ACADEMICIA

An International  
Multidisciplinary Research  
Journal

Published by  
**South Asian Academic Research Journals**  
A Publication of CDL College of Education, Jagadhri  
(Affiliated to Kurukshetra University, Kurukshetra, India)

**ACADEMICIA**

An International Multidisciplinary Research Journal

ISSN (online) : 2249 –7137

Editor-in-Chief : Dr. B.S. Rai

Impact Factor : SJIF 2020 = 7.13

Frequency : Monthly

Country : India

Language : English

Start Year : 2011

Indexed/ Abstracted : Scientific Journal Impact Factor (SJIF2020 - 7.13), Google Scholar, CNKI Scholar, EBSCO Discovery, Summon (ProQuest), Primo and Primo Central, I2OR, ESJI, IJIF, DRJI, Indian Science and ISRA-JIF and Global Impact Factor 2019 - 0.682

E-mail id: saarjournal@gmail.com

**VISION**

The vision of the journals is to provide an academic platform to scholars all over the world to publish their novel, original, empirical and high quality research work. It propose to encourage research relating to latest trends and practices in international business, finance, banking, service marketing, human resource management, corporate governance, social responsibility and emerging paradigms in allied areas of management including social sciences , education and information & technology. It intends to reach the researcher's with plethora of knowledge to generate a pool of research content and propose problem solving models to address the current and emerging issues at the national and international level. Further, it aims to share and disseminate the empirical research findings with academia, industry, policy makers, and consultants with an approach to incorporate the research recommendations for the benefit of one and all.

## An International Multidisciplinary Research Journal

(Double Blind Refereed & Reviewed International Journal)

SR. NO.	PARTICULAR	PAGE NO	DOI NUMBER
1.	AN ANALYSIS OF THE SECOND LANGUAGE LEARNERS IN LEARNING ENGLISH: A STUDY ON THE RURAL STUDENTS  Dr. Parupalli Srinivas Rao	40-51	10.5958/2249-7137.2020.00404.8
2.	MODERN SOCIO-PEDAGOGICAL NECESSITY OF INCREASING COMMUNICATIVE COMPETENCE OF FUTURE PHYSICAL EDUCATION TEACHERS  Toshtemirov Otabek Abidovich, Aminjanov Alisher Adxamjanovich	52-57	10.5958/2249-7137.2020.00218.9
3.	EFFECTIVE TOOLS AND SOLUTIONS FOR TEACHING "DRAWING-GEOMETRY AND ENGINEERING GRAPHICS"  Abdurasul Abdulakhatovich Kholmurzaev, Odiljon Isakovich Alijonov, Javlonbek Zafarjonovich Madaminov	58-61	10.5958/2249-7137.2020.00219.0
4.	THE RECTIFICATION OF CURVE FLAT ARCH  Xusanboev Abdulqosim Mamajonovich, Umarova Munavvar Omonbekovna, Abdullayeva Dono Toshmatovna	62-65	10.5958/2249-7137.2020.00220.7
5.	METHODS OF DEVELOPING STUDENTS' DESIGN COMPETENCIES IN THE DISCIPLINE "ENGINEERING AND COMPUTER GRAPHICS"  Javlonbek Zafarjonovich Madaminov	66-71	10.5958/2249-7137.2020.00221.9

6.	<b>THE STUDY OF PHOTOELECTRIC AND PHOTOGRAPHIC CHARACTERISTICS OF SEMICONDUCTOR PHOTOGRAPHIC SYSTEM IONISATION TYPE</b> Yuldashev Khurshidjon, Abdumalikova Zulfiya Abdumalikovna, Umurzakova Gulnara Muminovna, Qipchaqova Gavxaroy Mirzasharifovna	72-82	10.5958/2249-7137.2020.00222.0
7.	<b>USE OF GRAPHICS COMPUTER SOFTWARE IN THE STUDY OF THE SUBJECT "DRAWING AND ENGINEERING GRAPHICS"</b> Rustamova Muxlisa Muxtoraliyeva, Oxunjonov Zuxriddin Nosirjonovich, Madaminov Javlonbek Zafarjonovich	83-86	10.5958/2249-7137.2020.00223.2
8.	<b>THE ADVANTAGES OF USING INNOVATIVE TECHNOLOGIES IN IMPROVING THE QUALITY OF EDUCATION</b> Basharova Gulmira Galimyanovna	87-94	10.5958/2249-7137.2020.00224.4
9.	<b>USING GAMING TECHNOLOGIES IN ENGINEERING GRAPHICS LESSONS</b> Valikhonov Dostonbek, Arziev Saydullo	95-99	10.5958/2249-7137.2020.00225.6
10.	<b>TRANSITION PHOTOELECTRIC PROCESSES IN A SUPERFLUID GAS-DISCHARGE CELL WITH SEMI-CONDUCTOR ELECTRODES</b> Yuldashev Khurshidjon, Tillaboyev Azamjon, Komilov Abdullajon, Sotvoldiyev Xusniddin	100-09	10.5958/2249-7137.2020.00226.8
11.	<b>COVID-19 -: AN INVISIBLE SILENT KILLER: ITS EFFECT AND POTENTIAL THREATS TO THE WORLD</b> Nisha Rani	110-16	10.5958/2249-7137.2020.00407.3
12.	<b>STUDY OF THE HEPATOPROTECTIVE ACTION OF RUTAN</b> A.A. Mavlonov, R.R. Boboeva	117-20	10.5958/2249-7137.2020.00250.5

13.	APPLICATION OF THE LAWS OF PHYSICS IN PREPARATION OF PROFESSIONAL DANCERS  Abdukhakimova Durdona Mamatovna	121-25	10.5958/2249-7137.2020.00251.7
14.	PEDAGOGICAL BASIS OF PROMOTING PRESCHOOL CHILDREN INTEREST IN A HEALTHY LIFESTYLE  Alimdjanova Dilbar Negmatovna	126-29	10.5958/2249-7137.2020.00252.9
15.	EFFICIENCY OF USE OF AUTODESK INVENTOR ENGINEERING PROGRAMS AND PEDAGOGICAL INFORMATION TECHNOLOGIES IN THE FIELD OF "RESISTANCE OF MATERIALS" IN THE PROCESS OF TEACHING STUDENTS OF TECHNICAL UNIVERSITIES  Ulugov Bazar Dzhumaevich	130-43	10.5958/2249-7137.2020.00253.0
16.	DEVELOPMENT OF NATIONAL NETWORK (TAS-IX)  Dadamuxamedov Alimjon Irgashevich	144-51	10.5958/2249-7137.2020.00254.2
17.	EVALUATION OF THE EFFECT OF HEIGHT PARAMETERS ON LANDSCAPE TRANSFORMATION IN MEDIUM ZARAFSHAN LANDSCAPES ON THE BASIS OF MODERN METHODS  Gulmurodov Farrukh Eshmurodovich, Meliev Bakhtiyor Abdukhomidovich, Pulatov Asliddin Sayfullaevich	152-57	10.5958/2249-7137.2020.00255.4
18.	THE ROLE OF DANCE IN THE OPENING OF THE IDEA OF THE PERFORMANCE AND IN THE ART OF CINEMA  Abraykulova Nasiba Erkinovna, Fazlieva Zebo Kamarbekovna	158-62	10.5958/2249-7137.2020.00256.6
19.	DYNASTY IN TASHKENT SCHOOL OF WOOD CARVING: ON THE EXAMPLE OF M.IBRAGIMOVA'S CREATION  Gaipova Mukhayyo Tulyaganovna	163-68	10.5958/2249-7137.2020.00257.8

20.	<b>CLINICAL AND EPIDEMIOLOGICAL CHARACTERISTIC OF HYMENO-LEPIDOSIS IN CHILDREN</b>  Mirzoeva M.R, Khamidova N.K	<b>169-73</b>	<b>10.5958/2249-7137.2020.00258.X</b>
21.	<b>THE EFFECT OF COMMUNICATION PRACTICE ON CONFLICT MANAGEMENT IN ETHIOPIAN ELECTRIC POWER CORPORATION (A CASE STUDY OF ETHIOPIAN ELECTRIC POWER CORPORATION NORTH-WESTERN REGIONAL OFFICE)</b>  Haile Shitahun Mengistie	<b>174-88</b>	<b>10.5958/2249-7137.2020.00408.5</b>
22.	<b>SOCIO-PHILOSOPHICAL ANALYSIS OF THE CATEGORY OF SOCIAL TRUST IN CIVIL SOCIETY AND DEMOCRACY</b>  Jamila Matkarimova	<b>189-98</b>	<b>10.5958/2249-7137.2020.00371.7</b>
23.	<b>SOCIO PRAGMATIC ASPECTS OF THE OCCURRENCE OF METAPHORS IN THE WORKS OF CHARLOTTE BRONTE</b>  Ulugova Shohida Shohruhovna	<b>199-05</b>	<b>10.5958/2249-7137.2020.00372.9</b>
24.	<b>INTEGRATED REGIONAL DEVELOPMENT BASED ON FUTURE LAND USE</b>  Aminova Sevara Farxadovna, Shafkarova Manzura Xudoyberdiyevna	<b>206-09</b>	<b>10.5958/2249-7137.2020.00373.0</b>
25.	<b>BIOMETRICS AUTHENTICATION: A STUDY</b>  O'rinov Nodirbek, Madolimov Faxriddin, Aliyeva Gulzira, Umarova Ra'no	<b>210-14</b>	<b>10.5958/2249-7137.2020.00374.2</b>
26.	<b>EFFICIENT USE OF WATER RESOURCES OF THE AMU-BUKHARA CANAL</b>  HayitovYozil Kasimovich, Toshbekov Nurbek Ahmadovich, Jumaeva Tozagul Azamovna	<b>215-18</b>	<b>10.5958/2249-7137.2020.00375.4</b>
27.	<b>USE OF SMARTPHONE APPLICATIONS IN ENGLISH LANGUAGE LEARNING</b>  Miyasar Satbaevna Azatbaeva	<b>219-22</b>	<b>10.5958/2249-7137.2020.00376.6</b>

28.	<b>DOGWOOD (CORNUS MAS L) PLANTS – MEDICINAL PROPERTIES AND USES</b> Matkarimova Gulnaz Maksudjanovna	223-25	10.5958/2249-7137.2020.00377.8
29.	<b>PESTS AND CRITERIA FOR WHEAT DAMAGE IN THE CONDITIONS OF KARAKALPAKSTAN</b> Baoetdinov Bakhtiyar Otebayevich	226-28	10.5958/2249-7137.2020.00507.8
30.	<b>THE PERIOD IN WHICH IMAM BUKHARI LIVED AND THE STAGES OF THE SCIENCE OF INTERPRETING THE QUR'AN AT THAT TIME</b> Azizkhoja Inoyatov	229-48	10.5958/2249-7137.2020.00516.9
31.	<b>ANALYSING THE IMPACT OF COVID-19 ON STOCK MARKET USING FIBONACCI RETRACEMENTS</b> Dr. Esha Jain	249-65	10.5958/2249-7137.2020.00414.0
32.	<b>THE IMAGE OF FERUZ IN THE DRAMA</b> Xudayberganov Yodgorbek Satim boyevich	266-69	10.5958/2249-7137.2020.00347.X
33.	<b>CERTAIN ASPECTS OF REDUCING A SHADOW ECONOMY THROUGH THE MONITORING OF FOREIGN TRADE OPERATIONS COMMITTED BY CUSTOMS AUTHORITIES</b> Odilbek Burkitbayevich Gaipov, Sharipova Dilrabo Nadirovna	270-76	10.5958/2249-7137.2020.00348.1
34.	<b>THE NEGATIVE IMPACT OF THE COVID-19 PANDEMIC ON GLOBAL FINANCIAL MARKETS</b> Elmirzayev Samariddin, Kholikov Khamidulla	277-83	10.5958/2249-7137.2020.00349.3
35.	<b>TEACHING ENGLISH INDEPENDENTLY BY PARENTS TO DEAF CHILDREN</b> Nodira Nabiyeva Rustamjon qizi	284-87	10.5958/2249-7137.2020.00350.X
36.	<b>RISK FACTORS OF KIDNEY DAMAGE AT PATIENTS WITH RHEUMATOID ARTHRITIS</b> Aliaxunova Mavjuda Yusupovna, Naimova Shohida Anvarovna	288-93	10.5958/2249-7137.2020.00351.1

37.	<b>THE IMAGINE ALISHER NAVOIY IN OYBEK'S WORKS</b> Xudayberganov Yodgorbek Satimboyevich	294-97	10.5958/2249-7137.2020.00353.5
38.	<b>TYPES OF LOGICAL THINKING AND METHODS OF ITS DEVELOPMENT</b> Tukhtasinov Dadakhon Farhodovich	298-03	10.5958/2249-7137.2020.00354.7
39.	<b>PSYCHOLOGICAL CONDITION OF DEAF CHILDREN IN TEACHING ENGLISH</b> Nodira Nabiyeva Rustamjon qizi	304-07	10.5958/2249-7137.2020.00355.9
40.	<b>MOLECULAR GENETIC FACTORS OF BREAST CANCER DEVELOPMENT (REVIEW)</b> Abdukhakimov Abdulla Nusratillayevich, Tukhtaboeva Muqaddas Tukhtabieva	308-12	10.5958/2249-7137.2020.00356.0
41.	<b>LEARNERS AND LEARNING: MOTIVATIONAL STRATEGIES &amp; THE ROLE OF TEACHERS</b> Dr. Mohammed Quamruddin Ansari	313-26	10.5958/2249-7137.2020.00411.5
42.	<b>COVERAGE OF THE THEME OF THE WAQF (FOUNDATION) IN THE NOVEL "AL-HIDOYAH" BY BURHONIDDIN MARGHINANI</b> Rakhshona Kenjaboeva Mirzaevna	327-33	10.5958/2249-7137.2020.00445.0
43.	<b>LOVE AND ENLIGHTENMENT - A COMMON CONCEPT</b> Latipov Hayot Ramazonovich	334-41	10.5958/2249-7137.2020.00446.2
44.	<b>FORMATION, ACTIVITIES AND PROBLEMS OF PRESCHOOL EDUCATION INSTITUTIONS IN UZBEKISTAN. (1945-1980 YEARS)</b> Tishabayeva Irodaxon Rasulovna	342-47	10.5958/2249-7137.2020.00447.4
45.	<b>THE UNITED STATES AND CENTRAL ASIA: SIGNIFICANT ASPECTS OF RELATIONS AND INTERESTS</b> Yunusov Shokhrukh	348-56	10.5958/2249-7137.2020.00448.6

## AN ANALYSIS OF THE SECOND LANGUAGE LEARNERS IN LEARNING ENGLISH: A STUDY ON THE RURAL STUDENTS

**Dr. Parupalli Srinivas Rao\***

\*Lecturer in English,  
English Language Centre, King Faisal University,  
Al-Hasa, Kingdom of SAUDI ARABIA

### ABSTRACT

*For the development of the nation, advancement and development of the rural areas are actually associated with a at most value. English could play a crucial role of the advancement of rural places. Speaking and knowing of English language is able to open brand new jobs for the individuals of rural areas and could aid them in leading to the development of the nation of ours? Teaching kids of rural areas in India is additionally an extremely crucial facet in our country's development. Language is actually among the medium of expressing our emotions, feelings, and ideas. In case we consider language in present world, English is actually among the most frequently used languages in world as well as English can be used to find out as a difficult language in the rural areas. This particular paper studies the attitude of learners towards language learning in a second language learning environment. This particular study was done utilizing a survey method. In the conclusion of the study, the collected data examined by using formulas created for attitude.*

**KEYWORDS:** English, Language, Attitude, Rural, Students.

### I. INTRODUCTION

Learning English language is viewed as an essential requirement at each stage of academic process. Generally, the 2 levels that are different, both school as well as college, in which English is teaches to students in various learning situations, appears to deliver 2 various ends. The language trained as well as learnt at these 2 levels is based on requirements that are diverse & things. For example of schools, the language teaching focuses on elements as marks, conclusion of syllabus as well as coaching or training for students to create exams. In colleges,

the language teaching lays focus on smooth skills, communication skills as well as employability skills to meet the demands of employers from industries and businesses.

In India, English isn't used just for the utilitarian objective but additionally for the inter-institutional and interpersonal communication. It really works when the Business Language also the Lingua Franca, this means it's necessary to hold out the company and additionally to speak with individuals of cultures that are different as India is a multi-lingual and multi-cultural nation. It's no more operating when the condition language of the best category or even the educated category of the society, quite it's operating as an instrument to bring success in life. The youth of India are actually aware that English can easily earn them great jobs with abundant salary in case they're very good in English.

Attitude is actually driven through the individual's beliefs about attributes or outcomes of executing the behavior (behavioral beliefs), weighted by evaluations of those results or perhaps characteristics. As a result, an individual that holds strong beliefs which favorably prized results will end up from executing the behavior will have a good attitude to the conduct. Alternatively, an individual that holds strong beliefs which adversely prized results will end up from the actions will have a bad attitude." Attitude principle could be seen from these 3 dimensions. Each one of those dimensions has various options to draw out language attitude benefits. Appropriately, the attitude idea has 3 parts i.e., behavioral, affective and cognitive. These 3 attitudinal areas are based upon the 3 theoretical methods of behaviorism, humanism as well as cognitivism respectively.

In the changing scenario of language teaching theories & methodologies, exactly where the learners, instead of the teachers, are actually gaining a main position, learners' attitude plays a crucial role in maximizing learning as well as teaching output. Learners' attitude can be described as a set of thoughts concerning language consumption as well as the condition of its of the society. The thoughts are neutral, bad, and good. They could nurture or perhaps impede the learning method safely and effectively. Even after syllabus, teaching materials, teacher training programmes have been transformed as well as made up to date from time to time, the general output of the competence of the students has never been enhanced. One reason for this is that the changes have usually been powerfully constrained by the western cultural assumptions as well as lack of understanding of the social contexts. Not a lot of research has been directed to the subject of the way the local educational/teaching environment has affected students' learning once the students aren't English major, but learning English as non majors as a result of professional requirements in addition to educational requirements. The idea of attitude, as a solid variable, applies in this particular circumstance.

## **II. SCENARIO OF RURAL AREAS**

The city kids are subjected to a great deal of modules and they've the opportunity of learning English via various methods. Special training can be purchased in the city schools to enhance the students' Listening, Speaking, Reading and Writing skills that are the fundamental skills for learning some language whereas the rural student have just minimal exposure to learn English. The training offered in schools, is solely theoretical as well as English and bookish is explained exclusively in the examination point of view. Hence, even after 12 years of learning English as a subject the student are reluctant to speak in English. This is applicable to city kids too; a lot of them are excellent in English but with regards to the use of talking in English hesitation prevails

much more among student. It's high time to encourage the student, right from the school of theirs by producing a comprehension about the benefits of English language. It's crucial that the instructors that teach English in rural areas must be dedicated and also have an honest approach to provide the skills of the student. The readily available resources must be totally tapped and so as to present an encouraging environment for learning as well as studying the language.

### • **Problems Faced By the Rural Students While Learning English**

To start with, the very first as well as the primary element is the Financial and socio-cultural experience of the household. As the majority of the parents are actually illiterate, they're unable to guide the wards of theirs as educated parents do. Hence, the students' overall performance lacks parental supervision as well as direction and that is really needed for education. The illiterate parents are actually not able to understand the benefits of training as well as they don't comprehend the significance of communication skills which plays a crucial role in their ward's profession.

The kids from rural areas that go to the school in the neighborhoods of theirs aren't subjected to the exact same kind of facilities and driven as the city bred kids. In cities, the kids get motivated through 2 ways: Integrative and instrumental inspiration. Learning a language just for incentives is actually crucial inspiration, on the additional hand integrative inspiration comes with the desire to be a part of the town and that is very powerful that pushes the kid to pick up the language with perfection. Concerning the syllabus, probably the most crucial factor would be in the majority of the schools English is presented as another topic. The significance of English as a communicative device isn't recognized. So the present strategies followed at rural schools aren't adequate to train the student to talk efficiently in English. For this reason, the students from rural area that take up skilled courses face a great deal of problems. Because they're bad adequate to speak in English, they miss countless possibilities.

### **III. REVIEW OF RELATED WORK**

Sinushamurthy et al., (2018) state that goal of this particular analysis was to figure out the students' anxiety, attitude and commitment for learning English depending on the socioeconomic status of theirs as well as English language achievement in National type Tamil facilities. Samples for this particular study comprised of 144 season five Indian student from 4 Tamil facilities. Data because of this study had been collected by questionnaire adapted from instruments. The results of this particular study showed that Indian student from rural and urban areas have a reasonable amount of nervousness in learning English. Student from both areas had been instrumentally driven as well as showed positive attitudes towards learning English. Nevertheless, bad correlations had been determined between English Language achievement as well as amount of inspiration in learning English or even in between day spoken languages at home with friends as well as the degree of English language achievement. The consequence of this particular study likewise illustrated that amount of commitment as well as attitude is positively correlated. To conclude, the samples of this particular study showed high levels of anxiety and also attitude and commitment for learning English. It's suggested that future research take far more samples and also include qualitative data to boost the reliability of the study.

Shameenahmad (2015) analyses the product of a survey on 238 undergraduate EFL student at a public faculty of Malaysia. The survey focused on the attitude of theirs towards English learning

and leads to that may have hindered the learning of theirs. For data collection, a nineteen thing questionnaire had been developed as well as administered on 238 students. Outcomes of the qualitative analysis show that the attitude towards English language learning and making use of the language in different domains of consumption is very good. The data also discovered that the majority of the student had bad thoughts or maybe fear concerning classroom directions in the learning experience of theirs. Student of various fields varied in attitudes towards English language learning in phrases of domains of emphasis as well as use of learning skills, which reveals that a single curriculum or maybe teaching methodology isn't sufficient. Many tips are made concerning the status, teaching materials, curriculum, and teaching methodology of English in Malaysia from this point of view.

Goktepe (2014) examined ninety first year internet business research undergraduates at a Turkish faculty as well as their determination and attitude towards learning English as a different language. The results showed that these learners learn English generally for instrumental reasons as well as integrative inspiration is actually dominant motivational orientation for the learners in certain degree.

In his investigation, Gajalakshmi (2013) took a look at the IX standard students' attitude towards learning English language. A standardized questionnaire was administered in the type of normative survey to 600 IX regular student (selected randomly from different high as well as greater secondary schools within Puducherry region) to gather the attitude of theirs towards learning English language. The collected data was statistically examined by SPSS ver 16. The results revealed that there's a tremendous difference depending on the gender, locality of the school, school type, management type. Hence it was concluded that much more classroom activities of the study of English improve student' attitude to learn English.

Yang (2012) conducted a brief research with twenty Faculty Malaya Master student to assess their determination and perceptions in L2. The primary goal of the analysis was finding out what can make some individuals acquire as well as learn English better compared to others. The results show that' learners that were positively and highly involved in the English proficiency of theirs had positive perceptions and very motivated towards learning English'.

Akram, Aatika as well as Rabia Yasmeen (2011) confirms that individuals of Faisalabad have better attitudes towards English compared to Punjabi language as English is actually related with the favorable features as the support, prestige, status, and job opportunities from the authorities. Due to these favorable characteristics, nearly all almost all of the individuals show good attitude towards English language as well as learning.

Rao, P. S. (2019a) says, "It is essential for everyone to learn the English language to face the challenges in the global market. Therefore, one must realize the importance of English in the contemporary world and make others realize and learn English language not only for communication but also for other purposes." Rao P. S. (2019b) further states that the interesting trend in the twenty-first century is that some of the biggest economies such as China, Japan, Russia, France and Brazil are focusing on English language after realizing the value of English at global level. Rao P.S. (2020) also asserts that the successful educating and learning is relies upon utilization of reasonable showing helps and educators capability. There are numerous techniques risen in the 21st century for educating and learning of English language. Training English language gets trying for educators at school instruction framework in India. It proposes using the

assets that are accessible for correcting the issues so as to meet the necessities of the current circumstance all around by the students.

#### **IV. OBJECTIVES OF THE STUDY**

1. To study the general concept of English language learning and rural areas
2. To analyze the attitude of English learners in rural areas.
3. To analyze the association between male and female learners

#### **V. RESEARCH METHODOLOGY**

- **Research design**

The method of this particular research was a survey research. Based on Singh, survey method in research is actually telling what's that's describing the issue or even occurrence. Adding to it, survey method is able to respond to a broad range of research questions, out of the as well as what to the why and how given. Due to that, the researcher believed survey method might reply as well as describe the attitude of the student in term of affective, cognitive and behavioral element. In doing the survey research, the researcher likewise needs to concern about the actions or the methods. Right now there is actually planning, defining the population, sampling, building the instrument, conducting the survey, and processing the data.

- **Population of study**

The population of this research was the students studying in the villages of rural parts in India. Population is the group of individuals having one characteristic that distinguishes them from other groups.

- **Sample size**

In this quantitative analysis, the sample comprised a total of forty five students; out of which there were twenty five male and twenty students that are female, whom were enrolled in a brief English Language program arranged by a rural Indian population or government. This specific program had a rigid policy of enrolling students whose ages ranged somewhere between seventeen to twenty five years. Vast majority of the participants had been in between the age bracket of 20 as well as 21. There was just one student that was twenty five years of age, and just 2 that had been seventeen years of age. Though the program had an enrollment of fifty students, five didn't take part in the study.

- **Data collection technique**

The technique of data collection that was applied in this research was questionnaire. It was applied in order to know the students attitude towards English language learning in term of emotional, behavioral and cognitive aspect.

#### **Instrument used for data collection**

This particular study aimed to take a look at the inductee students' language learning attitudes on 3 sub levels: behavioral, cognitive and emotional using Likert scale questionnaire adapted from: Eshghinejad (2016), Rermyindee, Chuaymankhong, Boonrangsri, and Vongchittipinyo (2004) as well as Gardner's attitude as well as determination test battery (1985). There had been thirty

statements related to attitudes with reference to behavioral (1 - 10), cognitive (11 - 20), and emotional (21 - 30) facets of perceptions.

- **Data analysis**

Right after collecting the data, the researcher analyzed the data. Firstly, counting the student's result in answering the questionnaire that has been put based on the Likert Scale. Right after counting the researcher placed the outcome into method below:

### **Hypothesis of the study**

H1: There is no significant difference between male and female students towards Behavioral attitude based on English language learning.

H2: There is no significant difference between male and female students towards Cognitive attitude based on English language learning.

H3: There is no significant difference between male and female students towards Cognitive attitude based on English language learning.

### **VI. DATA ANALYSIS**

The study was done in rural villages of India to quantify the students' attitude towards English language learning in term of affective, cognitive and behavioral element. The attitude of the student found out by utilizing questionnaire which was developed correctly for understanding the student's attitude in term of those 3 elements.

The student had been asked to reply to the questionnaire depending on the students' private thoughts, opinions as well as encounters about English language learning. Right after collecting as well as counting the questionnaire that's been answered by the student, the frequency of the student solution for each belief as well as the mean score of the students' attitude towards English Language Learning could be known. A Chart for the mean score of the students' attitude is actually provided as below:-

**Figure 1: The Mean Score of Students' Attitude**

By the bar chart earlier, it could be concluded that the student have a strong emotional as well as behavioral attitude, but the cognitive attitude of the student is simply get adequate score. Since, according to the calculation of every element, nearly every student has probably the lowest score for behavioral element instead of cognitive and affective element.

**TABLE 1 DEMOGRAPHIC PROFILE**

<b>Gender</b>	<b>Frequency</b>	<b>Percent</b>
Male	25	55.6
Female	20	44.4
<b>Age</b>		
17	2	4.4
18	6	13.3
19	7	15.6
20	10	22.2
21	2	4.4
22	10	22.2
23	4	8.9
24	3	6.7
25	1	2.2
<b>Education</b>		
Inter	11	24.4
BA	10	22.2
BSC	5	11.1
BCOM	7	15.6
BBA	10	22.2
MA	1	2.2
MSC	1	2.2
<b>Total</b>	<b>45</b>	<b>100.0</b>

**STUDENTS' ATTITUDE****TABLE 2 GROUP STATISTICS FOR STUDENTS' ATTITUDE TOWARDS ENGLISH LANGUAGE LEARNING**

<b>GNR</b>		<b>N</b>	<b>Mean</b>	<b>Std. Deviation</b>	<b>Std. Error Mean</b>
Behaviour	Male	25	3.61	0.49	0.10
	Female	20	3.76	0.43	0.10
Cognitive	Male	25	3.90	0.43	0.09
	Female	20	4.06	0.49	0.11
Emotion	Male	25	3.98	0.43	0.09
	Female	20	4.01	0.51	0.11

Table two displays the distinction between female and male students' behavioral, cognitive, and emotional attitude towards English language learning. From this particular perspective, the mean values of male students are actually 3.61 for behavior, 3.90 for cognitive, as well as 3.98 for emotional attitude with 0.49, 0.43, as well as 0.43 as standard deviation and 0.10, 0.09, as well as 0.09 as standard error respectively. To be able to check in case the mentioned differences are statistically significant, Independent Samples Test was run stating the condition of hypotheses.

**TABLE 3 T-TESTS BASED ON STUDENTS' ATTITUDE TOWARDS ENGLISH LANGUAGE LEARNING**

Levene's Test for Equality of Variances				t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
<b>Behavior</b>	Equal variances assumed	.122	.729	-1.021	43	.313	-.142	.139	-.423	.139
	Equal variances not assumed			-1.037	42.668	.306	-.142	.137	-.419	.134
<b>Cognitive</b>	Equal variances assumed	.074	.787	-1.158	43	.253	-.160	.138	-.439	.119
	Equal variances not assumed			-1.142	38.352	.261	-.160	.140	-.444	.124
<b>Emotion</b>	Equal variances assumed	1.481	.230	-.215	43	.831	-.030	.140	-.311	.251
	Equal variances not assumed			-.211	36.923	.834	-.03000	.14241	-.31857	.25857

In Table, the Levene's Test for Equality of Variances establishes that the variability in the 2 various genders of students is all about the same, as the sig values for those 3 kinds of attitude are actually greater compared to .05. This particular finding of the current study reveals that the 3 kinds of mindset towards learning English language don't vary excessive among both genders of students. Thus, the (2 Tailed) sig values are actually to be looked at out of the rows "Equal Variances Assumed" instead of the rows "Equal Variances Not Assumed," which show the results of t test for Equality of Means. From this particular perspective, the (2 Tailed) sig values for every kind of students' attitude are actually .313 with .142 as .139, and mean difference as standard error distinction for behavioural, .253 with .160 as mean impact, as well as .138 as standard error difference for cognitive, as well as .831 with .030 as mean difference, as well as .140 as standard error difference for emotional attitude. Because all 3 (2 Tailed) sig values are actually greater compared to .05, it's safe to claim minor distinction between the 2 genders for those 3 kinds of attitude. In addition, the distinction in the mean appreciates talked about in Table two may be claimed as based on chance instead of the manipulation of distinction of

genders of students. Being a result, every one of the hypotheses, in the current study, is actually accepted.

**TABLE 4 STATUS OF HYPOTHESIS**

No.	Hypotheses	Sig Value	Status
H1	There is no significant difference between male and female students towards Behavioral attitude based on English language learning	.313	Accepted
H2	There is no significant difference between male and female students towards Cognitive attitude based on English language learning	.253	Accepted
H3	There is no significant difference between male and female students towards Emotional attitude based on English language learning	.831	Accepted

The outcomes of the t test illustrate that there's no statistically significant distinction between females and males regarding the attitudes of theirs (behavioral, emotional and cognitive) towards the learning of English. It was discovered from the calculation of independent sample t test which showed that the estimated p worth for the 3 attitudes I e BH#.068, COG#.974 as well as EMO#.731 was higher compared to.05 level to ensure the hypothesis that there's no distinction between language learning attitudes (behavioral, emotional and cognitive) as well as gender of the English students' is actually accepted.

## VII. CONCLUSION

In the procedure of learning, attitudes of learners play a crucial role, as such; their learning is actually impacted by a variety of elements. This particular analysis attempted to take a look at the behavioral, cognitive and emotional elements which might leave an influence on learner's attitude towards learning English language and discovered that participants possessed positive attitudes towards it. Even with acknowledging the worth of English for society, other things produce a part of indecisiveness as well as tentativeness for the actions of the students that appear to be in a state of anxiety whether to choose the target language or perhaps not due to the two schooling devices being applied in the nation. By two schooling process the scientists are talking about the English and Urdu moderate of instruction being utilized at the educational sectors.

The willingness to get into something totally new with no apprehension is crucial to building a good attitude. Likewise, for proficiently learning English, or maybe some additional language, it's highly appropriate as well as significant to have an optimistic attitude towards that specific

In the procedure of learning, attitudes of learners play a crucial role, as such; their learning is actually impacted by a variety of elements. This particular analysis attempted to take a look at the behavioral, cognitive and emotional elements which might leave an influence on learner's attitude towards learning English language and discovered that participants possessed positive attitudes towards it. Even with acknowledging the worth of English for society, other things produce a part of indecisiveness as well as tentativeness for the actions of the students that

appear to be in a state of anxiety whether to choose the target language or perhaps not due to the two schooling devices being applied in the nation. By two schooling process the scientists are talking about the English and Urdu moderate of instruction being utilized at the educational sectors.

The willingness to get into something totally new with no apprehension is crucial to building a good attitude. Likewise, for proficiently learning English, or maybe some additional language, it's highly appropriate as well as significant to have an optimistic attitude towards that specific language. Learners' perceptions figure out the success or maybe failure of the procedure of the attainment of any skill; similarly for language learning since at the conclusion of the day, it's the inclination of a person towards something that makes a positive change. Attitudes are viewed as probably the most crucial element in productive foreign language learning. With this study, the scientists have attempted to uncover the participants' perceptions in 3 domains: behavioral, cognitive and emotional. The results have proven that the students predominantly had good attitudes towards learning English as a different language. Keeping in view the good attitudes of theirs, it could be deduced that the language learning of theirs is effectively carried out. As a complete, it's anticipated that students in India are actually dedicated to English language learning. This is depending on the reality that the students that were sometimes currently competent or perhaps were learning for proper training someplace viewed English Works certificate training course as a chance to enhance their English language abilities. This shows the commitment of theirs and a general good attitude towards learning the English language.

### VIII. EDUCATIONAL IMPLICATIONS

1. Teachers are able to make an invaluable contribution in creating a friendly connection with the student of theirs, to produce an optimistic attitude towards learning English language,
2. Positive mental classroom environment required for learning language, as well as the mistakes are believed to be as a normal part of the procedure of learning English language.
3. Teachers must encourage the student to find out far better English, by highlighting the value of it's as they require English for getting employment objective in future.
4. Parents and educators should motivate learners to read through supplies written in English such as magazines and newspapers.
5. Educators that qualify to teach English should have gotten a pertinent training as well as qualification in English. In case the above mentioned problem is actually taken care of learners will get adequate awareness which would help them to have self-confidence and they are going to be proficient in the planet.

### ABOUT THE AUTHOR

The author, Dr. Parupalli Srinivas Rao, has a vast experience of teaching English at various levels. He has been specialized in ELT and has authored 10 books and published several research papers related to ELT in various international journals. He has attended several national and

international ELT conferences and also presented some papers in them. He has also attended many webinars organized by renowned British based international ELT training institutions such as *Cambridge English*, *Oxford University Press*, *Macmillan English*, *Pearson ELT*, *English First*, *IATEFL*, *British Council* and *American based Ed Web (USA)*.

He has been on the Editorial board for **twenty** well-reputed international journals. He has also done several prestigious projects including a project done for the *National Council for Teacher Education (NCTE)*, Government of India and another one for King Faisal University, Saudi Arabia. He has attended several in-service training programs in ELT. He has taught English in India, the Republic of Maldives and Kingdom of Saudi Arabia for 27 years. At present, he is working as Lecturer in English at English Language Centre, King Faisal University, Kingdom of Saudi Arabia. He is very much interested in research activities and preparing study material for Undergraduate and Master's Degree courses. He is also a member of ELTAI, the prestigious organization for English language teachers.

The author did his M. A. (English) from Osmania University in 1991. He also completed his PG Diploma in Teaching English (PGDTE) from CIEFL / EFL University and later he did B. Ed., M. Ed. and M. Phil. from Osmania University, Hyderabad. In 1999, he did PG Diploma in Functional English from Andhra University. He did *Cambridge CELTA* in London, UK, in the year 2008. He also completed two regular onsite ELT courses, namely, *Pronunciation for Language Teachers* and *Teaching Grammar in Context* from University of Edinburgh in Scotland in 2008. He also completed *TEYL* (George Mason University), *TGC* (World Learning) and *TYSE* (University Of Oregon) from the U.S. He also did "*How to Succeed at Interviews*" and "*How to Succeed at Writing Applications*" from the University of Sheffield, UK, and "*Testing Times in the Classroom: Challenges of 21<sup>st</sup> Century Education*" from the University of Exeter, UK. Recently, he has been awarded Honorary Doctorate for his outstanding endeavour in Education Sector, especially in the field of ELT. At present, he is also pursuing his Ph. D. in ELT.

### ABSTRACT

*The article analyzes the current state of development of the communicative competence of future physical culture teachers, problems, shortcomings, and ways to overcome them. Also, the interpersonal, intergroup and collective, social forms of communication and their peculiarities in the professional-pedagogical culture of future physical culture teachers.*

**KEYWORDS:** Education System, The Content Of Education, Pedagogy, Physical Education, Physical Development, Physical Culture, Students, Professional-Pedagogical Culture, Communicative Competence, Speech Culture.

### I. INTRODUCTION

It is important to ensure the spiritual and physical well-being of young people in the world, the formation of healthy life and physical culture through the centuries-old socio-pedagogical phenomenon, physical training. Because sports is one of the factors that give everyone a great opportunity to develop a healthy lifestyle, regardless of their nationality, race or religion.

In foreign countries, special attention is paid to the integration of social and economic spheres, training of personnel in accordance with international qualification requirements, the formation of their physical culture in education, the formation of practice in improving the educational process of the institution and strengthening its scientific and methodological base. The use of quality teaching methods and best practices for learning, such as the methods of forming and

developing students' physical culture, balancing indicators, universal quality management, quality assurance, key performance indicators, and continuous education quality improvement.

## II. MATERIALS AND METHODS

One of the main tasks in the context of educational reforms in Uzbekistan is to improve the health and physical culture of the younger generation. The new model of education aims not only to develop students' knowledge, skills and abilities, but also to develop their physical culture, and, above all, to develop a holistic, physically fit person. Therefore, President Sh. Mirziyoyev notes this: "We will continue to attach great importance to the accelerated development of sports, encouraging and supporting athletes who have achieved good results in international competitions." [1]. However, in spite of clearly identified directions for improving the education system, there is an increase in the number of adolescents and students with poor physical and mental health in recent years.

The country's pedagogical science and education system has a strategic goal that is to create all the conditions for education to help preserve and develop, not to undermine, the health of schoolchildren and students. In this case, the social and pedagogical importance of building a healthy culture that helps students to realize their dreams in life is growing.

The strategy of actions for further development of the Republic of Uzbekistan for 2017-2021 is in line with improvement of the state youth policy, spiritual and intellectual development, independent thinking, devotion to the homeland, and harmonious development of life.

Decree of March 5, 2018 "On Measures for Radical Improvement of Public Administration System in Physical Education and Sport", the tasks set by President Mirziyoyev at the meeting on September 20, 2018, dedicated to the development of physical culture and sports, "The Concept of Development of Physical Culture and Mass Sports in the Republic of Uzbekistan for 2019-2023", approved on February 13, 2019, the objectives set out in the 5 youth initiatives and other regulatory and legal documents proposed on March 19, 2019, provide for the development of physical health and culture of the population, especially the youth.

The main goal and driving force of reforms in the Republic is the formation of human beings, their harmonious development and well-being, the creation of favourable conditions and mechanisms for the realization of the interests of the individual, and the change of outdated thinking and social behaviour patterns.

Students are a distinctive group that is more susceptible to various environmental diseases than other social groups. They are also characterized by varying levels of physical training. Students are considered to have varying levels of physical training and physical development.

The results of the analysis of the existing scientific and methodological literature show that in recent years there has been an increase in the number of students with different levels of physical training.

This trend is typical of many universities in Uzbekistan. Most students are not fully prepared to handle the loads provided by standard curricula. It is difficult to carry out training programs developed by students of this type within the training regimes (according to the physiologically-based sandboxes of the given age groups). This is due to the discrepancy between the physical preparation of a significant number of students and the normative tests performed by them. The

fact that many students do not have the necessary motivation for physical education exacerbates the situation. These students are often shown to be inactive in practical exercises, not in elementary exercises, avoiding physical loads, as well as persistence in achieving the results required for optimal functioning of all systems of the body. Activation of the physical activity of such students remains an important issue. The methodology and organization of the process of teaching these students are unique. This results in the need to develop a new methodology for teaching students about physical activity and physical activity to varying degrees.

In recent years, there has been a widespread introduction of new innovative processes in the education system. At the same time, innovation is reflected in the combination of educational initiatives and innovations, and together they lead to global or small global change.

Several studies have found that higher education institutions do not pay enough attention to teaching physical culture and sports and that the process of training uses innovative technological tools. There is a fundamental contradiction between the typical system of teacher training and its individual, creative activity.

The development of new methods and approaches to the organization of the educational process, which encourages and stimulates the students' active involvement in the acquisition of professional knowledge, skills and skills, is crucial in improving the system of training specialists in the field of physical culture education.

To date, scientific and methodological developments in the field of physical culture and sport in educational institutions are not sufficiently developed.

Traditional teaching methods are no longer able to provide students with the knowledge, skills and abilities required to equip them with modern teaching methods. In this regard, at the current stage of education reform, it is necessary to develop new methods and tools of teaching and to integrate them into the educational process.

Introduction of new active forms of education into the educational process is one of the main bases for its improvement. The development of modern teaching methods is the most promising direction of training, improvement and professional development of the teaching staff.

The transition to the new paradigm of education in the Republic requires not only innovative approaches to student self-development but also improvement of methodological foundations of this process. In particular, "Creating healthy lifestyles in our society, creating conditions for the regular training of the population, especially the younger generation in physical culture and mass sports, strengthening youth's confidence in their will, strength and capabilities through sporting events, courage and patriotism; systematic organization of work on the development of devotion to the motherland, as well as a selection of talented athletes among young people and further development of physical culture and mass sports. Large-scale work is being carried out "[2]. In higher education institutions it is important to improve the theoretical and practical content of students' knowledge, to develop the professional knowledge, skills and abilities needed in the teaching profession, to develop creative educational technologies.

The future physical culture is the quality of teachers' professional training, above all, their willingness to engage in pedagogical communication, the ability to carry out specific professional activities to address teaching and methodological, spiritual and educational tasks. It

is based on the specific knowledge, skills and abilities of future teachers, and above all, the culture of pedagogical communication.

Future physical culture requires teachers to communicate communication skills, students' ability to present information accurately and accurately, to be able to give advice and suggestions to colleagues, to be transparent in pricing, to express wishes, to use appropriate speech and speech tools, and to communicate effectively. satisfaction, aesthetic, ethical, communicative needs.

- These requirements are, above all, the cultural and communicative qualities that are most important in professional and pedagogical activities - emotional culture, students' beliefs and their impact on them; motivation;

- Professional development; knowledge of theoretical knowledge and communication structure and technology (creative approach to them);

- To know the psychology of the interviewee; pedagogical collaboration and interpersonal interaction; occupation of the pedagogical board;

- Pedagogical communication techniques; It is reflected in the expression culture of speech and non-speech means of communication.

Characteristics of the pedagogical professional communication culture of a future physical culture teacher are as follows:

- in developing their physical qualities and abilities to their optimum level;
- Attention to the beauty, plastic freedom and health of the human body (through active physical activity);
- the perception of specific forms of physical and sports achievements, such as aesthetic events;

Aesthetics in sports are of high value, and this sporting event "reflects the value of an individual in certain emotional integrity, promotes comprehensive development of the individual, broadening the boundaries of his freedom, individuality" and reveals his hidden intellectual and creative potential.

Future physical culture teachers should be able to communicate professionally, physically and spiritually, and have the ability to engage students in sports in the future. Sport and aesthetics, sports and ethics, sports and communication, sports and culture, sports culture and personality development - Pedagogical culture in practice - are complementary and inseparable concepts of understanding, understanding and integrating the future physical culture teacher. In the process of forming a future physical culture teacher, it is important to see the beauty in sports, that is, their physical appearance, their excitement and excitement in their pedagogical activity, their impressions and their unforgettable impressions.

"The communicative component of pedagogical communication is the coordination of the positions and tasks of the dialogue participants. In the early stages of learning, students do not have the knowledge and experience needed to interact, interact with teachers and classmates. In this process, the teacher becomes a carrier of historical experience. Today, there is a need for teachers to enrich the experience of providing information to students. This requires the activation of teachers' knowledge and experience in building pedagogical communication with

students. Pedagogical communication takes many forms. This is directly related to the role of the teacher in the learning process, his personal qualities, and his level of knowledge. In pedagogy and psychology resources, pedagogical communication is analyzed in relation to the way teachers work. There are several classifications of the pedagogical method in pedagogical science. Pedagogical attitudes are often interpreted in the form of pedagogical communication. An important aspect of pedagogical communication is the ability to organize the educational process with a student-centred approach [3]”.

### III. CONCLUSION

The emphasis should be placed on the interpersonal, intergroup and collective social forms of communication in the future pedagogical culture of teachers of physical culture.

1. Interpersonal - evaluation and description of each other by interlocutors based on perception, knowledge, understanding, and empathy.
2. Intergroup - Social group communication. Taking into account the specificity of intergroup perceptions, the subject and objects of communication, group interactions, and the type and content of inter-group activities are taken into account.
3. Community-based, community-based communication is built on a cohesive, value-oriented unit of community members.

In conclusion, today it is necessary to consider the development of communicative competences of students in the teaching of physical culture and sports in higher education institutions, to take into account the development of new skills and methods of teaching.

### **ABSTRACT**

*In this article, one of the important factors in increasing the effectiveness of the process of studying the subject "Drawing Geometry" is the widespread use of the opportunities of new innovative pedagogical technologies. At present, various forms of determining students' knowledge are used in the educational process. In particular, control works in the form of tests are used during the intermediate, current and final tests. The article discusses the benefits and solutions of the most effective methods of visual control of this test.*

**KEYWORDS:** *Efficiency, Information Technology, Innovation, Intellectual, Methodological, Pedagogical, Software Methodology.*

### **INTRODUCTION**

One of the important factors in increasing the effectiveness of the process of learning science is the widespread use of the opportunities of new innovative pedagogical technologies.

At present, various forms of determining student knowledge are used in the educational process. In particular, control works in the form of tests are used during the intermediate, current and final tests.

#### IV. MATERIALS AND METHODS

Drawing geometry is one of the fields of geometry, which deals with the study of the geometric basis of the construction of images of objects in the plane, the methods of solving spatial geometric problems through images. Descriptive geometry is one of the mathematical sciences. The generality of methods in mathematics is also characteristic of this science. Drawing geometry is the theoretical basis for solving technical drawing problems.

The part of descriptive geometry of the subject "Descriptive Geometry and Engineering Graphics" in the curriculum is taught mainly in the 1st semester of the academic semester in most areas.[1; 2] The number of tests compiled from this section was more than 200 and was initially tested in the Mytest system. [3;4] The questions included in it were unofficial and did not allow to reveal the full essence of science. In the Mytest program there is an opportunity to ask questions in the form of pictures. However, their capabilities are limited, which is why the level of knowledge detection is insufficient.

The solution of the above limitations in the Isrping software complex has provided an opportunity to take advantage of the latest advances in information and communication technologies.[5; 6] Thus, versions of test programs on the subject "ChG and MG" created in the software complex Isrping Quizmaker were developed. New pedagogical technologies have been introduced, and the "Learning" and "Testing" programs, which include 12 different forms of test questions, have been introduced into the educational process.[7; 8]

The program includes test questions "correct-incorrect", "1 correct choice", "many correct choices", "fill in the blanks", "compatibility", "arrangement", "enter the number", "missing word", "summary answers"., The presence of such types as "vocabulary", "active space" allowed to effectively use the questions in the form of graphics.[9; 10]

In the "Learn" version of the test, immediately after selecting the correct answer, a message will appear stating that the answer is correct or incorrect. It contains the messages "correct", "incorrect" and "partially correct". In the "Learn" version of the test, all the answers come in sequence. The variation option is disabled, and the student has the opportunity to explore questions on topics that are consistent with the sequence in the science plan [1; 11].

Versions of the test program that work in different environments have been developed. While all versions of the program run on computers, including its Web version, it can run on the Internet, a local area network. The EXE version is designed to work on a student's personal computer. The most convenient version for the student is the Android version, which allows you to work on smartphones. A package of drivers required for using the Android version and instructions for installing them have been prepared and will be attached [3; 12].

According to the working curriculum of the disciplines taught at the department, it is planned to conduct 2 intermediate examinations in all areas. Correspondingly, the "Learning" programs for each midterm exam were given to the students to prepare them before the midterm examinations.

Each intermediate control has to answer 20 out of 100 questions. In the final control, the number of questions is 20, which covers the entire course, ie the student has to answer 20 out of 200 questions.

In the past, theoretical and practical questions were asked in written tests in midterm examinations. Practical questions were answered by students by drawing diagrams. When theoretical answers were given in writing, they were mostly "copied" and copied directly from a book or telephone. As a result, the student's grade did not match his or her real knowledge.

With the introduction of the test program, the participation of the "human factor" in determining the student's grade was reduced, which was determined by computer.

The diversity of the types of tests presented in the program has aroused the interest of many. The questions on the computer, with their game-like appeal, increased the learner's attention to science.

In the methodologically correct groups, there was an increase in students' residual knowledge of the subject. Because it is known from science that almost all the drawings included in the science plan are reflected in the program and their level of visual memory is much higher than verbal memory.

### ABSTRACT

*This article deals with the straightening of flat curve lines lying on a plane. To straighten the curve, a box curve of a flat arch is built according to its width AB and the height of the OS. The hollow roof box curve consists of four circular arcs. To straighten the arch, you had to define the length of each circle arc. The authors of the article applied the method of small chords. As the name itself shows, the method is that a broken line is inscribed into the flattened flat curve, the links of which represent small chords of the curve. Thus, the straightening and determination of the length of box flat curves of flat vaults find application in the construction of arches of bridges, entrances to buildings and metro, etc.*

**KEYWORDS:** Arcs, box curve of flat arch, curve, deployment, line, plane, point, the rectification of curve, segment, straightening.

### I. INTRODUCTION

The rectification of curves refers to unclosed box curves. They are used in the construction of vaults and arches of bridges, building entrances, various slabs, such as the subway, etc. Below the construction of box curves of flat and steep vaults is dismantled.

## II. MATERIALS AND METHODS

Flat and steep arches are distinguished by the ratio of their width  $AB$  and height  $OS$ . At the flat arch

$$\frac{AB}{2} > OC \quad (1)$$

and the cool one has

$$\frac{AB}{2} < OC \quad (2)$$

To measure the value of the box curves (more precisely circles), an approximate method is used, e.g. the length of the arc of the circle  $ASV$  is measured with a segment of  $CL$  tangentially (Fig-1), cut off by the rays  $SA$  and  $SB$ . The  $S$  point lies on the continuation of the direct  $CO$  at a distance  $CS=3R$ . The accuracy of this construction ( $\text{at} < 60^\circ$ ) is quite sufficient for practical purposes.

**Figure-1.**

With graphical deployment techniques, you always have to straighten curves of lines lying on a plane. For this purpose, the method of small chords is used, as the name itself shows, the method is that a broken line, the links of which are not large chords of the curve. If a curve needs to be straightened, its chords are successively placed on some straight line and the whole resulting segment is taken as the length of the curve flat arc.[1, p.79.]

Let's consider straightening the box curve of the hollow arch. At first, we shall construct a curve of the hollow arch on its width equal to  $AB=100\text{ mm}$  and height of  $OS=40\text{ mm}$  (Fig. 2). The width of the vault - segment  $AB$  - is placed on a horizontal line and a perpendicular line is drawn through its middle - point  $O$ . At this line from point  $O$ , the arc  $AE$  of the circle of radius  $OA$  is described and marked with point  $D$  using an arc of the same radius  $OA$  but centred at point  $A$ . Point  $D$  is connected straight between points  $A$ ,  $E$  and  $O$ . A straight  $CF \parallel DE$  is then passed through point  $C$  until it intersects with a straight  $AD$  at point  $F$ . Straight  $FO_2 \parallel DO$  is passed through point  $F$  until it intersects with segment  $AB$  at point  $O_1$  and straight  $OS$  at point  $O_2$ . The  $O_3$  point is obtained using an arc of the circle of the  $OO_1$  radius. The resulting  $O_1$  points,  $O_2$ , and  $O_3$  are the centres of the arcs that make up the curve. From centres  $O_1$  and  $O_3$  describe the arc of radius  $R_1 = O_3B$ , from centre  $O_2$  - the arc of radius  $R_2 = O_2C$ . The  $O_1$  points,  $O_2$ , and  $O_3$  are the centres of the arcs of the  $R_1$  and  $R_2$  radius by which you can draw the contour of the rectification of curve.[1, p.147;2, p.22]

**Figure-2.**

The box rectification of curve flat arch consists of four arcs of a circle. When straightening the vault, first determine the length of each arc of the circle. You can see from the drawing that arcs  $AF=GB$  and  $FC=CG$ . For this purpose, it is enough to define only arcs  $AF$  and  $FC$ . When arc  $AF$  is flattened, the circumference of radius  $R36$  (Figure 3) is perpendicular through the middle of chord  $AF$  until it intersects the arc at point  $M$ . To the right from the arc centre of circle-point  $O$  - Two lines equal to the radius of  $R36$  arc are placed in a perpendicular direction, and point  $N$  straight  $AN$  and  $BN$  are obtained before their intersection with a tangent to arc at point  $M$ , line  $KL = AF = GB = 36$  is obtained. This segment with sufficient approximation is equal to the arc length  $AF$ . Similarly, define arc  $FC = CG = 34$ . When defined, the actual dimensions of the  $FC$  arc are similarly defined as shown in Figure 3, which is 32 mm. Arc  $FC = CG$ , if so  $CG = 32$  mm.[3;4; 5, p. 46; 6, p. 80; 7, p. 36;]

**Figure-3.**

The arc of the ACS should be made with sufficient accuracy equal to the length of the box rectification of curve flat arch. If the curve is to be flattened, the arc length is sequentially set to a certain straight line and the resulting segment is taken as the arc length of the curve. [8, p. 11; 9, p. 9; 10, p. 7.]

If we summarize each length of an arch of  $ACB$ , then it is equal to the sum of  $AF+FC+CG+GB=36+34+34+36=140\text{ mm}$ . By the image, straightening and determination of the length of the box curves of shallow vaults, the use in the construction of vaults and arches, bridges, entrances to buildings of various floors, for example, metro and. etc.

### ABSTRACT

*The article discusses the development of the subject "Engineering and Computer Graphics", the problems of higher education institutions in the teaching of "Engineering and Computer Graphics" today, solutions to these problems and the development of design competencies of future engineers and teachers through computer graphics and the use of KOMPAS 3D V16 .*

**KEYWORDS:** *Information, Technology, KOMPAS 3D V16 Graphics Program, Design, Animation, Methodology, Intellectual, Pedagogical, Methodical, Professional, Ability.*

### I. INTRODUCTION

"Engineering and computer graphics" is used as a tool for drawing working drawings of details, drawing and modeling details, design, animation. The design system of engineers-educators is characterized not only by the fact that the drawings are drawn electronically, but also by computer graphics, and computer technology has its own database and the ability to use effective methods of geometric modeling of objects. That is, it forms a methodology for the development of design competencies of future engineers-teachers through computer graphics. Although "Engineering and Computer Graphics" has not been formed as a science for a long time, one of the main reasons for its rapid development is the fact that it is possible to achieve high quality, accurate and high results in a short time. Today, the subject of "Engineering and Computer Graphics" remains convenient and effective not only for the field of informatics and information technology, but also for other large-scale specialties. For example: mechanical engineering, energy, ground transport systems and their operation (road transport), technology of primary processing of natural fiber, technology of processing of light industry products and structures (sewing), construction of buildings and structures, construction of engineering and communications, urban planning , architecture, organization of architectural design of rural areas

and other developed areas are being studied as a much-needed field. In the discipline of "Engineering and Computer Graphics" drawings, working drawings and practical problems are designed using a computer. The subject of "Engineering and Computer Graphics" is the next stage of the science of graphic geometry and engineering graphics, engineering drawing and sketch, that is, before the study of this science, it is obvious that before studying this science, drawing geometry and engineering graphics, engineering drawing and sketch, engineering graphics it is impossible to master this science without mastering it. Компас 3D V16 graphics program, the most advanced and popular in the study of "Engineering and Computer Graphics" by Askon Russia, is based on graphic geometry and engineering graphics. is not considered absolutely correct.

