at school that students master book styles of speech. Comprehending the fundamentals of the sciences at school, children use the educational and scientific variety of book speech, when in the classroom they briefly or in detail answer the teacher's questions, make messages and reports (on the topics of the subjects being studied). The school also begins to develop a journalistic style of speech, the formation of which is associated with active participation in public life, the study of subjects of the humanitarian cycle. The latter is explained by the fact that in the social sciences, facts, phenomena, ideas, views are not simply communicated, but analysed from certain ideological

positions. The language of social sciences is characterized by a scientific and journalistic style of presentation.

The formation and improvement of students' speech requires purposeful work. In accordance with the current program, in the lessons of their native language, students receive special knowledge about speech

These general communicative (sometimes called communicative-speech) skills include:

- The ability to reveal the topic and the main idea of the created text;
- The ability to collect and systematize the material on the basis of which the statement will be created (this skill presupposes the ability to think over the content plan of the text);
- The ability to build a statement in a certain compositional form (speech genre), for example, in the genre of a non-fictional story, reportage, in the form of portrait sketches, etc.
- The ability to select the language means that are optimal from the point of view of the speech task and the conditions of communication;
- The ability to edit, improve what is written (the latter refers to the communicative skills of writing).

The need to form the above-mentioned communication skills is explained by the fact that without special work, schoolchildren do not master them properly. As shown by the research, the typical deficiencies of oral and written statements, students are:

- Expansion or narrowing of the topic of the statement, "departure" from the proposed topic; overloading the statement with details that are not relevant to the disclosure of the topic;
- The lack of an idea, the main idea of the statement or the inability to fully disclose it;
- Inability to select the material necessary for the statement and systematize it, violation of the sequence in the presentation of thoughts, repetitions;

Lack of connection between parts of the statement, the disproportion of its individual parts;

- Inconsistency of the content, compositional form and selected language means to the task and the addressee of the statement, the conditions of communication; unjustified violation of the stylistic unity of the text.

For the successful formation of communication skills, coordinated and purposeful efforts of all teachers are required, i.e. need a general program of work for the development of coherent speech, students at the inter-subject level.

AESTHETIC IDEAL AND AESTHETIC CRITERION

D.S. Kadirova*

*Associate Professor,
Department of Ethics and Aesthetics,
National University of UZBEKISTAN

ABSTRACT

The question of whether aesthetics determines the criteria of art, artistic creation, or when creating laws, new criteria, norms, aesthetics follows art has always worried thinkers. The theorist of classicism Boileau, from his point of view, recognized aesthetics as a science that presents its canons and laws to the artist, while others have shown that art is primary in the emergence of aesthetic norms. Of course, in the creative process it is impossible to adhere to only a scheme, a formula, but this does not mean that there are no normative foundations in aesthetics. In our opinion, in art and the creative process, adhering to aesthetic laws, norms and criteria, first of all, means creating artistry in works of art and ensuring that the works meet the highest aesthetic requirements. Thus, aesthetic norms are recognized boundaries, the crossing of which leads to a violation of the aesthetic level and perception. The ancient Greeks denoted disorderly and ugly by the concept of Chaos, order, harmony, harmony of the universe and the ideal were denoted by the word Cosmos. Where the lawful principle of beauty - the aesthetic norm - is preserved, there will always be beauty, while the ugly appears on the basis of a violation of aesthetic norms. For the art form in a work of art to become beautiful, order, high organization, perfect harmony, color, plastic and verbal construction are necessary. In the works of the classics, the logical development of the content requires harmony, balance of composition, a clear image, an accurate representation of volume, generalization of lines. Today, aesthetic criteria and norms play an important role not only in art, in all types of artistic creation, and even in the beauty industry, sports and medicine.

KEYWORDS: *Aesthetic criteria, aesthetic norms, harmony, order, quantity and quality.*

INTRODUCTION

Striving for the aesthetic ideal serves as the main factor in creating the newest aesthetic norms, beauty, and beautiful, sublime, amazement in aesthetics. The aesthetic ideal occupies an extremely important place in creating harmony out of chaos, creating an image in a work of art, the latest form and content, composition, genres and styles, in expanding the visual criteria of contemporary art and a person's desire for all-round beauty (human body, soul, face, plastic movement).

Vygotsky emphasizes: "Art, first of all, determines our character, organizes our behavior, it is an instruction into the future. Perhaps it will never happen, but throughout our life it is a requirement that makes us strive for a further goal" [1.230.] Since we are going to talk about the philosophical and aesthetic nature of aesthetic ideals in art, it should be noted: in art, the aesthetic ideal is in harmony with aesthetic criteria and their characteristics are technical: First, aesthetic values have been formed in the history of art over the centuries and on the basis of this ideals and criteria we value; secondly, we can observe that in art such aesthetic categories as the beautiful, the sublime, the comic, the harmony, the miraculous are expressed in the correlation of human aesthetic ideals; thirdly, the level of aesthetic taste is determined by the aesthetic ideal, the aesthetic taste largely depends on what the individual and society perceives as beauty and ideal.

Some factors that were the reason for the formation of the aesthetic ideal.

1. In art, in most cases, the aesthetic ideal begins with an idea, while idea proceeds from the aesthetic needs of each era. In the history of art, style creates its own criterion in the history of culture and is transformed into ideals, values, they are primarily the product of ideas created in accordance with the requirements of the time in a given society.

A person's thinking is always personal and individual, and it is a creative and constructive activity of the subject, which includes forecasting events, new ideas, assumptions and theories.

Ideas have their beginning and end. They also appear in a certain place and time, contribute to the development of society, exist in the minds and hearts of people, having lived their lives, having lost their strength and charm, they can turn into an historical memory. Aesthetic norms and criteria are also constantly changing and developing. For example, if we are talking about harmony, rhythm, beauty, style, we will see that each era in this respect has its own aesthetic criteria, views and taste. This means that a change in the ideas of each era leads to a change in the aesthetic ideals of that era and, on a par with this, to a change in aesthetic norms and criteria, aesthetic taste and aesthetic assessment.

Ideas serve good or evil, freedom or oppression, education or vandalism. Together with ideas, we see a similar parallel situation in relation to values:

2. Under the influence of social processes of representation, people's views about "values" change, which is associated with changes in living conditions, everyday life and the spiritual appearance of people in the process of development. In some cases, the decline in values is due to the fact that these values are incompatible with the ideals and tastes of the time. Different aspects are opposite aspects of all kinds of values. Positive and negative, contradicting each other, depending on the meaning and importance of the concepts of "good" and "evil", "truth"

and "injustice", "happiness" and "unhappiness" characterize aspects of life that are in conflict with each other.

3. Also in the emergence of the categories of science of aesthetics, as beautiful, ugly, sublime, base, tragic, comic ideas, values and their principle of opposition here occupy a worthy place. They are reflected in works of art.

Aristotle: "An artist," he writes, "selects certain people, they can be good or bad. They are better than us or worse than us, or they can be like us ... There is also a difference between tragedy and comedy: comedy is worse than the living, and the other tries to describe the best people." [2.9-10.] Farabi also dwelling on the art of poetry emphasizes: As for poetry, this is what is mentioned in the conversation to create a clearer picture, is used to enhance the subtleties. Here is an image (also poetic thinking) of the beautiful and ugliness, majestic and low or similar (life events). [3.80.]

Unlike ideology and values, aesthetics also explores, through these concepts, the experience of a person who develops aesthetic senses.

The opposite and the aesthetic ideal: The study in philosophy of dividing an object into opposite sides, the need to clarify their relationship is based on the fact that each thing absorbs the tendency of opposition. Opposition is the existence of all objects and phenomena in the material world, interconnection in the process of development, complementing each other, defining the unity of contradictions, a philosophical concept. This conflict between opposing forces, which is the source of progress, leads to the loss of the old and the emergence of the new.

In our opinion, proceeding from the concept of opposites in art, the origin of the aesthetic ideal is characterized by the following:

1. The history of eras.
2. in the internal structure of the work.
3. Psychic-sensual rational aspects of the artist and the work of art.
4. Specific features of the arts, etc.

1. Historical periods. The origin of the concept of opposition dates back to the ancient period. It is known that according to the teachings of the Avesta, all events in nature and human society originate from the opposition and struggle of two creators. One of these creators is Ahura Mazda, the god who created light, prosperity, well-being, health, peace and other good things. One of these creators is Ahura Mazda, the god who created light, prosperity, prosperity, health, peace and other goodness. The second Ahriman (Angra Manyu) fights against the good created by Ahura Mazda. The result of this struggle will end with the victory of light (ideal) against darkness.

The opposite is reflected in ancient Greek philosophy in the views of Pythagoras and Pythagoras. They explain the essence of events and phenomena in the universe by numbers. In particular, 1 is the basis of the universe of all things and phenomena in the universe, and 2 is the basis of contradictions in nature - beautiful and ugly, light and darkness, man and woman.

Changing the social ideal has always required a new creative approach. For example: the ideal of antiquity did not fit into the medieval religious and ideological ideal, or the ideal of the

classical period differed from the ideal of the Renaissance era, the hedonistic ideals of Rococo did not coincide with the high moral and political ideals that inspired the artists of classicism. Consequently, there were serious contradictions between classicism and romanticism, or the methods of classicism and baroque. Thus, the aesthetic ideals of a person are renewed in sync with social changes.²In the internal structure of the work. The principle of opposition was reflected not only in historical period's in general artistic issues, but also in the structure of a work of art, and terms appeared that express opposites. For example: collision, contrast, artistic conflict, dissonance and consonance. and others. They play an important role in creating an aesthetic ideal and harmony in a work of art.

3. Rational and psychological and emotional aspects of the artist and the work of art. All conflicts in a person's real life are reflected in a work of art. They are: 1. a conflict of characters; 2. Hero and environment; 3. internal psychological conflict. They are interdependent: one passes into the other, one generates the other, one manifests itself through the other, etc.

The Russian scientist L. Vygotsky noted that in a work of art, the opposite of feelings developing, they meet at the last point and at this moment there is a small pause, and here we feel the resolution of these effects, an event of renewal or bursting of emotions occurs.

The culmination is the apotheosis of emotions in the development of contradictions. Often the artist tries to fully reflect his aesthetic ideals, life positions and philosophical views. It is at this moment that "catharsis" occurs in the art of Aristotle. This is the Climax. This is an ascent to the highest point of the spring of the feelings of content, the achievement of the goal of the entire work - strengthening of inner feelings with a work of art.

4. Specific aspects of the arts.

Each art form has its own specific aspects of the opposite. For example, contrast in the visual arts From French means "sharp contradiction". In the visual arts, light and dark, white and black, warm and cold colors, and the presence of positive and negative imagery create contrast.

In the art of architecture, there is an alternative (opposite to each other). The two buildings are presented in the opposite dual location style. Among other forms of art, the conflict is especially evident in the performing arts. Aeschylus introduced the second actor into his tragedies, which allowed him to deepen the action in the tragic conflict and strengthen the behavioral aspects. Instead of the old tragedy, in which only one actor and chorus participate, a new tragedy appears on the stage, where the characters are revealed in the course of mutual battles. Even in the lyrics (in the art of music, poetry, etc.) there is an internal opposition (the opposite of feelings, contradictory details, reference to an imaginary object; life and death, kindness and sin; loyalty and betrayal, real thematic antinomies both in the past and in present, etc.).

So, at the end of the 4 option there is a contradiction;

1. As a result of conflicts and internal contradictions in art, movement and dynamics arise, an aesthetic ideal is created.

2. What is important, beautiful, which is the core of the aesthetics based on these contrasts? Becomes even more beautiful, one of the main aesthetic criteria of harmony appears.

We have considered above some of the criteria that led to the creation of the aesthetic ideal. In the history of aesthetic thought, many philosophers have studied the relationship of beauty to the ideal, or they consider beauty to be a standard, perfection, ideal.

Beautiful and aesthetic ideal: It is well known that the ancient Greeks defined the ugly, disorder with the word chaos, order, harmony, harmony of the universe and ideal with the word cosmos. The natural principle of beauty is an aesthetic norm, where beauty is always present. The ugly is based on the violation of aesthetic norms. There is a lot of evidence in historical sources that expresses these ideas.

In the work of Ananda vardhana (India, XI century), the famous "Dhvanyaloka" (Light of Dhvani) explains that the qualities that make the poem perfect and beautiful are clarity, power of thought, coherence, pleasantness, proportion, harmony, meaning, grace, sympathy, beauty, nobility. ... Despite this, the opposite qualities weaken the poem (superficiality, urgency, rudeness, indifference, obscenity, disgrace, evil) [4.].

So, a person models the criteria of beauty in his aesthetic ideal. A person, in accordance with the model of the ideal, in his consciousness evaluates the basic concepts of aesthetics, such as the beautiful, the sublime, the tragic and the comic, that is, in order to perceive the beautiful, the object must correspond to the aesthetic ideal of the subject.

Diderot states: "Although there is no absolute beauty, in our relation there are two kinds of beauty: real beauty and beauty in our perception" [5.117]. The concept of beauty is necessary for studying, researching the beauty of an aesthetic object that exists in nature, society or art, but interpreting the aesthetic nature of an event in objective reality; this also serves as a guideline for scientific interpretation. These aesthetic features of objective reality make up the beautiful: beauty, sublime, tragic, miraculous, interesting, etc. These features are present in art, in nature, and in society. When we say ideal, and we usually mean that a particular person or socio-historical event is perceived by others as a model, a high goal and perfection, which means that it must be exemplary, far superior to the present reality [6.200.].

The aesthetic ideal meets the aesthetic criteria. Aesthetic criteria and norms exist, they are manifested in harmony, rhythm, form, content, genre, style, composition, etc., but each of them also has its own criteria for ideal, skill and perfection

Beautiful and consciousness: The formation of artistic and aesthetic consciousness, worldview is one of the main imperatives of the formation of an artistic and aesthetic ideal and social and spiritual existence. This is confirmed by the thought of Ghazali "beauty is an object of love only to those who understand it."

The philosopher A. Sher says: Like all relationships, aesthetic relationships consist of two main elements: the object and the subject. But in this case, the object is determined by the subject: if the subject does not enter the aesthetic process, his attitude, no matter how beautiful or magnificent he is, will not take on an aesthetic form. Therefore, one of the two objects (object) is due to the aesthetic appearance of form and content, which are pleasant or delightful. Consequently, one of the two sides (object) is due to the aesthetic appearance of form and content, which are pleasant or delightful. The second (subject) - creates an aesthetic relationship with a combination of emotional and intellectual elements that help to perceive. [7.188.]

To understand the beautiful, the object must correspond to the aesthetic ideal of the subject in his consciousness and perception. A person's views on beauty are associated with the aesthetic ideal and taste in his mind. He compares every information about beauty that comes to him through human perception, first of all, he compares it with its ideal criteria in consciousness and he likes it, if it is high, he may not even understand it, if it is low, then he does not like it. The beautiful is, first of all, the main category of aesthetics. In each subject, "category" refers to its criteria. Categories (other Greek utterance, accusation) - important for philosophical thinking, the perception of general aspects of change, development, relevance and interdependence in the world; general concepts that form the basis of knowledge, representing uniqueness, similarities and differences, stability and change of things and events.[8.193.]

Each category in aesthetics expresses its relation to the aesthetic ideal. The categories of beautiful and ugly are associated with levels of quality between reality and ideal. The sublime of a person and the degree of his spiritual and physical strength make the category of the sublime an aesthetic value, for the sublime reflects the ideals of people and society. A person wants to imagine his life in an ideal state, but this vision, faced with reality, baseness, disgust and ugly, leads to the defeat of the ideal, which turns into a tragedy.

When laughter and smile become companions of the comic, if they want to overcome the opposite of human ideals and when a person experiences pleasure from it, because the emotional revelation of an ideal is overcoming evil and liberation from it. F. Schiller presents humorous contrasting reality to the ideal.

No matter how abstract the ideal is, the concept of the aesthetic ideal in art is especially associated with the "beautiful." In philosophy, the systemic principle requires the revival of the studied reality as an integral system, divided into separate elements and sides within the framework of universal categories and a system of laws. We have tried to systematize the ideal of beauty in the following way.

1. Recognition of the ideal of beauty as harmony.

Ancient Greek legend says that the goddess of beauty was named Harmony. Harmony is literally a symbol of beauty. Over the centuries, the expression has become synonymous with the correspondence of the name to the face, body, proportional, consonant, harmonious, perfect in all respects.

Although emphasizes the emergence of harmony from chaos, thinkers argue that harmony arises from contradictions. Many thinkers, for example, V. Shestakov, included harmony in the basic concepts of aesthetics - in categories. The scope of application of Harmony is huge. Harmony of form and content, harmony of the whole and parts, harmony of sounds, which is formed by a simultaneous combination of 3-4 sounds in music, harmony of colors, etc. There are many thoughts in philosophical sources on the philosophical and aesthetic essence of harmony. The concept of beauty in the Avesta comes from the divine point of view of justice, hospitality, proportionality, that is, the first primitive forms of the concept of harmony.

This is also emphasized in Eastern Chinese philosophy in the East; each fragment of the universe is like a pipe that produces a coherent melody, or a universal harmony of voices of different voices of Pythagoras, etc. In philosophy, "harmony" is the concept of a state of interconnectedness, interdependence at a certain stage of development of certain elements and

components of the system. [9.81.] It must be said, that every ideal of beauty in our system embodies harmony in one way or another.² To see the creation of the ideal of beauty and the reflection of this in literature and art. Ghazali calls beauty only that which is filled with all aspects of its perfection. Ghazali sees this beauty only in Allah.

Religion first of all promotes the ideal of beauty, is worthy of worship, love and unconditional obedience to God. For example, according to Islam, "true love is love for God. Why? Because, Allah, the Creator of all kinds of beauty, Allah, the Almighty, is perfect in all respects, Allah is Wise, Allah is all-knowing. Whatever you see, the highest of the most beautiful attributes is the most beautiful Allah. This is why Allah is the best of all! That is why a person can understand, be able to see, contemplate, Allah is the most beautiful of all! Allah's love is truth! "[10.24.]

3. Beauty and idea. In the teachings of Plato, beauty is defined as an eternal spirit, separated from the living, emotional and ever-changing world of things. He believes that beauty does not arise, it does not collapse, it acts outside of time and space.

The idea of absolute beauty is a manifestation of beauty, Hegel emphasizes. He considers an absolute spirit with an emotional shell, that is, beauty is only in that which shines. Art is a space of beauty.

4. The ideal of the beautiful in values. The complexity of the ideal lies in the fact that it is associated with values. Value is expressed in the form of the perception of the ideal in the object. In Hegel's words: "For an ideal to exist, the external form must correspond to the soul." That is, this is an approximate form, ideally suited for the soul of a living subject, then a person perceives the emotional and intellectual manifestation of his ideas as a spiritual value. [11.208.].

5. Viewing the ideal of beauty in classics, periods. The views of the Greek Greek thinkers were ideal both for the East (Farabi, Ibn Sino) and for the West, the thinkers of the Renaissance. Classicism sees the ideal of beauty in the reign of ancient Rome, the life of the emperor and the great commander. In our time, the standard of the ideal in all forms of art is the classical periods, classical artists and works of classical art.

Xozirgi davrda xam barcha sanat turlarida eng asosiy idealning etaloni classic davrlar, classic izhodkorlar wa classic sanat asarlari xisoblanadi.

6. The ideal of beauty combined with expediency and aesthetic taste. The aesthetic ideal is especially closely related to aesthetic taste. Aesthetic taste is not a definite aesthetic value or a set of values, rather it is a process of "production" that represents aesthetic value and develops norms of evaluations and criteria for the subject. The aesthetic ideal is a condition for the life of aesthetic taste; taste, in a sense, taste in a certain sense, a manifestation of the ideal in life; a change in the aesthetic ideal will inevitably lead to a change in taste. [12.198.].

6. The ideal of beauty in an orderly manner. Pythagoras states: Order is your sacred goal. Be firm to serve this purpose. Because order is a complex of everything. The existence of nature is based on order. Another important aspect of the norm is symmetry. Plotinus in the treatise "On Beauty" is interested in what specific situations are necessary and important for beauty and believes that the essence of primary beauty is symmetry. While some of the beautiful things, such as monochrome colors and musical notes, are not completely symmetrical: some symmetrical things, such as the face, can sometimes be ugly. Through the formal unity that he sees, beauty is perceived as unity and integrity [13.475.].

Democritus believes that beauty is in harmony, in the correct ratio of parts (symmetry) and he connected this with the concept of norms, sees the essence of art in imitation of reality (mimesis).

“The most important aspect of beauty is order, proportion and clear boundaries,” says Aristotle. [14.327.] another sign of beauty, according to Aristotle, is a limited number. Living things, such as inanimate objects, must also be easily quantified, says the philosopher, and the plot must also have an easily accessible lengthening.

Aristotle says that the things of the material world are the basis of the beautiful; the beautiful are manifested in the properties of order, consistency, clarity, harmony and integrity.

7. The ideal of the beautiful in the artist's talent. The artist idealizes perfection, beauty; he sees art as a means of reaching maturity. In general, the artist sees his search for the ideal as his destiny; he does not consider the ideal as a ready-made, unchanging thing. Each work creates a new ideal in the artist; otherwise all his works would be repetitive and similar to each other.

8. The ideal in relativity. For example: "Lovely girl", "lovely lyre", "lovely jug" - this is the only beauty that is unique to itself. None of them can be a common beauty for other things. The basis of their beauty is relative, which means that “even the most beautiful girl is ugly in relation” [15.295-296.].

9. The ideal of beauty in the form and content of its integrity and harmony. The beauty of art can be seen in the form of a work of art. After all, a real work of art is not just a factor in describing and challenging the beautiful, but it must also be beautiful from artistic to compositional construction: only a beautiful form can reveal the beauty of the content [16.209.].

10. The ideal of beauty as harmony with nature. Boileau emphasizes the need to imitate nature in poetry (art), saying that everything is natural. But not nature in its pure form, but ennobled, refined manner should enter art. In his opinion, a strict literary and aesthetic law must be observed in order to create an ideal artistic image for a work of art. Then the artist will discover true beauty for perception. Jung considers only natural beauty to be beautiful. A person connected with nature and having his own nature, he receives aesthetic pleasure only when he combines the external natural beauty of his nature with an internal vision of beauty. 11. The ideal of beauty in harmony with the human psyche and emotional perception; the beautiful, says Hume, is not a quality that exists in things themselves, it exists in the spirit of observing oneself without exception; the soul of each person has a different perception of beauty. Therefore, each perceiver should not try to force others to feel the state that he himself feels. ” [17.350-351.]

Diderot states: “Although there is no absolute beauty, there are two kinds of beauty in our attitude: real beauty and beauty in our perception.”[18.117.]. It is impossible to show how proportionality, benefit, expediency and perfection as the true causes of unshakable beauty. Because these reasons are related to rationality; But beauty is not the work of our mind. [19.138.] when the beautiful is perceived, all the senses are summed up and involved. So the beauty extends to all the senses at the same time.

12. The ideal of beauty as perfection. According to Farabi, the beauty of everything is that he reflects the fullness of his existence and is associated with the achievement of perfection. [20.113.] This classification can be continued, the ideal can be seen in styles, images and many

other factors of art, but most importantly, the pursuit of the ideal brings works of art to the highest artistic level.

The aesthetic ideal of art is the question of what will give it to a person in real life. The aesthetic ideal in art is, first of all, the motivation of the ideal person.

1. Motivation - a set of many reasons for being active.

Motivation is a set of psychological reasons that explain human behavior, his connection, orientation and activity. The origin of the aesthetic ideal is also closely related to the aesthetic needs of man. 2. Satisfies the aesthetic need of a person for beauty and at the same time it leads to the improvement and improvement of existence. Thus, art as a social phenomenon was one of the highest human needs - this is an activity aimed at meeting her needs for beauty and creating criteria for beauty, striving for the ideal motivates a person to live and work according to the laws of beauty. VS Slovyov says: "From an aesthetic point of view, beauty as an ideal image should lead to a real improvement in life." [21.31.]

3. The aesthetic ideal is chosen, modeled and evaluated by freedom itself. The aesthetic ideal finds the beautiful, the sublime or the miraculous more in art. First of all, through a work of art, the artist depicts reality through the prism of his ideal, materializes his ideals through the means of art and turns them into buildings, sculptures, novels, plays, paintings, fiction and other spiritual events. We choose our ideals through the images they represent, we cite them as a model for a certain period or for a lifetime, and In this case, our actions also take place through freedom.

4. The aesthetic ideal is based on the aesthetic experience of a person, personality and society. It is thanks to this experience that a person perceives the world aesthetically. For this reason, the aesthetic ideal acts as a criterion for determining beauty, harmony, sublime and other aesthetic features. A person chooses the beautiful or the sublime in accordance with this ideal, recognizes, evaluates, and rejects incompatibility as an aesthetic phenomenon.

5. The aesthetic ideal leads to the formation and development of cultural and moral norms in society. This is reflected in a person's habits, behavior, etiquette, rituals, relationships, and the emergence of new traditions, fashion and interests.

6. The ideal becomes a criterion, standard, template, canon of beauty, beauty, and these criteria imply their own norms... Stendhal said that in connection with this, with a change in the ideal of beauty, the form and content of art will change.

7. the most important thing is that the pursuit of the aesthetic ideal has developed a sense of norms, artistry and harmony.

In this rapidly changing world, the question naturally arises: what does the self-development of an ideal depend on, what is its transformation associated with.

Of course, with a change in the ideal, aesthetic norms and criteria also change. The philosopher scientist A. Erkaev says: "New aesthetic standards should serve the formation of true morality. The development of aesthetic norms is also based on the centuries-old artistic and creative experience of our people, the achievements of the peoples of the world, including the achievements of modernist methods. Providing them with new content is one of the prerequisites for building the spiritual foundations of independence. " [22.184-185.] If new norms do not

develop and change, art will also stop developing. Let's classify the main factors that contribute to the transformation of the aesthetic ideal:

1. New thinking, new ideas and, of course, social factors in society play an important role in our life.
2. Brilliant talent always creates criteria for new ideals
3. Innovation in the transformation of ideals, new technologies. They give artists new opportunities.
4. 4. Changes in the aesthetic needs and tastes of people can lead to a change in the criteria for the ideal. For example, recently the demand for short and laconic works has been growing. This is an example of social videos. There is a short plot composition, form, image with all the emotions. The need for poetry on social networks has increased, especially in photographing, now we can observe not only photographs, but also movements in it in order to increase its attractiveness
5. 5. Integration processes. Intersection and connections of different cultures and nations. In today's global network, this is becoming more and more natural.
6. Striving for excellence. The desire of the creators for a constant ideal, perfection, leads to the transformation of criteria.
7. The most important thing is to bring a person to the highest point of ecstasy, ecstasy and the point of ecstasy, surprise, singularity and, if necessary, euphoria, ecstasy, the desire to create a miracle in real life. We'll look at this in detail.
8. Today, surprisingly, the creation of oneself, oneself, oneself ... becomes the reason for the creation of new aesthetic ideals. Starting from the 20th century, the boundaries of new aesthetic ideals in art have been expanding so much, for example, the tallest buildings, the most unprecedented compositional solutions, colors, form and content, the use of new technologies (the use of new technologies in cinema to create films), unexpected designs, optical and kinesthetic art, 3D format, variety shows, etc. As a result of the psycho-aesthetic impact on a person, we believe that in the subject "aesthetics" a new category "surprise" becomes independent. In the past, it was only used as a factor of the sublime. "Surprise" is several times higher than ideal criteria, the creation of beauty more than beautiful, sublime more than sublime, interesting more than interesting, wonderful more than wonderful.
9. So, surprise is that a person's feelings are irritated, it is considered "appropriate" for the emergence of criteria for unforeseen situations, the transition to emotional surprise, going beyond the human ideal. According to Hegel, if the idea of beauty took shape in the classics, if the romantics did not fit the human soul into the image, then the idea and form of the amazing can be expressed as infinite.
10. Amazing new ideals are being created, new criteria, norms, their quality and quantity are changing.

Even today, in the era of the market economy, admiration is becoming a valuable mechanism, such as beauty. Not only in art but also in other industries attracting more people, at the same

time, new aspects of admiration and surprise are created to increase your competitiveness and make more profit

Creation of different brands, advertisements, logos, brand image, furnishing of exhibitions or shop windows, along with decoration, an attempt to surprise, is the basis for the success of the activity. All of the above is a factor contributing to the development and transformation of the ideal

The practical significance of the aesthetic ideal not only in art, but also in other areas. Today, the practical aspects of each science are important. The laws of art and aesthetics apply to all types of artistic activity. For example: Aesthetic medicine, rhythmic gymnastics, synchronized swimming, etc. In aesthetic activity, the creation of beauty is in harmony with art.

Artistry is the cornerstone of a work of art that takes it to the ideal level. Beauty, harmony, grace, a sense of the norm, a sense of rhythm and other aesthetic norms and criteria play an important role in its creation. Beauty, harmony, elegance, a sense of rhythm, rhythm and other aesthetic norms and criteria play an important role in its creation. The main aesthetic factors of artistry: image, form and content; conventionality of artistic creativity; aesthetic perception; versatility; harmony; beauty, etc. As the basic principle of artistic aesthetics, artistic activity reflects human existence, reality, realizes and perceives reality on the basis of specific forms of expression of a person's aesthetic attitude to the world, tries to portray his aesthetic ideal through artistic images.

Today, all types of aesthetic activity are rapidly developing and it is very important to cultivate beauty, grace, aesthetic taste, aesthetic appreciation and aesthetic ideal in almost all professions, but even in areas not related to art, the aesthetic ideal and criteria play an important role.

Take economics, for example. The study of the criteria of aesthetic taste, norms and aesthetic needs and ideals of society in the economy is a requirement of a market economy, the development of the proposed patterns of market equilibrium and marketing, to increase competitiveness, the development of commodity-money relations, as well as to improve the quality of life.

There is an auxiliary effect of aesthetics on all branches of the economy and they are as follows; product design, creativity, branding, etc. The aesthetic features include the conformity of the product form to its purpose, its color, spatial structure, harmony, consistency of all form elements, design compliance with modern fashion requirements, aesthetic taste and consumer ideal, etc.

In addition, fashion plays a special role in social life and the aesthetics of life. The development of fashion takes place in a spiral, in each new ring, old tastes and ideals that have been erased from memory are created in a completely new way, in an original way with new and unique elements. Fashion is the process of changing the aesthetic taste and ideal of society. Criteria and ideals of styles in the history of art can be traced in fashion: classics, romanticism, modern, baroque, gothic, eclecticism, etc. After all, fashion has the ability to reflect the level and originality of the mass aesthetic taste and ideal.

Or let's take tourism. The objects of tourism are considered to be the beauty of nature, cultural heritage and aesthetic values, folk applied art, town-planning architecture, etc. The main motive of a tourist for traveling is to discover new sides and criteria of the beautiful, sublime, amazing, interesting in national values, culture and art. Get aesthetic pleasure, cultural leisure. For this,

first of all, the creation of good advertising and brands will serve as an important incentive to attract tourists to the country. Artistic criteria and standards: form and content, plot, method, creative idea, brevity, harmony, chiaroscuro, composition, rhythm, selection of color combinations, will ensure the success of various exhibitions and brands. Their ultimate goal is to convince people that the product is "perfect". In this case, the ideal appears as "the most excellent", "the highest quality", "the most beautiful", "the best", "the newest". There are many such examples. Marketing relationships are purely psychological relationships between people based on live communication and people's tastes. The taste is in harmony with the ideal.

So today, not only art and artistic activity, even spheres where there is no artistic activity, require action on the basis of the laws of aesthetics, aesthetics. For this, in each activity it is necessary to use aesthetic knowledge, aesthetic taste and ideal. In general, when all professionals do their work at the "art" level, i.e., at an ideal level, which is the pinnacle of perfection, society will improve, because a person wants all aspects of his life to be beautiful and this desire applies not only to all professions, but to all of humanity as a whole.

We can conclude in our article that beauty is a value that has spiritual and material significance in public life, based on harmony, consistency, proportionality and expediency of events. From the earliest times, people have had an aesthetic need for beauty; a person's constant striving for the ideal will always be a constant renewal and development of the quality, quantity and standards of beauty. But no matter how people strive for novelty, they must know the classical criteria and values of the aesthetic ideal, which is the basis of all creativity and innovation. Thus, the aesthetic ideal serves to raise and socialize a person, creating the concept of "I" in an ideal person. The aesthetic ideal serves as a "criterion", "measure" in the understanding of truth and falsehood in relation to the beautiful. Each person in the mind has its own aesthetic ideal; it is natural that their degree may be different. The ideal of every person is his worldview, position in life, character, personal values, psycho-emotional and aesthetic taste. Even in modern psychology, web pages often perform various psychological visual tests based on artistic criteria: images, patterns, and shapes. They are often diagnosed with a mental, mental state, based on images of a person who is characterized by "best", "ideal". Therefore, the goal of aesthetics is to educate the aesthetic taste and ideal of a person, and the more a person's taste is developed, the higher his ideals will be and will be able to lead. High ideals create a person's interest in life, confidence in the future, optimistic feelings, from which society will also be stable.

OKKAZIONAL WORDS DEPENDENCE ON SPEECH (TEXT)

O. Tukhtasinova*

*Associate Professor,
Kokand SPI, UZBEKISTAN
Email Id: ytuxtasinova@gmail.com

ABSTRACT

This paper discusses scholars views on the specific properties of occasional words and the most important feature of occasional words, i.e., their dependence on speech as a unit of speech. An occasional word is a speech phenomenon that occurs suddenly, urgently, due to a specific speech need, based on a word-formation pattern that is rarely used, sometimes not yet known and does not exist, as an individual creation of the creator. The most important characteristic of such words is that they are closely related to the text and cannot be understood outside the text.

KEYWORDS: *Speech, Occasional words, Occasionalism, Emotional-expressive Paint, abnormality, Abnormal-rhythm, Expressiveness, Word-formation rules, Personal-creative artificiality, historical-modern adaptation.*

INTRODUCTION

An occasional word is a speech phenomenon that occurs suddenly, urgently, due to a specific speech need, based on a word-formation pattern that is rarely used, sometimes not yet known and does not exist, as an individual creation of the creator [1]. The most important characteristic of such words is that they are closely related to the text and cannot be understood outside the text [2].

According to EA Zemskaya, one of the characteristic features of occasional words is the specificity of the text, while others are distinguished from neologisms by the fact that they do not assimilate into the language and retain their novelty. The researcher points to the violation of language norms in order to ensure the emotional-expressiveness of speech as one of the reasons for the emergence of occasional words [3].

A. Mamatov studied occasional words in Uzbek linguistics from the point of view of their relation to the literary norm. He also distinguishes speech specificity as one of the main features of occasional words, and emphasizes that one of the main conditions in their creation is to give color to speech. The researcher points out seven signs of Uzbek occasional words. They are: 1) relevance to speech; 2) abnormality, 3) single use; 4) creation by the speaker or writers; 5) expressiveness; 6) follow the rules of word formation; 7) historical-modern adaptation [4]. The researcher does not take into account the nominative sign in this. In our view, occasional words are characterized by this sign, because they are also the names of things in existence - objects, events and actions. For example, a sandbox, a meadow, a cotton field, a football field, a winter camp, a hut, a joke, etc., either refer to a place or a person.

S. Muminov compares neologisms and occasionalisms and shows their peculiarities. He mentions the following as important features of occasionalisms: 1) the attitude of occasionalisms to the lexical layer; 2) individuality (occasional meaning); 3) a single-use, often emotionally-expressive, speech unit; 4) to serve for a clear artistic speech situation; 5) be motivated [5].

In her dissertation on "Occasional word formation in the Uzbek language" S. Toshaliyeva points out the following as specific features of occasional words: Occasionalisms: 1) speech phenomenon; related to text and speech situation; 2) abnormal-rhythm; 3) intended for single use; 4) personal-creative fabrication - related to word creation; 5) related to word formation and word usage; 6) based on the process of manufacture, method of manufacture, reason for use; 7) the usual and unusual relations connected with morpheme division and composition are clearly understood; 8) application and construction require a certain environment (microtext); 9) associated with certain linguistic-conscious perceptions and alterations; 10) appears as a method of verbal naming and text creation [6].

Although such words are used on an equal footing with other words (usual words that are a unit of language) in the speech process in which they are used, they differ from them only in their own peculiarities. One such important feature is the dependence on speech (text).

This sign is the most important sign of occasional words. In a given speech situation, there are speech units that are more necessary than a simple language unit in terms of content and emotion, that they are created in the text to which they belong, are used in that text, and live with it. Such words do not have to be accepted into the vocabulary of the language and pass into general use.

The units that make up the vocabulary of a particular language are stable words, and their dependence on the text is relative. Because stable words can be used repeatedly in speech alone, word-for-word, single-word sentences, and the like. The dependence of occasional words on the text is absolutely necessary in most cases, and they cannot exist separately, outside the text. In an occasional word derived from the text (e.g., uvadaband, kuzaytirmoq, damkash, sezim, nursiramoq, rangdosh), the lexical meaning has a probabilistic character and is clarified by the text, which allows the occasional word to be used alongside stable words in speech.

Consequently, while a stable word depends on the text, it itself predetermines and shapes it. In other words, a stable word is an active factor that shapes the text creatively. The occasional word, on the other hand, does not have the property of forming text on its own. For example: We are a spiritual organization — “Ranjkom”, that is, it is our job to offend others. (A.Oripov)

The word ranjkom in this text is incapable of any meaning without relying on a much broader text of stable words, and is absolutely incomprehensible.

ABSTRACT

In this article highlights of the principle of operation of transformers and the most common electrical devices in industry. The choice of a power transformer for operation in enterprises is based on the selection of power, as well as in accordance with the requirements for power reliability. To ensure uninterrupted power supply, in some cases, it is necessary to install several transformers. An alternating current is applied to the primary winding, which forms an alternating magnetic flux in the magnetic circuit. This is due to its closure on the magnetic circuit and the formation of coupling between the windings, inducing EMF.

KEYWORDS: *Power Transformers, Magnetic Induction, Efficiency, Operating Principle, Classification, Parameter.*

INTRODUCTION

Power transformers: definition, classification and operating principle

The most common electrical devices in industry and in everyday life are transformers. Their purpose is to transfer power within an uncoordinated electrical circuit between its various circuits. They are used in cases where it is necessary to lower or increase the voltage between the energy source and the consumer. Transformers are also included in the circuits of power supply units that convert alternating current to direct current. At the heart of the operation of transformers is their ability to transfer electricity between the circuits by means of magnetic induction.

Fig 1. Power transformers

Power transformers are electromagnetic devices designed to convert alternating current voltages while maintaining its frequency, as well as to convert the power supply system itself.

Design and arrangement of power transformers

The main part of each power transformer is its core with several windings, made of ferromagnetic material. As a rule, these are thin sheets of special transformer iron with magnetically soft properties. The sheets are laid in such a way that the shape of the rods under the windings in the cross section is close to the circle. To increase the efficiency of the device and reduce losses, whole sheets overlap the joints between individual plates.

The transformer winding is usually made of copper wire with a rectangular or round cross-section. Each turn is isolated from the magnetic circuit itself, as well as from neighboring turns. For the circulation of the cooler, technical voids are provided between the windings and its individual layers.

Each transformer has at least two windings: the primary (electric current is applied to it) and the secondary (current is removed after its voltage is converted).

Operating principle

The principle of operation of any power transformer is the phenomenon of electromagnetic induction. An alternating current is applied to the primary winding, which forms an alternating magnetic flux in the magnetic circuit. This is due to its closure on the magnetic circuit and the formation of coupling between the windings, inducing EMF. The load connected to the secondary winding leads to the formation of voltage and current in it.

Structurally, to obtain any voltage on the secondary winding, the necessary ratio of turns between the windings is used. The power transformer has the property of reversibility. In other

words, it can be used to increase or decrease the voltage. In most cases, a power transformer is used to solve certain tasks. For example, specifically raise or lower the voltage. In the step-up transformer, the voltage on the primary winding is lower than on the secondary.

Classification of power transformers

Depending on the voltage class and the total power consumption, power transformers are divided into the following categories:

By capacity:

Up to 100 kVA, up to 35 kV;

100 – 1000 kVA, up to 35 kV;

1000 – 6300 kVA, up to 35kV;

More than 6300kVA, up to 35kVA;

Up to 32,000 kVA, 35 – 110 kV;

32 000 – 80 000 kVA, up to 330 kV;

80 000 – 200 000 kVA, up to 330 kV;

More than 200,000 kVA, more than 330 kV.

Types of power transformers

Power transformers can be divided into several types, based on the following characteristics and indicators:

- Type of cooling. There are dry and oil transformers. The first version has air cooling, used where the requirements for ecology and fire safety are increased. The second option is a housing filled with oil with dielectric properties, in which the core with windings is immersed;
- Climate-controlled design: exterior and interior options;
- The number of phases. There are three-phase (the most common) and single-phase;
- Number of windings. There are two-winding and multi-winding options;
- Purpose: raising and lowering.

An additional criterion is the presence or absence of an output voltage regulator.

Power transformer elements

The design of the power transformer implies the presence of the following elements:

- Power inputs – devices through which the load is supplied. They can be located inside the product or outside. The inputs are insulated with various special materials, differ in the type of insulation and construction;
- Coolers. For high-power power transformers, an oil cooling system is provided. Cooling of the oil itself is carried out by means of radiators, a corrugated tank, forced ventilation, oil-water coolers or circulation pumps;

- Output voltage regulators are devices designed to change the transformation coefficient. They can be triggered both under the influence of a certain load, and without it (depending on the design). In fact, the regulators add or reduce the number of turns in the winding.
- Power transformers can be equipped with additional attachments:
- Gas relay-a device with a protection function. If the transformer is unstable, the oil decomposes into its components and releases gas. The gas relay either disconnects the transformer or alerts it with warning signals;
- Temperature indicators-sensors that measure the oil temperature;
- Dehumidifiers – devices that absorb the condensate formed under the protective cover, thereby preventing it from entering the oil;
- Oil recovery system;
- Automatic cooler pressure protection system;
- Oil level indicator.

Power transformer parameters

Rated power. For a transformer with two windings, the parameter is equal to the power of each of them. For the three-winding version with different winding power, the parameter is equal to the larger of the indicators;

- The rated voltage of the windings is a characteristic parameter for idle operation;
- Rated current-the indicator at which long-term operation of the device is allowed;
- Short-circuit voltage-characteristic of the total resistance of the windings.
- Short circuit losses;
- No-load current – losses of magnetic core material (reactive and active);
- No-load current loss;
- Transformation coefficient.

How to choose a power transformer

The choice of a power transformer for operation in enterprises is based on the selection of power, as well as in accordance with the requirements for power reliability. To ensure uninterrupted power supply, in some cases, it is necessary to install several transformers. The power of each device is selected in such a way that when it fails, other devices are able to take over the functions of this missing link, taking into account possible overloads.

Another important criterion is the availability of protection:

- From internal injuries. It is provided by devices that control the presence of gases, temperature, pressure and level of the oil cooler;
- Overload protection. The so-called differential protection is used when current transformers are installed on each phase.

Repair and maintenance

The reliability of power transformers directly depends on the quality and timeliness of their maintenance. Devices installed in the premises where the company's personnel work are subject to daily inspection with monitoring of the oil level, the condition of the absorber and the regeneration devices. In addition, the integrity of the housing and the main elements is checked. Transformers in the premises without personnel are inspected once a month, and transformer points-twice a year.

An unscheduled inspection of the power transformer and its protection systems is carried out in case of a sharp change in the ambient temperature, as well as in emergency conditions. The voltage control devices are also subject to periodic maintenance. The reason is the oxidation of the contact groups, which leads to an increase in their transition resistance. Before seasonal load changes (usually twice a year), the device is disconnected from the consumers and the power supply, after which the voltage regulator is moved sequentially to all possible positions. The procedure promotes the destruction of the oxide film.

Laboratory analysis of the oil is carried out every year during major repairs. If the oil does not meet the requirements for visual inspection (color) or according to the survey data, it is replaced or refilled.

THE AVAILABILITY OF NATURAL GAS AND THE COST OF BUILDING POWER PLANTS

Nabiyev Muminjon*; Rahmonov Fayzullo Valievichmaster**

Candidate of Technical Sciences,
Fergana Polytechnic Institute, Fergana,
UZBEKISTAN

**student

Fergana, UZBEKISTAN

ABSTRACT

The construction of thermal power plants that run on natural gas requires relatively small investments-in comparison with power plants that run on other fuels, such as coal, uranium, and hydrogen. In this article highlights of the availability of natural gas and the cost of building power plants.

KEYWORDS: *Natural Gas, Power, Effective, Technology, Cost, Alternative Energy, Ecology.*

INTRODUCTION

Natural gas as fuel for power plants is available in almost all industrial zones of Russian cities. In 2010, the level of gasification in Russia averaged 62%. In cities, the level of gasification has increased by 6% in recent years, to 67%. In rural areas, the level of gasification has increased by 8% and now stands at 44%.

The construction of thermal power plants that run on natural gas requires relatively small investments-in comparison with power plants that run on other fuels, such as coal, uranium, and hydrogen.

The electric efficiency of a modern gas-fired power plant reaches 55-60%, while that of a coal-fired power plant is only 32-34%. At the same time, the capital costs for 1 MW / hour of the installed capacity of a gas-fired thermal power plant are only 50% of the coal, 20% of the nuclear, 15% of the wind power plant.

Gas is more cost-effective than other fuels and alternative energy sources.

The construction of a gas-fired power plant takes only 14-18 months. The construction of a modern coal-fired power plant will take 54-58 months. In order to erect a nuclear power plant (NPP), it will take at least 56-60 months.

Gas is the most affordable and cost-effective solution for electricity producers and consumers who count money.

It is likely that someday alternative energy sources will replace fossil fuels, but this will not happen soon. For example, in order for wind energy to account for 10% of the world's energy consumption, between 1 million and 1.5 million wind turbines are needed. In order to simply place these wind turbines, you will need an area of 550,000 square kilometers. This is equal to the area of the Khanty-Mansi Autonomous Okrug or the largest European country — France.

The problem is not only in the area: alternative sources are not the best solution from a business point of view. Alternative energy sources are still economically untenable. The most cost — effective type of fuel today is gas. Gas allows you to get cheaper electricity, in comparison with alternative energy.

Gas and ecology

Gas is a significantly cleaner fuel than any other hydrocarbon energy carrier. When the gas is burned, less carbon dioxide is released compared to other traditional sources, such as coal. This, accordingly, has a much smaller negative impact on the environment. A modern gas-fired power plant has practically no harmful emissions into the atmosphere, and in this sense its emissions are similar to those of conventional gas stoves. The misconception of many people is the erroneous opinion about supposedly absolutely clean alternative energy sources. Wind, geothermal and hydroelectric power plants also cause their own damage to the environment, and sometimes considerable.

For thermal power plants, the transition from coal to gas contributes to a sharp reduction in carbon dioxide emissions into the atmosphere. Gas has a greater calorific value than coal. In order to get an equal amount of energy, you just need to burn more coal. Gas-fired power plants are more efficient in terms of efficiency: with the same amount of heat generated during burning, gas-fired CHPP produces more electricity.

As a result, the replacement of coal-fired power plants with gas-fired thermal power plants reduces CO₂ emissions by 50-70%. Gas is an environmentally adequate fuel.

Gas reserves — will they be enough for our children and grandchildren?

You can often read that the gas reserves are exhausted, but this is not the case. There is enough gas not only for our century. The gas will not run out during the lives of our children, nor during the lives of their grandchildren. According to the International Energy Agency, at the current rate of gas production, the already discovered reserves of this fuel will be enough for 130 years of production. We are talking about gas reserves, the production of which is possible and cost-effective at the current level of technology. The volume of gas reserves is estimated at 400 trillion. cubic meters.

The recoverable reserves of unconventional gas (such as dense rock gas, shale gas, and coal-fired methane) are still at least 380 trillion. cubic meters. As technology develops, their extraction becomes more and more real. Thus, the gas reserves already discovered will last for about 250

years. At the same time, exploration methods are constantly being improved, which makes it possible to increase reserves. To date, the United States, the world's largest consumer of energy, is provided with reserves of unconventional gas for 100 years to come. China, the second largest consumer, also has similar gas reserves.

Gas-the solution to the problem of energy shortage in the XXI century.

Khaira, Najafgarh, New Delhi,
INDIA

ABSTRACT

A Married Woman is a domestic novel by Manju Kapur. She is a notable Indian author who accentuates ladies' life in her books. She cries against sexual orientation, segregation and supporters for sex correspondence for an even society. Her second novel, A Married Woman is a genuine portrayal of the life of an Indian wedded lady. The tale contemplates Astha's battles to migrate herself opposing the male centric standards. Astha emerges from the male centric limit by partaking in the public issues. She reclassifies herself by rising above man centric limit and recovers her singularity by turning into a fruitful painter. Through the representation of her character Astha, Kapur distinctively shows the conceivable outcomes of lady's liberation from conventional servitudes by fusing different issues in her day-to-day existence. The paper is an examination of the writer's endeavor to revamp the tale of a wedded lady from 'an insider's perspective'. It examines the complex issues of the novel featuring the brutal real factors of a wedded lady as reflected in the novel. The goal of the investigation is to locate the unconventional attributes of Kapur as an author. It additionally targets finding the legitimacy of the author's contentions and ideas with respect to Indian culture and its ladies' lives. Manju Kapur is one such Indian lady author who manages a few issues in her books. Her second novel A Married Woman is a striking novel engraving her greatness in scholarly world. It contemplates the battles of Indian wedded ladies in their undertaking to reclassify themselves.

KEYWORDS: Domestic novel, liberation, legitimacy, man centric, sexual orientation.

BIO-NOTE

Komal Yadav is a Research Scholar from New Delhi-110043. She is post graduated (2020) and NET qualified in English Literature (2020). She belongs to a middle-class family. She was awarded by Khaira Gaon Sudhaar Samiti in 2017. She had a keen interest in Basket Ball and played in various schools and stadium on the behalf of Sri Krishna Public School. She also published and presented her papers in various National and International Webinars. She currently resides in New Delhi with her family.

INTRODUCTION**DISCUSSION ON THE TITLE**

Through the representation of the hero of the novel, Astha the author profoundly investigations Indian ladies' dilemmas, servitudes, bargains and forfeits, self-destruction and endeavors to declare their characters. The epic clearly portrays the multi-layered and multi-shaded existence of an Indian wedded lady. Specifically, the novel gives a definite record of Astha's battle to attest her selfhood. It is in the Bildungsroman structure as it records Astha's excursion from adolescence to adulthood archiving her change. It shows how Astha creates as an effective painter and individual outperforming different obstacles in her manner to progress. It describes Indian customary mores that relegate a fixed picture to Indian ladies and the battles of Indian ladies to undercut that generalization. Astha's folks carefully follow the codes and leads of Indian Hindu family in sustaining up her. They would prefer not to face any challenge that will imperfection her character. Her schooling, her character, her wellbeing, her marriage, these were their weights. She was their future, their expectation so they monitor her cautiously. In one of the occurrences where Astha's mom discovers Astha's sentimental dreams which she communicates in her diary her folks become much stricter in preparing her to be an ideal spouse. They bring her books of good and scholarly substance and demand her to understand Gita, Vedas and Upanishads with the goal that she gets temperances of convention and right lifestyle choices. They train Astha in such a manner to befit her to her future jobs.

Astha assimilates each exercise through her blood and skin to satisfy her folks' desire. After her marriage with Hemant, she is in the deception that she can satisfy their fantasy. She proclaims herself to be the most honored animal on the planet. She has all that each hitched lady wishes to have - a wealthy family, strong and modern parents in law, a caring spouse and two kids a girl and a child. In any case, sooner than later over the span of her wedded world she understands that she has optional situation in her family. Each choice is to be taken by Hemant. Her assessment in the family matter is practically irrelevant. She is treated as a teddy bear, a toy that needs to follow Hemant's directs. She has the ladylike persona looked by wedded ladies in their wedded life as pronounced by Betty Freidan in her age making book *The Feminine Mystique*. Like each wedded lady Astha likewise attempts to characterize herself comparable to her better half, her youngsters and family. She looks for her personhood in her purported wonderful family. She looks for a friendship with her significant other with a desire for acquiring fulfillment in her life. Be that as it may, she is baffled by her subordinate and enslaved position in her wedded world. On numerous occasions, through different activities and exercises Hemant helps her to remember her minimized position. She can't guarantee anything of her own in her wedded life. She lives as a sad remnant of Hemant. Her reality is outlined to homegrown issues. Distinction has no room in her life. Regardless of whether Astha wants to delete this non-presence and break

this reliance for a daily existence of a freed being she can't vocally communicate her inclination as a slight tumult against the fixed standards implies destroying her easily running wedded life.

Manju Kapur shows her ability in the specialty of characterisation. Her heroes are round characters having their own eccentricities that bring an energetic, exuberant and interesting personality to them. Astha, in *A Married Woman* also shows changes a lot as a part of her character as per the changing existence. She, however introduced as a normal Indian spouse at the underlying phase of her wedded life, builds up her character speaking to herself as an Indian wife who grasps both conventional and modern-day esteems in her day-to-day existence. Regardless of whether she maintains the conventional estimations of her family she can't thoroughly smother her inclination for selfhood. She can't disregard her desire for self-distinguishing proof for long in playing out her commitments to the family. By and large she shows her fomentations against the man centric standards and endeavors to move herself. Astha perseveringly plays out her obligations to the family yet doesn't have any desire to live as an accommodating and self-destroying lady bargaining her individual wishes and maintaining glorification.

“In this rapidly progressing world they [women] are redefining their proper place. They have revolted against their exploitation, victimization and marginalization. They are questioning the sexual politics in which they are always victimized. They are busy reshaping themselves in a more humanistic mould, emphasizing thereby the need for a thorough re-examination in depth of marriage and man-woman relationship for a better understanding and sharing of mutual love and respect.”

Kapur presents Astha as the model of the New Woman, a picture of current lady that numerous Indian essayists both male and ladies depict in their works. She is the encapsulation of the difficult lady who opposes male predominance and looks for ladies' liberation from customary servitudes. In Astha's excursion of self-acknowledgment the creator gets an alternate shade the plot of the novel. As referenced above Kapur shows her adaptability in the treatment of complex issues in her works. She interlinks the sub-themes with the fundamental topics in this manner getting consistency the surface of the novel. Kapur compares changed sub-themes with the main subject in this novel as well. Through such medicines of the sub-themes, she dives into the mental and philosophical substances of human brain. One of the significant issues in the novel is the Babri Masjid issue. The questionable issue that has been as of late settled somewhere near the summit court of the nation gives an alternate shade in the novel. The petulant issue pulls in concerns from the nation as well as from the world. It requires numerous a very long time to give a decision looking into the issue of Ramajanambhoomi and Babri Masjid. To arrangement a particularly touchy issue in an incredible detail by the writer is important. This is one of the components in the novel through which Kapur shows her dynamism as an essayist.

The author investigations outlook of each Indian with respect to the destruction of the mosque in the nation to give a socio-strict note in the novel. Her introduction of opposing viewpoints among Hemant and Astha with respect to this exceptionally touchy issue gives us a stage to examine assorted perspectives. Astha voices for compassionate qualities through her perspectives and acts with respect to the destruction of the masjid. She joins meeting, walks and fights to show her fortitude for an assembled country. Her dissent against communalism gives us an unadulterated understanding with respect to humanities, its qualities and convictions. Astha plays out her obligations of a wedded lady attempting to satisfy all the assumptions for her

family, yet she, as a resident shows her individual sentiments and feelings towards the country by communicating her socio-political and strict mindfulness for the improvement of the general public. She approaches rising above her exacting and occupied familial obligations, jobs and duties to battle for the secularism of the nation. She alongside the Sampradayakta Mukti Manch weeps for the respectability of the country. They look for equity for the heartless executing of Aijaaz and his group who battle for secularism of the nation. As a piece of her commitment to the battle against communalism Astha catches the call of the country by painting the pictures of the fights in her material. She crosses the fixed worldview of a wedded lady by taking an interest in the public issues. She attempts to reexamine herself through her familiarity with socio-strict issues by going past her homegrown jobs. Astha wants to get free beyond her home.

Simultaneously, she is limited by her obligation as a "great" mother, girl and the other homegrown jobs she epitomizes. Hemant, nonetheless, downgrades her commitment for the solidarity of the country. He helps Astha to remember her obligations as a spouse. Rather than empowering Astha's inclination for the country he rather regards her as an unreliable spouse. He even ridicules at Astha's strict mindfulness. Hemant underestimates Astha's work as well as that of the Sampradayakta Mukti Manch as well. Astha looks for that comfort in her female bond with Pipee. She finds an alternate world in her connection with Pipee. There is love, regard and common comprehension in this relationship. There is joy of a closeness that was finished and total, communicated through psyches as much as bodies. The unity and fulfillment that Astha looks for in her wedded life is accomplished in her female bond with Pipee. Regardless of whether Astha wants to live with Pipee she is caught by her obligations and duties to her family. Her failure to leave her family stops her relationship with Pipee. Her hesitation with respect to her connection with Pipee fulfills the finish of her reality. She can't spurn her duty as a mother to satisfy her individual longing. This is a proof of Manju Kapur's giving more significance to day-to-day life than the individual one. She makes Astha tired in her relationship with Pipee. Astha sidelines her individual cravings and sexual longings in playing out her bigger duties. It very well may be said that Kapur maintains Indian familial qualities with sexual orientation value. She makes her champion emerge from the worldview of man-controlled society looking for her personality in this way turning into an effective painter without relinquishing her obligations of a spouse and a mother.

Another magnificence of the novel is the utilization of images in the novel. Images are utilized by famous authors to communicate their thoughts in the base words. Manju Kapur uses images in the entirety of her books. Her development in dealing with images in her composing upgrades the excellence of her composition. Kapur shows her dominance over the utilization of images in this novel as well. Kapur's utilization of images is one such strategy. In the novel, Astha is contrasted with a teddy bear that follows the directs of her better half. The political distress of the nation due the shared uproars can be viewed as an image of Astha's internal agitation in light of the chains of jobs and duties that limitation her will. Another strategy Kapur uses in the novel is the utilization of letters. Kapur presents her philosophical thoughts in the novel through letters. In the greater part of her books, she utilizes letters as a medium to communicate her philosophical thoughts and contentions. If there should be an occurrence of Difficult Daughters it is through the letters of Harish to Virmati she presents her ideas with respect to schooling. In Custody Shagun communicates her troubled existence with Ashok in her letters to her mom implying that she laments for wrecking her family.

In this novel Kapur shows profound viewpoints through the letters of Astha's mother to Astha. Kapur depicts Hemant as a striving industrialist. Through the term of Hemant and his dad Kapur shows the materialistic voracity of person. As opposed to this Kapur presents otherworldly existence of Astha's mom. After the end of Astha's dad her mom lives in an ashram spurning every single common longing and giving to the desire of the God looking for internal harmony. Astha considers her move as an extreme method to bargain in her existential battle as she has no child to secure and watch her in her mature age. In any case, her mom sees it as a mechanism of acquiring salvation from common longings and insatiability. The philosophical thoughts passed on through one of the letters of Astha's mom. In this manner, Kapur presents her philosophical thoughts in the novel. Through letters she passes on her contentions with respect to human covetousness and how to control it for a tranquil life.

Strict issue is exceptionally touchy. It is worried about sensations of numerous individuals. Religion is subsidiary to the ethos, convictions and character of the individuals and that of the country on the loose. So, the examination of strict issues of the country gives us a provocative knowledge to contemplate on the veracity of its authority. Kapur through different occasions digs into the unpredictable strict circumstances of our nation and features its muddled ideas. In the midst of this discussion and circumstance Kapur incorporates the lesbian relationship in the plot of the novel. The female connection among Astha and Pipee gets an alternate taste the novel. The lesbian scene in the novel is introduced rather than the hetero connection among Astha and Hemant. Astha in her hetero connection lives at the fringe. Her reality is observed and screened by her better half. She can't guarantee anything of her own in the relationship. Along these lines, Kapur delivers a scope of issues in the novel giving assortment in its surface. She is skilled in keeping up consistency in the plot of the novel by causing these differed issues to rotate around the life of Astha and interlinking them with the main topic. Depicting Astha's existence with a numerous of issues creates her all genuine and lively, so every Indian wedded lady can characterize herself with Astha's life. It clearly explains the muddled mind of an Indian wedded lady. To put it plainly, it tends to be inferred that the novel genuinely checks Kapur as a fruitful essayist. The creator intensely clarifies the harsh man centric codes that urge Indian wedded ladies to carry on with a daily existence of penances and bargains and the plausible answer for the revolt of ladies against the sex one-sided standards.

ABSTRACT

In this article, information on the bioecology of the Papaya plant and the nature of the treatment of certain diseases in the human body, as well as their prevention, is presented. From the fruit of the papaya and vegetative organs, more than 100 different products and preparations are prepared. In order to grow papaya in room conditions, it is possible to reproduce it vegetatively, mainly with the help of seeds and a pencil, and various recommendations are also given.

KEYWORDS: *Vital Form, Alkaloid, Kanserogen Substance, Milk Juice, Rosehip, Sepal.*

INTRODUCTION

Plants and animals are one of the main components of the life shell of the Earth-the biosphere, which occupies a special place among natural resources. When plants and animals are used wisely, they can become a source of renewable and unlimited products. The specific stable balance in the biosphere in many respects is due to the presence in it of Biological Diversity of plants and animals.

"After the creation of the universe of spirits and bodies, the Lord created three children: a mineral, a plant and an animal, and then a man in the end" (20) plants and animals are considered the genophones of the planet, and each species has its own place in nature. In the biosphere, the circulating movement of substances takes place only with the participation of living organisms. This process can also be seen on the example of the circulating action of ugle rod (CO₂) in the biosphere. Without the products of plants and animals, human life can not be imagined.

If you look at the history of farming, along with the domestic ozocabop technical plant species, which are characteristic of each country, they are imported from abroad, and from the account of cultural crops, which are of great importance for different branches of the nation's economy, where they are climatized, their types and varieties are increasing. At the pace of modern life, pressure and tension in the work often occur, health indicators can worsen. We at the first signs of diseases are accustomed to drink without paying attention to the chemical composition of the drug. We often forget about natural remedies that are effective and safe. Today we will talk about an exotic fruit that has become a real gift to health.

Main part

The Papaya plant belongs to the family of papayadots (*Carica papaya*, Caricaceae), 4 categories of this family and about 30 species are common on the Earth's surface mainly in areas of tropical and subtropical climate of America and Africa.

Papaya has a unique vital form, somewhat similar in appearance to trees, though, but its almost unbroken stem, which grows erect, is not wooded. The height of the stem reaches 4-6 meters. The inner part of the young stem, sprouted from the seeds of the papaya, consists of soft porous tissue. As the plant grows larger, the tissue inside its stem is destroyed, the hollow tube passes into an empty position, and the thick intertwined fibers on the outside of its stem perform the task of keeping the stem upright, giving it consistency.

The leaves are simple, long bandaged, with a bud on the body part of the STEM and are located like an umbrella. The leaf plate is cut into slices or fingers with a barbell.

The heels will develop from the flower buds in the Leaf armpits, hanging downwards. The length of the male heels on which the daggers are located reaches 1 meter. The wreath is complex, the saucer is small, and from the basis it is added and grown. It consists of 5 petals, on which the petals grow with the addition of a tube. Pollen was observed to be 10 pieces, in some flowers 5 pieces, sometimes even less. The Seeder has 5 fruits, not grown with the addition of stalks. Flowers actinomorpha. Node top. In the papayas, 5 different types of flowers were observed. In the first type, all flowers consist only of seeds (ginesiy), the pollen is not developed at all. With the addition of the petals did not grow. Flowers of the second type are only pollen-bearing, they are small compared to coniferous flowers, the petals in the inflorescence formed a long tube, and more than half part was added and grown. Inside it there are 10 dusters. And the Seeder is reductioned. The flowers of the third type are of two sexes. There are 5 of them are pollen-growers and Seed-Growers. And on the fourth and fifth heels it is possible to observe cases of transition from two genders to one genders, that the pollen was from 2 to 10 soles, that the Seeder did not develop well, or in a normal civilized form. The flowers of papaya are mostly pollinated from the outside. In days when there is a wind, it is pollinated with the help of wind (anemophil), and in times when the air is calm, with the help of insects (entomophil). Self-pollination was also observed in the flowers of the genus. Bunda pollen and seeds are grown in the pollen without blooming, and they are fertilized. The fruit develops from the flowers of the sprouted seedling. The fruit is similar in appearance to the fruit of zucchini or melons.

The length of the fruit is up to 70 cm, the width is up to 40 cm. The weight of each fruit is 6-7kg. In cultural varieties, the weight of the fruit is 1-3 kg. The outer layer of the fruit has a yellowish-green or golden color. The fruit of the yellow-maple color is more juicy than the fruit of the pale yellow-maple color. The inside of the fruit will be empty, only the part stuck to the fruit peel will

be desired layer 2-2, 5 cm thick. It has a bluish tint. In its fruit, up to 300-700 seeds are formed. Papaya grows mainly from seeds. Inside the fruit of some cultural varieties there will be no seeds.

The composition of Papaya fruit also includes milk juice of white color. Articular milk tubes, which cover the inside of the fruit, are located a lot, especially on the outer layer of the fruit.

In order to obtain milk juice from the fruit, when slicing its unripe green fruit with a knife or a sharp razor, the white milk juice in it decomposes, and due to the water shine in it, it thickens in the fruit peel. Picking it up is used for different purposes. Its composition of milk juice contains all sorts of alkaloids. Therefore, the raw fruit is poisonous. From one hectare of papaya it is possible to harvest 400kg of papatin per year. The composition of Papaya fruit is determined by the presence of glucose, fructose, organic acids, ketchup, protein, vitamins C beta-carotene, vitamins B1, B2, B5, mineral substances K, Ca, R, Na, Fe. In 100 gr of its fruit consumed contains 26-34 calories. When the Papaya fruit ripens, the milk in it passes into a liquid state similar to the glaze water and loses its poisonous properties. The composition of milk juice includes such protolitin ferments as phenopapain, proteinase papain, proteinase "SH", which in terms of their physiological properties are similar to gastric juice. Therefore, the fruit of this plant is of great importance in improving digestion, being used as a dietary food. In addition to the raw fruit of milk juice, it is found that it is contained in the leaves and stems of the plant. If you take a piece of meat that is difficult to ripen and wrap it in a papaya leaf, it will immediately become soft and cooked.

Local residents of the US State of Florida also use the plant leaf in washing laundry with the name "negretan soap", putting it in laundry water. Papaya is also used in sharpening beer drinks, giving aromatic aroma in cheeses. From the drying of milk juice is used in the treatment of gastrointestinal diseases and eczema. Preparations from papain, xenopapain, peptitases and other types of flour, obtained from which the milk juice is processed, are widely used in medicine.

The original homeland of the papaya is South America and southern Mexico. In the XVI century, the Spaniards and the Portuguese distributed it to countries with a subtropical and tropical climate. The wild type of melon tree is not found. It is believed that this cultural species originated due to the fact that many species of carica genus grow in America.

Currently, more than 1000 varieties of this plant are grown worldwide. In addition to tropical Africa, the melon tree is cultivated in Brazil, Mexico, Nigeria, India, Indonesia, Sri Lanka, Pakistan, East Africa, Australia, in the countries around the Mediterranean Sea in the subtropical climatic areas of the Black Sea of the Caucasus, and now it is grown in some greenhouses even on the territory of our republic. Melon tree is a plant that quickly comes to fruiting. Papaya, grown from seeds in Indonesia, blossomed after 3 months in the first year. Papaya basically gives a good harvest in 2-5 years. When it is well cared for, it will last 5 years, and then it will dry up. In tropical conditions, it yields throughout the year.

From the fruit of papaya and vegetative organs, more than 100 different products with a name, preparations are prepared. Its fruit can be eaten both in moderation and dried and crushed. Local people eat papaya's fruit grown in tropical and subtropical climates, mainly in the morning breakfast. In addition, from its fruit is used in the preparation of various salads, pies, juices and confectionery products. The STEM is used in the preparation of rope and other fibrous things

from the thick fibrous fiber in the body. The most important aspect of papaya is its medicinal properties.

At present, it is no secret that various diseases have arisen due to the increased content of various carcinogens in a comprehensively polluted environment. It has been found that it is a unique product, especially in the Prevention of various cancer diseases, when treating the spine.

Below we explain the mysterious features of papaya on the circle of healing effects:

- The substance found in the fruit, seeds and leaves of papaya is given in the results of scientific studies of scientists of Great Britain, America and Japan about the property of stopping the growth of cancer cells. According to their data, it was observed that the substances obtained from papaya decreased and stopped the growth of cancer cells of the breast, liver, pancreas after 24 hours;
- Prevents and heals the accumulation of salt (osteocondrosis) in human organs and tissues;
- Heals spine osteochondrosis;
- Gives a good result in the treatment of arthrosis of the joints;
- Heals the disc hernia between the spine;
- Prevents diabetes;
- Used in the treatment of liver diseases;
- Prevents anemia (anemia);
- Normalizes gastric juice.
- Smooths skin, smooths;
- Protects skin from the appearance of wrinkles;
- Organic acids contained in the fruit prevent hair loss;
- Heals eczema, wounds, packaging, cutaneous, sepals;
- Papain in its composition has a good effect on digestion;
- Helps constipation;
- Reduces pain and fever;
- Increases the tone and strength of the body;
- Relieves of anemia and fatigue;
- Immunitetni kuchaytiradi;
- Prevents gastrointestinal diseases;
- Reduces excess weight;
- It also has substances that treat eye diseases;
- Used in the treatment of diseases of caries, pulpitis, periodontitis, stomatitis;

- Used in the prevention and treatment of diseases caused by colds and scar formation of sexual organs;
- helps relieve symptoms of weakness, excessive sleep and excessive sweating;
- Has the ability to drive away vomiting and worms.

Papaya is famous for vitamins C, A and E - the most popular and common antioxidants:

- Vitamin C cleanses poisons, heart diseases, oncology and inflammatory processes, strengthens the immune system to fight seasonal viruses;
- Vitamin A heals and heals the skin, protects the eyes, promotes the health of the lungs, prevents the accumulation of cancer and kidney stones;
- Vitamin E is useful for bladder and prostate cancer, Alzheimer's disease, inflammatory diseases and metabolic disorders.

Other plant antioxidants are also found in papaya: zeaxanthin, lutein and lycopene. Especially lycopene: 100 g to 2000 ME, other valuable substances: folic acid, potassium, calcium, chlorine, iron, phosphorus, silicon and sodium.

Useful properties of papaya:

- It strengthens the immune system, helps fight diseases in the body due to its anti-inflammatory properties.
- Papaya fruits benefit those who adhere to the body mass index. Mono-there are many different diets that include diet.
- The benefits of papaya are very important for the circulatory system: the amount of cholesterol decreases, the blood vessels are cleared, and the probability of thrombosis decreases.
- For external use, skin burns, insect bites, skin irritation from eczema are indicated. Masters of beauty use the juice as a means of scraping, and for smoothing the inflammatory processes of the skin.
- Speaking about the Prevention of caries and reducing bleeding, dentists claim that there are many benefits to regular consumption of papaya fruit pulp.
- If there are cases when it is impossible to apply, slices of well-ripened berries can be offered to children from the age of two, it is quickly absorbed and has a tonic effect.
- Abroad, "melon" helps to remove toxins from the body.
- Slows Retinal aging.

Men who eat 100-200 g of papaya per day contribute to the duration of sexual life and the onset of sexual activity.

The smell of fruit is similar to the smell of forest raspberries. Lack of smell and excessive stiffness, as well as uneven coloring indicate that papaya is not mature, this fruit can be poisoned. Papaya can be left to ripen at home, but the taste is already lost.

When cut, we blind the juicy pulp, in the middle a cavity consisting of seeds. Meat is close to melon according to taste. The seeds themselves do not usually eat, but the locals use them to prepare a seasoning similar to black pepper.

Due to the composition of the papaya, its properties are diverse, which can be of benefit to different systems of the human body. Papaya seeds contain palmitic and oleic acids - these acids help prevent cancer. Papain natural ferment is contained in papaya, which contributes to the digestion of protein foods. The benefit of papain is that it breaks down the fibrin protein, which is present in cancer cells. Plantain papain inhibits the emergence of tumors and metastases in the early stages.

But in addition to describing the useful properties of papaya, it is permissible to pay attention to some of its negative effects.

Important! Unripe papaya fruit is a danger for a pregnant organism, if a pregnant woman eats several pieces of such papaya, this will lead to bad consequences (interruption of pregnancy or bleeding).

According to reports from the internet, in order to grow papaya in room conditions, it is possible to reproduce it vegetative, mainly with the help of seeds and a pencil. The seeds, separated from the well-ripened papaya fruit to reproduce from the seeds, mix the soil, sand and well-decomposed gooseberry mixed soils prepared from the Leaf at the beginning of March, moisten it in its norm, and put it in the pot and plant seeds into it. In each pot, 2-3 seeds are sown to a depth of 3cm. It is desirable to soak the seeds for 1-2 days before planting. After the seeds have sprouted, one good seedling is left, the rest is plucked. There are two types of papaya that can be planted: Hawaiian and Mexican types.

The fruit of the Hawaiian type is slightly smaller, length 10-20 cm, Weight up to 0, 5 kg. The height of the plant is 1-1, 5 m. it is convenient to harvest the harvest. The fruit is sweet and aromatic smelling. The fruit of the Mexican papaya type is large, about 40 cm long, weighs 4,5 kg. The height of the plant reaches 6-10 m. It is more convenient to grow a Mexican type. Under the pots planted Papaya, the temperature is desirable to be 27-30 C. After sprouting seeds planted in the spring are transplanted 2-3 times a year into the canvases of the other, that is, 5-6 m larger in diameter than the previous one. Papaya is a warm-loving and light-loving plant. Therefore, low-temperature conditions adversely affect its growth, and the taste of its fruit becomes less juicy. In summer, it is more likely that the plant will absorb moisture, so it is necessary to moisten its growing soil more often in the amount of moisture, meeting the demand for water, even by spraying water on the plant. But if a lot of water is given to his growing canvas, the root can rot.

To reproduce the papaya with the help of a pencil, a pencil is taken from a plant for one or two years. The thickness of the cuttings should be about 1,5 cm. Cuttings are prepared by cutting into Length 10 cm. Since there is a lot of water in the composition of a clean cut pencil, it can be kept in a dry place for 1-3 days, after reducing the water contained in it, it is possible to pass it to the canvases in an environment where the sand particles are larger and grow roots. After the seeds of papaya or those grown with the help of a pencil reach 12-15 CM, the plant spacing is 1, 5 m for growing it in greenhouse conditions, and the range is 1m.

CONCLUSION

There are no contraindications to the use of papaya. Therefore, if you keep eating papaya fruit, you will have a prevention of the above diseases. In the future, we hope that the melon tree will also become one of the useful plants grown in our republic.

INTERPRETATION OF NATIONAL IDENTITY IN THE CHINESE TRANSLATION OF THE NOVEL “NAVOI” (IN THE EXAMPLE OF WANG JENG JONG’S TRANSLATION)

Guljahon Namozova*

*PhD Student,

Institute of Uzbek language, Literature and Folklore of Academy of Sciences,
Republic of UZBEKISTAN

ABSTRACT

The article discusses the extent to which the translator of the novel “Navoi” in Chinese, Wang Jeng Jong, has preserved the original national identity. In China, for example, such vibrating devices have long been used to put a child to sleep. The first swings in China carved the dried wood inside the tree so that it could fit a child, and laid the child in carved wood and shook it. Therefore, the translator must “preserve the spirit of the original when translating works, so that the golden powder of art in them shines in the translation” [2]. There is also a special symbolic meaning in the text when the father puts the dagger under the baby pillow. The dagger is a symbol of courage. There is a belief that a child holding a dagger under his pillow will not be afraid, and a dagger will protect him from various troubles.

KEYWORDS: Translation, National Spirit, Value, Symbol, National Reality

INTRODUCTION

In Uzbek novels, Oybek writes “The novel “Navoi” has a special significance as an artistic-aesthetic, historical-cultural phenomenon. How did I write the novel “Navoi”? Recalling the time when he began to write a novel in his article: “About 1936-37 I wrote a short poem – “Navoi”. But this exercise was just a sketch drawn in the creation of the image of “Navoi”. Then, in 1942, I went to the great canvas and wrote the novel “Navoi”. I collected a lot of historical facts, materials, analyzed them, and began to feel and think deeply to bite the core. I was so immersed in this work that the work plan of the novel was not on paper. He was in my heart, in my memory, occupying my whole being. I always thought of Navoi as I walked. I tried to fully understand his deep, subtle, philosophical thoughts. Finally, I began to write this material, which was collected in the heart, stored in the heart.” [1], which is probably why this historical novel,

written with the author's "gathered in the heart" and "the great excitement of the soul", became the literary property not only of the Uzbek people, but also of other nations through translations.

Hao Guang Jong (1999) and Wang Jeng Jong (2001), who translated this historical-biographical novel into Chinese, relied mainly on the translations of Russian translators M. Sale (1945) and P. Slyotov (1946). In the introduction to the book, Wang Jeng Jong noted that he was familiar not only with his Russian translations, but also with the Uzbek version. These translations play an important role in the development of Uzbek-Chinese translation.

THE MAIN FINDINGS AND RESULTS

In the translation of historical novels, such as the novel "Navoi", the translator must be well acquainted with the history, religion, language, customs and cultural life of the nation in order to convey to the reader the spirit of that period, preserving the national and spiritual identity. Therefore, the translator must "preserve the spirit of the original when translating works, so that the golden powder of art in them shines in the translation" [2]. We know that the preservation of national color in literary translation is one of the important tasks of translation and literature. Although the Chinese translator Wang Jeng Jong did not fully use the original in the translation of the work, he tried to preserve the historical and national color, to convey the national traditions and customs as in the original. Translator Vanderauvera Ria writes: "Translation is like processing a text. Because it is a special case that shows a slight difference from the source text. His demand is to make a significant difference from text to text, but to retain the meaning and content" [3].

The Chinese translator tries to preserve Oybek's philosophical-lyrical style in the course of his work. "The spring sun shines in the clear turquoise of the sky over the majestic dome of the Gavharshod Madrasa in Herat ..." the novel begins. Wang Jeng Jong Oybek strives to "breathe in an atmosphere of style: "春天的太阳在深邃的蓝宝石苍穹中，在赫拉特城“古海尔夏德”“经学院浑然雄伟的圆顶上方闪耀光芒..." [4] (Chūntiān de tàiyáng zài shēn suì de lánbǎoshí cāngqióng zhōng, zài hè lā tè chéng "gǔ hǎi'ěr xià dé" jīng xuéyuàn húnrán xióngwěi de yuán dǐng shàngfāng shǎnyào guāngmáng...)

"The spring sun shines on the dome of the dark blue sky, on the glorious dome of the Gavharshod madrasah in Herat ...". The translation of the sentence does not cause much difficulty for the translator. Finds and uses the appropriate Chinese equivalent of each word. Since Gavharshod Madrasa is familiar to Uzbek readers, but unfamiliar to Chinese readers, the translator will not limit himself to a single sentence, but will give specific information about Gavharshod Madrasa at the end of the page.

To what extent was the translator able to maintain the national color in the novel during the translation process? In response, we try to analyze some sentences.

"The old man hid his eyes in his dark eyebrows and held his breath. Then he hesitated and said:

- You've put me in a difficult situation, young man. What can I do?"
- "I came to you out of desperation", said Togonbek in a pleading voice. "When I was a baby, thank God my father put this knife in my cradle, under my pillow". He has always been with me since he recognized my name.

- “Good boy, I know.” This one piece of steel saved you from all sorts of troubles; this knife is associated with the rarest memories for you. That's why you hold dear. But I don't think I'll do it for every customer ... No, I'll give it to a guy like you. He prefers a good knife to a beautiful mistress, himself a *barlas* prince!
- Togonbek's hopes were dashed. He held out his hand to the blade. But the old man did not want to lose this precious thing. A month later, he dug into his pocket, hoping to buy it at a cheaper price, he said:
- “Well, son, it's not the husband's business to repeat the young man's words”.
- Tugunbek took five dinars, put them on his belt, said goodbye and got up [5, p. 35].

老头儿把双眼深藏在浓眉于，一时改坑气，然后犹豫地说：

“社士，你让我为难，不知怎么办才好……”

“我是迫不得已才到您眼前的，”托汉别克稍带展求的口吻“我还是要儿时，过世的父亲就把这把首放在我摇床的枕命运不济找不到钱，你再把它卖掉。你会凭良心作价的下。从记事起我一直带在身边。

“好一个壮士，我知道，这块钢曾保护你渡过种种大难。这如上首对你来说，是最珍贵的记忆连在一起的，因此你珍爱它。但你不要以为我会高价卖给随便一位买主...不，我会卖给一位像你一样喜爱上首的壮士，他得把好的上首看得比心爱的恋人还宝贵，他该是白尔拉斯部落的官家子弟！”

“托汉别克很失望，他伸手去取上首，但老丈可不想放手这件宝物，他抱着一个月后也许就能低价收购的希望，手伸进口袋：

“好吧，我的孩子，拒绝壮士言，不算男子汉。”

托汉别克把五个第纳尔缠在腰带里，站起身来与店主告别。[6] The old man hid his eyes between his dark eyebrows, paused for a moment, then said hesitantly:

Man, you put me in a difficult situation, what can I do ...

Here the translator used the word *two eyes* instead of the word *eyes*. Defined the word. It is important to specify words in Chinese oral speech.

I am coming to you because of my impossibility, Togonbek said in a pleading tone:

My father, who died when I was still an infant, had put this dagger under the pillow of my swing. I have been carrying it with me ever since I recognized my name.)

In this sentence of the translation, the emphasis is mainly on "my dead father", which means that Togonbek's father died in infancy. The original meaning is unclear. In fact, it is given as follows:

“ - When I was a baby, thank God my father put this knife in my cradle, under my pillow. He has always been with me since he recognized my name”.

In the same sentence, the translator used the word swing instead of the word cradle, which is our national value. When we say swing, Uzbeks mean a device that looks like a swing, hanging from a rope. Such swings have been used by almost all nations and still are. In China, for example, such vibrating devices have long been used to put a child to sleep. The first swings in China carved the dried wood inside the tree so that it could fit a child, and laid the child in carved wood and shook it. Later, baskets decorated with various patterns were made of bamboo wood or thin twigs and tied to the ceilings of houses with ropes. The translator used 摇床-yaochuang words.

摇- vibrating 床- bed when literally translated. The translator could also use the 摇篮 word “vibrating basket” closer to the meaning of the word cradle. In our opinion, it would be appropriate for the translator to leave the word cradle as it is and explain to Chinese readers the cradle and the Uzbek tradition of placing a dagger under a baby pillow. The cradle is a national reality. There is no exact equivalent of this word in other languages. After all, as Goethe said, “In translation it is necessary to go to a place where it is impossible to translate, only then can a foreign people, a foreign language, be fully understood”.

CONCLUSION

There is also a special symbolic meaning in the text when the father puts the dagger under the baby pillow. The dagger is a symbol of courage. There is a belief that a child holding a dagger under his pillow will not be afraid, and a dagger will protect him from various troubles. In addition, this dagger is inherited from his ancestors. The dagger owner follows in the footsteps of his ancestors and becomes as brave as they are.

“No, I'll give it to a young man like you”. He prefers a good knife to a beautiful mistress, himself a barlas prince! 但你不要以为我会高价卖给随便一位买主...不, 我会卖给一位像你一样喜

爱と首的壮士, 他得把好的匕首看得比心爱的恋人还宝贵, 他该是白尔拉斯部落的官家子弟! (Dàn nǐ bù yào yǐ wéi wǒ huì gāo jià mài gěi suǐ biàn yī wèi mǎi zhǔ...bù, wǒ huì mài gěi yī wèi xiàng nǐ yī yàng xǐ'ài to shǒu de zhuàng shì, tā dé bǎ hǎo de bǐ shǒu kàn dé bǐ xīn'ài de liàn rén hái bǎo guì, tā gāi shì bái ěr lā sī bù luò de guān jiā zǐ dì! Dàn nǐ bù yào yǐ wéi wǒ huì gāo jià mài gěi suǐ biàn yī wèi mǎi zhǔ...bù, wǒ huì mài gěi yī wèi xiàng nǐ yī yàng xǐ'ài to shǒu de zhuàng shì, tā dé bǎ hǎo de bǐ shǒu kàn dé bǐ xīn'ài de liàn rén hái bǎo guì, tā gāi shì bái ěr lā sī bù luò de guān jiā zǐ dì!)

Here the translator translated the word barlos as bai er la si, in a transcription method, and to the word barlos (白尔拉斯是帖木儿帝国时代起过重大作用的马总别克部落之一。一年者) [7], - Barlos are one of the Uzbek tribes that played a very important role during the reign of Timur's empire. Translator) left a comment at the end of the page. To the Chinese reader, without this little commentary of the author, the meaning of the word “barlos” would have been misunderstood, and the translation would not have been complete.

Tugunbek took five dinars, put them on his belt, said goodbye and got up.

托汉别克把五个第纳尔缠在腰带里，站起身来与店主告别。(Tuō hàn biékè bǎ wǔ gè dì nà ěr chán zài yāodài lǐ, zhàn qǐshēn lái yǔ diànzǔ gào bié) The word "belt" is translated in Chinese as “腰带 - yaodai”, which means "belt". In the explanatory dictionary of the Uzbek language:

Belt - a piece of fabric with or without flowers, sewn at the edges, in the form of a rectangular scarf, tied at the waist; crooked, crooked.

Belt - A wide band of cloth, usually made of leather, which is fastened to the waist over a garment; belt Soldier's belt [7].

It is clear that the author of the sentence was referring to the fabric belt. From time immemorial, our ancestors used to wrap money in cloth and tie it around their waists. In the translation, however, the translator was a bit confused and distorted the meaning. Naturally, a Chinese reader, like an Uzbek reader, is surprised that money cannot be kept in a cell. In our opinion, if the word equivalent that reflects the national reality in the play does not give the exact meaning of the word, it is better to leave the word alone.

“Yesterday, Dildor gathered the women next door and gave them a wedding: the old woman was frying pancakes. Despite the burning of his hands, the puppet that had exploded in the cauldron was thrown over the boy in a handful, and between his fat, clogged legs, they rolled small loaves of bread, which were specially covered, like the bottom of a bowl” [5, p. 281].

刚刚学会走步。昨天晚上迪尔达把女邻居们请到家里，办了小型“托衣”。姨妈在锅里炒了小麦，女人们并不怕烫手，双手捧起劈里啪啦作响的麦粒，从孩子的头顶上方撒出去；把特别烤制成小碗底大的圆饅从孩子的档下滚过去，他那两只小腿犹如香肠一般，胖乎乎的。

(①托衣，喜庆活动，泛指有庆祝意义伴有歌舞的宴会。此处为庆贺婴孩学会走路举办的“托衣。”—译者) [8, p. 291] (Gānggāng xuéhuì zǒu bù. Zuótiān wǎnshàng dí ěr dá bǎ nǚ línjūmen qǐng dào jiālǐ, bànle xiǎoxíng “tuō yī”. Yímā zài guō lǐ chǎole xiǎomài, nǚrénmen bìng bùpà tàngshǒu, shuāngshǒu pěng qǐ pīlípālā zuò xiǎng de mài lì, cóng háiizi de tóudǐng shàngfāng sā chūqù; bǎ tèbié kǎo zhì chéng xiǎo wǎn dǐ dà de yuán náng cóng háiizi de dǎng xià gǔn guòqù, tā nà liǎng zhī xiǎotuǐ yóurú xiāngcháng yībān, pàngūhū de)

(① Tuō yī, xǐqìng huódòng, fàn zhǐ yǒu qìngzhù yìyì bàn yǒu gēwǔ de yànhuì. Cǐ chù wèi qìng hè yīnghái xuéhuì zǒulù jǔbàn de “tuō yī.” Yī yì zhě))

(Last night in Di er (Dildor phonetically translated - G.N.) he called the women next door and made a small wedding, his aunt roasted the wheat. Rolled small loaves between the child's legs).

Here the translator conveyed the author's opinion fully and clearly. The original meaning and the national spirit in the text are fully preserved. He translated the word “wedding” as “托衣- tuo yi” and left a comment on the word at the end of the page. Chinese readers will learn from the commentary that there is a special event (wedding) in the Uzbek nation that celebrates the first steps of a child, and wedding traditions.

In the process of approaching the text of the work, the Chinese translator tried to fully preserve its original subtlety, epic scale, and most importantly, feeling the spirit of the author. While

recreating the novel “Navoi” in his own language, Wang Jeng Jong managed to combine his feelings and the author's “inner world.”

ABSTRACT

The article discusses the advantages of the factors of creative approach in the analysis of works of art, which are important in the formation of logical and figurative thinking. The play is about women's perseverance, patience, endurance, and life at that time. It tells about the life of the writer and the history of his eternal works, the processes associated with the events of today's work. At the same time, some criticisms of Sharof Boshbekov's life have not gone unnoticed.

KEYWORDS: Amir Temur, Sharof Boshbekov, «Iron Wife», Drama, Woman, «Door Of Destiny», « Gavroshs Of Old City», Language Features

INTRODUCTION

MOTHER, WOMAN! Mankind has not been able to find a definition for this mysterious and wonderful creature since he knew himself! Just as every soul renews the feeling of Love, so the descriptions of the Woman are renewed each time. But there is one divine truth that will never change: Allah has endowed her with the high status of a mother. It is no coincidence that Mother Earth, Mother Nature, Mother Tongue, Mother Earth are not emphasized as sacred and revered. Neither the great saints, nor the scholars, nor the sages sought the likeness of the Woman. For thousands of years, the cultural level and spiritual maturity of any society has also been determined by the way it treats women. Respect for women is a characteristic of the peoples of the East, including the Uzbek people. The unique words in the hadith, «Paradise is under the feet of mothers,» «Do goodness to your mother, to your mother, and to your mother, and then to your father,» show this endless respect. The more the nation honors women, the more it honors itself. There is a saying among our people, «The minister of husband is the wife.» Here, the woman is seen as a close like-minded person of her spouse, a person with her own ideas and opinions, a

wise, intelligent person with the ability to lead. It should be noted that during the reign of Amir Temur, the status of women was high.

A descendant of the khan, Saraymulkhanim was the eldest of all the harem princesses and was deserved the rank of «great lady» or «Bibikhanim». Saroymulkhanim was one of the people who had the opportunity to appeal to Amir Temur in writing on this or that issue, without the right to participate directly in the work of the congress, the council of the state and the country's administration. Given that only foreign rulers usually have the right to address a letter to the head of state, it is not difficult to understand how high status of Saroymulkhanim was in the palace.

Respecting and honoring women and mothers, Timur's and Temurid values were enriched with new content during the years of independence. Our country has created ample opportunities for women to actively participate in public administration, education and entrepreneurship. In the laws adopted after the independence of our country, women's rights began to be considered as an integral part of human rights. For example, in particular, the recognition of Article 46 of the Constitution of the Republic of Uzbekistan: «Women and men have equal rights» testifies to the legal guarantee of the full participation of women in all spheres as active members of society. Joining of our country to universally recognized international human rights documents, including the 1995 Convention on the Elimination of All Forms of Discrimination against Women, also indicates serious attention to the issue of women in our country. .. Islam Karimov said about the influence of the family and women on the formation of social and moral qualities: “If we look at the history of our people, the most valuable traditions are: honesty, truthfulness, honor, humility, kindness, diligence for all human qualities are formed first and foremost in the family. When it comes to family, first of all, the image of our Mother is formed in front of our eyes. After all, the first factor that ensures the sanctity of the family is the purity, wisdom, kindness, loyalty of the mother and all women.

The main part: Sharof Boshbekov is the author of great works about such women's courage. In all the works of the author, a special emphasis is placed on women. In a number of plays by the playwright, such as “Iron Wife”, “Released Horses from tushov”, “Door of Destiny”, “Gavroschs of Old City”, “Who Knocked on the Door”, the writer describes the peculiarities how an Uzbek woman is. He revealed it through his own works. Particularly, in his drama “Iron Wife”, the playwright reveals the chastity of a woman with the following examples. M: “They said: “*Ras*”, “*duva*”, “*vzali*” Qumri said in Russian with pronunciation mistakes.

Kuchkar. What?

Qumri. “*Vzali*” said again in Russian with pronunciation mistakes

Kuchkar. “*Vzyali*”, uneducated! (he also said in Russian with pronunciation mistakes) (166)

In this sentence, it is clear that Qumri is also an ordinary rural woman.

Each author must have his own signature. What does it look like? An author's signature is a unique description, style, and language of a subject, event, or object. For instance everyone sees a tree and describes it in their own way. The writer has always tried to create his own style. **Nobody can stop you in this case because of being like a tractor! (Qumri. P. 2)** A woman is always weak than a man. She can not be equal with. When a man is angry, he can't behave himself. There it is said that Qumri was not able to tie her husband that is Kuchkar. When a man gets angry, he looks at his wife and threatens to say divorce. The woman takes offence and

begins to pick up her things. It is in this drama that when he says that he is going to say divorce, the Qumri looks at the Kuchkar and says the same thing. **Now nobody asks their husband to say divorce (Qumri. P. 2)** As soon as she hears this, the Qumri immediately begins to pick up his clothes. **Come on, son! (Qumri. P. 3) (After that he noticed his wife who is preparing to leave). Where? (Kuchkar. P. 3) What did you say yesterday? (Qumri. P. 3) What do we mean? (Kuchkar. P. 3) (Crying). You said everything ... (Qumri. P. 3)** A woman's heart is so delicate that she cries even for something insignificant. Qumri is also tired of her husband drinking alcohol for 16 years. A woman does not want to see her husband drinking alcohol. This is one of the characteristics of a woman. Qumri replied when Kuchkar asked her to untie his hands. **I can't untie it, Dadasi (means my children's father/ uzbek women call their husband) Don't be upset with me (Qumri, p. 4)** As the playwright describes that the woman uses the word «dadasi» in reference to her husband out of pity. The word «dadasi» comes as a motivation and makes Qumri feel sorry for her husband. It also shows that a woman is good-natured in any difficult situation. I wonder why a woman is ashamed, laughs, angry, happy when she looks at her husband's eyes? The playwright's «Released Horses from tushov» features female characters such as Zumrad and Aunt Halima, and the author reveals their character. **You had better get into trouble instead of writing a poem (Aunt Halima. P. 216)** In this sentence, Aunt Halima speaks sarcastically to Tesha. Although Aunt Halima is much older than Tesha, Aunt calls you. The reason is that Aunt Halima used «you» ironically.. Older people used words like emerald and tirmizak in their speech. Older people use words like zumrasha and tirmizak for children in order to punish in their speech. The playwright used these words as a peculiarity in Aunt Halima's speech. What «a Sultan»! Driktor (she said it in uzbek with pronunciation mistakes), zumrasha! (Aunt Halima. P. 216) You'll pay, tirmizak! (Aunt Halima. P. 217) The words tirmizak and zumrasha, which are used in these sentences, come as a motivation and indicate that the aunt is an angry woman. In the following sentence, it shows how kind and polite she is: **The animal did not eat. I crushed it with ayron (made of sour milk) Saltpeter melts well in the ayron, aylanay (old uzbek people uses to pet the young) I put it instead of water. It's been a while since I've had a cup of tea, and when I go out, I see fourteen of them are going to die. (Aunt Halima. P. 217) [2: 217.]** Aunt Halima uses motivations in her speech and they indicate the unique qualities of Uzbek wife.

Dramaturgy is a bit more complicated. For example, the story can be easily described as «skin of nsomebody shivered like an ant walking.» But in order to express this in the play, the ant must walk on the character's skin and the audience must see it. This is just a complication. There are many other considerations. It can be said that no writer can be a playwright. Or oppositely: any playwright cannot be a writer. This idea is also true. It is impossible to write a play without some experience and preparation. How old was the writer Said Ahmad when he wrote The Brides' Rebellion? The writer must sense from the inside what he is writing. While writing, the writer played the role of each character and staged the play from beginning to end in his mind. Later, when the play was staged, it did not turn out as well as he had imagined. He tried to say every word. The word should not break the actor's language. There is also the possibility of acting. Whether he is a great or average actor, his potential is limited. This should also be taken into consideration. For instance you wrote a great drama. But if the protagonist cannot be played by an actor, then the play will have no value. Our people know very well who Sharof Boshbekov is and what works he has created. The most famous work that introduced the writer, of course, is «Iron Wife». This work, which was published in the end of 80s of the last century, has become a

well-known event in Uzbek literature. The play, staged at the Fergana Regional Theater, won first place in the international competition. It was translated into more than 20 languages, it has been staged in theaters in Russia, China, Poland, Belarus, Azerbaijan, Czechoslovakia and many other countries. Sharof Boshbekov is a courageous writer who speaks the truth, sees the complexities of life with great intelligence. Some high-ranking officials did not always like what he wrote, and he was repeatedly «banned» during his life. In the 90s, all performances were removed from theaters. The author's drama «Door of Destiny» also reflects the characteristics of a woman. *Something is burning... Woe is me! It's bad! Why don't you turn off the gas after you have heated the food ?! (Woman, p. 33)* The woman is very sensitive. In this sentence, a woman feels and speaks to a man. Even the «Iron Wife» was also banned. In recent years, it has been «blacklisted» on television. But difficulties and injustices did not dampen his will. Although he suffered from stroke, he continued to work. Twenty years ago, the Hero of Uzbekistan, the great writer Said Ahmad said to Sharof Boshbekov: «Aren't you still a 'people'?» I mean, did you have a People's Writer title? Titles do not determine the career of a writer. Sharof Boshbekov already has a strong place in the hearts of the Uzbek people. Many words and phrases in his works have become folk proverbs and sayings.

INCREASING FINANCIAL LITERACY OF STUDENTS: PROBLEM AND SOLUTION ANALYSIS

Khojiakbar Aslitdinovich Muxamadiyev*

*Head of the Department of "Public and Legal Sciences"
of the Jizzakh Regional Law College,
Ministry of Justice of the Republic of UZBEKISTAN

ABSTRACT

This article focuses on improving the financial literacy of student youth. Sociological surveys were conducted to identify problems in increasing the financial literacy of young students. Based on the results of the sociological survey, specific proposals and recommendations for improving the financial literacy of students were presented. It is also recommended that teachers use innovative technologies in the classroom to increase the financial literacy of students.

KEYWORDS: *Student Youth, Teacher, Financial Literacy, Sociological Survey, Innovation, Pedagogical Technology, Information And Communication Technology, Digital Economy, Budget, Money, Market, Poverty, Economic Development, Prospects, Labor Law, Income, Expenses, Daily Life, Family, Parent, State.*

INTRODUCTION

It is as if we are lagging behind in some of the things that are being done today. In particular, raising the financial literacy of young people is becoming more urgent as a requirement of the times. This is explained by the fact that in our country 2020 is called the Year of Science, Education and Development of the Digital Economy. The priority of developing the digital economy in our country is to ensure the rapid growth of the Uzbek economy, to keep pace with the times, to accelerate the integration of our country in the international arena and, as a result, to make Uzbekistan a democratic, economically developed country. Improving the financial literacy of young people, who are the main subjects of these processes, which make up the majority of our population, will, of course, make a small contribution to the development of the country's future digital economy.

MAIN PART

Sociological surveys were conducted to identify problems in increasing the financial literacy of students. In the sociological surveys Jizzakh Law College 3rd stage 5 groups of law 177 people (154 participants), 4 groups of social security lawyer 130 people (108 people), 1 group of archival science 31 people (27 people), a total of 338 students, of which the total number of participants was 289 students (85.5%). Their average age is 17-18 years.

The questions prepared for the sociological survey covered three sub-topics, which are;

1. The concept of financial literacy
2. About budget and spending
3. about money, the market and the prevention of poverty.

Students answered questions on financial literacy as follows. Does a person need financial literacy to live a prosperous life? When asked, "What do you think?", 23 percent of them said no. If your parents are rich, you don't need financial literacy, 58 percent Yes. Because a person should have less money, 7% Togrishi, I have no idea about it, 12% answered that I will get it when I become an adult in the future. If you had a small income, would you save it? When asked, 3% of students don't, because I'm still young, I think when I'm married, 62% Yes, of course, this will serve to ensure my future well-being, 23% spent more of my income for today I would be. For example, I would buy a book, flow, and be organized, and my knowledge would make my future great, 12 percent would use my income for things I need for my daily life, but it is too early to save because we are cared for by parents, they wrote. The next question was who will ensure your future economic security? Of these, 13 percent are provided by my parents and 11 percent by the state. Because the citizens are under the protection of the state, I provide 70% of zoom. Because this is my life, 73 percent of which I provide. I had a lot of dreams for the future, and some participants answered in two.

Summarizing the answers, 64% of the participants have already developed their understanding of financial literacy. They have the ability to act independently in such relationships. 16 percent need parental support in financial relationships. 11.6 per cent were more likely to think about the future, while 7 per cent showed a sense of dependency.

Would you like students to manage their Oz funds independently about budget and funding? When asked, 54% of them still manage their finances on their own. But I haven't heard any criticism from adults about it yet. So I'm running right, 27 percent would definitely want it if I had less money. I don't have much money right now, 12 percent Yes, of course. So it is now. I manage my little funds independently. My mother helps me in this and 7% of them answered that independence is achieved in our family only after higher education. To the question "Do you manage your small budget according to the plan?" 9% answered that I don't pay much attention to it, 2% don't care because I am still young, 29% say I don't have a small budget, 60% of course I calculate income and expenses. Let's say you have 1,000,000 soms. How would you decide to spend it and save it? - 30% of students

I would give it to my parents. I would ask for it to be added to the family budget, 61% would have been decided based on the income and expense plan, 18% would have been a gift from the

store to everyone, 9% would have been a raw fantasy. Because I don't work. Neither my parents nor anyone else gave me that amount of money, and they showed little response.

This means that the responses of college students show that an average of 59 per cent of them combine education with hard work. They have the concepts of money and budget. 41% are only engaged in education. That's why 28 percent of them said they had little money. 6% of students showed no interest in these processes at all. 7 percent of students wrote that they need the help of adults, parents in this regard.

Money, the market, and poverty prevention were addressed with the following questions. When asked if participants should give money to a student or a child, 40 percent of them said yes. Because their daily needs can also suddenly go out, 34 percent "What does a student or child need money for? If our parents bring everything from clothes and food?!", 15 percent Needed. It saves money and spends it wisely from a young age, after all, you don't have to give 11 percent. Because people of this age do not know how to spend money properly. What do you mean by supply and demand in the market? 8% of them do not work in the market. Maybe that's why I don't know, 37 percent of the demand is made by the consumer, the supply is shaped by the sellers based on the demand, 40 percent is that you can demand what you want from the market. Vendors, on the other hand, offer you to buy fewer items, 43 percent of which are Twin Concepts of Demand and Offer. Without them, the market would not be able to have children, some participants marked two or three answers. Today's problem "What do you think should be done to prevent poverty?" 24 percent of them need to work in a well-paying job. The higher your income, the better off you will be, and 61 percent of your income will have to be spent wisely. You also need savings. This will ensure prosperity in the future, with 11 per cent of the State's citizens must always be protected. I think he should give more in less time, 47% should try to live well. It is necessary to increase financial literacy from a young age, and some participants gave two answers.

When the students' opinions on money, the market and poverty prevention were organized, 79% of them had positive and correct views, and 33% chose correct and positive answers, even though the concepts were not yet formed. Ninety percent of the participants felt the need for state and parental support in this regard. They linked the results of human activity more to the care of the state and parents.

In general, as a result of sociological surveys, 63% of students have already formed concepts and views on financial literacy. The reason is that they combine education with hard work. Thirty percent of students do not have practical skills in financial literacy. They formed more theoretical concepts. 7% of students are indifferent and indifferent to these processes, and they do not lack a sense of dependence.

RESULTS AND DISCUSSIONS

Based on these findings, it became clear that in order to increase the financial literacy of college students, they should be divided into 3 categories.

Type 1. They are students who are effectively exercising their right to work without being deprived of education.

Type 2. They are just young students who are learning and looking to the future in the knowledge they have acquired.

Type 3. They are young students who cannot imagine their lives without the help of their parents and the state, who do not have feelings of belonging to the motherland and the state.

So, now we need to use innovative technologies to increase the financial literacy of these 3 categories of students, taking into account their level of preparation, mentality and mood. At the same time, we must first try to ensure the participation of Category 3 students in the final stage of the technologies used in the classroom or in extracurricular activities. Because many methods of implementation of technologies, methods teach the student to make independent decisions. Second, theoretical training should be organized in conjunction with practice. At the same time, theoretical knowledge can be strengthened through didactic games. This process encourages Category 2 students to enter into employment relationships in the community. This, in turn, will help them to develop life skills in financial literacy. Third, travel lessons or thematic roundtables with the participation of banking professionals and entrepreneurs should be organized for organizations that have achieved great success in entrepreneurship. These activities encourage Category 1 students to move forward and innovate, Category 2 students to apply their theoretical knowledge in practice, and Category 3 students to start the movement for a less prosperous life today through the formation of passions.

To do this, the teacher must work tirelessly and create conditions for the use of innovative technologies in the classroom. The teacher, using a little innovation, develops new, modern methods and skillfully applies them in the teaching process, which certainly does not leave any student out. At the same time, the conditions of the auditorium should be adapted to it, it should have access to a TV, electronic board or computer, projectors, Internet access. An auditorium is appropriate if it is equipped to accommodate students working in small groups. The visual aids and tools used by the teacher in the classroom should be colorful and modern.

CONCLUSION

So, in general, the main, central link in financial literacy is the person. Improving the financial literacy of the younger generation of college students is a requirement of the times. Because the main purpose of this process is explained by the fact that the future economic development of the country depends on improving their welfare and quality of life. The thinker Abu Rayhan al-Biruni said that the ladder of time is infinite, and that successive generations will ascend step by step. He emphasizes that each generation will pass on the accumulated experience to the next generation, which will gradually develop and enrich it.

However, for this to happen, young people need to have sufficient knowledge and skills to use the scarce economic resources, events and situations that may occur, and the conditions that may arise, in a way that is beneficial and effective for society. Most importantly, every young person should be able to make short-term decisions and organize the long-term financial planning process properly. In this regard, special attention should be paid to the social significance of financial literacy of students. This is because the financial knowledge and skills of the student youth ultimately determine the success and sustainability of the economic life of the whole society. The financial illiteracy of today's youth has a negative impact not only on their personal well-being, but on the entire financial sector. For example, when citizens do not have a clear idea of their low income and expenses, or plan incorrectly, creditor debt arises, and illiteracy leads to an increase in the number of financial pyramids and frauds. Globally, this could lead to a financial crisis in the country's economy.

In order to prevent such crises in the future, the need to increase the financial literacy of young people, through them, the nation as a whole, is once again relevant. Because tomorrow's youth today will at least be parents. So that they can fulfill their parental responsibilities in raising the financial literacy of their little ones.

OYKONIMS (THE NAMES OF PLACES) AND SOME NOTIONS ABOUT THEIR LEARNING (IN THE EXAMPLE OF BUKHARA TOWN)

Mirakmalov M.T*; Nasullaeva K.Sh**

*Dcs (Doctor of Geographical Sciences),
Head of the Department of Natural Geography,
Uzbekistan National University, UZBEKISTAN

**Doctorate student,
Department of Natural Geography,
Uzbekistan National University, UZBEKISTAN

ABSTRACT

This article deals with oykonims (the names of places) and their characteristic features, some notions about learning of oykonims of Bukhara region. They are situated in a faraway places of the region and is widely spread around of Bukharacity. Nowadays these places are on the border of Bukhara town. Bukhara town was founded on the 26 th of September in 1926. In conclusion, it is important to mention that the names of these places became more perfect due to the intelligence and the experience of our ancestors.

KEYWORDS: N.Khanikov, S. Korayev, M.Mirakmalov, Kh.Toshov, Bukhara Town, Losha, Safedmuy, Toshmachit, Khujarabot, Tuksaboy, Bogdasht, Foshun, Begijugi, Oqrabot, Khujamushkin, Jonbobo, Guloyon, Malikon, Leylak, Choydori, Urtarabot, Patput, Shekhlar, Toytepa, Asaka, Chandir-Chuqurrabot, Khomkhuron, Khushun, Novmetan, Alotkhona, Khumin, Udurgi.

INTRODUCTION

Bukhara region is famous with its ancient settlements of people. They are situated in a faraway places of the region and is widely spread around of Bukharacity. Nowadays these places are on the border of Bukhara town. Bukhara town was founded on the 26 th of September in 1926. The territory of it is 1.32. thousand square kilometers. The population is 170 thousand people, they live in 40 villages and in mahallas. There are more than 250 big and small villages there. The centre of the town is Gala Osiyo city. Former Losha village is also included there.

Nowadays former Losha village consists of 4 villages and mahallas. Mahallas like Gulshanobod, Dilobod, Zafarobod, Bog'dasht consist of the villages like Losha, Safedmuy, Toshmachit, Khujarabot, Tuksaboy, Bog'dasht, Foshun, Begijugi, Oqrabot, Khujamushkin, Jonbobo, Gulobyon, Malikon, Leylak, Choydori, Urtarabot, Patput, Shekhlar, Toytepa, Asaka, Chandir-Chuqurrabot, Khomkhuron, Khushun, Novmetan, Alotkhona, Khumin, UdurgiLosha, Diosiyo, Urtarabot, Patput, Shekhlar, Toytepa, Asaka and Chandir-Chuqurrabot.[3, 9-10 p.].

To the number of villages the factors such as bordering with Bukhara City increasing of population in the city, better conditions of infrastructure of buildings have a great effect on it. As a result of it during the years in places of villages there appeared block of flats. According to some facts, during 30 years modern city landscape took the places of 12 village settlements.[4, 5 p.].

At present time, it is very actual to prepare some articles about learning their names, preserving them and learning their history. "The features of the nature of the place, the most important historical, social and political events which occurred in the life of the society during centuries, the names of professions of the people, the name of the person who founded the place for the first time or the name of the tribes who lived there—are reflected on the theetnonyms-the names of city-villages" – was written by a famous scientist S. Korayev[5, 50-57 p].

Oykonims are considered as the most valuable monuments among the toponyms by their historical and linguistic features [1]

Oykonym means the name of the city, village, ovul and town. There is a proverb that " The name doesn't disappear even if the lake dries"

Losha, Safedmuy, Toshmachit, Khujarabot, Tuksaboy, Bog'dasht, Foshun, Begijugi, Oqrabot, Khujamushkin, Jonbobo, Gulobyon, Malikon, Leylak, Chardori, Urtarabot, Patput, Shekhlar, Chaqmoq, Toytepa, Asaka, Chandir-Chuqurrabot, Khomkhuron, Khushun, Novmetan, Alotkhona, Khumin, Udurgi, Diosiyo, Urtarabot, Patput, Shekhlar, Toytepa, Asaka, Chandir-Chuqurrabot.

- Orooykonims: appeared near the ancient river: Chuqurrabot, Urtarabot.
- Hydronyms: Chordori (the name of (water container) the well.
- Antroponyms: Jonbobo, Safedmuy, Chaqmoq (pirs and saints)
- Etnonyms: Shekhlar, Chandir, Begijugi, Alotkhona, Khujamushkin, Khujarabot.
- Toponyms connected with people's professions: Diosiyo, Patput.

In conclusion, it is important to mention that the names of these places became more perfect due to the intelligence and the experience of our ancestors. To learn them from scientific-practical view-point and explain them to the youth is the most actual task of present day.

LEGAL AND ECONOMIC BASIS FOR IMPROVING THE MECHANISM OF FINANCIAL INCENTIVES FOR INNOVATIVE ACTIVITIES IN INDUSTRIAL ENTERPRISES

Nodirbek Zamirdinovich Bahridinov*

*Researcher,
Department of Economy,
Namangan engineering-construction institute,
UZBEKISTAN

ABSTRACT

The article examines the legal and economic basis for the formation and improvement of the mechanism of financial incentives for innovative activities in industrial enterprises. The mechanism of financial incentives for innovative activities of industrial enterprises, on the one hand, will be an integral part of the country's innovation system, on the other hand, the activities of all other elements of the innovation system will be closely linked with its effectiveness. The point is that fundamental scientific ideas whose purpose is not to make a profit cannot be applied directly to economic activity. But they are the starting point or source of future innovations. Therefore, businesses and companies will be cautious in funding fundamental research.

KEYWORDS: *Financial Incentives, Industrial Enterprises, Economic Liberalization, Innovative Economy.*

INTRODUCTION

In the context of economic liberalization, Uzbekistan pays great attention to the formation of an innovative economy, further development and improvement of the regulatory framework for innovation, strengthening the mechanism of integration of science and industry. Since 2017, with this in mind, the system of targeted state support for research and development in higher education institutions and special institutions and organizations is being radically updated.

The state innovation policy is being transferred to the center of investment policy, the innovative content of investments is becoming a priority. The purpose of the financial elements of innovation policy is to accelerate the formation of the national innovation system of the country, to stimulate specific measures and mechanisms to ensure its economic development in

accordance with the chosen development strategy, to develop and implement a system of priorities. This policy will create new opportunities for the formation of scientific and technological potential of the country in line with the dynamically developing market economy, meeting the requirements of the country's resource potential and sustainable development strategy.

The mechanism of financial incentives for innovative activities of industrial enterprises, on the one hand, will be an integral part of the country's innovation system, on the other hand, the activities of all other elements of the innovation system will be closely linked with its effectiveness. In this sense, the effective functioning of the innovation system is expressed as a result of the operation of the mechanism of financial incentives for innovation. Accordingly, this mechanism is formed in accordance with the structure of the innovation system.

In our country, work has been done to create and improve the legal and regulatory framework for the development of scientific and practical research and innovation, as well as to stimulate the application of modernization, technical and technological renewal of production, including:

- Resolution of the President of the Republic of Uzbekistan dated August 7, 2006 No PP-436 "On measures to improve the coordination and management of the development of science and technology" [1];
- Resolution of the President of the Republic of Uzbekistan dated July 15, 2008 No PP-916 "On additional measures to encourage the introduction of innovative projects and technologies in production" [2];
- Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated May 20, 2009 No 144 "On additional measures to encourage the implementation of innovative projects in production" [3].