## II. LITERATURE REVIEW

Several scientists have conducted research on the design of the teaching process of "Engineering and Computer Graphics" in universities, as well as in all disciplines. According to the results of these studies, the science of engineering and computer graphics is interrelated with sciences such as drawing, graphic geometry and engineering graphics and can be considered as their next stage.

We can cite the results of E.I. Ruziev's scientific research. E.I. Ruziev has developed his own integrated course "Graphics" in this area and recommended teaching methods. It describes in detail the problems of teaching the subject "Computer Graphics" and its connection with other disciplines, the graphic requirements that a computer science teacher must have. R.V. Korneev, N.V. Kharkov (2017) in the teaching of the subject "Engineering Computer Graphics" showed the results of their research on the use of KOMPAS 3D V16 graphics software in the design work for future engineers-educators. E.M. Kudryavtsev (2000) conducted research on modeling, design, calculation of mechanical systems from the graphics program KOMPAS 3D V16 and proved it in his scientific results. V.P. Bolshakov, A.V. Chagina (2016) conducted research on the practical and theoretical implementation of design using new methods in teaching the subject "Engineering and Computer Graphics". Today, the subject "Engineering and Computer Graphics" is taught using graphics programs AutoCAD, ADT, Google Sketch up Pro 2016 v16, Autodesk 3ds Max. One of the most effective and convenient graphics programs in the design for future engineers-educators is KOMPAS 3D V16 graphics program.

## III. MATERIALS AND METHODS

The study, analysis of the state of teaching the subject "Engineering and Computer Graphics" in higher education institutions, the identification of existing problems in teaching and the requirements for the development of spatial imagination of students in this subject were studied.

The methodological system of teaching science has been improved on the basis of the competence of developing the creative activity of future engineers-teachers, in the design and design of the methodological system of teaching the subject "Engineering and Computer Graphics".

In teaching the subject "Engineering and Computer Graphics" developed methods for developing students' design activity using the graphics program KOMPAS 3D V16, as well as technology for designing a methodical system of the educational process of the subject "Engineering and Computer Graphics".

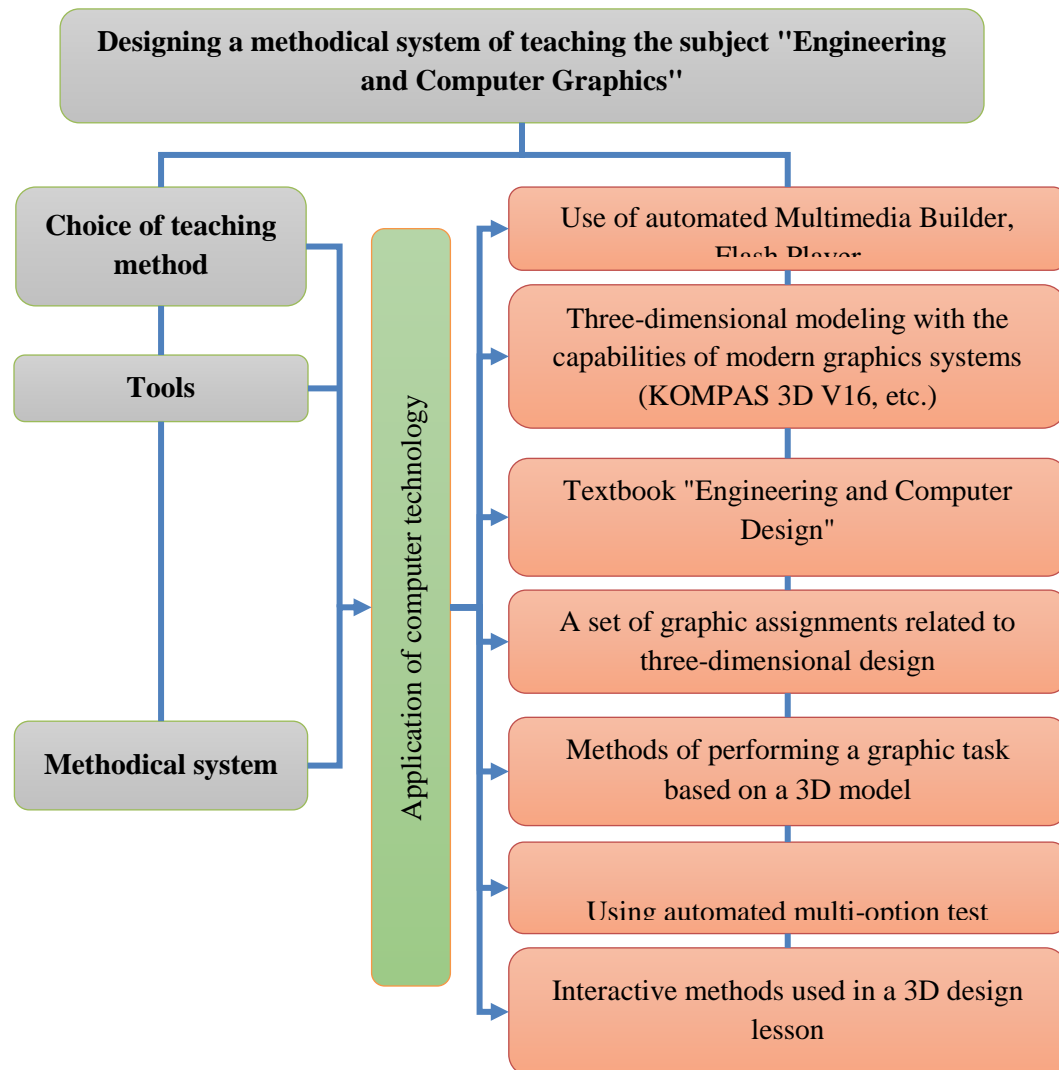

#### IV. RESULT AND DISCUSSION

The main requirement for the development of students' activity in design in the discipline of "Engineering and Computer Graphics" is the use of spatial imagination and the best method of its formation. Development and use of automated software "Multimedia Builder, Flash player", the development of spatial imagination of students using the graphics program KOMPAS 3D V16. Based on the criteria for the development of spatial imagination of students in the subject "Engineering and Computer Graphics" and a model for the development of creative activity of students using three-dimensional modeling in the teaching of "Engineering and Computer Graphics". (Fig. 1).

**Choice of teaching method** - At the beginning of the lesson, the teacher conducts a "Questionnaire-questionnaire" with the help of an automated program, which includes questions from students about their interest in science, basic knowledge, attitude to science. The results of this control allow the teacher to choose the method of teaching in this group and the optimal approach to teaching activities.

**Tools** - 2D and 3D modeling and design with graphic program capabilities, used in the development of students' spatial imagination and thinking skills in the subject "Engineering and Computer Graphics" and the formation of skills in working with graphics programs. Modern graphics software systems used in teaching the subject "Engineering and Computer Graphics" mainly include KOMPAS 3D V16.

**Methodical system** – a set of all pedagogical and methodological developments (electronic manual based on two and three-dimensional modeling, textbook, multimedia electronic textbook, a set of graphic tasks based on three-dimensional modeling, interactive methods used in the course) is used in the meaningful organization of teaching the subject "Engineering and Computer Graphics".

**Figure 1.** Technology of designing a methodical system of the educational process of the discipline “Engineering and Computer Graphics”

**A set of graphic assignments for three-dimensional design** - is designed to allow students to complete graphic assignments related to each topic throughout the learning process based on the design and is a key resource in developing students' independent and creative activities.

**Methods of performing graphic tasks on the computer** - a methodological tool used to develop students' creative activity in performing graphic tasks in practical classes. This ensures that students learn several of the methods of performing graphic tasks on the basis of three-dimensional design, as well as master the capabilities of graphics programs as perfectly as possible.

**Using automated multi-option test assignments** - a type of electronic control developed on the basis of graphical software capabilities and the rules of science.

**Interactive methods used in the lesson on 3D modeling** - is selected based on the characteristics of the topic. For example: mental attack, boomerang, problematic design, etc.

The above technology is developed on the basis of prioritizing the virtuality and features of the active, reflexive, integrative components of the development of motivational activity in students. The content of the subject "Engineering and Computer Graphics" in higher education institutions and the technology of designing didactic tools provide opportunities for building complex objects, algorithmic processes, spatial graphical representation of logical movements and students' acquisition of graphic knowledge and skills in the field.

## V. CONCLUSION

**First**, the theoretical and practical significance of the use of computer technology in the methodological organization of the teaching process of "Engineering and Computer Graphics" and the development of methodological bases for the introduction and organization of electronic assessment system in the educational process.

**Second**, the introduction of a two-part program (teacher and demand programs) designed to automatically monitor students' interest in science and knowledge in the learning process, as well as a software system for control through the "Multimedia builder" will be effective.

**Third**, students' design competencies will be developed if a methodology for developing students' spatial imagination using KOMPAS 3D V16 graphics software is developed.

**Fourth**, on the subject of "Engineering and Computer Graphics" developed a "Multimedia e-learning manual" and a method of using it to increase the effectiveness of the lesson, showing what requirements it meets and what to focus on when creating it.

### ABSTRACT

*The article deals with the results of the research studies of the current-voltage, photovoltaic and semiconductor ampere characteristics of photographic systems ionization type. The light source used illuminator OI-24 type. Having changed the intensity of the radiation incident on the input of the system began carrying out a set of grid calibrated filters. The working range of the spectrum of radiation and eliminating backlight were provided with a set of interference filters and semiconductor.*

**KEYWORDS:** *Semiconductor Photographic Systems, Semiconductor Electrode, Lux-Ampere Characteristic, the Current-Voltage Characteristics Of The Photovoltaic Characteristic Ionization Chamber, Discharge Gap, The Resistance Of The Semiconductor, A Transparent Electrode.*

## I. INTRODUCTION

The ionization system operates through the current. High sensitivity is achieved in the system if the input signal (light) causes considerable photocurrent in a predetermined spectral region. Therefore, the spectral and lux-ampere characteristics of photographic systems are some of the defining parameters of photo detectors [1-3].

Semiconductor photographic type ionization system in the form as proposed in the prior art is based on a) the effect of stabilizing the gas discharge in the cell with the distributed resistive electrode and b) the effect of the current control of the gas discharge in size and intensity over time. When this electrode is made of photosensitive semiconductor material with the same properties over the entire area. Such photographic system reached a certain degree of technical perfection and is now widely used for various imaging purposes, in particular in the infrared spectral region [4-6].

## II. MATERIALS AND METHODS

Schematic diagram of the semiconductor ionization photographic system is shown in Figure 1. The system is composed of a semiconductor photosensitive plate (1) provided with the semitransparent electrode (2). The inner surface of the plate is separated from the surface of the recording layer (4) by a gas gap (3). The recording layer (4) is located on a transparent conductive counter electrode (5), made for example from a glass plate coated with a conductive film  $\text{SnO}_2$ . When connected to the breakdown voltage of the gas discharge, wherein the cell is present in the discharge of the semiconductor distributed resistance, contributing to damping the current instabilities. Resistance semiconductor completely determines the value of the current density on the cross-sectional area of the semiconductor lighting and can control the amount and distribution of power in the gas gap.

**Figure 1.** Schematic diagram of the semiconductor photographic ionization type.

The main aim of research in this paper is to establish the link between sensitometric characteristics of the system and the parameters of the elements included in the system, and on this basis to determine the optimal operating conditions of photographic systems. This was done

by measuring the characterization system as a whole and the characteristics of the individual elements. He carried out a number of studies of the current-voltage and lux-ampere characteristics of the device and photo detector separately. Current-voltage characteristics (CVC) is conducting a study of the gas discharge between metal electrodes in conditions close to the conditions of discharge flow in the systems studied. The influence of the parameters of the gas-discharge gap and source on the intensity of the glow of gas and luminescent screen. A series of studies to investigate the resolution of the systems operating in the frequency converter operation. For photographic sensitometric characteristics of systems research was carried out for the technical options, which are used photo emulsion materials.

The experiments were performed as used direct current power and pulsed mode. The power supply allows you to change the voltage in the range of  $0 \div 2,5 \cdot 10^3$  V. The pulse generator has a pulse duration of  $5 \div 2 \cdot 10^{-3}$  microseconds with an amplitude of up to  $4 \cdot 10^3$  V. In constant the current mode to record current-voltage characteristics and the dependence of the luminescence intensity of luminescence screen and ionized gas discharge gap as a function of the applied voltage. The intensity of the luminescence in both cases was determined using a photomultiplier (Type 19A). Linearity work PMT provides neutral filters, installed in front of its front window. The light source lamp type OI-24. Changing the intensity of the radiation incident on the input of the system, to recruit grid calibrated filters. The operating range of the spectrum of radiation and the removal of background illumination is provided by a set of interference filters and semiconductor.

### III. The experimental results

**3.1. Current-voltage characteristics.** Research CVC is an important step in determining the relationship between the photoelectric characteristics of the optical detector (OD) and OD system - the gas gap in the study of the influence of the parameters of the discharge gap but the properties of the system as a whole.

The results showed that electrical processes occurring in these systems, almost independent of the temperature conditions of the experiments. Therefore, based on purely technical considerations, the most comprehensive series of studies carried out for systems operating at room temperature. The bulk of the results obtained in converter operation using a semi-insulating OD ( $\rho = 10^7 \div 10^9$  ohm·cm) made of gallium arsenide.

Figure 2 shows a family of current-voltage characteristics of the system at constant gas pressure P and the length of the discharge gap d (76 mm. Hg and 100  $\mu$ m, respectively). Curve parameter is the light intensity OD J. The light source used illuminator OI-24.

It can be seen that the small value of the current U system is virtually nonexistent. When you reach a certain critical voltage  $U_{ac}$  (in this case  $U_{ac} = 500$  V) appears the current growing linearly with further increase in the current-voltage characteristic steepness U. After disruptive field increases with increasing light intensity.

**Figure 2.** CVC system under different light intensities.

$d = 100 \mu\text{m}$ ;  $p = 76 \text{ mm. Hg}$ .  $J, \text{ W / cm}^2$ : 1 - 0;

2 -  $2,4 \cdot 10^{-5}$ ; 3 -  $3,7 \cdot 10^{-5}$ ; 4 -  $6 \cdot 10^{-5}$ ; 5 -  $1,8 \cdot 10^{-4}$ ; 6 -  $5,2 \cdot 10^{-4}$ ; 7 -  $1,3 \cdot 10^{-3}$ ; 8 -  $1,1 \cdot 10^{-2}$ ; 9 -  $4,6 \cdot 10^{-2}$ .

Figure 3 shows the reconstructed from the previous figure of lux current characteristic (LCC) for two values of the applied voltage. It can be seen that the change in voltage results in parallel shift characteristics. This is due to the linearity of the current-voltage curves for  $U > U_{ac}$ .

**Figure 3.** LCC system for two values of the applied voltage  $U, \text{ V}$ ; 1 - 800; 2 – 900.

Figure. 4 shows the effect of changing the length of the discharge gap in the form of the CVC system for some fixed values of P and I.

**Figure 4.** CVC system for different thicknesses of discharge gap,  $p = 76$  mm. Hg.  $J=1,1 \cdot 10^{-2}$  W /  $cm^2d$ ,  $\mu m$ : 1-100; 2-50; 3-30.

The slope of the current-voltage characteristic remains constant and change only the value of  $d$  changes  $U_{ac}$ . The data in figure 2 and 4 were obtained for the gaps filled with air. Experiments have shown that when you change the composition of the gas and  $p$  and  $d$  ( $p = 76$  mm. Hg and 30-100  $\mu m$ , respectively), I only have the value  $U_{ac}$ , and the slope of the CVC in after disruptive region remained unchanged

**Figure. 5.** Changes in the breakdown voltage, depending on the parameters of the discharge gas discharge air gap  $d$ ,  $\mu m$ : 1 – 150; 2 – 100; 3 – 30; 4 – 20.

Figure 5 shows the effect of changing parameters in the discharge gap breakdown voltage. For large values of  $d$  (curves 1, 2)  $U_{ac}$  growing in the investigated range of pressures. It should be noted that in the case of different gases breakdown voltage varied slightly.

For comparison of the photovoltaic characteristics of the system with the properties of OD last removed from the system and its surface previously facing towards the discharge gap, an ohmic contact is deposited. Further measurements were CVC at the same light intensity as in the study of the entire system. The experiments found that in the range of resistivity OD  $\rho = 5 \cdot 10^6 \div 5 \cdot 10^8 \text{ ohm} \cdot \text{cm}$  (determined by the intensity of light) within the experimental accuracy of the steepness of the current-voltage characteristics at  $U > U_{ac}$  determined by the resistance of the semiconductor. When high resistivity role of edge effects, i. e. A large proportion of the total system current is transferred along the edges of the gas-discharge gap. In this case one correspondence between the slope and the CVC system OD offline.

Study the CVC system in a pulse mode shown that these characteristics are linear up to a very significant current density. Figure 6 shows one of these dependencies, taken at supply voltage pulse 180mks.

**Figure 6.** The current-voltage characteristics in a pulse mode.  $d = 60 \mu\text{m}$ ,  $p = 76 \text{ mm}$ . Hg  $\tau_{\text{imp}} = 180 \mu\text{s}$

From the above results, it follows that a wide range of current differential impedance system OD - discharge gap coincides with the resistance of the semiconductor used and the presence of the plasma in contact investigated our case does not influence the transverse conductivity of OD. Generally in the system can occur positive feedback due to the fact that the glow of ionized gas and the surface of the semiconductor electron bombardment ion flow will increase (in addition to the external lighting) conduction of OD.

**Figure 7.** The graph for explaining the process of the discharge current control period.

**Figure 8.** LCC semi-insulating phase transition from GaAs.  $U = 200V$ .

Thus, after a breakdown field differential resistance of the discharge gap is zero, i.e. Gas CVC vertical. The process of discharge current control can be simplified to present figure 7. The current density is determined by the precision of the meeting load curve I (the slope is determined by the resistance OD) with CVC discharge gap (curve 2). It follows from the above that the LCC system at  $U > U_{ac}$  must match the corresponding character of AF. This is confirmed by a comparison of figure 3 and figure 8 for the semi-insulating gallium arsenide OD and comparing relevant relationships for OD.

### 3.2 Photographic characteristics.

Because our systems for determination of the main characteristics of the sensitometric advisable to use a characteristic curve expressing the relationship between the logarithm of the number of lighting  $\lg H$  and an optical density of blackening  $D$ , the ultimate goal was the construction of research sensitometric  $D$  ( $\lg H$ ) characteristics. The construction of the experimental

characteristic curves is given mainly on the results of measuring the optical density of blackening (weakening) of the test portion of the image. However, there is a possibility of construction of the characteristic curve, and other methods, such as the known dependence of the blackening density of the recording film of the logarithm of the amount of electricity that caused the photographic effect of the well-known LCC OD, you can use the conversion chart input intensity  $I$  in the optical density  $D$ . The most complete study photographic characteristics were carried out for two variants of the image on the recording layers of emulsion, which recorded the glow of ionized gas and the luminescent screen.

The following are experimental results obtained for the photographic system using gallium arsenide (research carried out at room temperature) and silicon photo detectors. This was studied according to the optical density of the blackening of emulsion films different from the time of exposure at a fixed light AF and blackening density depending on the light intensity at a fixed exposure time. Determination of the optical density of the films was carried out in transmitted light micro photometer MF-4.

Figure 9a and figure 9b shows the dependence of the blackening density on the intensity of the radiation incident on the phase transition at different exposure times obtained for GaAs OD during the image recording using a transparent electrode (a) and using a fibre optic light guide with a phosphor screen (b).

**Figure 9.** The dependence of the density of blackening of the light intensity at different exposure time  $1-5 \cdot 10^{-4}$  s;  $2 \cdot 10^{-4}$  s;  $3 \cdot 5 \cdot 10^{-5}$  s;  $4 \cdot 2 \cdot 10^{-5}$  s, obtained for gallium arsenide OD transparent electrode (a) and use a light guide with the phosphor screen (B),  $p = 76$  mm.Hg.,  $d = 50$   $\mu$ m,  $U = 1,8$  kV.

These data indicate that both methods used in the image recording on the film reach a high enough energy sensitivity. However, in the case of registration of the ionized gas emission threshold light intensity is lower than when using the luminescent screen.

**Figure 10.** Characteristic curves photo process when shooting on film RF-3 with GaAs OD for three values of the applied voltage  $U$ , kV:  
1 – 1,4; 2 – 1,6; 3 – 1,3;  $p = 76$  mm. Hg,  $d = 30$   $\mu$ m.

This is especially noticeable at short exposure times. It should be noted that in a system with the phosphor screen, we used the type of phosphor having a rise time and fall glow of a few milliseconds. Under these conditions, the light output of the phosphor is superlinearly diminished if the holding time, which leads to reducing the system sensitivity at short exposure times. With increasing exposure time-sensitivity of the system using both methods of recording levelled.

The use of a faster phosphor will increase the sensitivity of photosystem fluorescent screen.

Ha, figure 10 shows the dependence of the density of blackening of the exposure values for different amplitudes of the applied voltage, obtained by image registration with the use of a mesh electrode on the film of the RF-3. It is seen that with increasing voltage sensitivity photo process growing. This fact confirms the validity of the formula for determining the maximum power of sensitivity, it can easily be explained based on data for the study of the efficiency of conversion of the input signal to an output converter images using

Figure 11 shows the characteristic curves plotted for different values of gas pressure in the gap. Characteristically, at a constant value,  $lgH$  blackening density increases with decreasing gas pressure and further, it decreases the pressure subsides. These results are consistent with data on the distribution of shares of the power consumed by the discharge of the gas through various channels.

Figure 11. Characteristic curves photo process measured for different values of the gas pressure in the gap p. mm. Hg. 1 - 228; 2 - 138; 3 - 76; 4 - 38,  $U = 1,3$  kV,  $d = 60$   $\mu\text{m}$ .

At the low intensity of incoming light shutter speed should be increased. At the same time, the role of the dark current system, veils recording film. Thus, the presence of the dark current in the system limits the exposure to  $t_e \leq 102$ . Comparison of the data shows that increasing the thickness of the gas gap increases the sensitivity of the energy system. This is due to an increase in the conversion efficiency of the incoming radiation to the intensity of emission of the gas at high d.

#### IV. CONCLUSION

A detailed study of photographic performance experimental samples ionization photographic systems and studied the influence of various factors on them. Revealed a great opportunity to further improve the photographic characteristics. The achieved level of photographic performance on the prototyping laboratory samples is characterized by the following data: the sensitivity of the order of 5-10 units. ( $5 \cdot 10^{-7} - 10^{-8} \text{ cm}^2 / \text{J}$ ), latitude  $L \sim 1,5$  and resolution  $R \sim 15 - 20 \text{ mm}^{-1}$ , the boundary wavelength of  $4,5 \mu\text{m}$ .

### ABSTRACT

*The article is devoted to the study of the processes taking place in higher education in the field of research of engineering graphics of graduates. We evaluate the knowledge of graphics software and its ability to be easily used in computer graphics applications as a necessity for today's engineers. We are trying to solve a controversial problem with students trained in computer-assisted document writing skills. Increasing the need to study graphic packages by students in all specialties is justified. The paper demonstrates the findings of a comparative analysis of different methods of teaching graphics at A Higher School. The impact and capabilities of technology in education have been studied through theoretical material in the lecture course and practical studies.*

**KEYWORDS:** *Engineering, Graphic Editors, Autocad, Kompas Graphics, Engineering Graphics.*

### I. INTRODUCTION

The presence of microprocessor engineering and the appearance of graphic editors such as AutoCAD, Kompas Graphics, etc., stipulated the appearance of courses "Computer graphics",

"Engineering and computer graphics" in the training schedules. Along with the two programs of study of graphics for the courses "Descriptive geometry" and "Engineering graphics", which appeared earlier, these academic subjects have become a very serious addiction, qualitatively changing the concept of teaching the subjects discussed in the article.

## II. DISCUSSION

So far, there are two approaches to how engineering course sections are presented, two approaches to schedule training. The first is a traditional learning sequence from drawing geometry to engineering graphics and down to computer graphics. The second involves the study of the first two sections at once, which is carried out using computational means.

The article provides a comparative analysis of both approaches and provides methodological recommendations for adding automated design elements to each approach. The transition to engineering graphics training should be organized through teaching students all the possibilities of one of the graphic editors. This will make it easier for students to work with engineering graphics tools such as line types, font types, material identification codes on sections and sections, etc. It seems useful to solve all these issues in classroom classes using computers, as any computer program implementing graphic designs contains built-in primitive libraries necessary for automated drawing. In this case, the teacher's task is to explain the typical requirements for their use. This raises an important methodological question: Should a student, and to what extent, possess the skill of building the aforementioned graphic primitives on paper? There are two mutually opposing opinions on this issue.

Those who support the idea that students should learn graphing skills on paper while studying do not take into account the fact that in most secondary schools the subject of "drawing" does not even exist as an elective. Thus, this means that students should learn drawing skills "from scratch", as the secondary school did not provide enough knowledge in this area for new educational programs. There is no time for this in university curricula. This drawback in the programs of secondary schools is also a psychological barrier for first-year students. Training in graphic design skills occurs simultaneously with the study of complex subject-descriptive geometry. Representation of three-dimensional objects on a flat diagram for many freshmen who do not know the basics of projection drawing is an incomprehensible set of graphic primitives.

Apparently, one should not expect a return to the curriculum of the Soviet high school. On the contrary, the requirements for the competencies of graduates of the Higher School tend only to tighten [2]. We believe that the only way out of these two mutually contradictory circumstances is to strengthen the methodological component in training using technical teaching aids. The latter allows using the project methodology to increase the percentage of students studying lecture material and make the teacher's work more effective during practical hours.

The need for the student to develop skills in graphic construction of the image of parts is associated with sketching, a necessary stage in any design work. It would also be methodologically incorrect to exclude such training from the training process. A sketch, like a drawing, is a certain abstraction of the image of a real object using several conventions. The student can learn this faster and better with the help of the teacher. In addition, when drawing up sketches, it is possible to study several issues on compliance with standards. To complete the task without outside help, students must know the types of lines, cuts and cuts and be able to perform pencil sketches of all parts of the assembly.[1; 3]

Sketch details should be prepared simultaneously through a graphical editor so that the student can approach the process of designing the component assembly as a confident user of one of the programs. The task of designing a sketch for assembling a part should not include more than 4 or 5 parts, half of which may have a simple axisymmetric shape. It is impractical to give the basic part as a design assignment for students of technical specialties. A thorough discussion of dimensional analysis problems is also considered excessive. It is enough to determine the geometry of the part, observing the only rule that dimensional chains in the drawings do not close.

In the conditions of constantly decreasing classroom time, it is advisable to take into account one more set of questions. The following are the most reasoned. Can the requirement acquire computer design skills for students of technological specialties be considered justified? Is it possible to limit only to classroom hours of working at a computer? These and many other issues must be addressed differently each time. Everything that was proposed for discussion in this article relates only to the training of students with specialties that do not include separate courses in “computer graphics” and “engineering and computer graphics”. The educational process for students of mechanical specialties or specialties related to information technology may be more significant.[4; 5]

The need to form a unified information educational system in higher education institutions attaches particular importance to teaching students the computer design of graphic objects. In this environment, as you know, in addition to the quality indicators of student performance, all work performed over the entire period of study should be presented. It is clear that these will be not only text documents, but also graphic works of the course design in technical or even special subjects. And without a graphic package, it is impossible to prepare for the fulfilment of the mandatory requirement - the placement of graduation qualification work on the university website.

### III. CONCLUSION

It is especially necessary to note that learning to work with any graphic package is not an end in itself. A computer with its program is just a tool, although it seems very advanced compared to other programs.

Drawing supplies, but it's just a tool. For a student who is going to become an expert in the future, you need to know the technology for creating design documentation and know about the capabilities of graphic editors. Conclusions:

- the study and use of graphic computer programs in the educational process is an absolute necessity;
- the capabilities of these programs make it possible to make the presentation of theoretical material more understandable;
- In the educational process, it is necessary to maintain the acquisition by students of the skills to build parts according to technical sketches.

## THE ADVANTAGES OF USING INNOVATIVE TECHNOLOGIES IN IMPROVING THE QUALITY OF EDUCATION

**Basharova Gulmira Galimyanovna\***

\*Assistant,  
Department "Uzbek Language and Literature",  
Fergana Polytechnic Institute, UZBEKISTAN

### ABSTRACT

*The article deals with the benefits of using innovative technologies to improve the quality of education. In order to develop scientific methodological recommendations, methods of observation, testing, sociometric, mathematical-statistical processing and analysis of scientific results and evidence have been used. Social and pedagogical peculiarities of the use of innovative technologies in teaching pedagogical sciences are shown. Effective criteria for the use of innovative technologies in improving the quality of education have been studied, and methodological recommendations and methodological guidelines on the problem have been developed. Learning using innovative technologies to improve the quality of education positively affects the learning of all four components of educational content (knowledge, skills, qualifications, creative activities). They give readers the opportunity to independently build, express, find solutions and solve problems, that is, situations that are very important for specific subjects. The study was based on the fact that on the example of teaching sciences theoretical knowledge can be used by methodically based innovative educational technologies, able to quickly solve the problems of fully communicating theoretical knowledge to students and independently applying the knowledge obtained from them in practice.*

**KEYWORDS:** *Technology of Test Training, Educational Technologies, Guidelines, Modular Education, Innovative Technologies, Quality Of Education, Technologies Of Cooperation.*

### I. INTRODUCTION

In the traditional learning system, the learner receives knowledge under the pedagogical influence, and the student's activities will not be active in creative nature. Every day it is confirmed that education based on education, including interactive technologies that create a new

pedagogical, innovative, competent situation in the teaching of various subjects, gives much higher efficiency than traditional education. Every day it becomes clear that teaching using interactive methods affects the development of cognitive abilities, creative abilities and practical skills of students and the organization of their independent thinking.

Learning using innovative technologies to improve the quality of education positively affects the learning of all four components of educational content (knowledge, skills, qualifications, creative activities). They give readers the opportunity to independently build, express, find solutions and solve problems, that is, situations that are very important for specific subjects. The study was based on the fact that on the example of teaching sciences theoretical knowledge can be used by methodically based innovative educational technologies, able to quickly solve the problems of fully communicating theoretical knowledge to students and independently applying the knowledge obtained from them in practice. Where do innovative technologies have an effect? When and how to use it? To what extent do we use innovative technologies to organize lessons today? What is the attitude of the teacher and student to the task using innovative technologies? Thus, the relevance of this study is that: the need to create conditions for improving innovative technologies and tools for teaching pedagogical sciences; Social order to solve the problem of increasing the efficiency of teaching pedagogical sciences and cognitive activity of students is based on the relevance of the topic.[1; 2.]

In the field of methodology of innovative research in education today the research of R. Mavlonov, N. Muslimov, Yu. Yuldasheva, innovative approach to education based on pedagogical technologies N. N. Azizkhajayev, U. Tolipov, U. Nishaniliyev, B. Ziyamuhamedov, etc. Problems of intensification of the approach in the education of F. Y. Izlikev. M. Ochilov, B. Rakhimov. The study by N. Muslimov deals in detail with the structure of vocational and pedagogical activity and its important components.[5; 6; 7.] During the years of independence, a very close approach to innovation was found in the works of our scientists, such as S. Ochilov, O. Muslimova, M. Ochilov, U. Makhkamov. In addition to work directly related to pedagogical activities, work on creative development issues played a significant role in innovation. In the works of M.I.Mmutov, V.A. Slastenina, etc. Great interest in problems of creativity, criticism of extensive collection of knowledge, creative work of students and teachers on reading., "Explosion" diversification in the education system has led to the relevance of another block of innovative tasks related to standardization of education and improvement of its quality. In the following years N. Shodiev, E.Seithalilov, Sh.Kurbanov, O.Tolipov, U. Inoyatov, R. Sh. Akhliddinov, L.Golish, S.Volkov, O.Rashidov, associate their research with the development of state educational standards. In order to justify the system of use of innovative technologies in improving the quality of education and to develop scientific and methodological recommendations, familiarization with the literature on the use of innovative technologies in improving the quality of education, Determining the problem of using innovative technologies in improving the quality of education, determining the current state of using innovative technologies in improving the quality of education, The identification of factors and criteria for the use of innovative technologies in improving the quality of education and the organization of testing are the main objectives of the study.

## II. MATERIALS AND METHODS

When determining advantages of the use of innovative technologies in improvement of quality of education methods of monitoring, skilled and test, test, sociometric, mathematical-statistical processing and the analysis of scientific results and proofs were used. Our country pays great attention to the education of young people, their education, health and a number of other spheres, and such efforts are based on the guarantee that future heirs will be truly strong. Russian Methodists E.F. Bugrimenko and G.A. Zukermana [4.] they divide the game technology into 2 types, which are implemented in the course of training.

1. Entertaining games.
2. The training games.

The requirements for didactic games are somewhat more serious. They serve an educational purpose directly. These games have some advantage in children's mental leaping, encouraging them to know, logical thinking. Will contribute at the same time to the formation and the development in the pupil of qualities of diligence, resourcefulness, resourcefulness, resourcefulness and intelligence. These games are organized by a teacher specifically for educational purposes. New abstract concepts the reader must achieve the emotional perception of the image. Thus, the teacher should know to what extent he used didactic and entertaining types of games in the lesson, know the norm, place and time. The use of didactic game objects in the lesson eliminates difficulties in learning educational material. Visual aids, interesting questions, humorous tasks, surprises related to the type of activity related to vision and hearing, ensure the efficiency of the reader's mental activity. The lesson uses not only game technologies, but also innovative and integrative methods of education, expansion of the child's thinking, provision of knowledge to the child based on cognitive and life events. They serve to address issues such as meeting their aspirations for innovation, achieving more knowledge, skills and skills to be provided during the year, developing a child's creative, demanding, responsive, thinking skills. The Innovative Method of Education is a method of innovative education characterized by introducing innovation, using unconventional methods and teaching methods, introducing new methods and methods, meaning "innovative" English "in" - "new" vacation "-" introduction. "Innovative teaching methods produce positive results in the practice of pedagogical processes compared to the traditional managed education system. The reason is that, according to the content of learning managed by traditional methods, students passively participate in the learning process. Listening to the teacher's lecture and hearing what he said, he plays the role of an informant receiver. All students take an active part in the innovative and non-traditional method of education. In particular, the basics of innovative methods of teaching "mental attack" are the answers to one of the students to the question asked by the teacher. "Modified learning" is a lecture in which the form is changed. The teacher conducts a lesson in the form of communication with students through question-and-answer, discussion. "Improvisation" - description without preparation. To questions or tasks asked by the teacher, without preparation, from mouth to mouth, suddenly pupils answer in their own way. "Multimedia" - "lessons with video programs." A method of conducting a lesson using software, voice, visual, television, video devices on a specific topic. "Analysis of a specific situation or state" - analysis of any life event, situation, an event to make the correct conclusion. "Critical thinking" - Charters express their thoughts with a critical approach, without repeating each other in the questions asked by the

teacher. The purpose of implementation of innovative technology is the comprehensive judgment of the reader, disclosure of each its aspect and identification in it various abilities and also improvement of such abilities and qualities as thinking, thinking, speech development of the child. It increases the focus on deepening and advancing reforms in modern education, convinced that they will be implemented in practice. One of the most important aspects is to ensure that the student does not miss the lesson, that the educational process achieves this goal fully in the student's mind, especially to increase knowledge, enrichment, logical thinking, and search, serious approach to each issue, to be attentive and attentive. In addition, the reader will need a convenient and comprehensive method and methodology to implement the above at a time when the lesson is attended not only by the listener or receiver but also by the direct participant, the free person, the independent thinker, the critic, the real Contemporary. For this purpose, we want to consider the application of didactic games in the lessons of pedagogy. It is known that didactic games in the form generally serve as the tutorial, drawing the attention of children, are held at the interesting, interesting, clear level. Even children in need of special assistance, that is, students with a low level of learning, who receive education, who are difficult to learn scientific theories, try to perform every task, and in the game activity, there is an opportunity to learn easier, faster. Because of the interest in performing didactic materials, tasks are increasing, they begin directly with this situation. Didactic games include the visibility of education, teacher speech, and the movement of children. As a result, there is a uniqueness of perception, vision, hearing, skin sensations. This ensures the growth and development in the child not only of the activity of the senses but also of the process of thinking in them. Contributes to the growing ability of logical thinking in the reader. The use of didactic games will undoubtedly make it easier for students to learn the basics of science. Therefore, we believe that it is necessary to organize a lesson on the basis of game classes, to bring to the lesson the technology of the game directly on a permanent basis, so that the knowledge to be mastered is easily and easily mastered, in order to deepen reading thinking. Still, in the lesson, there are several goals from the application of game technology and carrying out game classes, which directly serve as a program for the formation of reading personality.[8] These are: - didactic goals; - educational goals.

Didactic goals: - Strengthening and thorough mastery of the knowledge system through game classes;

- Exchange of experience in the development of gaming sessions;
- Organization and solution of various issues and problems.

Educational goals:

- Training in creative thinking, approach to the problem;
- give instructions when performing gaming practice;
- The ability to behave in the process of communicating with people, to form skills of self-control;
- Absorption of important educational tools in the formation of the personality of the student.

In order to implement these goals, the educational process should be organized directly at the level of the Moroccan, interesting multifilm or performance. When developing and organizing game classes, it is necessary to pay attention to the following and ensure the introduction of new qualities in the learning process.

- Development of the formation of active joint or private activities of the student through the organization of game classes;

- Achieving changes in the growth and development of the reader, demonstrating the various modes and options of the game.

Assuming that gaming technologies will bring the following new qualities to the educational process, we considered it necessary to abandon traditions and be based on the principles of novelty and unconventionality of the new century.

- The introduction of a model demonstrating the educational process, that is, a new method for the content of educational material;
- Determine what form of activity leads the reader in the game model;
- The game is directly through the game, but in fact, approaching the educational process and the transformation of the educational activities of students;
- ensuring the unity of the implementation of educational and educational goals;
- Organization and management of activities by the teacher and implementation by students;
- Widespread use of data and knowledge systems.

Game training should perform the following tasks:

- give students a holistic view of a particular learning activity that they must master in the game;
- Mastery of individual and group decision-making on entry into educational activities and mastering a subject based on social experience;
- Development of theoretical and practical thinking while mastering knowledge and solving problems;
- The formation and creation of conditions for the active development of educational activities and the process of mastering knowledge.

The application and introduction of didactic games in the lesson differ from traditional methods in a number of qualities expressing an unconventional approach to the educational process. That is, thanks to the organization of the educational process directly on the basis of interesting games, ensuring the joint movement of participants in the educational process, a group approach to the issue, an active movement and the development of logical thinking of students are formed. The advantage of organizing a problematic educational process in pedagogical classes. Effective teaching technology in the current high school is problem-based learning. Its task is to promote an active cognitive process and the formation of a research method of thinking. Problem learning is consistent with the goals of creative, active personality education. Problem-based learning is advanced learning technology. The technology of instruction in the current efficiency high school is problem education. Its task is to promote an active cognitive process and the formation of a research method of thinking.

The thought process in problem education covers theoretical and practical aspects, such as the activity of inventing educational science, namely its new features and relationships. In solving a problem in problem education, an essential element of the problem situation is the unknown, consisting of knowledge that is missing from the student. Uncertainty in problem situations is characterized by two main indicators:

- 1) The level of innovation (in relation to the acquired knowledge and existing methods of action);
- 2) The degree of assimilation of the acquired knowledge or ways of action (relative to the achieved level of generalization). These two indicators are important in determining the degree

of complexity of a problem issue. The student's need for knowledge in the educational process consists in feeling the need for certain practical or theoretical knowledge, conditions and methods of activity on the way to achieving the goal. The need for knowledge is a necessary part of the problem situation and requires reasonable activity to the mastered knowledge in search of novelty. It plays an important role in the child's self-control in the process of thinking. The need for knowledge is a necessary condition for managing the learning process in training.[9.]

The advantage of using test technologies in knowledge control is that in the process of education of young people specific goals and tasks have been developed to determine the qualities of spiritual and intellectual development. Monitoring and evaluating the knowledge and mental abilities of students and students are important on a state scale. At the same time, the process of monitoring and evaluation affects the enrichment of the reader's knowledge, the development and education of his personality. When controlling knowledge, it is necessary to constantly monitor what points and grades leave an impression on the reader and student, how they relate to the achievements and shortcomings of their comrades in the study. The Student and Student Knowledge Monitoring and Evaluation System are introduced regularly during the school year, and sometimes prevents random checks and opens up opportunities for orderly, ongoing evaluation. Regulatory tests have the following advantages:

- Test questions involve testing many abilities; - although it is useful to determine the overall level achieved by learners in studying a large amount of complex material with different arcs;
- Provides an opportunity to select the most talented students.

The lack of regulatory tests is striking if the educator does not determine to what extent he is willing to move on to the next boss-CIC.

When testing by criteria, the results are unchanged, comparable to permanent standards. For example, a driving licence is a requirement for the extradition of Christ that must be matched to an existing standard of knowledge. It cannot be compared to the abilities of a worker in another sphere. Standardized tests are based on a program with specific requirements of the standard and are designed to determine the knowledge, skills and skills of the learner. They have types of diagnostics that determine and determine the achieved level, abilities (as well as interests). Tests that determine the level achieved are standardized tests that awaken the amount of knowledge learned by learners in a particular area. [10] The use of such tests for the whole group or individually, in the calculation of results can be used a different system of points. Diagnostic tests are used individually to identify problems in education.

Specialized disciplines make the most extensive use of closed tests, open tests, Compliance tests, and correct sequence tests.

Open tasks. If the student can answer freely, the test task will have an open forum.

It is assumed that the Shooting Men respond briefly and unambiguously, consisting of one, two words. This should be described in the ticket attached to the test. Space required for the answer is left on the blank of the form.

For example, the "concept of test" was first used in the year. Closed tasks. Such a task will consist of approval and several answers, one of these answers will be correct, the rest-correct but wrong. The number of responses offered can range from two to five or more.

Didactic requirements to the preparation of test tasks: the sphere of professional activity is the sphere of application of professional knowledge, skills and skills, the name of which is adapted to the names of economic spheres. All prepared test tasks are not unambiguously valid. For test questions to be ideal, a number of requirements must be met when drafting them. These include the feasibility of training material of test tasks content; material importance; scientific accuracy; sequence; viscosity and harmony; Stratification by the degree of assimilation; efficiency (kumulyativnost); Language sensitivity and accuracy; unambiguity; strictly certain time; compactness; the standard of complexity; No additional signs of a correct response; variability; The relationship between form and content. Now let 's take a quick look at these requirements:

**1. Compliance of the educational purpose.** The content of test tasks should be oriented to educational purposes. The set of learning objectives has a hierarchical structure. Therefore, without realizing a relatively close goal. The overall (relative) goal cannot be achieved. Each test question should ensure the realization of a certain educational goal.

**2. Importance of material.** Test questions include the most important, basic parts of the training material. The number of jobs in a test is usually limited.

Therefore, all topics that are directly addressed may not be fully covered. The student 's conclusion from the general state to the private (deductive) and vice versa, the conclusion of some facts from the general (inductive) shows how much he assimilates the application of theoretical provisions in exceptional cases, and the knowledge of details-his ability to explain theoretical foundations.

**3. Scientific accuracy.** The test includes truthful data that can be justified through abstract, knowledge. Controversial opinions in science are not recommended to be included in test questions. The nature of test assignments basically requires a pre-known, accurate answer.

**4. Sequence.** The tasks in the test must be linked by essentially general knowledge relating to a certain science. Consistency manifests itself in that the same job response correlates (correlatively) with the results of the general test.

**5. Viscosity and harmony.** It is important that the total number of tasks in the test is distributed according to the topic and parts. At the same time, it is necessary to fully cover all aspects of the science studied.

**6. Stratification by the degree of learning.** It is necessary to draw up test tasks in which the degree of learning of a certain component of the educational material is different (knowledge, description of what is remembered, productive and creative thinking). Cognitive level test jobs are based on restoring previously learned data. Memory capacity will be important. When testing at the reproductive level, the reader thinks independently on the basis of the data obtained earlier, and when performing the task relies on previously known rules and algorithms (directions) in science. In this case, it follows the path of recreating, implementing the memorable. Test tasks for productive creative thinking test the ability of the subject to apply certain general methods independently to certain conditions specified in the task. Fruitful creative thought activity is carried out not on the basis of ready-made rules and algorithms, but according to certain rules, which were created or recreated in the process of activity in new conditions. Compiling test assignments based on the above requirements requires teachers to have knowledge of test compilation theory. For this purpose, it is necessary to learn from testing courses and to learn the

corresponding literature on your own. Criteria for assessing students' knowledge, skills and skills have been developed in the testing. The teacher must learn to know them well and practice them in the learning light.

For this purpose:

1. It is necessary to tell students about the system of evaluation of test results, to show on the example of answers of students what knowledge is evaluated medium, good and excellent.
2. When evaluating, you must analyze the test result and specify what to pay attention to when repeating this material.
3. When evaluating, it is important to encourage pupils, but not always to encourage one or two readers in a naughty way.

It should be noted that the responses of each student on the results of the test should be objectively analyzed.

Department of Descriptive Geometry and Engineering Graphics,  
Fergana Polytechnic Institute, Fergana, UZBEKISTAN

### ABSTRACT

*This article discusses the challenges of using gaming technology in engineering graphics science. According to the results of the study, the level of theoretical knowledge of students in the field of engineering graphics about methods of using game technologies will increase, their interest in the study of engineering graphics science will increase, skills of creative thinking, spatial imagination and independent analysis will lead to conclusions. Experience such as parish is expanding. The data of modern literature on methods of using game technologies in the field of engineering graphics have been studied. The benefits of using gaming technology were emphasized, and recommendations were made to increase students' spatial awareness and improve their drawing skills. The task of education today is to teach students competently, independently in the context of the information and educational environment, based on various game technologies, to use information technologies competently, to organize training based on new technologies. General secondary education also includes primary education. At this stage, students receive regular knowledge of the basics of science, the need for knowledge, the acquisition of basic educational, scientific and cultural knowledge, spiritual and moral qualities based on national and universal values, hard work, creative thinking. Pedagogical conditions are created for an informed attitude to the environment, as well as the formation of skills of choice of profession.*

**KEYWORDS:** *Engineering Graphics, Graphics, Creative Thinking, Spatial Imagination, Pedagogical Technologies.*

## I. INTRODUCTION

The future of a society is determined by the extent to which the education system, which is an integral part of it, is developed. Today's task of education is to teach students the rational use of information technologies in the information and educational environment, on the basis of various game technologies, and to organize training on the basis of new technologies independently. General secondary education also covers primary education. At this stage, pedagogical conditions are being created to provide students with systematic knowledge of the basics of science, the need for them to acquire knowledge, master basic educational and scientific knowledge and universal knowledge, to form spiritual and moral qualities based on national and universal values, diligence, creative thinking, conscious attitude to the environment, as well as skills for choosing a profession.

## II. Materials and Methods

General secondary education is compulsory; this form of education creates the need for students to acquire a systematic knowledge of the basics of science, to assimilate knowledge in them, to have a conscious attitude towards basic educational and scientific values, spiritual and moral qualities, work skills, creative thoughts and the environment, and to choose a profession.

The purpose of the organization of education is to provide the young generation with deep knowledge and develop their abilities and abilities. At present, the Government pays special attention to identifying and supporting educated, talented young students. Pupils have a lot of training to do in order to master theoretical knowledge and practical skills of drawing, as well as to improve themselves [1].

Learning to read a drawing means developing the ability of students to describe the subject in the drawing, to give a clear verbal description of its structure and components, to make a complete analysis. At a performance of the task on the reading of the drawing of a subject at pupils and the given drawing of anybody or model, it will be necessary to develop skills and to expand reserves of spatial imagination, ability to present visually the geometrical form of geometrical bodies or real subjects familiar to them. In case of insufficient development of the ability to imagine something graphically complete and correct it will be difficult to depict something. Indeed, looking through the drawing, studying the length, width, and height of the object described in it, as well as the component and conditional signs of its elements, we read a clear image and drawing of the object in front of our eyes. Thus, under drawing reading it is understood knowledge of the external and internal structure of an object, knowledge of its sizes, ways of processing, depending on the executed images. They show that the spatial imagination when reading a drawing is the most important indicator, so when the spatial imagination is read low, they find it difficult to read the drawing, and their interest in drawing fades. Therefore, we will need to pay full attention to drawing lessons at school and make every effort to increase the spatial imagination of students. Only then will we prepare the youth for the future phase of education. A modern teacher must be the future creator, author, developer, researcher, user and promoter of new pedagogical technologies.[2]

The school curriculum has now been modified and each subject has been given special attention, including the importance of drawing, and different methods have been developed and applied to enhance the spatial imagination of students. In particular, the use of creative games in teaching plotting will create a basis for expanding the spatial representations of the younger generation,

real mastering of graphic knowledge, improving the efficiency of perception and comprehensive improvement of creative activity. The educational goal of the game will be aimed at educating students in independence, will, certain approaches, views, cooperation in the formation of spiritual, aesthetic and attitudinal worldview, ability to communicate, communicativeness [3]. The games will be held in the following main areas:

- the didactic goal is set as a game task;
- educational activities are subject to the rules of the game;
- educational material is used as a game tool;
- the training process includes elements of competition turned into a didactic game;
- Successful completion of the didactic task is linked to the results of the game.

The game is a type of activity that focuses on learning, shaping social experiences and improving behaviour. The purpose, functions and application of games are different. [3]

The game is defined as an activity in situations aimed at learning and recreating the social experience in which the self-control of the individual is formed and improved. According to D.N.Unidze, the game is a form of internal mental behaviour. L.S.Vygotsky describes the game as the internal social world of the child, a means of mastering social orders. A.N. Leontyev sees personal freedom in a game to realize unrealizable interests (interests) in imagination. American philosopher, psychologist, and educator John Dewey founded an experimental school in Chicago in 1885, based on the concept of "learning through action," which is a key feature of practical learning. The main principles of this system are:

- Take into account the interests of students;
- Reading of activities (education of thought and action);
- Knowledge and knowledge - as a result of overcoming difficulties;
- Creative work and collaboration.

At the same time, the author takes into account that the student can learn lessons through interest, movement, free creative work. Professors Ruziev, Riksiboyev, Associate Professors I.Rakhmonov, M.S.Isayev, A.Abdurakhmonov, A.Ashirbayev, senior teachers L.A.Kuzina, Z.Mirzaliyev and others carried out many studies in this field. In his book "Didactic Games from Drawing," written by Assistant Professor I. Rahmonov, he was one of the first to cite several didactic games for use in the educational process. This book has not lost its importance and is used in educational institutions.

Nowadays, with the constant growth of educational technologies, the students' attitude towards reading is changing, which reduces the chances to master all this knowledge.

It is desirable to use available knowledge to increase students' interest in reading, to teach them strategies to restore existing knowledge to increase their spatial perception. [4; 5]

In general, the game does not choose age, it can be played by everyone, from babies to the elderly. But people only play games that match their age. Psychologists say that the possibility of entering the game does not depend on the age of the person, but the game is unique for each age group. For example, young students are more likely to play active, creative games, while adults are more likely to play games that require more mental activity. Each game is a product of folk pedagogy, and teachers can effectively use some elements of these games in the classroom.

These include action, creativity, role-playing, business games, conferences, games and more that are part of didactic games. These games include team games, individual games as well as games designed for learning material. [6; 7]

They are divided into educational games, games to determine knowledge, games to consolidate the acquired knowledge and skills, games of a creative nature and others. Using and conducting creative games in drawing lessons is of great educational importance. The main purpose and objective of such games are to develop and activate the spatial imagination of students. Observations show that teachers pay more attention to the graphic drawing field and pay less attention to reading the drawing. That's why more than half of drawing lessons are with graphic works. From a psychological point of view, the same adversely affects the human brain and causes fatigue. In practice, you can notice that in the first 10-15 minutes of one lesson students remember 9 out of 10 words out of 10, that is, they learn 90%, in the next 5 minutes do not get new knowledge and work with old knowledge, in the next 20-25 minutes they remember 6 out of 10 words, that is, they learn 60%. Based on the results of these studies, creative drawing games can be conducted within 5-6 minutes after 15-20 minutes of classes in order to replace and activate the work of students and attract attention to the topic. Sensation in games, excessive excitement is a natural phenomenon for readers. The reason is that the students behave freely in games and have very high demands on themselves, trying to get out of difficult situations on their own. Then students who act in their way, confident in themselves, will be able to cope with any difficulties, adversity. Therefore, it is natural that when conducting creative games in drawing lessons, they superficially perceive the bright images or models in the drawings and resemble other household items. In order to use these characteristics of readers, it is necessary to achieve a lasting perception of them by comparing models or details with things from life. Only then will it be possible to increase their spatial imagination.

### III. CONCLUSION

At present, the education system has a rich treasury of teaching methods. If we can make the right use of pedagogical technology in the development of education, we can achieve the desired result confidently and briefly. The continuous development of research in the field of educational technologies and the emergence of new opportunities, the successful implementation of educational tasks require responsible updating of teaching methods, creative use of folk pedagogy, especially the pedagogy of the peoples of the National East. But it should also be noted that, as we mentioned earlier, new technologies are being created depending on changes in time, the development of education. It is better to use more modern technologies that are being created, but we must not forget about the old technologies, that is, we must support them (old technologies) in the process of the lesson, using the best, quality, sharp methods. It is worth noting that we have seen good results in determining the level of knowledge of students, the level of absorption of science through various methods.

### ABSTRACT

*In this paper, transient photoelectric processes in a hyperfine gas-discharge cell were investigated. The issues of delay of the gas discharge breakdown in the pulsed mode of the cell operation and the electrostatic phenomena of the transient processes are considered. It is established that the breakdown delay time depends on the semiconductor illumination intensity, the duration and magnitude of the voltage pulse, and also the state of the surface charge, that is, the field strength of the surface charges.*

**KEYWORDS:** *Gas-Discharge Cell, Photo Detector, Breakdown Delay, Surface Charge, Watt Ampere Characteristic, Kinetics Of Pulse Current, Intensity Of Glow Discharge.*

## I. INTRODUCTION

An ultrathin gas discharge cell (20–100  $\mu\text{m}$ ), consisting of a photosensitive semiconductor electrode and located through a gas discharge gap of a fiber-optic washer with a conductive transparent coating of  $\text{SnO}_2$ , is the main element of a semiconductor photographic ionization chamber (PFIC) [1-4]. The kinetics of the current in such a cell and the kinetics of the glow of the discharge have already been partially investigated in [5]. It was found that the statistical spread of the breakdown delay at a negligible resistance of the electrodes corresponds to a distribution function of exponential type, while the spread at a sufficiently large value of the resistance of the semiconductor electrode is described by a function close to the random error function [6].

Indeed, the semiconductor electrode is the highest resistance element of the electric circuit of an ultrathin gas discharge cell, and therefore it will determine the value of the passing stationary current of the PFIC, which is equal to the photocurrent in the semiconductor [7].

In the case of transients, for example, when an external voltage is connected or an “instantaneous” change in the conductivity of the semiconductor, the surface charge may be in complete discrepancy with the conductivity current, which causes electrostatic phenomena. A significant role in the current transmission is played by the surface electric charge, which is localized at the semiconductor – gas discharge interface, self-consistent in magnitude with the current density and largely determines the stationary current-voltage characteristic of the PFIC. However, until now transient photoelectric processes in an ultrathin gas discharge cell have not been sufficiently studied. Data on the effect after breakdown of statistical spread and breakdown delay time, as well as the magnitude of the surface charge on the photoelectric characteristics of an ultrathin gas discharge cell, are not available in a wide scientific publication.

The aim of this work is to identify patterns of transient processes occurring in an ultra-thin PFIC gas discharge cell, taking into account the delay in the breakdown of a gas discharge and the distribution of the surface charge on a semiconductor photo detector.

This report presents the results of a study of a gas discharge cell with a thickness of 40  $\mu\text{m}$  and 100  $\mu\text{m}$  at an air pressure of 0.2 atm with electrodes of chromium-compensated gallium arsenide at room temperature with a dark specific resistance of  $\sim 10^8 \text{ Ohm} \cdot \text{cm}$  and silicon doped with platinum at  $T = 80 \text{ K}$  with a dark resistivity of  $\sim 10^9 \text{ Ohm} \cdot \text{cm}$  in conditions of very small through currents or their absence, when the effects of an electrostatic nature are most pronounced.

## II. Experimental setup and research methods.

To carry out the experimental work, the PFIC was used, the circuit diagram of the ultrathin gas discharge cell of which is shown in Fig. 1. The main DC power supply  $U_1$  was connected between the photo detector and the fiber-optic washer; in addition, a high-voltage thyatron pulsed generator  $U_2$  with a pulse duration of  $t_v = 0.5 \div 30 \mu\text{s}$  and a leading edge duration can be connected in series or directly to the gas discharge cell  $\tau_\phi = 50 \text{ ns}$ . The maximum value of the pulse voltage was  $U_2 = 1.6 \text{ kV}$ , with an output impedance of 100 Ohms. For registration of direct current, a two-coordinate self-cleaning laboratory complex of the LKD4-003 type was used, and for registration of a current pulse, a two-beam oscilloscope of type C1-91 was used, which recorded the voltage drop across the load resistance  $R_H$ .

Fig. 1. Schematic diagram of an ultra-thin gas discharge cell. 1 - infrared photosensitive semiconductor plate with a transparent electrode, 2 - mica plate with a hole in the center, 3 - fiber optic washer with  $\text{SnO}_2$ .

In the present work, we developed an averaging method based on a change in the optical density of the image of the current waveform photographed from the screen of the oscilloscope to film. The essence of the method is that, since the photographic effect of the cell's gas discharge on the recording medium is determined by the average amount of electricity, we were interested not only in the current values in each individual pulse, but also in the average current values for the period. Therefore, the experimental task was to determine the average current averaged for each moment in time over the total number of pulses during the exposure time.

Indeed, assuming that the optical density of blackening is proportional to the number of pulses for each moment in time, we can assume that the average current value at a given moment in time is determined by the following relation:

$$i_t = i_{tmax} \frac{n}{N} = i_{tmax} \frac{D}{D_{max}} \quad (1)$$

where  $n$  - is the number of current pulses for a given moment in time;  $N$  is the total number of voltage pulses;  $D$  is the optical density on the waveform corresponding to the number of pulses for a given moment in time ( $D \sim n$ );  $D_{max}$  is the maximum optical density on the waveform corresponding to the total number of pulses ( $D_{max} \sim N$ ).

Thus, by conducting densitometry of waveforms, it is possible to obtain an averaged shape of the current pulse. The method for obtaining the average current kinetics from densitometry of waveforms is schematically explained in Fig. 2, a, where the optical density on the waveform is conventionally shown by lines of different thicknesses, and the smooth dash-dot curve in Fig. 2, b shows the obtained average current kinetics. The oscillogram was recorded on aerial film-42 with a Zenit-E camera with a Helios lens and an additional adapter ring. The densitometry of the

photographs was carried out on an IFO-451 type microdensitometer with a slit width providing a resolution of 20 lines / mm. In all measurements, the radiation power was measured with an LETI type thermal column with a sensitivity of 0.72 V / W.

Fig. 2. a). Schematically - the distribution of the optical density of blackening on the waveform of the current pulse,

b) The time dependence of the average current obtained from the waveform (a).

### III. The experimental results.

#### A. Breakdown kinetics in an ultrathin gas discharge cell with a semiconductor electrode made of high-resistance gallium arsenide compensated by chromium.

To study the kinetics of the current and the breakdown delay, the densitometric current waveforms of the ultrathin gas discharge cell were processed by the densitometric method described above. In this case, between the semiconductor photodetector of gallium arsenide compensated by chromium and a fiber optic washer, a pulse voltage of the order of 1.6 kV was applied from a high-voltage thyatron generator. The residual air pressure was 0.2 atm,

Fig. 3. Oscillograms of voltage (A) and current (B) in a gas discharge cell with a semiconductor electrode of gallium arsenide compensated by chromium.

The thickness of the gas gap in one experiment was 40  $\mu\text{m}$ , and in the other 100  $\mu\text{m}$ , the illumination was carried out with white light on OI-24, the power of which was measured by a thermal column.

Figure 3 shows a typical waveform of voltage and current when a single voltage pulse is applied to the cell. As can be seen from the figure, after the first capacitive current surge (bias current) after a certain delay time, depending on the illumination of the semiconductor, a second current surge is observed at the time of the breakdown of the gas-discharge gap, passing into the horizontal section of the steady-state through current flow. Thus, the second surge in current is associated with a transient in the electric circuit (Fig. 1), which begins at the moment of breakdown of the gas gap.

Figure 4 shows the dependences of the breakdown delay time on the light intensity for two values of the gap thickness. The breakdown delay decreases with increasing illumination of the photo detector and with increasing thickness of the discharge gap.

The obtained photocurrent curves made it possible to construct the dependences of the average current in the pulse on the light intensity for various values of the voltage pulse duration.

## **B. 2. Electrostatic phenomena in an ultrathin gas discharge cell with a platinum-doped silicon semiconductor electrode.**

To study transients of an electrostatic nature, DC sources and a high-voltage pulsed thyatron generator were connected in series to an ultrathin gas discharge cell. In this case, the photo detector of the cell is platinum doped silicon [8], which is cooled to  $T = 80\text{ K}$ , the gas-discharge gap is 40  $\mu\text{m}$  thick, and the residual air pressure is 0.2 atm.

Fig. 4. The dependence of the breakdown delay time on the intensity of illumination of the semiconductor at various values of the thickness of the gap. The thickness of the gap: 1 - 40 microns, 2 - 100 microns.

To enhance the glow of the discharge, an electro-optical converter of the EP-16 type was used (Production in Russia). When a constant voltage of 550 V is applied to the cell, a stationary discharge is ignited and a uniform glow is observed at a current density of  $10^{-8} \div 10^{-7} \text{ A / cm}^2$ . If, in addition to the cell, a short (25  $\mu\text{s}$ ) voltage pulse of 1.6 kV of the same polarity is applied, the discharge glow disappears and then gradually recovers. The pattern of recovery of the discharge glow at different instants of time after a voltage pulse is shown in Fig. 5.

Fig. 5. The picture of the glow of the discharge at different points in time after the voltage pulse: a) after 4 s; б) - 8s; в) - 12s; г) - 20s.

In a purer form, electrostatic phenomena are observed in the absence of a constant through current in the following formulation of the experiment.

A short (25  $\mu$ s) rectangular voltage pulse of 1.6 kV is applied to the cell, causing a breakdown of the gas gap and, accordingly, a flash of uniform luminosity over the area. After a certain period of time  $\Theta$ , a second voltage pulse of the same polarity is applied. Moreover, if at the moment  $\Theta$  the total field in the gap is equal to the difference between the external field  $E_{im}$  and the field of surface charges  $E_{zaryad}$ , during relaxation it reaches the breakdown strength  $E_{pr}$ , a discharge flash is observed. Just for this case, the time  $\Theta$  is fixed. If a discharge flash is not observed, then the time of the threshold breakdown time  $\Theta$  in these parameters is longer, and for this case, the moment of supply of the second pulse must be delayed. Thus, the selection of random errors determines the true value of  $\Theta$ . Figure 6 shows the experimentally obtained dependence of the threshold value of the breakdown time  $\Theta$  on the illumination of the semiconductor J, increasing its conductivity (the illumination intensity was measured by a thermal column), and Fig. 9 shows the experimentally obtained dependence of the glow intensity of the discharge I (the photomultiplier FEU-19A was measured discharge glow intensity) from the threshold breakdown time  $\Theta$  for the dark current (curve 1) and for infrared radiation with a wavelength of 3.6  $\mu$ m at a power of  $\sim 10^{-9}$  W / cm<sup>2</sup> (curve 2).

#### IV. RESULTS AND DISCUSSION

Before discussing the results, we consider it appropriate to consider the issue of the breakdown of the gas gap from the point of view of theoretical analysis. The calculation of the time dependence of the voltage at the gas-discharge gap U (t) before breakdown can be performed similarly to the problem of charging a two-layer capacitor [9], one of the layers of which is a semiconductor, has a permittivity  $\varepsilon_1$ , thickness  $d_1$  and conductivity  $\sigma_1$ , and the second layer has a gas gap has a dielectric constant  $\varepsilon_2 = 1$ , thickness  $d_2$  and conductivity  $\sigma_2 = 0$ :

$$U(t) = \frac{U_0}{R \frac{1}{4\pi d_2} \left( \frac{1}{\tau_2} - \frac{1}{\tau_1} \right)} \left[ \left( \frac{4\pi\sigma_1\tau_1}{\varepsilon_1} - 1 \right) \exp - \frac{t}{\tau_1} - \left( \frac{4\pi\sigma_1\tau_2}{\varepsilon_1 d_1} - 1 \right) \cdot \exp - \frac{t}{\tau_2} - \frac{4\pi\sigma_1}{\varepsilon_1} (\tau_1 - \tau_2) \right],$$

(2)

$$\text{где } \tau_1 = \frac{R\varepsilon_1/16\pi^2 d_1 d_2}{\frac{\varepsilon_1}{\pi d_1} + \frac{1}{\pi d_2}}; \quad \tau_2 = \frac{d_1}{\sigma_1} \left( \frac{\varepsilon_1}{\pi d_1} + \frac{1}{\pi d_2} \right);$$

$U_0$  is the supplied voltage; R is the internal resistance of the voltage source. If the internal resistance of the generator is negligible, the applied voltage at the initial time is redistributed inversely with the capacitances:

$$\frac{U}{U_0 - U} = \frac{U}{\varepsilon_1 d_2}. \quad (3)$$

Then, with a time constant  $\tau_2$ , all the voltage passes to the discharge gap. Thus, the breakdown of the gap occurs under conditions of increasing voltage on it. Since  $\sigma_1$  depends on lighting, the breakdown delay value is determined by the time  $\Theta = \tau_2 = f(\sigma_1)$ . Another factor determining the breakdown delay is the natural statistical spread of the breakdown time, which is the only reason for the breakdown delay in a cell with equipotential electrodes. Therefore, the total delay time is determined by two components: the delay time of the discharge gap capacitance through the

illuminated semiconductor and the time of the statistical breakdown delay at a given voltage in the gap. The study of the breakdown delay in the PFIK gas discharge cell is of practical importance.

Fig. 6. Threshold time dependency breakdown  $\Theta$  from semiconductor J. illumination

Therefore, based on this task, experience was set. First, the kinetics of the current in the gas discharge cell were constructed by the densitometric method from the current waveform. As can be seen from the curves in Fig. 4 that during the voltage pulse, the relaxation curves of the average current come to a stationary value, the value of which depends on the illumination. Breakdown delay, defined as the time the current reaches half the steady-state value, and the spread of the breakdown delay time (slope of the curve) decreases with increasing illumination. In addition, the average current value at a gas discharge gap thickness of 100  $\mu\text{m}$  is more than three times greater than at a thickness of 40  $\mu\text{m}$ . Apparently, this is the best case for pulsed PFIC operation. The curves shown in Fig. 6, the dependence of the average current in the pulse on the light intensity (current-voltage characteristics of the PFIC) demonstrates a characteristic feature of the curves, that is, the “threshold” form of these dependences, which is a consequence of the breakdown delay effect. With an increase in the duration of the voltage pulse, the threshold value of the illumination intensity decreases below which the conduction current in the PFIC, and hence the discharge glow, are absent. We also note that, starting from the threshold value, the photocurrent increases sharply with increasing light intensity. The obtained “threshold” dependences of the average current with regulation of the threshold value are of considerable interest, being, in principle, a method of background discrimination.

Now we turn to a discussion of the results of studying the electro-statistical phenomenon occurring on the surface of a semiconductor photodetector in an ultra-thin PFIK gas discharge cell. It should be noted here that the ultrathin gas discharge cell in the PFIC operates in two modes: 1. Standby mode, when a DC power source is connected to the cell, as if it is waiting for light information to be registered; 2. Pulse gate mode, in this mode of operation, against a constant background of radiation of the detected object, a pulse high voltage is applied to the cell. To identify patterns of transient processes in an ultrathin gas-discharge cell, we simultaneously used both modes of supplying voltage to the cell. When a DC voltage of sufficient magnitude for breakdown is applied to the cell, then against the background of a constant radiation intensity of the object, a uniform discharge glow is observed on the PFIC

screen. If, in addition to the cell, a high pulse voltage is applied, in our case 1.6 kV, then the glow of the discharge goes out. After this discharge, that is, the image of the object is established after a certain time. As can be seen from fig. 6, this time  $\Theta$  depend on the radiation intensity of the object. In turn, this value also depends on the intensity of the discharge glow (Fig. 9). This last result led us to the idea that the intensity of the discharge  $I$  is proportional to the square of the electric field

$$E_{np}^2 = (E_{umh} - E_{zaryad})^2$$

acting at the time of the breakdown and has a threshold character of this dependence qualitatively corresponding to the theoretical relation

$$I = \left\{ \alpha (E_{umh} - E_{np}) \left[ 1 - \left( E_{zaryad} \exp\left(-\frac{t}{\tau}\right) / (E_{umh} - E_{np}) \right) \right] \right\}^{1/2} \quad (4)$$

here  $E_{imp}$  is the field strength of the supplied voltage pulse,  $E_{charge}$  is the field strength of surface charges,  $\tau$  is the Maxwell time in the semiconductor, and  $\alpha$  is a constant coefficient.

It should be noted that the spread in the luminescence intensity and in the moment of ignition of the discharge increases as it approaches the threshold time, which is apparently due to the inhomogeneity of the semiconductor conductivity and the dispersion of the breakdown delay (Fig. 5). [12; 13]

Electrostatic phenomena of this type are determined by the peculiarity of transients in ionization devices and, on the other hand, can serve as an effective tool for studying the physics of a gas discharge with distributed electrode resistance.

## **COVID-19 -: AN INVISIBLE SILENT KILLER: ITS EFFECT AND POTENTIAL THREATS TO THE WORLD**

**Nisha Rani\***

\*Department of Commerce,  
Punjab University, Chandigarh, INDIA  
Email id: nisha44593@gmail.com

### **ABSTRACT**

*Covid-19, an outbreak of global pandemic causing massive destruction to the world resulting in high rate of distress and loss of life. With each passing day, the quantum of death and the economic loss keeps on rising throughout the world. This study is an attempt to access the effect of this invisible silent killer on the humanity and the economy and to access its potential threats to international peace. Here we get to know that how covid-19 has killed more than 3 million people and causes 9 trillions loss to global economy And its Bio weapon connection is also indicating towards future Bio warfare. It maybe even possible that we are facing it right now and its evidences may come to notice later on.*

**KEYWORDS:** *Pandemic, Infectious, Lockdown, Economic, Destruction, Bio weapon*

### **INTRODUCTION**

We saw many major epidemics whether its Ebola in 2013-14 or SARS in 2003. But the very recent Covid-19 has proved to be most terrifying pandemic spread all over the world till the date of writing this paper. Covid-19 is an infectious disease which had its origin in Wuhan, capital of China's Hubai province, during Dec. 2019. It found to be spread through contact with infectious person. During the initial period of this pandemic breakout the infectious persons were showing the common symptoms including fever, dry cough, and shortness of breath followed by some other symptoms such as fatigue, sore throat etc. But after 4 months of this virus attack many asymptomatic causes comes to notice where even patients showing none of the above mentioned symptoms are tested positive. Its incubation period is 2 to 14 days. After a sudden outbreak from china, it spread like wild fire to Italy, Spain, America and rest of the world. The major reason that makes this disease a matter of distress for the whole world is that there is no vaccine and antiviral medicine to prevent and treat Covid-19 till date of writing this paper as notified by

WHO (world health Organization). In the absence of medicine and other medical treatment , social distancing, global lockdown and other containment measures become the only means to combat this global crisis.

## OBJECTIVES

The Objectives of this study is to access the Following:

- Effects of a Global pandemic COVID-19 over the world
- Its potential threats to international peace

## RESEARCH METHODOLOGY

The current study is an attempt to outline the effects and threats of a severe kind of global crisis named COVID-19. It is completely Descriptive in nature and a review of previously done researches in this area. The data used in this study is gathered from secondary sources such as newspaper, journals, Govt. Publications and other online resources.

## COVID-19-: A Mystery Virus

The origination of this deadly virus is a mystery in itself. As some state it as accidental outbreak caused due to eating wild animals meat mainly the Bat. Whereas other state it as a Biological weapon used to become a global leader. However its transmission between human being is through the direct contact with the infected person and the droplets generated from cough, sneeze and speaking by infected person or by touching a contaminated surfaces and then touching the eyes, mouth, and nose without washing or sanitizing the hands. China being the epic centre claim this virus to be spread out of wild animal ( i.e. BAT ) from Wuhan 's seafood market. But Dr. Francis Boyle ( creator of Bio weapon Act ), US president and many other claims this virus to be a Bio weapon of china that could have been created in Wuhan Institute of virology ( one of the top most lab of china studying the deadly pathogens ) where china is supposed to be researching over bat since 2018. The reasons supporting this allegation is that the doctor who for the first time alert the govt. and bring this matter to public notice was found dead in china. Another reason in support is China's lack of transparency regarding numbers of cases of deaths in their country. Beside all the above facts the emergence of this virus is still a matter of debate.

## EFFECT OF COVID-19

The seriousness of this global pandemic is visible from the following effects it causes at global level-:

### Immediate Effects-:

- It puts a check on the fast moving global economy by the way of global lockdown, shutdown business large and small and force millions of people to get confined at their homes.
- Due to lockdown, production disrupted that affect a large numbers of developing countries having deeply integrated global supply chain network.
- Sudden and unexpected announcement of lockdown by governments create internal disturbance, results in fear among people, panic buying and migration from one place to another.
- Millions of workers in different countries are facing the threat of loosing their jobs

- Service sectors, particularly place of direct contact with others such as retail trade, leisure and hospitality, recreation and transport facilities etc. get highly effected due to restricted inward and outward mobility.
- Governments, in order to protect their economies from this economic downfall, are rolling out large stimulus packages which could result in deep global economic recession.

### Effect on the humanity:-

COVID-19, a global pandemic being a biggest hit to humanity, put millions of people to death all around the world. It affects all the segments of society but particularly detrimental to older persons and persons with weak immunity, and those suffering from any severe disease like hypertension or diabetes. Number of confirmed cases and death toll “(Table 1)”(World health organization (2020)) is increasing in multiples all around the world with each passing day.

**TABLE 1: REGION WISE SITUATION REPORT OF COVID-19 CONFIRMED CASES AND DEATHS (AS TO 10 :00 AM, 7 MAY 2020)**

Reporting Area (region wise)	Confirmed Cases	Deaths
European Region	1626037	150238
Region of the Americas	1542829	84804
Western Pacific Region	156184	6361
Eastern Mediterranean Region	229198	8465
South-East Asia Region	81808	2936
African Region	35470	1228
<b>Global Total</b>	<b>3672238</b>	<b>254045</b>

In a quite short period of 4 months, this disease have been spread through out the world “(Figure 1)” (World health organization (2020)). Hardly there is any country that have been survive from the effect of COVID-19

Figure 1: Ten Countries with maximum number of confirmed cases and death (including China and India ). Data as of 7 May 2020.

### Effect on Global economy :-

Covid-19 causes a major hit to the Growth of the global economy. Due to frequent shutdown of major industries, and restricted economic and business activities all over the world, the global economy is expected to have major downfall. Many countries are facing health crisis, financial crisis, economic downfall and collapse in commodity prices.

“As per one of the report of DESA ( Department of Economic And Social Affairs ) COVID -19 has disrupted the global supply chain and international trade as nearly 100 plus countries closes their national boundaries and also restrict any kind of internal movement in their countries by imposing lockdown and curfew. The World economy is projected to be contracted by 1 percent in 2020” (Corona virus impact on global economy, 2020, April 2)

IMF( International Monetary Fund ) in one of his report (world economic outlook, 2020, April) projects the world's economy in 2020 to face a worst recession with 3 percent fall in GDP that is far worst than the global crisis of 2009 which was 0.1 percent . However IMF has also projected a partial global growth of 5.8 percent in 2021 but still its quite less than the level projected for 2021, before the virus hit. “The cumulative loss to global GDP over 2020 and 2021 due to COVID-19 pandemic could be around 9 trillion dollars that is much more greater than economies of Japan and Germany,combined” (Gopinath, 2020, April 14). It is for the first time since great depression both advanced and developing economies facing worst recession with a growth projection of -6.1 percent and -1.0 percent (-2.2 percent if excluded China ) respectively in 2020. A major decline in output, Import, Export and Consumer prices is expected “(Figure 2)” (World Economic Outlook, April, 2020). Income Per Capita is also expected to reduce for nearly hundred plus countries.

Figure 2: Percentage Change in Output, Import, Export and Consumer prices of Advanced and Emerging Economies.(Projections for 2020)

### Effect on Employment:-

Due to globally adopted containment measures such as complete and partial lockdown and social distancing, employment and labour market has been affected directly. “International labour organization (ILO) projects nearly 3.3 billion of global workforce to get directly affected. As per their nowcasting model, around 6.7 percent ( i.e. equal to 195 million full time workers , assuming 48 hours working week ) decline in global working hours is estimated in second

quarter of 2020. Labour intensive sectors such as accommodation and food services, real estate, business and administration activities, manufacturing, wholesale and retail trade, repair of motor vehicles and motorcycles etc. that employs almost 38 percent of the global workforce is at high risk. Depending upon the country context, workers are facing the threat of wages and salary reduction, declining working hours and layoffs” (International Labour Organization (2020), page 2-5).

### COVID -19 -: A game changer

Undoubtedly, COVID -19 causes an irreparable loss to humanity and a long lasting damage to the economy, resulting in death and distress all around the world. A couple of months before when the countries, whether developing or developed, were competing each other in the race of growth and development . But due to this sudden outbreak of deadly virus their focus has been shifted from development of country to prevention of country. Now the race is on for economic recovery and to see which country bounces back faster. According to IMF the top leading countries of the world will face a great depression with negative growth rate “(Figure 3)” (World Economic Outlook, 2020, April). But China is expected to have a positive growth rate of 1.2 percent followed by India with 1.9 percent. Whereas the growth rate of the so called superpower of the world , US is expected to get shrunk by -5.9 percent, Russia with -5.5 percent, Italy with -9.1 percent and Spain with -8.0 percent .

Figure 3 : Real GDP (Annual Percentage Change, Projections for 2020)

### COVID-19-: A THREAT TO INTERNATIONAL PEACE

Due to this sudden pandemic attack global economy faces a severe economic crisis. Countries highly depend upon tourism are suffering a lot. Many major industries all over the world are facing financial crunch as their production shut, No transportation took place, no business activity took place during the period of lockdown. They are at a stage of non existence and looking for financial assistance from others which have a potential threat of being takeover.

However some players of the development race are looking for favourable investment opportunity to capture the global market through FDI. A recent example of this is China's Central Bank's investment in HDFC ( Housing Development Financial Corporation of India ). "China's central bank ( People's Bank of China ) has bought 1.01 percent stake in HDFC which is India's one of the biggest housing mortgage lender. HDFC in turn owns 19.43 percent stake In HDFC Bank and 52.7 percent in HDFC assets managing company and 51.45 percent in HDFC life insurance company. HDFC Bank further own 96 percent stake in HDB financial services and 98 percent in HDFC securities" ( Mascarenhas, 2020, April). Indian Govt. Immediately after this incidence change their FDI norms, taking into concern the matter of transfer of internal control to foreign countries by way of acquisition and takeover. China whereas regarded it as an act contravening the WTO norms.

However many countries looking into the seriousness of the matter, believe this to be a Bio weapon used to become a global leader, take immediate action and change their FDI norms. But it further have the potential threat of trade war between the countries.

Far away from a longstanding trade war between US and China, a very dangerous war of words has been broken out between both the countries. "US president repeatedly blaming China for this global attack of a micro nano virus by renaming COVID-19 as 'Chinese virus', 'Kung Flu' and replacing 'Corona with China' " (Mellisa & Liu, 2020, Apr.12). These incidence also posses a threat of lack of cooperation , mutual differences and conflict between both the countries.

## CONCLUSION

Humanity all around the world is being trapped in a war between human And imperceptible virus. Each infected person carrying the corona virus infection work as a human bomb which in turn affect multiples of people in their contact. Its not just the humanity but covid-19 has also catastrophe the world economy. Being a silent killer Covid-19 results in immense human suffering, massive destruction to global economy, fear and chaos. It put millions of people to death and around 9 trillion dollars loss to global economy and create fear of loss of job among people and leave them to starve. Its Bio weapon connection create international conflicts and chaos among different nations who are competing each other in their development race. However if this fact prove to be true in near future then it might be an emerging threat to global peace as well leading the world towards a biological destruction result of which would be far more greater than any previous world war and natural epidemic.

### ABSTRACT

*In this work, the pharmacological action of Rutan on the biliary function of the liver in white rats is evaluated in experimental acute hepatitis. At the beginning of the work, toxic damage to the liver was simulated in white rats by subcutaneous administration with carbon tetrachloride. After that, the drug rutane was administered at a dose of 25 mg / kg for 5 days. The results of the studies showed that on the 6th day after the toxic damage, an increased level of ALT, a decreased level of the de Ritis coefficient and the level of total protein in the blood serum were observed. On histological sections of the liver of white rats, foci of fatty degeneration and necrosis of hepatocytes were observed causing a violation of the structural organization of the organ. Under the influence of rutan, the survival rate of rats with toxic hepatitis increased and the state of blood biochemical parameters (ALT, AST, total protein) improved. The experiment revealed that the drug rutan is promising in the prevention and treatment of diseases of the hepatobiliary system.*

**KEYWORDS:** Interferon Inducers, Rutan, Toxic Hepatitis, ALT, AST.

### INTRODUCTION

Diseases of the hepatobiliary system around the world is one of the global medical and social problems. According to WHO statistics, about 2 billion people in the world have different liver pathologies [1.3]. Moreover, among the causes of disability and death, a significant place is occupied by such liver diseases as cirrhosis, chronic hepatitis, liver failure, hepatocellular cancer,

etc. [2]. In 2015, viral hepatitis caused 1.34 million deaths worldwide. The number of deaths caused by viral hepatitis is increasing year after year.

Despite the successes achieved in the treatment of diseases of the hepatobiliary system with pharmacological agents, the rates of development of complications from pathology remain high [3, 5]. Although there is a large arsenal of means and methods of treatment, the search for effective ways to correct structural and functional disorders of the liver in diseases of chemical etiology does not stop. At the same time, along with synthetic, an important place is occupied by natural compounds with antioxidant properties

Among the drugs that have been intensively developed over the past decade, antiviral drugs have come to the fore. An important achievement was the development and widespread use of interferon inducers (IFN) in the treatment of a number of pathologies such as respiratory viral infections, herpes viral infections, viral hepatitis, neuroinfection, chlamydia, etc. [6, 9, 10].

IFN inducers have a universally wide range of antiviral activity and pronounced immunomodulatory effects. Moreover, their activity coincides with the activity of exogenous IFN. It is important to emphasize that their combined use with other drugs often leads to a synergistic effect [7,8].

It has been established that one of the properties of IFN inducers is the formation of persistent long-term antiviral resistance in the body after their administration, since even a single administration of IFN inducers in therapeutic doses leads to prolonged production of IFN. It is noteworthy that domestic scientists created and introduced effective IFN inducers based on polyphenolic compounds of plant origin: Megosin, Celagripp, Rutan [11, 13].

The use of IFN inducers in the treatment of viral hepatitis requires a deep and comprehensive study of their effect on the functional state of hepatocytes. The results of experimental studies in recent years indicate that the inducer of IFN Celagripp has a distinct choleric effect. Moreover, it is effective in restoring the functional state of the liver with its acute toxic lesions of various etiologies.

In terms of the search and introduction into clinical practice of effective hepatitis treatment agents, our attention was drawn to the Rutan drug, an IFN inducer created by employees of the Institute of Organic Chemistry of the Academy of Sciences of Uzbekistan, on the basis of biologically active compounds isolated from the tanniniferous plant *Rhus coriaria* L. [12]. This drug is recommended in the treatment of acute viral infections. However, being an inducer of IFN, it, like Celagripp, can be effective in correcting violations of the functional state of the liver during its pathologies [11, 14].

The purpose of this work is to evaluate the pharmacological action of Rutan on the biliary function of the liver in experimental acute hepatitis.

## **MATERIALS AND METHODS**

In white rats, toxic liver damage was first modeled by subcutaneous administration with tetra chloromethane according to a therapeutic regimen. After that, the compound rutane was administered at a dose of 25 mg / kg for 5 days. In the control group, in which toxic damage to the liver was simulated in a similar way, in which treatment with silibor was performed.

Results. The results of the studies showed that on the 6th day after the toxic damage, an increased level of ALT, a decreased level of the de Ritis coefficient and the level of total protein in the blood serum were observed. On histological sections of the liver, foci of fatty degeneration and necrosis of hepatocytes were observed, causing a violation of the structural organization of the organ. Rutan representing a two-fragment drug conjugate compared to silibor

Of the 5 compounds studied, the leading compounds were identified by the effect on blood biochemical parameters, changed as a result of acute toxic damage with carbon tetrachloride during the prophylactic administration schedule. The best effect of this scheme had rutan. Under his influence, a decrease in total and indirect bilirubin and a manifestation of a tendency to a decrease in direct bilirubin and hepatocyte cytolysis markers (ALT, AST) were observed.

Under the influence of the studied drug, an improvement in biochemical parameters and structural-morphological organization of the liver was observed. The advantage of rutan at a dose of 25 mg / kg compared with silibor was revealed, since the survival of rats with toxic hepatitis increased and the biochemical parameters (ALT, AST, total protein) improved, in contrast to the comparison drugs. Given the low toxicity and high pharmacological activity, it can be assumed that Rutan is promising in the prevention and treatment of diseases of the hepatobiliary system.

## CONCLUSION

Rutan, in contrast to comparison drugs, has low toxicity. Under the influence of rutan at a dose of 25 mg / kg, the survival rate of white rats with toxic hepatitis increased and the state of blood biochemical parameters (ALT, AST, total protein) improved. It was revealed that the drug rutan is promising in the prevention and treatment of diseases of the hepatobiliary system.

### ABSTRACT

*This article discusses the theoretical and practical relationship of the laws of physics and choreographic art. The formation of scientific knowledge and generalized skills in the preparation of ballet dancers. Landing is an important part of the jump, since the laws of physics establish that momentum must be scattered. A heavy landing could destroy the whole illusion of lightness, and perhaps injure the dancer. The secret to the decision is a special floor designed to absorb shock that dissipates momentum. The ability to coordinate the movements of body parts in time and space to music. Even the impeccable legs of future ballerinas will be powerless without a good school and the painstaking work of competent teachers. Skillful possession of aplomb, as a rule, requires from the performer many years of intensive training. In the exercise with the repeated repetition of various exercises and other movements, the elementary technique of maintaining a stable position is worked out. The stronger and stronger the muscles of the legs, the lower the center of gravity of the performer and the more stable his position.*

**KEYWORDS:** Ballet, Exercise, Stable Equilibrium, Gravitational Force, Law Of Conservation Of Momentum, Mastery Of A Ballet Dancer.

### INTRODUCTION

The art of ballet is one of the most famous theatrical performances, the basis of which is dance. The weightless, aspiring movements of artists seem to argue with the laws of nature itself. How would we not like to believe in the mystery of choreographic art, the question arises, what exactly helps us understand the language of dance, revealing the incredible ideas of choreographers. The audience admires the beauty of the ballet dancers performed movements,

not suspecting what kind of work he should achieve an impeccable performance. So how does this happen?

Professional dancers must have good physical and natural data. Ballerinas should have an ideal eversion, a high rise, excellent flexibility, a big step. The ability to coordinate the movements of body parts in time and space to music. Even the impeccable legs of future ballerinas will be powerless without a good school and the painstaking work of competent teachers. And of course the presence of talent and hard work. Classical dance is a titanic work when you need to go a long and thorny path “from simple to complex” and achieve professional mastery.

Exercise is the study of elementary movements, from which the most complex forms of classical dance are then composed. It helps to master the exact technique of performing skills, it is necessary for the continuous strengthening and improvement of the dancer's skills.

Only with years of persistent, everyday training, the muscles of ballet dancers become strong and hardy, like iron rods capable of supporting body weight on a patch of shoes of pointe shoes with an area of not more than 2 square centimeters.

The issues of stability and balance are very important for the work of ballet dancers. Since they create the fundamental core in the work of the performer. Knowledge of the laws of physics helps to reveal the dancing possibilities of each performer.

In physics, the law of equilibrium is a state of the body in which it is at rest relative to the selected reference frame. There are types of stable, unstable and indifferent balance, which play an important role in choreography.

**a)** A stable equilibrium is an equilibrium in which a body, taken out of equilibrium and left to its own devices, returns to its previous position.

**b)** An unstable equilibrium is an equilibrium in which a body, taken out of equilibrium and left to its own devices, will deviate even more from the equilibrium position.

**c)** Indifferent equilibrium is an equilibrium in which a body, taken out of equilibrium and left to its own devices, does not change its position (state).

Confidently standing on the feet, and often even on one, helps knowledge and maintaining a stable balance (a). Let's look at it, where  $N$  is the support force vector,  $mg$  is the gravity vector, and  $F$  is the total vector of 2 forces.

Here, the vertical projection of the center of gravity should be inside the area of the support. If the center of gravity of the performer is shifted, then the person has to step over and take a new pose. The dependence also acts here: the higher the center of gravity, the greater the difficulty is maintaining a stable position.

Back in 1806, the famous French choreographer Jean-Etienne Despros defined aplomb (equilibrium) as a specific type of dynamic equilibrium, which is fundamental for all positions and movements in classical ballet. They begin to develop aplomb by staging the body, legs, arms, head and showing movements at the working machine. The main characteristic of a good body aplomb is stability. The core of aplomb is the spine, which controls muscle sensations. Good vision, the functioning of the vestibular apparatus, coordination, overall good physical development and a healthy nervous system also play an important role.

Skillful possession of aplomb, as a rule, requires from the performer many years of intensive training. In the exercise with the repeated repetition of various exercises and other movements, the elementary technique of maintaining a stable position is worked out. The stronger and stronger the muscles of the legs, the lower the center of gravity of the performer and the more stable his position. In this case, the area of the support increases, since the body mass is in the lower part and the likelihood of a vertical projection of gravity getting there also increases.

For example, complex exercises during the transition from one foot to another, from pose to pose in jumping, in rotations and supports require exact compliance with stability, both in static positions and in transitional dynamic states. Therefore, to fix this or that pose - "stop the beautiful moment" can a dancer with mastery of dance stability. Strength and skill to keep balance is always required for dancers.

Supporting a ballerina is one of the most beautiful elements of ballet numbers and also directly depends on maintaining balance. The ballet dancer raises, holds and carries his partner. Therefore, observing stability in the performance of various supports, the ballet dancer needs to ensure that the common center of gravity is always exactly above his feet. Strength and the ability to maintain balance are always necessary - this is the law of physics, the very little secret of any movement on which the whole element rests.

In the technique of spins in dance and jumping, slightly different laws apply. The law of conservation of angular momentum of the body (the law of conservation of angular momentum) is one of the fundamental conservation laws. For example, we can analyze the dance rotations in the middle of the hall. When performing rotations, the angular momentum characterizes the number of rotational movements and at what speed the rotation occurs. Rotation is the circular motion of a body about a fixed axis. The axis is the straight line around which rotation occurs.

Impulse, it is also a force - a short-term application of force in a certain direction. Focus is a point that is held during a turn by a look. There are basic principles for the execution of rotation.

1. This is the axis of balance. The center should always be assembled, the body is upright and taut in order to maintain balance.

2. Preparation. The dancer helps himself to rotate his hands, making a swing. The sequence of movement of the body - head - body. The body begins to move, then the head, which instantly returns to the same point (focus), and the body completes the rotation. A prerequisite, an ideal vertical and stable balance.

A jump in the ballet gives the dance the qualities necessary for it: lightness, airiness, flight - and therefore it is an important and integral part of it. Preparing for jumping takes a huge amount of time in order to strengthen the muscles and build leg strength. When jumping, the working muscles contract for a short time to the maximum, while two main forces act: the repulsion force from the support and the body's gravity. Therefore, the height of the jump is directly dependent on them. It is necessary that the individual links of the body at the time of separation from the support were in a state of immobility relative to each other. Performing the grand jet, ballet dancers seem to fly over the stage, but in fact the center of gravity describes the parabola, like any object during the fall is guided exclusively by gravitational force. But the dancer's body changes configuration during the flight.

Jumping, the ballerina bends her knees (plié) and stretches the leg from her toes to the heel. Such a maneuver makes the landing almost imperceptible and creates a feeling of weightlessness of the performer. Landing is an important part of the jump, since the laws of physics establish that momentum must be scattered. A heavy landing could destroy the whole illusion of lightness, and perhaps injure the dancer. The secret to the decision is a special floor designed to absorb shock that dissipates momentum. This is necessary not only for artistic design, but also for the safety of performers. Having become acquainted with the necessary laws of physics, we can compare their influence on the elements of classical dance.

<i>Classical dance</i>	<i>Application of the laws of physics</i>
Exercise at the machine and in the middle of the hall	Stable balance + center of gravity
Fouete (fouetté)	The law of conservation of angular momentum of the body
Grandjete	Gravitational force + center of gravity
Support, upper support ballerina on one arm	Stable balance + center of gravity
Pointe Dance	Solid pressure + stable balance

So, we can conclude: the basics of physics and the science of human perception provide an understanding of how this is achieved. All the beautiful movements, supports shocking rotation, jumping in zero gravity - this is the correct application of the laws of physics in the training of professional dancers. But if all the laws of physics can be calculated by the formula, then ballet dancers will need many years of long and hard work on themselves to achieve the highest technology and dance mastery.

## **PEDAGOGICAL BASIS OF PROMOTING PRESCHOOL CHILDREN INTEREST IN A HEALTHY LIFESTYLE**

**Alimdjanova Dilbar Negmatovna\***

\*Senior Teacher,  
Samarkand State Institute of Foreign Languages,  
Samarkand, UZBEKISTAN

### **ABSTRACT**

*This article discusses theoretical proposals for promoting a healthy lifestyle in the preschool education system, which is one of the most pressing issues today. There is also talk about the legal framework for the implementation of preschool education in our country. We believe that the importance of sports in the upbringing of children and their future development as spiritual and physically mature people is relevant.*

**KEYWORDS:** *Preschool Education, Pedagogical Technologies, Sports And Fitness Programs, Child Rearing, Healthy Lifestyle.*

### **INTRODUCTION**

The law provides for preferential treatment for children and young people, who are the founders of our future. In particular, among the state guarantees for social protection of youth specified in Article 10 of the Law "On the Fundamentals of State Youth Policy in the Republic of Uzbekistan", preferential access to sports, health and cultural-educational institutions for young people the opportunity to participate in the conditions is strengthened. Uzbekistan pays special attention to the development of out-of-school education. In our country, which is rapidly developing in all spheres of development due to national independence, it is important to raise the level of knowledge of the younger generation to meet world standards, to be aware of scientific and technological innovations, to think independently, to start life confidently, entrepreneurially and spiritually. For this, of course, we need a pedagogical basis based on modern technologies. We have always paid special attention to the upbringing of children. This work is still going on. In particular, Article 17 of the Law of the Republic of Uzbekistan "On Education" states that "to meet the individual needs of children and adolescents, the organization of their leisure and recreation, government agencies, public associations, as well as , other legal

entities and individuals to establish out-of-school educational institutions in the cultural-aesthetic, scientific, technical, sports and other areas "and to ensure the economic and material efficiency of these educational institutions. the foundations were laid.

**Main part:** The Decree of the President of the Republic of Uzbekistan dated September 30, 2017 No PF-5198 "On measures to radically improve the management of the preschool education system" and retraining and advanced training of managers and teachers of preschool educational institutions capable of solving problems of comprehensive development at a professional level "1. The decree also stipulates the use of modern innovative pedagogical technologies, effective forms and methods of education and upbringing in the educational process. Indeed, in recent years much attention has been paid to the problem of professional development of preschool teachers. One of the characteristic features of the modern scientific and technical stage is the computerization of all aspects of society, which leads to a dramatic change in the structure of professional and pedagogical activity. The use of information technology in all parts of the education system creates a daily demand in the informatization of education, which, in turn, makes it easier for a future teacher of technical education in a new information environment. requires mastery of working skills. The use of effective technology in the training process will increase the professionalism of educators. In the process of professional development courses, the development of pedagogical creativity in educators is effective in preparing children for school education by providing them with spiritual education and the development of pedagogical skills in educators. According to the Russian pedagogical scientist A.S Makarenko, mastery is "how to achieve what, the level of mastery of pedagogical activity." Pedagogical skills ensure his personal qualities and success in the pedagogical process. In our opinion, pedagogical skills are the art of teaching, the desire and interest of every teacher to work. B.T. Likhachev describes pedagogical skills as a part of pedagogical art, the ability of the educator to master modern methods and forms, pedagogical skills and abilities, the embodiment of pedagogical art in the process of forming a child's personality. The development of modern science and technology requires educators to be creative, responsible for their profession and personality, to think freely on important issues in science, in short, to have professional skills. According to P. Azarov, the basis of pedagogical skills is knowledge of the laws of child rearing. In order to improve the pedagogical skills of educators, it is desirable to organize the educational process on the basis of individual learning, problem-based learning, collaborative learning, modular learning, design, game technology. I.P.Andriadi, on the other hand, emphasizes that pedagogical skills are personality traits, spiritual-moral and intellectual preparation, social values and a tendency to socio-cultural creativity. The development of pedagogical skills of educators leads to an increase in their personal values, as well as general cultural competence. in particular, by playing a variety of roles in game technology, educators are provided with a full understanding of theoretical and practical knowledge on how to solve pedagogical problems. When thinking about the professionalism of the educator, it is necessary to pay attention to his commitment to the national idea and ideology, the breadth of knowledge and ideas, his attitude to his duties. professional skills and abilities are not easily formed in the educator. To do this, he must constantly read, study, research, work creatively, quickly understand the reality. At present, along with the professional skills of educators, the issue of children's health and care is one of the most pressing issues. In kindergarten, a critical question arises about ways to improve health, movement development, and physical development of children. It is known that health is only 7-8% dependent on health and more than half on a person's lifestyle. Caring for a healthy lifestyle

is the foundation of physical and moral health, and health can only be achieved through the solution of pedagogical, medical and social problems. The concept of 'health-saving technologies' has become firmly entrenched in the education system, starting with preschools. One of the main tasks of the preschool educational institution is to create conditions that ensure the formation and strengthening of students' health. After all, human health is very important for all times and peoples, and now it is crucial. The relevance of the topic of a healthy lifestyle is also confirmed by statistics. Developing respect for health should begin in childhood. According to experts, 75% of all human diseases are specific to childhood. A teacher may do less work than a doctor for a student's health. The teacher must learn the psychological and pedagogical technologies that allow him to work in the classroom in a way that does not harm the health of his students. The learning environment should be health-promoting and health-promoting. The concept of "health-saving technologies" integrates all areas of preschool education activities to protect, shape and strengthen the health of preschool children.

- Pedagogical culture of educators;
- have physical skills;
- Pedagogical skills and abilities;
- Speech culture and pedagogical interaction;
- Organization of sports in accordance with the age of children;
- Pedagogical communication and culture;
- Psychological and pedagogical knowledge;
- Self-analysis.

### CONCLUSION:

In short, in the process of professional development, along with the development of professional skills of educators, the development of their physical skills is one of the most pressing issues of today. To do this, it is necessary to identify the main approach in improving the skills of educators. That is, it is necessary to jointly improve the personal and professional qualities of educators, to acquaint them with the latest developments in the preschool education system, to organize the training process on the basis of world experience, to improve teaching and methodological resources. Today, we also have world-renowned athletes. If we can involve them in the pre-school process, it will evoke a special feeling in the hearts of children. Thank God, in every region today, our famous athletes have grown up. We hope that they will also contribute to pre-school education by sharing their views with them.

## **EFFICIENCY OF USE OF AUTODESK INVENTOR ENGINEERING PROGRAMS AND PEDAGOGICAL INFORMATION TECHNOLOGIES IN THE FIELD OF “RESISTANCE OF MATERIALS” IN THE PROCESS OF TEACHING STUDENTS OF TECHNICAL UNIVERSITIES**

**Ulugov Bazar Dzhumaevich\***

\*Senior Lecturer,

Termez branch of the Tashkent State Technical University

Republic of UZBEKISTAN

Email id: [ulugovbozor@gmail.com](mailto:ulugovbozor@gmail.com)

### **ABSTRACT**

*The article is devoted to the formation of students' information competence in the study of the discipline "Resistance of materials". This paper presents a systematic review of models and methodologies that integrate information and communication technologies (ICT) and education. An important component in the formation of information competence is the ability to use ready-made software products in their professional activities. The article shows the relevance of the development of students of applied programs that contribute to improving the readiness of students for engineering activities. Emphasis is placed on improving understanding of the subject area when integrating experimental research and finite element modelling. The paper gives an example of using the application module of the Autodesk Inventor software package to calculate one of the problems of material resistance. One of the main goals of education at the global level has reduced the educational gap by bringing education to all people around the world [6].*

**KEYWORDS:** *Information and Pedagogical Technologies, Information Competence, The Resistance Of Materials, Application Program.*

## 1. INTRODUCTION

Currently, a very important factor in human life is higher education. “Maintaining a high level of education is the main factor in socio-economic progress and the most important condition for the sustainable development of any state, and this requires the improvement of the entire system of higher education” [12]. According to the World Bank's Learning for All [3], investment in people's knowledge and skills promotes the development of the world's population.

For the most part in the world, innovative engineering education now stands in the way of development [1]. And this education is currently aimed at the formation of specialists not only certain knowledge in the field of engineering and technology, but also personal qualities that contribute to becoming a competitive specialist in practice. Almost immediately, students are shown the relationship between the material being studied with their future engineering activities, the prospects of a technical and innovative society. And, of course, the question arises of obtaining a quality engineering education. The Inter-American Development Bank (IDB), Education for the 2012 Transformation, indicates that education must focus on quality, preparation for global scenarios and markets. The primary goal of modern engineering education is that it is necessary to prepare a competitive personality. Unfortunately, not every university graduate is a competitive person, because it is not enough to have a high level of education and professional skills, it is important at the same time to have psychological training and the ability to realize the tasks. Close the gap between education and the business world, it defines real needs and educates in skills to provide real solution's[3].

Currently, there is a rapid development of the process of informatization of education; new information technologies penetrate almost all spheres of life of a modern person. Effective use of these technologies helps to gain new knowledge, achieve success in the chosen professions. Currently, an education without ICT is not conceivable due to the impact and permeability of technology in all environments and areas of society [13].

Modern information technologies provide the teacher with a powerful toolbox that allows you to design and fill the learning process with information resources, as well as monitor its actions in the course of independent study of various teaching materials.

Along with the informatization of education, the main task of engineering education is the formation of special competencies among students focused on the ability to apply knowledge and skills in future professional activities. In the list of competencies, a competency reflecting information skills is mandatory.

### Research Focus

The purpose of the article is to prove that design and research activities contribute to the development of motivation for learning from students. Solving the problem on the subject of “Resistance of materials” in the Autodesk Inventor program, developing strategic areas for improvement in the graphic education of university students. The study of the effectiveness of the use of pedagogical information technology (PIT) using engineering graphics software in the process of teaching students of a technical university.

Objectives of the article - analysis of the solution of problems on the subject of "Resistance of materials" using computer programs of computer engineering like "Autodesk Inventor",

assessment of the effectiveness of design and research work. The solution to the problem of "Resistance of materials" plot in engineering graphics.

The scientific novelty is determined by the practice-oriented empirical basis of research.

The relevance lies in the growing social and economic importance of education as a strategic resource for the development of the individual, society and the state. To improve the quality of training of specialists, the level of development of the educational-material and educational-methodical base of education is essential [14]. It makes it possible to organize educational and cognitive activities of students at a higher level, to increase the intensity of teachers' work and students' interest in the process of obtaining the necessary education [17].

The subject of the study is the impact of project activities on the motivation of students to study the "Resistance of materials".

The problem posed in this article is the development of the motivational sphere of learning through the design and research activities of students.

## RESEARCH METHODOLOGY

### General Background

The study of the problem of formation of readiness of higher education institutions' students to the introduction of pedagogical information technology (PIT) has been carried out with the help of theoretical and empirical methods. **Theoretical methods** include; *analysis of scientific sources* on the research problem which made it possible to determine the object, subject, the content of the study, to formulate its objectives, to clarify the essence of the key concepts of the study; *modelling method* – to develop a model for forming students' readiness to the introduction of pedagogical information technology (PIT); **empirical methods:** *conversation* – a dialogic method in which a teacher, with the help of well-posed questions, prompts students to reproduce previously acquired knowledge; *testing* is a method that allows revealing the level of knowledge, skills and abilities, abilities and other personality traits; *questionnaire-receiving information* using respondents' written answers to the system of standardized questions; *pedagogical experiment* – recording, forming, control, for checking the hypothesis of the study; **observational methods** – *direct and indirect pedagogical observation, self-evaluation and evaluation*; **statistical** – *methods of mathematical statistics* to process the statistical data, to prove the statistical reliability of the results of experimental research.

### Instrument and Procedures

The scientific novelty of the results is to develop a model for the formation of the readiness of higher education institutions' students to the introduction of pedagogical information technology (PIT). An empirical study has been conducted based on Termez branch of Tashkent State Technical University named after Islam Karimov. There were 116 students in the control groups. The methodological basis of formation of readiness of higher education institution's students to the introduction of pedagogical information technologies establish such methods as: methodological-target (purpose, tasks, approaches, principles); content-technological (stages, content, forms, methods, technologies, means, pedagogical conditions); productively-estimated (components, levels, criteria and indicators). By the ethics of organizing and conducting the research, the procedure of participation of first-year students and teachers of professional

departments in the experiment has been considered and discussed at the meetings of the professional chairs. Discussion procedure was recorded in the minutes at the meetings of Department of General Professional Sciences of Tashkent State Technical University named after Islam Karimov (Minutes № 2 of September 3, 2019). With this approach, respondents agreed to work in control and experimental groups, and the teachers of these educational institutions to work as experiments.

## MATERIALS AND METHODS

We analyzed the indicator of the quality of comprehensibility of the material passed (IQCMP) and the results of the independent work of students who studied at the Department of General Professional Subjects of the Termez branch of Tashkent State Technical University in the subjects of “Resistance of materials” for 1 year. The IQCMP indicator was calculated based on the following formula:

$$\text{IQCMP index} = (\text{AKG} + \text{IS} + \text{FG} + \text{AS}) / 100.$$

AKG - the average current grade (the sum of daily grades/school days);

IS - interim estimates (total amount of interim estimates/number of interim polls conducted);

AS - the average score for independent work;

FG - final grade;

Given that the assessment is based on a 100 point system, in the end, the amount received was divided by 100.

A good result of the assimilation of the consumed material was considered when the index of IQCMP was from 0.8 to 1. Average - from 0.7 to 0.79. Unsatisfactory - from 0.69 and below.

The resistance of materials is a discipline that allows the most widely and varied use of various elements of informatization in the learning process. One such tool is application software.

There are many programs equipped with application modules designed to solve the problems of solid mechanics. As an example, let's consider solving the problems of the “Material Resistance” discipline using the Autodesk Inventor software package. The proposed program includes several application modules, of which Autodesk Inventor Simulation [2] is of most interest to us. This module, based on the finite element method, allows you to calculate the strength of structures in the elastic zone, to solve the problems of mechanics of a deformed solid. The resistance of materials is an engineering discipline that is studied by students of all technical specialties.

This discipline lays the foundations of general principles and methods for calculating structural elements for strength and rigidity, develops a culture of multi-criteria setting and solving problems, as well as the ability to analyze.

The state educational standard in the discipline “Resistance of materials” provides for a series of laboratory works, during which an experimental verification of the validity of the assumptions and hypotheses used in theoretical calculations when deriving the final formulas is carried out.

The integration of finite element modelling and experimental research improves student's understanding of experimental observations made in the laboratory and mechanics.

The introduction of new technologies, such as finite element modelling, already at the initial stage of training not only provides a powerful tool for visualizing mechanical processes but also increases students' interest in working in the technical field [4–8]. Also, an integrated approach helps students understand the meaning of computational and experimental methods for solving engineering problems and allows them to evaluate the significance of each component of engineering analysis, design and research. Mastering by students of finite element modelling at an early stage of their education allows improving the mastery of special disciplines in advanced courses and increasing students' readiness for engineering practice after graduation.

**As a computational experiment**, it was proposed to carry out finite element modelling to calculate the stress-strain state of structural elements based on the Autodesk Inventor program.

Currently, this program is widely used in the educational process by higher educational institutions. In particular, depending on the direction of preparation, this program can be studied in various disciplines: computer science, engineering graphics, CAD; therefore, as a rule, starting to study the resistance of materials, students already have the skills to build three-dimensional models.

But even if such skills are absent, this is not a significant obstacle to the implementation of laboratory work using the program, since Autodesk Inventor has a standard user interface combined with many Windows applications, which significantly reduces the time it takes to learn the program.

Resistance to materials is the course that develops creativity and analysis ability. However, if students do not realize the physical meaning of the task and the nature of the given conditions, then they will not be able to evaluate the results of computer calculations. Therefore, before proceeding with the implementation of laboratory work, it is necessary to study the theory and perform computational and graphic tasks for each section of the discipline passed. The implementation of the laboratory work is a logical continuation of the development and consolidation of the studied sections of the discipline "Resistance of materials".

In this regard, we list the main tasks of a computational experiment using an application program:

- Formation of a visual representation of the stress-strain state under various types of load;
- Demonstration of the advantages of using application programs in solving tasks to optimize structural elements;
- Verification of the reliability of the results obtained using the analytical calculation method.

**As an example**, we consider the implementation of laboratory work on the topic "Investigation of the stress-strain state of a stepped beam under tension (compression)." Before embarking on a computational experiment, the student must perform an analytical calculation of the stepped beam, determine the internal forces, stresses, strains, plot and determine the dimensions of the cross-sections. The admission to the laboratory work is the completed computational and graphic task, the results of which are used as source data for the computational experiment.

The result of the analytical solution of the problem will be the diagrams of internal efforts, stresses and deformations.

Successful completion of this work indicates that the student is familiar with the methodology for determining internal force factors, has familiarized himself with the basic terminology on the topic being studied and can begin to calculate the task on the computer. Static structural analysis using the program consists of several stages. Consider the main stages of calculating the strength of a straight stepped beam.

1. Launch Autodesk Inventor.

2. In the 3D model mode, we build a three-dimensional model of the beam. This operation, as a rule, does not because great difficulties for the student, since all the objects under consideration have a simple configuration that does not require complex constructions (Figure-1).

Figure-1 3D model mode

As a result, we obtain a three-dimensional model of a stepped beam, giving a visual representation of the object being studied (shape, size and relationships).

3. To perform the strength calculation, it is necessary to activate the stress analysis module and run this module in the 3D model area (Figure-2).

Figure-2 Launching the stress analysis module

An active Research Consultant command will appear on the toolbar, in which we select the Create Research command (Figure-3).

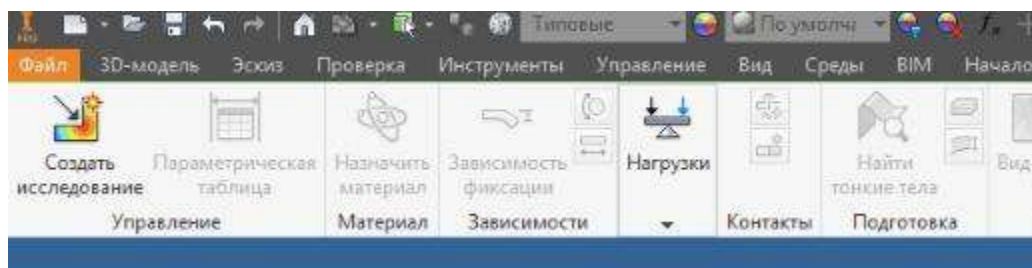

Figure-3 Launch the Create Study module

After that, various types of studies will be proposed, of which the Static study is of most interest to us.

4. The next step is to select material from the Autodesk Inventor library. The program offers a wide range of different materials, among which we select the material according to the assignment, in our case, alloy steel. This section provides complete information about the characteristics of the materials available in the database (Table-1) and (Table-2).