Adoption of the Resolution of the President of the Republic of Uzbekistan No. PP-436 of August 7, 2006 "On measures to improve the coordination and management of science and technology development" innovative scientific and technical programs and the solution of pressing issues of economic development has created certain opportunities for the effective use of existing scientific and technological potential [4].

An important step in improving the financing of innovations was the Resolution of the President of the Republic of Uzbekistan dated November 1, 2017 No PP-3365 "On measures to further strengthen the infrastructure of research institutions and the development of innovative activities."

According to him, in order to ensure the implementation of the tasks set out in the Action Strategy for the five priority areas of development of the Republic of Uzbekistan in 2017-2021, as well as to further improve the activities of research institutions, strengthen their material and technical base and create favorable conditions for innovation;

- A comprehensive program of measures to strengthen the infrastructure and develop innovative activities of research institutions for 2017-2021 has been approved, including:

- In 2017-2021, a set of measures to strengthen the infrastructure of research institutions and the development of innovative activities has been identified;

-The parameters of the estimated volume of financial costs for the implementation of the Program in 2018-2021 and the program for strengthening the material and technical base of research institutions in 2018-2021 were adopted.

The resolution of the president of the republic of uzbekistan dated may 5, 2018 no pp-3697 "on additional measures to create conditions for the development of active entrepreneurship and innovative activities" a number of structural problems were noted:

First, there is no systematic analysis of the market of advanced and modern innovative developments, technological projects-startups and innovations, taking into account the existing resource base and potential of the regions;

Second, the work on attracting investments to innovative projects-startups, promoting and coordinating the activities of talented entrepreneurs who are actively implementing innovations in the field of production and services is not carried out;

Third, in the field of innovative development, especially in the field, the business environment remains low, as well as the lack of entrepreneurs with the necessary skills to develop and promote innovative and successful technology projects-startups;

Fourth, there is no database of innovative ideas, developments and technologies, the practice of creating new resources and transferring experience to business structures remains underdeveloped;

Fifth, the mechanisms to support the market of innovative developments are poorly developed, the coordination of the effective use of innovative ideas is not established, and the quality of innovative developments does not meet market requirements;

Sixth, insufficient attention is paid to the involvement of graduates of technical higher education institutions and talented youth in the field of innovative developments, technological projects-startups, as well as the creation of business incubators;

Seventh, the promotion of innovative entrepreneurship among the population is not carried out effectively, technical and psychological barriers to attracting to the development and promotion of innovative products and services remain.[5]

According to the resolution, measures have been identified to create more favorable conditions for innovative activities. In particular, at the suggestion of the Ministry of Innovation Development of the Republic of Uzbekistan, centers of innovative ideas, developments and technologies were established in the Republic of Karakalpakstan, regions and the city of Tashkent to develop, test and master innovative projects, transfer and commercialize the results of innovative activities.

In order to further expand the commercialization and introduction of innovative ideas and technologies in production, as well as increase the efficiency of innovative organizations, on September 11, 2018 the Cabinet of Ministers of the Republic of Uzbekistan adopted Resolution No. 721 on measures to further support innovation. The resolution stipulates that the Fund for Support of Innovative Development and Innovative Ideas will co-finance research startups on the basis of grants or interest-free returns, which provide for the introduction and commercialization of local scientific developments, and serves to expand its resources.[6]

No. PP-3365 of November 1, 2017 of the President of the Republic of Uzbekistan "On measures to further strengthen the infrastructure of research institutions and the development of innovative activities", "On additional measures to improve the mechanisms of innovation in industries and sectors of the economy" 2018 7 Resolution No. PQ-3698 of May 9, 2019 and No. PQ-4546 of December 9, 2019 "On measures to further reduce bureaucratic barriers, the introduction of modern management principles in the activities of government agencies and organizations." Also, in order to improve the regulatory framework for the formation and implementation of the state order for research, the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan dated March 9, 2020 No 133 "On measures to further improve the regulatory framework for research and innovation" accepted.

Regulations on the state order for research work with this resolution; Regulations on the procedure for selection and financing of startup projects; On Scientific and Technical Councils under the Ministry of Innovative Development of the Republic of Uzbekistan. [7]

The charter was approved. Adopted by the Legislative Chamber of the Oliy Majlis of the Republic of Uzbekistan on April 7, 2020 to strengthen the legal framework for innovation in our country.

Particular importance is the Law of the Republic of Uzbekistan "On Innovative Activity", approved by the Senate on June 19, 2020. It states that "state support and encouragement of innovative activity is carried out in order to create the necessary legal, economic and organizational conditions for innovative entities, to finance innovative projects and new developments" (Article 10). Article 4 of the Law sets out the basic principles of innovative activity, Article 10 the directions of state support and encouragement of innovative activity, Article 16 the rights of innovative subjects and Article 17 the obligations of innovative subjects create appropriate legal conditions for innovative activity in industrial enterprises.[8]

The fact that Article 18 of the Law clearly defines the types of innovations on a scientific basis is also important in the financial management of innovative activities:

"Product innovations - innovations aimed at the development and introduction of technically and technologically new or improved products (works and services);

Process innovations - innovations aimed at the development and introduction of technically and technologically new or improved production or training methods, as well as the transfer of technology;

Marketing innovations - innovations aimed at the introduction of new or improved methods, including changes in the design and packaging of products, the use of new ways of selling and providing products (works and services), the formation of new pricing strategies;

Organizational innovations - innovations aimed at the organization and conduct of business, the creation of jobs and the introduction of new or improved methods of external relations.

At present, the current stage of socio-economic development of our country necessitates a radical reconsideration of the role and place of innovative activity in the economy and the social sphere. Innovation is based on the technology of various industries and the foundations of high-tech industries, which are the leaders of all-round development in the country. Such an approach is a necessary condition to support the competitiveness of the product in terms of market relations

and to create a new competitive advantage. In terms of the well-being of the population, innovations serve to increase the opportunities and the level of human capital formation. It is clear that financial incentives for innovation are focused on achieving these results effectively.

The traditional direction (scope) of state support for scientific activity is the funding of fundamental research. The point is that fundamental scientific ideas whose purpose is not to make a profit cannot be applied directly to economic activity. But they are the starting point or source of future innovations. Therefore, businesses and companies will be cautious in funding fundamental research. Through the launch of the national innovation system, the financial and technological resources of companies, institutes, universities and other institutional units will be integrated through legislative and economic incentives. In the current situation, such integration is the basis for ensuring sustainable economic growth, improving the welfare of the population, the national economy can have a competitive advantage.

The following areas of state support of the national innovation system and innovative activities of industrial enterprises can be noted:

- Direct funding from the state budget;
- Allocation of loans to innovative entities from the budget;
- Establishment of venture funds with public funds;
- Identification of opportunities for the application of accelerated depreciation in the tax legislation;
- Simplification and reduction of the process of patenting of inventions and discoveries;
- Additional incentives and extension of resource-saving patents;
- Organization and development of a network of technopolises and technoparks.

The formation of a national innovation system requires, first of all:

- Training of managers for the organization and management of innovation, bringing the standards of local production management to the level of international standards in the organization of innovation activities;
- Development of financial mechanisms (leasing, investment insurance, venture financing, etc.) that adapt world experience in the development, financing and implementation of innovative projects to the economic conditions of the country, depending on the level of risk;
- A well-developed network of information services, including a database of innovative projects and information systems, information on the situation in the capital and money markets, recommendations on the feasibility of investing in certain projects;
- Engineering services, product standardization, technological processes, certification of goods and services.

In recent years, Uzbekistan has introduced the necessary mechanisms for the introduction of modern information technologies in governance, the regulatory framework to support the development of innovation, tax and customs regulations, technology transfer and the formation of an intellectual market, preferential lending and financing to stimulate the transport system. serves for rapid strengthening.

The need and cost of the necessary financial resources should be calculated at each stage of the innovation process in relation to the available capacity and sales volumes. A different approach to cost distribution is required at different stages of the production cycle and at different capacities of production capacity. Considering that costs are entirely innovative will result in lower efficiency and appropriate decision-making. How the issue is resolved will depend to some extent on the innovative and creative thinking of the company's management. This is especially true for industrial enterprises in our country, where there is a frequent shortage of financial resources.

Also, the selection and approval of the main option of financing innovation depends on the nature and characteristics of the innovation, the expected impact on the current state and future of enterprise development, compliance with standards, resource, scientific and technical capabilities of the enterprise.

Innovative activity is considered to be an activity that includes all scientific, technological, organizational, financial and commercial measures that lead to the emergence of technologically new or significantly improved products or processes, including investment in new knowledge completed in the last 3 years. 192 business entities per year innovative products, works and services. Of these, 91 were completed in 2018 and 106 in 2016-2017. In addition, during 2016-2018, products, works and services were innovatively improved by 30 organizations and enterprises.

Innovative activity in the region is also carried out in the small business sector. Innovative by 181 small businesses products, works and services were performed, of which 84 were performed in 2018 and 95 in 2016-2017. In addition, during 2016-2018, products were improved by 25 organizations and enterprises. Innovative products, works and goods worth 643385 million soums were performed in Namangan region. In particular, the volume of innovations mastered for the first time in 2018 amounted to 155678 mln. soums, for the first time in 2016-2017 the volume of disbursed 390313.1 mln. soums, the volume of improvements for 2016-2018 amounted to 97893.9 mln. soums.

In Namangan region in 2018, the sources of funding and expenditures on technological, marketing and organizational innovations will amount to 136723.1 mln. soums. From them at the expense of own means of the enterprise and the organization 120604.5 mln. soums, at the expense of foreign investments 12456.4 mln. soums, 288.4 mln. soums from the budget. soums, 3141.0 mln. soums at the expense of loans of commercial banks. soums and 47.1 mln. soums from other sources. soums were spent.

In 2018, 136723.6 mln. soums were spent. Innovations are mainly of a technological nature. In particular, technological innovations have been introduced by 60 businesses in the region. The total number of introduced technological innovations is 109. 100 of them were carried out by business entities on their own. Expenditures on technological innovations (capital and current expenditures) totaled 134051.7 mln. soums. Of which 120346.8 mln. soums and 13704.9 mln. soums. soums of process costs.

Of course, the main part of innovations in Namangan region is assessed as innovation at the level of local conditions and opportunities. However, it is undeniable that these changes have a positive impact on the socio-economic development of the region and create the conditions for future innovation on a global scale.

ABSTRACT

In the modern world, tourism is one of the most massive, lucrative and intensively developing sectors of the world economy. Historical and cultural heritage can and should be one of the priorities for the development of large and small cities. Increase should be seen as a tool for managing labor migration. To promote the development of tourism in cities, it is necessary to actively encourage entrepreneurship, create a favorable investment and business environment, formulate a tourism marketing strategy.

KEYWORDS: *Tourism, Economy, Geographical, Historical Place, Historical Artifacts, The Organization And Development Of Tourism.*

INTRODUCTION

From the first days of independence, our country has begun to organize the national economy in accordance with the geographical location and mentality, and to develop reforms in accordance with the requirements of the times. The reforms were first continued in the manufacturing sector and then in the service sector. It should be noted that in the service sector, the banking system, the insurance system, trade and marketing, in a sense, in the field of education. The benefits provided to commercial banks are that they have been exempt from basic taxes for several years. They had a good opportunity to modernize the material and technical base. Such achievements are undeniable, of course. However, it should be noted that there is a tourism sector in the national economy, which costs less, but you have the opportunity to earn a higher income. Among the Central Asian countries, our country has the opportunity to become a leader in the organization and development of tourism. There are a lot of buildings, structures and historical relics left by our ancestors to their descendants. This is confirmed by the following quote: "Uzbekistan has a huge potential for tourism and recreation, with a total of 7.4 thousand cultural

heritage sites, 209 of which are four museum cities - "Ichon-kala in Khiva", "Historical center of Bukhara", "The historical center of the city of Shakhrisabz is located in the territory of the city of Samarkand and is included in the UNESCO World Heritage List." All these historical artifacts are objects that directly serve to increase the flow of tourists and the development of tourism. In short, the tourism industry is one of the sources of opportunity to earn high socio-economic income at low cost. Nevertheless, we have not paid enough attention to the development of tourism in accordance with the requirements of the time since the early days of independence. But the CIS countries have paid enough attention to this area. As a result, it has achieved unprecedented success. This is evidenced by the following statistics: "According to the National Tourism Administration of the country, in 2018, Georgia's tourism revenues will reach 3 billion. Exceeded the U.S. dollar. The number of tourists visiting Georgia in 2018 increased by 14.9% compared to the previous year and reached 8.7 million people. What is the positive trend in the field of tourism in Georgia, which is already free of the former Soviet Union? However, the territory of Georgia is smaller than the territory of our Navoi region. 65-70% of the existing land area is mountainous. Its population is slightly larger than the population of our Fergana region.

We are convinced that the number of historical buildings, religious scholars and places where they have settled is several times less than ours. Let's take another look at the above quote, which shows that for every Georgian living in Georgia, there are 2.35 tourists (8.7 million tourists: Georgia's population is 3.7 million). With this figure, Georgia is one of the top 10 countries in the world in terms of tourism services. In our opinion, at the right time, that is, from the first day of independence, the Georgian government and leading economists have focused on the organization and development of tourism. As a result, it is making enviable achievements in the field of tourism. Over the past two years, the Republic of Uzbekistan has begun to pay close attention to tourism, as in all sectors and industries of the national economy. Modern normative documents serving the development of tourism have been adopted. In particular, the Presidential Decree No. PF-4861 of December 2, 2016 "On measures to ensure the accelerated development of tourism in the Republic of Uzbekistan" was adopted. Also, the State Committee for Tourism Development was established on the basis of the National Company "Uzbektourism". In addition, all enterprises serving within the National Company have been transformed into unitary enterprises that can provide services in accordance with the requirements of the time. In addition, dozens of normative documents regulating and coordinating tourism have been adopted, which focus primarily on the development of outbound tourism. An open door policy is being pursued with neighboring countries that are close neighbors, religious and mostly allied. In addition, tourists from a number of foreign countries are given the opportunity and freedom to enter the country without a visa for a month. In the field of tourism, the tourism environment, developed on the basis of timely adopted and implemented regulations, is dramatically improving. As a result, there is an opportunity to sharply increase the number of tourists visiting our country.

As a proof of our opinion, we pay attention to the following figures mentioned in the media: "From 2010 to 2017, the volume of exports of tourism services doubled and amounted to 546.9 million US dollars in 2017 and 1,041 million US dollars in 2018. In 2018, the export of global tourism services increased by 4% and the number of international tourist visits increased by 5% to \$ 1.4 trillion, reaching 1.4 billion. , Exceeded 2.69 million. In 2018, 5.3 million foreign tourists visited the country. As a result, in 2019, exports of tourism services increased by 26.1%

compared to 2018 and amounted to \$ 1.3 billion, and the share of the sector in the export of services increased to 39.3%. At the end of 2018, the number of tourism organizations increased to 950, and the number of hotels - from 661 to 900. In addition, the development of tourism and the improvement of infrastructure serving tourists and the provision of services that meet the requirements of the times. Diplomatic corps abroad have also been instrumental in promoting the sector. As a result of these actions, the share of revenues from tourism services in GDP has been growing for a short two years. The number of tourists has also almost doubled. Of course, positive work is being done in the field of tourism. ” In short, there are many measures taken in the future in relation to the achievements in the field of tourism. One of them is the need to introduce international standards in the development of tourism in accordance with the requirements of the time, to approach the issues of increasing the country's export potential through tourism through research. In this regard, the following measures should be taken in the near future. In particular: - In order to gain practical skills from the experience of Georgia, it is necessary to jointly organize and hold an international conference on tourism; - Following the example of the advanced achievements of the Turkish state in the field of tourism, which is both a language and a religion, it is necessary to positively address the issue of increasing the number of foreign tourists to the country in the future; - In order to prolong the days of tourists in the country, it is desirable to sharply increase the number of swimming pools for them. Because most tourists love to swim in hot countries; - It is necessary to sharply increase the enrollment of foreign students in the field of education in the country. They live like tourists for at least 4 years of study. There is a great opportunity for parents and close friends to visit them during their studies. This means that the number of additional tourists will increase without further promotion. We are confident that if the above-mentioned scientific recommendations are taken into account at the governmental level, in the near future, the achievements of Turkey and the Republic of Georgia in the field of tourism, as well as Uzbekistan's opportunities will expand.

BIOGRAPHICAL APPROACH AS A SCIENTIFIC AND THEORETICAL PROBLEM

Sanobar Panjievna Tulaganova*

*Doctor of Philological Sciences,
Institute of Uzbek language, literature and folklore,
Academy of Sciences of the Republic of UZBEKISTAN

ABSTRACT

The article deals with the study of the issue of biographical approach in world literature, the possibilities of the biographical genre, the creative personality, the creative "I" and the biographical "I". In the historical and literary process, the issue of biographical approach in Russian literature has been widely discussed, and the views of scholars on this issue have been studied. Any work of art is a product of individual perception and creative activity. Figuratively speaking, the author is likely to leave a "fingerprint" in the text of the work, which is not noticeable at first glance, but different from others.

KEYWORDS: World Literature, Author Or Text, Biographical Approach, Biographical Genre, Literary Personality.

INTRODUCTION

In the history of literary and aesthetic thought in world literature, in the field of philosophy, aesthetics and psychology, the scientific-theoretical study of the problem of harmony between the psychology of creativity, the writer's laboratory, the creative personality and artistic creation has a long history. The creative personality as a scientific problem has been studied to some extent in world literature, and specific principles have been developed. Any work of art is a product of individual perception and creative activity. Figuratively speaking, the author is likely to leave a "fingerprint" in the text of the work, which is not noticeable at first glance, but different from others. This "trace" embodies a number of features present in the author's personality. A special biographical approach to the creator is required to study the specific "traces" in this way. According to the historical-comparative, biographical, psycho biographical, historical-cultural methods widely used in literary criticism, the problem of the creative personality is studied as a literary-aesthetic category of literary criticism, approaching the phenomenon of harmony between the creative "me" and the human "I".

"Biography" is a Greek word meaning "life", "I write" - a biography, "life history", "destiny in writing". Literary critic Abdugafur Rasulov connects the term "biography" with Alisher Navoi's attitude to this word: "The great Alisher Navoi revered the word" hol "and used it very effectively. "Hol" is an Arabic word. The more the merrier, the more the merrier. Alisher Navoi used such combinations as "hasbi hol", "status adosi", "status mood", "pleasure state", "distressed state". "Hol" actually means spiritual life, spiritual movement, like "biography" [1.22]. The scientist argues that the biography is the manifestation of a person's spiritual life and mental states, his personality through nature.

In the biographical genre, documentation, no space for texture, strict adherence to certain rules in the depiction of space and time, adherence to gradualism are required. So, the artist who intends to create a work in the biographical genre must take into account these aspects. The use of artistic text in biographical works is limited. The reason is that the author relies solely on documents in this genre. "The author of a biographical story is a slave to factual material. A biographical story is built not only on facts, but also on perceptions - on the basis of emotions that appear in an absolutely legitimate way on the basis of a dramatic description of events. The facts can be incredibly easily forgotten, but the emotional excitement once experienced will never be forgotten." [2.97] It is understood that in the analysis of a work created in the biographical genre, it is important not only to follow the numbers, but also to understand the author-human mental state, experiences and the situation in which he lives. A biographical work is a historical-artistic documentary work dedicated to the life and work of a particular writer. An author who intends to write a work in this genre must have a deep knowledge of the historical and literary process, the socio-psychological climate of the period, literary traditions and criteria. A biographical work is a documentary example of a work of art in which the image of a historical figure is created through the imagination and understanding of the author.

The study of the creative-human biography is based mainly on the biography prepared by the author. Sometimes the incompleteness and irregular scattering of sources about a writer causes a number of problems in the work. It should be noted that the scarcity of sources encourages the researcher to reflect on the text. "The author's biography and analysis of his works are rarely successful." [3.85-86] Continuing the above idea logically, M. Lotman says: "The interaction of two works - that is, the analysis of the author's biography and his work - can rarely find a successful solution [4.28]. The problem is, first, that numbers and documentaries are a priority in biography. Second, the creator is also a living soul, his freedom of thought and relations is unrestricted, stability cannot be demanded from him, it is impossible to fully comprehend the personality of the writer and the world of creation. Therefore, the ability to combine the two phenomena requires a great deal of responsibility on the part of the researcher, and it is important to find a vivid image of the creator among the sources. In the creative man (meaning the writer - S.T.) the creative "I" and the biographical "I" form a mutual point. When the creative "I" is considered on the basis of creative originality, creative uniqueness, aesthetic ideals and poetic criteria, the biographical "I" takes the next place. Biographical "I" plays a key role in a deeper understanding of the creative "I". It should be noted that the absoluteness of the biographical approach in the study of the work is far from the idea that the author and the protagonist are the same. It is not correct to look for a biographical element in every work, to focus the analysis on this factor. In recent years, literary criticism has focused on the creative personality as a result of a comprehensive study of the human person, his way of thinking and the spiritual world. After

all, it is not justified to exaggerate the biographical or personal "trace" of the author in the analysis of the work, to pay too much attention to it.

The basic principles of the biographical approach in world literature were developed and applied to science by Sh. Saint-Byov, A. Morua. In the West, it has become a tradition to synthesize a work of art with its author's nature, talent, psychological state, and an individual approach to the creative process. Since the creative-human personality is full of mysteries, it is difficult to regulate his biography on the basis of strict rules. Therefore, in Russian literature, the author's biography was considered a "genre that does not obey the rules." One of the main problems of the biographical method is the integration and study of various parts of human life in a biographical work. It is more accurate to call the biographical genre an inter-genre genre.

In the early 1920s and 1930s, the "biographical approach" to Russian literature was dominated by the West. At the same time, many scholars have differing views on the concept of "text or author." In the former Soviet Union, since 1933, a creative group led by Gorky has been publishing the series *The Lives of Wonderful People*. At the time of publication of the series, the Russian press publishes a number of controversial scientific articles. In 1939-1940, the "Adabiyot Gazeta" held a large-scale discussion on the biographical genre. As a result of the biographical approach to the creator-man, the content of the genre expands and a biographical novel begins to appear. Since the full principles of the genre have not yet been developed and are new, various controversies arise. What type and genre do biographical novels belong to, and is there a need for this genre in literature? the criteria of the biographical genre are developed due to the objection that. [5. 36-42].

M.O. Gershenzon, a scholar who studied Pushkin's work in depth, states that "Pushkin, as a poet, is completely true in the essence of his simplest and simplest words, and in each of his poems there is a personal autobiographical confession, you just have to listen to him and believe in him." [6.53.] Proper interpretation of the biographical lines in the poet's poem ensures the success of the work. Feeling and understanding the feeling and confession of the artist to the artistic expression, along with the understanding of the poet's creative concept, serves to determine the theoretical and methodological value of the biographical method. BV Tomashevsky sarcastically accepts such comments about Pushkin's poetry as "the truth of the world" and interprets this study as an approach of a psychobiographical nature in the narrow sense [7. 9.]. Scholars approach the issue from an artistic-aesthetic and socio-cultural perspective, proposing to blur the line between a work of art and a personal biography. Some theorists, however, object to this, claiming to be representatives of antibiography. In particular, representatives of the formal school B.M. Eichenbaum [8. 36], V.B. Shklovsky [9.143.] object that fiction and real life are not one and the same, it is not an acceptable way to look for any biographical elements in a work of art. A.A. Potebnya, on the other hand, believes that the study of a work of art on the basis of a biographical context should cover such issues as the personality and psyche of the author [10.616.]. Each scholar has focused on different aspects of the biographical approach in his or her views.

Representatives of the formal school try to confirm their views with the views of the representatives of the "psychological school". None of us has the right not to be distracted by the events of BM Eichenbaum's life, that is, "verbal statements do not reflect the true anguish of the human heart or be deceived by the author's words in his diary and memoirs" [8.43]. Analyzing the work of the Russian poetess A. Akhmatova, B. Shklovsky argues that "we must separate the

laws of real life from the laws of literature" [9.143]. In general, the problem of the creative personality and the literary hero determines the historical-cultural, literary-aesthetic, socio-psychological value of the problem as a scientific-theoretical problem.

V. Commenting on the formal school, Zhirmunsky concludes that "the creative style is reflected in issues such as his aesthetic views and tastes, which in turn are integrated into his biography" [11.213.]. Scholars have argued that no matter how controversial, a biographical approach, the study of a writer's life in relation to his work and protagonists, would provide the basis for new scientific and theoretical conclusions. M. Bakhtin in the study of the work in the biographical genre highlights several factors, 1. The author-man to look at the individual as an individual creature, and this feature ensures its originality; 2. The principle of historicity should be followed in such work; 3. It is necessary to study the author in connection with the conditions of his time, the principles of literary criteria; 4. The researcher should not confuse the author-creator (at the time of the work) with the author-person (historical period and society, socio-political), although there are several similar situations in life [12.216.]. In the study of the creative personality, the scientist prefers to formulate the problem on the basis of a holistic system and to study it in relation to its own period, as required by historical poetics. The study of the creator on the basis of the principle of historicity plays an important role in understanding the general picture of the period and the social factors in the life of society. The creative work serves as a link between history and the future. In the process of writing a work, the writer must be able to summarize the units of time, such as yesterday, today and tomorrow, in terms of space and time.

V. Zhirmunsky notes that in studying the biography of the artist it is necessary to consider three problems:

1. Personal biography of the writer, his attitude to creativity.
2. Social biography of the author.
3. Literary biography of the author, his views on literature. [12.133.]. The scientist distinguishes the personal, social and literary biography of the artist and suggests a special study of it. Hence, in the process of studying the creative biography, it is necessary to observe the three problems as a whole. The problems posed by the scientist complement and clarify the other, creating a holistic view of the creator.

In Uzbek literature, Professor Fitrat first tried to reconstruct the author's biography based on his work. The scholar Ahmad Yugnaki, Ahmad Yassavi, poets of the Yassavi school, Muhammad Salih, Turdi and Mashrab, as well as Abdurahman Saadi's "Imam Ghazzali" and Wadud Mahmud's "Fuzuli Baghdadi" have developed a unique method of creating a scientific biography. These studies emerged as a result of a holistic view of the author's personality and creativity. A number of researches devoted to the creation of a creative scientific biography of modern Uzbek literature have been created, and works in the spirit of enlightenment, created in a biographical way, have been published. At the request of the ideology of our independence, efforts have been made to restore the "biography" of our national literature. Socio-political changes at the beginning of the century, the Jadid movement, the establishment of the Bolshevik regime, political repressions in the 30s and 50s, the policy of the long-ruling Soviet government had a significant impact on the lives and works of Uzbek writers. Therefore, the biographies of our writers who lived and worked during the Soviet era were studied on the basis of new principles.

If we focus on the roots of the biographical approach in Uzbek literature, it goes back a long way. The history of the life of the Prophet (peace and blessings of Allaah be upon him) is called Siyarat. When the word "siyarat" is translated from Arabic, it means "a person's life history, way of life", or "biography". The science devoted to the study of the life of the Prophet (peace and blessings of Allaah be upon him) is called As-Siyratun al-Nabawiyah, and the scholars who specialize in this science are called the scholars of Siyarat. [14.188.] There are many books on the history of Islam in the history of Islam, and biographical works on the lives of saints and prophets in the Middle Ages tell the story of the genre.

Amir Temur's "Temur's Statutes", Zahiriddin Muhammad Babur's "Boburnoma", Muhammad Salih's "Shaybaniynoma" are also among the unique sources of biographical character. In the rarest examples of our classical literature, the science of poetry has been systematically improved. Alisher Navoi's first prose works "Khamsat ul-mutahayyirin", "Haloti Pahlavon Muhammad", "Holoti Sayyid Hasan Ardasher" were arranged in Turkish. managed to create. Or Alisher Navoi's "Nasoyimul-muhabbat" gives detailed information about the life and work of 707 sheikhs. Alisher Navoi spoke at the Majlis un-nafois about the works of 459 people of different professions engaged in fiction, and analyzed their achievements and shortcomings. In the classical literature, Khandamir's work "Makrim-ul-akhlaq" covers the leading aspects of the biography of the great Alisher Navoi. Thus, the issue of the author's biography and biographical approach to it has a special place in the history of Uzbek classical literature. Uzbek literary critics continued the traditions of their predecessors in the biographies of celebrities, and by the twentieth century (30s) the demand and supply of biographies had changed.

Academician I. Sultanov in his book "Navoi's book of the heart" [15.] studied to the smallest detail in the biography of the creative person and used it very appropriately. This work is the product of the work of the scientist, who has been writing about the works and works of Alisher Navoi for many years. Turkologist, Doctor of Philology M. Khamroev considers this work as a "documented biography" [16.208.]. In this, of course, the scholar's writing skills came in handy.

Biographical works, educational novels, biographical short stories, biographical essays appear in Uzbek prose, which means that the possibilities of this genre are expanding. In all of this, documentary is a priority, and the author is guided by the goal of deepening the creative and human image of the creator, based on his emotional feelings and experiences. N. Karimov's enlightenment novels "Cholpon", "Mirtemir", "Maqsud Shaykhzoda" are a vivid example of this. At the same time, artistic creativity and literature approach in a certain sense, one complementing the other. It is expedient to form the existing scientific and theoretical views on the basis of world literature on the basis of the heritage of our ancestors in our national literature, and much research is still being done in this regard.

THE ART OF PUPPET THEATER IN THE TEMURIAN PERIOD

Mohisadaf Ubaydullayeva*

*Basic Doctoral Student (PhD),
State Institute of Arts and Culture,
UZBEKISTAN

ABSTRACT

This article discusses what the Uzbek puppet theater looked like during the Timurid era. In particular, the puppet theater is referred to in a special chapter of Navoi's epic "Hayratulabror" about the XIV century, and about the situation in the XV-XVI centuries in the treatise "Futuvvatnomaisultoniy" by Hussein VoizKashifi. In conclusion, the development of the Uzbek puppet theater during the Timurid period and its importance among the intelligentsia.

KEYWORDS: Puppet Theater, Dramaturgy, Puppetry, Spectacle, Counter, Theme, Chadirjamol, Chadirxayol, Lu'bat.

INTRODUCTION

It is known from history that the Uzbek puppet theater has existed since ancient times and developed in close connection with various ceremonies and traditions. We can learn the historical roots of puppet theater from the references in the works of scientists, writers and poets who lived and worked in a certain period. They expressed their views in a particular field by linking them to types of art, including theater and puppetry. As a result of research, we can see that the drama of the Uzbek puppet theater has been developing since ancient times and flourished in the XIV century. During the reign of Timurids, not only the art of puppetry, but all kinds of art flourished.

"Amir Temur has a positive attitude to poetry, music, dance, storytelling, games and performances," Kadyrov said. It should be noted that he had a serious attitude to art and entertainment because he liked simplicity in life, took everything seriously, from the point of view of the interests of the country and the state. [3 – 16 p.], obviously not indifferent. The development of this art during this period can be seen in the works of AlisherNavoi and Hussein VoizKashifi.

In Navoi's HayratulAbror, one can find many terms related to puppetry. Here are some examples:

"Her face(lu'bat)turned pale,
 Her face opened it and turned it into a pleasant. [4 – 84 p.] ”
 "This tonight it was a hundred years,"
 They were different of each other,
 It was doing upset destiny
 With each breath the secrets are revealed.
 Sky is the veil (chodari) of this destiny.
 then she became a puppet (lu'bat). [4 – 85 p.]”

These verses are from the Second Amazement, in which Navoi uses the words lu'bat and chodar. In the first two, he uses the term puppet art to describe the structure of the universe, the sky, while emphasizing the beautiful girl.

“And the world is full of irony. it is the work of a lie. And it was full of noise. And the language of the pen is powerless to write it.” [4 – 261p.]

“Rather, he is a master look like puppet player (qovurchoqchi),
 Shows a thousand different plays behind the scenes (chodaridin)
 Held the curtain (chodarin) without nailing and installing wood,
 Took the tent into a circle
 Does different things behind him
 Shows a hundred different puppets (lu'bat) each time.
 He shows so many puppet plays (lu'bat)
 As if he had committed suicide. [4 – 263 p.]”

The above ghazals belong to the "Fourteenth Article", in which Navoi tells the whole truth, using the words "lu'bat", "qovurchoqchi", "chodar". That is, “the irony of the world puppet is that he looks like a beautiful and handsome woman, but he himself is so old that his work is cunning and deceitful; and the hypocrisy is excessive; And the language of the pen is powerless to write it, this old man's standing is a waste. 2 O heart, this puppet has come out! O heart, do not be offended by his deceit! 3. Like a puppet, this cunning sky shows a thousand different pictures in its trick tent. 4. His tears are the stars of deceit. The white of the morning in the lie is his head. 5. Below is a sign of makeup - white morning powder and sunscreen. 6. The meaning of these two verses: Before the wedding, the bride asks for her life, demands her faith in the next dowry, and after receiving her life and faith, she is exiled from the house of this world. [4 – 415 p.]”

Here "chodar" is the Uzbek word for "tent", "kovurchoqchi" is the Uzbek word for "puppet player", "lu'bat" is the Persian word for "puppet". Navoi, a master of the art of imitation in poetry, uses elements of the art of puppetry so skillfully that we see a puppet playing in a circle. He calls the puppet player a "trickster." By this he meant to tell the puppet master that he would masterfully take various puppets out of the tent without being seen by the audience.

“They distract everyone

Turned the period into a theater (fonusxayol) [4 – 143 p.]”

These verses are taken from the "Fourth Article", in which Navoi speaks about the actions of false sheikhs and compares their conspiracies to turn the period into a theater of chodirxayol.

It is important to us that the poet used terms related to puppetry in the art of simile and spoke about the styles of this art. It is not surprising that Navoi used these verses to describe two types of Uzbek puppet theater, ChadirKhayol and ChadirJamol. In his sentence, "took the tent into a circle" refers to the "ChadirJamol" whose tent is tied around the puppet's waist, and in the sentence "Does different things behind him" it refers to the "ChadirKhayol". In the above verse about the period, he also mentioned the "FonusKhayol" theater. It is obvious that Navoi was well aware of the three types of puppet theater art, studied its elements. Navoi in his time was both among the common people, and in the palace and in the circle of cyborgs. He looked at each reality and the things around him from his own philosophical point of view. That is why he tried to express his thoughts with things that were close and familiar to them so that they could be understood by all. At the same time, using the tools of puppetry, it can be concluded that in the XV-XVI centuries, almost all forms of this art existed and managed to form its own names and terms.

There is another historical source on the art and dramaturgy of the Uzbek puppet theater, from which we can get a broader idea of the puppetry that developed in the XV-XVI centuries. This source is Hussein WaizKashifi's treatise Futuvvatnomaisultoni, the sixth chapter of which deals with various ceremonies and types of art. In the fourth chapter of this chapter, the philosopher divides the performing arts into three types. One of them is called Puppets, and the second part of this chapter is called The Puppet Statement. This section is entirely dedicated to puppetry, which explains this art in detail. Kashifi gives detailed information about the types and structure of the Khorasan and Movarounnahr puppet theaters of that period, the skill of the puppet players, the performance technique and dramaturgy. "Though the forms and appearances in the world of photography are humorous, but in essence they represent serious truths. [1 – 92 p.]”

Here Kashifi is talking about puppet theater dramaturgy. While the show is full of humor, it says the themes are serious. So, even if the dialogues made people laugh, or the events reflected funny situations, behind them there was a thought-provoking, serious thought. "If they ask you what the conditions of puppetry are, tell them: the main condition is that the puppet player be wise and enjoy the truth. [1 – 92 p.] ” The philosopher thinks of puppet players with these words. When he says, "Let the puppet player be wise," the puppet fabricates events and dialogues from within while watching. If he's not wise, he may not be able to connect words during the show, confusing events. In addition, the events reflected in the show should be directly relevant to life and be able to convince the audience. It is not surprising that Kashifi meant this when he said, "Let him enjoy the truth." Kashifi also dwells on the types of puppet theater. "What is typical of puppet players," he writes, "is a tent and a peshband (counter). The game will be shown in the tent during the day and in the pavilion at night. [1 – 92 p.] ” Here, the game shown in the tent is "ChadirJamol", and the game shown in the front is "ChadirKhayol". So, in the XV century, we are once again convinced that the Uzbek puppet theater already has its own types and names. The play also gives a special description of these species. "They call the box Peshband. They play puppets on the box. In daytime games, puppets are played by hand. In the evening games, they move the puppets through a few strings on the box. [1 – 92 p.] ” It is clear from these words that the two types are described separately and their differences are explained in detail. He also

mentions the plot of each round. "During the interrogation, they quarreled, then beat each other and eventually had to make peace." We are talking about the comedy "PolvonKachal" by the theater "ChadirJamol". Because in this comedy, PolvonKachal and Bichakhonim usually quarrel like this and then make peace. These words are very important for the history of Uzbek puppet theater dramaturgy. For example, this dramatic basis means that it has existed since that time.

The dramaturgy of the "ChadirKhayol" theater, which is controlled by strings, was also considered. We can understand the phrase "Peshband is said to be in a box with a fantasy in front of it" by saying that this type of puppet show is based on imaginary, in other words, mythical-fantastic themes. "If they ask you what the counter (box) means, say it is a sign to the human heart. After all, the heart is a wonderful box, a sign of a person's condition. [1 – 93 p.] ” The words here mean that the play “ChadirKhayol ”was performed with the participation of heroes of different characters, and the play emphasizes human qualities and worldview. Analyzing the work, M. Kadyrov also explains that the word "wonderful" in this sentence refers to strange and legendary events. He analyzed the word "fantasy" both as a species and as a mythical subject. M. Kadyrov admits that he was surprised by Kashifi's ability to speak the voices of puppets in different ways, sometimes female, sometimes male. It is hailed as the "pinnacle of skill." He also shared his valuable thoughts on the subject: “We are also amazed by the art of Khorasan puppetry. Because even the famous puppets we know and their ancestors could not give the language of female and male puppet-characters, a special device under the tongue - safil - deprived them of this opportunity. It follows that puppets, who were contemporaries of Kashifi, sometimes made great strides in giving a verbal description of the characters, using their natural voice without the use of safil. Perhaps behind the fierce attack of the scribes in the late sixteenth and early seventeenth centuries, live speech was replaced by utterly pure speech. [2 – 184 p.] ”Kashifi writes in such a way that he can give a clear idea of the technique, theme, types and plot of the puppet show. indicates that he was able to attract attention.

ABSTRACT

This article is about language skill assessment that we can use to assess the progress our students are making in our classroom. We introduce the purposes and basic types of assessment, provide some guidelines for testing large, multilevel classes, and provide suggestions for evaluating listening, speaking, reading, and writing in large multilevel classes. This article includes recommendations for keeping records and suggestions for preparing students for major examinations. And finally, as we think about monitoring and assessment, we consider how we as teachers can assess and improve our own efforts in the classroom.

KEYWORDS: *Language, Assessment, Skills, Listening, Writing, Speaking, Reading, Test, Evaluate, Improve.*

INTRODUCTION

The English Language Skills Assessment (ELSA) is a group of tests designed to measure English language proficiency of subjects. The test is designed for non-native speakers, with different levels of testing available from beginners to advanced.^[1] The tests can be utilized to track progress among those studying English or to measure proficiency for employment or education where English language skills are required.^[1] The tests are intended for an international audience and are available in British English or American English.^[2] The tests are utilized by such

educational organizations as the Australian Council for Educational Research to help predict student success and are compulsory at The University of the South Pacific.^{[3][4]} It is used by international businesses such as BASF, Unilever and DaimlerChrysler.^[5] Its usage is mandatory in Germany and Poland as part of the re-training programs for unemployed. When we learn a language, there are four skills that we need for complete communication. When we learn our native language, we usually learn to listen first, then to speak, then to read, and finally to write. These are called the four "language skills". The five skills of language (also known as the four skills of language learning) are a set of four capabilities that allow an individual to comprehend and produce spoken language for proper and effective interpersonal communication. These skills are Listening, Speaking, Reading, and Writing. In the context of first-language acquisition, the four skills are most often acquired in the order of listening first, then speaking, then possibly reading and writing. For this reason, these capabilities are often called LSRW skills.

The main part:

Languages are generally taught and assessed in terms of the 'four skills': listening, speaking, reading, and writing. Listening and reading are known as 'receptive' skills while speaking and writing are known as 'productive' skills. Listening to and reading content in the language you are learning is a great way to develop your vocabulary and comprehension.

Developing your speaking skills will involve gaining fluency in spoken interactions with others, as well as practicing your pronunciation. To practice pronunciation try reading aloud or repeating after a recorded text, trying to reproduce the pronunciation and intonation of the original. As in your first language, your writing will be improved by becoming a critical *reader* - try to think actively about how texts are structured and what kinds of phrases or vocabulary are used for different purposes (e.g. introducing a topic, describing, comparing and contrasting, writing conclusions).

1-Listening

You should understand the main ideas of most speech in a standard dialect.

You should demonstrate an emerging awareness of culturally implied meanings beyond the surface meanings of the text.

2-Speaking

You should be understood without difficulty by natives, and converse in a clear and participatory fashion.

You should be able to initiate, sustain, and bring closure to a wide variety of communicative tasks.

You should be able to narrate and describe concrete and abstract topics using sustained, connected discourse.

3-Reading

You should easily follow the essential points of written text.

You should be able to understand parts of texts which are conceptually abstract and linguistically complex.

4-Writing

You should be able to address a variety of topics with significant precision and detail.

You should be able to write competently about topics relating to particular interests and write clearly about special fields of competence.

You should be able to organize writings with a sense of theoretical structure.

5-Cultural awareness

Someone's **cultural awareness** is their understanding of the differences between themselves and people from other countries or other backgrounds, especially differences in attitudes and values. ... programs to promote diversity and **cultural awareness** within the industry.

CONCLUSION

As we define assessment in this article, we are referring to activities which show whether or not each of your students has met specified learning objectives. Student assessment takes place when you are keeping a written record to document the progress that your individual students have made. As you think of the stages in a four-step lesson plan, assessment is the process that helps you to monitor the level of student comprehension and progress during motivation activities presentation or new information, and practice exercises. Throughout each of these stages, you observe class behavior and ask questions to determine whether or not most of the learners have mastered key concepts, vocabulary, and skills to respond. As a rule of thumb, if your assessment indicates that approximately 80% of your students are making satisfactory progress, you proceed to the next stage. On the other hand, the purpose of student assessment is to document, in written form, what takes place following the application stage. Assessment can take the form of paper and pencil tests, teacher checklists and rating scales, or student self-assessment questionnaires.

Through assessment, you are able to determine whether or not your students are able to apply what they have learned. Research indicates that the best way to assess students' ability to read and write is through reading and writing activities rather than multiple-choice tests. To determine at what level of proficiency your students are reading, you can design a fill-in-the-blank reading passage, called a cloze. Cloze tests are reading passages which measure a student's reading comprehension by his or her facility in filling in missing words. The assumption is that if the student understands the meaning of the passage, he or she will be able to supply appropriate words to fill in the blanks.

LOSS OF PLASTICITY BY CEMENT SYSTEMS DURING TIME

Teshaboeva Nodira Djuraevna*

*Senior Lecturer,
Fergana Polytechnic Institute,
UZBEKISTAN

Email id: teshaboyevanodira1953 @gmail.com

ABSTRACT

The article presents, in the conditions of concrete supply to the place of laying and the production of concrete placement in a block in hydraulic engineering, such that slowing down the time of loss of plasticity and setting of concrete mixtures is of considerable interest. In this regard, an attempt was made to model these processes to a certain extent in relation to large-scale hydraulic engineering. Mortars were prepared on various cements and their plasticity was determined at different times by measuring the diameter of the spreading of the mortar cone. Measurements were taken every hour. In the intervals between determinations, the solutions were stored in metal cups at a temperature of -28-300 and a relative humidity of 60%. The results of these studies are shown in Table 1.

TABLE 1 LOSS OF PLASTICITY OF CEMENT SYSTEMS OVER TIME (MORTAR 1: 3)

itive type	Dosage %	The plasticity of the solution (under the line, the diameter of the spread in the axis under the line in%) after holding for

As can be seen from the data presented, surface-active additives, having a flocculating effect on cement systems and increasing their resistance to delamination, at the same time significantly slow down the loss of plasticity of the systems. The thixotropic handling capability of surface-active cement systems is especially noticeable in hard mortars and concretes. The smallest loss of plasticity is achieved with the introduction of bottoms, the largest with the addition of FFA fractions C10-C16 and oxidized petrolatum. Solutions with these additives retain a sufficiently high plasticity even after three hours of exposure to air. Similar results were obtained with concrete mixes. It is known that the homogeneity of the concrete mix largely determines the physical and technical properties of the hardened concrete. In hydraulic structures, the homogeneity of the concrete is especially important. The homogeneity or uniformity of concrete depends on many factors and varies significantly during one work shift at the same construction site. The most important factors on which the homogeneity of concrete depends are the plastic-viscous properties of the concrete mixture, the type and nature of the operation of the mixing equipment, the methods and conditions for transporting and placing concrete in the structure.

Since surface-active additives make it possible to actively regulate the plastic-viscous properties of concrete mixtures, work was undertaken to clarify the effect of surfactants on the homogeneity of concrete and a relationship was established between the homogeneity of concrete and its compressive strength. To determine the homogeneity of concrete mixtures, a method specially developed by the laboratory of cement-concrete materials of the IISS was used to determine the homogeneity of various cement systems, since the existing methods and the criteria adopted for assessing the degree of homogeneity of powder and suspension mixtures used for the manufacture of various building materials allow indirectly, not objectively enough, and only with the expense of a large amount of time, to judge the homogeneity of the mixtures achieved in the mixing process, the subsequent stratification of the main components during transportation and molding, to evaluate the efficiency and optimal parameters of the existing and newly created mixing equipment. This method for determining homogeneity is based on the use of one of the mixture components colored with special luminescent substances. To prevent the

erasure of the phosphor from the surface of the reduced component during the mixing process and its transition into the mixture, a water-insoluble light-yellow homogen was chosen; fixing on the surface of the powder under study was carried out using waterproof adhesives, for example, VF-4. For coloring 1 kg. Powder requires 2 g of phosphor. The labeling component is introduced into the test mixtures in an amount of 0.05-0.1% of the weight of dry components.

Determination of the distribution of the labeled component in the mixture can be carried out visually or using a photoelectronic installation. The fastest and most accurate determination of homogeneity is obtained using a photoelectronic installation, which includes an MBS-2 stereoscopic microscope, a photomultiplier, and an electronic scaler PS-10000. The principle of operation of the installation is reduced to measuring a part of the luminous flux reflected from the considered area of the surface.

The magnitude of the reflected monochromatic luminous flux and the metering rate of the PS-10000 device under optimal operating conditions of the entire installation are linked by a linear relationship [9]. In the general case, when studying the surface of a mixture containing n components, each of which has the same reflection coefficient at all its points, depending only on the wavelength of the light wave, the counting rate is linearly related to the area occupied by each component in the area under consideration. The ratio of the area occupied by any component to the area of the entire area bounded by the diaphragm is called the surface content of this component in the area under consideration.

To study the homogeneity of the mixture at a given technological stage of its processing, a sample was taken, on the surface of which a grid was applied, after which the sample was illuminated with an ultraviolet spectrum.

When visually determining the surface content, the number of points (for example, luminescent grains of sand) was counted, and when working on the photo electronic one on the site under consideration. Studies of the distribution of the number of sites by the volumetric content of components have been established. That with sufficiently large measurements of the area exceeding the size of the particles, in the particular case the size of the aggregate, this distribution obeys the normal law. The normal distribution, as is known, is determined by two parameters: the mean X and the standard deviation of the random variable δ [22].

The parameter X indicates whether the center of the grouping of the random variable " x ", and the parameter δ , being the standard deviation, characterizes the spread of the values of the quantity " X ".

Thus, the standard deviation of the volumetric content, calculated for a site in $m\ cm^2$, can serve as a quantitative and objective characteristic of the uneven distribution of a given component in a mixture. In fig. Figure 1 shows the normal distribution curves of the marked sand in the concrete mixture typical for this method. Kryva I refers to a concrete mix made in 1500 liters, a free fall concrete mixer, and roofing 2 refers to a mix made in 1000 liters, a forced-action concrete mixer with additional selection devices.

As follows from this graph, the heterogeneity of the concrete mix on a conventional mixer is about 12%, while the mix on the mixer has a heterogeneity of 5.7%. In fig. 1 is a graph showing the effect of the duration of movement on the homogeneity of the concrete mixture and the strength properties of concrete; the construction of such curves for any mixing unit will allow

you to choose the optimal duration of mixing, taking into account the obtained strength characteristics of concrete.

Special studies were carried out to establish the effect of surface active additives on the homogeneity of concrete. It is known that minor deviations from the optimal water-cement ratio from the optimal, which often occur in the production of hydraulic concrete, reduce the homogeneity of concrete and its water resistance, frost resistance and other properties.

As our studies have shown, surface-active additives in concrete mixtures under intense mechanical stress have a plasticizing effect, and in a calm state and even with weak shaking they exhibit a special "flocculating" effect, causing the formation of coagulation structures, increasing the "hardness" of the concrete mixture and its value ultimate shear stress. Therefore, concrete on hydrophobically plasticized cements is better mixed in mixing units, much less delamination during transportation and disposal, especially in the case of compaction using deep vibrators, which are characterized by strong local impact. The results of these studies are translated in Table 1. number of sites percentage

Figure: 1. Influence of the mixing method on the homogeneity of the concrete mixture: 1- Concrete mix prepared in a free fall concrete mixer. 2- Concrete mix prepared in a forced-action concrete mixer with additional vibration devices.

MODERN REQUIREMENTS FOR THE SOCIO-CULTURAL COMPETENCE OF A TEACHER OF HISTORY

Rashidova Gulnoza Gulomovna*

*Teacher,

Jizzakh Regional Center for Retraining and Advanced Training of Public Educators,
Jizzakh, UZBEKISTAN

ABSTRACT

The Article Reveals The Essence Of The History Teacher's Socio-Cultural Competence And Their Disclosure In The Course Of The School Subject "History", Defines The Requirements For The Knowledge And Skills Of Future Teachers For The Practical Implementation Of The Socio-Cultural Component Of History Education.

KEYWORDS: *Socio Cultural Approach, Competence, Socio Cultural Competence, School, History Teacher. Social Institution, Formation, Technology, Requirements, Knowledge, Skills, Qualification, Importance, Connection, History Programs, Pedagogical Process, Educational, Culture, Professional, Competence, Individual, Introduction, References, Conclusion, Political Information*

INTRODUCTION

A new approach to determining the degree of qualification of workers is based on the definition of competence as an integrated characteristic of the degree of preparedness of a specialist to perform professional activities. In relation to competence, competence is considered as a potential ability to apply professional knowledge and skills, which can be manifested successfully or less successfully depending on different reasons and in different circumstances. Consequently, competence and competencies form a complex resource of the individual, ensuring the effective emeses of activities in the professional and broader social sphere.

Socio cultural competence is a complex of qualities and skills of a person, allowing him to carry out effective socialization at different levels of life in accordance with the knowledge of cultural traditions and norms of a given society. As a result, there is a need for a teacher - a professional who, taking into account the changing socio-economic conditions and the general situation in the education system, is able to choose the best options for organizing the pedagogical process,

predict its results, navigate in a timely manner, adapt to modern conditions, anticipate and get ahead of difficult situations.

It is at the formation of these qualities of the future history teacher that activities in pedagogical higher educational institutions should be directed.

In the Decrees of the President of the Republic of Uzbekistan №UP-4947 dated 02/07/2017 "Strategy of actions in five priority areas of development of the Republic of Uzbekistan in 2017-2021", "On approval of the Concept for the development of the higher education system of the Republic of Uzbekistan for the period up to 2030" №UP -5847 from 8.10. 2019, "On measures to further enhance the role and importance of the sphere of culture and art in the life of society, №UP-6000 dated 6.05.2020 emphasizes the role of youth in an active social life, the importance of the spiritual, moral and cultural foundations of its upbringing.[1,2,3]

MAIN PART

In connection with the provisions of these program documents, the significance of the development and use of socio-cultural components of history education in secondary schools and pedagogical universities that train history teachers is increasing.

History is inseparable from the national soil and roots of its people, forms and preserves the national culture, therefore the organization, forms and methods of teaching and upbringing of the young generation should be based on a socio-cultural approach, taking into account the thousand-year history, the original tradition of the people on the basis of national culture, enrichment with the best achievements of universal humanity culture.

In the concepts and theories of modern scientists, attempts to find a relationship between the national and international basis of education, the search for real ways of mutual enrichment of all nations, nationalities and national groups living in the country are clearly traced. [4,5,6,7,8]

This is an important factor in the formation and development of the system of professional and pedagogical training of future history teachers in conditions cultural and national revival. Modern society is in need of educated history teachers with a high level of internal culture.

Formation of socio-cultural competence of a teacher due to:

- Features of the historical and cultural development of society;
- The role of teachers as a social and professional community;
- The development of modern education as a socio-cultural phenomenon;
- The peculiarities of the functioning of the socio-educational situation of a specific educational environment;
- Personal mechanisms for the formation of professional activity;
- Mastering the humanistic paradigm of education by the teacher and its implementation in practice.

To determine the ways and possibilities of the teacher's influence on the personality of the pupil and the development of the social and educational situation, it is necessary to study the specifics of the teaching profession and identify the factors that determine the professional and personal

orientation of the teacher, his self-determination and identification with the professional role, compliance of the above factors with the social needs of society.

However, a holistic concept of the socio-pedagogical foundations of the teacher's professional self-determination, which would consider it, on the one hand, as a set of targeted effects of social policy on the development of education, manifested in the socio-educational situation, in the models of educational institutions and in their organizational and cultural environment, and on the other hand, as the efforts of the teacher himself, who chooses, accepts and fulfills his professional role, has not yet been created.

RESULTS AND DISCUSSIONS

In our opinion, the formation of the sociocultural competence of a history teacher should be based on the amount of knowledge, skills of a sociocultural nature and the requirements for this side of specialist training.

Such knowledge includes the following:

- About the national and cultural characteristics of their country, the importance of the native language in the modern world, knowledge of the etiquette of interpersonal and intercultural communication;
- Knowledge of the "socio-cultural portrait", symbols and cultural heritage of their country;
- Knowledge of the realities of the country - the peculiarities of the way of life, way of life, traditions, customs, national cuisine, weekends, main national holidays, common forms of folklore, etc.
- Knowledge in the field of culture and cultural heritage (world famous monuments and sights, outstanding people and their contribution to world culture, works of art, artifacts).

In accordance with the requirements of standard state and history programs, a teacher must be able to:

- describe the stages of national and world history, historical events, processes, phenomena of world and domestic

Stories from ancient times to the present day;

- explain the characteristics of the socio-political, economic and socio-cultural development of Uzbekistan and countries of the world, cultural diversity of mankind.
- To evaluate historical events, religious phenomena from the point of view of their influence on national and world history in different historical periods.

The history teacher must master the socio-cultural content of the content of school history education at a level that ensures the satisfaction of social needs for humanitarian knowledge. These needs include: ensuring the entry of a person into domestic and world culture, expanding his cultural horizons; assimilation of the historical and social experience accumulated by humanity; understanding the tendencies of the development of man and society, the problems arising in this case.

Requirements for the historical training of students:

- mastering by students of knowledge about the laws of development of human society from antiquity to the present day in the social, economic, political, spiritual and moral sphere, development of a problematic, dialectical understanding of history based on generalization of factual material;
- development of students' ability, on the basis of historical analysis and a problematic approach, to comprehend processes, events and phenomena in their dynamics, interconnection and interdependence, guided by the principles of scientific objectivity and historicism;
- the formation of a social system of values among students on the basis of understanding the regularity and progressiveness of social development and awareness of the priority of public interest over personal, the possibility of revealing the uniqueness of each person only in society and through society;
- education in the spirit of respect for the history of their Motherland - Uzbekistan as a single and indivisible multinational state built on the basis of equality of all peoples inhabiting the republic in the spirit of patriotism and internationalism, in mutual understanding and respect between peoples, rejection of chauvinism and nationalism in any form, terrorism and religious extremism, militarism and war propaganda; developing students' desire to contribute to the solution of global problems of humanity;
- To develop the ability to study and analyze sources of historical information, to make judgments about their reliability, value;
- To correlate data from different sources;
- To compare different versions and assessments of historical events and personalities, identifying the common and differences; define and substantiate your point of view, participate in the discussion;
- to gain experience in the active development of the historical and cultural heritage of their country and other countries of the world, the desire to preserve and increase it.

The teacher's ability to master new layers of knowledge in a rapidly changing world is one of the main professional competencies.

CONCLUSION

A modern teacher must master all available pedagogical technologies and teaching aids. The history teacher must have the ability to manage information flows containing public and political information. The public consciousness of the student is being formed at the present stage, and (this should be admitted) by no means on the basis of school textbooks. One of the main roles in obtaining information is played by the media, primarily television, the Internet, communication with adults and peers. The information obtained from these sources is often mythological in nature, filled with conjectures, cliches, superstitions that can be socially dangerous. On the basis of such information, schoolchildren may have a misconception about social life and social norms that regulate human behavior it interferes with making adequate decisions. The school can act as a social institution, which, to a certain extent, is capable of correcting historical and social consciousness by teaching the student how to work with information, receive and evaluate it. An

important aspect of this problem is the student's ability to educate himself, which is also based on the students' informational skills and, accordingly, on the teacher's readiness to shape them.

As already mentioned, the study of history in close relationship with national cultural values, the focus of this approach on personal and professional socialization fully meets modern requirements for training specialists and the level of spiritual, cultural development of society.

In turn, socio cultural - oriented history presupposes a radical renewal of the content of history courses at a university, a significant increase in their methodological level. In this regard, an important task of history courses is to form students' consciousness of the intrinsic value of the culture of each nation or era.

For an objective coverage of the historical experience accumulated by previous generations, it is necessary to show the basic socio-cultural ideas of the people of the studied era, their mentality, value orientations and worldviews.

VASILY AFANASEVICH SHISHKIN'S RESEARCHES IN AFROSIYAB AND VARAKHSHA MONUMENTS

Yuldashev Jamol Juraboyevich*

Head Teacher,
Jizzakh Regional Center for Retraining and Advanced Training of Public Educators,
Jizzakh, UZBEKISTAN

ABSTRACT

This article is devoted to the life and scientific activity of the famous archeologist V.A. Shishkin, the results of his archeological research, his research on the monuments of Afrosiyab and Varakhsha, his great contribution to the development of archeology in Uzbekistan.

KEYWORDS: Archeology, Expedition, Arch, Zodiac Sign, Afrosiyab, Varakhsha, Poykend, "Archeological Reserve", Dome, Bukhara.

INTRODUCTION

Although the study of historical monuments of the Uzbek people began in the second half of the XIX century, after the conquest of Central Asia by Tsarist Russia, archeological research and comprehensive scientific research of material and cultural monuments in the republic in the 40-70s of the XX century. Has been extensively done by archaeologists. One of such archeologists is a member of the Academy of Sciences of the former USSR, Professor V.A. Shishkin. V.A. Shishkin was born on December 29, 1893 (October 1, 1894) in the Kirov region.

He died in Samarkand on October 18, 1966, as an archaeologist and oriental's. In 1966 he became a corresponding member of the Academy of Sciences of Uzbekistan, in 1961 he received a doctorate in history. From 1943 to 1966 he worked as the head of the archeological sector of the Institute of History and Archeology of the Academy of Sciences of Uzbekistan. From 1923 he taught at secondary and higher educational institutions in Bukhara, Samarkand and Tashkent. If we look at Shishkin's archeological research, we can see that he made a great contribution to the development of archeology in Uzbekistan. V.A. Shishkin first led the expeditions of Zarafshan (1934-1935) and Termez archeological complex in 1936-1938, participated in the study of Poykend in 1939, participated in the opening of the mausoleum of Amir Temur in 1941, as well as in 1938 G.A. In collaboration with Pugachenkova, he took part in the inspection of the

Dzharkurgan tower and other archeological expeditions. The Ulugbek Observatory was excavated by Shishkin in 1948. From 1938 to 1939 he conducted archeological research in Varakhsha, and in 1963 created a large monograph consisting of 3 parts - "Varakhsha". Shishkin has written about 100 works in his 40 years of scientific activity.

From 1959 to 1965 he was the editor of the scientific collections of the Institute of History and Archeology of the Academy of Sciences of Uzbekistan. He participated in the preparation of the books "History of the peoples of Uzbekistan", "History of the Uzbek SSR".

MAIN PART

Let us first turn our attention to the research carried out in Varakhsha.

Varakhsha is one of the ruins of an ancient city located 40 km northwest of Bukhara, in the ancient Rajfandun oasis of Lake Dashti Urgenji. V.A. Shishkin in and around Varakhsha. V.A. Shishkin conducted extensive archaeological research in 1937-1939 and 1947-1954; Archaeological excavations show that Varakhsha was built in the 2nd century BC in the form of several fortified villages connected to each other. In the north-west of the ruins of Varakhsha, the outer wall of one of the ancient fortresses and a semicircular tower (inner stage 4.5x5 m) were excavated. The wall (thickness 1.8-1.9 m) is made of raw brick (size 37x41x10 cm). In the walls and towers there are pierced target holes (38-40 cm on the inside, 75-80 cm on the outside, 20-22 cm wide). In the II-I centuries BC and in the I-II centuries AD, cultural life flourished in and around Varakhsha. In the III-IV centuries Varakhsha fell into decline. In the 5th century, Varakhsha was revived and became the residence of the ancient rulers of Bukhara - the Bukhara gods. During this period Varakhsha was surrounded by a strong wall, in the southern part of which an arch was built. It was especially prosperous in the VIII-X centuries. Varakhsha and its environs are irrigated by 12 canals, making it one of the largest and central forts in the Rajfandun oasis. The caravan route between Bukhara and Khorezm passed through Varakhsha (Istakhri and Ibn Hawqal). Every fifteen days a one-day market festival was held in Varakhsha, and at the end of the year a 20-day market festival (Navruz Kashovarzon, ie the New Year of Farmers) was held (Narshakhi). With the settlement of the Bukhara gods, Varakhsha became a large city. In the XI-XII centuries, its territory was more than 6 km wide. In the twelfth century, life in the Varakhsha oasis suddenly came to a halt for unknown reasons.

The history and architecture of Varakhsha were studied in 1949-1954. One of the bas-reliefs (15 meters high) surrounded by a large square-shaped raw brick is built with a king's scepter and the other with a guard gate. In the eastern part of the arch there were rooms with a long corridor (navkarkhana and gatehouse) with a vaulted roof. In the center of the arch is the palace of the ruler of Varakhsha, whose southern side is adjacent to the defensive wall. It consisted of the East (11.5x17 m) and West (6.6x7.25 m) hotels and the Red Room (hall) (8.5x12 m). The palace is surrounded on the west side by a luxurious porch with 3 arched ganchkori columns. The columns and rafters of the porch arches are decorated with ganchkori reliefs and various entrances. The Red Room and the Eastern Hotel of the Palace are fully excavated. The walls of the room are plastered with fine plaster over fine straw clay plaster, and the murals are decorated with red, yellow, gray, black, blue, pink, and brown paints. They depict a variety of scenes, an elephant-riding prince and a chokers fighting with tigers in front and behind, a rider on a horse shooting a bow and arrow at a target, a ruler sitting on a golden throne in the shape of a winged camel.

A princess kneeling on the east wall of a hotel, holding a glass in her hand, a king with a sword at his waist, a clasp in one hand, a sacred fire burning in the middle of the fire, a prince kneeling on his right or a helmet and helmet, the images of the cavalry holding the shields fighting, as well as the hunting scenes in the bushes and groves, are particularly noteworthy.

Archaeological finds indicate that the room on the second floor of the southern rooms was decorated with ganchori patterns. Among the many embossed ganchkori patterns found are fish swimming in a pool, an argali eating a bullet from its shoulder, a gazelle carrying quails, a female-headed bird of happiness - Humo, a dragon preparing for an attack, a horseman tied to his neck, and many other women's heads and girths fragments occur.

In 1958-1966, V.A. As a result of large-scale archeological excavations carried out under the direction of Shishkin, materials of ancient cultural strata were found in other parts of Afrosiyab. On July 13, 1966, a special resolution of the Government of the Republic was adopted in order to organize a comprehensive archaeological study of Afrosiyab. According to this, Afrosiyab was declared an "archeological reserve" and Tashkent and Samarkand state universities and the Institute of Art History of the Ministry of Culture were mobilized to study it. Archaeological research started on the basis of clear scientific plans revealed not only the centuries-old age of the city, but also its historical topography in different periods, the structure of the city, the stages of development of city life, the period of crises caused by invasions. The royal palace of Samarkand sheds was opened.

Afrosiyab is the ancient ruins of Samarkand. This name appears in historical sources in relation to ancient Samarkand only since the XVII century. In ancient Samarkand Sughd sources it was called Smarakanve. After the conquest of Samarkand by the armies of Alexander the Great in the IV century BC, it is mentioned in the diaries of Greek authors as Morocco. Greek translation of Smarakanve in Morocco. When the Samanids came to power in Movarounnahr, the ancient Smarakanve began to be called Samarkand from the ninth century. In the literature written in the Turkic language in the XI-XV centuries, Samarkand occurs as Semizkent. From the 15th century, the name Samarkand was used interchangeably in Persian and Turkish sources. Afrosiyab is a wide hollow hill adjacent to the northern border of present-day Samarkand, with an area of 219 ha. The north of the hill is bordered by the Siyab River. From the south it joined Samarkand, known as the "old city". Information about the early history of the city in written sources is very rare. Archaeological excavations in the ancient city provide more such information. Archaeological excavations have uncovered cultural layers several meters thick, including houses of the rich and poor, artisan workshops, merchants' shops, streets and squares, royal palaces and temples, mosques and madrasas, defense structures, the city's water supply system, and so on.

CONCLUSION

In conclusion, it should be noted that, first of all, the archeological excavations carried out by V.A. Shishkin in Varakhsha and Afrosiyab testify to the formation of the first state associations in Uzbekistan. Second, in the II-I centuries BC and in the I-II centuries AD there was a cultural life in and around Varakhsha.

Thirdly, the study of both ancient and medieval sources in Afrosiyab is of great importance in the study of the history of Samarkand. Fourth, the excavations carried out by VA Shishkin brought great innovations to the science of archeology of Uzbekistan. Fifth, the results of such

archeological excavations show that cities in Uzbekistan, such as Bukhara and Samarkand, are still young.

DIALOGUE AS AN OBJECT OF TRAINING

A. Djumamuratov*; **A. Mambetniyazova****; **G. Babaeva*****

^{1,3}Karakalpak State University,
UZBEKISTAN

ABSTRACT

This article deals with dialogues in teaching a foreign language in the learning process, forms, types of dialogic exercises and their use in the classroom. Dialogue speech is much less developed than monologue, since in the conditions of natural communication it is supplemented by the generality of the situation, the joint experience of the speakers. A speech situation is understood as "a combination of such factors of pre-speech orientation, which are constant in various specific conditions of orientation and which change affects the change in the program or the operational structure of speech action."

KEYWORDS: *Organization, Dialogue, Unit, Situation, Activity, Degree, Intermediate, Communication, Stimulation, Response, Listening, Melodic, Rhythmic, Phonogram, Factor*

INTRODUCTION

One of the most important applied aspects of linguistics is the methodology of teaching foreign languages, which today has become a testing ground for theoretical research and practical applications. If we trace the history of the methodology of teaching foreign languages over the past century, it becomes obvious that this is far from a frozen system.

The modern theory of speech activity considers dialogue as a form of social-speech communication, as the basis for cooperation and mutual understanding between people in the process of joint activities. Dialogue speech is formed under the influence of the motives of the activity. It has a specific purpose and tasks. The unit of dialogical speech, as well as monologue, is a speech act, or speech action.

Three different approaches of defining the role and place of dialogue are reflected in the methodological literature in teaching a foreign language. Dialogue is viewed as a means of mastering a foreign language (linguistic material); as a form of organization of the entire

educational process in a foreign language; as one of the types of speech activity that must be mastered in the learning process. This paper reflects a third approach of teaching dialogue.

MAIN PART

Features of the dialogue: within the framework of one speech act, there is a combination of reception and reproduction; a speech whole is constructed by two (or more) interlocutors; each of the participants alternately acts as a listener and a speaker [1, 63].

The following extra linguistic features of the dialogue are distinguished, which are a consequence of the participation of several partners in it: collectivity of information; possible diversity of information; differences in the assessment of information; active participation in the speech of facial expressions, gestures, actions of partners; the influence of the subject environment of the interlocutors

Dialogue speech is much less developed than monologue, since in the conditions of natural communication it is supplemented by the generality of the situation, the joint experience of the speakers. These circumstances exacerbate the difficulties of understanding the interlocutor in the process of dialogue in a foreign language. However, in the process of understanding dialogical speech there are also tight-fitting factors - predictability of reactions based on the knowledge of the interlocutor and the generality of the situation, the ability to rely in the process of understanding on the mimicry and articulation of the partner, on repetition typical for dialogue [2, 47].

Dialogue speech action is carried out in a common speech situation for both participants. A speech situation is understood as "a combination of such factors of pre-speech orientation, which are constant in various specific conditions of orientation and which change affects the change in the program or the operational structure of speech action." These factors include the place of dialogical speech action in the activity act and the resulting motives and goals; the conditions in which the speech action takes place, the nature of the roles in which the participants in the dialogue act; communicative psychological attitudes from which the speakers proceed; the subject of the conversation and the level of awareness of the participants in the dialogue.

Dialogue speech action, like any action, can be single-stage and multi-stage, can act as an integral part of a whole and be considered as a whole made up of parts. A speech act is defined as establishing a correspondence between two activities and the inclusion of speech activity in a wider system of activity as one of the necessary and interdependent components of the latter. In a natural act, speech action can be correlated in different ways with the activity as a whole, plays a greater or lesser role in achieving the final goal.

The degree of development of dialogic action depends on the nature of its relationship with non-speech. If the goal of an act is carried out mainly due to a non-verbal action, the act of speech is minimized, single-stage. Single-stage speech action occupies a subordinate position in the act, can be carried out in parallel with another action and have a common motivation with it. The background for it is a static external situation that unites both participants. People who are engaged in joint production activities or household chores exchange 1-2 brief remarks in order to correct the performed action, get help or the missing item for its implementation, attract another person to joint actions, evaluate his actions or jointly observed actions of other people, or simply wish a friend good health to a friend, wish each other happy holiday.

A speech action can be multi-stage when it is dominant in the act. The motives for such an action may coincide with the social needs of the speakers (with the need for self-expression, communication, self-affirmation, knowledge). The purpose of the utterance may be to convince the interlocutor of something, to give instructions, to express their feelings, to obtain information, etc. A multistage speech may precede a non-verbal one (then the goal will be planning); can follow him (discussion of results, flashback). The place time of an argument or exchange of memories is not essential to the content of the conversation. It is caused by the internal situation, the features of the speaker come to the fore: his tastes, views, the degree of his awareness of this issue and so on [4, 71].

An intermediate form between single-stage and multi-stage action is dialogue. Such dialogues are conducted mainly in the service sector, where the communication is carried out between the person performing the objective action and the customer. Such a dialogue arises on the basis of the external situation. Its content is more or less stereotyped, the language is replete with cliches. Qualitative characteristics bring it closer to single-stage action. However, in terms of the number of messages per participant, such a dialogue is closer to a multi-stage action.

Speaking appears in two forms: monologic and dialogical. These forms differ not only in linguistic characteristics, but also psychologically. Let us consider the dialogical form of speaking from the point of view of revealing the psychological content of teaching it.

Dialogue is a process of communication between two or more interlocutors-partners, therefore, within the framework of one speech act, each of the participants alternately acts as a listener and speaker. Dialogue cannot be planned, "programmed", since the speech behavior of one partner depends on the speech behavior of the other partner [5, 49].

Dialogue is associated with a number of skills that ensure the flow of conversation.

The first is to stimulate the interlocutor to speak. The stimulus for conversation can be:

- a question, for example: Are you going home? Does Peter live far from school? Where are you going? You will stay after classes, won't you? Can you play football or hockey?
- statement, for example: I'm going home, which can stimulate a reaction of different forms;
- request, suggestion, for example: Help me, please. Let's go there together. Will you open the window? Will you give me your pen? Give me your pencil, please, etc.

The second skill is responding to a speech stimulus. The stimulus-response and the response-response constitute a dialogical unity. The most common are four types of dialogical unity.

Question - statement:

To the question Are you going home? possible speech reaction No, I'll stay at school or No, I'm going shopping.

When asked Does Peter live far from school? possible speech reaction Yes, Peter lives very far from school, or I don't know or Not very far, or Near "Rodina".

Question - question:

Are you going home? - Why do you ask me?

Will you help me? - What shall I do?

Approval - approval:

I'm going home. - So am I or And I'll stay at school.

Assertion - Question:

I'm going home. - Why are you going home?

I'm writing a letter. - Who are you writing to?

The third skill is the deployment of a replica-response before giving the statements the character of a conversation. For instance:

- Have some more fish?

- No, thank you. It is very nice, but I can't eat any more.

K. Hello, Mike!

M. Hello, Kate! It's nice to see you.

K. Are you glad to be back to school again?

M. I am. But it was nice to have holidays. I was out-of-doors all day long. I had a lot of fun. And what about you?

K. I had a very good time, too. I often went to the stadium and played with my friends.

CONCLUSION

These skills are formed in students when teaching English speaking at the initial stage. Now we will consider the types of dialogic exercises in types.

1. The first type is a phonogram with dialogic speech, presented at the level of a preparatory exercise for developing listening skills. This type of phonogram "demonstrates" a dialogue that is conducted in a foreign language. The presence of interrogative sentences with a specific melodic and rhythmic pattern and the corresponding cues, the so-called "pickup" of the interlocutor's speech, the use of elliptical forms motivated by previous expressions, somewhat complicate the perception of dialogical speech. Therefore, at first, one has to teach in small simplified, sometimes even artificial (for example, questions followed by a complete answer) dialogues, which students understand relatively easily. Control in such cases is most expedient to carry out in the form of translation or retelling in the native language [2, 47].

2. The second type is a phonogram with dialogical speech, offered at the level of a speech exercise for the formation of the skills and abilities of listening to a foreign language speech. Unlike the previous type of background materials, here the dialogue is presented in a "natural" form, without any comments, without pauses for explanations. In this case, listening to a phonogram is complicated by the normal tempo of speech, the continuous process of conversation between two people. The most effective form of control is the transmission of content in the native language.

3. The third type is a phonogram with dialogical speech, offered as a preparatory exercise for the formation of skills and abilities of speaking in a foreign language. The educational difficulties mentioned in connection with the description of phonograms of the third and fourth types are also characteristic of this type of phonogram. But unlike them, students in this case must

reproduce dialogical speech, although reproduction is not an obligatory component for all cases. The main thing here is the achievement by students of a more or less accurate reproduction of the dialogue. At the middle and senior stages of training, it is advisable to retell the dialogue in pairs, imitating what was heard.

4. The fourth type is a phonogram with dialogical speech, offered as a speech exercise for the formation of active speech skills. Depending on the complexity of the dialogue itself, such an exercise can be performed at different stages of training. After repeated listening and performing the preparatory exercises, students will be able to use fragments of such dialogues when solving their speech problems in similar situations.

5. The fifth type is simultaneous dialogues. A positive aspect of such "linguaphone" teaching of dialogic speech can be considered its relatively easy controllability. Using the control panel, the teacher not only guides but also corrects the ongoing conversation. Depending on the complexity of the educational material, the level of speech training of students, such work can be revitalized by changing the roles of students, speech situations and extralinguistic factors.

THE STUDY OF QUANTITATIVELY IN LINGUISTICS

Kimsanboeva Basoat Nabievna*

*Assistant

Department of Uzbek Language and Literature,
Fergana Polytechnic Institute,
UZBEKISTAN

ABSTRACT

Quantitatively and this system is of particular importance in various developed languages, as well as in the Uzbek language with its unique features and brilliance. We can observe the units of quantitative expression in almost all of the language levels.

KEYWORDS: *Quantitative, Linguistic, Method, Language Unit, Education.*

INTRODUCTION

The opinions of world and Uzbek linguists on the category of quantitatively and its peculiarities and their relations on the classification of this system are diverse. Quantitative methods are of particular importance, especially in statistical linguistics. Quantitative analysis provides an opportunity for accurate and full-fledged analysis and research. Alternatively, the orderly placement of language units helps to achieve accurate sorting.

When the conducted research is studied, it can be observed that quantitatively is a complex product of human thinking, which has the property of classification, as well as a broad coverage category, which is actively practiced at any level of language, manifested in various forms.

This system was analyzed by Russian and European linguists according to different directions and aspects. Especially widely and comprehensively covered the issue of units of quantitative expression by Russian linguists, a number of scientific research works were carried out. G.A.Menovshikov's "methods of expressing the degree of unity-plural in different languages", S.I.Krasova's phraseological units representing quantities in the Russian language, A.I.Lashkevich "genetic devices that denote a metaphorical quantity in the modern Russian language", N.V.Manuylov research such as "the category of uncertainty in the structure of scientific skills", V.V.Akulenko, L.G.Akulenko, N.L."Lexical-phraseological units that denote an indefinite plural in modern Russian", compiled by clemencies, "lexical-phraseological units

that denote an indefinite plural in modern English", "lexical-phraseological units that denote an indefinite plural in modern English", Thesis such as "lexical-phraseological units that represent an indefinite plural in modern German", "lexical-phraseological units that represent an indefinite plural in modern Spanish", "lexical-phraseological units that represent an indefinite plural in modern Russian", Igoshina Tatiana Vladimirovna's morphotheme analysis of the category of quantitatively in different systematic languages, the candidate's thesis and dozens of other scientific studies show that units scientific research, it has served as a resource for new research and can be a resource for today's modern linguistics with even unexplored aspects. At the same time, science can be the basis for many new classifications on the basis of integration. Given that we are relatively new in this research work, T.V. We tried to study the candidate thesis of Igoshina "morphotheme analysis of the category of quantitatively in different systemic languages". Linguist considers the study of the category of quantitatively as a methodological specifics. In his opinion, the result of the process of assimilation of reality by man can be considered a complex of knowledge formed in his consciousness. Summarizing the researcher's views on this matter, it is concluded that as a result of the knowledge formed in consciousness, the foundations of the language system are created and its parameters are constantly perfected.

Quantity implies the possibility of calculating different categories and measuring units. Quantitative expressive units means a feature in which the interaction of categories and signs is carried out in combination and in the composition of a unit syntagma, logical-semantic categories about a complex of concepts of Essence to a different degree.

In most cases, units that represent quantities are subject to other semantic - logical categories and describe them. In speech, it serves as an attribute element in the combination of language units.

In Russian and English there is a layer of words that is considered a functional measure, and not semantic. Such words have a non-quantitative category sign. Such categorical lexemes as: book pages, novel chapters.

I.G.Koshevaya in his book "problems of linguistics and the theory of English language" writes: ".....the difference in the number of units and multiples in verbs refers to the radical essence of the process. The difference between them can be determined by the accuracy in the number of units and the abstract in the number of multiples. Although the enumerative category in verbs has an intermediary character, in addition to the number of acting verbs, the FE itself also has lexical and grammatical features that ensure the occurrence of the quantitative meaning. With these views, the scientist confesses that the number of units and multiples in the verbs depends on the number of its acting at the same time. But his views on the fact that there are tools that make up the meaning of quantity in the FE itself is also somewhat problematic. In particular, the quantitative meaning is felt in the contradiction of the action on the basis of space-time capacity restriction and non – restriction: bring – bring – bring-bring-run, come-roll. The quantitative expression of subjects participation in motion is evident, especially in the category of proportions in Fels, - says the scientist. But in our opinion, the lexical and grammatical means listed by the scientist also serve to uncover the quantitative meaning.

He is a scientist who has consistently studied the relevance of language and philosophy V.Z.Panfilov admits that the category of meaningful quantities is the result of the perception of the quantitative accuracy of the universe.

Philosophers say about the heterogeneity (heterogeneity) of the quantity category, when studying the lens being. This variety covers a variety of characters, such as quantity, number, size, large-small. At the same time, it is possible to observe a strong relationship of the quantity category with other categories. Communication with each category in linguistics, categories with the names of substantiality, qualitatively, temporality, axially have a specific character.

The Researcher V.Igoshina uses morphochemical analysis to study the relationship of the category of quantitatively with other categories, that is, the relationship between categories. Quantitatively these are two different processes, on the one hand, quantitatively is interpreted as an independent category. On the second hand, quantitative units of expression are cloistering according to the attitude of logical semantic characters.

The concept of the plural, which is determined by the quantity and its units, is manifested as follows:

1. Common plural. The exact amount of the understood: all, the crowd, alone
2. Zero plural. And the is lexical-grammatical, determined by the word-forming means: without you. In addition to forming an additional new meaningful word, forming a word on this place, the word composition also implies an additional amount.

Specially checked the category of society in English Z.I.Kotova says that the gang of society, along with the expression of integrity, the amount that enters the gang should be something of some kind, indefinite, if it remains, then the word should stand in the form of a unit number. With this look P.Vinogradova expresses respect for the idea that "society expresses the set of subjects in the form of a unit and a plural number in a holistic, holistic way." So, if the society is logically a unit on the one hand, then on the other hand it is a plural. The arrival of words tied to the nouns of the community in the plural number of units of rest, rest is also an indication of the Association of society on both sides. A.A.Potebnya was referring to the same characteristic of the society as unity with the plural when he said that "society is a holistic plural, which is read as Unity", - says the scientist of Uzbek linguistics Y.D.Zulfiyev.

Also, the units that represent the quantity in the composition of word combinations also affect the connection with other units. According to Shuhga, T.Igoshina shows the types of quantitative units, such as the exact quantity (AM), approximate quantity (TM), and indefinite quantity (NM), which are related to the concepts of accuracy, uncertainty and size. Two more types of uncertain quantity: uncertain large quantity (Nkat.M) and an indefinite small amount (Nkich.M) divides.

The Researcher T.Igoshina tries to explain the different manifestations of polireferentny capacity in different systemic languages. It is noted that in English there is a greater number of polyreferential measure nouns than in Russian. In both languages, the possibility of measure nouns can be said to be significant. In Russian, such a series of words is constantly replenished: a team of readers. In English, however, the number of plural denotations is replenished on the account of growth. On the basis of the presented classification lies the division of measure nouns into two classes:

- 1) Preference of measurement parameters;
- 2) The predominance of the plural parameter as a generality;

At the same time, the measure distinguishes different parameters of nouns:

1) Material Measurement of exact quantity. For example, lomat – a slice, a flea; dolka – a small share; kusok – a piece, a piece.

2) an indefinite abundance of material measurements. Like lomti-scrap, dolki – stakes, kuski – pieces, for example.

Tilshonos also differ in the scope of use of the unit or plural measure of something-items:

- use in a "narrow" limited range: lomtiko-burdock, shmatok-one piece

- units used in the "wider" circle: kusok-a piece, kusochek-a piece

- staya (gala, gang nis to animals.n), roy (NIS to gala bees.n), an indefinite plural, similar to the communion of quantitative units such as gruda(heap), kucha (stacks), the same words refer to the state in which the plural takes its form as an indefinite plural.

- enters the set of one or another set of subjects that do not have a definite form into an irregular plural, which is limited in one place: such as Kocha (stacks), vorox (balls)

- a complex of living things is a kind of plural locally organized: tabun(sleep, herd), staya (gala, gang)

- plural with a quantitative boundary: Regiment, class, team

- plural with a high degree of associative semantic sign: like tabor (gang of people), tolpa (crowd)

- an organized Association of individuals or institutions: such as an association, a group, a society, a circle, a circle.

A.A.Kholodovich compared two types of plural: concrete, grossly chattering, continuous plural is opposed to the exact plural, which is separated from the singular, unstressed. Because of the integrity of the first type of plural, absolutely cannot be divided into parts. If they are divided into parts, then immediately the second type of plural becomes the plural, which is divided into the singular. Therefore, even the first type of plural can be called the plural in the image of unity," - writes. With these views of the scientist T. There is a harmony between Igoshina's view of the above thing-the difference between the items according to the scope of use of the unit or plural measure.

In Russian linguistics, two intersecting circles of quantitativity and locality are distinguished:

1. An organized plural, which is located in a certain way in the width

2. Limited plural in width

The first circle includes the concepts of size, the units of language that determine the close location of the members of the plural: ritual, turn

In the second circle, the main type of plural is the language units that retain its objective feature in speech: garden, flower

On the account of the reproducentative semantic variation, the general plural is also allocated: the city is sleeping, the earring is like breakfast.

And it is noted that quantitativity and temporality are bilateral interrelations, in contrast to locality. On the one hand, the composition of the unit of measurement is associated with the means of measurement, and on the other hand with the occurrence of the synthesized meaning of periodicity and frequency, which is determined by the determinative-semantic level of ecstionality. Sometimes, like at night.

In the noun form of the plural suffix of the singular, it has the quantitative parameters of the singular and plural with locality and temporality. A large part of the results of such a interconnection represent quantitative-relational cooperation. In this case, it is considered productive because the axial signs of iterativity represent the aspectual aspects of axiality. The action will be directed at an obyek, which has a destructive and quantitative discretionary property, such as verb methods. The combination of the repetition of action and the plural object is carried out with the help of morphological means. For example, narvat – (an amount) sever, pachistit – (an amount) arch. In the omitted form, the axial will have a morphological number sign, and the singular and plural sign, expressed in the variety of contextual filling. In the composition of transmutative and locative morphemes, quantitatively denotes a multiple or total subject or object of the action. The army moved to his house to feed and take care of the girl.

Thus, in categories other than the periodicity and repetition of the action and other parameters, the direction in which the patented opportunity is mobilized in the general plural or actualize the sign of the plural in them is observed. Therefore, the morphotemic structures of the more interconnected frequency categories indicate that the presence of two categories occurs at the categorical-semantic level.

In the process of speech, the language unit enters into a predictive relationship with other language units at the syntagmatic or syntagmatic levels. In this process, the unit of language is three into the interrelation process of the syntagmema, which is objective by the most important thought concepts in modern linguistics. As a result, an obliterated syntagmema retains the same appearance, or partial or complete incompatibility of contextual components occurs, that is, a non-uniform syntagmema is formed.

As can be seen from the above points, in the syntactic level, the quantitative meaning is expressed in the process of speech, when the quantifiers affect the semantic meaning of the coming Language Unit.

The substantive construction is contextualized by a quantitative measure, changing its logical-semantic categorization and serves as a background for expressions of temporality, axiomality. After three melodies, Greyen's boredom is contagious. This place refers to the time when three went to listen to music. This trend can be attributed to the units of other categories and is based on objective legislation.

Therefore, in World linguistics, it is also emphasized that morphological units form a separate system in quantitative expression. In the speech process, a mutual syntagmatic relationship of two Language units is realized, which in the form of a word combination is formed by a unit of speech. In the nominative combination of a quantitative unit expressed by a number, with units of other logical-semantic categories, quantitatively carries out its base quantitative semantics. If a quantitative measure is expressed in such combinations as two stones, two rivers, it can also be expressed with the help of a measure horse, which has a secret: two water – like two glasses of water.

THE INFLUENCE OF FAMILY VALUES ON PERSONALITY DEVELOPMENT

Zarifa Raxmonova*

*Doctoral student of the Department of Psychology,
UzMU, UZBEKISTAN

ABSTRACT

All the values, traditions, parental interactions between parents and their children, all the behaviors in the family affect the consciousness and norms of behavior of each of its members. These influences are primarily reflected in the individual's social perceptions, knowledge and evaluation system, attitudes toward family values, beliefs and trust. Family life and its values The first ideas about marriage and family relations, as well as social attitudes, also occur precisely because of the presence of parents and their educational influence.

KEYWORDS: Value, Tradition, Custom, Individual, Principle, Marriage, Family, Behavior, Heritage, Culture, Identity.

INTRODUCTION

The family is the place where all human qualities, good intentions, values and social imaginations are formed in the human mind from the earliest childhood. The creation of a spiritual and moral environment in this school and the formation of this person as a rational, innovative, well-rounded person is a problem of national importance for Uzbekistan in the current period of reforms. After all, preparing young people for family life by forming an objective view of national values, including family values, traditions and unique customs, is an effective tool to increase the effectiveness of spiritual and educational work in our country.

As President Shavkat Mirziyoyev said, "The greatest happiness is that I never tire of repeating it a thousand times, may our family be at peace! The family is a small homeland, if the family is peaceful, happy, the homeland is peaceful. May we all see those happy days for the perfection of our country and our youth as we intend to do now!" [1].

It should be noted that in the opinion of the President, special attention is paid to the unique role of the family in building a healthy worldview, which is formed in the family, the first place of

human socialization, through the system of perceptions studied by social psychology. Similarly, the task of studying the laws of folk traditions, especially the essence of family values preserved in family relationships, is the basis of the means of educational influence associated with the socialization of the child in the family, the study of their socio-psychological conditions,

From this it can be said that in the process of socialization, a person's attitude to the family and its values, attitudes are specific criteria and qualities of human behavior, in which the values that are important for a person in family relationships, ie behavioral rhythms, evaluation system and overall direction finds its reflection. In this process, a person's own behavior and subjective attitude towards the family is reflected in his social perceptions. In this sense, the attitudes towards family values formed on the basis of social perceptions define perceived needs, skills and social norms, which become so intertwined with real life that as a result all actions and behaviors of the individual are completely subordinated to them.

Family values are shaped by a person's life experience and attitudes toward society. That is why values are closely connected with the processes that form a person's worldview, attitude to people, family.

It is well known that the family is a social environment in which all the values, traditions, rhythms of interaction between parents and their children, all behaviors affect the consciousness and norms of behavior of each of its members. These influences are primarily reflected in the recipient's social perceptions, knowledge and evaluation system, attitudes toward traditional-family values, beliefs and convictions. Family life and its values The first ideas about marriage and family relationships, as well as social attitudes, also occur precisely because of the presence of parents and their educational influence.

One of the qualitative criteria that motivates a person to assimilate family values is responsibility or the quality of responsibility in a person. It is the ability to understand how each action performed by a person, by imagining the product of his activity, will benefit him and others for himself. A responsible person is always able to plan carefully, anticipate the consequences and be able to mobilize all his strength and potential to achieve the result. [4] In the family, parental love for the child is the most important thing [8,118] the child's mind is inculcated, first of all, through the responsibility of the parent's family, adherence to its values, personal maturity. Respect for family values is therefore associated with responsibility towards them.

It is necessary to determine the direction of its influence in the formation of the right attitude towards the family in young people through its sacred traditions, which have been preserved for centuries. "This can be done mainly by improving the traditions of upbringing in every Uzbek family, making national values an integral part of life, combining modern forms of communication culture with Eastern views, labor education, its value as an important principle of well-being of children" [2; 122].

Family traditions, ceremonies and celebrations, formed over the centuries and passed down from generation to generation as an invaluable heritage, are also an important factor in the development of children in the family environment. The existence of traditions and customs that every family should follow, their harmony with the traditions of society and the community is also an important aspect of the formation of positive attitudes towards the family in the child. [3; 117]

Another factor that can be highlighted here is family treatment. Communication in the family environment is the interaction between family members on a daily basis. While acknowledging the value of radio, television, newspapers, magazines, fiction, and scientific literature in the formation of attitudes toward human behavior, it can be said that face-to-face interactions, words, and emotions are invaluable. . Therefore, if it is necessary to explain a point, the parent should also turn his child's face to himself, with the sincerity of the face and eyes, when psychologically analyzed, using extralinguistic and paralinguistic means, and such communication is effective. This effect is most evident in the behavior of more emotionally and psychologically affected mothers and grandmothers.

In conclusion, under the influence of the family and the social environment that directly surrounds it, the consciousness of young people is a multifaceted factor influencing the system of social perceptions. is of great importance.

ABSTRACT

The article examines the professionally oriented study of a foreign language at an agricultural university, describes a semiotic-situational approach as the basis of the study, and identifies the pedagogical principles of the process being studied. The author provides information about the experience of working with students in this discipline, talks about some of the features of training at the Tashkent State Agrarian University.

KEYWORDS: *English, Agrarian University, Vocational-Oriented, Student,*

INTRODUCTION

A graduate who has mastered a bachelor's program, according to the federal state standards of higher education of the last generation, must have "the ability to communicate in oral and written forms in Russian and foreign languages to solve the problems of interpersonal and intercultural interaction." When mastering this competence in an agricultural university, it is necessary to take into account: a relatively small amount of hours devoted to learning a foreign language; significantly different basic level of students who need during the first semester; the need to master a set of special knowledge in a short time.

In addition to the main textbook of the German language in the learning process, the manual "Ecology and Water" is used, developed for the directions "Water hydro resources and Aqua culture", "Ecology and nature management", "Agro ecology", "Nature arrangement and water

use". The requirements for the manual were: 1) introduction of students into the field of professional communication; 2) coverage of professionally significant topics; 3) the presence of problematic tasks that increase the independence of students; 4) a large proportion of authentic material.

The purpose of the manual is to develop skills about oriented reading and communication skills for participation in discussions. The main objectives of the manual: activation of the vocabulary of the specialty, training the skills of translation from German into Russian and from Russian into German, the formation of communication skills within their specialty. The texts are arranged taking into account the growth of lexical and grammatical difficulties from adapted to authentic. At the initial level, the focus is on various types of reading adapted literature; texts from periodicals, educational, popular scientific publications are used ("Why does the sea never dry up?", "Water for everyone", "Lake Baikal", "Water pollution", "Freshwater fish", etc.). The exercise teams determine the sequence of work on each specific text. The exercises provide for the removal of language difficulties, the consolidation of special vocabulary, the development of the skill of orientation in the read text and abstracting, activate the speech activity of students.

The main source of information for a specialist is a scientific article, report, description of the experiment. In this regard, at the next level of specialist training, as a rule, this is the second semester, professionally oriented reading takes the first place in order to obtain the necessary information, its processing with the installation for further use (for example, "The new desire for eco", "Water supply in London", "Green travel", "Man and the moor"). The second part of the manual includes exclusively authentic materials with which you can recreate the conditions of the language environment and real communication situations. These materials tell about the current state of science, society, novelties and discoveries, therefore, working with such authentic texts implies close cooperation between the teacher of the German language and teachers of special disciplines.

Students for independent extracurricular work can also use the manual, since the electronic version contains photo and video materials, useful links, relevant topics that allow students to expand their professional interests, teach them to navigate the flow of information. In order to consolidate the terminology, lexical minima are presented that are relevant. Students memorize vocabulary minimums, make crosswords, select illustrative material.

In our practice, we actively use the project method as an effective teaching tool, as well as a means of assessing the results of educational activities. Student mono- and interdisciplinary projects (for example, "My job", "Fish dishes", "Lake Baikal") are presented in the form of presentations at the annual student scientific-practical conference "Youth's View on the Solution of Actual Problems of Modern Science Development". The texts presented in the manual also provide an opportunity to apply new educational technologies: training by stations, case technology, and technology of cooperation. Performing in such conditions certain functions of a future specialist related to professional communication and its ethical aspects, students master the skills of interpersonal and business communication, assess themselves as future specialists, and independently analyse possible behaviour in situations related to their future specialty. The teacher, on the other hand, gets more opportunities to develop students' creative skills, as well as their communicative and managerial competence for future practical activities.

The above manual and the applied methods of work demonstrate an integrated, multidimensional approach to professionally oriented teaching of the English language in an agricultural university and leave room for the teacher's creativity, since language education is continuous, open and promising in nature, professional teaching of the English language.

Namangan Institute of Engineering and Technology
UZBEKISTAN

ABSTRACT

This article examines the neglect and plundering of historical monuments in Uzbekistan during the dictatorship, as well as their transfer to famous museums in Russia State. The restoration of historical monuments was so bad that even the Central Committee of the CPSU and the USSR Council of Ministers in 1987 for the "protection and preservation of monuments and historical monuments" noted that the republic has a primary organization for the protection and restoration of cultural values.

INTRODUCTION

Historical monuments that amazed mankind with their beauty and antiquity have not lost their significance in our time, they are a rich historical heritage of the culture of our people.

After, when Uzbekistan gained national independence, one of the main goals was the legal protection of our material and cultural monuments and their transfer to the next generation. In particular, this issue is reflected in Article 49 of Chapter XI of the Constitution of the Republic of Uzbekistan, which reads and says: "Citizens are obliged to carefully preserve the historical, spiritual and cultural heritage of the people of Uzbekistan. Cultural monuments are under state protection,"

In Soviet times, it was the other way around; first of all, an attempt was made to destroy the history of the nation. Insufficient attention was paid to historical monuments on the territory of Uzbekistan, they did not care about their preservation, and ultimately these monuments were demolished, destroyed and looted. The museums of Moscow and Leningrad were replenished

with Uzbek exhibits as a result of thefts, robberies and smuggling of valuable tiles from historical monuments. For example, the best relics of Vislosky's expeditions to Samarkand were brought to the Hermitage. Among them are inscriptions on gravestones, embroidered rivets, plates, tiles copied from the walls of Ishratkhan, Bibikhanim mosque, Ulugbek madrasah, gold and silver star chandeliers in the tombs of Amir Temur and Ahmad Yassavi, weapons. Looting and appropriation of state property continued until the 1990s, when no organization took care of the preservation of historical monuments. On the contrary, they were viewed as outdated or religious structures.

According to Mamaraimov's opinion: "... most of the historical monuments, which are vivid examples of folk culture, were used by priests for religious purposes." He stresses the importance of studying their history and removing them from the shell of religion. This policy had its effects: firstly, not to show the public a negative attitude towards historical monuments, and secondly, to wage a comprehensive fight against religion. At the beginning of the 20th century, there were 512 mahallas, 349 mosques, 26 madrasahs and 30 caravanserais in Tashkent. During the years of the personality cult, many of the city's ancient relics were destroyed under the guise of a struggle against religion. In the 30s of the twentieth century, there were unique monuments in Shaikhantakhur - mausoleums, mosques, from which only the monument to Yunus Khan has survived to this day. Unfortunately, the history of Beklarbegi and Hotinmasjid, once considered the most beautiful mansions in the world, is a thing of the past.

Such disregard for historical and cultural monuments led to the fact that the Soviet government used buildings belonging to a rare culture of the people for other purposes. Basically, these buildings of historical value performed storage, production and other functions. In particular, at the end of the 19th century, the Namazgokh mosque in Samarkand was renovated and turned into a pharmacy for the Russian army, and after the establishment of Soviet power - into a sanatorium for the treatment of lung diseases. ... Later, this place became a place for the cars of the sanatorium.

The restoration of historical monuments was so bad that even the Central Committee of the CPSU and the USSR Council of Ministers in 1987 for the "protection and preservation of monuments and historical monuments" noted that the republic has a primary organization for the protection and restoration of cultural values. And historical monuments. There is evidence that economic support for existing restoration organizations is weak and there is no concern about further training for restorers. As a result of inadequate qualifications and training of restorers, savings of funds of higher organizations, historical monuments began to lose their prestige and historicity.

Architect K.S. Kryukov notes that many engineers and technicians accidentally ended up in restoration organizations, noting that most of them had no special training and did not know about ancient construction work. He also criticizes the lack of specialized experts among architects involved in restoration research, as well as the fact that there are cases of deviations from their duties in the organizations that manage their work. The aforementioned criticism of architects was very appropriate, and among such categories were those who made calls not to need cultural and historical monuments of the greatness of the nation. In particular, the article "Spots on repair" states: "The reconstruction of Registan, the famous architectural ensemble of Samarkand, turned out to be extremely unsuccessful. As if all the work was done to the detriment of the ensemble. Today the chief architect of the city asks: "Who needs Registan?"

"This is an inappropriate question." Such a careless statement about such a unique monument of history and culture was an inappropriate statement not only for the Uzbek people, but for all of humanity. After all, the historical monuments of Samarkand, Bukhara, Khiva and other regions are the wealth of mankind, the priceless heritage of the people, which has been developing for centuries.

As a result of the blind policy, some historical monuments have become completely irreparable, and some have disappeared.

Of course, even under Soviet rule, there were a number of laws on the protection of cultural monuments. In particular, in May 1968, the Supreme Soviet of the Uzbek SSR adopted the Law "On the Protection of Cultural Monuments", but no significant work was carried out on this law. For example, in 1970, only 351 monuments were under state protection, of which 125 were architectural, 196 were archaeological, and 31 were historical and artistic. They did not include many unique monuments of the republic, which have not yet been fully explored.

In the mid-1950s, there were 30 thousand historical monuments in the Republic of Uzbekistan, but as a result of indifference to historical riches, by the end of the 80s of the last century, only 7 thousand of them remained.

After the Republic of Uzbekistan gained its state independence, much attention was paid to the protection of historical and cultural monuments. In particular, if in 1989, under Soviet rule, more than 6700 monuments of culture and history were repaired, 10.2 million UAH. soums, in 1990 - 12.4 million. In 1992, 65.4 million soums were allocated from the republican budget for these purposes. soums. During 1991-1997, the volume of work performed by the Samarkand workshop for the repair of cultural and historical monuments increased 20 times, and the amount of work performed in the workshop of Shakhrisabz increased 23 times. In 1997, 366 million UAH. soums, in Khiva 185 million 250 million soums for the second stage of repairing monuments to Amir Temur. It is planned to carry out works in the amount of sum. If in 1999 it was 700 million. In 2000 this figure was 750 million soums. soums

It is worth noting that the Government of the Republic of Uzbekistan uses the existing monuments of material culture in order to educate the nation, self-awareness.

ISSUES OF MAN AND HUMANISM IN RENAISSANCE LITERATURE AND ART IN EUROPE

Dildor Normatova*

*Associate Professor,
Fergana state university,
UZBEKISTAN

ABSTRACT

In this article, a philosophical analysis of the coverage of human and humanitarian issues in the art and literature of the era of European civilization has been made. The development of aesthetic taste and the moral aspects of personality must be compatible with each other. For one example, in the 15th and 16th centuries, the all-round development of the individual in some cases resulted in the growth of egoism. Humanism arises when man begins to think about himself, his place in the universe, the essence of his nature and what he is capable of, the meaning and purpose of his existence. Undoubtedly, humanist considerations have always had a concrete socio-historical basis. More precisely, it fulfills the basic function of humanist anthropocentrism. Unfortunately, when reflecting on the European Renaissance, some scholars overestimate the role and importance of ancient cultural heritage in shaping Renaissance culture, especially humanism.

INTRODUCTION

In the literature and art of the Renaissance era, more attention is paid to man than ever before. Neither in antiquity nor in the Middle Ages was so much attention paid to the living creature known as man. By this time, everyone's unique abilities and skills were given preference over everything else. Emphasis was placed on the unique talents of great individuals. This situation led to the formal formation of the concept of man during the Renaissance. The concept of "man" began to be used in conjunction with the concept of "personality. The term "personality" was also understood in Renaissance literature as the ability to feel responsibility for one's actions and behavior. According to thinkers of this period, the comprehensive glorification of personality and

its growth does not always correspond to the development of human personality. The development of aesthetic taste and the moral aspects of personality must be compatible with each other. For one example, in the 15th and 16th centuries, the all-round development of the individual in some cases resulted in the growth of egoism. In the works of anthropologists and poets, the main theme was the study of the relationship between man and nature, the individual and society. Representatives of humanistic philosophy began to promote the idea of the all-round development of the individual.

Main part

The European Renaissance had different characteristics. The Renaissance had an Italian humanist nature in its early stages. Florence became the true center of the Italian humanist movement. As the organizers and promoters of the Florentine humanist movement pondered the ideas of humanism, they followed the advice of the ancient Roman thinker, the famous philosopher Cicero (1st century B.C.). Cicero, when he spoke of humanism, was referring first and foremost to the humanism of man. Humanity was formed on the basis of the various contradictory pluralistic views of the ancient Greeks, who believed that the greatest achievement of Roman culture was its result. Hence, according to Cicero, humanism is a phrase expressing man's elevation to the level of man, his rebirth, the process of integrating the signs of humanity into man.

By using this phrase, Cicero wanted to explain to the "fathers" of the church that humanity is the greatest value. For the same reason the term "humanity" came to be used in the various Latin correspondences of the "fathers" of the Christian church, Tertullian, Lactantius (3rd-4th centuries). Hence, humanism is a Latin expression (humanus) meaning the pursuit of humanity or the creation of the conditions necessary for man to live as a human being. Humanism arises when man begins to think about himself, his place in the universe, the essence of his nature and what he is capable of, the meaning and purpose of his existence. Undoubtedly, humanist considerations have always had a concrete socio-historical basis. If we analyze the phrase "humanism" in its narrow sense, it can be assessed as an ideological movement. For example, the ideas of humanism in its early stages manifested themselves in the form of the study of ancient literature, art, language and culture in Italy. In particular, Dante's Divine Comedy, the famous philosophical work The Feast, and the most important political treatise Monarchy, the founder of Italian literary language, served as a powerful source in shaping the ideas of Italian humanism (more on Dante's humanism). The value of the humanist movement was judged not only by its contribution to the culture of philosophical thought, but also by its research work on ancient manuscripts. By the same token, Italian humanism, which characterized the first stage of the European Renaissance, came to be characterized in some cases as a literary and philological phenomenon.

The theoretical foundations of Italian humanism were the ideas of Platonism and Neoplatonism. In Italian humanism, the philosophy of Platonism and Neoplatonism was understood as a symbol of development and progress. In particular, Plato's philosophy was regarded as the crowning, culminating philosophy of the entire past. Consequently, Plato's Academy in Florence declared Plato the "god of philosophers." It has been repeatedly emphasized that Plato's philosophical doctrine has made a worthy contribution not only to the culture of philosophical thought, but also to the development of Christianity. Florentine thinkers also fully supported the philosophy and religion formulated by Plato and his followers, the relationship between man and God, especially

the brilliant conceptions of man. A similar situation can clearly be seen in the works of the famous Italian scholars Dante Alighieri and Pico della Mirandola. One of the Christian scholars who made a worthy contribution to the development and promotion of the ideas of humanistic anthropocentrism was Dante Alighieri[1], the great poet, publicist, philosopher and politician of the late Middle Ages and the first Renaissance in Europe.

Dante Alighieri[2, 56] was a great poet, publicist, philosopher, and politician of the late Middle Ages and the first European Renaissance.

He added to the treasury of the world's cultural heritage works as *The New Life*, *The Banquet*, *The Monarchy*, and *The Divine Comedy*. Dante's services in introducing Europe to the culture of the East, especially Oriental philosophical thought, were invaluable. In his collection of poems, *The New Life*, dedicated to his beloved Beatrice Portinari (composed between 1291 and 1292). He continues the Eastern traditions of Ibn Sina and Ibn Rushd, honoring true love and affection, loyalty and devotion[1, 56-120]. He emphasizes that love is a truly human quality, the highest morality, decency, the supreme quality inherent in man in general. He tries to explain the process of love's formation and development, calling for it to be respected in every way.

During the time of his exile from 1304 to 1308 Dante wrote one of his greatest scientific and philosophical works, "*The Banquet*". Moreover, it was also composed an artistic-philological work, "*On Vernacular Eloquence*". "*The Banquet*" is a major encyclopedic work of medieval philosophical thought. In this work Dante first of all urges his contemporaries and colleagues to study philosophy comprehensively and deeply. He considers it the human duty of every citizen to be aware of the philosophical heritage. In *The Banquet*, Dante pays great attention to the analysis of the human problem, especially the process of forming his spiritual and moral image. According to the poet, the spiritual and moral image of each person determines the cultural level of society. In contrast to medieval teaching, Dante gives preference to morality over all sciences, even theology and metaphysics. In his view, the most important quality that characterizes a person's humanity is generosity, nobility. The poet explains that human life passes through four main seasons: the first is youth, which is like warmth and moisture; the second is puberty, characterized by warmth and dryness; the third is old age, which is cold and dry; the fourth is aging, which is cold and damp[1]. The holiday recognizes that man is able to learn the mysteries of nature. In the same way, man always seeks knowledge, feels the need for it. Knowledge is the highest attribute of our soul, and for man knowledge is the highest joy, says Dante.

Dante expresses his political and secular views in his "*Monarchy*" (1312-1313). The Church and the Pope consider it necessary not to interfere in the affairs of the state. Following in the footsteps of the famous Oriental thinker Ibn Rush, he denies that priests ruled the kingdom. He promotes the idea of a unified state under a just ruler. He advances the idea of the unification of the oppressed Italian peoples through political disintegration and the creation of a war-destroying system, a world empire. He concludes that there are some similarities, commonalities, in a word, universal qualities, even among people of various religions living in different regions. He was one of the first in the history of European history to introduce the concept of "humanity" into literary and philosophical literature. For the same reason, Christian scholars began to demand that the Italian rulers burn Dante's monarchy and hawk the author from his tomb. However, the governor of Ravenna defends Dante.

The greatest work that made Dante worldly famous was the “Divine Comedy”. This work was not only the culmination of his ideological and political views, the crowning achievement of his artistic thinking, but also the culmination of medieval culture as a whole. At the meantime, it was a socially significant event that determined the further course of European fiction. Each religion expressed its own views on these matters. For example, according to Christians, the universe consists of three parts: heaven, earth, and the underworld. While heaven and earth are called this world, the underworld, which is hell, is called the afterlife. People in this world are encouraged or punished in the afterlife based on their actions. For instance, the souls of the godly in this world will find rest in heaven. Those who do evil will be punished in hell. No religion, however, has explained in detail the process by which these occurrences took place. Dante tried to explain the same process in his “Divine Comedy”.

Dante was one of the first to portray the afterlife in the Divine Comedy. In the poet's words, the afterlife consists of three main parts: Inferno (Hell), Purgatorio (Purgatory), and Paradiso (Paradise). The thinker explains that the structure of the afterlife is also based on certain rules. The changes that take place there will also follow certain rules. For example, people go to the afterlife according to their service in this world, that is, their behavior in this world. They will be punished in this world according to what they have done in this world, or they will be at rest. In particular, some from Heaven and some from Hell. Dante's the Divine Comedy was written in the genre of imagining and predicting the afterlife, which was common in medieval literature. While medieval clerical literature associated the genre of divination with the deprivation of human life, viewing this world as transitory, unreliable, tempting the afterlife, Dante celebrated this literary genre for the enjoyment of this world, a more complete description of the relationship between all peoples on Earth turned aside.

Dante does not want to frustrate the man of the world, but urges him to understand the beauty of life, to truly love it, to take an active part in the life of society, to defend the interests of the people, the homeland, to guard it as the apple of his eye. He is not interested in the temptations of the future, but in humanizing the beauty of life, its meaning and content. In order to make life better, the poet spent his life in this world senseless and meaningless, devoted his whole life to evil, cruelty and never did well to others, criminals, sinners, rulers and leaders who acted contrary to the interests of the people. Hypocritical clergymen who use religious doctrines to their personal advantage, in a word, place their political opponents in the Hell and judge them.

To enter Paradise, the human soul must pass through a thick wall. The soul passing through this wall of fire will be free from all defects and ignorance. Passing through the wall of fire, the soul encounters a unique area of beautiful gardens, flower beds, lush green lawns and vast fields. It is from here, from this place, that the preludes to a new prosperous life begin. Heaven, like hell, is built on the basis of nine. Because heaven is on earth, it is surrounded by nine heavens. For example, the first is the Moon, the second Mercury, the third Venus, the fourth the Sun, the fifth Mars, the sixth Jupiter, the seventh Saturn, the eighth the fixed stars, and the ninth the throne, the abode of the angels. In contrast to hell, action always takes precedence in heaven. The light, enlightenment, spiritual perfection reigns throughout heaven.

Dante places the best, the noblest, those who have served their people, their homeland, and their nation in the various heavens of paradise. For example, lovers in the crescent moon, martyrs of love, active and unselfish people in Mercury, generous people on Venus, priests, philosophers, historians, the honest and pious in the Sun, Dante placed Adam, saints and angels in the Constant

Stars. Obviously, in all the good deeds he has done in this world, in his goodness and honesty, people have a place in the Immortal, especially in Paradise. Moral purity in Paradise, the behavior of the spirits settled there forever, the intellectual ingenuity in their behavior-the country that Dante dreamed of was the spiritual image of the citizens of society.

Hence, Italian humanism made a worthy contribution to the formation of the ideas of humanity in the philosophy of the European Renaissance. More precisely, it fulfills the basic function of humanist anthropocentrism. Unfortunately, when reflecting on the European Renaissance, some scholars overestimate the role and importance of ancient cultural heritage in shaping Renaissance culture, especially humanism. Scholars who hold this view believe that humanism is only a concept that reflects the influence exerted on the formation of Roman or Greek culture- the Enlightenment. If thought from this perspective, humanism would be an event belonging only to the realm of spiritual enlightenment. The constantly changing practical aspects of humanism, the call for creativity, the call for universal values, remain unnoticed.

CONCLUSION

The arising of these ideas, in turn, demonstrates that humanism-concrete manifests itself in different forms, depending on historical socio-economic conditions.

Certainly this tendency applies to Italian humanism, which is reflected in various social movements. Despite its historical limitations, it remains a major event in European history.

REFERENCES

1. Dante Alighieri was born in May 1265 in Florence to a poor noble family. He attended a religious school, the University of Bologna. He studied philosophy, ethics, theology, history, and logic. The influence of the works of the Oriental philosophers Farabi, Ibn Sina, and Ibn Rushd on the formation of his scientific outlook was incomparable. He took an active part in the social and political life of Florence. He died on September 14, 1321 in Ravenna. His social and philosophical views are expressed in his works: "The New Life," "The Banquet" "Monarchy," and "The Divine Comedy".

SOCIO-HISTORICAL AND CULTURAL DETERMINANTS OF SUFI TEACHING

Mamatov Mamajon Akhmadjanovich*

*Professor,
Doctor of Philosophy,
Ferghana State University,
UZBEKISTAN

ABSTRACT

The article deals with some aspects that characterize one of the most mysterious philosophical and religious teachings in Islam-Sufism. The article examines the history of its origin, development and current state. It is proposed to use his positive experience in the spiritual education of the individual. It also reveals the distinctive features of the philosophical aspects of the philosophy of Sufism from classical philosophy and theology.