Material	Typical	
Density	1 g/sm <sup>3</sup>	
Weight	0.0290597 kg	
Area	6126.11 mm <sup>2</sup>	
Volume	29059.7 mm <sup>3</sup>	
Center of mass	x=0.00000000178048	mm
	y=0	mm
	z=7.16216 mm	

Table-1 Physical parameters

Name	Alloy steel	
General	Mass density	7.73 g/sm <sup>3</sup>
	Yield strength	250 MPa
	Ultimate Tensile Strength	400 MPa
Tension	Young's modulus	205 GPa
	Poisson's ratio	0.3 br
	Shear modulus	78.8462 GPa

Table-2 Materials

5. After the material is selected, in the Anchorages section, we set restrictions on movements in the corresponding directions. The program offers several options for the types of connections, from absolutely rigid terminations - Fixed-1, to the choice of axial and angular displacement restrictions in various directions, presented by the Reference Geometry team, with which the movable and fixed joints are modelled. As a result, the fastenings are depicted on the model in the form of directed vectors along those axes where displacements are limited (Figure- 4).

Figure-4 The choice of fastening timber

6. The external load is specified in the load section. In this section, you should pay attention to the units of measurement of the entered values. By default, in the settings, power characteristics are entered in the SI system, however, the settings allow you to change them at your discretion.

The entire external load (concentrated forces, distributed loads, concentrated moments) is set in the form of projections on the coordinate axes. In the case of tension (compression), only a longitudinal load acts on the beam, therefore, in the Force section, we set the concentrated forces and the distributed load located in one place, not forgetting to take their directions into account (Table-3).

Dependency name	Reactionpower		Reactivemoment	
	Value	Component (X,Y,Z)	Value	Component (X,Y,Z)
Commit dependency:1	20000 N	0 N	0 Nm	0 Nm
		0 N		0 Nm
		20000 N		0 Nm

Table-3 the strength and moment of reaction in the dependencies

Thus, the implementation of the preparatory stages of the calculation requires the student to know the main types of loads and their dimensions, as well as a clear idea of the main types of connections and materials.

The correctness of the calculation directly depends on how much the restriction on the movement of the beam and the power characteristics of the design scheme specified in the program correspond.

7. The last step is the Run command, which performs the static structural analysis. As a result of the static calculation, the program by default produces a stress diagram in the worst-case scenario (Table-4).

Name	Minimum	Maximum
Volume	29059.7 mm <sup>3</sup>	
Weight	0.224632 kg	
Mize's Stress	14.5516 MPa	580.028 MPa
Displacement	0 mm	0.0496744 mm
The coefficient margin of safety	0.431014 br	15 br
Equivalent deformation	0.0000747572 br	0.0025952 br

Table-4 Result

In this case, we are interested in the normal stress arising in sections perpendicular to the axis of the rod. The program provides a choice of viewing stresses in various planes, as well as a choice of voltage units

1. As a result of the static calculation, the program produces a stress diagram of the Mize's stress (Figure-5).

Figure-5 Mize's stress

2. As a result of the static calculation, the program produces a displacement diagram (Figure-6).

Figure-6 Displacement

3. As a result of the static calculation, the program produces a coefficient diagram. safety margin (Figure-7).

Figure-7 The coefficient margin of safety

4. As a result of the static calculation, the program produces an equivalent strain diagram (Figure-8).

Figure-8 Equivalent deformation

### Research Result's

Nowadays yet it's not possible to carry out educational processes without technology and more if they are oriented to the web [11]. The effectiveness of the quality of forming the readiness of university students to the introduction of pedagogical information technology (PIT) depends to a large extent on a purposefully designed model of involving students in active activities that covered such components and their elements: methodological-targeted (purpose, tasks, approaches, principles); content-technological (stages, content, forms, methods, technologies, means, pedagogical conditions); productive-evaluative (components, levels, criteria and indicators).

The use of modern technical means of creation, storage, processing, obtained using the Autodesk Inventor application software is becoming more and more simple and affordable in the learning process, thanks to the rapid development of new information technologies. There was an opportunity for the wider use of information and technology in the process of teaching students.

At the same time, the group of pedagogical information technologies (PIT) using engineering graphics software includes:

- training audio and video materials;
- Internet resources on the subject and direction of the educational process;
- Electronic textbooks, teaching aids and educational materials;
- Interactive tests, etc.
- Computer engineering programs like Autodesk Inventor

We have analyzed the indicator of the quality of digestibility of the consumed material and compared the results of independent work of students who completed training at the Department of General Professional Subjects of the Termez branch of Tashkent State Technical University in the subjects "Descriptive Geometry and Engineering Graphics" for 1 year (Table-5).

Table-5 Student's feedback: descriptive statistics.

Based on the approved standard and work program for each subject, specific hours are given for the classroom (practical, theoretical) and independent work of students, which are assessed by the teacher, and summarized in the final grade:

Final grade = (sum of daily grades / days of class) + sum of intermediate grades + grade of final control

When comparing the results of the student's digestibility of material consumed by students, based on testing, our results showed that the wider use of IPT tools using application software contributes to the higher achievement of the PMC index.

## DISCUSSION

The needs of education for new students are different and they need pedagogical and technological models, strategies, methodologies and updated technological paradigms, allowing to visualize the education of the future to apply it in the current education[16]. In particular, with the daily use of IPT using application software in practical exercises or in the process of conducting SOS, the IQCMP index reached an average of 0.87. When using IPT only during the organization and conduct of practical exercises - an average of 0.84. When conducting practical exercises, without using IPT using application software, an average of 0.76. When analyzing the results of independent work of students without the use of IPT, the IQCMP index did not exceed 0.73 (Table-6).

Table-6 Comparing the results of the students.

As our research has shown, the role of pedagogical information technologies PIT tools using application software is to intensify the work of teachers, which allows students to increase the pace of studying educational material, relying heavily on their independent work.

The results of the study show that before the organization of the scientific-experimental work, the students of the experimental and control groups were at almost the same level, but after the experimental work, the students of the experimental group showed high results, and we can conclude so. The use of pedagogical information technology and engineering programs "Autodesk Inventor" in teaching the subject "Resistance of Materials" to university students, their level of knowledge has increased significantly.

### CONCLUSIONS AND IMPLICATIONS

The teaching and learning of engineering courses are always challenging due to its complex and abstract nature, and the mathematics involved. Whenever there are new ICT that may apply to education, is possible to develop new studies and research related to the impacts of technologies in educational processes[15]. With diminishing resources (e.g., continuous funding cut, frequent professional/academic staff career movement, lack of competent professional staff, inadequate laboratory infrastructures), teaching and learning of engineering courses become harder and it is progressively becoming difficult to teach basic engineering courses effectively. As a result, students cannot achieve effective learning outcomes. To overcome these challenges, a three-step teaching approach has been developed to enhance students' learning outcomes. This approach is cost-effective, user-friendly and attractive. The method comprises a real laboratory demonstration video clip, conduction of a real laboratory experiment and a computer simulation/modelling. The developed three-step teaching and learning approach can be applied to any engineering courses. When interviewing students, it was noted that, in contrast to printed educational materials, pedagogical information technologies PIT tools using applied software affect the emotions of students, activate them, so they help to solve educational problems, strengthen interest in academic work, and develop the cognitive activity. Thus, the application of the Autodesk Inventor application program for solving the problems of material resistance contributes to the formation of a holistic picture of the stress-strain state of the studied object, consolidates the knowledge gained, builds skills in mathematical modelling and computational experiments using software packages, and forms the ability to interpret the results of computer modelling and make decisions on optimizing parameters and characteristics, and also develops information hydrochloric competence. A representation of a system that allows for the investigation of the properties of the system and, in some cases, prediction of future outcomes [18].

## DEVELOPMENT OF NATIONAL NETWORK (TAS-IX)

**Dadamuxamedov Alimjon Irgashevich\***

\*Department of "Modern Information and,  
Communication Technologies"

International Islamic Academy of UZBEKISTAN

Email id: a.dadamuhamedov@iiu.uz

### ABSTRACT

*This article is devoted to the development of the national data network of Uznet and Tas-IX, the history and development of Tas-IX, to improve the efficiency of using international communication channels, by excluding the transfer of local traffic over them. Strengthening the economic state of small and medium-sized businesses in the telecommunications sector by reducing their production costs for traffic transmission. The work aims to directly contribute to the development of information and communication technologies in the telecommunications market of Uzbekistan. Promotes the development of the Uzbek Internet segment as a factor in the overall development of the society and raising the level of education in it, including by accessing the Internet resources of scientific, educational, state and business institutions.*

**KEYWORDS:** *Tas-IX, IP, TSP, Internet exchange Point, ATS, ADSL, Uznet, Internet festiveal.*

### INTRODUCTION

Worldwide global network. It is based on data transmission protocol, incorporating government, education, business, corporate networks. The parts are interconnected through a unique address space based on IP and TSP protocols. A set of interconnected computer networks that cover the whole world. The Internet provides access to computers, e-mails, board boards, databases and backgrounds, and many other systems that use the IP protocol. [1]

Internet - International - from international and net - network. The Internet is a colorful network, that is, all computers in the network are of one type and any computer can be connected to another computer in the network.

There are so many "secret" terms in the Internet. One of them is Tas-IX. The abbreviation Tas-IX in the Uzbek phrase "Tas" is "Tashkent". Place of agreement on creation of Internet traffic

exchange point - Tashkent city. "IX" is derived from the English word "Internet eXchange Point" - "Internet exchange point". Generally speaking, we can describe the Internet as an information exchange point in Tashkent. The point of Tas-IX is located at ATS 244. There are only 4 employees working there.

## LITERATURE REVIEW

The strategy we used to create the search strings was as follows [4] [19]: • Finding papers about cloud computing in education sector. Listing keywords mentioned in primary studies which we knew about. Use synonyms word (usage) and sub subjects of cloud computing in education such as (E-learning, management systems in education). Use the Boolean OR to incorporate alternative spellings and synonyms. Use the Boolean AND to link the major terms from population, intervention, and outcome. The complete search string initially used for the searching of the literature was as follows: Cloud computing AND education. It has been highlighted in [5] [20] that there are two main issues on conducting an SLR search which are the sensitivity and specificity of the search. In our preliminary search, when we used the complete search string defined above we retrieved a very high number of articles. For instance, Google scholar, Scopus, ProQuest education, IEEEExplore, Science Direct, Springer Link retrieved more than two hundred results. Therefore, we have deepened our search and used this search string: (Adoption OR Usage) AND (Cloud OR "*eXchange Point*") AND (*Tas-IX*, OR *IP*). The revised search string has given us a reasonable number of studies and we finally selected relevant empirical studies

## METHODOLOGY

When was the idea of Tas-IX born? What motivated him? In January 2004, the Ministry of Justice of the Republic of Uzbekistan registered the Tas-IX Transmission and Communication Center (ISS). Founders of the organization are: "Business Information Business Center" (BCC), "Buzton", "Sarkor-Telecom", "Sharq Telekom", "Texnoprosistem" LLC. The website of the organization - [www.tas-ix.uz](http://www.tas-ix.uz)[2]

Tas-IX Traffic Exchange The Tashkent point has been recognized by RIPE's international organization, which has provided its own AS30865 Autonomous System. In September 2004, five perfect Tas-IX members - VSS, Buzton, Sarkor-Telecom, Sharq Telekom and Technoprossystem - were created with excellent dynamic piring.

" MUTBM NGOs TAS-IX traffic exchange point of the Uzbek independent of the organizational and technical aspects of a number of international traffic exchange points in Europe (Moscow, London, Madrid, etc.) samples. Based on the rich international experience of TAS-IX Members, a wide range of excellence and competence has been achieved. [3]

Tasks of "TAS-IX" NGO: Creating opportunities for direct IP traffic exchange between different networks of data transmission in the Republic of Uzbekistan without use of international channels.

## State Policy

On August 14, 2017, the Cabinet of Ministers of the Republic of Uzbekistan adopted Resolution 625 "On Measures for Further Development of National Content in the World Wide Web." The

Resolution envisages the adoption of a comprehensive program for the development of national content in the global information network between 2017 and 2019 [4].

This program, in particular, provides for the creation of a traffic sharing network, which envisages the introduction of mutual settlements between operators, service providers and content creators in the national Internet segment of the global information network. "Implementation of this technical project is entrusted to the Ministry of Information Technologies and Communications of the Republic of Uzbekistan, "Uzbektelecom" JSC, telecommunication operators and providers of Uzbekistan.

After adoption of the resolution media outlets called this project "TAS-IX 2" or "paid" TAS-IX ", the new acquisition network has been operating since 2004 -" TAS-IX MUT "The NGO will become an alternative to the ping-ping network, a traffic exchange point. [5]

Joint Stock Company "Uzbektelecom" has shared plans for the organization of traffic exchange in the new charging network.

"We follow the principle of" breaking old things before building a new home ", which means that the new system will provide services in parallel with existing TAS-IX systems. In this case, all aspects that are restricted in TAS-IX are taken into account. Later on, which of them will remain in the market[6].

It should be understood that the NGO "TAS-IX MUT Cooperation Center" was registered in 2004 by the Ministry of Justice of the Republic of Uzbekistan. The center has been recognized by the RIPE international organization, which has granted the AS30865 Autonomous System to this organization. The initiator of TAS-IX creation is the largest Internet providers in Uzbekistan. "TAS-IX MUT Interaction Center" NGO is a financial and technical independent organization, and its main source of funding is payments of current accounts and current accounts. "Uzbektelecom" JSC is also a member of "TAS-IX MUT Cooperation Center" NGO. Despite the positive aspects of the TAS-IX, there are some shortcomings[7].

The content generator in the existing system, that is, the owner of the site is that it has to pay for your hosting provider. In the new system, everything is contrary, it is planned to create such conditions in which providers themselves "run" after content developers, that is, they are interested in the product distribution. Such conditions will be more convenient, accordingly, the number of those who want to place their content will also grow, and healthy competition will be emerging as a market-based competition for consumers of this content. Thus, national content will be attractive to the network users, so its generations will be a profitable business. This, in turn, appears in the richness of the content of the Web[8].

Additionally, the introduction of the TAS-IX options involves a number of existing problems, particularly the owners of sites / portals, to resolve the problem of sharing content between hosting providers. " This project is planned to be implemented this year. A new format of mutual relations creates new market conditions that will help to increase the number of content and ease of use. As a result, the number of users in the network grows. Specifically, the content-provider's interests are on the target, which is reflected in the improvement of the quality of the private product [9].

Additionally, the new project will provide a "ticket to the system" for small providers because it solves the problem of connecting to content resources. Content providers will also be provided

with the technical aspects of the issue by allocating the appropriate resources within the center of data processing. The center will be installed on the basis of high-speed channels, including inter-network speeds of up to 100 Gbit / s. up to speed. Thus, subscribers will have an unlimited access to quality content, including national content. As a result, it is necessary to develop new beneficial tariffs. [10]

Not all of this is a simple task, "Uzbektelecom" JSC is ready to support and implement them not only technically, but also within the framework of a business-friendly approach. Assistance in creation of favorable conditions for creation of national network of Internet. [11]

Participation in various activities of the population of the Republic, popularization of the Internet through press and electronic publications. Enhancement of economic conditions for the activity of small and medium-sized businesses in the Internet, including but not limited to: Internet access services (Internet providers, internet cafes); use of the Uzbek content of the Internet in production, trade and advertising[12].

### **Data analyses, Current status**

Telecommunication operators are unable to continue sharing information through internationally-funded international channels. The information exchange between users in neighboring buildings The situation in Tashkent or Moscow is technically inconvenient. So it does not only cost-savings for both operators and the state, but also saves currency resources.

That is why, despite the sharp competition in this market, five interconnected operators have united their efforts to create a single point of internal traffic, which, in turn, reiterates the relevance of this issue to the entire Internet market in Uzbekistan. . The ping-ping center, created by them, is a non-profit, non-profit organization that is open to all participants of this chain of the market but also of other educational institutions[13].

Every year, Tas-IX administrator and technicians of the Founders will consider the project of traffic exchange development. The required equipment is purchased and installed. The full functioning of "TAS-IX" NGO provides the following:

Increasing the effectiveness of using international communication channels through non-transmitting local traffic. [14]

Reducing production costs for traffic leads to the strengthening of the economic situation of small and medium-sized enterprises.

It contributes directly to the development of information and communication technologies in the telecommunications market of Uzbekistan.

It promotes the development of the Uzbek Internet-segment as a factor for the overall development of the society and raising the level of education, in particular through the involvement of science, education, public and business institutions in Internet resources.

All in all, Internet connection was initially made through dial-up modems. The speed of the 32Kbps or 56Kbps speed can be maintained. (Good or bad speed is directly related to ETS). Over time, with the advent of Internet technology, providers have been increasingly offering the Internet broadband (ADSL) connection[15].

There are about 100 different internet providers, from them status able ones are UZNET, UCELL, BEELINE, TPS, EVO, SARKOR TELEKOM, INFONET, SHARQ TELEKOM, EAST TELECOM, INFORM SERVIS TV, UZBEKTELECOM, CRON TELECOM, S-LINK, ARS-INFORM and others. Since 2004 ADSL technology has been widely used in Uzbekistan. By 2019 the share of using ADSL technology will increase by 45%. Instead, the G-Pon technology works on the fiber optic.

As a result, the volume of traffic used by the users has increased dramatically. Its growth has been attributed to the limited access to external channels that connect UZNET with the world. Connection to sites within UZNET was also made through an external channel. The channel was twice as busy as it was for the entrance and exit[16].

For example, if you visit [www.iiu.uz](http://www.iiu.uz) (if you want to access this site), this site is available on Uzinfocom ([www.dc.uz](http://www.dc.uz)) servers, but still goes to an external network and then goes back to your desired address. was going. The size of the external Internet access channel is limited. It costs a lot for every megabyte. As a result, access to our sites was slow.

This is a reason why Uzbek providers have joined forces to create traffic sharing points on Uzneta. The goal is to ensure that a local provider (such as Sharq Telecom) can access the hosted site (eg, Uzneta) via a local Internet service provider rather than through an external channel.

Here is an example of a fictitious Internet Explorer, which started its work in 2005. The best site in the field of science and education is the best site in the field of media, the best site in the field of public administration, the best thematic site, the best site in the field of culture and sport, the best site in medicine and health, the best site in the field of network services, The best corporate site, the best site in the field of tourism and regional linguistics, is the best personal page nominations.

"Heavy" content - movies, music, and downloaded them at great speed. There are many interesting thematic, personal, computational sites, blogs, social networks. For example: Ziyu.uz, Muslim.uz, Ziyonet.uz, Edu.uz and others.

Almost all providers will not subscribe to the Tas-IX sites at the tariff and will provide this service free of charge. If you do not get out of Uzneta, the information is free and enjoyable long enough [17].

But EVO internet provider, for some reason, is connected to the Tas-IX system, but does not count the Tas-IX. This means that if you go on an external channel, you can still pay for megabytes if you go inside the channel.

Indeed, if the site is in the .uz domain, it is likely that they are at Tas-IX. It may also be located in our domain site as well as in Russia, the US, or any other country. For example, the site islam.uz has its domain, but the host is located in the United States. However, in some countries with sites with other domains, there are strict limitations on this subject. For example, Kazakhstan has sites that use domains with .kz domains only for hosting in Kazakhstan. Rejected [18].

There are various services available to know if the site you are trying to access is at Tas-IX. The first and most popular one is SHARQ TELECOM, located at <https://st.uz/>. If you type the site

address in the box on this page, it will immediately answer the question whether the site is on the Tas-IX or on the Internet. Tas-IX, you can easily sign in, and your account will not be charged.

The Top-rating also featured sites at Tas-IX - they are separately flagged. You can see Tas-IX in green.

### **Web sites that have negative and positive resources and their importance**

Internal threats of the Internet are threats that may have negative consequences for the status and development of the network information space. These include: information collapse due to overloading of the network; attacks by hackers for destroying or modifying data, blocking traffic and blocking "traffic" routes; casual or organized arbitrary communications channels; incompleteness of information search systems; "moral" outlook of protocols and so on.

External threats are potential threats to users. External threats can be technological and social:

- Technological: slow speed channels; Unfavorable ways to connect to the network; infected viruses; information "flood" and so on.
- Social: Impact on users' physical and mental health; impact on human consciousness; information terrorism, crime and so on [19].

The impact of information threats on the human mentality in the process of globalization has become a pressing issue. The extent to which violent information is increasing is increasing. The day-to-day advancement of communication places creates favorable conditions for human life. We are aware of the changes and innovations that are taking place around the world. We control the technical equipment easily. Techniques are driving us. In the process of globalization, the speed of information exchange, the rapid development of new models of technology, or the inability of the virtual space to comply with ethical standards. A positive or negative adjustment to the process depends on the will of every person[20].

Healthy minded individuals are brought up in the family. When a baby is born, it usually takes on a primary school course with family members. There is a wonderful transcript of our people, "It does what it sees in a bird's house". In society, we need to create a basis for our child to work well. To do this, it is crucial to set the agenda and to define the norms of each used technique. The information obtained through the sensory organs is analyzed in our brain, divided into parts, compared to the previous information, and then summarized and expressed its opinion. That personal opinion creates an independent thinking, broadens the outlook, increases the vocabulary. It creates positive qualities for the country, parents, their relatives and friends. It gives us opportunities to know our history, to understand ourselves. Some of our news feeds our enthusiasm and our peaceful lives. We call them "Informational Threats". The number of such threats increases with independent Uzbekistan, which has been enriched with the world and achieved its every success. Influence of information threats or misuse of vertical space is more common among young people. The human brain accepts all the information that is relevant and not relevant, and expresses its perception of it.

### **CONCLUSION**

We would recommend that web developers who are creating their own Web sites install at Tas-IX. There are several reasons for this. First of all, as we have already said, access to the site will be free for the population of Uzbekistan. That is, if you have a resource similar to yours in the

external network, users will find that your access to your site is financially acceptable. The above services are free of charge, that is, how many Mb and Gb you move, your account will not be charged. (<http://mrtg.tas-ix.uz/>)

Second, the speed in Tas-IX is much greater than that of external channels. Most providers use Tas-IX at speeds of up to 2 mb / s and more. This is also a major factor that attracts users. (<https://www.uztelecom.uz/uz/jisman/internet-2/tariflar-2>)

Thirdly, an external channel is sometimes "dropped" and can not be accessed from external sites. For example, Vnimanus and its subscribers on the provider's web sites! В связи с внеплановыми работами на территории России: 20.08.2016г. с 01:00 до 07:10 (ТШК) возможно ухудшение качества услуги Интернет. Internal resources, however, are operating regularly. This saves \$.

### **ABSTRACT**

*Special attention is paid to landscape reclamation in the field of ecology and environmental protection, the study of landscape stratification and their structure using modern methods, including aerospace, remote sensing, geoinformation systems. Carrying out landscape research based on modern methods requires analyzing and evaluating their existing capabilities, identifying current problems and developing ways to solve them on a scientific basis. Three-dimensional models of regions, mathematical modeling of geographical events, application of mathematical statistics in the study of individual components, in turn, in the study of complex dynamic processes occurring in landscape classes and their morphological units, their differentiation and transformation based on the specifics of regions attention is paid. This article analyzes the topography of the area, which is a key component of the landscape, the relationships between them, and the impact of these relationships on plant vegetation indices (NDVI).*

**KEYWORDS:** *Landscape, Factors, 3D Model, Slope, Aspect, Algorithm, Correlation, Matrix, Links, Vegetation Indices (NDVI).*

## INTRODUCTION

Due to the intensive use of landscapes in the world to provide mankind with natural resources, man-made degradation, desertification, land reclamation, soil erosion, degradation, deflation, desertification and other negative geo-ecological and natural geographical processes are increasing day by day. International organizations are paying great attention to combating these problems. In particular, the UN Sustainable Development Program until 2030 sets the tasks of "protection and restoration of terrestrial ecosystems, their rational use, rational forest management, combating desertification, stopping land degradation and preventing the loss of biodiversity." These tasks, especially in arid climates, require the development of irrigated agriculture on the basis of a systematic and structural analysis of the area, a set of landscape and reclamation measures.

A number of measures are being taken in the country to use the natural resource potential of the regions on a scientific basis, use modern scientific and technical achievements in their assessment, improve land reclamation, maintain their cadastre, combat salinization and desertification, ensure environmentally safe living. The Action Strategy for the further development of the Republic of Uzbekistan for 2017-2021 identifies important tasks for "further improvement of the reclamation of irrigated lands, development of reclamation and irrigation facilities." In this regard, targeted research on the mapping of the structure of natural and anthropogenic landscapes in the Middle Zarafshan basin and the role of geographical factors influencing the stratification of landscapes are important.

Resolution of the President of the Republic of Uzbekistan dated November 27, 2017 "On the State Program for the development of irrigation and reclamation of irrigated lands in 2018-2019", Decree of February 7, 2017 "On the Strategy for further development of the Republic of Uzbekistan" and December 28, 2018 In accordance with the requirements of the Appeal to the Oliy Majlis, this research work is carried out in the implementation of the tasks set out in other normative legal acts related to the activity. serves to a certain extent.

**Methods of research:** The research used methods such as field research, laboratory, comparison, cartographic, aerospace, mathematical, statistical analysis, simulation and systematic, mapping using geoinformation systems.

**Level of study of the problem:** Complex natural geographical studies of the Zarafshan basin SP Suchkov, LN Babushkin, NA Kogay, NA Gvozdetsky, AS Saidov, P. Baratov, LA Alibekov , AA Abdulkasimov, NI Sabitova, A. Rakhmatullaev, AN Khojimatov, Yu.H. Abdurahmanova, O.Sh. Ruzikulova and others. Foreign scholars P.A. Burrough [1], G.Eichorn [2], C.Le Bas, M.Jamagne [4], I.Yu.Katorgin and A.A.Kashin were engaged in the study of landscapes by modern methods.

However, in the study of landscapes of the Middle Zarafshan basin to date, little attention has been paid to the application of modern methods, including geoinformation systems, aerospace

methods, probability equations in mathematical modeling of natural processes. The main purpose of this work is to fill the above gaps.

**The results of the study:** A model and method of mapping the effect of erosion processes and hydrographic networks on changes in landscape types on the basis of satellite images and digital model of relief; analysis of dynamic changes in landscapes through multi-zone space images, vegeta It is possible to use indexes as an indicator of landscape dynamics.

**Main part:** Determination of slope (Fig. 1) and exposure (Fig. 2) using slope and aspect algorithms representing relief on the basis of 3D model, based on which correlation matrices with changes in landscape vegetation, regression statistics and vegetation with landscape components and it is possible to analyze the dynamics of soil cover change[3].

**Figure 1. A slope card based on a 3D model**

After these maps were created, the images taken in 3 periods were converted to NDVI values in the form of a three-dimensional model and slope and aspect values. On this basis, the extent to which the calculated NDVIs of the base section were related to slope, aspect, and height was calculated (Figure 3).

**Figure 2. Aspect card based on 3D model**

**Figure 3. Create Random Point Random Point Placement Card (Analysis Card)**

As a result of combining all the above-mentioned cards and placing 50 points at random on them, the ArcMap program automatically calculates the Attribute Table.

Based on this table, it is possible to perform correlation correlation matrices, regression statistics and make graphs of them.

**TABLE-3 LANDSCAPE CHANGE IN 2017 ACCORDING TO NDVI CORRELATION  
BOND MATRIX**

	<b>2017 ndvi</b>	<i>Height</i>	<i>Slope</i>	<i>Exposition</i>	<i>Coordinate X</i>	<i>Coordinate Y</i>
<b>2017 ndvi</b>	1					
<i>Height</i>	-0,0257	1				
<i>Slope</i>	-0,1345	0,781	1			
<i>Exposition</i>	0,3490	-0,073	-0,121	1		
<i>Coordinate X</i>	0,2242	0,588	0,381	-0,044	1	
<i>Coordinate Y</i>	-0,2367	0,791	0,647	-0,160	0,152	1

We will look at the data in this matrix and attribute table using the following graphs. Since the matrix only shows NDVI values in 2017, it does not reflect well the complete correlation of all parameters. Therefore, we consider how height, exposure, and slope are related to the average values of NDVIs in 2013, 2015, and 2017.

It is clear here that there is a correct and clear correlation of altitude with average NDVI values. That is, as the altitude increases, so do the NDVI values. This means that the vegetation index increases with altitude and decreases with altitude. With the exception of some anomalous cases (irrigated lands) it can be seen that it has the correct connection. Vegetation indices of agricultural crops are carried out on the basis of other methods. Since the main area of the base plot is a non-irrigated erosion plain, an algorithm for calculating NDVIs of irrigated lands has not been introduced. A similar connection can be seen in the correct connection when viewed through the exposure.

Here, 19 of the 50 cases correspond to the western slope, 14 cases to the northern slope, and the remaining 17 cases to the southern and eastern slopes. From this case it can be seen that while the humidity coefficient is high due to the barrier of the western slopes, NDVI has large values due to the low radiation on the northern slopes.

From this graph, it can be seen that the slope has an inverse relationship with the vegetation index. That is, as the slope increases, the index decreases, and vice versa. This is due to the fact that on large sloping surfaces the washing erosion is strong and the bedrock is exposed. Although the process of soil formation is accelerated, they accumulate in low-lying areas. As a result, unfavorable conditions for plant growth occur.

## CONCLUSION:

Separate NDVI (vegetation index) of each of the satellite images of the base plot taken at the Landsat space station was automatically calculated and mapped. This made it possible to create a differential map to determine the dynamics of change over the years.

Maps reflecting the slope (slope) and aspect (exposure) properties of the base plot were created. After that, all the created layers were merged and random points were optimally placed on it

using the Create Random Points command line in ArcGIS. On this basis, it is possible to determine the extent to which the calculated NDVIs of the base section are related to slope, aspect and height.

### ABSTRACT

*In this article, dances staged in performances, the use of dance in theatrical and cinematic art to express the inner experiences of the protagonist, the expression of emotions, and dance is a delicate and magical means of expressing the character of the protagonist. The artist wants his or her sample of creativity to remain in the audience's attention for years to come, and to enjoy it every time he or she sees it for the first time. To do this, directors must pay attention to the fact that every detail, every means of expression is used in place during the filming process. The play glorifies the kindness, traditions and national values of the Uzbek people. The dance scenes of the play were staged by the Honored Worker of Culture of Uzbekistan Sivilya Tangurieva. In it, Maryam and her friends dance to the national anthem of the Russian people. The cheerfulness and cheerfulness of the dance attracts the audience in the hall as well. Every work of art tries to convey an idea to people. Also cinema, theater, dance. While the image of man is at the center of all art forms, the power of each is unique in expressing his feelings, joys, sorrows, and heartaches. Every work of art is a means of conveying an idea to people. Each dance performance on the stage also depicts the idea of the play, its essence, and expresses the emotions in the minds of the protagonists through actions.*

**KEYWORDS:** Art, Dance, Performance, Actor, Theater, Performance Idea, Dance In Performance, Film, Dance Activity In Cinema, Film Idea, Means Of Expression.

## INTRODUCTION

Art is an artistic expression of beauty, sophistication, love. That is why all kinds of art call people to beauty and goodness, kindness. Every work of art tries to convey an idea to people. Also cinema, theater, dance. While the image of man is at the center of all art forms, the power of each is unique in expressing his feelings, joys, sorrows, and heartaches. In cinema, the human psyche is expressed through artistic words and actions, while in theater, character is created in the stage space. In dance, the human psyche is expressed through the wordless body, facial expressions, dance movements.

“Dance is about human labor and the emotional impressions we have of being. The art of dance is aimed at illuminating the spiritual world of man, it has a strong ideological - emotional impact on the audience. Harmonic movement, posture, plastic expression, facial expressions, rhythm and tempo, spatial formation and composition are the main tools of the art of dance” [1]. Dance expresses indescribable rage, pain, enthusiasm, joy, suffering, love, affection through bodily movements.

"The body has its own language," said French actor and dance expert François Delsart. Indeed, in the Andijan polka, joy and applause are expressed, in Dilkhiroj the enthusiasm, in Tanovor the love song, and in Lazgi the energy and enthusiasm. When a poet puts his dreams and heartaches on paper through words - as poetry is born, in the harmony of pleasant music and beautiful movements - dance emerges. The artistic image in dance is created through a constant exchange of plastic movements, body expressions and rhythmic means.

At the same time, the masked play, pantomime, labor ceremonies, hunting processes have become an independent spectacle, which also means a theatrical work a play.

The use of dance in performances often enhances the charm and spectacle of the show. Dance scenes are staged by the choreographer based on the theme and idea of the play. The use of dance in theatrical art is useful in revealing the inner experiences of the protagonist in the performance of the actor, in expressing his anger, in expressing his feelings.

At the Uzbek National Academic Drama Theater, we will analyze the dance scene in the play "Uzbek Dance" by Nurillo Abbaskhan, staged by People's Artist of Uzbekistan Turgun Azizov. The play glorifies the kindness, traditions and national values of the Uzbek people. The dance scenes of the play were staged by the Honored Worker of Culture of Uzbekistan Sivilya Tangurieva. In it, Maryam and her friends dance to the national anthem of the Russian people. The cheerfulness and cheerfulness of the dance attracts the audience in the hall as well. Young actors-actresses perform in chains, circles, in pairs, following the rules of choreography. The next scene depicts the son of Tursunboy (T. Muminov) and Maryam (L. Eltoeva) in the form of a circumcision ceremony, the Uzbek dance, the trumpet, the drum, the courage of the Uzbek guys.

The accuracy of the actors' hand-foot movements, their obedience to the rhythm, and their sense of music testify to their professionalism. The play, titled "Uzbek Dance" by the playwright *Qumri Chevar* (People's Artist of Uzbekistan D. Ikramova), depicts the patience, contentment and love of an Uzbek woman. *Qumri Chevar* raised his only child with a thousand and one

sufferings, married a child of another nation without going against the love of his child, and rejoiced in the noise of his grandchildren. However, Tursunboy's sudden nailing to the bed, burning in the spot of the child, filled the mother's heart and poured all her pain and sorrow on Allah.

A monologue full of pain connects to the scene of dhikr as heartbreaks. A dervish dance performed to the point of exhaustion brings the performance to a climax. The arms are raised, the head is thrown back, and the feet are hit hard on the ground. At first glance, it looks crazy. It is the prayer of the servant to the Creator, the rebellion of the heart.

There is also a ballet troupe at the Uzbek State Musical Theater named after Muqimi. The team has been giving aesthetic pleasure to the audience with their performances in most performances. Some performances feature dances performed by actresses.

In addition, M. In Azizov's Persian classmate "Classmate or Candidate for Groom," a female dancer named Tutikhon uses her "art" to make a living. She appears as a player, not a dancer. Tutikhon (D.Ibrahimova) performs dances in the style of "Doira". Dance choreographer Sh. Staged by Akhmedov. The actress is limited to one or two dance moves, performing muqam. It uses decorative movements, not concrete movements. In a sense, the actress's actions can be justified in terms of the Persian genre of the play. However, in any case, a dance performed in accordance with the rules of the art of choreography would further enhance the artistry, integrity and spectacle of the performance.

It is worth noting that dance is a subtle and magical means of expressing the character of the protagonist. In the play "*Toptalgan tuygu*" by H.Khalikov, the protagonist (M.Bekchonova) will dance to the tune "*Tanovar*" to one of the bridesmaids. It is known that "*Tanovar*" - "represents the desire to understand the feelings of man through all the details of life, from love, tenderness, kindness to betrayal and spiritual death" [2]. It is clear from the facial expressions and eyes of the dancer that she is tired of the insults and insults of her innocent husband, and that it is difficult to protect her trampled honor, love, and sweet words. The deep lyrical melody, which reflects the anguish of the heart, and the figurative lyrics of the song, which penetrate the human heart, require that the song be performed softly, half-heartedly, and even gently. In fact, dreams of eternal longing, freedom, and happy love are the content of lyrical songs by women all over the world.

Cinema is a synthesis of arts. It generalizes the fine arts, theater, art of speech, choreography and conveys the idea it wants to convey to the audience while absorbing its features. Feature films vary in genre, and the art of dance is no exception.

Indeed, the use of dance in the art of cinema is a convenient tool in conveying the idea of the film to the audience, in expressing the character of the protagonists.

It is safe to say that the elements of rhythmic gymnastics performed by the little bride Nigora in Melis Abzalov's film "Brides Revolt" have become a memory for every movie fan. In particular, Sotti's bride's comic dance moves evoke an involuntary laugh. Dance performed by Nigora is a type of artistic dance in which the human body reveals the character of the protagonist through

the use of figurative, associative-descriptive and expressive artistic means, combined with music, thoughts, feelings, imagination. The movements of the arms, shoulders, and legs move in precise, rhythm-controlled ways. The actress also used gymnastics. The director could have described Nigora's character in the language of other heroes. However, given the comedy of the film genre, the director made effective use of the art of choreography, aiming to increase the audience, raise the aesthetic spirit.

It is also useful in expressing national and traditional customs, wedding ceremonies through the activities of dance in cinema. For example, the film "Happy Wedding". In the film, Kyzlarkhon Dustmuhamedova will perform the dance "Spring". In order to give aesthetic pleasure to the guests, the dancer skillfully performs dance movements that symbolize the awakening of nature, the singing of birds, the opening of flowers, the ripple of water under the soft melody. It's as if the dancer is speaking through her body parts with her performance.

Ritual dances are often used in films. Rituals reflect the relationship between man and nature, demonstrating the "living" forces of nature; calendar periods represent the events of the seasons.

Films shot in the 60s and 70s of the twentieth century, such as "I'm fascinated", "Yor-Yor", "Mahallada duv-duv gap" show dance compositions in their entirety. Nowadays, the dance begins with half of the song and ends before the end of the song. This is a sign of unprofessionalism. The fact that the actress studied at a choreography school could have been aspect of her performance in the film, but being able to put the theory into practice is also a skill.

It should be noted that each dance has its own language. While the dances in the films express the hero's pains, joys and sorrows, each dance action should serve to convey the idea of the film to the audience. In cinema, music and soundtracks are chosen based on the theme of the picture. When we watch some movies, the dances in it seem superfluous. Neither the song nor the dance seems to have anything to do with the theme.

In the film "*Tango, yohud adashgan sovchilar*", the heroine dances to the song of her classmate, the first representative of pop art Botir Zokirov. The fact that the film is called "Tango" does not correspond to the content of the film. Because there is no mention of this dance at any time other than that birthday night. The dance is forgotten that night. If this dance had caused the boy and girl to find each other, his name would have been justified.

True, dance expresses human emotions. However, there must be aesthetics and ethics in the expression of language expressions. Because dance is a symbol of beauty, elegance, grace. The artist wants his or her sample of creativity to remain in the audience's attention for years to come, and to enjoy it every time he or she sees it for the first time. To do this, directors must pay attention to the fact that every detail, every means of expression is used in place during the filming process. It would be a great light upon light if they would consult with the choreographers and, if possible, offer to stage a dance for the actresses as they begin to use dance performance in their films. We can comfort ourselves by saying that there is a shortage where there is work. But overcoming the shortcomings is in our hands.

In this way, he revealed the most delicate aspects of both the art of cinema and the art of dance. When both types of art come together, they display universal qualities in bright movements, impressive and attractive. The skillful use of means of expression in conveying the idea of the film to the audience plays an important role in the spirituality and worldview of our people.

“... Every talented person is a unique world, so it is impossible to teach the creative people any wisdom, and most importantly, to try to control them. But in this life there are sacred concepts that unite them, inspire them to new creative achievements, which are inextricably linked with the interests of the Motherland and the people, the principles of goodness and humanity. If every artist puts these immortal ideas as the main goal in his works and is able to express them artistically, then, without a doubt, literature, culture and art will be able to fully fulfill their social function, serving for spiritual growth. 3], - said the head of state. This means that art is the most powerful means of finding a way into the human heart.

Every work of art is a means of conveying an idea to people. Each dance performance on the stage also depicts the idea of the play, its essence, and expresses the emotions in the minds of the protagonists through actions. Effective use of theatrical opportunities ensures the artistic integrity of the play, its long place in the repertoire.

## **DYNASTY IN TASHKENT SCHOOL OF WOOD CARVING: ON THE EXAMPLE OF M. IBRAGIMOVA'S CREATION**

**Gaipova Mukhayyo Tulyaganovna\***

\*Teacher of History and Theory of Fine Arts,  
Kamoliddin Behzod National Institute of Art and Design,  
UZBEKISTAN

### **ABSTRACT**

*This article examines the role of the Tashkent school of wood carving in the national architectural integration of traditions, the artistic features of the development of the master of the people's Republic of Uzbekistan in the work of M. Ibragimova is highlighted very clearly. Also, the creative activity of M. Ibragimova is studied in detail in the unity of artistic works created on an evolutionary basis. Some works focus on the semantic features of patterns in applied art. However, in the field of handicrafts, the tradition of succession, dynastic issues have been neglected. In Tashkent wood carving, the "pargor" style is widespread, and the word "pargor" or "pargol" itself is a phrase that fits into a list of patterns rather than style. It means drawn in a compass. For this reason, the circular or circular patterned flowers commonly used in woodcarving and painting compositions are called "pargory". The doors of M. Ibragimova's building for the Oliy Majlis building were made of palm trees (a type of tree grown in the subtropical zone) imported from Malaysia, which not only served as a traditional decoration, but also met other modern requirements. She designed a carved wall (panel) for the State Art Museum of Uzbekistan. This carved ornament is still preserved. Since 1982 she has been working in the creative group of the Master Association.*

**KEYWORDS:** *Applied Art, Wood Carving School, National Traditions, Types Of Patterns, Artistic Features, Architecture, Style, International Vision.*

## INTRODUCTION

Wood carving is a widespread type of applied decorative art of the Uzbek people. In this case, a pattern or image is drawn, cut and engraved on a wooden or wooden object. By the 1990s, Uzbekistan had entered a new phase in the history of woodcarving and painting.

When it comes to research in this area, it should be noted that while some researchers have studied wood carving patterns as part of the field of architecture, another group of other factors examines that type of applied art as a work of art, as part of material culture. Some works focus on the semantic features of patterns in applied art. However, in the field of handicrafts, the tradition of succession, dynastic issues have been neglected. Therefore, this article for the first time analyzes the work of master Muharram Ibragimova, a member of the Ibragimov dynasty, which preserves and develops the traditions of the Tashkent School of Wood Carving.

Wood carving is one of the most widespread national arts in our country. Each region has its own style and direction of wood carving. The schools of wood carving and painting in Uzbekistan are mainly Tashkent, Fergana, Bukhara, Samarkand and Khiva. While there are many similarities in the technical, methodological, and compositional aspects of these schools, there are also differences.

For example, the monumentality of Khiva wood carving differs from others by the preservation of the natural color of the wood. Bukhara wood carving is distinguished by the attractiveness of the carved pattern, the silent patterns are decorated with gold and silver water, the use of colors on the background of the pattern. Margilan wood carving used a flat carving with a deep floor. Kokand carvings used short-relief, flat-carved carvings. In Tashkent, flat-carved, groundless drawing carvings covered with patterns are widespread.

In Tashkent wood carving, the “pargor” style is widespread, and the word “pargor” or “pargol” itself is a phrase that fits into a list of patterns rather than style. It means drawn in a compass. For this reason, the circular or circular patterned flowers commonly used in woodcarving and painting compositions are called “pargory”. This style is found in the works of almost all masters. But in the second half of the last century, in the work of Tashkent master Muharram Ibragimova, she reached her peak. L. According to Rempel, “wood carving is superior to terracotta and plaster in terms of the theme and shape of the embroidered ornaments”.

Muharram Ibragimova was born on July 1, 1949 in Chakar mahalla of Tashkent in a family of wood carvers, masters. 9 children, 3 girls and 6 boys grew up in the homes of Nigmat ota Ibragimov, an artist whose father served in Uzbekistan, and her parents Mashhura aya Kosimova. Surprisingly, all the children grew up to be masters of handicrafts.

The dynasty of wood carvers, consisting of seven generations, and M. Ibragimova became artisans, preventing the disappearance of centuries-old family traditions. Her grandfather was once a famous carpenter. His art is highly framed. Forty camels were given in exchange for the piled door. According to family legend, one of the piled doors was taken to Switzerland and installed in one of the banks. Scholar Hamid is in Switzerland, and indeed his grandfather, Ibrohim, sees a door piled with fatherly patterns. Ibrohim ota lived in caravans in Tashkent and

Bukhara, where she lived in "two houses", and the dynasty of wood carvers from her "Tashkent" wives continued.

It is no exaggeration to say that Muharram Ibragimova grew up among wooden objects and her legs were in the workshop. From a young age, she grew up playing wood carving tools instead of dolls. Seeing the interest in her daughter, Nigmatova Mashkura aya Muharram began to teach the secrets of woodcarving from the age of 5. When she left school in 1956, her lessons were prepared in a workshop. All the activities of the school, with the help of Muharram Ibragimova, helped to decorate the hall and publish posters. In 1972 she entered the Faculty of Biology of Tashkent State University.

After graduation in 1978 she joined the Research Institute of Endocrinology of the Academy of Sciences of Uzbekistan as a researcher. But his deep-rooted love for his profession did not leave her alone. In 1979, she connected her life with Tulagan Gaipov. In 1989, she began working as a wood carver in her father's workshop.

At the same time, she began working as a wood carver at the Tashkent Folk Art Experimental Combine (Tashkent experimental creative arts and crafts complex). During her career, she participated in various exhibitions, construction of cultural and public facilities with her creative work.

In 1968, the building of the Institute of Oriental Studies was built and it was planned to install columns decorated in the style of wood carving. Management said it would be very costly. In response, Muharram, 18 said the column would be close to the price of a diamond, but that if she was provided with the necessary material, she could engrave a pattern on those columns for free. Recognizing her tenacity, the leadership entrusted the pillars to this girl. These columns still adorn the building. She and her students also made carved doors for the neighborhood mosque and offices. She designed a carved wall (panel) for the State Art Museum of Uzbekistan. This carved ornament is still preserved. Since 1982 she has been working in the creative group of the Master Association. Throughout her career, she invented non-reversible, unique pattern methods and researched on a variety of ideas. During these years, in 1984, she worked on 3 carved doors

to the Musical Drama Theater of Jizzakh region.

In 1985, he painted patterns for 2 carved doors to the Museum of Military Labor Glory and participated in carving them into wood. This work is done in the style of a three-tiered, deeply carved Islamic pattern, chokapardoz. They built and installed 4 carved doors to the mausoleums of Turbat Ismail ota and the Palace of Culture in the Republic of Kazakhstan. In 1986-1987, a carved door was made for the teahouse at the Elektrkhipromkombinat in Chirchik. They also made a carved door for the Museum of Local Lore in Chirchik.

Muharram Ibragimova carved a number of shelves, 8,6,4-sided tables, chairs, plates of different sizes, carved bowls, jugs, upadons and other items on the basis of unique patterns. Most importantly, among the masters of wood carving, Muharram Ibragimova developed the technology of weaving carvings in different shapes on the first pumpkin.

Among the samples in the department of folk arts and crafts of the State Museum of Arts of Uzbekistan, a number of works by Muharram Ibragimova are regularly exhibited. Many of their works of art have been exhibited in exhibitions in France, Italy, Germany, Bangladesh, Korea, Romania, Japan, Finland, Malaysia, and Turkey. A number of carvings were exhibited at the Museum in Riyadh, Saudi Arabia.

Muharram Ibragimova paid a creative visit to Malaysia in 1995. A number of works were exhibited at the Museum of Islamic History in Kuala Lumpur, Malaysia.

Four large carved doors made in 1997-1998 are installed in the building of the Oliy Majlis of the Republic of Uzbekistan, two doors in the building of the Navoi Theater. It should be noted that among the great works of Muharram Ibragimova, the doors have a special place. Among the architectural decorations, the door has a special function in Islamic art. "At first glance, the door, which is an element of service in the architectural space, is a symbol of the divine gate, which is more widely interpreted as a transition from the mortal world to the higher heavens." The master sought to capture this tradition in the creation of each door and tried to express a particle of heavenly beauty on the door through Islamic patterns.

The doors of M. Ibragimova's building for the Oliy Majlis building were made of palm trees (a type of tree grown in the subtropical zone) imported from Malaysia, which not only served as a traditional decoration, but also met other modern requirements. Muharram Ibragimova's modest work was awarded in 1999 by the First President of the Republic of Uzbekistan Islam Karimov. She was awarded the Medal of Fame.

Along with creative research, Muharram Ibragimova teaches the younger generation the secrets of her profession. Among the students who learned to work in their home, many children in the neighborhood also learned to work and became masters. Their children Jamshid and Khurshid Gaipov, Mukhayo Gaipova and students Elmurad Pirmatov, Nuriddin and Ulugbek Rasulov, Botir Mavlonov, Olim Fayziev, Jamol Ibragimov, Bakhrom Juraev have studied and are still working.

Muharram Ibragimova and her students participated in the creation of all the wood carving equipment of the restaurant "Seven Treasures" in Almaty, Kazakhstan. They carved wood carvings with their students at the Silk Road restaurant in Tashkent. They also took part in the construction of two carved doors to the Muyin Ota tomb in Uchtepa district of the capital.

In 2007, Muharram Ibragimova was given a special place in the master's studio of the Barakkhan madrasah of the Khasti Imam complex. There, Muharram Ibragimova demonstrated to foreign tourists wood carving, carving pumpkin making techniques. They took an active part in various events in the city, district and the country.

Muharram Ibragimova has works in the Bukhara Hall of the Navoi Theater, museums and many palaces. Muharram Ibragimova is not only a craftswoman, but also the only woman in this field, the People's Master of Uzbekistan.

In 2004, the Movement of Entrepreneurs and Businessmen became a member of the Liberal Democratic Party of Uzbekistan. The Republic of Uzbekistan is a member of the Public Association "Entrepreneur and businesswoman" in Tashkent.

In short, since the 1990s, most of the "professional" folk artists who have been engaged in independent creation have created by being members of centers and associations. The masters, members of the Republican Special Creative and Production Association "Usto", participated in large-scale facilities and constructions of national importance, members of the research and production centers "Musavvir" and "Hunarmand" created at home and distributed their products through these centers. The center provided them with methodological assistance, promoted the work of masters among the general public, at major exhibitions in the country and abroad, and so on.

Today, the art of wood carving and painting is regaining its former status. Demand for it is growing day by day in a number of religious and secular buildings under construction, commissioning or reconstruction in Tashkent and other major cities of the country.

## CLINICAL AND EPIDEMIOLOGICAL CHARACTERISTIC OF HYMENOLEPIDOSIS IN CHILDREN

**Mirzoeva M.R\*; Khamidova N.K\*\***

<sup>1,2</sup>Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*Hymenolepidosis is a chronic parasitic disease that develops with parasitization in the human intestine of the tape helminth *Hymenolepis nana*, or dwarf tapeworm. Hymenolepidosis affects mainly the urban population. More often, children 4-14 years old are sick, which is explained by the insufficient instillation of hygienic skills in them, as well as the characteristics of age-related immunity. Hymenolepidosis disease is asymptomatic. The main symptoms of the disease are: abdominal pain in the form of seizures, skin rashes, loss of appetite, heartburn, nausea, diarrhea, weight loss, dysbiosis, dizziness, asthenia, irritability, headache, skin itching, rhinitis, Quincke's edema. With severe helminthic invasion, the patient may experience fainting, low-grade fever, myocardial dystrophy, seizures, hepatomegaly, anemia, hypovitaminosis. In addition to standard research methods (general analysis of blood, urine, bacteriological and biochemical studies), we conducted a thorough study for all children. At the same time, they paid attention to their complaints, to the transferred and concomitant disease, premorbid background, the cause of the disease, the duration, the effect of previous treatment measures. When studying the results, hymenolepidosis in children is often found in hot climates and, which is apparently associated with the anatomical and physiological characteristics of the child's body, age, and possibly with the severity of the underlying disease. Children were examined regardless of the presence of complaints. In addition to standard research methods (general analysis of blood, urine, bacteriological and biochemical studies), we conducted a thorough study for all children.*

**KEYWORDS:** *Hymenolepidosis, Children, Hot Climate, Immune System.*

## INTRODUCTION

According to the World Health Organization, intestinal helmentoses among parasites are in second place after diarrhea - their frequency is more than 3.5 billion cases per year. World Bank experts put intestinal helminthiasis in 4th place among the leading causes of damage caused by human diseases. However, the importance of helminths in human pathology until recently has been underestimated. Helments are one of the oldest and most numerous life forms on our planet. In the human body, helminths parasitize, mainly related to two types of worms: round (class Nematoda) and flat (class tapeworms - Cestoda and flukes - Trematoda). Currently, more than 250 types of helminths capable of invading humans are known, of which approximately 60 species are recorded in Russia and the CIS countries, 20 of which are most common (1,3,8,9).

According to the results of epidemiological studies conducted in many countries, the most at risk group for helminth infections is children, mainly 5-14 years old. Prevalence of geohelminthiasis in children under the age of 17 varies from 27% (India) to 6-7% (Indonesia, China, Nigeria) and 2-3% (Democratic Republic of the Congo, Tanzania, and the Philippines) (2,6,7).

Among human helminthiasis, enterobiosis (up to 65%), ascariasis, and opisthorchiasis have the largest share. In recent years, there has been an increase in the frequency of severely occurring helmentoses —hymenolepidosisin children.

Hymenolepidosis is a chronic parasitic disease that develops with parasitization in the human intestine of the tape helminth *Hymenolepis nana*, or dwarf tapeworm. Hymenolepidosis affects mainly the urban population. More often, children 4-14 years old are sick, which is explained by the insufficient instillation of hygienic skills in them, as well as the characteristics of age-related immunity. Hymenolepidosis disease is asymptomatic. The main symptoms of the disease are: abdominal pain in the form of seizures, skin rashes, loss of appetite, heartburn, nausea, diarrhea, weight loss, dysbiosis, dizziness, asthenia, irritability, headache, skin itching, rhinitis, Quincke's edema. With severe helminthic invasion, the patient may experience fainting, low-grade fever, myocardial dystrophy, seizures, hepatomegaly, anemia, hypovitaminosis (2,4,5).

Currently, the issues of studying the clinical manifestations of the disease of hymenolepidosis in children are relevant, taking into account the infection paths and regional characteristics. The classic manifestation of hymenolepidosis that an infectiologist may encounter is the development of hymenolepidosis in children, which dictates an urgent need to perform the study.

## AIM

Clinical and epidemiological characteristics of hymenolepidosis in children at various stages of the disease.

## MATERIALS AND RESEARCH METHODS

For the period from 2016 to 2019 under our supervision there were 60 children with hymenolepidosis under the age of 14 years. There were 28 boys (48%), 32 girls (52%).

**TABLE 1. DISTRIBUTION OF PATIENTS WITH HYMENOLEPIDOSISIN CHILDREN, TAKING INTO ACCOUNT AGE AND GENDER**

sex	Age of patients								Total	
	from 1 month. to 1 year		from 1 yearto 3 years		from 3 to 7 years		from 7 to 14 years			
	abs	%	abs	%	abs	%	abs	%	abs	%
M	6	21,4	10	35,7	9	32,2	3	10,7	28	46,6
W	13	40,6	12	37,5	5	15,6	2	6,3	32	53.4

All of them are registered at the Bukhara Regional Infectious Diseases Hospital. The diagnosis was based on determining the method of fecal retention (for protozoal cysts).

In the case when immediate examination of the material is not possible, its conservation is used. The principle of detection of intestinal protozoa in feces by conservation is based on the fact that the preservation solution causes fixation of protozoa with prolonged preservation of the basic morphological characteristics of all stages, especially cysts (amoeba, lamblia, balantidia), unchanged. The following preservatives are often used: Safaraliyev preservative: zinc sulfate - 1.65 g; concentrated formalin - 10 mg; phenol crystals. - 2.5 g; acetic acid conc. - 5 ml; methylene blue - 0.2 g; distilled water - 100 ml. Phenol is pre-dissolved in a water bath. The protozoa turn blue. Preservative Turdiyeva: aqueous solution of sodium nitrate 0.2% - 80 ml; Lugol's solution - 8 ml; concentrated formalin - 10 ml; glycerin - 2 ml; acetic acid conc. - 5 drops.

Protozoa are stained golden brown. Preservative is poured into penicillin vials to half the volume. The test material from each patient immediately after taking is transferred to the bottle in a ratio of 1: 3 (one part of feces, 3 parts of preservative). A wooden stick is mixed, closed with a rubber stopper and fixed with adhesive tape. Each vial should have a label or serial number.

The main manifestations of abdominal pain in the form of seizures in 10 (16.6%), skin rashes in 14 (23.3%), loss of appetite in 8 (13.3%), heartburn in 16 (26.6%), nausea in 8 (13.3%), diarrhea in 4 (6.6%), weight loss in 8 (13.3%), dysbiosis in 8 (13.3%), dizziness in 8 (13.3%), asthenia in 8 (13.3%), irritability in 8 (13.3%), headache in 8 (13.3%), pruritus in 8 (13.3%), rhinitis in 8 (13.3%), Quincke's edema in 8 (13.3%) patients.