KEYWORDS: *Sufism, Islam, Humanism, Freedom Of Thought, Asceticism, Truth, Spirituality.*

INTRODUCTION

The study of the historical and philosophical essence of Sufi teaching and, especially, its socio-historical and cultural determinants of the genesis and worldview is largely due to the fact that in the Soviet period, when a person's beliefs were subordinated to a certain ideology, the study of one of the features of spiritual values - Sufism was prohibited. Today, the study of its essence is primarily related to the ongoing reforms in the socio-economic, political, cultural and spiritual life of society.

In the modern world, which recognizes the value, the priority of a person, a person, the difference in understanding the meaning of life has been transformed into the recognition of his right to freedom of thought, freedom to profess any religion, or not to profess any.

The main part

The Universal Declaration of Human Rights states that "everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change one's religion or belief

and freedom to manifest one's religion or belief, either alone or in community with others, in public or private, in teaching, worship and the performance of religious and ritual rites"[1].

The freedom of ideas and thought established in society requires critical reflection and analysis from the perspective of a new attitude to the cultural and spiritual heritage of the people. This necessity follows from the principles of continuity in the dialectics of the development of objective reality, including in the sphere of the spirituality of society. In the process of correcting distortions and in the scientific assessment of the historical past, there is a need for a deep study of the historical heritage, philosophy, its component part – the religious and philosophical teachings of Sufism, which is distinguished by its social soil, a variety of epistemological roots, inconsistency and complexity.

One of the factors of relevance of the topic is the activation of religious consciousness in society, especially after the collapse of the Soviet Union and the monopoly of communist ideology, excessive politicization of religions, sometimes turning into fanaticism and extremism.

In Islam, a person is placed above the angels by his status, and Allah has ordered him to perform such duties as landscaping, ensuring peace and establishing justice on earth, spreading knowledge, education, and improving culture. A real person should follow this sacred covenant.

When studying the philosophical socio-historical and cultural determinants and features of Sufism, it is important to keep in mind that one can find many ideas and thoughts for our days about the struggle against evil, violence, wars, fanaticism, for the triumph of justice, the establishment of friendship between individuals and peoples. The development of this problem, in addition to scientific and cultural significance, has also political significance.

A comprehensive study of Sufism will allow us to more adequately and fully represent the development of the spiritual culture of the East in the Middle Ages. As you know, the knowledge of this or that phenomenon requires to follow the nature of this spiritual phenomenon in everything, to see it as it really was and is. And this requires an objective approach to the problem under study.

The study and comprehensive study of the origin and ideological features of this mystical teaching-Sufism is of particular relevance in our days, when religious fundamentalism in every possible way seeks to use Islam for its own selfish political purposes. Fundamentalism and extremism under a religious mask, hiding behind the dogmas of Islam, falsify its true essence, give a political color, and thus act with the slogan of creating a single caliphate under the shadow of the black banner of holy Islam.

The teachings of Sufism, its true aspirations are alien to modern fundamentalism and extremism, which hides its true goals with religious slogans, it completely ignores the positions of the latter.

Sufism, as an original teaching that has a special socio-ideological ontological status in medieval society in recent decades, the research interest of orientalists, Islamic scholars, philosophers, historians and literary critics has been growing. This indicates that the study of aspects of the essence of the sufism teaching in the light of the accumulated experience and the latest achievements of the world social and related sciences and the search for optimal solutions on the part of researchers remains relevant – this is, firstly, and secondly, it is due to the aggravation of the ideological and political struggle around the problems of the theory and practice of Islam at the present stage.

Despite the versatility and diversity of its manifestations, Sufism and its features serve as a positive assessment as a kind of historical and legitimate direction of the search for truth within the framework of the brotherhood and sociality of Islam. After all, the ultimate goal of Sufism is to achieve perfection. And the idea of a perfect person is a high ideal that calls for good, which has a national and universal essence, containing the highest spiritual and physical perfection, characteristic only of human nature.

According to the famous contemporary Muslim theologian Shaikh Muhammad Said Ramazani al Buti (1929-2013), "As for sufism in its true and common sense, it is essentially the core of Islam and its true essence, resting in the depths of the consciousness of a sincere believer. Without this core, Islam becomes only rituals, outward expressions of commitment to Islam, and empty rites through which people try to present themselves to each other in a favorable light."

Sufism as a special form of perception of the world, was born and developed at the junctures of the mythological, scientific, religious mystical phenomenon on the basis of the Muslim worldview. Those who wish to take the path of this teaching undergo special physical, spiritual and psychological training under the guidance of certain spiritual mentors. At the same time, it is considered possible, if Allah deigns, and a sudden divine illumination without outside help. In this case, he becomes a Sufi, but he cannot be a mentor for others because he did not go through the stages of formation under the guidance of a particular teacher – shaikh.

Sufism manifests itself in the search for creative, creative, non-standard solutions to the problems of the development of being, consciousness and society. It has three main directions: subjective (BayezidBistami, Mansur Hallaj), objective idealism (Hakim Termizi, Abu HomidGazzali, Fariduddin Attar, ibn Arabi, Ahmad Yassavi), pantheism (Sa'diyShirazi, Abdurahman Jami, Mirza Bedil).

Sufism mainly propagated their materialistic views in a pantheistic way. The Sufi strives to achieve the highest perfection by strict observance of the requirements of Islam and by limiting his material needs (zuhd), fear of Allah (taqvo), modesty, physical and spiritual purification, and the way of life of the Prophet Muhammad's deeds is a model for example.

In Sufism, a cause is true if it follows from the divine will, and not from a law. And it serves as a justification for a religious belief. Becoming a Sufi consists of mastering such four stages as shariat (the code of laws of Islam), tariqat (the way), marifat (knowledge, insight), and haqiqat (truth). Each of them is also divided into several parking lots (maqom).

Sufi ideas appeared in the VIII-VIII centuries in the bowels of Islam on the basis of the Koran and Sharia in the Arab land. Initially, the bearers of these ideas were called zahids-ascetics, who were distinguished by a constant struggle with their worldly needs, "animal soul" (nafs), constant fasting; abids – worshippers, wanderers. They were distinguished from the masses by their piety and strict observance of prayer recitations; they were Gnostic arifs. This category had a secret knowledge of Allah.

At the same time, Sufism is a multi – causal phenomenon, since it has, along with Muslim, ancient Indian, Iranian, and Greek elements. These non-Arab ideas in Islam are reflected in the essence of the teaching, without denying some influence of Eastern Christian mysticism on Sufism, it is necessary to note their insignificance.

Sufism is a mystical, religious and philosophical understanding of the world with its own harmonious system of achieving truth. Its representatives believe that through personal spiritual and practical experience, a person has the opportunity of spiritual communication and dissolution in Allah, one of his names-the Truth.

Questions of interrelationship and contradictions between philosophy and theology have always been the focus of Sufism. Pantheistic and dualistic ideas played an important role in the development of Sufi philosophy. In this teaching, causality is derived not from the regularity and development of being, but from God's will, which serves as a justification for religiosity.

Sufi approaches to the theological interpretation of the essence of existence are revealed by Muhiddin ibn Arabi and set out in his teaching "Vahdatulvujud". However, the main ideas of the doctrine, as noted above, were set out long before him by Hakim Termizi[2].

At all stages of the formation and development of Sufi views, the ideas of God, being and man were studied in interrelation and integrity. His ontological concept asserts the uniqueness, absoluteness, and eternity of Allah.

In the conditions of the powerful development of natural sciences in the IX-XII centuries, the integrity and dialectics of being, man and consciousness were explained by the thinkers of that time, proceeding from the "first cause" - Allah. At the same time, although the truth is the same, however, in the course of the study, numerous examples from the practice of individual Sufi tariqas have proved the existence of different ways of understanding it.

The contradictions between the philosophical explanation of being from the standpoint of logic and the Sufi idea of esoteric science, the method of mastering it in a state of trance that occurs in individual people, were considered insurmountable. Only by applying the principles of the new science-synergetics in the study of social phenomena has it become possible to overcome them. Synergetic conclusions about the principles of self-organization, the lack of stable uniformity, and nonlinear movements create completely new directions in the world of social science, which means that the idea of the possibility of approaching the philosophical, theological, and Sufi theories of knowledge based on these principles has the right to exist, further study, and the possibility of approaching the philosophical, theological, and Sufi theories of knowledge based on these principles.

According to the Russian academician A. E. Akimov "" One of the ways of knowing the world is the Eastern method, according to which knowledge is obtained in an esoteric way, for example, in a state of meditation. This path has been forgotten for some reason and has therefore formed an extremely complex and very slowly leading to the truth, the Western path. We have followed this path for a thousand years and have reached the knowledge known in the East three thousand years ago"[3, 24-25], which means that the synergistic approach to reality confirms the above conclusions.

At present, in the context of universal globalization, including in the sphere of the spiritual life of society, there is a growing interest in Sufism among believers in the world. The famous Russian scientist A.D. Knysh states: "Sufis say: do not try to fight with fate, you just need to rely on the Lord and not get hung up on the momentary, transient. I practice it all the time. Sufism can teach both Muslims and non-Muslims a lot, for example, to make a person's life more meaningful and calm"[4].

CONCLUSION

Thus, it can be stated that Sufism as an integral theoretical, ideological, philosophical, and theological teaching - a fully formed system, has taken an important place and has a certain significance in the moral and ethical development of the Muslim world.

ENDURANCE AND RESILIENCE: A STUDY OF THE SUBALTERN VOICE IN A THOUSAND SPLENDID SUNS

Suhana P.A*

*Assistant Professor

M. E. S. Arts and Science College, Perinthalmanna,
Kerala, INDIA

ABSTRACT

Dedicated to the women of Afghanistan, Khalid Hosseini's second novel A Thousand Splendid Suns delivers a heartbreaking portrayal of women in Afghanistan during the years of Soviet occupation, then the civil war and the Taliban dictatorship. According to Gayatri Chakravorty Spivak, the subaltern women are more susceptible to oppression and pressure than subaltern men because they are the second sex destined to be silent. The subaltern women community in Afghanistan portrayed through the lives of Nana and her daughter Mariam, Laila and her daughter Aziza in the novel, is triply suppressed by patriarchy, militarization and religious fundamentalism. This paper studies the existence of the subaltern women community in Afghanistan as portrayed in the novel A Thousand Splendid Suns and their attempts to "speak". The two central characters Mariam and Laila, belonging to two different generations and brought together by their violent and cruel husband Rasheed, develops a mother-daughter relationship between them and use their love as a weapon to combat patriarchy. Through them the novel tells the story of a thousand splendid women who through their courage, endurance and resilience becomes the hope and future of Afghanistan.

KEYWORDS: Subaltern, Afghanistan, women, endurance, resilience, colonialism, patriarchy, militarization, religious fundamentalism.

INTRODUCTION

The Subaltern is a term used by Antonio Gramsci to indicate groups in society that are subjected to the control of ruling classes. While subaltern classes traditionally include peasants, workers and others denied access to controlling power, Gramsci, interested in politics and the state, focused on their historiography. It was Gayatri Chakravorty Spivak who specifically linked the

notion of the subaltern to that of Eastern women, silenced, marginalized and disenfranchised economically and socially. According to Spivak subaltern women are subject to more oppression than subaltern men. Women bear a double burden being oppressed by authority powers and subordinated by men.

Afghanistan was controlled by successive colonial powers for thirty years starting from the invasion of the Soviet Union and then civil war between ethnic groups such as Najibullah, Mujahideen and Taliban followed by the control of the United States. The idea of panopticism put forward by Foucault can also be applied here. It feels as if common Afghans were constantly watched and monitored and a slight deviation from the rules of the dictatorial regimes resulted in their highest punishment. Rosemarie Skaine in the book *The Women of Afghanistan under the Taliban* said that “while much of the Afghan population suffers under the Taliban, women bear more specific, unrelenting and often violent adversity, including the denial of basic human rights, veiling, seclusion and segregation”. Life in Afghanistan puts female as the second sex and the victims of patriarchy.

Khaled Hosseini's second novel *A Thousand Splendid Suns* delivers a heartbreaking portrayal of the life of the women in Afghanistan. Aptly dedicated to the women in Afghanistan, the novel provides an inside view of war-ridden, oppressed Afghanistan and its women through the lives of Nana and her daughter Mariam, Laila and her daughter Aziza. The central characters Mariam and Laila, belonging to two different generations and brought together by their cruel and violent husband Rasheed, develop a mother-daughter relationship between them and use their love as a weapon to combat patriarchy.

From Nana to little Aziza every female character in the novel is a victim of patriarchy one way or the other. Afghan men had the right to marry as they wanted but still Jalil refuses to marry Nana and legitimize their relationship. Thus Mariam has to live as a “harami” all through her life. Nana has to live away from the city secluded from society because of their relationship while Jalil lives in his mansion with his three wives and family. Nana is the only one accused of everything that has happened in their lives and she suffers. She tells Mariam “Like a compass needle pointing north, a man's accusing finger always finds a woman. Always”. Nana knows that Jalil will never accept Mariam as his daughter though he meets her every week with presents and seems to care for her. When Mariam expresses her wish to go to school Nana tells her “There is only one, only one skill a woman like you and me needs in life, and they don't teach it in school. Look at me.”... “Only one skill. And it's this: tahamul. Endure.”(18), a hard lesson she learned from her own life. Mariam never believes what her mother tells of her father and visits his mansion in town irrespective of her mother's warning. Unwanted and unacknowledged by her father and his family, she returns home to find Nana dead. The guilt that she is responsible for her mother's suicide remains with Mariam all through her life and she suffers all the atrocities she faces as a punishment for the same. She is hastily married away to Rasheed, a very elderly man, when she is just fifteen by her father's wives while her father remains silent. No one cares about her opinion. Mariam takes her revenge on her father by never again acknowledging his existence.

After marriage, even though Mariam shifts to Kabul, the most liberal place in Afghanistan, life fails to liberate her. Rasheed was a staunch patriarch. He considers Mariam only as an object to satisfy his lust, to cook for him and to provide his male child. When she fails to provide him his child life becomes hell for her. He even makes her eat gravel which causes her losing her teeth.

She is subjected to domestic violence and also not allowed to have social connections. Rasheed makes burqa compulsory for Mariam before the Taliban makes it compulsory for all women. Rasheed proclaims his masculinity by differing himself from “soft men: like the teacher Hakim and other educated Afghan men by claiming “But I’m a different breed of man, Mariam. Where I come from one wrong look, one improper word, and blood is spilt. Where I come from a woman’s face is her husband’s business only.”Mariam endures everything silently.

When Mariam is the symbol of a traditional woman Laila is a symbol of modern women. Laila, the free spirited daughter of the teacher Hakim lives a vivacious life like any other girl in any independent country during the Soviet period. Though affected by the fact that her brothers are fighting with the Mujahideen and her mother grieved by the same fails to take care of her, she finds love and support in her father and her friend Tariq and his family. Laila is the representative of a period in which women in Afghanistan had much freedom and was part of the nation building process being doctors, lawyers, teachers etc. According to Hakim “women had always had it hard in this country, Laila but they are more free now, under the communists and have more rights than ever had before...It’s a good time to be a woman in Afghanistan.”But life changes forever for her when her family is killed in an explosion and Tariq is lost among the refugees. Rasheed marries her, to which Laila consents because she had to take care of her child by Tariq. Rasheed was nice to her until childbirth and changes his attitude as the child is a girl. Mariam who initially hates her later develops a close bond with Laila and the baby. Laila’s strength mesmerizes Mariam and gives her the strength to fight as well. The hospital scene in which Laila undergoes a caesarian without anesthesia proves Laila. It is said in the novel that Mariam would always admire her for the time passed before she screamed. The women find love and support in each other. They try protecting each other from Rasheed’s violence. Laila’s second child Zalmai alone receives care from his father as he is a boy. Aziza is sent to an orphanage. The Taliban do not allow women to travel alone without a marham, a man and Laila is caught again and again in her attempts to see Aziza. She is punished severely but she never steps back from visiting her daughter being a symbol of strength and resilience. Rasheed never accompanies her and even wish to get rid of her with the help of the Taliban. The Taliban also is against the education of women. But we find in the novel Aziza and other children in the orphanage taught in a clandestine manner by Kaka Zaman. This symbolizes another resistance and also proves the strength of Afghanistan where there were still men who believed in the rights of women as humans. The two women tries to escape but is caught. Finally Mariam takes the greatest decision in her life- to kill Rasheed so that Laila and her children can live peacefully. “This was the first time that she was deciding the course of her own life.”She sacrifices her own life for her love for her children. In the prison she is treated as a celebrity by other prisoners who were arrested for the crime of running away. It seems they saw in her the hero they all wanted to be. Laila’s return to Afghanistan from the peaceful life in Pakistan suggests the strength and future of Afghanistan to grow again and fight back.

Khaled Hosseini himself says:

Women suffered not only through the bombings and indiscriminate shelling of civilian areas like everyone else, not only were beaten and tortured and humiliated and imprisoned, not only had their fundamental human rights violated over and over again, but in large number also suffered from gender-based abuse.(411)

In the novel we find the subaltern women eventually raising their voice. Mariam was a passive victim of Rasheed's domestic violence because she had internalized what her mother had taught her – to endure with silence. When Mariam accepts Laila as her daughter, she is amazed to see Laila's courage and resistance. It is after this Mariam regains her lost voice. The women in Afghanistan are victims of not simply colonization but the triple oppression of militarization, patriarchy and religious fundamentalism. These two women realize their common enemy and their need to fight for each other. It is Laila who actively fights against Rasheed but the final blow comes from Mariam. It can be said that all the women in the prison respected her for she is a winner against patriarchy.

ABSTRACT

This article discusses the issue of corruption, how this negative vices are fought in Islam, and the very dangerous social consequences of taking and giving bribes in our religion. Some Hanafis responded to the opposite of the narrated truth, thinking that the king's taking a bribe was like a judge taking a bribe. I ask the Almighty Allah to make my research impartial. During the years of independence in Uzbekistan, corruption was at the root of some officials' greedy treatment of the property of entrepreneurs and farms, and artificial barriers to obtaining bank loans.

KEYWORDS: Corruption, Islam, Surat An-Nisa, Surat Al-Baqara, Bribes, Bribes, Gifts, Gifts, Etc.

INTRODUCTION

Islam has focused on reforming society as much as it has focused on educating and reforming the individual. In reality, there are vices such as fraud and unjustly eating the property of others, from which it is the duty of every Muslim to save society. Studying and following the instructions of our religion in this regard will undoubtedly make a great contribution to the prosperity of our country. The abuse of power by members of society, the misuse of state property, the stagnation of growth and development in various spheres of society, the loss of public confidence in reform, and other similar negative consequences.

Unfortunately, in our land, which is predominantly Muslim, there are sins that our ancestors despised, such as fraud and unjustly eating the property of others.

Our religion also has strict rules on corruption.

It is common for many bribe-takers to suspect that a bribe was given as a gift. The giver was also heartbroken, accustomed to carrying out ugly intentions with atadid and other beautiful words. Therefore, it would be appropriate to describe the gift in this context. A "gift" is the gratuitous giving of goods to someone for use. The gift is usually meant to gain the love and affection of the person being given, or simply to honor him or her, or to treat him or her according to the good he or she has done. He has no intention of taking anything from him unjustly. This is the main difference between a gift and a bribe.

Corrupt people should be well aware that by their actions they are betraying their duties, the state, the people.

The same goes for corruption. First you meet someone's need, and he or she will give you a thank-you gift or meet your need as well. In the meantime, someone else's job will fall on you and you go down the path of covetousness for him, that he may give you his gratitude in material terms. Regardless, after this situation is repeated two or three times, it becomes normal and becomes a daily routine. Everything that has become a habit for humanity occurs as a result of constantly repeating a task.

Corruption spreads like wildfire throughout the dry areas pulling into its own trap. It is becoming more and more difficult to control it, as if the measures taken by the states alone are lacking.

Today, many countries are fighting corruption with their domestic laws.

Ibn Nujaym (may Allaah have mercy on him), one of the leading scholars of the Hanafis, wrote in his treatise:

Bribe, or bribe, in the dictionary means "payment", "reward". The term is something given to the governor and officials like him to rule in his favor. Imam Abu Nasr al-Baghdadi, in his commentary on Quduri, explained the difference between a bribe and a gift: "A bribe is something given for help, and nothing is conditioned on the gift."

The impurity of the bribe was fixed by the book, the sunnah, and the ijma'. "O you who believe! And do not consume your property unjustly. (Surat an-Nisa', 29) "Do not consume your wealth among yourselves in vain. Also, do not knowingly hand over some of the rights of the people to the rulers in order to usurp them through sin. (Surat al-Baqara, 188)

The Messenger of Allaah (peace and blessings of Allaah be upon him) said: I am also a human being. You come to me with a claim and a claim. If you master the word and unjustly misappropriate the rights of others, know that it is a blaze of hell. Let him who wants it take it, and let him who does not want it take it. "

The Messenger of Allaah (peace and blessings of Allaah be upon him) said: "Allaah has cursed the bribe-giver, the bribe-taker and the one who mediates" (Narrated by Ahmad).

Imam Qazikhan's fatwa divides bribes into four parts:

The first is that if a judge makes a judgment based on a bribe, he will not be a judge. In this case, the bribe is haram for both the giver and the receiver.

The second is a bribe given to a judge to rule in his favor. Whether the judgment is right or wrong, a bribe is unclean to both parties.

Third is bribery to protect one's life or property. Such a bribe is only unclean to the recipient, not to the giver. The same is the ruling even if he gives some of his wealth when it is coveted.

Fourth is the bribe paid to have his case considered in the presence of the sultan. He is honest to the giver and not honest to the receiver. This sentence is in the case where the bribe was given in advance. But if the bribe is given after the case is over, some say it will be haram, while others say it is halal. That's right, because it's about rewarding goodness and kindness. Just as it is a good deed to give something to an imam or muezzin unconditionally.

It is also not halal to accept a gift from a stranger who has never given a gift before, just as it is not halal to bribe a judge. The judge's request for a loan or an arya is also in the same sentence.

In the Book of Will, "What is given to oneself or one's property to ward off oppression is not considered a bribe to the giver. Property given to someone for a fee is a bribe."

The report concludes: "If a judge takes a bribe and then gives a verdict, or if he or his son takes a bribe after the verdict, the verdict will not pass."

There are three types of gifts:

The first is the gift given to create love, which is honest to both the recipient and the giver.

The second is that a gift given to promote injustice is not fair to either party.

Third, oppression, that is, the gift given to get rid of injustice, is only impure to the recipient. However, there is no harm in accepting a gift when the case is over by the decision-maker without any conditions or greed."

Fath al-Qadir says, "Then there are four kinds of bribes.

The first is unclean for both the giver and the receiver. He is so bribed, judged, or judged that he is left to fend for himself as a result.

The second is the bribe that the judge takes to pass judgment, which is also haram for both parties. In this case, it does not matter whether the judge's verdict is right or wrong. Because it is obligatory for him to reveal the truth. It is not fair to charge a fee to perform an obligation. But there is no need to explain the unjust verdict. It does not matter whether the bribe is taken before or after the verdict.

The third is a bribe given in order to get rid of harm or to make a profit, given his work in the presence of the sultan. It is unclean to the recipient, not to the giver.

The fourth is a bribe given to ward off danger from one's life or property, which is halal to the giver and impure to the recipient. Because it is obligatory to repel harm from a Muslim. It is not permissible to take goods to do the obligatory"

At a time when we had to issue a fatwa on bribery in our time, some of my friends commissioned me to do research on the subject. Some Hanafis responded to the opposite of the narrated truth, thinking that the king's taking a bribe was like a judge taking a bribe. I ask the Almighty Allah to make my research impartial. So we start by saying that bribes have two different meanings. It has lexical and terminological meanings. In the dictionary, the meaning of bribe is shirinkoma - truth, reward.

A gift is a gift to a judge. If the gift is intended to benefit, it is unclean on both sides. If a person comes to a judge and gives him something to judge without reciting a sentence, or after giving a sentence, the giver has committed an unclean deed. If the judge does not accept this and wants to influence him, the judge will be able to do the same. There is a saying of the scribes: "Any sin committed is obligatory if it is not weighed against it." It is similarly stated in al-Badoye: "The reason why Tazir is obligatory is because it is a crime that is not prescribed by the Shari'ah. It does not matter whether the crime is a violation of the rights of Allah or a betrayal of the rights of the slave. That is, if anyone in his right mind commits a crime without a specified limit, he will be punished. " If you ask me if the judge's remarks will be taken into account, I will say "Yes!" Based on information from Fuslayn and other sources. I answer. If someone tells the judge that I took a bribe, he can influence him. As for giving effect by making it public, it is permissible because it is also a form of giving effect. Imam Abu Hanifa (r.h.) said that anyone who bears false testimony will be affected by making it public in the markets. Nothing else is done. Two Imams (Abu Yusuf and Muhammad) said they would be beaten and arrested.

It is narrated in Fath al-Qadir: "The meaning of Imam (Abu Hanifa's) words is, 'I cannot affect him in any other way, nor can I beat him.' So the alliance is that he will be affected in any way. it is enough to be transparent in the markets, because sometimes it is harder to be transparent than to strike secretly. And the two imams have added to that. " That's it. the same is cited in al-Inaya and other sources.

So, exposing the guilt of the offender is a form of excuse. If the judge finds it advisable to give the same reprimand to other offenders in addition to giving false testimony, it is permissible for the judge to give the same reprimand to the perpetrators. After all, to impress is a matter left to the discretion of the judge. If you asked a judge if it is permissible for a judge to do something that is forbidden in the Shari'ah, such as painting the face of a criminal black and shaving off one side of his beard, I would answer that it is permissible for a judge to do that.

According to the UN, the world now receives \$ 1 trillion in bribes each year. The world economy loses \$ 2.6 trillion a year due to corruption, which is 5 percent of world GDP. According to the UN Secretary-General, "Corruption deprives people of schools and hospitals, frightens investors, plunders natural resources, and creates conditions for various other crimes.

In order to prevent corruption in the legislation of developed countries, in addition to the introduction of a number of prohibitions, restrictions and guidance standards to prevent corrupt activities of public officials, a special method of "Corruption Tolerance Test" has been introduced.

During the years of independence in Uzbekistan, corruption was at the root of some officials' greedy treatment of the property of entrepreneurs and farms, and artificial barriers to obtaining bank loans. The same problem has existed in the admission of young people to higher education institutions, colleges and lyceums with high competition, and after becoming students to collect the necessary points for the current, intermediate and final control, based on the greed of some "teachers".

The relentless fight against corruption in our country began in October 2016. On October 14 this year, on the initiative of the President of Uzbekistan ShavkatMirziyoyev, the draft law "On Combating Corruption" was adopted by the OliyMajlis, which came into force on January 4, 2017. The law provides for full legal regulation of relations in the field of anti-corruption,

increasing the effectiveness of measures taken by government agencies and civil society institutions to combat corruption, creating an environment of intolerance to corruption in society by raising legal awareness and culture of citizens.

"Everywhere you look today, the tide of protectionist sentiment is flowing. Achievements are promoted. It is not surprising that such mature and skilled people as Ibn Sina, Fergani, Beruni, Khorezmi were born. First of all, in order to achieve high development, it is possible to eradicate the root of corruption only if citizens act in the interests of society, not themselves and the course of action.

Corruption is a terrible scourge that oppresses society in various ways. It undermines the foundations of democracy and the rule of law, violates human rights, impedes the functioning of markets, impairs the quality of life, and creates conditions for organized crime, terrorism, and other threats to human security.

Speaking about the upbringing of the younger generation, President Shavkat Mirziyoyev said that each of us, especially our sons and daughters, should follow the following words: "People should strive for a clear goal. to be rich, to be happy and honored, to be a warrior or to be weak, to be humiliated, to bear the burden of unhappiness, to be neglected, to be enslaved and enslaved, depends on the upbringing they received from their parents as children.

In conclusion, it should be noted that corruption and bribery lead to the loss of justice, which is an important basis for the stability of society. Society becomes fragmented as bribery becomes unjust. Every citizen who wants the stability of our country, the well-being of our people, the development and prosperity of the country, the prosperity of the hereafter, must get rid of the vice of bribery and bribery.

ABSTRACT

In this article, students develop approaches to active civic initiatives, nurture as a person of intellectual potential, develop socially active civic competence, approaches to the concept of citizenship, the concept of active citizenship, socially active civic education, the goal of active participation in society, political through the means of pedagogical and psychological influence on the development of a professional profession on the way to building a free democratic state, civil society by striving to participate in life, to have an active civil position.

KEYWORDS: Competence, Citizen, Active Citizen, Initiative, Socio-Professionalism, Perfection, Generosity, Justice, Democracy, Civil Society, Education, Ethics, Legal Thinking.

INTRODUCTION

In the world education system, models for the development of socially active civic competencies in students through participation in the socio-political life of society have been put into practice. The Incheon Declaration of UNESCO, funded until 2030, recognizes "Education as a key driving force and an important activity leading to sustainable development goals". On this basis, systematic work is being done to develop active civic competencies in the education system of the United States, France, Russia, Germany, England.

The following scientific assumptions play an important role in the development of students in the education system as socially active, harmoniously developed individuals: factors influencing the development of socially active civic competencies in students (intellectual, motivational, emotional, volitional, self-government, subject-practical, existential) protection of civil rights, voluntary self-control, the acquisition of socially significant situations, the creation of conditions

conducive to state and society ideology improvement on the basis of; development of socially active civic competencies in students from imaginary types (interactive methods, creative thinking, sociodrama) to synergy (structural, functional, phenomenal) on the basis of demonstration of civic qualities and initiatives of the educational institution in the form of social and community life; model of development of socially active civic competencies in students, functions of pedagogical process (intellectual, motivational, emotional, volitional, systemic, competent, active, creative) civic and social projects, improvement in the social direction, on the basis of systematization of the level of confidence and the structure of social behavior;

It is important to determine the level of social pedagogical individual qualities that affect the student's personality, the level of assessment of the development of socially active civic competence (necessary, optimal, maximum) on the basis of ethical systematization of democratic values, humanity, ideals. One of the basic rules of the competency approach in education is to understand competence as a subjective quality of a person. This is reflected in the collective nature of learning activities and the acquisition of knowledge through rigid social factors, the development of skills and competencies in students related to subjective motives of learning, attitude to the subject, taking into account the abilities and experience of the learner. Therefore, it is important to consider the research work in recent years, the development of socially active civic competence as a factor influencing the social qualities of students in the education system.

The researches of A.Bine, J.Dewey, A.Maslow, K.Rodgersa and others helped to formalize the fundamental basis of pedagogical conditions of individual approach to the educational process in pedagogy as a "basic concept", its expression in the practice of teacher training in the completely independent work of students (A.K. Ellis, RJMarzano, A.Ornstein, F.Hunkins, V.Zimmerman, etc.).

V.M Rosin emphasized the importance of education through independent learning, trying to "ensure that the educational effects are individual from a particular period and provide the individual with freedom of choice, the individuality of the direction of education."

AS Zapesotsky noted that modern society aims to improve the educational process based on the ideas of individual approach, creating great opportunities for the expression of personality. However, the clear meaning of this concept is that each depends on what goals and means are meant when it comes to an individual approach in a particular case.

There are significant differences in the use of this concept in many countries, in the work of different researchers, and in the practice of an educational institution. The individual qualities of students and the problem of their differentiated learning are of concern to teachers and scholars and are viewed not only as a socio-psychological and philosophical but also a pedagogical problem. Inge Unt gave the most concise definition of an individual approach to the learning process. He understands this as "the development of the individual characteristics of students in the learning process, through all its forms and methods, regardless of any characteristics and norms". Inge Unt also believes that in practice it refers to a relative individual approach rather than an absolute one.

TABLE 2.2.1 PEDAGOGICAL CONDITIONS OF THE MODEL OF DEVELOPMENT OF SOCIALLY ACTIVE CIVIC COMPETENCIES IN STUDENTS:

Pedagogical conditions for the development of socially active civic competencies in students

development of all areas of individual qualities of the student's personality in the classroom and extracurricular activities of students (volunteering, independent work on the knowledge acquired in the classroom);

increase the opportunities for educational content in the development of pedagogical and psychological qualities of students, which are a component of socially active civic competence;

relying on the principles of individual approach through pedagogical and psychological support of students in the development of socially active civic competencies;

continuous monitoring of the level of components of active civic competence in the development of socially active civic competencies;

creating opportunities for student self-expression during educational and social design activities (volunteer activities, seminars, active science clubs);

analysis of the process of development of socially active civic competencies through the development of individual qualities of the student;

organization of spiritual, moral educational classes in the educational process of the educational institution, ensuring the compatibility of knowledge, skills and abilities of students with active civil activity of their own initiative in building civil society in the country;

In our study, the pedagogical conditions for the development of socially active civic competence of students are integrated with the qualities of individual development. In her research, TV Burlakova describes the individual approach as a pedagogical process by the interconnectedness and interdependence of its internal and external aspects.

The development of socially active civic competencies in students, the view of them as a subject, leads to the need to change attitudes through three basic rules:

- pre-determination of individual behavior (recognition of each student's right to individual choice and, accordingly, a person's strict prediction and refusal to manage the student's learning activities in accordance with the purpose);
- personality values (refraining from classifying students on the basis of good-bad criteria in terms of assessing their abilities, while maintaining the criteria for assessment of specific aspects of student behavior);
- Rareness of individual capabilities (readiness of the student to be accepted as another person with separate, unique qualities and individual peculiarities of his own development).
- Among the conditions for the development of socially active civic competencies are developed through objective (democratic lifestyle of the educational institution, openness of its educational system, educational technologies, etc.) and subjective (socially active civic competence and personal qualities of teachers) conditions.

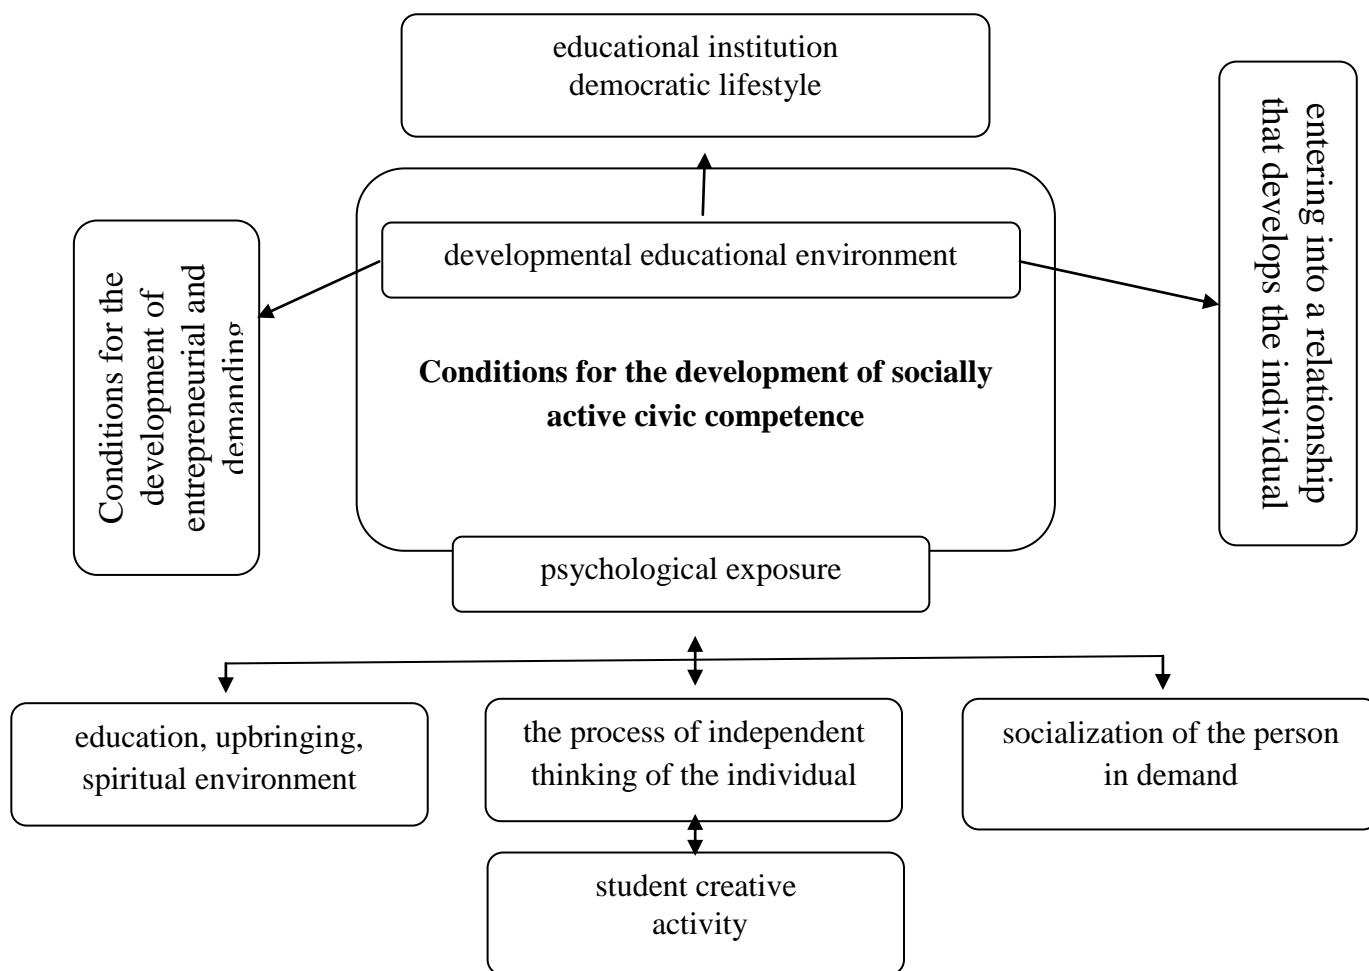

Figure 2.2. Conditions for the development of socially active civic competence in students

In addition, among the competencies related to the interaction of the social sphere in man, the competencies of social interaction are: communication with society, community, family, friends, partners and their resolution, cooperation, tolerance, self-respect, respect for the younger (race), nationality, religion, status, gender), social perfection plays an important role.

Development of socially active civic competencies Students acquire certain ideas, beliefs and relevant moral values, active citizenship position, civic values (respect for the basic values of national and universal culture). Traditional values are manifested in the development through patriotism, service to one's people, humanity, the supremacy of spiritual and moral values over material-pragmatic, human rights, inter-religious tolerance and other moral qualities.

A. Maslow emphasizes that the role of teacher-learner cooperation in the formation of mental qualities in students is not the basis of mastering the basics of science, but the process of acquiring socio-cultural qualities of the individual.

Through the concept of civic competence, E.V Baryshnikova described the active civic knowledge and skills, the valuable areas of mastered civic methods provided in the basic and vocational education programs as a socially acceptable quality.

Based on the model of competence development - basic, specialty, special courses, organization of social practice, development of the system of social partnership and separation of the educational module in the development of students' extracurricular activities, self-government, university public organizations, volunteering with them lies in the implementation of the principles of integrated teaching. A democratic way of life in an educational institution is a necessary condition for achieving this goal.

A.M Knyazev introduces the concept of citizenship as an integrative feature of the individual, which includes socio-cultural, spiritual, moral, cognitive, relational, volitional, moral and reflexive-regulatory components in the basis of civic competence.

Based on the research experience of EV Barishnikova, BA Ozerova, AM Knyazev, VP Gurova and others on the competency approach, we believe that socially active civic competencies can be divided into three groups:

Cognitive block is related to knowledge and methods of acquiring them. These are primarily manifested in the following:

- ✓ Knowledge of society and its structure: social, political, legal, historical, cultural, etc.;
- ✓ economic literacy, knowledge of the principles of modern economic systems, knowledge based on a market economy;
- ✓ knowledge of the state, political system, human rights, elections, social trends and mechanisms for the protection of human rights at all levels, the basics of social design;
- ✓ knowledge of the main spiritual categories ("goodness" - "evil", "humanity" - "cruelty", "generosity", etc.).

In this case, not only the multifaceted knowledge, but also the system of knowledge through important terms, facts, concepts is important, which allows the student to independently fill the necessary source of information. Therefore, the acquisition of knowledge demonstrates the need for certain skills and competencies to master socially active civic competence.

The active (operational) component includes a set of skills and competencies necessary for the life of a multinational society, which is based on democratic principles:

- ✓ Readiness to perform various social roles related to socially active civic activity: the role of voter, consumer, family member, neighbor, student, colleague, social and political figure, litigants, leader or team member, etc.;
- ✓ competencies of social choice and social behavior, skills of socially active citizens to fulfill their rights and obligations necessary for participation in society, political and active civic skills, ability to analyze the political situation, knowledge of democratic procedures, exercise and protection of their rights. He should participate in social design, demonstrating motivational activity in public affairs (in public organizations, self-government, etc.);
- ✓ communicative culture - a democratic style of communication, the ability to renounce authoritarianism, to express their ideas clearly and reasonably, to speak in front of an audience, to debate, to enter into dialogue, to define and justify their position, to oppose democracy, conjuncture, pressure;
- ✓ critical thinking - the ability to analyze, evaluate, summarize and systematize information, draw competent conclusions based on a variety of data;
- ✓ analysis of personal, professional tendencies and opportunities, understanding of the field of market relations, labor legislation, acquisition of labor organization skills, knowledge of labor and collective ethics.

Axiologically competent person has the following pedagogical and moral values:

- Humanity;
- Patriotism;
- Freedom;
- Social interest;
- Justice;
- Personal responsibility for the fate of the country;
- Respect for human rights and freedoms;
- Preservation of national traditions and national cultural heritage, respect for universal values;
- Democratic norms and rules;
- recognition of belonging, national and universal values as one's own, the ability to connect oneself with a particular national culture, nation and state.

However, methods of activity with knowledge of an objective nature, values cannot be realized through the perception of a person without certain abilities, they serve as "information for self-improvement", developed through the formation of individual qualities of man developed through.

The country is on the path of "building a democratic state governed by the rule of law and an open civil society, ensuring the observance of human rights and freedoms, the spiritual renewal

of society, the formation of a socially oriented market economy, integration into the world community." An important factor in the education of the individual in any society is the strengthening of the individual factor and passion, the formation of the ability to work independently, the development of socially active initiative.

Social justice plays an important role in increasing the social activity of students in society. Social justice is about ensuring the equality of all citizens before the law, regardless of their political views, gender, nationality, language and religious beliefs.

In his research, Professor Sh.R.Baratov stated that personal activity, first of all, self-development, the process of striving to use their potential effectively, and the constant study and development of this process is one of the important tasks of society to ensure personal development.

Through a competent approach, a socially active citizen should be able to:

- Clear understanding and assessment of their active civil status;
- Active participation in socio-political life, analysis of the effectiveness of such participation based on the interests of society in building a civil society;
- Management in accordance with the effectiveness of citizen participation in society and the interests of the individual, society and the state;
- Analysis and correction of the system of civil relations in connection with the events of public and state life;
- development of its active civic competence, aimed at ensuring the interests of society in accordance with the interests of society and the state, based on the analysis of events in the country and society;
- regulation of the rights and obligations of young people involved in socio-political events based on ethical and legal norms;
- understanding and regulation of personal, moral, civic, cultural and other values.

By summarizing the views expressed by scientists in the study, the system of interaction between the teacher and the student is expressed in the form of social interaction, education, nature, active activity.

In psychology, the following qualities of social cooperation in the development of personality traits from students were highlighted: introduction of pedagogical-psychological cooperation; implementation through the individual qualities that the student performs in interaction with the teacher; the teacher initiates the action as an individual and engages students in it; the student acts on the basis of a pattern, following the example of the teacher; participates in the control of active individual actions of the teacher in student self-management; students perform reflexive actions of self-activation, self-organization.

The following considerations should be noted in the development of socially active civic competencies in students:

- The main task of civil society in educating the younger generation is to develop a socially active citizen;

- To inculcate in students the idea of building a democratic state, to ensure socially active participation in all spheres of life;
- Ensuring the active participation of students in building civil society, incorporating the ideas of interethnic harmony, inter-religious tolerance, the welfare of the people, the perfect man;
- preparing students for independent life and developing their socio-political and legal literacy;
- Development of socially active civic competencies in students through active participation in social projects such as "Mentoring", "Student Tribune";
- It is possible to develop socially active civic competencies of students in higher education institutions through "active participation in the activities of youth unions, wide involvement in the activities of self-governing bodies."

Thus, in the development of social civic competence, students are the most important initiative factor in building a democratic state, civil society.

CONCLUSION

As a result of the analysis of scientific sources on the competent approach to socially active citizenship:

- Social roles of students are defined as specially organized lessons and extracurricular activities aimed at studying the rights and responsibilities of students and mastering the subject "Strategy for the development of Uzbekistan: Civil Society" (socio-cultural (active civic) competencies);
- The development of socially active civic competencies was noted as a condition for building a democratic state governed by the rule of law and increasing the social stability of society, as a factor in its sustainable development;
- Socially active civic competence prepares a person for successful work in a democratic state governed by the rule of law, civil society and market economy, which in turn defines the elements of the subject "Uzbekistan Development Strategy: Civil Society" in pedagogical higher education institutions: socially active civic knowledge, skills, skills and civic qualities; In the work of many researchers, the main factors of the effectiveness of the environment and conditions of the educational institution "Strategy for the development of Uzbekistan: the science of civil society" were identified;
- It was noted that today the priority of a socially active civic competence approach, the main content of which is to train students who can apply their socio-political knowledge in practical activities and solving a wide range of life tasks;
- The development of socially active civic competencies was explained to students a set of skills that allow them to actively, responsibly and effectively implement the full range of civil rights and obligations in a democratic society, to apply their knowledge and skills in practice.

The analysis of the scientific literature also focuses on the development of socially active civic competencies in students in the work of researchers. At the same time, the existing scientific works do not address the qualities that affect the activities of the individual, and in our opinion, in the development of scientific competencies, the educational environment of the educational institution can develop more socially active citizen.

Significant indicators of socially active civic competence in students are new products in the field of individual qualities of the student, which serve as a necessary condition for the development of socially active civic competencies of the individual.

MODAL PARTICLES AND THEIR INFLUENCE ON THE STRUCTURE OF SPEECH

Babaeva Gulzira Sarsenbaevna*; **Bakbergenov Aybek Yesbergenovich****;
Koblanova Gulbanu Bakbergenovna***

^{1,3}Karakalpak State University,
UZBEKISTAN

ABSTRACT

This article discusses the meanings of different particles in German language, the differences between Karakalpak and German particles in translation and their usage in various contexts. We can see that in German dictionaries, in rare cases, the translation of modal particles is given. This is because, modal particles can express a lot of meanings depending on the context or situation. In German, it is not uncommon to use modal pronouns. However, the use of modal particles gives the speech a natural look.

KEYWORDS: *Particle, Conjunction, Modal Particle, Closed Class Parts Of Speech, Simple Sentence, Declarative Sentence.*

INTRODUCTION

Lexical units in modern linguistics are considered to be the most important communicative tool in the process of speaking. In this case, the speaker does not express his opinion in a uniform way, but expresses to him emotional feelings. That is, words that do not answer a specific question, do not serve as a part of the speech, only affect the whole speech and give it additional meaning are also used. Similar words occur in most languages, and in German the same words are common. Such words used in speech are called particles. Particles usually have a emotional function in German and are often used in oral speech. They are closely related to the context, so it is difficult to find an exact translation because they do not have a clear meaning and do not have an equivalent in other languages. However, depending on the role they play in the speech, it is a conjunctive, which corresponds to the Karakalpak conjunctions. However, in the case of a particle, it can be seen that the function of the particle is similar to that of the particle. Particles do not perform a significant grammatical function, so their use in speech is not strictly forbidden (it can be omitted).

MAIN PART

Most modal partitions can come in different meaning depending on the context, that is, the meaning that is expressed in one context becomes completely different in another context. For example, the following examples show that the word **aber** has a different function in speech.

Ich habe kein Fahrrad, **aber** wir haben zwei

Meniñ velosipedim joq, biraq eki mashinamız bar.

(I have not got a bike, but I have two cars)

In this sentence, **aber** is translated into Karakalpak as **biraq** and has its own grammatical function, that is, it serves as a contradictory link that connects two simple sentences.

Das freut mich **aber**, dass du wieder gesund bist.

Seniñ táwir bolǵanıńnan quwanışlıman! (I am glad that you are recovered!)

In the second example, the word **aber** comes in the form of a modal particle, which adds meaning to the word and plays a sensory role in conveying the surprise of the speaker to an unexpected event. Thus, the word **aber** in this sentence is not translated into Karakalpak.

Compared to other languages, spoken German is distinguished by its modal particle richness and diversity. In this case, they are widely used to give vitality and clarity to the opinion of the speaker. Through the use of modal particle, the second speaker is able to choose, be interested, confirm, suspect, predict, express mildness, and so on. applied.

The literal translation of the word **aber** is **biraq** (but). The word **biraq** serves as an interconnected link between two opposing verbs. However, he performed other services in German:

Du bist **aber** groß geworden!

Sen úlkeyip ketipseñ! (You've been growing a lot!)

The function of the word **aber** in this sentence is to impress the speaker in expressing the astonishment of the speaker. In this case, the speaker, using the word "aber", expresses his feelings to him without fully expressing his opinion.

Dein Hund ist **aber** klug.

Seniñ iytiñ aqıllı eken! (Your dog is smart.)

In the second example, the compliment uses the word **aber** to express a feeling of amazement.

The word **bloß** means – **az, ko`p emes** (little, not much) when translated from German:

Ich habe **bloß** 5 Euro bei mir, kannst du mir leihen?

Meniñ 5 evrodan azıraq pulım bar, maǵan azǵantay qarız berip tura alasañ ba?

(I only have less than 5 euros with me, can you lend me?)

In this sentence, the word **bloß** signifies a degree and has always been a part of speech. In addition, in some cases, it is usually a modal particle. The word **bloß** in German means to surprise, confusion when it comes to interrogative sentences:

Was will man **bloß** von uns? [1]

Bizlerden ne qálep tur ózi?(What does he want from us?)

In this example, the speaker expresses his choice and admiration by using the word **bloß**. When the word comes in the German language in the sense of command and demand, it means a precautionary warning:

Komm **bloß** nicht zu spät! [2]

Kesh kelme! (Don't be late!)

The word **denn** is translated from German as "cause". The speech function of the word **denn** coincides with the causal link in the Karakalpak language. He connects two simple sentences in the sense of reason.

Wir haben zwei Autos, **denn** wir mögen Autos.

Bizlerdiń eki mashinamız bar, sebebi bizler mashinanı jaqsı kóremiz.

(We have two cars because we like cars)

In this example, **denn** has served as an auxiliary word, connecting the two sentences in the sense of causation.

The word **denn** is not only used in German as a linker, but also as a modal particle in some cases. They are, of course, very common in interrogative pronouns. There are two types of interrogative sentences in German:

Interrogative sentences with question words;

Interrogative sentences without question words.

The word **denn** is used in both types of interrogative sentences. It is used to express one's opinion on a situation. It also conveys the meaning of doubt, pity, warmth, and astonishment. For instance,

Hast du **denn** kein Geld mehr?

Basqa aqshań joq pa ne?(Don't you have any more money?)

In this example, he showed how he was affected by a situation.

Kommt Dennis **denn** heute?

Dennis búgin kele me ózi?(Is Dennis coming today?)

In the third example, **denn** comes in the sense of suspicion. As can be seen from the above examples, if the word **denn** was not used, the speech would have become a simple text without expressing any of the author's feelings.

When we translate the word **doch** from German, means **sonda da, ne bolsa da, solay bolsa da, biraq(even so, whatever, but)**. For example,

-Hast du keine Zeit? -Seniń waqtıń joq pa? (-Do not you have time?)

-**Doch**, natürlich habe ich Zeit. – Sonda da waqtım bar, álbette.(-Yes, of course I have time)

The word **doch** comes from the German word modal particle and changes the word. When it is used in declarative sentences, it expresses wish and command sentences. The word **doch** has been used to express feelings of guilt and sadness when it comes to declarative sentences:

Die Männer können **doch** nicht kochen! [3]

Erkekler awqat pisire almaydı! (Men cannot cook!)

Here, the word **doch** means sadness, that is, a feeling of resentment through mockery.

The word **doch** comes in the German language in an imperative sentence, adding to the feeling of amazement and excitement:

Ich habe dir **doch** gesagt, dass ich es nicht verstehe.

Men sağan onı túsınbeytuğınımıdı ayttım goy! (I told you I didn't understand.)

In the example above, there are feelings of excitement and amazement. Increases the amazement of speech. Also, **doch** is used to express demand and ask for, showing modesty:

Probier **doch** mal, es schmeckt lecker.

Jep kór, mazalı eken. (Try it, it tastes delicious.)

In this case, the **doch** adds gentleness to the general speech and intensifies the desire. For example,

Wenn er **doch** bloß gefragt hätte! [4]

Eger ol sorağanda ma edi! (If only he had asked!)

The word **eben** in German performs the functions of adjective and adverb. When it comes as adjective, it means *tekis*, *mulayim* (smooth, gentle). But when it comes as adverb – *meansha`zir*, *tap ha`zir* (now, right now, just). For instance,

Er war **eben** hier.

Ol tap házir usı jerde edi. (He was just here)

In the given example the word **eben** used as an adverb and used as a modal particle in German. In the sentence expresses the feelings of being angry, sadness. The word **eben** is used only in declarative sentences:

Sie versteht es **eben** nicht.

Ol bunı tek túsınbeydi. (She just doesn't understand)

In the example above, we can see that the word **eben** gives a sense of absence.

The word **eigentlich** in German performs the functions of adverb and adjective. When it comes as an adverb, it means **haqiqatında**, **shinında**, **negizinde** (actually, in fact, in principle). However, when it comes as an adjective, it means *shin*, *haqiqiy* (real, true):

Eigentlich, darf ich es nicht sagen, aber Ihnen sag ich es.

Negizinde, men onı aytpawım kerek edi, biraq sağan onı aytaman.

(Actually, I'm not allowed to tell, but I'll tell you)

Hence, the word **eigentlich** in the example comes as an adverb. **Eigentlich** comes as a modal particle and comes especially in interrogative sentences. It expressed great interest in the question. If you are curious about something that you have not been able to ask for a long time, we use the word **eigentlich** as follows:

Kannst du **eigentlich** Spanisch?

Sen ispansha sóyley alasañ ba?(Do you actually speak spanish?)

As we can see in the examples, the question asked with an interest.

The word **etwa** in German comes as an adverb. When we translate it from German, it means **shama menen, átirapında (about, approximately)**. For instance,

Etwa zehn Tage. – Shama menen on kún.(About ten days)

In the given example this word is given in approximate meaning and gives the sentence inexactness. The word **etwa** comes in German as a modal particle. Usually used in interrogative sentences. In interrogative sentences it intensifies the question and the sense of uncertainty:

Hast du **etwa** im Bad das Wasser laufen lassen?

Sen vannağa suwdı ağızdın ba?(Did you run the water in the bathroom?)

In this case, the questioner expressed a feeling of distrust of the question, as he expected the opposite answer to the question from the respondent.

The word **ja** means **awa** in Karakalpak and means positive answer:

Kommst du? – **Ja**!

Keleş be? – Awa!(Will you come? – Yes!)

Ja can be used in German as a modal particle. In declarative, imperative and in the sentences of the sense of demand it intensifies the sentence. For example,

Da ist **ja** toll! Bul ájayıp eken!(It is wonderful)

In the example the word **Ja** comes in interrogative meaning and it expresses the joke or anger.

In the following examples, when it comes to demanding sentences, the sentence intensifies the sense of urgency and warning: Komm **ja** nicht zu spät heim! [5]

Úyge kesh qaytpa!(Don't be late!)

In the given example the word **Ja** comes in the meaning of warning. Furthermore, **Ja** as a modal particle in interrogative sentences, it expresses the general truth:

Frauen können **ja** nicht Autofahren!

Hayallar mashina aydawdı bilmeydi! (Women cannot drive)

As we can see, this example is about general truth.

Ruhig in German used as an adjective and translated as **tinış, arqayın**(calm):

Peter geht am liebsten im Olympiapark joggen, weil es dort so schön **ruhig** ist.

Piter Olimpia parkine juwırıwğa baradı, sebebi ol jer júdá tinış.

(Peter prefers to go jogging in the Olimpiapark because it's so nice and quiet there.)

Ruhig can be modal particle in German. **Ruhig** used in declarative and in the sentences of demand and intensifies the feeling of permission.

Sie können **ruhig** rauchen, mich stört das nicht! [5]

Siz arqayın shekseñiz boladı, mağan kesent etpeydi.

(Come and smoke, I don't mind!)

As we can see in this example, the word **ruhig** used in the sense of permission.

Ruhig in the demanding sentences, intensifies the sense of demand.

Machen Sie **ruhig** die Fenster zu!

Aynanı jabıń qáne!(Close the windows!)

Schon translated from German, means **álleqashan, qashshan-aq(already)**. **Schon** used as an adverb as follows:

Wir haben **schon** mit ihr zusammengearbeitet.

Bizler onıń menen álleqashan birge islegenbiz.

(We have worked with her before)

Schon can be used as a modal particle and expresses the meaning of being annoyed, resentment, submissiveness. We can see the word **schon** in the examples of declarative, imperative and interrogative sentences:

Mach **schon**!

Isleyǵoysa endi!(Go ahead!)

So, in the example above, in the interrogative sentence given with a sense of urgency, and the order was required to be carried out quickly. In the declarative sentences as follows,

Das wirst du **schon** erfahren!

Bunı da bilip alasań ele!(You will find out!)

In the example the word **schon** expresses the meaning of submissiveness. **Schon** can be used in some cases in rhetorical questions. For example, if a person asks a question to another person, and the other person answers that question with another question, the word **schon** is included in the given answer. This rhetorical question may sound awkward, but it is a natural situation in German. For example,

A: Was willst du denn machen?(What are you going to do?)

B: Na, was **schon**?(What do you mean?)

A: Ne isleyjaqsan endi?

B: Haw, neni?

Vielleicht means in Karakalpak **báلكim, múmkin (perhaps, may be)**. **Vielleicht** used as an adverb:

Ich komme **vielleicht** heute Abend. (I may come tonight)

Báلكim búgin keshte kelermen.

Vielleicht used as a modal particle in imperative sentences and means astonishment.

Du bist **vielleicht** schlau!

Sen dım sumlıqlı ekenseń! (You may be too smart!)

As you can see in the example above, there is a feeling of wonder when you see something you have never seen before.

When we translate the word **wohl** from german, it means **múmkın, shaması, jaqsı** (possibly, almost). **Wohl** used as an adverb. If the word **wohl** comes in the meaning of **jaqsı (good)** (adjective), represents a sign of movement and serves as an adverb. Usually means **múmkın, shaması** (possibly, almost):

Er fühlt sich **wohl**.

Ol ózin jaqsı sezip atr.(He is feeling well)

In the given example the word **jaqsı** comes as an adverb. However, in the following examples expresses the meanings of possibility:

Heribert kommt **wohl** heute nicht.

Heribert búgin kelmedi-aw. (Heribert is probably not coming today.)

In the sentence the meaning of possibility is clearly visible. **Wohl** comes as a modal particle. As a modal particle it can be used in interrogative and declarative sentences and intensifies the sense of probability. For example,

Was meint sie **wohl** damit?

Ol bunıń menen ne demekshi?(What do you mean by that?)

In the given example the **wohl** serves as a modal particle and means possibility and probability.

Wohl in declarative sentences serves in the sense of probability:

-Wo ist Karl?

-Der wird **wohl** nach Hause gegangen sein.

-Karl qay jerde?(Where is Carl?)

-Ol úyine ketken shıǵar.(He probably has gone home)

CONCLUSION

Each of the above-mentioned modal particles has its own peculiarities, which give it a different feeling. Although modal particles in the German language appear to be simple, it is a bit difficult to understand them. Even in the usage of the simple words like **Ja**, can be some confusions. This is because it has been used to explain different meanings in difficult situations or contexts.

In addition, one of the peculiarities of modal particles is that they cannot be translated from German into other languages. That is why, we can see that in German dictionaries, in rare cases, the translation of modal particles is given.

In German, it is not uncommon to use modal pronouns. However, the use of modal particles gives the speech a natural look. Native Germans make extensive use of modal particles in their daily lives. Those who are learning German as a foreign language also have the opportunity to use the modal participles in their speech and to respond to the real German. For this reason, in-depth study of modal particles is of great importance as a step in the study of the German language.

THE ACHING METHODS OF READING

A. Mambetniyazova*; G. Babaeva; A. Djumamuratov*****

^{1,3}Karakalpak State University,
UZBEKISTAN

ABSTRACT

This article deals with the development of reading strategies in studying foreign languages. The article provides information on the rules that are important to the understanding and effective interpretation of the text. At the same time, there are some differences in reading comprehension between weak and strong pupils present in all classes and groups.

KEYWORDS: *Skills In Studying Languages, Types Of Competence, Ability To Read, Reading Strategies, Effective Reading Comprehension, Intensive Reading, Intensive Implementation, Figurative Image, Visual Image, Basic Tendency.*

INTRODUCTION

Reading is one of the core competences that students acquire during their elementary school years. The ability to read and interpret textbooks and other assigned material is a critical component of success at university level. Reading skills form the basis for learning and are an important element for obtaining knowledge in academic learning in all subject areas. However, research on both L1 (first language speakers) and L2 (second language speakers) reading indicate that proficient reading is a complicated process that involves a combination of different abilities and strategies at the same time to compensate for each other in processing a text. These competencies are an integral part of communicative competence and are essential for developing students' ability to read fiction texts.

REVIEW OF LITERATURE

While the research cited to this point has relied upon the use of mature accomplished readers, the present study seeks to determine the influence of schemata on the comprehension skills of a sample with less reading experience and a greater diversity of reading aptitude. Brown and Smiley (1) have argued that a reader's ability to detect the structure or theme of a passage and to utilize this information in determining which statements within the passage are important develops with age. The ability to apply an external structure may be subject to the same

developmental constraints. A similar prediction can be made in regard to the grouping of students by general reading competence. Obviously, it is expected that good readers will be able to recall more information. However, this study seeks to determine if the assigned perspective causes good and poor readers to differ in the pattern of their recall. If asked to take a perspective, the superiority of the good readers should be most obvious in this group's recall of information related to then perspective. If good and poor readers are given no perspective, the good readers should retain all material at a uniformly higher rate

According to Zare-eel (2), "Reading comprehension is essential to academic learning areas, to professional success, and to lifelong learning." The struggle to improve the quality of education provided to students relies on the necessity of teaching reading comprehension strategies. The comprehension of written text is now embedded in all content areas, which is assessed on the standardized test given to our students. According to the No Child Left Behind Act of 2001 (2002), for schools to continue to receive government funding, all state schools must show "continuous and substantial improvement" for all students including students with disabilities, minorities, English as a second language, and the low income population. In order to raise standards in the public school system standardized testing is used to measure accountability. In order for students and teachers to obtain a fair evaluation, students must know how to use reading comprehension strategies to provide the accountability data.

Reading comprehension is the main factor that all content standards have in common. In order to provide growth opportunities in every subject matter, reading comprehension strategies must be taught to obtain the knowledge needed to satisfy the accountability standards.

One of the most important opportunities for the development of reading competencies is the fact that a pupil is able to work on the text. In fact, in any classroom, we categorize pupils into strong and weak categories. The question arises as to how the pupil should read the texts and what they should pay attention in order to develop reading comprehension skills. It is also natural to wonder how strong and weak pupils differ from one another. Based on the results of his research, Duke / Pearson (3) acknowledges what the reader needs to pay attention to in reading and using strategies:

- a strong pupil actively monitors the learning process and initially works on the basis of a clear learning objective;
- continuously focuses on the correctness of the purpose of the reading process;
- a strong pupil will look at the text before reading it in detail and determine the purpose of the reading with the help of specific features such as text structure;
- the pupil makes different hypotheses about the continuation of the text in the reading process;
- the pupil is constantly confronted with some questions in selective reading, such as what I read quickly or slowly, what I should read again;
- a strong pupil records and controls the content of what he or she is reading;
- they activate their previous knowledge and link it with the content of the text;

- learns about the author, reflects on the style of reading and the purpose of the text, on historical relationships;
- the pupil strives to understand the meaning of unfamiliar words or concepts in the text;
- they focus not only on the content and the quality of the text, but also on it intellectually and emotionally;
- a strong pupil reads different types of text in different ways;
- they study the text not only in the reading process but also in the short pause and the reading;

We can see from studies that weak students' attitudes toward learning and the use of reading strategies differ from strong students. At the same time, we must note that low levels of knowledge about auxiliary and important strategies are less relevant to the use of reading strategies.

On the other hand, weak pupils have a lack of motivation to study. Intensive reading with texts is essential to successful reading. Intensive implementation of strategies also requires extra effort and attention. A weak pupil not only becomes passive in the learning process but also avoids strategic exercises. It is important to recognize that the reading strategies available to strong pupils are supported by all students in the classroom.

The development of reading skills in the learning process requires the use of learning strategies and self-training. It is also important that pupils have sufficient time for performing text and exercises related to reading skills.

It is important to choose the right texts to increase your interest in reading, for example, be aware of the information contained in the text, understand the rules and regulations of the game and so on. They can understand different types of text if they have sufficient reading and writing skills. In conclusion, we must also note that the understanding of the text always applies to the knowledge of the reader. In this way, by reading a well-chosen text, the reader not only learns new words about the topic, but also focuses on their use in the text.

Teachers can have students diagram the *story grammar* of the text to raise their awareness of the elements the author uses to construct the story. Story grammar includes:

METHODS

As we have demanded, it is important for linguists not only to read and understand all types of texts they understand, but also to write different texts. As a result of the link between reading and writing skills, writing develops in writing, and writing develops in reading.

Based on the above considerations, let us focus on the following steps in developing new strategies. They are:

- express and explain the strategies;
- provided by the teacher and learner;
- general use;
- to do exercises in small groups based on instruction;
- independent expression of the strategy;

- re-examination and identify the acquired knowledge and skills.

The teacher should always pay attention to how the strategies of the learner are used in the use of these particular stages. In this way, they will develop their reading and understanding skills. It is important to choose other approaches when presenting or explaining additional guidelines in order to avoid ineffective and simple use of the strategy. Language learners should independently test the use of strategies and understand their own skills and shortcomings in reading and understanding the text.

Several strategies for effective reading comprehension are presented. Students' knowledge of the topic will be revealed during the pre-text exercise. As you read the sequel, you will see whether the points you make are true or false. Written data is abstract because it is difficult to remember. Figurative images help us to understand and relate the text as well as being specific and easy to remember. Visual images present textual information in graphics, diagrams, models, or drawings. Moving to a visual form enhances the relationship between the learner's ability to read and understand and interpret the text. Summing up the above points, we would like to present below the purposes that are important to the structure of the conversation and the questions that are necessary to continue the conversation.

<i>Purpose</i>	<i>Questions</i>
To start the conversation	What does the author want to report about? What is the author going to say ?
Identifying the author's opinion	What is the author going to say and what does it mean?
Identifying of data connection	What kind of information has the author given us? How can we respond to the information given by the author?
Determine the existing barriers to text comprehension	What kind of shortcomings we have in understanding the content of the text? What can we find?
Read the text to determine whether the comments and conclusions are relevant	Has the author told about that? Have we found the answers from the opinions given by the author?

CONCLUSION

In summary, most language learners need detailed instruction and exercises to perform complex tasks and to understand the text (oral and written). In understanding and interpreting the text, we would like to draw attention to the following rules:

1. Delete insignificant information;
2. Delete excessive information;
3. Express the idea, which was expressed in many words, in one word;
4. Expressing the events in one word;
5. Choose the basic tendency;
6. They should create the basic tendency themselves.

Mentioned rules play an important role not only in the understanding of the text, but they give effective results in conclusions. In summary, the effectiveness of students' learning competences

will be enhanced if the effective use of learning tools is based on the above-mentioned pedagogical and didactic factors. Forming students' reading comprehension competencies also includes teaching them to think, summarise, analyze, make conclusions and express their own ideas. By giving students a creative approach, they can develop a sense of patriotism, respect for their profession and hard-working.

EFFECTS OF USING SIGNAL SPEECH IN TEACHING DEAF CHILDREN

Maftuna Abdulayeva*

*Lecturer of the Tashkent State Pedagogical University,
Tashkent, UZBEKISTAN

ABSTRACT

This article analyzes historical approaches to the importance of sign language in the education and upbringing of deaf children. The use of sign language in the education and upbringing of deaf children ensures the establishment of a unified system of teaching, upbringing and labor activities in a special school, significantly affecting the generalization, robustness, completeness and differentiation of formed concepts. This has a positive effect on the acquisition of the concepts that make up the content of academic subjects. The article highlights the positive effects of the use of sign language in the teaching of deaf children.

KEYWORDS: *Deaf Children, Teaching, Sign Language, Special Education, Process, Psychological, Pedagogical Approaches, Labor Activity, Integration, Psychological And Pedagogical Bases.*

INTRODUCTION

The use of sign language in the education of deaf children has been at the center of heated debates for centuries. At different times, the solutions of different pedagogical schools and directions have been decided differently depending on the methodological views, ideas about the goals and objectives of teaching, and understanding of the linguistic structure of sign language. The following key approaches can be identified in assessing the role of sign language in the education and upbringing of deaf children: recognition of the leading role of sign speech in the development and upbringing of deaf children ("mimicry method", "bilingual approach"); complete denial of the role of speech in learning ("pure oral method", modern "oralism"); the emergence of sign language as an auxiliary tool (the tradition of teaching Russian sign language in the first half of the 19th century) or one of the tools of the pedagogical process ("general communication") [1,12].

Let's analyze the main arguments of the proponents of the above directions. S. M. Delepe and RA Sicard, the creators of the "mimicry method", the development of the ideas of "Spanish" and "English" schools in the period of individual training, considered the need to include sign speech in the pedagogical process, Voltaire, Diderot, Rousseau and other encyclopedists. Based on their ideas, Delepe and Sicard set the task of educating the deaf spiritually and morally for the first time in the history of sign language pedagogy. Educational opportunities for hearing-impaired, disabled, and deaf children were considered for the possible development of deaf children with healthy sense organs. Therefore, the principle of "natural", "natural - like" (Rousseau) education required the inclusion in the pedagogical process of visual speech, which is perceived through the eyes, which is the child's native speech. In deaf sign language, Delep and Sikar see a way for deaf people to naturally express their feelings and thoughts. Therefore, in the system of means of speech, sign speech played a key role in the pedagogical process. [2, p. 12].

Heinicke Kant's ideas, in particular, the role of spoken language in the development of human thinking [8, p.45]), also reflected on the concept of A. Dister - VYeGA, according to which the priority goal of education is "formal" education, thinking and speech development [2, p. 62]. So, according to Geinica, the main task of educating the deaf is to form oral speech. As for sign speech, Geinicke and his successors could not use sign speech to solve the problems of developing deaf mental operations, because gestures cannot express abstract concepts. In the Pure Oral Method, sign language is not only used in teaching, but also as a way for deaf people to communicate.

When it comes to modern trends in teaching deaf children their mother tongue, proponents of 'oralism' actually use the classic 'pure oral method' argument and thus exclude sign language from the pedagogical process. At the same time, representatives of "total communication" mainly share Detepa's views and advocate the expediency of using all means of speech in the school for the deaf, including sign language. "The most consistent ideas of the" mimicry method "system of teaching deaf children developed by its creators and is called the "bilingual approach". This system began to take shape in Western Europe and America in the late 70s and early 80s. The theoretical platform of the "Bilingual Approach" is based on the latest achievements of modern science: linguistics, psychology, psycholinguistics, sociology, etc. allowed for a different approach. Psycho-logical and psycholinguistic research in recent decades has convincingly shown that sign speech plays an important role in a child's mental development, in the processes of receiving and processing information, and in the formation of a deaf person's personality. Recognition of sign language as one of the most advanced natural languages, recognition of the important role of sign speech in the lives of the deaf, and their cognitive and communicative activities have led to a change in the attitudes of deaf people as members of society [3, p. 34].

In modern cultural-sociological concepts, it is generally accepted that the development of a developed society stems from the successful interaction of its structural micro-societies, which differ in their various national, religious, linguistic and other traditions. Members of such microcolumns do not have all the "standard eligible conditions" that fit a certain size, and have every right to meet their special needs. It has radically changed the way society treats people with disabilities, including the deaf. Deaf people are "not required to be like the deaf, like many." And deaf people who consider themselves members of microsociums of the deaf have the right to develop their culture, speech, and education in national sign language (GL Zayseva [4 , p.78] .These rules formed the basis of the theoretical platform of the "bilingual approach"

system. "Ideologists of the" bilingual approach "should use two equal means of speech in the education of deaf children: the national language (English, German, etc.). and the national status of speech. The new status of sign language and the widespread use of sign language in the education and social services of the deaf in modern Western society and its role in the system of sign language teacher training made it necessary to consider. We will focus on this issue in the next section and look at how sign language is addressed in sign language teaching.

The formation of views on the role of sign language in education in Russia was closely linked with the formation of a national system of teaching the deaf. This system (since the XVIII century) is based on the generalization of the experience of working with the deaf in orphanages, as well as the ideas of AN Radishchev, who considered sign speech as an important tool for the spiritual development of the deaf formed [1, p. 29].

In the Russian school for deaf children in the first half of the XIX century (GA Gursev, VI Fleury had to solve a wide range of tasks (moral education, mental and physical development of children, etc.)) For this purpose from all means of speech: oral speech (in oral, written, and dactyl forms) and sign language. Many questions related to sign language have been considered by V.I. Fleury as "deaf-Mutes in relation to the methods of teaching which are inherent in nature" [4, p. 43] has been discussed in detail and surprisingly sagaciously. Fleury considers sign language to be a "temporary helper" in teaching the deaf, and its use (mainly "natural pantomime") is appropriate in the early stages of teaching. As you become more verbal, sign language will gradually become a tool. Interestingly, VI Fleury was convinced that a sign language teacher should be able to speak in sign language, to work in this way with deaf children, "... combine and, if possible, combine these three methods: facial expressions , writing, and words. "c. I. Fleury and G. A. Gurava commented on the issues, mainly Y.T. Speshnev, I.Y. Seleznev and other teachers, whose activities took place in the 50s and 60s of the XIX century [4, p. 45].

However, in the late 1970s (beginning with A. F. Ostrogradsky), the work of schools for the deaf in Russia was gradually revived under the influence of the ideas of the "pure oral method" [5, p. 45]. The expediency of using sign language is strongly denied. However, it is interesting to note that sign language is of deep interest to experts. Thus, Lagovsky, a strong supporter of the Pure Oral Method, devotes a special section to the signing of language in his book Teaching Oral Speech to the Deaf and Dumb. The author has enough experience working with deaf children and concludes that sign language can be of great benefit to deaf children as a means of interpersonal communication, such as aesthetic education, etc.

However, Lagovsky believes that all this is dangerous for the formation of oral speech. Therefore, the conclusion is to use sign language in the classroom and the communication between students. "Pure oral method" in Russia in the late XIX - early XX centuries. The "pure oral method" was used by most schools in the country in the first decades after the October Revolution. However, gradually the best teaching teams in the theoretical and practical work of many specialists. summarizing his experience, he made it clear that a "pure oral method" for solving new problems was not acceptable. L. S. Vygotsky made a great contribution to the theoretical substantiation of the need to reconsider the content, methods and means of teaching and educating deaf children [6, p. 18]. Vygotsky's approach to identifying the nature and structure of the defect allowed him to see the problem of speech formation as important, but in

his view, it was not the only component of educational work that needed to address the shortcomings and the social upbringing of children in general.

S. Vygotsky considers the developmental features of a deaf child as development in the context of polyglossia. JS Vygotsky formulates his views in his speech at the All-Russian Conference of Deaf Teachers: “.... using all the possibilities of a deaf child’s speech activity, without rejecting facial expressions and treating them as enemies, different forms of speech can only compete with each other. We must understand that they can serve and hinder each other's development. Therefore, the maximum use of all available forms of speech for a deaf child is a prerequisite for radically improving the upbringing of deaf children. Theoretical study of the problem, The importance of sign language in determining the features of the structure of sign speech, the formation of cognitive and communicative activity of the deaf.

GERMANY IN COOPERATION IN THE FIELD OF EDUCATION OF THE REPUBLIC OF UZBEKISTAN

Boymurodov Shukhrat Toshkentovich*

*Candidate of Historical Sciences,
Karshi Engineering Economics Institute,
UZBEKISTAN

ABSTRACT

The work of the United Nations in the field of education is coordinated by UNESCO, and at the initiative of the organization measures are being taken to improve the quality of education in various countries, the introduction of relevant standards, standards, various innovative projects. Cooperation of Uzbekistan with international organizations and foreign countries in various fields, in particular, with Germany on strengthening the material and technical base of secondary special education institutions, the organization of the educational process, as well as training, organizing scientific conferences on various topics will be analyzed.

KEYWORDS: *Uzbek-German Project, Kfw, Goethe Institute, Academic Lyceum, German Foundation, Inwent.*

INTRODUCTION

The education system has been one of the most important factors in the development of society in all periods of historical development. There is a serious focus on education in the world, and a number of international organizations have been established in this area. In addition, the work of the UN in the field of education is coordinated by UNESCO, and at the initiative of the organization measures are being taken to improve the quality of education in various countries, the introduction of relevant standards and standards, the implementation of various innovative projects. In 2003, UNESCO declared the 10th Anniversary of Education for Sustainability and Development, and extensive work has been done in Uzbekistan in this regard. Uzbekistan has become a member of UNESCO's Global Partnership in Education.

The process of improving the concept and practice of secondary special vocational education in Uzbekistan has been carried out on the basis of innovative technologies. This, in turn, contributes to the process of shaping the strategy of education, as well as the basis for the development and

implementation of an effective model of the modern secondary education system. However, in the context of the government's training policy, it is necessary to study the multifaceted complexity of secondary special education, including the tendency to pursue the development of the sector, staffing issues, shortcomings in the management system and other factors. One of the urgent tasks is the comprehensive study of the history of the field, the study of historical specifications, legal, organizational components in accordance with the requirements of modern historical science. During the years of independence, Uzbekistan has actively cooperated with various international organizations and countries in the political, economic, social and cultural spheres. In international relations, the field of education is one of the central links, and institutions at all levels of the education system have established interaction with certain educational institutions of foreign countries. Uzbekistan has established relations with international organizations such as the UN, UNESCO, UNICEF, as well as international organizations in the field of education in Uzbekistan, such as the Konrad Adenauer Foundation (Germany), the British Council, Tassis.

Results of the research

The project "Support to the development of vocational education in the field of information and communication technologies" in cooperation with the German KfV Bank, the German Technical Cooperation (GTZ) projects "Support for primary vocational education in Uzbekistan". 8.7 million from the German bank KfV. The Grand Project of the German Agency for Technical Cooperation "Support to the Development of Primary Vocational Education in Uzbekistan" worth 4.4 million euros has been implemented. 850,000 marks of the funds were directed to equip professional colleges with modern technical means. During 1999-2001, 1.5 million soums were allocated to equip the training laboratories of 5 colleges in Tashkent city and region, Samarkand region. doychmarka was spent. Curricula and programs have been developed in these educational institutions on the basis of international experience. Also, the German company Pfaff-Zingir from 1999 to 2003 helped to install new equipment in 65 colleges in the country.

During 1999-2004, on the basis of the Uzbek-German project "Support of primary vocational education in Uzbekistan" together with partner companies, the process of training specialists in 4 new professions was piloted in 8 vocational colleges. For example, specialists in financial and organizational work at Kuylik Consumer Services, Bukhara Economics and Banking and Samarkand Light Industry Vocational Colleges, specialists in hotel management, restaurant business and tourism at Sartepa Tourism Vocational Colleges in Tashkent, Bukhara and Samarkand. service, in Tashkent and Bukhara tourism colleges and mechanics on agricultural machinery and equipment were trained in agricultural vocational colleges located in Kibray district of Tashkent region and Khojayli district of the Republic of Karakalpakstan. The educational process in these scientific institutions is organized on the basis of new experimental curricula and programs, where 240 enterprises are involved in the educational process. The educational process was conducted by teachers and engineers-educators of professional colleges, as well as leading specialists of partner manufacturing enterprises.

GTZ is the main executor of the project of the German Society for Technical Cooperation in cooperation with the Center for Secondary Special Vocational Education of the Ministry of Education and Science of the Republic of Uzbekistan and the company ABU-Consult (Berlin). The project, which has been in operation for 5.5 years, was funded by the German Federal Ministry for Economic Development and Cooperation.

1.2 billion soums will be allocated for the equipment of experimental colleges involved in the project. soums were spent. In particular, 9 commercial training companies, 2 foreign language laboratories, 3 training restaurants, 9 special hotels, restaurants and tourism science rooms, 3 training kitchens, 2 metalworking, welding and agricultural machinery repair shops, 1 computer room is equipped with modern technical equipment and tools. The total number of scientific institutions is 53 million. UZS were provided with textbooks, methodical manuals and special computer programs. The German Development Bank (KfW) has pledged \$ 8.69 million. The project "Assistance in the development of vocational education in the field of information and communication technologies", implemented at the expense of investments in the amount of 1 billion euros, includes 14 professional colleges in the field of computer and information technology. Due to a soft loan of 7669.4 thousand euros from the German Development Bank, vocational colleges were equipped with information technology equipment and furniture by German companies Fujitsu Sieshens Coshputers and Lucas Nuelle. Due to the saved 746.6 thousand euros of the German Development Bank's soft loan and an additional 1,200.0 thousand euros of project funds, 8 more professional colleges were equipped with information technology equipment and furniture. In order to improve the content and quality of education in 32 specialized vocational colleges, a grant from the German Development Bank in the amount of 1023.0 thousand euros was spent.

In the 2010-2011 academic year, the workshops of the Tashkent Vocational College of Construction and Communal Services in the field of installation and repair of water, gas supply and sewerage systems were provided with the most modern equipment (on the basis of a soft loan from the German Development Bank). These were training modules of various equipment, which are just beginning to enter the market of construction and housing and communal services, as well as the latest equipment and tools used in the industry. Electric and gas home heating systems, air purification equipment for small businesses, gas distribution point, devices for converting renewable alternative energy sources into electricity and heat, modules of artificial climate devices in buildings and welding, installation equipment, various plumbing tools the set is one of them.

The Center for Social Cooperation was located in Copenhagen, and its representatives in Uzbekistan were Soren Kay Andersen and Mikkel Maylund. The center's programs focus on secondary special education in a particular area.

Social partnership is a mutually beneficial partnership of government agencies, public organizations, businesses and citizens, combining resources and opportunities for common social goals and performing certain tasks. The scope of social partnership is wide, including various categories of NGOs, local associations and entrepreneurs involved in employment and education. Social partnership is inextricably linked with democratic, social and economic development, universal values, and its history has shown that in Western Europe over the past 20 years, a model of corporate relations based on "success" in the labor market has been chosen. Social dialogue is of mutual benefit to employers, employees and government organizations.

In cooperation with influential international organizations and developed countries, Uzbekistan plays an important role in improving the skills of personnel and sending them to foreign countries for internships and training of students, the effective use of world experience in the educational process. All this has significantly helped professors to look to the future with

confidence, to develop new programs for further development and improvement of education, to educate students in modern standards.

The Ministry of Foreign Affairs of the Federal Republic of Germany announced the project "Schools: Future Partners", which was actively attended by students and teachers of a number of academic lyceums in the country. According to the project plan, an international program supporting German language teaching in selected educational institutions around the world has been implemented. The goal of this program is to form an international system of educational institutions where students have the best access to education. Within the framework of the project "Schools: Future Partners", a cooperation agreement was signed between the Goethe Institute and the Nuristan Academic Lyceum under the Karshi Institute of Engineering and Economics. such as teaching students in language courses for young people in Germany. As a result of this cooperation, Dilfuza Otamuradova, a German language teacher at the Nuristan Academic Lyceum, and Shahnoza Nusratullaeva, a student, returned to study in Germany, one of the most developed countries in the world. According to the program plan, 52 students from 8 countries of the world were divided into four classes. Nine students from Uzbekistan took language courses, two of them from Kashkadarya. On June 16-26, 2008, within the framework of the project, 10 executives of the Center for Secondary Special and Vocational Education, professional colleges included in the project were trained in Germany.

On November 17-21, 2008 at Chirchik Vocational College of Industry and Economics with the participation of a specialist from Germany Domenik Wilson was held a seminar-training on "Introduction and effective use of automated control and installation of electrical laboratory equipment in the educational process."

Since 2003, the grant project has been successfully implemented at the expense of the German Fund for International Development (DSE). As part of the project, 75 employees of the secondary special vocational education system attended a six-month training course in Germany. In addition to the 68 seminars conducted in Germany, the in-service educators used the textbooks and materials obtained during the in-service training. The system of secondary special, vocational education has published training manuals based on the experience gained by researchers of the Institute of Advanced Training and Retraining.

In September 2004, a conference was held on the results of the Uzbek-German project "Support for Primary Vocational Education in Uzbekistan", where the project coordinator, Dr. Jürgen Kupfer, spoke and commented on the key indicators. The heads of Samarkand Light Industry, Tashkent Tourism and Kibray Agricultural Vocational Colleges T.Tosheva, A.Shamsiev and Sh.Iskandarov also spoke at the conference about the results and problems of experimental vocational training in their scientific institutions. Professor Stockman, proposed by the German Society for Technical Cooperation, developed the software "Material and technical base of secondary special, vocational education institutions, staffing and information system for monitoring the educational process" and its implementation in the educational process. studies were analyzed. The German International Organization for Advanced Training and Development (InWent) organized a seminar on "Maintenance and repair of vehicles" at the Institute for Advanced Training and Retraining of Secondary Special, Vocational Education from 4 to 9 February and from 14 to 26 April 2008. "Dialogue seminars were organized for teachers who took part in the in-service training course to strengthen the dissemination of the acquired knowledge and skills in educational institutions.

Thus, the cooperation of Uzbekistan with Germany in the field of education plays an important role in the system of international relations, especially in the development of secondary special education. It has established mutually beneficial relations with the developed countries of the world in order to train highly qualified specialists for secondary special education institutions in a market economy and provide them with education at the level of world standards. In order to realize the initiative and talent of the student youth, various funds have been set up and large sums of money have been allocated to them. Uzbekistan has been cooperating with leading international organizations and foreign countries in various fields, including strengthening the material and technical base of educational institutions, organizing the educational process, improving staff skills, attracting students to international competitions, organizing scientific conferences on various topics.

LEGAL AWARENESS AND CULTURE OF THE POPULATION TOPICAL PROMOTION ISSUES

Makhmanazarov Kakhramon Abdievich*

*Senior Lecturer,
Department of History of Uzbekistan,
Kashkadarya region of the Republic of Uzbekistan,
Karshi Engineering and Economic Institute,
UZBEKISTAN

ABSTRACT

Demonstration of individual potential in Uzbekistan, its comprehensive development ensures social formation and implementation. and respect for the rules of ethics, loyalty to national values, arousal of intolerance to offenses, the task of raising the legal awareness of the population, raising the legal culture in society were analyzed.

KEYWORDS: *Concept, Legal Consciousness, Legal Culture, Community, Legal Information, Civil Servant, Civil Society, Legal Democratic State.*

INTRODUCTION

The main goal of the ongoing political, socio-economic reforms in the Republic of Uzbekistan is to build a democratic state based on the rule of law in our country. We know from history that since ancient times, humanity has fought for justice and legal guarantees. Even today, this problem remains relevant. It is important to study the role and importance, meaning and essence of the concept of raising legal culture in society in Uzbekistan, educating and raising the legal consciousness, thinking and culture of the younger generation, ensuring the rule of law in our society.

Research results

Raising legal awareness and legal culture in society is one of the most important conditions for ensuring the rule of law and strengthening the rule of law. Thus, the Decree of the President of the Republic of Uzbekistan No. PF-5618 "On the radical improvement of the system for increasing legal literacy and legal culture in society", signed on January 9, 2019, and the Concept

for improving legal culture in society. The Roadmap for Effective Implementation (Section 5, Clause 88) was approved in 2012.

The adoption of the concept was due to the following problems and shortcomings that impede the formation of respect for human rights and freedoms, increase the legal awareness and legal culture of the population, and increase the level of legal literacy of citizens in society:

First, the work to improve legal awareness and legal culture in society is not organized systematically and organically. There is no effective mechanism for providing legal information in the community, family, district, educational institutions and organizations. The idea of a balance between personal interests and the interests of society is not sufficiently instilled in the minds of the population, especially civil servants;

secondly, in the system of continuous education, the educational process is not carried out in accordance with legal education, history, religion, customs and national values of the Uzbek people are not based on the formation of the legal culture of the population. especially young people;

thirdly, there is no effective system of interaction with non-governmental non-profit organizations and other institutions of civil society when organizing events to improve legal culture, work is not organized on the principle of social partnership;

fourthly, there are no clear targeted measures to form legal immunity from factors that negatively affect the legal education of young people;

fifth, the active participation of government agencies and other sectoral services in organizing and conducting targeted legal advocacy in society is not ensured, there is no high efficiency and effectiveness in this regard;

sixth, legal activity is still conducted in traditional ways, through simple meetings, while innovative methods of the legal profession are not used, including web technologies, there is a lack of legal websites;

Seventh, there are no legal mechanisms to encourage projects aimed at increasing legal literacy, which are organized only for the sake of activities, publication and distribution of legal literature to increase legal knowledge, research is ineffective.

The main goal of the concept is to create an integrated system of regular legal education for all segments of the population, strong-willed, knowledgeable and respecting the law, able to apply legal knowledge in everyday life, an active civil position and an uncompromising attitude to crime.

The main tasks of increasing legal awareness and legal culture in society are: [1]

formation of a system of consistent information about the content and essence of ongoing socio-economic reforms, legislative acts adopted in the country and state programs "The solution of the spirit of respect for the law in society is the key to building a democratic governed state." in law! "strengthening the life idea;

in raising legal awareness and legal culture in society, first of all, to pay special attention to the systemic and holistic management of education, to instill legal consciousness and legal culture in

all segments of the population, starting with preschool education, to promote the development of the idea of a balance between personal and public interests;

instill in the younger generation the concepts of law and duty, honesty and purity, as well as moral norms, teach them important aspects of the Constitution from childhood;

organizing legal and educational activities to form a legal culture among the population in accordance with the history, religion, national values of our people, as well as strengthening the sense of belonging and patriotism in the country through the formation of pride in oneself. State symbols;

raising the legal awareness and legal culture of civil servants, forming their intolerant attitude towards corruption and other offenses;

strengthening cooperation between state bodies and administration, including law enforcement agencies and civil society institutions, in conducting targeted legal protection;

to establish, on a systematic basis, a wide and effective use of the principles of social partnership in organizing activities to raise legal awareness and legal culture in society;

increasing the role of the media in providing legal information, widespread use of innovative methods of legal protection, including the expansion of the use of web technologies;

improvement of legal education, as well as the development of a system of training, retraining and advanced training of legal personnel;

in-depth study of the scientific foundations of increasing legal awareness and legal culture in society

increasing the role of the media in providing legal information, widespread use of innovative methods of legal protection, including the expansion of the use of web technologies;

improvement of legal education, as well as the development of a system of training, retraining and advanced training of legal personnel;

in-depth study of the scientific foundations of increasing legal awareness and legal culture in society

The main directions of the Concept:

1. Raising the legal culture of the population in the relationship between the individual, the state and society;
2. Introduction of innovative methods of legal protection in improving the legal culture of society;
3. Strengthening the role of the media in enhancing the legal culture of the population;
4. Development of the legal education system, as well as training, retraining and advanced training of legal personnel;
5. Researching the scientific foundations for improving legal culture.

Improving the legal culture of the population in the relationship between the individual, the state and society is carried out in the following areas: [2]

1. Formation of legal education in the family and improvement of legal culture;
2. Strengthening the role of the institution of makhalla in enhancing the legal culture of the population;
3. Increasing legal literacy in educational institutions;
4. Raising the legal culture of employees of state bodies and organizations;
5. Raising the legal culture of all strata of the population;

The concept of improving legal culture in society

The roadmap for effective implementation for 2019 [3] provides for the implementation of the following measures to strengthen the role of the mahalla institution:

1. Widespread promotion of legal solutions to common problems of everyday life and the essence of recently adopted legislation, as well as free distribution among families of leaflets, booklets and other handouts aimed at conveying legal information.
2. Conducting regular legal advocacy among young people and parents on the age of marriage, conditions for the payment of alimony, marriage between relatives and its legal consequences.
3. Organization of the project "Day of Legal Information" in the makhallas, ensuring the provision of legal clarifications to the population by qualified specialists (lawyers, notaries, legal services, etc.) in a certain area.
4. In order to prevent crime and other offenses, radically reduce civil unrest and educate the population, especially people with difficult upbringing, a sense of respect for the law:
systematic organization of open dialogues of courts with the population in makhallas, expansion of the volume of field trials.
5. Increasing the volume and quality of measures to prevent crime among the population of makhallas in cooperation with public patrol groups "Fidokor Yoshlar".
6. Take appropriate measures to raise awareness of the new legislation among the assistants of prevention inspectors, members of the Mahalla Posboni public structure and members of the Fidokor Yoshlar public patrol group.

It is known that one of the most important means of ensuring the observance of human rights is the formation of a high level of legal culture, in which everyone is well aware of their rights and obligations. Every citizen is obliged to fulfill his duties, using the existing rights and freedoms. In this case, if the law indicates the possibility of action, debt implies an obligation. As long as a citizen exercises his right, these rights should not harm the rights and interests of the state or other persons.

Thus, the following results are expected from the implementation of the Concept:

increasing the legal culture and social activity of the population in the relationship between the citizen, the state and society, ensuring a balance between personal needs and the needs of society;

to systematically instill in children and youth the basic legal concepts and rules of etiquette, to achieve a comprehensive and systematic conduct of legal education;

creation and implementation of innovative methods of legal protection, strengthening the role of the media in promoting legal knowledge;

strengthening respect for the law and the rule of law among officials and citizens, ensuring the effectiveness of crime prevention.

For this, it is necessary to ensure the priority of the Constitution and laws in life. Article 15 of the Constitution also states that “the supremacy of the Constitution and the laws of the Republic of Uzbekistan is unconditionally recognized in the Republic of Uzbekistan.

The state, its bodies, officials, public associations and citizens act in accordance with the Constitution and laws ”[4]. This means that everyone is equal before the law, all relations in society are regulated by law, and violators are unconditionally responsible. However, the fact that human rights and freedoms are enshrined only in law does not solve the problem. In order to build a rule of law, which is obligatory for everyone and which can never be violated, each of us must acquire legal knowledge, cultivate a culture of applying the knowledge gained in life, as well as inculcate legal norms. culture in the hearts and minds of the younger generation.

In conclusion In recent years, significant work has been done to radically reform the national legal system, to form a legal culture in society and to train qualified legal personnel. In particular, in raising the legal culture, first of all, the work on legal education and upbringing is not carried out systematically and organically. The removal of jurisprudence in the higher education system is a clear example. It is necessary to take a comprehensive approach to the formation of legal immunity against the factors that negatively affect the legal education of young people, respect for the law and morality, loyalty to national values, intolerance of crime.

Today, the general definition of the tasks to increase the legal knowledge of the population and the lack of a clear effective mechanism for their implementation show that the work to improve the legal culture in society is ineffective.

THE REGULATION OF LABOR MIGRATION OF YOUTH IN THE REPUBLIC OF UZBEKISTAN

Shahnoza Rahmatullayeva*

*Senior Teacher, Researcher,
Tashkent State University of Economics,
UZBEKISTAN

ABSTRACT

Labor migration is a situation that arises on the verge of a crisis in the local labor market. The International Labor Organization identifies the following main types of labor migration: contract labor, migration of skilled labor and illegal migration. It should also be borne in mind that there are significant problems in the analysis of migration processes. In particular, in most cases migrants are exploited and their rights violated. The increase in the international mobility of intellectual labor resources in the country is also due to the fact that migration is poorly regulated.

KEYWORDS: *Migration, Labor Migration, Youth Migration, Intellectual Migration, Regulation Of Labor Migration.*

INTRODUCTION

The world scientific literature as the migration of the population is defined as "any territorial movement which involves the crossing of internal and external borders of the administrative-territorial entities.

Migration comes from the Latin word "migratio", which means moving a population to another place. It is from this term that the narrow and broad meanings of migration are distinguished. In a narrow sense, population migration is a change in territorial position, which ends with a change in the place of permanent residence. In a broad sense, population migration is the movement of people between different settlements in one or several administrative-territorial units, regardless of their duration, regularity and purpose [1].

According to the recommendations of International Labor Migration, depending on the length of stay in the country, citizens are divided into the following categories:

1. Visitors - these are people who are here less than three months (for example, tourists). This category is not considered immigrants, but practice shows that the share of labor migration may occur for a short period (less than three months), for example, seasonal migration or the hiring of foreign workers for certain short-term work.

2. Migrants, including

- short-term migrants - people who move from the usual place of residence in another country for a period of not less than 3 months and not more than 12 months;
- long-term migrants - people who move to another country with habitual residence for a minimum period of one year (12 months).

It is known that Turkey, China, India, the Philippines and even industrialized Japan, which have achieved great economic results over the past half century, have made great strides through the systematic scientific study of migration processes and the sociology of human experience. Their experience is now being effectively used by other developing countries.

In general, labor migration is a situation caused by a crisis in the local labor market. There are a number of structural problems that characterize the labor market crisis:

- inefficient employment in some sectors of the economy (for example, in the agricultural sector), which leads to poverty;
- weak business activity;
- uncertainty of the population in the future;
- a tendency to use old equipment and technologies, manual labor, low-income, socially unprotected activities;
- underdevelopment of the manual business due to the lack of labor-intensive industries and sectors;
- weak regional and professional mobility due to the inactivity of the modern housing market in some modern regions;
- discrepancy between the professional and qualification structure of the labor force, taking into account the needs of the labor market¹.

The current stage of the migration process differs from the previous ones in scale, geographical characteristics, dynamic indicators of transformation and integration, and socio-demographic structure. The direction of migration flows around the world is changing. In particular, the migration of citizens of Uzbekistan to distant countries (USA, Europe, Arab countries, mainly the UAE, Egypt, Bahrain, Kuwait, Saudi Arabia, Southeast Asia, South Korea, Thailand, Malaysia), as well as to neighboring countries (for example, Russia, Kazakhstan).

As we see a dramatic increase in the number of people migrating around the world in pre-pandemic conditions, it is no coincidence that the number is expected to increase even after the pandemic. Increased migration is driven by factors such as poverty, unemployment, human rights violations, frustration and despair about the future, unrest and fear over various conflicts and wars.

Today, science and practice have effective tools for vocational guidance of young people, digitization of existing and new jobs, management of high-quality migration processes with the participation of young people, and hence regulation of the youth segment of the labor market, minimizing the professional, qualification, qualification and regional balance. improvement requires a comprehensive concept.

Today, science and practice have effective tools for vocational guidance of young people, digitization of existing and new jobs, management of high-quality migration processes with the participation of young people, and therefore regulation of the youth segment of the labor market, minimizing the professional, qualification and regional balance for improvement, a comprehensive concept is needed.

This, in turn, will form the basis for a scientific study of regulation and improvement of the youth segment of the labor market.

Migrants in their nature are businessmen and active members of society. Historically, migration has led to economic growth, assimilation of nations and enrichment of marginalized cultures[2].

It should also be taken into account that there are significant problems in the analysis of migration processes. In particular, in most cases, migrants are exploited and their rights are violated. It is difficult for migrants to adapt to the culture and lifestyle of the host country. The host countries deprive the indigenous population of jobs. This, in turn, shapes the negative attitude of the local population towards migrants. For these and many other reasons, the problem of migration needs to be studied comprehensively, including politically and sociologically.

Socially in-depth scientific research, on the one hand, covers the new infrastructure of the labor market, labor-intensive industries and technological processes of production, on the other hand, creates and develops market relations in traditional sectors of the economy.

In recent years, migration has been at the center of active political debate. Most people welcome immigrants, but there are also misconceptions and fears. For example, some believe that migrants are burdensome for the economy. Regulated migration has always shown its positive aspects.

The most important tool for regulating migration processes is the improvement of the legal and regulatory framework.

Decree № PP-4829 "On measures to implement the system of safe, orderly and legal migration," signed by the President of the September 15, 2020, opened the way to solving the many problems that still exist in Uzbekistan.

The main purpose of the Decree is to improve the work of the competent authorities in the field of external labor migration, training of persons wishing to work abroad in high-demand professions, protection of the rights of citizens abroad, employment of returning labor migrants, as well as social support for their families

Safe, orderly and legallabour migration system was identified as the following:

- increasing the scale of the organized sending of citizens of the Republic of Uzbekistan abroad for temporary work, expanding for these purposes the range of tasks and powers of ministries, departments and local executive authorities;

- development of international cooperation in the field of external labor migration, strengthening ties with organizations of compatriots and Uzbek diasporas abroad;
- the establishment of effective teaching practice professions and languages of citizens of the Republic of Uzbekistan before leaving to work abroad, the introduction of the issuance of an internationally recognized system of certificate attesting to their professional qualifications;
- expansion of the practice of financial and social support for migrant workers in a difficult situation, the security of their life and health organizations for their cultural and educational events;
- implementation of measures aimed at promoting and ensuring the rights of citizens carrying out labor activities abroad, creating favorable conditions for them;
- reintegration of those who returned from labor migration, including their employment, professional development and promotion of entrepreneurial initiatives[3].

According to the decree, one of the main directions of the system is the effective implementation of the practice of teaching the citizens of Uzbekistan a profession and foreign languages before going to work abroad, the introduction of a system of internationally recognized certificates of professional competence.

Also, according to the decree from January 1, 2021:

- introduced the procedure of issuing microloans persons recognized by the information system "Unified Register of Social Protection," a member of a needy family and traveling abroad by organized labor migration for temporary employment;
- microloans are issued in the amount of up to 10 (ten) million UZS for a period of one year to cover expenses related to employment abroad (including travel expenses, registration of permits for employment);
- part of the microloan interest rate that exceeds the Central Bank's base rate, but not more than 1.5 (one and a half) times the base rate, is compensated by the State Employment Promotion Fund.

A new study from Chapter 4 of the World Bank's World Economic Outlook for Q2 2020 concludes that "... we will look at the economic impact on countries receiving migration, and migration typically improves economic growth and efficiency in host countries." [4]

However, as a result of the pandemic, migration flows suddenly stopped. Excessive self-isolation is temporary, but the pandemic could heighten a general sense of isolation and mistrust of openness to the outside world and have a long-term impact on countries' propensity to accept immigrants. Reduced immigration has led to higher unemployment in the countries that support external migration, and reduced remittances to households.

In addition, migration is viewed as a complex social process affecting many areas of social life, since migration has played an important role in the history of mankind, they are associated with the development of collective and labor relations, land development, the formation of different races, cultures, languages and peoples.

Except for pandemic conditions, the rapid expansion of migration flows has become a component of all global change.

Youth labor migration is now global in nature and is a sign of globalization [5]. As you know, globalization is the process of uniting nations and states; leads to the destruction of borders between peoples and the creation of a single political, economic and spiritual space. It unites the economic systems of different countries into a single system, the world market, which contributes to a change in the culture and lifestyle of peoples. The process of globalization facilitates the access of all mankind to new inventions, technologies, knowledge, removes prohibitions and restrictions on development and creativity, therefore, globalization is systemic and covers all areas of society.

Different types of migration - economic, ethnic, increasing labor intensity - are a characteristic feature of globalization, and the share of migrants in the permanent population of countries reflects the degree of integration into globalization processes. However, migration processes have both advantages and disadvantages, so they become a source of contradictions and conflicts.

Rapid population growth in developing countries has led to an oversupply of labor resources there. The development of modern education in developing countries allows young people to adapt to the requirements of the labor market of developed countries.

For decades, sustainable youth migration has led to segmentation of the labor market in developed countries and the division of sectors in which migrants mainly work. These include, above all, the most discriminatory prestigious jobs that do not require high qualifications in formal or informal employment segments, harsh conditions and low wages.

The increased migration activity of young people can also lead to interethnic problems. Some researchers note that there is a conflict of different cultures, values, confessions, which can lead to serious consequences, such as an interethnic conflict, a war due to the migration activity of youth [6].

The reasons for the increase in the international mobility of intellectual labor resources are: a decrease in the birth rate in developed countries and an increase in demand for highly qualified specialists in the modern sector of the national economy; recipient countries seek to save money and time on their training by attracting appropriate specialists; lack of highly qualified domestic specialists due to technological changes in production in order to ensure the competitiveness of the national economy; expansion of multinational companies; expanding workforce mobility networks; strengthening of intellectual partnership (between research institutes, universities, medical centers, etc.); unification of educational and qualification standards and mutual recognition of diplomas; virtualization of the transfer of knowledge and experience (as a result of the development of information technologies, the possibility of realizing the mobility of labor resources without changing the place of residence).

Advantages of youth labor migration:

1. Migration can provide young people with job opportunities that do not exist in their places of origin.
2. The exit of job seekers can ease the internal pressure of the local labor market related to excess labor supply.
3. Migration can create opportunities for young women and strengthen fair gender norms.

4. Migration for reasons related to education or employment can prevent early marriages between minors.
5. Remittances can contribute to economic growth and poverty reduction in countries of origin and attract investment in human capital.
6. Young migrants can be a source of technology transfer, investment and venture capital for their home countries.
7. The physical or “virtual” return of skilled workers leads to an increase in local human capital, skills transfer, and foreign network connections.
8. Unmarried youth can actively and easily participate in international migration processes.

Negative consequences of youth labor migration:

- Migration often leads to the loss of highly skilled workers and a decline in the quality of important services in the domestic market.
- Economic growth and productivity decrease with the reduction of the stock of highly skilled workers.
- The impact of mental and social deficiencies and intervals on the growth of children in young families can negatively affect the upbringing and healthy development of children.
- Migration can increase the risk of abuse, discrimination and exploitation of young people, especially inexperienced and young women.
- Can allow highly qualified personnel to go abroad and stay there.
- Can create a basis for encouraging the negative impact on the national mentality of the country.

Thus, the globalization of youth migration processes, first of all, serves to objectively increase the permeability of interstate divisions and dramatically increase the speed and intensity of national, transnational flows of human resources. The consequences of migration, as we have seen, manifest in different areas and can be both positive and negative. In this regard, one of the main tasks facing countries in the era of globalization is to develop an effective migration policy that clearly regulates migration processes in order to ensure the prosperous development of these countries, their subsequent economic, political, cultural and social well-being.

In this regard, the following proposals and recommendations have been developed in the regulation of youth labor migration:

1. Establish common use of digital work platforms. This will ensure that young people’s online employment and income are up to international standards.
2. Establishment of relevant international and non-governmental training centers for vocational training and provision of international certificates in accordance with the International Standard Classification of Occupations (ISCO). This will allow young people to find work abroad quickly and easily in their field.
3. Develop a mechanism for in-depth analysis of employment contracts of young migrant workers with higher education in recipient countries.

4. Formation of a database on labor migrants. In this way, it is possible to develop promising programs for their future socio-economic status. This serves as the basis for the development of science-based recommendations.

ABSTRACT

This article discusses the main parameters of the cutting process that affect the reliability of the axial tool. The stability of the technological process of machining is largely determined by the quality characteristics of the tool used: its design, tool materials and modes of its operation, which are determined at the design stage of the technological process. A drill with MNP (multi-faceted non-resurfacing plates) of a new design was developed at the Department of Engineering Technology of the Tashkent State Technical University named after I.A.Karimov, and the study was carried out on the same drill. According to the research carried out: when processing steel 12X18H10T, the specific energy consumption of the cutting process with a drill with MNP is more than 5.0 times lower than that when processing with a twist drill, and when drilling steel 45, it is almost 2 times lower.

KEYWORDS: *Process Mechanics, Drills With MNP, Built-Up Zones, Chip Shrinkage, Friction Coefficient, "Column" Formation, Energy Consumption, Hole Length, Specific Energy, Rotational Speed, Cyclic Load*

INTRODUCTION

Tool wear and durability are closely related to tool reliability. For each tool and each combination of parameters of cutting conditions, there is a wear value that determines the limit of economic durability. In this case, the level of tool reliability is the higher, the more stable the

cutting process in a given operation. The cutting process (as well as its stability) is simultaneously influenced by many factors: the physical parameters of the tool and machined materials (their strength, hardness, thermal conductivity, etc.), cutting modes (cutting speed, cutting depth, feed), cutting temperature (as a result of the above parameters), coolant.

MATERIALS AND METHODS

Technological characteristics of the drilling operation. Drilling is one of the widespread operations in mechanical engineering. In the total machine-tool park of machine-building plants, drilling machines make up 10-20%, in bridge building, crane building and also in agricultural engineering, drilling machines make up 40-50% of the machine-tool park. Drilling operations have the following varieties: drilling holes in solid metal; reaming holes pre-drilled with a smaller drill; countersinking holes cast or punched; deployment of precise holes; deep drilling and deep reaming. An essential feature of the process of drilling holes in solid metal with twist drills is the variable cutting speed along the cutting edges of the tool. The speed is maximum at the periphery at the cylindrical surface and approaches zero at the core of the drill, where the cutting edge has a bridge and its effect is no longer equivalent to that of the cutting tool. By increasing the cutting angle from the periphery to the center, the deformation of the chips along the blade towards the center increases. On the lintel, the deformation is even more significant. Drilling chips are separated by two tapered spirals. In shavings, as well as in turning, crumples in the contact surface and shifts are observed.

When using assembled drills with MNP, it is possible to increase the productivity of the drilling process by an average of 5-6 times in relation to a high-speed tool.

Analysis of literary sources and industrial practice show that there is no coherent system of data and recommendations for the use of drills with mechanical fastening of carbide inserts, and the industry has not accumulated experience to optimize their design. There are practically no data on the dynamics of the drilling process with MNP drills.

The generalization of the research results shows that in the proposed drill designs, the cutting process in the central part of the tool is difficult. This zone determines the value of axial and radial forces during drilling, regulates wear. It is not possible to find fundamentally new solutions that exclude such a significant influence of the transverse cutting edge, rake and clearance angles on the dynamics of the drilling process in traditional designs of two first drills. In this regard, drills with indexable cutting inserts are, perhaps, the only type of tools in the design of which, to some extent, it is possible to provide cutting conditions acceptable for carbide.

The process of drilling with a tool equipped with replaceable carbide inserts is similar to boring in terms of force effects. Experimental verification of the equation that establishes the relationship between the displacement of the cutting edge of the tool, the axial and radial components of the cutting forces P_x , P_y shows that with an increase in the speed and depth of cut, the machining accuracy increases, and with an increase in feed, it decreases. So, in the case of a cantilever bar for boring, the displacement of the cutting edge of the tool Δr depends on two components of the cutting forces.

$$\Delta r = f(P_x, P_y) = A_x P_x + A_y P_y, \quad (1)$$

where

$$A_x = -1.5 \cdot \frac{L_a}{L} \cdot \frac{L^3}{3EJ_x}, \quad A_y = \frac{L_a}{L} \cdot \frac{L^3}{3EJ_x},$$

L_a - distance from the point of application of cutting forces to the axis of the mandrel;

L - mandrel length.

Operators A_x , A_y have different signs, so the total tool displacement may coincide with the direction of P_y , or it may be directed in the opposite direction, or be absent altogether when $A_x P_x = A_y P_y$.

The presence of the force component P_y leads to the appearance of transverse bending stresses in the horizontal plane, and the component P_x leads to eccentric buckling. The combination of unbalanced forces causes elastic deformations in the holder. In this case, the radial vibrations of the tool lead to breakage of the cutting edges and errors in the dimensions of the hole being machined. In such a situation, the main link that compensates for the radial forces is only the cantilever holder, the elastic characteristics of which should provide a margin of resistance to its complex bending and torsion.

Drills with MNP, as a tool with two cutting blades, are divided into two groups. The first group consists of tools working on the principle of dividing the cutting width, the second - on the principle of dividing the feed. The designs of both groups of instruments are widely described in the literature [1,2]. For drills of the first design, one plate is located closer to the center, and the second to the periphery of the drill, providing overlap along the entire diameter of the hole being machined. For drills of the second, both plates are located symmetrically relative to the axis of the drill. In theory, the cutting edges are in all cases positioned such that to ensure a balance of forces, the resultant force at the peripheral cutting edge is parallel, equal in magnitude, and oppositely directed to the resultant force at the inner cutting edge. Regardless of the selected shape of the cutting edges, their angular positions and length are calculated in such a way that the cutting forces act in parallel and mutually perpendicular directions [3]. As a result, for drills with MNP, the ratio $A_x P_x = A_y P_y$ should be maintained. In practice, this ratio is not maintained. This is due to the following reasons.

First: The cutting process is carried out at different speeds along the cutting edge. The mechanics of the cutting process are considered separately for low and high cutting speeds, because anomalous phenomena occur in all zones of speed variation. The result of the temperature-rate factor is the simultaneous existence of built-up zones and zones with different coefficients of friction in a carbide drill. In the transition zones, the process is unstable and in them it is practically difficult to provide equivalent operating conditions for both edges and, accordingly, the balance of forces. Since the build-up process is not stable, the size and shape of the build-up are continuously changing over time. The actual rake angle changes accordingly. This is evidenced by a significant variation in parameters with changes in chip shrinkage, friction coefficients and actual rake angles. Schematic view of P_x ; P_z ; $\xi = f(V)$ for the zone of low and high velocities is shown in Fig. 1. Drill with MNP structurally, the drill is made in such a way that, in contrast to the spiral, a hole is left in the central part, the minimum diameter of which is

0.7 ... 1.2 mm. As a result, in the process of work, a column is formed, which periodically breaks.

Fig. 1. Schematic representation of the effect of cutting speed on cutting forces and chip shrinkage.

Consequently, the zones without build-up, inherent in ultra-low cutting speeds ($V = 1 \dots 2$ m / min), are absent in drills with MNP.

Second. Differences in the wear of individual parts of the cutting edges, the processing of inhomogeneous materials, inevitable errors in the manufacture and installation of cutting inserts, as well as inaccuracies in the manufacture of the drill body lead to a redistribution of the load and can disturb the balance of forces [3]. Drills, in addition to torque and axial force, experience a bending moment. As a result, a single cutting edge in split feed drills will practically take up the entire load on the tool. Drills with MNP do not have guiding elements, like twist drills for deep drilling, therefore, the disturbing force resulting from an imbalance of forces, except for the rigidity of the drill body itself, has nothing to compensate for. An oscillating system is created, and the drilling process can proceed under interrupted cutting conditions with vibrations.

Third. The design of the cutting part of drills with MNP determines the constancy of cutting angles in a static coordinate system. The actual angles in the kinematic coordinate system will change along the cutting edge depending on the feed [4].

Fig. 2. Micrographs of the cross-section of the roots of the shavings recorded during turning of steel 40 at different cutting speeds. ($\gamma = 10^\circ$, $s = 0.285$ mm / rev).

$$\gamma_s = \gamma + \mu_s \quad (2)$$

$$\mu_s = \arctg \frac{S_0 \cdot \sin \varphi}{\pi d}, \quad (3)$$

where

φ - angle in the plan;

S_0 - feed, rpm;

d - drill diameter.

RESULTS AND DISCUSSION

It follows from formulas (2) and (3) that the kinematic angles are always greater than the static ones. However, for a MNP drill, the change is less than one degree. If an insert with a positive rake angle is used, then this change can be ignored. A number of designs and technologies for the manufacture of drills with mechanical fastening of cutting plates have been developed at the Department of Mechanical Engineering Technology of the Tashkent State Technical University. During the development and manufacture of drills of new designs, the rich experience described in foreign literature was used. Drill manufacturing technology developed at Tashkent State Technical University was based on the use of CNC lathes and milling machines. The most important and distinctive features of the investigated type of drills with MNP structures of Tashkent State Technical University from drills available in the industry and offered by firms are the following:

1. Standard three-sided hard-alloy plates according to GOST 19048-80 are used as cutting inserts.
2. The base plane of the cutting inserts is turned at an angle of $-5 \dots -7^\circ$.
3. The central column is formed by displacement of the plates above the axis of symmetry by $0.25 \dots 0.3$ mm.
4. The planes of the chip flutes are located above the axis of the drill, which significantly increases the size of the core and, accordingly, increases the rigidity of the tool.

Experiments were carried out to study the peculiarities of the cutting process when drilling with MNP drills and the possibilities of their design.

In the process of cutting with MNP drills, a series of instantaneous radial unbalanced forces arise, leading to dynamic instability of the drill. This kind of instability under conditions of rapidly changing forces imposes its own limitations on the design of drills. Insufficient knowledge of the process of drilling with MNP drills has led to the fact that today there is a large range of designs of this tool, even within one firm, which, nevertheless, does not meet the requirements of accuracy and productivity of machining. It is interesting to analyze the specific energy consumption spent on hole processing. The cutting work per hole is determined by the formula:

$$A = 9,8 \cdot \frac{2\pi m}{60} M \frac{L}{nS}, \quad (4)$$

where

M - cutting moment, Nm;

n - tool rotation frequency, rpm;

L - hole length, mm;

S- feed, mm / rev.

Hole volume:

$$W = \frac{\pi \cdot d^2}{4} L, \quad (5)$$

then the specific work of cutting will be:

$$A_{yo} = \frac{A}{W} = \frac{8M}{d^2 \cdot S}, \quad (6)$$

In fig. 3. illustrationthe diagram of the maximum specific energy consumption when processing steel 45 and 12X18H10T with a twist and drill with MNP is presented. The diagram shows that when processing 12X18H10T, the specific energy consumption of the cutting process with a drill with MNP is more than 5.0 times lower than those when processing with a twist drill, and when drilling steel 45, it is almost 2 times lower, i.e. the efficiency of using a drill with MNP significantly increases with a decrease in the machinability of the material (total energy costs

when machining one hole with a twist drill are equivalent to machining five holes with a drill with MNP when cutting 12X18H10T and two holes when drilling steel 45).

The peculiarity of the flow of contact processes during the operation of the drill with MNP and the formation of cutting forces is largely determined by the absence of a bridge[5]. The "column" formed in this case should be chipped without reaching too great a length. The destruction of the "column" occurs due to fatigue loads, which are formed according to the following scheme. A drill with MNP has two symmetrically spaced plates that form a gap δ , i.e. the diameter of the "column" will be determined by the value δ . The cutting edges of the installed plates protrude from the body by the value, k , and the body itself has a jumper in the form of a sharp wedge located asymmetrically relative to the tool axis (Fig. 4). The "column" formed during the drilling process when drilling a hole with a depth of k will have a cylindrical shape. In this case, the forces acting on it in the form of a torque will not have a cyclic component [6].

Fig 3. Specific cutting work diagram during operation twist drills and drills with MNP.

With further drilling, the top of the "column" will begin to interact with the asymmetric jumper of the body, the resulting force will begin to bend the "column", and taking into account the rotation of the tool, it will have a rotational character.

The rotational speed of the bending force is equal to the rotational speed of the tool. The number of cycles perceived by the "column" can be determined:

$$N = \frac{l - R}{S} n, \quad (7)$$

where

l - the total height of the "column",

R - plate overhang;

S - minute feed,

n - spindle speed.

Fig. 4. To the calculation of the maximum height of the central "column".

The number of cycles of oscillation of the central column establishes the relationship between the tool feed and the dimensions of the column itself, which must be known when constructively choosing the radial arrangement of the cutting inserts, especially with their asymmetric arrangement.

The amount of deflection of the "column" relative to the axis of rotation of the tool can be determined by the formula:

$$f = (l - k) \cdot \tan \psi, \quad (8)$$

where

ψ - the angle of inclination of the asymmetric body jumper.

The "post" can be thought of as a cantilever clamped beam. The radial force can be determined:

$$P = \frac{3EJf}{l^3}, \quad (9)$$

where

E - modulus of elasticity of the processed material:

$J = 0,05\delta^5$ - moment of inertia of the "column" section.

As a result of the bending of the "column" in the section of the base, stresses arise, the average value of which can be determined:

$$\sigma_{cp} = \frac{24EJf}{\pi\delta^3 l^3}, \quad (10)$$

or

$$\sigma_{cp} = \frac{1,2EJ\delta^2}{\pi l^3} = \frac{1,2E\delta^2}{\pi l^3} (l - k) \cdot \operatorname{tg} \varphi. \quad (11)$$

The cyclic load arising from the bending of the "column" is characterized by a symmetric loading diagram with an asymmetry coefficient $R = -1$. In the presence of an initial crack located radially from the surface to the center of the "column", the change in the stress intensity factor will be:

$$\Delta K_1 = \gamma \frac{P}{\delta^{1.5}}, \quad (12)$$

$$\gamma = 1,72 \frac{\delta}{d} - 1,27,$$

where

P - radial load;

δ - the diameter of the rod;

$d = \delta - 2a$;

a - crack length.

The fatigue crack growth equation is:

$$\frac{da}{dn} = A \cdot (\Delta K)^m. \quad (13)$$

In expanded form it will look like:

$$\frac{da}{dn} = A \cdot \left(\gamma \frac{P}{D^{1.5}} \right)^m = A \cdot \left[\left(1,72 \frac{\delta}{\delta - 2a} - 1,27 \right) \cdot \frac{3EJf}{l^3 \delta^{1.5}} \right]^m$$

$$\frac{da}{dn} = A \cdot \left\{ \left[\frac{1,72}{(\delta - 2a)\delta^{0.5}} - 1,27 \frac{1}{\delta^{1.5}} \right] \cdot \frac{3EJf}{l^3} \right\}^m,$$

or

$$\frac{d \cdot a}{\left[\frac{1,72}{(\delta - 2a)\sqrt{\delta}} - \frac{1,27}{\delta^{1.5}} \right]^m} = \left(\frac{3EJf}{l^3} \right)^m dn.$$

After simplification, we get

$$\frac{(\delta - 2a)^m \delta^{1.5} da}{[1,72\delta - 1,27(\delta - 2a)]^m} = \left(\frac{3EJf}{l^3} \right)^m dn, \quad (14)$$

where:

A, m - constants of the equation of fatigue crack growth,

a - average crack length.

Solving equation (14), it is possible to determine $a = f(h)$, while destruction can occur at

$$a \geq a_{kp}. \quad (15)$$

a_{kp} - the critical crack length is determined from the equation:

$$K_{1c} = \gamma \frac{P}{D^{1.5}} = \left(1,72 \frac{\delta}{\delta - 2a_k} - 1,27 \right) \frac{P}{\delta^{1.5}}, \quad (16)$$

where

K_{1c} - material viscosity

From (12) the critical crack length is equal to:

$$a_k = \delta \left[0,5 - \frac{1,72 \cdot P}{K_{1c} \cdot \delta^{1.5} - 1,27 \cdot \rho} \right] \quad (17)$$

The number of loading cycles before the destruction of the "column" can be determined by jointly solving equations (10) and (14), i.e.

$$n = \left(\frac{l^3}{3EJf} \right)^m \delta^{1.5} \cdot \int_0^{a_k} \left(\frac{\delta - 2a}{0,45\delta - 2,5a} \right)^m da, \text{ and}$$

$$a_k = \delta \left(0,5 - \frac{1,72 \cdot P}{K_{lc} \delta^{1,5} - 1,27 P} \right). \quad (18)$$

CONCLUSION

The solution of equation (17) is possible by a numerical method or by expanding the integrand into a Maclaurin series. The following conclusion can be drawn from the system of equations (18):

- with a decrease in the minute feed and an increase in the spindle rotation frequency, the number of cycles per unit length of the drilled hole increases and, as a consequence, the length of the "column" decreases;
- with an increase in the strength properties of the material being processed, the breakage of the "column" is carried out at its smaller length, i.e. the drilling process is more stable;
- the angle of inclination of the asymmetric body jumper should be performed as much as possible;
- the gap between the plates should be kept as minimal as possible.

THE FIRST DASTAN OF THE "FIVE" ALISHER NAVOI AND THE PROBLEM OF THE UNIVERSAL CHRONOTOPE

Uzok Khaydarovich Dzhurakulov*

*Professor,

Doctor of Philological Sciences,

Tashkent State University of Uzbek Language and Literature named after Alisher Navoi,
UZBEKISTAN

ABSTRACT

This article deals works of AlisherNavai. In particular, comparison of historical genres on the basis of the principle of poetic evolution has shown that "Five" Navoi is a whole, unified genre system. It has been shown that the function of the framing component organising semantics-structural integrity of "Five" performs the first dastan. In the semantic-structural connection of this dastan with the subsequent four leading is the principle of epic universalization. Semantic-structural units, which serve as the basis of epic universality, also define and canons of genre and at the same time give us grounds to assert that "Five" is a universal genre.

KEYWORDS: *Koran, Alisher Navoi, Comparative-Historical, Comparative-Typological, Textological Aspects, Chronotope, Makalat, Creative Methods*

INTRODUCTION

The uzbek people, possessing a historically rich cultural heritage, originality and way of thinking, have presented the world with a whole galaxy of great thinkers, and Navoi occupies a special place among them.

The XXI century puts on the agenda the problem of studying the work of writers of a universal scale, including AlisherNavoi, from the standpoint of globalized scientific and theoretical thought. The application of the experiments of historical and theoretical poetics in the system of theoretical methods that are updated and improved from year to year and the study on this basis of the works of the great masters of the word with a worldwide reputation, including AlisherNavoi, has become an urgent task of modern literary science, which involves the implementation of a comprehensive study of creativity great poet.

The first edition of AlisherNavoi's "Five" was published in 1939. In 1960, the Navoi expert P. Shamsiev prepared and published a complete edition of "The Five". At the same time, the publication of the collected works of Navoi in 15 volumes was carried out. Between 1987 and 2003, a twenty-volume edition was published, and in 2011 a ten-volume edition of the complete works of AlisherNavoi. All these works had a significant, positive impact on the development of the literary-historical process, especially in the following four aspects: a) contributed to the formation of the academic system of textual criticism and source study¹; b) provided a comprehensive study of the heritage of Navoi; c) raised the scientific level of research in the comparative historical and theoretical directions; d) opened the way for the study of the poet's epic heritage, in particular, questions of the poetics of the "Five". Despite the existing problems associated with the social and social life of the era and the methodology of literary criticism, it can be argued that, starting from the 20s of the twentieth century to the present time, Navoi studies have acquired specific outlines as an independent scientific direction.

The first studies devoted to the study of the "Five" were carried out by representatives of Uzbek literary criticism of the era of national revival. In their works, they paid attention to: A. Fitrat in the 1920s in his book "Samples of Uzbek Literature" and in a study devoted to the dastan "Farhad and Shirin"; V. Mahmud in some of his articles in the form of remarks and comparisons; A. Sadi in his articles and doctoral dissertation².

In his works, published in the 1920s - 1940s, in particular, in the books by Olim Sharafiddinov "AlisherNavoi, Life and Work", S. Aini "AlisherNavoi", M. Shaikhzode "The Genius Poet" and in the collection "The Founder Uzbek literature" in a general context, the life and work of Navoi and issues related to the study of the "Five" were considered. The works of H. Zarif and H. Alimjan were republished, studies of such representatives of the academic school as V. Bartold, A. Kononov, A. Borovkov, A. Semenov, M. Salie, A. Yakubovsky, A. Boldyrev appeared, which have great scientific significance³. Among them, one should especially emphasize the works of E.E. Bertels, who comprehensively investigated the life and work of AlisherNavoi in the comparative-historical, comparative-typological, textological aspects.

In the works of such scientists as V. Zakhidov, H. Suleimanov, I. Sulton, A. Kayumov, S. Ganiev, A. Khaitmetov, A. Abdugafurov, A. Rustamov, B. Valikhodzhaev, S. Erkinov, N. Komilov, Ya. Iskhakov, R. Vakhidov, I. Khakkulov, created in 1960-1990, carried out a comparative study of the epic poetry of Navoi with folklore and works of classical literature of the East, highlighted the issues of the creative method, poetics, problems of sufism⁴. Being one of the central problems of literary criticism, the poetics of the chronotope, which we applied to the «Five» of Navoi, has been studied in world and Russian literary criticism within the framework of certain eras, literary trends, creative methods, specific literary figures, genres and genre components, philosophy of philology. This can be confirmed by the studies of V. Toporov, M. Okhundov, A. Gurevich, N. Trubnikov, P. Florensky, E. Voitovich, E. Efremova, O. Rezina, B. Sorokin, T. Prokhorov, M. Geio,

N. Rzhevskaya⁵. It should be emphasized that the basis of all studies devoted to the poetics of the chronotope in world and Russian literary criticism are theoretical concepts substantiated in a number of fundamental works of the Russian scientist M. Bakhtin⁶. In Uzbek literary criticism, there are not enough scientific works devoted to this issue. Their list is limited to a few studies, which consider the issues of the system of artistic time, the chronotope of the novel, the history of the theory of the chronotope, the poetics of the chronotope and Uzbek classical dastan⁷.

In monographic studies dedicated to the problems of the classical gazel (the process of composing the divan) and daznas, the “preamble” (“debocha”) has been studied to a certain extent. Some literary scholars characterized it as the «traditional introductory part», while others pointed to the connection with the author’s biography, the history of the creation of the work and the composition peculiarities of the divan.⁸

But there is no experience in the study of the preamble of the first dastan as a single system that concentrates and generalizes within the artistic chronotop the composition, plot and images, as well as the semantic-structural meaning of the preamble in the genre system.

The preamble of the “framing dastan” in the “Five” Navoi consists of seventeen composite parts of generalizing content. Starting with the first lines of the first chapter, the style of “Five” is defined and takes concrete features. It is a style of “system contrast” and in a work by means of such contrast different concepts are interpreted, numerous events and phenomena are described, such as faith-disbelief, knowledge-ignorance, good-evil, white-black, day-night, fire-water, sweet-bitter. The thesis, which is presented in a strict sequence at the beginning of the story, is divided into two opposite parts, a detailed description of the first and then the second part, after which the author reverts back to the thesis and draws a conclusion (conclusion, synthesis).

In parts of “unfomed” (glorification of Allah) and “munajat” (a plea to God) the “three worlds” are depicted as a system of worlds without borders, infinite, to which the concepts of astrological time, space do not apply. On the basis of this, we classified them as follows: “primary world”, “middle world”, “lower world”.

In the “preamble” the chronicle of the life of our prophet (may peace be upon it!) is reflected in the framework of five “Nats”(praises) and at the same time each step is subordinated to the goal of advancing a specific concept of the righteous, and also has a peculiar chronotypical form. The part of the “preamble”, located after the praise of the prophet, touches on three important issues directly related to the “compositional frame”. It is: 1) the history of creation Hamsa, the poet-forerunners of the creator of “Five”, the artistic discourse with teachers in a great perspective; 2) Judgments on the word and thoughts, which constitute the semantic-structural basis of the genre “Five”; 3) Questions related to the human soul which are present in the sections “Five” as many significant interlayers.

In the context of the “framing dastan” as the object of the discourse, mainly, the three great predecessors of Navoi - Nizami Ganjavi, Khusrav Dehlavi and Abdurahman Jami - are chosen (only in some places other poets are mentioned, including Ashraf). While the two poets and teachers who developed the basics of Hamsa writing occupied an important place in Navoi’s choice, Abdurahman Jami, a contemporary of the poet who supported him, took his place alongside them. In addition, three dastans of Abdurahman Jami (“Gift of pure soul”, “Rosary of righteous”, “Book of wisdom of Iskander”), which were part of “Seven Thrones”, on their conceptual basis, content and form very close to the framing dastan of Navoi. Last Lines of Discourse

If they disappear in the cave of eternity,

Let me be, «fourth - dog»...⁹

They emphasize that this dialogue takes place in a vast artistic and cognitive space (Islamic knowledge), and reveal such features of Navoi’s character as extreme courtesy and humility.

Their content coincides and harmonically combines with the conceptual views of the author regarding the word and thought, which were reflected in “Five”.

The chapter dedicated to the description of the soul in the chronotope “Preamble” performs the following four tasks: a) shows the degree (poppy) of the soul and its connection with the “chronotop of the three worlds”; b) Gives human touches to the essence of the soul; b) contains a hint on those manifestations of the Dastani phenomenon, the interpretation of which the author intends to give in “Five”; r) is the conclusion of the “Preamble” and directs the reader’s attention to the main part.

In general, the chronotop “Preamble” in the context of “Five” performs the function of a poetic key for subsequent composite parts (Dastan), and is also a poetic whole in which the world view, faith, talent, artistic concept and image of the author are manifest. At the same time, the three astronomical dimensions of time (past, present, future) and time outside these dimensions are concentrated in one circle. Thus, the epic concept of subsequent daostan is defined and the ground for chronotop “Five” is prepared.

The function and conceptual essence of the phenomenon “amazement” are determined by three factors. The first of them is connected with the leading cognitive concept of the author in comprehension of the Creator and himself, the second - with compositional traditions in the history of Hamsa writing, the third - with the method of artistic interpretation of the image of a person in “Five”

By its essence and goals “Astonishment of the Righteous” is a work that depicts the way of understanding the Creator through the analysis of the person, his essence. The conceptual basis of “Five” finds its reflection in the term “amazement” (hayrat). The chosen words-concept at the same time determines the nature of the artistic components of “Five”, such as genre, composition, plot, image. In our view, it is no accident that Alisher Navoi came to this concept. First, he first as a Sufi who achieved perfection, as a spiritual guide led “amazement” through the prism of his individual, theoretical thought and reworked it. Secondly, he drew on existing deep traditions in the history of the cognitive thought of the East and Sufism. On the basis of all this, Navoi put the phenomenon “astonishment” in the center of “Fives”. In “Winds of Love” in the section assigned to the ninth sheikh - the saint, the following wise sayings are given: «And Zunnun has told: The desire to comprehend the essence of Allah with thought - ignorance and hint on it - disbelief. *Truth of knowledge is amazement*» (highlighted by us - U.J.). *A generalized analysis of the text «Fives» shows that the roots of the concept of «amazement» in the works of Alisher Navoi go into this cognitive concept.*¹⁰

In the section «Three Astonishments» three states of the soul are gradually represented. In the image of the process of amazement, its stages, including the last higher stage, consistently retain the principles of systematism and evolution. According to this sequence, the first stage of astonishment and cognition is intuitive (sensual) cognition, the second is rational (mental) cognition, and the highest is belief, divine intelligence. Each individual stage of “journey”, depicted in the chapter “Three Amazement”, has the purpose of showing the rise of “passage” on these steps and in them the artistic grounds of thinking that each step is comprehended through amazement and its result - knowledge, The highest point of knowledge, its truth is the knowledge of Allah. The interpretations of these processes applied to the “middle world” (land, earthly life and society) have found their reflection in “macalats and stories” dastan.

J.C. Trimingham gives such a general definition of the term “abror”: “Rank in the spiritual hierarchy of Sufism¹¹”. In the note he notes that this word derives from the root of the Arabic word “barren” in the form of a single number and literally means “fulfilling their vow”. But he, on the basis of the general purpose of the research, as well as following the majority of European orientalists, “constrains” to get a deeper insight into the essence of the term. In the “Explanations of Sufi Terms” in the book “Sufi Life” “Abrore” is interpreted in the following way: “Abror” are people who themselves their words and deeds are righteous; people known for their good deeds and their moral integrity. In Sufism, the Abraham is divided into two groups: 1. Futuvy people are those who have dedicated themselves to the service of humanity. 2. People who have distanced themselves from creatures made by God, who have fully devoted themselves to Allah¹² i.e. This interpretation is also limited to Sufi teaching and specialized. Therefore, in our opinion in dastan Navoi, cannot express the essence of the concept “abrogation”. We believe that considering the term in a system of specialized Sufi terms, understanding it and explaining it from that point of view, or giving it too much secular meaning, would mislead us and discourage study, uncovering the true essence not only of Dastan “Astonishment of the Righteous”, but also “Five” as a whole, for at Navoi the temporal-spatial dimensions of the human phenomenon are defined so widely that both simple and selective are equally covered. It is this feature that they acquire a common Islamic and universal character. In their essence, the vocabulary meanings of the term “abror” – “fulfilling their vow”, “faithful to their vow”, “committed vow¹³” - in Navoi from the point of view of time universalised up to maximum. Here the concept of “vow” (Akhed) is directly related to time “al-misak” and question “Alastou birobbikum?” – “I am not a god to you?” Then the souls of all people not yet created by the Creator, confirmed that he is their God: “Kolu bala” – “Have told: Yes, of course” (Sura “Aarof”, oyat 172). Abror at Navoi a man who, according to this vow, has gone on a great “journey”. The path of the righteous man is, in fact, the way of the fulfillment of this vow, the way of loyalty to the vow.

In the dastan before the section about “macalata and stories” a general conceptual artistic interpretation of the degree (poppy) achieved by the righteous in the first two worlds – “world of angels” and “world invisible” is given, as well as in one country – “country of the body” within the chronotop of “primary” and “median” worlds. The path of testing is gradually traced from “evening of non-existence” to “country of body”, which is overcome by “walking”. In the section “makalats and stories” the author, using the method “allegoria-truth”, interprets the knowledge of the “walker”, which has reached the degree of the ruler in the country of the body, in the secular plane (social, horizontal chronotop), as well as the knowledge of the Creator, aspirations to the “original homeland”. In short, the means and conditions allowing the righteous person, being within the time space of the “median world”, to associate with the “world of primary”. At the same time, most of the plots of the stories, which serve as a peculiar illustration to the Makalats, coincide with events from the lives of the persons mentioned in “Love Breezes”.

The life path of the man-abraham, the parking places through which he passes, his noble qualities served as a basis for the artistic ideal of Navoi, his conceptual generalizations. But in life, not everyone can reach that level. The ancient laws of life are such that in it the knowing and ignorant, morally perfect and lecherous, truthful and hypocritical, sheared and greedy, impatient and patient, satisfied little and selfish are beside each other. The path of Allah to the step of the happiness of the righteous passes between these opposites. That is why Navoi in his macalates shows two sides of the medallion, depicting also in sharp dramatic contrast to the style

of the holy Koran. At the same time, the stories fulfill the task of artistic argument for the Makalats. Thus, the chronotop of macalates and stories has a function of universal scale, so it together with the chronotop "Five" makes one organic whole. As part of the makalats and stories, Navoi also gives important touches to the portraits and characters of such later dastan heroes as Farhad, Majnun, Bahram, Iskander, Shirin, Layli, Dilaram. Such strokes he makes to the image and the path of trial through which these heroes pass, gives a conceptual generalization of the poetic steps of the path of love, the type images of rulers.

CONCLUSIONS

1. According to the historical poetry, the first examples of poetry were syncretic. They originated from human role models of a particular reality, objects, phenomena and movements. Poetry, which existed as a syncretic unit, over time, as a result of social, cultural, biological, psychological processes, survived the phenomenon of "physical explosion", which contributed to the beginning of the differentiation process. The circular movement of singled out from the poetic units of the syncretic form of "fragments" led to the process of synthetics. Thus, conditions for the emergence of new genres, genre components, poetic canons.
2. "The Five" represents a perfect model of world artistic thought, in particular, the phenomenon of synthetics, characteristic of East Islamic literature. Comparative analysis shows that "Fives" has synthesized specific features, artistic components of such genres as epos, novel, narration, drama, story, kasyda (ode), gazel, sonnet and such works of world significance as "Shahname", "Science leading to happiness", "The Pearls Made", "The Center of Truth". The results of primary analyses give us grounds to conclude that "Five" is a synthetic phenomenon, at the same time an independent poetic system.
3. In the history of world literature there are independent works combining forms of several genres. This poetic phenomenon is consistently observed in folklore, in the written literature of the West, and in the history of Eastern literature. In particular, the artistic structure of epic cycles of world folklore, ancient Greek romances, tales of prophets, "Thousands and one night", "Kalila and Dimna", "Shahnome" testifies to the fact that this process has developed consistently before the emergence of "Five" shows that the system of five-year-old (Hamsa), of which Nizami is the founder, did not appear by accident, but arose on the basis of certain regularities of the development of aesthetic thought of mankind.
4. A comparative analysis of the above-mentioned processes shows that "Five" has a number of differences from the genre cycles that existed before it and has an advantage in terms of perfection of its theoretical canons, a manifestation of purely genre features. Although the cycle of works that existed before "Fives" has certain properties, they acquire a common essence, but the system of canonical units that make up the genre system is not sufficiently formed in them. In "Five Steps" Nizami and Khusrav Dehlavi he also does not act as a coherent, independent system, as it is not foreseen by the artistic design of the author. But Navoi from the very beginning aimed to create a whole artistic system, which is specially underlined by the author in some places "Five".
5. Comparison of historical genres on the basis of the principle of poetic evolution has shown that "Five" Navoi is a whole, unified genre system. It has been shown that the function of the framing component organising semantics - structural integrity of "Five" performs the first dastan. In the semantic-structural connection of this dastan with the subsequent four leading is the

principle of epic universalization. Semantic-structural units, which serve as the basis of epic universality, also define and canons of genre and at the same time give us grounds to assert that “Five” is a universal genre. Based on the chronotopic comparison and analysis, the above canonical units can be classified as follows: a) Universal epic time; b) Universal epic space b) A universal story and a fable system; r) a universal image; d) A universal epic concept.

6. Universality of epic chronotop in “Five” Navoi found its reflection in the semantic-structural system of the preamble “Astonishment of the Righteous”.

The system analysis of parts “hamd” (praise of Allah), “munajat” (pleading, appeal to God) and “nat” (praise of the prophet) allows to come to the following conclusion. This chronotyped form serves as an image of artistic time space in three dimensions, consisting of “primary”, “median” and “lower” worlds, and in a harmonic combination gives a poetic interpretation of the trinity “The Creator - everything is human” circularly.

7. The section “three amazement” in the first dastan serves as the justification of the author’s concept in “Five”.

In it three stages of amazement, through which goes “hoja” - sensual (irrational), mental (rational) and betrayable (superrational), serve as an artistic and conceptual basis for the steps of love in subsequent dastans. Therefore, for the love of ordinary people the basis is a sensual (irrational) amazement, for the people of the chosen - mental (rational) and for the love of righteous - betrayed (superrational, divine). Evidence of this can be found in the passion for all worldly in Bahram, the madness and selflessness inherent in Farhad and Majnun, the principle of loyalty to the Creator, strict compliance with Iskander’s installations.

8. At the heart of the concept of the human being, which has its artistic meaning in the section of makalats and short stories, is the phenomenon of the human-abrector. The human-abromous image depicted here does not fit within the existing artistic and Sufi terms. By its essence and content, the roots of this image reach to the time “al-misak” (a vow) and a vow given before the Creator, and in the vocabulary as well as in the artistic-conceptual meaning denotes a person faithful to his vow in “al-misak”. In this way, the image of the human-abroint from Navoi acquires a universal human essence and at the same time, in a semantic-structural sense, concentrates in itself the central images of the following four dastans.

9. The interpretation of the “Human-Abrore Path” and the theoretical basis of the “Human-Abrore” image were reflected in the work of Navoi “Love Winds”. The analysis of images of our prophet Muhammad (peace be upon him!), his four friends, as well as episodic images of such saints as Bahauddin Nakshband, Feared Bistami, Robiya Adaviyah, Ibrohim Adham, etc. Thus it can be argued that the theoretical results of the study of “Five” Navoi on the basis of the chronotop poetry lead us to the following conclusion: “Five” is an independent genre, a universal poetic phenomenon characterized by the original composition system, A kind of story and a complete system of images.

ABSTRACT

In the following article the impact of the Zoroastrian teaching on the development of early Greek science and its influence on the modern day development of the Pedagogies are analyzed. Its origins are discussed through the framework of the Oriental and Occidental points of views. The hereditary relations of the science and the Middle Eastern and Central Asian schools of thought are revealed through the comparative study of the texts.

KEYWORDS: *Greek philosophy, AhuraMazda, Zoroastrianism, Yasna, Universe, Avesta, Thales, Jacques Duchesne-Guillemin.*

INTRODUCTION

For centuries, among scholars, the development of science of world has been dominated by the idea that the classification of sciences in its present form originated and developed in ancient Greece. Moreover, the philosophy which had fulfilled the role of foundation for all of social sciences was developed based by the efforts of Thales, Anaximander, Aristeus, Germotim, Socrates, Plato, Aristotle, underlining the rule that the notion that other sciences were founded based on the philosophy is recognized as an axiom.

However, the in-depth, scientific analysis of the Avestan texts and historical-ethnological, eschatological, archeological sources suggests that the first scientific buds appeared in Central Asia and later influenced the development of Greek philosophy and later sciences based on the

ideas of Zoroastrianism. When studying the influence of Zoroastrianism on the formation and development of early Greek philosophy, firstly we must rely on the text of the Avesta and Zoroastrian didactics, as well as passages from the works of ancient Greek philosophers, also the political and economic situation between states, nations and tribes.

Due to the fact that the Scythian-Sarmat tribes in eastern regions gradually transferred the vast territories to their sphere of influence, their worldview, as well as their ideas, which were considered advanced for their time fulfilled their programmatic function for the peoples living in the regions of Asia Minor, they became the impetus for the formation of their worldview and teachings. As a result of the development of cultural ties between the peoples, the ideas of Zoroastrianism, which are the blessings of the thinking of the peoples of the East, began to adapt to the emerging sources of Greek philosophy.

LITERATURE REVIEW

In the teachings of Zoroastrianism, ideas such as being, the absolute soul, the movement of the soul, the properties of the mind and thinking, goodness and depravity were first incorporated into the content of his teachings by Thales of Miletus (624-546 B.C.), the founder of philosophy¹.

When we compare the basic principles of the philosophy of Thales with the principles of Zoroastrianism, we see a striking resemblance, a balance:

According to Thales: He is the most ancient of all beings, yet he was not created.

According to "Avesta": -"Hey, Mazda! The seed of the eternal universe – basis- founder! (Yasna 28-verse,1) I praise ... the greatest of the great, the most beautiful of the beautiful, the most superior of the superior, the wise of the wise, the mighty and the unique Ahura Mazda. It is the one who gives Good Will and joy with good intentions. He created the lone of lones. Created our body. He raised us". (Yasna 1, Verse1)

According to Thales: Universe is the most beautiful of all, yet it was created by God.

According to "Avesta": "O Mazda Ahura! You warn me of your world! Tell me in your own language about the beginning of this world! What was it and how was it built? (Yasna 28-verse.11).

"Finally, we applaud Ahura Mazda. It is Allmighty, the great. We praise it. We sing of its beautiful creation. He created the classical universe and the supreme truth. The light, the ground, and the whole good thing was done". (Seven great Yasht, 16)

O Mazda Ahura!... The thinking of the world that created the world was Yours ... Let's give him the prosperity of this world, the splendor of grace", ... Ahura is the only just judge in this world. It will be what he wants (Yasna 29-verse.2,4).

According to Thales: It is the largest space of all, it encompasses everything.

According to "Avesta": "Ahura Mazda, which Zoroaster reported to the Magavan Mughals, means to enter the abode of obedience and worship. This place is the palace of Mazda Ahura from the beginning. This is the truth that is revealed because of the guidance of good intentions and Ashah-Khaqiqat. I warn you about them" (Yasna 51- Verse.15)

According to Thales: The most powerful destiny, the one who rules the world.

According to “Avesta”: O Mazda Ahura!...You have made this destiny worthy for us; so that we may be with you and Ashah-Khaqiqat forever in our earthly life and in the world of the mind. We will be together”(Yasna 40-verse,2).

“Recognize and don’t forget, The fidelZaroastr,

It is totally dependent on our opinions,

Whatthis world should be good,

What will happen in the end of Universe?”(Yashts, 1-yashts.26)

According to Thales:It is the smartest of all, it leaves everyone behind.

According to “Avesta”: “O Mazda! O Glorious One, Who created the earth, the water and the plants!Give me perfection and eternity.Give strength and endurance with the guidance of good intentions. Enjoy the light of your enlightenment!”.

“Ormaiti-Perfect mind gives purity to human beings, and man gives strength to Ashakh-Khaqiqat with knowledge, words, deeds and religion ...I also want this good knowledge ”(Yasna 51-verse.7,21).

According to Thales:The wisest of all is time, in which existence is manifested².

According to “Avesta”: “Hey, ashavanAhuraMazda! We glorify you in search of the wealth and wheat; in the hope of all good deeds and events created by good men and Ashakh-Khaqiqat. Let us we all live for long periods in this wealth. In summer, also in winter” (Yasna 16-verse.10)

“O Mazda! All the goodness of this world of life, which you have, was, is, and will be forever, please us with your grace.With the help of Good Aim, the emperor of the Universe and Ashakh-Khaqiqat.

May lord, with the assistance of the Emperor of the Universe and Ashakh-Khaqiqat provide with the eternal body virtue” (Yasna 33-verse.10)

According to Thales:

What is difficult in the universe? – “Self-awareness”.

What is easy? – “Give advise to someone”.

What is with splendour? – “Success”.

What is from Allah? – “It who does not know the beginning and the end”.

“When does unhappiness easily recede from your heart? “When you see your enemies in a worse situation than you”

Who is happy? -“A person who is physically healthy, pure in heart and devoted to upbringing”³ such ideas are also recognized in harmony with the ideas of the essence of the spiritual world of the peoples of the East.

In turn, on the basis of the analysis of the works of Greek historians, hystrioigraphers, as well as the analysis of sources, the ideas of the sacred book of Zoroastrianism “Avesta” had a significant impact on the emergence and development of the teachings of the first Greek philosophy (6- 5

centuries BC) the brightest representatives Anaximander, Pythagoras, Xenophanes, Heraclitus, Parmenides and Empedocles.

Sources also state that Spytamen Zoroaster was the master of a Mugh named Aston, who was famous in Hellas, and that the same Aston propagated the Mugh doctrine in Greece and in turn he was a master of Democritus and Protogor⁴.

MAIN PART

Through the data of Greek thinkers, the image of Zoroaster became the property of European culture.

The famous Belgian Avesta scholar Jacques *Duchesne-Guillemins* says the following about Zoroaster: "Among all the children of Asia, the West first adopted Zoroaster as its 'son'. His teachings enriched Greece four centuries before the teachings of Jesus. Plato well knew Zoroaster. It took a long time for the teachings of Buddhism and Confucius to arrive in Europe. For this reason, for centuries, Zoroaster was the only person in the West who demonstrated the wisdom of ancient Asia ... In Greece, Plato's contemporary and student Cnidus Eudoks equated his master with Zoroaster ..." ⁵.

The followers of Prodicus, a contemporary of Plato, boasted that they possessed the secret works of Zoroaster and were familiar with their contents. Aristotle, Dinon, Eudex, Theopopos were well aware of the principles of Zoroastrianism. Even then, the Greeks swore by "the right to the name Zoroaster" ⁶.

Philostratus in the book «Appolonius of Tyana» writes the following (I,2): "Empedocles, Pythagoras, and Socrates, after negotiating with the Mugh, interpreted many unnatural words and ideas. But for this, no one has taken them to responsibility" ⁷.

The Timon from Fliurt mockingly describes the greatness of Pythagoras in his comic book "Sillalar":

Before lied Magis of the imaginary words,

Bending head, the Pythagoras,

Afterwards the bearer of absolute words,

Tried to "hunt" for the humans

Plinius (23-79 B.C.) in his treatise "Natural History" (XXX,1,9) states: "It is well known that Pythagoras, Empedocles, Democritus and Socrates 'swam across the seas' in order to study and understand the teachings of the Mugh. After they returned, they adopted the teachings of the Mugh and began to teach them to the people, but kept their contents secret from others" ⁸.

In "The Life of Pythagoras", Porphyry: "After Kambiz conquered of Egypt, Pythagoras, who was being educated by priests, was taken as prisoner and exiled to Babylon, where he studied the teachings of the Mugh. He learned from the Mugh all the information about the cult of the Gods and the rules of life" ⁹ his admission that Zoroastrianism had an incomparable influence on the formation of the philosophical views of the Greek scientific circles.

At this point, it is important to recognize that Pythagoras and members of his school made a revolutionary, tremendous contribution to the development of world culture.

It is noteworthy that the representatives of the Pythagorean school laid the foundation stone of ancient civilization, laid the foundation for the system of primary, secondary and higher education, and determined the content and scope of the seven disciplines. Also, the emergence of sciences such as solid state physics, astronomy, optics, the design of the first amphitheater and theater buildings, the theory and practice of governing the state with the help of police are associated with the name of the Pythagoreans. We still use terms introduced to science by Pythagoras today, regardless of the original source: philosophy and philosopher, esoteric, symbol, mathematics, symmetry, catheter and hypotenuse, parabola, hyperbola, ellipse, optics, cycle, ecliptic, diatonics, engarmonics.

Paying attention to the testimonies of ancient historians, we can see that many ideas in the views of Pythagoras (570-497) are manifested in quality in harmony with the ideas of the doctrine of Zoroastrianism. Well what is this harmony and reciprocity manifested in:

First, Pythagoras, in his interpretation of the concept of being, acknowledges the two bases and causes of the existence of things in it, namely **light** and **darkness**.

Hippolytus (Oproverjenievsekyerese, I, 2, 12) noted the following: "Pythagoras received education from a wise man of the Chaldean nationality named Zaratu. Zaratu told him that the two bases of all things are the presence in the form of the mother and father: father-light, mother-darkness, in turn gave knowledge that light consists of: boiling, dryness, lightness and speed, and darkness-cold, humidity, heavy and slow"¹⁰. It can be seen that the concepts of light and darkness are also ingrained in the content of the Pythagorean doctrine under the influence of the concepts of good and evil (Ahura Mazda and Ahriman), which form the basis of Zoroastrian teaching.

In "Avesta", the sacred book of Zoroastrian, the content of the process of constant struggle between Ahura Mazda and Ahriman, that is, on the basis of life, progress, is always in mutual struggle, such as good and evil, light and darkness, truth and falsehood, beauty and ugliness, justice and injustice, the interpretation of the mutual struggle of contradictory concepts and ideas.

Based on the content of these ideas, Pythagoras introduced the concept of opposition to philosophy. He drew up a table of 10 pairs of opposites. They are: infinity and infinity, even and odd, singular and plural, right and left, male and female, stable and moving, straight and curved, good and evil, square and parallelogram. The first of all contradictions is the pair of end and infinity, and it is possible that this recognition was formed under the influence of the Zoroastrian idea of Zurvan brin (intiho) - Zurvon akanarag (timelessness).

Second, Pythagoras interprets wisdom as one of the main attributes of the creator of being: "there is no other wise man than God"; "Whoever pursues a wise attitude and way of life with reason should be called a lover of wisdom, that is, a philosopher"¹¹. This idea, in turn, is interpreted as an initial definition of the term philosopher. In this view of Pythagoras lies the idea that God, as the creator of all beings, is the "philosopher of all philosophers".

Here we can see that the main of the qualities of god Ahura Mazda, that's from the viewpoint of his being wise, the holder of supreme mind was ground for the teaching of Pythagoras, that's in the "YashtKhurmuzd" of Ahura Mazda said:

"My name is requestor, the faithful **Zoroaster**.

My second name is Matlub, my third name is **Qudrat**.

The fourth is Truth, and the Fifth is **All Goodness**.

The sixth is Wisdom, and the Seventh is I am **Wisdom**.

Eighth - I am the **Doctrine**,

Ninth — I am a **Master**".

"In practice I'm head, In Truth **I'm needed**...,

Wise is my name¹²,"

In Zoroastrianism, special attention is paid to the concept of intelligence and mind (khrad).

"The moon, the earth, and all created creatures and beings are protected and governed by the intelligence and mind.

- The laws of the Universe are determined by it. Good deeds and noble deeds are done through the intelligence and mind.
- It does little harm to an intelligence and thoughtful person.
- A person with an intelligence and mind is rich.
- The intelligence and mind are superior to any wealth and cannot be bought.
- The intelligence and mind help to acquire knowledge, experience, skills and competencies in all areas, to live a good life, to have joy, to have glory, and to go to heaven after death."¹³.

Also, when thinking about the educational process, Pythagoras emphasizes the following: "Properly organized education ... should be done through the mutual will and desire of the teacher and the student. The secret of any science and art, as it is studied voluntarily, is to achieve its goal correctly, while in the compulsory case it is ineffective and effectless".

THEORETICAL BACKGROUND

In turn, the Avesta interprets the struggle of contradictory concepts and ideas, such as good and evil, light and darkness, truth and falsehood, beauty and ugliness, justice and injustice, on the basis of life and development, as a logical development of these is described as the wise teacher and coaches, are opposed to the ignorant and letter less teacher, coaches. In this case, teachers and educators are divided into good and bad teachers, depending on how much they know their knowledge, attitude to the profession, dedication, responsibility for their duties.

"A smart teacher admonishes his student... He deceives and misleads the ignorant" that is, a good teacher encourages his disciples to avoid such vices as ignorance, blasphemy, dishonesty, selfishness, injustice, greed, immorality, unprofessionalism, and ignorance, and to praise God always, believing in God, truthfulness, kindness, purity, justice, honesty, and fairness and considered it his sacred duty to help him display such qualities as humanity, and served in this way. It is praiseworthy to sing about the Master: "He is the one who leads to the abode of humility and cheerfulness in the light of truth, and you have made this path a building for those who are aware of goodness".

At the same time, in the holy book Avesta, bad teachers who sell their faith and knowledge to giants and durujs are severely criticized and condemned. “The evil educator, by his teaching, reverses the divine words and destroys the perception of life. In fact, it turns people away from the priceless investment of truth and good intentions”, or “O people who come from near and far with the intention of acquiring knowledge! Now all of you listen, hear my transparent words and keep them in your mind tightly: Never let a bad educator degrade your life, never let with the help of beast loving seducing language it should’d mislead you¹⁴”. Just as goodness and goodness (Ahura Mazda) always triumph over evil and ignorance (Ahriman), the teachings of wise teachers and mentors take precedence over the teachings of bad teachers, ultimately leading to the maturation of students and pupils who have embraced good deeds in their hearts and minds.

It is clear from this that there is no doubt that the definition of teacher and master in the Avesta, the interpretation of the teacher-student relationship, influenced the views of the Greeks on the educational process. At the same time, it is clear that the application of these ideas and views in the educational process, in the direction of spiritual and enlightenment education will have a high effect. This, in turn, requires a deeper, specialized study and analysis of the rich cultural, spiritual and enlightenment heritage of our ancestors.

Concluding our remarks on Pythagoras, we quote the words of Heraclitus from Ephesus (Hērakleitos ho Ephésios), who showed that the ideas in the context of Zoroastrianism were the basis of Pythagorean doctrine: “Pythagoras was aware of their religious teachings and then adopted them as his own”¹⁵.

There is an opinion that Heraclitus himself studied the teachings of the Mughals and priests based on Zoroastrianism and formed the framework of his views on the basis of these teachings.

In his article “The Influence of Zoroastrianism on the Philosophical Views of Plato and Aristotle”, A.N.Khrust admits that the teachings of Zoroastrianism have roots in the views of the ancient Greek thinkers. Included there, he considers Heraclitus’s famous phrase “war is the father of all things” and Empedocles’ idea that “love and hate form the two foundations of the universe and govern it in turn” to be a sign of the eternal struggle between Ahura Mazda and Ahriman and he asserts that Heraclitus and Empedocles were more or less aware of the basic ideas of Zoroastrianism¹⁶.

Hippolytus makes the following points about Heraclitus: “Heraclitus has the teaching that the soul returns to the body from which we originated. He knows that God is the cause of this resurrection. He says following: The wise people while wakening from the sleep of death in Aida (inferno), in standing mode protects the existing and dead people”¹⁷.

It is here that Heraclitus’ views on the eternity and protection of the soul, as well as the doctrine of the Fravashis in Zoroastrianism, became clearly intertwined. In the Avesto, fravashi means to protect, to support, to shelter. “The Fravashis have a number of responsibilities: to resist the forces of evil, to protect the interests of relatives and the people, to bless, to cooperate with Ahura Mazda in preserving the world - all of which he is responsible for,” he said”¹⁸.

Ahura Mazda said to Sipiytmon Zoroaster:

- Spiytimon! Actually, it informs you on the truth and impact, the help and assistance of the zavr, power, mighty fravavashis, also, the help of happy ashavans of fravashis to me and their extent.
- Zoroaster! I will preserve the bottomless earth created by Ahura because of their majesty and splendor. This low-rise and endless ground is selected from the beauties... Due to their might and splendour I save the children born in the fetus of the mothers... If the mighty fravashis hadn't helped me my beautiful animals and men could be perished... due to their might and glory the brave men will be born: This man while discussing in the meetings, his words are put to ears; This wise man will be the victor in the disputes¹⁹.

RESULTS

It is clear that the teachings of Zoroastrianism served as the basis for the perception of body and soul, soul and heart, life and death, goodness and depravity, beauty and ugliness, which later became the central problem of Greek philosophy.

Heraclitus' only pamphlet, "About nature" has reached us in 130 pieces of patchworks. According to his teaching, all things come from the fire and are in constant change. For Heraclitus, fire is the basis of existence. The fire combines with the air, and the air turns into water, and the water into the soil. This is the way down. In turn, the soil melts and turns into water. Everything else is made of water. The water evaporates and turns into fire again. This is the way up ... In fact, the Earth we live in was once part of a common fire, which later "cooled"... This cosmos is one and the same for all, it was not created by any god or man, but it has always existed and will exist like a fiery, restless fire. "Fire is a necessity, an abundance and a scarcity"²⁰.

Given the fact that in the doctrine of Zoroastrianism, the fire is considered sacred and recognized as the basis of all things in nature, it seems that Heraclitus is also well aware of the ideas of this doctrine.

In the "Avesta", fire is applauded in harmony with the names of Ozar and Otash. "Ozar" is considered to be the guardian god of fire, and it has a very responsible job. Fire is recognized by Zoroastrians as a symbol of the greatness of Ahura Mazda. The Zoroastrians recognized not the flame, but the hilarity in the quality of light, which is radiated from it as a higher cosmic substation. All material things are wounded by light, irradiation. Fire is the most advanced, most visible form of light. It is the energy that controls temperature, heat, dryness, movement, activity. In Christians, the cross and the crescent in Islam are symbols that serve to strengthen the foundations of religion, while in Zoroastrianism, fire has played a similar role. This is why it is absolutely wrong to call Zoroastrians fire followers. Now, in our opinion, we quote excerpts from the "Avesta" texts which influenced the worldview of Heraclitus about the fire:

"Hey the fire of Ahura Mazda! We applaud you, we honor you; we want to make the best sacrifices, vows. You deserve total praise and honor. Hope to see you having applauds and glory in this wealth".

"-Hey the Fire of Ahura Mazda! May the wood in our hands be for you! Let its smoke be yours! May its blessings be upon you! May the heaps of wood be yours! Let this noble creature be your creature! Let this religion aware be your custodian!

Be in this wealth the light!

Be eternal light in this household!

Be enlightened in this wealth!

Stay on foot for long periods til the Resurrection; be eternal, till the Domesday having the good and might!

Hey the fire of AhuraMazda, dedicate to me the solution immediately! Give me shelter immediately! Give me a prosperous life and shelter immediately! Immediately grant me long life, wisdom, eloquence, beautiful language, vigilant spirit, immortal and prosperous intellect!²¹

CONCLUSION

There is no doubt that how deep are the sources of thought of our ancestors, the world around us, the rich content of their weltanschauung formed on the basis of levels of imagination about being, for thousands of years the springs of science have sprouted in these heaven-like regions were one of the cornerstones of the foundation of world civilizations of this spirituality and culture.

In our next research, we will try to cover issues of influence, mutual harmony and proportionality on the formation and development of the teachings of Socrates, Plato and Aristotle, which are considered the founders of Greek philosophy, science, the doctrine of Zoroastrianism.

Especially during the conquest of Persepolis by Alexander the Great, it was on his orders that the 12,000 head of cattle kept in the library of King Darius were engraved in golden letters on the Avesta, the most advanced artistic-philosophical, natural, medical, socio-economic, political the translation of legal, enlightenment-ethical, ecological ideas into Greek by Aristotle is an important historical fact, indicating that these sources were the basis for the development of Greek science in the later period.

In its turn, the studying and researching emergence of the essence of the ideas in the teaching of Avesta and Zoroastrianism as the basis for the emergence of politics, ethics, aesthetics, didactics, grammar, rhetoric, poetics, arithmetic, geometry, astronomy, music and many other sciences requires a complex, scientifically based branching research.

ABSTRACT

In this paper, the main physical properties of terry towels are air permeability, absorption and drying of vapor, capillary properties of body and back yarns, and the construction of a mathematical model using statistical analysis based on experimental results. In the mathematical modeling of the physical properties of terry products, the method of determining the regression model based on the results of experiments from multivariate planning was used to analyze the effect of changes in Pili length and fiber composition on the physical properties.

KEYWORDS: *Terry, Terry Towel, Pili Length, Fiber, Cotton, Polypropylene, Air Permeability, Water Vapor Permeability, Liquid Transfer Rate.*

INTRODUCTION

The main factor in the production of any product is the use of products that meet the requirements of quality consumption with the correct use of available raw materials. Fur is one of the most widely used textiles in everyday life. Users prefer ready-made gowns and towels to be comfortable and fresh, made of light and soft construction, stay dry with quick absorption of accumulated water and sweat on the body, and be in a hygienic and natural form. Therefore, for water-related cases, terry fabrics are an important need for textiles, and the physical properties of towel fabrics must be unique. In such products, air permeability, water vapor permeability, liquid transfer rate, drying time and water absorption are distinguished among the quality characteristics. In order to identify and predict these features, they were selected and implemented in the Central Non-Composite Experimental Experimental Unit (MNKT), which is widely used in the study of technological processes in the textile industry.

Selection of unwanted parameters

Convenience properties were determined according to the areas of application of terry products and weaving properties were selected and convenience features were considered taking into account the studied literature [1].

Cotton fiber Ne 24/2 (34.5 / 2) linear density yarn for the body and cotton fiber Ne 16/1 (27/1) linear density yarn for the back, as well as staple cotton fiber for the fur (Ne 36/2) Ne 20/2 yarns have been used and we have used polypropylene yarns for Pili yarns in experiments and its effect on product properties has been studied.

In mathematical modeling, the parameters of the product raw material and technological processes are taken as an unwanted property. Air permeability, water vapor permeability and liquid transfer rate of terry products have been identified as important factors determining the following properties.

X₁- fibrous composition of Pili yarns. Changes in the proportion of cotton and polypropylene in the yarn,%;

X₂-is the length of the thread used for the Pili on the surface unit of the piece. The number and heights of the Pili strands in the product vary, so we use the sum of the lengths of the Pili strands per unit area, cm;

X₃-final processing — final processing is mainly the cutting of ring-shaped Pilis, in which the change in the proportion of cut Pilis is taken as factor 3;

The following were identified from the properties of Terry products as parameters that take into account the composition of the raw material, the properties and processing of the yarn:

Y₁-Air permeability (mm / s);

Y₂-Water vapor permeability (g / m at 21 hours);

Y₃-Water absorption rate, capillary in the direction of the body strip (mm / 60 s);

Y₄- Water absorption rate in the direction of the back strip, capillary (mm / 60 s);

In determining the limits of variation of factors, the basic level and range of variation of each factor was selected on the basis of preliminary research and theoretical research, as well as the experience of enterprises. The levels and intervals of change of all factors are given in Table 1.

TABLE 1. LEVELS AND INTERVALS OF CHANGE OF FACTORS

Name the factors	-1	0	1	Change
X ₁ - fibrous composition of Pili yarns.	100 % Cotton	50% Cotton and 50% Polypropylene	100 % Polypropylene	50 %
X ₂ -the length of the Pili thread per unit area of the product	46	53	60	7 cm
X ₃ -final processing	0	50	100	50 %

The central non-composite experimental working matrix and the results of the experiments are given in the following table 2.

TABLE 2. CENTRAL NON-COMPOSITE EXPERIMENTAL MATRIX

Based on the results of the experiments, we look for a secondary regression multivariate mathematical model. As a result of this experiment we can obtain the following general regression model:

$$Y_R = b_0 + \sum_{i=1}^M b_i x_i + \sum_{\substack{i=j=1 \\ j \neq 1}}^n b_{ij} x_i x_j + \sum_{i=1}^M b_{ii} x_i^2$$

or because three factors are involved in our experience, the above expression takes the following form:

$$Y_R = b_0 + b_1x_1 + b_2x_2 + b_3x_3 + b_{12}x_1x_2 + b_{13}x_1x_3 + b_{23}x_2x_3 + b_{11}x_1^2 + b_{22}x_2^2 + b_{33}x_3^2$$

In the equation $b_0 \dots b_{11} \dots$ are the regression coefficients of the mathematical model, x_1, x_2, x_3 are the coded values of the factors.

To calculate the regression coefficients, we use the following values of the coefficients. [3]

$$g_1 = 0,2; \quad g_2 = 0,166; \quad g_3 = 0,125; \quad g_4 = 0,25;$$

$$g_5 = 0,125; \quad g_6 = 0,0625; \quad g_7 = 0,3125$$

1. Y_1 -We construct the regression coefficients to construct the air permeability property model.

We determine the regression coefficients:

$$b_0 = \frac{1}{N_y} \sum_{u=1}^{N_y} \bar{Y}_u = \frac{1}{3}(372 + 313 + 410) = 365$$

$$b_i = g_3 \sum_{u=1}^N x_{iu} \bar{Y}_u$$

$$b_1 = 0,125(421 + 474 - 483 - 529 + 288 + 672 - 282 - 753) = -24,12$$

$$b_2 = 0,125(421 - 474 + 483 - 529 + 301 + 713 - 284 - 788) = -19,75$$

$$b_3 = 0,125(288 - 672 + 282 - 753 + 301 - 713 + 284 - 788) = -442,75$$

$$b_{ij} = g_4 \sum_{u=1}^N x_{iu} x_{ju} \bar{Y}_u$$

$$b_{12} = 0,25(421 - 474 - 483 + 529) = -2$$

$$b_{13} = 0,25(288 - 672 - 282 + 753) = 21,75$$

$$b_{23} = 0,25(301 - 713 - 284 + 788) = 11,5$$

$$b_{ii} = g_5 \sum_{u=1}^N x_{iu}^2 \bar{Y}_u + g_6 \sum_{i=1}^M \sum_{u=1}^N x_{iu}^2 \bar{Y}_u - g_2 \sum_{u=1}^N \bar{Y}_u$$

$$\sum x_1^2 \bar{Y}_1 = 421 + 474 + 483 + 529 + 288 + 672 + 282 + 753 = 3901$$

$$\sum x_2^2 \bar{Y}_1 = 421 + 474 + 483 + 529 + 301 + 713 + 284 + 788 = 3992$$

$$\sum x_3^2 \bar{Y}_1 = 288 + 672 + 282 + 753 + 301 + 713 + 284 + 788 = 4081$$

$$\begin{aligned} \sum \bar{Y}_1 &= 421 + 474 + 483 + 529 + 288 + 672 + 282 + 753 + 301 + 713 + 284 + 788 + 372 + 313 + 410 \\ &= 7082 \end{aligned}$$

$$\sum_{i=1}^M \sum x_i^2 \bar{Y}_1 = 3901 + 3992 + 4081 = 11974$$

$$b_{11} = 0,125 \cdot 3901 + 0,0625 \cdot 11974 - 0,166 \cdot 7082 = 60,39$$

$$b_{22} = 0,125 \cdot 3992 + 0,0625 \cdot 11974 - 0,166 \cdot 7082 = 71,76$$

$$b_{33} = 0,125 \cdot 4081 + 0,0625 \cdot 11974 - 0,166 \cdot 7082 = 82,89$$

We also determine the regression coefficients of the remaining outgoing parameters in the above sequence and write the equations taking into account the determined regression coefficients:

$$Y_1 = 365 - 24,12x_1 - 19,75x_2 - 442,75x_3 - 2x_1x_2 + 21,75x_1x_3 + 11,5x_2x_3 + 60,39x_1^2 + 71,76x_2^2 + 82,89x_3^2$$

$$Y_2 = 486,67 - 282,6x_1 + 30,8x_2 - 466,75x_3 - 19,5x_1x_2 + 264,75x_1x_3 - 37x_2x_3 + 201,69x_1^2 + 159,57x_2^2 + 159,44x_3^2$$

$$Y_3 = 33,7 - 5,3x_1 + 1,6x_2 + 29,27x_3 - 1,1x_1x_2 + 6,28x_1x_3 + 0,3x_2x_3 - 0,3x_1^2 - 0,93x_2^2 - 0,79x_3^2$$

$$Y_4 = 32,9 - 7,5x_1 - 0,36x_2 + 22,17x_3 - 0,02x_1x_2 + 8,43x_1x_3 + 0,8x_2x_3 + 0,28x_1^2 + 3,72x_2^2 + 3,72x_3^2$$

We determine the significance of the regression coefficients.

To do this, we determine the variance of the outgoing parameter.

$$S^2\{Y\} = S_m^2\{Y\} = \frac{1}{N_y - 1} \sum_{u=1}^{N_y} S^2\{\bar{Y}\}$$

$$S^2\{\bar{Y}_1\} = \frac{1}{3-1} \cdot 42,8 = 21,4 \quad S^2\{\bar{Y}_2\} = \frac{1}{3-1} \cdot 50,4 = 25,2$$

$$S^2\{\bar{Y}_3\} = \frac{1}{3-1} \cdot 35,6 = 17,8 \quad S^2\{\bar{Y}_4\} = \frac{1}{3-1} \cdot 32,2 = 16,1$$

and on this basis we calculate the variance in determining the regression coefficients:

$$S^2\{b_0\} = g_1 S^2\{\bar{Y}_1\} = 0,2 \cdot 21,4 = 4,28$$

$$S^2\{b_i\} = g_3 S^2\{\bar{Y}_1\} = 0,125 \cdot 21,4 = 2,68$$

$$S^2\{b_{ij}\} = g_4 S^2\{\bar{Y}_1\} = 0,25 \cdot 21,4 = 5,35$$

$$S^2\{b_{ii}\} = g_7 S^2\{\bar{Y}_1\} = 0,3125 \cdot 21,4 = 6,69$$

We calculate the variance in determining the regression coefficients of the remaining outgoing parameters in the above sequence and write them in Table 3 below.

Table 3. Mean squared deviation values in determining regression coefficients:

Mean square deviation	Y_1	Y_2	Y_3	Y_4
$S\{b_0\}$	2,07	2,25	1,89	1,79
$S\{b_i\}$	1,64	1,76	1,49	1,42
$S\{b_{ij}\}$	2,31	2,51	2,11	2,01
$S\{b_{ii}\}$	2,59	2,8	2,36	2,24

Then, using the following equation, determine the calculated value of the Student Criterion and write Table 4:

$$t_R\{b_i\} = \frac{|b_i|}{S\{b_i\}}$$

Table 4. The calculated value of the defined Student Criterion

The calculated value of the student criterion	Y_1	Y_2	Y_3	Y_4
$t_R\{b_0\}$	176	217	17,7	18,3
$t_R\{b_1\}$	14,8	159	3,56	5,29
$t_R\{b_2\}$	12,1	17,3	1,09	0,26
$t_R\{b_2\}$	271	263	19,6	15,6
$t_R\{b_{12}\}$	0,86	7,77	0,52	0,01
$t_R\{b_{13}\}$	9,4	105,5	2,97	4,2
$t_R\{b_{23}\}$	4,97	14,74	0,14	0,4
$t_R\{b_{11}\}$	23,35	71,87	0,13	0,13
$t_R\{b_{22}\}$	27,75	56,86	0,39	1,66
$t_R\{b_{33}\}$	32,05	56,82	0,33	1,66

Table value of student criterion
 $t_j [P_d = 0,95; f\{S_u^2\} = 3 - 1 = 2] = 2,77$

It is known that if the calculated value of the criterion is less than the table value, that coefficient is not significant and we subtract it from the equation. We rewrite the equation by subtracting the checked values.

$$Y_1 = 365 - 24,12x_1 - 19,75x_2 - 442,75x_3 + 21,75x_1x_3 + 11,5x_2x_3 + 60,39x_1^2 + 71,76x_2^2 + 82,89x_3^2$$

$$Y_2 = 486,67 - 282,6x_1 + 30,8x_2 - 466,75x_3 - 19,5x_1x_2 + 264,75x_1x_3 - 37x_2x_3 \\ + 201,69x_1^2 + 159,57x_2^2 + 159,44x_3^2$$

$$Y_3 = 33,7 - 5,3x_1 + 29,27x_3 + 6,28x_1x_3$$

$$Y_4 = 32,9 - 7,5x_1 + 22,17x_3 + 8,43x_1x_3$$

RESULTS AND DISCUSSION

Since the equation constructed to determine the properties of the output parameter for the study is three-dimensional, one of the input factors in the analysis is assumed to be $X_i = 0$ (central position), and we construct a two-dimensional graph by dividing the models into 3 equations.

Y_1 -Air permeability (mm / s);

As can be seen from the graph above, the air permeability shows the result at the lowest value of the X_3 property, and we see that the values of the X_1 and X_2 factors change over a short range.

From the graph describing the permeability of water vapor, we can see that the results of the turbine X1 and X3 show the result at the lowest value, and the values of the factors X2 change in the range. We can see the results in the same form as the models of the remaining properties.

CONCLUSION

Models were created using the results of experiments in 15 cases that we analyzed. From these models, Y_1 -Air permeability (mm /s) and Y_2 -Water vapor permeability (21 hours g/m) were closely related models. we can see that they decrease during the final processing of X3 tissue, and the number of Pils per X₂-tissue surface unit is a key factor in the corresponding improvement of the values of these two properties.

From the 3-4 models in the body, we can conclude that the rate of water absorption in the direction of the body and back strip, capillary (mm/60 s) X² is completely insignificant, but the higher the content of cotton fiber, the better the capillary.

THE ROLE OF UZBEK FOLKLORE IN THE AESTHETIC DEVELOPMENT OF YOUTH

Azizbek Haydarov*

*Fergana Regional Branch of Uzbekistan State Institute of Arts and Culture,
UZBEKISTAN

ABSTRACT

This article tells about the role of examples of Uzbek folklore in the aesthetic development of our youth. Folklore heroes not only live as artistic images, but also become emblems and symbols that represent our people. As the First President of the Republic of Uzbekistan Islam Karimov noted, "Each of the national emblems and symbols serves to enhance our national pride. Each of them is a great textbook." Folklore springs are still boiling all over the country. It is no secret that the world community is studying our masterpieces with sincerity and enthusiasm.

KEYWORDS: *Folklore, culture, spirituality, tradition, legend, myth, talent.*

INTRODUCTION

Examples of Uzbek folklore are our invaluable heritage, which has been passed down from generation to generation for centuries, renewed and expressed in its content the culture and spirituality of the people. That is why the words of the head of our country Shavkat Miromonovich Mirziyoyev: "We have a great history worth envying. We have great ancestors who spoke to the staff of creative organizations, writers and artists who are worthy of envy. We have incomparable riches that are worth envying. And I believe that if we are lucky, we will have a great future, a great literature and art, which is worth envying. "directly apply to folklore (Mirziyoyev, 2017).

Indeed, one of the priorities of folklore studies is always to cherish national values, to study them comprehensively and to make them the object of scientific research.

In this regard, it is worth noting that in our country, along with the highest examples of modern art and literature, great work is being done to make the rich spiritual heritage of our nation, which has withstood the test of centuries, in the way of a partnership, solidarity, and progress for present and future generations.

In this regard, it should be noted that the decision of the Cabinet of Ministers of the Republic of Uzbekistan on October 7, 2010 "On approval of the State Program for protection, preservation, promotion and use of intangible cultural heritage in the years of 2010-2020" is being implemented. This creates great opportunities for the treasures of our national folk art to make a more effective contribution to the spiritual development of the present and future generations.

Folklore is an artistic treasure of the wisdom of life. We can cite many examples to prove this.

It is known that the best customs, traditions, folk etiquette play an important role in the development of the younger generation with high moral qualities. Because whoever - from a young age, who has mastered the etiquette of our people's centuries-old, popular way of life, who listens to the advice and teachings of our ancestors, will find a high reputation in the country.

We want to focus on one important thing based on these views. It is known that folklore lives in harmony with all layers of people's lives, it is impossible to imagine it without some of the listeners. The listener of an epic, fairy tale, or folk song is also a carrier of folklore. That is, folklore is alive not only with the narrator, the storyteller, the singer in general, but also with the listeners who are the carriers of folklore. The listener who listens to a particular piece of folklore assimilates it, and when he hears it again and again, he also develops the ability to perform certain parts of it. Even the most talented and intelligent listeners rise to the level of folklore critics, in modern parlance. As noted in the works of our master folklorists, before passing mature students to recite independent epics, they passed the examination of great poets. Along with these great poets, the audience also gave their assessments. Therefore, as a unique feature of folklore, it should be noted that in this creative process, along with the performers, the audience also participated, and the audience contributed to the preservation and development of centuries-old patterns of the people.

It is no coincidence that Ergash Jumanbulbul's son said, "Uzbeks have a lot of critics of words" (Bulbul Taronalari, 1973: 112).

Why does our great poet emphasize that there are many critics of the word among our people? Because: the critic of the word does not accept the negative word, denies it, and does not allow himself and others to be morally harmed.

We need to pay special attention to this quality today. This is the reason why our country is trying to bring up a healthy, spiritually mature, harmoniously developed, aesthetically harmonious person. If our youth is aesthetically perfect, then "Popular Culture" will never be able to influence it. Therefore, we should learn from the experience of educating folklore not only the consumer, but also the creator.

Folklore springs are still boiling all over the country. It is no secret that the world community is studying our masterpieces with sincerity and enthusiasm.

Journalist Abdulla Holmirzaev published an article about the art of Badash, which is still going on in Surkhandarya, but has not yet received scientific attention. The author notes that Badash is performed mainly on Navruz and Hosil holidays, circumcision and weddings with the accompaniment of such musical instruments as doira, chonqovuz, drum sibizga, dutor, and writes that Badash is mainly called doira, chonqovuz or drum badashi in relation to the accompanying instrument, thus indicating that there are about 70 types of badash, of which about 50 types of badash are performed at weddings:

“The interesting thing is that a woman who didn’t know how to play the doira didn’t have that much prestige, which is why girls have been taught to play the doira since childhood. Most of the women knew about 50 badash words and danced accordingly” (Kholmiraev, 2014).

After all, this is an aesthetically perfect person! An aesthetically harmonious woman raises an aesthetically harmonious generation.

Let's read the rest of the article:

“The woman who tells Badash is wearing a red satin dress and a white shawl over her head, which is called a qasaba. She had a pearl button pad on her feet. She wore a five-cornered earring and the hair around the ear, is curled” (Kholmiraev, 2014).

So, a spiritually beautiful person has become beautiful on the outside as well. Every female performer lived as a living work of art, a living artistic image.

So, in the process of educating young people, we need to make them active and creative. It is important that the thousands of years of creative experience of our people are fully realized today in the example of folklore.

In this sense, the fact that schoolchildren, students of academic lyceums and vocational colleges, students of higher educational institutions, as well as children and young people in general participate in our biggest events as amateurs, often captivates everyone with their skills. It shows that the experience of folklore is also being used effectively. We believe that our generation, which is growing up familiar and creative with folklore, national and world culture, will never be deceived by "Popular Culture".

It should be noted that our young people are proving themselves as carriers and successors of our rich culture. For example, the folklore expeditions of students of philological faculties are rich in discoveries. In one article, folklorist O. Madaev describes the results of folklore practice conducted by undergraduate students of the National University of Uzbekistan named after Mirzo Ulugbek in Kashkadarya region (Madaev, 2012). They visited villages, houses, talked to young and old, and recorded samples of different genres of folklore. The author of the article points out that there are legends, myths, fairy tales, jokes, bridal greetings, quick recitations, labor songs, fairy tale versions of epics "Alpomish", "Ravshan", "Dalli", that include riddles, laments, prayers (donation prayer, table prayer, travel prayer, bride and groom prayer, melon-watermelon prayer, exam prayer). "It has also been revealed that there are songs that are rarely recorded in folklore, such as 'Churiya', 'Hosh-hosh', 'Calling the wind', 'stopping the wind', and 'Calling the rain.' At the same time, he includes in his commentary the full text of a "Hosh-hosh" song, three proverbs, four riddles, a lament, two joke stories, or a comic-story. In our opinion, the essence of this report is summarized in the following sentences: "In the works of folklorists there are some comments about the declining process in the development of folklore in the late twentieth and early twenty-first centuries. However, direct contact with the population living in the villages of the region shows that it is too early to make a firm decision."

Most importantly, the students recognized the examples of folklore in a vivid way - in the image of dear people full of compassion. Now they can feel the charm of its live performance even when they read the written text of a folklore work.

Widely popular execution patterns, on the other hand, can have a great aesthetic impact.

It is no coincidence that there is a growing desire to embrace intangible cultural heritage, including musical folklore, in all its diversity and at the same time in harmony with this diversity. We think that the fact that in the film "Odnoklassniki.ru" (directed by Hilol Nasimov) thirsty melodies appear as a symbol of our national spirituality is a proof of this. Bo'ri, who has sunk into the swamp of badness and earns his living by making money for his countrymen, finds out that the next victim is his own daughter. She rushes to the rescue ... It's as if she rescued her daughter from the clutches of trouble, as if she took him into her shelter. But what happened was a tragedy that even animals wouldn't ... didn't allow him to think so. Then the remnants of honor and humanity, preserved in the blood of this unfortunate man, but also in his instinctive roots, are shaken and spoken. When he was face to face with his daughter, he must have felt how low he was... He instinctively expects salvation from the folk melody - chankobiz, ringing, ringing ... It's as if the melodies of thirst are relieving her daughter's pain, igniting her extinct feelings of humanity ... These melodies are a living expression of the people's spirituality, purify the soul, bring the fallen to their feet, and satisfy those who walk. The scene of chankobiz melodies is the moral and aesthetic embodiment of the film "Odnoklassniki.ru". If we imagine that this scene does not exist, it will be as if the beauty of this film is lost.

In conclusion, I would like to say that we all have an equal duty to ensure the effectiveness of the noble work being done in our country to form and enrich the spirituality of a healthy generation - no matter what field we work in.

Folklore heroes not only live as artistic images, but also become emblems and symbols that represent our people. As the First President of the Republic of Uzbekistan Islam Karimov noted, "Each of the national emblems and symbols serves to enhance our national pride. Each of them is a great textbook."

ABSTRACT

The main way of successful socio-economic development of the country is the development of innovative activities of enterprises, the production of competitive products and economic growth in production. The article highlights the adoption of various normative and legal documents on the development of innovation in Uzbekistan, the work being done in this regard and the indicators. Also, the content and essence of innovation, innovative activity, the scientific approaches of scientists in this regard are presented. In recent years, the indicators of innovative activity in the economy of Namangan region, the existing problems have been highlighted. The parameters of the development of innovative activity in our country are reflected. In our research, the methods of observation, generalization, comparison, logical approach were used, as well as recommendations for existing problems.

KEYWORDS: Innovation, Innovative activity, types of innovation, Financing of innovation activities.

INTRODUCTION

The reforms carried out in our country require the introduction of modern innovative ideas, developments and technologies that will ensure the rapid and high-quality advancement of our

country on the path to becoming one of the leaders of world civilization. An analysis of the sectors of our economy shows that technical and technological innovations, the production of products that are competitive on foreign markets have not yet been fully implemented and the degree of utilization of available opportunities is low. As a result, it was not included in the Global Innovation Index rating which in recent years was made up by influential and authoritative international organizations.

As a result, a number of regulatory documents in the field of innovation have been adopted in our country, and attention is being paid to finding solutions to a number of issues in this area. In particular, the creation of effective mechanisms for the promotion and implementation of promising achievements of research and innovation in the country, including scientific and experimental specialized laboratories, high technology centers, establishment of technoparks and other innovation-oriented structures, especially with the participation of foreign investors, and strengthening the material and technical base¹; carrying out fundamental, applied scientific researches and implementation of innovative developments in advanced technologies; implementation of targeted scientific, technical and innovative programs at the level of world requirements and standards, assistance in research and development in manufacturing enterprises²; development of human capital as a key factor in determining the level of international competitiveness and innovative development of the country, Achieving the Republic of Uzbekistan to be among the top 50 countries in the world according to the Global Innovation Index by 2030, innovation, scientific research, strengthening the inflow of public and private funds for experimental design and technological work, introduction of modern and effective forms of financing of measures in these areas³; to organize their public procurement in order to ensure the guaranteed implementation of science-based products and advanced technologies; assistance in training, retraining and skills development in the field of innovative activities⁴ and a number of similar normative documents.

Thus, the development of educational institutions, research institutes, manufacturing enterprises to work with them is one of the main ways of innovative development, since it develops knowledge and skills associated with the economy entering new stages of development.

Analysis of the relevant literature.

In the course of the literature review, it was revealed that: innovation is a revolution and alteration; application of new knowledge to the production or marketing of a product, as a result of which the investor and his company gain an advantage over competitors. By using patents, a successful innovator can secure a temporary monopoly. Innovation plays an important role in the economy: it contributes to the growth of labor productivity, reducing production costs, improving product quality, as well as increasing the opportunities for competition, stimulating sales, maximizing firm profits and ensuring economic growth⁵.

Innovation (eng. Innovationas – introduced transformation, invention) - 1) funds spent on the economy to ensure the replacement of equipment and technology generations; 2) innovations in areas such as engineering, technology, management and labor organization, based on scientific and technical achievements and best practices, as well as their application⁶ in various fields and activities.

Innovation is a new or significantly improved product (product, service) or process introduced for use, a new method of sales or a new organizational method of work practice, job creation and external relations.

The concept of "innovation" in the early twentieth century in the scientific work of the Austrian and American economist J. Schumpeter illuminated his new life as a result of the analysis of "innovative combinations", changes in the development of economic systems. Schumpeter was one of the first scientists to introduce the term into scientific use in economics in the 1900s. The specific content of innovation is, in the words of J. Schumpeter, "change", and the main function of innovation is the "change management function". This is the most general and broad view of innovation.⁷

According to V. I. Prikhodko, F. E. Lyashko "... the management of innovations in the organization should be considered as a system that includes the development and implementation of an innovative strategy, as well as constant updating of all internal and taking into account changes in external factors of the functioning of the organization in consistent with this strategy. Management of innovations involves the solution of complex multicriteria problems in conditions of initial uncertainty and in constantly changing external conditions. As an example, consider a situation in which only three parameters of innovation management are taken into account: products, technology (internal factors) and the market (external factor)"⁸.

According to A.V. Tychinsky "Innovation is a product (product or service) of scientific activity, as a result of the application of which fundamental changes occur in production, entailing cardinal organizational, administrative and production and technological transformations. Innovation is the improvement of a certain part of the technological or production process, which does not require stopping production and significant economic costs. The innovation does not change the organizational and production-technological processes. It is aimed at both improving the manufacturing process and improving the final product (product or service).

The strategic importance of state policy is acquiring the innovative activity of companies, the content of which is the development and launch of new products on the market, the development and implementation of new technologies, the creation and application of new knowledge".⁹

The innovation process is the process of transforming scientific knowledge into innovation, which can be represented as a sequential chain of events during which innovation matures from an idea to a specific product, technology or service and spreads in practical use.¹⁰

Innovation activities are activities aimed at using and commercializing the results of research and development to expand and update the range and improve the quality of products (goods, services), improve their manufacturing technology, followed by implementation and effective implementation in domestic and foreign markets. Innovation activity associated with capital investment in innovation is called investment activity.¹¹

Theoretical bases of innovation activity are studied by economists of our country F.M. Matmuradov, B.E. Tashmuradova, N. Jiyanov, D.X. Suyunov, M.N.avshanov, M.Sh. Butaboev, A.T. Akhmedova, G.K. Tarakhtieva and studied in the scientific work of others.

According to B.E. Tashmuradova and N. Jiyanova, the concept of "innovation" includes not only technical research, but also to mastering innovations in enterprise activities.¹²

Innovation ensures technological development of the enterprise, which allows modernization, new processes, product, and service diversification due to the integration of new ideas. Optimization of existing or planned activities is aimed at introducing new ideas and scientific and technical activities into business through constant updating, explains G.I. Tarakhtieva.¹³

In general, innovations can be divided into the following types:

1st Picture Types of Innovation

Product innovations are innovations aimed at the development and introduction of technically and technologically new or improved products (works and services). Process innovations are innovations aimed at the development and implementation of technically or technologically new or improved production or training methods, as well as the transfer of technology. Marketing innovations are innovations aimed at introducing new or improved methods, including changes in product design and packaging, the use of new ways of selling and providing products (works and services), the formation of new pricing strategies. Organizational innovations are innovations aimed at introducing new or improved ways of organizing and running a business, creating jobs and establishing external relations.

Consequently, innovation is about - 1) a new set of innovations in the field of implementation, management and organization of scientific and technological achievements; 2) investment in the economy, ensuring the change of generations of technology and technology; 3) new technology, technology, which are the result of scientific and technological progress. The development of invention, the emergence of pioneering and major inventions is an essential factor of innovation.

Innovation activities are all scientific, technological, organizational, financial and commercial steps which actually, or are intended to, lead to the implementation of innovations. Some innovation activities are themselves innovative; others are not novel activities but are necessary for the implementation of innovations.

RESEARCH METHODOLOGY

The research has formed, studied and analyzed data, statistics on innovative activities in our country, in particular in Namangan region. Based on the collected data, the methods of generalization, observation, comparison, logical approach were used.

ANALYSIS AND RESULTS

In recent years, the country has been taking targeted measures to develop innovative sectors of the economy and social sphere, to provide comprehensive support and improve the effectiveness of science and research. A strategic program was approved, aimed at including the country in the list of 50 most advanced countries in the world ranking of innovations, new mechanisms for financing research projects were introduced, and additional conditions were created for material incentives for highly qualified personnel in science.

The main criterion for the effectiveness of reforms is the timely implementation of innovative ideas in practice, including science and industry, in the development of the economy of our country. Innovation is an innovation introduced to ensure the quality growth efficiency of processes and products based on market demand. And any kind of innovation must be influenced not only by innovation, but also as a factor that significantly increases the efficiency of the existing system. Innovation is the transformation of knowledge and ideas into capital. In this regard, it is important to study some aspects of the evaluation of products produced in enterprises, which are applied in practice.

Innovation is the result of the creative activity of an enterprise or organization designed for marketing (implementation). In recent years, special attention has been paid to the development of innovative activities in Namangan region. The share of enterprises and organizations producing innovative products, works and services is growing.

TABLE 1 NUMBER OF ENTERPRISES AND ORGANIZATIONS PRODUCING INNOVATIVE PRODUCTS, WORKS AND SERVICES IN NAMANGAN REGION
(*In quantity*)

Naming	Year 2017	Year 2018	Year 2019	The rate of change, the ratio of 2019 to 2017 in percentage
Enterprises and organizations that produce innovative products, works and services on their own	117	192	184	157.3

According to the table, the number of organizations engaged in innovative work in 2019 was 184, which is 67 more than in the previous 2017, or 57.3%. In recent years, a certain amount of money has been spent on the development of innovative activities, focusing on technological, marketing and organizational innovations. In particular, in 2017 and 2018 for technological innovations, respectively, 52668.2 and 134051.7 million uzbek sums; 2585.2 and 2582.7 million uzbek sums for marketing innovation; Expenditures on organizational innovations amounted to 354.8 and 89.2 million uzbek sums.

Of particular importance in the development of innovative activities is financing, which is carried out from several sources, including in 2020 at the expense of own funds of enterprises

and organizations 127312.1 million uzbek sums, foreign investments 16457.3 million uzbek sums, 133412.8million uzbek sums from loans of commercial banks and 67.8 million uzbek sums from other sources.

In 2020, the financing of innovative activities increased by 5 times compared to 2017.

TABLE 2 SOURCES OF FINANCING OF INNOVATIVE ACTIVITY IN NAMANGAN REGION

(Million soums)

#	Source of financing	Year 2017	Year 2018	Year 2019	Year 2020	The rate of change, the ratio of 2020 to 2017, in percentage
1	Own funds of the enterprise and organization	49769.4	120604.5	152954.6	127312.1	2.5 times
2	Foreign investment funds	1112.2	12456.4	14328.6	16457.3	15 times
3	Loans from commercial banks	3614.5	3141.0	165081.2	133412.8	37 times
4	Other funds	1112.1	335.5	55.9	67.8	6.1
	Total	55608.2	136723.6	332420.3	277250.0	5 times

Funding from foreign investments is also growing from year to year. One of the fastest growing sectors in Namangan region is light industry, in which innovative development plays a significant role. With this in mind, it is planned to implement new projects for the innovative development of the industry.

TABLE 3 PROJECTS TO BE LAUNCHED IN NAMANGAN REGION IN 2021 IN THE FIELD OF LIGHT INDUSTRY

#	Project	Product type	Production capacity	Project cost	New jobs (person)	Start date
1	"Aminjon Xalima Tekstil" LLC	Terry towel products	1500 million units	13.5 million USD	800	01.11.2021
2	"OQTOSH TEKSTIL" LLC	Terry towel products	3200 metric tons	9.5 million USD	600	01.11.2021
3	"Shofirkon ekvatorial teks" LLC	Denim products	3 million units	11.2 million USD	1500	01.12.2021

4	"ART SOFT HOLDING" LLC	Terry towel, bed sheets	22.5 million units	8.6 million USD	1000	20.10.2021
---	------------------------	-------------------------	--------------------	-----------------	------	------------

Using the table above, we have listed the indicators of some projects to be implemented in 2021 in the light industry in Namangan region. We can see from the data that this will increase the level of economic development and employment in the region. In addition, the regional economy will receive additional foreign exchange inflows from exported products.

As a result of research, we can see that there are cases of non-implementation of innovative activities, problems and risks in the development of these activities:

- There is no perfect method and methodology for the development of innovative activities;
- Incomplete use of scientific, technical and educational potential, production capacity;
- The development of innovative activities is lower than world standards; lack of experience;
- The need to identify contradictions that negatively affect the development in this area;
- The need to pay more attention to the innovative development of education, the continuous development of teachers and continuing education, which promotes the development of innovative activities; import of new technologies in education for the development of science; the need to learn from experience;
- Increase the attitude of the population to science, scientists and their activities in social life;
- Probability of non-implementation of the innovative project; this includes unexpected political changes, organizational conditions, the possibility of changes in the environment being an obstacle, and so on.

Overcoming the above problems, the development of innovative activities in the future, large-scale reforms at the current stage of development of the country, improving the mechanisms of public administration in science and innovation, increasing transparency in the formation of state programs of scientific activity and scientific achievements and innovation. In order to accelerate the introduction of technologies, development indicators have been identified. It envisages a number of indicators - funding for research and innovation projects, training of scientific and technical personnel, increasing the share of funds allocated to science in GDP and other indicators.

TABLE 4 PERFORMANCE INDICATORS OF THE MINISTRY OF INNOVATIVE DEVELOPMENT OF THE REPUBLIC OF UZBEKISTAN FOR 2020-2021¹⁴

#	Name of indicators	Unit of measurement	The current figure for the beginning of 2020	Indicator on the results of 2021 (plan)
1	The average amount of funding for a single research and innovation project	Million uzbek sums	530	600

#	Name of indicators	Unit of measurement	The current figure for the beginning of 2020	Indicator on the results of 2021 (plan)
2	Training of highly qualified scientific and scientific-technical personnel (per 1 million population)	person	950	977
3	The total cost of conducting research and preparing developments	Billion uzbek sums	570.0	780.9
4	The share of funds allocated to science in relation to GDP	Percentage	0.2	0.5
5	Funds raised from abroad to finance research and innovation projects	Billion uzbek sums	7.2	12.0
6	Young scientists sent abroad for internships	person	242	500
7	Number of international joint research projects	Units	21	55
8	Number of participants in startup project acceleration programs	units	60	200
9	Production capacity of products based on commercialized scientific developments	Billion uzbek sums	35	70
10	Introduction of new technologies, innovative products	Units	60	400

According to the table, in assessing the effectiveness of the Ministry of Innovation Development of the Republic of Uzbekistan in 2021 compared to 2020 to increase funding for science from 0.2% to 0.5% of GDP; increase the number of introduced new technologies and innovative products by 6.5 times; increase the number of participants in the acceleration programs of startup projects by 3.5 times; doubling the number of commercialized scientific developments; It is planned to double the number of international joint research projects.

Innovative activity and its development is first of all directly related to the development of science, in this regard, the concept of development of science in our country until 2030 has been developed.

TABLE 5 TARGETS AND INDICATORS OF THE CONCEPT OF SCIENCE DEVELOPMENT UNTIL 2030¹⁵

#	Targets	Unit of measurement	Indicators						
			year 2021	year 2022	year 2023	year 2024	year 2025	year 2027	year 2030
1.	The share of funds allocated to science in relation to GDP	%	0.5	0.8	1.0	1.1	1.2	1.6	2
2.	The share of funds allocated by the private sector for research and development in the total funding of science	%	12	15	17	18	20	25	30
3.	The share of innovative products (goods, works and services) in the total volume of products (goods, works and services) sold in the field of research and development	%	3	5	7	9	10	15	20
4.	Proportion of the value of machinery and equipment up to 5 years in the total value of machinery and equipment available in research and development organizations	%	15	20	24	27	30	40	50
5.	The share of expenditures on self-implemented technological innovations in the total cost of technological innovations in the field of research and development	%	11	15	17	21	25	35	65
6.	The share of the cost of purchasing machinery, equipment and software in the total cost of technological innovation	%	52	50	48	45	40	30	15
7.	The share of new markets for innovative goods, works and services in the volume of innovative products (goods, works and services) in the field of research and development	%	6	7	8	9	10	12	15

Increasing the share of innovative products (goods, works and services) in the total volume of products (goods, works and services) sold in the field of research and development in Provard, innovative goods in the volume of innovative products (goods, works and services) in the field of research and development, It is planned to increase the share of new sales markets for works and services and raise the development of innovative activities to new levels.

**TABLE 6 EXPANSION OF FUNDING AND DIVERSIFICATION OF FUNDING
SOURCES FOR SCIENCE AND RESEARCH IN 2021 - 2023
TARGET PARAMETERS¹⁶**

#	Name of expense items	Currency type	Source of funding	total	Including by years:		
					2021	2022	2023
		Total expenses	Million uzbek sums		8715309.1	1592137.1	2508927.6
Thousand USD			284515.4	30 283.1	102542.3	151690	
Including:

It is known from the target parameters for the expansion of funding for science and research in 2021-2023 and the diversification of funding sources that the financing of science and research is mainly funded by the program to strengthen the material and technical base of scientific organizations, innovative development and For the needs of the Fund for Support of Innovative Ideas, it is planned to take measures to attract funds from international credit organizations on favorable terms for the development of science and innovation.

CONCLUSIONS

In order to overcome the existing problems in innovation in our country, as well as in Namangan region, and to develop this area, we recommend the following:

- In the direction of exports of industrial products, focus on reducing the export of raw materials, in particular, the export of semi-finished and finished products;
- Membership in the international insurance system "Green Map";
- Placement of orders of international brands in enterprises;
- Implementation of cooperation in innovative activities, conclusion of agreements with interested foreign organizations, funds and investors;
- Implementation of joint innovative activities, development and implementation of international innovative programs and projects, creation of favorable legal, economic, financial and organizational conditions for their implementation;
- Organization of joint training, retraining and advanced training in the field of innovative activities and mutual exchange of experience;
- Holding international conferences, seminars, symposiums, innovation fairs (exhibitions) and events in the field of innovation, etc.

ABSTRACT

In recent years, the historian recently evaluating objectively in the history of the Soviet era has intensified. Because unilateral approach has dominated the historical processes that took place during the Soviet era. In recent years, Uzbekistan has conducted specific research on the study of collectivization, listening, and exiles in this process. The Soviet government's land and water reforms in the Kashkadarya oasis are later implemented than in another region, and the cooling process in the oasis villages is significantly flawed. All villages in the mass partial areas were included in the kolkhoz, which is gradually implemented.

KEYWORD: Soviet Era, Collecting, Listening, And Shoots, Land, Water, Reform, Communal, Land, Work, Work, Work Animals.

INTRODUCTION

In recent years in Uzbekistan, it is strength to evaluate objectively in the history of the Soviet era. Because unilateral approach has dominated the historical processes that took place during the Soviet era. In recent years, Uzbekistan has conducted specific research on the study of collectivization, listening, and exiles in this process. In Kashkadarya oasis, the Soviet government's land and water reforms were later carried out later than another region.

With the adoption of the Resolution of the Session on January 5, 1930 on January 5, 1930, the collectivization process of the Collective processing process began to adopt the Resolution of the Central Committee of the Central Committee [1]. It is noted that as a strict instructions for the

construction of decisions, strengthen the material and technical base of the kolkhoosis, assisting training of agricultural and increasing the amount of loans to the kolkhozes. It was divided into three groups of the alliance and when each area completes the collections. The decision set out when the collective process will continue in every territory of the country. Uzbekistan is included in the third group, which was scheduled to end the collections in the spring of 1933. In Uzbekistan, the rapid movement has begun to carry out government commission.

The issue of Uzbek Commissioner in the IV plenum of MC on January 12-19, 1930 was measured in the IVlun of MC, measures to develop a plan to collectively mass collective in areas [2]. One of the leaders, one of the leaders, said AkmalIkramov noted that the "Embers of the Emper Restriction Politics is a Participant." However, the leaders of the Soviet state, in particular, the rapid focus of the collective collection in the center, has not paid its demand to the establishment of the Central Asian republics and the leadership of the Uzbek leadership did not pay attention to it. A. Ikramov's output is criticized by Soviet government leaders. Because Uzbekistan has objective and subjective factors of limited access to collective policy in the Kashkadarya and Surkhandarya areas. Uzbekistan's southern oblasts were economically backward and national liberation movements lasted longer in the area. The springing process in the villages of these areas is much more defeated.

On January 28, 1930, the Resolution "On the tasks of the MC MK MK Central Asia Bureau (Sredazburo) was adopted" On the functions of the Central Asia Parties. With the decision, the issue of the collectivization was transformed into the focus of party and Soviet organizations in the spotlight. In Uzbekistan, the rapid implementation of the plan to quickly began the implementation of the plan and the "self-control" of the collectivization in the central standards was put up for the agenda. But in the central regions, they lost that the amount of funds allocated for the collection, as well as "the concept of the traditional medium landowner can be easily eliminated."

On February 17, 1930, its decision was announced on February 17, 1930, the Resolution "On collectivization and liquidation of ear farms." The document previously declared 17 areas in Uzbekistan as the district of the collectivization. But Uzbekistan was not ready for the collection. Because farms are just adaptating to the changes to the result of land and water reform, which most of the leaders responsible for the collectivity is a serious barrier for the collection process.

The research result: in the mass collection, the kolkhoz was used forms of kolkhoz, such as the communal, Artel, the land together. The table is a high form of collective farm, which is summarized by production tools and the distribution of production. The main production facilities in the form of Artel will be summarized by the buildings of labor, tractors and work, management buildings. Land-building companies are a form of collective shape to drive the Earth as a team, which is not summarized.

Results of the research

With the announcement of the Soviet government's decision to collectively collectively, work has become accelerated in this area. Collections have been made in the main task of local authorities. These events were also carried out in Kashkadarya district. Each district of the district, relieving headquarters was organized. In accordance with the task of the headquarters, active workers were involved in advocacy work. They were working mainly to pooren cutters and promoting poor windows and threatening to deprive them of water and stop selling industrial

goods. At the same time, among the population, it was threatened to put the police for top of the hesitant.

In 1930-1931, it became a period of mass collectivization for Uzbekistan. In March 1930, Uzbekistan (47.3%) was collected (47.3%) [3]. In general, in 1928, the collectivization of individual farms in Uzbekistan was 1.2%, in 1932, in 1932, 74.9% was 98.9 percent. So the collectivization process was continued until the end of the 30s. Also, the number of collective farms in the Kashkadarya region has increased year by year. In 1927, in 1927, in the region, in January 1930, in January 193, 147 in March this year, and in April, their number in April. Also, the number of farms has increased from 85 to 14,119, as well as for these years. 21.2% in the area in general is combined to collective farms. Collective farms in the region was organized in the form of cleaning, Artel and communal. In particular, by May 1930 in Uzbekistan, the collectivization was 288.5 thousand (29 percent) [4]. The reason for the decrease in the number of kolkhozes is explained by the integration of small collective farms. It is also important that in the course of the collectivization, local authorities have established the way to write the number of collective farms in order to perform the tasks of the top on fire. The collective farms were formed on the paper. As a result of the investigation of this process, the collectivization rate decreased.

The collective processors did not have a simple understanding of the collective forms. In the collective structure, it is generalized not only industrial tools, households, small pets and poultry, but also housing.

At the beginning of 1933, 79.5 percent in Uzbekistan was joined collective farms. As of April this year, this was 83.8% [5]. A number of dissidents were allowed as a result of rapid carrying out collectivization policy. In January 1930, A. Alimov, chairman of Kashkadarya regional performance, held a meeting on the collection of the Collection, saying, ordered. The rest of the farmers will move to the left side and the rest. A. Salimov writes that 15 people cannot conduct the activities of 15 people, "where will you," go there, "he said against them. These processes show that they do not have enough learning and concept of responsible for the collectivization.

This situation can be observed in other regions. For example, in the Chirakchi district, the mass consent of the population without commenting on the farmers and the consent of entering the "consent of the entry." The worst is the 5 villages away from each other to a single collective. Most of the farmers did not participate in these meetings [6]. The Lenin Road Colossor was formed in the Guzar district. The population fled and applied to the kolkhozes. Or the other way, that is, the population, was legally licensed by the order of the Soviet access on the collective farm. The Kashkadarya region, especially books and Karshi regions, has managed the collectivization in Oblad. For example, on January 18, 1930, representatives of the Soviet government held a meeting in Varganza, Urus, Winter, Sufibek, Sinaboh villages, and deciding on the liquidation of the collection in rural areas [7]. It is planned to establish collective farms on 25-30 thousand hectares in Kashkadarya region Guzar district. The collective measures are becoming a real purpose of the Soviet state.

On March 3, 1930, the Kalinin's district of the Kashkadarya region was held in the Kalinin Polkhose in the village of Karnari, where in which the issue of finding seeds for crops will be discussed. The meeting decides to seize the seed from rich farms. From the village of Guzarhoja, 200 pounds and gates from KingwojaKabarko, 200 puddanKholikov, 150 pounds and qorinajimov is pulled for seeds of 150 pounds and qilikNajimov;]. From the village of the

Covenant, 11 psalopes of NasrullaShodiev were taken away and given to the Agricultural Artel. These actions clearly demonstrated the nature of the robbery of the collectiveization process of the Soviet authorities. In addition, the work of landowners took over the work was continued.

Thoughts on the process of collectivics of the Soviet government are the truth, indicating that they have acknowledged the outcome of the agricultural policy.

The article "Narrers" was announced in the March 2, 1930 issue of the March 2, 1930 issue of I. Savda, the title of "Neighboring" [10]. The article is an artificial accelerative of collectiveization, only the "paper" collective farms, and the situation in Uzbekistan is also criticized.

UzKP (b) MK decided that on March 10, 1930, 1930, the principle of voluntary access to the kolkhoz should be ruled for a serious situation. According to the document, compulsory kolkhozers were determined to leave the kolkhoz, while retaining their own land and inventory. As a result, forcibly collocated farms began to leave the kolkhozes. Up to 25 years, up to 25 times, a newly established 535 joint collective spread by 1,135 Central Asian kolkhox was divided into 1,19415 farms. There are 270 colloxes in Uzbekistan. In Kashkadarya district, there are 2 collective farms with 450 farms. There are also 230 farms from the surviving kolkhozes. In general, 47% of farms in 1930 in Uzbekistan have fallen into May - 29 percent. This means that these figures indicate that farmers are forcibly held by farmers.

In order to support collectivization measures, the Resolution of the SSR HKS "On additional benefits" was adopted on the Columbers of MK on February 2, 1930. In accordance with the decision, the Columbers were exempted for two years from the generalized land, work, animals, irrigated plants, vines and gardens. The cotton fields were exempt from taxes. At the same time, the collective farms were partially equipped with building materials, and land and rent was reported. In addition, if there was an industrial to the disposal, if there is an industrial facility, if in the field of kolkhoz, it was transferred to the disposal.

The Soviet government has tried to support the collective farms everywhere. For example, in the pricing of agricultural products, 47.4 rubles, poor farms farms were paid 47.4 rubles, and poor farmers' average advance. The Columbers also gave a number of benefits. Partial collective farms were exempt from collective taxes. Lammi lands were exempt from full tax.

So, the collectivity of dehkan farms in Uzbekistan was almost once higher than the center. There are specific factors of this situation, which are first in the social structure, the high share of poor and pastors in the social structure is explained by the lack of the high share of poor dehkan farms. In the success of the policy of the collection, the reconstruction of new economic policy, land and water reform, water reform, provision of quality seeds, agricultural and work animals, the introduction of tax benefits is named.

The impact of the communist party, as the influence of the Soviet ideology (workers, collective farmers), was strengthened in the state and society. The Soviet state formed a base in the construction of kolkhozes in rural areas. All villages in the massivities are included in the collective farms. This process is gradually implemented.

FEATURES OF EXPRESSION OF GENDER RELATIONS IN ENGLISH AND RUSSIAN LANGUAGES

Xakimboyeva Ozoda Kalandarovna*

Teacher,
Uzbek State World Languages University,
UZBEKISTAN

ABSTRACT

Currently, the linguistic component of gender studies attracts a large number of scientists, however, gender studies in linguistics still do not have a clearly established scientific definition. In the scientific literature, you can find such terms as “gender linguistics”, “linguistic gender studies”, “genderology” (Kamenskaya, 2001) and “linguistic genderology” (Kirilina, 2002). The fundamental works in this area were the works of R. Lakoff, S. Tremel-Ploetz, Y. Kristeva and other scientists. The subject of this article is the gender marking of phraseological units of the English language, considered not only as fragments of the nominative system, in which the gender factor is manifested in its purest form, but also as examples of embodiment in the language of the nation's worldview, serving as an indicator of cultural information and historical memory of the people. They recorded and reflected the mentality of the people, their way of life, customs, beliefs, national stereotypes and standards, relations within society, historical events, everything that is the subject of national culture and participates in the formation of a conceptual picture of the world, which materializes in language, reflects the linguistic picture of the world.

KEYWORDS: *Feminization Of Modern Society, Formation Of Gender Asymmetry, Masculine, Feminine, Andro-Centricity, Real Man, True Woman, Mental Disability, Humanitarian Branches Of Knowledge, An Unspoken Code, Behavioral Patterns Of Men And Women.*

INTRODUCTION

The study of gender aspects in such humanitarian branches of knowledge as linguistics, sociology and cultural studies began half a century ago at the moment when scientists drew attention to a special type of social interaction, based not on social, physical, national or class

characteristics. The revealed pattern testified to the existence in any society of certain norms of behavior, or an unspoken code, according to which men and women are prescribed to perform certain roles. The behavioral patterns of men and women adopted in each community are based not so much on biological and anatomical differences between the sexes, but on cultural and social stereotypes, in accordance with which there is a clear division and consolidation of certain standards of behavior and responsibilities for men and women. Historically, gender interaction was based on asymmetry: gender inequality reinforced in the minds of most representatives of society the second-rate women and the primacy of men. The gender system, created in most cultures, is based on mental and social stereotypes, according to which the overwhelming majority of the role of women is reduced to serving men and procreation.

Gender is understood as a set of norms of behavior that is usually associated with males and females in a given society. Gender is based on the idea that "it is not so much biological or physical differences between a man and a woman that are important, but the cultural and social significance that society attaches to these differences". One of the first researchers who put forward the idea of considering gender, and then "gender concepts" was the English scientist - historian Joan Scott. She refers to "gender concepts", first of all: a figurative-symbolic system, describing a woman and a man in culture; a set of norms that predetermine the figurative-symbolic system and find expression in scientific, legal, religious and political doctrines and trends; social relations and institutions formed by them; personality self-identification. It must be said that gender research focuses on stereotypes about female and male roles and qualities. Gender stereotypes mean "culturally and socially conditioned opinions and presuppositions about the qualities, attributes and norms of behavior of both sexes and their reflection in the language". Thus, gender stereotypes underlie the formation of certain social expectations in relation to the sexes, encouraging some and negatively evaluating other traits and qualities of people depending on their biological sex. Studies of language and gender asymmetries in it are based on the Sapir-Whorf hypothesis: language is not only a product of society, but also a means of shaping its thinking and mentality.

Being the main form of transmission of everyday knowledge, folklore, in comparison with other literary forms, most accurately and vividly expressed folk philosophy, fully consolidated experience previous generations, served as a source of knowledge and understanding a person of other people, including the opposite sex, and reflected linguistic picture of a person of the era. Therefore, consideration of gender, in particular problems of gender inequality, based on folklore seems motivated.

Folklore - folk spiritual culture, the art of words; spiritual, verbal, poetic creativity. V. Ya. Propp, discussing the relationship between folklore and literature, indicates the simultaneous closeness and specificity of these two forms. Based on the need to highlight special methods of researching folklore as folk art, Propp distinguishes the following literary tasks of folklore:

- 1) Highlighting and studying the category of the genre and each genre in separately;
- 2) study of the internal structure of works, that is studying composition, building;
- 3) study of specific means of poetic language and style;
- 4) study of the specifics of folklore poetics, different from poetics literary.

T.V. Zueva speaks about the inseparability of folklore from history: "The works of folklore are comprehensively determined by the time. Some folklore genres reflect historical representations of the people themselves. "The connection of Russian folklore with folk history, preservation of folk historical memory in folklore researched the historical school, which was one of the most influential in folklore of the late XIX - early XX century. The principles of the historical school finally took shape in the middle 90s XIX century. In the generalizing work of V.F. Miller "Essays on Russian folk literature". Miller wrote: "... I see the main interest of our

epics in the nationalization of these plots, I try to trace the history epics in the mouths of the people and note the layers deposited on it from different epics. I am more interested in the history of epics and the reflection of history in epics".

V.F. Miller believed that the researcher of the epic should answer four main questions: where, when, in connection with what historical events it was created and on what poetic sources it relied creators. The culturological approach to the study of folklore is highlighting four concepts, each of which gives its own definition the concept of "folklore":

- 1) sociological (folklore - orally transmitted common people experience and knowledge; this concept should have arisen in the early period of the development of ethnography and folklore studies, since it could not yet propose a unified method for studying various areas of folk culture, differentiated to consider different areas of traditional culture);
- 2) aesthetic (folklore - popular artistic creativity, "artistic communication"; being oriented exclusively on artistic forms of artistic culture, this concept is fraught with disregard of natural nature traditional archaic forms of folklore);
- 3) philological (folklore - common verbal tradition; folklore is recognized as speech, verbal communication; wherein two problems arise: first, the isolation of folklore from the ordinary, business, practical speech, secondly, folklore, as opposed to language, presupposes the entry of texts into tradition, their assimilation and playback);
- 4) oral (folklore - oral tradition; orality as the most important peculiarity of folklore; the concept is based on the desire to distinguish among verbal forms oral, connect the main features of folklore with direct and contact type of communication).

Modern cultural studies emphasize the connection between culture and tradition, that is, there is no society without culture. Both fabulous and epic traditions they create, as it were, their own world, which has no direct analogies in reality. This world is invented by collective fantasy, it represents transformed reality. However, no matter how complex the connection fabulous reality and genuine reality, it exists and reflects not just and not only something universal, but also the features of being and thinking of a certain people.

Despite the feminization of modern society, such stereotypes continue to influence the development of the individual. The formation of gender asymmetry is laid at an early age, when adults convincingly advise a crying boy not to "cry like a woman". In the future, the system of upbringing and education, the media and culture as a whole lay in the mind of a person the setting for compliance with certain stereotypes about what a "real man" or "true woman" should be. Going beyond these stereotypes threatens public censure and labeling, of which the expressions

"Masculine woman" or "man, but behaves like a woman."

The influence of gender on the language system is most vividly expressed in paremiology - an industry that studies proverbs, sayings and phraseological units. Proverbs and sayings are an excellent example of cultural stereotypes that capture people's experiences and self-awareness. When considering Russian paremiology in the gender aspect, it is impossible not to notice an important component: along with the existence of androcentricity, that is, such a picture of the world that assumes the primary importance of the masculine principle, there is also a female worldview in Russian proverbs and sayings.

In other words, Russian culture differs from Western culture in that a woman, despite a huge number of oppressive and enslaving factors (such as, for example, the Domostroy system), managed not only to defend the right to vote, but also to preserve her point of view, your attitude. Of course, in the quantitative ratio in Russian paremiology, male triumph is recorded.

The male picture of the world is filled with power over the woman

("Wife is not glass - you can beat"),

self-awareness

("The husband plows, and the wife dances") and the representation of a woman as a half-man

("A chicken is not a bird, a woman is not a man").

A striking evidence of the intervention of men in the female world are "pseudo-feminine" sayings that imitate women's speech, but in fact reflect gender stereotypes:

"Sell, husband, a horse and a cow, but buy my wife an update."

The female picture of the world, reflected in Russian paremiology, testifies to the greater gender role and importance of women. Unlike Western culture, in which a woman is mostly presented as a weak and voiceless being, the Russian woman is not devoid of willpower and determination.

However, here too negative qualities prevail, which are attributed to any woman: grumpiness, talkativeness, lack of intelligence. Sayings illustrating these qualities are known to every native speaker of the Russian language since childhood:

"The hair is long, but the mind is short", "a woman's tongue is a pomelo", "an evil wife will drive you crazy" etc.

The positive qualities of women are associated in Russian consciousness exclusively with the cultural concept of "woman - mother". In this case, the feminine principle is associated with creativity, hard work and the warmth of maternal care: "There is no better friend than dear mother", "warmth from the sun, good from mother". Thus, despite the dominance of the male picture of the world, female influence can be traced in Russian culture, and gender roles assigned to women do not always have negative characteristics.

Such asymmetry (by gender) in the Russian language exists not only at the lexical level. A striking example of the inferiority of women is the absence of feminine forms in certain nouns. Most of these words are lexemes denoting persons of a certain profession: doctor, professor, general, secretary, and so on. The rules of the Russian language only allow the use of verbs with these words in the desired generic form: the doctor(he) came / the doctor(she) came. The

historically established trend, according to which only persons of a certain gender could receive these professions, continues to influence the Russian language today. Despite the fact that the overwhelming majority of secretaries today are women, the word “secretary” is used exclusively in a negative way. The same can be said about such forms as "doctor", "professor", the use of which indicates a disdainful attitude towards this person. This allows us to conclude that there is a gender stereotype in the language system and in the Russian mentality, which reflects the idea of the secondary and mental disability of women.

PHRASEOLOGICAL UNITS WITH ADJECTIVAL COMPONENTS AND THEIR PRAGMATIC AND SEMANTIC ANALYSIS

Rasulova Saodat Valijonovna*

*Teacher,
Yeoju Technical Institute in Tashkent,
UZBEKISTAN

ABSTRACT

This article dedicates the study of the phraseology units and its linguistic structure with the usage of adjectives which presents a certain interest both for theoretical investigation and for practical usage. Phraseology is one of the sources of vocabulary enlargement and enrichment. It is the most colourful part of vocabulary system, and it describes the peculiar vision of the world by this speaking community. It reflects the history of the nation, the customs and traditions of the people speaking the language.

KEYWORDS: *Phraseological Units, Linguistic, Analysis, Component, Thematic, Denote, Compound Word, Structural Type, Free Word Group.*

INTRODUCTION

“The road is difficult, not because the deep river and the high mountains that bar the way, but because we lose heart when we think of the river and the mountains”- Vietnamese saying.

The Vietnamese saying exactly describes the difficult process of learning and teaching phraseological units. It is often seen by both teachers and students as an extremely complex area of language teaching.

Phraseology tends to reflect the correspondence of language and culture. Consequently, the language user needs shared knowledge in order to be able to understand given units properly. The knowledge of connotative meanings of components enables the language user to decode modifications of canonical forms of phraseological units as well as to create their own modifications.

Phraseological units may be defined as specific word-groups functioning as word-equivalents; they are equivalent to definite classes of words. The part-of-speech meaning of phraseological

units is felt as belonging to the word-group as a whole irrespective of the part-of-speech meaning of component words. Comparing a free word-group, e.g. a long day and a phraseological unit, e.g. in the long run, we observe that in the free word-group the noun day and the adjective long preserve the part-of-speech meaning proper to these words taken in isolation.

Prof. A.I. Smirnitsky worked out structural classification of phraseological units, comparing them with words. He points out one-top units which he compares with derived words because derived words have only one root morpheme. He points out two-top units which he compares with compound words because in compound words we usually have two root morphemes.

Among one-top units he points out three structural types;

a) Units of the type (verb + postposition type), e.g. to art up, to back up, to drop out, to nose out, to buy into, to sandwich in etc.;

b) Units of the type “to be old”. Some of these units remind the Passive Voice in their structure but they have different prepositions with them, while in the Passive Voice we can have only prepositions “by” or “with”, e.g. to be tired of, to be interested in, to be surprised at etc. There are also units in this type which remind word-groups of the type “to be young”, e.g. to be akin to, to be aware of etc.

c) Prepositional- nominal phraseological units. These units are equivalents of unchangeable words: prepositions, conjunctions, adverbs, that is why they have no grammar center, their semantic center is the nominal part, e.g. on the doorstep (quite near), on the nose (exactly), in the course of, on the stroke of, in time, on the point of etc.

Among two-top units A.I. Smirnitsky points out the following structural types:

a) attributive-nominal such as: a month of Sundays, grey matter, a millstone round one's neck and many others.

b) verb-nominal phraseological units, e.g. to read between the lines, to speak BBC, to sweep under the carpet etc.

c) phraseological repetitions, such as : now or never, part and parcel, country and western etc.

Phraseological units the same as compound words can have more than two tops (stems in compound words), e.g. to take a back seat, a peg to hang a thing on, lock, stock and barrel, to be a shadow of one's own self, at one's own sweet will.

According to these classifications of structures of phraseological units, in my research I have analyzed the components of phraseological units with the usage of adjectives in the following way;

Component analyses:

Adj + N

A blind alley – тупик

A false alarm – ложная тревога

A smart Aleck- самоуверенный наглец

The awkward age – переходной возраст

The gilded age – позолоченный век

Golden age - золотой век, период расцвета

Tender age - ранний, нежный возраст

Executive agreement - договор, заключаемый президентом с иностранным государством

Hot air - болтовня, пустые слова; вздор, чепуха, ерунда

The strong arm - применение силы, насилие

Cold arms - холодное оружие

The assumptive arms - геральд. вновь присвоенный, ненаследственный герб

Bear arms - служить в армии

High camp - талантливое использование примитивного, наивного, банального

An old campaigner - бывалый человек

Red carpet - элегантный, изящный, парадный

A red cent – медный грош

Fat chance - ирон. никаких шансов;

Long chance – риск, сомнительный шанс

V + ADJ + N

To put (or throw) a wet blanket - охладить пыл, действовать расхолаживающе, обескураживать, отбивать

To make a long arm - протянуть руку, потянуться за (чем-л.)

To sell a bag of gold bricks - обмануть, надуть, обжулить, облапошить кого-л

V + ADJ.

To do brown – обманывать

To bleed white – бледнеть

To look back – грустить.

V + N + ADJ

To keep the bones green – беречь здоровье.

To catch somebody red-handed – задержать кого-то в преступлении.

To make the air blue – ругаться, сквернословить

V + ADJ + N + PREP

To make little account of smth – Непридавать значения чему-л

To drive a hard bargain for - много запрашивать, усиленно торговаться

To get a new angle on - стать на новую точку зрения по какому-л. вопросу

N + ADJ + N

Worship the golden calf – поклоняться золотому тельцу

PREP + ADJ + N

Of small account - незначительный, не имеющий большого значения; не пользующийся авторитетом

For so far - совершенно, совсем

Of good cheer - весёлый, жизнерадостный, полный жизни

V + PREP + ADJ + N

To be in great demand – пользоваться большим спросом

To be in different camps - принадлежать к разным лагерям

N + PREP + ADJ.

The gentlemen in the black – дьявол.

The boys in blue – полицейские.

Agony in red - ярко- красный костюм

In component analysis I defined that there are a lot of phraseological units which belong to the type of adj+n.

From the above examples it is seen that every meaning in language and every difference in meaning is signaled either by the form of the word itself or by the context. The complexity or the semantic structure of the word in general, in particular, explained by the fact as reflection of nature, of people life and culture including their history, traditions, and other such like factors which are sometimes full of contradictions and deep unity.

Grammatical features of adjectives in Phraseology.