Children were examined regardless of the presence of complaints. In addition to standard research methods (general analysis of blood, urine, bacteriological and biochemical studies), we conducted a thorough study for all children. At the same time, they paid attention to their complaints, to the transferred and concomitant disease, premorbid background, the cause of the disease, the duration, the effect of previous treatment measures.

If necessary, sick children were consulted by neurologists, pediatricians and other specialists. On examination, the condition of the patient was evaluated depending on the course of the underlying disease. Results and their discussion: When studying the results of the study, the epidemiological characteristics of hymenolepidosisin children in the regions of the Bukhara region were revealed.

Due to the significant increase in the number of cases of hymenolepidosisin children, the likelihood of contact by an infectiologist with hymenolepidosisin infected patients also increases.

With hymenolepidosis in children often there are various manifestations of the disease with damage to the internal organs. Infectiologists, as well as other specialists, already have to take an active part in the diagnosis, treatment of hymenolepidosis in infected people, and preventive work, which, of course, will require knowledge of the features of the course of hymenolepidosis in children. Patients who do not know about the infection of hymenolepidosis can hide at the reception, hiding - for well-known reasons - the infection; patients in the incubation stage, which can also become a source of infection for other patients. To prevent infection of personnel, one should know the ways and factors that realize the transmission of hymenolepidosis in children, and assistance should be carried out in compliance with the necessary safety measures and with strict observance of the rules for disinfection and sterilization of used tools.

Another issue that will be addressed in this article is a statistical analysis of the frequency and development of hymenolepidosis in children. Similar to the previous analysis, it covers the territories of Bukhara region (Bukhara, Peshku, Karakul and Zhondar regions).

**TABLE 2. DISTRIBUTION OF SICK CHILDREN IN AREAS OF THE BUKHARA REGION, DEPENDING ON THE PREVALENCE OF HYMENOLEPIDOSIS**

Age of patients	Districts of Bukhara region							
	Bukhara district		Peshku district		Karakul district		Zhondar district	
	abs	%	abs	%	abs	%	abs	%
1 month. to 1 year (20 children)	3	13,6	5	22,7	6	27,2	8	36,5
1 year to 3 years (16 children)	3	7,8	7	18,4	10	31,6	14	42,2
3 to 7 years (14 children)	6	21,4	10	41,1	14	58,8	24	78,8
7 to 14 years (10 children)	2	3,4	3	5,1	3	5,1	2	3,4

The dynamic indicator of the incidence of hymenolepidosis in children of detected cases in the Karakul region is more than in other regions.

Therefore, hymenolepidosis in children is often found in hot climates and, which is apparently associated with the anatomical and physiological characteristics of the child's body, age, and possibly with the severity of the underlying disease.

Thus, hymenolepidosis contributes to the violation of the immune system and causes the emergence and development of various secondary diseases, the severity of which depends on the course of the underlying disease.

## CONCLUSION

Hymenolepidosis in children leads to the onset and development of various secondary diseases characterized by a specific clinical course. This is clearly related to the severity of hymenolepidosis and the frequency of development of various secondary diseases in children.

## ABSTRACT

*The main purpose of this paper was to investigate the effect of communication practice on conflict management in Ethiopian electric power corporation (a case study of Ethiopian electric power corporation north-western regional office). It adopted both descriptive and explanatory research design. The sample size of 100 respondents was selected from 200 employees. The study findings of correlation analysis showed that all constructs of communication practice (Open Communication Channel, Formal communication, Informal communication, and Freedom of act in communication) were positively and significantly related to conflict management. The findings of the multiple regressions analysis showed that the observed changes in conflict management attributed by the elements communication practice is 47.1% (adjusted  $r^2 = .471$ ). The study also reveals from four major dimensions of communication practices, Open communication Channel, formal communication, and Freedom of act in communication has a positive effect on conflict management, while informal communication doesn't have a significant effect.*

**KEYWORDS:** Communication Practice, Conflict, Conflict Management, And Ethiopian Electric Power Corporation

## 1. INTRODUCTION

### 1.1 Background of the study

As long as people in organization work together, conflict is inevitable or unavoidable and even desirable. This means as people work together the incompatibility of goals, attitudes, and

behaviors lead to disagreement or opposition between parties both at home and at office. Conflicts occur because people do not agree on goals, issues; perceptions and people inevitably compete for the scarce resources (Rahim, 2001). It cannot be avoided, but it is possible to manage them in a way that companies recognize it on time. According to (Kinicki & Fugate, 2018) conflict is a disagreement occurs when one party perceives that its interests are being opposed or negatively affected by another party.

Traditionally, conflicts have been viewed as obstacles to organizational functioning. However, for modern organizations; they are essential to the growth, change, and evolution of systems (Aula & Siira, 2010). The extent of organizational conflict increased today than ever before as organizations become more open and diverse, financial uncertain, technologically advanced, flatter and more decentralized. Managers in the twenty first century do not seek to avoid conflict rather manage conflict in the organization (Aduet *al.*, 2015). According to (Kinicki & Fugate, 2016) employees spend two or more hours per week, or one day per month, dealing with some type of conflict at work. Due to this, conflict management is receiving increasing attention from top managers and policymakers across major corporations. Managing conflict viewed as an important element in achieving organizational effectiveness and enhancing productivity (Wairimu, 2016).

According to (Schermerhorn, Hunt, & Osborn, 2002) organizations experienced conflict as functional (constructive) and dysfunctional (destructive). Constructive conflict induces a positive performance, while destructive conflict heats up the work environment and results in reduction of productivity and job performance. This is suggestive that Conflict can be managed in different ways; a well-managed conflict aims at the improvement of organizations for the purpose of stimulating performance in the work-situation. When conflict arises, we need to be able to manage them properly, so that it becomes a positive force, rather than a negative force, which would threaten the individual and group (Robbins & Judge, 2013). Ineffectiveness in conflict management is the reason of undesirable outcomes (VatanKhah, Raeisi & Kalhor, 2008).

(Aduet *al.*, 2015) also argues that unmanaged conflict significantly affects employee morale, increase turnover and absenteeism, which affects the performance of a company in long term. Conflict management does not mean the elimination of conflict, nor does it refer only to conflict reduction. It means maintaining conflict at the right level to help the department, work unit, or organization reach its goals (Champoux, 2011). To manage conflict accordingly managers at different level and organizations must create an open environment to aware the interest of conflicting parties before and after the conflict intensify. According to (Murerwa, 2019) Communication plays a vital role in management where employees' views are listened to and interest of management and employees indeed coincide.

Effective communication skill serve a key role in successfully resolving conflict, both in the home and work place through increase mutual understanding of conflicting situation among parties and reduce the risk of making bad generalization (Hener, 2010). Nothing can be achieved in an organization without effective communication. It is not possible to have good human relation and proper organizational functioning without effective communication (Shonubi & Akintaro, 2016). An effective communication is required, not only for maintaining human relation and for achieving good business performance but also to manage conflict accordingly. Spaho (2013) recommends that all levels of management have a responsibility for good

communication and conflict management in an organization as many factors prevent employees from direct and open communication, whose consequence is an increased risk of conflict situations.

Good or effective communication can facilitate peaceful conflict management or resolution. On the other hand, Poor communication such as offensive and unclear communication is probably the most frequently cited source of conflict. Poor communication transforms latent conflict into violent (Gyamfi, 2009). Nyamboga and Kiplangat (2008) also argued conflict can result from misinformation between people with respect to their needs, ideas, beliefs, goals or values. Communication with employees should be on-going and consistent; especially when organizations need guidance or when there is opposition to changes inside the organization (Dawson, 2003).

### **1.2 Statement of the problem**

Ethiopia has seen dramatic economic growth in recent years, to sustain this growth mass industrialization and dramatic expansion of energy supply is mandatory. Electricity plays a driving role in social-economic development and improvement of the quality of life of a society and it is also linked to all sectors of the economy. Energy is an important factor in all sectors of the economy. For industrialization and growth in economic condition, the access to energy is a key concern, which is useful to remove poverty, enhance food production, increase clean water availability, upgrade medical facilities, boost up education standards, and develop employment opportunity for young people including women (Khan & Singh, 2017).

Ethiopia is endowed with outstanding and diversified renewable energy resources, namely hydro, wind, solar, geothermal, and biomass. For many decades, the power generation for the electric grid in Ethiopia currently depends almost entirely on hydropower. Even if the government of Ethiopia is firmly determined to increase the production and availability of electricity to satisfy demanding needs of citizens and industries, the consumers are unable to get uninterrupted and good quality services yet. According to (Odi, 2016) only 23% had access to electricity, in urban areas 85% had access, compared with 10% in rural areas. Lack of reliable electricity service has been listed as a major obstacle preventing growth of firms in developing countries. In the 2017 World Bank Enterprise Survey (WBES) cited at (Carlsson *et al.*, 2018) about 40 percent of firms in Sub-Saharan Africa stated that a shortage of electricity was a major constraint to the operations of the firm. The electricity services are still characterized by high frequency of interruptions with long duration of outages. Long and frequent outages can damage assets (such as electronics) and inventory. Moreover, they can disrupt work by shutting down equipment and cutting off lighting, heating or internet connections, which increase an economic burden on households (Toleshi, 2016).

This unsatisfied demand becomes higher burden for Ethiopian Electric Power Corporation (EEPO). The corporation must satisfy the needs of individuals (citizens), business organizations, industries, and government requirements. To do this effectively, the company must create clear cut communication practice both within and outside it. No business task is performed without communication. Based on this, the researcher motivated to examine communication practice and its impact on conflict management that can be created as a result of higher burden on the corporation.

### **1.3 Objectives of the study**

#### **1.3.1 General objective**

The general objective of study isto assess communication practice and its effect on conflict resolution in Ethiopian electric power corporation (a case study of Ethiopian electric power corporation north-western regional office)

#### **1.3.2 Specific objectives**

The specific objectives of the research are to

1. Determine the relationship between communication practice and conflict management.
2. To determine the impact of communication practice on conflict management.

## **2. Review of related literature and conceptual framework**

### **2.1 Communication; meanings and concepts**

Organizational communication is a crucial aspect for the effectiveness of organizations and of individuals inside an organization. It is a fundamental mechanism by which members show their satisfaction and frustrations, and the manager aware their interest. Organizational communication includes the purpose, flow, and direction of messages and the media used for those messages (Champoux, 2011).The term communication is freely used by everyone in modern society, including members of the general public, organizational behavior scholars, and management practitioners.

Communication is from a Latin word-communis, which means common or shared understanding. Therefore it is a purposeful effect to establish commonness between a source and receiver (destination) (Schramn, 1965 cited at Shonubi &Akintaro 2016).

According to (Mensa, 2010) communication is a process of sharing ideas, information, and messages between two or more parties in a given place and time. For communication to be said to have taken place, there is the exchange of shared meaning which occurs between two or more parties and feedback must obtained. That means the interaction between individuals or groups is should not belinear. (Keyton, 2011) also define Communication as the process of transmitting information and common understanding from one person to another through amedia.

Communication is the exchange of information between a sender and a receiver, and the inference (perception) of meaning between the individuals involved. It is a circular and dynamic process in which people interpret and make sense of the information they exchange (Kinicki& Fugate, 2018).

Communication is the process of transmitting or sharing meaning (idea, feeling, thought, experience, knowledge, and skill) for some purpose through the transmission of symbolic messages this means if no information or ideas have been conveyed, communication has not taken place. For communication to be successful, the meaning must imparted and understood perfect communication , if such a thing existed, when a transmit thought or idea will perceive by the receiver exactly as it will envisioned by the sender(Adler, 1989).

## 2.2 Types of Communication

There are different types of communication that flow within an organization. However, the key distinctions with respect to organizational communication involve: levels; formal versus informal; direction (vertical, horizontal, diagonal), verbal and non-verbal, and internal versus external focus. Communication occurs at several levels and is divided into interpersonal communication, Group level communication, Organizational level communication, Inter-organizational level communication and Mass communication (Canary, 2011).

According to (Champoux, 2011) Verbal and nonverbal communication are the two major types of communication found in organizational communication processes. Verbal communication includes oral, written, and electronic forms of communication. Nonverbal communication also called the “silent language,” nonverbal communication can be defined as “no word human responses such as gestures, facial expressions, eye movements, tone of voice, and the like (Luthans, 2011).

Communication can flow vertically or laterally. Communication that flows from one level of a group or organization to a lower level is downward communication. Group leaders and managers use it to assign goals, provide job instructions, explain policies and procedures, point out problems that need attention, and offer feedback about performance (Robbins & Judge, 2013).

Upward communication flows to a higher level in the group or organization. It is the flow of information from lower levels to the higher ones (from subordinates to superiors or from employees to management). It's used to provide feedback to higher-ups, inform them of progress toward goals. It keeps managers aware of how employees feel about their jobs, co-workers, and the organization in general (Hener, 2010).

Horizontal Communication refers to the exchange of information between people operating at the same or similar levels, managers at the same level or any other horizontally equivalent workers. It saves time and facilitates coordination (Tubbs & Moss, 2008).

Diagonal communication flows between people, which are not on the same organizational level and are not in a direct relationship in the organizational hierarchy. This type of communication is rarely used – usually in situations when it supplements other types of communication (Spaho, 2013).

## 2.3 Conflict and conflict management strategies

Conflict is inevitable. It is part of all relationships. When people work together, conflict becomes a part of doing business; it's a normal occurrence in any workplace. It is inevitable part of organizational life since the goals of different stakeholders such as managers and staffs are often incompatible (Robbins & Judge, 2009). Conflict is doubt or questioning, opposition, incompatible behavior, controversy, or antagonistic interaction. It includes disagreements, debates, disputes, and active efforts to prevent a party from getting what it wants. Conflict in organizations includes interactions in which one party opposes another party interest or one party tries to block another party from reaching his goals (Champoux, 2011).

According to (Robbins & Judge, 2013) functional or constructive conflict supports the goals of the group and improves organizational performance while, a destructive or dysfunctional conflict hinders group performance. Conflict in organizations connected to task, relationship, and process.

Task conflict relates to the content and goals of the work. It occurs when the members of a group cannot agree about the tasks they are expected to perform (Stroh, North craft, & Neale, 2002). Relationship conflict focuses on interpersonal relationships. It diverts energies, hurts group cohesion, promotes interpersonal hostilities (increase personality clashes and decrease mutual understanding), and overall creates a negative environment for workers. It is a dys functional or destructive conflict (Schermerhorn et al., 2002). Process conflict relates to how the work gets done (Robbins & Judge, 2013).

Conflicts have both negative and positive outcomes to the individual employees and organization at large. Conflict management involves implementing strategies to limit the negative aspects of conflict and to increase the positive aspects of conflict, such as through enhanced team learning and group outcomes. It helps to find a middle way, an alternative to any problem and successful implementation of the idea (Kazimoto, 2013). Conflict management is the principle that all conflicts cannot necessarily be resolved, but learning how to manage conflict (avoidance, reduction, or termination) to minimize the dysfunctions of conflict and enhancing the constructive functions of conflict (Rahim, 2002).

Conflict management involves acquiring all-encompassing skills related to conflict resolution, self-awareness about conflict models, conflict communication skills, and impacting the degree to which an employee experiences ongoing conflict (Pathak, 2010).

A number of scholars have developed typologies of conflict management styles using the conceptual foundation provided by Blake and Mouton's (1964) managerial grid. The two dimensions have been labeled as cooperativeness (the degree to which one party attempts to satisfy the other party's concerns) and assertiveness (the degree to which one party attempts to satisfy his or her own concerns) (Robbins & Judge, 2013, Schermerhorn *et al.*, 2002, & Stroh *et al.*, 2002). Based on these five conflict-handling mechanisms are developed as follows:

**Avoiding;** (low concern for self and others) style has been associated with withdrawal, buck passing, or sidestepping situations. An avoiding person fails to satisfy his or her own concern as well as the concern of the other party (Rahim, 2002). Avoidance may be the best course of action if others can better handle the problem and when the issue is trivial (Stroh *et al.*, 2002).

**Competing:** it exists when one person seeks to satisfy his or her own interests regardless of the other party's desires. It is achieved through force, superior skill, or domination by one party. This is a high-assertiveness and low-cooperativeness situation (Schermerhorn *et al.*, 2012).

**Collaborating:** When parties in conflict each desire to fully satisfy the concerns of all parties, there is cooperation and a search for a mutually beneficial outcome. In collaborating, the parties intend to solve a problem by clarifying differences rather than by accommodating various points of view. It is a win-win solution that allows both parties' goals to be completely achieved (Robbins & Judge, 2013).

**Compromising:** One conflict management strategy is to reach a compromise, which means the parties to the conflict settle on a solution that gives both of them part of what they wanted. It occurs when each party gives up something of value to the other. No party gets exactly what it wanted, but neither loses entirely either. Parties choose to compromise are assuming they cannot reach a solution completely acceptable to everyone, but they would rather not force someone to accept a completely disagreeable choice (Kazimoto, 2013).

**Accommodating:** it exists when a party who seeks to settle an opponent may be willing to place the opponent's interests above his or her own, sacrificing to maintain the relationship. It is lower Assertiveness and higher cooperativeness (Robbins & Judge, 2013).

## 2.4 The role of communication in conflict management

Communication and conflict are in an interdependent relationship; communication can engender conflicts, can escalate conflicts and it also can prevent conflicts, help in conflict management and resolution activities (Hener, 2010). It is an important source of conflict situations, but that communication can prevent, avoid, manage, control and solve conflicts. According to (Robbins & Judge, 2013) most of the conflicts in organization arise due to communication problems. There are several situations that can be considered failed communication: when communication includes only a part of the information, when it incorporates ambiguous or threatening information or when it offers too much information (either in terms of quantity or too highly coded for the recipient). (Spaho, 2013) also concludes the exchange and sharing of information through communication process can help in a great way to resolve crises and build confidence between the parties in conflicts.

Joseph & Adewale (n.d) conducted a study on Effective Communication: A Strategic Tool for Managing Organizational Conflict from two multinational organizations in Lagos, Nigeria and concluded that effective communication is vital in reducing organizational conflicts and the communication skill of the communicator is crucial in managing organizational conflict. Nordin, et al., (2014) in their quantitative research in gas and Oil Company, the results of the study revealed that good communication climate associate positively to conflict management and conclude that the importance of organizational communication however cannot be overlooked in conflict resolution.

Aduet *al.*, (2015) conducted study on the Role of Conflict Management in Improving Relationships at Work with The Moderating Effect of Communication from two major manufacturing companies in Ghana and founded that that there exist a significant positive relationship between conflict management and communication at the workplace. Thus as conflict management increases then the entire communication channel within an organization is at its peak.

Chatterjee & Kulakli (2015) conducted a study to identify the effect of organizational communications system on the conflict among the employees in management institutes based in NCR region using an instrument used to examine the organizational communications system with five dimensions (freedom of act in communication, efficient inform, formal and informal communication, one-way communication, and open communication channels) and interpersonal conflict with three dimensions (conflict with colleague, conflict with chief, and conflict with subordinate). The study confirmed that communication is the key factor with an issue becoming an interpersonal conflict.

Thomas (2020) conducted a study on The Role of Effective Communication in Resolving Conflict in Afar Regional State, Ethiopia and founds that employees believed that communication plays role in resolving conflict and communication used in resolving conflict in the municipality.

### 3. RESEARCH METHODOLOGY

**3.1 Research design:** This study employed both descriptive and explanatory research design. Descriptive research design is selected because it is a powerful form of quantitative analysis and enables to describe the area of the research, characteristics of the variables and analyze data logically. Moreover, the method permits description of the collected data in words, pictures, charts, or tables. As this study to establish causal relationships between variables, explanatory design was used to determine the relationship between the dependent ( conflict management) and independent variables , and to address the effects of communication practice on conflict management.

**3.2 Target population and sample size:** This study was aimed determine the role of communication on conflict management. The population of this study is all permanent employees of Ethiopian Electric power corporation (EEPCO) it accounts for 200 individuals (employees). From them 100 employees are selected for the study.

**3.3 Sources of Data and methods of data collection:** This study focuses on primary data. A primary survey has been conducted to discover the effect of communication practice on conflict management. The items are all close ended items to get opinions of the respondents. The questionnaire carefully developed in a way that measures the effect of communication on conflict management.

**3.4 Data Analysis:** The data collected were analysed quantitatively. For quantitative data the researcher used graphs, tables, frequencies and percentages to show the highest number of group responses or the most common opinions from the group responses. To estimate the influence of communication practice on conflict management multiple regression analysis was used. The researcher has treated conflict management as the dependent variable and communication practice as the independent variables.

### 4. RESULTS AND DISCUSSIONS

#### 4.1 Demographic profile of respondents

**TABLE 4.1 PERCENTAGE AND FREQUENCY DISTRIBUTION OF DEMOGRAPHIC PROFILE**

	Description	Frequency	Percentage
1. Gender	Male	66	66.0%
	Female	34	34.0%
	<b>Total</b>	<b>100</b>	<b>100.0%</b>
2. Age	18-30	53	53.0%
	31-40	42	42.0%
	41 and above	5	5.0%
	<b>Total</b>	<b>100</b>	<b>100.0%</b>
3. Level of education	Primary education	5	5.0%
	Secondary	16	16.0%
	Diploma	27	27.0%
	Bachelor	33	33.0%
	Masters	14	14.0%
	PhD	5	5.0%

	Total	100	100%
--	-------	-----	------

**Source; Own survey (2019)**

As it is shown on the above table, 66 respondents, representing 66.0% are males and 34 respondents, representing 34.0% is female. This shows the gender distribution for male employees is larger than the female. In the case of classification of respondents by age, 53 respondents representing 53.0% of respondents are their age between 18 – 30 years, 42 respondents representing 42.0 % are their age between 31- 40 years and the remaining 5 respondents representing 5.0% are their age above 41 years. This indicates that the majority of respondent's age is lies between 18 – 30 years. With regard to educational level of respondents, the table shows that 5 respondents, representing 5.0% of the employees have primary education, 16 respondents, representing 16.0% holds secondary education, 27 respondents, representing 27.0% holds diploma, 33 respondents, representing 33.0% holds Bachelor degree, 14 respondents, representing 14.0 % holds master's degree, and the remaining 5 respondents, representing 5.0 % are PhD holders.

This shows that nearly 79.0% of respondents have educational preparations of diploma and more than diploma.

**4.2 Correlation Analysis**

Based on the Table 4.2, the result of correlation matrix between each communication practice constructs and conflict management (CM) is analyzed as follow: As per Table 4.2 showed, Open communication channels (OCC), positively related to conflict management (CM) with a Pearson correlation coefficient of 0.301 ( $r=0.301$ ) and significance value 0.002. This significance tells that there is positive relationship between open communication channel and conflict management (CF). The Table also depict that as there is positive association between Formal communication (FC) and conflict management (CM) with a Pearson correlation coefficient of 0.374 ( $r=0.374$ ) significance value 0.05. This significance tells that there is medium effect and positive relationship between formal communication (FC) and conflict management. On the other hand, the Pearson correlation test indicated in the Table 4.2 also showed that there is high effect and positive correlation between Informal communication (IC) and conflict management (CM) with a Pearson correlation coefficient of 0.494 ( $r=0.494$ ) and significance value is 0.000. This significance tells that there is significant association of informal communication and conflict management. As per the Table 4.2, the correlation test conducted between Freedom of act in communication (FAC) and conflict management clearly indicates that there is high and positive relation between the two. The result of correlation coefficient showed 0.517 ( $r=0.517$ ) and significance value is 0.000 which indicates as there is significant relation between them. As Table.1, indicated all the independent variables are positively correlated with the dependent variable at 0.05 level of significant.

**TABLE 4.2: CORRELATION BETWEEN ELEMENTS COMMUNICATION PRACTICE AND CONFLICT MANAGEMENT**

		OCC	FC	IC	FAC	CM
OCC	Pearson Correlation	1				
	Sig. (2-tailed)					
	N	100				
FC	Pearson Correlation	0.301**	1			

	Sig. (2-tailed)	.000				
	N	100	100			
IC	Pearson Correlation	.318**	.306**	1		
	Sig. (2-tailed)	.000	.000			
	N	100	100	100		
	Pearson Correlation	.310**	.330**	.344**	1	
FAC	Sig. (2-tailed)	.000	.000	.000		
	N	100	100	100	100	
CM	Pearson Correlation	.301*	.374*	.494**	.517**	1
	Sig. (2-tailed)	.002	.001	.000	.000	
	N	100	100	100	100	100
**. Correlation is significant at the 0.01 level (2-tailed).						
*. Correlation is significant at the 0.05 level (2-tailed).						

Source: Own survey (2019)

### 4.3 Regression analysis

A Multiple Linear Regression analysis was conducted to investigate the relative influence of each variable on conflict management. In this part, conflict management was regressed against the four variables (Open Communication Channel, Formal communication, Informal communication, and Freedom of act in communication). The results are presented in table 4.3, 4.4 and 4.5 below.

**TABLE 4.3: MODEL SUMMARY**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.696 <sup>a</sup>	.484	.471	.654

a. Predictors: (Constant), Open Communication Channel, Formal communication, Informal communication, and Freedom of act in communication

R defines the relationship among the variables and that should be more than 0.5 and the table result shows that (R=0. 696) which is greater than 0.5 (Bashir, 2017). The magnitude of the adjusted R Square is 0.471. This means that 47.1 percent of the dependent variable (conflict management) can be explained or influenced by the independent variables, while the remaining 52.9 percent is explained by other variables. The model summary result clearly revealed that the model is reasonably fit for further analysis. R<sup>2</sup> values of 0.26 and above are considered substantial as Cohen (1988) discussed cited in (Rahman and Kamarulzaman, 2012).

**TABLE 4.4: ANOVA<sup>A</sup>**

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	62.126	4	15.531	95.390	.000 <sup>b</sup>
	Residual	66.274	96	.428		
	Total	128.400	100			

a. Dependent Variable: conflict management

b. Predictors: (Constant), Open Communication Channel, Formal communication, Informal communication, and Freedom of act in communication

The ANOVA results associated with the model are presented in table 4.4 and shows that F-stat which is used to measure the overall significance of the model is 95.390 and the p-value was 0.000 ( $p < 0.05$ ). This indicates that the overall model was reasonable fit and there was a statistically significant association between communication practice and conflict management.

**TABLE 4.5: REGRESSION COEFFICIENT BETWEEN INDEPENDENT VARIABLES AND DEPENDENT VARIABLE**  
**COEFFICIENTS <sup>A</sup>**

Model	Unstandardized Coefficients		Standardized Coefficients	T	Sig.
	B	Std. Error	Beta		
1 (Constant)	1.754	.285		5.650	.000
Open Communication Channel	.196	.063	.211	3.117	.002
Formal communication	.160	.080	.168	2.004	.003
Informal communication	.156	.078	.162	1.989	.048
Freedom of act in communication	.320	.067	.341	4.742	.000

a. Dependent Variable: conflict management

Source: Own survey, 2019

Table 4.5 above displays the estimates of the multiple regression of conflict management against its variables for the sample of 100 individuals from the corporation. On the basis of the analysis of multiple regression result, it can be said that the relationship between the independent variables (viz. Open Communication Channel, Formal communication, and Freedom of act in communication) and dependent variable (i.e. conflict management) is significant at 5 percent significance level, while informal communication is not significant at 5 percent.

Unstandardized beta coefficients (also known as rate of change) indicated how much the dependent variable varies with an independent variable, when all other independent variables are held constant. Standardized regression coefficients, were used to determine the relative importance of communication practice in predicting conflict management. The beta coefficients indicated that how and to what extent communication practice dimensions influence conflict management. On the basis of the result of multiple linear regression analysis result, multiple regression models can be written as follows;

$$Y_i = 1.754 + 0.211X_1 + 0.168X_2 + 0.162X_3 + 0.341X_4 + 0.05$$

Where,  $Y_i$  is the dependent variable (conflict management),

The value 1.754 is the constant (the value of  $y$  when the value of all independent variables are 0), whereas,  $X_1$ ,  $X_2$ ,  $X_3$ , and  $X_4$  refers Open Communication Channel, Formal communication, Informal communication, and Freedom of act in communication respectively. Finally, the researchers set its confidence level at 95 percent with 5 percent (0.05) error term.

The standardized beta coefficient column shows the contribution that an individual variable makes to the model. The higher the value of beta coefficient shows the great contribution or impact of the independent variable in explaining and predicting the dependent variable. Among

all communication practice constructs, Freedom of act in communication with its beta coefficient value of 0.341 has emerged as the most important construct in predicting conflict management followed by Open Communication Channel, formal communication, and informal communication with beta value of 0.211, 0.168, and 0.162 respectively. Generally, as indicated from the regression result, the researchers identified that all of the proposed communication practice dimensions except informal communication have positive and significant influence on conflict management.

## 5. Conclusions and Future Research Direction

The study sought to examine the effect of communication practice on conflict management. The study findings of correlation analysis showed that all constructs of communication practice (Open Communication Channel, Formal communication, Informal communication, and Freedom of act in communication) were positively and significantly related to conflict management. The findings of the multiple regressions analysis showed that the observed changes in communication practice attributed by the elements of communication practice is 47.1% (adjusted  $r^2 = .471$ ).

This finding of this research shows communication practices significantly affect conflict management of Ethiopian Electric Power Corporation north western regional office. The study also reveals from four major dimensions of communication practices, Open communication Channel, formal communication, and Freedom of act in communication has a positive effect on conflict management, while informal communication doesn't have a significant effect. The results of this study will have important implications and is believed to be helpful for public sectors in Ethiopia. The study recommends that future studies should include more variables from different variables and models as well as additional social issues at macro level.

### ABSTRACT

*New conceptual horizons allow us to revise existing approaches to the analysis of relations between society and the state and analyze them in the context of systemic socio-economic and political processes. Thus, this article pursues two goals: on the one hand, to describe the main approaches and arguments explaining the development of civil society and democracy, and to show their relationship with system theories that describe socio-economic and political processes in various societies; on the other, to analyze the scientific literature and show research prospects. The solution of these problems will make it possible to demonstrate the explanatory power of the concepts of civil society for understanding social processes, as well as determine the factors that influence the development of the phenomenon itself.*

**KEYWORDS:** *Civil Society, Democracy, Social Trust, Interest, Democratization, Theoretical Approaches, Values, Tolerance.*

### INTRODUCTION

The first ideal-typical concept of civil society was described as "a dynamic complex which is characterized by a non-violent, self-organizing, self-assessing tendency and protected by the law of non-governmental institutions in constant problematic relations with each other and with public authorities." [1]. There are different district views and approaches on the context of the emergence of the concept of civil society. As Michael Edwards describes, the concept of civil society has been repeatedly distorted and reinterpreted because of its multifunctionality, its use not only in the scientific environment, but also in the political and social, public spheres [2]. Indeed, during its existence, this concept has become very important not only for researchers and

analysts, but also for politicians, active citizens. Charles Taylor also defined the concept of civil society as follows: “A network of associations that unites citizens on the basis of common interests, is autonomous and relatively independent of the state. The existence and activity of such associations provide an opportunity to influence public policy” [3].

One of the debates about the relationship between civil society and democracy is the thesis that civic associations can both help and hinder its development. Recognizing that civic associations do not always lead to tolerance and participation in public activism, but can create repressive scenarios and support authoritarian regimes, as well as promote clientelism and corruption, was an important step toward eliminating the normative resonance of civil society theory [4]. Researchers cite the collapse of the Weimar Republic as an example, that is, citing hyperinflation in the 1920s and a radical shift in needs and values in society [5]. Another example of the proliferation of civil society organizations, which has not always led to the practice of democratic governance, is Germany in the 1930s, where civil society groups developed during this period could not prevent repression and undemocratic regimes [6]. These findings have led to the development of evidence that a specific context must be taken into account that clearly affects how social capital “works” in different contexts. According to Nord, this or that scenario of the development of civil society depends on a number of external conditions. In general, the researcher distinguishes three factors, the options of which had long-term consequences for the development of civil society in nineteenth-century Europe:

1. The integration of the rural population into urban life during the formation of the national state (in the case of France and the United Kingdom, this played a decisive role);
2. The role of religious communities and churches in the structuring of civic associations (the positive role of Protestantism in socio-economic and political development is highlighted by Max Weber, but the role of other denominations in shaping civic practice is not always the same);
3. The nature of liberal-designed community initiatives and their interactions with parliamentary institutions (primarily connected with political parties) [7].

Hence, the impact of civil society on the political regime depends heavily on the context. If the quality of democratic governance in Patnem's idea is the key to answering the question of the participation of citizens in activities and associations, then the development of his arguments allows to take into account the role of political culture in the formation of democratic values in society.

The phenomenon of civil society is closely related to the perception of citizens of the values of civil, democratic political culture. Discussing the existing theoretical data on the compatibility of democratization and civic political culture, Ronald Inglehart and Christian Weltsel acknowledge that the exact direction of the interaction between these phenomena (phenomena) is not yet clear [8]. At the same time, according to their research, the political culture and values that dominate society have an impact on democracy, but in turn they are shaped by socio-economic conditions. The evidence based on the scholars is that the category of “political culture” is a complex and complicated measurable concept, often used as a residual category. Measuring and evaluating its impact on the development of a society is extremely complex, both methodologically and theoretically. Therefore researchers focus on the concept of value as a more understandable category, distinguishing between two types: survival (survival) and self-expression values. The

relationship between citizens' values and common priorities for political development is unclear. In the case of less developed countries, however, society can separate democratic values on its own. However, the primacy of the values of survival (basic material needs of man) hinders the formation of democratic practice. For example, the survival (survival) values inherent in the majority of the population in relatively poor countries do not allow for the creation and maintenance of democratic practices of citizen participation. On the contrary, the values of self-awareness, self-expression, and demonstration have a positive impact on supporting democratic institutions [9]. Values of self-expression are a complex indicator that includes the following components: 1) the general level of trust between people; 2) level of tolerance; 3) postmaterialistic aspiration to civil and political freedom; 4) civic activism; 5) subjective feeling of well-being. At the same time, the statistical model of Inglehart and Welzel shows that the level of socio-economic development is determined by the priority of one or another value in society, which is ultimately reflected in the practice of civic participation and democratic governance.

It should be noted that the concept of understanding the relationship between social capital, political culture and democracy and civil society according to the Neotokvillian tradition dominates in both Western and Eastern scientific literature, civil society and NGOs (non-governmental non-profit organizations). Theoretical reflection and empirical research allow to form a modern interpretation of the concept of civil society and understand its impact on political and socio-economic processes [10]. That means, it served as a reason for a critical rethinking of the thesis on coordination with the practice of democratic governance and civic participation..

Teda Skocpol's argument for the role of citizens and organizations in the formation of democracy is based on historical institutionalism, which observes associations not as a generator of social trust but as a source of public pressure [11]. According to the American researcher's points of view, a democratic political system is the result of conflicts between different social groups, as well as between the authorities and society [12]. Current social and political disagreements force citizens to unite in order to influence the government to protect their interests [13]. Elites, in turn, mobilize citizens united for common goals to exert political pressure. Civil society institutions and organizations institutionalize channels that influence power, allow lesser-known groups to participate in political decision-making, and oppose unlimited governance [14]. Teda Skocpol and her colleagues point out that civic associations are not a separate organization separated from the government simply because of the individual actions of citizens. According to them, the mass formation of political parties in the first half of the twentieth century coincided with the period of development of civic associations. Government institutions and political parties have undoubtedly exerted their influence on the diversity, codes of conduct and strategy of civic associations. Research shows that the process of electoral mobilization in national elections in the United States encourages citizens to join the activities of volunteer associations [15]. Civic organizations help to activate their members to carry out political actions and law enforcement activities under certain conditions [16]. The result of such activities is membership registration and the growth of organizations that include a wide range of citizens. The institution of equal and free elections has become an important way of structuring existing conflicts and disagreements in society. In the 1950s and 1960s, both elites shifted their focus from collaboration to professional and human rights organizations focused on social services. As a result, the demand for large-scale volunteer movement has declined, leading to a decline in public participation in civic associations. Thus, Skocpol's interpretation provides

an opportunity to explain the qualitative changes in civil society based on the strengths of the political elite. According to Scotcpol's logic, conflicts create civic activism, and their activities lead to the emergence of institutions, and institutions structure these conflicts and ensure equality and protection of interests. Depending on their preferences and elite selection, they are mobilized with the help of social groups or mass political parties and trade unions, or human rights organizations.

Nancy Bermeo explains in her book that since the 1970s, civil society has been seen as a positive component of democratic governance. The development of concepts of interest groups, class associations, and popular organizations have demonstrated their uncertain role [17]. At the same time, Juan Linz, a scholar who studies the change of political regimes, considers the close relationship between the ruling elites and the organized groups of citizens problematic, as overly active civil society often leads to instability in the democratic era [18]. First of all, the relationship of political parties with labor movements, trade unions and religious organizations does not contribute to the sustainable functioning of institutions, as existing social conflicts have a political dimension. Researchers such as Martin Lipset and Giovanni Sartori have also highlighted the role of political parties as important institutions in ensuring that citizens interact with the state in support of democracy. The ability of civil society to structure social conflicts is crucial because an institutionalized, politically mobilized, divided society poses a threat to democracy [19].

Some studies show that the participation of similar citizens in public (non-profit) organizations does not affect the quality of political institutions, and in many cases can be the opposite. Sheri Berman believes that political institutionalization determines at the national level whether public participation is used in civil (democratic) or non-citizen practices [20]. Strong political institutions have the ability to resolve and structure existing contradictions in society [21], they direct citizens to achieve long-term goals, not short-term ones. Political stability and transparent rules of the game (rule of law and security of private property) guide citizens to perform tasks within the existing system. The lack of such stability leads to civil society becoming an alternative to politics for a citizen who is dissatisfied with the current situation. A number of researchers agree that the results of civic activism depend on the state's ability to meet public demands and the nature of the political community [22].

The theory of noncorporateism, which sheds light on the interactions between interest groups and the state, has shown that the role of the state is key in resolving social conflicts, creating platforms for dialogue, and developing certain communities. In particular, the experience of the Scandinavian countries shows that the leading role of the state in resolving disputes between employers (trade unions) and trade unions is to take into account and agree on the views of these two leading stakeholders in shaping the political direction will help achieve stability in the development of the society.

Philip Schmitter, one of the leaders in the theory of necorporatism, defines this as a system of interaction and representation of interests, a special ideal-typical agreement that provides communication between decision-makers, associative stakeholders of civil society and the authorities [23]. There is a much broader definition to the concept of civil society, which is all the associations in society, which are not part of the state, and thus include themselves in business systems and civil society organizations. Schmitter prefers to describe noncorporateism

as a system of interaction of interests. First of all, he doubts the ability of formal associations to express the demands of their members, as he believes that this may not be a task of great importance to them [24].

Based on this interpretation, some researchers extend it to a system of political participation, in which citizens delegate their rights to the leaders of organized and centralized groups [25]. In this sense, non-corporate systems are representative bodies use forms that compensate for the protection of interests by political parties and parliament. Sometimes the emergence of non-corporate systems interaction is associated with the inability of political institutions (political parties and parliaments) to resolve existing social conflicts in society. Therefore, the government should always rely on the “most reliable” ways to reach an agreement [26]. One of these ways is used to create non-corporate areas.

Schmitter links the systematic involvement of stakeholders in the decision-making process at the national level to the development of capitalist society [27]. Consideration of the advantages of socio-economic stakeholder groups in the interaction as an object of research has left its mark on the methodology and basic principles of the theory of corporateism. The scope of researchers' interests here includes tax and socio-economic policies in which the state has a serious interest. In addition, interaction or activity agents are often large business systems and trade unions that have significant resources and can influence the state apparatus. Therefore, it is necessary to take into account the specifics of non-profit organizations that can behave as interest groups, unite citizens for common goals, and influence the existing political path using certain methods. Scholars acknowledge that noncorporate groups have been severely negated in noncorporate analysis [28]. Annette Tsemmer's scientific work also emphasizes that this concept can be very useful in some countries to shed light on the specific interactions between society and the state. In the example of Germany, we see that large associations and citizens of non-profit organizations are integrated into the process of political decision-making and implementation.

One of the scholars who developed this theory was Klaus Offe, who defined corporateism as a system of political participation in which the right of citizens to participate in political processes was divided into centralized group leaders [29]. To describe the relationship between the state and stakeholders, Offe proposes the concept of public prestige (status). This status includes many aspects:

1. Representation system is provided with state resources;
2. State regulation of the range of stakeholders;
3. Formal regulation of the relationship between members of the organization and its representatives.
4. The right of associations interested in the formation and implementation of political directions to act within the legal system [30].

One of the important developments of this theory is the elucidation of two models of noncorporateism, i.e. there is a system of stakeholders who may or may not be able to advance an independent political agenda independently of the state, depending on the state of the organization management system. The point is that “bottom-up” associations with a hierarchical system of governance can advance relatively independent requirements set by stakeholder members. Such a model is called “liberal” corporateism. In contrast, the “state” model of

corporateism is characterized by the state's control over the system of interest representation and the inability of interest groups to maintain a relatively independent agenda. This is mainly due to the weakness of the organizational system and the lack of mechanisms for the involvement of stakeholders in the governing bodies. These models make it possible to distinguish significant differences between systems based on stakeholder representations.

In conclusion, it should be noted that noncorporateism explains a special type of interaction between stakeholders and the state, demonstrating its ability to resolve and stabilize existing social conflicts. In such a relationship, the state plays a crucial role in shaping the political direction, in which it limits the influence of interest groups only to recognized and significant (from his point of view) associations. Under certain circumstances, when it is not possible to reach an agreement without state intervention, this allows the interests of the latter to be taken into account. Thus, in non-corporateism, the leading and regulatory role of the state is necessary for some communities to form a political agenda that takes into account the interests of the main stakeholders in society.

In general, research by stakeholders shows that their specific activism may counteract the effective functioning of the market and the state [31]. Non-transparent, non-competitive cooperation of interest groups with representatives of the ruling class leads to the formation of redistributed alliances, coalitions, which take advantage of the close interaction that has arisen, preventing the reform of similar practices. Of course, the socio-political context plays an important role in creating such relationships.

Research in this area suggests that it is the characteristics of the existing political regime and the degree of transparency of the political decision-making process that determine the nature of civic associations, their values and the results of collective action [32]. In particular, economic inequality, the selectivity of application law, and social conflicts affect social capital options [33]. The example of transition to democracy and return shows that in Eastern Europe and Latin America, attempts by a repressive political regime to influence civil society are inevitably denied [34]. Thus, the strength and viability of civic associations depends directly on the ability of political institutions and the government to exercise the rule of law [35]. It is the guaranteed legal norms that ensure the predictability of social interactions and their transparency, which, in turn, leads to the formation of general social trust. Such accumulated social capital is, as researchers point out, the state's ability to guarantee the rule of law [36].

The debate over the role of civil society in the democratization of the political system can also be seen as a result of political reflection on the political system of the European Union. Its critics question whether the bureaucracy and the expert community are capable of providing effective governance if they have weak traditional institutions of representation and civic participation mechanisms in political decision-making. Theoretically, the role of civil society in activating good governance is related to the fact that it is civil society associations that are able to represent the truly important interests of society and report important issues [37]. It means this important information function that has enabled the EU to be able to propose optimal management decisions and monitor their implementation. The informational and representative functions of NGOs, as well as their ability to provide social services, were recognized by various structural units of the European Commission [38].

On the one hand, in the context of the lack of democratic legislation of the national institutions of the European Union (EU), the improvement of interaction with civil society organizations for EU institutions should help to create a democratic practice of involving civil society organizations. On the other hand, the interaction with civil society is aimed at improving management efficiency by involving civil society organizations in the process of developing policy documents.

Expansion of the practice of participation of NGOs in EU programs required European officials to regulate the categories of existing organizational and legal forms. At the same time, the European Commission adopted the following division of non-profit organizations: service providing NGOs help to provide social services; "Advocacy NGOs" represent the interests of sections of society, designed to influence government policy and public opinion. Of course, both activities belong to all organizations to one degree or another. European countries use different criteria to describe NGOs whose main area of activity is socially useful activities.

The European Commission is concerned with providing representation to improve its interaction with civil society organizations. For this purpose, the strategy of non-profit organizations to create and implement pan-European associations (so-called umbrella organizations and associations) was selected. To a series of such organizations CONCORD and the European Environmental Bureau were initially 100% sponsored by the European Commission [39]. The amount and order of funding will vary depending on the purpose and involvement in the NGO. Thus, it is a support system that includes long-term (5-6 years) administrative costs, and organizations such as the European Youth Forum and the European Women's Lobby are open. The EU represents the organizations of all member states.

From the pluralistic position of the theory of democracy, understanding the experience of the European Union, Robert Dahl argues that the citizens of Western European countries are confronted with a problem (dilemma). On the one hand, a national government that is accountable to its citizens may not always be effective, which is prone to populism after the election, and tends to change its political course. On the other hand, the EU's professional paperwork (bureaucracy), capable of effective governance, does not adequately account to the public. This dilemma is relevant not only for the EU, but also for all modern political systems, in which society and the economy are subject to external influences that are difficult to control, such as the global economy and world politics [40].

The debate over how to ensure the participation of citizens in non-democratic national institutions has aroused interest in the concept of public participation within the theories of deliberative democracy and participatory democracy, in which civil society has a special role to play. These integrative concepts of democracy are supposedly aligned with Gegel and Montesquieu's notions of high-level civil society. The deliberative concept of democracy considers the relationship between the political process of decision-making and public debate [41]. This area prepares the ground for a debate on issues such as government and decision-making requirements. The collective discussions help to bring important issues to the attention of decision-makers, who act by justifying themselves by proving as they are in the "common interest".

## SOCIO PRAGMATIC ASPECTS OF THE OCCURRENCE OF METAPHORS IN THE WORKS OF CHARLOTTE BRONTE

Ulugova Shohida Shohruhovna\*

\*Doctoral Student,

UZBEKISTAN

### ABSTRACT

*The article explores how the formation of metaphors in a specific communication environment is based on cognitive practices and, in general, on the main causes of metaphorical creativity. The article observed that the social environment of communicants plays an important role in choosing a metaphor. Indeed, it is difficult to imagine the manifestation of the process of linguistic thinking not justified for certain reasons. The literature on cognitive linguistics refers to the practice of generalizing and using one's own experience in metaphorical thinking and speech. However, such an interpretation can only lead to a partial understanding of the nature of the metaphor. It is worth noting that the formation of contextual requirements and conditions is not only a metaphor, but also a key feature that determines the essence of other linguistic phenomena.*

### INTRODUCTION

Metaphor is created by a specific person, in exact, the author or the subject of the speech. This process is interpreted directly as a product of the creativity of linguistic thinking, as an example of the conceptualization of reality and linguistic realization in cognitive linguistics. Indeed, Kovech stated that at the same time, this creative activity involves the formation of a metaphor and attempts to use it for expression of thought [Kövecses, 2010]. Such kind of broad approach allows for a study focused on the creation of a metaphor, and for a separate or specific analysis of some aspects of it also.

Particularly, the metaphorical structures, which were activated in the text of the novel "Jane Eyre" are the product of efforts to rework and create one or another type of conceptual metaphors. Thus, even though many of them are as a consequence of conceptual comparisons appeared urgently such as "knowing is seeing" (bilmoqko'rmoqdemakdir), "events are action" (voqeafaoliyatnatijasidir), "emotion is force" (hissiyotkuchdir), others are based on conclusions from familiar everyday experiences such as "life is a journey" (hayotsayohatdir), "a life time is a day" (tiriklikkuningo'tishidir), and "people are plants" (odamlaro'simlikkao'xshaydi). That is why, the goal isto observe what cognitive actions they rely on the formation of metaphors in a particular communication environment and what reasons underlie metaphorical creativity in general in this part of our work. It is difficult to imaginelinguistic mentality process would in any way be spontaneous, without cause and without basis.

According to the literature on cognitive linguistics, when a person thinks and speaks metaphorically, he refers to the practice of generalizing and using his own experience. However, such an interpretation might lead to a partial understanding of the nature of phenomenon "metaphor". According to Z. Kovech's viewpoint, it is not possible to contradict that core reasons of metaphorical thinking are in most cases related to context [Kövecses 2006; Kövecses 2010]. It should be stressed that the formation on the basis of the context's requirements and conditions is not only key feature that determines a metaphor, but also the essence of other linguistic phenomena. In addition, Z. Kovech and his followers came to this conclusion while analyzing material collected from various resources. We try to explain the aspects of metaphor formation in relation to the context of the text, the statement of reality, by referring to the Charlotte Bronte creative works.

While describing the concept of 'context', linguists often refer to the linguistic framework, taking this or that unit, in conjunction with any other unit, coming side by side into account. Such kind of approach is even reflected in dictionaries about linguistic terms. To illustrate, the linguistic siege is dominant in all four meanings of the definition of the term "context" according to the dictionary compiled by David Crystal [Crystal 2005: 108-109]. Indeed, it difficult for linguists, who emphasize the importance of context for semantic expression, to move away from the rules defining the specific features of a language system, the functions that its units perform. However, especially, in the analysis of speech structures, identifying their communicative content, it is necessary to take into account, its transition situation, the relationship between the interlocutors, the genre of the text, as well as taking into account socio-cultural indicators in addition to the previous and subsequent structures. American scholar Bronislaw Malinowski in his time suggested that the term "cultural context"(madaniykontekst) which was brought in by him is important with the environment in which communication takes place [see Swann and others 2004: 50]. In the same way, the concept of "context of situation" (vaziyatkonteksti) describes the state of speech activity, that is, what speech actions participants perform in a given situation. According to J.Martin, "culture can be described with actions that can be understandable to everyone" [Martin 2001: 156].

So, besides being connected with social and cultural environment, the concept of context is considered in relation not only to, but also to the natural-physical environment. The environment or surroundings are based on geographical basis, covering the surrounding landscape, fauna, flora, habitat, and so on, and the speaker has his or her own outlook on them. The objects, which have their own place in the linguistic scenery of the world, are reflected in a certain language and

in the mind of each interlocutor. It is inevitable that diversity in the environment affects the linguistic occurrence of concepts formed in thinking. The reason is that human activity is related to the characteristics of the environment.

Usually, the geographical, biological-physical environment around people who communicate in a particular language is understood the content of the environment or the natural environment is talked about. It is predictable that there will be differences in the natural environment in which people of different nationalities live, and people will involuntarily adapt such kind of environment. It is obvious that such adaptation is also reflected in their communication. The ability to form metaphors is not the same among individuals living in different languages and in different environments, including creators. Let us provide the example from the following passage from Jane Eyre's novel:

*Reader, do you know, as I do, what terror those cold people can put into the ice of their questions? How much of the fall of the avalanche is in their anger? Of the breaking up of the frozen sea in their displeasure? The avalanche had shaken and slid a little forward, but it did not yet crash down.* [Chapter 35, 396].

This pattern is Jane's very emotional response to St. John Rivers, the reason is that St. John had begun to treat him coldly, as he received a rejection of his offer. In the passage, the leading conceptual metaphors should be defined as "EMOTION IS SUBSTANCE, EVENTS ARE ACTIONS, RATIONAL IS COLD".

Here, source domain (tayanchhududi) of metaphorical change such as ice (muz), fall of avalanche (muzko'chkisi), breaking up the frozen sea (dengizmuzqatlaminingyorilishi) move to another place and serve to express the meanings of cold attitude, anger, protest. As a result, the reader of the novel believes in St. John River's being really upset.

The phrase in the opening part of the passage "*the ice of question*" came as the result of a metaphorical conceptualization of St. John Rivers 'cold and indifferent attitude toward Jane. This metaphor reflects the human psyche partially, as the ice is a cold thing and the unpleasant and rude actions of one of the speaker affect the other one. Here, the conceptual connection between ice and emotion happens.

Similarly, the compositions like "*fall of the avalanche is in their anger*" and "*breaking up of the frozen sea in their displeasure*" are as the result of the development of the metaphor "EMOTION IS FORCE". The writer encourages the reader to feel reality differently by means of developing an individual member of a pre-existing source in an unusual method. In this case, the concept of "power" (kuch) is realized in a exclusive way through the concepts of "*fall of the avalanche*" and "*the breaking up of the frozen sea*". It becomes a means of clearly transmission to the reader the anger and resentment towards the interlocutor in its turn.

However, knowing the reason for choosing such source areas is important. As mentioned above, the means by which metaphor is formed are not based on the human psyche, but also the role of a specific environment or environment in it is also vital. As the natural, physical environment changes, the process of selecting the intended source will differ. It is definite that England is an island and its nature is unique. Of course, Jane's metaphorical creativity adapts to this very environment as she lives on this island, and it is natural for her to refer to the environment she is familiar with to express negative emotions, such as the ocean, the sea, the ice avalanche. In order

to understand the impact of the environment on metaphorical choice better, the metaphorical abilities of those living in another environment can be compared. For instance, it is hard to imagine that a representative of the Uzbek nation would choose such concepts as "frozen sea" and "ice avalanche" as a source for comparison in the situation above.

Let us analyze another passage from the novel:

*A ridge of lighted heath, alive, glancing, devouring, would have been a great emblem of my mind when I accused and menaced Mrs. Reed: the same ridge, black and blasted after the flames are dead, would have represented as meetly my subsequent condition, when half-an-hour's silence and reflection had shown me the madness of my conduct, and the dreariness of my hated and hating position* [Chapter 4, 31].

In this passage, Jane's rage is taken as a target during the assimilation of the conceptual metaphor "ANGER IS FIRE," which is likened to fire. Thus, his mental state is reminiscent of the peak of a blazing fire that ignites an alternative and angry passion for the endless desert. Here, the fire first begins to burn slowly, and the description of this condition with the word "alive" (tirik) is a metaphorical expression of the birth of a feeling of anger, which demonstrates the reality. After several time, the fire burns vigorously, and the use of the word "glancing" indicates that the anger is increasing. Eventually, the fire rockets completely out of control, and the use of the unit "devouring" (yamlamoq, komigatortmoq) is an example of the metaphorical conceptualization of the states of outrage and explosion. The combination of "black and blasted", which is one of these metaphorical structures, indicates that after the fire, the character experiences depression after anger in the image of the situation.

The conceptual metaphor of "ANGER IS FIRE" mentioned by Jane, precisely, by her prototype Ch. Bronte, reflects the natural environment and conditions which she had. Haworth, where the Bronte family lived, is located in the Worth Valley in the middle of pastures in Pennin. The pastures are as endless as the steppe. According to L. Miller, the American literary critic and who studied the works of Charlotte Bronte, Haworth is the place which "has the appearance of a legendary shrine and is a romantic space in the middle of an endless pasture where the wind blows without stop" [Miller 2003: 40]. Other writers have also emphasized the magical power of this place, which inspired the family of Bronte. Emily Bronte's novel "Wuthering Height" is an example of this. The events described in this novel, which tells the story of a relationship between a lady named Catherine (Katerin) and a man named Heathcliffe (Hitkliff), occurred in pastures and bogs near Haworth.

In another type of natural environmental context, the direct material environment the situation in which the event or conversation takes place takes the lead. As Z. Kovech stated, material events not only create an environment for objects to live, but also affect the actions of mind. Besides, the poet or writer can describe the nature, the environment around there, and use that environment as a conceptual source [Kövecses, 2010]. However, it is also noticeable that the surrounding natural environment serves as a target for metaphorical transmission sometimes. As an example of this, use of the natural-material context can be seen in the following situation:

*The thought of Mrs. O'Gall and Bitternutt Lodge struck cold to my heart; and colder the thought of all the brine and foam, destined, as it seemed, to rush between me and the master at whose side I now walked, and coldest the remembrance of the wider ocean – wealth, caste, custom intervened between me and what I naturally and inevitably loved* [Chapter 23, 239].

The interest and uncertainty about Jane's feelings encourage Edward Rochester to look for a way to persuade Jane to tell the reality. Suddenly, he tells her that he will soon marry Miss Blanche Ingram and Jane has decided what she will do in the future that she will go to Iceland and bring O.Gall's offspring up. Ireland is separated by the sea from the UK, and this context helps to activate the frame of ocean, and let Jane talk about the barrier of wealth and castle (tabaqato'sig'i), the barrier stood between Jane and Rochester.

According to our opinion, on the basis of the phrase "intervene between" in the text, the conceptual metaphor "SOCIAL GAP IS PHYSICAL DISTANCE AND BARRIER" is activated within the frame above. In this place, the concepts, which act as a source, "distance" (masofa) and "barrier" (to'siq), are developed using the concept of "vast ocean" (bepoyonokean). Through applying such a linguistic reasoning practice, it is associated with the material environment mentioned during the conversation and encourages the speaker to choose a metaphorical expression appropriate to that environment.