As I have studied and analyzed all literatures, I found out that the adjective in phraseology sometimes lost its meaning but anyway the function of the adjective in phraseology is an **attribute**. As an example the following adjectives proof my opinion.

A smart Aleck - самоуверенный наглец

The awkward age - переходный возраст

The gilded age – позолоченный век

Golden age - золотой век, период расцвета

The assumptive arms - геральд. вновь присвоенный, ненаследственный герб

Bear arms - служить в армии

The broad arrow - английское правительственное клеймо

A round dance – вальс

A bad deal грубое, суровое, несправедливое обращение, притеснение

Drydeath- любая смерть кроме смерти от утопления, насильственная смерть без пролития крови

Toput (orthrow) awetblanket - охладить пыл, действовать расхолаживающе, обескураживать, отбивать

Tomakealongarm - протянуть руку, потянуться за (чем-л.)

Tosellsmb.agoldbrick - обмануть, надуть, обжулить, облапошить кого-л

Tomakegoodcheer - пировать, веселиться

Tokeepgoodcompany - бывать в хорошей компании, встречаться с хорошими людьми

To make the air blue – ругаться, сквернословить

Tobeabuttonshort - винтика в голове не хватает, не все дома

Toclimbintotheblack - давать прибыль, стать рентабельным

Keepclearofsmb - держаться подальше от кого-л

Agonyinred - ярко- красный костюм

Thelongarmofcoincidence - удивительное совпадение; редкий случай

By the way I also have analyzed proverbs and sayings, while classifying the structure of the phraseological units with the adjective components and I found out that the adjective's function as an attribute stays the same not only in phraseological units but in proverbs too.

Foreg:

Shortacquaintancebringsrepentance - с новым другом недолго и в беду попадет, на нового друга не полагайся

Angerisashortmadness - гнев — кратковременное безумие, гнев сродни безумию

Asoftanswerturnedawaywrath - кроткий ответ отвращает гнев, повинную голову меч не сечёт

The higher the ape goes, the more he shows his tail - чемвышеобезьяनावзберётсянадерево, темвиднеееехвост

The devil is good when he is pleased - и чёртбываетдобр, когдаондоволен

Lexica - Semantic features of Adjectives in Phraseology

It would be interesting now to look at phraseological units from a different angle, namely: how are all these treasures of the language approached by the linguistic science? The very miscellaneous nature of these units suggests the first course of action: they must be sorted out and arranged in certain classes which possess identical characteristics.

It should be clear from the previous description that a phraseological unit is a complex phenomenon with a number of important features, which can therefore be approached from different points of view. Hence, there exist a considerable number of different classification systems devised by different scholars and based on different principles.

The traditional and oldest principle for classifying phraseological units is based on their original content and might be alluded to as "**thematic**" (although the term is not universally accepted). On this principle, idioms are classified according to their sources of origin, "source" referring to the particular sphere of human activity, of life of nature, of natural phenomena, etc. So, L. P. Smith gives in his classification groups of phraseological units used by sailors, fishermen, soldiers, hunters and associated with the realia, phenomena and conditions of their occupations. In Smith's classification I also found groups of phraseological units associated with domestic and wild animals and birds, agriculture and cooking. There are also numerous phraseological units drawn from sports, arts, colour etc.

For eg:

Proverbs and sayings

Short acquaintance brings repentance - сновым другомнедолгои вбеду поасть,
нановогодруганеполагайся

Anger is a short madness - гнев — кратковременное безумие, гнев сродни безумию

A soft answer turned away wrath - кроткий ответ отвращает гнев, повинную голову меч не сечёт

The higher the ape goes, the more he shows his tail - чем выше обезьяна взберётся на дерево, тем виднее её хвост

The devil is good when he is pleased - и чёрт бывает добр, когда он доволен

Phraseological units denoting colour

Red cheeks – красные щёчки.

Red meat – консервированная говядина.

Black Friday – бедный день.

Black Monday – первый учебный день после каникул.

White light – дневной свет.

White man – дисциплинированный человек.

Blue study – погружаться в дом.

Blue blood – семья аристократов.

Phraseological units denoting features of character of person's

Give a good (fine, splendid, etc.) account of oneself - показать себя молодцом

Good advice is beyond price - подлый человек

A smart Aleck - самоуверенный наглец

An angel of light - дорогой, всеми любимый человек

A straight arrow - прямой, честный человек

Black beast - ненавистный человек

Phraseological units denoting variety of action

Getanewangleonsmth - стать на новую точку зрения по ка- кому-л. вопросу

Have a longarm - иметь длинные руки, достигать всюду

Makealongarm (for) - протянуть руку, потянуться за (чем-л.)

Be glad to see smb.'s back (или the back of smb.) - радоватьсяизбавлениюоткого-л

Gofrombadtoworse - становиться всё хуже и хуже, ухудшаться

Phraseological units denoting object and quality

Colddeck - колода краплёных или подтасованных карт

Drydeath - любая смерть кроме смерти от утопления

Black (или dark) comedy - чёрная комедия

Diplomaticcold - дипломатическая болезнь

Falsecoin – подделка

Blind alley employment - (job или occupation) бесперспективноезанятие

A false alarm - ложнаятревога

The thematic principle of classifying phraseological units has real merit but it does not take into consideration the linguistic characteristic features of the phraseological units.

A strong knowledge of phraseological units will help language users to be better speakers and negotiators. And they will be in a much better position to take advantage of the opportunities that come to their way.

LINGUOCULTUROLOGY AS THE THEORETICAL BASIS OF LINGUISTIC CULTURE

Ruziyeva Komila Yangiboyevna*

*TACEI,
Tashkent, UZBEKISTAN

ABSTRACT

This article is devoted to linguo culturological problems have appeared in modern linguistics. Linguo culturology is a complex field of scientific knowledge on the interconnection and interaction of language and culture. Linguoculturology is designed to identify, with the help and on the basis of linguistic data, the basic oppositions of culture fixed in the language and manifested in discourse. Reflected in the mirror of the language and in it are fixed ideas about cultured areas: spatial, temporal, activity, etc

KEYWORDS: *Linguoculturology, Brunch, Linguistics, Structure, Discipline, Material, Goal, Culture, Language.*

INTRODUCTION

Linguoculturology is closely connected with such disciplines as linguistics, ethnolinguistics, psycholinguistics, cognitivistics. As a relatively new science, linguoculturology is characterized by a number of contradictions. So, for example, in the framework of linguoculturology, according to V.N. Telia, language phenomena in synchrony should be considered. However, at the turn of the XX–XXI centuries it is necessary to study the language and using not only the synchronous but also the diachronic method. The emergence of linguoculturology is a natural result of the development of the philosophical and linguistic theory of the XIX–XX century. In the last decade, several works devoted to this discipline were published. The most popular in science work can be considered a textbook by V.A. Maslova. It provides a methodological basis, describes the current trends of linguoculturalresearches. The author emphasizes the interdisciplinary nature of linguoculturology, defining it as “a branch of linguistics that emerged at the junction of linguistics and cultural studies’ as” a humanitarian discipline that studies the material and spiritual culture embodied in a living national language and manifested in linguistic

processes' or as an "integrative field of knowledge that absorbs the results of research in cultural science and linguistics, ethnolinguistics and cultural anthropology".

The goal of linguoculturology, in the opinion of V.A. Maslova (the study of the ways in which the language embodies in its units, preserves and translates the culture), the tasks (to identify how culture participates in the formation of linguistic concepts, or whether the cultural and linguistic competence of native speakers exists in reality), as well as the conceptual apparatus are formulated very widely. The author affirms the possibility of using a wide variety of techniques and methods of research "from interpretative to psycholinguistic".

Linguoculturology is considered as the theoretical basis of linguistic culture; It is defined as "a complex scientific discipline of the synthesizing type that studies the interrelation and interaction of culture and language in its functioning and reflects this process as an integral structure of units in the unity of their linguistic and extralinguistic (cultural) content through systemic methods and with an orientation to modern priorities and cultural Establishment (a system of norms and universal values)". The main object of linguoculturology, the author calls "the interaction and interaction of culture and language in the process of its functioning and the study of the interpretation of this interaction in a single systemic integrity", and the subject of this discipline are "the national forms of society, reproduced in the system of language communication and based on its cultural values", — everything that makes up the "linguistic picture of the world".

Vorobyov introduces the main unit of linguocultural analysis — lingvoculture, defining it as a "dialectical unity of linguistic and extralinguistic (conceptual and objective) content". V. Krasnikov also solves similar problems: in the work "Ethnopsycholinguistics and linguoculturology" he defines the latter as "a discipline studying the manifestation, reflection and fixation of culture in language and discourse, directly related to the study of the national picture of the world, linguistic consciousness, features mentally -lingual complex". In the opinion of V.V. Krasnykh, the subject of linguoculturology is a unit of language and discourse possessing a culturally significant content, which is the "channel" by which we can enter the cultural and historical layer of the mentally-lingual complex.

Linguoculturology is designed to identify, with the help and on the basis of linguistic data, the basic oppositions of culture fixed in the language and manifested in discourse; Reflected in the mirror of the language and in it are fixed ideas about cultured areas: spatial, temporal, activity, etc.; The ancient representations, which correspond to cultural archetypes, emerging through the prism of the tongue.

The problems of linguoculturology are also developed by scientists of the Volgograd school, in particular, V. I. Karasik and E. I. Sheigal. V. I. Karasik regards linguoculturology as a "complex field of scientific knowledge about the interconnection and interplay of language and culture" and emphasizes its comparative character. The main unit of linguoculturology, he calls the cultural concept, and as units of study, the realities and "background values, that is, Content characteristics of specific and abstract names that require for an adequate understanding of additional information about the culture of this people". Karasik V.I. calls a number of reasons why linguoculturology is in its heyday: the rapid globalization of world problems, the need to take into account the universal and specific characteristics of the behavior and communication of various peoples in solving a wide variety of issues, the need to know in advance those situations in which the probability of intercultural misunderstanding is high, the importance of defining and

accurately denoting those cultural values that lie in the basis of communicative activity; an objective integrative trend in the development of the humanities, the need for linguists to master the results obtained by representatives of related branches of knowledge.

The applied side of linguistic knowledge, understanding of language as a means of concentrated reflection on collective experience. In the work of E.I. Sheigal and V.A. Buryakovskaya, linguoculturology is defined as a discipline that studies “individual objects of the conceptual picture of the world and their comprehension by the public consciousness and language from the point of view of the object of reflection, one of which is the ethnos”. The authors study the linguocultural potential of ethnonyms that are part of stable combinations, as well as the specifics of the functioning of ethnonyms in the texts of articles, stories and anecdotes. In 2004, A. Khrolenko’s textbook “Foundations of Linguistic Culturology” was published, in which he defines the goal of science — the generalization of all information accumulated by ethnolinguistics and the disciplines entering into it, revealing the mechanisms of interaction between language and culture.

Linguistic culture is the philosophy of language and culture. The object of the study is language and culture; The subject is the fundamental issues related to the transforming side of the connection between language and culture: changes in the language and its units, conditioned by the dynamics of culture, as well as changes in the structure and changes in the functioning of culture, predetermined by the language realization of cultural meanings. The set of sciences that study the problems of interaction between language and culture, each in its aspect, can be called generically, for example, as suggested by A. T. Khrolenko, linguistic and cultural studies, since each of them aims to identify and preserve linguistic cultural values. In the opinion of A. Khrolenko, linguoculturology should be interested in revealing the mechanisms of interaction, mutual influence of two fundamental phenomena — language and culture, which determine the phenomenon of man. Khrolenko AT believes that linguoculturology within linguistic and cultural studies corresponds to the status of general linguistics in the system of language sciences.

Like general linguistics, linguoculturology is called upon to identify and describe the most general patterns of interdependence, the interaction of linguistic and cultural practices of man and society. This analogy helps to understand that linguoculturology, as well as general linguistics, is possible only in the system of other, more specific in terms of subject and other methods of research of scientific disciplines. In the opinion of O. I. Kourova, linguoculturology is a section of linguistics that studies the interaction of language and culture in the form of systems that embody and represent linguistic cultural values. The task of the new discipline is the explication of the cultural significance of linguistic units by correlating their symbolic reading with the known “codes” of culture.

The basic concepts for linguoculturology are: linguocultural paradigm, cultural connotation, linguistic picture of the world, concept and others. Thus, the theoretical and methodological basis of this discipline for the present the moment is in its infancy. Among scientists, there is no consensus on the status of linguoculturology (an independent discipline or branch of linguistics), nor about the subject and methods of linguocultural research. It is generally accepted to define linguoculturological research as the study of language in indissoluble connection with culture.

There are also studies aimed at revealing the linguocultural specifics of individual concepts; similar works are based, as a rule, on the texts of classical literature.

AL-FARABI'S VIEWS ON HUMAN ANTHROPOLOGY

Hasanov Mirshod Numonovich*; Tukhtaboev Eldor Abdujabborovich**

*Teacher of Tashkent State transport university,
UZBEKISTAN

**Senior Lecturer,
Tashkent State transport university,
UZBEKISTAN

ABSTRACT

This article expresses the philosophical views of Abu Nasr al-Farabi and provides an analysis of man and his problem in his works. By studying man from the point of view of metaphysics and theology, Farabi not only advanced his understanding of the origin and essence of man in ontology, but also substantiated his spirit, intellectual human nature, moral structure, and functional function. Man's daily lifestyle, happiness, and purpose have also been studied.

KEYWORDS: *Thinker, Structure Of The World, Intellectual, Philosophical, Cultural, Moral, Happiness, National, Human Anthropology, Natural Need, Social Need.*

1. INTRODUCTION

Al- Farabi was constantly trying to study the structure of the world. According to their research, the head of all is Allah, as always. The middle is the hierarchy of beings. Mankind is a cripple who understands the world and moves in it. The end is to achieve true happiness. Al-Farabi clarified the essence of human knowledge. Feeling is not enough to understand the essence. This can only be achieved with the help of the mind. The Treatise on the Perspectives of the People of Himmatli is one of al-Farabi's greatest works. It was written in 948 in Egypt. The Doctrine of the Blessed Sacrament is quoted by the philosopher.

2. METHODOLOGY

Al-Farabi believed that the goal of man is happiness, which can only be achieved through reason. The thinker equated society with the state. Society is a human organism. "A benevolent city is

like a healthy body with all its members helping each other to save the life of a living being." Farabi was truly a world-class man who, in his creative achievements, studied and generalized Arabic, Persian, Greek, Indian, and his own Turkish culture. The echo of Turkish culture is evident in his famous Kitab al Musiq al Kabir (The Great Music Book). Farabi's manuscripts are in many libraries around the world. The number of scholars studying Farabi's work is just as wide[1].

Scholars who have published Farabi's works and studied various aspects of his true encyclopedic legacy are contributing to Farabi studies. The Yahili paradigm reveals the simplicity and clarity of "natural" (Qur'anic) transcendents in Islamic purity as a means of communication between "Me and Others", the second with a break, rejection of it, and the third.

In fact, when we talk about Islamic anthropology, we are not simply referring to the human problem, which is opened up on the basis of the idea of transcendence, magnifying meaning. Man's purpose, man's problem, is manifested in the discovery of the prospect of understanding his humanity. Islamic humanism is a divine revelation to man as a phenomenon "manifested" in concept, but its realization should only take place once in the practice of daily life, when human humanism is practiced as a law practice. Even my own manifestation can be interpreted as the humanity of Me and others, for I would only consciously be the humane practice, as well as the formation of a modern personality would be impossible outside of communicative relationships[2].

If in Christianity a person has manifested himself through the way of Christ, to become a unique person, then in Islam, a person becomes a person because of the pattern of daily life. Piety and righteousness are combined and further perfected in daily life as a measure of humanity.

Al-Farabi's ideals and socio-humanitarian development reveal the essence of what a person is actually like in the practice of daily life. Al-Farabi's views on the individual directly acknowledge the superiority of Islamic humanism over human humanism. The following statements of the scientist are definitely relevant in the deepening of human anthropology:

3. Results

Truthfulness in relation to oneself arises only when a person ascribes good qualities to himself, the good deeds that he has. When a person attributes anything to himself, but not what is inherent in him, then it develops it is pretense. "

- "Man became man thanks to reason."
- "Art whose goal is to achieve beauty is called philosophy or, in the absolute sense, wisdom. "
- "Any thing is good only when it is good for achieving happiness".
- "The healer of the body is a doctor, and the healer of the soul is a statesman, called the ruler. "
- "The soul, like the body, is inherent in health and disease. Soul health lies in the fact that the states of herself and her parts are such thanks to which good deeds are always performed, good deeds and wonderful actions. "
- "A person cannot be naturally endowed with virtue or vice, just as he cannot be a born weaver or a scribe. But he by nature can be predisposed to states, encouraging him to take one action rather than another. "

- “Wisdom is knowledge of distant causes on which being depends the rest of existing things and the immediate causes of things, having reasons” [3].

However, this raises a fundamental question: what does Al-Farabi consider the expression of a person's true being - his natural existence as a natural being or its social being? For people who are professionally involved in philosophy are known for certain that both the natural and social dimensions of life are shared for all people and at the same time they are inherent in every person. Wherein any individual can give preference to certain aspects of life, thus defining their existence.

Al-Farabi is under the influence philosophy of antiquity Greece is trying to identify the objective grounds he process of human self-awareness. What should be the main thing for a person - needs of his natural nature or social requirements? It seemed it would be easy to answer this question. In practical life, individuals usually they try to combine their personal needs with requirements public, determining the line of their behavior and way of life. Human being, as the objective basis of the truth of self-consciousness, is quite controversial. General principles reflecting these contradictions, can exclude each other and at the same time contain moments of truth of being.

Considering the relationship between man and society in this vein, generalizing individual, social and political experience, al-Farabi developed his original socio-philosophical concept. In the study of socio-political life, he, like Aristotle proceeded from the following principle: as everywhere, the best way theoretical construction is a consideration of primary education items. Such an education, he considered the natural tendency of people to living together and political communication. According to the thinker, man is a political being, i.e. social, and it carries instinctive desire for cohabitation. Strongly influenced by Aristotle, Farabi believes that the acquisition of the highest good by an individual is, of course, a great merit, but much more beautiful and divine is its acquisition for the people and the whole state, i.e. society.

Al-Farabi does not consider a separate a person and his rights as a principle of the state. On the contrary, like Plato, he proceeds from the primacy of the general over the individual primacy of the state and society over the personality. An individual is only a part of a social whole. The state is the essence of man, "by himself" a man cannot exist[4].

4. CONCLUSION

Al-Farabi understood perfectly well that at the heart of all public life are the production and consumption of material goods, "economic goods, necessary for life. " In the "Treatise on the inhabitants of the virtuous city" the ontological principle is elevated by the thinker to the rank of the main in the social the doctrine of the transformation of the world by a moral (virtuous) person, affirming justice in society. As we noted above, the individual, society, politics, power-everything is in interaction. Al-Farabi's "virtuous city" (or "city") was not only socialutopia. For him, it was the ideal model of a consolidated society, in which everything operates in accordance with reasonable-practical principles and is built on education, upbringing and morality. Al-Farabi, studying a person from the standpoint of metaphysics and theology, put forward not only his concept of the origin of man and his essence in context ontology, but also substantiated the structural and functional task of his soul, intellectual human nature, moral and spiritual foundations being of a person, his creative essence, the way of his self-improvement. This philosopher defined the social essence of man and answered questions about what it means to be human in society and what society should be for manifestation in a human being. Both the one

and the other questions acquire the meaning of a metaphysical questioning about the purpose of man and his role in creating a truly humanistic society.

COMPARATIVE EVALUATION OF THERAPEUTIC EFFECT OF FERROCERONE IN ROSE SYRUP

Barno Inakova*

PhD, Docent,
Head of Department of Facultative Pediatric and Neonatology,
Andijan State Medical Institute, Andijan,
UZBEKISTAN

ABSTRACT

A new composition of ferroceron with improved organoleptic properties has been scientifically substantiated and proposed, which makes it possible to expand the scope of application of ferroceron in children with iron deficiency anemia, regardless of age. For the first time in young children with iron deficiency anemia, a comparative study of the therapeutic efficacy of ferroceron in rosehip syrup was carried out. At the same time, not only immediate but also long-term results of treatment were analyzed. The newly created composition of ferroceron in rosehip syrup, used as an iron-containing drug in the treatment of iron deficiency anemia in young children, turned out to be a highly effective agent without side properties. A comparative assessment of the antianemic effect of a combination of ferroceron and other iron-containing drugs, often used in children's practice, is given, which gave reason to recommend ferroceron with rosehip syrup as an antianemic drug that has an effect on the processes of hemoglobin synthesis and an erythrostimulating effect. The predominant both direct and long-term effect of treatment of children with ferroceron in rosehip syrup was revealed, which determined the created composition to be considered the drug of choice in the treatment of young children with iron deficiency anemia, an etiopathogenetic agent.

KEYWORDS: Predominant, Syrup, Iron-Containing

INTRODUCTION

Treating iron deficiency anemia in children, especially young children, is difficult. Until now, all issues of ferrotherapy, which is the basis of pathogenetic therapy for IDA, have not been sufficiently resolved[3].

Currently, despite the availability of a number of effective parenteral iron preparations, iron deficiency anemia is treated with oral preparations. This method is simple, affordable, and never leads to serious consequences.

A number of iron preparations used in the treatment of patients with IDA are already known. However, the reception of some of them is accompanied by a number of undesirable signs. Symptoms of intolerance are quite common (loss of appetite, nausea, vomiting, stomach pain, diarrhea). Therefore, in assessing the antianemic efficacy of the drug, in addition to the speed of onset of hematological remission, the absence of complications will also matter [9].

Some questions of the choice of a preparation containing iron, its dose, and the duration of administration are still open. The use of preparations containing ferrous salts is generally accepted[4].

In order to avoid side reactions, better tolerance of the selected iron preparations, it is recommended to start IDA treatment with half or one-third of the optimal dose and gradually, within 5-7 days, reach the age-specific daily dose. For young children, iron preparations are prescribed in conventional doses (5-8 mg of elemental iron per kg of body weight) [1,2,8].

For better absorption, the time of administration of drugs is also important. It was found that taking iron supplements after meals leads to its dilution by food masses, as a result of which the percentage of absorption decreases. Therefore, it is now considered justified to introduce them in the intervals between meals. For young children who are breastfed, iron supplements are prescribed 1 hour before meals or between meals, since milk reduces iron absorption by 10: Parenteral administration is recommended for disorders of intestinal absorption, poor tolerance of the drug, and also for some severe forms of IDA [3,7].

Based on the foregoing, as well as the goals and objectives of the study, we conducted a clinical and hematological comparison of the antianemic efficacy of the new ferrociron composition with the iron preparations most often used in pediatric practice for the treatment of IDA: iron lactate, Ferrum-lek, aloe syrup with iron [10].

MATERIALS AND METHODS

To study the antianemic effect of the combination of ferrociron in rosehip syrup, we examined 195 children aged 3 months to 3 years with iron deficiency anemia, who were on outpatient treatment. The control group consisted of 224 children of the same age.

RESULTS AND DISCUSSIONS

The age composition of the observed children is presented in Table 1.

TABLE 1 AGE COMPOSITION OF THE OBSERVED CHILDREN WITH IRON DEFICIENCY ANEMIA

Age of patients	Number of patients	%
from 3 months to one year	111	56,9

from 1 to 2 years	59	30,3
from 2 to 3 years	25	12,8

As can be seen from Table 1, in 170 children, anemia was noted at the age of 3 months to 2 years, which was 87.2%.

The diagnosis of iron deficiency anemia was established on the basis of the following criteria: serum iron level, total serum iron-binding capacity (TIBC), transferrin saturation coefficient with iron, latent serum iron-binding capacity.

When distributing patients according to the severity of iron deficiency anemia, we used the WHO recommendations. According to these recommendations, among the patients we examined with mild anemia (hemoglobin level 110-90 g / l) there were 104 children, with moderate severity (hemoglobin level 90-70 g / l). 1) - 70 children, and severe anemia (hemoglobin level below 70 g / l) was diagnosed in 21 children.

Table 2 contains data on the distribution of sick children according to the severity of anemia.

TABLE 2 DISTRIBUTION OF PATIENTS ACCORDING TO THE SEVERITY OF THE DISEASE

Severity of IDA	Number of patients	%
Severe anemia	21	10,7
Moderate anemia тяжести	70	36,0
Mild anemia	104	53,3

As can be seen from the data presented in Table 2, 21 children had severe and moderate anemia (47.7%), and mild anemia was diagnosed in 104 children (53.3%). It should be noted that 91 children with severe and moderate anemia are children mainly under the age of 1 year - 79 children: 18 children with severe anemia and 61 children were diagnosed with a moderate form of the disease.

Patients under our supervision were periodically admitted to the department for examination and, if necessary, for repeated treatment. Such observation in dynamics made it possible to obtain information not only about the initial period of the disease, but also to trace the further course of the disease, to study the immediate and long-term results of treatment. Clinical signs were characterized by symptoms characteristic of iron deficiency anemia.

Upon admission to the clinic, it was revealed: lag or delay in physical development in 152 sick children (77.9%), lag in psychomotor development - in 111 (56.9), general lethargy, drowsiness - in 164 (84.1%), appetite - in 161 (82.5), vomiting, regurgitation - in 89 (45.6), pallor of the mucous membranes and skin - in 195 (100%), dry skin - in 102 (52.3%), taste perversion - in 102 sick children (52.3%).

As can be seen from the data presented, the most frequent complaints were: lagging in weight gain, lagging behind or decreased appetite, vomiting, regurgitation, taste perversion, lethargy. From the anamnesis it was found that about 80% of the examined children suffered from acute respiratory viral infection 3-4 times, therefore, children with iron deficiency anemia can be considered as often bleating children.

In some patients, we detected hyperpigmentation of the skin, most often on the face, neck, and lateral surfaces of the chest (8.2%). Changes in the oral mucosa were characterized by the

smoothness of the papillae of the tongue ("lacquer tongue"), cracks, "seizures" in the corners of the mouth were observed, the so-called angular stomatitis was observed in 84 patients (43.1%), in 96 children (49.2%) there were signs of dry hair, increased fragility, hair loss.

It is necessary to emphasize the presence of symptoms of damage to the central nervous system in the form of mood swings in 54 children (27.7%), inactivity in 57 (29.2%) children, tearfulness in 64 children (32.8%). From the side of internal organs, we observed systolic murmur (in 148 children - 75.9%); an increase in the size of the liver (in 52 patients - 26.6%); spleen (in 28 patients - 14.3%). In 18 children, unstable stools were noted, constipation - in 11 children (5.6%).

We observed 195 children with iron deficiency anemia at the age from 0 to 3 years. The age of the examined was: from 0 to 1 year - 111 children, from 1 to 2 years - 59 children, from 3 years - 25 children.

As can be seen from the data presented, children under the age of 1 year prevail among the patients. This result is confirmed by the data of most authors with the highest prevalence of IDA among children of the studied age group.

All patients were treated with iron preparations. Of the total number of patients, 42 children received iron lactate, 48 - aloe syrup with iron, 45 - ferrum-lek, 60 - ferrociron in rosehip syrup. The drugs used enterally were mixed and diluted in fruit juice, young children willingly drank the prepared cocktail, we did not observe any side effects or complications. Ferrum-lek was administered enterally as a syrup.

Among the examined patients, 21 children were diagnosed with a severe form of the disease (hemoglobin concentration below 70 g / l), 70 children - moderate anemia (hemoglobin level was in the range of 90-70 g / l), the rest of children (104) - mild anemia degree. The causes of iron deficiency were found out and the symptoms of the disease and the frequency of their manifestation were assessed, the possibility of the presence of a feature was studied, and specialists were consulted.

Considering the possible participation of endogenous factors in the pathogenesis of hypohidrosis, namely, insufficient intake of iron and its deposition in the fetus in the antenatal period, the anamnesis was carefully studied in 193 mothers, as a result, abundant and prolonged blood loss was revealed in 111 mothers as a result of menstrual irregularities. frequent pregnancies were also noted; in 87 women at 11 half of pregnancy was observed long-term toxicosis. According to the anamnesis, 152 women suffered from hypochromic anemia during pregnancy, and 98 had chronic infections. Among the concomitant diseases, rheumatism, adnexitis, gastritis, gastric ulcer, cholecystitis were also noted. In 87 women, pregnancy was complicated and was characterized by the threat of termination.

Thus, the above factors acting in the antenatal period were the main reasons for the insufficient supply of iron from the mother. This confirms the conclusions of a number of researchers on the effect of endogenous iron deficiency on the occurrence of anemia in young children.

We carried out a study of the postnatal history in all examined children. It was revealed that out of 111 infants, 67 were artificially fed (60.4%), 44 children were breastfed (30.6%), 10 children were mixed feeding (9.0%). 97 children (89.4%) had a late introduction of complementary foods (vegetables, meat dishes) - from 8-9 months of age. In children who were artificially and mixed

feeding, biscuits and cereals based on diluted cow's milk prevailed. Children from 1 to 3 years old also had significant nutritional errors. Attention was drawn to the predominance of flour, dairy, and plant foods in their diet; children received little meat products, vegetables, and fruits.

Analysis of the results obtained showed a pronounced effect of unbalanced feeding and nutrition on the development of anemia in the studied group of children.

Table 3 provides information on the incidence of clinical signs of anemia in children with IDA, taking into account the severity of the disease.

Table 3 shows the direct relationship between the incidence of clinical symptoms of IDA and the severity of the disease.

Based on the foregoing, the following conclusions can be drawn: iron deficiency anemia in young children with a high frequency was observed in children under 1 year of age, and the reasons for its development in all studied groups were endogenous and exogenous iron deficiency caused by various factors against the background of concomitant diseases (rickets, exudative - catarrhal diathesis, hypotrophy).

The clinical manifestations of iron deficiency and parental complaints were diverse. Among the complaints most often, parents reported pallor of the skin (177), lack of appetite (161), taste perversion - eating earth, clay, chalk (102), the appearance of frequent regurgitation (89), vomiting (34). An objective study revealed pallor of the skin and visible mucous membranes in all examined patients, dry skin (103), dry hair, hair loss (96), brittle and thinning nails (65). In children over a year old, changes in the oral mucosa were quite common in the form of atrophy of the papillae of the tongue - "polished" or "lacquered" tongue (84), so-called "seizures" in the corners of the mouth - angular stomatitis (52)

TABLE 3 THE FREQUENCY OF CLINICAL SYMPTOMS OF ANEMIA IN CHILDREN WITH VARYING DEGREES OF SEVERITY

Factors	Severity of anemia in children		
	Mild	Moderate	Severe
Pallor of the skin, mucous membranes; trophic disorders of hair, nails, skin; atrophy of the papillae of the tongue	- +	+ + +	+ + +
Anorexia, perversion of taste, smell; regurgitation, vomiting; angular stomatitis	- +	+ + +	+ + +
Changes in the cardiovascular system; gastrointestinal tract and other systems	+ -	+ + +	+ + +

One of the signs of iron deficiency in young children, especially in severe and moderate forms, was a lag in physical development indicators: 152 (77.9%) children were identified with signs of hypotrophy and hypocitraturia, while hypotrophy was observed mainly in 103 children under the age of 1 year (52.8%).

We noted deviations in psychomotor development, which were especially clearly manifested in the 1st year of life: children began to hold their heads late, sit, stand, walk, and later began to speak (111). In 164 children, a decrease in emotional tone, a rapid change in mood was revealed to one degree or another, the children were inactive, lethargic, whiny, capricious, a decrease in interest in the environment, toys. The observation results showed that organ function

abnormalities were mainly related to the cardiovascular system (148), which boiled down to the presence of systolic murmur, tachycardia, and a slight expansion of the borders of the heart.

Hepatomegaly and enlargement of the spleen were found in 80 patients. Both organs were determined by palpation, the lower edge of which protruded from under the costal arch by 3.5-4 cm. Stool changes were not typical and constant. Constipation and unstable stool were noted with the same frequency.

The above clinical symptoms of iron deficiency in young children supplement laboratory studies characterizing the state of red blood and indicators of iron metabolism.

As can be seen from the presented table 4, characteristic changes in peripheral blood during IDA are a low level of hemoglobin, a decrease in its content in an individual erythrocyte, a decrease in the hematocrit value, a color index, and a decrease in the total number of erythrocytes. The iron deficiency nature of the identified anemia is confirmed by the data contained in table. 4: sideropenia, an increase in the total iron-binding capacity of blood serum and a significant decrease in the transferrin saturation coefficient.

TABLE 4 PARAMETERS OF PERIPHERAL BLOOD AND SERUM IRON METABOLISM IN CHILDREN WITH IDA AGED 3 MONTHS TO 3 YEARS.

№	Indicators	IDA of moderate severity (n = 70)	Severe IDA (n = 21)	Healthy children (n = 214)
1.	Hemoglobin,	79,0±1,62	64,6±2,3	129,0±1,8
2.	Erythrocytes, 10 ^{12/l}	3,26±0,12	2,81±0,08	4,41±0,07
3.	Hematocrit, vol%	26,3±0,76	22,5±0,9	34,8±0,4
4.	Average hemoglobin content in erythrocyte (PG)	22,4±0,06	21,0±0,03	33,2±0,04
5.	Color index, units	0,74±0,01	0,67±0,02	0,89±0,003
6.	Serum iron, µmol / L	8,7±0,07	3,4±0,02	20,2±0,5
7.	TIBC, µmol / L	89,8±0,8	97,4±0,6	60,8±0,02
8.	LVSS, µmol / L	52,1±0,4	100,3±4,0	33,0±0,01
9.	Transferrin saturation coefficient, %	11,8±0,07	8,0±0,05	38,7±0,15

Thus, the examination of sick children revealed the iron-deficient nature of anemia, as evidenced by a low level of serum iron, a low coefficient of saturation of transferrin with iron. In addition, clinical data characterizing trophic changes in epithelial integuments, as well as hematological data in the form of pronounced hemolysis, with reduced actual erythropoiesis with a shortened erythrocyte life, speak eloquently about iron deficiency. Changes in the morphological properties of erythrocytes in the form of microcytosis, an increase in the thickness and volume of erythrocytes, hypochromia can also be evidence of the iron deficiency nature of anemia.

CONCLUSION

Treatment of all observed patients was carried out in a comprehensive manner, it was pathogenetic, systematic and consisted of measures aimed at eliminating the causes of the development of anemia and at eliminating the lack of iron in the body. The nutrition of sick

children was strictly and individually organized. Vitamins and mineral salts of iron were introduced into the diet. Children of the first year are introduced to complementary foods earlier, including vegetable dishes and homogenized purees (vegetable with meat, vegetable with liver). The complex of treatment of children included intramuscular injections of vitamins B6, B1, 0.5-1.0 ml daily. Iron preparations were prescribed to young children, taking into account the content of the element, valence, tolerance, and the absence of side effects.

The study of the comparative therapeutic evaluation of the new composition of ferrociron in rosehip syrup made it possible to establish a high direct and persistent antianemic effect. The drug, which actively affects the processes of hemoglobin synthesis, stimulates erythropoiesis in the absence of toxic side effects. In the treatment of young children with iron deficiency anemia, ferrociron in syrup and rose hips, in comparison with other iron-containing drugs most often used in children, gives an increase in hemoglobin 1.5 times more and more than doubles its average daily growth, as well as under the influence ferrociron in rosehip syrup much earlier (by the end of 1 week) a reticulocytic crisis appears in children, its value was 1.5-2 times higher than in the group of children treated with other drugs, the normalization of the erythrocyte balance, the number of erythrocytes and indicators iron exchange.

SALABAT KHAN TOMB: AN UNDER EXPLORED HERITAGE SITE

Dr. Meera Kulkarni*

*Professor,
SP Pune University, INDIA
Email id: meera630@gmail.com

ABSTRACT

The tomb of Salabat Khan was constructed in 1579A.D. on a hill called Shah Dongar (Salabat Khan II was a wazir of Murtuza Nizamshah and was an able administrator, planner, architect and water management expert). Later this tomb was also of strategic importance. It is currently a monument with ASI & is surrounded by land with private owners & the forestry department. At a height of about 3080 feet above sea level, located on top of a hill, it is 700 and 800 feet above the city of Ahmednagar. Surrounded by vegetation and giving a panoramic view of the city, it has a cool breeze flowing throughout the day. Attempts have been made in the past to promote this historic tourist spot but have been ineffective. In the absence of adequate consolidated effort of the administration, government machinery, political leadership and local citizenry it lies in neglect. This case study attempts to focus on marketing the peripherals along with the essentials in this destination tourism.

KEYWORDS: *Subaltern, Afghanistan, women, endurance, resilience, colonialism, patriarchy, militarization, religious fundamentalism.*

INTRODUCTION

Heritage sites are a big draw in encouraging tourist services (visits, memorabilia, selling experience, entertainment etc). If well managed it provides a steady income flow for the local population & is a revenue earner for the economy. It calls for an integration of many areas of knowledge - anthropology, history, psychology, sociology, geography, economics and marketing management specially services marketing.

The fast rate of growth of heritage tourism has also brought in many dimensions of concern. With an appetite for development, many nuances are bypassed. In the impatience to maximize returns from these sites, the plunder & exploitation has resulted to another set of problems. So, though it seems easy to develop a heritage tourist site, it does involve a lot of sensibilities.

Understanding heritage tourism & its marketing

“Tourism is too important a resource to be left to the tourism professionals. Tourism needs to be part of a community mobilization strategy that can reinvent the role of heritage so that it serves the needs of everyone” Bob McNulty President, Partners for Livable communities.

Today it has added newer dimensions of concern to this kind of tourism. Prevalence of an integrated approach by all stake holders is essential to market heritage sites. It is not only the authentic recording of historical events around it, its geographic location of this site per say that is draw for its success but also other considerations as reach ability (travel convenience), importance of other destinations around it, personalities that draw people to it (living & dead), involvement of ASI & other governmental machinery in promoting it - all add up to the brand value proposition. Governmental involvement is in the cultural offerings, education, preservation, creating an identity. The commercial reward to this (lodging, boarding, food, entertainment, selling of artifacts) is usually taken by the private business sector. For the heritage brand to have a long marketing life, the overall site along with it's add on subsidiary brands of additional services & products needs to be nurtured. The site has to be preserved besides giving attention to morality, privacy, personal identity & fundamental change in human nature (Rheingold 1991). It has been established that successful marketing of a heritage site, an effective tourism plan enabled by local involvement leads to a sustainable development of a heritage site. Tourism industry can have many effects on the environment (Romeril1989). When marketing of these sites, the goal of the marketer needs to be well defined. Myopia in this has very negative consequence. There is a threat to heritage assets due to “tension between commodification & conservation” (Mc Kercher & du Cros 2002).

There are similarities between brand heritage & heritage tourism (Hudson 2013) – historical approach, applying marketing theories, identity, nostalgia and authenticity. If experience is the product of authentic heritage tourism than, nostalgia (for recollecting & longing past glory) is the food it thrives on. Served with a developed hospitality industry, this product will be delivered successfully. Tourists would be interested in the monument, museums, art galleries, theaters, festival, concerts, performances, other significant sites nearby (Williams, 2006). Tourism & hospitality sectors are in synch when we talk of experiential marketing & service excellence. With World Heritage sites, sustainable tourism and integrated management are important requirements. (Newtownabbey A. G., 2007)

Promotion of heritage tourism is popular in the digital platform. By using nosography & online communities, electronic bulletin boards, web rings (web pages, link based on a theme, chat rooms etc.) & listings allowing interactions, generates interest in these sites. Uploading the site through videography & fostering creation of a global heritage space (Sigala 2005) are ways to promote. Outbound tourism efforts are required in plenty. Within the country of its origin as well as a global presence is required to promote.

It is imperative to have research that pulls in information regarding demand (ensuring & forecasting), distribution of local marketplace (food, entertainment, and lodging), travel systems, operational capacity etc need to be in place. The visitor looks forward to an entire experience in this service.

The Salabat Khan II Tomb, Mohekari near Ahmednagar city, Maharashtra, India

The saga of Salabat Khan Tomb

It is the tomb of Salabat Khan II, who was a minister with the fourth Nizam Shah – Murtuza Nizam Shah from 1579.

This historic heritage site of Salabat Khan Tomb, lies on top of the hill of Shah Dongar, Mohekari near Ahmednagar city, Maharashtra, India. One has to walk up an incline to reach the footsteps that lead to the structure. The tomb is located in an underground crypt. It is a three storied stone structure that can be seen from anywhere in the city. This landmark is at a height of about 3080 feet above sea level (700 and 800 feet above the city of Ahmednagar). It is 13 kms away from Ahmednagar city. It is wrongly called as Chand Bibi fort, though Chand Bibi had been in this region during this period (1550–1599). This tomb is commonly referred as SKT by the locals.

The octagonal raised plain central floor, above the underground chamber, is surrounded by tall walls that have many angular holes. These holes on the walls permit sunlight & air to flow freely within the verandah which is 100 feet broad & 12 feet high. On top of the structure lies an open terrace that is very breezy. From here a panoramic view of the city can be seen & appreciated. The entire city can be seen from this height due to which it served as a strategic vantage point against any insurgency. Salabat Khan II was a minister of Murtuza Nizamshah and was an able administrator, planner, architect and water management expert. His water preservation expertise can be witnessed even today. At a height of 3080 feet above sea level during his period water self-sufficiency was created by building deep trenches that held plenty of rain fed water. This ancient rain water harvested lakes can be seen even now and do hold water during summers.

This high rise structure is surrounded by green vegetation that the forest department is looking after. A tar road is built to the top of the structure. On all the sides, corporate have invested in many a windmill. The wind here allows power generation. On one side lies a temple of a statue of Veerbhadra, built by the Nizam so that the workers from Karnataka (from the Lingayaat clan) could perform their prayers & the construction of the monument would not be affected by their absence when they desired to offer their prayers. Strangely, as per the wish of this community,

this temple cannot be seen from any height. As we go down & away from the tomb, a playground has been constructed. On either side benches & playing areas & facility has been made for children. These also are wanting in upkeep. The forest department has also constructed a “Nisarg Mahiti Kendra”, which is supposed to disseminate information. Most of the times it is unmanned and locked. In early 2000, as an impetus to tourism promotion, four rooms were constructed for tourists. The forest department also had constructed a guesthouse. Due to neglect in their upkeep and bad publicity these facilities have closed down attracting only few tourists who come by the day. It was hotel Chand Bibi & later Sai Anand hotel that provided ethnic food to the tourists along with serving them hot beverages, soups, pakoras along with Indian and Desi Chinese preparations. Both these hotels closed down as regular footfalls petered away after about an year. It was not financially viable & getting employees to work in these facilities became difficult.

Strangely there is no write up /information board/signage for the tourists. The wall housing this board is under repairs for the last year.

Early morning the entire road from the base of the hill is flooded with enthusiastic walkers. They reach midway leading a small plateau where the playground is (some return from there) & others walk right up to the top of the tomb which about two & a half kilometers is either taking the tar road or trek up the hillock.

The locals of Ahmednagar have definitely visited SKT. The pride of this heritage is not so strongly ingrained amongst the ethos of the locals.

Challenges

Till date, in the absence of proper MIS and long term planning, tourism in Ahmednagar district, Maharashtra is suffering. Fragmented approach of various government departments (forest, tourism, ASI, irrigation department), a callous attitude towards environment & socio economic concerns, lack of public – private partnership & raising of adequate funding has led to this sorry affair. SKT is also a brunt of this apathy. Further, understanding the past creates an attachment to present, has still to be developed among all to appreciate this heritage site.

A self sustaining model has to be put in place. Private land owner (Pote family own about 75 acres of land around the site), tourism industry along with the government agencies and local population need to explore SKT in a better way. Paucity in allocating appropriate government funds for restoration and its proper usage has led to this state of affairs at SKT. The leadership of this region has not kept heritage tourism as of any significance in their plan of things.

Vitalizing SKT as a heritage tourism site

The target tourists would be an inflow of domestic & foreign tourists. MTDC, travel sites would host information on SKT in a very attractive & compelling way. Schools in the state, holiday goers within the country would be targeted. Being close to Aurangabad, which pulls a lot of foreign tourists visiting Ajanta & Ellora and also Mehraabad near Ahmednagar (followers of Meher Baba) would bring in the adequate foot falls. The product/experience itself needs to be well defined & understood. Nostalgia for past has to be created throughout the experience without any trace of boredom setting in. For this various options of the service could be provided at a price (guided tour only in the vicinity of the tomb, walking trail from the base on the tar road, trekking experience, mountain climbing from mid-way, an active information center

wherein all visitors will be briefed on the authentic history of SKT, heritage walk, heritage corridor- covering three or four heritage sites nearby within a day, an evening of sound & light show covering the glory of Nizam Shah's period etc.). Newer exciting models to publicize on the digital platform, information sharing across all medias to promote this site, information boards on all the seven routes around the city & on the trail along SKT, regenerating interest amongst the community, preservation of the structure & its upkeep (respecting the heritage and not writing graffiti on walls), from sheer indifference & neglect by all stake holders to having pride & attracting tourists could recreate the glory for SKT.

The unobtrusive space around SKT allows one to appreciate best in Nature- flora & fauna, mountains, cool breeze and peace around.

A tri-component model for vitalizing SKT has been suggested, all along keeping a subtle focus on the experience generated.

The first component is the governmental machinery that needs to gear up. The ASI, Forest Department, local government, all will be activated through lobbying. The basics of cleanliness- washrooms, dustbins, drinking water and creation of clean spaces can be done simultaneously. The children's play space can be cleaned up and seasonal flowering plants can be planted to beautify the area. All this leading to experience quality of the servicescape. The rusticity has to be kept intact & it cannot get a manicured look. Clean benches can be placed along the entire trail. The ancient water holes can also be revived for the tourist's curiosity. The preservation & upkeep of this structure as desired of a heritage site could be taken up earnestly. Government needs to get involved in two areas of training. Firstly, training guides to share & repeat authentic history of the place with enthusiasm. It is vital that this narration should give a true picture of recorded history with pride. The delivery of this standardized script could be given in Marathi, English, Hindi and also using translators in Japanese, Spanish, Chinese & other languages as per demand. Secondly, to develop a service culture amongst all involved in marketing & delivery of this service. Short training programme needs to be conducted in order to serve the requirements of experience marketing. Further, governmental involvement in commute to the site by dedicating a city bus plying with a good frequency should be taken up urgently. This bus can pick up the tourists within the city and from other feeder hubs around it. Travel convenience has to be looked into.

Second component is the public private partnership. The public here includes the community, large corporate (Larsen & Tubro, Crompton Greaves etc.), small businesses (like Kohinoor – a cloth retailer) and individuals can come together to pool in resources (ideas, finances, art, creativity etc.). This would bring in more involvement & ownership. To boost the economy, third party involvement in plying taxis, housing tourists, providing local cuisine as well as varieties of food, bringing in bazaar activity on fixed days, selling memorabilia etc could help in tangibilising the experience. With more avenues of revenue emerging, a sustainable model with responsible developmental activities would thus emerge.

Third component is getting the locals involved socio economically. Training them & hand holding these new entrepreneurs would be beneficial. Creating a market and employment for this slice of history – sound & light show covering the era of Nizam Shah, selling interesting memorabilia, having safe parking, eateries offering finger food & snacks along with local cuisine & other food varieties, local bazaars & some events on some fixed days in a week or

month could be baby steps in the right direction. Tour operators & local guides could become operational. Small treks could be organized. The experience can be priced differently based on the choice of the consumer (trek, heritage walk, heritage corridor tour etc.)

Great potential lies hidden in the heritage site at SKT that needs to be explored sensibly. SKT would be able to have an identity and this would dissipate the dispiritedness that mars it today.

THE IMPORTANCE OF PHYSICAL EDUCATION IN THE FORMATION OF A HEALTHY LIFESTYLE

Makhmutaliev Adkhamjon*

*Teacher,
Fergana State University,
UZBEKISTAN

ABSTRACT

One of the main tools for the formation of a harmonious generation is physical education and sports. Because, physical education and sports play an important role in the growth of young people in adulthood, healthy. In a healthy person, self-confidence, perseverance, skills and virtues of being able to bring The started work to the end are formed. Therefore, the development of this sphere and the identification of the problems that arise in it and the proposal of its solutions are one of the pressing issues.

KEYWORDS: *Sports, Physical Education, Competition, Skill, Healthy Generation, Physical Preparation, Sports Psychology.*

INTRODUCTION

It is known that physical education and sports activities lead to the development and strengthening of the human organism in all respects, the improvement of physiological functions and the improvement of Health. Correctly organized physical education classes are highly effective, taking into account the age, gender and individual characteristics of the participants. Otherwise, they lose their importance in addressing the health-improving function of physical education. "In the process of physical education, special pre-implementation is planned, applied for training, a system of physical exercises that favorably affect the form and function of the body, the forces that restore nature and hygienic factors are used"[1, 19].

The main part

The development of physical education and Sports has always been one of the pressing issues facing the state and society. The Negus of people's health was built on physical education and sports, and the regular physical education and sports activities of the people played an important

role in the restoration of his health. And this served to the training of great commanders, brave warriors, people with a healthy mind. In very ancient times, thinkers and educators in Central Asia believed that nothing can effectively educate such feelings as kindness, truthfulness, patriotism, love for the ecological purity of nature in a person as national games and sports. They are formed in our country due to the ethnographic, climatic, geographical, historical, spiritual conditions of Uzbekistan. They are the result of the people's creative activity in continued for thousands of years. They are reflected in labor activity, social and everyday order, lifestyle, culture and belief. During the entire historical evolutionary course of the formation of the nation, the selection work was carried out on the selection of the optimal methods, means and ways of physical education of the growing generation. At the same time, they reflected the views, ideals and aspirations of the Uzbek people on living in harmony with nature, living a healthy lifestyle. It can be seen that the primary sources of the socializing role of physical education in the upbringing of the growing younger generation are explained in the annals, in ancient times, by the people, that physical education was considered to be a universal phenomenon at a daily, intuitive level. He not only limited himself to health and strengthening it, striving to form a certain moral and physical qualities in children, but also provided for the perfection of a certain attitude to the existing procedures for living in a community in which he was born.

The current development of science, technology, production and technology determines the image of modern society. The most important characteristic feature of modern society is that in all its spheres globalism is conspicuous. Globalization itself is subject to rapid movement, the immediate capture of the necessary information, their processing and effective implementation into practice. They will have the opportunity to move in this way only those personnel who are knowledgeable in their field, have a high level of professional skills, have rich experience and skills. Therefore, in the process of training personnel in higher educational institutions, it is desirable to take into account this requirement of the period.

"Physical education is one of the most ancient means of education that affects human perfection. The main tasks of physical education, which are carried out in secondary schools, are to strengthen the health of students, prepare them for labor, protection of our independent country and social life. It is given to students in school through physical education, mobile games, gymnastics, sports, classroom and types of extracurricular sports activities"[2, 23].

It is established through a culture of physical harmonious generation education and its perfection, a stable lifestyle. The main criterion for it is the level of health, health of the individual. Health, as well as health, goes to the perfection of the human body, and the laying of its foundation is carried out from the very first period of its biological age.

Before each age to choose a type of physical education, it is necessary, first of all, to assess its level of health by passing a medical examination, what kind of sport it is possible to engage in, it is necessary to correctly choose the type of physical activity, assessing the age, the season of the year, the current state of the organism and.

In each person, physical education and sports begin with a loving awakening family. "A person who is regularly engaged in physical exercises will rarely need treatment," wrote Abu Ali ibn Sina.

The health-improving and educational functions of physical education are as follows:

- You will be in a good mood for the whole day;
- Your work will be productive, your creative activity will be strong;
- Nervous system balanced, press, you will be thoughtful;
- Feelings of activity, initiative, bravery, friendship are formed;
- Regularly engaged in physical exercise leads to the formation of hygienic skills;
- Fats in the body will decrease, you will become more compact, agile, agile;
- Your muscles will tighten, your muscles will become more slender and shapely;
- improves blood flow in the vessels, oxygen to the body and organs, as well as the progress of nutrients;
- The protective ability of the organism increases;
- You will be younger, more sympathetic, more working and healthier than others.

The content of physical education training is expressed in the work of physical perfection, diagnosis of physical condition, culture of physical education, sports work, physical reference. When we say physical perfection in pedagogy, we understand that the data on the growth of physical culture in a person, that is, the formation of a sequence of exercises and exercises that bring about physical and mental changes in a person, from simple to complex.

When we say physical maturity - harmony in the external appearance of the body - the form of beauty, the qualities of Jimenez - we understand the way to achieve a high degree of perfection of agility, elasticity, strength, agility. Physical culture is a component of physical education and its content includes:

1. The structure of human organs and their functional perfection.
2. Strengthen the health of those involved.
3. Habituation to the rules of hygiene.
4. Improve the skills of the contestant in every way.
5. Formation of physical and physiological qualities of future workers-servants.
6. Create conditions for physical and age characteristics in the occupants.
7. Perfection of the sense of Will, endurance, perseverance, discipline, friendship in the host.
8. Educate personal physical abilities.

Physical Education coach educators are obliged to perform the following tasks:

- ensure the passage of the lesson at a high level and complete the corresponding class physical education program;
- Together with the doctor, timely conduct medical examination of students and take into account the results of medical examination in their work;
- To ensure that the places where the lessons are held are kept in the appropriate sanitary and hygienic condition;

- To achieve that all students are engaged in physical exercises in comfortable clothes;
- participation in organizing and conducting work in addition to studying in physical education, as well as wide involvement of students in it;
- To carry out explanatory work on the importance of physical education of students;
- Regularly increase their knowledge in the field of physical education;
- formulate habits to interest students in Physical Culture and to engage in regular exercise in them.

CONCLUSION

According to the above ideas, having drawn a conclusion from these opportunities, we are working with each student, attracting them to sports, organizing their leisure time, forming a healthy lifestyle, choosing young people with good health and energetic attitude, an indicator of further glorification of the name of Uzbekistan in high sports arenas. After all, we should not forget that physical education and sports on the one hand have a positive effect on the strengthening of Health, a high level of physical development, the performance of all kinds of activities throughout life. On the second hand, educational value, which has a wide world view, has a positive impact on spiritual and socio-biological adaptation, serves as an important factor in the Prevention of diseases, the fight against delinquency, cocaine addiction, the restriction of harmful habits of adolescents.

AS FOR THE UNITS THAT REPRESENT THE CONDITIONAL RELATIONSHIP

Rasulova Azizakhon Muydinovna*

*Teacher, doctor of philosophy in philological Sciences (PhD),
Fergana State University,
UZBEKISTAN

ABSTRACT

The article focuses on the works done in the field of world and Uzbek linguistics, opinions about the linguistic field, the attitude to the condition and its study, the units representing the meaning of the condition. In the sentence it is necessary to open the contents of the condition, which helps the predicate. This condition arises through a barrier connection. Hindrance will be determined by the question anyway.

KEYWORDS: *Systematic Research, Area and Its Types, Conditional Area, Units Representing Conditional Semas.*

INTRODUCTION

At present, the Uzbek linguistics has begun to pay serious attention to systematic research. A distinctive feature of these studies is that without an autonomous approach to linguistics, attention is paid to the opening of the essence, which lies hidden under any phenomenon. The researcher will focus on highlighting the relationship between more linguistic phenomena. F.DeSassyur focused the attention of linguists on opening the relationship between linguistic units, indicating the existence of paradigmatic and syntagmatic types of relations[1].

The main part

The unification of linguistic units on the basis of a certain meaning, the unification of lexical units in a certain language into such meaningful nests, developed in Eastern linguistics. Later in the nineteenth century, the idea of merging linguistic units into meaningful groups or dividing the idol into certain meaningful groups arose in Europe. Accordingly, this theory was inextricably linked with European linguistics [2].

In Uzbek linguistics, field theory began to be studied extensively in the following years. In Particular, A.Sabirov, T.Mirzaqulav, M.Abduvaliev, Sh.Iskandarova, N.Nishanova, D.Vakkasova, H.Hojieva, F.Safarov the work of and other researchers is noteworthy [3,4,5,6,7,8,9,10]. In each of these studies, the generalization of semesters to one archisema, their grouping under different integral SEMAS and their specificity with differential semas were investigated consistently [3].

Despite the variety of materials presented as a field and the different interpretation of this concept by some linguists, in a field-specific approach it is possible to distinguish two directions: a paradigmatic and syntagmatic approach. This is the most common approach. According to G.S.Shchurin linguistics, the "field" component involved and popular expressions can be defined as: functional-semantic field, morpheme field, phoneme field, word-constructors field, lexical field, meaningful field, micro and macro field, relativity field, time Field, number macromedias, check field, negation field, existence field, declination field, personality field, lexical-grammatic field, transformation field, absolute (relational) field, activity field, Status field, etc. [11]. what?

The study of the paradigmatic relationship of linguistic units with each other made it possible to combine them into certain groups, nests on the basis of a certain sign. In particular, the unification of linguistic units on the basis of a certain meaning forms meaningful nests. The linguistic units belonging to this Hive are located in the human consciousness in a interconnected state. The unification of linguistic units into a certain paradigm on the basis of a certain associative meaning has created a field theory in linguistics.

In his research work, T.Mirzaqulov points out his idea of space and paradigm: "when approached from the point of view of space, he confines several surface phenomena of the language and puts an end to the difference in the level, while the paradigm remains within one level and the boundary in the Level" [4].

Sh.Iskandarova according to, both the semantic groups of words that are characteristic of one category of words and the groups of words in which different categories of words have a meaningful relationship with each other, both lexical-grammatic (functional-semantic) fields and paradigms of syntactic structures connected by transformational relations, and certain types of meaningful-syntactic syntagma are included in the scope of the

The systematic analysis of language phenomena is an inextricably linked phenomenon with the structure of the field. A.Hojiev gives the definition of "a set of words and phrases that unite on the basis of a certain archaism" to the meaningful field [13].

The methodological basis of systematism shows that the expression of different meanings of language means is not expressed as their completely undiscovered features, but the variety of meanings indicates that they are adjacent at some point on the basis of a certain systematic connection and relationship.

Means indicating the conditional relationship are units that are expressed in all languages of the world. These units are studied not only by linguistics, but also by psychology, logic and philosophy, as well as by disciplines that study language and speech from different goals and perspectives. It is not surprising that the combinations that represent the meaning of the condition are given the definition of "Assumption (hypothesis) close to reality". Because the

units that represent the conditional relationship are also recognized as specific "keys" that allow us to reveal some secrets about speech activity[15].

The peculiarity of the units that characterize the conditional semas is that they directly reflect the fact that a person can choose one of two possibilities that contradict each other, think, draw conclusions on the basis of "condition", which can be between different situations, based on incomplete information, and, if this condition is fulfilled, be able to understand "the transformation of the world".

There are a number of research works in linguistics on the expression of the conditional relationship in the Uzbek language. One of these is A.Azizova, M.Askarova, A.A. Salkalamanidze. The work of and others is noteworthy. These scientists have studied paradigmatically the units in the position of joint sentences that follow the condition condition, condition, condition, condition, which must be expressed in the meaning of the condition. However, studies on the interdependence of the conditional and barrier semas and the approach to them in the quality of the field, the Central and boundary semas of the conditional field, the additional meanings of the units that represent the meaning of the conditional, have not yet come across in our linguistics in a monographically. Proceeding from this, we can say that the problem of the area of conditionality and inaccessibility is one of the topical issues in the Uzbek language.

In traditional linguistics, the meaning of the surreal condition in the Uzbek language is within the framework of the verb category. Also studied by Saidov[14]. The researcher in his article expresses the idea that the meaning of surreal, that is, unequivocal condition can be expressed not only through the conditional declination, but also through other means if *-ганда эди, -са эди, -ган бўлса эди, -ётган бўлса эди, -диган бўлса эди* had commented and cited examples of such units. At the same time, Real and surreal compare the condition to each other. Surreal considers the connection of the condition with the Times of Fe. There is no significance of the contemporary category to be a surreal condition, the researcher believes.

As you know, the functional-semantic field is a hierarchical structure of language units, United on the basis of common content and denoting a certain concept in the language. In the center of each functional-semantic field lies a certain semantic category, which combines different language tools and creates their interrelation. Proceeding from the above points, the area of the condition can be described as follows: the sum of the units expressed by various means of relations based on the content of the condition in the object reality is called the area of the condition.

The functional-semantic field reflects all the features of the language tools in terms of form and content in two ways, that is, in form and meaning, under one commonality. For the structure of the functional-semantic field, the relationship of Central and peripheral meaning is significant. From the center of the field are the language units that are more used in the expression of a certain semantic category.

Hence, the combination of language tools with different types of expression under the general condition content constitutes a prerequisite area. From the core of the square takes place the language tools representing the sema in the central plan. At the morphological level of the conditional declination and the conditional conjugation are significant, at the syntactic level, the conditional declension and the conditional declension follow. And from the periphery of the field

there are units that indicate the meaning of the condition as a boundary sema. These units, in turn, can take place from the central part of other semantic fields, and indicate the conditional semas as an additional meaning "in the shadow" of other semantic meanings, or in part.

One semantic meaning, which takes place from the center of the field, can also be reflected in the periphery of another field. Or vice versa, the meaning in one field periphery can be located at the core of the next field. For example, it also indicates a barrier, as well as representing a scheme of some language units that take place from the conditional area.

If he has not yet repented, he will eventually repent anyway. (T.M.)

Although a given sentence is necessarily formed as a follow-up clause joint sentences, you can see hindrance in meaning. In the sentence it is necessary to open the contents of the condition, which helps the predicate. This condition arises through a barrier connection. Hindrance will be determined by the question anyway. If we formulate the sentence with the help of the form –sada, then the attitude of Hindrance is more noticeable: although he has not yet repented, he will eventually repent anyway. In this joint sentence, it seems that hindrance, the meanings of the condition are connected with the moment: the fact that the third person has not yet repented, and repentance is associated with time. The same "time" in turn arises in relation to the "condition". That is, his act of repentance arises through the condition that he does not repent at a certain time interval.

It should be noted that the conditional scheme is also tied to the occasion of the moment in most cases. That is, the implementation of an action or condition with a certain "condition", of course, brings the time category together with itself.

If attention from something remained, the poem that stood as would also remain. (S.A.)

In a given joint sentence, along with the literal meaning of the condition, the causal relationship also appears. The parts of the joint gap are interconnected using a reciprocal conditional bias. When speaking follow the uppermost sentence to see the contents of the moment? it is enough to ask: when would the poem that was called bite be left? - At a time when attention is drawn from something. The conditional relationship in the sentence can be seen in the following case: in order for the poem to remain standing bite, the condition "to be careful of something" must arise. The meaning of the result coming in the task of another boundary seam appears in the case after the action in the first sentence (attention from something) (as a result of which the poem that stands as bite is left). It follows that in this example, the meaning of moment is the core, while the meaning of condition and result comes from the function of peripheral – boundary seam.

CONCLUSION

Proceeding from the above, we can say that the meaningful fields are interrelated in most cases and differ in that the meanings indicated with each other take place from the core or periphery of the field. The material obtained for the analysis can also be analyzed on the periphery of another area according to the concave meanings, if it is included in the core of a certain area according to the first indicative meaning. Fields such a link opens the way to new research.

INNOVATIVE METHODS IN THE TEACHING FOREIGN LANGUAGE

Mirpayazova Saodat Zafarovna*

*Academy of the Armed Forces,
Republic of UZBEKISTAN

ABSTRACT

The article analyzes the possibilities of student centered and information technologies in teaching foreign languages. In context of foreign language teaching there is revealed the importance of the pedagogical potential of the innovative technologies use for the students' language skills formation and increasing their motivation to learn a foreign language. To the above, too add that online work with the newspaper provides unique opportunities for formation of intercultural communication, where students can take part in discussion of the problems that interested them. Proceeding from this, among the list different pedagogical technologies have most confidently passed the test of time the following: a multi-level training; co-operative learning; individual and differentiated approach to training; method of projects.

KEYWORDS: *Innovative Learning Technologies, Foreign Language, Information Resources, Internet-Technology, Language Competence, Communicative Culture, Pedagogical Potential, Methods, Techniques And Tools For Learning, Cognitive Activity Of Students.*

INTRODUCTION

Today a graduate of a higher school should be competitive, in demand on the market labor, which a priori implies a high level of its overall development, possession information and communication competence, high professionalism, ability to make independent decisions, non-standard thinking and productive adaptation to changing conditions. All this leads to the fact that in Currently, pedagogical activity should be innovative in nature, that is one of the essential factors for the successful educational activity of any educational institution. The reality is that it is innovation activity, with on the one hand, creates the basis for creating the competitiveness of this or that institutions on the market of educational services, on the other - determines the direction professional growth of teaching staff, creative search for each teacher, really contributing to the personal growth of students.

In this regard, in recent years, the use of information technologies in the university, which are not only modern technical means, but also new approaches to the learning process. This is due to the main purpose teaching foreign languages: the formation and development of communicative culture students, their practical mastery of a foreign language. The task of the university teacher consists in creating all the conditions for the practical mastery of the language by everyone student. This involves the selection of training methods that would allow him to show their activity and their creativity. This is what modern innovative technologies associated with the use of various information technologies and Internet resources.

The activities of Uzbekistan universities shows that today they are betting on the principle of variability, which contributes to the construction of a pedagogical process for any educational model. Against the background of the development of various content options we see the birth of new ideas, as well as an introduction to philosophy education of the concept of pedagogical technology. Proceeding from this, among the list different pedagogical technologies have most confidently passed the test of time the following: a multi-level training; co-operative learning; individual and differentiated approach to training; method of projects. All of them promote the development of innovations in education, which require improvement pedagogical technologies and related methods, methods and means of teaching, developing in students the ability to motivate actions and self-orienting in the information received; the formation of their creative thinking and the disclosure of their natural abilities.

Pedagogical technologies are associated with a wide application of new information technologies, which make it possible to fully disclose didactic functions of these methods and realize the potential educational opportunities. Since today we need free access to necessary information, then in the information centers all possibilities are created access to scientific, cultural and information centers around the world, so that comprehensive study of this or that problem to form their own independent opinion. Thus, students should be provided with favorable conditions for the use of technological capabilities of modern means of communication both for searching and information, and for the development of cognitive and communicative abilities and the formation of their ability to make quick decisions in difficult situations. This process is most successful through the use of information and communication technologies of education, including specific methods and technical means (computers, audio and video facilities, telecommunication networks, etc.) to work with information. This kind of pedagogical technologies today are termed "computer-based learning technologies", which continue to develop the ideas of programmed learning, opening new technological capabilities of the learning process associated, for example, with certain advantages of computers and telecommunications.

According to the latest data, provided, in particular, by the Internet, now time the largest universities in Uzbekistan make maximum use of innovative technologies in learning process; periodically conduct seminars and conferences on the implementation of innovative technologies. They are attended as specialists of institutions higher professional education, and teachers of general education schools. We emphasize that education in universities that use innovative technologies is always open to modern scientific research. In the curriculum of such universities is compulsory there are such forms of training as project development, training, internships at the production, as well as participation in research organizations.

Considering in this connection the technological aspect of education in universities, that at the present time the most personally-oriented and information technology training. Personally oriented technologies of differentiation and individualization of training, project technologies, etc. The main forms of using information technology are as follows:

- 1) Multimedia tutorials, which are conducted on the basis of computer training programs;
- 2) Lessons based on author's computer presentations during lectures, seminars, laboratory works, reports of students. So, with the help of a computer program PowerPoint teachers organize a series of multimedia lessons, training modules, electronic teaching aids that enable the integration of audiovisual information presented in various forms - graphics, slides, text, video etc.;
- 3) Testing on computers;
- 4) Telecommunication projects, work with audio and video resources online;
- 5) Distance learning, which includes all forms of educational activity, they are carried out without the personal contact of the teacher and the student. In the global Internet today almost all educational services from short-term refresher courses and ending with full-fledged programs higher education;
- 6) work with interactive tablets Smart Board;
- 7) voice chat over the local network, used to teach phonetics. So, for the implementation of the chat are applied free programs Net Speakerphone or Speaker, allowing to communicate in any mode: teacher-pupil, pupil-pupil, mode conference;
- 8) Linguaphone devices, which include a teaching console and workers places of students, as well as equipment according to one of the following schemes: audio passive, audio active or audio comparative.

Audio passive devices are aimed at allow students to listen to phonograms; audio-active devices allow students not only to listen to phonograms, but also to train in loud speech, that is, in speaking; audio devices you can record your speech on a tape recorder, and then listen to this recording and compare it with the model one).

Today, as is known, the priority in the search for information is increasingly given Internet, which provides a wide choice of sources of information, so necessary in the educational process. This includes basic information located on the Web and FTP-servers of the network; operational information sent by e-mail; various databases of various information centers, information about books and magazines distributed through Internet shops, etc. Hence, the information resources of the Internet are organically integrated into the educational process, helping to solve various didactic tasks in foreign language classes, for example, such as:

- Forming reading skills;
- Replenishing your vocabulary in the language you are learning;
- Improving the writing skills, for example, when answering your partners
- Improvement of listening on the basis of original sound texts of the Internet
- Acquaintance with culture, speech etiquette, features of speech behavior translating language;

- Improving the skills monologue and dialogue statements
- The formation of motivation for foreign language speech and knowledge special academic letters [7].

That information Internet resources on any subject matter also contribute to the formation of communicative competence. Although these resources are not an educational material, nevertheless they give the opportunity to work in the network with authentic texts, which is a motivational source for students, and it can be used in the educational process. Therefore, the opportunity to see, read, listen to authentic material and then communicate with native speakers forms independent creative and critical thinking. In this regard, you can offer electronic versions of newspapers, most of which have their own web pages.

To the above, too add that online work with the newspaper provides unique opportunities for formation of intercultural communication, where students can take part in discussion of the problems that interested them. Thus, the possibilities of using Internet resources are enormous, since they create conditions for obtaining information necessary for students in anywhere in the world, whether it's news from the life of youth, articles from newspapers and magazines, geographic material, etc.

However, it is important to understand that each teacher follows the next position: the computer in the learning process is not a mechanical teacher or its the deputy; it is a tool that enhances and enhances opportunities his educational activities. The teacher in this case organizes cognitive activity of students, trying to interactively use, for example, situational models of training; Use creative methods, including the newest techniques ("case studies", role-playing, business games, dialogues, debates, seminars, conferences, the protection of abstracts, etc.) so that with the help of innovative technologies learning to solve the problems of quality training.

In this regard, the use of innovative educational technology provides tremendous opportunities for effectiveness of the learning process. The information and information multimedia training programs, as practice shows, have advantages traditional methods of teaching, because they not only allow them to train or other types of speech activity, combining them in various combinations, but also promote the implementation of an individual approach and increase the independence students. To this we add that the use of innovative technologies in the process foreign language training also makes it possible to raise qualitatively the general cultural development of young people, contributing to the further development of their skills possession of computer technology. This contributes to the formation of language competencies, increase of motivation in learning a foreign language. Hence the use of innovative technologies in teaching foreign languages carries a huge pedagogical potential, which allows to translate the mastery of a foreign language in alive creative process.

THE SOCIAL NORM IN THE CONDITION OF GLOBALIZATION

Berdikulova Surayyo Aslamovna*

*Senior Lecturer,
National University of UZBEKISTAN

ABSTRACT

In this article, the concepts of social norms, values and social institutions that cause the individual to be a deviant-minded or educated person have been studied and their attachment to them and the resulting form of behavior have been analyzed. At the same time, pluralism is spreading as a new format of sociality, where in the conditions of a variety of positions and opinions, everyone has the right to set their own priorities. The usual social groups are changing — the old ones lose their meaning and content, and the new ones are replacing them. Social institutions are in a crisis situation. If earlier the institutional and organizational format of social reality prevailed, then the network model of public organization seems to be the most relevant in the context of globalization. A person lives by striving for events-something that is dear to him, and when two situations that are dear to him contradict each other, he strives, depending on what is of paramount importance to him.

KEYWORDS: Social Norm, Value, Social Institution, Deviant Behavior, Crime, Suicide, Drug Addiction, Alcoholism.

INTRODUCTION

The transformation of the basic structures of social development taking place in the modern world, which is called "globalization", is so large-scale that it concerns all aspects of modern human civilization. First of all, globalization processes contribute to the geographical expansion of social life, and now this trend has reached a global scale. Therefore, at the present stage of globalization, there is an emphasis on the person and the social sphere (according to other parameters, the world system has already closed or is approaching such a state-geographically, information ally, economically, politically, and even partly culturally).

Globalization leads to many significant, fundamental changes in modern society, and, accordingly, we can say that globalization is the most important factor in social transformations.

Since these social transformations are fundamental, they primarily relate to the level of the systemic organization of human society, namely, they represent the transformation of its social structure, the nature of social relations and interactions of subjects of social relations, as well as social norms and values as the main regulators of social life. Therefore, this type of social transformation, which is the subject of consideration, the author considers it more accurate to call socio system.

First of all, we will focus on the transformation of the social structure. In this aspect of modern social transformations, such trends as de — hierarchization, the emergence of new social institutions of a fundamentally different nature-supranational, global level, the spread of network forms of social organization, the increasing importance of informal communities, the formation of a global society, etc. are manifested. The ongoing transformation of social structures leads to a change in the subjects of social relations and the emergence of new structures: transnational corporations, non-governmental organizations, network and virtual communities. The usual social groups are changing — the old ones lose their meaning and content, and the new ones are replacing them. Social institutions are in a crisis situation. If earlier the institutional and organizational format of social reality prevailed, then the network model of public organization seems to be the most relevant in the context of globalization. At the same time, there is an increase in the role of small informal communities, which gain strength due to the weakening of traditional large social institutions. The very principles of forming social groups and communities are changing: increasingly, social groups are formed according to the principle of common interests, regardless of the territorial location of their participants, family ties and other traditional principles of division.

In the scientific literature, a fair opinion is expressed that the very wording of the definition of a social norm is important only for methodological reasons. From the point of view of its research, it is more important to develop the concept of social norms. Apparently, this is why many textbooks on the theory of law do not formulate a definition of the concept of a social norm.

Thanks to social norms, the society creates stability and order in the relations between people and their associations. At the same time, the content of social norms is constantly changing, depending on a variety of subjective and objective factors. Therefore, it is impossible to fully understand this category, to fully determine its role in social development. That is why social norms have always been and will always be the focus of attention of both scientists and practitioners.

The concept of "social norm" was first studied by thinkers of antiquity. In particular, Plato states that in the work of "laws" people cannot live like animals, but are guided by laws developed with the mind. The great thinker, referring to all the manifestations of the social norm under the term "law", proved at that time that in the life of society they occupy an important place. Later, he developed his views on the work of Aristotle "morally". The great thinker considered maintaining moderation and normality in all actions as a virtue. He noted that "virtue is a situation between an anti-dependent character and inclinations." Even in the views of medieval Eastern thinkers, we can observe close views on the approach of Plato and Aristotle. They were one of the manifestations of social norms in the regulation of human relations – recognizing the place of morality, focusing on the issues of educating more perfect morality.

The division in the methodology of Science and philosophical approaches also divided the approaches to social norms from the nineteenth century into two great directions. The first direction – supporters of the metaphysical approach, like other social phenomena, characterize the social norm as a concept that has hardened itself separately from society. In their eyes, the social norm is the starting point, the specific base program. Each individual moves out of it. The second direction – supporters of dialectical methodology, however, consider the social norm as an element of a complex structure of society that changes.

In sociology, “social norms” are widely studied as a factor that greatly affects the relationship between people. Initially This is about E.Dyurkgeym widely touched on the work of “suicide”. Later T.Parsons and R.Merthonsin his works, the analyzed the issues of social norm, its role in the life of society, its structure, its validity. Representatives of the school of classical sociology interpret the social norm as a behavior that must be recognized and fulfilled by society.

Social norms govern the behavior of a person, although sometimes it goes against the will of a person. That is, some of our lives are led by something we “do not like”-events, too, we are forced to subordinate them to our own will. If it is not done so, it is difficult for mankind to survive. All social norms are created according to the norms of international law, primarily based on this need.

As noted above, "social norms" regulate human relations. By performing this task, it affects human behavior. However, this is not the only factor that controls behavior. Man moves in two or more rounds within the framework of one norm, Without Borders. In particular, building a family without marriage is a social norm. If you follow it, you do not violate the order established in society. However, when choosing a marriage couple, everyone has their own opinion, and this is a huge variety. Someone is looking for a rich bride, someone appreciates beauty. For whom else training is important. So one more factor that drives our behavior is social values. That is, what is dear to us, we strive accordingly.

A person lives by striving for events-something that is dear to him, and when two situations that are dear to him contradict each other, he strives, depending on what is of paramount importance to him. The values that drive a person are what we call the purposes of his values. In addition to the variety of values in these purposes, it will also have a sequence according to its priority. That is, each person will have placed all the cases that he considers valuable in a row in the style of hierarchy, both according to their importance. This complex system is largely absorbed through the knowledge obtained in youth, and some can also be acquired through later life experiences. Therefore, along with education in youth, special attention is required to be paid to upbringing, in particular to teaching what is valuable in society, and to determine the priority value in the diversity of existing values and to be taught to follow it in activities. But what if the educational institutions and social institutions in general have different problems in themselves? It is of course necessary to come up with various problems and to study in-depth the undesirable situations in social institutions.

In this way, violations in social norms, values, as well as in social institutions eventually undermine social relations. The correct formation and accurate functioning of relations in this triangle will help to ensure that the deviant circumstances associated with young people in our country – crime, alcoholics, drug addiction, suicide, family conflicts, all-help us to overcome and prevent what concerns us today regarding the upbringing of young people.

In order to prevent these cases, the normative requirements corresponding to the values that have traditionally prevailed in our country should be developed strictly and the barge should be interpreted equally by representatives of social institutions – family, educational institutions, media, state and public organizations. In this regard, especially youth organizations are required to take the initiative into their own hands.

The trend of virtualization of society is actively developing, and many people strive to build parallel realities, in particular, by going online. Such forms of social organization as social Internet communities, virtual social networks, which unite people not on the basis of location, formal ties and hierarchies, belonging to traditional social institutions, such as the family, school, and state, but on the basis of a real community, are becoming widespread.

At the same time, it is possible to state the transience and superficiality of everything that happens, and relations between people are no exception. There is an increase in the pace, frequency, number, breadth and range of social communication channels, but at the same time there is a decrease in the quality of communication acts, a weakening and superficiality of social ties. There is greater freedom in establishing and terminating communication. Fewer and fewer formal social regulators restrict a person's behavior. It becomes a priority to spend as little time as possible on the implementation of specific communications while increasing their total number. That is, if earlier society was characterized by building communication with a smaller number of people, but this interaction was long in time, mainly focused on the long-term perspective and the depth of relations, now communication is a kind of service and a consumer attitude is manifested to it. It turns out that due to the transformation of value orientations and attitudes in relations between people, modern people realize themselves as an independent, self-sufficient subject, and the individualistic approach is actualized in the context of pluralism and multiplicity of the modern social world.

A person's personal life becomes open and accessible globally to everyone without exception, and, as a result, his thinking becomes globally oriented.

There is an increase in the pace, frequency, number, breadth and range of social communication channels, but at the same time there is a decrease in the quality of communication acts, a weakening and superficiality of social ties.

A manifestation of the protective reaction of society to the high pace of globalization, which, erasing differences, carries the threat of loss of identity and identity by individuals and communities under the influence of the global mega-trend. All of the above leads to a simplification and "flattening" of relations between people.

There is a change in the nature and methods of interaction — the transition from personal contacts to indirect, remote, depersonalized. Our daily communications-access to information, as well as communication with other people-are mediated by the Internet, computer, telephone, = vehicles, mass media, as well as a variety of consulting firms and information resources that specialize in" bringing together " the original source of information and the subject making the request for this information. This is expressed in the so — called mediatization of public life, which just reflects the trend of increasing the number of intermediaries in any process and act of communication to such an extent that virtually any communication in the modern world somehow becomes mediated and falls into a significant dependence on the means that provide it or specialized social actors-mediators. Thus, the media and various intermediaries (in their broad

sense) actively participate in building the network as a new social format and, thus, act as an increasingly significant component of modern society.

The transformation of social norms and values as principles and regulators of social interaction also takes place in modern society and is an essential component of the ongoing transformations in the context of globalization. Increasingly, ideas about universal values and norms are beginning to spread in a globalizing society. At the same time, such traditional values as the Motherland, family, citizenship, state, collective, faith, friendship, etc. time, speed and mobility appear as new super-values of the globalizing world, which is due to the high rate of change in reality and the dynamics of life, as well as the need for a person to survive in such conditions.

Social norms are being eroded. Everything that was previously accepted as truth or axiom is now called into question. At the same time, pluralism is spreading as a new format of sociality, where in the conditions of a variety of positions and opinions, everyone has the right to set their own priorities. Pluralism is becoming one of the key norms of the global social reality. As a result, it is popular and common in a period of social turbulence and instability, such as we are currently seeing, to avoid responsibility, because it makes no sense to commit yourself, because at any moment everything can change.

Thus, in the new architecture of sociality, the content of social life is recoded. Globalization and the problems it creates leave humanity with no choice but to overcome fragmentation and differences and move towards its unity. Of course, this process leads to a partial loss of traditional values, the weakening of traditional social institutions and the formation of new ones. The main system-forming factor of public life is information, and, accordingly, the importance of communication processes is actively increasing. Social communication models are being transformed, and network and virtual forms of interaction between people are being strengthened. A person understands himself, his role and place in the new conditions of world development in a new way.

ABSTRACT

This article discusses the results of research on the factors of the effectiveness of the professional trainers of modern trainers and the generalized classification of professional skills in sport-pedagogical activity of the modern trainer-pedagogue. Socio-psychological study of the professional skills of modern trainer-pedagogues in the field of physical culture and sports is one of the key factors in the ensuring high sports results.

KEYWORDS: *Modern trainer, sports pedagogical activity, ability, pedagogical activity, self-development, the ability to improve, professional-important qualities.*

INTRODUCTION

The section of the action strategy for the five priority areas of development of Uzbekistan for 2017-2021, entitled State youth policy improvement the special recognition of the issue of "Education of physically healthy, mentally and intellectually developed, independent-minded, strong-willed, loyal to the motherland, deepening democratic reforms and increasing their social activity in the process of developing civil society" shows the importance of physical culture and sports at the level of state policy.

Besides, practice shows that modern physical culture and sports should be studied primarily as a result of goal-oriented activities of a collective character, covering the full range of socio-psychological problems associated with communication, interaction, individual styles and approaches. Creating and maintaining the necessary socio-psychological conditions that ensure the effective development of future sports and pedagogical activity skills of students is, on the

one hand, an important issue in the training process, on the other hand, psychic phenomena, individual psychological characteristics that determine the level of professional development of future sports specialist covers a wide range of topical issues of socio-psychological science.

Socio-psychological study of the professional skills of modern trainer-pedagogues in the field of physical culture and sports is one of the key factors in the ensuring high sports results.

PURPOSE OF THE RESEARCH

Describe and substantiate social psychological factors of professional activity ability of modern trainer-pedagogues on the basis of scientific-theoretical and experimental results

TASKS OF THE RESEARCH

1. Describe the structure of sport-pedagogical activity ability;
2. Research the efficiency of social psychological conditions of developing the sport-pedagogical activity ability;
3. Disclosure the social psychological factors of professional activity ability of modern trainer-pedagogues on the basis of empirical materials.

In modern, dynamically developing society rapid development of physical culture is observed. The number of people involved in sports, both professionally and at the health level, is increasing. This trend has established itself as a globally recognized social norm, an urgent need for any state in General and for every person in particular.

Actively supporting the policy of a healthy lifestyle, promotion of physical culture and sports, in the Republic of Uzbekistan over the past period there have been cardiac transformations aimed at comprehensive support, improvement of this important area. Thus, the organizational structure, educational and material resources have been optimized, effective motivational and stimulating mechanisms of sports activities have been put into operation, favorable economic conditions have been created for the production of the necessary sportswear and equipment, a powerful infrastructure covering all popular sports has been developed on a permanent basis. At the same time, one of the key elements of the effective functioning of this popular system is qualified personnel - specialists directly engaged in sports and educational activities.

Today, this category is prepared in various educational institutions of the country, among which the basic higher educational, research and scientific-methodical institution for training is the Uzbek state University of physical culture and sports. The process of training in educational institutions is organized in accordance with the educational state standard through the implementation of specially prepared training programs. An important link in the preparation process is a cycle of sports and pedagogical disciplines, during which students master narrowly specialized knowledge and skills, thereby developing the ability to sports and educational activities.

At the same time, the analysis of the training process shows that today there are not realized reserves to improve the efficiency of this process. These include socio-psychological conditions that ensure the effective development of abilities for sports and educational activities. In addition, practice shows that modern physical culture and sport should be considered primarily as a result of purposeful activities of a collective nature, covering a full range of socio-

psychological issues related to communication, interaction, impact, mutual influences, individual styles and approaches. The creation and maintenance of proper socio-psychological conditions ensuring the effective development of the abilities of students for future sports and educational activities, on the one hand, is an important problem of the training process, and on the other - it contains a wide range of topical issues of socio-psychological science, which are directly related to individual psychological characteristics, mental manifestations, which largely determine the success of professional development of the future specialist of the sports industry.

As you know, the growing popularity of the profession of coach-teacher engaged in sports and educational activities primarily due to the intensification of the world Olympic movement, active development of professional sport, and the increasing popularization of the sports lifestyle. In the public consciousness, this activity is associated with its main external structural functions (organization and conduct of sports training, training of athletes, direct support of athletes in competitions). This perception is largely superficial and does not reflect the essence, all the important features, and difficulties of sports and pedagogical activity of the coach-teacher. This trend is due to the prevailing attitudes of the mass public experiences when visiting the classroom for physical education in secondary schools, institutions of higher education [1,2,3.].

So, according to A. Ya. Korh, the main feature of sports and pedagogical activity is that this activity belongs to difficult pedagogical work. Therefore, it combines two main and targeted processes:

- Training;
- Education.

Due to the fact that the process of training and education is bilateral and involves subject - object and object - subject interaction, its result is mediated by the attitude of the object (student) to the subject (teacher) and to its activities [4]. The presence in the activities of socio-psychological share an undeniable great. In turn, the psychological peculiarity of sports and pedagogical activity lies in the fact that an effective teacher has a creative character, which is manifested in the possibility of independent choice and creation of new, non-standard ways of training athletes to achieve the desired goal. Creative-oriented, creative teacher, has the relevant skills, owns techniques, pedagogical skills, which are successfully applied in emergency situations, while their constant correction. This coach-teacher to a large extent, there is a close relationship between his activities and sports specialization. The specificity of the sport imposes rigid behavioral patterns and therefore an effective coach-teacher must take them into account. Unlike the teacher of physical culture, he is much more interested in the result of its activities, as its success is the new sports achievements of students in competitions.

The analysis of scientific literature on the studied problem shows that modern sports and pedagogical activity is considered by the majority of scientists as a complex and multifaceted process, characterized by extreme, emotionality, increased psychophysiological loads, aimed at effective training of the athlete, achieving outstanding sports results. However, this activity is very diverse. Each of the many sports has its own specific features. In this regard, sports and pedagogical activity of trainers-teachers in various sports differs from each other to a certain extent.

The generalized list of professionally important abilities to sports and pedagogical activity of the modern trainer-teacher; In order to develop an effective model, we have clarified the relevance of these abilities through expert evaluation. A special expert questionnaire was prepared for this purpose. At the same time, in the process of selecting a generalized list of abilities, we adhered to the previously formulated definitions that:

-The ability to sports and pedagogical activity is a set of interrelated mental properties of the personality of the coach-teacher, which on the one hand, reflect the structural components of sports and educational activities, and on the other, are an appropriate condition for its effectiveness and long-term development;

-In essence, the ability to sports and pedagogical activity, act as an important component of the subjective activity of all internal conditions of mental activity, are those properties, those features that affect the ability to carry out activities in General, as well as the effectiveness of sports and educational activities in particular .

In order to obtain a more objective assessment of professionally important abilities reflecting the modern views of sports and pedagogical activity, 587 experts of various categories took part in the survey, including those with significant experience in the main Olympic sports, including:

- Coaches - teachers directly engaged in sports and educational activities - 119 (20.3%) people.;
- Teachers engaged in teaching activities at the Uzbek state University of physical culture and sports - 113 (19.3%) people.;
- Students of the Uzbek state University of physical culture and sports 3, 4 courses - 265 (45.1%) people.
- Athletes with sports achievements - 90 (15.3%) people.

Figure 1: The quantitative characteristic of experts of an assessment of abilities to sports and pedagogical activity of the modern trainer-teacher on categories (n=587)

To determine statistically significant indicators, the results of expert assessments were subjected to factor analysis, which allowed identifying 5 significant factors, and their content to determine the conventional names of these factors. The first factor covered 6 statistically significant professionally important abilities, the second factor - 12, the third factor - 11, the fourth factor - 8, the fifth factor - 7 (Fig. 2).

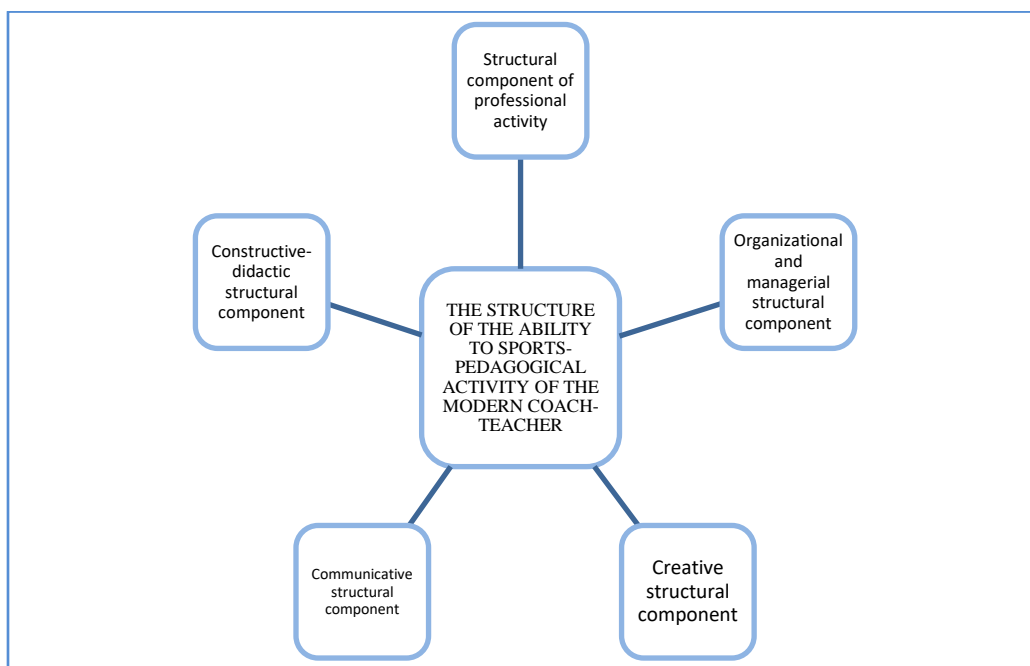

Figure 2: Structure of actual abilities to sports and pedagogical activity of the modern trainer-teacher

Interesting is the fact that the experts in the course of the assessment, it was independently indicated 18 additional names of abilities to sports and educational activities. Thus from the total, 15 abilities proved to be less significant [5]. This clearly confirms the importance of expert evaluation in clarifying the relevance of the abilities of sports and pedagogical activity of the modern coach-teacher according to the previously identified methodological approaches of this study.

The analysis of the scientific literature on this issue allowed distinguishing a generalized classification of important professional abilities in the sport-pedagogical activity of the modern trainer-pedagogues. The relevance of these abilities was determined through expert evaluation in the research process to develop an effective model in this area. For this purpose, a special expert questionnaire was prepared, in the process of distinguishing the generalized classification of abilities based on the following descriptions, which were previously formed:

-Abilities in sport-pedagogical activity are a set of interconnected psychic characteristics of a trainer-pedagogue, which, on the one hand, reflect the structural components of sport-pedagogical activity, on the other hand, are a suitable condition for its effectiveness and future development;

-In fact, the abilities of sport-pedagogical activity are an important component of all the internal conditions of psychic activity, that is, these features are the ability to carry out activities in general, as well as the effectiveness of sport-pedagogical activity.

In addition, the content of each of the identified factors should be considered in detail. Thus, the first important factor covered the following abilities. (figure 3):

Figure 3: The characteristics of the first factor of expert assessment of the abilities of a modern trainer-pedagogue in sport-pedagogical activity (n=587)

- Ability to fulfill oneself through success in sports
- Ability to achieve new successes
- Ability to participate actively in various aspects of sport-pedagogical activity
- Ability to express professional and important qualities as a personal example
- Ability to work in different roles, in particular, as a psychologist, leader, trainer
- Ability to self-improvement and perfection

TABLE №1 NUMBER OF PARTICIPANTS AND GENDER DIFFERENCES IN THE EXPERIMENT

	Women		Men		total	
	Number	%	Number	%	Number	%
Trainer-pedagogues	54	45,4	65	54,6	119	20,3
Teachers	57	50,4	56	49,6	113	19,3
3rd, 4th course students	134	50,6	131	49,4	265	45,1
Athletes with sports achievements	49	54,4	41	45,6	90	15,3
total	294	59,8	293	59,6	587	100,0

- Ability to self-improvement and perfection – 0,92;
- Ability to actively participate in sport-pedagogical activity, any problem of a student athlete – 0,88;
- Ability to work in different roles, in particular, as a psychologist, leader, trainer – 0,90;
- Ability to be the personal symbol of all the professionally important qualities of a student athlete – 0,89;
- Ability to strive for new achievements – 0,86;
- Ability to express oneself through sports results, successes of athletes those they taught – 0,74.

The content of this factor is a professionally active sphere of a modern trainer-pedagogue, which is a necessary condition for efficiency, self-development, as well as professional self-expression. The characteristics of the activity include the ability of the trainer- pedagogue to exert a conscious and purposeful influence on his students. This phenomenon is associated with an active, entrepreneurial self-consciousness in the accumulation of appropriate means for solving professional problems with the presentation of activities.

The manifestation of the goals of sport-pedagogical activity and the ways to achieve it in the consciousness provides activity a more conscious understanding of the constituent structures of abilities in sport-pedagogical activity.

Activity performs as a structural feature, provides a real movement of space and time, its dynamics, development and realization. This conclusion was made based on the results of the research that this important phenomenon also has socio-psychological significance and reflects the following characters:

- Quantitative and qualitative characteristics of the process or level of intensity of any interaction;
- Quantitative and qualitative characteristics of the subject's potential for interaction;

In our opinion, the concept of activity is usually applied in two semantic ways:

- a) Any manifestation of the psyche that goes beyond adaptive activity;
- b) Level of psychic state in the form of a certain quality is manifested in this plan through its contradictory-passive position;

In this sense, activity is characterized as a specific quality, the interaction of the subject with surrounding objects, in particular, the measure of activity and the way in which a person manifests and realizes himself in life, where his quality is achieved as a whole (or not) [6].

In addition, by its nature, activity embodies the image of a motivated trainer-pedagogue who is looking for new achievements, new needs, goals, ideals. According to L.E. Orban-Lembrick, activity should be studied not only as an abstract circle, but also as a set of personal characteristics, the specific form of the specialist's professionalism. [7] With the improvement of the structure of professional activity, develops the complex structure of the activity of specialist. These views of scientists confirm the reliability of factor analysis and show the importance of the interconnectedness of the researched problems. Depending on the content the significance of the

first factor is conditionally called by us a component of professional activity. By importance the second factor includes the following abilities of sport-pedagogical activity. (figure 4):

- ability to solve quickly problem situations – 0,84;
- Ability to foresee activity results – 0, 81;
- Self-reflection ability – 0, 80;
- Will power effect and logical certainty ability -0, 79;
- Ability to formation of a team of student athletes – 0, 78;
- Ability to realization athletes' management strategy – 0, 75.
- Ability to search for sports ideas and to realization the solutions - 0, 72;
- Ability to take responsibility – 0, 71;
- Ability to organize student athletes - 0, 70;
- Ability to make decisions quickly – 0, 70;
- Ability to adequately evaluate owns self and other student athletes – 0, 69;
- Ability to manage own psychic situations – 0, 68.

Figure 4. The characteristics of the second factor of expert assessment of the abilities of a modern trainer-pedagogue in sports-pedagogical activity (n=587)

In understanding the semantic basis of this factor, two main directions can be distinguished. One of them is management abilities and the other is organizational abilities. Analysis of the scientific sources relevant to our research shows that the relevance of management abilities is due to the presence of management methods in the sport-pedagogical activity of a trainer-

pedagogue, who is usually focused on organizing and managing the training of student athletes, as well as making management decisions.

The activities of a trainer-pedagogue are based on the organization, planning of the training process, monitoring the activities of teams or individual athletes, positive impact on them, making an appropriate emotional situation. All this, of course, requires from a trainer-pedagogue volitional qualities, managerial and organizational abilities, ability to inspire success and confidence to fortune in students. In this regard, the development of organizational and managerial abilities among trainer-pedagogues is one of the important tasks in the process of training specialists in this field.

According to specialists, the decision-making by trainer-pedagogues, organizers of sports events, and their subjective choice is closely related to individual psychological characteristics, the first of which is the management ability. In addition, managerial decisions that remain an act of personal choice occur simultaneously under the influence of certain determinations and are reflected in the process of interpersonal decisions and interactions. In this regard, the organizational and communication abilities of the trainer are very relevant. [8]

Most psychological studies have shown that self-image, that is, the ability to adequately evaluate oneself, is an important factor in effectiveness of the activity, especially in management activity.

Self-respect can create a zone of permanent failure at a certain stage of activity, which reduces professional motivation. Otherwise, as a result of low self-esteem, low passivity, fear of responsibility, and inclination to set very simple tasks, low subjective probability of failure impairs the consequences of failure. The result of inadequate self-image is usually the incomplete realization of the potential of a trainer-pedagogue in sport-pedagogical activity.

This became clear from the inspection of research sphere that young trainer-pedagogues often experience a sharp decrease in their self-image during their first year of work, often a decrease in self-confidence, a decrease in motivation and even rejection in sports-pedagogical activity. It is known that a sharp decrease in self-image affects efficiency causes negative emotions, neuroticism. But maintaining inadequate self-image provides a person with temporary adequate comfort, which is more inconvenient for activity. Of an inadequate personal point of view, the trainer-pedagogue uses known knowledge and tools to solve a creative task. An adequate point of view, on the other hand, implies individual's creative approach to his activities, which means, on the one hand, the maximum approach to the content of tasks in order to find his creative moments, on the other hand, a self-reflection attitude to his actions, perseverance to own faults and failures.

Thus, based on the semantic basis of statistically significant abilities, this factor is conditionally called the organizational and managerial component.

The third important factor includes the following abilities in sports-pedagogical activity. (figure 5):

Figure 5 the characteristics of the third factor of expert assessment of the abilities of a modern trainer-pedagogue in sports-pedagogical activity (n=587)

- Ability to be a sample of sustainable and purposeful behavior – 0, 81;
- ability to pedagogically influence on positive emotions – 0,80;
- Processing and shaping study materials in a form that is acceptable to athletes – 0,77;
- Ability to express one's view, study material in a meaningful and understandable form – 0,77;
- The ability to influence effectively to student athletes – 0,75;
- The ability to influence effectively to student athletes with politeness – 0,75;
- The ability to correlate study material with sports life and etc. – 0,74;
- The ability to influence to student athletes – 0,73;
- Pedagogical projecting ability – 0,73;
- Ability to see sports problem, significant tasks – 0,72;
- Ability to analyze sports results – 0,71.

The aforementioned abilities, on the one hand, represent various constructive functions in sport-pedagogical activities, on the other hand, the effective completion of didactic tasks. According to I.V. Trudnev, one of the important tasks of a trainer-pedagogue is to change the object, create, activate various ways of its development. This function is closely related to the systematic and purposeful process of pedagogical influence on student athletes. [9]. There are didactic aspects that reveal actual tasks, as well as requirements for a trainer-pedagogue. Under the didactic effect, the author offers the understanding of a complex functional system aimed at the development of the student, the acquisition of relevant knowledge and skills. In content, this factor is conditionally called the constructive-didactic component.

The forth important factor includes the following abilities in sport-pedagogical activity (figure 6):

Ability to understand student athlete based on inspection – 0, 74;

Ability to act clearly in various pedagogical situations - 0, 71;

Ability to organize interactions – 0, 72;

The ability to understand the different conditions of the student athlete – 0, 73;

Self-management ability – 0, 75;

Ability to be constantly in an appropriate psychic state when working with student athletes – 0, 70;

Ability to communicate, understand the interlocutor – 0,69;

Ability to politely express one's opinion, requirements – 0,69.

Figure 6. The characteristics of the forth factor of expert assessment of the abilities of a modern trainer-pedagogue in sports-pedagogical activity (n=587)

All of the above mentioned abilities, by their nature, mainly reflect the communicative aspect. In our opinion, modern sport cannot be imagined without contact, proper communication, intense interpersonal interaction and the interaction of athletes with each other and with a trainer.

Communication in sport-pedagogical activity is a relatively independent component and affects its outcome. Communication creates a common fund of information that combines group perception and the accumulated experience of participants in joint activities, which is used by each member of the society. This creates more effective means of exchanging information, ways of coordinating actions, which positively affects the regulation of group relations. Important communication functions in sport-pedagogical activity should include the management of the

psychic state of behavior and joint activities, as well as the exchange of information and emotions.

Research experts studied the dialogue in sport-pedagogical activity, noting that it is associated with various interactions between athletes, as well as athletes and trainer-pedagogues. Communication is the interaction and mutual acceptance between these people through language or other means to achieve changes in their cognitive, motivational, emotional and behavioral areas. Communication depends on the vital necessity, but its content and activity are determined by a subjective attitude. [10]

It is known that the formation of interpersonal relationships in the "athlete-trainer" system is associated with changes in the communicative behavior of the trainer-pedagogue, as well as their joint activity with the psychological organization. Communication is a living material of a trainer-pedagogue. Real trainer' work is, first of all, the joint daily life and activity of the pedagogue and students, the experience of interpersonal interaction, the experience of cooperation, joint participation in team work, which is manifested in communication skills. In this, communication should not be considered as a form of providing other types of activities or as a system of methods and techniques for realizing goals and tasks in sport-pedagogical activity. This is the central link in a complex pedagogical process, an integral form of activity that must be studied as communication. Therefore, the effectiveness of the trainer-pedagogue is determined by the level of development of his communication skills, the presence of professionally important communicative qualities. The problem of communication is not new for psychological and pedagogical science and the role of communication and its role in the process of professional formation of a trainer-pedagogue has never been hidden, or rather, it has not been sufficiently evaluated or taken into account. Thus, the sphere of communication has not been recognized for a long time, has got incomprehensible and uncontrollable, that is, has not been used purposely or effectively.

Thus, from the researched content, this factor is conditionally called the communicative component.

Studying the features of the development of abilities in sport-pedagogical activity allows us to make the following conclusions:

The analysis of scientific sources and empirical materials obtained as a result of research shows that it is advisable to realize a methodological approach that includes three general directions in the research of the development of abilities in sport-pedagogical activity:

- The first direction involves the use of a systematic approach aimed at identifying the integrity of the subject of professional activity. Whether his individual, personal and subject characteristics are studied as a whole taking into account their relations and interests, it is necessary to identify the diversity of relations and integrate them into a single system model in order to achieve the highest level that a trainer-pedagogue can achieve;
- The second direction provides the basis for the selection of methodological conditions, taking into account its integrative characteristics;
- The third direction involves a set of specific research methods (survey, inspection, interview, primary and secondary mathematical and statistical processing of the received data, empirical data acquisition methods).

UZBEKISTAN

ABSTRACT

The article is devoted to the use of excursion practice in natural science. The article also highlights topical issues of natural science and biology, the science of science and its significance for human consciousness, the relationship between man and nature, didactic conditions for the formation of environmental consciousness in young people, excursion science, conditions of excursions, types. excursions and their educational value for young people.

KEYWORDS: *Natural science, biology, ecology, schoolchild, school, ecological consciousness, excursion, zoo excursion, biological excursion, ecological culture, environment, plant, animal, man, natural environment, wildlife, inanimate nature.*

INTRODUCTION

It is known that an excursion is a form of organizing the educational process that allows observation, direct study of various objects, phenomena and processes in natural or artificially created conditions, thereby developing the cognitive activity of a younger student, nature is also studied in nature. According to R.S. Oganova, this excursion is based on the direct perception by children of the objects and phenomena being studied in a natural or artificially created environment. And therefore it can be carried out both during the lesson and outside the classroom. Its content is determined by curricula [1,90].

As a rule, excursions are of great educational and educational value. They expand and improve student knowledge. Students see plants and animals in their natural environment: plants - in connection with soil, animals - in connection with plants, getting ideas about biocenoses, about holistic nature at certain times of the year.

The first stages of this work begin in high school, in which environmental awareness is formed among students. According to Alekseev, ecological awareness is the correct attitude of young people to the environment, which is characterized by the ability to use natural resources wisely, to treat plants and animals with care, to preserve all the natural resources of the world [2, 66].

A school excursion is a form of teaching and educational work with a class or a group of students, carried out outside of school with a cognitive purpose when moving from object to object in their natural environment or artificially created conditions, at the teacher's choice and on topics related to the program. The excursions are part of a lesson system on a number of topics, taught mainly in spring and autumn in courses in botany, zoology and general biology. The content of the excursions has a direct connection with the material covered in the previous lessons, and at the same time, the ideas obtained, the results of observations and collected in nature are used in many subsequent lessons.

The teacher determines the dates of the excursions in advance in the annual plan, and in the corresponding lessons before the planned excursion creates for the students the situation of the need to familiarize themselves with the studied phenomena in nature itself. At the same time, questions are highlighted that need to be clarified in nature, tasks are given for repetition and preliminary acquaintance with the material in terms of preparation for the excursion. The teacher also provides feedback on the excursion after it is conducted: what should then be remembered from what he saw and how to use the collected material for demonstrations and practical work. On excursions, students experience aesthetic emotions. A lively perception of the beauty of nature evokes love for Russian nature, for the Motherland. The methods of conducting excursions teach students to navigate the terrain, observe, compare, establish connections between phenomena, find the necessary objects, acquire the skills of independent naturalistic work - the skills of an elementary study of nature.

According to the description of I.V. Izmailova, on excursions, material is collected (taking into account the protection of nature), which is used in the future in lessons, extracurricular and extracurricular activities. At the same time, the skills of collecting living objects of collecting and herbarization are acquired [3,114].

Excursions to agricultural production, to experimental breeding stations, to fruit nurseries, showing the application of biological knowledge in practice, diverse plant varieties and animal breeds created by man, conditions that increase plant productivity and animal productivity, acquaint students with man-controlled nature, which is of great informative and educational value. Clarification and expansion of biological concepts, education of the worldview of thinking, aesthetic feelings, the acquisition of the ability to observe in nature - all these possibilities for the teacher must be borne in mind when conducting an excursion.

Preparing for the excursion. Each excursion requires a thorough preparation of the plan. Previously, in a day or two, the teacher needs to inspect the area, find the most typical objects of study and determine the route, stopping places for explanations, students' independent observations, collecting material, generalizing conversations.

With this reconnaissance, the time of transitions, stops and rest is scheduled.

According to B.E. Raikov, excursions are different methods: a story, a conversation, a demonstration, independent practical work on assignments (observation, recognition, collection of objects). Preparation of students for the excursion is of particular importance. Equipment must be provided. For each group of students there should be [4,145]: a compass, a magnifying glass, a shovel, a hatchet, a meter, a rope to limit areas, labels, folders for herbarium, stains, jars, a net, etc., depending on the topic and class. But the main thing is the cognitive preparation of students. It is necessary that they know what to see, consider, learn in nature.

According to the classification of V.V. Travnikova, types of excursions [5,123]:

- Excursions in botany;
- Guided tours in general biology;
- Excursions in zoology;
- Excursion to nature;
- Excursions to museums, botanical and zoological gardens;
- Excursions to agricultural and other industries.

In the classroom, the teacher makes an introduction on the topic of the excursion, distributes the students into groups and gives them assignments, marking the questions that need preliminary additional work on literature. For example, questions about an excursion to the forest require a study of books (about light-loving and shade-tolerant breeds, biological characteristics of plants, about the distribution of seeds, etc.).

For excursions dedicated to vertebrates, especially birds and mammals, the teacher gives individual students tasks to familiarize themselves with two species of birds (size, color of plumage, nesting places, feeding, singing). Such tasks, given to 10 students, will make it possible to recognize 20 birds on an excursion. The same tasks are given to students for two types of mammals (footprints, food supplies and remnants, habits, burrows). On an excursion, if you cannot see the animals themselves, you can observe their footprints and the environment of life. The previously acquired knowledge of individual students is used during the guided tour.

All requirements for the organization of excursions, preparation for them, specified in relation to botanical and zoological excursions, are observed for the IX-X grades. Only special attention is paid to the independence of the students' work.

Elements of independence are included in the methods of conducting an excursion already in grades V-VI: students are given one after another short assignments to find and collect objects, but with the subsequent obligatory summing up by the end of the excursion. The performance of each individual assignment is checked by the teacher before the children proceed to the next. In our opinion, during the excursion the following rules:

1. Remember that the excursion is not a walk, but an obligatory part of the training sessions.
2. Explore the place where you are taking the excursion, outline its topic and make a plan.

Maintain the theme of the excursion, do not be distracted by random questions. Only tell about what you can show during the excursion.

3. Avoid lengthy explanations.
4. Do not leave sightseers only as listeners, make them work actively.
5. Do not bombard tourists with many names: they will forget them.
6. Be able to show objects correctly and teach your listeners to look at them correctly: everyone should be able to see everything.
7. Do not tire the tourists unnecessarily: they will stop listening to you.
8. Secure the excursion in the students' memory by further working through the material.

When conducting excursions into nature for all biological courses, general methodological provisions should be taken into account. It is inappropriate to turn an excursion into nature into an open-air lesson with a long questioning of students on the material covered, ostensibly to link theory with the upcoming work on assignments. For example, having arrived at the place of the excursion, they repeat the provisions of the teachings of Charles Darwin, correct the students' answers and spend most of their time on this, which almost does not remain for completing assignments - the excursion loses its specificity and meaning. It is natural to start each excursion with determining the place - forest, swamp, field, meadow, wasteland, park - according to typical features: the main features of the landscape and the most characteristic plants. At the same time, it should be noted the features showing the seasonal development of nature (the state of vegetation and animals), and draw the attention of students to the aesthetic side - the peculiar beauty of each corner of nature at different times of the year and even at different hours of the day.

Confirmation by B.D. Komissarov, the excursion can have approximately the following structure [6,39]:

1. Signs of biocenosis (general impressions: forms, colors, smells, sounds).
2. Signs of the season;
3. Tiers of the forest. General observation and definition;
4. Independent work of groups of students on assignments on trial sites;
5. Gathering all students bypassing the places of independent observation with their demonstration and students' messages;
6. General conversation on this biocenosis.

From the above considerations, it is clear that the practice of excursions is one of the most important pedagogical activities in teaching biology and science, as well as in improving the biological and environmental knowledge of students. So, the introduction of excursions into the educational process in biology is a must. In our opinion, the excursion develops the following skills among young people:

- The knowledge of students is expanding and improving;
- There is a keen interest in what is being studied;
- There is a development of the ability to look and accurately perceive the appearance of the observed object;

- Subtle and sensitive attention develops;
- A love for Uzbekistan nature, for the motherland is brought up.

If these measures are taken in a timely manner, it is unlikely that a specific local area of biology teaching will develop further.

PRINCIPLES OF THE HISTORICAL FORMATION OF JOURNALISTIC FUNCTIONS

Hasanboy Madolimov*

*Independent Researcher,
National University of Uzbekistan named after Mirzo Ulugbek
UZBEKISTAN

ABSTRACT

This article is devoted to analyzing principles of the historical formation of journalistic functions in journalism. The functions of journalism are closely related to the emergence and historical development of the press, the media. That is, as long as the press is connected with the emergence and historical development of mankind, this feature, its essence, is reflected in the social work it performs.

KEYWORDS: *Journalism, journalistic functions, historical development of the press, periodicals.*

INTRODUCTION

It is well known that the emergence of the press is associated with the emergence of humanity on earth and the need for interaction, first with the emergence of language, then writing, then the printed word. The press in the original sense is a product of human civilization and a factor that plays an important role in its development. In other words, along with the fact that the main reasons for the emergence of the press are based on people's need to know the news, socio-political, economic, and spiritual factors also play an important role in this regard. All these important aspects are reflected in the functions of periodicals and journalism.

It is also known that in the period before the press was fully formed, that is, before the press, its functions were performed by other social methods - publishing, reporting, oratory, and at the same time oral and written literature. Interaction between people, people giving accurate information to each other, achieving the reality of social life are reflected in the examples of written literature created in the early days. "The truth holds the earth, says the ancient Indian holy book "Narada-smriti". Truth is the highest blessing; truth is the foundation of human life. Speak the truth, avoid lying, truth is the essence of man." The Laws of Manu, the first moral

and legal document of mankind, also emphasize the importance of accurate information in life, which comes as a function of the press: "Everything is known by words. It is based on the word that comes from the word. He whose word is a liar is a liar in all things." The Sumerian and Mesopotamian writings from prehistoric times also had specific manifestations of information dissemination, analysis, and influence. Historical data show that the factors that performed their functions in the pre-press period also existed in the ancient Egyptian state. In particular, during the construction of the famous Egyptian pyramids, to attract more people to the work, a plaque with the inscription "Let's Get Generous ...!" was erected in front of the construction site.

RESULTS AND DISCUSSION

In the pre-press period, the dissemination of information, which was its function, also existed in various forms in the eastern countries. For example, the Shaks living in ancient Central Asia sent birds, mice, frogs, and five arrows to the Persian king Darius, who invaded their homeland. The purpose of this symbolic letter was to convey the message: "If you Iranians do not fly like a bird, do not dig into the poplars like a mouse, and do not hide underwater like a frog, you will die from these bullets." It is known that the ancient Turkish writings also contained information and conclusions that were important for the life of the country: "Turkish Oghuz beys, listen, people! If the sky did not rise from above, if the earth did not crack below, O Turkish people, who destroyed your state and government? " is called in the Gray Tegin script. This is the first appearance of a journalistic appeal that plays an important role in the implementation of the functions of the press. Written sources about our ancient Turkic ancestry Oguzkhan, his letter to the Chinese queen, and the writings in the great encyclopedic scholar Mahmud Qashqari's "Turkish Dictionary" are examples of his prepress imaging and analytical functions. It is known from history that verbal methods of collecting and disseminating information for the purpose of ideological and psychological influence on people were also carried out by preachers, heralds, couriers. This activity was established during the reign of the great statesman and the commander Amir Temur. "I have appointed storytellers from among the pious and straightforward people to write down the situation in each country, the mood of the army, their way of life, their actions, and the connections between them, I punished such storytellers when it became clear to me that they had written something wrong" it is written in "Temur's charters". The above data indicate that the image function of the press has been established for a long time in the history of the eastern countries. At the same time, the analysis function has been widely used. This was often done by an eastern preacher. The famous scholar and writer of the 15th century, Hossein Vaez Kashefi, and others were leading representatives of this activity. In the pre-press period in the East, his social work was carried out, among other means, by oral and written literature. Representatives of ancient Turkic literature Yusuf Khos Hajib, Ahmad Yugnaki, Persian-speaking poets Firdavsi, Rudaki, Abdurahman Jami, founder of Turkish literature, thinker Alisher Navoi, Zahiriddin Babur, and others raised important social issues of their time in their poetry and prose works. These works contained elements of analytical and artistic journalism, a strong journalistic spirit, which served the analytical function of the press. Alisher Navoi in his work "Majlis-un-Nafois" gave a general assessment of the work of artists of that time. This work corresponds to the genres of creative portraiture or literary observation of contemporary art journalism. The poet's works "Holoti Sayid Hasan Ardasher" and "Holoti Pahlavon Muhammad" can be considered the first manifestations of the genre of portrait essays in fiction. Poets Mashrab, Turdi Farogi, Ogahi, Uzbek people's democrat poets Furkat, Muqimi,

Zavqi, who created in the later periods of Central Asia, in their works raised important issues of public life, exposed the social vices that occur in life. This is in line with the social work performed by journalism that serves the functions of the press. Muqimiy and Zavqiy's humorous poems, which were later brought to life, later moved to the pages of the first Uzbek editions and directly contributed to the emergence of Uzbek comic journalism. As a result of the development of society, the expansion of social relations and communication between people, and the growing need for social information, the first appearances of the press were born. It is known that although the first buds of the press date back to prehistoric times (gypsum boards founded in Rome in the first century BC, etc.), they were not fully popular. It is known from history that the first manuscript leaflets appeared in the 15th century. The first manuscript leaflets formed in Byzantium during this period (which were the basis for the origin of the word newspaper, later called the main edition of the press, because they were sold for an Italian coin called a "Gazzetta"). Although these manuscripts were not a full-fledged press publication, their journalistic functions showed their first appearances. Leaflets issued in Byzantium contained the image function of the press, i.e., the arrival and departure of merchant ships, reports on the prices of various goods, and the first appearances of advertisements and announcements.

The development of society and the growing need for information among people began to place new demands on the era. Now the manuscript leaflets no longer meet these requirements. The invention of the printing press by the middle of the fourteenth century made it possible to distribute the word in print in large numbers. The printing press, invented by Johann Gutenberg of Germany, first led to the appearance of books and later the first press releases. The method of reproducing the word by print has also reached Russia. A century later, printed newspapers began to appear in the east, including Central Asia. It should be noted that most of the first publications of the press were published by the rulers of that period and naturally served their socio-political interests. For this reason, in the history of journalism, this press has been called the authoritarian press. While these same publications have all three functions of the press - image, analysis, and exposure - they have a unique character. In other words, the rulers who organized and managed the press (the first Russian newspaper, Vedomosti, was edited by Tsar Peter I himself and edited by him) served the functions of the press in their own direct political interests. This would have limited these functions to a certain extent. This situation was also evident in the analytical function of the first printed publications, in which facts, events, and happenings in life were conducted, interpreted, and evaluated authoritarian, from the point of view of the individual. The first publication in Turkestan, the Turkestan Regional Newspaper, was a clear example of the authoritarian press representing the interests of Tsarist Russia. The statement reads: "By order of the Governor-General of Turkestan, The Gazette of Turkestan will be published this month. In this newspaper, in order to be known to the whole population, every decree of the Governor-General is announced, and all kinds of new news, trade, and events in Tashkent and other cities are written." It is obvious that the first Uzbek-language publication in our country, The Gazette of Turkestan province, has been authoritarian in its press functions.

With the development of society, new socio-economic changes have taken place in the world. As a result of the people's movements and revolutionary changes in Europe in the seventeenth and eighteenth centuries, several European countries began to be replaced by new, relatively advanced regimes. By this time, the need for a variety of information had risen to a high level, and as a result, the first appearances of the media were fully formed and began to develop

rapidly.

It should be noted that the periodicals that emerged during this period had a different character than the authoritarian press that preceded it. They came to be known as the free world press because they were not the will of individual rulers, but the result of a mass popular movement and a state of freedom, equality, and other positive, universal slogans. The press served as a political tool for the bourgeois class to seize power, to mobilize the masses to their side in the struggle against individual rulers. In particular, the press played an important role during the revolutionary movements of Britain and France. Created during this period, Kamil Demyulen, Jean-Paul Marat, and others exposed the flaws of the old system by making extensive use of the sharp pamphlet genre of journalism in the fight against their political opposition. This was a distinctive feature of the analytical function of the press.

As a result of the social life of the West, the influence of progressive ideas, social thought developed in the East, especially in Central Asia, and the first editions of the free world press began to appear. These include newspapers such as Taraqqiy and Shuhrat, which have been published since 1906, Sadoyi Turkistan, Samarkand, Sadoyi Fergana, Oyina, and Al-Islah. M. Behbudi, M. Abdurashidkhonov, X H Niyazi, A. Avloni, Fitrat, Cholpon, and others, who were supporters of Jadidism and new social development, took an active part in the press of this period, deeply analyzed the events of social life in their works and drew some important conclusions. In the Jadid press publications based on advanced ideas, the analytical function of journalism was extensive and comprehensive and served fully for that period. Even in the pages of the religious magazine Al-Isloh, published in Tashkent in the early twentieth century, the social analysis was widespread. It should be noted that one of the peculiarities of the free world press is its social aspect, which in turn has certain contradictions. The bourgeois class used the press not only for its political purposes but also for its economic interests and became a source of sales, profit, and enrichment by publishing newspapers and other periodicals. For this reason, the main goal is to publish various news and interest the reader. As a result, trendy, "lacking in depth or solidity" materials, advertisements and announcements began to be given too much space in the press. This suggests that the image function has a distinctive character in the publications of the free world press. This feature continues in some foreign publications, as well as in many private newspapers.

As society developed, new ideas began to enter the human mind. An example of this is the doctrine of scientific communism developed in Europe in the mid-nineteenth century by K. Marx and his colleague F. Engels. They laid the foundations for new press publications to carry out their ideas, and as a result, a completely new - communist press - emerged in human history. In the early twentieth century, the newly formed party, led by the Russian revolutionary V. I. Lenin made extensive use of the press to communicate its ideas to the people. As a result of the political revolution of 1917, the communist press began to appear. The function of this large-scale press was defined as that of "collective propagandist, collective propagandist, and collective organizer." During the communist regime, which ruled for more than seventy years, it was legal for all media outlets to follow this rule in their activities. But these functions of journalism acquired a negative character by serving only the domination of a single idea.

CONCLUSION

Mankind is always striving for progress, goodness, advanced ideas. A democratic system based

on the will of the people has always been his dream. Only in a society based on democratic order can the press operate freely, independently, perform its functions, describe the life of society broadly and comprehensively, deeply analyze the events in it, and have a positive impact on people's consciousness and society. From the above brief historical observation, it is clear that the main functions of the press are always present, it is the social, economic, and cultural-spiritual life of each period, it works in accordance with the requirements of the time and has the necessary characteristics. Only in a democratic system and its press will the functions of journalism be broad, comprehensive, and unhindered.

THE IMPORTANCE OF JUSTICE AS A MORAL VALUE

Havashon Omonovna Solieva*

*Fergana Regional Branch of Uzbekistan,
State Institute of Arts and Culture
UZBEKISTAN

ABSTRACT

Justice plays an important role today as a broad concept that has its place in all spheres of social life. On the moral aspect of justice, the National Encyclopedia of Uzbekistan states that "the moral aspect of justice means to treat people equally, not to offend each other's dignity, to follow the rules of morality." Ethical qualities are formed in the family, educational institution, neighborhood and work community. People develop insights and conclusions about moral values. The role of these structures in the rise of justice to the level of moral value is invaluable. As we strive to form the perfect man, we must pay attention to the principles of justice on all fronts.

KEYWORDS: *Justice, social life, values, peace, equality, truth, democracy, civil society.*

INTRODUCTION

Justice plays an important role today as a broad concept that has its place in all spheres of social life. Many opinions have been expressed about justice in the past and present. They have been interpreted by scientists on a different basis. However, as noted by the philosopher Haydarbek Alikulov, the essence of the concept of justice, its modern interpretation, especially the manifestation of social justice in the conditions of independence, its legal and political aspects have not been sufficiently studied. Unfortunately, most ethics textbooks and manuals do not address the issue of justice, with extensive analysis of good and evil, duty, conscience, happiness, and other categories.

There are also differing views on the role of justice in the context of values. In particular, Abdulla Sher admits that justice itself does not mean any value, but determines the relationship between values and has a position to evaluate them. Justice is one of the main themes of political science. Evaluating justice as a value, the scholar said: "As the concept of" Justice "is formed at

the complex intersection of spirituality, economics and politics, the same concept of dignity manifests itself as a central point that connects these areas." B.Aliev and T.Hashimov noted that the criteria and content of values change with the passage of time, conditions, requirements and needs, and Toshpolat Matiboev, who included the pursuit of justice in the category of universal values, considered justice as a concept related to the ideas of democracy: "Social justice is a democratic value that ensures socio-political stability through the provision of as many fundamental sources of development as possible in society - health care, housing, education, material and cultural benefits." Other scholars have expressed similar views on justice.

On the moral aspect of justice, the National Encyclopedia of Uzbekistan states that "the moral aspect of justice means to treat people equally, not to offend each other, to follow the rules of morality." In this regard, we agree with the ethicist Abdullah Sher. Oral justice is more important as a category of evaluation in an ethical relationship than value. This is one side of the issue. On the other hand, justice is a relative concept, and its content also changes over time. Therefore, no one denies that justice can rise to the level of universal value in the moral relations between people over time. All moral values were also initially decided as a criterion for evaluating people's behavior. The place and importance of moral values in life is determined by the value placed on them. Whether or not to include ethical concepts in a set of values is determined by the needs, interests, and goals of the people. They are included in the list of values as a result of meeting the needs of people. Below we consider the idea that justice should be included in the list of values.

We consider the establishment of a democratic state and civil society in our country as our priorities. A democratic state based on the rule of law is, first of all, a state based on the rule of law, where human and civil rights are fully protected. It will establish fair principles in governance, state and society, state and individual relations. Legal and political justice becomes full-fledged values. Civil society is a unique social space. In it, individuals will have the freedom to realize their potential and potential. The powers of the supreme bodies of state power are transferred to the lower structures of power. In short, the state is governed by society. In the management of state powers, members of society control each other's behavior.

Man differs from other creatures of nature by his psychology. Human-level thinking, reasoning, evaluation, and creativity are not present in any species of the animal kingdom. Creatures that live in groups unite with each other on the basis of natural instinct. They help each other because of their natural-biological needs; they fight to save their offspring. Even then, the strong will pass judgment on the weak. Unlike them, a person can help the weak, helping those in need to behave. At the same time, it can fight against those who are immoral, hypocritical, and greedy who harm the interests of society.

In civil society, people participate in public administration as well as in public administration. At the same time, they treat each other's activities on the basis of equality, and help them to establish the principles of justice in society by assessing their behavior and attitudes. Everyone increases the place of justice in moral relations by evaluating their actions, supporting their activities of goodness and virtue, and condemning negative situations that harm society. The realization of human potential and potential, the enhancement of the human factor cannot be achieved without the means of justice.

The importance of justice in the system of moral values is clearly seen in the issue of national relations. The sentimental feelings inherent in our spirituality are in stark contrast to the ideas of chauvinism and nationalism. A large part of the population living in our country is non-Uzbek. Therefore, it is necessary to be careful and fair in approaching their culture and traditions. Failure to take this into account will lead to national animosity and resentment. Dissatisfaction and hatred when it comes to a nation whose national culture is overly idealized lead to damage to social relations, including moral values;

Ethical qualities are formed in the family, educational institution, neighborhood and work community. People develop insights and conclusions about moral values. The role of these structures in the rise of justice to the level of moral value is invaluable. As we strive to form the perfect man, we must pay attention to the principles of justice on all fronts.

The family is the cradle of moral values. Everyone who is born and grows up first acquires moral skills in the family. It is not for nothing that our people say, "He does what he sees in the bird's nest." Despite the parents' constant admonition to raise their children, the child remembers well what he saw. In the future, he will imitate the situations he has witnessed, not the pandas he has heard. Neglect among parents in the family, in their relations with society, towards moral norms leads to disorders in the upbringing of children. If there is no cooperation with speech in the family environment, the rules of justice will be violated if there is no reasonable attention to children. The internal environment in the family deteriorates. Parental injustice to children causes them to face many problems in the future.

We can also see such cases in educational institutions, neighborhoods and labor communities. They are a favorable environment for the development of moral values in social relations. In these structures, ethical relationships are perfected. If people are not kind to each other, if they are useless in difficult times, if they do not fight together against the injustices done to their relatives, morality will decline. The issue of forming a civil society and the rule of law remains at stake. Civil society and the rule of law are realized through the unity and solidarity of the people. This goal cannot be achieved unless members of society are fair in their dealings with one another and make justice a value in their daily lives.

In conclusion, justice has an important place in the moral system. The fact that justice reaches a level that we value in every action, in our relationships, facilitates the fulfillment of the tasks we set ourselves. In the process of building a civil society, the rise of justice to the level of universal moral values will help us to effectively complete our reforms in the economic, political and spiritual spheres.

INDIA-CENTRAL ASIAN STATES RELATIONS

Hilola Islomovna Mustapova*

*Senior Teacher,
Tashkent State University of Oriental Studies,
UZBEKISTAN

ABSTRACT

Relations between India and central Asian states have always been in high level, but India's active interaction with the Central Asian States began after the disintegration of the Soviet Union. This thesis will discuss all important points, including historical, geographical, security, energy, trading, marketing, policy, interests, importance of areas, challenges and make a conclusion.

KEYWORDS: *energy security, Silk Road, trading routes, geographical proximity, land bridge, East-West Trans-Eurasian transit economic corridors, Chabahar, TAPI pipeline, commercial interests, national security, transport connectivity, JWG, SCO.*

INTRODUCTION

India has had relations with Central Asia since the 3rd century B.C as the nations fell on route to the Legendary Silk Route. The Silk Route not only served as the medium for transportation of goods, silk, textiles, spices etc. but also facilitated dispersion of thoughts, ideas, religion and philosophy. Buddhism found inroads in several of Central Asian cities such as Merv, Khalachayan, Tirmiz and Bokhara etc in form of Stupas and Monasteries. Babur in 1526 came from the fertile valley of Fergana (food bowl of Central Asia) to the dusty town of Panipat and established the mighty rule of Mughals in India. Men of prominence such as Amir Khusrau, Dehlawi, Al-Biruni, Abdur Rahim Khan i Khanan etc having Central Asian routes came and made their name in India. During the Soviet period- culture, music, dance, movies and literature bound the Soviet Republics closely with India. Popularity of iconic stars like Raj Kapoor, Nargis, and others brought India into the homes and hearts of common people of this region. Bilateral relations however suffered considerable neglect in the 25 years after emergence of these countries as independent States in 1991¹.

In the past, India was closely linked to Central Asia through trading routes as well as successive invasions of the subcontinent which swept down from the north-west².

Due to its geographical proximity to Turkey, Iran, Afghanistan, Pakistan, China, Russia and India, Central Asia is going to play an important role in the geopolitics of this region³.

Central Asia has the potential to become the most significant trade route linking China, India, Middle East, Russia and the fringe of Europe. As hoped by various concerning nations through the revival of Silk Road, that was once a commercial artery between countries and linked the Ganges and the Yellow River to the river to the Near East and the Mediterranean⁴.

Turning to the importance of Central Asia for India, it has a very wide array of interests in Central Asia covering security, energy, economic opportunities etc. Central Asia serves as a land bridge between Asia and Europe, making it geopolitically axial for India. Security, stability and prosperity of Central Asia are imperative for peace and economic development of India. The region is rich in natural resources such as petroleum, natural gas, antimony, aluminum, gold, silver, coal and uranium which can be best utilized by Indian energy requirement. Central Asia has huge cultivable areas lying barren and without being put to any productive use, offering enormous opportunity for cultivation of pulses. Indian agribusiness companies can setup commercial agro-industrial complexes in Central Asia. Owing to higher economic growth, several areas have become attractive for construction business, providing huge scopes to Indian companies engaging in financial services, contractors, engineers, and management specialists. Both India and Central Asian Republics (CARs) share many commonalities and perceptions on various regional and world issues and can play crucial role in providing regional stability. For India to use Chabahar as a vital gateway to access Eurasian markets and optimally operationalize its use, requires a Central Asian state joining the project as a direct stakeholder. Central Asian Regions are fast getting linked to the global market for production, supplies of raw materials and services. They are also increasingly getting integrated into the East-West Trans-Eurasian transit economic corridors⁵.

India has registered significant progress recently through renovation of Chabahar port, development of the International North-South Transport Corridor (INSTC) and becoming a member of Ashgabat Agreement. International North-South Transport Corridor (INSTC), is multi-modal transportation established in 12 Sep 2000 in St. Petersburg, by Iran, Russia and India for the purpose of promoting transportation cooperation among the Member States. This corridor connects India Ocean and the Persian Gulf to the Caspian Sea via the Islamic Republic of Iran and then is connected to St. Petersburg and North Europe via the Russian Federation. The INSTC was expanded to include eleven new members, namely: the Republic of Azerbaijan, Republic of Armenia, Republic of Kazakhstan, Kyrgyz Republic, Republic of Tajikistan, Republic of Turkey, Republic of Ukraine, Republic of Belarus, Oman, Syria, Bulgaria (Observer). India uses the instrumentality of soft power and its ready acceptability in Central Asia to strengthen bilateral ties⁶.

Indian government efforts to negotiate with Turkmenistan-Afghanistan-Pakistan-India (TAPI) pipeline has been estimated to cost \$ 7.6 billion to construct. The TAPI project is intended to transport 30 billion cubic meters of gas from natural gas fields in Turkmenistan via Afghanistan and Pakistan to India⁷. But this project is facing some problems whether international companies will be willing to finance it. Moreover, with the Chinese Prime Minister, Xi Jinping's visit to Turkmenistan in September 2013, there is further speculation that the TAPI project may be held for sometime more⁸.

Recently India's External Affairs Minister (EAM) participated in first India-Central Asia Dialogue in Samarkand, Republic of Uzbekistan. Five countries from Central Asia participated in the dialogue- Kazakhstan, Uzbekistan, Kyrgyzstan, Tajikistan and Turkmenistan. All the countries participating in the dialogue are also members of the Shanghai Cooperation Organization. It was the first ministerial level India-Central Asia dialogue. Dialogue focused on a number of issues including ways to improve connectivity and stabilize war-ravaged Afghanistan. India has proposed setting up of 'India-Central Asia Development Group' to take forward development partnership between India & Central Asian countries. The group may enable New Delhi to expand its footprints in the resource-rich region amid China's massive inroads and to fight terror effectively, including in Afghanistan. India will host the next India-Central Asia Dialogue in 2020⁹.

Although Central Asia's occupies a favourable geostrategic location between Europe and Asia, the region is rich in mineral and hydrocarbon resources and offers much reason for intensive engagement with the region. But there persist numerous challenges that need to be addressed. The most obvious challenge is the geography of Central Asia. India's location in the region remains extremely vulnerable because lack of direct geographical access to the region.

In conclusion, there may be several challenges; there are obstructions of physical connectivity due to Pakistan's hostility and Afghan instability for its desultory attitude towards Central Asia. India's current trade volume with Central Asia is minimal, and cannot be increased without substantially improving transport connectivity. Politically, the Central Asian republics are highly fragile and also face threats like terrorism, Islamic fundamentalism etc making the region a volatile and unstable market.

In near future, relations between India and Central Asian countries is going to rise to another high level which has lots of advantages and beneficial sides. Year by year this trend has been shifting considerably in terms of economical, political, social, cultural connections. And now, both sides are working on various new economic projects including road, trade corridors, pipelines, such as International North-South Transport Corridor, Turkmenistan-Afghanistan-Pakistan-India (TAPI) pipeline, India-Central Asia Dialogue ("India-Central Asia Development Group"), trade routes with Central Asia, is via the Leh-Yarkand and Leh-Demchuk routes that passes through China. Also, This security challenge has been taken seriously by India when it India established Joint Working Groups (JWG) on terrorism with Kazakhstan and Tajikistan. It is also one crucial point to consider that India has already been a full member of the Shanghai Corporation Organization (SCO), which can be an effective trend in relations.

India's 'Connect Central Asia Policy' was reinforced in 2015, when Prime Minister Narendra Modi became the first Indian head of state to visit all five nations between July 6 and 13. Since then there has been significant progress in cooperation, particularly in the fields of defence, energy and connectivity. This renewed focus on the region can be attributed to the changing geopolitics of the region, particularly the formation of China's Belt and Road Initiative (BRI) and the external security threats to the region. The convergence of China's BRI projects in the region with India's unrealized economic interests there has prompted the latter to adopt a more proactive approach and look at new avenues for economic cooperation. Since China has been able to leverage its geography, finances and population to ensure that its projects can contribute toward making its dream of a new and improved Silk Road a reality, India is also committed to expanding the scope of its economic relations with the region.

Apart from the bilateral cooperation, India has also focused on multilateral engagement with the region at two levels. The first is through regional connectivity, with a renewed push for long delayed projects starting with Prime Minister Modi's visit to Iran, India's gateway to Central Asia, in 2016. During this visit, both sides signed an agreement to develop Chabahar Port, which has now become commercially operational.²⁸ To facilitate transport of goods between India and Central Asia via Iran, India acceded to the Customs Convention on International Transport of Goods under cover of TIR Carnets in 2017 and joined the Ashgabat Agreement – which includes Iran, Oman, Turkmenistan, and Uzbekistan – in 2018.

Apart from developing trade via the Chabahar port in Iran, India would like to explore setting up “air corridors” between India and five Central Asian nations, External Affairs Minister S. Jaishankar said on Thursday. The air corridors — similar to what India established in 2018 with Afghanistan — would include regular cargo flights with special clearing and customs facilities to expedite the movement of goods, especially fresh fruit and other agricultural produce, and were currently being discussed by the MEA.

The main spur is the 7,200-kilometer corridor between Mumbai and Saint Petersburg, based on ferry links between the ports along the Russian coast of the Caspian (Astrakhan, Olya, and Makhachkala) and the Iranian ones (Bandar-Anzali, Nowshehr, and Bandar-Amirabad). Indian goods are delivered to the Iranian port of Bandar Abbas on the Persian Gulf and shipped across the Caspian for onward rail or road transport to Russia and Europe. The Indian Federation of Freight Forwarders Associations estimates 30 percent cost and 40 percent transit time reductions compared to the Suez route.

“While flying time from Delhi for most of the Central Asian destinations is two hours, it may take two months for containers sent overland from India to reach these places,” Mr. Jaishankar said, speaking at the inaugural of the “India Central Asia Business council” which brought together Indian businessmen and diplomats from five Central Asian countries: Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan and Uzbekistan. “Availability of air corridors can boost trade in perishable goods, agricultural and food products,” he added. The minister also observed that it was a “matter of concern” that a lack of “overland connectivity” — a veiled reference to barriers to transit trade through Pakistan — had kept the total trade between India and Central Asia quite low at approximately \$2 billion per year. India, Mr. Jaishankar emphasised, remains committed to the Chabahar port project in Iran.

“India proposes to overcome this challenge through the Chabahar route. India, Iran and Afghanistan believe that Chabahar will become the fulcrum of connectivity for Indian goods to reach Afghanistan and further north to Central Asian states, and for the landlocked Central Asia to find access to ocean through this port,” he said, referring to the ₹100 crore investment the recent Bbudget has proposed to develop the Iranian port.⁴

Chabahar is key to India's connectivity towards its west, providing routes to Afghanistan and Central Asia while North-South Transport Corridor made up of rail, shipping, and road route currently passes via cities like Bandar Abbas, Bandar Anzali, Tehran in Iran, Baku in Azerbaijan and Astrakhan in Russia.

More than 10 countries are part of the corridor, with more countries keen to join it. Uzbekistan and Afghanistan, both landlocked countries, are keen on joining the connectivity project.

Uzbekistan had proposed joining the project during the India-Uzbekistan virtual summit last year.

ABSTRACT

Eastern classical literature cannot be imagined without miniatures. Decorating the manuscript with miniatures in accordance with the content of the work has become a tradition. In the miniatures of the works of art, the events of the work are explained and interpreted by means of images [1]. A miniature artist is an artist who gives life to colors [2, p. 40]. In the East, miniature originated and developed as part of medieval fine art. In the Iranian peoples it appeared in the pre-Islamic period.

KEYWORDS: *Hayratul-abror, Farhod and Shirin, Layli and Majnun, Sab'ai Planet, SaddiIskandari and Lisonut-tayr. Mujahideen, Badi'uzzaman, Timurids, Abu Ali ibn Sina, Ulugbek, Nizami, Khusraw*

INTRODUCTION

Several experts were involved in the creation of the manuscripts: paper cutter, calligrapher, muzahhib (gold solver), lavvoh (annoying titles and tables), artist, painter, and sahhof (cover). The value of manuscripts is determined by the quality of various ornaments on paper, ink and especially calligraphy. Naturally, the manuscripts, skillfully crafted by a few artists, were ordered only by wealthy people and were bought for big money, and gold, along with jewels, was considered a treasure trove.

“During the IX-XIII centuries, the peoples of the Middle East, Iran, Azerbaijan and Central Asia have been in close contact with each other. Cities such as Baghdad, Sheroz, Tabriz, and

Samarkand were centers of culture and development, and were known throughout the world for their outstanding scientists, poets, and centers of science and culture” [3, p. 19].

In the middle Ages, the development of literature, science and art reached its peak in the East. Many unique manuscripts have survived since that time. Their uniqueness lies in the fact that these manuscripts were prepared by skilled calligraphers and scribes, and skilled artists drew miniatures on the manuscripts in accordance with beautiful artistic ornaments, borders, and the plot of the text. The important thing is that at that time all inks and paints of different colors were made from natural products. This is probably why such unique manuscripts still retain their quality to this day. Here we explain below what the miniature itself is.

“Miniature is one of the most complex decorative elements of the manuscript, along with calligraphy, page decoration, and cover decoration. The main purpose of the miniature was to explain the content of the text and, in general, to decorate works of a secular nature. Mostly works of prose, poetry, historical chronicles are miniature” [3, p. 19]

By looking at the period in which the miniatures were drawn, we can also learn about the culture of that period. Considering this, we can say that; there are schools of miniature that reflect the unique culture of each nation. Examples include miniature schools in Arabia, Iran, Turkey, Azerbaijan, India, and Herat. All of these schools have a special significance and still retain that importance to this day.

In the IX-X centuries the art of painting and miniature existed. Written sources contain information that the walls of the palaces and houses of the rulers were decorated with portraits. At that time, the artist Abu Nasr bin Arron had painted a portrait of Abu Ali ibn Sina. This information means that there was a fine art in the IX-X centuries. By the time of Timur and the Timurids, the art of painting developed. This can be seen in the battalion compositions on the walls of the palace near Samarkand, built by Temur, and in the fact that the walls of the observatory built by Ulugbek contained images of natural landscapes.

With the Renaissance in the fine arts of the Middle East, miniature art also flourished. Miniature flourished mainly in the direction of book graphics.

Miniature became one of the main genres of Iranian fine art by the Middle Ages. With the emergence of the tradition of Khamsanavism, miniature work also became a tradition for them [4, p. 231].

These are miniatures starting from Nizami's “Khamsa”. Sometimes several miniatures are made on an event or plate from the Nizami Five and this analysis has formed a certain tradition [4, p. 236]. For example, in Nizami's epic “Khusraw and Shirin” from 1384 to the beginning of the XIX century, 126 miniatures were made on the plate where Khusraw saw Shirin bathing in spring water [5, p. 127-133]. Among them, the paintings drawn in the early XV century, regardless of the stylistic differences of each artist, have the following aspects that are mandatory for these miniatures [2, p. 50]:

- A certain position of Khusraw on horseback is that the hand must go towards the face and put its fingers on the lips;
- The condition of combing the hair of the dessert while sitting in the water;
- Sweet horse grazing in the distance;

- A tree full of bows and arrows;
- Shirin's dress, hat, and boots tucked away on the water's edge.

Regardless of the city in which it was created, the fact that the participants are repeated in this way shows that they have formed a tradition of compositional construction on the same theme, writes Muqadima Ashrafi in her book. The Samarkand miniatures on the same theme (p. 41b) [6] can be attributed to the above idea, and according to tradition, the usual pattern of heroes and objects is completely repeated. Only the differences in this are reflected in the uniqueness of the image of the characters, in the plates of nature that carry them in their arms.

There are three types of miniatures in the manuscripts of Nizami's "Khamsa":

1. Miniature - illustration.
2. Miniature - interpretation.
3. Decorative miniatures (frontispis, under the rosin or miniatures at the end of the manuscript) [5, p. 13].

The first two rounds play an important role in the interpretation of the miniature work. While a miniature-illustration is more of an interpretation of a plate, an interpretive miniature serves to explain the text of a work of art and absorb it into the reader. Because in these miniatures the main focus is not on the plate itself, but on the general idea of the work, its generalization. In Oriental miniatures, the generalization of the idea of a work of art, its expression through symbolism, is of paramount importance. As a result, the "pursuit of meaning" of poets and artists has intensified [9, p. 231]. For example, KhusrawDehlavi in the epic "Majnun and Layli" Majnun meets his father in the desert. The artist depicted the meeting in the garden in his miniature [9, p. 170]. Such inconsistencies between the text and the miniatures can be found even in the miniatures of Nizami's "Khamsa" [5, p. 32-35].

It is known that Movarounnahr has long been a center for compiling and collecting books. The famous Samanid library described by Ibn Sina alone testifies to the rich tradition of collecting books and preserving them in this country [2, p. 10].

Until the 15th century, the collection of mostly scientific literature was a priority. Only from the 15th century onwards gradually the collection of manuscripts of poetic complexes decorated with miniature paintings began to dominate.

At the beginning of the 15th century, the magnificent miniatures of Junaid painter Sultani, who was educated by the Baghdad artist Shamsiddin, showing the sources and styles of Samarkand miniatures, have come down to us. Miniatures by JunaidSultani for the Khamsa ofHodjaKirmoni in Baghdad in 1396 (London, British Library), a shining example of the Baghdad style of painting in the late fourteenth century. The landscapes and palaces in these works served as the basis for the painting of the 15th century [2, p. 14].

It is also known that the miniature depicting Ulugbek's hunting trip from his time to the present day is kept on a separate sheet in 1946 at the Frira Art Gallery in Paris and published in 1969 in the magazine People of Africa and Asia by G.A.Pugachenkova. According to G.A.Pugachenkova, this miniature was created in 1441-1442 and depicts a clear historical landscape - Ulugbek, his 4 wives, sons Abdulatif and courtiers. The compositional structure of

the work and the depiction of the characters show that this miniature was originally a complete double-edged sword - the right side of the diptych that has survived to the present day, if derived from the essence of the text at the bottom of the page; it was designed to decorate the manuscript of the lyrical epic of Khusraw and Shirin. If we recall the opinion of the Samarkand state that Ulugbek was devoted to the poet Nizami, we can conclude that this miniature decorated Nizami's epic "Khusraw and Shirin", writes Muqaddima Ashrafi in his book [2, p. 14].

In Eastern poetry, it is well known to us as a literary method that two heroes know or fall in love with each other through a picture. The heroes of Firdavsi, such as Farhod, Shirin, BahromGor, Som, Nizami, Amir HusravDehlavi, AlisherNavoi, are also known or loved through the image copied from the living image [2, p. 37].

These miniatures, designed for Nizami's "Khamsa" in 1446-1447, give a broad idea of the role of the Samarkand school in solving various topics, in the interpretation of the interior of the palace, landscapes, images of people and animals [2, p. 48]. 5 paintings decorated the epic "Khusraw and Shirin", 3 miniatures "Layli and Majnun", 7 miniatures "Haft Paykar", 3 photos "Iskandarnoma". Nizami's favorite miniatures for "Khamsa" are "Khusraw's Seeing Shirin in the Bath", "The Battle of Layli and Majnun Tribes", "Majnun Among the Animals in the Desert", "Bahrom in the Palace with One of the Beauties", "Alexander the Great's Visit", Alexander and the Mermaids and etc [2, p. 49]. All the illustrated copies of Nizami's "Khamsa" contain miniatures on the above themes.

In the composition construction based on ragns, we can see the method of emphasizing the color orange - in the miniature "The madman exchanges his clothes and his horse for captive oxen". Below the hill on a light purple background, which occupies almost the entire composition, is depicted a shepherd tying Majnun and the oxen with a horse in the background. The left part of the composition is occupied by a madman in a blue dress and a shepherd in a sloppy dress [2, p. 53]. To the right is a white horse with an orange saddle. The orange color of the saddle is repeated in the lining of the garment that Majnun offers to change, in a small sack hanging from the shepherd's waist, then as if this color is scattered, the very small echoes of the grass covering the hill begin to resound in the delicate lines on the hill. Colors served as one of the main tools of compositional construction for this great artist.

The image at the beginning of the text of the Samarkand manuscript "Khamsa" is also made in the traditional style. The twin is based on an unbiased theme - the "Palace Feast" - / 1 = b - 2 = pages / theme, with servants carrying tables full of treats to the left of the diptych, a group of young guests standing guard; on the right is a picture of a ruler, musicians, and guests sitting with their beloved under an umbrella. The events take place in front of the palace, in a courtyard lined with energetic bricks and luxuriously decorated walls [2, p. 55].

Nizami's painting "BahromGor in the White Castle with the Princess" [6] based on the manuscript of "Khamsa" copied in 1446-1447 gives a good impression of how the interior of the buildings of the Samarkand school was solved.

Miniatures of the Ulugbek period are distinguished by a unique solution to the image of natural landscapes, architectural monuments, characters. Samarkand artists are not interested in large-scale depiction of architectural buildings from afar. We see the opposite in the miniature "In front of the Majnun Kaaba" [6] based on the manuscript of Nizami's "Khamsa" copied by Herat artists in 1445-1556. Artists from Samarkand emphasized only the vertical and horizontal aspects

of the building, depicting everything symmetrically through the planes. The trunks of the people are also placed vertically, which is proportional to the vertical lines of the buildings and trees [2, p. 59].

Here is some information about KamoliddinBehzod, one of the most prominent artists of that period.

KamoliddinBehzod was born in 1455 in Herat to a family of craftsmen. His interest in painting and painting awakens in him very early, and MawlanaMirak takes him as an apprentice. MawlanaMirak was also a book illustrator. KamoliddinBehzod returned to Herat in Tabriz in 1522-1524 and worked there until the end of his life. Behzod fights for the works of great poets; miniature compositions depicting hunting scenes; illustrations, portraits worked. He decorated Saadi's "Boston", "Gulistan", Nizami's "Khamisa", KhisravDehlavi's "Khamisa", Sharafiddin Ali Yazdi's "Triumph of Temur", AlisherNavoi's epics with his miniature compositions. The portraits of Navoi, Jami, Hussein Boykaro, and Shaibanikhan by KamoliddinBehzod symbolize the artist's maturity in this art. The following is information about some manuscripts of "Khamisa" epics by KamoliddinBehzod.

The British Museum has five paintings by NizamiGanjavi in one of his "Khamisa". (The rest of the pictures in the book do not belong to Behzod's pen.) [13, p. 92] This copy of Nizami was copied in 1442 and contains four paintings by Behzod, executed in 1493, and was one of his first royal works. All of them have Behzod's signature. This copy of "Khamisa" has a picture of Layli and Majnun's love in the madrasa.

Another copy of Nizami'sKhamisa, which is on display in the British Museum (according to Martin), contains 16 paintings by Behzod. This copy is the signature of Jahangir Sultan (1605 - 16270) of the Baburi dynasty, and it is noted that the paintings were mainly made by Behzod, MawlanaMirak and Qasim Ali [13, p. 99].

There are also paintings by Behzod in the epic "Layli and Majnun" by Amir KhisravDehlavi, which are kept in two copies in the Saltikov-Shchedrin People's Library in Leningrad. In one of the manuscripts (inv.№395) two of his paintings are elegantly executed: one depicts the time of Layla and Majnun studying in a madrasa, which was done in 900-1495 [13, p.105]. On page 23 of another manuscript (inv. № 394) there is a photograph of Behzod depicting Layla and Majnun in the desert [13, p. 108]. The four paintings in Amir KhisrawDehlavi'sKhamisa, copied by Muhammad ibn Azhar in 1485, belong to Behzod. This painting was published in 1912 in Munich by the Swedish orientalist F.R. Martin [14, pp. 9,16,18,21].

Another copy of Nizami'sKhamisa manuscript, kept in the British Museum, contains masterful drawings by MahmadMuzzahib, a student of Behzod from Kamolid.

Below are some of the manuscripts of the Khamisa epics, which contain photos and miniatures. According to NaimNorkulov and IlyasNizomiddinov's book "Plates from the History of Miniatures", a total of 10 miniatures were drawn on the Khamisa epics of KhojuKirmani, NizamiGanjavi and Amor KhusrawDehlavi. The most miniature and illustrated Khamisa epics are in the manuscript of NizamiGanjavi'sKhamisa epic. It is obvious that NizamiGanjavi's "Khamisa" was one of the most popular works of any period.

Moreover, from the process of studying historical manuscripts, it can be understood that Herat was generally a group of skilled craftsmen, artisans, architects, calligraphers, painters; has

become a place of great personalities whose names still remain in history. As Zahiriddin Muhammad Babur said, there was no city in the world like Herat. The person who led Herat to this level was Hazrat Alisher Navoi [15, p. 42]. It is very fair to say about this in “Boburnoma”: “I do not know Alisherbek as a coach and a cover for all seasons and all professions. Ustaz Kulmuhammad and Sheikh Noyi and Husayn Udiykim were sozdasaromad, who developed and became famous with the upbringing and strengthening of the bey. Master Behzod and Shah Muzaffar became world famous due to the efforts and efforts of the bey in the image. It's good that so many people have succeeded in the world”.

There are a number of miniatures of Navoi's manuscripts, which are found in the world's manuscript collections.

Navoi's Khamsa, copied in 1591, contains a number of miniatures, but they are more elaborate [16]. Nevertheless, Khamsa is significant for its closeness to the time of writing and for its non-traditional writing [4, p. 236].

The epic “Farhod and Shirin” from the manuscript of Navoi “Khamsa”, copied in 1824 by the decree of the Khan of Kokand Amir Umar Khan, also includes a miniature depicting Khusraw seeing Shirin bathing in the spring water [17, p. 275]. In the East, when illustrating works of art with miniatures, it was not considered important that the picture corresponded to the text of the work. This is probably due to the fact that stereotypical compositions can more widely express the literary tradition” [5, p. 29].

In 1983, on the basis of the fund of the Hamid Suleymanov Institute of Manuscripts (now in the Oriental Studies University of the Academy of Sciences of Uzbekistan), Muhammadjon Hakimov wrote in his book “Description of Manuscripts of Navoi Works” that there were three miniature manuscripts of Navoi epics.

1. Manuscript “Khamsa” inventory number 2630-I contains 18 miniatures. The photos do not have the artist's signature. According to the palaeography of the manuscript and the method of processing the miniatures; it is a product of the Bukhara school of miniatures of the XVI century [14, p. 9]. A unique copy of the work adorned with exquisite calligraphy, book and miniature art. At the end of the Khamsa epics, the Lisonut-tayr was added, and the date of copying was recorded at the end of each copy. Hayrat al-Abrar consists of 46 pages, starting from page 1b and ending on page 46a, written in the month of Muharram 23 (Hijri 22 March 1579). Layla and Majnun consist of 40 pages, starting from page 47b to page 86b and copied in 1 Rabiul-Awwal (April 28, 1579 AD) in 987 AH. Farhod and Shirin consisted of 65 pages and ranged from page 87b to page 151a and were written on Saturday (June 27, 1579 AD) before the 2nd Friday of 987 AH.

Sab'ai Sayyar was written on 50 pages and from 152b to 201b and on 25 Muharram 258 AH (March 12, 1580 AH) and finally Saddi Iskandari wrote 79 pages from 202b to 280a AH, 988 AH 2 Rabiul-Awwal Muharram (1520 AD). April 26). The scribe who copied the manuscript mentions his name as Abdulwahhab al-Khajazi, Ibn Abulmakarim Abdulwahhab, Abduwahhab. Hence, it is clear from these signatures that the full name of the secretary was Ibn Abulmakarim Abdulwahhab al-Hijazi. According to the narration of al-Hijazi in the name of the scribe, we can say that this manuscript was copied in Hijaz. Secretary al-Hijazi must have taken the ratio for a reason, probably because he was in Arabia. The book marks of the copy show the features of Central Asia on the cover, paper, letters and other symbols in comparison with the

16th century manuscripts in the fund of the Institute of Manuscripts. Therefore, according to preliminary inspections, the copy was copied in Bukhara.

There are four different stamps on the finished page of each work in the manuscript. These should be the personal seals of the people who kept the manuscript.

At all times there are also races. However, the words poygir were erased on some pages at the time of reading the manuscript, as the poygir was placed very under the border.

The manuscript used *novvotrang* (like *sweet crystal*), a thin, shady, quality paper made in the East. Copied in a small, elegant Nasta'liq letter. The text is written in black ink, the headings are written in red (red) ink. The text on each page consists of 25 lines with four columns. Occasionally there are slashes (four lines in a row).

The copy is artistically highly embellished. It reflects all the achievements of the Bukhara manuscript of the XVI century. On pages 1b - 2a the text is arranged in two columns, surrounded by patterns with golden water and various colors, flowers are drawn. It made up a unique, wonderful twin. There is a gold plate at the beginning of each piece. Each of them has a different look and does not look like each other at all. An elegant gold table is drawn for the text. The copy contains 18 miniatures in accordance with the plot of the epics.

This copy is a unique source for studying the texts of the Khamsa epics and the influence of the Khamsa plots on the development of miniature art in Central Asia in the 16th century.

Original, leather, embroidered, lid cover. Some sheets were repaired once.

Number of sheets - 280 (vv. 1b - 280a). The size of the text is 13x23. The size of the manuscript is 21x32.5.

Bibliographic information: M.Hakimov. "Khamsa" dynasty - "Science and life", 1980, issue 7, pages 18-19; That author. Copies of Navoi "Khamsa" in the fund of the Institute of Manuscripts of the Academy of Sciences of the USSR. - Literary heritage. 17. Tashkent, 1981; R.Hidoyatova. Navoi's works - in miniatures. - "Art of Soviet Uzbekistan", 1980, No. 9, pages 16-17 [16, p. 118].

2. There are some miniatures in Navoi "Khamsa", inventory number 2752, copied in 1591, but they are more elaborate [16]. One of the oldest and most revered, but inaccurate, tried-and-true copies. The beginning and end of the manuscript have been dropped.

At the end of the saga, after 290 interests, the position of the six pages alternates. At the end of the epic "SaddiIskandariy" the text is interrupted by 174 bytes.

The history of the copying of the manuscript comes only at the end of the epic Hayratul-abror. Subsequent works in the copy do not make history. The location of the secretary and bookstore is also unknown. According to MuhammadjonHakimov, the book was probably copied in Bukhara. Because the style of writing of the copy is very similar to the style of other manuscripts copied in Bukhara in the second half of the XVI century. An independent poetic dictionary was written by an unknown person in the margin of pages 202b, 203a, and 203b of the manuscript. The dictionary is called "NisobiNavoi". This small dictionary of 76 verses is of great linguistic significance, as the Persian meanings of the old Uzbek words found in Navoi's works are explained in poetry.

Not all the pages of the manuscript show a rug, which was hidden during the repair. Leaky, thick Oriental paper.

The text of the copy is written in black ink, the captions are written in red (crimson) ink. Clear and fluent, elegantly copied in a beautiful *nasta* letter. Each page has four columns of 22 rows. At the beginning of each epic (vv. 42b - 43a, 107b - 108a, 151b - 152a, 211b - 212a) there is a space for double editing, ie 10 bytes of text are written in the middle of these pages, leaving a blank space. The text on the pages was written according to the rules, and the table and column rows were not drawn. There are 3 miniatures (vv. 56b, 78a, 90a) on the epic "Farhod and Shirin". Unfortunately, the artist's work was not completed in these paintings, and several pages were left blank for drawing (vv. 54a, 264b, 268a). wanted to destroy. However, this work was left in the hands of the miniature artist, and did not pass into the hands of the tablet.

The first, a curly, patterned, ornate cover. The faces of the patterns were given gold water, which they spilled.

The manuscript was tried, the pages were moved, many pages fell from the beginning (Chapter 15 of Hayrat al-Abrar), and two pages fell from the end.

Once the copy has been repaired, most of the sheets are thinly glued to the edges and margins. Number of pages - 296. Text size - 11x20. The size of the manuscript is 16x17 [19, p. 120]. Nevertheless, Khamsa is significant for its closeness to the time of writing and for its non-traditional writing [4, p. 236].

3. The next manuscript we have studied is the manuscript of Navoi "Khamsa", which is now kept in the Museum of Literature named after AlisherNavoi of the Republic of Uzbekistan, copied in 1824 by the decree of the Kokand khan Amir Umar Khan, his epic Farhod and Shirin is also given a miniature depicting Khusraw seeing Shirin bathing in a spring [17, p. 276]. In the East, when illustrating works of art with miniatures, it was not considered important that the picture corresponded to the text of the work. This is probably due to the fact that stereotypical compositions can more widely express the literary tradition" [5, 29]. We will cover this in more detail in later chapters. Now we need to give a little information about the paintings on the epics of AlisherNavoi, composed by Hamid Suleiman. "The paintings in the album based on AlisherNavoi's epics are among the classic examples of the Theurian period art, which reached the stage of high development in Khorasan and Central Asia in the first half of the 15th and 16th centuries. These paintings were created as illustrations for the epics of *Hayratul-abrar*, *Farhod and Shirin*, *Layli and Majnun*, *Sab'ai Planet*, *SaddiIskandari* and *Lisonut-tayr*. The painter, Dost Muhammad, and Mahmud belong to the mujahideen.

The photos included in the album include AlisherNavoi's Khamsa Manuscript for Badi'uzzaman in 1485 in Herat (Bodleian Library of Oxford Dorulfunu, № 287, 317, 339, 408), Navoi College in Paris between 1525 - 1527 were taken from the manuscripts of separate epics copied in the first half of the twentieth century (Oxford dorulfunu's Bodleian Library № 318, 340, Paris Milly Library, Suppl. Terc 996, Windsor Palace Library MS 65) [19, p. 120]. In the introduction to the album that says. Below is a list of photos included in the album:

1. The number of miniatures of different names in the manuscripts of the Oxford Dorulfunu kept in the Bodleian Library is 24.

2. There is a copy of the manuscript kept in the library of the Windsor Palace, which is only 16.5x24 cm in size, and on page 36a there is a miniature of the king's conversation with the imam in the bathroom.

3. 4 miniatures with different names are drawn on the copy of the manuscript kept in the National Library of Paris.

UZBEKISTAN

ABSTRACT

This article develops a conclusion and proposal based on the results of specific scientific research on the production of silk fabrics in textile enterprises, technologies for obtaining natural silk products. The main challenges facing enterprises specializing in the production of knitted goods in the country are to increase the export potential of the country, increase the range and quality of products in domestic and foreign markets, import substitution using local raw materials, high physical, mechanical and hygienic properties and meet seasonal requirements. production of knitted goods. In the joint ventures specializing in the production of knitted goods in the country, the products are mainly made of cotton yarn.

KEYWORDS: Knitwear, Cotton yarn, Silk fabric, Weaving, Yarn and yarn, Natural silk, Silk component, Assortment.

INTRODUCTION

The main challenges facing enterprises specializing in the production of knitted goods in the country are to increase the export potential of the country, increase the range and quality of products in domestic and foreign markets, import substitution using local raw materials, high physical, mechanical and hygienic properties and meet seasonal requirements. production of knitted goods. In the joint ventures specializing in the production of knitted goods in the country, the products are mainly made of cotton yarn. This limits the range of products. Also, the technological capabilities of modern knitting machines installed in existing joint ventures have not been sufficiently studied. Therefore, to take full advantage of the technological capabilities of knitting machines installed in joint ventures, expand the production of domestic consumer goods through the use of silk yarn, one of the local raw materials, to develop import-substituting

competitive, high-quality knitted products that meet domestic and foreign market requirements release is one of the current problems of today.

MAIN PART

In the context of the transition to a market economy, the country has adopted more in-depth directions for the processing of raw materials and identified a reduction in fiber exports by increasing the supply of yarn [2]. This requires a special approach to the problem of improving the quality of silk products by improving the quality of silk yarn. To solve this problem, research has been conducted for several years to expand the range of products by developing new linear density silk yarns from natural silk assortments. In addition, research is carried out in specialized scientific and design organizations, the association "Mikotem", several research institutes. During the research, a technology was developed for the production of yarn and yarn, mainly natural silk yarn mixed with chemical fibers. The use of new types of yarn and yarn for knitting products will allow to expand the range of products. In this regard, V.A. Usenko developed a technology for obtaining a mixture of silk fiber waste with wool [3]. This technology has been tested on top knitwear, perfumery and a wide range of fabrics. The application of the silk component increased the tensile strength and elongation properties of the fabric, as well as gave softness and softness to the finished product. However, this technology has not been used in manufacturing due to a lack of demand-driven equipment.

More recently, research has been conducted on the production of yarn by mixing natural silk waste with nitron [4], lavsan [5], wool [6] and other types of fibers. X. Alimova [7] in her research work described in detail the methods of improving the quality and processing capacity of silk yarn in automatic cocoon spinning and created a scientific basis for waste-free technology in the processing of natural silk [8]. A number of scientific works on the development of new technologies for the production of natural silk yarn [9], the design of high-density silk yarn using low-grade defective cocoons, the creation of semi-component complex yarns with similar properties to natural silk, containing chemical and natural fibers known. Foreign scientists are also working on the widespread use of silk yarn. Indian scientists [10] have proposed a technology to obtain a silky texture similar to chemical fiber polyester. According to the author, a large export can be achieved with silk fabrics obtained from a mixture of a certain amount of natural and artificial fibers. According to U.S. experts [11], the most popular blends in the knitwear industry are: cotton-silk, linen-silk, silk mixed with fine fibers, silk mixed with wool fibers. Japanese scientists have developed and patented a method for obtaining mixed-shape yarn by wrapping staple fibers of silk yarn with chemical fibers in a special spinning machine of chemical fiber [12]. It is more convenient to produce yarns of a new structure at the expense of non-standard effects. Much research in this area has been done by Japanese scientists. In particular, M. Midzude [13] developed a technology for obtaining a new type of yarn under the name "new feature silk yarn" (shens), "thin silk" (beauty silk) [14] and using them in the production of various silk products [15]. The first steps in this direction have been taken and need to be developed. Based on the studied literary sources, internet data and the above analysis, it became clear that new types of silk yarns, their blends with other types of yarns and the creation of technologies for their production are constantly being researched. Such research has been carried out extensively, mainly in the field of weaving in the manufacture of fabrics. Recently, in the knitting industry, the production of knitted products is gradually developing, using silk yarn and its mixture with cotton yarn.

RESULTS AND DISCUSSION

The knitting industry is an important branch of the textile industry. The range of products made in this industry is diverse, they include tops, underwear, socks and more. Knitted products are mainly made depending on the type of fabric. There are many types of fabrics in the knitting industry, and most pressed knitted fabrics are used for underwear and outerwear products. Pressed knitted fabric is a group of fabrics with high shape retention properties. Tissues consisting of loosely connected (nabroska) rings with interlocking rings are called pressed tissues. Or press knitwear is a fabric in which the yarn is placed on all the needles and no rings are thrown from some or a group of needles. When weaving press knitwear, the yarn is put on all the needles to form new rings, but not all of them throw away the old rings. Pressed knitted fabrics can be single- or double-layered, crocheted and patterned, woven horizontally and vertically.

The following knitting effects can be achieved when weaving press knitted fabrics.

1. A row is placed side by side with normal, colored rings in size with unattached (nabroska);
2. Openwork (perforated);
3. Resilient;
4. Embossing.

Figure 1. Different annealing rings of Polufang 2 + 2 tissue.

Figure 1 shows the different structures of the pressed tissue. It is obvious that they have perforated, reflexive, embossed effects. The creation of the so-called "Mikromesh" and "Nonran" structures of press fabrics puts a sharp limit on the number of cases when women lose their thin, transparent socks. It was clear that if any loop of silk socks woven with glad tissue was cut, the rings on this ring column would instantly be torn both upwards and downwards. The inclusion of loose rings in the tissue structure causes it to expand in width and shrink in length. In general, the presence of unconnected rings tends to extend the width of the tissue ring columns, the rings being connected by two points rather than by four points.

Therefore, the unattached rings do not participate in the formation of the pressed tissue surface and allow the rings of the soldered ring columns to be suspended. There are a wide range of methods for obtaining pressed knitwear, the simplest of which is that if one or a group of needles are not compressed to form a loop, then all the needles are inserted together with the old loops in the core of the hook. the compressed needle is inserted under the hook without moving the old rings. No compression operation was performed on needles I1, I2, I3. That is, the thread is bent into rings N1, N2, N3 and inserted under the hook, because the hook of I2 is not compressed, its old loop is not pushed over the compressed loop like S2, S1 and S3, but folds into a new bent loop and forms an unattached loop. If the compression operation is performed on all needles in the next loop row (Fig. 1.7, b), N (nabroska), which is not connected to the old ring S2, is thrown from the needle I2 at once. If the compression operation is not performed 2-3 times on any needle, then these rings will bend and an embossing effect will be achieved on the surface of the future tissue. If the ring is caught in the needles without dropping, a new row of rings will not form, which means that it will not affect the overallity of the machine.

CONCLUSIONS

One of the important conditions of the Uzbek economy is the improvement of technologies in the textile industry, increasing production capacity, delivery of raw materials to the finished product and increasing their competitiveness in the world market. The Government of the Republic of Uzbekistan is taking a number of measures to address this issue.

Deep structural changes are taking place in the Republic of Uzbekistan through the renewal and modernization, diversification of production at textile enterprises.

However, shortcomings in the full use of production capacity, fixed assets, increasing labor efficiency in a number of sectors lead to an unreasonable increase in the cost of production. The main reasons for this are:

First, with the participation of interested ministries, departments, business associations, companies and enterprises, it is necessary to develop a program of comprehensive measures for each industrial enterprise to reduce the cost of production in industry by 10-15%;

Second, it is necessary to critically analyze the level of processing of agricultural raw materials in domestic enterprises and identify existing resources and opportunities for its development, as well as to accelerate the development of processing industries, increase the range and improve the quality of consumer goods. ;

Third, in today's highly competitive environment, it is necessary to reconsider the work in this direction in order for our products to be in demand in the global and regional markets and take a strong place. At the same time, it is necessary to further strengthen the incentives for export-oriented enterprises to expand the production of consumer-friendly, highly liquid products in foreign markets, to develop additional measures to provide them with new benefits and preferences;

Fourth, to adopt a separate Government decision to expand the export fairs of industrial enterprises and other industries producing competitive products in the country, as well as to use modern methods of selling products, to involve our major manufacturers in prestigious international fairs to present their products and conclude new export contracts. should.

COGNITIVE DISORDERS IN SCHIZOPHRENIA

Khamroev Sayid Baqoevich*

*Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

Currently, there is evidence that schizophrenia is associated with impairment of many cognitive functions (Green M.F. et al., 2004). They are found in healthy relatives of the first degree of kinship, in patients - already in childhood, in the premorbid condition of the disease, most clearly manifested in high-risk states - psychopathological diathesis (Sheinina N.S., Kotsyubinsky A.P., Skorik A.I., Chumachenko A.A., 2008; Sofronov A.G., Spikina A.A., Savelyev A.P., Pashkovsky V.E., 2011). In the prodromal period of schizophrenia, there is an increase in cognitive deficit associated with morphological and functional changes in the brain, which leads to the development of psychosis (Yanushko M.G. et al., 2014; Welham J. et al., 2009), during which cognitive disorders persist (Lesh TA et al., 2011). Patients with endogenous psychosis, already at the first hospitalization, have impaired cognitive functioning, and in patients with schizophrenia they are most pronounced (Reichenberg A. et al., 2009). While in the ICD-10 cognitive impairments are noted only sporadically as diagnostic criteria (for example, speech impoverishment in schizophrenia), the DSM-V emphasizes the clinical importance of cognitive dysfunctions for verifying psychiatric diagnoses (APA, 2013). The possibility of including cognitive impairments in the number of diagnostic signs of schizophrenia was considered, which was rejected due to the lack of sufficient data to differentiate cognitive function in schizophrenia and other disorders. Cognitive deficits, for which effective remedies are currently lacking (Vingerhoets WA et al., 2013), are associated with the problems of social functioning of patients and functional outcome (Sofronov A.G. et al., 2012; Milev P. et al., 2005) ; Prouteau A. et al., 2005; Torrey EF, 2006), prognosis of schizophrenia (Kahn and Keefe, 2013).

KEYWORDS: Schizophrenia, Cognitive Disorders, Neurocognitive Deficits, Mental Disorders.

INTRODUCTION

In recent decades, there has been an increased interest in the neurobiological underpinnings of schizophrenia and cognitive functioning in psychiatry. Neurocognitive deficit (NCD) in schizophrenia is considered as the "third group of symptoms" along with positive and negative disorders [12]. It is believed that neurocognitive deficit largely determines the social and therapeutic prognosis of the disease, and also affects the formation of other psychopathological symptoms [8, 27]. The latest advances in molecular biology, genetics, and neuroimaging, together with the accumulated knowledge about the significant similarity of the clinical manifestations of these two endogenous mental disorders, the commonality of diagnostic and therapeutic principles, make us think about changing our ideas about the dichotomous model of endogenous psychoses [6, 19, 24]. One of the factors that initiated the revision of these concepts are data from studies of cognitive impairments in patients with endogenous psychoses. It was the separation of cognitive deficits into a separate cluster of disorders, first in schizophrenia, and then in affective psychosis, that caused a new wave of interest in neuroimaging research and coincided with the latest advances in molecular genetics, which allowed researchers to gain a new look at many previously considered unshakable postulates ... Cognitive dysfunction, as evidenced by the results of numerous studies, is one of the central links in the etiopathogenesis of schizophrenia, and therefore it can be distinguished into a separate pathological cluster, by analogy with positive and negative symptoms [4, 16]. Cognitive decline in patients with schizophrenia precedes the development of mental illness and is a genuine disruption in the flow of information processes. The need to take cognitive impairments into account in experimental psychological studies of schizophrenia was noted in many works, for example, E. R. Isaeva showed that for the choice of constructive coping with stress, an adequate cognitive assessment of the social situation is important [42]. In cognitive impairment, according to VG Morogin, it is necessary to take into account the motivational side of cognitive processes in schizophrenia [43]. That is why foreign scientists have focused their main efforts on the study of cognitive processes proper. Researchers emphasize the importance of studying, within the framework of neurocognitive deficit, attention disorders (mainly selectivity), limitations of auditory and visual working memory, decreases in the speed of reaction and activity of mental (information) processes and disorders of executive functions - functions of programming, regulation and control of mental activity [26, 27]. Thus, according to foreign authors, the basic cognitive functions include memory, attention, and performance functions. There are several types of cognitive impairments: - I type of impairment is associated with the functions of attention: concentration, stability and selectivity, decreased purposefulness of activity, etc. - II type of impairment is associated with mnemonic functions: visual and auditory speech memory, reduced accuracy when copying, etc. - III the type of impairment includes executive functions: hand-eye coordination, speed of learning, planning and change of attitude, control over activity, speed of sensorimotor reactions [44]. Researchers disagree about the stability of ICD in schizophrenia. Some authors consider neurocognitive deficit to be quite stable and not undergoing changes during the course of the disease [28]. Others believe that the dynamics of cognitive impairment is ambiguous: in some cases, there is an improvement in performance compared to the period of the manifest, in others - further deterioration [11]. In addition, at present, researchers are trying to conduct a comparative analysis of basic cognitive functions in patients with schizophrenia, organic brain lesions, depression and neuroses [45].

Cognitive impairments occur even in the prodromal stage of psychosis, remain relatively stable throughout the course of the disease and largely do not depend on its clinical manifestations and antipsychotic therapy [7]. The parameters of cognitive functioning are important indicators of the level of social functioning of patients with schizophrenia, regardless of their clinical status [10]. A wide range of cognitive functions affected by disease include attention, perception, learning ability, and psychomotor skills [31,32]. Cognitive deficits in schizophrenic patients are also manifested in impaired ability to plan, initiate, and maintain targeted strategies. In the implementation of full-fledged cognitive control, many areas of the cerebral cortex are involved, including the dorsolateral prefrontal cortex, medial frontal cortex, and parietal regions [30]. Studies on the relationship between the prefrontal cortex and working memory led to the assumption that it is the prefrontal cortex that is the main lesion zone in schizophrenia, which leads to impaired working memory, performance skills, abulic symptoms, and behavioral disorganization. Interacting with the sensory, motor, and subcortical regions of the brain, the prefrontal cortex plays a major role in integrating external information and coordinating the subsequent behavioral response [21, 22]. Cognitive control is, in fact, the ability to maintain an algorithm of appropriate behavior in response to a specific situation that requires priority selection. Weakened cognitive control leads to insufficiency of the corresponding clusters of higher psychological functions. Recent studies highlight preventive and reactive types of cognitive control, within the framework of the theory of "double control mechanism" proposed by T.Braver et al. [2].

The preventive type of cognitive control is described as a mechanism of purposeful retention of information that optimally mobilizes attention, perception, and readiness to respond in advance of an event requiring cognitive tension. At the same time, the reactive type reflects the current, momentary cognitive control when performing tasks. Due to its relationship with sensorimotor regions, the dorsolateral prefrontal cortex plays a central role in maintaining a preventative type of cognitive control, which is reflected in increased blood flow when performing appropriate cognitive tests on functional MRI. Reactive control, in turn, is associated not only with an increase in blood flow in the dorsolateral prefrontal cortex, but also in the anterior cingulate gyrus [18]. In healthy volunteers, when performing tasks, the preventive type of cognitive control predominates. Patients with schizophrenia are more likely to include reactive control mechanisms at the initial test performance, including due to insufficient perfusion in the prefrontal cortex. Later, when the tasks are repeated, the prefrontal cortex is activated, leading to a change in the type of cognitive control to the preventive one [2,34,38]. In most cases, the debut of psychosis in schizophrenia occurs in adolescence and young age, while cognitive deficit becomes evident long before the clinical manifestations of the disease, even in childhood or adolescence [4, 23]. It is assumed that cognitive deficit increases during the prodromal period along with morphological and functional brain changes, which ultimately leads to the development of psychosis [20]. Such changes lead to disturbances in various neuropsychological clusters [5]. Thus, cognitive deficits can be a predictor of the subsequent development of psychosis. New data on the role of cognitive deficits in the pathogenesis of schizophrenia have caused an increase in the number of studies aimed at studying the pathophysiological mechanisms of cognitive impairment and on possible ways to correct them [39, 40]. Despite all the advances in molecular genetics and biology, progress in the development of drugs to improve cognitive functioning in schizophrenia has not been significant. To date, there is no consensus on the effect of second-generation antipsychotic therapy on cognitive functioning in patients with

schizophrenia, and on the use of adjuvant drugs to correct cognitive deficits [36, 37]. Clinical studies of the possibility of using various stimulants of nicotinic, GABA-ergic receptors are being conducted, however, none of the investigated drugs has been registered as a stimulant to improve cognitive functioning [3, 9]. However, encouraging results are also emerging. So, N.V. Maslennikov et al. [35] describes the positive dynamics in the state of cognitive functioning in depressed patients with schizophrenia after a course of transcranial magnetic stimulation. Comparison of the profile and severity of neuropsychological deficits in patients with schizophrenia and in patients with other endogenous psychoses can make a significant contribution to understanding the pathogenesis of these disorders and to nosological models of psychotic disorders in general. Data from numerous studies indicate that patients with other endogenous psychoses also exhibit abnormalities in the profile of cognitive functioning [33, 29]. Most studies compare cognitive deficits in schizophrenia and bipolar disorder. There is sufficient evidence that cognitive impairment is common in patients with affective psychosis. For example, one study indicated that cognitive impairment occurs in 84% of patients with schizophrenia, 58.3% of patients with depression with psychotic symptoms, and 57.7% of patients with psychotic symptoms in the context of bipolar disorder [25]. Some studies argue that patients with schizophrenia have more pronounced neurocognitive deficits [25], in other studies, differences in the severity of cognitive impairment between patients with schizophrenia and bipolar disorder with psychotic manifestations have not been identified [14, 15]. Psychotic symptoms in the clinical picture of bipolar disorder are a factor aggravating cognitive deficits. One meta-analysis confirmed the evidence that patients with psychotic depression have more manifestations of cognitive deficits than those with depression without psychotic symptoms [29]. Despite numerous studies of cognitive functioning in bipolar and unipolar affective disorder, there is still no consensus on the neuropsychological profile characterizing affective psychoses. Currently, there are three main hypotheses of cognitive impairment in affective psychosis. The first of these, the so-called "diffuse", provides that patients with depressive disorder suffer from global or diffuse cognitive decline [17]. The second is the hypothesis of specific cognitive decline, which suggests that depressive disorder is associated with a marked decrease in specific cognitive parameters, mainly executive function and memory [1]. According to the third hypothesis, patients with major depression experience cognitive deficits when performing tasks that require cognitive efforts, while they do not show cognitive decline when performing automatic tasks. Automatic cognitive functioning implies a response in response to a stimulus, while tasks requiring cognitive tension include attention functions and cognitive abilities in general in response to presented tasks [13]. Recent studies have demonstrated disagreement in the assessment of cognitive impairment in patients with depression, since none of the cognitive functions characterizes this particular pathology. Moreover, not all patients show the same severity of cognitive deficits. Differences in research results are explained by different methodological approaches, such as the inclusion in the study of patients with different degrees of severity of depression, different clinical subtypes of the studied conditions.

Based on the analysis of literature data and the results of numerous studies of neurocognitive deficits, it can be stated that no convincing differences in neurocognitive deficits in patients with schizophrenia, affective disorders, and organic brain lesions have yet been identified. In general, despite the popularity and high density of scientific research in the field of neurocognitive deficit, this phenomenon remains poorly understood and, unfortunately, is practically not used in the work of Russian psychologists. In this regard, it should be noted that at present, the

methodological approaches to the study of disorders of mental processes in Western clinical psychology and Russian psychology differ significantly. The founders of Russian pathopsychology and neuropsychology A.R. Luria, L.S.Vygotsky, A.N. Leontyev, B.V. Zeigarnik, B.G. quantitative measurements. "For a long time, clinics were dominated by the method of quantitative measurement of mental processes, a method that was based on Wundt's psychology. Investigation of the decay of any function consisted in establishing the degree of quantitative deviation from its "normal standard", "wrote BV Zeigarnik [46]. In the Russian school of pathopsychology, the founder of which was B.V. Zeigarnik, violations of the functions of memory, attention, thinking are combined into a system of the leading symptom complex (schizophrenic, organic, etc.), in each of which there is a "core" of violations. Foreign researchers are based on a quantitative measurement of individual basic mental functions.

Bukhara State Medical Institute,
UZBEKISTAN

ABSTRACT

The article reveals the most important role of motives, drives and interests in the development of civic culture, as a priority direction in the upbringing of a harmoniously developed generation. The importance of these factors in the formation of youth as a personality of students is clarified.

KEYWORDS: Education System; Motive; Pedagogy; Psychology; Intersubject Communications; Connectedness; Technology; Socialization; Intelligence; Society; Regularity; Civil Culture.

INTRODUCTION

Activity leads a person to a new goal, desire, and he leads to a motive. Motive is a conscious action that gives a person an inner aspiration, interest. Motive becomes a source of action as an aspiration (Rubinstein S.L. Osnovy obshchey psichologii, v dvux tomax, tom 2.M.: Pedagogika, 1989, p.42) [43].

Motive (Lat. Moteo-move, motive-motivated reason) is a tendency, or reason, to direct a person to mental and practical action, to understand reality, to satisfy moral needs. serves as an internal impetus in determining the direction of future professional activity[3,11,22,42].

It is known that in the transition of each person from one age to another, there are changes in his anatomical and physiological features, as well as certain changes in his personal and mental state. In the early stages of adolescence-student adaptation to the conditions of the new microenvironment, understanding of the requirements, procedures, obligations of the new environment establishes a new look at interpersonal relationships.[12,15, 23, 44, 47].As a result, the student's personal characteristics and social relations become more relevant, and the importance of value-guiding factors as behavioral management increases. In this case, the

realization of the motive is characterized by the student's personal success (self), team (group) and activity (task) orientation [1, 2, 24, 25, 48, 49].

The orientation of the motives is directly and indirectly determined by the result of the degree of interdependence of the motives of the group members. The more cohesive the group, the more effective the motive-positive result. The motive differs in that it is goal-oriented or process-oriented. If each student has a motive to separate from the group, it primarily weakens the performance of the group members. Significant values in society and a positive attitude to the educational process lead to increased motivation of each group member and the whole group[13,14,17,18,43].

In the motivation of human development, social activism finds its bright expression in its attitude to ideology, law and morality. Motives These relationships have an impact on human activity and every action. This is very important in motivating the development of human spirituality.

It is known that in our independent society, social morality and law determine the objective content of the behavior and actions of citizens. Social morality is the appearance of normative actions, and even if it does not correspond to the internal aspirations-motives, man derives from the objective content of the moral norms of society. Man adapts his personal interests and aspirations to the interests of society, based on socially-essential moral requirements. Such actions of man stem from his duty and responsibility to society, to the people. Take, for example, the involvement of young people in entrepreneurship[19, 20, 21, 40, 41]. They must accept these activities as a duty to the people, the Motherland and society. They give up their own interests and try to align their personal interests with the interests of society as a whole. This means that he has a deep understanding of social duty, which should be inculcated in all our youth[5, 6, 7, 26, 27, 45, 46].

A person's personal interests may not always be in harmony with the demands of society. However, even when a person is uncomfortable with the situation, conditions, time, homeland, the interests of the people, he accepts it as a social duty and a requirement of the situation and tries to act in this direction. In such behavior, a person's civic culture manifests itself as a guiding force. The deep inner essence - the moral character or culture of a person - plays a role in determining the acquisition of the social essence of a personal thing that is important to a person and its personal significance for a person. Socially important moral and legal norms acquire a personal quality and give a person inner strength, initiative, high spirits[28, 30, 34].

In the process of living, a person feels the need for things in the external world and for someone else. Needs: acquires biological and social orientation. Biological factors consist mainly of the pure physiological needs of the organism as well as the aspirations of a person of the opposite sex. Social needs: to be spiritual-cultural, to know, to meet intellectual requirements; aesthetic taste, moral aspects, and human relationships. Satisfaction of needs depends on the motives of the individual's activities, the level of development of his civic culture, as well as the direction, beliefs and ideals of his activities. In this sense, needs motivate and manifest in a person's activities as a person's pursuit of a goal, interests and aspirations, inclinations and perceptions of the need for things around him (the external world). With this in mind, it can be noted that depending on the activities of people, they have formed a civic culture[29, 31, 33].

Thus, people's activities evoke needs, interests, and inclinations that lead to the development of civic culture in students. Curiosity is a person's focus on something, their desire to know

something and events. On this basis, the desire (necessity) for the development of civic culture is considered inclined.

Interests and inclinations are inextricably linked to the emotional lives of young people, and they serve as a source of interdependence, motivation and motivation. Needs based on need are material and spiritual. Satisfaction of the interest that arises in human activity leads to new interests and motivates the activity to new actions. It can be said that these are specific psychological features of the approach to the process of developing civic culture in students.

A distinctive psychological feature of curiosity is that it is always focused on something specific. Curiosity is a motive that acts in a way that is perceived essentially and emotionally appealing.

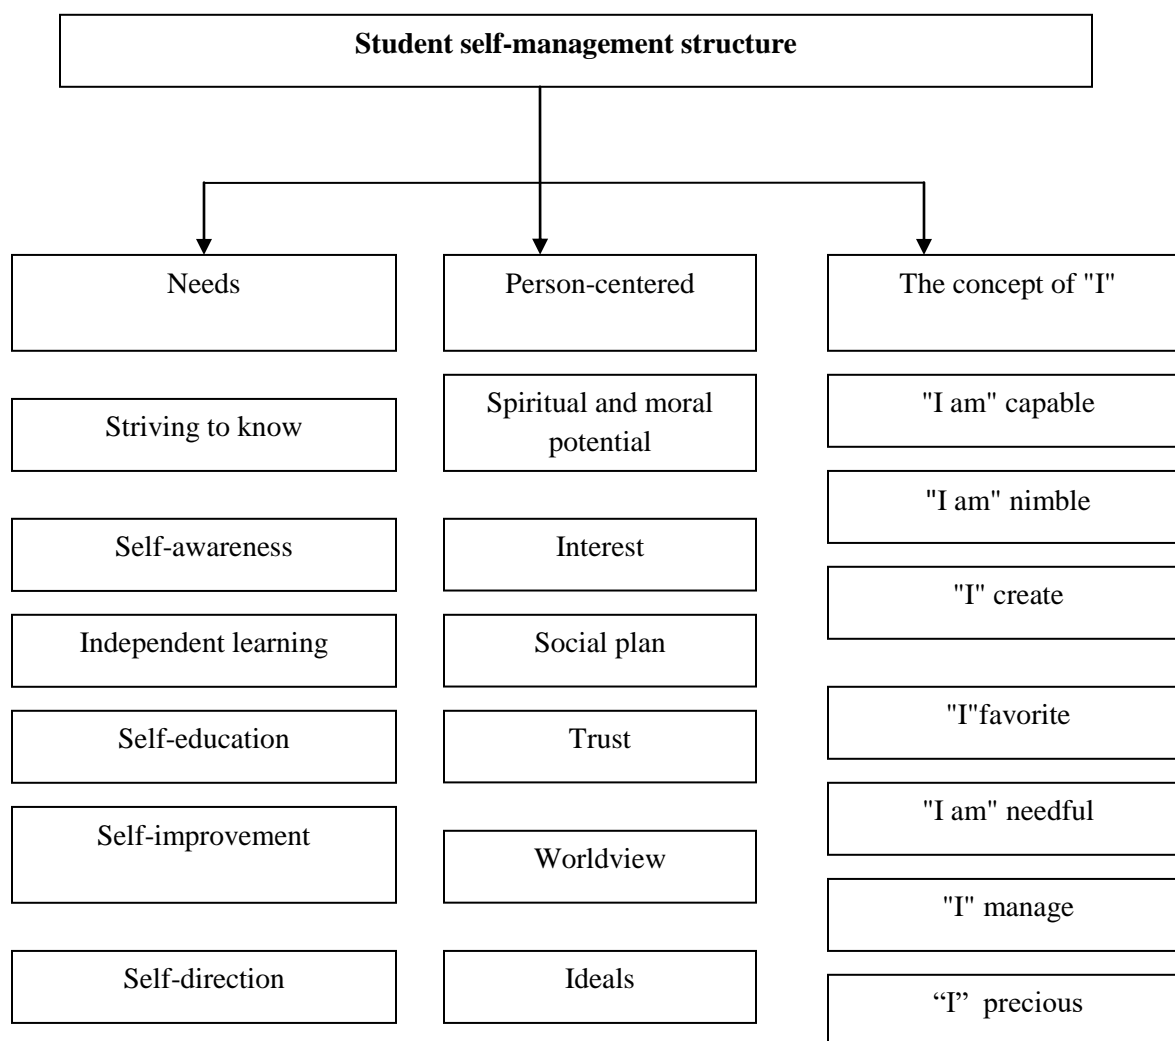

We have a duty, a responsibility of conscience, which also regulates our behavior, our conduct. When a person has to do something, it is as if he is confronting the person with his general social essence. But when a person perceives it as an abstract, not unknown, concrete necessity, something of general significance acquires a personal essence. The obligatory thing becomes a human aspiration, acquires a personal significance with its social essence, becomes a person's personal belief, idea, and occupies his thoughts. This process is determined by the essence of the human worldview, becomes a norm of human behavior, morality, and with its whole integrity finds its clear expression in the culture of man[38, 39].

At the same time, civic culture is manifested in the form of a set of norms of human behavior. In some cases, the image serves as a model, embodying valuable, remarkable features of human character. Civic culture is not expressed as a person's traits or existing behavioral norms, but as an expression of how he or she lacks or wants to see himself or herself as he or she wants. A person's civic culture is an example of what the future holds. Influences the development and perfection of the individual or the whole society as the best features of individuals or an individual and in this regard directs them (Rubinstein S.L. Osnovy obshchey psichologii, v dvux tomax, tom 2.M.: Pedagogika, 1989, p.119) [43].

Thus, needs, interests and culture are manifested in the form of motivation (driving force) of human activity, forming a diverse and multifaceted and unique (holistic) orientation of the individual. The essence of civic culture also depends on the image of the individual. Appearance determines the direction, character, content of civilization. A person's image influences the content of his or her needs, interests, and culture. Features of the human image, such as moral purity, honesty, nobility, define the content of the breadth of needs, interests, culture, and represent the range, the breadth of the individual. The spiritual image of a person is a criterion that determines his needs, interests, the essence and breadth of his culture (Rubinstein S.L. Osnovy obshchey psichologii, v dvux tomax, tom 2.M.: Pedagogika, 1989, p. 121) [43].

Another psychological feature of them is that in students the mechanisms of self-regulation and willpower consist of a structure of self-control. This structure can be observed in the table below.

2.1.1-table

The needs envisaged in the table represent their material, spiritual, physiological, social needs as a mechanism that reflects the activity and mental state of students. These mechanisms involve the formation of self-awareness, the development of positive qualities in the student's personality, the re-education of negative qualities, and on this basis help to bring them up harmoniously.

Personal orientation is a set of determined actions and activities of a student to acquire a future profession, which explains the spiritual and moral maturity, interests, social plan, beliefs, worldview, ideals of the student.

In the second period of adolescence, interests are of a growing nature, covering not only the student's academic activities, but also the student's material and spiritual life. It is therefore manifested as the driving force of the student's social life, cognitive activity, economic life.

Spiritual and moral potential - as a subjective factor of the student's behavior, intelligence, ideological views to reality, ensures that their actions are based on the requirements of the time. [4, 9, 35, 37].

This period is characterized by the development of faith for young people, which is an important factor in the formation of civic culture in students. After all, faith is an expression of confidence in the goals set by the student, strengthens the future profession, mastering the basics of science, adherence to moral standards, loyalty to the family, the motherland, love. After all, knowledge (theory, ideas, teachings) is a force that can improve human practice. it will be possible to achieve such a great goal as development [8, 10, 36].

Thus, interests, beliefs shape the worldview in the student. The worldview is a set of knowledge, ideas, perceptions about the world and man, which helps to strengthen the student's knowledge of socio-economic development, to gain a worthy place in society. On this basis, it leads to the formation of civic culture in the student.

ABSTRACT

This article presents the results of treatment of 540 patients with tibia fractures using Ilizarov compression-distractive osteosynthesis. The patients were divided into two groups. The first group included 486 patients who underwent one-stage manual repositioning of fractures and fixation with the Ilizarov apparatus of 4 rings. The fragments remaining after displacement were gradually repositioned in the apparatus. 80% of the fractures healed in time, and 20% of the patients had poor consolidation, no fracture heal and false joints. The second group consisted of 54 patients. They underwent complete repositioning of the fragments under EOP control and

were fixed in an Ilizarov apparatus of 4 rings. In the second group of patients, special attention was paid to complete fracture repositioning and rigid fixation in the apparatus. All patients in the second group had fracture healing in time, except for one patient who had concomitant diseases such as third-degree obesity and diabetes mellitus. Positive results were obtained in patients in the second group, where complete repositioning and rigid fixation of the fracture fragments were performed immediately before fracture heal.

KEYWORDS: *Tibia Fracture, Compression-Distraction Osteosynthesis, Poor Consolidation, Non-Unionised False Joint.*

INTRODUCTION

Currently, the most popular compression-distraction apparatus is the G.A. Ilizarov apparatus, which provides stable fixation of fractures and gradual dosed repositioning without exposing the fracture zone. A significant number of scientific publications and clinical practice testify to the wide possibilities of transosseous compression-distraction osteosynthesis by the apparatus. At the same time, the widespread use of this method of osteosynthesis has revealed a number of complications (from 7 to 56.4%) in the form of suppuration of the pins, poor consolidation of the fracture site, non-union of the fracture and even false joints. The process of bone repair depends on a number of general and local factors. In the vast majority of patients, fracture heal ability mainly depends on local factors. Some authors attribute these complications to physician error, others to poor tactics and management, and still others to the poor quality of devices produced by the medical industry. The results of long-term application of the percutaneous extrafocal compression-distraction osteosynthesis for fractures of the tibia bones in the trauma department of the Republican Specialized Scientific and Practical Medical Centre of Traumatology and Orthopaedics show the presence of patients with impaired consolidation of fractures of the tibia bones.

Objective of the study. To investigate the causes of impaired consolidation of tibial fractures when using the Ilizarov transverse compression-distraction osteosynthesis apparatus.

Materials and methods of research

A comparative study of the results of 540 patients with diaphyseal fractures of the tibia bones treated with the Ilizarov apparatus was carried out. The patients were divided into 2 groups. The first group consisted of 486 patients treated in 2016-2018. Of these, 286 (59%) were male and 200 (41%) were female. Among these patients, 152 (31%) were under 25 years of age, 213 (43%) were under 40 years of age and 121 (25%) were over 40 years of age. 330 (68%) had closed fractures and 156 (32%) had open fractures. Dislocation of bone fragments was observed in 480 (98%) victims. In 95 (20%) patients there were various comorbidities. Fresh fractures were observed in 380 patients and non-fresh fractures in 106 patients. In the first days of admission after anaesthesia, manual repositioning of the fractures was performed and the fractures were fixed in an Ilizarov apparatus consisting of 4 rings. The remaining displaced fragments, if any, were eliminated gradually in the apparatus. The average time of fixation with the apparatus was 3.5 months. The second group consisted of 54 patients with various diaphyseal fractures of the tibia bones treated between 2019-2020. The age of the patients ranged from 20 to 52 years. There were 39 (72%) males and 15 (28%) females. Open fractures were in 21 (39%)

patients and closed fractures in 33 (61%). Displaced bone fragments were observed in 49 (90.7%). 46 (84.7%) patients had fresh fractures and 8 (15.3%) had non-fresh fractures. 14 (25.9%) patients had various comorbidities. The care of this group of patients was based on the shortcomings of the first group of patients. In fractures without a bone defect, the main cause of non-union is poor bone separation and inadequate and too short-term immobilisation. In this group of patients, special attention was paid to ensuring sufficient fracture separation under EOP control and rigid fixation. To this end, the two rings of the apparatus closer to the fracture line were fixed with three spokes across the central and peripheral fractures.

Results of the study

The results of treatment of the first group of patients, 79 (16%) patients had delayed fracture healing (treatment period more than 5 months), and 18 (4%) had unhealed fractures and false joints. These complications were mainly observed in patients who did not achieve complete fracture juxtaposition, fracture immobility, errors in appliance technique (application of appliance rings at different distances from the fracture line), and patients who had concomitant diseases (anemia, diabetes mellitus). In addition, the vast majority of these patients had high-energy injuries with significant damage to soft tissue and paraosseous structures. In addition to the above, non-standard Ilizarov apparatuses were used in 18 patients. Soft tissue inflammation around the spokes of the apparatus should also be mentioned among the complications of hardware treatment. Among our patients, they were observed in 25 (5%). These complications occurred mainly in those patients where the apparatus spokes were insufficiently stretched and the care of the apparatus was impaired. Treatment results of the second group of patients. The average time of fixation was 2.5 months. Two patients had inflammation around the pins, which was eliminated by conservative treatment and did not affect the results of fracture treatment. One patient, who suffered from stage III obesity and diabetes mellitus, showed poor consolidation of the fracture. His fracture healed within 9 months. Immediate and long-term results were good in all patients in this group.

CONCLUSIONS

Thus, the comparative analysis showed that meeting the basic requirements for hardware treatment, i.e. a one-stage complete repositioning of the fracture and its rigid fixation until fusion, makes the method effective, as evidenced by the positive treatment results we obtained in patients of the second group.

ABSTRACT

The results of blocked intramedullary osteosynthesis (BIOS) in 50 patients with fractures of the distal and diaphysis of the tibia are presented. Blocked intramedullary osteosynthesis is a reliable and predictable method for the treatment of diaphyseal fractures of the tibia, which allows the restoration of limb function in the shortest possible time in most patients.

KEYWORDS: *Blocking Intramedullary Osteosynthesis, Tibia, Implant.*

INTRODUCTION

Fractures of the shin bones occupy, according to various sources, the first place, accounting for 13 to 21.4% of all injuries of the musculoskeletal system [1,2,8]. The incidence of diaphysealtibial fractures is 26-32 cases per 100,000 population per year. The treatment and early recovery to work of patients with unstable diaphyseal fractures of the shin bones are still far from being solved and the most urgent problem. The difficulty of treating patients with unstable leg fractures, the complexity of their reduction and the impossibility of stable fixation often leads to an unsatisfactory treatment outcome, which, as a rule, increases the disability of patients [1,3,10].

In the treatment of diaphyseal fractures of the lower leg bones, various methods of surgical treatment are used. There is no specific standard of treatment for these fractures. Different researchers have different opinions when choosing a treatment method. In modern traumatology, when choosing a treatment method, preference is given to the one that provides a quick restoration of the limb function, as close as possible to physiological [4,5,6,12]. While some authors argue that transosseousosteosynthesis is an effective method in the treatment of patients with fractures of the shin bones, others prefer intraosseous and extraosseous methods of fixing the fracture.

Interlocked intramedullary osteosynthesis has become the standard treatment of most diaphyseal fractures of the lower extremities in developed countries. The biomechanical features of the method (the location of the fixator in the center of the bone) and low invasiveness, with the correct technical execution and appropriate material support, make it possible to achieve a quick predictable recovery of the function of the injured segment with a minimum number of complications. The shortage and high cost of implants, insufficient technical equipment and the need for special training of traumatologists for a long time held back the introduction of this method [1,6,7,9,11].

Purpose of the study: To study the results of intramedullary blocking osteosynthesis in diaphyseal fractures of the shin bones.

MATERIALS AND METHODS: Intramedullary osteosynthesis of the tibia with blocking has been used in the Samarkand branch of the Republican Scientific Practical Medical Center of Traumatology and Orthopedics since 2017. This study included 50 patients with a follow-up period of at least 12 months after primary intramedullary osteosynthesis of fractures. ChM (Poland) implants were used in 46 patients and in 4 SIGN (USA) patients. The average age of the patients was 45 years (range 20 to 71). The average duration of the intervention after the injury was 12 days, with 16 patients operated on the day of admission, 9 patients within the period up to 3 days from the moment of injury, 5 - from 4 to 7 days, 12 - in the second week, 8 - in the third or fourth weeks after injury.

Technique for performing interventions. All operations were performed with the patient supine using general or spinal anesthesia. A healthy limb was placed on an abduction support, and an injured limb was placed on a support in the lower third of the thigh with a freely hanging tibia, while providing a flexion position in the knee joint of about 100°. Access to the insertion point was through the patella's own ligament with its longitudinal fibrillation. After opening the medullary canal in 38 (76%) cases, it was reamed with hand drills or drills with a mechanical drive along the guide wire. The canal was processed sparingly, with an emphasis on the tapering

zone to determine the most suitable retainer diameter (1-2 mm less than the drill diameter). In 12 (24%) cases, reaming of the medullary canal was not performed. Fracture reduction was always performed manually without the use of additional devices. In 46 cases, the reduction and insertion of the rod were performed, closed, in 4 cases, minimal approaches were performed (1 case - segmental fracture, 1 - long co-spiral fracture, 2 - after the injury was 15 and 24 days old). To correct angular deviations of short periarticular fragments of the proximal part of the tibia, in 5 cases, additional deflecting pins and screws were used, held near the nail. The blocking of the rod was carried out in a standard way with the introduction of 1-2 screws into each of the fragments.

B-th B., 35 years old, closed fracture of the bones of the right tibia with displacement. Intramedullary osteosynthesis was performed in a planned manner (Fig. 1).

Figure: 1. X-ray of the bones of the right leg before and after the BIOS. B-th A., 50 years old, open fracture of the bones of the left leg s / c with displacement. Intramedullary osteosynthesis was performed in a planned manner (Fig. 2).

Figure: 2. X-ray of the bones of the left leg before and after the BIOS.

When studying long-term results, clinical and radiological data were evaluated. To systematize and objectify clinical results, the developed 100-point assessment scheme, including the determination of the range of motion, axial deviations, the state of soft tissues, the severity of pain and edema, the degree and timing of recovery.

Results: When studying long-term results, clinical and radiological data were evaluated. To systematize and objectify clinical results, a developed 100-point assessment scheme was used, including the determination of the range of motion, axial deviations, the state of soft tissues, the severity of pain and edema, the degree and timing of recovery. The timing of the consolidation of fractures. In the majority of patients with fractures of the middle and lower third of the lower leg, rapid consolidation of fractures was observed by 3-4 months after surgery with the transition to full load of the limb with body weight. In 7 (14%) of patients, clear signs of fracture consolidation were radiologically determined by 6 months after surgery, in 4 (8%) - by 8 months.

CONCLUSIONS

1. Intramedullary blocking osteosynthesis is reliable and a predictable method of treating diaphyseal fractures of the tibia, which allows to achieve restoration of limb function in the shortest possible time in most patients.
2. Intramedullary osteosynthesis of diaphyseal fractures of the upper third of the lower leg is associated with a number of technical difficulties and must be performed by experienced surgeons. To treat such injuries, fixators with extended blocking capabilities are required.
3. Control of the postoperative course of consolidation from the side the operating surgeon is optimal both for reducing the time of treatment of patients and for timely correction of surgical tactics.

ABSTRACT

In the article were solved high quality warp yarns production problems on the base of property analyses of the modern high speed weaving looms.

KEYWORDS: *Loom, Manufacture, Disadvantage, Speed, Shaft, Spinning Machine, Length, Size, Process, Tension.*

INTRODUCTION

The improvement of looms took place in several stages, the main purpose of which was to increase the productivity of the loom and automation [1].

At the heart of the transfer of manual control of the loom to the machine was the invention of the mechanisms for forming the loom, throwing the loom weft and attaching it to the edge of the fabric.

The mechanical loom used in industry was first invented in 1784 by the English inventor E.J. Created by Cartwright. The creation of these looms not only dramatically increased the productivity of the loom, but also made it possible to service several looms in the industry at the same time. This significantly increased the worker's labor productivity.

English mechanic R. Robert introduced in 1882 the manufacture of a device that stops the loom when the back thread in the tube is finished or broken. As a result, the machine became the basis for increasing labor productivity, as well as the creation of a mechanism by the American

inventor Nortron to replace the empty tube in the shuttle with a full tube while the machine was working.

The disadvantage of automatic looms is that the shuttle is 100-150 grams heavier than mechanical looms/shuttle and requires high precision in its preparation. This limits the speed of the machine head shaft. The problem has prompted industry inventors to find another way to throw weft to the shed. The problem was solved in three directions: by creating a weft thrower (dwarf shuttle), rapier, and by throwing weft methods to the shed using an air or water drop. From the 50s of the last century, looms working in these methods began to be widely introduced in the world's textile enterprises.

For more than 50 years, the practice of expanding the working width, increasing productivity and the use of modern information and communication technologies in the management of equipment in the improvement of sewing machines in the practice of weaving is being addressed.

From the references published in the CIS countries [2,3,4,5] the main economic and technical indicators of weft throwing machines in different ways are given in the table.

TABLE BASIC ECONOMIC AND TECHNICAL INDICATORS OF VARIOUS LOOMS

Economic technique indicators			Workshop model	General shaft speed	Workshop width	Weft throw speed	Theoretical productivity	An area occupied by a workshop	Electric motor power	To manufacture 1m ² tissue in 1 hour for hand. energy. cost
Measurement unit			-	1/min	M	M/sec	Ark·m/s	M²	kW	kW·M²/s
Year of manufacture	979	Weft throw method	AT-100-5M (with shuttle)	240	1	11	14400	3,54	0,800	5,48
			CTБ 175 (with shuttle)	260	1,75	24	27300	6,28	2,200	28,6
			Π-125-ZB 8 (pneumatic)	350	1,55	30	32550	3,41	1,100	13,7
	1987		AT-100-5M (with shuttle)	240	1	11	14400	3,54	0,800	5,48
			CTБ-180 (projectile)	300	1,8	24	32400	6,47	2,200	33,9
			Π-155 ZB (pneumatic)	350	1,55	30	32550	3,41	1,100	17
			Somet (rapier)	500	1,9	0	57000	10,9	4,000	108

		СТБУ-180 (projectile)	360	1,8	24	38880	7,89	4,000	74
		Toyoda (pneumatic)	1000	1,9	35	114000	7,97	5,500	209

From the analysis of the table, it can be seen that in the former Soviet Union in 1957, no sewing machines were produced. The installation of tens of thousands of AT-100 looms in the country before independence was the basis for comparing their performance with other types of looms (table).

In 1957-1987 [3,4] on AT-100 machines, mainly due to the improvement of some mechanisms, the increase in dimensions led to a 10% increase in the area occupied by the machine, which reduced the amount of product per 1 m².

In the 60s of the last century, the former Soviet Union introduced textile-free STB machines into the textile practice [3]. The data showed that the head shaft rotation speed of STB machines was 13.3% higher than that of AT machines. Considering that the working width of the machine will be 175 cm, it was observed that the theoretical productivity increased by 1.9 times. The productivity of pneumatic looms introduced into production during this period is twice as high as that of looms. The increase in the theoretical productivity of the machines led to an increase in the amount of product per 1 m². The increase in the power of electric motors installed on machine tools has led to an increase in the amount of electricity consumed for the production of 1m² of fabric on STB machines by 2.5 times, and on pneumatic machines by 1.3 times. The years 1987-2006 can be described by the widespread introduction of non-sewn looms instead of looms. In particular, during the years of independence, we can see the example of Italy's Somet, Italy's Toyoda and Russia's improved STBU-180, STB-250, STB-360, which are installed in the republic's textile enterprises. These machines are primarily distinguished by the high speed of rotation of the main shaft. It can be seen from the table that the head of the STBU-180 increased the rotation speed of the loom by 1.2 times, on the loom "Somet" by 1.66 times and on the loom by 3.3 times compared to the loom STB-180. While noting the high productivity of the new looms, along with their cost-effectiveness, it is necessary to reduce the breakage of the threads on the loom first in order to use them effectively.

It should be noted that during the period under review, the "technological chain" of preparation of cotton yarn for weaving (rewinding, selection, loading and transfer or tying) has hardly changed. However, the fact that large windings were obtained on pneumomechanical spinning machines did not solve the problem of rewinding.

During the years of independence, cone-shaped coils ready for weaving have been delivered to the textile enterprises of the republic, with an integrated system of rewinding machines with ring spinning machines. Special research is being conducted on the problems associated with repackaging machines.

During the period under analysis (50-80 years), instead of drum machines, first SV-140, then SP-140 and SP-180 (without drums) machines were introduced into production. According to references published in 1957, 1979, and 1987, the design speed in the selection remained virtually unchanged. In 2006, the design speed of the SP-140 increased to 1000 m / min.

In general, is there a need to increase the selection rate? After all, the capacity of modern weaving enterprises is 100-150 looms, and a single picking machine that supplies them can work

5-6 hours a day. In addition, the difference in the length indicated by the counter with the speed of rotation of the warp spool and the length of the threads on the spool was a factor in the selection. This in turn leads to an increase in the amount of waste in the aggravation. The size of the width of a modern loom can increase the number of yarns in the body, as well as the number of spools in the band, while increasing the number of yarns in the body. An analysis of the research papers devoted to this process revealed that they are mainly devoted to the development of the tension of the yarns being wound from different bobbins and to ensuring that the tension of all the selected yarns is the same.

The number of yarn broke in the selection is much smaller than in rewinding, but in modern equipment of this type, the torn yarn ends can be tied without knots, the yarn broke can be tied by hand in knots, untied on a loom or loom, the knot can not be broken.

In the selection, increasing the speed of the warp yarns, along with increasing the theoretical productivity of the machine, also causes a number of shortcomings. When a single thread is broken, the spool may spin 1-2 or more times during the stop period. As a result, it may take a long time to find and connect the end of the broken rope, or the spinning worker may start the machine without connecting the end of the rope coming from the bobbin at all. In some cases, tying the end of the thread to an adjacent thread will cause the loom machine or loom to stop.

In the years of analysis, the use of multi-drum machines, including 11-drum machines, was observed instead of mounted machines during the loading process. Due to the increase in drums, according to the data for 1987-2006, the drying capacity of the machines was increased from 330 kg / h to 490 kg / h. This event is also mainly aimed at increasing the speed of movement of the threads and the theoretical productivity of the machine. Although the modern information and communication technologies of spinning machines installed in joint ventures are aimed at improving the quality of products, along with the automation of process control, the problem of improving the quality of yarns, taking into account the specifics of modern looms.

CONCLUSION

The acceleration of the process of tissue formation in modern non-woven looms and the width of the woven fabric in them is 1.7 m to 3.5 m and more compared to looms requires improvement of raw material quality as a result of improving the process of making warp and weft yarns.

THE ROLE OF ORGANIZING SPEAKING PRACTICE THROUGH DISCUSSION AND DEBATING IN TECHNICAL INSTITUTIONS

Gulrukh Mirkhodjaeva*

*Turin Polytechnic University in Tashkent,
UZBEKISTAN

ABSTRACT

This article presents the developing speaking skills through organizing effective discussion and debating in speaking part of the classes. As well as, to improve speaking within the educational discussion using developed critical and reflective thinking, and to show the necessity of the general development of created intelligence, to expand the boundaries of perception to different approaches to the same subject or phenomenon, due to divergence of opinions.

KEYWORDS: *Speaking Skill, Debate, Discussion, Critical And Reflective Thinking*

INTRODUCTION

Speaking is a complex **cognitive** and **linguistic** skill. Speaking is the skill that makes human beings **different from and superior to** the species of living beings. Speaking is a **verbal** skill that involves words and sounds[1]. It also involves:

1. **Meaning:** connotation, denotation, grammar
2. **Sociality, Relationship, Affect:** formal, informal, slang, turn-taking
3. **Cultural Issues:** class, ethnicity, nationality, religion, gender, dialect
4. **Performance:** articulation, projection, pronunciation
5. **Sound Elements:** how volume, pitch, pace, and nature of sound complement/contradict/replace words [2].

To develop speaking skills teachers design the practical classes using various methods and strategies. The main role of organizing speaking classes plays discussion and debating.

Discussion, as a form of dispute resolution, differs from simple logical argumentation, which only checks things for consistency from the point of view of axioms, as well as from a dispute

about facts in which they are only interested in what has happened or has not happened. Although logical consistency, and actual accuracy, as well as emotional appeal to the public, are important elements of persuasion. While someone expresses their point of view, the rest of the students act as listeners, which helps to improve listening comprehension skills.

Furthermore, it should be noted that the discussion involves the use of verbal and non-verbal means, in order to form a positive impression of other participants on their own position. Therefore, this form of organization of classes helps students not only learn to concisely and competently build speech using an active vocabulary and grammar minimum. However, by expanding the passive vocabulary, but also learn and use the sign language appropriately.

Nowadays, in conditions of heated discussions and polemics, primarily on socio-political issues, there is an acute shortage of a culture of discussion communication. People think little about their activities in public disputes: facilitators - over how to conduct a discussion, speakers - over their arguments. As a result, the so-called "discussions" turn into chaos, their participants are often defeated, problems are not solved.

In the meantime, questions of the methodology of argumentation (which forms the basis of the discussion) were the subject of thoughts of scientists of Ancient China and India, Ancient Greece and Rome - Protagoras and Socrates, Plato and Aristotle.

The problem of teaching discussion and debating as a communicative phenomenon of a systemic nature are not developed in the methodology. So, there is still no clear definition in the literature of the term "discussion speech", and the names "dispute", "polemic", "discussion" is often used as synonymous.

Adjust in accordance with the main characteristics highlighted in various forms of public dispute, we mean by discussion the oral (less often - written) form of organizing public speech, during which different, as a rule, opposing points of view clash.

Debating is a type of oral (less often - written) public speech that occurs during a dispute, debate, polemic, discussion, when conflicting or diverse points of view are encountered.

The information from our study showed that many high school teachers, as well as university teachers, do not know how to teach discussion speech. Typical mistakes made by students in evidence indicate that teachers (and teachers) do not acquaint students (and students) with the structure of evidence, with possible tricks and errors in argumentative texts. Consequently, it is quite obvious that teaching future teachers the ability to lead a discussion and actively participate in it (i.e., the ability to build arguments) acquires special significance. The widespread use of the method of discussion in solving problematic situations develops the logical, independent and critical thinking of students, arming them with the most important skills for personal and social activity to defend their own and refute someone else's point of view, persuade and persuade. Therefore, for the effectiveness of the learning process of unprepared spoken language, a unity of motives is necessary, such as students' awareness of their success in mastering speech and its language enrichment, the desire to satisfy cognitive needs, interest in solving problematic issues and awareness of their spiritual growth. In this regard, discussion is a highly effective type of speech activity.

It should be noted that the discussion is an analytical activity in the process of which the participants develop the following skills:

- Critical thinking;
- Separating and grouping important information;
- Identifying and isolating the problem;
- Determining the causes and possible consequences;
- Drawing conclusions and conclusions;
- Facts and opinions determining;
- Expressing thoughts correctly gathering the ideas.

In the field of language proficiency, the following positive aspects are noticeable:

- the usage of machine language cliches;
- memorizing words on the topic as a result of their repeated repetition and listening;
- freer expression of one's thoughts;
- development of spontaneous speaking skills;
- development of speaking skills with increased emotional stress [6, p. 79].

In speaking practice the basis of problem is based on learned material. The purpose of speaking or organizing discussion is to make each student individually stronger in his own position while expressing the developed ideas to improve certain communicative qualities as the individuals. Organized discussions will help students to study together what they can subsequently use individually.

ABSTRACT

This paper examines the treatment of disease and provides an experimental analysis of the treatment of patients diagnosed with tuberculosis. The study of attitudes towards the disease in patients treated with tuberculosis is important in the formation of loyalty to treatment and in measures aimed at improving mood. The study involved patients diagnosed with tuberculosis treated at the Khorezm Regional Center for Tuberculosis and Pulmonology. Developed by A.E.Lichko and N.Y.Ivanov on the classification of types of disease response in patients PQBI (Personality Questionnaire of the Bekhterev Institute) methodology was used. The study found that participants had increased self-esteem, risk of separation from the social environment, changes in family relationships, depression, long-term treatment, increased susceptibility to depression due to separation from family relationships, experiencing economic hardships is reflected in the impact on their position in the family and society.

KEYWORDS: *Psyche, Inner Picture Of The Disease, Emotional State, Attitude To The Disease, Tuberculosis, Mental Experiences, Neurosis, Guilt, Emotion.*

INTRODUCTION

According to the World Health Organization's 2017 Sustainable Development Goals monitoring, TB in African countries ranges from 9.5 to 834 per 10,000 population on average. however, it ranged from 3.2 to 194 per 100,000 population in America and from 2.4 to 152 per 100,000 population in European countries. In 2015, the incidence rate in Uzbekistan was 79 per 100,000 population.

In the global health system, psychotherapeutic interventions are recognized as one of the methods of treatment. The importance of the human psyche in treatment was reflected in research conducted in the second half of the twentieth century. It should be noted that when there are changes in the psyche of a person with the disease, the internal psychological manifestations of various diseases are specific, there are neuroses, depression, depression, internal anxiety in tuberculosis. This indicates the need for psychological support for this category of patients.

MATERIALS AND METHODS

The classification developed by A.E. Lichko and N.Y.Ivanov on the classification of types of diseases is widespread. The PQBI (Personality Questionnaire of the Bekhterev Institute) method developed by them has a high level of reliability. According to the survey, a study was conducted in patients with tuberculosis treated at the Khorezm Regional Medical Center for Tuberculosis and Pulmonology. The aim of the study was to identify and improve the direction of psychotherapy in patients with tuberculosis based on their attitude to and assessment of their disease.

The scientific and methodological basis of the research was the ideas of the internal picture of the disease (R.A. Luria) and the theory of relationships.

One of the most pressing issues in the study of TB patients is their psychoemotional state. Tuberculosis, like other serious illnesses, causes chronic psychological stress in many patients. In particular, in the second century CE, the famous Roman physician Galen wrote in his manuscripts that tuberculosis was a painful condition. The reflection of the disease in human experiences is usually determined by the concept of the internal landscape of the disease. This concept was introduced by the Russian therapist R.A. Luria and is now being interpreted in its own way in medical psychology. According to the scientist, this concept is "a large inner world of the patient, consisting of a combination of all the complex perceptions and feelings, emotions, affectes, conflicts, mental experiences and injuries." [1]

The inner appearance of the disease is determined not by the nosological unit, but by the personality of the person, which is as individual and dynamic as the inner world of each of us.

V.D. Mendelevich is based on the idea that the type of response to a particular disease is determined by two characteristics: the objective severity of the disease (determined by the criterion of lethality and the probability of disability) and the subjective severity of the disease (assessment of the patient's condition). [2]

Lethality- (derived from Latin, letalis mortality rate is an indicator of medical statistics, if death from a particular disease or health error is recorded, for a certain period of time is equal to the ratio of the total number of people with different diagnoses.

There is a typology of ways in which a patient responds to an illness. Knowing the patient's type of relationship will help him or her and his or her family to choose an adequate strategy of interaction, use appropriate communication methods, and motivate treatment. A.E.Lichko and N.YA. The Ivanovs commented on the relationship between the type of disease and the type of response to the disease, and identified the neurasthenic, egocentric, and paranoid type in the bronchial asthma clinic. (A.E.Lichko, N.Y.Ivanov, 1980).

In his Psychological Research, N.N. Lange explores the concept of "state" extensively. He calls states emotions, influences, affect, and volitional acts, "psychological manifestations are conditional elements of non-high physiological influence of perceptions, such as the internal organs of the body, just as the muscles, joints in the cavities of the internal organs of the body, stakes, like blood vessels ". He later expands the field of psychological states, saying that "it is possible to insert any mental state into the mind of the hypnotized subject, to exclude others." [3]

A.F. Lazursky did not distinguish psychological states as a special psychological category, but analyzed the term as a temporary episodic term and used the definition of psyche as a whole. Lazursky rarely uses the term psychological states in the analysis of experiences. He states that states can be apathetic or calm [6,228]. The fallen person does not notice the "comprehensive feelings" after the emotions have stopped. There are also cases of strong agitation, which some people can discuss through self-observation and objective evaluation, while in others there are pathological emotional states — hysterical, obsessive states (involuntarily arising). in the form of ideas, memories, thoughts, doubts, fears, actions, etc.) is found not only in the mentally ill, but also in ordinary people.

It leads to denial of the severity of the disease (hypognosia and anosognosia), loss of interest in examination and treatment, disregard for therapeutic recommendations. Despite the severity of the disease, patients remain calm and courteous. (e.g., myocardial infarction, tuberculosis). This is often the case when the patient feels guilty and thus seeks to satisfy his or her need for punishment. The experience of guilt occurs in situations where a person waives the personal responsibility he or she needs. To be guilty, according to M. Heidegger, means to be "responsible for".[8] TB patients have an increased sense of responsibility for their behavior, and often do not complain to a doctor or nurse about their condition, even in life-threatening situations (such as "Don't bother them unnecessarily").

In such a situation, it is important to address the individual through psychotherapeutic interventions. At the same time it is necessary to help the patient to form and understand the right behavior. It has been pointed out that this sign is an accentuation sign in the origin and course of the disease. According to different accentuation definitions (up to K. Leongard), AV, Kvasenko, and YG Zubarev (1980) describe a group of 4 different types: excitable, braked, unstable, and rigid. Pathological variants of the disease are divided into depressive, phobic, hysterical, hypochondriac and anosognosia. [4]

The term psychological rigidity (Latin - rigiditas - inflexible, rigid) comes from physics / Lewin, 1935: Cattell, 1949 /, refers to the properties of resistance to change. Rigidity is measured by its opposition to the term "flexibility". Many authors consider rigidity as a relative concept, a "change in one's psychological appearance" in the case of insecurity of personality, inability to adapt to objective situations [5].

V.D.Mendelevich (1999) evaluates the assessment of personality in any disease and its psychological response to it on the basis of the following factors:

1. Probability of fatal outcome
2. Probability of disability and chronization.
3. Painful features of the disease
4. The need for radical or palliative treatment.
5. The effect of the disease on the ability to maintain the previous level of communication.
6. The social significance of the disease and the traditional microsocial attitude towards patients.
7. The impact of the disease on family relationships and the sexual sphere.
8. The impact of illness on habits and interests. [7]

Regardless of whether the expression of emotions is strong or weak, it always causes physiological changes in the body, which leads to serious changes, even if they are not significant. Of course, somatic changes with smooth, unquenchable emotions are not so noticeable, they are not visible until they reach the threshold of consciousness. Somatic reactions are not strongly expressed in moderate emotions, and if the violent reactions are continuous, the emotional experiences will last longer. The effect we call "mood" is usually caused by such emotions. Long-term negative emotions, even moderate intensity, are very dangerous and can eventually lead to physical or mental illness. Recent research in the field of neurophysiology shows that emotions and moods even affect the immune system, reducing its resistance to disease. [8]

Therefore, building a trusting relationship with patients diagnosed with TB can lead to a positive change in attitudes towards oneself, others, and the social environment. This, in turn, leads to positive results in the patient's personal emotional sphere.

The methodology is divided into 13 types of treatment. In this methodology, patients' attitudes toward the disease participate as part of the "internal picture of the disease" and as an important aspect of the psychotherapeutic effect.

RESULTS AND DISCUSSION

The results of the study are presented below. Women and men were compared for each type of relationship.

№	PQBIIndicators	Participants		In percentage terms	
		Men	Woman	Men	Woman
1	Harmonic	-	-	0 %	0 %
2	Worrying	21	21	18 %	22 %
3	Melancholy	-	-	0 %	0 %
4	Apathetic	8	6	6 %	10 %
5	Neurasthenic	24	21	20 %	22 %
6	Obsessive phobia	2	6	1,7 %	6,4 %
7	Sensitive	16	13	13,7 %	13,9 %
8	Egocentric	16	5	13,7 %	5,3 %

9	Euphoric	6	1	5,1 %	1,07 %
10	Anosognosic	3	-	2,5 %	0 %
11	Ergopathic	3	1	2,5 %	1,07 %
12	Paranoid	13	6	11,2 %	6,4 %
13	Hypochondriac	5	13	4,3 %	13,9 %

According to the results, 21 men, or 18% of the participants, and 21 women, or 22%, were of the anxious type, 6% of the apathetic type in men, 10% of the female type, 20% of the neuroasthenic type in men, and 22% of the female type. Obsessive-compulsive phobia type 1.7% in men, 6.4% in women, sensitive type men 13.7%, women 13.9%, egocentric type men 13.7%, women 5.3%, euphoric type men 5, 1%, 1.07% in women, 2.5% in men of anosognosic type, 2.5% in men with ergopathic type, 1.07% in women, 11.2% in men of paranoid type, 6.4% in women, hypochondriac type 4.3% in men and 13.9% in women.

This means that patients with tuberculosis have a higher rate of anxiety and neuroasthenic type in men and women. The anxious type is explained by the constant anxiety and skepticism about the course of the disease in both women and men, as well as the high risk of complications, ineffectiveness, and even the risk of treatment.

Women and men belonging to the neuroasthenic type are characterized by inability to tolerate pain, unpleasant sensations, thoughts of treatment failure, hypersensitivity, and this behavior can lead to a loss of commitment to treatment. Sensitive-type women and men are characterized by a strong fear and guilt that they are alienated from others because of their illness, and this figure is also high. The egocentric type, that is, the exaggeration of one's own experiences and worries in order to fully capture the attention of others and one's loved ones, is explained by the fact that in conversations with others it is focused only on oneself. high prevalence of real disease and experiences in the hypochondriac type, exaggeration of the side effects of drugs is predominant in women, this type is also characterized by egocentrism. The paranoid type, on the other hand, has a mystical worldview in understanding the origin and content of the disease, and this type occurs on the basis of personal characteristics, which is the average percentage in men.

CONCLUSION

Thus, according to the results of the study, anxiety, low self-esteem, reasons for isolation from society, as well as the formation of negative attitudes to treatment in patients with tuberculosis are highly expressed in each person, both sexes. Feelings of inadequacy, self-blame, increased vulnerability, and economic hardship were evident in the conversation.

In conclusion, the content of the internal picture of the disease reflects not only life situations, but also the characteristics of the patient's personality before the disease. The right choice of psychotherapy with TB patients should focus on the patient's attitude to the disease and its social status, self-confidence and confidence in the future.

CHARACTERISTICS OF RAUF PARFI'S LYRICS

Kamolova Sadoqat Jabborqizi*

*Master, faculty of journalism, Tashkent,
National University of Uzbekistan named after Mirzo Ulugbek
UZBEKISTAN

ABSTRACT

This article describes the poetry of the poet Rauf Parfi, who has a worthy place in Uzbek poetry, its peculiarities, the peculiarities of the poet's work on the basis of analytical ideas. In twentieth-century Uzbek poetry, Rauf Parfi created a unique style that raised the synthesis of thought and experience to the level of art, combining the natural flow of pure emotion, the figurative expression of the bubble. In particular, first of all, the purpose of life is to perfect the soul. Second, without spiritual freedom, man cannot express himself; and third, the preconceived notion that a nation, a people, cannot survive without national unity, defined the aesthetic value of the poet's poetry.