The role of socio-cultural factors in the formation of nominative and communicative units is at the center of researchers' attention [Rezanova 2003: 41]. of Non-verbal social factors includes the nationality, age, level of education, position in the community, profession of communicants. According to the literature on sociolinguistics and pragmalinguistics, much information has been provided on the role that these indicators play in the environment of communication.

According to psycholinguist V.P. Belyanin, "Worldview, which is reflected in the literary text, is the result of the author's perception of the world as a separate person and his linguistic realization" [Belyanin 2000: 55]. If we consider any individual to belong to a particular group, it must be agreed that the gender factor is also an integral part of the social context. According to N.Z. Nasrullaeva, who stressed that gender is manifested as a phenomenon that arises at the meeting of cultural, psychological, social norms, "the concept of gender has a social character, which reflects the occurrence of male and female stereotypes" [Nasrullaeva 2018: 28].

Linguists stressed that the linguistic actions and speech activities of men and women are not always compatible, and that their ability to create metaphors and use them in discursive activities is no exception also. Stanley Brandes's book "Metaphors of Masculinity" can be a striking example of this. Being familiar with the examples of oral creations prevalent in the Spanish province of Andalusia, the author states that one of the main aspirations of the male members of the indigenous population is to know in what respects they are similar to or different from females. Reference to examples of folklore, especially the metaphors they contain is one of the ways to achieve [Brandes 1992: 8].

There are also differences in the metaphorical abilities of men and women in the material that we have collected:

a) *The water stood in my eyes to hear this avowal of his dependence; just as if a royal eagle, chained to a perch, should be forced to entreat a sparrow to become its purveyor. But I would not be lachrymose: I dashed off the salt drops, and busied myself with preparing breakfast* [Chapter 37, 423].

b) *"I am no better than the old lightning-struck chestnut-tree in Thorn field orchard, - he remarked ere long. "And what right would that ruin have to bid a budding woodbine cover its decay with freshness?"*

*"You are no ruin, sir—no lightning-struck tree: you are green and vigorous. Plants will grow about your roots, whether you ask them or not, because they take delight in your bountiful shadow; and as they grow they will lean towards you, and wind round you, because your strength offers them so safe a prop"* [Chapter 37, 428].

It is visible that the metaphors of likening animals and plants are becoming more active in the above passages. While Rochester compares Jane to lamb, bird, skylark, flower, woodbine (qo'zichiq, qush, to'rg'ay, gul, beshbargli), he compares himself to a shepherd or a chestnut tree. The metaphors used in Jane's answer have a different source. She gave Rochester the qualities of an eagle and a tree while keeping the resemblance of a sparrow (sparrow) and a flower (woodbine) to herself. The appearance of such metaphors suggests that the social status of men and women in society is assessed variously. In other words, the delicate nature of women shifts to the imagination of them, to the scope of perception. In its turn, it is reflected in the process of conceptualizing the worldview through metaphor.

As we use metaphors in our speech activities, we try to adapt them to the social circumstances in which we communicate. It is stated that the social environment has a different look, this environment covers the relationship between the interlocutors, the norms of intimacy, and extends to the gender status of individuals interacting in different social conditions. We should also not forget that these social relations can be manifested in direct and indirect contexts.

Mainly, the impact of the direct social environment on the choice of metaphor is observed in the context of oral communication and is less common in literary texts. In Z. Kovech's article, there is an example from "USA TODAY" newspaper. The newspaper published an article about the famous musician Fats Domino, who lived in the flooded New Orleans, and the description to Domino was given in a such way: *"The rock'n'roll pioneer rebuilds his life- and on the new album 'Goin' Home' his timeless music"* [USA Today, 2007, September 7]. Z. Kovech regards the metaphor *"rebuilds his life"* as a symbol of the development of the conceptual metaphor "LIFE IS A BUILDING". According to the scientist, the reason why the conceptual basis is exactly this semantic analogy can be attributed to the fact that, Domino was rebuilding his house destroyed during the 2005 hurricane during the dialogue [Kövecses 2010: 683].

If Z. Kovech's comment is believed, we have to admit that the social situation, that is, the reconstruction of the house, the metaphor "LIFE IS A BUILDING" served as a conceptual basis for the development of a new metaphor.

Let us illustrate the place of the direct social environment in the choice of metaphor; here is an example from the novel "Jane Eyre":

*The forehead declares, Reasons sits firm and holds the reins, and she will not let the fillings burst away and hurry her to wild chasms* [Chapter 19, 190].

We see that the figurative expression is built around the central conceptual metaphor "EMOTION IS A CAPTIVE ANIMAL" here. The content of the metaphorical structure is trying to control emotion is equal to the animal control in the coverage. The metaphorical conceptualization of the concept of "encircled horse" (more precisely - "wild horse") is directly related to the environment. It is known that the events described in the novel took place in Britain in 19<sup>th</sup> century, and the main means of transport in this country was a horse-drawn carriage at that time. The same animal motivated Rochester to think metaphorically.

While predicting the future of her interlocutor Jane, Rochester, whose behavior resembles that of a fortune-telling gypsy woman, urged her to speak openly about her feelings. Rochester aimed at grasping the true nature of Jane's independent, confident and determined character through the use of a horse-riding frame model. On the other hand, Jane prefers to see herself in rational control rather than giving in to feeling. Such wisdom is metaphorically likened to a chariot driven by a horse. The task of the chariot driver is to control the movements of the horse, which is showing violent behavior. If the horse gets out of control, it will drag the cart into risk. The formation of such quality metaphor is directly based on the environment, and also to the characteristics of the speaker, Rochester as well. It is known that this person, who is one of the main characters of the novel, is one of the aristocrats who has enough belongings. Wealthy aristocrats spent a lot of time relaxing, riding horses and having a rest. Consequently, the choice of this metaphor is natural and appropriate to the conditions.

### ABSTRACT

*The article is referred with the analysis of the content of activities for the development of land property. The projects implementation of land use planning and management is extremely relevant nowadays. The concept of "Land Development" is substantiated, the content of activities for the integrated development and development of large land properties is analyzed, the main problems and prospects for the development of this area are considered. The prospect of land-development is related not only with the development of the territory, but also with creation of laws and regulations on nature protection issues. It will help to improve the current situation in this area, as well as to prevent other possible problems.*

**KEYWORDS:** *Land-Development, Land Market, Investment And Construction Complex Investment Project, Land Property, Development Project, Development, Complex Development,*

### INTRODUCTION

The relevance of the chosen topic is due to the fact that the development of land assets is one of the most important areas of development. Land acts as the primary property and is part of the property complex of any building and structure. For many years in Uzbekistan there was no legal and economic base, which was necessary for the development of activities for the integrated development and development of land plots. However, in recent years, basic regulations have been developed that allow for the implementation of land development in the form that corresponds to established market relations.

To date, the development of land has become so relevant that it has formed as a separate professional area, called Land Development. Land development has become widespread, both in Uzbekistan and abroad. In this article, we considered such terms as Land development which represent the development of land plots.

The term “land” is supposed to be understood not in the usual everyday sense, but in the legal sense, which implies understanding the term “land” as an object of economic relations. This term in legal terminology is understood as a plot of the earth’s surface that has the ability to be an object of ownership, in conjunction with everything that is attached to it by nature or human labor. Land is an integral part of any property, and moreover, is the primary property. The land as well as the building undergoes fundamental changes in order to increase value. Land transformations can occur both within the framework of a development project to create or change a real estate object, and as part of an independent project aimed at changing the land plot. It is such projects that include the development of land, which is called Land Development. The Russian scientist Anatoly Nikolaevich Asaul in his writings characterized land development as an activity that is aimed at increasing the liquidity and investment attractiveness of land [1].

Under land development in foreign practice, it is customary to understand the type of investment business, the essence of which is to perform several successive stages:

1. Acquisition of land
2. Land development in order to increase market value
3. Preparation of the project for the targeted use of the land
4. Sale of the project to an investor who is ready to begin construction.

As in any other development project, in land development the main task is to increase the profitability of the project and reduce risks [2, p. 459]. All the tasks presented above are aimed at achieving these goals. For example, market analysis and land selection should be carefully conducted to select the most attractive property in which to invest and to develop a concept that will bring high profits with minimal risk. And most importantly, such a project should be in demand on the market. Kamenetsky Yu.V. believed that when developing the concept of a project for integrated development of the territory, it is necessary to take into account real solvent demand, otherwise such a project and the efforts of all project participants will be in vain [3, p. 251]. Justification of the necessary investments is also a very important stage, since already at the stage of project development, it is important to determine the feasibility of investing and the effectiveness of the project as a whole. As for the legal development of the land plot, these measures are aimed to a greater extent to reduce risks. These activities include such works as: registration of property rights to the land plot, change of the purpose of the plot, permitted use, work on land surveying and zoning of land plots, allocation of land and other works. The stage of design and engineering and technological development of the land plot is aimed at increasing the efficiency of land use and increasing its market value. The implementation of each of the tasks of Land Development increases the final cost of the land.

According to world practice, in many developed countries and cities the creation of the necessary infrastructure and engineering preparation of the land lies with the state. As a result of this, it most often turns out that the infrastructure is incomplete or when constructing facilities, outdated technologies and materials are used, since investors are not ready to invest heavily in non-

profitable facilities. The most rational solution in this situation is the concept of public-private partnership. This concept is widely used abroad. PPP is a kind of union between the state and an investor, businessman or developer in order to create projects that are of great importance to the state. The prospect of developing land development should be connected with the integrated development of the territory and the creation of a regulatory framework governing relations in this area, only after these changes are improvements in this area possible and the existing problems will not be easier to solve, they will not even be formed and to pile up. To implement these projects, it is necessary to create conditions under which the interaction of municipal authorities and developers (developers and project initiators) will be most optimal.

Today, there are many problems in land management due to the lack of inter-municipal coherence and interest in solving both general and private issues of land use in urban districts and municipal areas. One of the main problems is the problem of the practical impossibility of expanding the boundaries of an urban settlement or urban district in cases where the territory requires the consent of an adjacent municipal entity to seize their land, and even in cases where this does not affect the interests of other municipalities, the procedure itself expanding borders is quite complicated and time consuming. Another important problem in land management during the implementation of promising investment projects of regional significance in the inter-settlement territories is the lack of a consistent organized process of selection and registration of land plots, as well as poor activity in the selection and provision of land from the forest and water resources for the implementation of tourist and recreational areas.

The article is devoted to the analysis of activities on the integrated development of large land plots. The purpose of this scientific research was to analyze the activities on the integrated development of large land plots, to consider the main problems and prospects for the development of Land Development, and to develop mechanisms and tools to improve the efficiency of project management for the integrated development and development of large plots.

After analyzing the experience of implementing integrated development projects, examining the scientific and methodological literature and regulatory legal acts in the field of integrated development projects, we came to the conclusion that the concept of integrated development of the territory should be clarified in terms of the goals of this process. Integrated development of the territory is considered as an activity involving the implementation of all development tasks, including the preparation of documentation for the planning of the territory, preparation of land for construction, design and construction of residential, commercial, social, engineering and transport infrastructure and other development tasks, in order to create complex development, combining a complete set of real estate needed for a comfortable stay.

As a tool to improve the efficiency of project management for integrated development and development of large areas, we have developed a classification of integrated development projects for the territory, which structures all existing integrated development projects, highlighting the main characteristics of such projects. The presence of a carefully thought-out classification serves to improve the information exchange between the participants of the investment and construction complex and gives a clear understanding of the diversity of such projects. We also proposed several activities that contribute to improving the management and implementation of integrated development projects.

### ABSTRACT

*We'll use the term access control as an umbrella for any security issues related to access of system resources. Within this broad definition, there are two areas of primary interest, namely, authentication and authorization.*

**KEYWORDS:** *Biometrics, Universal, Collectable, Authenticate, Fingerprints.*

### INTRODUCTION

Biometrics represent the “something you are” method of authentication or, as Schneier so aptly puts it, “you are your key” [1]. There are many different types of biometrics, including such long-established methods as fingerprints. Recently, biometrics based on speech recognition, gait (walking) recognition, and even a digital doggie (odor recognition) have been developed. Biometrics are currently a very active topic for research [2, 3].

In the information security arena, biometrics are seen as a more secure alternative to passwords. For biometrics to be a practical replacement for passwords, cheap and reliable systems are needed. Today, usable biometric systems exist, including laptops using thumbprint authentication, palm print systems for secure entry into restricted facilities, the use of fingerprints to unlock car doors, and so on. But given the potential of biometrics—and the well-known weaknesses of password-based authentication—it's perhaps surprising that biometrics are not more widely used.

An ideal biometric would satisfy all of the following:

- Universal — A biometric should apply to virtually everyone. In reality, no biometric applies to everyone. For example, a small percentage of people do not have readable fingerprints.
- Distinguishing — A biometric should distinguish with virtual certainty. In reality, we can't hope for 100% certainty, although, in theory, some methods can distinguish with very low error rates.

- Permanent — Ideally, the physical characteristic being measured should never change. In practice, it's sufficient if the characteristic remains stable over a reasonably long period of time.
- Collectable — The physical characteristic should be easy to collect without any potential to cause harm to the subject. In practice, collectability often depends heavily on whether the subject is cooperative or not.
- Reliable, robust, and user-friendly — these are just some of the additional real-world considerations for a practical biometric system. Some biometrics that have shown promise in laboratory conditions have subsequently failed to deliver similar performance in practice.

Biometrics are also applied in various *identification* problems. In the identification problem we are trying to answer the question “Who are you?,” while for the authorization problem, we want to answer the question, “Are you who you say you are?” That is, in identification, the goal is to identify the subject from a list of many possible subjects. This occurs, for example, when a suspicious fingerprint from a crime scene is sent to the FBI fingerprint database for comparison with all of the millions of fingerprint records currently on file.

In the identification problem, the comparison is one-to-many whereas for authentication, the comparison is one-to-one. For example, if someone claiming to be Alice uses a thumbprint mouse biometric, the captured thumbprint image is only compared with the stored thumbprint of Alice. The identification problem is inherently more difficult and subject to a much higher error rate due to the larger number of comparisons that must be made. That is, each comparison carries with it a probability of an error, so the more comparisons required, the higher the error rate.

There are two phases to a biometric system. First, there is an enrollment phase, where subjects have their biometric information gathered and entered into a database. Typically, during this phase very careful measurement of the pertinent physical information is required. Since this is one-time work (per subject), it's acceptable if the process is slow and multiple measurements are required. In some fielded systems, enrollment has proven to be a weak point since it may be difficult to obtain results that are comparable to those obtained under laboratory conditions.

The second phase in a biometric system is the recognition phase. This occurs when the biometric detection system is used in practice to determine whether (for the authentication problem) to authenticate the user or not. This phase must be quick, simple, and accurate.

We'll assume that subjects are cooperative, that is, they're willing to have the appropriate physical characteristic measured. This is a reasonable assumption in the authentication case, since authentication is generally required for access to certain information resources or for entry into an otherwise restricted area.

For the identification problem, it is often the case that subjects are uncooperative. For example, consider a facial recognition system used for identification. Las Vegas casinos use such systems to detect known cheaters as they attempt to enter a casino [4]. Another fanciful proposed use of facial recognition is to spot terrorists in airports.<sup>1</sup> In such cases, the enrollment conditions may be far from ideal, and in the recognition phase, the subjects are certainly uncooperative as they likely do everything possible to avoid detection. Of course, uncooperative subjects can only serve to make the underlying biometric problem more difficult. For the remainder of this

discussion we'll focus on the authentication problem and we'll assume that the subjects are cooperative.

### Types of Errors

There are two types of errors that can occur in biometric recognition. Suppose Bob poses as Alice and the system mistakenly authenticates Bob as Alice. The rate at which such misauthentication occurs is the *fraud rate*. Now suppose that Alice tries to authenticate as herself, but the system fails to authenticate her. The rate at which this type of error occurs is the *insult rate* [5].

For any biometric, we can decrease the fraud or insult rate at the expense of the other. For example, if we require a 99% voiceprint match, then we can obtain a low fraud rate, but the insult rate will be high, since a speaker's voice will naturally change slightly from time to time. On the other hand, if we set the threshold at a 30% voiceprint match, the the fraud rate will likely be high, but the system will have a low insult rate.

The *equal error rate* is the rate for which the fraud and insult rates are the same. That is, the parameters of the system are adjusted until the fraud rate and insult rate are precisely in balance. This is a useful measure for comparing different biometric systems.

### Biometric Examples

In this section, we'll briefly discuss three common biometrics. First, we'll consider fingerprints, which, in spite of their long history, are relative newcomers in computing applications. Then we'll discuss palm prints and iris scans.

#### Fingerprints

Fingerprints were used in ancient China as a form of signature, and they have served a similar purpose at other times in history. But the use of fingerprints as a scientific form of identification is a much more recent phenomenon.

A significant analysis of fingerprints occurred in 1798 when J. C. Mayer suggested that fingerprints might be unique. In 1823, Johannes Evangelist Purkinje discussed nine fingerprint patterns, but this work was a biological treatise and did not suggest using fingerprints as a form of identification. The first modern use of fingerprints for identification occurred in 1858 in India, when Sir William Herschel used palm prints and fingerprints as forms of signatures on contracts.

In 1880, Dr. Henry Faulds published an article in *Nature* that discussed the use of fingerprints for identification purposes. In Mark Twain's *Life on the Mississippi*, which was published in 1883, a murderer is identified by a fingerprint. However, the widespread use of fingerprinting only became possible in 1892 when Sir Francis Galton developed a classification system based on "minutia" that enabled efficient searching, and he verified that fingerprints do not change over time [6].

Figure1: Examples of Galton's Minutia

Today, fingerprints are routinely used for identification, particularly in criminal cases. It is interesting to note that the standard for determining a match varies widely. For example, in Britain fingerprints must match in 16 points, whereas in the United States, no fixed number of points are required to match.

A fingerprint biometric works by first capturing an image of the fingerprint. The image is then enhanced using various image-processing techniques, and various points are identified and extracted from the enhanced image. This process is illustrated in Figure 2.

Figure 2: Automatic Extraction of Minutia

The points extracted by the biometric system are compared in a manner that is somewhat analogous to the manual analysis of fingerprints. For authentication, the extracted points are compared with the claimed user's stored information, which was previously captured during the enrollment phase. The system then determines whether a statistical match occurs, with some predetermined level of confidence. This fingerprint comparison process is illustrated in Figure 3

Figure 3: Minutia Comparison

#### ABSTRACT

*The article discusses the water supply of Bukhara region. The construction of the Amu-Bukhara canal and its hydrological regime have been studied in connection with the increase of irrigated lands in the region. Currently, the issues of effective use of this channel are covered.*

**KEYWORDS:** *Amu-Bukhara Car Canal, Kyzylkum Desert, Kuyimazor Reservoir, Dengizkul, Ayoqogitma, Shurkul, Todakul Reservoir, Jilvon, Parsonkul, Ogitma, Groundwater.*

#### INTRODUCTION

Bukhara region is one of the oldest centers of irrigated agriculture in the country. From ancient times, irrigated lands in the region were irrigated by the Zarafshan River.

The increase in population in the Zarafshan valley has led to a growing problem of water as a result of the increasing number of irrigated lands. As a result, in order to prevent water shortages and water problems in the Bukhara region in the late 50s of the last century, the Amu-Bukhara machine canal was launched from the Amudarya in 1965.

The Amu-Bukhara car canal supplies water to the territory of Bukhara region and partly to Navoi region. The Amu-Bukhara machine canal is an irrigation canal in Bukhara region. The Amu-Bukhara car canal starts on the right bank of the Amudarya, 12 km above the city of Chorjoi (now Turkmenabad).

The first turn of the Amu-Bukhara car canal was put into operation in 1965, and the second turn in 1976. The total length of the Amu-Bukhara car canal is 197 km. The maximum water lift is 111 m, the maximum water capacity is 270 m<sup>3</sup> / s. After the commissioning of the first stage of the Amu-Bukhara canal, 136.5 thousand hectares of land in Bukhara region, irrigated from other

sources, can be irrigated with Amudarya water. It is possible to improve the water supply of 377 thousand hectares of land in the Amudarya basin, to irrigate 23.8 thousand hectares of new lands. The Amu-Bukhara car canal flows from the Kyzylkumbarkhans to the foothills of the Dengizkul plateau. The canal water is then pumped upwards by pumping stations up to 50 m in several stages, and the canal water is discharged towards the Tudakul, Kuyimozor and Shurkul reservoirs and distributed through irrigation outlets. The Amu-Bukhara machine canal has 65 hydraulic structures, 11 pumping stations (including 10 pumping units with a capacity of 12.5 thousand kW, each of which lifts water to a height of 54 m. Today, the attitude to water has completely changed not only in the country but also in the region. issues of use have been put on a new agenda.

The issues of planned use of water from the Amu-Bukhara canal are currently complicated. The amount of water taken from the Amudarya through the canal is now relatively stable, averaging 4.0-4.2 km<sup>3</sup> per year. By means of suction pumps, this water is discharged in reverse relative to the relief slope and gradually rises to a height of 125 meters. Thanks to the Amu-Bukhara canal, new areas, oases, reservoirs and settlements have been built. In the lowlands around the oases, more than a dozen abandoned lakes, several ditches, and road systems were formed.

Administratively, the Amu-Bukhara machine canal belongs to the Bukhara and Navoi regions, in other words, it covers the entire desert zone, from the Ayoqogitma-Malik desert meridian to the Amudarya riverbed. Of particular note are the small closed basins with the lowest hypsometric surface among the areas affected by the Amu-Bukhara car canal. Many of these are now turned into reservoirs, abandoned lakes. Lowlands such as Khojka, Konjakul, Khojamsayyod, Shurkul are covered with salt deposits with accumulative basis. During the period since the launch of the Amu-Bukhara canal (55 years), the hydro-ameliorative properties of irrigated lands in its zone of influence have changed dramatically. Irrigated lands in Bukhara region have long been formed by the Zarafshan River, and at the same time by the Amu-Bukhara system of canals.

Hydrological and hydrochemical properties of these irrigated areas are directly related to the water consumption of the Amu-Bukhara canal. Due to the erosion, numerous lakes and ponds, tugai forests were formed along the canal valley. Large amounts of water evaporate from these surfaces throughout the year. Brief information about water resources of Bukhara region.

Todakol Reservoir is a reservoir in Navoi region. It was built in a natural ravine 26 km east of Bukhara, southwest of the Kuyimozor reservoir. Launched in 1968. Renovated in 1977. Tudakol basin and its foothills are covered with saline, gypsum alluvial deposits. Today its area is 215 km<sup>2</sup>. It is replenished from the Amudarya via the Amu-Bukhara canal. Provides additional water to irrigated lands in Bukhara region.

Kuyimozor Reservoir - In the Navoi region, the bowl of the reservoir, built in 1958 around one of the depressions in the foothills of the Zarafshan River, is located in the deposits of sandstone and mud. The area reaches 17.3 km<sup>2</sup>. Water will be pumped into the reservoir through the Kuyimozor pumping station in the second stage of the Amu-Bukhara machine canal. Its water is mostly used as drinking water. Most of the irrigated areas in Bukhara region are ditches and lakes. At present, only a part of the ditch water is discharged into the Amudarya River through the Porsonkol ditch, and the main part is discharged into the lowlands around the Bukhara oasis. As a result, more than 10 abandoned lakes have been formed in the region: Ayoqogitma, Qoraqir, Zamonbobo, Kichik-Tuzkon, Katta-Tuzkon, Dengizkul, Devxona, Khadicha. Especially

in the southern part of Karavulbozor district, their area is growing every year. In the following years, Devxona-1, Devxona-2, Khadija and in recent years, Qumsultan lakes were formed. Due to the lack of well-developed drainage systems in the region, pastures continue to be flooded, swampy, saline, and chemically polluted. Improvements to drainage systems are still ongoing. This is due to the fact that the launch of the Amu-Bukhara canal, which flows in the opposite direction to the relief of the region, requires further improvement of the drainage system.

When the canal overflows, its water seeps into the surrounding lowlands and forms puddles. When the canal is dehydrated, the reverse process is observed, i.e. the surrounding saline groundwater flows towards the canal bed, resulting in seasonally variable specific ecotone areas. Saline areas are common in low-lying areas, where groundwater is directly close to the surface and rises to the surface. It should be noted that in addition to the Kuyimazor-Tudakul reservoirs, there are parts I-II of the Amu-Bukhara machine canal, as well as canals and several ponds, such as Ortachul, Shohrud, Kuyimozor, which receive water from them.

It is necessary to regulate such irrigated areas, the appearance of canals, to develop ways of rational organization of tugai forests growing along the water. In the future, it is expedient to carry out the following work on the efficient use of irrigated areas of the Amu-Bukhara canal and the rational organization of the areas in its zone of influence. It is necessary to strengthen measures to save canal water, to prevent its erratic and inefficient use of water. One example is the installation of pumps in 11 places on the left bank of the Todakul canal, which developed 1,800 hectares of land. But the harvest from these lands, the income that comes, does not justify itself.

There are changes in the nature of the Amu-Bukhara car canal and its associated region. It is known that irrigated lands in Bukhara region are concentrated in three places: Bukhara, Karakul and Karavulbozor oases. In order to improve the reclamation of irrigated lands, a system of ditches has been created. Most of them are open ditches. Annually, 0.5 km<sup>3</sup> of ditches and sewage are discharged out of the oasis. A small part of this saline water of different levels (11-12) flows into the Amudarya River through the Katta-Turkon Lake Porsonkol ditch. The rest of it is collected in such lakes as Dengizkul, Karakir, Ogitma. According to rough estimates, these artificial lakes accumulate about 5 million tons of salt and various harmful chemicals each year. This situation has a negative impact on the ecological situation in our region. In order to solve this problem, the Shurdarya main ditch is being built at a rapid pace in order to discharge sewage and drainage water from the oases in the south-western part of Uzbekistan into the Aral Sea. Part of it passes through the territory of Bukhara region. In the future, taking into account the interests of fisheries and nature protection, it is necessary to direct the drainage of the region to Shurdarya and accelerate the measures to radically improve the ecological environment. In addition, the development of ways to effectively use groundwater is another way to overcome the existing problems, as Bukhara region has a large fund of groundwater.

Despite the timely implementation of complex measures, the shortage of water resources in the country, including in our region, is growing. As a result, agriculture is suffering severely. In years of water scarcity, even sewage and groundwater are widely used. This affects the quality of river water. For example, the level of mineralization of the Amudarya water has increased for this reason. Most of the newly developed lands have become fallow, fallow, tugai forest. The canal water should be diverted to the ancient and uncultivated lands of the Bukhara oasis. It is

necessary to establish effective use of tugai forests, such as willow, reed, willow, poplar, which are formed in the canals along the canal. However, in most cases it is burned every year in autumn and winter. It is advisable to plant fruit and woody trees (bread, apricot, gujum, etc.) instead. The low-lying ponds around the canal should be filled with soil-sand. Otherwise, a large amount of water evaporates every year in vain.

### USE OF SMARTPHONE APPLICATIONS IN ENGLISH LANGUAGE LEARNING

**Miyasar Satbaevna Azatbaeva\***

\*Sophomore Student Of Nukus State Pedagogical Institute,  
UZBEKISTAN

#### ABSTRACT

*Since English became one of important disciplines in educational system even among youngsters. Nowadays, parents also have a desire to teach basic words to their children at home independently with a help of technology, however come across several problems in selecting appropriate android apps and effective methods. This article will guide those who are willing to overcome the issue.*

**KEYWORDS:** Overall, Assess, Repeat, Research, Utilize, Point Out, Phone, Drawback, Active, Complete, Productive, Divide, Communicate.

#### INTRODUCTION

It has been proved by psychologists that the most appropriate age for teaching a child a foreign language is from 3 (or even from 1.5 year) to 7 years. At this age, the child learns to speak. And it is precisely at this age that they can learn to speak not only in their native language. Each child has a certain type of memory someone can easily memorize sounds, words and expressions by ear, and someone must write them down, someone cannot remember a word without demonstrating the corresponding image. Defining abilities, preferences and interests of the child about the subject, the first thing is to determine what type of memory and perception it has. The efficiency of the whole educational process depends on it. Since English is an international language it is very popular among pupils and students even in Uzbekistan this language is thought from early age a child it means from nursery school. Listening ability of children is active in comparison with other skills that can be proved by examining

In most cases, children are trying with interest to learn new words, they like it, because the language is completely unfamiliar to them. Children don't even ask why they need to learn English; they are so captured by this process and more interested in the process of learning, of knowing, rather than the results. Psychologists recommend starting English classes at the age of

five. In this case, the children will quickly learn a new language for them. There are some ways in which English becomes much faster and easier to learn.

It is very significant to make the child have a desire to learn the language. That is, there must always be a motive for learning a new language. It is very useful for a child to peer into pictures at the moment of learning a new language. Playing with the child in the game, he or she quickly begins to master the world. Using cognitive activity, teaching children English is easy.

In this technological era, everyone has their own handheld mobile devices. Using these devices, with easy access to internet, they interact with people from anywhere in the world. Irrespective of time and place people chat or exchange information with each other. The very term “mobile” stands for the “mobility” or the ability to move freely and easily from one place to another. Mobile implementation of mobile devices in any branch of study. The features of mobile technology such as the portability and information accessibility plays enhancement of English language teaching and learning (El-Hussein & Cronje (2010)). Young generations from birth are being raised with smartphones on their hands. Using phones the best way to utilize in a descent and educational purpose. As the interest in vocabulary acquisition is growing, today various kinds of aids are available to the learners and students, among which mobile applications are one of the most effective and popular. Still research in English language teaching and learning has often underestimated the vocabulary resources of the language. The effectiveness of mobile learning in education is still in its first stages of implementation and concepts and instructional issues surrounding mobile learning are still evolving and require further research (Kukulska-Hulme, 2007).

A mobile app, as a computer program, is designed to run on mobile phones, tablet computers (like iPad) and other mobile devices. The word "app" is a shortening of the term "application software". Apps are easily available through application distribution platform called App Market, and these apps are typically operated by the owner of the mobile operating system, such as the Apple App Store, Google Play, Windows Phone Store, and BlackBerry App World. There are two main app stores: Google Play for Android and Apple App Store for iOS. Google Play, known as Android Market, is an international online software store developed by Google for Android devices (Chu, 2009). Apple App Store for iOS is the first app market, which set the standard for app distribution services (Rao, 2011).

Nowadays, in these mobile operating systems can be found a number of educational apps, which are helpful to acquire a language independently and easily. Let's have a look at one app that is appropriate to children to learn English. The app «ABC kids» where children are able to learn basic vocabulary in an interactive way, even without any assistance. It is divided into categories, for instance, family, animals and fruits. By entering the specific topic you come across pictures and words that are pronounced in English. In this way children are able to learn by repeating the words again and again. At the end of all topics there can be found quizzes, which are very effective method of reviewing all learnt words and assessing the learners' work. Examples of tasks may be matching words and colorful pictures, since most kids are not able to read, pronouncing and finding suitable units are very productive assignments. The can get presents or point to each correct answer and overall one mark. Using these kinds of apps attractive not only for children but you can still enjoy the magic of childhood to meet your language learning needs

because language learning resources for kids are some of the best out there. Educational apps are appropriate not just for children but also their parents are able to use them to acquire a language.

Language learning begins with listening and repetition. Therefore, any theory is inappropriate for preschoolers and younger students. Children should not be bored. If the child is still not interested, do not force it. Your task is to interest. Learn only what surrounds the child: family members, parts of the body, animals, and colors. You need to constantly engage with the child: even huge successes can be forgotten if you give your children a monthly break.

The emergence of apps about education has changed the traditional learning mode, gradually changing from the teacher-centered to self-regulated, learner changed into knowledge construction of the active learning (Yiping & Lei, 2010). The technology enriched learning is designed to enhance students' self-regulation and motivation (Kramarski & Gutman, 2006). According to López-Morteo & López (2007), it helps students improve their academic performance and increase positive attitudes towards learning. More and more studies show that using mobile apps can engage students in self-regulated cycles of learning (Kitsantas & Dabbagh, 2010). Relatively a decade ago teachers of kindergarten and primary schools were the only people who teach children, even pupils started attending classes without any basic knowledge. At the beginning it was difficult to pay attention to all children at the same time; however with the development of technology parent also became a teacher who teach their children using mobile apps and sometimes learn themselves together with them.

One more example is Busuu app forms a part of a website (busuu.com) that covers learning language of 12 countries. According to Busuu founders it was pleasure to them to replace traditional way of learning and teaching to modern one then they decided to create their own learning materials based on image and sound. It also consists of games and downloadable apps. The user receives busuu berries after finishing sections of the learning courses, and the result is visible to all community users that can be compared with others' progress. Busuu is ad downloadable app and does not require an Internet connection. The user himself has a chance to opt for a section of learning among the given ones. The app is divided into 4 proficiency levels (A1-B2) and within each there are multiple sections which cover various every-day life topics and grammar. Each unit includes 3 or 4 tasks. First there is an exercise that teaches vocabulary supported by cards containing images and written words.

There are diverse theories and approaches to instructions, such as teacher-centered approach, student-centered approach and self-regulated learning which belong to pedagogical approaches. The development of mobile technology and abundance of online learning resources are changing the pedagogical approaches and enhancing students' learning outcomes (Govindaswamy, 2002). Nowadays, teacher-centered class counts like traditional method of teaching for this reason modern teachers do not use it because they are less effective and entertaining to young generation. Mobile technology is one of innovative inventions that can be used in educational sphere productively, despite where and when the learner studies.

The developers of English course apps use different approaches and methodologies that all are supposed to guarantee a fun and easy learning process. Now there are a great deal of books available on the Internet instead of searching for the best one it is preferable to find an android app that include several books. Gamlo emphasizes the importance of motivation to learn English. The author believes in using mobile game-based language learning. Nevertheless, the apps

should be selected based on students' interests, needs and level. It means it causes no problem if a learner does not like the structure or used source there are a number of them that are attain enthusiasm of a user.

In current educational system it can be hardly seen traditional methods of teaching even in kindergarten. Even though there are some drawbacks of using phones to health, such as causing poor eyesight, its benefits are overweight. From early ages there is a point that teacher-lead classes can never been replaced by any source of technology however at this time information technology the thing that makes lessons flourishing and productive which is the main aim of teaching.

### DOGWOOD (CORNUS MAS L) PLANTS – MEDICINAL PROPERTIES AND USES

**Matkarimova Gulnaz Maksudjanovna\***

\*Assistant,  
Department of Medical Biology and,  
Genetics Samarkand State Medical Institute Samarkand,  
Republic Of UZBEKISTAN

#### ABSTRACT

*Dogwood food berry plants of god- biologically active substances. As a medicinal plant, fruits, leaves, dogwood bark were used in ancient medicine. Dogwood is a popular drug in modern folk medicine. Scientific research shows dogwood is promising in modern scientific medicine.*

**KEYWORDS:** *Dogwood, Cornus Mas L., No Planting, Fruit, Propagates Medicine.*

#### INTRODUCTION

Currently, herbal medicines are very widely used in world practice. Biologically active substances and extracts of plant origin are most popular in such developed countries as Japan, France, Germany, Italy. In many developing Asian countries (India, Sri Lanka, Mali), herbal medicines are of paramount importance. This "red doctor" is a truly folk healer — it has many useful properties and effects: normalization of blood pressure, prevention of atherosclerosis, elimination of diseases of the gastrointestinal tract, normalization of stool, increased activity of the pancreas, accelerated metabolism, antipyretic effect, excretion of uric acid and toxic substances, lowering blood sugar, increasing concentration, improving memory and attention.

Dogwood is a shrub or small tree (it all depends on the conditions in which the plant grows) from the genus Kizil and the Kizilovy family. Need to say. That in the forests of the Caucasus, dogwood is more often found in the form of a tree reaching a height of 8 m. It should be noted that dogwood belongs to the class of long-lived plants, since it can reach more than one hundred years of age (more often the plant's age varies between 100-250 years.) Dogwood bears fruit starting from the age of ten, while the last fruits are collected from this plant when its age reaches 100-150 years. Young dogwood shoots initially have a greenish-yellow hue, but eventually become covered by a cracking gray bark. The leaves of the plant pointed at the ends

are distinguished by a solid, elongated elliptical shape. I must say that the leaves of dogwood on top have a green color and a shiny surface, while below they are lighter. Dogwood bark has a reddish-brown color. The fruits of the plant are 1-4 cm and weighing 1-6 g, not only juicy and edible, but also healthy. Dogwood is a very ancient fruit, valuable food, medicinal, soil-protective and ornamental plant, undemanding to growing conditions, almost not damaged by pests and not affected by diseases. Dogwood fruits, according to the data, contain 7-15% sugars (glucose and fructose), 1.0-2.5% organic acids (malic, gallic, salicylic, etc.), 0.5-1.5% pectins, 60- 105 mg% ascorbic acid, 250-700 mg% Reactive substances. dogwood is a source of biologically active substances, which allows us to consider it as a valuable food, medicinal plant, serves as a raw material for the production of healthy foods. Due to its decorativeness, it can be used in landscape construction and landscaping, in soil-protective plantations, as well as as a honey plant and in turning and carpentry. Dogwood prefers the warm climate of the Caucasus and Transcaucasia, where it grows in mountain forests, on sunny edges, as well as in thickets of other shrubs.

## RESEARCH METHODS

The studies were carried out in laboratory and field conditions using morphological-biological, selection-genetic and other research methods.

Cornel-Cornus mas L. is a heat-loving plant and is most successfully grown in regions with a rather mild climate. In our conditions, the fruits of dogwood ripen in a warm, rainy summer. Plants are not demanding on the composition of the soil, although they feel better on lime-rich than on acidic soils, they are rather photophilous, but they also grow in the shade. Dogwood begins to bear fruit in the eighth year of life. Since that time, breeders from various parts of our planet have created a fairly large number of varieties, characterized by a whole set of useful qualities and properties, among which are large-fruited, highly decorative, resistant to temperature changes and some tolerance to cold. But most varieties of dogwood are intended for cultivation in the middle zone of Uzbekistan. Dogwood after transplantation grows slowly, there is a development of the root system, with age much faster. It tolerates urban conditions, haircut, is durable.

For pregnant and lactating women, cornel is also a very useful product - it not only replenishes the vitamin balance in the body, but also reduces fatigue, prevents the development of various infections and viruses, saturates the mother's blood with iron, which prevents the occurrence of anemia, and also normalizes digestion and bowel movements. Dogwood has an excellent anti-aging effect, so it has been added to the daily menu of long-distance sailors since the 19th century, and today it is also included in the diet of astronauts.

The concentration of vitamins in the wood is actively involved in strengthening immunity and the fight against viral infections. The following vitamin decoction helps to strengthen health and restore strength. To relieve a headache, you can use tea, decoction or stewed dogwood, or you can prepare the following external product. Dogwood jam is the best way to fight colds and viral infections. For treatment for hemorrhoids, dogwood is consumed fresh-a handful of berries per day. The following external remedy also helps. With diarrhea, indigestion is successfully treated with decoction. In the field of cosmetology, masks with crab from dogwood fruit are also actively used (bark is used only in anti-inflammatory masks). From the pulp of this plant, you

can make a natural, moisturizing and inexpensive vitamin mask for skin and hair at home, and a scrub for the face and body from the seeds.

All parts of the dogwood plant have healing properties: roots, flowers, fruit bones, leaves are widely used in folk medicine. The great Hippocrates mentioned the healing properties of dogwood. Dogwood is also used to make juice, syrups, compotes, preserves, marmalades, jelly, marinades, wine, tinctures, liquors and liquors. Dogwood is used as a seasoning for meat and fish dishes. In butter and coffee substitute. A piece of dogwood can be brewed instead of tea.

In conclusion, I would like to recommend it to everyone, it improves immunity and speeds up metabolism: dogwood contains vitamin C, so this berry can strengthen the immune system and increase the protective functions of the body, especially during autumn diseases, colds and viruses. It is enough to eat a handful of fresh dogwood berries every day for only one to two weeks. And in winter, dried dogwood is useful to you, from which you can make a decoction. Due to pectin substances contained in cornel, it cleanses the body, eliminating toxins and toxins, and also helps get rid of oxalic and uric acid. So, if you want to lose weight, include dogwood in your diet.

UZBEKISTAN

#### ABSTRACT

*In this article explained the results of researching about the bioecological developing of sucking pests in wheat, dominant kinds and theirs damage measures. Distribution areas, distribution and damage of wheat juice, which is the main type of damage, have been identified, and control measures have been recommended.*

**KEYWORDS:** *Sucking, Natural Habitat, Dynamics, Damage, Damage Measures, Fights, Effects, Decrease Of Harvest.*

#### INTRODUCTION

Wheat (*Triticum vulgare* L.), which is the main type of grain crops in Karakalpakstan, is grown annually on 53-55 thousand hectares in Krasnodar-99, Asr, Omad, Aral, etc. 289-290 thousand tons of varieties are planted and harvested. Mainly winter wheat varieties are planted, the biological characteristics of which are 280-300 days, the optimal sowing period is september, the green mass overwinters, hangs in early spring and begins to develop. The substitute for wheat flour from agricultural crops used for human consumption is an irreplaceable product. It is estimated that in order to be healthy, a person needs to consume 90.9 kg (159.8 thousand tons per year) of flour and flour products according to medical standards. However, due to the fact that today's harvest is slightly lower than the per capita norm, the area under wheat in the region's farms increased by 1.5-2.0 times, increasing the yield per hectare by 30 percent. An increase of - 40% is required.

One of the main abiotic reasons for the low productivity of wheat varieties grown in Karakalpakstan is the emergence of new species of fauna in the biocenosis in recent years, with some pests causing significant damage and reducing yields. Observations show that an average

of 10-20% of today's wheat crop is destroyed by pests in the agrobiocenosis. Despite efforts to control pests in the fields, there is an annual process of destroying crops that require protection.

It has been proven that the prevalence and damage of pests in the field, which are biotic factors affecting agricultural crops, depend on the emergence of factors of this biotype, the conditions of harmonious development of biological organisms. In addition, the bioecology of the development of pests, which are widespread in the types of crops grown, and the scientific basis for the application of coordinated control measures have been developed by studying the damage caused.

These peculiarities of the wheat plant create a microclimate in the field and prevent the fall of agricultural pests (*Agrotis segetum* Den. Et Schiff.) (Other species of rodents), wheat nematode (*Anguillutina tritici*). Steinb.), Italian locust (*Calliptamus italicus* L.), Asian locust (*Locusta migratoria* L.) noxious weevil (*Eurygaster integriceps* Put.), Wheatgrass (*Schizaphis graminum* Rond.), Wheat thrips (*Haplothrips tritici* Kurd. ), pyavitsa (*Lema melanopus* L.), Hessen fly (*Mayetiola destructor* Say.), Swedish fly (*Oscinosoma frit* L.), grain flea (*Chaetocnema hortensis* Geoffr, Ch. *aridula* Gyll.) [1; 2].

**Object and methods of experiment.** The main objects are autumn wheat and sucking pests found in the fields. In the wheat fields, the recommended agro-technical measures for the agro-climate and soil of the region were applied. Pest species in the field were identified visually by observing the dynamics of their distribution. The damage caused by pest species was studied in accordance with the method of VI Tansky [3].

**Results of the study:** The results of observations and research In the northern regions of Karakalpakstan, it was noted that wheat is planted in late August and fibrous grasses go to winter. As a result, pests of agricultural crops, including suckers, which had not yet overwintered in these fields, gathered in the fields in September and prepared for winter. it was found that the offspring would accumulate in the plants and continue to develop.

In late march, the years of growing out of winter and starting to develop, it was found that acacia, melon, apricot cane juice from sap appeared in the plants growing in the field in the first ten days of april, and in recent days steamed it was taken into account that with the formation of leaves and spikes of doy, the field was damaged by the proliferation of wheat juice, thrips and harmful weeds.

During the growth and development of wheat, the emergence of wheatgrass pests can cause significant damage. If the pest causes damage to the vegetative organs of wheat during the winter, the plant will not produce spikes, and the quality and quantity of the harvest will decrease as subsequent generations multiply among the grains and absorb the sap.

The morphology of the pest is that the body of the wingless surviving fin is 2.7-2.9 mm. , 6 mm., width 0.2 mm., green. In broad stripes, the whiskers are six-jointed, the tubes are slightly longer, the eggs are oval, 0.6 mm long and 0.2 mm wide, and green. These offspring quickly began to feed and multiply, forming herds.

The pest reproduces 10-16 times during the growing season, and those that emerge from the winter in early spring accumulate in the wheat field, and the wingless off spring of the next generation cause damage by multiplying their live offspring among the grains in the ears.

Special observations have been made in such a field since the second decade of May to determine the damage caused by the pest, which has multiplied to varying degrees with the appearance of the spike.

The results show that the emergence of wheat juice with the germination of wheat has proved to be very harmful. Because between 5-7 grains per grain (average 45.7-67.9 grains per grain), 35.6-42.8% of the crop was lost when fed, the number of pests. When it reached 8-10 units, the damage rate was 56.8-61.4%. As the number of pests in the spikes increased from 17 to 20, it was found that the spikes of the plants turned yellow and some of them withered.

The damage of wheat to the milk ripening phase with the emergence of wheat juice is to a certain extent, that is, when 5-7 pests appear and feed, 5.1-7.8% of the crop is lost, when the number of pests reached 8-10, the damage rate was 11.4-14.5% and when it increased by 15-20, it was 22.5-26.3%.

## CONCLUSION

The results of research to determine the extent of damage to wheat juice in the conditions of Karakalpakstan show that the increase in wheat juice from the beginning of the field phase causes significant damage. When the number of insects increased by 15-20 per head, the crop was completely destroyed. This requires control measures from April, when the pest offspring appear.

Pest control from early spring requires an opportunity to increase the number of entomophagous wheat fields. With the emergence of sap in the field, it is advisable to use the biological method, which is one of the most effective methods of production, that is, the distribution of 1000-2000 pieces of goldeye entomophagy propagated in biolaboratories per hectare. The increased entomophagous nature of the three-fold distribution of the specified amount of goldeye in the field reduces the number of aphids and allows the number of pests to be kept below the specified norm until the wheat is fully ripe.

In areas where the number of pests exceeds the criteria for economic damage, high biological efficiency has been achieved through the use of chemicals recommended for wheat pests for an optimal period of time and in moderation.

## THE PERIOD IN WHICH IMAM BUKHARI LIVED AND THE STAGES OF THE SCIENCE OF INTERPRETING THE QUR'AN AT THAT TIME

**Azizkhoja Inoyatov\***

\*Independent Researcher,  
International Islamic Academy of UZBEKISTAN

### ABSTRACT

*The development of the science of tafsir after our Prophet (s.a.w.), its stages and types. This is due to the fact that he was free from the caliphate for a long time, that he lived longer than other caliphs, and that people of different nationalities also embraced Islam, and that there was a great need for the tafsir of the Qur'an during this period. The most famous scholars of Medina relied on narration to understand the meanings of the Qur'an. The situation was completely different in the cities of the Islamic world except Madinah. In search of knowledge, he traveled to cities such as Basra, Wasit, Kufa, Syria, Palestine, Beirut and Fustot. He spent most of his life (50 years) in Baghdad, where he wrote his tafsir.*

**KEYWORDS:** Caliphs, Palestine, Nationalities,

### INTRODUCTION

When Muslims were formed in the form of a socialized society in both Mecca and Medina during the time of the Companions, they did not have serious problems in the social sphere. They were not yet numerous in number at that time and lived under the same culture. The laws and restrictions of Muslims as a society were similar to the Qur'an.

The Qur'an was the solution to the small number of seemingly simple issues encountered at that time. However, over time, Muslims spread beyond the Arabian Peninsula to other areas.

The borders of the Islamic world have expanded. They began to rule non-Arab and non-Muslims nations along with Muslims.

Foreign religions and cultures began to exert their influence among Muslims. Translated foreign works and philosophical movement began to spread in the Islamic world. As a result, along with religious differences among Muslims, political differences also escalated, and religious sources began to be interpreted in a different way.

The economic situation changed and society entered the path of development. In the time of the Companions, during the lifetime of the Prophet Muhammad (s.a.w.), problems were solved by asking him.

**In the time of the Taba'ins, however, such an opportunity no longer existed<sup>1</sup>.**Traditionally, the Taba'ins used to turn first to the Qur'an and then to the Sunnah of the Prophet (pbuh) to solve their problems.As the problems of the Muslim community increased, so did the number of interpretations of the Qur'an compared to the time of the Companions.As the borders of the Islamic State expanded, the message from the Hijaz could not easily reach remote areas due to the limited possibilities of the time.

Therefore, due to the cultural situation of different regions, various interpretations of the tafsir of the verses of the Qur'an began to emerge, and personal views were not left out.

As the owners of these views grew up in different racial, linguistic, religious, and cultural environments, their views also varied.Thus, in comparison with the tafsir of the time of the Companions, more developed tafsir movement with different characteristics began to emerge.Among the Companions, there were minority people those who were famous for interpreting the Qur'an.

Suyuti listed the names of the commentators in his book "Al-Itqon". The previous ten included four caliphs (Abu Bakr, Umar, Uthman, Ali), Ibn Mas'ud, Ibn Abbas, Ubayy ibn Ka'b, Zayd ibn Thabit, Abu Musa al-Ash'ari, and Abdullah ibn az-Zubayr (r.a.).<sup>2</sup>.

Anas ibn Malik, Abu Hurayra, Abdullah ibn Umar, Jabir ibn Abdullah, Abdullah ibn Amr ibn 'As, and A'ishah were mentioned after them. But there are very few narrations in the field of commentary from the "later ones".

Their fame in this field is not equal to the previous ten.Although more and less commentaries were narrated from some of the Companions in the previous ten, they were known among the people for their good knowledge and good interpretation of the Qur'an.

Due to the fact that Abu Bakr, Umar and Uthman (r.a.) were more engaged in the work of the Khilafah, and their deaths were relatively rapid, there were many scholars and commentators at that time, and the Muslims' need for knowledge was met with them.

But many commentaries have been narrated from Ali ibn Abu Talib.This is due to the fact that he was free from the caliphate for a long time, that he lived longer than other caliphs, and that people of different nationalities also embraced Islam, and that there was a great need for the tafsir of the Qur'an during this period.It has also been narrated from Abdullah ibn Abbas, Abdullah ibn Mas'ud, and Ubayy ibn Ka'b.

Although it is known to the Muslims that the remaining ten (Zayd ibn Thabit, Abu Musa and Abdullah ibn Zubayr) are skilled commentators, there are not many narrations left from them.<sup>3</sup>.

Political differences between Muslims began to emerge in the 40s AH. The period of Taba'ins also coincides with this time. Foreigners and similar political movements like Shia, Mu'tazila, Murji'a dates back to these years.The actions of these movements were also reflected in the writing of commentaries on the verses of the Qur'an.Therefore, the study of the place of the taba'ins in the science of tafsir, in turn, is important in terms of an in-depth study of the science

of tafsir. In summary, while the Companions were the first generation in Islamic history, the followers (taba'ins) are the second generation.

Hakim an-Naysaburi (d. 405.1014) said that it is important to know about the descendants of the Taba'ind, and that a person who does not know them well will confuse the Companions, the Taba'ins and the Tabaa's.<sup>4</sup> Due to this, the place of the followers in the science of tafsir comes after the place of the Companions in the science of tafsir. Because of these factors, we are convinced that it would be beneficial to conduct research on the role of followers in the science of tafsir.

Just as not all of the Companions were aware of the science of tafsir, not all of the followers were aware of the science of tafsir. The following can be listed as followers of the tafsir of the Qur'an:

1. Alqama ibn Qays (died. 61/681)
2. Masruq ibn al-Ajda' (died 63/683)
3. Asvad ibn Yazid (died 74/693)
4. Murra ibn Shurahbil (died 76/695)
5. Abul Oliya ar-Riyohi (died 90-709)
6. Said ibn Djubayr (died 95/713)
7. Ibrahim an-Nakho'I (died 95/714)
8. Mujohid (died 103/721)
9. Dahhok ibn Mudhohim (died 105/723)
10. Towus ibn Kaysan (died 106/724)
11. Ikrima ibn Khalid ibn Said ibn al-As al-Makhdhumi (died 107/725)
12. Amr ibn Sha'bi (died 109/727)
13. Muhammad ibn Sirin (died 110/728)
14. Hasan al-Basri (died 110/728)
15. Atiya ibn al-Awfi (died 111/729)
16. Ato ibn Abu Rabokh (died 114/732)
17. Qatoda ibn Dhiyoma (died 117/735)
18. Nofi (died 117/735)
19. Muhammad ibn Ka'b al-Quradhi (died 118/736)
20. Qays ibn Muslim (died 120/738)
21. Qosim ibn Abu Badhdha (died 124/742)
22. Ato ibn Dinor (died 126/744)
23. Siddi al-Kabir (died 127/745)
24. Ibn Abu Nadjikh (died 131/749)
25. Zayd ibn Aslam (died 136/753)

Although most of the Companions were engaged in the science of tafsir, the most famous and leading among them were four. They were Abdullah ibn Abbas (d. 68/687), Hadhrat Ali (d. 40/661), Abdullah ibn Mas'ud (d. 32/652) and Ubayy ibn Ka'b.<sup>5</sup>

Among the same followers, the following four were famous for their commentary on the others:

1. Said ibn Djubayr (died 95/713)
2. Mudjohid (died 103/721)
3. Ikrima (died 107/725)

#### 4. Ato ibn Abu Raboh (died 114/732)

As we know, the Companions spread to different parts of the Islamic world, and those of them who were leaders in tafsir, hadith and jurisprudence made a huge contribution to the development of knowledge wherever they reached. They cultivated taba'in scientists in the areas they reached, and as a result, various scientific schools were established.

As a result of this development, the schools of Mecca, Medina, and Iraq were formed in the field of tafsir during the time of the Taba'ins.

Abdullah ibn Abbas (d. 68/687), one of the Companions who formed the school in Makkah, was also the master of great scholars such as Said ibn Djubayr (died 95/714), Mujohid ibn Jabr (died 103/721), Ikrima (died 104/722), Towus ibn Kaysan (died 106/724), Ato ibn Abu Rabah (died 114/732)<sup>6</sup>.

Ibn Taymiyyah (d. 720/1320) said: "Those who are famous in the science of tafsir among the Taba'ins are, without any doubt, the scholars raised by the Meccan school. Because they were taught by Abdullah ibn Abbas (d. 68/687)." He had praised the taba' in commentators who grew up in the school of tafsir.<sup>7</sup>

Az-Zahabi. At-Tafsir and al-mufasssirun, vol. -p.114.

At the beginning of the school of tafsir in Madinah comes Ubayy ibn Ka'b (d. 19/640), who was one of the Companions. Most of the descendants of the followers in Madinah became proficient learners in the science of tafsir and recitation. Among them Zayd ibn Aslam (d. 137/753), Abul Aliya (d. 90/708), Muhammad ibn Ka'b al-Qurazi (d. 118/736) and others were leaders.<sup>8</sup> It is known that the city of Madinah was the area where the Prophet Muhammad (s.a.w.) migrated to and where every branch of Islam flourished in the beginning. Even after the death of the Prophet Muhammad (s.a.w.), most of the Companions settled there. For this reason, the followers who grew up here had the opportunity to learn the Qur'an and the Sunnah more deeply from the Companions than the followers who grew up in other regions. The school of tafsir in Madinah is based more on narration than on others as the place where the prophet lived. It is known that the tafsir of the Qur'an came from the time of the Companions in two ways in the narration and opinion.

The most famous scholars of Medina relied on narration to understand the meanings of the Qur'an. The situation was completely different in the cities of the Islamic world except Madinah. In these areas, attention was paid to the interpretation of opinion, as was the interpretation of the narration. For example, Abdullah ibn Abbas (ra), the founder of the school of tafsir in Makkah, near Madinah, relied on opinion and ijtihad as well as narration in interpreting the Qur'an. For this reason, 'Abdullah ibn' Abbas (may Allah be pleased with him) also referred to Arabic poetry, dictionaries and some other aids in his commentary.<sup>9</sup>

The scientific character of the Madinah school of tafsir continued during the time of the Taba'ins. In later times, scholars and faqihs of other regions also considered the scholars of Madinah to be superior in knowledge and jurisprudence. In particular, Imam Malik (d. 179/795) in his letter to Lays ibn Sa'd (d. 175/791), who was one of the Egyptian scholars of the time, wrote:

“Know that the people are subject to the people of Madinah. Indeed, the migration took place there, and the Qur'an was revealed there. The Medinans are the ones who witnessed the revelation. The Prophet Muhammad (s.a.w.) conveyed to them the commands he had received through revelation, and they obeyed them. This situation continued until the death of Muhammad (s.a.w.)”