KEYWORDS: *Rauf Parfi, Poetry, Fiction, Lines Of Poetry, Line, Satire, Metaphor, Emotion, Inner Experience.*

INTRODUCTION

The change of seasons is a natural process, a product of the immutable law of nature. In fiction, too, the replacement of the enlightened generations by the younger generations is a spiritual-intellectual need, a spiritual necessity. This means that new tastes and aesthetic levels are always emerging in artistic and aesthetic thinking. The biographies of the original poets are very short, and their destinies are very long. Birth is a life spent in the last breath, it is a bright destiny, a bitter experience. The alternation of night and day is not just a matter of nature. It is the eternal process of good and evil, muteness and free breathing, good and evil, justice and falsehood, the eternal struggle between light and darkness. Fate is poetry.

There is nothing in poetry that a poet hides from anyone. It's just that poetry is a mystery. This is the fate that has become art. A poem that puts the fiery eyes of destiny in the heart. From the very beginning of his poems, Rauf Parfi showed himself as an artist whose worldview, spirituality and spiritual faith were formed. "There are many sorrows in the world", "Mudrar

midnight ...", "Sharia", "Dawn is breaking". Dozens of poems, such as "Dawn Shoots," "The Sky Is Rising," "Termulaman Goes to the Far Horizon," and "Infinite Minutes," are the brightest signs of the socio-aesthetic ideal. "A bird sings in my soul, I do not know your name, my bird ..." says the poet in his poem "Gazelle written on the waves of the river".

Rauf Parfi, who entered the poetry of the mid-60s and early 70s of the XX century and showed his bright personality, is a new, unadulterated, unexpected non-traditional metaphor (Bird, Lamp, Tree, Nay, Light). won the love of the literary community with his images, fell into the public eye with the nature of artistic thinking, built on the basis of figurative imagery. In Rauf Parfi's poems, the warmth of love, the spirit of trust, the sad and melancholy tone, the unseen and unheard sincerity, the eye-catching respect for man are found. And more importantly, the socio-philosophical essence of the poet's works was a new direction in our poetry. In particular, first of all, the purpose of life is to perfect the soul. Second, without spiritual freedom, man cannot express himself; and third, the preconceived notion that a nation, a people, cannot survive without national unity, defined the aesthetic value of the poet's poetry. "Living in the same dreams, in the same sorrows, in the same joys" is the essence of life, he said.

MAIN PART

The issue of human spiritual freedom is at the heart of Rauf Parfi's work. For this reason, in the poet's lyrics, it has become a special principle to paint the life of emotions, the landscape of experiences, the picture of moods. That is why he is called the artist of emotions. In that sense, it is enough to look at the poem, which begins with the line "It's not raining, it's raining pearls." Rain is, according to Eastern ideas, the seed of blessing, divine grace, goodness and virtue. Poets assign to it meanings similar to their spiritual states and moods. That is, each poet, based on his own aesthetic principles, seeks to express a different artistic and philosophical content through the rain. Someone sees tears in the rain. Imagine for a second you were transposed into the karmic driven world of Earl. In another poet's poem, rain is understood as the words of the clouds, the dark brown sky sent to the earth.

In Rauf Parfi's picture, the rain is in the form of a dark night. At night it flows like water. That is why the night is full of joy and bearmon. Because in its bosom there is a life-giving clarity like water, a bright light of tomorrow.

The lyrical protagonist's experiences are like the rain that falls on a dark night. He is driven by hope. In that sense, it is like a breeze blowing in the leaves. Even the darkest of nights is pleasant in the form of sabo. Like flowers, it seems to be telling legends until dawn. That's why the lyrical protagonist shines in his heart, his lashes shine. Imagination is not a dream in the depths of endless space. It's dark in the rain. He can be trusted. Although it is dark, the moonlit breeze in the rain gives hope for tomorrow's morning.

Apparently, the figurative lyrical lyricism is the essence of Rauf Parfi's style. The rebellion against the realities of the time, the political situation in society, events, social oppression, which tramples on human dignity, rights, and forms of injustice, gives reason to prioritize the realism of emotions in the poems of Rauf Parfi. In twentieth-century Uzbek poetry, Rauf Parfi created a unique style that raised the synthesis of thought and experience to the level of art, combining the natural flow of pure emotion, the figurative expression of the bubble. This is a special direction in the development of Uzbek poetry in the XXI century since the middle of the XX century. It was formed as a culture of independent artistic perception and expression.

In the late 60s and early 70s of the twentieth century, Uzbek poetry became a new independent artistic and aesthetic direction, introduced by Rauf Parfi Ozturk. In the aesthetics of Rauf Parfi, the issue of the educational role and significance of art and the word has a special place. "... As long as there is a nation, there is literature, there is the Word. This soil, this air, this water, this fire, which gave the world great words, has not been able to save humanity from cruel, bloody games, massacres, disasters and calamities. But I am glad that the noble word is on the side of the good. " According to the poet, good words bring light to people's minds and drive evil, ignorance and evil out of their hearts. In this way, it purifies the mind. It purifies the soul. As religion purifies man, so the original poetry has the highest spiritual potential as religion. Kind words drive away betrayal, hypocrisy, betrayal, and fear that have taken root in people's minds. Nobility and kindness grow in the hearts, the gardens of generosity and mercy are fulfilled.

The issue of freedom of conscience has a special place in the poet's aesthetics. The phenomenon of freedom of spirit and soul is studied in the aesthetics of R. Parfi at the level of socio-philosophical category. In particular, a force as strong and invisible as the invisible, imperceptible iron in our consciousness binds us to the threads of text. From the way we act to the way we talk, the way we act, the way we think, in a word, our footsteps, our eyes, our eyes control us. It makes it difficult to see anything under the boom. The obedient dominant position of the political overseer within us enslaves one. This is what makes a weak creator of faith play the drums of a skeptical dominant ideology. When a creator is not spiritually free, he can never get rid of ideological stereotypes and political interests. It is given to modernity. Unless a person is free, neither his nation nor his homeland will be free. This is the high point of freedom in the poet's interpretation. Achieving this status begins with self-knowledge. We are enslaved to material things, we are enslaved to material things, "said Rauf Parfi. - These are the conclusions of the "cunning" mind, not the intellect. When the mind is distracted from knowing Allah, it is deceit. It is said that one who knows Allah is wise. A person who knows Allah is not bound by material things, he is not his guardian. He is the owner, the one who seeks his identity. "

The roots of Parfi's aesthetic views go back to the classics of Eastern and Western art. For this reason, the poet is more interested in the blind of art, which is prone to the realism of images and realism of emotions in world aesthetics. In particular, according to the aesthetics of realism, the poet is preoccupied with the issue of individual freedom against secular oppression, the tumult of life, the four seasons of nature. For this reason, the poet considers the potential and art of the scholar as the main criterion in determining the aesthetic value and importance of literary works. Even when it comes to the sword, only speaking the truth, defending the Truth and Truth, denying all forms of lies, hypocrisy, deceit, oppression and betrayal, and rebelling against them are at the heart of R. Parfi's aesthetics.

In the aesthetics of Rauf Parfi, the Turan-Turkestan theme forms a separate page. "The subject of Turan-Turkistan appears in the written literature of BC," R. Parfi wrote. "Turan-Turkestan, like Egypt-Babylon, China-India, Rome, Iran, Europe, America, the Turkic world has given and will give its worthy heritage to the treasury of world science, culture, literature and art".

RESULTS

In his poems on the theme of Turan-Turkestan, R. Parfi raises the height and value of words according to their philosophical and social content, raises their wings and flies to them:

The poet's "Words", "Poetry", "Map", "Mother tongue", "Turkistan", "Desert Iraq", "Awakening Turkistan, awakening world", "From the ancient Turks", In dozens of poems, such as "Do not spare yourself, the growing root", "Where are the heads that understand what is being said", we see a series of different artistic interpretations of the distant past, present and future of Turan-Turkestan. We are amazed at the potential of the word art.

There is a saying that if you want to know the heart and work of a poet, go to his homeland. The poet's homeland is a world of mysterious images that absorb his magical, wise meanings. In Rauf Parfi's lyrics, images such as the Word, the Eye, the Bird, the Spring, the Tree, the Lamp, the Imagination, and the Light become symbolic in terms of their subtle, meaningful content. They depict the pages of the historical life of the peoples of Turanzamin, Turkistan. It reflects the essence of the tragic events in the destiny of the Turkic peoples. One of the leading features of R. Parfi's poems on Turan-Turkestan is the revival of the spirit of generosity, militancy, heroism, which has left an indelible mark on the fate of the nation and has been dormant for centuries.

In word art, everyone is a student to each other, but everyone goes their own way, says the author. The essence of R. Parfi's research is to reflect the rich semantic aspects of the Uzbek language. He can feel the taste, the smell, the color, the color of the word. In this sense, the poet's hot, passionate breath is felt in every poem. It's as if he's watching every word. He doesn't choose words for what he says. Perhaps the thought experience is born with its own meaning, its own expression. That's why Parfi says, "Every word is my world." He writes in the poem "Words": "Words. In the middle of the night, as the hands of emptiness squeeze my chest, my soul does not give up, but moves forward, a white building appears in front of me, wrapped in thick and white blankets in a white building. I see sleeping words in a row of seats. Again in the middle of the night, as the iron arms of space squeeze my chest, I shout, "Help, don't fall asleep." That's the decent thing to do, and it should end there. "

DISCUSSION

In the poetry of R. ParfiOzturk, in addition to the concrete meaning of the word, it has a socio-philosophical, artistic and aesthetic significance, as it expresses a certain beauty, symbolic or exemplary content in the personality and spirituality of man. In R. Parfi's research, the conditionality in the nature of words, the portable meaning expressed in the form of a semicircle under a cup, is especially preferred. R. Parfi's hard work on the word is that, as can be seen in the poem "Words", he "sleeps in a row of chairs, wrapped in thick and white blankets in a white building." awakens. The ulamamobilizes to live, to struggle, to work. Because, in the poet's own words, poetry is constantly updated. Sometimes words that teach us to shed the blood that we carry in our chests. Needless to say, the General was wounded in the war. Capitalized words. The children's speech is strange, the words are wrinkles on their foreheads, our hands are thoughtful words. Apparently, the figurative lyrical lyricism is the essence of Rauf Parfi's style. The rebellion against the realities of the time, the political situation in society, events, social oppression, which tramples on human dignity, rights, and forms of injustice, gives reason to prioritize the realism of emotions in the poems of Rauf Parfi. In twentieth-century Uzbek poetry, Rauf Parfi created a unique style that raised the synthesis of thought and experience to the level of art, combining the natural flow of pure emotion, the figurative expression of the bubble. This is a special direction in the development of Uzbek poetry in the XXI century since the middle of the century. It was formed as a culture of independent artistic perception and expression. In the

late 1960s and early 1970s, Uzbek poetry became a new independent artistic and aesthetic direction introduced by Rauf Parfi.

CONCLUSION

Twentieth-century Uzbek poetry is a poetic phenomenon that can be considered on the pages of world literature. There is no doubt that the poetic works of this period, the literary personalities of the period, can, in essence, interact with world literature and literary figures. Among such great writers, the name of Rauf Parfi has a special place. Themes in the poet's work are as diverse as life itself. They cover a wide range of poetic observations: good and evil, compassion and cruelty, man and nature, war and peace, ancestors and generations, love, homeland ..., literally discovering the uniqueness of the universe and man. The issue of human spiritual freedom is at the heart of Rauf Parfi's work. For this reason, in the poet's lyrics, it has become a special principle to paint the life of emotions, the landscape of experiences, the picture of moods. Symbolic, figurative lyricism is the essence of Rauf Parfi's style. The rebellion against the realities of the time, the political situation in society, events, social oppression, which tramples on human dignity, rights, and forms of injustice, gives reason to prioritize the realism of emotions in the poems of Rauf Parfi. In twentieth-century Uzbek poetry, Rauf Parfi created a unique style that raised the synthesis of thought and experience to the level of art, combining the natural flow of pure emotion, the figurative expression of the bubble. The issue of freedom of conscience has a special place in the poet's aesthetics. The phenomenon of freedom of spirit and soul is studied in the aesthetics of R. Parfi at the level of socio-philosophical category. In particular, a force as strong and invisible as the invisible, imperceptible iron in our consciousness binds us to the threads of text. In Rauf Parfi's lyrics, images such as the Word, the Eye, the Bird, the Spring, the Tree, the Lamp, the Imagination, and the Light become symbolic in terms of their subtle, meaningful content. They depict the pages of the historical life of the peoples of Turanzamin, Turkestan. It reflects the essence of the tragic events in the destiny of the Turkic peoples.

ABSTRACT

This article describes the origins of comparative literature, its growth and development as one of the fields of literature, the similarities and differences between national and world literature in comparative literature on the basis of analytical ideas.

KEYWORDS: *Literature, Comparative Literature, Object Of Comparative Literature, Subject Of Comparative Literature, School Of Comparative Literature, National Literature, World Literature.*

INTRODUCTION

Comparative literature is one of the main branches of literature, which deals with the study and comparison of two or more national or world literatures. Identifies their similarities and differences, interactions and interactions. The term "comparative literature" is derived from the French "literature comparee" and the German "Die vergleichende Literaturwissenschaft". According to K. Pishua and V. Zhirmunsky, the German concept in particular reflects the essence more clearly. Because it focuses on the science of comparison. The object of comparison, that is, the type of literature, can be more than one.

Comparative literature began to develop as an independent science in the second half of the nineteenth century. The object of comparative literature is several comparative literatures, and the subject is inter-ethnic literary relations. Many Western as well as Russian scholars have contributed to the development of comparative literature. F. Baldansperje, P. Azar, P. Van Tigem, R. Wellek, A. Veselovsky, V. Zhirmunsky, N. Konrad, and many other scientists are among them. Initially, the literature was compared textually. That is, the texts of the works were considered to be comparable only if they met from different criteria. contraction occurred. The scientist expanded the boundaries of the objects of analysis by solving comparisons of literary events that did not have a general connection or genetic connection. In this way, he took comparative literature to a new level. Veselovsky (1872-1919) is considered to be the founder of historical poetics, which deals with the study of the structural unity of descriptive means in works of art. Historical poetics is a branch of literary criticism that studies the history of the origin and development of literary genres, works, styles, as well as the author's attitude to the artistic perfection of the content of the work, the protagonist, the reader. Historical poetics as a science appeared in the books of A. Veselovsky in the second half of the XIX century. In his view, the main methods of historical poetics are historical and comparative methods. In addition, the scientist also recommends a typological research method. The scientist believed that in different literatures there is a phenomenon of repetition of the same plots or "mobile plots", the repetition of symbols and emblems. He attributed this situation to the unity of mental processes, as well as the similarity of cultural and historical conditions, the commonality of origins, and interactions. Moreover, according to another well-known literary scholar Zhirmunsky, the main idea of A. Veselovsky is to evaluate the history of the development of literary history as a science. A new stage in the history of literary criticism is defined in connection with its name - the stage of transition to the study of literary and folklore monuments on the basis of the comparative-historical method. Interestingly, Veselovsky paid special attention to the connection between literature and linguistics. He identified holistic and unique patterns of speech formation. These include the repetition of adjectives such as "blue" sea, "sleepy" forests, "spotless" fields, and "strong" winds. From a number of adjectives that describe objects, writes AN Veselovsky, and like the "blue" waves of the ocean. " Nowadays, we can also note that many literary works, especially translated works, have many similar pictorial expressions. Although stylistically they are quite repetitive.

In the early twentieth century, a school of comparative literature was formed in France. Its purpose is to study the development of literature from the Renaissance, focusing on inter-ethnic literary relations. It was these connections that were able to bridge the political, ethnic, and linguistic barriers between European literature. Representatives of this school have identified a category of literary influences that affect different literatures. The main directions of this school are described in Paul Van Tigham's books "Comparative Literature" and "Pre-Romanticism". VM Zhirmunsky (1891-1971) is one of the scholars who developed a comparative-historical method of studying world literature. This method helps to identify similar elements in various national literatures over long periods of time.

RESULTS

Zhirmunsky studied German and Turkish folklore and epics, the works of Goethe and Byron, as well as other classics of German and English literature, as well as the history of German-Russian literary relations. The scholar replaced the concept of 'Influence' with the concept of

'Interaction' in France, given that national literatures and world literature contribute to the development of each other. He prefers to talk about literary connections and interactions, rather than assuming that there should be two-way or reciprocal relationships. In his view, individual biographical evidence cannot be considered as an influence, nor can it be a casual acquaintance with a book or an engagement in literary fashion. There must be a need for it and there must be proportional principles of development. Zhirmunsky believes that it is not enough to compare objects and identify similarities and differences between them. However, it is important to pay attention to the historical analysis of these features. According to him, the following three areas of research can be distinguished in comparative literature:

- 1) Historical-typological
- 2) Historical-genetic
- 3) Interactions in cultural and literary relations.

Examples of historical-typological research are observed at different stages of development in different nations. These patterns are very common in works and can be considered examples of literary interactions. They can also be distinguished by the fact that they reflect the national identity of peoples and the specificity of literature. Historical-typological correspondences can be defined in terms of ideas and spiritual content, motives and plots, situations and images, genres and styles.

The historical-genetic direction reflects the unity of the compared facts in terms of their common origin. In addition, Zhirmunsky pays special attention to world literature because he believes that world literature is very important for comparative literature. However, he emphasizes the concept of "world literature", which includes only European literature.

Comparative literature today is divided into two areas:

- 1) Direct and inverse study of the literature (influence-perception-effect), genetic proof (when a unit of reality or event is defined as the unity of origin), as well as synchronous (simultaneous) and diachronic relationships through (different times);
- 2) A comparative typological study, i.e., identifying the commonalities and differences of different literatures, which are independent of each other and do not affect each other. It is expressed in "literary" characters and themes in similar genres and styles in common genres.

CONCLUSION

In many cases, typological commonality contributes to the development of connections between literary events. In addition, comparative literature studies the problems of translation and thus helps to understand national and interethnic phenomena in literature. The main research method in comparative literature is the comparative-historical method. This method, also known as comparativeism, was mobilized to identify common elements of the various national literatures over a long period of time. For our work, however, the psychological method is also interesting. Because when comparing English, Uzbek and Russian literature, it is important for us to identify common problems in education and freedom of choice. This method is also important in studying the author's psyche, the inner world of the protagonists, the thinking of the protagonists, as well as the peculiarities of the reader's emotional perception.

ABSTRACT

Globally 2.4 billion people live without access to improved sanitation of which 1 billion people practice open defecation (WHO-2015). Sanitation was one of the most off-track Millennium Development Goals (MDG). Only 68% of the world's population has access to improved sanitation (WHO-2015). Sanitation lies at the root of many other development challenges, as poor sanitation impacts public health, education and the environment. Based on the Global WASH fact sheet (2012), Maldives and Sri Lanka have better sanitation facilities than the great India and Afghanistan which is having least coverage. South Asian Conference on Sanitation (SACOSAN) is working on the improving the sanitation facilities in the SAARC. Among Indian states, North Eastern states are having better facilities compare to other regions (Census-2011). After launching SBM programme sanitation growth is observed across the country. The paper is based on secondary data and focuses mainly on sanitation condition in South Asian countries, India and states. GIS Techniques are used to prepare the maps and analyse the data and is presented in the paper.

KEYWORDS: Sanitation, Rural, Urban, Households, GIS, SAARC.

INTRODUCTION

Sanitation includes environmental sanitation which is largely viewed as “the control of all those factors in man’s physical environment which exercise a harmful effect on his physical environment, health, improving poverty, enhancing quality of life and raising productivity- all of which are essential for sustainable development” (WHO 1992). Sanitation is one of the basic determinants of quality of life and human development index. Good sanitary practices prevent

contamination of water and soil thereby prevents diseases. The concept of sanitation was therefore expanded to include personal hygiene, home sanitation, safe water, garbage disposal, excreta disposal and waste water disposal. Globally Sanitation word is used for safe disposal of human excreta (used by UNICEF-WHO Joint Monitoring Program).

As per the Global WASH fact sheet (2012) 780 million people do not have latrine facilities and more than 35% of the world people lack access to improved sanitation. Worldwide, soil-transmitted parasitic worm infect more than one billion people due to lack of adequate sanitation in the world. Safe and sufficient drinking-water, along with adequate sanitation and hygiene has implications across all Millennium Development Goals (MDGs). Goal number 7 is related to this indicator only. As the world turns its attention to the formulation of the post-2015 Sustainable Development Goals (SDGs) much remains to be done particularly to reduce inequalities across populations. As per the JMP-2014, 2.5 billion people lack access to improved sanitation and 1 billion people practice open defecation and out of 10 people 9 people are still going out for defecation in rural areas. 2.5 billion People lacking of basic sanitation in the world and out of 7 people 1 person is practicing open defecation in the world. According to the WASH – GLAAS*2014 facts, 67% of the countries recognize sanitation as a human right by law, 80% of countries reporting insufficient financing as the main cause for poor sanitation facility in the country.

WASH – GLAAS* The Global Analysis and Assessment of Sanitation and Drinking-Water (GLAAS) is a UN-Water initiative implemented by WHO.

OBJECTIVES OF THE STUDY

1. To study the status of Sanitation facilities across the world and specifically South Asian Countries (SAARC).
2. To study the sanitation conditions in India between 2001 - 2011.
3. To analyse the status of sanitation among Indian states.

GIS TECHNIQUES

This paper has utilized the information and decision support systems to enhance its effectiveness in the analysis of data. GIS techniques are used to prepare maps for this paper. The maps are compared and further analysed to understand the categories of the sanitation facilities across the state and country. From the analysis of such data various conclusions and recommendations are incorporated in this study.

1. WORLD SANITATION SCENARIO

As per the Global Health Observatory data repository 2015, Australia, Austria, Malta, Republic of Korea and Uzbekistan tops in the chart of sanitation facilities. These are all countries now open defecation free countries. These countries rural and urban households are having 100% latrine facilities. Niger is the lowest sanitation having country in the world with 10.9% followed by Togo (11.6) and Madagascar (12). Out of 193 (UNO) countries, 14 countries are having below 20% of the sanitation facilities. 20 countries are having below 25% of sanitation coverage, and 25 countries are having 25 to 50% of the sanitation facilities. Surprisingly out of 193 countries, 98 countries are having above the 75% of the sanitation facilities. Some of the countries like Peru, China, Myanmar, Colombia, Brazil, Mexico, Iraq, Turkey, Argentina,

Poland, UAE, Norway, France, Bahrain and United Kingdom of Great Britain and Northern Ireland, Belgium, Italy and Denmark countries having 75 to 99.6% sanitation facilities. And some of the countries like Spain (99.9), Switzerland (99.9), Canada (99.8), Portugal (99.7), and Denmark (99.6) countries are also having best sanitation facilities in the world. In Spain rural areas have 100% sanitation facilities whereas the urban areas have 99.8% sanitation facilities. Out of 193 countries 11 countries data is not available.

FIGURE 1: WORLDWIDE COUNTRIES % OF SANITATION COVERAGE-2015

2. SOUTH ASIAN COUNTRIES (SAARC)

South Asian Countries like India, Pakistan, Bangladesh, Sri Lanka, Nepal and Butan countries are sub continental country and Afghanistan and Maldives also come under the south Asian countries. In 1985, The South Asian Association for Regional Cooperation (SAARC) is established for improving (developing) economic cooperation among the eight countries.

FIGURE 2: SOUTH ASIAN COUNTRIES

SAARC started with 7 countries in 1985, added Afghanistan in 2006. South Asia covered 5.1 million sq.km. It covered 11.5% of the Asian continent area and 3.4% of the world land surface. The population of the south Asia is 1.749 billion people and have highest Hindu and Muslim population in the world. Overall the world it is having 24% of the population share. Among SAARC countries, India is the largest country in the context of area and the population followed by Pakistan and Maldives are having lowest area and population. The table 1 reveals that Maldives is have highest density of 1053 followed by Bangladesh (1033), India has 382 persons per sq. km area and lowest density at Butan 18.8 persons per sq. km. SAARC countries are performing very low HDI rankings in the world ranks. Sri Lanka (73) is the only country having below 100th rank in the SAARC members.

2.1 SOUTH ASIAN COUNTRIES SANITATION SCENARIO (SACOSAN)

South Asian Countries like India, Pakistan, Bangladesh, Sri Lanka, Nepal and Butan, Afghanistan and Maldives facing lot of problems due to lack of sanitation facilities. These countries are working on the sanitation issue. They established South Asian Conference on Sanitation (SACOSAN)*. It is a government led biennial convention held on a rotational basis in each SAARC country provides a platform for interaction on sanitation. SACOSANs are intended to develop a Regional agenda on sanitation, enabling learning from the past experiences and setting actions for the future. The objectives of such conferences are to accelerate the progress in sanitation and hygiene promotion in South Asia and to enhance quality of people's life.

FIGURE 3: PERCENTAGE AND RANKS OF SANITATION FACILITIES IN SOUTH ASIAN COUNTRIES

Asper the Global Health Observatory data repository 2015, Maldives (97.9) have highest sanitation coverage in the South Asian Countries followed by Sri Lanka (95.1). Only the two countries have above 90% sanitation facilities. The data shows that in Sri Lanka rural areas (96.7) have better facilities than urban areas (88.1). Two countries Pakistan (63.5) and Bangladesh (60.6) have reported more than 60% sanitation facilities. Butan (50.4), Nepal (45.8), India (39.6) and Afghanistan (31.9) have less than 50% sanitation facilities. Afghanistan provides least sanitation facilities in south Asia countries. India is the largest among

SAARC nation. It is having total 39.6% sanitation facilities in the country. Pakistan urban (83.1) area having some good facilities compare to the rural areas (51.1). Except Afghanistan, all countries of the South Asia are well performed than India. The figure 3 showing world ranks in Sanitation facilities also as per the data Sri Lanka (41) and Pakistan (61) having some better ranks in the World ranking. India and Afghanistan countries are having poor ranks with 150 and 155 respectively.

3. CURRENT SCENARIO IN INDIA

Some of the urban areas are having good facilities but rural areas people are still practicing open defecation. Since 1980's Indian government trying to remove open defecation and spend lot of efforts on it and many world organisations funded but still we are not reached 100% sanitation facilities in the country. First Government of India was launched Central Rural Sanitation Programme (CRSP) in 1986 and with the main objective of improving quality of life of rural people and also to provide privacy and dignity to women. Later on CRSP, another programme started Total Sanitation Campaign (TSC)". The main objective of the TSC is to eradicate open defecation in rural areas and to give subsidy to construct toilet that is under poor category. TSC gives support to schools and Anganwadis also. TSC gives strong emphasis on Information, Education and Communication (IEC). To give a fillip to the TSC, Govt. of India also launched Nirmal Gram Puraskar (NGP) that sought to recognise the achievements and efforts made in ensuring full sanitation coverage. Encouraged by the success of NGP programme the government renamed to TSC as 'Nirmal Bharat Abhiyan' (NBA). The objective is to accelerate the sanitation coverage in the rural areas.

SACOSAN*South Asian Conference on Sanitation (SACOSAN), a government led biennial convention held on a rotational basis in each SAARC country provides a platform for interaction on sanitation. The SACOSAN process is instrumental to generate political wills towards better sanitation in the region.

FIGURE 4: AREA WISE PERCENTAGE OF HOUSEHOLDS HAVING LATRINE FACILITIES IN INDIA

Recently the Prime Minister of India launched the Swachh Bharat Mission on 2nd October, 2014 which aims to achieve Swachh Bharat by 2019, as a fitting tribute to the 150th Birth Anniversary of Mahatma Gandhiji. The main objective of this programme is to remove the bottlenecks that were hindering the progress during the previous programs such as Total Sanitation Campaign and Nirmal Bharat Abhiyan and focus on critical issues affecting outcomes. State and Central Governments are aiming to construct latrines to the every household in the country. After launching the SBM (Gramin) within one year period nearly 95 lakh toilets have been constructed in rural areas. It is almost 46% of the toilet constructed since launching of the SBM (Gramin). In spite of the best efforts of the Government of India and respective State Governments' to improve the sanitation conditions in the country, the toilet coverage in rural India is only 30.7% which shows around 70% of the rural people still practice open defecation in the country.

If compare to the 2001 to 2011, the total country was not covered 63.6% and 53.1% respectively this means 36.4% and 46.9% of the households having latrine facilities within the household's premises. In the rural area, 30.7% and 21.9% households are having the latrine facilities respective period. In urban area covered more latrine facilities compare to the rural areas. Urban India households are having 81.4% (2011) and 73.7% (2001) latrine facilities within the

household's premises. As per the 69th NSSO Survey during the July 2012 to December 2012, 59.4% of the country rural households are defecating in the open. Jharkhand and Odisha households are doing 90.5% and 81.3% respectively. But As per the Global Health Observatory data repository 2015 data showing sanitation facilities are increased in India in terms of total, rural and urban areas. As per this data total India 7.3% sanitation facilities are decreased from 2011 Census to 2015. Mainly Rural areas sanitation facilities are decreased from 30.7% to 28.5%. Urban areas are data also showing the declining rate. The main reason is increasing the households and population of the country.

3.1 STATE WISE TOTAL SANITATION

India has 29 states* and 7 union territories. Sanitation facilities are very poor in some states where illiteracy, rural population and forest area are more. The country has an average coverage of sanitation 46.9%. 7 states have below country average they are like Jharkhand, Odisha, Bihar and Chhattisgarh, Madhya Pradesh, Rajasthan and Uttar Pradesh. Union territories have good sanitation facilities compare to the all the states of the country. As per the 2011 Census data figure 2 developed. The figure 2 shows total country wise sanitation facilities in the states. According to this map, out of 36 administrative province/states only 4 states have below 25% coverage in sanitation facilities like Jharkhand (22), Odisha (22), Bihar (23.1) and Chhattisgarh (24.6). Madhya Pradesh (28.8), Rajasthan (35), Uttar Pradesh (35.6), Andhra Pradesh (47.5) and Tamil Nadu (48.3) states (Only 5 states) are have 25 to 50% coverage in sanitation facilities

Out of 36 administrative province/states, 15 states are having 50 to 75% of the sanitation facilities. These states (except Telangana and Haryana states) located in the edges of the country boarder. Almost 40% of the states (15 states) are having 50 to 75% of the sanitation facilities.

***State means:** According to Article 12 of the Constitution of India, the term 'State' can be used to denote the union and state governments, the Parliament and state legislatures and all local or other authorities within the territory of India or under the control of the Indian government.

Three states from north eastern such as Assam (64.9), Meghalaya (62.9) and Arunachal Pradesh (62) are having above 60% of the facilities and North states like Himachal Pradesh (69.1), Haryana (68.6), Uttarakhand (65.8), and Jammu and Kashmir (51.2) are also having good facilities compare to the South and Western side states. Western part of the country states like Gujarat (57.3) and Maharashtra (53.1) and southern states such as Telangana (52.5) and Karnataka (51.2) states are have good facilities.

Total 12 states are having more than 75% of the sanitation facilities in the country. Kerala state has highest sanitation coverage with 95.2% followed by the Mizoram (91.9). Delhi, Manipur, Sikkim and Tripura states are having 70 to 80% of the facilities. Four north eastern states have above 75% of the sanitation coverage; these states are covered with hills and low population due to these reasons the coverage is more. Sikkim (87.2) and Punjab (79.3) also having coverage in the country.

FIGURE 5: STATE WISE TOILET COVERAGE IN TOTAL INDIA

3.2 STATE WISE URBAN SANITATION

Urban India has better sanitation facilities compare to the rural India. As per the Census 2001, 26.3% households were not having sanitation facilities were as in 2011 it decreased to 18.6%. In

India out of the 7.88 crores urban households, 82.4% households are having sanitation facilities. In all states urban areas have more than 60%.

The figure 3 is developed based on 2011 Census data. The figure shows that all in states, urban areas are having best sanitation facilities. Among the states, the sanitation facilities are lowest in Chhattisgarh with 60.2%. Out of 36 administrative province/states, 6 states are having 50 to 75% of the sanitation facilities they are Orissa, Jharkhand, Bihar, Maharashtra and Madhya Pradesh. All other 30 states have above 75% of sanitation facilities. In 11 states households are having above 90% of the sanitation facilities. Mizoram state is having maximum coverage in sanitation facilities with 98.5% followed by Tripura (97.9), Kerala (97.4), Manipur (95.8), Meghalaya (95.7), Sikkim (95.2), Nagaland (94.6), Assam (93.7), Uttarakhand (93.6), Punjab (93.4) and Telangana (90). Out of 11 states, 6 states are from North Eastern area of the country. Among Indian states 12 states have 80 to 90% of the sanitation coverage. This includes Haryana, Arunachal Pradesh, Himachal Pradesh, Gujarat, Jammu & Kashmir, Goa, West Bengal, Karnataka, Uttar Pradesh, Andhra Pradesh and Rajasthan states. Tamil Nadu state is also having above 75% of the facilities.

FIGURE 6: STATE WISE SANITATION COVERAGE IN URBAN INDIA

3.3 STATE WISE RURAL SANITATION

Comparatively, Rural India has poor sanitation facilities than urban India. As per the 2011 Census, rural India have 16.78 crores households out of them 69.3% household doesn't have sanitation facility within the household premises. The ministry emphasized on the need for innovative thinking to stop the old practice of open defecation and the ministry report saying the many states like Chhattisgarh, Madhya Pradesh, Arunachal Pradesh, Karnataka, Sikkim, Manipur, and Meghalaya have been at the forefront of the mission for construction of rural areas and they were likely to achieve targets in the next 1-2 years. Changing age-old attitudes toward open defecation is critical in attaining 'Swachh Bharat' goals and the sanitation. The target of the first one year is 60-65 lakh but total 95 lakhs toilets have been constructed in the rural areas under the 'Swachh Bharat' mission.

As per 2011 Census, Out of 36 states, 14 States are in the country is still below the national average (30.7%) of toilet coverage. Out of 36 states only 8 states like Lakshadweep, Kerala, Chandigarh (88%), Manipur (86%), Mizoram (84.6%), Sikkim (84.1%), Tripura (81.5%) and Delhi (76.3%) having above the 75% latrine facilities. Total 11 states are falling 50-75% range. Goa, 71% rural households having the latrine facilities, Punjab is also maintain same percentage (70.4%) other states like Nagaland (69.2%), Himachal Pradesh (66.6%) and Andaman (60.2%) states are having above the 60% latrine facilities. Assam, Haryana, Uttarakhand, Meghalaya, Arunachal Pradesh and Daman Diu states are having 50 to 60% latrine facilities. Total 17 states are having below 50% of the sanitation facilities in the country. West Bengal only has 46.7% latrine facility and other states such as Puducherry, Jammu & Kashmir, Maharashtra, Gujarat, Andhra Pradesh, Karnataka and Dadra Nagar Haveli states are having 40-50% facilities.

FIGURE 7: STATE WISE TOILET COVERAGE IN RURAL INDIA

Maharashtra (38%), Gujarat (33%), Andhra Pradesh (32.2%) and Karnataka (28.4) states are well advanced situation in all other indicators but availability of latrine facilities is very poor and states are having above the country average. The lowest coverage states like Jharkhand (7.6),

Madhya Pradesh (13.1%), Odisha (14.1%), Chhattisgarh (14.5%), Bihar (17.6%), Rajasthan (19.6%), Uttar Pradesh (21.8%) and Tamil Nadu (23.2%) states are having below 25% of the latrine facilities within the household's premises.

CAUSES OF THE BACKWARDNESS

- More density of population and low infrastructure facilities also cause to low coverage
- Lacking of sufficient water also influence to the increase of the sanitation facilities.
- States having more rural population and these are the one of the most backward states in the country. Main Reason is Illiteracy and more rural and tribal population.
- Forest also one of the causes of the open defecation. Availability of the more open space also a reason.
- Levels of the understanding the situation is very poor due to more tribal population.
- Illiteracy is the one of the main causes of the backwardness of the progress in the latrine facilities.
- Lack of Funds in all states leads to inadequate infrastructure
- Geographically some of the lowest coverage states are not suitable for construction of the toilet due to having dense forest and not growth in urbanisation.
- One of the important reasons for people not interested to construct the toilet is problems in availing the government incentive system due to lack of effective monitoring systems.
- Some places people are not using community toilets because of the unsafe for girls or women's. Some issues (rape and Murder) happened in Uttar Pradesh state in May 2014.
- Low latrine coverage due to illiteracy and more rural and Tribal population and lack of awareness about the sanitation facilities.

SUMMARY AND RECOMMENDATIONS

Out of 8 South Asian countries, 5 countries are having above the 50% of sanitation facilities. Other three countries are having very low sanitation coverage. Maldives and Sri Lanka countries are having top position in the SAARC. Afghanistan country is having lowest sanitation coverage. Only Sri Lanka and Pakistan countries are having below 100 ranks in the world sanitation ranking. SACOSAN is working on the sanitation to change the situation in the SAARC membership countries. SACOSANs are intended to develop a regional agenda on sanitation, enabling learning from the past experiences and setting actions for the future in the 6th conference which held in Bangladesh, January 2016 in Dhaka.

India also having just 46.9% of the sanitation facilities and it has 121 crores population. The country is facing lot of problems to facilitate to all people is a big challenge to Indian government. Recent studies are showing around 6 crores people in the country still practices open defecation due to lack of toilet facility. Water supply and sanitation is a State responsibility under the Indian Constitution. The government developed lot of programmes to poor people to eradicate open defecation in the country but lack of proper implementations of these programmes are not touched to the poor people. After launching Swachh Bharat Programme lot of changes are happened across the country. It may increase the sanitation coverage in the households.

Overall the country, more sanitation facilities are observed in the North Eastern states of the country. Jharkhand and Odisha states are having lowest coverage in the country. All states urban areas are having good sanitation facilities in the country but compare to the national average only eight states are having below country average. Whereas the rural India, northern part states are having good latrine facilities compare to south, West and Eastern states of the India. Union Territory states also having some better facilities within the household's premises. Indian capital city (New Delhi) surrounding states rural households are having some better conditions and new born Telangana state also having below the country average.

Lowest coverage states are requires not just building lavatories but also changing habits. In all states rural people do in the morning and night time monitoring in the open defecation fields and it will gives good result and eradicate open defecation in rural areas. Countries or States are needed instead are public campaigns, in schools and in the media, to explain the health and economic benefits of using toilets and of better hygiene.

ABSTRACT

In the context of information and communication changes, the problem of intercultural and interethnic stability in the multicultural space of a digital society is the most important task of philosophy, sociology, cultural studies and other areas of scientific knowledge and empirical research. Unfortunately, today the process of unification has affected almost all spheres of human life, which naturally negatively affects the preservation of national identity.

KEYWORDS: *National Identity, Language, Japan, Uzbekistan, Nation, Loss Of The National Language.*

INTRODUCTION

In this study, the language is presented not only in socio-cultural processes, but in the conditions of an open cultural space, the susceptibility of language to a powerful transformation is shown, during which there is a rapid borrowing of words from a foreign language. The structure of modern society in the context of integration is rapidly changing, the dialogue of cultures is growing, cooperation with international organizations, as a result, the borrowing of the English language in the educational, business or cultural sphere occurs. Terminology used in cooking, education, engineering, sports, fashion, etc. became international. In particular, interest in linguistic globalization has increased. The term “linguistic globalization” or (globanglization) represents the rapidly evolving process of interpenetration of languages, the borrowing of foreign words, and an increase in the number of Anglo-Americanisms. In such conditions, the universalization of linguistic forms is taking place, which is a direct consequence of the formation of the national information and economic space [1, p. 45]. In addition, the problem of

depletion of vocabulary (creolization) leads to the loss of fundamental foundations, turning the language into a “substitute”. This process leads to the de-structuring of the language and the loss of identity. In this regard, the question arises about the importance of language in the formation of national identity. The study of identity (formation, boundaries) is necessary to understand the features of the dialogue of cultures in the context of globalization.

THE MAIN FINDINGS AND RESULTS

Considering language in the context of the theory of communicative action, Y. Habermas emphasizes the special role of language not only in preserving the social norm, but also in ensuring that a person conforms to this norm, due to which the socio-cultural interaction of individuals is carried out while maintaining the spiritual and moral foundations of relations between people. “A person's understanding of himself depends not only on how he describes himself, but also on the models that he follows. Self-identity “I” is determined simultaneously by how people see themselves and how they would like to see themselves” [2, p. 7].

Primordialists argue that peoples who have lost their ethno-culture and their historical language experience the painful experience of being “between life and death”. Together with the loss of the language, they lose their established ideas about morality, the significance of the past, present, and future. Constructivists continue to predict the coming of “a brave new world of single markets and closely related mega-values, mega-cultures and mega-languages” [3, p. 120]. Researcher E. Bertolazi notes that the unity of the state is expressed primarily through communication in one language, i.e. “One language - one culture” [4, p. 8].

In this context, we are closest to the statement of E. Bertolazi, language as an element of reproduction of certain information carries historical memory, cultural and literary heritage and serves as the main means of communication for each nation.

Language as an indicator of identity, when one speaks the “native language”, a certain way of thinking is formed. As a consequence, certain “mentality” and “national character” are associated with the respective languages [5, pp. 55-56]. In accordance with this, we define that the “native language” determines the way of thinking, social behavior, display or control of feelings and emotions. In this case, the comparison of languages turns into a comparison of mentality and national characters. From the above, we can conclude that it is the language that creates the differences between different societies, groups, ethnic groups, peoples, nations.

The language captures the cognitive experience of the people, its moral and ethical, social and aesthetic, artistic and educational ideals. The language keeps the history of the civilizational development of the people. It reflects national characteristics, accepted and maintained from generation to generation norms of relations with other people and standards of social behavior, communication with other peoples. The language has absorbed the peculiarities of the attitude of the ethnos to the surrounding reality, its perception in the system of values and assessments, and the motivation of behavior [6, p. 34]. In addition, language provides communication links in the synchronic and diachronic planes, that is, both within one generation and between them. That is, one of the main mechanisms for the consolidation and transfer of knowledge, social experience, cultural achievements, and norms of human behavior and is the main means of preserving ethno-cultural identity [6, p. 36]. Speaking about the relationship between language and culture, it is necessary to refer to such a concept as a picture of the world. Today, the linguistic picture of the world is existing and transmitted using verbal symbolic means, i.e. language and symbols, a

conceptual (scientific, religious, philosophical) picture of the world, formed on the basis of the accumulated historical and cultural experience of the people, which allows us to consider it in a cultural aspect [6, p. 47].

Each new generation, each representative of a certain ethnic group, learning a language, is included in a historically defined system of social relations, joins collective experience, collective knowledge about the surrounding reality, generally accepted norms of behavior, and sociocultural values [6, p. 48]. O.A.Kornilov claims that the linguistic picture of the world “captures the perception, comprehension and understanding of the world by a specific ethnos, not at the present stage of its development, but at the stage of language formation, that is, at the stage of its primary, naive, pre-scientific knowledge of the world” [7, p. 15], where the image of the world is reflected in the everyday consciousness of native speakers through the semantics of linguistic categories, thus the worldview of the people is carried out through the prism of language.

Nations in the modern world can be equated with "linguistic nations" consisting of people speaking the same language. In turn, the language provides access to the national cultural tradition. Together with its linguistic “shell”, its semantic “filling” is also being mastered - cultural traditions, value attitudes, ideals, norms of thinking and behavior, etc. adopted in culture. Language is not only a powerful means of expression, communication, socialization of a person, his introduction to culture, but also one of the main features of a nation and national identity. The loss of a national, unique language is identical to the loss of national identity as a whole. Language as a living organism and a basic element of culture, it becomes an object and means of transformation, sensitively reacts to all kinds of influences [8, p. 54].

Based on the above, we can conclude about the relationship between language and national self-awareness, the mentality of both an individual and the nation as a whole. The basic functions of the language together provide a unique property of the design of information received by a person, its storage and retransmission. This serves as the main mechanism for communicative interaction, reproduction and transmission of historical, social and cultural experience to future generations.

In this context, let us consider the role of language as the main mechanism for protecting national identity using the example of the Japanese and Uzbek peoples. The main impetus for the formation of the Japanese language was the Chinese writing, texts, philosophical and historical chronicles and vocabulary. Sh. Watanabe extols “the irrationality of the Japanese language, which is impossible for foreigners to comprehend” [9, p. 9]. The thesis of the Japanese researcher Sh. Watanabe that the Japanese language has a completely unique spirit and confirms the exclusivity of the Japanese people and Japanese culture in the world. The ambiguity of the Japanese language is a prime example, reflecting the peculiarities of the culture of the Japanese people.

Today, the Japanese language is considered popular and in demand, it is complex and multifaceted, mysterious and interesting, especially among the younger generation. It is important for the Japanese to preserve their language, since this is directly related to ethnicity. It is very indicative that on the basis of the hieroglyphs, the Japanese alphabet appeared, used in two versions –“hiragana” and “katakana”, reflecting only sounds, but not having the image that is embedded in the hieroglyph. The contextual nature of the language influenced the formation of

the national character and developed such qualities inherent in the Japanese people as collectivism and the ability to cooperate. The flexibility of the hieroglyph always leaves it simply for the interlocutors; they have the opportunity to talk about the same thing in different ways, while retaining the possibility of dialogue. In Japan, hieroglyphics are considered the main part of national identity and, despite the fact that the reproduction and translation of knowledge of hieroglyphs requires the use of colossal mental and cultural resources, the transition to the alphabetical system is seen as disastrous for the Japanese nation. This attitude to the word in Zen culture and Japanese culture in general contributed a lot to the hieroglyphic structure of writing, which prompted the Russian sinologist V. M. Alekseev to introduce the concept of “hieroglyphic thinking”: “The Japanese ... thinks hieroglyphically and admires everything that hieroglyphics gives original, irreplaceable (hieroglyphics is a picture, a picture is assimilated differently than talking about it)” [10, p. 205]. Currently, Japan, considering the issues of language policy related to the spread of the Japanese language in the world, is developing special programs for teaching the Japanese language, conducting large-scale studies of the Japanese language aimed at improving the language so that the modern Japanese language meets all the challenges of the global world, while maintaining individual traits [11, p. 442].

In this regard, Japan is pursuing a certain foreign language policy of “soft power” [12], trying to preserve the viability of its language, which could meet the modern challenges of the global world. The soft power of Japan is based on the image of a mysterious, hospitable, spiritual country, which is the embodiment of grace, beauty, wisdom, with an ancient culture and centuries-old traditions. One of the main tools for the implementation of “soft power” is the dissemination of the Japanese language and culture in order to show the historical significance of Japan for the world heritage and stimulate the interest of other countries in the depths of the Japanese language.

Speaking about the meaning of the Uzbek language in the modern world, it is defined as follows: it is the national language of the Uzbek people, which includes all the variety of lexical and grammatical means, having dialects of different regions. The Uzbek language began to form on the basis of the Karluk-Chigil group of the Turkic language family.

There were three main dialects - Karluk, Kipchak and Oguz. At the turn of the XI-XII centuries. The Old Uzbek language began to separate from the Old Turkic and developed during the subsequent historical development. The most ancient (VIII-X centuries) were the Karluk and Oghuz dialects. Historically, the Old Uzbek language in various scientific sources was called differently – “Turks”, “Turkic language”, “Chagatai language”, “and Chagatai-Turkic language”, “Sart language”.

In the second half of the 11th and during the 12th century, the Uzbek language separated from the ancient Turkic and continues to develop and improve as an autonomous language. At the time of Amir Temur and the Temurids, the Uzbek language was called the “Turkic language” [13, pp. 107-139], the “Chagatai language” [14, p. 42], and in Soviet linguistics it was called the “Old Uzbek language” [15, p. 464]. According to Professor Sh.Madaeva, the development of the Uzbek language can be divided into five main stages: 1) sources of the 15th century; 2. the period of Chigatai literature; 3. the period of Jadid literature; 4. the period of Soviet literature; 5. literature during the period of Independence. These five periods include periods of progressive and regressive formation of the Uzbek language [16, p. 108].

A great contribution to the formation and development of the ancient Uzbek literary language was made by Alisher Navoi as a great thinker, writer, great poet and linguist. His creative, scientific and practical activities gave the Uzbek language the status of an official language both in state affairs and in poetry. He revealed the unique possibilities and charm of the Uzbek language, and in his scientific works, as a major linguist, he analyzed the ways of its development. Alisher Navoi, became “the poet of all the peoples of our country” (N. Konrad), “master of the Uzbek word”, “sultan of poetry” (V. Zakhidov) - statesman and public figure, poet, composer and scientist [17].

Indeed, the language of Alisher Navoi is the language of an entire era, the literary language of an entire people. Just as Alisher Navoi founded the Uzbek literary language in the 15th century, the literary language he founded was used not only by the Uzbek people, but throughout Central Asia and some other Turkic peoples. In the work “Khazoyinul Maoniy” (Treasury of Knowledge), “Hamsa” (Five) demonstrated the refinement and splendor of this language. At the same time, in the scientific treatise “Muqakamat al-lughatayn” (The Dispute of Two Languages), he substantiated the phonetic, lexical and grammatical development of the Old Uzbek language, comparing the Old Uzbek language with Persian, which is in no way inferior to Persian and proved that his native language is a language fiction [18, p. 4].

During the period of creation of the Jadid enlighteners, at the end of the 19th - at the beginning of the 20th centuries, the Uzbek literary language manifests itself in some normative difficulties. At this stage, firstly, socio-political problems, secondly, educational and educational problems and problems of enlightenment, thirdly, complex theoretical and practical problems such as the national language, attitude to the literary language, adaptation of the language to the requirements of the time, the definition of its path of development as a national literary language formed a kind of collapse of common problems [19, p. 37]. Taking a short excursion into history, the first newspaper in the Uzbek language began to be published under the name “*Turkiston viloyatining gazetasi* - Turkestan regional newspaper” in 1892 in Tashkent. In the newspaper, the main importance was attached to oral speech, new turns, and expressions taken from various Turkic dictionaries. Another very popular publication in Uzbekistan was the “*Yer Yuzi magazine*” - Around the World, which was edited by Chulpon. The great Uzbek poet Abdulhamid Suleiman - Chulpon put forward a fiery motto: “As long as literature is alive, the nation lives!” [20, p. 7].

An important place in the formation of a new ethnic identity was assigned to the Uzbek language. Universal compulsory primary and then secondary education, the development of a higher education system in the native language, the development of printing, mass periodicals, radio broadcasting, television expanded the sphere of functioning of the Uzbek language, determined its formation as a single language of all groups of the population, contributed to overcoming significant differences in local dialects. After gaining independence, education in Uzbekistan was proclaimed a priority direction of the state policy. Uzbekistan is a multinational state, it included 130 nations and ethnic groups, and the Uzbek language serves as a means of communication between representatives of different nations and nationalities living on its territory for many reasons. The popularization of the Uzbek language in modern Uzbekistan is part of state policy. In the process of educational renewal taking place in the country - on the occasion of the Day of the holiday of the Uzbek language, President Shavkat Mirziyoev noted:

“The life-affirming power of our national language serves as an important support for us in building a new Uzbekistan, forming the foundation of a new Renaissance” [21].

In our country, which is confidently moving from national revival to national progress, in recent years, large-scale work has been carried out to improve the status and prestige of the Uzbek language as a state language. The adoption on the eve of the holiday of the decree of the head of state “On the wide celebration of the 580th anniversary of the birth of the great poet and thinker Alisher Navoi” and the Decree of the President of the Republic of Uzbekistan “On measures to radically increase the role and authority of the Uzbek language as the state language” [22] was an important step in the implementation native language development initiatives.

CONCLUSION

In conclusion, we can state that, firstly, language is an important component in the process of formation and development of national identity; secondly, language is understood as a product of self-identification and construction of the nation as a whole; thirdly, the language expresses cultural and value features that make up the basis of the nation and ethnos. Language is a powerful mechanism for uniting a nation and contributes to solving the problem of preserving national identity at the turning point of the formation of a new world order.

FEATURES OF A COUNTRY HOUSE IN HOT COUNTRIES

Makhmudova M.T*

*Associate Professor,
Department of "Design",
National Institute of Arts and Design named after K. Behzod,
UZBEKISTAN

ABSTRACT

The construction of summer terraces is becoming more and more relevant to which little attention has been paid so far. Examining the content of the article, this document tries to reveal the importance of summer terraces for a country house in a hot climate, examples from world practice are given. The architect must solve not only the issues of aesthetic value - think over the style of the facade and interior, but also the functionality of buildings is one of the main tasks. The new trend naturally led to the renewal of architectural and planning solutions.

KEYWORDS: *Summer terrace, Country house, Country house in hot countries, Design, dwelling house, Country house, Open terrace, Gazebos, Verandas.*

INTRODUCTION

A residential building can be: a mansion, a villa, a manor, a cottage. The most popular group of buildings of this type should be considered a country house, which may not have communications, located in the suburbs or isolated from other residential buildings. A cottage is a residential building with one or two floors, the second can be of an attic type (Makhmudova M. 2020). A mansion, in principle, can resemble a cottage. The design of a country house reflects not only the social status of the homeowner, but also his character and tastes. Villas, as well as country houses, are intended for seasonal use during summer vacations and holidays. The manor is an analogue of a mansion; in addition, the manor necessarily has additional buildings: gazebos, a park, a pool, possibly located next to a forest or a lake [1].

The first impression about a house is formed by its facade. Therefore, the design of the exterior of the house and the cottage is of great importance. A country house can be built from various materials: brick, wood, concrete blocks and other building materials.

The architect must solve not only the issues of aesthetic value - think over the style of the facade and interior, but also the functionality of buildings is one of the main tasks. The new trend naturally led to the renewal of architectural and planning solutions.

MATERIAL AND METHODS

The creation of the design of the facade and interior of a country house is a difficult task that requires professional skills. When arranging suburban house, it is necessary to take into account not only the area and configuration of rooms, but also the size of windows, landscape design of the territory of a country house, the height of the ceilings and many other factors [2].

The style concept of the design of a country house largely depends on whether the house is a guest (country house) or an apartment for permanent residence. In the first case, you can safely experiment with shades, styles and decorative elements. If the country house is for permanent residence, color contrasts and an excessive amount of detail can cause discomfort.

The style in which the design of the cottage will be made should not only correspond to the tastes of the owners of the house, but also harmoniously fit into the overall landscape so that the house is not like the others, has its own bright personality and the unique exterior of the renovated mansion is in harmony with the surrounding environment.

When creating a design of a country house in a modern style outside, one should take into account current trends, comfort and keeping up with the times. At the same time, the choice of a modern style for decorating a country house implies ample opportunities for implementation. This style direction can be combined, for example, with elements of classic, modern, minimalism or hi-tech, etc. Each new version will have its own individual features that form a stylistic unity.

The main trend of modern architecture is the creation of the most comfortable environment for life. This is achieved due to functionality, competent organization of space, aesthetics, emotionality, efficiency and care for the environment [3].

For example, when developing the exterior of a country house in the style of minimalism, it is advisable to use natural materials for finishing the facade of the house: wood, stone. But glass is also widely used, which gives airiness and lightness to structures, one of the main features of modern minimalism.

The design of a modern country residence today is rarely limited to the development and implementation of a design project of only one building. As a rule, there are several other buildings adjacent to a private house: gazebos, verandas and other structures. Buildings executed in the same style, along with landscape design, form a complete architectural ensemble.

Many people dream of a luxurious house that will be spacious, stylish and modern, possibly with a beautiful patio and pool, panoramic windows and several terraces. The terrace is not only present in every home, but also occupies a significant size, especially in hot regions such as Uzbekistan. There is often a terrace on the first and second floor (as an exploited roof), or terrain features are used to create multi-level terraces. A summer terrace with an open-air pond for summer residents is a great place for active outdoor activities, enjoying the landscape design and the landscape of the mountainous area

Open spaces, natural light, lightness of glass forms in the architectural world are trends that will never become obsolete.

Glass House (Farnsworth House), USA. Illinois, 1946-1951 Arch. Mies van der Rohe. General form

For example, in 1950, Mies van der Rohe designed a house that became an extreme expression of transparency and dissolution in the surrounding nature - a "crystal box". It was Farnsworth House, a riverside house a few miles from Chicago. The house consists of three elements: an open area raised above the ground, a covered terrace and a single glazed living space. The closed core of the house (bathrooms, kitchen niche) is sheathed with precious woods (Anisimova I.I. 2009).

Large bay windows are both a source of natural light for the interior and a design feature of the facade of a country house. This detail creates the illusion of a glazed veranda, making the facade and interior more festive and light.

Country house with panoramic windows

Glass is a tool used by an architect to control light and neutralize the heaviness of a building. Glass doors, partitions, large floor-to-ceiling windows erase the boundaries of the building, expanding the space.

So, for example "House above the waterfall" (architect F.L. Wright, 1937) is a house for summer vacations. The main compositional motive of the villa was the contrast between the rusticated surfaces of the vertical volumes, the light, floating in the air planes of the cantilever terraces and the transparent weightlessness of the horizontal glazing. Cantilever ribbed reinforced concrete slabs rested on the peeled walls of the base, the removal of one of the terraces above the level of the stream was about 5.5 m. From the terrace you can go down the stairs to the waterfall [1,4].

“House over the waterfall”. Arch. F.L. Wright, Bear Run, USA, 1937

While decorating an open terrace, you can show all your imagination and use the most unusual materials for its arrangement. But of course, plants play the "main violin" in the design of an open terrace - they can be used to decorate the building and give it a unique look. The cobbled summer terrace, decorated with plants and different flowers, can be a great place to relax for years to come.

Villa Savoy Arch. - Le Corbusier, Poissy, France, 1929 - 1930. General form

So in the Villa Savoy (Arch. Le Corbusier, Poissy, France. 1930), a significant part of the residential floor of the house was occupied by an open terrace, flowing into the living room space thanks to continuous glazing, the roof was a terrace with a garden, which, according to Le Corbusier, returned to the city greens taken away by the volume of the house. (Anisimova I.I. ; 2009. Getashvili N. 2004).

Arch. - Le Corbusier, Poissy, France, 1929 - 1930. Terrace

An open terrace located under a canopy is a feature characteristic of houses located in areas with a warm climate. This feature has become characteristic of the design of Italian-style country houses and cottages on the outside. On the semi-open terrace under a canopy, you can comfortably relax in the summer. The interior of a villa or a country house can be expanded with adjoining areas and terraces - dining and living rooms in the open air.[6,7]

Villa Savoy Arch. - Le Corbusier, Poissy, France, 1929 - 1930. Terrace

The presence of a terrace and large windows blur the border between the house and the environment, further bringing people closer to nature. The summer terrace today is a continuation of the living room. One of the key principles used by architects when designing country houses is that living space flows seamlessly into the exterior.

The fully enclosed terrace is a structure with walls and a roof. It can be adjacent to the main building, or it can stand alone. The advantages are obvious: rain and wind will not spoil your mood; an excess of sunlight is also not threatened, but the lack may well be felt.[8,9]

To avoid stuffiness, window openings in the closed terrace (veranda) can be left empty. Thus, the breeze will blow over you, and all the smells and sounds of the country will contribute to relaxation.

The best option is a glass sliding facade, which makes it easy to feel “in the air” and also quickly isolate. In such an extension, you can safely place expensive furniture and accessories: in the event of a sudden rain or departure, you will not have to bring them in or cover them with foil. All three walls surrounding the terrace can be sliding. In this case, the glass walls go up like a garage door. Terraces and balconies can be enjoyed throughout the year if positioned correctly.

Sometimes in a country house, technically, a terrace is used - this is a platform raised above ground level, most often - flooring on a concrete base. It can be with or without a roof, fenced or not, flat and multi-level, separate and adjacent to the house. A country house with a terrace immediately becomes more comfortable and attractive. Also, due to the flooring, you can increase the usable area of the house. Here you can equip: a lounge area with sofas and armchairs, which can play the role of a summer living room; a place for meals with a large dining table; summer kitchen or barbecue area; a relaxation area with swings, sun loungers or a hammock.

Technically terrace

If you have an open space, however small, you can place mobile ovens to combat the cold. If you want to get more light and a more airy terrace, a transparent roof will be a good solution.

Vegetation can also play the role of a visual barrier on a terrace without walls. If you do not erect a railing, you can create the impression of a secluded area in a dense thicket.[10]

Terrace with a transparent roof

You can do without green spaces altogether. A thick lattice is a self-sufficient decor and a good fencing. It will serve as a visual barrier not only from above, but also on the sides. The sun's rays will reach you unhindered, and you will be inaccessible to prying eyes.[11]

CONCLUSION

A beautiful country house is always a combination of a spectacular facade, an attractive interior and a refined landscape, as well as a high quality of the completed project.

The study of historical experience helps to understand the prevailing trends in the design of individual dwellings in world practice and to determine how much the world experience is suitable for modern domestic conditions. The owners of such houses want to get away from the monotony of ordinary houses, to self-identify due to the uncommonness, originality of the author's solution, which gives the prospect for the further development of this housing sector, which is important for the general intellectual level of society.

ON THE PROBLEM OF PRESERVING THE ECOLOGICAL PURITY OF THE LANGUAGE IN THE LINGUOCREATIVE MEDIA SPACE

Mokhinur Ibrokhimova*; **Timur Alimov****

^{1,2}Lecturer,

Department of Methodology of Russian Language,

Ferghana State University, Ferghana,

UZBEKISTAN

ABSTRACT

The close relationship of the ecology of nature and the ecology of language as part of culture revived a new term and a whole direction in modern linguistics associated with it - ecolinguistics, which, in turn, was introduced into scientific circulation by the American linguist Einar Haugen [2, p. 87]. Being the founder of the concept of ecology of language and the founder of the theory of ecology of language, Haugen in 1970 defined the ecology of language as a science that studies "interactions between any language and its environment, environment", while the environment (environment) is understood as "a society that uses language as one of its codes" [5, p. 73]. There are also a number of other conflicting opinions on the correlation of the authorship of this term and even the correlation of the terms "ecolinguistics", "ecology of language / languages", "linguistic ecology" and "linguoecology" / "linguistic ecology". As a rule, these terms are used as synonymous, but attempts are made to differentiate them [3, p. 65–71].

KEYWORDS: *Ecolinguistics, Discourse, Creativity, linguoecology, linguoecology.*

INTRODUCTION

The term "ecolinguistics" is used to refer to all areas of research that link ecology to linguistics. This is how Alvin Phill defines it, and after him other scientists. According to Alvin Phill, "the ecology of language (s) examines the interaction between languages (with the aim of preserving linguistic diversity)"; "Environmental linguistics uses the methods and principles of ecology to

learn a language (for example, the concept of an ecosystem)"; "Linguistic (linguistic) ecology studies the relationship between language and environmental issues".

DISSCUSION

It is advisable to consider the object of ecolinguistics such manifestations of linguistic signs or units in which identical features of independent disciplines such as ecology and linguistics are clearly indicated at the junction of the general laws of their existence. Various aspects of the functioning of languages and discourses in their social and natural environment are considered to be the subject of this direction.

At the present stage of the development of media discourse, an important role is played by the problems of linguistic creativity, which in turn affects linguistic ecology. The tendency of the formation of new words, terms and related concepts does not always obey the traditionally accepted linguistic laws of a particular language. Sometimes there is even a clear contradiction of new formations with the basic structure of the whole word-formation system. But nevertheless, adequate perception of the lexical form of new words unusual for language and widespread use, in particular in the media space, "fixes" it so much in the minds of speakers and listeners that they gradually begin to acquire the meaning of a norm. In this sense, as a reverse process of this phenomenon, the disappearance of the eradicated classical forms of words due to their "displacement" as a result of the results of linguistic creativity is also observed. If we consider the language as a reflection of the soul of the nation, the traditions of the people, the primary factor in the awareness of its originality, the issue of preserving the ecological purity of the language becomes especially relevant.

According to scientists, in order to counteract the negative tendencies of word use and search for ways to enrich and improve speech communication, it is necessary to study the ecology of the language. The term "greening" was introduced, which in relation to linguistics is gradually spreading and clarifying in Russia. In practical terms, greening is closely related to language policy. A language policy is necessary to preserve the moral and spiritual values imprinted in the language, which at the present stage of the country's development are beginning to degrade due to the penetration of foreign words into our language and the borrowing of elements from other cultures. A necessary requirement for the development of a language should be the unity of the people, who would like to preserve their culture, morality, spiritual values, because language is the most important means of national identification: belonging to a nation is determined by what language a person speaks.

At the moment, due to the expansion of technical capabilities in communication and their features of functioning, there is a tendency to replace verbal communication with sign, or non-verbal. The social characteristics of the language change somewhat; increasingly, the author's neologisms, slangs, jargons are adjacent to a number of literary words. Understanding the process of formation of this kind of words will help to identify the reasons for such a wide use of them in the speech of native speakers. So, the formation of the dictionary of the so-called "systemic" slang - occurs at the expense of the same sources and means that are characteristic of language in general and Russian in particular.

1. On the first place in terms of productivity are foreign-language borrowings, and, almost exclusively - English-language borrowings. Only two Spanish were recorded (to be proud - "to

get fat" and fumarite - "to smoke"), two German (Bundes, Bundes - "Germans from FRG", "West German" and Kind - "child") and one Finnish (yux "one

Ruble ") Having appeared in such a grotesque guise, the borrowed slangism immediately actively enters the system of inflection: girl - girls, girls, street - to street, perent - with perent, zipper" lightning "- zipper, byte" white "- byte. to note that some foreign words, long assimilated by the Russian language, seem to be re-adopted in a different meaning (and sometimes with a different stress) and already in this meaning form derivatives: record (record) - "gramophone record"; record - "plate"; rally - "meeting"; meeting - "to meet"; ring - "phone"; ring, triganut - "call on the phone", ring - "notebook with phone numbers"; speech - "conversation"; to speak, to speak - "to talk". The leading place in the social networks of young people is occupied by the use of neolexics. Stable phrases and special words were the result of the functioning and their use when communicating in the virtual world [1, p. 114].

2. Affixation, as a means, is very productive and with primordial Russian roots: ottyag - "pleasure", to be delayed - "to receive pleasure, indulge in fun; pin up - "pay attention, cling, mock, get carried away"; joke - "something that you can laugh at, what you can get carried away with"; prankster, prank - "one who loves to find fault, joking at someone "; cool - " funny, interesting "; cool - " fun, original".

3. The next powerful source of the formation of the lexical composition of slang is metaphor. Here are metaphors proper (such as pussy - "narrow triangular dark glasses", zagolyak - "complete absence of anything", extinguish - "kill"), and metonyms (such as hairy - "hippies").

In metaphor, there is often a humorous interpretation of the signified. As an example, let's call metonyms: splevich - "ephedrine, a medicine for the common cold, which is used as a narcotic drug"; shaggy - "bald"; or metaphors with an ironic connotation a basketball player is a "short man".

Compared with the three named (foreign borrowing, affixation and metaphor), the share of other sources of the formation of the lexical fund of youth slang is insignificant.

4. Borrowing thieves' argotisms: lawlessness - "complete freedom, revelry"; ksiva - "documents"; wet - "beat, kill".

5. Development of polysemy: to throw - "to steal something from someone, take something from someone and not give it back, cheat when making a deal, do not keep a promise, deceive"; nishtyak - "everything is all right, it doesn't matter! it is irrelevant! not bad, passable, excellent "; "Please" - "okay, agreed".

6. Antonomazia (proper noun as a common noun): Levis, Louis "jeans"; Masha, Natasha - "girl"; listening to Mendelssohn - "to be present at the marriage ceremony"; to drive mumu - "to lie".

7. Synonymous or antonymic derivation (one of the components of a phraseological unit is replaced by a close or opposite word of the national language or slang): to hammer in a joint - "fill a cigarette with a drug for smoking" - to nail a joint - to nail a joint - to nail a joint; get on a needle - "start using drugs on a regular basis" - get hooked; add a needle - "teach someone to use drugs" - add a screw - add a jeff; get off the needle - "stop using drugs" - get off the needle - jump off the needle.

Speech is an ecosystem, self-renewing and self-regenerating, serving both modern man and future generations. As the researchers say, a cultured person's concern for the future is manifested in a respectful attitude towards native speech. Obscene vocabulary, foul language and incomprehensible Englishisms that require translation for the majority come into conflict with the Orthodox spiritual tradition of the Russian people, destroy the Russian language, and with it - the culture of the Russian people, which has evolved over the centuries.

In addition, this series can be continued by describing such linguistic manifestations as truncation of roots, addition of roots, universalization, abbreviation, etc. These processes are especially vividly observed within the media space, where there is a "shift in communication towards non-environmental friendliness", which is confirmed by "environmental disasters", for example, such as the influx of foreign words, stylistic decline in speech, its jargonization, vulgarization, stamping, the use of obscene words and expressions, disregard for the formulas of politeness, depletion of the vocabulary of native speakers. Moreover, this shift is reflected in the terms used by scientists, for example: "speech irresponsibility".

CONCLUSION

Thus, if all structural, linguistic and stylistic norms are observed in speech, but "the choice of goals is determined by anti-values (moral, existential, aesthetic, etc.)," then such speech is a manifestation of speech anti-culture, this concept is so understood. In other words, the goal set also determines the degree of environmental friendliness of speech. The degree of environmental friendliness of speech should be determined taking into account the goal of the performed speech behavior and its linguistic implementation. The eco-linguistic approach to the culture of speech is based on the Russian spiritual tradition, which describes the relationship between words and nature. Today, the ecology of a language is understood as "the science of the integrity of the language, of its connection with the culture of its people and, at the same time, of its connection with the earthly semiosphere. This is the science of the energy of the word, of its creative power, of its connection with the biosphere, with the language of living nature. Hence it becomes more and more clear that biological, terrestrial ecology cannot do without the ecology of word and spirit. "

LEGAL BASIS OF COOPERATION BETWEEN GOVERNMENT AGENCIES AND NON-GOVERNMENTAL ORGANIZATIONS IN THE PROTECTION OF CHILDREN'S RIGHTS IN UZBEKISTAN

Nargiza Noufarbekovna Dusmukhamedova*

*Independent Researcher,
Academy of Public Administration under the President,
Republic of UZBEKISTAN

ABSTRACT

The article deals with the theory of regulation of cooperation between government agencies and non-governmental organizations in the field of protection of children's rights, ensuring their legitimate interests; issues of strengthening and improving the practical and organizational and legal framework, the implementation of children's rights by non-governmental organizations; their role in supporting them in every way is revealed. Fundamental ideas have been put forward to introduce a new system of special care for children with disabilities.

KEYWORDS: *Protection Of Children's Rights, Cooperation Between Government Agencies And Non-Governmental Organizations, Government Programs, International Public Fund, Children With Disabilities, Compassion, Social Adaptation, Public Control, Advocacy Activities.*

INTRODUCTION

Today, the number and quality of non-governmental organizations in the world community, their cooperation with government agencies in solving problems related to humanity is growing. To date, the number of NGOs worldwide has exceeded 10 million. Especially in developed and developing countries, their number is growing rapidly. For example, there are more than 1.5 million registered NGOs in the United States, 1.2 million in France, and about 4.5 million in India [1].

THE MAIN FINDINGS AND RESULTS

In Uzbekistan, too, the effective organization of cooperation between state and civil society institutions, the development of its legal framework on the basis of modern approaches, innovative ideas is of great importance. Because in our country, where there are more than 9,000

civil society institutions [2], such as more than 9,000 non-governmental organizations, more than 9,500 mahallas, about 1,500 media outlets, it is very important to ensure cooperation between the state and its bodies and civil society institutions.

It should be noted that the use of the power and resources of such a large number of non-governmental organizations in the protection of children's rights and the protection of their legitimate interests; To this end, the effective organization of their cooperation with government agencies will lead to great success in this area. However, there are a number of shortcomings in the interaction of government agencies and non-governmental organizations in the protection of children's rights and their legitimate interests. In this regard, the President of the Republic of Uzbekistan emphasized the following: "... there are no clear mechanisms for the interaction of public administration and civil society institutions in the field of human rights" [3].

At the same time, it should be noted that in the regulation of cooperation between government agencies and non-governmental organizations to protect the rights of children, ensuring their legitimate interests, programs and memoranda have not been developed that define specific tasks and functions, rights and obligations.

Uzbek scientist M. Akhmedshaeva noted that today the interaction and cooperation between the state and civil society is developing rapidly; she acknowledged that the social role of the state in such cooperation is growing, that it cares for the socially vulnerable segments of society, and that the tasks and functions of the state and civil society are interrelated for these purposes [4, p. 67].

One of the scientists in the field, Sh. Yakubov, noted that the cooperation between government agencies and non-governmental organizations is the main link between the population and the government [5, p. 5].

The views of the Russian scientist VV Grib, who conducted research in this area, on the issue of cooperation are also noteworthy. According to him, effective cooperation between government agencies and civil society institutions will help solve many problems in society. One of the most pressing issues is the analysis of both legal, theoretical and practical aspects of this cooperation, strengthening its organizational and legal framework.

Of course, the cooperation of government agencies and non-governmental organizations in the effective regulation of existing social relations in society, in particular in the field of children's rights; further strengthening and improving its organizational and legal framework is extremely important in today's globalization [6, p. 24-26]. The purpose of the formation of non-governmental organizations also shows how important these organizations are today, that is, the rights and legitimate interests of individuals and legal entities; protection of other democratic values, achievement of social, cultural and enlightenment goals; to meet spiritual and other intangible needs, to carry out charitable activities and for other socially useful purposes [7].

It should be noted that the normative legal acts adopted in the country stipulate cooperation with non-governmental non-profit organizations in the implementation of the tasks set out in the norms, which provide for the powers and functions of government agencies. In particular, this provision is reflected in the relevant laws on the rights of the child. Such normative and legal documents, in turn, are used in our country as a legal basis for cooperation between government agencies and non-governmental organizations in the protection of children's rights and ensuring their legitimate interests.

Article 4 of the Law of the Republic of Uzbekistan “On Guarantees of the Rights of the Child” sets out the main directions of state policy for the protection of children's rights, including cooperation between government agencies and non-governmental organizations to ensure the rights of the child; as well as the powers of government agencies to develop cooperation with international organizations working in the field of protection of children's rights [8].

Article 27 of the Law of the Republic of Uzbekistan “On Education” gives the powers of local authorities in the field of education, which states that local governments cooperate with citizens' self-government bodies, non-governmental organizations and other civil society institutions in the development of educational institutions. . Also, Article 64 of this law defines public-private partnership in the field of education; according to which public-private partnership in the field of education is legally formalized by public and private partners for a certain period of time; is a partnership based on pooling its resources to implement a public-private partnership project. It was noted that non-governmental educational organizations can be established on the basis of public-private partnership in the field of education [9].

The Law of the Republic of Uzbekistan “On protection of children from information harmful to their health” stipulates that the specially authorized state body shall cooperate with local and foreign research and educational institutions in the field of protection of children from information harmful to their health; to cooperate with other bodies and organizations engaged in activities to protect children from information harmful to their health and participating in these activities.

The law also regulates the state education authorities and educational institutions, public health system management bodies and health care institutions; citizens' self-government bodies; at the same time, the participation and cooperation of non-governmental non-profit organizations in protecting children from information harmful to their health was noted.

In accordance with the Law of the Republic of Uzbekistan “On protection of children from information harmful to their health”, non-governmental non-profit organizations have the following powers:

- Participation in the development and implementation of state programs in the field of protection of children from information harmful to their health;
- take initiatives to ensure the protection of children from information harmful to their health and make proposals to a specially authorized state body;
- participation in the implementation of public control over the implementation of legislation on the protection of children from information harmful to their health;
- may cooperate with bodies and organizations engaged in activities to protect children from information harmful to their health and participating in these activities.
- it is established that the media may cooperate with the bodies and organizations involved in this activity in order to ensure the protection of children from information harmful to their health [10].

One of the important legal bases of cooperation between government agencies and non-governmental organizations in the protection of the rights and legitimate interests of children; of course, the Law of the Republic of Uzbekistan on Social Partnership; In accordance with this

law; social partnership programs of state bodies with non-governmental non-profit organizations and other institutions of civil society; including cooperation in the development and implementation of sectoral, regional programs, as well as regulations and other decisions affecting the rights and legitimate interests of citizens. One of the important areas of such cooperation is the protection of motherhood and childhood, as well as women's rights in this law; the socio-political nature of their country; socio-economic; ensuring full participation in cultural life; defined as forming a healthy family [11].

The strategy of actions for further development of the Republic of Uzbekistan, developed on the basis of the Decree of the President of the Republic of Uzbekistan Sh. Mirziyoev dated February 7, 2017 no. PD-4947 [12] also pays special attention to cooperation. In particular, the implementation of public control mechanisms in the first priority area of the Strategy, aimed at improving the state and society building; strengthening the role of civil society institutions and the media, thereby strengthening cooperation between government and civil society institutions. These aspects, of course, are directly related to the interaction of governmental and non-governmental organizations on the issue of children's rights.

The legal framework for cooperation between government agencies and non-governmental organizations in the protection and promotion of children's rights in the country is set out in the relevant laws and by-laws. In particular, in the Resolution of the President of the Republic of Uzbekistan dated May 29, 2020 No PD-4736 "On additional measures to improve the system of protection of the rights of the child" the Deputy Representative of the OliyMajlis for Human Rights (Ombudsman) a number of powers, including the conclusion of memoranda of understanding, agreements, joint programs and projects with national human rights institutions and other organizations; as well as regular participation in international forums on the rights of the child, government agencies in the field of ensuring and protecting the rights, freedoms and legitimate interests of the child; including local public authorities; It is important to note the establishment of cooperation with non-governmental non-profit organizations and other institutions of civil society [13].

On October 7, 2020, the Deputy Representative of the OliyMajlis for Human Rights (Ombudsman) of the OliyMajlis of the Republic of Uzbekistan signed a Memorandum of Cooperation between the Ombudsman for Children and the Association of SOS Children's Villages of Uzbekistan. It serves to expand and strengthen cooperation between government agencies and non-governmental non-profit organizations in further raising awareness and culture, the implementation of advocacy activities in the legal, socio-political direction.

It should be noted that the current implementation of these regulations protects the rights of children in our country; we can see that the role of NGOs in protecting their legitimate interests is growing. Today, the International Non-Governmental Charitable Foundation "For a Healthy Generation"; Realization of children's rights by non-governmental organizations such as the Republican Public Children's Fund "You Are Not Alone", "Mahalla", "Public Opinion", "Youth Affairs Agency", "Zamin" International Public Foundation; we must emphasize their role in supporting them in every way.

About 90 non-governmental and non-profit organizations in Uzbekistan focus their efforts on social support, adaptation and protection of the rights of people with disabilities. Among them are a number of children's organizations that have won competitions announced by the United

Nations Development Program (UNDP). : Republican Center for Social Adaptation of Children, Zamin International Public Foundation, “MILLENIUM” Center for Social and Legal Rehabilitation of Youth with Disabilities, Center for Youth and Children with Disabilities under the Central Council of the Youth Union of Uzbekistan, Public Association of People with Disabilities “Inclusive Society” and others [14].

The strategic goal of the International Public Foundation “Zamin” is to contribute to the sustainable development of the country and improving the living standards of the population. Today, the Foundation is implementing ongoing projects to develop the education of children with hearing impairments. In this regard, ZiroatMirziyoeva, Chairperson of the Board of Trustees of the Zamin International Public Foundation, said: Zamin emphasizes that this is one of the main goals and objectives of the International Public Foundation. Finding an individual approach for children with disabilities in the educational process; not neglecting any child ensures that they enjoy the right to a full and quality education” [15]

Republican Center for Social Adaptation of Children with Disabilities (children with disabilities, children with physical and mental disorders, children suffering from chronic serious diseases); children belonging to socially and legally at-risk groups (orphans, children left without care by their parents or guardians, children from troubled families), as well as those with difficulties in social adaptation; but is an independent organization that studies the problems of social adaptation of gifted children (children with general special abilities, in particular: children with sports, artistic, scientific and other abilities) who do not belong to risk groups [16].

The Agency for Youth Affairs carries out its activities in accordance with the Regulations on the Agency for Youth Affairs of the Republic of Uzbekistan. The Agency, within its competence, protects young people from various information attacks, radical ideas and ideologies; uniting the younger generation in the interests of the Motherland; to take measures to educate in the spirit of respect for the history and national values of our country, to form a sense of humanity; to bring up the younger generation spiritually and physically harmoniously; large-scale organization to involve them in a healthy lifestyle; performs functions such as carrying out advocacy work [17].

President of the Republic of Uzbekistan Sh. Mirziyoev proposed to introduce a new system of special care for children from needy families, orphans, children with disabilities and those in need of treatment; “Currently, we have 150,000 children under the age of 18 in need of special attention in our country. Helping them to get an education, to have a specific profession; treatment of the seriously ill, helping orphans to find their place in life; providing housing is not only our duty, first and foremost, our human duty. In general, if we create a public fund to support children and allocate 100 billion soums from the budget to systematize such good deeds ... I am confident that this initiative will become a nationwide movement, and our generous compatriots will make a worthy contribution to this good cause. It is expedient for the chambers of the OliyMajlis to strengthen the activities of the Public Fund for Child Support at the legislative level and to encourage our compatriots who are active in this are” [18].

It should be noted that the COVID-19 pandemic had a significant impact on the activities of NGOs. Allocations from sponsors and their own businesses have stopped, to weak interaction with society, to give the shortening of measures and the scale of other consequences [19], today's initiative put forward by our President is extremely important.

CONCLUSION

Important information on the interaction between government agencies and non-governmental organizations in the protection of children's rights and the protection of their legitimate interests shows that such cooperation allows government agencies to better perform their duties, while NGOs promote the rights and protection of children in need, achieve effective results in the exercise of their freedoms.

On the basis of the above research, in our opinion, in cooperation with government agencies and non-governmental organizations to protect the rights and legitimate interests of children, it is expedient to pay more attention to the following areas:

- creation of clear mechanisms for cooperation between government agencies and civil society institutions in the field of children's rights;
- implementation of the legislation on the rights of the child, regulation of the interaction of public authorities and administration with non-governmental organizations in the protection of the rights of the child on the basis of specific policy documents, memoranda;
- strengthening public control over the activities of public administration bodies and civil society institutions in the field of children's rights;
- it is especially important to adapt the cooperation between the state and civil society institutions to the content of today's radical reforms, to determine their optimal form and method, to determine the most appropriate directions.

ABSTRACT

The article is devoted to the biological aspects of human adaptation to environmental conditions. The article also discusses natural conditions and human adaptation to them, desert, desert, mountain, land, north, south, sea, hills and life around it, relations between man and nature, technological processes and their negative impact on the environment, preservation of the ecosystem, biological environment and life in it, lifestyle in cold and hot climates, biological adaptation, social adaptation, environmental hazards and methods of their prevention, healthy lifestyle and environment, natural resources and their rational use, preservation of living and inanimate nature - such questions how hands-on experience is also widely reported.

KEYWORDS: *Environment, nature, organism, ecology, biological environment, man, lifestyle, ecosystem, adaptation, biological adaptation, social adaptation, natural conditions, extreme conditions, technologies.*

INTRODUCTION

Throughout his life, a person is constantly exposed to a variety of environmental factors. Many of these factors, such as chemical compounds, are natural and necessary for normal functioning. So, a person cannot exist without oxygen, which is a necessary factor in life support. With a decrease in the oxygen content in the atmospheric air, there is a serious threat to life. Metabolic and physiological disorders of the body also occur when the partial pressure of natural gases in

the atmosphere, such as carbon dioxide, increases. According to N.A. Aghajanyan, Man regularly consumes various organic compounds and minerals: proteins, fats, carbohydrates, vitamins, trace elements, biologically active substances, water. All of them are necessary for the body, since they take part in the synthesis of various compounds, provide the ability to think, move, grow, adapt and neutralize harmful substances [1,66].

At present, the term "human ecology" denotes a complex of not yet fully delineated issues related to human interaction with the environment. The main feature of human ecology as an independent field of science is its interdisciplinary nature, since sociological, philosophical, geographical, natural science, medico-biological problems converge in it. Human ecology studies the laws governing the emergence, existence and development of anthropoecological systems, which are a community of people, which is in a dynamic relationship with the environment and thus satisfies its needs. Natural conditions are of great importance in determining the size of the anthropoecological system. The most numerous modern populations, uniting more than 80% of humanity, live on 44% of the land in the area of tropical forests and savannas, as well as in the temperate zone with shrubby vegetation or mixed forests. Drylands and desert zones, which account for 18% of the land area, are home to 4% of the population.

The main distinguishing feature of anthropoecological systems in comparison with natural ecosystems is the presence in their composition of human communities, which play a dominant role in the development of the entire system. Communities of people differ in the method of production of material values and the structure of socio-economic relations, on which the method of organizing labor, the volume and method of distributing the products produced among the members of the community depend.

Confirm that T.P. Bogdanets In the process of the existence of anthropoecological systems, the interaction of people and the natural environment is carried out in two main directions. First, there are changes in the biological and social indicators of individual individuals and the community as a whole, aimed at meeting the requirements of the environment for a person. Secondly, the restructuring of the environment itself is carried out to meet human requirements and is influenced by environmental factors. Their diversity can be conditionally subdivided into two large groups - natural and social [2,42]:

- Natural factors. This includes factors of animate and inanimate nature. In accordance with this, biotic and abiotic factors are distinguished. Abiotic environmental factors include the air environment, atmospheric pressure, light radiation, magnetic fields, ambient temperature, meteorological factors, etc.

- Social factors. Social factors in the life of a modern person are very diverse. Recently, anthropogenic factors, especially soil, air and water pollution, have become of great importance. Traditionally, social factors are considered various types of work, living conditions in cities and villages.

Human adaptation is one of the key concepts in human ecology, as well as in many other disciplines (physiology, anthropology, medical geography, sociology, ethnography, etc.). Adaptation of a person to a new environment for him is a complex socio-biological process, which is based on a change in the systems and functions of the body, as well as habitual behavior. This is a two-way process: a person not only himself adapts to the new ecological

situation, but also adapts this situation to his needs and requirements, creates a life support system, which includes food, housing, clothing, transport, infrastructure, etc.

According to N.S. Dezhnikova, the mechanisms of human adaptation. are very different, therefore, in relation to human communities, they distinguish [3,51]:

- Biological adaptation;
- Social adaptation;
- Ethnic adaptation

Each person is an individuality, therefore environmental and socio-economic adaptations are complemented by psychological ones. Individual and group adaptations of a person, in contrast to biological adaptations of plants and animals, provide, along with the survival and reproduction of offspring, the fulfillment of social functions, the most important of which is labor.

According to N.N. Moiseeva, biological adaptation of a person is an evolutionary adaptation of the human body to environmental conditions, expressed in a change in the external and internal characteristics of an organ, function or the whole organism to changing environmental conditions [4,129]. In the process of adaptation of an organism to new conditions, two processes are distinguished - phenotypic adaptation, or individual adaptation, which is more correctly called acclimatization, and genotypic adaptation, carried out by natural selection of useful traits.

They can develop not only in natural (Arctic, highlands), but also in anthropogenic habitats. So, immigrants from the temperate climate zone, arriving to work in the Arctic or Antarctica, are greeted by a harsh climate, atmospheric phenomena unusual for mid-latitudes, a sharply reduced number of microorganisms in soil and air, life in relatively small, crowded collectives. As a rule, such people upon arrival in the Arctic for a long time experience painful conditions and sensations that intensify, for example, when the polar day and night change. They are manifested in an increase in blood pressure and an increase in the pulse rate, which are then replaced by a decrease in pressure (sometimes to the level of 70/30 mm Hg) and a decrease in the pulse rate. These phenomena, designated by some researchers as metoneurosis, are accompanied by a drop in working capacity.

According to research by Yu. N. Smirnov, the described situation is reflected in the recommendations of hygienists, limiting the duration of work for newcomers to the Arctic. So, at temperatures down to -30 ° C and a wind speed of 4-8 m / s, the main staff of the polar station can work in the open air full time, while newcomers - no more than 1 hour. In polar explorers, the number of leukocytes in the blood is usually reduced to level 3000-3500 in 1 mm³. During the period of change in the composition of winterers upon contact with new arrivals, as a rule, an almost universal incidence of colds and intestinal diseases is observed [5, 49].

Signs of fatigue and even exhaustion of the nervous system are revealed - working memory deteriorates, the reliability of a person's work decreases, and the duration of the latent period of motor reactions increases. Adaptations are created in relation to factors of both the natural and the built environment, so they are not only ecological, but also socio-economic in nature. In modern society, we can observe the strengthening of the role of social adaptation.

According to the research of P.M. Baevsky, social adaptation is the process of active adaptation of an individual (a group of individuals) to the social environment, manifested in the provision of

conditions conducive to the realization of his needs, interests, life goals [6,55]. Also, social adaptation includes adaptation, first of all, to the conditions and nature of work (study), as well as to the nature of interpersonal relations, ecological and cultural environment, leisure conditions, and everyday life. The process of social adaptation is closely related to the process of socialization of the individual, the interiorization of social and group norms. Due to the biosocial nature of man, his adaptations to living conditions are partly biological, but mainly social in nature.

In short, social adaptation is to urban and rural conditions, to various types of labor and professional activities, demographic processes are studied. The body's response to stress is considered. Recently, the issues of adaptation to anthropogenic factors, including environmental pollution, have become especially acute. If you carry out extensive scientific research on the formation of a rational attitude towards the environment, then many negative factors that threaten the environment and the environment can be prevented.

ABSTRACT

A study of 63 patients with a diagnosis of COPD of the II-III degree was carried out. The main group I of 43 patients, along with the basic therapy, received insiron at a dose of 80 mg 2 times a day for 10 days. II control 20 patients received basic funds. In group I, the intensity of cough significantly decreased, the patency of the bronchi increased by 17.7%, and the indices of local protection moderately increased. In patients taking inspiron, there was a tendency to a decrease in the viscosity of sputum, an improvement in its discharge, and a decrease in the intensity of cough. Thanks to these positive shifts, the rate of reproduction of microflora in the bronchial mucosa decreases and the severity of adhesion and aggregation indicators of blood corpuscles decreases, and humoral immunity is enhanced.

KEYWORDS: *Chronic Obstructive Pulmonary Disease, Bronchitic, Emphysematous, Bronchial Secretions, Spirometry, General And Local Immunity, Cytology, Morphology Of Mucous Membranes.*

INTRODUCTION

Chronic obstructive pulmonary disease (COPD) is a chronic and slowly progressive disease characterized by irreversible or partially reversible obstruction of the upper airways (10,12,13,16). The disease is characterized by progressive airflow restriction (14,16,17). In recent years, the problem of COPD has been increasing and acquiring more and more medical and social significance, worsens the quality of life and leads to an increase in disability and death of people (2, 15,17). The reasons for the exacerbation of COPD are air pollution from industrial waste, combustion products of various fuels, exhaust gases and household dust substances, and smoking and an infectious factor are of no less importance (3,5,7,13,17). The combination of smoking with bronchial hyperreactivity and hyperimmunoglobulinemia E accelerates the formation of COPD. Long-term smoking disrupts the drainage function of the mucociliary apparatus. Hypersecretion of mucus occurs under the influence of tobacco smoke and other harmful effects. This hypersecretion is combined with a change in the rheological properties of bronchial secretions, which become more viscous. Viscous sputum, tobacco smoke, industrial hazards, viral and bacterial toxins suppress the function of mucociliary cells and at the same time lead to dysfunction of the ciliated epithelium due to the reabsorption of excess mucins from the lumen of the bronchi (4,6,8).

Exacerbation of the disease occurs by inflammatory processes in the respiratory system, which impairs the patency of the bronchial tree and leads to an increase in all signs of the disease (12,13,15). According to the literature (6,7,12), about 55-60% of cases of exacerbation of COPD is an upper respiratory tract infection and about 40-45% of other causes. The leading link in the development of the disease is a violation of the drainage function of the mucociliary apparatus, the latter plays the leading role of the protective mechanism of the respiratory tract. As you know, the efficiency of bronchial cleansing depends on the rheological properties of bronchial secretions and the coordinated work of the ciliated apparatus, contraction of the smooth muscles of the bronchial walls (14).

The main symptoms of the disease are shortness of breath, cough, and sputum production. The accumulation of sputum disrupts patency in the bronchial systems, which initiates other symptoms. In COPD, along with pulmonary manifestations, extrapulmonary symptoms appear, such as a decrease in the mass of skeletal muscles, which leads to muscle dysfunction and leads to a restriction of ventilation. The latter lead to shortness of breath and fatigue. Dilution and secretion of sputum leads to an improvement in the course of the disease (16).

In the respiratory system, violations of the cell protection of the I-II line occur. So the first line includes the protective factors of the oral mucosa and palatine tonsils, the second - surfactant, alveolar macrophages and others (9). Recently, the effect of natural natural factors on the state of protection of the mucous membranes of the upper respiratory tract, which are the first barriers to the penetration of various infections, has been of particular interest (2, 3, 6, 8, 10, 11).

In this regard, when treating COPD, it is necessary to take into account the following principle, the elimination of factors that cause the development and progression of the disease. In the phase of exacerbation of COPD, therapy should be aimed at eliminating the inflammatory process in

the bronchi, improving bronchial patency, restoring the impaired general and local immunological reactivity, and further anti-relapse and supportive therapy is needed (1,5,8,9). Inspiron is a drug for thinning sputum and facilitating the drainage function of the bronchopulmonary systems, has an anti-inflammatory and antispasmodic effect on the smooth muscles of the bronchi.

Main part. The aim of the study was to compare the therapeutic efficacy and tolerability of the drug Inspirona in the complex therapy of COPD.

Materials and research methods. The study was carried out in the pulmonary department of the Bukhara regional multidisciplinary medical center. There were 63 patients under observation, including 34 men and 29 women with a diagnosis of COPD II-III degree, aged 42 - 71 years. In 28 patients, grade II was established, in the remaining 35 patients, grade III COPD. 34 patients had bronchitis, and the remaining 29 patients had emphysematous type of COPD. The studied patients were disturbed by cough, discharge of mucopurulent sputum and shortness of breath. All patients heard dry and moist wheezing in the lungs. Examination revealed diffuse cyanosis in patients, and when examining blood, they revealed compensatory erythrocytosis from 6 to 6.7 million and leukocytosis from 9.4 to 10.1 thousand in 1 mm³ of blood. Depending on the method of treatment, all patients were subdivided into two groups, representative in terms of gender indicators of patients, average duration of illness, type of COPD, and other characteristics. The first (experimental) group of 43 patients, along with basic therapy, received Inspiron at a dose of 80 mg 2 times a day, in the morning and in the evening before meals, for 10 days. Basic therapy included antibiotic therapy, anticholinergics, xanthines, antihistamines, expectorants and general tonic. The second (control) group of 20 patients received only basic therapy. General clinical analyzes were carried out, the main clinical symptoms of the disease were assessed on a three-point scale. Also the indicators of spirometry, data of the immunological research method were analyzed. In addition to clinical, functional studies, cytological studies (Nadzhimitdinov S.T. 2002) were carried out on preparations of prints taken from the mucous membrane of the palatine tonsils and nose (7). The study of the qualitative and morphofunctional characteristics of platelets was carried out according to the method of S.T. Nadzhimitdinov (2004). Endoscopy was performed using the apparatus "Olimpus" Japanese device, the state of the mucous membranes and the patency of the trachea and large bronchi were assessed.

RESULTS AND DISCUSSIONS

Analysis of the results of the studies showed that in patients who took the drug Inspiron on days 6-7 of the disease, coughing attacks significantly decreased by 1.7 points and sputum discharge improved about 2 times ($p < 0.05$). Although there were positive changes in terms of the intensity of cough, however, the drug Inspiron had a relatively weak effect on the course of dyspnea in patients with bronchitic type of COPD. There was a tendency towards a decrease in the dyspnea indicator, which was comparatively less, which was 1.4 points ($p < 0.05$). This effect was even weaker in patients with the emphysematous type of COPD. In the latter, after the treatment, although the coughing attack and sputum discharge significantly decreased by 1.2 and 1.3 points, respectively, when comparing the initial indicator ($p < 0.05$), however, shortness of breath continued to bother the patients, no significant changes were found ($p > 0.05$). During the indicated period of therapy in the studied patients, the severity of cyanosis decreased. Studies of a general blood test in patients with bronchitic type of COPD showed the return of the number of erythrocytes and leukocytes to normal values.

In patients who took only basic therapy after the treatment, minor changes were observed. A decrease in the severity of a cough attack and an improvement in sputum discharge in patients with bronchitic type were observed on days 8-9 of treatment. Similar changes in patients with emphysematous type of COPD were observed relatively weaker. During the indicated period of treatment, although coughing attacks and the amount of sputum secreted changed in a positive direction, when comparing these indicators with the initial data, unreliable changes were revealed ($p > 0.05$). In patients receiving treatment in the control group, the intensity of dyspnea practically remained at the initial value. Approximately the same picture was observed in the dynamics of changes in cyanosis. The indices of compensatory erythrocytosis and leukocytosis remained almost at the same level. Analysis of these indicators of cough and sputum production and dyspnea significantly decreased in patients of the main group when compared with controls, the differences were 0.5, 0.6 and 0.4 points, respectively ($p < 0.05$).

Before treatment, the main parameters of FVD in all patients were significantly reduced in comparison with the norm (Table 1).

Respiratory function indices in the dynamics of treatment with Inspiron ($M \pm m, \%$) Table 1

Index %	I group (n=26)		II group (n=25)	
	Before treatment	After treatment	Before treatment	After treatment
FVC	62,2±2,6	75,3±3,2*	63,1±2,4	68,4±2,4
FEV 1,0	61,3±2,1	75,6±2,3*	63,1±2,5	67,2±2,6
PEF	63,1 ± 2,6	75,8 ± 3,5*	62,2 ± 2,2	66,1 ± 2,4
FEF 75	57,2 ± 2,3	74,9 ± 2,7*	59,3 ± 2,0	64,4 ± 2,0
FEF 50	60,2 ± 2,2	74,3 ± 3,2*	61,2 ± 2,2	65,3 ± 2,7
FEF 25	65,3 ± 3,4	71,2 ± 3,0	67,1 ± 2,4	70,2 ± 2,3

Note: * - ($p < 0.05$) compared to pre-treatment data.

Analysis of the spirometry data showed that before the treatment, the main parameters of the bronchial tree were significantly reduced, in patients of groups I and II FEV 1.0 - the forced expiratory flow rate was reduced by 39.7% and 36.9%, respectively, when comparing and to the proper values ... Also, the patency of the bronchi at a glimpse - FEF 75, medium - FEF 50 and a large level - FEF 25 were significantly reduced when compared to normal. After treatment with insiron, mainly in patients with bronchitic type of COPD, there was a significant increase in bronchial patency, an increase in FEV -75, FEV-50, FEF -25, respectively, amounted to 14.3%, 17.7%, 14.1% ($p < 0.05$). This indicates an improvement in patency at all levels of the bronchial tree, especially at the level of small bronchi. Improvement of bronchial patency occurs due to an improvement in rheological properties and sputum discharge, in connection with an improvement in the excretory function of the mucociliary apparatus, which leads to a decrease in bronchial obstruction with mucus and due to a reversible component of inflammation of the bronchial wall. It should be recognized that in the patients of the control group there was no significant change after treatment compared to the initial indicator, as evidenced by the relatively low growth of FEV -1.0 FEV -75, FEV -50, FEF -25, which looked respectively: 4.1% , 5.1%, 4.1%, 3.1% ($p > 0.05$). The data obtained by the endoscopic method indicated damage to the mucous membranes of the trachea and large bronchi, which were characterized by hyperemia,

edema and deformation of their walls, the lumen of the bronchus was filled with thick viscous secretion. After the treatment, regression of endoscopic signs of the inflammatory process was noted, mainly in groups I and II, respectively, 72% and 12% of patients, there was a decrease in the secretion of bronchial mucosa, the disappearance of hyperemia and edema of the mucous membranes and restoration of their patency.

Initially, on preparations of prints taken from the palatine tonsils and nasal mucosa in patients against a background of contamination, mainly by coccal flora (*Streptococcus pneumoniae* 22%, *Streptococcus piogenes* 33%, *Haemophilus influenzae* 5%), single lymphocytes were found, a large number of inactive segmented neutrophils without signs of phagocytic activity. After the treatment, according to the indicators of cytological examination of smears from the mucous membrane of the palatine tonsils, along with the leveling of clinical symptoms, a decrease in the dissemination of coccal microflora was noted in patients in groups I and II, respectively, in 74% and 11% of patients compared with the initial data. At the end of treatment, patients of group I were found to have the 3rd (8% and 16%) and 4th (88% and 48% of patients) stage of inflammation according to S.T. Nadzhmitdinov, which indicates the activation of the cellular defense reaction of the body. However, in patients of group II, significant changes in the colonization of coccal microflora were not revealed.

Analysis of the results of platelets before treatment showed that 60% of patients had initial signs of the process of adhesion and aggregation of platelets in the peripheral blood, their sizes were large and active. The initial data obtained indicated an increase in the process of peripheral blood coagulation. After the treatment in patients of group II, slight shifts in platelet counts were revealed, only in patients of group I significant positive shifts were noted, which indicated an increase in the process of disaggregation in 7 (47%) patients, characterized by a decrease in the process of adhesion and agglomeration of platelets to normal in peripheral blood. Platelets were located alone, became small, inactive, which indicated a decrease in the process of hypercoagulation and normalization of blood coagulation.

An increase in the viscosity of bronchial secretions is accompanied by changes in its quality, which leads to a decrease in nonspecific components of local immunity (interferon, lactoferrin and lysozyme and secretory IgA, which have antiviral, antimicrobial activity. All this leads to disruption of the mucociliary apparatus and the accumulation of mucus and its infection due to the multiplication of microbial flora. Thick and viscous bronchial mucus with a reduced bactericidal effect is a demanded breeding ground for microorganisms. Under certain conditions, these patients are activated respiratory infection (12).

In the course of treatment, it was revealed that the main group of patients examined showed a tendency to a decrease in the viscosity of sputum, an improvement in its discharge, and a decrease in the intensity of cough. It is clear that due to the indicated positive shifts, the rate of reproduction of microflora in the bronchial mucosa decreases and the severity of adhesion and aggregation indicators of blood corpuscles decreases, and humoral immunity is enhanced. Improvement of blood rheology leads to improved blood supply in the focus of inflammation, the influx of protective cells in the affected organs and regression of the inflammatory process.

CONCLUSION

Thus, on the basis of the studies carried out, it can be concluded that the following positive changes were observed in patients with COPD who took the drug Inspiron:

The rheological properties of sputum improved with a decrease in its viscosity and an increase in the amount of secretion secreted.

The function of external respiration was restored comparatively faster, the permeability of the air flow at the entire level of the bronchi improved.

Decreased contamination of the microflora of the mucous membranes of the upper respiratory tract.

The processes of platelet aggregation and normalization of blood coagulation decreased.

ABSTRACT

In the article there is adduced the information distribution, etiology, specific endo-crinological and metabolic aspects of Endemic goiter of cows farms of Samarkand, Kashkad. The results of the studies show that in all regions of the country where the studies were conducted, endemic goiter in breeding cattle manifests itself in three types: latent goiter, hypothyroidism, and hyperthyroidism. The results of the analysis of the nutritional value of the rations show that in all farms the share of high-quality roughage in them was no more than 12-15%.

KEYWORDS: *Endemic goiter, metabolism, thyroid, hypothyroidism, hyperthyroidism, T₄, T₃.*

INTRODUCTION

One of the most significant obstacles to the implementation of tasks to deepen the agrarian reform specified in the "Strategy of actions in five directions of development of the Republic of Uzbekistan for 2017-2021"; as well as in Resolutions No. 4841 "On additional measures to deepen economic reforms in animal husbandry" dated March 16, 2017 and PD-4576 "On additional measures of state support for the animal husbandry industry" dated January 29, 2020, prepared personally by the President of Uzbekistan, in the Laws of the Republic of Uzbekistan No. LRuZ-97 "On the prevention of iodine deficiency diseases" dated May 3, 2007 and No. Law of the Republic of Uzbekistan-397 "On veterinary medicine" dated December 29, 2015 (Collection of legislation of the Republic of Uzbekistan, 2007, No. 17-18, Art. 175; 2015 No. 23, Art.) And the Decree of the President of the Republic of Uzbekistan No. PD-5696 "On measures to radically improve the system of public administration in the field of veterinary medicine and animal husbandry" dated March 28, 2019, are diseases of imported breeding cattle.

THE MAIN FINDINGS AND RESULTS

It is known that endemic goiter (Struma endemica) is a disease that develops due to iodine deficiency and is accompanied by specific morpho-functional changes in the thyroid gland [1, pp. 478-540; 3, pp. 157-160; 5, p. 543].

The results of studies carried out by us over the past 10-15 years have shown that endemic goiter and metabolic disorders associated with it are relatively widespread among imported cattle and their offspring [2, pp. 391-393; 7, p. 340].

As a result of thyroid dysfunction and its metabolic consequences in cows in a relatively short period of time, there is a decrease in live weight by 20-30%, milk yield by 25-50%, as well as deterioration in fertility and product quality. As a result, farms endure an average of 1.5-2.5 million soums per cow per year. Therefore, studies aimed at increasing the productivity and reproduction of cows by preventing endemic goiter and metabolic disorders associated with it are relevant [4, p. 72; 6, pp. 210-13; 8, p. 437].

The aim of the study is to develop scientifically based measures for early diagnosis, effective therapy and group prevention of endemic goiter and metabolic disorders associated with it in breeding dairy cows.

Research objectives:

- To determine the spread and economic damage of endemic goiter and metabolic disorders associated with it in breeding cows;
- To identify the main nutritional and endemic causes;
- To establish clinical-physiological, hemomorpho-biochemical, hepatological and immunological changes characteristic of endemic goiter and metabolic disorders associated with it in breeding cows;
- to develop methods for early diagnosis of endemic goiter and metabolic disorders associated with it in breeding cows;
- through alternative experimental research to develop effective means and methods of therapy for endemic goiter and metabolic disorders associated with it in breeding cows;

- through alternative experimental studies to develop effective means and methods of group prevention of endemic goiter and metabolic disorders associated with it in breeding cows;
- to develop recommendations for early diagnosis, effective treatment and group prevention of endemic goiter and metabolic disorders associated with it in breeding cows and introduce them into production.

Material and research methods

The studies were carried out in 2015-2020 in cows and heifers of the black-and-white breed of the educational and experimental farm of the Samarkand Institute of Veterinary Medicine (Akdarya district of the Samarkand region), in cows and heifers of the local and Simmental breeds of the Fazo and OmadliZarnigor farm in the Chirakchi district, black-and-white breed LLC “Karpat-olachashmasi” of Yakkabag district of Kashkadarya region, in cows and heifers of the local breed of the farm “ZoirAbbosAzizjon” of Kogon district of Bukhara oblast.

Healthy and sick with endemic goiter, cows and heifers in the context of breed, age, seasons, lactation periods and types of diet, were subjected to clinical-physiological, hemo-morpho-biochemical, thyroid-immunological, and samples of the thymus gland were forced to leave cows - organoleptic and specific morphometric research.

Analysis of research results

The results of the studies show that in all regions of the country where the studies were conducted, endemic goiter in breeding cattle manifests itself in three types: latent goiter, hypothyroidism, and hyperthyroidism. In addition to the symptoms of the general metabolic syndrome (problems with milk production and fertility), sick animals are characterized by a peculiar structure of the body (ovality or flatness), the presence of hairless (forested) or hairless areas on the skin, the formation of “false mushrooms” and “false eyebrows”, in an average of 30-50% of cows and heifers on palpation morphological changes (increase or decrease) in the thyroid gland.

The results of the study of blood samples for indicators reflecting the state of the thyroid gland functions were characterized by strict thyroid specificity. So the average level of thyroxine (T_4) in the blood of healthy cows was $3,6 \pm 0,15$ - $5,36 \pm 0,21$ $\mu\text{g}\%$, triiodothyronine (T_3) in the blood serum - $1,25 \pm 0,10$ - $1,50 \pm 0,13$ ng / ml. As the disease progressed, significant changes in these parameters were observed, in particular, an increase in serum T_3 (on average up to $2,45 \pm 0,22$ - $2,9 \pm 0,25$ ng / ml) and a decrease in the amount of T_4 in the blood (up to $3,4 \pm 0,33$ - $4,1 \pm 0,36$ $\mu\text{g}\%$). During the chronic course of the process, these changes deepened.

General endemic metabolic disorders (GEMD). Studies have shown that in about 30-60% of cows of experimental farms, along with specific thyroid changes, profound metabolic disorders were established, the dominant type of which was a violation of protein-carbohydrate-lipid metabolism, which was characterized by a decrease in hemoglobin (up to 66-84 g / l) and the number of erythrocytes (up to 4.4-4.9 million / μl) in the blood, as well as total protein (due to albumin), glucose and reserve alkalinity in the blood serum.

With GEMD, as a result of endemic, especially after the third and fourth calving, degenerative changes in the liver develop, which are characterized by an increase and soreness of the organ on palpation. Bile secretion, albumin-synthesizing, urea-synthesizing, lipid-synthesizing, enzyme-

synthesizing and bilirubin-conjugating functions of the liver are impaired. Such disturbances are especially evident in highly productive cows, in conditions of hay-concentrate and straw-concentrate types of ration compared to silage-concentrate.

The results of the analysis of the nutritional value of the rations show that in all farms the share of high-quality roughage in them was no more than 12-15%. The degree of provision of rations for sugar was no more than 40-50%, for carotene - 50-60%, phosphorus - 70-75%, for digestible protein - 75-80%, for iodine - 45-55%, for calcium - 130- 150%. The calcium-phosphorus ratio was 2-2.5, the sugar-protein ratio was 0.45-0.55.

CONCLUSIONS

1. In the conditions of the farms of the Republic of Uzbekistan, the environment of pedigree dairy cows, the infection with endemic goiter is on average 30-60%, the main etiological factors of which are the lack of high-quality roughage in the diet, the tyrodendemicity of the regions, as well as its low availability in sugar, carotene, phosphorus, digestible protein and iodine as well as low sugar-protein (0.45-0.55) and high calcium-phosphorus (2.2-3.0) ratio in it.

2. When assessing the state of the thyroid gland in pedigree dairy cows, along with specific thyroid changes, it is advisable to take into account general metabolic disorders and the functional state of the liver.

ABSTRACT

This article covers the ways of developing spatial imagination, thinking and creative abilities of students in the process of teaching drawing Science in general secondary education. Examples of the development of the student's creative abilities through the issues that require creative research are presented.

KEYWORDS: Creativity, Creative Ability, Innovation, Drawing, Reading Of Drawing, Spatial Imagination, Contemplation.

INTRODUCTION

Great scientist and inventor in the process of education and upbringing of the younger generation. E Kant said, "It is not necessary to teach thoughts, but to teach thinking"¹.

As we all know, the process of introducing students to the basics of graphic education and its acquisition is carried out through the content of the school drawing course. The content of the school drawing course: reflects a number of processes, such as the development of technical thinking, spatial imagination of students, the activation of creative and cognitive activities, deep acquisition of general and polytechnic knowledge, visual perception of nature and techniques, as well as careful study of processes and phenomena that cannot be seen by eye.

The role of the science of drawing in the formation of technical knowledge in the younger generation, their technical and graphic literacy, the ability to "linger" with various technical means, is great.²

It is known to all of us. “..one of the main tasks of the science of drawing is the formation and development of knowledge, skills and qualifications for drawing up a drawing of a piece and its reading in students. To perform such a task, it is necessary to bring the spatial imagination and thinking of the students to the course process of development focused materials.³ As a result of solving such issues, the creative ability of students is checked and, depending on their “strength”, abilities are developed.

One of the tasks of education is to allow everyone to demonstrate their talents and creativity, which means for each person the opportunity to make their own personal plans. Each child has his own abilities.

To date, it is necessary to successfully achieve this in the process of developing the spatial imagination and thinking of students, graphic literacy, creative abilities, in particular in the teaching of drawing science. The science of drawing shows that such an opportunity has its own advantage over other sciences. This issue is always a matter of days and a number of scientific research works are being carried out.

METHODS

Expressing confidence in the youth of our country in vain, President Sh.M. Mirziyoyev also said in his speech: “Of course, only you, who have modern knowledge and professions, think independently, always live with a sense of belonging to the people, You, dear youth, will be able to stand on the field and solve the tasks set before us by life today”.⁴

MAIN PART

It is known that scientific technical development in many ways is based on technical design. The technique of drawing can not be done without drawings. To do this, it is necessary to integrate elements of a creative approach in the drawingilikni in the learning process and in the execution of each graphic work. Bunda develops the creative ability of the pupil. Graphic issues that require creative research for the formation and development of creative abilities should be integrated into the content of the science of drawing. It is also important to analyze, understand psychological terms, such as creativity, creativity, ability, resourcefulness, which occupy an important place in cognitive activity.

Creativity is derived from the Arabic word, which gives the meaning of creation, discovery, being. Creativity-gives meaning to the creator, the creator, the creator.⁵

When called creativity, it is understood to create the necessary and useful innovation at a certain time and situation. In general, what is created except for a certain thing can be called the product of creativity. In turn, when it is called innovation, it is understood that the product of technical thinking, which was not in such a form before, but at the same time entered a certain element of course not previously known in the form of the finished, although there are certain materials in the composition.

When called creativity, it is understood to create the necessary and useful innovation at a certain time and situation. In general, what is created except for a certain thing can be called the product of creativity. In turn, when it is called innovation, it is understood that the product of technical thinking, which was not in such a form before, but at the same time entered a certain element of

course not previously known in the form of the finished, although there are certain materials in the composition.

Ability-derived from the Arabic word, declination means interest, inclination, loyalty, support, dignity, ability, talent, talent.

A capable person is capable of something, capable of something, worthy of something, worthy of something.⁶

Creativity is a conscious, purposeful activity of a person aimed at knowing and changing existence, as a result of which new, specific, previously non-existing material and spiritual blessings are created.⁷

Any creativity is not a rejection of existence, but a full penetration into existence. An individual approach to training is an important requirement of the educational process. An individual approach to training should be carried out not only in the work of exercises, but also at all stages of the training process: in the transition, strengthening and repetition of the new material, giving homework and in addition to the lesson, it is also necessary. This opens another door to the growth of creativity skills and abilities of students.

Psychologists have different views on the nature of talent and the concept of creativity in relation to the intellectual development of students. From didactics it is known that there are two levels of ability: reproductive and productive (creative).

As a result of the analysis of Psycho-pedagogical literature, it was possible to identify the following main indicators of the formation of creative abilities of students:

1 – ascertain fund of knowledge and skills, the level of their quality and generalization.

2 - development of students ' creative ability the level of development of minds based on: attention, memory, imagination.

These qualities were the basis of effective thinking.

3-the development of the level of thinking of the student is determined mainly by the level of intelligence action and the complexity of operations capable of producing in the process of educational activities.

4-knowledge of methods of search and creative activity.⁸

The algorithmic map of the development of creative abilities of students in the field of Technology Science reveals the possibility of its implementation through 4 stages.⁹

Developing students ' creative ability in the careful study of educational literature, one can find interesting tasks in almost all subjects of the drawing science program. From Russian scientists in this regard I.A.Roytman's "Technology and design elements in machine drawing", V.A.Gerver's "creativity in drawing lessons", N.A.Sevastopol "Project tasks", N.Y.Bakhnov "extracurricular work on technical drawing", V.Rassokhin and N.Tselinsky "interesting tasks on projection drawing", S.V.Titov said that "interesting tasks on drawing" and from local scientists. I. Rahmonov and A. Valiyev "Drawing" (construction of the basics in drawing)", It is possible to bring the books of N.X.Gulomova "Drawing (designing)" and other authors.

RESULTS

One of the sources of improvement in the educational process is a new approach to the use of existing techniques and tools, which requires a certain correction and improvement from the point of view of development. School practice shows that 90 percent of traditional school education is dominated by a teacher's monologue teaching. Schoolchildren are waiting for new forms of acquaintance with new materials, their activities, the active nature of thinking, their aspirations for independence. And a great way to solve this problem is cognitive problems, children's developmental abilities, interests and tasks that are ready to solve them.

In order to develop the interest of the spatial imagination of students, it is necessary to use a wide range of tasks that require entertaining and creative research. Especially effective is the use of functions to find the third projection. In the case of the reader, it is difficult to imagine the third projection. To do this, you will need the skill of reading the drawing. For example, on the basis of the two projections given in the 1-th drawing, the image of the geometrical form and the design of its third projection are divided into sections with the following result when asked.

- many students in the classroom express the graphic issue with a single solution;
- 20 percent of readers will be able to see 2 and 4 solutions;
- one or two readers will be able to design solutions in many variants.

Everyone knows that in any activity person needs knowledge, invention, ability, that is, intelligence and creative ability. Drawing one of the main and most difficult tasks of teaching is the development of the spatial imagination, thinking and creative abilities of the student, in which you cannot develop the abilities to perform various mental operations. Knowledge and knowledge, the mind can develop through systematic exercises. An important task of each drawing teacher for the development of the minds of the students is to develop the imagination of the students, which leads to the creation of new images mentally based on past perceptions expressed in previous concepts.

1. Preparation of students for innovative activities for the development of creative activity.
2. Establish collaborative activities between teachers and students.
3. The use of innovative cognitive technologies in the development of creative activity.

Graphic images are the link that connects many types of creativity activities. Therefore, in the drawing course there are very large potential opportunities that shape the creative abilities of an individual. The Polytechnic features of science make it possible to use a variety of subjects that contribute to the discovery of individual interests and abilities of students.⁹

One of the directions for the content of students' creative abilities are the solution of creative issues in these drawing lessons. From the point of view of the pedagogical point of view, it can be said that in the process of creating this type of activity, the only valuable asset is the ability to open and develop.

Graphic creative activity of students requires the following:

- Number and inclusion with creative content in the planning process obtained on account of the training sequence;
- graphic methods of developing creative activity ;
- selection of specific types of work more suitable teaching tools techniques for creative;
- setting the allotted time for the species is in the midst of creative tasks;
- take into account the specificity of separately in children;
- creative lesson in the process of creating an environment, to be able to treat students well and to take into account every creative proposal.

To establish creative activity, it is necessary to create conditions for solving educational tasks that can provide maximum efficiency. Students should not only have a clear set of knowledge, but also know how to master skills and apply the necessary knowledge.

The scientist, who contributed to the development of drawing methodology, according to L.M. Gosudarsky - "in order for students to fully master the graphic knowledge, first of all they need to master the deep projection drawing, which is the theoretical basis of drawing. In the field of production, drawings on a rectangular projection system are more often used. That is why it is incredibly necessary that students are deeply taught how to read and perform such drawings.

Indeed L.M.Gosudarsky correctly showed the projection drawing department as the basis of graphic literacy. Because this section constitutes the theoretical basis of the drawing course. But, it follows from the demand of that period, the graph recommends the use of some elements of geometry. This, of course, can not give the requirements of today, the goals pursued. Because, in today's day, graphic education requires teachers to develop spatial thinking of their readings through projection drawing themes, to activation their inventive and creative activities. 2-detailed axonometric in the drawing and given points in it. It is required to determine the location of these points in a detailed orthogonal projection. In this also develops the spatial imagination of the student, the ability to read the drawing and the ability to design.

2-drawing Specify the horizontal projection that corresponds to the head view of the detail(3-drawing)

3-drawing Change the geometric shape of the detail according to the specified socket line (the line on which the points are laid) and make its appearance(4-drawing).

4- drawing

Draft rush eaters through a given hole (5-graph, a) details. It will be necessary to make a combination of geometrical surfaces, so that the rush can design several details. The student is given a 5-th drawing from this hole, and in 6 options in b, the ma solution.

a)5 – drawing b)

It has always been a wave of educators, specialists who begin to engage in creativity, develop creative abilities in students, engage students directly in creativity. In the content of pedagogical and psychological literature, more attention is paid in advance to the search for educational methods that promote the intellectual and practical activities of students.

It is necessary to develop creative activity in people from a very small age, from the school party. It is necessary to improve the personality of the child independent creativity due to his existing creative abilities. In this regard, educational subjects such as drawing, technological education and Fine Arts are of great help.

For the effective development of students ' creative abilities:

- develop students ' abilities and interests;
- to increase the mustache of each student in the same field, based on their capabilities;
- to have the skills of eating different creative tables;
- with the help of intelligent activity, it is envisaged to improve the creative abilities of students and improve their quality.

There are different types of creativity, which are inextricably linked with each other. In technical creativity, design cannot be distinguished from design. These two networks are connected by several types of creativity. Reflect the content of creative work in the drawing, Fine Arts and technologies, which primarily include drawings, graphic images. Therefore, there are included opportunities that can educate the quality of a creative person with the content of drawing. The creative graphic activity of students can be applied in all departments of the subject of drawing education. Along with the full implementation of the knowledge gained in this, the process of effective mastering is also carried out. One of the ways to design students ' creative abilities is to solve creative issues in these projection drawing lessons. In the process of creating this type of activity from the point of view of the pedagogical point of view, the only valuable thing is the ability of a person to open and develop. The use of multiple-answer questions and options in solving tasks shows readers an unknown solution algorithm.

Tasks related to the design elements, which are specified in a technical or other purpose, are considered high-level for a while. It is this complex creative process that the designer, architect and designer face in his everyday activities - designing.

DISCUSSIONS

To set up a creative graphic activity, it is necessary to create conditions that can provide maximum efficiency, solution of educational tasks. During the period when the student is studying, it is necessary to ensure that each of them adequately solves the tasks. Students not only have a clear set of knowledge, but also know how to master and apply skills. It is also necessary to create opportunities for educational and developmental education:

Graphic creative activity of students requires the following:

- have creative content in the educational process (inclusion of the obtained planning on account of the number and sequence;
- development of creative graphic activity methods;
- selection of methods of teaching aids that are more suitable for specific types of creative work;
- setting time allotted for separately types of creative tasks;
- to take into account the specificity of children in separately;
- to create a creative environment in the course of the lesson, to have a good attitude to the students and to take into account every creative proposal.

CONCLUSION

As long as these requirements are met, they will serve a great deal of the imagination and thinking of the students. They also enable the student to develop creativity skills by engaging in logical thinking and creative research activities. Similar issues related to projection drawing also serve a great deal of the imagination and thinking of the students. Also, they will prepare the ground for the future development of good constructors, architects.

ABSTRACT

This article deals with the importance of idioms and phraseological units in oral speech and presents some analyzed examples of phrasal units that are common in English and Uzbek language. For interpreting reality, language is a tool. Body part images appear frequently in Uzbek and English idioms carrying simile and metaphor meanings and ontological metaphors are used widely.

KEYWORDS: *Idioms, Phraseological Units, Cultural Backgrounds, Comparative Idioms, Body-Part Idioms, Equivalency, Spoken English, Negative Evaluation.*

INTRODUCTION

As a matter of fact to master language, learning idioms is an important way. They are a typical component of English, and spoken English in particular, and are used more and more widely in everyday conversations. The image of human body parts is contained in large portion of idioms. English and Uzbek are two different languages with their own cultural backgrounds. Besides, language and culture are closely related. An understanding of common idioms will increase comprehension and make conversations more natural in both languages. However, while learning process, idioms present a problem to language learners. They find it hard to understand the meaning of idioms due to their unawareness of and confusion about the similarities and

differences between English and Uzbek idioms. As a result, they instinctively avoid trying to produce idioms themselves.

In this article it is aimed to provide students and teachers with necessary information so that they can benefit in their learning and teaching process, particularly in the field of translation and cross-cultural communication. Furthermore, suggestions to solve the problem as well as implications for teaching idioms are also given.

MAIN PART

At first, we are going to focus on what are body part idioms themselves? And people are familiar with their own bodies. A lot of idioms are from human body parts. Some common organ that are used in idioms are: **head, eye, ear, mouth, arm, leg**, etc. For instance, “**keep a cool head**” means “to keep calm in difficult and stressful situation”, “**not see eye to eye with someone**” means “not agree on something”, “**keep your chin up**” means “something that you say to someone in a difficult situation in order to encourage them to be brave and try not to be sad” and so on. Body-related idioms reflect the functions of major organs and are frequently used in daily life.

For interpreting reality, language is a tool. Body part images appear frequently in Uzbek and English idioms carrying simile and metaphor meanings and ontological metaphors are used widely. Ontological metaphor is one in which an abstraction, such as an activity, emotion, or idea, is represented as something concrete, such as an object, substance, container, or person. With the help of following examples we are going to elicit our ideas:

1. **Get into someone's head** (to understand what someone thinks and feels so that you can communicate well with him or her) E.g. I want to get into my wife's head indeed, and keep on getting along well with her.
2. **Give someone their head** (to allow someone to do what they want without trying to stop them) E.g. John has given his son his head to make up his mind on choosing the profession.
3. **Fly in the face of something** (to oppose or be the opposite of something is usual or expected) E.g. Such a proposal is flying in the face of common sense.
4. **To have a face like a thunder** (to have a very angry expression) E.g. He had a face like a thunder when he heard of his failing from the CEFR test.
5. **To be all ears** (to be very eager to hear what someone has to say) E.g. When Henry was speaking about his journey to Dubai I was all ears.
6. **Not believe your eyes/ears** (to be very surprised at something you hear/see) E.g. I couldn't believe my ears when he proposed me.
7. **To open someone's eyes** (to make someone realize the truth, make someone aware of something) E.g. Your wife is lying to you, please, open your eyes.

An image underlying a phrase may express either approval or disapproval depending on how a body part functions: a functional use of a body-part suggests approval. On the contrary, if there is an inappropriate function of a body part, it creates disapproval. For instance:

The head is a container for the brain and head-idioms are evaluated positively as in **“Get your head round something”** (to be able to understand or accept something); **“Have a good head on your shoulders”** (to be a sensible person), etc.

We have many hand-idioms denoting positive meaning, such as **“To give someone a hand”** (to help someone); **“Be good with your hands”** (to be skilful at making or doing things with your hands); **“Hold someone’s hand”** (to give someone support in a difficult situation); **“An old hand”** (someone who has done a particular job or activity for a long time and who can do it very well).

Some negative idioms carrying the image of nose are **“Look down your nose at someone/something”** (to behave in a way that suggests that you think that you are better than someone or that something is not good enough for you); **“Poke/stick your nose into something”** (to try to become involved in something that does not concern you); **“get up someone’s nose”** (to annoy someone).

We also have mouth-idioms referring to negative meaning, such as **“A big mouth”** (if you have a big mouth, you talk too much, especially about things that should be secret); **“Be down in the mouth”** (to be sad); **“Foot-in-mouth disease”** (the tendency to say the wrong thing at the wrong time) and so on.

English and Uzbek are two different languages with different cultural backgrounds but human beings have similar process of thought. Talking about language and idioms in particular, we can recognize a great deal of equivalence between the two languages’ idioms namely in images and implied messages. Owing to the differences in culture, with the same values of content, the way of expressing ideas through comparative idioms varies among cultures. Such pairs of idioms have the same meaning but different images are used. Below are some examples which confirm the points that are given above.

- **“To give someone the ax”** (to fire someone) – **“Pattasiniqo’ligatutkazmoq”**;
- **“Easier said than done”** (more difficult than you think) – **“Aytishgaoson”**;
- **“Right-hand man”** (the most helpful assistant or employee) – **“O’ngqo’libo’lmoq”**;
- **“When pigs fly”** (never) – **“Tuyanidumiyergatekkanda”**;
- **“To work like a dog”** (to work very hard) – **“Itdayishlamoq”**;
- **“To beat around the bush”** (to talk around the subject; to avoid getting to the point) – **“Aravaniquqolibqochmoq”**;
- **“You scratch my back and I’ll scratch yours”** (if you do me a favor, I’ll do you a favor) – **“Sizdanugina, bizdanbugina”**;
- **“Now you are talking”** (you are saying the right thing) – **“Ana buboshqa gap”**;
- **“To bite off more than one can chew”** (to take on more than one is capable of) – **“Ikkioyoqnibiretikkatqmoq”**;
- **“Like a chicken with its head cut off”** (in a hysterical manner) – **“Oyog’ikuygantovuqday”**;
- **“To know one’s stuff”** (to have expertise in a field) – **“Ishniko’zinibilmoq”**;

- **“Count one’s chickens before they hatch”** (to plan how to utilize good results before they have occurred” – “Jo’janikuzdasanamog”

RESULTS

As for learners, the best time to address the complexity of idioms is at upper-intermediate and advanced levels, when they already have a certain grammatical and lexical foundation. According to the teaching experience of a linguist, there are three steps to bear in mind when learning a new idiom. First of all, it is advisable for learners to find equivalent Uzbek idioms of English ones. In this way, they can install the relation between the two languages; thus, can put them into their long-term memory. Second, learn how to use the idiom in a particular situation. Then, start using the idiom in conversation with others as soon as possible.

Above the average expresses the meaning to be higher or better than the average. E.g. His intelligence is clearly above average. The Uzbek version is “Kichkinademangbizniko’tariburamizsizni”.

Chin up is used for somebody who has changed his character towards someone after having a great amount of money. E.g. It was impossible not having seen me at the street; I thought that she was chin up. Uzbek versions are: “Burniko’tarilibqolmoq”, “Ko’zinishirabosdi”.

As cool as a cucumber means to be calm and not agitated; with one’s wits about one. E.g. During the fire the homeowner was as cool as a cucumber. There are many variants in Uzbek language: “Yuragidaryodekkeng”, “Dunyonisuvbossao’rdakka ne g’am”. All of them express one meaning.

All talk and no action is used for someone who talks about doing something, but never actually doing it. E.g. Bill keeps saying he’ll get a job soon, but he is at all talk and no action. In Uzbek we say: “Aravaniququqolibqochmoq”, “Qulog’igalag’monilmoq”, “Qulog’igatepmoq”.

CONCLUSION

Hopefully this article can provide teachers with some suggestions and ideas so that they could take them into account to effectively teach idioms, raise the learners’ awareness of idioms so that they should develop a habit of noticing them in everyday situations, including reading and listening.

ABSTRACT

This article provides information on the development of virtual resources for English language learners and the problems that arise in the process based on analytical ideas. We think that there is enough information in e-books and websites to learn English. It is known that a number of works are being carried out in our country in the study of foreign languages, especially English. An electronic reference book, encyclopedias, translators and dictionaries built on the principles of multimedia are amazing. There are various electronic encyclopedias on history, geography, medicine, sports and other fields.

KEYWORDS: *Virtual Resource, Information Technology, Pedagogical Technology, Learning English, Virtual Material, Information And Communication Technologies, Electronic Encyclopedia.*

INTRODUCTION

One of the requirements of the "National Training Program" of the Republic of Uzbekistan is the use of new pedagogical and information technologies in the educational process, the acceleration of training of students using a modular system of training. Extensive work is being done in our country on the use of pedagogical and information technologies in the educational process. The scientific and theoretical basis of this problem, the specifics of each pedagogical technology have been developed and sufficient experience has been accumulated. Relevant organizations of foreign countries are closely assisting in the introduction of pedagogical and information technologies in the educational process.

At present, the government pays special attention to public awareness. This can be seen in the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan of June 6, 2002 "On

measures to further develop computerization and the introduction of information and communication technologies."

Nowadays, learning English has become one of the most pressing issues. There are bound to be several problems in language learning. Because language is such an abstract learning process in which a set of elements is considered.

Organizing the learning process on the basis of KIM allows you to teach English live lessons. In the teaching of some topics, it is convenient to create simulation models for dynamic processes, observation and repetition. In addition, on the one hand, it provides a basis for the preparation of topics on the basis of KIM and the acquisition of related concepts and grammatical rules, on the other hand, it creates effective tools for students to read and master independently.

MAIN PART

As the need for a foreign language grows, so does the demand for learning it. However, the lack of information resources in foreign languages is now considered a problem. Learning English requires not only books, but also visual materials, virtual resources, ICT tools. It is clear that every lesson taught with these ICT tools will give effective results, because in learning a new language, every piece of information received through sight and hearing will have enough imagination in the human mind. The solution to the problem of creating virtual resources in English and its introduction in the educational process is currently being solved by ICT professionals. Because when introducing foreign language lessons through ICT, first of all, they must have sufficient language skills and be able to work with ICT. In the study of English, along with ICT tools, it is necessary to first of all learn the concept of multimedia, because multimedia is a tool that carries this image in the form of an image, which accelerates the process of gaining understanding. The first of these is computer multimedia, in which work with audio and video elements is done with special technical and hardware devices called multimedia tools. An electronic reference book, encyclopedias, translators and dictionaries built on the principles of multimedia are amazing. There are various electronic encyclopedias on history, geography, medicine, sports and other fields. However, the creation of multimedia programs in English and their use in the educational process is currently under solution. It is known that the lecture is mastered by about 25% of students. Experiments show that both listening to a lecture and seeing the material on a computer screen and actively controlling its output on the screen increase the quality of mastery. Now multimedia training programs use a combination of powerful software products such as Math CAD, PLUS 6.0. There are currently not enough serious applications using multimedia technologies. The main problem is that professors and teachers are not organized to work with programmers who are well versed in multimedia capabilities. Such curricula should be developed and widely disseminated in educational institutions. This is a new technology in the creation of modern software products. This frees the non-professional user from the complex task of programming program objects such as dialog menus, beautiful images, synthesized sounds, music sounds, various effects of dynamic graphics.

Transfers information appropriate to multimedia hardware, such as audio and video elements, from a simulated, continuous form to a computer-understood digital form. At the same time, multimedia creates the necessary images, such as sound and video elements, from the numbers of interest so that the stored and processed relevant information can be adequately received by the person.

A necessary element of multimedia computer is a sound card that processes sound. The sound card is connected to a sound output device, acoustic systems or individual listeners, as well as microphones that serve to input audio data. Audio kits such as tape recorders and electric musical instruments can also be connected to the sound card.

To work fully with video, you need a device video card that returns video information to a computer-compatible form and original. Devices such as camcorders, VCRs and televisions can be connected to it. However, computer processing of video forms is usually done by a narrow range of professionals. For most users, it is enough to be able to represent video elements on a monitor. A video adapter and monitor available on any modern computer are enough to solve such a problem.

When comparing audio and especially video data storage to a computer, extremely small capacities appear. Therefore, multimedia quality software products (textbooks, reference encyclopedias, various recreational programs) are usually distributed on CDs. To be able to use such products, we will need a compiler called a CD ROM. Without it, the computer is a new technology in the creation of products. This frees the non-professional user from the complex task of programming program objects such as dialog menus, beautiful images, synthesized sounds, music sounds, various effects of dynamic graphics.

Transfers information appropriate to multimedia hardware, such as audio and video elements, from a simulated, continuous form to a computer-understood digital form. At the same time, multimedia creates the necessary images, such as sound and video elements, from the numbers of interest so that the stored and processed relevant information can be adequately received by the person.

Multimedia is a necessary element of a computer, a sound card that processes sound. The sound card is connected to a sound output device, acoustic systems or individual listeners, as well as microphones that serve to input audio data. Audio kits such as tape recorders and electric musical instruments can also be connected to the sound card.

To work fully with video, you need a video card that can return video data to a computer-friendly form and original. Devices such as camcorders, VCRs and televisions can be connected to it. However, computer processing of video forms is usually done by a narrow range of specialists. For most users, it is enough to be able to represent video elements on a monitor. A video adapter and monitor available on any modern computer are enough to solve such a problem.

Extremely small capacities appear when comparing audio (especially) and especially video data storage to a computer. Therefore, multimedia quality software products (textbooks, reference encyclopedias, various recreational programs) are usually distributed on CDs. To be able to use such products, we will need a compiler called a CD ROM. Otherwise, the possibilities of the computer in the sense under discussion are limited to computer games.

The so-called CD ROM drive is not only necessary for the use of multimedia applications, but is also distributed on CDs for the distribution of other large-scale software products. They can replace dozens of ordinary high-density floppy disks. That is, aggregators are devices that not only belong to multimedia, but also have a wide range of applications.

Users who want to work with audio and video should be aware that multimedia products place high demands on the computer's non-volatile memory, as well as the computer's microprocessor,

RAM, and video system. Such high qualities are especially necessary when working with video data. Naturally, the requirements in this direction will increase in the future. Since the capabilities of modern personal computers are not enough to fully display widescreen video data, they are forced to condense this data. This process loses the completeness of the relevant data, unlike normal data compaction. There are hardware and software tools for compacting VCRs, it is also possible to compact audio data, and this practice is less relevant due to the lack of appropriate references.

RESULTS

A set of software tools designed to work with minimal applications, audio and video, satisfying most users, is available directly in windows. We will get acquainted with the content of use of these applications. They allow audio and music compact discs, i.e. CDs, to listen to, record and edit audio files, watch video clips, connect signals from different sources, and set their pitch and timbre. You can listen to audio CDs using the CD Player program. Prior to the creation of CD-ROMs, compact discs with works such as melodies, music, and sound compositions limited the possibilities of CD-representation in the sense in question to computer games. The so-called CD ROM drive is not only necessary for the use of multimedia applications, but is also distributed on CDs for distribution of other large-scale software products. They can replace dozens of ordinary high-density floppy disks. That is, aggregators are devices that not only belong to multimedia, but also have a wide range of applications.

Users who want to work with audio and video should be aware that multimedia products place high demands on the computer's non-volatile memory, as well as the computer's microprocessor, RAM, and video system. Such high qualities are especially necessary when working with video data. Of course, the requirements in this direction will increase in the future. Since the capabilities of modern personal computers are not enough to fully display widescreen video data, they will be forced to condense this data. This process loses the completeness of the relevant data, unlike normal data compaction. There are hardware and software tools for compacting VCRs, it is also possible to compact audio data, and this practice is less relevant because the corresponding volumes are not large. You can listen to audio CDs using the CD Player program. Before the creation of CD ROMs, CDs with works such as melodies, music, and sound compositions were played on CD players. Nowadays, we can listen to our favorite music directly on computers, without deviating from our main work. To do this, insert the CD into the drive and press the Play button. The volume is controlled by the installer on the surface panel. In the absence of such an installer, it has to be used in software tools. The surface panel may also have a sound card and a special listening device connector that is planned to be used separately from the acoustic system. The other buttons that provide minimal functions in listening to sound are located on the surface panel, the characters in them are standardized and you will get acquainted with them below. The CD Player laser program, which belongs to the category of windows, creates a wider range of options for listening to audio CDs. This operating system is organized in such a way that the CD Player program offers its services with great pleasure and is constantly activated by the installation of the CD. This deprives the ability to listen only when limited by technical means without special measures. One of the special measures is the need to press the Shift key with the installation of the CD. Windows accepts audio CDs as computer discs. For such quality, more precisely, for the Autoplay function, we should be grateful to the authors of the system. If the CD player program is running, you will need to close it as needed.

The implementation of software in foreign language classes requires the application of innovative ideas in education through the placement of important information in the program, as well as the training of teachers through ICT. Knowing ICT tools as well as a foreign language facilitates the learning process in every way. The use of simulation models in foreign language classes also helps to solve these problems.

CONCLUSION

It is known that in the modern evolving age of information and communication technology there is no need for technology. Creating a database is also now easier through ICT. We think that there is enough information in e-books and websites to learn English. It is known that a number of works are being carried out in our country in the study of foreign languages, especially English. Textbooks, books, newspapers and magazines that meet various state standards are being published. Special rooms are equipped for learning a foreign language from primary school. In addition, you will need virtual resources to learn a foreign language. Because the teaching process is hard to imagine without them. To solve these problems, various innovations are being implemented at the Academy of Sciences of Uzbekistan. Currently, a number of working groups on foreign languages are conducting research on the preparation of virtual resources and their introduction in the educational process. As a result, we can cite the example of the virtual resource creation team conducted at SamDCHTI. Previously, the problem of creating virtual resources from a foreign language subject was one of the most pressing issues. Previously, virtual resources were created from biology, chemistry, physics and other specific sciences, but now, due to the strong focus on foreign languages, imitation models are being created from English as well as the sciences listed above. The level of convenience is that the student not only perceives the knowledge in a vertical way, but also through hearing. Another convenience is that these special programs can be used by the student even at home. This builds the student's ability to work with ICT tools as well as language learning to improve quality.

ABSTRACT

This article discusses modern pedagogical technologies used in foreign language teaching methods, their importance in education, the effectiveness of their use, based on analytical approaches. In his view, any science teaching methodology, although a science, is not a theoretical science. He solves practical problems. In particular, the methodology of foreign language teaching is based not only on the evidence of psychology, but also on the research of general and specific linguistics.

KEYWORDS: *Pedagogical Technology, Interactive Method, Teaching Effectiveness, Analytical Approach, Foreign Language Teaching Methodology, Psychological Arguments, Non-Translational Method, Communicative Didactics.*

INTRODUCTION

Foreign language teaching methods have a history of more than 200 years as a science. During this period, different approaches to foreign language teaching methods have been observed. One such view belongs to academician L.V. Shcherba. In his view, any science teaching methodology, although a science, is not a theoretical science. He solves practical problems. In particular, the methodology of foreign language teaching is based not only on the evidence of psychology, but also on the research of general and specific linguistics. If linguistics deals with

the origin of linguistic phenomena and the laws of motion, the methodology answers the question of what must be done to put into practice the necessary linguistic phenomenon based on these laws. The most valuable books on methodology have also been written by linguists. These included G. Suite, one of the great English phonetics of the nineteenth century and the great English linguist, O. Jespersen, the most original phonetist and theoretical linguist in England in the late nineteenth and early twentieth centuries, and F. Bruns and Brealya, prominent Englishman and well-known phonetist. V. F. F. et al. Academician LV Shcherba and his teacher, the great linguist I.A. Baudouin-de-Curtone, and his students studied the methodology of language teaching in Russia. Psychologists have a different approach to foreign language teaching methods. Professor VA Artemov gave a valuable opinion on the relationship between the sciences of methodology and psychology. In his view, psychology provides material for methodology. The methodology teaches the teacher how to teach. Psychology, on the other hand, deals with how students learn a subject. But I don't completely agree with that. Because the teacher experiences certain mental processes and situations during the teaching process, and the student during the mastery process, they are exposed to and influenced by the laws of psychology, whether they want to or not.

Methodology A closer look at the historical literature shows that some researchers call methodology an art. They usually refer to the French Methodist Penlash's idea that there are "good" or "bad" teachers who do not have a "good" or "bad" method. To those who hold such an opinion, the German Methodist E. Otto can answer with the ideas expressed in 1924. He says, "If anyone thinks of methodology as art, he is confusing science theory with its practical application."

Each science has its own set of concepts. Among the basic concepts adopted in the methodology of teaching a foreign language are: education system, teaching method, teaching principle, teaching tool, methodical method.

A foreign language teaching method is a set of teacher and student activities that ensure the achievement of practical, general, educational and developmental goals of foreign language teaching. The term method is used to mean "a set of teaching methods" and "a direction of education". The first is used in the theory of education in the sense of process methods, and the second sense can be found in works on the history of teaching methods. For example, the translation method of foreign language teaching, the correct method, the comparative method, the traditional method, the intensive method, and so on.

Natural and social phenomena are interconnected and evolving. Since the sciences are a reflection of objective reality, none of them exists in isolation from the others. The event and the subject can be the source of research in many disciplines at the same time, for example, the study of the social phenomenon of "language" from its point of view in linguistics, psychology, didactics. The term "Clien language methodology" evokes in the human mind the following association: first, a set of methods and methodological approaches to language teaching, or scientific knowledge of teaching methods, and finally, independent pedagogical science comes to mind. Foreign language teaching methods have developed in harmony with didactics. It is well known that the teaching theories of all disciplines are based on the science of didactics and receive scientific nourishment from it. Foreign language teaching is also based on didactics. General theory of didactic education, methodology is considered as the science of teaching a particular subject, lingvodidactics is considered as a general theory of teaching languages,

linguomethodics is considered as a science of teaching a specific language. The term "method" refers to the way in which a teacher and student work to acquire knowledge, skills, and attitudes, and to create opportunities for students to form worldviews and knowledge. There are countless definitions of this concept. The application of methods in foreign language teaching dates back a long time, and the principles are relatively new methodological terms. Historically, the methods have been grouped into four groups, which are called "translation", "correct", "comparative", and "mixed".

MAIN PART

History of methods The famous Methodist prof. IVRaxmank ". The method of translation is mainly in two forms. They are called grammar-translation and text-translation methods. From the point of view of grammar-translation method, a foreign language is studied for general educational purposes. Grammar The exercises are performed in order to develop the logical thinking of the language learner. The main goal of education is to express grammatical knowledge. Themainprinciplesofthismethodare:

1. Language learning is based on written speech.
2. Grammar was chosen as the subject of study, and vocabulary was chosen accordingly. Grammarexerciseswerethemainwaytowork.
3. First, the grammatical rule is memorized, and then it is recommended to make sentences based on the rules.
4. The grammatical form and the meaning of the words are revealed through literal translation.
5. Language material is mastered through literal translation and dry memorization.
6. The word is out of context, limited to individual memorization

Method without translation. Various aspects of this method have been known throughout history. They can be divided into two main groups: natural and correct methods. Learning a foreign language in a natural way should be similar to learning a native language. The idea that the main goal of the method is to learn to read and write by learning to speak a foreign language is formulated as a practical goal. The most important of the principles included in the natural method is to create a language environment. There are different approaches to the practical application of the proposed methodological principles. This can be clearly seen in the creative work of the representatives of the method.

In the new interpretation of the purpose of foreign language teaching, based on the results of pragmatic linguistic research. Linguistics this field is not a system of language-related forms of language, but a field of human activity interprets. Foreign language education has been concentrated since the early 1970a set of new findings in the field of educational goal setting led to heated debates. New curricula have been adopted that define the main directions of foreign language teaching, such as "teaching students to behave" and "BefaeigungzurKommunikation" (communicative Competence). In the 1970s, the "communicative method" proved its worth in several stages after a series of attempts. At the same time, the science of methodology developed. No foreign language can we learn without a thorough study of its methods. The method of "communicative didactics" is also important in foreign language teaching methods. Communicative did acticscombines the following.

1. Open and flexible course concept;
2. theme and content are important;
3. the main form of work in the classroom is conversation and group work;
4. emphasis should be placed on student engagement and creative and free use of language;
5. Strong emphasis on exercise based on the principle of comprehension;
6. Visualization plays an important role in revealing meaning, defining the scope of movement, and organizing the exercise;
7. Learning everyday speech in real-life situations (practice dialogue);
8. Oral use of language, as well as original texts understanding is important.

RESULTS

Communicative didactics prioritizes the use of natural speech situations as listening comprehension material, such as advertisements in transport, at the station, radio and television commercials, telephone conversations, and so on. The goals of listening comprehension have changed. Telling and controlling what he heard also took on a different tone. This method, depending on the purpose, distinguishes the following types of listening comprehension:

- Understand the main content of a text in a broad sense, without paying attention to certain details;
- This method is used when specific information is important, such as the need for weather for a particular location, the announcement of a train's arrival and departure, and so on. It is precisely this knowledge that we retain in our minds, our study of communicative didactics, that, from the concept of 'communication', is semantically linked to the term 'intercultural communication'.

The term intercultural communication is now widely used in foreign language teaching methods. It is this concept that we can use in a variety of contexts. In fact, intercultural communication is the dialogue between different cultures about their social origins, mentality, national character, lifestyle, customs, value system, and so on. In this process, students should be educated and developed in the spirit of respect, tolerance for the culture of the country being studied, and a correct understanding of the culture of another country.

Every foreign language lesson is a crossroads of cultures, a practice of intercultural communication. Because every word in a foreign language in this process reflects a foreign life and culture. The task of teachers is to develop the ability of students to communicate and communicate. This requires the development of textbooks that teach people to communicate effectively and new teaching methods aimed at developing the four speaking activities in a foreign language.

The formula for intercultural communication is patience. It is necessary to avoid socio-cultural mistakes in intercultural communication. For example, in German, "Tee oder Kaffee?" that is, we answer the question "tea or coffee" in our native language - "Tee", "tea", but in German such an answer is incorrect. In German, the answer is "Bitte, Tee", which means "Please, tea". Words connect people through communication. Applying new material to all types of speaking activities at the same time builds skills and competencies. In this process, the quality and effectiveness of

education will increase if the means of communication, demonstration, types of modern technology, methods, the principle of consistency are provided.

In order for a teacher to be successful, not only subject, pedagogical and psychological knowledge, but also other special skills and communication skills are absolutely necessary.

From infancy a person begins to acquire communication skills. But not everyone is able to communicate well when they grow up. The pedagogical profession is one of the "human-to-human" professions, and therefore the ability to communicate is one of the leading, professionally important skills for a teacher. Depending on how the educator interacts with students, your child's interest in the subject will be shaped by the learning motives. The method of pedagogical communication influences the culture of subject knowledge, the effectiveness of skills, interpersonal relationships by students, creates a unique moral and psychological climate in the educational process. Communication is an important condition for a person's socialization. Here it is important to know what pedagogical communication really is.

Pedagogical communication is a interaction between a teacher and a student, which is based on the exchange of information, primarily educational information, helps to understand the partner of pedagogical communication, as well as to carry out collaborative activities. In this case, the information is conveyed both verbally, ie through speech, and through nonverbal means. In the process of pedagogical communication, the teacher should play a key role and be a role model for students. This is judged by its communicative culture.

A teacher's communicative culture is a professional-pedagogical dialogue with the subjects of his educational process. A necessary level of communicative culture can be defined as a teacher who is able to positively accept his students and colleagues and unconditionally ensure the achievement of educational and pedagogical goals. The social significance of communicative culture is that the teacher who masters it can create a positive psychological climate in the interaction of all subjects of the educational process, implement the important principles of modernization of education - humanism and democratization. The personal significance is that the educator with a communicative culture has high self-confidence, enjoys the communication built with the pupil, feels free in the chosen work activity. The communicative culture of a teacher includes:

1. Communication skills.
2. Educator's communicativeness.
3. Educator's communication culture.
4. Methods of pedagogical communication.

Communication skills can be divided into the following groups:

Socio-psychological skills. They prepare students to communicate, make a positive impression, help each student to accept his personality, level of status, predict the development of interpersonal relationships, use the tools of psychological influence, persuade, absorb, allows identification.

Ethical and aesthetic skills. To see this dialogue on a humane, democratic basis, to adhere to the rules of professional ethics, to restore the dignity of each student as an individual, to develop creative cooperation with the student body and each student. 'rnata acquisition skills.

Aesthetic skills. It is characterized by the ability to combine internal and external situations, to have artistic abilities, aesthetic expression, to engage adolescents in a high culture of communication, to activate their emotional mood, optimistic perception.

Technological skills. It is determined by the choice of different forms of interaction of teaching aids, methods, techniques, the choice of the optimal method of communication management, adherence to pedagogical tact, increasing its educational effectiveness.

DISCUSSIONS

A number of personal qualities necessary for a culture of pedagogical communication - honesty, openness, self-control, assertiveness, sincerity, patience Oral and written exercises in a foreign language. Oral exercises are divided into dialogue and monologue exercises, as well as lexical, grammatical and pronunciation exercises performed orally. Writing exercises focus on teaching expression and writing techniques. Reading exercises are designed to learn information and reading techniques by reading a graphic text. Phrases such as exercise and text, exercise and poetry, exercise and letter, sound, exercise and picture are non-methodical concepts because the second word in the phrase is the material of the exercise, i.e. the object or product of the exercise. Such expressions may be freely used in the mother tongue and second language. This is due to the fact that the rules are taught regularly, grammatical analysis is performed, and poems are read expressively. Listening comprehension exercises are divided into two types depending on the purpose. These are: special and non-special exercises. In non-specific exercises, listening comprehension is taught along the way. Examples of non-specific exercises include, for example, a speech lesson at the beginning of a lesson, listening to a teacher's story as it unfolds, listening to a teacher's presentation in a grammar presentation, and recording another person's speech on a magnetic tape.

Teaching a foreign language is also a great way to teach listening comprehension. In order for students to understand the sentences used during the lesson, the teacher is required not to repeat them too many times, not to say them too slowly, and not always to translate them into the native language. Special exercises, in turn, are divided into listening comprehension and pure speech exercises. The purpose of the training exercise is to overcome the difficulties in advance. Preparatory exercises are performed to prevent language and student psychology difficulties. Finding, distinguishing and understanding new phenomena in other speech in overcoming language difficulty, linking sound symbolism with meaning, understanding meaning of word formation, discovering the contextual meaning of lexical and grammatical unity, semantics and exercises such as recognizing and understanding conflicting events are performed. They appear as lexical, grammatical, and pronunciation exercises for listening comprehension.

Speech exercises play a key role in learning a foreign language. Speech exercises are designed to be communicative. They can be divided into audit engagement and engagement exercises. The introductory exercises teach the student to use language and life experiences to act on different linguistic and non-linguistic bases in understanding audio text. Understanding the context, using practical knowledge, understanding the nature of vocabulary, overcoming difficulties and understanding the text are some of the guiding exercises. The use of exercises not only in the

acquisition of a foreign language, but also in the acquisition of any science, knowledge is a way to a positive outcome. Therefore, exercise serves as a bridge for each of us not only to conquer the world of science, but also to take our place in life.

CONCLUSION

Learning a foreign language is a multifaceted discipline, in the process of which a person experiences complex psychological changes. In particular, there is a process of comparing a native language with a foreign language. Different teaching methods and technologies are used in this process. Comparative teaching of a foreign language with a native language with the help of modern pedagogical technologies gives effective results. Teaching a foreign language requires knowledge of its methodology. Methods and technologies play an important role in learning a foreign language. There are different methods of methodology in the organization of the lesson. The most widely used methods of teaching a foreign language are: the method of communicative didactics, the method of organizing intercultural communication and the method of organizing exercises. The three methods are closely related and complementary. Because the science of methodology is related to the science of didactics, the study of a foreign language is based on communicativeness, and the method of communicative didactics emerges.

ABSTRACT

In these tourist areas, the tourist flow will increase after the creation of tourist routes. Uzbekistan is a country rich in tourist resources and has significant potential for the development of tourism. However, most of the entities that serve tourism, i.e. the cost of tourism resources, are not taken into account when evaluating the activities of tourism firms. These include indirect costs associated with the restoration and maintenance of historical, religious,

architectural and cultural monuments. In general, taking into account the natural conditions of the region and their ecological status, the study and identification of tourist facilities, the definition of tourist routes, the establishment of the service sector based on their serviceability is important today.

KEYWORDS: *Restoration, Architectural, Evaluating*

INTRODUCTION

Tourist resources are used to develop the tourism industry. This is because the development of international tourism in the world is not evenly distributed across the regions. It depends on the availability of tourist and recreational resources in the region, as well as the favorable conditions for the formation of tourism infrastructure and industry. This is due to various factors that affect the development of tourism. Uzbekistan has all the conditions to make tourism one of the most important components of the socio-economic complex [1]. The sector plays an important role in creating new jobs, improving the welfare of the population, increasing foreign exchange and tax revenues. To achieve this goal, it is necessary to identify and effectively use tourist resources. Because the tourism resources of Uzbekistan reflect the current state of various historical monuments, buildings, structures and other places.

The number of objects of historical, cultural and archeological significance in the country alone exceeds 4.0 thousand. Of these, 545 are architectural, 575 are historical, 1457 are art and 550 are archeological monuments. In particular, there are 310 tourist facilities in Khiva, 221 in Bukhara, 144 in Tashkent, 118 in Samarkand and 372 in Jizzakh region. Also, 12 nature reserves, 16 orders and 2 national parks, unique nature, fauna and flora are huge tourist resources in the development of ecotourism. In these tourist areas, the tourist flow will increase after the creation of tourist routes. Uzbekistan is a country rich in tourist resources and has significant potential for the development of tourism. It is characterized by the presence of many unique natural objects, such as lakes and mountain peaks, as well as a rich cultural and historical heritage. To this end, a system of indicators should be used to assess the effectiveness of tourism resources in the development of tourism. In world practice, the issue of economic evaluation of efficiency has been studied in more depth. However, due to the specific nature of the methods of evaluating the effectiveness of tourism, this issue has not been fully resolved.

Currently, the direct costs associated with the commercial activities of tourism enterprises serving tourists are taken into account. However, most of the entities that serve tourism, i.e. the cost of tourism resources, are not taken into account when evaluating the activities of tourism firms. These include indirect costs associated with the restoration and maintenance of historical, religious, architectural and cultural monuments. These are not taken into account in the calculation of tourism efficiency. However, their costs are covered by the local or state budget and should be completely eliminated. Because repairing and maintaining such tourist resources is very expensive.

TABLE 1. DEMAND AND USE OF TOURIST RESOURCES IN UZBEKISTAN [5]

Resources	Demand from local travelers	Demand of foreign travelers	Resource potential	Level of use

Recreation and eco-tourism resources	low	high	average	low
Cultural and ethnographic tourism resources	average	high	High	low
Historical, architectural and archeological resources	average	high	high	average
Religious tourism resources	high	average	high	average
Exotic environment and various adventure resources	low	average	average	low
Service quality	low	high	low	low

The table above shows that the demand for tourist resources in the country is high. This is because the influx of tourists will increase significantly once they are ready to enter. As a result, travel companies will earn more. The economic efficiency of tourism depends not only on the activities of travel agencies, but also on a number of external factors. Thus, the efficiency of tourism is the ratio of the financial results achieved and the costs incurred as a result of the use of tourist resources necessary for its operation and development.

In order to provide scientific clarity in determining the efficiency of the formation and use of tourist resources necessary for the development of tourism, it is necessary to classify efficiency indicators. Therefore, the efficiency of tourism resources is divided into economic and social efficiency indicators. Based on these indicators, the use of tourism resources will be considered, discussed and opportunities for future tourism development will be created.

Efficiency is manifested by a number of other types of efficiency. In particular, budget efficiency is the amount of tax paid to state or local budgets for the use of tourism resources, the ratio of cash and foreign exchange earnings to expenditures on these tourist resources. This is because with the use of tourist resources through tourism firms, the costs of maintaining tourist resources are covered by the state budget.

In the process of determining the efficiency of the use of tourist resources is calculated as the ratio of all revenues received to the sum of all expenditures on it. In this regard, the region with a well-developed tourist resource is characterized by the fact that the Khorezm region has long been located in the center of the Great Silk Road, laid the foundation for its economic and social development, as well as rich tourist resources. Today, the tourist resources of the area are divided into natural, cultural, historical and socio-economic objects. The assessment of the tourist resources used in the formation of tourism in the region is the basis for determining the prospects for its development.

The economic value and value of tourist resources, in turn, depends on the type of tourist resource, its quality, location, technology of use and the state of the environment. In this case, it is important to quantitatively and qualitatively assess the tourist resources of the region. Quantitative assessment of tourist resources takes into account the tourist resources that can be used in tourism activities, while qualitative assessment takes into account the sensitivity, grandeur, ease of location, environmental conditions and the attractiveness of natural and recreational resources.

TABLE 2. QUALITATIVE ASSESSMENT OF THE POTENTIAL OF TOURIST RESOURCES IN URBAN AREAS OF KHOREZM REGION (0-10 POINTS) [6]

№	Districts	Natural tourist resources	Cultural and historical tourist resources	Socio-economic tourist resources	The average size of the potential of tourist resources
1	Bagatdistrict	4	6	2	4
2	Gurlan district	3	1	4	2,7
3	Urgench district	3	1	6	3,3
4	Urgenchcity	3	3	10	5,3
5	Khiva city	6	10	10	8,7
6	Khanka district	8	1	5	4,7
7	Shovot district	7	3	4	4,7
8	Yangibazar district	3	1	4	2,7
9	Yangiariq district	3	2	3	2,7
10	Koshkopir district	3	3	3	3,0
11	Hazorasp district	5	7	8	6,7

As shown in the table, the analysis showed that 10,8 points - very high, 7,6 points - high, 5,3 points - medium, 2,1 points - low. The analysis also showed that Khanka, Khiva and Hazarasp districts have a high potential for natural tourism resources. There are opportunities for tourism development in Koshkopir, Shavat and Urgench districts of the region. This is explained by the fact that the tourism infrastructure in the surrounding areas is relatively well formed. Therefore, the districts that are relatively close to the city of Khiva, which is the basis of tourism, are distinguished by the ease of use of tourist resources.

TABLE 3. OPPORTUNITIES FOR THE DEVELOPMENT OF TOURISM IN THE DISTRICTS OF KHOREZM REGION (0-10 POINTS) [4]

№	District names	Historical, architectural, archeological acquaintance tourism	Recreational and ecological tourism Jami	Rural tourism	Religious, pilgrimage tourism	Cultural and ethnographic tourism	Overall
1	Bagatdistrict	2	2	2	0	1	7
2	Gurlan district	0	1	2	0	1	4
3	Urgench district	1	2	2	0	1	6
4	Urgenchcity	1	2	0	1	2	6
5	Khiva city	3	2	0	3	2	10
6	Khanka district	0	3	2	0	1	6
7	Shovot district	1	3	3	1	1	9

8	Yangibazar district	0	1	2	0	1	4
9	Yangiariq district	0	1	2	1	1	5
10	Koshkopir district	1	1	1	1	1	5
11	Hazorasp district	2	1	1	1	1	6

As shown in the table, 3 - high level of opportunity, 2 - medium level of opportunity, 1 - low level of opportunity, 0 - no opportunity at all. Some of the historical sites and beautiful natural areas in the districts will lose their tourist attractiveness if special attention is not paid. Therefore, these areas should be recognized as a historical and cultural heritage or recreational resource, and should be specially protected, that is, specially registered and protected under ecological and architectural control. It is necessary to create economic conditions for the use and protection of these areas. At the same time, it is expedient to implement economic and political assistance of the state, effective tax policy and financing program.

It is important to know how to study and evaluate tourism resources in order to use them in the development of the tourism industry. According to the analysis, the potential for the development of eco-tourism in the region can be considered as a direction for assessing the use of tourist resources. In this regard, the direction of tourism in the world is ecotourism.

Our republic is rich in historical, archeological, architectural, art, music and other tourist resources. In addition, the unique nature of the country, mountains and plains, rivers, deserts and oases, many and varied landscapes are the main recreational resources [3].

In other words, the exotic nature, diverse landscapes, flora and fauna of Uzbekistan, which are not found in other countries, are the main factors that determine the high potential of the entire tourist region.

Uzbekistan has sufficient resources for the development of eco-tourism. However, the potential and cost of using these resources have not yet been fully explored. Without solving this problem, it is impossible to determine the strategy for the future development of this type of tourism.

Areas where eco-tourism can be developed have been explored. However, an assessment of the extent to which these resources can be used needs to be made. Therefore, in assessing the potential of ecological and tourist resources in our country, it is necessary to pay attention to the following aspects [3]:

- Natural and cultural landscapes, ie the potential of available resources for the development of eco-tourism;
- Means of travel in eco-tourism;
- The extent to which the conditions are conducive to travel.

Facilities for the organization and development of eco-tourism include national parks, government orders, natural monuments, botanical gardens, health resorts, health resorts and nature reserves. An important object of ecotourism is an ecologically clean area, beautiful nature and other recreational resources, and our country is rich in these resources.

Uzbekistan has rich opportunities and unique features for the development of ecotourism and its types of adventure, such as rafting, mountaineering, agritourism, mountaineering and other sports. Objects of interest to ecotourists as various natural and cultural landscapes within specially protected areas, flora and fauna resources, gene pool of rare and endangered organisms, magnificent natural complexes, natural monuments are considered as an important basis for the development of ecotourism.

The presence of the remains of ancient cities such as Afrosiyab, Ayozkala, Kampirkala, Tuprakkala, Pop and Nasaf is an available resource for the development of ecotourism of historical monuments. And mountain ecotourism is directly related to how nature and man interact. This situation is also important in the region, as the region has natural areas that serve as recreation and health for tourists. However, the beauty of the mountains attracts foreign tourists. It is only by being able to attract them that every tourist can relax in the bosom of nature and restore their health, that the possibilities of ecotourism will be further expanded. However, this will require improving the environmental situation and tourism services.

Equipment for ecotourism trips includes transportation, eco-friendly products, specialized guides and all kinds of information. By the way, the use of not only modern transport networks, but also horses, camels and donkeys in ecotourism trips is very effective. Our sunny country has a variety of sweet fruits. The uniqueness of different national dishes attracts tourists. Because nowadays the demand for environmentally friendly products is growing. However, the lack of information about these opportunities is a major problem. The main task today is to accelerate the propaganda work about the unique nature of our country. The level of travel conditions is determined by factors such as the ecological and sanitary-epidemiological condition of the area, the clearance process and travel safety.

In general, taking into account the natural conditions of the region and their ecological status, the study and identification of tourist facilities, the definition of tourist routes, the establishment of the service sector based on their serviceability is important today. In this regard, tourist and recreational resources are of paramount importance for tourism, which are the basis for the successful development of the tourism business. Tourist-recreational resources are defined as a set of natural or man-made artificial objects ready to create a tourist product. Also, tourism resources determine the specifics of tourism development in the region, are the basis for the production of tourism products, in planning the priorities of investment policy in the region. It is important to pay attention to the large set and complexity of the components required to assess the resource and reception potential of a tourist area and their regional differences.

THE AESTHETIC AND COMMUNICATIVE FUNCTIONS OF THE LANGUAGE

D. Turdalieva*

*Independent Researcher (PhD),
Fergana State University,
UZBEKISTAN

Abstract

This article analyzes the phenomenon of artistic aesthetic functions of the folklore version and the problem of proverb option, as well as grammatical lexical syntactic changes in the transformation of folklore proverbs. It is also clear that the choice of texts is based on the use of the non-speech option and the use of the author's use of the artistic work, as well as the value of the literary work, not on how much the use of the phrase is used. Z. Valeriy also points out the existence of such a form of transformation (Russian, rediscovered poslovitsy) and underlines that this change is related to the reduction of a component in the proverbial text. (3.12-33) For example, the name of O.Yakubov's "If Everyone Fells" novel is part of an article about ethics and water, when it comes to work on Earth. Although the article is taken in a shorter form, when you read it, the full form of the article will be immediately remembered by the reader. In the article, "Man, a man can overcome any difficulties," the artistic idea, which is being narrated in the narrative, is characterized by exceptional sophistication. Even if the article was taken literally, it would have had a significant impact on the sensitivity of the matter, as the article would have to do with the next part of the article, with the subsequent ethics and the more water-free content, the higher the judgments that would be ignored even when working on the ground. But the second part of the article is about the reader's mind. The name of O'.Umarbekov's "The Hardest to Become" novel is the second part of a difficult, easy-to-learn article. In this, the reader draws attention to the artistic idea that he wants to be exposed in the novel. The use of a range of

article options is not just about the event event, the situational change, or even the specific context itself

KEYWORDS: *Phenomenon, Sophistication, Existence*

INTRODUCTION

M.Yuldashev based on the opinion of V.Arrorin, in modern literature on linguistics it is noted that the language has four or five main tasks, such as communicative communication, communication, and the accumulation of experience and knowledge). (8.118-119b) The use of a particular version of the article in the speech of the speaker or the author of a work of art ensures that one or more of these tasks occur simultaneously. The famous Russian philologist V.Vinogradov "Stylistics.Poetic Speech Theory.Poetic "in his book" The Poetics "distinguishes the uniqueness of the artistic and scientific thought, that is, the idea of a creative fantasy in scientific thought creates an abstract, commonly formulated concept. In artistic fantasy, creative fantasy becomes a powerful driving force of the process of artistic creation, which is a concrete and at the same time a very symbolic image, which leads to the birth of the emblem. Science text can only be translated individually from expressivity and cannot exist without other visual aids. (7.11b) Expressiveness in artistic text is one of the ways to provide it - the use of the article's version suitable for speech situations.

The Uzbek people's proverbial dictionary contains no grease, no drool - no tea, no good, no goodness - a good thing, a good house, a rich house, a rich man, a good man, a good man, There are options for the Karamli mountains, until you get to the bay. The options given are also of significance. In order to analyze this line, it is desirable to clarify the matter of matter and transformant in the first place.

Components of folklore creativity: transformant, transformed by macro, witch, puzzle with small (lexical, grammatical, syntactic) changes. The meaning of the articles is closely related but the forms that have the greatest difference are considered as a variance. In our opinion, the content of this article is one of the only communicative tasks, and articles that have different forms of expression. Since the artistic text looks as aesthetically integral, thinking that this whole form is only a form can lead to false interpretations. The aesthetic function of the language is "sits" on the communicative function in artistic texts, so the aesthetic task is clearly visible, and the communicative task is clearly visible (8.99b) The philosopher JafarGaribâr, who investigates the mechanisms of scientific, artistic expression of a particular idea and the clear and secret ways of thought in the artistic text, says, "The problem is that ethical aspects of language and how to make sure that the integrity of any immigration matter. The art work differs from that of the scientific works, the approach of the literary researcher and other scientific approaches. The literary researcher is obliged to consider the idea of art as part of the aesthetic community. "

In order to use the aesthetic function of the language, the creator chooses what he wants in his language to fill his or her own artistic intentions. This feature is found in all phonetic, lexical, morphological, syntactic, and higher levels of the language, and proceeds to artistic aesthetic integrity on the basis of different combinations of each layer and interlinear units. Creator will never be limited to aesthetic ability to a specific surface. It is clear that the artistic text created only in one direction by the expression method can not claim the artistic aesthetic perfection.

Variety, originality and uniqueness of expression options and methods in literary texts are evaluated in terms of positive and acceptable qualities of this text. (8.102b) The aesthetic function of the tongue is based on the whole of its uniqueness, its complexity, which is also based on the communicative function, its transformation, and its artistic interests, directly in the art. All levels of national language are of aesthetic importance to artistic text.

3), the choice of options such as the doves of the dove until the city is burned (4), the artistic-aesthetic character of the modification of the maqol (1), the kobobim (2) We try to explain the value. In a figurative sense, the above articles are used only for selfish people who are self-interested and who do not deal with the loss of others. This comment in the article is general for the foregoing articles, but each variant has a different aesthetic purpose. 1 is at the very bottom of the line of rankings according to the low / high meaning of word meaning (eccentricity). The article in article 2 replaces the word world in the first word, which implies the peculiarity of the article, ie the first and second articles are differentiated by the category of generality / As a result, the selfishness of selfishness is greatly increased, and this article is applied to a selfish man. In verse 3, the exchange of the word hut in the word literally means to increase the meaning of the word, and to rank higher in rank. The grave is a place where mankind will find eternal life; its burning is a great torment in the Islamic faith, a sin of worldly sins. "Boiling the boil with butter" also proves unbelief, not just selfishness. In article 4, the larger space - the city is mentioned. It is not the selfishness of this ordinary citizen but the selfish king / amir / bek, and in general, serves to express the negative character of the official. As you can see, the versions of articles do not mean the same, there is a very subtle divergence. The author or speaker chooses exactly one of these to express his point of view in a more precise way, in accordance with his purpose. This is not the only communicative function of the language, but also its expressive function. Just imagine the language of literary texts only in the form, the sequence of events expressed in it, the imagination of the form and content in artistic style, in such a dictatorship, not merely the essence of literary art. The artistic essence of the author is the ability to shape the content, and individual features are of special value. VV Odintsov rightly point out that the emotional-artistic structure in the art is transforming the "natural" (ie, the real link between the concepts and the relationships), so the form of the artwork is of great importance as compared to other literary works.

T.V. Zueva, B.P. Kirdan, writes about the phenomenon of folk proverb article: "Articles and stories represent the typical situation and the particular situation, when demonstrating the experience of the people on vital issues. Often, in such cases, there is a choice of popular wisdom. " Here are the versions of the following: Xleb da voda - krestyanskaya (mujitskaya, soldatskaya, burlatskaya, shahterskaya, zdorovaya, molodetskaya). The Goal also provides options such as golkakbuben, golkaksoszka, golkakperst, Golkakosinovyykol.

J. Jumaboyeva gives an insight into the synonyms and the gradu- ones: "Synonyms, meaningful words, contextual and occlusive synonyms are given in compound dictionaries, and some definable dictionaries do not produce antonyms. I have to refer to several sources to find contextual synonyms and antonyms. This is a glossary of graduonimic rows, which is very important for language learners, language trainers and translators, and the dictionary of graduational dictionaries in both Uzbek and English, ie bilingual dictionaries. Semantic categories and stylistic tools are of utmost importance to semantics and lexicography when it comes to interpreting it. Each translated lexema differs by its specificity, level, and usage scale.

This difference can only be understood by the interpreter through the study of graduating lines, by applying graduate dictionaries, and correctly interpreting it. " J.Jumabayeva is also interested in the study of semantic categories and stylistic tools for translation, semicology and lexicography, as well as researching the problem of dialectic version of folklore, and its descriptive / gradual dictionary.

ABSTRACT

The city of Khiva, which is rich in historical and cultural monuments, are of great importance for the development of tourism in Uzbekistan and bringing them to a new level. There are many ancient historical monuments in this city all over the world. Therefore, the tourist potential of Khiva was studied.

KEYWORDS: *People, Germany, France, Italy, Since, Bukhara, Khiva, Amir Tura.*

INTRODUCTION

By now, tourism has become one of the leading sectors of the world economy. In this regard, Uzbekistan pays special attention to the modernization of the tourism industry, the development and improvement of the regulatory framework for the sustainable development of the industry, the organization of services for foreign guests in accordance with international standards. During the years of independence, our country made a significant breakthrough in this area, coupled with the preservation and enhancement of the historical and cultural heritage of the people, the revival of national traditions and customs, the restoration and arrangement of the sights of the republic.

In order to create a modern, highly efficient and competitive tourist complex, a solid regulatory and legal base has been formed in the republic, the basis of which is the Law "On Tourism",

adopted on August 20, 1999. There are programs of targeted measures to improve the tourism infrastructure, including attracting investment, diversifying tourism products, enhancing educational and informational activities, training and advanced training of specialists in the field.

An important step in the formation of the national model of tourism was the creation in 1992 of the National Company "Uzbektourism" by the Decree of President Islam Karimov. Since then, the structure has been coordinating the activities of industry organizations, training relevant personnel, facilitating the inflow of internal and external investments in creating a new and expanding the existing material and technical base, stimulating the development of all types of tourism, actively participating in foreign events, organizing large international forums.

The result of measures taken in this direction is an increase in tourists arriving in our beautiful land. Thus, more than 2 million people from different parts of the world visit Uzbekistan every year. The geography of foreign guests is wide. Our country is especially popular among the citizens of Germany, France, Italy, Republic of Korea, Japan, China, Malaysia, Russia, India.

Since the first years of independence, Uzbekistan has been actively building up cooperation with international organizations, regularly comes up with initiatives to deepen cooperation in this promising direction.

An important milestone in the history of domestic tourism was the entry of the republic in 1993 into the UN World Tourism Organization (UNWTO). Within the framework of cooperation with it, in 1994, 19 countries of the world adopted the Samarkand Declaration on Tourism along the Silk Road. In 1999, the Khiva Declaration on Tourism and Preservation of Cultural Heritage was adopted, supported by UNWTO, UNESCO and the Council of Europe. In 2002 - the Bukhara Declaration on Tourism along the Silk Road, which emphasizes the benefits of sustainable tourism and identifies concrete steps to stimulate cultural and ecological tourism in this direction.

Moreover, in recognition of the special place of the republic in the world tourism industry, in 2004 a regional UNWTO office was opened in Samarkand to coordinate the development of tourism on the Silk Road. It should be noted that such an office exists only in two countries - Japan and Uzbekistan. Its main function is to indicate directions in the development of not only regional, but also international tourism.

The possibilities of our country are evidenced by the presence of over 7 thousand objects of material cultural heritage of different eras and civilizations, including the historical centers of Bukhara, Khiva, Samarkand and Shakhrisabz included in the UNESCO World Heritage List. World famous historical monuments, modern cities, the unique nature of Uzbekistan, unique national cuisine, as well as the unsurpassed hospitality of our people attract travel lovers.

Through the efforts of the leadership of the republic, the tourism infrastructure has been raised to a fairly high level in recent years. In the country, in particular, 1176 tourist organizations are successfully functioning, including 621 tour operators, 555 hotel enterprises. An extensive hotel chain with more than 25 thousand beds meets modern international standards.

Over the years of independence, thanks to truly large-scale work on the construction and reconstruction of infrastructure facilities in Uzbekistan, 11 airports have received the status of international harbors. Modern comfortable aircraft of the UzbekistonHavoYollari National Airline, consisting of Boeing and Airbus airliners, operate regular flights to more than 40 cities

in Europe, Asia, the Middle East and America. In 2016, the country's civil aviation fleet will be replenished with two most modern dream liners - Boeing Dreamliner.

Tourists visiting Uzbekistan have the opportunity to get to the sights of the republic by means of railway transport. So, in addition to regular and high-speed trains, high-speed Afrosiab trains produced by the Spanish company Talgo run daily between Tashkent, Samarkand and Khiva, which significantly increased the quality

More than 400 architectural, historical and cultural monuments and archaeological monuments of Uzbekistan were included in the list of UNESCO World Heritage Sites for each period of preservation of the regions of Uzbekistan (in particular, Samarkand, Bukhara, Khiva, Shakhrisabz). Currently, this list includes 32 cultural heritage sites. Today, more than 300 cultural heritage sites are included in tourist destinations and presented to tourists visiting Uzbekistan. This suggests that there are enough tourist opportunities in the regions of our country.

The recreational potential of the republic is diverse and rich in natural and climatic conditions, flora and fauna, mineral resources. It includes the acquisition of tourist centers, uranium farms, national parks, nature reserves, recreational complexes, mineral resources, tourist centers and children's excursion and tourist centers, the development of tourism and the main sources of state budget revenues. can be the basis.

The cities of Samarkand, Bukhara, Khiva, Shakhrisabz and Margilan, which are rich in historical and cultural monuments, are of great importance for the development of tourism in Uzbekistan and bringing them to a new level. In these cities there are many ancient historical monuments all over the world. Everyone who lives in different parts of the world will live in this dream with their own eyes. In many countries, Uzbekistan is famous for its cities.

Tourism affects the life of the local population, its material and spiritual activities, value system, social behavior and interests. Tourism is traditionally relative, and the cultural level is less than the number of tourists in the region where social and cultural events are held, and tourism does not have much impact. At the same time, the growth of tourism in industrial regions can lead to significant changes in social structure, environment and local culture. This phenomenon served as the basis for studying the problems of social interactions that have arisen as a result of intercultural communication.

Although mass tourism can be called a characteristic event of the second half of the 20th century, there are many reasons why people do not travel. The future or potential barriers must be identified and defined. Pinpointing and pinpointing the reasons for leaving a trip is the first step towards lessening these efforts and even developing special measures to remove obstacles in the way.

The Ministry of Culture spoke about the plans for the development of tourism in Khiva. It is planned to complete the restoration of monuments, open new exhibitions and create a caravanserai.

Income from tourists visiting Ichan-Kala in Khiva in 2019 amounted to 6.6 billion soums compared to 2.7 billion soums a year earlier (an increase of almost 2.5 times). This was announced on February 27 at a press conference in the village of Gaibu in the Urgench region by the deputy khokim of the Khorezm region for tourism development TemurDavletov. The event

was organized by the Ministry of Culture of Uzbekistan as part of a press tour of Ichan-Kala ("inner city") and Dishan-Kala ("outer"). That next year a caravanserai will be opened on the territory of Ichan-Kala. Currently, the project has already been agreed with the Ministry of Culture and is awaiting approval from UNESCO.

The Ministry of Culture announced the imminent completion of restoration work in the Amir Tura madrasah and the Hasan Murad Kushbegi mosque. The project for the restoration of two cultural heritage sites started in 2017. The budget was US \$ 5 million.

The head of the Department for the Development of Museums and Libraries under the Ministry of Culture spoke about the development of four new exhibitions that will provide detailed information about the history, culture and art of the region from the time of the emergence of civilization to the beginning of the twentieth century. Special attention will be paid to Ancient Khorezm, the Khorezm dynasty and the Khiva Khanate.

The expositions will correspond to the modern standards of European museums. A mobile application will be created that will allow reading information from the exhibits and will play the role of a mobile guide. The museums will use audio guides, video visualization, 3D technologies, and panoramic photography.

One of the expositions will devote tourists to the life of German Mennonites. In Ichan-Kala, a Mennonite store has been preserved, on the site of which a library was located. Already this month, a small exposition of archival photographs and German household items will be presented in the shop.

This ethno-confessional group arrived in Khiva at the end of the 19th century. Khiva Khan Said Muhammad Rakhim allocated 50 hectares of land to the colonists in the village of Ak-mosque. The Germans accepted the citizenship of the Khan at the beginning of the 20th century, but were deported from Central Asia in 1937.

The specialist told about the changes on the site of the 17th century fortress "Ulli-Khovli", or "Bolshoy Yard".

The fortress was renovated in 2014. At the initiative of ShavkatMirziyoyev, a hotel was built in the complex in 2018 and conditions for tourism were created. In April 2018, the President of Uzbekistan received the Head of Turkmenistan GurbangulyBerdimuhamedov at Ulli-Khovli.

The disadvantage of the center is the lack of heating during the winter season. Considering the mild winters, low price tag and interesting infrastructure of the complex, Ulli-Hovli could bring in more income if the premises were warm.

STAGES OF DEVELOPING THE CREATIVITY OF STUDENTS IN TEACHING THE ENGLISH LANGUAGE

Ibodatkhon Makhmudova*

*Teacher of English in the chair of the English language,
Ferghana State University,
UZBEKISTAN

ABSTRACT

The development of students' creative abilities is an important task that teachers should consider in an innovative environment. In order to achieve this goal, pedagogical activities are organized in stages. Graham Wallace's ideology was used to determine the stages of development of students' creativity when the research work was being conducted. According to the idea of Graham Wallace, the development of students' creativity is organized in four stages: preparation, "budding", maturation and control. Defining a clear goal at each stage made it possible to achieve the expected results. The article outlines the essence of each stage, aimed at developing students' creative abilities as well as the methodological approach for the organization of each stage.

KEYWORDS: *Teaching English, Students, Creativity, Creative Abilities, Development, Graham Wallace, Stages, Stages Of Development.*

INTRODUCTION

The process of formation and development of creative qualities in a person does not happen spontaneously, it evolves gradually. In essence, any process or activity is based on integrity. This integrity is also expressed as a "system".

According to the Oxford Learner's Dictionary, a system is: 1) an organized set of ideas or theories or a particular way of doing something 2) a group of things, pieces of equipment, etc. that are connected or work together 3) a set or arrangement of things so related or connected as to form a unity or organic whole[3]. Accordingly, pedagogical activity aimed at developing students' creative abilities in teaching English is also manifested as a whole. The stages are the most important structural basis in this unity and provide positive dynamics.

In the "Explanatory Dictionary of the Uzbek language" the concept of "stage" is defined as follows: "particular periods of the implementation of a single action" [5, 327]. Thus, the stages of developing students' creative abilities in teaching English are separate periods aimed at achieving a specific goal (the terms "particular" and "separate" are synonymous words in the Uzbek language).

In our opinion, the achievement of the main goal of developing students' creativity in teaching English is provided by reaching the specific goals at certain stages of the process. Defining the specific goals step by step, in a certain sequence ensures the achievement of the main goal without excessive stress.

The stages of development of creativity in students in teaching a foreign language were identified according to the ideas of Graham Wallace [7]. At each stage of this process, specific pedagogical tasks were accomplished by making partial changes to the author's ideas.

In order to make the teaching process creative students are required to know the English language at least at a basic level. This represents the initial, i.e., preparatory stage of the developmental process of creativity based by Graham Wallace. The preparatory phase serves as the foundation for the "budding", maturation and control stages.

Note: The organization of stages is not done in a single lesson process, but can consistently cover several lessons, even a semester.

I. Preparation stage. Diagnostic methods are used to determine the creativity of university students at this stage.

The diagnostic methods can be used to determine a person's creativity in terms of general and direct linguistic features. They are: 1) methods of determining the creativity of the person - the method of "Random Associations" [2], Incomplete Figure Test by E. P. Torrance [4]; 2) exercises that determine the students' ability of thinking creatively in English (question-answers, descriptions, situational exercises, memory tasks, debates, preparing a lecture, presentation, short articles).

In the preparatory stage of creative development, students work individually. The reason for this is that it is at this stage that each student has information about how creative they are.

The use of diagnostic methods in the first stage of the development of creativity in students is as follows:

1. Using the method of "random associations" students work in an academic group, small group, in pairs or individually. It is up to the teacher to select the suitable mode of interaction in class. In choosing the form of work, the teacher can take into account the preference of students. The freedom of students is ensured during the lesson.

According to Graham Wallas [7], at this stage the person involved in the experiment (student) is supposed to work on the source, this may be a novel, scientific magazine or newspaper depicting one of the various spheres of social life.

In the course of the following research, the scope of the source was narrowed with some modifications to this approach. The respondent-students used a source published in English.

Therefore, based on the students' interests "The Adventures of Oliver Twist" by Charles Dickens was chosen. One of the students was appointed as a leader. Students were given two assignments based on the novel:

1. Mark 3 random words in the text and write a short story using these words.
2. Give a title to the story you made.

In the first task, the leader opened one of the pages of a closed book (or scientific journal), without thinking, randomly placed his index finger on any word, and wrote the word on the board. After the leader chose three words from the book in the same way, the students wrote a short story in English based on it.

In the second task, students were asked to entitle their stories, so the students came up with titles for the stories they made.

At first sight, the assignments seem not to be complicated. However, it is not easy for students to write a story even in their native language and name it. If this process is carried out in a foreign language, it acquires a more complex character.

Completing the task consisting of two stages will further develop students' creativity as well as their synthesizing skills. The title is considered as the "visit card" of the story, through which the general content of the process or event is described in a single word or phrase.

The task was performed according to several requirements.

Requirements for Task # 1: all the three selected words should appear in the story; the ideas and events in the story should be connected with each other in a logical sequence; the story should be based on a specific (original) idea.

Requirements for Task # 2: the title should correspond exactly to the content of the story; the title should be short and concise.

The short and laconic title chosen by a student allows the teacher to get to know the student's word stock in the English language.

Once the assignment was completed, a discussion was organized within a group and the most original and the most appropriate title was selected.

2. The Incomplete Figure Test by E. P. Torrance was also used with students working both in small groups and in pairs.

Note: Students can also work individually while using the method. The mode of interaction may be selected by the teacher or it may also be chosen according to the preferences of students.

According to the author's idea, students should create images related to a different area on each figure given in the Incomplete Figure Test by E. P. Torrance. "The most important thing is that students are expected to use their fantasy broadly and pay attention to the originality of the images" [4].

During the study, when working with the Incomplete Figure Test, we added some changes. These changes were made taking into account the direction of education, the subject, the purpose of education, as well as the preferences of students. According to E. P. Torrance the respondent (student) should form as many and unique images as possible in different areas without limiting

the subject area for each barcode. Usually the images are not interpreted, so they can give the person enough visual information. In the process of developing students' creative abilities in teaching English, the scope of the topic was limited in order to complicate the task when working with the Incomplete Figure Test.

These changes are beneficial to students in two ways:

1. The student chooses one of the areas for which he or she is well informed; the description of the objects of the field in the process of the task forms a kind of "system";
2. The fullest possible disclosure of the essence of the "system" by the student ensures the logical consistency of the stated idea.

Талабаларнинг эътиборига Э.П.Торренсинг қуйидаги “Тугалланмаган расмлар” тести [4] иш қўғози сифатида тақдим этилди:

Another assignment was brought to the students' attention to help them determine if they have creative thinking skills.

Assignment: For each figure given in E. P. Torrance's test add lines and make pictures out of them on the topic "Nature".

The following Incomplete Figure Test by E. P. Torrance [4] was presented to the students as a working paper:

Incomplete Figure Test by E. P. Torrance

(working paper)

Incomplete figures				
				
Solutions				
Incomplete figures				
				
Solutions				

Once the assignment was completed, a discussion was organized in the academic group and the most original solution was identified.

II. The stage of "budding". At this stage, students worked in small groups. The formation of small groups was based on the location of the tables in the classroom.

Note: There are several methods that can be used to form small groups: 1) draw lots (write numbers 1, 2 and 3 on small papers, place them face down and ask students to choose); 2) use the order of registration of students in the journal of the academic group; or 3) based on the location of the tables in the classroom.

Learning Objective: To further develop each student's individual creative thinking ability by combining the abilities of small group members.

In the second stage of developing the creativity of students ("budding" stage) diagnostic methods were used in the following ways:

1. In the preparatory stage of the method of "random associations" [2], each subgroup remakes another complete story of average length based off of the stories composed by its members.

Task:

- 1) Remake a medium-sized story based on the "stories" created by each member of the small group at the previous stage;
- 2) Entitle the story in agreement with the group members.

Note: The second remade story should cover the content of the stories created by each member of the small group; "small stories" should be able to form a coherent story that is logically connected to each other.

The complexity of the task is that it is not easy to connect several small stories, to achieve a logical unity. But this process encourages students to think, to find a solution to the logical problem.

Once the assignment was completed, a discussion was organized in the academic group and the most original (specific) solution was identified.

2. In the preparatory stage of working with the **Incomplete Figure Test by E. P. Torrance** [4] a table was formed based on the different answers suggested by the members of each small group.

Assignments: 1) form a table based on the different answers suggested by the members of each small group during the preparation stage; 2) Together with your teammates, think about what other solutions you can suggest on a given topic in English.

During the study, the following working papers were presented to the small groups to complete the task:

Incomplete Figure Test by E. P. Torrance

(working paper)

№	Incomplete figures	Solutions	№	Incomplete figures	Solutions
1.		1) 2)	6.		1) 2)

2.		1) 2)	7.		1) 2)
3.		1) 2)	8.		1) 2)
4.		1) 2)	9.		1) 2)
5.		1) 2)	10.		1) 2)

Note: 1) at the end of the task, the number of proposals of the small groups on each figure is calculated; 2) If the same solution is provided by more than one member of a small group on a particular figure, it is taken as a single answer (option).

This assignment involves the development of the social and communicative skills of group members. Such as:

- working together;
- listening to each other;
- approving each other's opinions;
- adding some points to the ideas of teammates;
- reasonable denial of each other's opinions where necessary;
- supporting each other in making a single decision in the members of the small group.

Once the assignment was completed, a discussion was organized in the academic group and the most original (specific) solution was identified.

III. Maturation stage. Again students worked in small groups. The students were given a small life story without an ending.

Assignments: 1) read the story; 2) translate the text; 3) predict the end of the story.

Note: Group members choose the most effective way to translate the text. The methods can be as follows: 1) the translation of the story is done in collaboration; 2) students share the parts of the story, e.g. a sentence and translate it (this saves time and does not interrupt them from thinking, but if a member of the group needs help, he can get help from others); 3) it is prohibited to use mobile phones and Internet to translate the text, except printed dictionaries; 4) the teacher acts as a supervisor in this activity.

In the current research students were given the following short life story [1]:

After receiving the Nobel Prize in Physics, Max Planck went on tour across the world. Wherever he was invited, he delivered the same lecture on new quantum mechanics. Over time, his chauffeur memorized the lecture and said, "Would you

mind, professor Planck, because it's so boring to stay in our routine. What if I gave the lecture in Munich and you just sat in front wearing my chauffeur's hat?". Planck said, "Why not?"

And the chauffeur got up and gave this long lecture on quantum mechanics. After which a physics professor stood up and asked a perfectly ghastly question. The speaker said,....

When the task was completed, the whole group discussed the answers given by small groups, and the most original answer was identified. At the end of the process, the real answer was given:

"Well I'm surprised that in such an advanced city I get such an elementary question. I'm going to ask my chauffeur to reply".

IV. Control stage. Students worked in small groups. Students were presented unfinished quotes by a former President of the USA Thomas Jefferson.

Assignments: 1) Think logically and complete Thomas Jefferson's unfinished ideas in English; 2) Translate the ideas into the Uzbek language; 3) Suggest your alternative answers retaining the content of the quotes.

Note: Each group worked on 3 of the top ten opinions of former U.S. President Thomas Jefferson. As for the last 10 ideas, all the three groups offered their alternatives.

Assignment 1. The following quotes by Thomas Jefferson were presented to the small groups [6]:

1. Never put off till tomorrow what you _____ (phrase).
2. Never trouble another for what you can do _____ (pronoun).
3. Never spend your money before _____ (sentence).
4. Never buy what you do not want, because it is cheap; it will be _____ (adj.) to you.
5. Pride costs us more than hunger, thirst, and _____ (noun).
6. We never _____ (verb) of having eaten too little.
7. Nothing is troublesome that we do _____ (adverb).
8. How much pain have cost us the _____ (noun) which have never happened.
9. Take _____ (things) always by their smooth handle.
10. When angry, count ten, before you speak; if very angry, a _____ (number).

After each task was completed, the answers of the small groups were discussed. The teacher presented the answers for both of the tasks at the end of the discussion.

Answers.

Task 1. Ideas of Thomas Jefferson:

1. Never put off till tomorrow what you can do today.
2. Never trouble another for what you can do yourself.

3. Never spend your money before you have it.
4. Never buy what you do not want, because it is cheap; it will be dear to you.
5. Pride costs us more than hunger, thirst, and cold.
6. We never repent of having eaten too little.
7. Nothing is troublesome that we do willingly.
8. How much pain have cost us the evils which have never happened.
9. Take things always by their smooth handle.
10. When angry, count ten, before you speak; if very angry, a hundred.

Task 2. Translation of the ideas into Uzbek:

1. Бугун қила оладиган ишингни ҳеч қачон эртага қолдирма.
2. Ўзинг қила оладиган иш учун ҳеч қачон бошқаларни безовта қилма.
3. Ҳали пулга эга бўлмасдан туриб, уни сарфлама.
4. Ҳеч қачон ўзингга керак бўлмаган нарсани сотиб олма, чунки у арзон бўлса-да, сен учун қиммат бўлади.
5. Кибр бизга очлик, чанқоқлик ва совуқдан кўра қимматга тушади.
6. Биз ҳеч қачон кам овқат еяётганимизданафсусланмаймиз.
7. Ниманики сидқидилдан бажарсак, у машаққатли бўлмайди.
8. Ҳеч қачон юз бермаган ёвузликлар ҳам бизга машаққат келтиради.
9. Ҳар қандай зиддиятли вазиятда “олтин оралик”ни танла.
10. Жаҳлинг чиққанида бирор нарса дейишдан аввал ўнгача, жуда ғазабланганингда эса юзгача сана.

Task 3. Students working in groups suggested different alternative answers.

Alternative answers of Group 1 on the first 3 points:

1. Never put off till tomorrow what you can do, procrastinated work will form a huge mountain.
2. Never trouble another for what you can do yourself, but think about your own opportunities .
3. Never spend your money before you have it, it leads you to stay in debt.

Some more alternative ideas were proposed by the three small groups. The following hadith was recognized as unique among them:

It was reported by Abu Dawud, may Allah bless him and may peace be upon him: “When one of you becomes angry while standing, he should sit down. If the anger leaves him, well and good; otherwise he should lie down!”

Working in small groups and collaborating while completing creative learning tasks not only supported effective education, but also made the learning fun and engaging for students. In

addition, the quality of the assignments created conditions for students to achieve creative thinking.

In conclusion, the pedagogical activity aimed at developing students' creative abilities in teaching English in higher education is carried out in several stages. Each of the stages is organized on the basis of a specific aim. Achieving the goal set at each stage helped to achieve the main goal. The work of students in small groups not only ensured that the learning process was interesting, but also provided an opportunity to promote specific solutions to learning tasks.

INCREASING THE SOCIAL ACTIVITY OF STUDENT GIRLS IN EDUCATIONAL INSTITUTIONS

Nargiza Nurmatova*

*Lecturer of Tashkent State Pedagogical University,
Tashkent, UZBEKISTAN

ABSTRACT

This article is devoted to the analysis and pedagogical interpretation of the increase in the social activity of girls' students in general education institutions in the conditions of modern Uzbekistan. The stages of development and conditions for the development of social activity of female students are shown.

KEYWORDS: Social Activity, Students, Girls, Society, Continuing Education, School, Usefulness, Adaptation, Developed Personality.

INTRODUCTION

Modern independent Uzbekistan, having chosen its own path of renewal in the field of education, joined the global concept of sustainable development, confidently striving to create a humane civil society, a democratic rule of law based on a stable socially oriented market economy, integration into the world community and information space.

In the system of lifelong education, on the path of recognizing human priorities, social justice and universal harmony, the revival of spirituality and national identity, the state emphasizes the equality of men and women, realizing the principles of their equal rights and freedoms. Today's world culture and human civilization as a whole, being at the beginning of the 21st century, is going through an era of changes, the next round of its development. Following its own path of renewal and progress, Uzbekistan joined this global concept, defining the socially oriented nature of the legal and social protection of a person, shaping his spiritual and moral formation.

In order to implement these ideas in recent years, various legal institutions have been created in the republic: the Ombudsman Institute, the National Center for Human Rights of the Republic of Uzbekistan, the Institute for Monitoring Current Legislation, the Center for the Promotion of Legal Education, the Center for the Study of Human Rights, the Center for the Study of Public Opinion, as well as a number of NGOs of the corresponding profile. Currently, there are more

than ten women's public organizations in Tashkent and more than 50 nationwide, the women's movement is expanding. Many international legal documents and information on the activities of the international women's movement and non-governmental women's organizations became known to the general public only after the approval of the independence of the Republic of Uzbekistan. The republic was one of the first in Central Asia to join the UN Convention on the Elimination of All Forms of Discrimination against Women, which confirms the rights of women and defines a plan of action by states to protect them. The same task was formulated as one of the main ones at the Fourth World Conference of Women (PRC, Beijing, September 1995), which was held under the motto "Action for Equality, Development, Peace". Of fundamental importance for understanding women's rights is the fact that the generally recognized principles and norms of international law are an integral part of the legal system of our society.

All these facts are clear evidence of the social activity of women, including girls. Today, a new generation of girl students has emerged, a new social institution "social activity" has established itself, historical epoch-making signs have affirmed the female part of the population in its new quality: as the most active and socially mobile part of society.

Education as a process of purposeful personality formation, carried out against a broad social background with the participation of the student himself, requires students to be focused on socially active aspects of life. An appeal to the main trends of renewal, ripening in the depths of the development of society and modern schools, makes it possible to identify an effective toolkit for the development of social activity of schoolchildren based on the socializing function of education.

The sociality of education is an indicator that determines interests, desires, the formulation of tasks, learning goals, the order of representatives of society in the form of social groups, strata, strata. Sociality concretizes the mechanisms of the impact of education on the formation of society. Education is presented as a space that includes students, teachers, parents, representatives of various social spheres, individual individuals, their groups as socio-pedagogical structures in the system of social and cultural life. The sociality of education is considered as the focus of the educational system on the study and development of the peculiarities of the functioning of modern society, on the formation of a socially oriented position of students. Education is a mutually oriented phenomenon of social and personal orientation, reflecting the realities, risks and prospects of education.

The state order for the social education of girl students is enshrined in the "Law on Education" of the Republic of Uzbekistan, which sets out the requirements for a school graduate who shows initiative in social interaction, responsibility, civic and moral orientation. The social function of education is realized in the development of social interaction and the strengthening of society's solidarity according to significant landmarks: the creation of an accessible educational space; providing social orientation in the real and virtual world.

Our study gives grounds to present the importance of social activity as a space for the development of a socially active personality, especially girl students in the relationship between the educational and non-educational aspects, in reliance on the principle of the binarity of the spiritual and material, personal and social in the essential cognition of reality.

The socio-pedagogical meaning of the development of a socially active girl consists in the implementation of the purposeful socializing influence of socially significant affairs on the

formation of the student's worldview, his general cultural and civic competencies. The social activity of girls as a personal quality, manifested in an inalienable attitude and the development of the world, is realized in sociability, objectivity, meaningfulness, selectivity in the course of realizing needs, abilities, interests in learning, work, communication, and behavior.

The gender characteristics of schoolchildren should also be taken into account when engaging in socially oriented activities. In the professional baggage of the teacher, this is reflected in taking into account the uneven development of the hemispheres of the brain of girls and boys, identified by scientists [4].

Since in boys, the right hemisphere matures faster, which is responsible for involuntary intuitive reactions, irrational mental activity, the development of figurative memory, negative emotions, which manifests itself in the underdevelopment of the sphere of positive emotions (due to the slow development of the left hemisphere), in negative emotions, aggressive behavior (prevails excitability, irritability, anxiety, intolerance, self-doubt); the emotionally positive assessment of the activity is significant and “what” is assessed in the activity; low empathy in understanding another person through intellectual similarity; underestimation of another; high mobility, which causes injuries and delinquency in boys 2 times more often than in girls; the importance of achieving each specific result and acquired skill, which has a positive effect on personal growth, allows you to be proud of yourself and strive for new achievements; preference for noisy outdoor games, friendly fights, which creates a positive emotional background in boys; boys' games are subject; in the boys' play, the foundations of the social activity of the individual are laid, the scale of future charity.

It is important to take into account that girls develop more quickly the functions of the left hemisphere, which is responsible for conscious voluntary acts, the verbal-logical form of memory, rational thinking, and positive emotions. Therefore, girls demonstrate a high reading speed and fluency of speech, the development of fine motor skills of the hands, ensuring accurate writing, and work associated with fine motor skills; sensitivity to noise, harsh sounds; intonations, the form of assessing her publicity (praise in the presence of others); awareness in the management of behavior and the adequacy of self-esteem; for a girl, a negative assessment of the activity is more significant and “by whom” the assessment is made; high empathy, interest in the inner world of people, the ability to see their positive and negative sides, understanding through emotional sympathy and openness in the manifestations of feelings; preference for verbal and quiet games, showing the high ability of girls to unite in play activities.

From the standpoint of social development, the development of the social activity of girl students is based on a person's ability to continuously change, grow, self-disclose, self-realization and self-improvement. From a pedagogical point of view, the development of the social activity of girl students will consist not so much in the transfer of information and the formation of knowledge, but in the disclosure of individual abilities, the enrichment of personal experience of socially useful activities, the acquisition of values and meanings in the context of culture.

- ✓ An individual, including girls, can be socially active in all spheres of society. Consequently, the social activity of a person can be divided into several types:
- ✓ labor; shows the degree of involvement of a person in social production and the constant growth of feasible labor, the degree of realization by a person of his own physical and mental capabilities, knowledge, skills, abilities in performing specific types of work.

- ✓ socio-political; participation in the work of public councils, organizations, meetings, the implementation of public tasks and assignments.
- ✓ cognitive and creative; participation in the work of public councils, organizations, meetings, the implementation of public tasks and assignments.
- ✓ physical activity; implies mobility in the process of knowing reality.
- ✓ mental activity; optimality of assimilation of social, emotional, logical, moral, labor, artistic experience available to schoolchildren.
- ✓ aesthetic activity; characterizes independence and creativity in the process of creating expressive images by students in play, artistic speech, visual activity
- ✓ ethical activity, expressed in the manifestation of a respectful attitude towards everything that has been done by nature and man, benevolence in communication with children and adults, expressed in sympathy, empathy, compassion, help.
- ✓ From the point of view of the nature of the manifestation of social activity, there are:
- ✓ internal activity, that is, the need for self-development, the desire to go beyond one's limits, motivation to meet personal and socially significant needs;
- ✓ external activity, due to internal, that is, conscious, independent activity, which manifests itself in interaction with society, creative transformation of oneself and the surrounding reality, and, as a result, comprehensive self-development of the individual
- ✓ The manifestation of social activity of girl students is caused by a system of the following motives:
- ✓ motives of self-determination and self-affirmation in various social communities (school, classroom, courtyard, street, etc.);
- ✓ social motives, consisting in the desire to gain knowledge in order to be useful to the Motherland, society, the desire to fulfill their duty, in the understanding of the need to learn and in a sense of responsibility; social motives provide a solid foundation of collectivism, responsibility for a common cause, citizenship, independence; expressed through the need for communication and interaction;
- ✓ motives of personal prestige aimed at striving to occupy a certain position in society; the motive for self-improvement based on this desire;
- ✓ motives of personal achievements aimed at realizing the needs for self-expression;
- ✓ cognitive motives aimed at satisfying cognitive needs;
- ✓ individual motives aimed at resolving contradictions between individual experience, internal motives and external socio-pedagogical norms and rules;
- ✓ moral motives (motive of duty, moral motives)

The motives for the manifestation of social activity are due to the desire of a person to satisfy his needs and interests in interaction with society. Unlike motives, incentives act as external stimuli to activity. In relation to social activity, stimuli can be numerous factors of an economic, political and other nature, acting in the structure of the personality's environment.

The motivational mechanism of social activity includes the interaction of needs, value orientations and interests, the end result of which is their transformation into the goal of the individual's activity, into the goal of self-manifestation. This is determined by the fact that the realization of certain needs, attitudes, interests of the individual is possible through the manifestation of activity, since if there are no needs, then there is no need for the manifestation of activity. Also, the implementation of social activity allows through the mechanism of meeting the needs of the same order to stimulate the needs of a higher level. In this case, the inner need for purposeful participation in social life can be considered the driving force of a higher order, the incentive reason for the social activity of the individual..

The social activity of a person, especially a teenage girl, implies such personal qualities as:

- life position or citizenship, which manifests itself in a personal attitude towards everything that happens in society, country and world;
- independence;
- morality;
- sociability. Their combination characterizes a person as a socially active person.

Values act as motivational mechanisms that set the style of human behavior, and are the embodiment of freedom and the ability to be creative, and, consequently, to be active, which can be considered as a significant confirmation of the existence of the value foundations of social activity.

The following stages of the formation of social activity of girl students are distinguished:

- 1) The formation and development of social needs in the social environment of life;
- 2) Awareness of the personal meanings of specific types of social activity;
- 3) Setting personally significant goals in the chosen social activity;
- 4) The choice of personally and socially acceptable forms and methods of the chosen social activity;
- 5) Personal inclusion in the chosen social activity and the transformation of social reality;
- 6) Analysis, personal reflection and self-assessment of the process and the result of one's own social activity.

Successful passage through the stages of the formation of a teenager's social activity depends on the influence of various factors on the personality. It should be noted that the factors influencing the formation and manifestation of a teenager's social activity are significant and most often objective circumstances, therefore their change is laborious and long-term.

All factors of social activity of a teenager can be divided into external and internal. The external factors for the successful formation of social activity include natural, environmental, biological, and social factors. External factors can both stimulate the process of the formation of social activity, for example, in favorable conditions, it will proceed much more efficiently, and inhibit this process. Internal factors include the worldview, the system of values and self-consciousness of a person, which form his inner world, through which there is an awareness of the external world and a person's understanding of his place in it, the meaning of his existence. The most

important external factors in the formation of the social activity of girl students include: the presence of a developing socio-cultural space, in which a person's abilities and potencies can be manifested; social needs (in the form of society's requirements for an individual), a positive attitude from others, trust; freedom in choosing directions for manifestation of social activity; success and achievement of personality in various activities.

The formation of social activity is characterized in two aspects - internal (the position of the individual, the active nature of the relationship of the individual with the environment, the orientation of motivation to meet the needs in socially significant activities and socially valuable communication) and external (active participation and initiation of social projects, participation in social contests, active participation in socially significant activities, etc.)

We attribute the following to the qualitative and quantitative indicators of the social activity of adolescents: 1) The degree of freedom of the activity carried out. Freedom acts as the ability to change objective conditions, as social activity, manifested in social practice and aimed at overcoming the contradictions between the needs and interests of the individual, on the one hand, and external circumstances and society, on the other.

2) The degree of consciousness in the search for a space for applying one's forces and the degree of imposing social responsibility on oneself in the process of activity. The personality as a subject of social activity makes a conscious effort to search for a space for the application of their forces, to become aware of landmarks and their own activities in a changing world. The degree of social activity of girl students will depend on the degree to which social responsibility is imposed on themselves, on the degree to which a person is included in solving social problems.

3) The degree of involvement in social creativity. The presence of the creative nature of social activity, which is considered in the system "man-society-culture", allows us to conclude that the higher the level of organization of a person as a person, the more his activity acquires a transforming, creative, culture-creating character. In this case, the creative nature of the activity can be recognized as an essential feature of social activity that distinguishes it from inactive activity.

4) The degree of expediency of the type of activity being carried out. A necessary factor for the manifestation of social activity is the choice of purpose, mode of behavior and action.

5) The degree of social significance and social usefulness of the activity. The manifestation of social activity is closely related to the collective interaction of people and the social assessment that is given in this regard to human activity. This assessment can stimulate or reduce the measure of personality activity.

6) Degree of manifestation of initiative. Without the manifestation of initiative, the disclosure of the potential abilities of the individual, activity cannot become as active as possible, get the most adequate and desired result. At the same time, the social initiative of a person can be assessed according to various qualitative and quantitative indicators.

7) The degree of manifestation of orientation towards positive values in motivating activities. The leading motivational force in the implementation of social acts becomes a positive system of values, which the individual initially assimilates (through the mechanism of accepting a moral ideal), and then translates the formed morally positive spiritual potential.

At each age stage, activity tends to increase in accordance with the volume of social responsibilities and experience. As students develop, their activity as a natural ability is transformed into a social system of interests and needs. This process includes students' awareness of social phenomena that make up the objective side of relations; the development of social needs with a civic orientation, primarily the need for collective interaction and the corresponding motives that encourage cooperation; participation in practical activities with a socially valuable focus.

The goal of the social activity of girl students acts as an ideal final result and can be defined as a manifestation in the activity of self-determination, consistent with the requirements and needs of society, aimed at changing the social reality in which the life of a teenager takes place.

The main goal of the development of social activity of students is associated with the formation of a citizen, a personality capable of fully living in a new democratic society and being as useful to this society as possible.

VOICE FORMATION MECHANISM AND CAUSES OF VOICE IMPAIRMENT

Shokhista Shaikramovna Shaabdurakhimova*

*Trainee Teacher of the Tashkent State Pedagogical University,
Tashkent, UZBEKISTAN

ABSTRACT

Violations of speech and voice, regardless of the reasons for their occurrence and the structure of the defect, complicate the communicative function. The human voice is a unique phenomenon and the ability to speak, express one's thoughts characterizes a person as a person. Voice disorders are the absence or disorder of phonation due to pathological changes in the vocal apparatus. In the presence of pathological changes in the larynx, the normal function of the voice is disrupted - the sonority of the voice decreases, hoarseness appears, the voice can completely disappear. Particularly persistent voice disorders are found with organic changes in the larynx. In this article, we will consider the anatomical and physiological mechanisms of speech and voice and the causes of voice disorders.

KEYWORDS: Voice, Voice Disorders, Vocal Apparatus, Respiration, Pathology, Pseudo-Voice, Organic And Functional Causes, Congenital And Acquired Causes.

INTRODUCTION

Speech is the main form of human activity and is characteristic only of a person. Speech supports the individual with society. On the basis of modern scientific data, speech can be taken as a phenomenon of the mechanical function of speech organs, the central part of which in the brain is closely connected with the cortical centers of the auditory, kinetic and visual analyzers. The speech apparatus can function normally only under the condition of clear coordination and regulation of the functions of anatomophysiological structures, which communicate back to the central nervous system how the orders received from it are carried out on the periphery.

The human voice is a unique phenomenon as an acoustic phenomenon, as an anatomical and physiological product, and also due to its social significance:

1. As an acoustic phenomenon, the human voice cannot be replaced by anything, even the most modern sound-producing acoustic installations.
2. As an anatomical and physiological product, following the development of the human nervous system against a single enzyme-endocrine background, the voice objectively reflects higher nervous activity within the framework of the mechanisms of the second signaling system.
3. the social significance of the voice is extremely important. Vocal function, inextricably linked with expressive speech, is a social category of paramount importance. The ability to speak, express one's thoughts characterizes a person as a person.

A voice is a set of sounds that are diverse in their characteristics, resulting from the oscillation of the elastic vocal folds. The phonatory apparatus is a composite anatomical concept. It includes the structure of the respiratory system throughout the respiratory tract. The respiratory system provides the basic vital function of the body, without the maintenance of which no living creature could exist. The main mechanism of this function - gas exchange - underlies all other functions of the body. The first life phase of this function is inhalation. Behind it lies a somewhat longer, no less important second phase - exhalation. The exhaled air, moving under pressure along the airway canal, is directed in the form of an air stream to the initial sections of the respiratory tract and goes out through the oral opening and nasal passages. In this phase, due to the presence in the larynx of certain muscle mechanisms formed here in direct connection with the primary function, conditions are created for the physical production of sounds and their transformation, after appropriate processing, into phonemes

Voice disorders are the absence or disorder of phonation due to pathological changes in the vocal apparatus. In the presence of pathological changes in the larynx, the normal function of the voice is disrupted - the sonority of the voice decreases, hoarseness appears, the voice can completely disappear. Particularly persistent voice disorders are found with organic changes in the larynx. Voice is one of the structural components of expressive speech, ensuring its intelligibility, expressiveness and emotionality, plays an important role in the social life of society, performing a communicative and informative function, and for many people, including number of teachers, is a "tool of production", a tool that ensures professional activity.

In the presence of pathological changes in the larynx, the normal function of the voice is disrupted - the sonority of the voice decreases, hoarseness appears, the voice may completely disappear. Particularly persistent voice disturbances occur with organic changes in the larynx. Preliminarily, we present some data on the anatomical and physiological mechanisms of voice formation. The vocal apparatus produces sound by vibrating the elastic vocal cords, or vocal membranes. The work of the vocal apparatus is subordinated to the cerebral cortex. Cortical impulses play a starting and regulating role here. But fine control of the muscles of the larynx (especially in the acts of speech and singing) is impossible without the participation of afferent impulses coming from the receptor endings, which are enclosed in the vocal cords, muscles, tendons of the vocal apparatus. In this case, the analytical role of the cerebral cortex takes place, therefore, they speak of the speech-motor analyzer as a particular form of the activity of the motor analyzer. There are also subcortical centers of the vocal reaction, subordinate to the cerebral cortex, which can inhibit these reactions. Undoubtedly, the reflex manifestation of these vocal reactions can be checked, for example, with pain. The human vocal apparatus consists of three parts:

- 1) The cavity of the lungs, bronchi and trachea;
- 2) The larynx, in which the vocal cords are located;
- 3) Upper respiratory tract - pharynx, nasopharynx, nasal cavity, paranasal sinuses and oral cavity (the so-called supra-tube).

In special literature, a person's vocal apparatus is usually compared with a musical - wind, or reed instrument, in which the sound is obtained due to the vibration of an elastic solid body - the reed, caused by a stream of air. The vocal cords are like a double tongue, with the ability to change their size, tension and elasticity. The lungs play the role of bellows; the extension tube serves as a resonator. When lowering the root of the tongue, the larynx falls, and this lengthens the extension tube; this lengthening can be increased by pushing the lips forward. The main part of the vocal apparatus - the vocal cords - are located in the larynx. The larynx is the tube that connects the windpipe (trachea) to the pharynx. The walls of the larynx consist of cartilage - cricoid, thyroid, epiglottis and two arytenoid.

The muscles of the larynx are divided into external and internal. The external muscles connect the larynx to other parts of the body, they raise and lower it. The internal muscles, during their contraction, set in motion certain cartilages of the larynx. They set in motion the vocal cords, widen or narrow the glottis. In the upper part of the larynx are the false vocal cords, in which the muscle fibers are poorly developed. Below them are the true vocal cords, they protrude in the form of folds, have a triangular shape and mainly consist of muscle tissue. The space between the vocal cords is called the glottis. When breathing, the vocal cords diverge and form a wide opening for the passage of air, the glottis takes the shape of a triangle. During phonation, the vocal cords come closer and the lumen of the glottis disappears. The innervation of the larynx is carried out by the sympathetic nerve and two branches of the vagus nerve - the superior and inferior laryngeal nerves. The superior laryngeal nerve consists of two branches: internal and external. The inner branch is more powerful, it is a sensory nerve. The outer branch is the motor nerve. The lower laryngeal nerve supplies motor fibers to all the internal muscles of the larynx, except for the anterior cricoid-thyroid. Damage to the lower laryngeal nerves paralyzes the vocal apparatus and the voice disappears. With damage to the superior laryngeal nerves, only a slight change in voice occurs. The larynx performs three functions: 1) respiratory; 2) protective; 3) voice. The respiratory function is to carry air into the lungs. In this case, the vocal cords diverge, forming a gap in the form of an isosceles triangle. The protective function prevents the penetration of foreign bodies into the lower respiratory organs. With regard to the vocal function of the larynx, i.e. in the question of the mechanism of voice formation, recently there have been two theories - tonic and clonic. The tonic theory, shared by most researchers, unites the formation of voice as follows. A stream of exhaled air coming under pressure from the lungs and bronchi meets resistance from the closed and tense true vocal cords (and sometimes, with the defeat of the latter, false vocal cords). An air jet that breaks through causes the vocal cords to vibrate.

This is how sound waves arise, which undergo changes and transformations in the extension tube and are perceived by the auditory organs as sounds of a particular height, strength, timbre. The clonic theory, denied by many scientists, gives a more independent role to the vocal cords. French physiologists (Isson et al.) Believe that impulses pass along the recurrent nerve that coincide in frequency with the sound emitted by the patient. Based on this, Esson believes that

the recurrent nerve sets in motion the vocal cords and the pitch of the voice depends only on the degree of excitability of the recurrent nerve. The emergence of a person's vocal function is attributed to the moment of his birth - to the first cry of a child, which is of a reflex nature. Later (by the end of the second month of life), the child develops sound complexes, which include some consonants. But these sound complexes have not yet been formed into words. As he grows, the child gradually masters articulate speech, in the formation of which the speech of others, hearing, vision and kinesthetic control play a decisive role. For the formation of articulate and loud speech of a person, a combination of voice function with respiratory, resonator and articulatory functions is necessary.

The voice is divided into spoken and singing (from the point of view of the mechanism of voice formation, methods and purposes of use). A professional singing voice differs from the everyday one in a wide range, the strength of sounds, a beautiful timbre, good diction and the ability to move from one register to another in the process of singing. The range of the voice is a combination of successively rising sounds emitted by a given subject. The pitch depends on the number of vibrations of the true vocal cords per second. The strength of the voice is determined by the amplitude of the vibrations of the vocal cords. The timbre of the voice depends on the addition of additional tones to the main tone - overtones. The timbre of the voice is greatly influenced by the movement of the muscles of the pharynx, soft palate, lips, cheeks, tongue, as well as the movement of the epiglottis, the larynx itself, the activity of the respiratory muscles. Breathing while speaking and singing is significantly different from breathing at rest. When at rest, it is done automatically, mainly through the nose. A resting inhalation is almost equal in duration to an exhalation. When inhaling, the glottis looks like an isosceles triangle. With a rest expiration, the glottis narrows somewhat. Exhaled air volume - 500-600 cm²

Speech and singing breathing has the following features in comparison with breathing at rest:

- 1) it is done arbitrarily, not automatically;
- 2) inhalation is made quickly, but silently, and exhalation is slow;
- 3) mainly oral breathing is used, and not nasal;
- 4) when inhaling, the vocal cords diverge widely, and the glottis acquires the shape of a pentagon. When you exhale, the glottis narrows.
- 5) Speech breathing is usually acquired independently, while the assimilation of singing breathing requires special training.

The varieties of voice (in addition to the usual spoken voice) include a whispering voice, a false-connective voice, a pseudo-voice (in persons after extirpation of the larynx, etc.). A whispering voice is formed without the participation of the vocal cords; when whispering, the vocal cords come closer, but do not touch. A whisper is obtained due to the friction of the exhaled and inhaled air stream against the walls of the cavities of the larynx, pharynx, mouth and nose. Not only true vocal cords, but also false vocal cords take part in the formation of a false vocal cords. Such a voice is characterized by hoarseness, monotony, narrowing of the range of sounds, a peculiar unpleasant shade, reminiscent of the croaking of frogs. The voice, like any other function of the body, can be subject to one or another violation. Diseases of the larynx, extension tube, lungs, bronchi and trachea, heart and cardiovascular system, as well as non-observance of

the rules of hygiene of the spoken and singing voice, non-observance of the rules of general hygiene (excessive smoking, alcohol abuse, lack of sleep, etc.) can lead to voice disorders.

Especially deep, difficult to treat, voice disorders are found with organic, deforming the larynx, changes. Stenosis of the larynx, papillomatosis of the larynx, tracheotomy operations and later plastic surgery in order to restore the respiratory function of the larynx and close the stoma - this is the main list of reasons leading to severe organic changes in vocal function. A speech therapist in his daily practice has to meet with various voice disorders. Especially great difficulties in terms of providing speech therapy assistance have to be experienced with patients suffering from severe voice disorders after organic lesions of the larynx. Restorative work in these cases does not yet have firm, established speech therapy methods. We studied Russian and foreign literature on the etiology, pathogenesis, clinical picture and treatment of typical organic voice disorders - aphonia and dysphonia. It should be noted that there are almost no indications on the issue related to the peculiarity of the method of work in cases of organic voice disorders. However, we found it possible to use the guidelines available in the literature on the treatment of functional aphonia and dysphonia (in particular, some provisions of the method of voice restoration in functional aphonia and dysphonia can be used with benefit in the treatment of organic aphonia and dysphonia).

Etiology. The causes of organic changes in the larynx can be various processes - diphtheria, laryngeal stenosis, laryngeal trauma, false croup, laryngeal papillomatosis, laryngeal neurinoma, as well as the laryngeal membrane, and in some cases, stumectomy.

MI Fomichev, ANSafarov (1936) indicate that organic aphonia result from painful changes in the voice-forming apparatus (tuberculosis, syphilis, tumors) or as a result of operational injuries. These phenomena change the structure of the vocal apparatus. The transitional step from aphonia to the voice is the false-ligamentous voice - the voice of the false ligaments. The prognosis for organic aphonia depends on the nature of the organic lesion. Far-reaching changes in the vocal apparatus will affect the outcome. L. Stein (1942) divides the causes of voice disorders into organic and functional.

Organic causes - nodules on the vocal cords (in singers), paralysis of the recurrent nerve, the absence of true vocal cords. If the paralysis is bilateral, then the voice will be aphonic; if the paralysis is unilateral, then the voice may not be sharply disturbed. If the true vocal cords are absent as a result of the operation, then their role is assumed by the false vocal cords. This is how the so-called "voice of the false ligaments" is formed. It arises as an attempt to compensate for the lost function of the true vocal cords.

M. Beri and D. Eisenson (1956) also believe that voice disorders can be caused by organic and functional reasons. The cause of a hoarse voice is pharyngitis (inflammation of the pharynx), laryngitis (inflammation of the larynx), tuberculosis of the larynx, paralysis of the ligaments, residual effects after diphtheria, scarlet fever, enlargement of the thyroid gland, aneurysms (protrusion of the palatine tonsil), pathological weakness of the phonatory musculature, chronic throat, nose. The authors divide the organic causes of a laryngeal-harsh voice into congenital and acquired. Congenital is a pathological weakness of one or more parts of the phonatory system, weakness of the laryngeal muscles. Acquired - as a result of the transferred operation tonsilloectomy (removal of the palatine tonsil). Violations of speech and voice, regardless of the reasons for their occurrence and the structure of the defect, complicate the communicative

function. Among the many disorders, a special place is occupied by a violation of the voice-speech function in people after removal of the larynx. The first removal of the larynx was performed by T. Bilroth in 1873. From that moment on, it became necessary to look for a replacement mechanism for the formation of a voice. Such a mechanism could be the esophagus, which has sufficiently movable walls and is innervated by branches of the recurrent nerve. The voice replacing phonation is called esophageal, that is, esophageal. At the beginning of the last century, the mechanism and methods of the esophageal voice were described by M. Seaman.

In Russia SL Taptapova (1963, 1975, 1984, 1985 [39, 40, 41] conducted a clinical and experimental study and developed a method of teaching the esophageal voice of patients after removal of the larynx. Muscular weakness after paralysis of the phonatory system. Organic causes of nasal voices are clefts of the hard palate, paralysis or muscle weakness of the soft palate, the presence of adenoids. Green M. (1957) indicates that the cause of voice disorders can be stenosis (congenital and acquired), as well as laryngeal papillomatosis. Sometimes children are born with a membrane through the anterior part of the ligaments. For treatment, a tantalum plate is inserted between the ligaments, which remains here for 3-4 months. As a result, the voice can be deep and hoarse. Acquired stenosis occurs from an accident, after serious injury during injury, scalding.

Surgery is necessary here, but it can be complicated by damage to the cartilage and the formation of fibrous scar tissue. Speech therapy improves the voice after surgical treatment. Laryngeal papillomatosis usually develops in early childhood. The development of the voice is affected by papillomatosis of the larynx and, although it can be restored, the hoarseness of the voice remains for several years. If, as a result of elimination of papillomatosis, scars are formed on the vocal cords, then the quality of the voice cannot be restored completely. The author points out that in some cases, dysphonia exists as a habit, and the violation of the voice is aggravated by emotional layers (the child sees that he is different from other children). The clinical picture of pathological changes in the larynx with organic voice disorders is very diverse, it is difficult to fit it into certain frameworks and schemes. Various authors indicate that such patients have extensive, severely deforming the larynx, persistent organic changes inherent only in this patient.

We list these changes: deformity of the larynx, limitation of mobility of the right or left half of the larynx, hyperemia of the true vocal cords, their thickening, incomplete closure, limitation of the mobility of one or the other true vocal cords, the gap between the vocal cords, false ligaments can move to the true, with phonation come closer ; breathing is usually noisy, shallow, during phonation there is a sharp tension in the muscles of the neck and face. MI Fomichev and AN Safarov (1936) note the "stiffness" of articulation with organic lesions of the larynx, disorganized speech breathing. They consider a pseudo-connective voice to be a transitional step from aphonia to a voice - "croaking", monotonous, hoarse, colorless, stifled.

V.P. Khrakovskaya-Chernyak (1937) divides patients with voice disorders into three groups:

Group 1 - purely functional diseases,

Group 2 - functional with pseudo-organic layers and

Group 3 - organic with functional moods.

For the third group of patients, the author considers a discrepancy between the severity of organic changes in the larynx and the degree of voice disorder characteristic. After the

restoration of the voice, the laryngoscopic picture changes slightly. L. Stein (1942) notes that with the formation of the voice of the false ligaments, all muscles move. The pseudo-ligaments converge and produce an unpleasant low, monotonous sound. NF Lebedeva (1952) defines the hyperfunction of the false ligaments. Their role is in the protective function of the true vocal cords. At first, when the false ligaments perform the function of the true ones, they seem to drown out the work of the weakened true ligaments and the patient can only speak in a whisper. As you train, the false ligaments begin to move. The phonation of the false ligaments is characterized by a croaking voice, of a rough timbre, with an admixture of noise. With papillomatosis of the larynx, the voice is deaf in the initial stages, soundless in the presence of a large number of papillomas or frequent relapses. IA Voznesenskaya (1958) indicates two symptoms of laryngeal papillomatosis: 1) change in voice, 2) change in breathing. The author divides the change of voice into three degrees: 1) the voice is rough, hoarse, but loud; 2) a hoarse voice; and 3) aphonia. Aphonia is associated with multiple papillomas

The question of the treatment of organic voice disorders (aphonia, dysphonia, pseudo-ligamentous voice) is very difficult due to the presence of deep organic changes in the Larynx - scars, ankylosis of the cartilaginous joints, adhesions, etc. These changes make it difficult to restore the voice. The vocal mechanisms providing sound production in these cases are preserved and functionally activated remnants of the true vocal cords or false vocal cords.

As mentioned above, there are a significant number of reports in the literature on the treatment of functional disorders of voice formation, while there are almost no indications on the treatment of organic voice disorders. In these cases, it is still advisable to apply some provisions of the method of voice restoration in case of functional disorders.

PECULIARITIES OF MNESTIC ACTIVITIES IN PRESCHOOLERS WITH DYSARTRIA

Nadezhda Vasilievna Sosedova*

*Tashkent State Pedagogical University,
Tashkent, UZBEKISTAN

ABSTRACT

This article examines the relationship between speech disorders in preschool children with mental processes, in particular with the features of verbal memory. One of the main features is a later onset of speech, speech is agrammatical and is characterized by fuzzy pronunciation, poorly understood by others. The child understands the speech of others well, but utters words completely indistinctly and inexpressively. Along with general somatic weakness, preschoolers suffering from dysarthria are characterized by some lag in the development of the motor sphere, which is characterized by poor coordination of movements, decreased speed and dexterity of performance.