Lays ibn Sa'd also sent him the following reply: “According to what you wrote me, you seem to have proved it. Of course, people are subject to the people of Madinah, the land of migration and revelation. The city of Madinah is the city of the Prophet Muhammad (s.a.w.) and the area where the Qur'an was revealed and the Companions witnessed the revelation.”<sup>10</sup>

Abdullah ibn Mas'ud (d. 32/652), one of the Companions, is mentioned as the founder of the Iraqi school. Abdullah ibn Mas'ud (ra) had raised many disciples among the followers in the fields of tafsir, recitation and jurisprudence. Alqama ibn Qays (d. 61/681), Masruq ibn al-Ajda' (d. 63/682), al-Aswad ibn Yazid (d. 74/693), Murra al-Hamdani (d. 76/695), Amir al-Sha'bi (d. 109/727), Hasan al-Basri (d. 110/728), and Qatada ibn Diyama (d. 117/735) were some of his disciples. Likewise, Abdullah ibn Mas'ud (r.a.) also made many disciples in the science of recitation. Students who grew up in the field of recitation during the time of the Taba'ins were Abu Abdurahman as-Sulami (d. 73/692), Abu Amr al-Shaybani (d. 98/716), Zayd ibn Wahb (d. 84/692), Amr ibn Shurahbil (d. 63 / 683), Obida ibn Qays as-Salmani (d. 72/691) and others.<sup>11</sup>

Although the schools of tafsir in Syria and Egypt were not as popular as the schools of tafsir above, they flourished in their time and leading scholars were educated in these schools.<sup>12</sup> Naturally, the views of the scholars from these schools were not the same in every field, and there were some differences among them. The schools of tafsir in Makkah and Madinah did not pay much attention to opinions and comparisons, only the Iraqi school of tafsir paid more attention to them. However, the Israelites had become accustomed to interpretation in the schools of influence.

Although some scholars have tried to prove that the Arabs were superior to other nations in science, book writing, language, and poetry during the time of the Taba'ins<sup>13</sup>, the Arabs did not pay much attention to be engaged in religious knowledge.

Ibn Khaldun (died. 808/1406) described their condition like this: “Because new knowledge was in the form of art, they (the Arabs) did not begin to learn new knowledge, considering it inferior to them to engage in it. Because the leaders were always reluctant to engage in crafts, art and related things.”<sup>14</sup> A man from the Qurayshi tribe saw a young man from the tribe of Attab ibn Asid reading “al-Kitab” by Sibawayh and he said: “Woe to you! You want to master science with need and humiliation and spend time with it.” Saying this he had condemned his action<sup>15</sup>.

For this reason, most of those who were engaged in science during the time of the Taba'ins were “Mawalis” The Arabic word “mawali” is a plural of the word “mawla” and is used to mean helper, friend, comrade, slave, worker and so on.<sup>16</sup> The word “mawali” here refers to a slave who was bought and released at that time, or to a person who converted to Islam in his presence.<sup>17</sup>

In the time of Taba'ins the social status of the Mawalis was shaped by the people who cared for them. For example, Abdullah ibn Abbas (d. 68/687) was a scholar, so his mawla Ikrima also became a scholar in his presence. Likewise, the situation of Nofe', the Mawla of Abdullah ibn

Umar (d. 73/692), was similar to this.<sup>18</sup> When we study the works on the subject, we can see that most of the scholars who appeared in the tafsir, hadiths and jurisprudence of that time were mawalis.

Ikrima (d. 107/725) who was famous in the field of tafsir among Taba'ins, was the mawla of Abdullah ibn Abbas (d. 68/687), Ata ibn Abu Rabah (d. 115/733) was Banu Fihri's, and Abu Zubayr Muhammad ibn Muslim (d. 128/745) was the Mawla of Hakim ibn Hizam.

The same situation was observed in other regions of the Islamic world. For example, in Kufa, Sa'id ibn Jubayr (d. 94/713) was the mawla of Banu Waliba, and in Basra, al-Hasan ibn Yassar (d. 110/728) was the mawla of Zayd ibn Thabit.<sup>19</sup>

At that time Ata ibn Abu Rabah (d. 114/732) was the jurist of the Makkans, Tawus ibn Kaysan (d. 106/724) was the jurist of the people of Yemen, Yahya ibn Kathir (d. 129/746) was the jurist of the people of Yamama, al-Hasan al-Basri (d. 110/728) was the jurist of the people of Basra, Ibrahim al-Nah'i (d. 95 / 713-14) was the jurist of the people of Kufa, Makhul (d. 113/731) was the jurist of the people of Syria and Ata al-Khurasani (d. 133/750) was the jurist of the people of Khurasan. As we study the lives of these scholars, we find out that they were all mawalis.<sup>20</sup>

Just as it was painful for the Mawalis to be entrusted with this task due to the decline of Muslims' interest in the sciences at that time, even today it is also painful that those who practice the religion are made up of the poorest sections of society. Unfortunately, we are witnessing that most of those currently studying in madrassas and higher religious educational institutions are children of poor families. In addition to providing this information about the Taba'ins, we would like to emphasize that the Imams of the recitation are also descendants of them.<sup>21</sup> There is also information in the sources that the activity of writing commentaries began during the time of the Taba'ins. Although it was stated that it was controversial, the first written commentary, narrated by Rabi' ibn Anas, was the tafsir by Abul Aliya (d. 90/709).

It is narrated that Mujahid ibn Jabr (d. 103/721) gathered his students at home and he made them to write down the commentary on the Qur'an,<sup>22</sup> and also it is narrated that there was commentary designated him.<sup>23</sup>

According to some sources, this commentary by Mujahid was researched by Abdurahman ibn at-Tahir ibn Muhammad as-Surti and published in three volumes in Islamabad.<sup>24</sup> Scholars have praised the achievements of the Taba'ins in the science of tafsir, as well as their differing views.

According to some scholars, their interpretations are valid and accepted as evidence because the Taba'ins heard and accepted the interpretations and explanations of the verses of the Qur'an directly from the Companions. Some of the Taba'ins supported this view cited the narrations on this subject as evidence.

For example, Mujahid, one of the Tabi'een, narrates that he recited the Qur'an three times from beginning to end to his master Abdullah ibn Abbas (d. 68/687), and that he stopped at each verse and was asked questions about that verse.<sup>25</sup> Ikrima also said, "Everything I have told you about the Qur'an is from Abdullah ibn Abbas."<sup>26</sup> Qatada, one of the followers, said: "There is not a verse in the Qur'an about which I have not heard anything from the Companions."<sup>27</sup>

Some scholars have also argued that some verses of the Qur'an refer to the followers and there is praise for them in these verses. Here are some examples of these verses:

*“And the first forerunners (in the faith) among the Muhajireen and the Ansar and those who followed them with good conduct – Allah is pleased with Him, and He has prepared for them gardens beneath which rivers flow, wherein they will abide forever. That is the great attainment”<sup>28</sup>.*

There are various interpretations of the verse as “those who followed them with good conduct.” This notion is often described as pure faith and righteousness towards the Muhajireen and Ansar.<sup>29</sup> Some scholars emphasize that the Taba’ins and those who followed this path until the Day of Resurrection were assassinated.<sup>30</sup>

*“And (there is a share for) those who came after them, saying, “Our Lord, forgive us and our brothers who preceded us in faith and put not in our hearts (any) resentment toward those who have believed. Our Lord, indeed You are Kind and Merciful”<sup>31</sup>* There are also different opinions about the concept of “those who came after them” in this verse.

Some commentators say that this refers to those who came after the Companions and followed their path, who had pure faith and led a righteous life, while some scholars say that only the followers were meant here.<sup>32</sup>

In both verses it is informed about people who have faith and do righteous deeds, and praise those who live in this way. Such people, praised by Allah, are not limited to a specific time and place. This category of people can be recognized as people who lived this way of life until the Day of Judgment and will live in the future, along with people who lived a righteous life during the time of the Taba’ins. The Prophet Muhammad (s.a.w.) also used expressions of praise about the followers in some hadiths. The meaning of some hadiths in this regard is as follows: “Blessed is the man who sees me and believes! How happy is the one who sees me!”<sup>33</sup> “The best of my ummah are the Companions who lived in my time. Then there is the generation that comes after them, and the best of them is the generation that comes after them.”<sup>34</sup>

Al-Zarkashi (d. 794/1391), who conducted in-depth research in the field of Qur'anic sciences, also arranged the sources of Qur'anic commentary into four groups. The first is a commentary narrated from Muhammad (s.a.w.), the second and the third commentaries made with the views and evidence of the Companions and the followers, the fourth is that man interprets the Qur'an through meanings that arise in his heart.<sup>35</sup>

In his comments, al-Zarkashi stressed the importance of the tafsir made by the descendants of the Taba’ins.

Some scholars, on the other hand, argue that the interpretation of the Taba’ins is not taken as evidence, and emphasizing that there is no direct means of connection, they support the following view points as the evidence of their words:

“The followers did not hear anything directly from Muhammad (s.a.w.). What is taken into account in the commentary of the Companions is that they heard it directly from Muhammad (s.a.w.). It cannot be said that judgment is derived from the interpretation of the followers. While the Companions witnessed the causes of the revelation directly, the Taba’ins learned these messages only by hearing them from the Companions because they lived later. The texts on the justice of the Companions are not applied in practice for the followers. During the time of the Tabi’een, the Israelites became more widespread. Due to these factors, it is possible that the

followers may err in the process of interpreting the verses of the Qur'an and cite some non-evidence as evidence.<sup>36</sup>

It is also narrated that Imam A'zam Abu Hanifa (d. 147/767) said the following about the tafsir of the Taba'ins:

"It is welcome from Muhammad (s.a.w.). We are independent of what came from the Companions: we take what we need and do not take what we do not need. As for what is narrated from the Taba'ins, they and we are both human."<sup>37</sup>

Shu'ba ibn Hajjaj (d. 160/776) also said: "The words of the followers cannot be a proof against those who oppose them. So, how can it be accepted as evidence in the tafsir?" He said that it is not obligatory to be accept the words of Taba'ins as evidence in the tafsir. There is no doubt that their views on that subject will be accepted as a document only if the followers unite as a consensus on one subject. If the followers disagree on the interpretation of any verse, their views cannot be a proof for each other or for those who came after them.<sup>38</sup> The Companions were the direct witnesses of the causes of the revelation, vujud al-Qur'an (forms of recitation of the Qur'an) and similar events<sup>39</sup>.

Similar events took place in front of their eyes. For the Tabeis, this was not the case. Therefore, their attempts in the field of tafsir would not be equaled to the actions of the Companions in the field of tafsir. The praiseworthy expressions quoted above about the Tabi'een show that they are noble generation.

They, also, have expressed among themselves differing views on the interpretation and tafsir of certain verses. As in the case of the next generation of respected scholars, the views they have accepted in the field of interpretation may or may not be taken.

### **Prominent commentators on the science of tafsir in Imam Bukhari's period and their works on tafsir**

The stages of development of the science of tafsir can be conditionally divided into 3 periods, the first one is the period of the Prophet (s.a.w.) and his Companions. There are a number of peculiarities in the commentaries of this period, such as the Qur'an is not fully interpreted, some verses are interpreted, the meaning of the verses is explained in general, and the commentaries are not summarized in separate books. The second stage in the development of the science of tafsir belongs to the period of the Taba'ins, and by this time many Israiliyots and Christian narrations were included in the tafsir. This was due to the conversion of people in Judaism and Christianity to Islam. At the same time, not all the narrations related to tafsir had been collected, and the inhabitants of each city were studying the narrations they had heard from the Companions in that city. By this time, representatives of various groups and madhhab began to interpret the Qur'an according to their own views. For example, Qatada ibn Daoma Sadusi was devoted to the issue of qadha and qadar because he was one of the Qadaris.

The third stage of the development of the science of tafsir began at the end of the reign of the Bani Umayyads and the beginning of the Abbasid period. Initially, the Companions used to narrate tafsir from the Prophet (s.a.w.) and from each other, while the Taba'ins used to accept these narrations from the Sahabi and other Taba'ins. Hadiths began to be written during the time of the Taba'ins. All the hadiths are summarized in these books, and the science of tafsir is also mentioned as a part (chapter) of these books. However, no works dedicated to the interpretation

of the Qur'an have been created. Yazid ibn Harun Sulami (d. 117), Shu'ba ibn Hajjaj (d. 160), Waqi' ibn Jarrah (d. 197/813), and Sufyan ibn Uyayna (d. 197/813), Ravh ibn Ubada al-Basri (d. 205/820), Abdurazzaq ibn Humam (d. 211/826), Adam ibn Iyash (d. 220/835), Abd ibn Humayd (d. 249/855) were mentioned as the authors of the commentaries in this period.

These commentators have compiled the narrations on tafsir and placed them in a separate chapter in their books. By the end of the third stage, the sciences of tafsir and the narrations on tafsir have been separated and brought into book form. At the same time, all the verses of the Qur'an were now being interpreted. The narrations on the tafsir began to be arranged in the order of the mushaf. Ibn Majah (d. 273/886), Ibn Jarir Tabari (d. 310/922), Abu Bakr ibn Munzir Naysaburi (d. 318/930), and Ibn Abu Hatim (d. 318/930), Abu Shaykh ibn Hibban (d. 369/980), al-Hakim (d. 405/1015), and Abu Bakr ibn Marduwayh (d. 410/1019) were mentioned as the authors of the commentaries in this period.<sup>40</sup> It is important to study the activities of the scholars working in this field in assessing the development of the science of tafsir and the role of the muhaddithin in the period of Imam Bukhari's life, i.e. the last decade of the second century AH and the first half of the third century AH.

Muhammad ibn Sawr (d. 190/806), Waqi ibn Jarrah (d. 197/812), and Abu Bakr al-Asam (d. 200/816), Ravh ibn Ubaidah (d. 205/820), Abu Bakr ibn Abu Shaybah (d. 235/849), Ishaq ibn Rahawayh (d. 238/853), Ahmad ibn Hanbal (d. . 241/855), Duhaym (d. 245/859), Abd ibn Humayd (d. 249/863), Yaqub ibn Ibrahim Davraqi (d. 252/866), Yusuf Qatton (d. 253/869), Abu Said A'shaj (d. 257/871), Sunayd ibn Dawud (d. 266/880), Ibn Majja (d. 273/886), Baqi ibn Mahlad (d. 276/889), Abu Ali ibn Abdulwahhab Jubba'i (235 / 849-303 / 916), Riyazi (223 / 838-298 / 911), Abu Ja'far Tabari (224/839). -310/923), Abu Dawud Sijistani (203 / 818-316 / 929) were mentioned as the commentators of the science of tafsir on the sources of the history of the science of tafsir who were contemporaries of Imam Bukhari<sup>41</sup>. The following is a brief biography of them, as well as narrations and works on the science of tafsir. Abu Abdullah Muhammad ibn Sawr Sa'nani (d. 190/806) was born in the city of San'an in Yemen. Ibn Sawr, known as a commentator, muhaddith and jurist, was considered as "siqa", namely reliable narrator in the hadith.

Ibn Sawr narrated hadiths concerning tafsir on the authority of Awf A'rabi, Ibn Jurayj and Ma'mar ibn Rashid. And of Nuaym ibn Hammad, Muhammad ibn Ubaydullah ibn Hisab, Muhammad ibn Abdullah al-Sa'nani and others narrated hadiths from him.<sup>42</sup>

There is information that Ibn Sawr had a three-volume work on tafsir, and the sources state that his tafsir is authentic (sahih) and he is on the level of "siqa"<sup>43</sup>. At the same time, it is known that Ibn Sawr narrated the commentary of Abdulmalik ibn Abdulaziz ibn Jurayj<sup>44</sup>. There are many narrations made from him in famous commentary books. In particular, in Tabari's commentary, his narrations from Ma'mar are given in more than 550 places<sup>45</sup>.

Waqi ibn Jarrah ibn Malih Ruasi Abu Sufyan Kufi (d. 197/812) was born in Naysabur and learned from Abu Hanifa. He heard hadiths from Abu Yusuf and Zufar. Ibn Mubarak, Yahya ibn Aksam, Ahmad ibn Hanbal, Yahya ibn Mu'in, Ali ibn Madini narrated hadiths from him.<sup>46</sup>

In the hadith, "siqa" is considered one of the trustworthy narrators. There are also some legends that he was a pious man. In particular, Yahya ibn Aksam narrated to Waki that he was with him on a journey and he fasted constantly (sawm ad-dahr) and recited the Qur'an every night.<sup>47</sup>

Waqi' has authored several books, including "Tafsir al-Qur'an". This work was narrated by Muhammad ibn Ismail al-Hasani, and Salabi used it in his "al-Kashf wa al-Bayan"<sup>48</sup>. Zirikli gives information about his works such as "Tafsir al-Qur'an", "Sunan", al-Ma'rifa wa at-Tarikh and "az-Zuhd".<sup>49</sup> Although this commentary has not survived to this day, it can be seen in many tafsir sources that its narrations are quoted in the commentary of the verses.<sup>50</sup> Abu Bakr Asam (d. 201/817) is one of the leading scholars of tafsir, kalam and fiqh of the Mu'tazilites of Basra. He is considered the sixth strata of narrator among Abulhuzayl Allaf, Nazzam, Bishr ibn Mutamir along with Muammar ibn Abbad Sulamis.

He lived a poor life. His sources include 27 works such as "Tafsir wa Kitab al-Khalk al-Qur'an", 'Kitab al-Hujja wa ar-Rasul', 'Kitab al-Harakat', "ar-Raddu'ala al-Mulhida", "ar-Raddu'ala al-Majus wa Asma. al-Husna", "Iftiroq al-umma wa ashyo'idda", and only one of them, "Tafsir al-Qur'an" has survived to the present day.<sup>51</sup>

His unique views on the interpretation of the Qur'an have been narrated in many places by scholars such as Jubbai, Moturidi, and Razi. According to this, verses whose meaning does not need any proof or cause any objection are firm, and verses whose meaning need mental interpretation are called mutashabehat.<sup>52</sup>

He also has the idea that the Qur'an is a body, the unity of faith and action, that a person who commits a sin should not deviate from the faith while keeping it a secret, and that a believer should not be called a hypocrite or a disbeliever because of his sin, he can be called fasia instead.<sup>53</sup>

It can also be seen many of his views quoted in the description sources. In particular, Imam Moturidi quotes from the views of the Mu'tazilites in many places in the Tawheed al-Sunnah in order to express and refute their views.<sup>54</sup>

Fakhriddin Razi also narrated some narrations regarding mental interpretation of verses in many places of Mafatih al-Ghayb<sup>55</sup>.

Ravh ibn Ubaidah ibn Ala Qaysi al-Basri ibn Hassan ibn Amr (d. 205/820) is considered a "saduq" (truthful) in the hadith, and is estimated as a great Imam, hadith scholar and commentator. He narrated hadiths from Ibn Avn, Hisham ibn Hassan, Ash'as ibn Abdulmalik Humrani, Awf Arabi, Husayn Muallim, Usama ibn Zayd Madani, Ismail ibn Muslim Abdi, Ayman ibn Nabil, Zakariya ibn Ishaq, Abbad ibn Ishaq, Ibn Jurayj, Ubaydullah ibn Ahnas, Ali ibn Suwayd and many others. Ali, Ahmad, Ishaq, Ibn Numayr, Bundar, Abd ibn Humayd and many others narrated from him.

Ravh also paid great attention to the work of compiling hadith and was more advanced than others in this field.

This is confirmed by the narration of Ali ibn al-Madini, who said: "I saw more than a hundred thousand hadiths of Ravh ibn Ubaidah and wrote down ten thousand of them."<sup>56</sup>

It is narrated that Ravh classified the books on the Sunnah and compiled the narrations on the tafsir.<sup>57</sup> There are many narrations from Ravh in the sources of tafsir. For example, in the Tabari commentary Ravh's narrations can be seen in many places.<sup>58</sup>

Abu Bakr Abdullah ibn Muhammad ibn Abu Shaybah Ibrahim (159 / 849-235 / 849) was a famous muhaddith, commentator and historian of Kufa. Among the muhaddithin, the narrator,

known for his work al-Musannaf, traveled to Kufa, Basra, Ray, Baghdad and the centers of Hijaz to study. He attended the classes of hadith scholars such as Abdullah ibn Mubarak, Waqi ibn Jarrah, Sufyan ibn Uyayna, Yahya ibn Said Qattan.<sup>59</sup> Among his disciples were great hadith scholars such as Imam Bukhari, Muslim, Abu Dawud, Ibn Majah, Ibn Sa'd, Abu Zur'a Razi. Ibn Abu Shaybah, Ahmad ibn Hanbal and Yahya ibn Main mentioned him as "saduq", Abulhasan Ijli and Abu Hatim Razi as "siqa".<sup>59</sup>

He lived for many years in Baghdad and died there. Ibn Abu Shaybah has a work on tafsir, which is kept in the Sulaymaniyah Library of Turkey under the name Tafsir ibn Abu Shaybah.<sup>60</sup> He also has works "al-Musnad" and "al-Musannaf".<sup>61</sup>

Abu Ya'qub Iskhaq ibn Ibrahim ibn Mahlad ibn Ibrahim Hanzali Marwazi, who was known as Iskhaq ibn Rahawayh, was born in Marv in 161/778. He was one of the memorizers of hadith and got primary knowledge from Abdullah ibn Mubarak, Sufyan ibn Uyayna, and Waqi ibn Jarrah. Among his disciples, Baqiya ibn Walid, Yahya ibn Adam, and many others became famous in Islamic sciences.

In the narration by Ahmad ibn Hanbal from his father, in Hanbal's view, Iskhaq was the Imam of the Muslims. In search of knowledge, he traveled to Iraq, Hijaz, Yemen and Syria, and spent the rest of his life in Naysabur. His narrations on tafsir also contain mutashabehat verses, among which one can find intellectual evidence.

He authored the Sunan, the Musnad, and the Tafsir of jurisprudence, which have not survived to this day. Ibn Rahawayh died in 238/853.<sup>62</sup>

Ahmad ibn Muhammad ibn Hanbal ibn Hilal was originally from Merv. He was born in 164/790. Along with the hadith, he was educated by Ibn Hanbal Hushaym, Sufyan ibn Uyayna, Ibrahim ibn Sa'd, Jarir ibn Abdulhamid, Yahya Qattan and many other masters who were advanced in the sciences of nahv, vocabulary, tafsir and recitation. The presence of Imam Bukhari, Muslim, Abu Dawud and other great hadith scholars among his disciples testifies to his high status in the study and narration of hadiths. Among his works "Kitab at-tafsir", "an-Nasih wal-mansukh", "az-Zuhd" and "al-Musnad" are well-known in Islamic science. Ahmad ibn Hanbal died in 241/855.<sup>63</sup>

Abu Said Abdurahman ibn Ibrahim ibn Amr ibn Maymun Damashqi (d. 245/859) was known with the title "Duhaym". He was known as a judge, Imam, faqih, hafiz, and muhaddith of Sham (Syria). He traveled to Syria, Egypt, Kufa, Basra and other countries, heard and compiled narrations from Sufyan ibn Uyayna, Marwan ibn Muawiya, Walid ibn Muslim, Suwayd ibn Abdulaziz, Ishaq ibn Yusuf Azraq and many other hadith scholars. Duhaym did not limit himself to compiling the hadiths, but did research to determine the levels of its narrators in the jarh and modification, whether the hadith is authentic or flawed. Imam Bukhari, Abu Dawud, Nasai, Qazvini, Abu Hatim, Abu Zur'a Razi and many other famous hadith scholars narrated from him.<sup>64</sup>

Abu Muhammad Abd ibn Humayd ibn Nasr al-Kashi (d. 249/863) was one of the memorizers of hadith and was also known as a commentator. Abdulhamid, who studied hadiths from Abu Dawud, Muslim, al-Tirmidhi and many other hadith scholars, was known as one of the most famous hadith scholars of the Movarounnahr region. There is information about his works "Tafsir lil-Qur'an al-karim" and "Musnad". Some scholars point out that Abdulhamid's commentary is

one of the first stages in the formation of “al-Tafsir al-Masur”, that is, one of the books of tafsir divided into separate chapters in the books of hadith.<sup>65</sup>

The books of tafsir written at this stage include the commentaries of Waqi', Ravh ibn Ubaidah, and Adam ibn Iyas, discussed above. Dhahabi included “al-Muntahab” along with his works.<sup>66</sup>

Abu Yusuf Yaqub ibn Ibrahim ibn Kathir ibn Yazid in Aflah Davraqi Baghdadi (d. 252/866) is also mentioned among the hadith scholars and commentators.

Yaqub Maholimi who was educated by Ibn Aliya, Yazid ibn Harun, Ravh ibn Ubaida and many other muhaddiths and commentators, became a master of Qasim Matraz, Ibn Sa'a and many other commentators. According to the muhaddithin, the commentator, who was at the level of “siqa”, “aimma al-hadith”, “soduq” and “hujja”, wrote “Tafsir”, “Musnad”<sup>67</sup>. The authors of the “Kutub Sittah”, and famous hadith scholars such as Abu Zur'a, Abu Hatim, and Ibn Abu Dunya narrated from him.<sup>68</sup>

Abu Ya'qub Yusuf ibn Musa ibn Rashid ibn Bilal Kufi Qattan (d. 253/869) was born in the city of Ray and moved to Baghdad when he grew up and died there. He was engaged in the science of hadith and tafsir. He heard and narrated hadiths from Ahmad ibn Abdullah Yunus, Hammad ibn Salama, Sufyan ibn Uyayna, Sulayman ibn Hayyan Ahmar, Abu Nuaym ibn Dukayn, Abu Muawiya Darir, Abdurahman ibn Muhammad Muharibi, Amr ibn Khalid Osho, Mihran ibn Abu Umar, Abu Walid Tayalisi, Waki', Ubaydullah ibn Musa, Muhammad ibn Ubayd and Ibrahim ibn Rustam.<sup>69</sup> Imam Bukhari, Abu Dawud, al-Tirmidhi, Ibn Majah, Ibrahim Harbi, Qasim Matraz, al-Nasa'i and other hadith scholars narrated hadiths from him. Yusuf was famous in all fields of Islamic science, especially in hadith and tafsir, and his works include those related to tafsir.<sup>70</sup>

Abu Said Abdullah ibn Sa'id ibn Husayn A'shaj Kindi Kufi (d. 257/871) was mentioned among the famous hadith scholars and commentators of Kufa. He was educated by hadith scholars such as Hushaym ibn Bashir, Abdullah ibn Idris, Abu Bakr ibn Ayyash, Muhammad ibn Fuzayl. In the sources, Abu Zur'a Razi, Abu Bakr Razi and others are mentioned as his disciples. Dhahabi stated that he was the author of several works and that he saw a one-volume commentary by A'shaj<sup>71</sup>. He is mentioned in the sources as a trustworthy muhaddith with a strong memory. Yahya ibn Main stated that he narrated hadith from some weak narrators. Imam Bukhari narrates from him in his books “al-Jame as-sahih” and “al-Adab al-mufrad.” Imam Muslim narrated 70 hadiths from him in his “Sahih”<sup>72</sup>.

Abu Ali Hasan ibn Dawud (d. 266/880) is considered one of the hadith scholars of Saghr.<sup>73</sup> His nickname was Sunayd Mismisi and he was with his work “al-Tafsir al-Kabir.”

He heard hadiths from Hammad ibn Zayd Ja'far ibn Sulayman Zabi, Abu Bakr Iyash, Abdullah ibn Mubarak, Isa ibn Yunus and many other hadith scholars. Abu Bakr Asram, Abu Zur'a Razi, Ahmad ibn Zahir, Abdul-Karim Dir Aquli and many other commentators narrated hadiths from him. According to the muhaddithin, he was at the level of “soduq” and “laysa bi siqa”<sup>74</sup>.

Abu Abdullah Muhammad ibn Yazid Rabi 'Qazvini (d. 273/886) was born in 209/825 in Qazvin. He was known as Ibn Majjah. He heard narrations about tafsir from Muhammad Tanafisi, Abdullah ibn Muawiya and others. Among his disciples Muhammad ibn Isa Abhari, Abu Amr Ahmad ibn Muhammad ibn Hakim Madini are well-known.

His tafsir is the third stage in the development of the science of tafsir, that is, the tafsir is separated from the hadith collections and brought into a separate book, and all the verses of the Qur'an are included in the category of works in which they are interpreted.<sup>75</sup>

Besides Ibn Mojja Dhahabi mentioned Ibn Jarir Tabari, Abu Bakr ibn Munzir Naysaburi, Ibn Abu Hatim, Ibn Hibban, Hakim, Abu Bakr Marduwayh, and others in the aforementioned list. His works "as-Sunan", "at-Tafsir" and "at-Tarikh" are famous.<sup>76</sup>

Abu Abdurahman Baqi ibn Mahlad ibn Yazid Andalus Qurtubi (d. 276/889) is one of the most famous commentators. His sons Ahmad, Asam ibn Abdulaziz, Ahmad bin Khalid ibn Yazid and others were famous among Baqi's disciples, who learned from Abu Mus'ab Zuhri, Abu Bakr ibn Abu Shaybah, Ahmad ibn Hanbal. Ibn Hazm Zahiri stated that Baqi's "Tafsir" is very popular in the Islamic world.<sup>77</sup>

Dhahabi stated that he had reached the level of a mujtahid and he ruled on the basis of hadiths and did not imitate anyone<sup>78</sup>. It is known from the sources that he was the one who brought and spread the hadiths to Andalusia, and as a result, he was opposed by local Maliki scholars, was accused of heresy.<sup>79</sup> It is narrated that he wrote "al-Musnad" on the subject of jurisprudence and Ibn Hazm ranked it higher than Ahmad ibn Hanbal's Musnad.<sup>80</sup> Abu Ali Muhammad ibn Abdulwahhab ibn Salam ibn Khalid ibn Hamran ibn Aban Jubba'i (d. 235 / 849-303 / 916) was one of the famous scholars of the Mu'tazilites.

He learned from Yaqub ibn Abdullah Shahham Basri and others. His son Hashim was a mentor to famous scholars such as Abulhasan Ash'ari. Musalliti Shafei mentioned that he was a prolific writer, and said: "He wrote 40,000 pages in the Qur'an and 100-volume book in the interpretation of the Qur'an, and no one can approach him on this matter. It made it easier for people to accelerate (the science of debate)"<sup>81</sup>

Evaluating his interpretation, Imam al-Ash'ari said: "I saw Jubba'i writing a commentary that contradicted what Allah had sent down from the beginning. This book is in the language of his village of Jubba (the name of the place between Basra and Ahwaz) and not in the language of the people to whom the Qur'an was revealed. At the same time, he relied on his heart and the temptations of the devil, without narrating a single letter from any commentator in his book"<sup>82</sup>. Abulyusur Ibrahim ibn Ahmad Shaybani (d. 223 / 838-298 / 911) was known as "Riyazi" and was born in Baghdad. He was educated by Jahiz, Mubarrad, Sa'lab, Ibn Qutayba and others. In the sources, Abu Said Uthman ibn Said Sayqal and others are mentioned as his disciples. Riyazi, who became famous in the sciences of nahv and tafsir, died in Qirwan. He is the author of "Laqt al-Marjan" and "Siroj al-Huda" (about Qur'anic meanings) and "Qutb al-Adab."<sup>83</sup> Abu Ja'far Muhammad ibn Jarir ibn Yazid Amuli Tabari (224 / 839-310 / 923) was one of the most famous scholars of Baghdad in tafsir, history, hadith and jurisprudence. Several of his books, such as "Jame 'al-bayan" and "Tarikh al-umam wa al-muluk", have survived nowadays. Tabari studied first in Ray and then in Baghdad. He studied hadith, tafsir, recitation, maani, fiqh, Arabic literature and grammar, sarf and nahv, poetry, siyar and history from great scholars. In search of knowledge, he traveled to cities such as Basra, Wasit, Kufa, Syria, Palestine, Beirut and Fustot. He spent most of his life (50 years) in Baghdad, where he wrote his tafsir.<sup>84</sup>

Tabari, known as "Imam al-Mufasssin" with his tafsir, was the 6<sup>th</sup> rank muhaddith after Termidhi and Nasoi in the field of Sunnah and Hadith, a mujtahid Imam in the field of

jurisprudence, a “shaykh al-muarrikhin” in the history<sup>85</sup>. Abu Dawud Sulayman ibn Ash'as ibn Ishaq Sijistani Azdi (203 / 818-316 / 929) was known as both a commentator and a muhaddith. His book “Kitab al-Masahif” serves as a source for the books on the text of the Qur'an. His “Sunan” is included in the “Kutubi Sitta” collection. There are some reports that his great grandfather Imran stood by Ali in the battle of Siffin and was martyred. In search of knowledge, he traveled to Sijistan, Baghdad, Basra, Herat, Kufa, Balkh, Khorasan, Aleppo, Homs, Damascus, Egypt, Mecca and Medina. Ibn Hajar says he was educated by about 300 teachers<sup>86</sup>. Musa ibn Harun states that he was created for hadith and that he did not meet anyone more virtuous than him. Ibn Yassin Ibn Hibban and Abu Abdullah ibn Mandala, the authors of the “History of Herat”, state that the authenticity of the hadiths can be distinguished by Bukhari, Muslim, Abu Dawud, and Nasai. According to the Governor Naysaburi, Abu Dawud was the hadith Imam of his age. During his lifetime, Abu Dawud recorded 500,000 hadiths, selected 4,800 of them, and included them in “as-Sunan”<sup>87</sup>. There are many works by Abu Dawud, such as “as-Sunan”, “al-Marosil”, “Masail al-Imam Ahmad ibn Hanbal”, “Ijobaala sualat Abu Ubayd Muhammad ibn Usman al-Ajuri”, “Kitab az-Zuhd”, “Tasmiya ihwa allaziyna ruviya anhum al-hadith”, “Kitab al-ba's van-nushur”, “Kitab al-qadar”, “Nasih al-Qur'an and mansuhuh”, “Dalail an-nubuwwa”, “at-Tafarrud fi as-sunan”, “Fazoil al-ansar”, “ad-Duo”, “Ibtido al-wahy”, “Akhbar al-khawarij”, “Ma tafarrada bihi ahlu al-amsar and al-adab ash-shariyya”<sup>88</sup>.

In general, during the time of Imam Bukhari, tafsir developed not as a separate branch of science, but as part of the science of hadith. Scholars who lived during this period included chapters on the science of tafsir in their works, or enumerated the hadiths narrated by the Sahabah, Tabi'ins, and Tabaa Tabi'ins, which belonged to the Tafsir narrated by them.

## ANALYSING THE IMPACT OF COVID-19 ON STOCK MARKET USING FIBONACCI RETRACEMENTS

**Dr. Esha Jain\***

\*School of Management,  
The NorthCap University, Gurugram, INDIA  
Email id: dr.eshajain1985@gmail.com

### ABSTRACT

*The purpose of this study is to analyse the impact of COVID19 on stock market, presentation and description of technical analysis tools based on the Fibonacci sequence with an emphasis on price patterns created using Fibonacci numbers. It also presented the Fibonacci sequence and the golden ratios and found that metal stocks traded at lower valuation due to slumping metal prices and demand. Similarly, oil and gas stocks traded at trough valuations due to lower oil and gas prices, lower demand, and lower margins. Zee Entertainment's valuations have been lower due to weak business outlook, given the economic slowdown due to COVID-19 pandemic. It was also observed that due to this pandemic, investors do not want to invest in the shares because today everyone wants liquidity cash but for the new investors this is a good time to invest in the shares because all the shares are buying at less price and suggested that at this time investors have to buy the shares of the company which falls slowly and not always fall like a little bit falling.*

**KEYWORDS:** COVID-19; Economic Slowdown; Fibonacci Retracements; Nifty50; Pandemic; Stock Market.

### INTRODUCTION

Contributing to the securities exchange is related to facing challenges. Contemporary investors use various methods that support their decisions. Aside from crucial examination, the specialized investigation, wherein an assortment of apparatuses is utilized, considers an exact investigation of outlines and inclines and, accordingly, empowering anticipating future changes in the prices of financial instruments, becomes more and more popular. With that, investors can adequately react and maximize their profits or minimize risks on the stock market. A Fibonacci retracement

is a well-known device among specialized merchants. It depends on the key numbers recognized by mathematician Leonardo Fibonacci in the thirteenth century. The Fibonacci succession of numbers isn't as significant as the scientific connections, communicated as proportions, between the numbers in the arrangement. In the specialized investigation, a Fibonacci retracement is made by taking two extraordinary focuses (normally a significant pinnacle and trough) on a stock diagram and isolating the vertical separation by the key Fibonacci proportions of 23.6%, 38.2%, half, 61.8%, and 100%. When these levels are distinguished, flat lines are attracted and used to recognize conceivable help and opposition levels. Backing, or bolster level, alludes to the value level that advantage doesn't fall underneath for some time. A benefit's help level is made by purchasers entering the market at whatever point the advantage plunges to a lower cost. In the specialized examination, the straightforward help level can be outlined by drawing a line alongside the most reduced lows for the period being thought of. The helpline can be level or inclined up or down with the general value pattern. Other specialized markers and diagramming procedures can be utilized to recognize further developed renditions of help. Obstruction, or an opposition level, is the value point where the ascent in the cost of a benefit is ended by the rise of a developing number of merchants who wish to sell at that cost. Obstruction levels can be fleeting if new data becomes exposed that changes the general market's demeanor toward the benefit or they can be dependable. Regarding specialized examination, the straightforward obstruction level can be graphed by drawing a line alongside the most elevated highs for the period being thought of. Contingent upon value activity, this line can be level or inclined. There are, in any case, further developed approaches to recognize opposition fusing groups, pattern lines, and moving midpoints.

### ***Working of Fibonacci sequence***

The Fibonacci arrangement of numbers is as per the following: 0, 1, 1, 2, 3, 5, 8, 13, 21, 34, 55, 89, 144, and so forth. Each term in this succession is essentially the total of the two going before terms, and the grouping proceeds endlessly. One of the surprising qualities of this numerical grouping is that each number is roughly 1.618 occasions more noteworthy than the former number. This regular connection between each number in the arrangement is the establishment of the normal proportions utilized in retracement contemplations. The key Fibonacci proportion of 61.8% is found by separating one number in the arrangement by the number that tails it. For instance, 21 partitioned by 34 equivalents 0.6176, and 55 isolated by 89 equivalents 0.6179. The 38.2% proportion is found by isolating one number in the arrangement by the number that is discovered two spots to one side. For instance, 55 partitioned by 144 equivalents 0.3819. The 23.6% proportion is found by separating one number in the arrangement by the number that is three spots to one side. For instance, 8 separated by 34 equivalents 0.2352.

### ***Fibonacci Retracement and Predicting Stock Prices***

For hazy reasons, these Fibonacci proportions appear to assume a significant job in the financial exchange, similarly as they do in nature and can be utilized to decide basic focuses that cause a benefit's cost to turn around. Fibonacci retracements are the most broadly utilized of all the Fibonacci exchanging devices. This is incomplete because of their relative effortlessness and mostly because of their appropriateness to practically any exchanging instrument. They can be utilized to distinguish and affirm backing and obstruction levels, put in a stop-misfortune request or target costs, and even go about as an essential component in a countertrend exchanging

system. Fibonacci retracement levels utilize flat lines to show where conceivable help and obstruction levels are. Each level is related to one of the above proportions or rates', demonstrating the rate is the amount of an earlier move the cost has backtracked. The course of the earlier pattern is probably going to proceed once the cost of the advantage has followed to one of the proportions recorded previously. The accompanying diagram delineates how a Fibonacci retracement shows up. Most present-day exchanging stages contain a device that naturally attracts the even lines. Notwithstanding the proportions depicted above, numerous merchants likewise like utilizing the half level.

### ***Fibonacci Retracement Pros and Cons***

Despite the prominence of Fibonacci retracements, the instruments have some calculated and specialized inconveniences that brokers ought to know about when utilizing them. The utilization of the Fibonacci retracement is abstract. Various dealers may utilize this specialized marker in various manners. Those dealers who are beneficial utilizing the Fibonacci retracement check its adequacy; the individuals who lose cash say it is questionable. Some contend specialized examination is an instance of an inevitable outcome. If dealers are on the whole watching and utilizing similar levels or similar specialized pointers, the value activity may mirror that reality. The fundamental rule of any Fibonacci device is a numeric oddity that isn't grounded in any consistent verification. The proportions, numbers, successions, and equations got from the Fibonacci arrangement are just the result of a numerical anomaly. This isn't naturally off-base; however, it tends to be awkward for merchants who need to comprehend the basis behind an exchanging technique. Besides, a Fibonacci retracement system can just highlight potential redresses, inversions, and countertrend skips. This framework battles to affirm some other pointers and doesn't give effectively recognizable solid or frail signs.

### ***The Difference between Fibonacci Retracement and Fibonacci Extension***

While Fibonacci retracements apply rates to a pullback, the Fibonacci augmentation applies rates to a move back in the inclining course. For instance, a stock goes from \$5 to \$10, and afterward back to \$7.50. The move from \$10 to \$7.50 is a retracement. On the off chance that the value begins mobilizing again and goes to \$16, that is an expansion.

## **REVIEW OF LITERATURE**

**Bhattacharya and Kumar (2006)** guaranteed that there was some prescient utility-related to Fibonacci successions utilized as channels in robotized exchanging frameworks. Nonetheless, it was additionally expressed this was only characteristic and in no way, shape, or form indisputable observational proof.

**Gupta (2011)** found that EMH is the main model that the information seemed to affirm. While there was restricted proof that Fibonacci retracements applied prescient control over trade rates, the size of this force was negligible (at most 4%). Extra tests found no proof to recommend that the constrained prescient intensity of Fibonacci proportions differed over the period considered or over the financial specialist time skyline, both as per the EMH.

**Otake and Fallou (2013)** presumed that the examination for Fibonacci retracement demonstrated the stock costs which were quite often switched around Fibonacci proportions. Although it was not satisfactory how to distinguish which Fibonacci proportions were the most successive, it was

seen that the Fibonacci exchanging can be a helpful apparatus for brokers in the African securities exchange.

**Hellal and Meyer (2014)** built up an extremely basic however tradable exchanging framework in which the passage guide was close toward the half Fibonacci retracement and the objective/stop was near the past variant 2 moderately high/lows. By shifting these parameters one can hope to improve the exchanging framework. Numerous different arrangements, in light of recursive adaptations, higher than variant 2, can almost certainly be used for a potential exchanging framework, including a more drawn out holding period.

**Alalaya and Almahameed (2018)** indicated when the financial specialist in ASE can purchase or – hold, and it appeared on a convincing proof of critical examination through this technique levels exchanging system, because of the investigation the speculators can be played out the way of ASE for future investors desires which reflected in the wake of bookkeeping to exchange cost and hazard. This examination concentrated on the example acknowledgment in the time arrangement of ASE with test reproductions, to bless the motivation behind the investigation that will introduce the patterns. Consequently, the consequences of this examination didn't dismiss the impact costs yet bolster it in managing purchasing or hold.

**Promen (2018)** secured the arrangement of candle designs and their utilization in value expectations just as the utilization of Fibonacci retracement lines and its association with general market designs, explicitly the Elliott wave hypothesis. It was noticed that the writing concerning specialized exchanging rules, (for example, the markers tried in this work) was predominantly composed by experts and investigators who execute exchanges on their customers' records as normal everyday employment. It was obvious that there was no accord on how solid prescient force Fibonacci retracements have and which of them are progressively "regarded" by the market.

**Shaker et al. (2018)** presumed that in four organizations of the concrete segment, there was an aggregate of 63 help levels out of which 17 (27%) and all-out 66 opposition levels from which 24 (36%) were followed Fibonacci retracements. Along these lines, the examination discoveries acknowledged the speculation that the pattern inversions in the Cement division recorded in PSX follow Fibonacci retracements somewhat. Examination of this investigation indicated that there are at any rate one in number help and one in number obstruction in each organization and some little opposition and bolster levels.

**Gurrib (2020)** found that the Fibonacci retracement tool captured the price movements of energy stocks better than energy cryptos. Further, price violations tend to occur more during downtrends compared to uptrends, suggesting the Fibonacci tool does not capture price increases during downtrends as well as price decreases during uptrends.

**Hartono (2020)** proved that provided accurate sell and buy signals to help investors invest in stocks, the combination of these indicators was only suitable for stocks that were experiencing a trend both uptrend and downtrend.

### **The rationale of the Study**

- It helps people who want to invest, and investors can know how to make their investment more profitable and to minimize risk for future investments.
- It also helps to give correct guidance to investors.

- It also tells investors at which time they can buy or sell the shares.

### Research Objectives

- To analyze the significance of Fibonacci retracement in predicting stock prices.
- To analyze the price movements of shares by using Fibonacci retracement.
- To interpret the impact of COVID-19 pandemic on the trading of shares.

### Materials and Methods

In the present study explanatory research design has been adopted and is based on secondary sources of data. The data is collected from the website of the National Stock Exchange of India from December 1, 2019 to April 20, 2020. Data were collected for all the 50 companies listed on the NIFTY index by using the census method.

### Analysis of Data

#### NIFTY 50

Nifty 50 consists of 50 companies, so to know the future movements of nifty 50 used a technical tool which is a Fibonacci retracement. The Fibonacci retracement helps us to predict the movement in Nifty 50. It also helps to trade simply and shortly. The site used for this is investing.com. And the picture is given below.

**Chart1:**

*Showing price movements of Nifty 50*

Source: <https://www.investing.com/indices/s-p-cnx-nifty>

After going on the site search for the nifty 50 and then go in indicators and prefer Fibonacci retracement to predict future movements. From there, found the points of swing high or swing low create Fibonacci retracement from 2 February 2020 to 18 April 2020. Track the future movements with the help of the Fibonacci retracement and as see in the Chart there are some levels of Fibonacci retracements 0, 0.238, 0.382, 0.5, 0.618, 0.786, 1, 1.618, 2.618 and so on. After crossing this level, we have decided the market is bullish or bearish.

**Chart2: Fibonacci retracement on Nifty 50**

Source: <https://www.investing.com/indices/s-p-cnx-nifty>

From now the future prediction of the market is that it goes upward and reaches the point 0.786 and then again goes upward and reaches on next level 1 but this time due to COVID-19 effect market cannot grow as fast so maybe this time it reaches to the point 0.786 and then goes down or maybe move upward a little.

**Chart3: Showing prediction**

Source: <https://www.investing.com/indices/s-p-cnx-nifty>

This is the time if investors want to invest in the market they can buy shares at a low price because at this time market is down due to COVID-19 and after few years when the market is stable investors got higher returns in the future. So according to me this the time investors buy more and more shares.

### Effect of COVID19 on Nifty 50

Half of the Nifty 50 stocks, barring financials, are exchanging at single-digit valuations as Indian value markets are about 33% off record-significant levels they scaled in January. The coronavirus pandemic, which resulted in the world's biggest lockdown and threatens the slowest growth since the global financial crisis, led to this fall in the market. Currently, of the 41 ex-financial Nifty 50 stocks, 21 are trading at single-digit 12 months forward price-to-earnings ratio. Commodity-metal and oil-stocks are the ones with the lowest valuations in the list, according to Bloomberg data.

Metal stocks like Vedanta Ltd., Hindalco Industries Ltd., Coal India Ltd., Tata Steel Ltd., and JSW Steel Ltd. are trading at lower valuation due to slumping metal prices and demand. Similarly, oil and gas stocks like ONGC Ltd., Indian Oil Corp. Ltd., and GAIL (India) Ltd. are trading at trough valuations due to lower oil and gas prices, lower demand, and lower margins.

Auto stocks-Tata Motors Ltd., Mahindra, and Mahindra Ltd. and Hero Motocorp Ltd. also trade at cheap valuations. While Lacklustre sales of jaguar Land Rover in China and elsewhere impacted valuations of Tata Motors, M&M and Hero MotoCorp were hurt by lower sales at home due to the lockdown.

Zee Entertainment's valuations have been lower due to weak business outlook, given the economic slowdown, pending receivables from group companies, news related to the investigation conducted by MCA, and TRAI's proposed tariff order changes.

At this time investors have to buy the shares of the company which falls slowly and not always fall like a little bit falling, ACC Ltd, Adani Transmission Ltd, Ambuja Ltd, Bajaj Holdings and investments Ltd, Godrej Consumer Products Ltd, HDFC Asset Management Company Ltd, Havells India, SBI Life Insurance Company Ltd, ICICI Lombard General Insurance Ltd, ICICI prudential life insurance company Ltd, L&T Finance Holdings Ltd, Marico Ltd, Piramal Enterprises Ltd, Shriram Transport Finance Co. Ltd and The New India Assurance Company Ltd. These are the companies which fall a little bit for new investors this is the time to invest in these companies and the investors who already invest in these companies can sell their shares because they buy shares at high prices so if the shares fall more than they can pay the more price in buying and less in selling, means suffer from the loss.

Ashok Leyland Ltd, Bandhan Bank Ltd, Bank of Baroda, Berger Paints India Ltd, Biocon Ltd, Bosch Ltd, Colgate Palmolive (India) Ltd, DLF Ltd, Divi's Laboratories Ltd, HDFC Life Insurance Company Ltd, Hindustan Petroleum Corporation Ltd, Lupin Ltd, Motherson Sum Systems Ltd, NHPC Ltd, and Vodafone Idea Ltd. These are the companies that fall more in this case Fibonacci retracement tells that the investor who already invests in that can sell their shares as fast as they can and the new investors can invest in these companies because in the future maybe these companies earn good profits when they start rising.

Aurobindo Pharma Ltd, Cadila Healthcare Ltd, Dabur India Ltd, General Insurance Corporation of India, Hindustan Zinc Ltd, Indiabulls Housing Finance Ltd, United Spirits Ltd, Oracle Financial Services Software Ltd, Page Industries Ltd, Pidilite Industries Ltd, Power Finance Corporation Ltd, and Punjab National Bank. These are the shares which are going continuously upward in this case the new investors do not want to invest in these shares because maybe in future after some time they start falling and new investors face losses, and for investors

who have already shares of these companies can sell the shares when they reach the highest point.

Avenue Supermarts Ltd, Container Corporation of India Ltd, Interglobe Aviation Ltd, NMDC Ltd, Petronet CNG Ltd, Procter & Gamble Hygiene Healthcare Ltd, Siemens Ltd, and United Breweries Ltd. These are the shares that are going upward but a little bit in this case the investors sell their all shares.

Due to this pandemic, investors do not want to invest in the shares because today everyone wants liquidity cash but for the new investors this is a good time to invest in the shares because all the shares are buying at less price.

## CONCLUSION

The business organization plays an important role in the development of the financial structure of the nation. The current study deal with the “Analyzing the impact of COVID19 on the stock market using Fibonacci retracement with special reference to Nifty 50” which will give an alert zone for buyers as well as sellers to purchase or sell the securities. They can take decisions on whether to buy or sell according to the ratios. These ratios act as a tool for indication. This study can talk about the Fibonacci, which covers all 50 companies of Nifty 50 from this year (2020) to get more reliability. The application of the Fibonacci extension gives more clarity to this. Here extension is applied in the combined share price of the NIFTY 50 which gave an exact result. We can conclude that the share prices of the companies are following the Fibonacci ratios. They act as an indicator for buyers and sellers either to buy or sell the securities. Impact on nifty 50 of COVID19, most global markets, including India; have gained ground over the past couple of sessions after a choppy week. Indian benchmarks, the S&P BSE Sensex and the Nifty 50 saw their worst week in a decade and slipped around 7 percent each. Commodity prices, too, were hit. While gold surged to a seven-year high of over \$1600 per ounce, crude oil slipped from \$68 a barrel to around \$50 a barrel. Oil prices, reports say, have corrected by around \$14\bar{barrel} year-to-date, leading to savings of \$20 billion.

## THE IMAGE OF FERUZ IN THE DRAMA

**Xudayberganov Yodgorbek Satimboyevich\***

\*Student,  
Faculty of Philology,  
Urgench State University, Urgench, UZBEKISTAN  
Email id: yodgor\_alishon17@mail.ru

### ABSTRACT

*This article analyzes the works of art written about the king and poet Muhammad Rahimkhan II - Feruz. In the drama type of fiction, the spiritual world of the historical image, that is, Muhammad Rahimkhan II - Feruz, and its specific characteristics are studied in relation to other types and genres.*

**KEYWORDS:** Khiva Khanate, Historical Drama, Historical Image, Muhammad Rahimkhan II, Symbol, Teacher and Student, Russian Invasion, King and Poet.

### INTRODUCTION

"Famous people and world events in the interests of the motherland and the people are the subject of history. There is a special place in this series of works dedicated to creative historical figures. "This means that a historical figure who has become an artistic hero can be an artistic symbol with his character, deeds, positive and negative aspects. Such historical works are not only fiction, but also the revival of a forgotten history or a history that has not yet been studied by scholars. Many scientific and artistic works are being created about our world-famous historical figures such as PakhlavonMakhmud, JaladdinManguberdi, Amir Temur, Alisher Navoi, ZakhriddinMukhammad Babur. But there has been almost no in-depth research on a number of our historical figures, who have been worthy successors to our great men, and who have been instrumental in bringing the sources of their works and deeds to us. In particular, no major scientific research has been conducted on the khan of Khiva MukhammadRakhimkhan II. After all, this historical figure has made a great contribution to the material and spiritual development of the people.

## MATERIALS AND METHODS

In the history of Uzbek literature, there are many kings who have equal kings and poets. For example, ZakhridinMukhammad Babur, MukhammadShaibanikhan, Ubaydullakh, Amir Umar Khan are among them. MukhammadRakhimkhan II, who ruled the Khiva Khanate from 1863 to 1910, was one of the rulers who equated the kingdom and poetry. Muhammad Rahimkhan II created Devon under the pseudonym Feruz (Feruz - happy, prosperous) in history, sponsored many poets, historians, composers and architects, as well as made a significant contribution to the development of the Khorezm literary environment and led it. Muhammad Rahimkhan II succeeded his father Said Muhammadkhan in 1863 and succeeded him to the throne of the Khiva khanate. Dedicated to this event, the poets and fuzalas finished their history and poems, and created the Masnavi. The history written and written by Feruz's teacher Agahi is of special importance. "Agahi's poem dedicated to Feruz expresses the father's advice to his son, the teacher's student, his wishes and desires, his justice and people's intentions. Agahi's poem was a work of great instruction and an instruction to Feruz in governing the country.

Their teacher-disciple relationship was very strong. Agahi was also Feruz's closest political adviser. Scholars and poets who lived and worked at the same time as Feruz interpret him as one of his civic, just, and merciful kings. Feruz's poetry has reached us in its entirety in manuscripts and lithographs. The Beruni Institute of Oriental Studies has about a dozen collections of poems by the poet. At Feruz's initiative, the talented poet AkhmadjonTabibi composed the commentaries Majmuatush-shuaroyiFeruzshakhiy and Mukhammasatush-shuaroyiFeruzshakhiy. The MajmatushShuaro presents examples of the work of about thirty poets gathered at the Feruz Palace.

As a musicologist, Feruz, poet and composer Pahlavon Niyaz Mirzoboshi said, "He encouraged Komil to write a note for the Khorezmshashmaqom on the tanbur. Kamil created the "Tanbur line" called "Khorezm tanbur note". Muhammad Rahimkhan II organized a lithograph in Khiva and published a book. Feruz has compiled a list of works that need to be translated and has hired various translators. "As the famous translator N. Kamilov rightly pointed out, the Khorezm school of translation appeared during this period. Muhammad Reza Agahi's historical work, Iqboliferuzi (or Shahidi Iqbal), is dedicated to the events of Feruz's reign.

Feruz wrote poems, sang and composed music. He composed thirteen melodies for Shashmaqom. These melodies are still popular among music lovers in the West and East. At present, Feruz is published in the Academy of Sciences of the Republic of Uzbekistan, the Institute of Oriental Studies named after Abu RayhonBeruni, the Institute of Manuscripts named after H. Suleymanov, libraries in Moscow, St. Petersburg and other countries such as Britain, France, Turkey. such works are preserved.

In recent years, a number of studies have been conducted on Muhammad Rahimkhan II. And that serves as a resource for every creator. Literary critic M. Kushjanov noted that in our opinion, paying more attention to the environment in which a historical person lived and worked is an important aspect of creating the image of large figures. As a result of these efforts, we can see the image of the king and poet Feruz in a number of works of art. For example, in the drama "Agahi" by Kamil Avaz, the image of Feruz is portrayed in a unique way. Although the work is dedicated to Agahi, the image of Feruz is also mentioned in many places. For example, Feruz's royal duties, his teacher-disciple relationship with Ogahi, and others are covered. The drama is a

two-part, seven-act musical historical drama featuring Ogahi, Allakulikhon, Muhammad Rahimkhan II-Feruz, and Kamil Khorezmi.

The drama chronicles the years 1839-1840 and 1873. The first part mainly deals with Ogahi's youth, love affairs, and political processes related to Khiva khan Allakulikhan. Feruz's character begins to appear in the second part of the drama. It mainly describes Feruz's teacher-disciple relationship with Ogahi and the consequences of the Russian invasion. Agahi's following speech says that Feruz is also a good musician. "I have heard that the khan has finished a wonderful melody, and the poor man's insignificant essay has become even more melodious and cheerful" (p. 128). It is said that Feruz's teacher composed music for Agahi's ghazal, which quickly became popular. The name of this song is "Feruz" and it is known in the following speech of Kamil Khorezmi. "I am just happy to be here. Ghazal-u-navo merged to give birth to an immortal estate called Feruz" (p. 129). As mentioned above, Feruz was known as a patron of science and enlightenment during this period. He organized lithography in Khiva, collected and republished many works. In the following sentence from the speech of Kamil Khorezmi, we can see that Feruz's services were recognized. "As the khan entrusted you with the task of compiling Tawiz-ul-Ashiqin, so he entrusted me with writing down the maqams" (p. 129). Historical figures in works of art are transformed into characters based on life facts. That is, "the social position of historical figures in their time, their role in life, is preserved without distorting it in accordance with the historical reality, and is portrayed realistically in relation to the characters created by texture."

## RESULT AND DISCUSSION

In every age, kings have fought for the throne. Or they killed their brothers to save the throne. But the just and merciful Muhammad Rahimkhan II - Feruz did not do that. Even after the betrayal of his uncle and brother, he was not sentenced to death from a human point of view. The author claims that this is a trait inherited from Feruz's ancestors. The following passage from Agahi's speech in the drama also acknowledges Feruz's noble character in the memory of his ancestors. "Bless you! At all times, for the sake of the khanate, for the sake of the practice, they killed each other, hanged, ran, slaughtered each other, but this dynasty is pure! (Silence). Do you remember Rahimquli's generosity? After the death of his father, Allaqulikhan, my brother wanted Madamin to be a khan, but he said no, my brother wanted to be a khan. Isn't this a blessing from God for the prosperity of this new country?" (P. 129). The final seventh episode of the drama begins with a description of the damage caused by the Russian invasion. Here, through the speeches of other characters, it is said that Feruz has unseen qualities. While Siddiq and Jumaniyaz count the severe consequences of the Russian invasion, Feruz points out that he foresaw these days. "O Jumaniyaz, there is life in those who say that Hazrat Khan is prophetic. It is no coincidence that Figon recited the ghazal. Oh, say that, say it out loud! Hearts are bleeding! Let these disbelievers hear!" (P. 131).

"Russia's interest in Khiva began during the reign of Peter I. It is known from history that Peter I's expedition led by Bekovich-Cherkassky was crushed on the threshold of Khiva in 1714-1717, and later V.A. Perovsky's expedition (1839-1840) also failed.

In 1873, under Kaufmann, an army of 13,000 men, with 55 artillery pieces, marched against Khiva. On May 29, 1873, Khiva was captured. However, Feruzkhan pursued a number of policies in the interests of the people, so that they would not lose their identity and become

spiritually mature. In the drama, Feruz sees such difficult days as a test of God. The following is an example of Feruz's speech. "It simply came to our notice then that we were in for a rude awakening. May God protect you from this evil "(p. 132). Khorezm, which had not surrendered to the enemy for centuries, was saddened by the defeat during Feruz's rule. The following Feruz's speech reflected his anguish. "Alhazar! The Russians have done their best! Khorezm was humiliated and the country was trampled. Wealth will be found, but our heads are bowed before the spirits of our great ancestors, and our feet are straight! " (P. 132). Feruz regrets not the loss of the throne and wealth, but the loss of the services of his great ancestors.

The tragedy that befell Feruzkhan left an irreparable wound in his heart. In the drama, Feruzkhan interviews his teacher, Agahi, in search of solace. Agahi, who has gone through many trials in life, gives the best advice to his student. "Sir, there is no need to be sorry. You are not the only loser. As a result of the unification, the whole of Turan was defeated. This tragedy was foretold by our servant Khodja AkhmadYassavi 600 years ago "(p. 132). Agahi's words are true. It is known from history that the Bukhara Emirate, the Kokand Khanate and the Khiva Khanate did not unite against Russia in time. Referring to this, Agahi says that Ahmad Yassavi predicted these events and cites the following poem by Yassavi as an example.

Ming ikkiyuzsaksonbirmungaerurdalil,  
 Paydobo'lg'ayo'zga el, islomqo'ldinketaro.  
 Kofirkelibqishlag'ay, ko'pmo'minlarocho'lg'ay,  
 Osonqilg'aybuishniyaratguvchisattaro.

Throughout the work, stunning sentences are uttered. The author refers to the year mentioned by Ahmad Yassavi through the speech of KamiolKhorezmi. That is, in the year Ahmad Yassavi said, Feruzkhan ascended the throne. "Vodarig! The year one thousand two hundred and eighty-one is the year of the mouse, the year when the khan ascended the throne. " (P. 132). Upon hearing this, Feruz confirms it. That is, he remembers that this year the Russians occupied Khojand and Tashkent. As Feruz said these words, he felt as if he had fallen into a deep abyss, feeling helpless and helpless. But Feruzkhan's tenacity and courage do not allow him to break his spirit. Feruz says he has found another way to fight for freedom, which means focusing on science and publishing many books and passing them on to future generations. After all, no invader can take away a person's knowledge.

### ABSTRACT

*This article outlines some measures fulfilled by customs authorities through the monitoring of foreign trade operations due to decreases negative impact of “shadow economy” on integration of the Republic of Uzbekistan into the world economic community. Furthermore, below given a number of offers targeted improving this trend whereby legally coupled with international experience.*

**KEYWORDS:** *Foreign Trade Operations, Monitoring, Shadow Economy, Customs Authorities, Export, Import, Currency, Accounts Receivable, Accounts Payable, Invoice, Contract, Unified Information System Of Foreign Trade Operations (UISFTO), Smart-Contract.*

### INTRODUCTION

There are concealed trade operations, unofficial employment, illegal merchandise of specific commodities, black market of cash, money laundering and other patterns of shadow economy presented in whatsoever country. An underground economy is part and parcel of formal economy, furthermore might have extensive connections with a huge number of its sectors.

It is a different share of informal economy in various states, as well as different opinions of researchers. While some people consider that it is as a negative influence on economic

development, the negative impact on the management of the state economy and the basis of criminal activity, others feel that it is the basis for new directions of the economy and innovations, firstly concealed trend and subsequently an evident one.

Although crime and shadow economic activities have long been a fact of life—and are now increasing around the world—almost all societies try to control their growth, because of the potentially serious consequences:

- A prospering shadow economy makes official statistics (on unemployment, official labor force, income, consumption) unreliable. Policies and programs that are framed on the basis of unreliable statistics may be inappropriate and self-defeating.
- The growth of the shadow economy can set off a destructive cycle. Transactions in the shadow economy escape taxation, thus keeping tax revenues lower than they otherwise would be. If the tax base or tax compliance is eroded, governments may respond by raising tax rates—encouraging a further flight into the shadow economy that further worsens the budget constraints on the public sector. (On the other hand, at least two-thirds of the income earned in the shadow economy is immediately spent on the official economy, resulting in a considerable positive stimulus effect on the official economy.)
- A growing shadow economy may provide strong incentives to attract domestic and foreign workers away from the official economy. [9]

Although, in general, the impact of the shadow economy on society is more negative than positive.

Estimates of Central Asia's shadow economy vary depending on methodology – and simply because so much of the action takes place out of sight. These figures are measured against gross domestic product (GDP) for a sense of scale; activity in the shadow economy is not included in official calculations of GDP.

Among the states of the former Soviet Union in 1998–99, Georgia's shadow economy was the largest, at 64 percent of GDP; Russia's was 44 percent of GDP; and Uzbekistan's was the smallest, at 9 percent.[9]

According to a 2019 report by Kazakhstan's National Academy of Sciences, which cites data from the Commonwealth of Independent States' statistics committee, the “non-observed economy” was equivalent to 29-33 percent of the economy in Uzbekistan; 22-27 percent in Kazakhstan, Tajikistan and Turkmenistan; and 17-19 percent in Kyrgyzstan. [10]

However, according to the Ministry of Economy and Industry of the Republic of Uzbekistan at an international press club meeting in January 2018, the average share of the “hidden economy” in GDP is more than 50% in Uzbekistan. [11]

Furthermore, on the Appeal of the President of the Republic of Uzbekistan to the Oliy Majlis on January 24, 2020 provides for an in-depth analysis of the factors contributing to the emergence of a “parallel economy” and the development of a program to combat it.

## ANALYSIS AND RESULTS

One of the main components of the shadow economy is the illegal implementation of foreign exchange transactions in the process of export coupled with import of commodities, and the

analysis of the data available in the State Customs Committee of the Republic of Uzbekistan (SCC) in this area revealed the following:

According to paragraph 14 of the Resolution of the Cabinet of Ministers of the Republic of Uzbekistan No. 416 was dated the 30<sup>th</sup> of September 2003 “On measures to further improve the monitoring of export-import operations”, the period of total receipt or re-importation of goods on export operations (except certain categories of exporters) should not exceed 120 days from the date of actual export.

Actually, according to results of the implementation of export contracts by business entities, from last year till April 2020, overdue receivables amounted to \$ 733.6 million. [8]

Analyzed data of analogous period according to the Regulation registered by the Ministry of Justice of the Republic of Uzbekistan dated June 12, 2013 No. 2467 “On approval of the Regulations on the procedure for monitoring the validity of foreign exchange transactions by legal entities and individuals” showed:

- Imports of goods on three-party contracts are composed third of total imports, additionally reached \$ 6.5 billion (\$ 1.3 billion of them during 2020);
- Goods imported under contracts with residents of offshore countries amounted to \$ 590 mln. (\$ 94.1 mln. in 2020) or 2-3% of the total import amount;
- Cases of gratuitously over valuation assessment of imported goods amounted to \$ 838.7 million (2020 - 197.5 million) or 4% of total imports value. At the same time, an assessment of commodities indicated in exporter's documents amounted to \$ 656.2 million (2020 - \$ 153.5 million) and discrepancy during customs registration went to \$ 182.5 million (2020- \$ 44.0 mln.). [8]

Cases of gratuitously underreported figures of goods prices during import customs procedures amounted to \$ 7.4 million (1.0 million), owing to a reduction was filled in as a discount from the real price of the producer in the exporting country. [8]

The high share of imports, which is carried out through contracts of this type, leads to covert operations related to the actual turnover and concealment of money laundering crimes, unjustified misappropriation of funds for the purpose of money laundering.

An analysis of recent irregularities shows that the illicit circulation of cash currency values is on the rise. For instance, in order to cover receivable accounts in fact exported goods as a result of urgent measures taken by the responsible departments of the SCC of the Republic of Uzbekistan in 2019, a total value of illegal cash currency was \$ 20.9 mln. As a consequence, it was detected in several special operations by customs authorities through the falsification passenger declarations. In general, the customs authorities in 2019 elicited a total of equal 14.1 (2018 – 7.5) billion Uzbek sums (UZS) within the confines of 221 (2018 - 176) cases of customs violations. Therefore, the sum of infringements of an illegal transferring cash through the customs border for the last year compared with previous one has been grown almost double. [8]

Above given violations due to another element of the shadow economy. On purpose, the contract prices of imported goods are dropped, owing to the reason that a fee settlement on received goods is carried out in cash outside the bank accounts. In particular, there is accounts payable of \$ 14.8 billion for imported consignments within 96,144 contracts, till April 2020, including \$ 3.5 billion in 2019. Thus, detailed trend shows the following larger ratio among countries: China – 17%,

South Korea – 15%, Russia – 10%, Kazakhstan – 7.4%, Great Britain – 7.1%, Japan – 6.2% and Turkey – 5.3%. [8]

An increase in such cases can be seen in the large-scale measures taken by other public services and their results. In particular, during a number of measures in 2019, the State Security Service of the Republic of Uzbekistan arrested a total of \$ 8 million, which would be transferred by illegal ways through the state border to citizens of Kyrgyzstan. [13] Obviously, above written 17% rate of accounts payable between Chinese and Uzbek traders.

One of the major changes which took place for Uzbek business communities and even for all segments of the population had been realized in accordance with the Decree of the President of the Republic of Uzbekistan №5177 “On priority measures for the liberalization of foreign exchange policy” signed on September 2, 2017. In particular, the Central Bank's devaluation of the national currency UZS by 48% [12] along with the prudent policies in this direction are targeted to destroy, the most important elements of the country's shadow economy, currency black market.

The main purpose of announcing the new version of the Law of the Republic of Uzbekistan "On currency regulation" on October 22, 2019 was to reduce the influence of the shadow economy in the country by liberalizing the currency policy and bringing it in line with international standards. As a result, there were a huge number of innovations such as changes in the procedure for opening accounts in foreign currency, clearly defining the repatriation of assets for foreign trade operations, where new types of foreign exchange transactions were introduced and their list was expanded. Also, changes were made to cross-border transactions regulations (transfers between individuals in the amount of up to UZS 100 mln. (approx.. USD 10,000)). Separately, the New Law defines the Central bank, the Audit Chamber, the Ministry of Finance, the State Tax Committee and the State Customs Committee as authorized bodies in the area of foreign currency control. In particular, these state bodies are authorized to conduct currency control inspections and require relevant information in this respect.

## DISCUSSION AND RECOMMENDATION

Since has being the head of state, the President of the Republic of Uzbekistan Shavkat Mirziyoev realized a great liberalization of monetary policy in the country. Range of explicit examples for this would be transition to free currency conversion; achieving the market rate of the national currency, the “floating rate” of the UZS; cancellation of the requirement for the mandatory sale of foreign exchange earnings. Such kind of measures were a vast step for reducing the impact of parallel economy to country's development. Moreover, for contributing customs authority's mite for future expansion of the protection of economic interests of our state as well as studying the experience of foreign countries in this area below given a number of possible offers.

Firstly, the fact that cash still occupies a significant place in international trade is a reason for the expansion of the shadow economy. Supposedly, did fix the high rates for each transaction service in the implementation of foreign exchange transactions on the import and export of goods charged by commercial banks pose a certain financial challenge for business participants. These interest rates are reduced to an average of 0.3-1%, but other additional costs for remittances are also charged by banks as mandatory fees. Also, one of the problems with remittances is the time spent, which is one of the most important indicators of successful merchandise. Especially,

transactions under a foreign trade agreement take an average of 1 to 5 days. This, in turn, reduces the devaluation of the national currency, the attraction of free funds in circulation to the bank, bank turnover, financial attractiveness and activity.

One possible way to deal with this problem would be put in practice the “smart contract”, which fulfills the requirements of the contract in an automated algorithm on the basis of a block chain platform specializing in modern digital technologies. As a result, nowadays the smart contract technology saves the time of business entities if the conditions related to the human are fully implemented in a timely manner. Also, the smart contract will automatically transfer money from any risk-free system in digital form for about 1-2 hours, furthermore, the problem of accounts receivable and payable couldn't be mentioned as issue whenever. Additionally, using innovated systems in the government programs would be an alternative for operating in the country as a single system since 2003 – Unified Information System of Foreign Trade Operations (UISFTO). The introduction of the smart contract in the country was first mentioned in the Resolution of the President of the Republic of Uzbekistan dated 03.07.2018 No PP-3832 “On measures to develop the digital economy in the Republic of Uzbekistan”. However, there might be still numerous ado to put it in practical usage.

Secondly, an invoice is a document that is universal and contains all the necessary information not only for the customs authorities, but also for all entities engaged in foreign trade operations.

In international trade, the information required to obtain an invoice document is not based on a single general agreement, but over the years, the information required for trade has been recorded and formalized in various forms. In order to draw up such a travel document, each country has to make a decision on the basis of national legislation, if necessary. For instance, in the Republic of Uzbekistan the minimum requirements for foreign trade contracts and invoices are validated in accordance with the Resolution of the Cabinet of Ministers on September 30, 2003 No. 416 “On measures to further improve the monitoring of export-import operations”. However, the fact that the participants of the foreign trade in our country, based on domestic legislation, furthermore, dictating terms to the consigner would not have a positive influence on trade. In addition, most of the violations detected by the customs authorities are related to forgery or substitute of the invoice document.

In accordance with the Resolution of the Cabinet of Ministers No. 522 of June 25, 2019 “On measures to improve the usage of electronic invoices in the system of mutual accounts”, as of January 1, 2020, all entities are entitled to electronic accounts. This new procedure will create transparency for the conduct of trade operations in the domestic market and simplify the system of tax accounting in the near future. In addition, it will principally save a lot of time, effort and finance.

Such a system works effectively in many developed countries, as well as among large organizations and regulators of international trade. In particular, “SEEBURGER”, founded in Germany in 1986, now has more than 19 branches in Europe, Asia and North America, and has gained a lot of trust among business participants for the creation of numerous electronic systems. One of the most effective systems used by the company is electronic data exchange. One salient example for that is “E-Invoicing program”, when trade affairs between participants are carried out by means of electron certified documentation without using paper one. For more than 20

years, the world's largest 8,000 companies have officially entered into international trade practice-invoices. [14]

In June 2005 the World customs organization (WCO) Council adopted the SAFE Framework of Standards to Secure and Facilitate Global Trade (SAFE Framework) that would act as a deterrent to international terrorism, secure revenue collections and promote trade facilitation worldwide. In 2007, the WCO's flagship Customs-Business partnership programme - the Authorized Economic Operators (AEO) Programme - was introduced. It would be possible within the confines of that partnership programme to put in activity of business community single electron form of universal document – invoice, besides this to authorize restricted using for service aims by customs administrations. Such kind of possibilities would be a great chance to improve online monitoring fulfilled by customs services, to develop of the world trade operations, to increase the transparency of information on the border with the quick and effective customs control based on the first data transmission, as well as preventing violations of customs facilities.

## CONCLUSION

Taking everything into consideration, achieving a balance between a simplification of a monetary control coupled with strict control systems fulfilled by authorized bodies would be possible if each citizen of the state recognizes own's duty to fight against the “shadow economy”, which must be tackled only in solidarity and through the mutual integration of countries.

### ABSTRACT

*Today, no country is immune to the negative effects of the COVID-19 pandemic, not only economically but also socially. This article analyzes the impact of the COVID-19 pandemic on the global financial markets, which has left behind all the financial and economic crises in history with negative consequences. In particular, the negative effects of the pandemic on international stock markets were presented, and the author made detailed analysis about these consequences.*

**KEYWORDS:** *COVID-19 Pandemic, Economic Recession, GDP, Financial Markets, Government Bonds, Advanced Economy, Emerging Market And Developing Economies, Monetary Policy.*

### INTRODUCTION

The COVID-19 pandemic poses unprecedented challenges to health, economic and financial sustainability. Of course, in such a situation, the primary goal is to save human lives. However, the necessary measures taken to limit the spread of the virus are leading to a sharp decline in economic activity. As a result, in just three months, the forecast for 2020 has shrunk sharply from the expected 3 percent increase globally to a negative 3 percent, far exceeding the product losses seen during the 2008-2009 global financial crisis. The extent of the impact of the crisis on the global economy and the timing of the economy's recovery are very uncertain. This crisis poses a serious threat to the stability of the global financial system. Following the outbreak of

COVID-19, financial conditions have deteriorated at an unprecedented rate, leading to some “cracks” in global financial markets. Volatility in the market has intensified and borrowing costs have increased as a result of widespread defaults. Tensions have arisen in key financing markets, including the global financing market for the U.S. dollar. The outflows of large capitals have also exacerbated various shocks in the domestic markets of countries in emerging market economies. These changes could put pressure on banks as borrowers become unable to repay their debts, leading to a halt in credit markets over a period of time. Long-term dislocation in financial markets can cause panic among financial institutions and in turn lead to a credit crisis for non-financial borrowers and exacerbate the economic crisis.

## LITERATURE REVIEW

The COVID-19 pandemic has affected all financial markets around the world, in particular, the stock price trend has declined significantly and steadily. The Dow Jones and S&P from the United States are among the financial markets facing such a situation. In Daily FT (March 2020) which is one of the most well-known financial magazines, it is supported the fact stating that, “The Dow Jones, and S&P both of which take into account the share prices of a variety of companies in the US have dropped by over 20%”.

Globally, financial markets are experiencing some closures and stock prices are falling significantly due to the COVID-19 pandemic. The pandemic has shifted financial markets to completely different trade routes that affect the world economy. In particular, Colombo stock exchanges sometimes close their businesses and stock prices fall significantly. In Daily FT (March 2020) it is suggested that, “Even the Colombo Stock Exchange has seen almost a 9% drop in its All Share Price Index over the course of the last week, and has been forced to close trading three times during this week”.

Another evidence of the impact of the pandemic on global financial markets is the Nikkei, which trades on the Tokyo Stock Exchange. The trend of market price of Nikkei as well experienced the volatility of the share prices and mostly a downward trend throughout since the outbreak of the COVID – 19. In Daily FT (March 2020) it is elaborated that, “Similarly, the Nikkei, which takes into account share prices of companies in the Tokyo Stock Exchange has also dropped significantly in the last few days”. The most well-known economic experts suggested that the current pandemic has a serious impact on the global economy, with the attention that the world is going to the global recession. A global recession is a situation where the world production goes down with the effect of employment which means companies production will be affected and falls down and people will lose employment while the import and exportation activities will be affected by the recession worldwide. In Euro New (March 2020) they have reported that, “A global recession is now a real possibility; central banks worldwide have slashed interest rates to record levels”.

## ANALYSIS AND RESULTS

The coronavirus (COVID-19) pandemic is seen as a historical problem because it is the first-time humanity has encountered such an unprecedented problem. In mid-February, when financial market participants feared that the epidemic would turn into a global pandemic, stock prices plummeted from previous levels. The impact of the pandemic on credit markets, especially in risky segments such as high-yield bonds, leveraged loans and private debt, has been widespread, and the issuance of these segments has largely ceased. Oil prices fell as global demand fell and

OPEC + countries failed to reach an agreement to cut production, which further exacerbated the risky situation. These changing market conditions have led to a return to quality with a sharp decline in yields on secure bonds.

The negative consequences of this pandemic are causing enormous economic hardship to any category of states. According to the international organizations like the IMF, global economic growth in 2020 will be minus 3%, which is a negative decline. This situation is even worse than in the 2009 global financial crisis. According to the International Monetary Fund in October 2019, the growth forecast for the current year was 6%, but after the onset of the pandemic, the situation has changed radically, and the above data is re-analyzed. The slowdown in economic growth during the pandemic period mainly falls on the group of developed countries, and the growth rate for 2020 was minus 6.1 percent for this group of countries. In most developed countries, the decline is projected for 2020, which is as follows: The United States (–5.9 percent), Japan (–5.2 percent), the United Kingdom (–6.5 percent), Germany (–7.0 percent), France (–7.2 percent), Italy (–9.1 percent), and Spain (–8.0 percent). The impact of this pandemic is much severe in most European countries than in the rest of the world.

Global economic growth is expected to rise to 5.8 percent in 2021, which is a positive indicator, showing a return to normal levels of economic activity from very low levels of it. While the growth rate in the emerging market and developing economies is 6.6 percent, in developed economies it is 4.5 percent. For comparison, the global growth rate in 2010 rose from minus 0.1 percent in 2009 to 5.4 percent. The resumption of global economic growth in 2021 is due to the complete cessation of the pandemic in the second half of 2020, and the removal of strict restrictions on the pandemic will lead to a gradual return of consumer and investor confidence and which in turn restarts the laws of the market. Significant economic policy measures have been taken to meet the requirements of public health care by limiting to some extent the economic activity and the financial system around the world. The projected recovery assumes that these policy measures will be effective in preventing widespread bankruptcy, rising unemployment, and financial strains of firms. Nevertheless, Figure 1 shows that GDP levels in developed and emerging markets and developing countries are expected to remain below the pre-virus base by the end of 2021. As with the level of decline, there is extreme uncertainty in the recovery of the economy. Failure to implement some of the aspects that support recovery could lead to more negative global economic growth, depending on how the pandemic goes and the severity of the interrelated economic and financial consequences. For example, a further increase in restrictions in 2020 will lead to a lower rate of economic growth in 2021.

**Figure 1. Quarterly World GDP (2019: Q1 = 100; dashed lines indicate estimates from January 2020 World Economic Outlook Update)**

**Source:** IMF staff estimates

At the beginning of the year, a broad sense of optimism emerged against the background of monetary policy supported by financial markets, easing of trade tensions and the first signs of stability in the global economy. However, with the global spread of COVID-19, as the prices of risky assets and commodities began to fall at an unprecedented rate while the prices of safe assets such as gold and the U.S. Treasury rose as investors reassessed the economic consequences of the COVID-19 pandemic. The stock market experienced the fastest decline in history, with the S&P 500 falling about 20 percent in just 16 trading sessions. The decline in asset prices halved the level observed at the worst selling point in 2008–09, and the volatility between asset classes was, in some cases, the last to be observed during the global financial crisis. However, markets have recently reduced some losses as tough policy measures, including the aftermath of the pandemic, have stabilized investor sentiment.

**Figure 2. Change in value during coronavirus outbreak of selected stock market indices worldwide from January 1 to March 18, 2020**

**Source:** Statista 2020. Worldwide; Il Sole 24 Ore; January 1 to March 18, 2020

According to Figure 2 above, the world's most popular stock market indices experienced sharp negative changes between January 1 and March 18. In particular, China's CSI 300 stock market index value fell 1.9% as of Jan. 23, followed by a decline of 12.1% from March 6 to March 18. Compared to other stock market indices, the CSI 300 alone saw a 3.4% increase from January 23 to March 6. The NASDAQ 100 and S&P 500, two popular U.S. stock market indices, also fell sharply, falling 12.4% and 14.9%, respectively, from March 6 to March 18. The highest declines were recorded in the Italian FTSE MIB and the Greek ATG stock market indices, which were 27.3% and 28.8%, respectively.

**Figure 3. Share price index in major Developed and Emerging Economies from April 2019 to April 2020**

**Source:** Statista 2020. Worldwide; April 2019 to April 2020

Figure 3 shows the stock price index of developed and developing countries from April 2019 to April 2020. According to the figure, Brazil's stock price index was at its highest level for the entire period cited, reaching 156.2 in April 2020, up from 191.51 in April 2019. In second place is the Russian stock price index, which during this period was 151.89 and 153.7, respectively, almost reaching the level of Brazil in April. The lowest change during this period was recorded in the Chinese stock price index, which means that although it is at a low level, the country has not seen a sharp rise or fall. It is noteworthy that the stock price index of all these countries gradually increased from January to February 2020, then fell sharply from February to March, and again rose in April.

Figure 4 below shows the percentage of government bond yields in the United States and Germany for 2018-2020 with maturities of 2 and 10 years. In September-November 2018, the yield on bonds of both countries was high with the yield on 10-year U.S. government bonds was above 3%, and the yield on 10-year German government bonds was minus 0.5%. However, the 10-year bonds of the two countries have had a general downward trend during the given period.

**Figure 4. Advanced Economy Government Bond Yields (Percent)**

**Sources:** Bloomberg Finance L.P.; and IMF staff calculations.

In March 2020, the yield of these bonds was about 1% in the US and 0.5% in Germany. The yield of 2-year government bonds of these countries was close to the yield of almost 10-year bonds. It is noteworthy that the yield of German 2-year government bonds during the years was only a negative percentage with almost 0.5%.

**Figure 5. Advanced Economy Government Bonds (Percent of bonds outstanding, by yield)**

**Sources:** Bloomberg Finance L.P.; and IMF staff calculations.

The changing market conditions in February and March have led investors to move towards safer and more liquid securities. Government bond yields in Germany and the United States declined sharply in net terms (Figure 5). In response to the easing of tight monetary policy by central banks, policy rates in a number of developed countries have approached zero, and government bond yields are expected to remain low. Government bonds with yields of less than 1 percent (shown in light and dark blue in Figure 5) increased from about 40 percent of bonds outstanding at the end of 2019 to about 80 percent in March.

## CONCLUSIONS

This crisis is not like any other one. First, the shock is huge. The costs associated with this emergency and the measures to prevent it are more than the losses caused by the global financial crisis. Second, as in a war or political crisis, there is a strong uncertainty about the duration and intensity of the blow. Third, there are different roles in economic policy in the current context. In normal crises, policymakers try to stimulate economic activity by stimulating aggregate demand as quickly as possible. This time the crisis requires a certain amount of preventive measures. This makes incentive activities more difficult and undesirable, at least for the most affected sectors. Countries are taking drastic measures to maintain economic and financial stability and prevent the emergence of negative macro-financial gaps. Central banks have eased monetary policy and are ensuring the liquidity of the financial system, including influencing the economy through currency exchange lines to maintain credit flows. As a result of these efforts, funding markets have retained their functions and have shown that investor sentiment has improved. Supervisors are urging banks to renegotiate loan terms with those who have problems repaying their debts to help reduce losses and overcome economic hardship. The country's government is

helping people and companies through large-scale, timely and targeted financial measures to limit the defaults of firms and households through moratoriums on payments and guaranteed loans. Multilateral cooperation has increased the available resources to support the most vulnerable countries and communities. The IMF, with \$1 trillion in available resources, is actively supporting its member countries. These policies are necessary to ensure that the suspension of production does not lead to further damage to the productive capacity of the economy, the financial system and the structure of society. Once the spread of the virus is under control, policies should be aimed at stimulating economic recovery, as well as assessing and treating the damage caused by the pandemic to the balance sheets of non-financial firms, financial institutions and governments.

## TEACHING ENGLISH INDEPENDENTLY BY PARENTS TO DEAF CHILDREN

**Nodira Nabiyeva Rustamjon qizi\***

\*Student of English Faculty,  
Namangan State University, UZBEKISTAN  
Email id: nodiranabiyeva@yahoo.com

### ABSTRACT

*This article promoted to deaf people especially hard hearing and deaf children. It is given general conception of teaching and learning English to children who are deaf. Moreover, effective methods and modern techniques is mentioned as way of teaching and learning English.*

**KEYWORDS:** *A Sign Language Alphabet, Physical Ability, Deaf, Hard Of Hearing, Blind, Demanding,*

### INTRODUCTION

Demanding for learning English is improving day by day all of the world. Because, if you can speak English you can speak with world. Also you will have chance to show your magnificent talent. So most philological researchers give their attention to improving consequences of teaching and learning English. They made lots of different methods, strategies and styles for English teachers and English learners.

Today's learners are very different: young, children, edult, man, woman, businessmen, doctor, teacher, builder and so on. They are also different from each other according to their age, gender, learning language ability, mental or physical skills.

There are many methods, research works for healthy people. They give their good results. But as healthy people, people with disabilities want to learn English. They should be have the same opportunity as healthy people to learning English. Nevertheless, there have lack of methods and styles to teaching and learning English to students who are disabilities. So in this article highlights the current problem's solutions in this field.

First of all, we must divide disabilities people according to their mental or physical ability [1]. They are:

- Hard hearing or deaf
- Blind
- chronicle disease
- Mental illness
- Physical illness

## Methods

What Parents should or shouldn't do?

If parents want to see their children's success in English language, they should work hard with their children and teachers as the same time. They should pay attention to children's spiritual and physical conditions. For deaf children their parents only people who are counted on. So it is important for them their parents' opinion about their chances. they believe their parents every words and they try to gain praise from their parents.

Many parents would like to teach their children English at home, or they want to give help to their English but don't know how to start. It doesn't matter if you own English is not perfect [2]. The most important thing is that you are enthusiastic and that you give your children lots of encouragement and praise. Your child will pick up on your enthusiasm for the language. Doesn't worry if your child doesn't start speak English immediately [3]. They will need a certain amount of time to absorb the language. Be patient, and they will begin to speak English in their own time. Most parent's think of their children cannot learn English because of being deaf. But it isn't wrong! First of all, parents must give motivation to their children. After that children begin to feel confidence in learning English.

There are given some important rules in order to teach children by their parents[4].

- Establishing a routine
- Using sign language alphabet
- Playing games
- Using stories
- Using everyday situations
- Work with a teacher and a psychologist as a partnership

Establishing a routine

Establish a routine for you English time at home. It is better to have short, frequent sessions than longm infrequent ones. Fifteen minutes is enough for very young children. You can gradually make sessions longer as your child gets older and their concentration span increases. Keep the activities short and varied in order to hold your child's attention. Try to do certain activities at the same time every day. Children feel more comfortable and confident when they know what to expect [5]. For example, you could play an English game every day after school, or doing exercise in the morning by showing finger spelling. If you have space at home you can create English corner where you keep any connected to English, for example books, games, DVDs or

things that your children have made. Repetition is essential - children often need to practice words and phrases many times before they feel ready to produce them themselves.

Using sign language alphabet

Parents should more practise finger spelling letters together with their child. Because, sign language alphabet is the only thing to communicate for deaf children. When their teacher begins to learn this alphabet, Parents must learn and try to teach their child to this. If parents give help children to doing homework, children feel free themselves.

### **Playing games**

Children learn naturally when they are having fun. Flashcards are a great way to teach and revise vocabulary and there are many different games which you can play with flashcards, such as Memory, Kim's game, Snap or happy families. Also watching videos of cartoons which are showed words and phrases using finger spelling by cartoon's heros.

### **Using everyday situations**

The advantage of teaching English at home is that you can use everyday situations and real objects from around the house to practise the language naturally and in context. For example:

- Talk about clothes when your child is getting dressed, or when you are sorting laundry (let's put on your red socks; it is Dad's T-shirt, etc.)
- Practise vocabulary for toys and furniture when you are helping your child to tidy their bedroom. (let's put your teddy bear on the bed!, where is the blue car?)
- Teach food vocabulary when you are cooking or going shopping. When you go to the supermarket, give your child a list of things to find (use pictures or words depending on their age.) Revise the vocabulary when you put the shopping away at home.

Using stories

Younger children love books with bright colours and attractive illustrations. look at the pictures together and say the words as you point to the pictures[6]. Later you can ask your child to point to different things, e.g. where's the cat? After a while encourage them to say the words by asking what's that? Listening to stories will get your child used to the sounds and rhythms of English.

Work with a teacher and a psychologist as a partnership

In order to gain the goal, parents, teachers and psychologists keep in touch very often. They should work together as a single team. They should aware of child's motions, spiritual conditions and physical conditions.

### **Results**

Following by these methods hard hearing and deaf students could achieve more success in English. Also their parents have the opportunity to teaching their English by independently. If children are learnt by their parents, it would be grateful chance to occupy new language.

**DISCUSSION**

To sum up, as a healthy children have opportunity to study a foreign language, it should be chance to deaf children for it. If we support them, even it must be very small detailed, deaf children can achieve success in their studying.

### ABSTRACT

*The article presents the materials of kidney damage in patients with rheumatoid arthritis (RA). The most common cause of kidney damage among inflammatory joint diseases is rheumatoid arthritis, which increases the rate of occurrence of the kidney pathological process with an increase in the duration of the disease. Risk factors for kidney damage in rheumatoid arthritis are older patients with high activity, a disease duration of more than 5 years, a late clinical stage, and the seropositive type of RA. The basis of the work was the results of a comprehensive clinical, instrumental and laboratory examination of 60 patients with RA.*

**KEYWORDS:** Rheumatoid Arthritis, Inflammation, Kidney Damage, Microalbuminuria, Proteinuria, Glomerular Filtration Rate.

### INTRODUCTION

Rheumatoid arthritis (RA) is characterized by a high prevalence in the population, difficulty in early diagnosis, rapid development of disability and poor life prognosis [1,2]. A high risk of premature death in these diseases is associated with the development of cardiovascular diseases [2,3]. RA characterized by chronic erosive arthritis and systemic damage to internal organs [4]. The prevalence of RA is about 0.7% of the total population. About 0.02% of the population fall ill with RA each year [5]. In recent years, the attention of many researchers has been attracted by the prognostic value of kidney damage in rheumatoid arthritis, including at a subclinical level [6]. According to some estimates, kidney damage in RA can occur in more than half of patients

[7,8]. It is important to note that when considering kidney damage in RA, its systemic forms can be represented as glomerulonephritis, amyloidosis, drug-induced tubulointerstitial nephritis, and subclinical kidney damage, manifested mainly by functional disorders (chronic kidney disease) without a clearly defined nosological affiliation. Clinical diagnosis of kidney damage in RA is significantly difficult due to the paucity of symptoms. In the absence of an extensive clinic of amyloidosis, most patients may experience periodic or constant proteinuria [8,9]. According to Boers M., out of 132 autopsy cases in RA patients, changes in urine tests were recorded in 20% of them, initial functional disorders in 21%, severe renal failure with a serum creatinine level of more than 200  $\mu\text{mol} / \text{L}$  in 23% of patients [9,10]. The development of chronic kidney disease in RA can probably be associated with the active involvement of the kidneys in the pathological vicious cycle of endothelial dysfunction in RA. At the same time, there is still insufficient data on the variants of functional renal impairment in RA, approaches to the early detection of renal pathology and risk assessment of its progression in RA have not been fully developed.

### **Aim of the stud**

To study the prevalence of kidney damage in patients with rheumatoid arthritis (RA), to identify the main risk factors for the development of renal dysfunction.

### **MATERIAL AND RESEARCH METHODS**

The study was open comparative randomized. The basis of the work was the results of a comprehensive clinical, instrumental and laboratory examination of 60 patients with RA (40 women and 20 men). The age of patients in the clinical group ranged from 20 to 68 years, averaging  $50.2 \pm 1.1$  years. Criteria for inclusion of patients in the study were: age 18 years and older, verified diagnosis of RA in accordance with the criteria of the American College of Rheumatology (ACR-EULAR, 2010), informed consent. The exclusion criteria were clinically significant diseases of the internal organs - moderate and severe forms of chronic circulatory failure, organic kidney pathology not associated with RA, liver failure, diabetes mellitus, chronic kidney disease (CKD) stage 4-5 ( $\text{GFR} \leq 29 \text{ ml} / \text{min} / 1.73 \text{ m}^2$ ). Patients of the clinical group, depending on the presence or absence of clinical signs of kidney damage, were divided into two groups. Group 1 comprised 34 (57.0%) patients who did not have renal dysfunction, and group 2 consisted of 26 (43.0%) patients with renal dysfunction. Within the 2nd group among patients with RA, subgroups were distinguished with different involvement of the kidneys in the pathological process: depending on the value of glomerular filtration rate (GFR) ( $\text{GFR} \geq 90 \text{ ml} / \text{min} / 1.73 \text{ m}^2$ ;  $\text{GFR} 60-89 \text{ ml} / \text{min} / 1.73 \text{ m}^2$  and  $\text{GFR} 30-59 \text{ ml} / \text{min} / 1.73 \text{ m}^2$ ), the presence or absence of microalbuminuria (MAU), proteinuria, the level of excretion of albumin and protein in the urine. The study of the functional state of the kidneys included a general urine analysis, urinalysis according to the methodology of Zimnitsky, Kakovsky-Addis; determination of glomerular filtration rate according to Cockcroft-Gault and MDRD (Modification of Diet in Renal Disease Study) formulas. An ultrasound examination of the kidneys was also performed, the presence and severity of MAU, proteinuria were assessed. During a biochemical blood test, the determination of total protein, albumin, creatinine, uric acid, the ratio of albumin / creatinine, total cholesterol, glucose was determined.

### Characteristics of patients with rheumatoid arthritis

The characteristics of patients in the study group are presented in table No. 1.

**TABLE 1**

	Total	Gender		Average age Me	Average duration of diseases Me	Clinical types	
Groups		F	M			Seropositive RA	Seronegative RA
Patients RA with kidney damage	26	18	8	52 ±2.4 P<0.05	9,29±0.4P<0.05	12 (46%)	14 (54%)
Patients RA without kidney damage	34	22	12	50±2.5 P <0.05	8.9±0.5 P <0.05	22 (67%)	12 (33%)
Control healthy	20	15	5	50,3±2.2	-	-	-

Note: p-differences

Most were diagnosed with a late stage of the disease - 36 (60%), early - in 24 (40%) patients. The group was dominated by patients with high RA activity, the average value of DAS 28 - 5.91 (5.20 - 6.58).

The main goal of our work was to study the prevalence of kidney damage in patients with rheumatoid arthritis (RA), to identify the main risk factors for the development of renal dysfunction.

Statistical processing was carried out on a DELL personal computer using the Microsoft Office Excel - 2010 software package, including the use of built-in statistical processing functions. We used the methods of traditional variational parametric and nonparametric statistics with the calculation of the arithmetic mean of the studied indicator (M), standard error of the mean (m), relative values (frequency,%), the statistical significance of the measurements when comparing the average values was determined by the Student criterion (t) with the calculation error probability (p). For statistically significant changes, a confidence level of  $p < 0.05$  was taken.

### DISCUSSION

Among 60 patients of the clinical group, 34 (57%) patients did not show kidney damage (group 1). Accordingly, 26 (43%) patients were included in the 2nd group. Among patients of the 2nd group, among kidney damage with microalbuminuria (MAU), 16 (61%) patients were identified: in 4 patients on the basis of persistent MAU, and in one patient on the basis of persistent urinary syndrome in the form of erythrocyturia. In RA, various clinical and morphological variants of renal pathology are described (mesangio-proliferative glomerulonephritis, tubulo-interstitial nephritis, amyloidosis) [9, 10], most of which are accompanied by the development of proteinuria in the debut, which can remain the main diagnostic sign for a long time. Early

manifestations of functional renal impairment, especially with moderate severity of proteinuria, do not always attract the attention of clinicians, while the progression of CKD in RA can be rapid, especially in old age and in association with cardiovascular disease.

A slight decrease in GFR (60-89 ml / min / 1.73 sq. m) was observed in 16 (61%) patients with RA with kidney damage. 10 (39%) patients with nephropathy had a moderate decrease in GFR in the range of 30-59 ml / min / 1.73 sq. m. Normal or elevated GFR (90 or more ml / min / 1.73 sq. m) was determined in 3 patients of the 2nd group. Noteworthy is the small proportion of patients with RA with normal or elevated GFR (90 or more ml / min / 1.73 sq. m) among patients of the 2nd group with kidney damage. In general, the MAU group was observed in 17 (28%), and proteinuria was detected in 10 (16%) patients. In the 2nd group of patients, MAU was observed in 4 patients with a slight decrease in GFR, in 10 patients with a moderate decrease in GFR, and proteinuria in 1 patient with a 2nd and 10 patients with kidney damage. In total, in the 2nd group, MAU was detected in 18 (69%), and proteinuria in 8 (31%) patients.

The average creatinine level in patients with RA was  $82.6 \pm 1.6 \mu\text{mol} / \text{L}$ , the swing range was from 61 to 135  $\mu\text{mol} / \text{L}$ . Hypercreatinemia (in men above 115  $\mu\text{mol} / \text{L}$ , in women above 97  $\mu\text{mol} / \text{L}$ ) was observed in 8 cases (13%). In patients with RA, blood urea ranged from 2.9 to 13.7 mmol / L, averaging  $6.4 \pm 0.8 \text{ mmol} / \text{L}$ . An increase in urea above normal (8.3 mmol / L) was detected in 8 patients (13%).

At the next stage of the study, the main indicators reflecting the functional state of the kidneys were analysed separately in groups with the presence or absence of kidney damage.

In patients of the 2nd group, with the addition of kidney damage, there was a decrease in GFR by 48.7% ( $p < 0.001$ ), the level of daily proteinuria increased by 863.5 times ( $p < 0.001$ ), and the content of creatinine by 9.8% ( $p < 0.05$ ).

In a preliminary assessment of the specific gravity of urine according to the results of a general analysis, it was found that in the group, the relative density of urine ranged from 1005 to 1030, the average value was  $1018.2 \pm 1.2$ . In the 1st group, the relative density of urine varied from 1005 to 1030, in the 2nd group - from 1005 to 1020. The average specific gravity of urine in patients of the 1st group was  $1016.9 \pm 0.56$ , of the 2nd group -  $1018.7 \pm 0.59$ . The average value of the relative density of urine in patients of the 1st and 2nd groups, as well as in the clinical group in general, was slightly less than the lower limit of the norm. According to the results of the Zimnitsky test, it was found that in the whole group, as well as in the 1st group, the concentration and water excretion ability of the kidneys was normal. In patients of the 2nd group, the concentration ability of the kidneys was impaired; since the relative density of urine was lower than 1018. In patients of the 2nd group, the concentration index was lower by 35.7% compared with the 1st group ( $p < 0.001$ ).

## RESEARCH RESULTS

Thus, the group of patients with signs of kidney damage included older patients with high activity, a disease duration of more than 5 years, a late clinical stage, and the seropositive nature of RA. Early detection of kidney damage will provide timely intervention and a decrease in the rate of progression of kidney damage, therefore, the incidence of CKD is reduced.

According to modern concepts, the presence of protein in the urine is considered as the most important predictor of the development of functional renal impairment and increased mortality,

with various pathologies, including RA [10]. According to some researchers, microalbuminuria and proteinuria with normal or reduced kidney function can develop in the early stages of the course of RA, at the same time, its prognostic value may be ambiguous due to the variety of nosologically options for kidney damage. According to modern concepts, renal dysfunction lasting more than three months (the so-called chronic kidney disease), including without a specific nosologically diagnosis, it is considered as the most important prognostic factor requiring correction of therapeutic tactics, with various pathologies in the general population.

Thus, the determination of microalbuminuria can be a simple and sensitive marker for early renal damage, including drug-induced damage. A large amount of data on the most important prognostic significance of the determination of microalbuminuria (proteinuria) as an additional marker of functional renal impairment has been taken into account recently at the international level, which was reflected in the new classification of chronic kidney disease, in which the division at the stage was performed not only by assessing glomerular velocity filtration, but the significance of microalbuminuria (proteinuria).

So, patients with RA are a group of increased risk of renal pathology, the likelihood of developing which increases with a prolonged and active course of RA. Clinical symptoms of renal dysfunction in patients with RA with high activity and duration of the underlying disease, as well as in the detection of arterial hypertension and dyslipidemia, should be the basis for active clinical observation of patients. This approach will direct the efforts of clinicians in the timely treatment of kidney pathology in patients with RA, which will extend the life of patients and improve its quality.

## CONCLUSIONS:

1. Among patients with RA, the prevalence of kidney damage is 43% and is manifested by a decrease in GFR of less than 90 ml / min / 1.73 m<sup>2</sup> in 31%, MAU in 28%, proteinuria in 16%, hyper creatinemia and increased urea.
2. Risk factors for renal complications were established: age, high activity and duration of the disease, seropositive nature of RA.
3. In patients with RA, the development of kidney damage and the severity of its manifestations are determined by the duration and activity of the underlying disease and age.

## THE IMAGINE ALISHER NAVOIY IN OYBEK'S WORKS

**Xudayberganov Yodgorbek Satimboyevich\***

\*Student,  
Faculty of Philology,  
Urgench State University, Urgench, UZBEKISTAN  
Email id: yodgor\_alishon17@mail.ru

### ABSTRACT

*This article examines Alisher Navoiy's interpretation of fiction in fiction based on Oybek's novel Navoiy. Its place in the century as an artistic image, methods of depiction, character traits were studied. The artistic image is compared with the historical figure, and the similarities and differences between them are analyzed.*

**KEYWORDS:** *Oybek's Novel "Navoiy", Alisher Navoiy, Historical Novel, Historical Concept, Historical Image, Type, Specific Feature, Syncretic Image.*

### INTRODUCTION

In the literature of almost all the peoples of the world we encounter various myths about eternal life. As a means of eternal life, we see a flower growing on the bottom of the sea, another with the fruit of a legendary tree, and another with a magic glass of water. But it is important to note that these are just simple, woven details from the legend. Man has the opportunity to live forever without such magic. An example of this is Mir Alisher Navoiy, who took with pen the land that no king could occupy with a sword. Yes, Alisher Navoiy is still alive. Its impact on the future of humanity affects us more than you do. Many scholars have defended Navoiy's dissertations by studying Navoiy's works. His historical works have opened the doors of history that were closed to us, and through this we have gained a lot of facts. The wisdom and ideas put forward in his work have not lost their value and serve as the main program in educating young people. He made a great contribution to the Uzbek classical literature of his time, as a result of which our literature flourished. After that, Uzbek literature gained a special significance and gained its name and place in world literature. At present, statues, libraries and research centers named after Alisher Navoiy have been erected in the most developed countries of the world in honor of him. The most famous writers and poets of the world have created many works dedicated to Navoiy.

---

## MATERIALS AND METHODS

Oybek, the son of Musa Tashmuhammad ogli, a powerful writer of 20th century Uzbek literature, also studied the life and work of our great ancestor Alisher Navoiy. He had a special love for Alisher Navoiy's work. Oybek says in an article: "Navoiy's poetry and Navoiy's image have always fascinated me like a strong sun. I had a great desire and desire to create the image of Navoiy in my works. From my youth I loved to read Navoiy's immortal, literary poems, his captivating poems became more and more ingrained in my heart, their form and content intoxicated and fascinated my heart... I always thought of Navoiy as I walked. I could feel his meaningful, intelligent eyes, his always kind, compassionate, noble appearance, his pure, great heart, I could see in my eyes. " Thus, in 1928, Oybek began to study the works of Alisher Navoiy. After that, his articles and works about Alisher Navoiy began to be published. As a result of Oybek's scientific research, in 1944 the novel "Navoiy" was created. Oybek won the State Prize for this novel. "Navoiy, Ulugbek and Babur emphasized the diversity and diversity of their images as artistic images, and that they are dynamic images that are hardened, improved and developed in action and struggle".

The novel describes the socio-political life of Movarounnahr in the 15th century. The main idea of the work is humanity. The lines of destiny of each image are revealed in direct connection with the image of Navoiy. The novel begins with a spring tariff. The beauty of spring illustrates the beauty of Herat. The birds in the bosom of nature are also symbolic and point to the conflicts in the political life of the Timurids. We can see this in the following sentences: "The debaters sometimes forgot themselves in the flames of debate, uttered harsh words to each other, and sometimes froze like an eagle, for a moment in an interesting situation, as if preparing to dust each other" (p 6 ). Navoiy was a man of knowledge, a man who respected knowledgeable souls. Oybek described this character in his conversations with his student Sultanmurod. When Navoiy and his eight-year-old Sultan Murad met for the first time, he noticed the young man's true talent. Realizing that the country's development requires young people like Sultan Murad, who prefer education to anything else, Navoiy pays him a lot of compliments. People around Navoiy wondered why this simple, poor, poor young student needed so much attention. This image of Sultan Murad is actually a textured image. The novel also features textured characters such as Arslanqul and Dildora. The author depicts the social life of ordinary people through these images. At the same time, they are important figures in portraying Navoiy's human qualities. Jami, Hussein Boykaro, Behzod, Nizamulmulk, Majididdin and other heroes are historical figures.

According to the poet and translator A. Naumov, in an interview with him, Oybek spoke about the history of the creation of the novel "Navoiy" and said: On my desk lay a map of medieval Herat that I had drawn myself. I would go to sleep in Herat and wake up in Herat, and only at night would I dream of Tashkent, where I live. " Such feelings must be born of a true artist

Only those who work day and night on the work, disconnected from the real life around them, feel their own destiny and the highest service to the people, can feel such feelings. As you read the novel, you will come across many historical facts about Navoiy. These include his father, Giyosiddin, a trip to Iraq, a meeting with Sharafiddin Yazdi, and more. The author was able to summarize all these facts and express them under one plot.

The play discusses the conflict between Darwishali and Navoiy between the two Shiite and Sunni sects in the Islamic world. Navoiy cites such conflicts as an obstacle to his work, saying: "My brother, there is nothing more enjoyable in the world than reading a book, thinking, and reciting poetry. My nature was more inclined in this direction. I wanted to live in a quiet place and swim in this river of pleasure" (p. 39). It seems that Oybek has introduced all the historical facts into the century without any changes, but at the same time, it seems that he has revived history by making it artistic and making it artistic. The whole world of Navoiy, which is in the center of the work, is revived, and a whole series of events is described through it. This means that Oybek was able to bring the image to a typical level in this work. The humanistic ideas of this typical image are embedded in the general events of the work. Indeed, "it is more difficult to generalize a real person and an event, to elevate it to a typical level, it is so valuable to know the facts, the idea is hidden in them".

The play also focuses on the relationship between Alisher Navoiy and Hussein Boykaro. We know that Alisher Navoiy and Hussein Boykaro have been friends since school. From that time on, Hussein Boqaro was also interested in writing poetry and was always on the move. Even after he ascended the throne, he continued to practice this custom. He was the first to teach his poems to Navoiy. In the novel we can find a description of similar situations. For example, Hussein Boykaro wrote a ghazal and showed it to Navoiy. Navoiy, who read and analyzed this poem, says the following. "How clean, colorful and potential our language is. This word can be used to describe any spirit or meaning. I am convinced that our language has more possibilities than the Persian language in gathering the pearls of thought, the thread of poetry. How dare the Persian (beautiful speakers) and our own Persians read these poems! " (P. 45). In this way, the author points out that in the XIV-XV centuries in the literature of Central Asia it is possible to give beautiful expressions in the old Uzbek language with the help of various figurative words to describe each situation, which is not inferior to Persian.

"Usually, the interpretation of historical works has two directions. The first accurately reflects the biographical interpretation of the historical figure, and historical events serve as a background. In the second, important socio-ethical issues are raised through the interpretation of certain events in the life of a historical figure or part of them".

## RESULT AND DISCUSSION

In the novel "Navoiy" we can find these two interpretations in a syncretic state. That is, from the beginning to the end of the work, along with information about the autobiography of Navoiy's life, the events that took place around him are described in a consistent manner. Also, almost all the images related to Navoiy show universal problems and their solutions. This means that the burden of an entire work is placed on the image of Navoiy. The author was able to infuse the main idea of the work in terms of form and content for each character, each event, no image was simply used.

Navoiy was a man who spoke the truth, even to the king, for truth and justice. In the play, we can see this character in his own words: "The truth is on the side of the crowd. It is not necessary to stone the lips of those who speak the truth, but to cut off the hands that are raised to destroy the foundation of truth. Gathering zakat is a state affair, but not a source of wealth for a few ugly creatures! ... I repeat, the anger of the people is justified. It is our duty to listen to his voice and listen patiently to his complaints" (p. 84). While speaking to the king and ministers, Navoiy said

that the images in his condition did not depict fear, excitement or similar feelings at all. On the contrary, he is portrayed as being overly restrained and frustrated by the hypocrisy of ugly ministers. Both the king and the people were well aware of Navoiy's actions in the interests of the whole society. For example, Sahib Doro's words in the play are an example of this: "The nation sees its only hope in Navoiy" (p. 199). They also slandered Alisher Navoiy's brother Darweshali and ordered the king to imprison him. Worst of all, the decree was written by Alisher Navoiy himself. As Navoiy reluctantly obeys the king's order, his situation is described as follows: "They want revenge for our truth! He said, gnawing in agony. "What more deceit, what hypocrisy!" Indeed, the ancients did not make a mistake: "The choir that brings water is hard, the saint who breaks the jug!" Let the mountains of oppression fall on my head, but you will not include me in the ranks of your executioners, looters and mastitis! I agree to give up my life, to leave this country, which is dearer and sweeter than my soul, but I will not choke the word of truth! " (P. 399). So, in the novel, Alisher Navoiy knows the truth more than his soul. In the eyes of the reader, he is a real person who can tell the truth, even if it means ruining his life.

Throughout the work, Navoiy goes through many classes. The only thing that comforted him in those difficult times was creativity. After each tragedy, it is beautiful to describe how he took a pen in his hand to comfort himself and loved to share his feelings. The conditions of his work are as follows: "Navoiy was able to work quietly for a few months. He worked with great pleasure on the "bird's tongue" and rejoiced in the power and beauty of the mother tongue "(p. 458).

## CONCLUSION

There is a big problem with the end of the play. The king and his son are at loggerheads. Because King Hussein Baykaro unknowingly sentenced his grandson to death under the influence of alcohol. In such a precarious situation, Navoiy's words to Badiuzzaman seem to have been addressed to an entire ruler: "It is not necessary for a man to be crowned, but to have a conscience and a sense of responsibility to society!" (P. 481).

This novel is the greatest work of Alisher Navoiy's life dedicated to goodness. There are still many works about Alisher Navoiy, both today and in the future.

### **ABSTRACT**

*In this article consider conception of thinking, types of thinking operations, opportunities for development of intellection through using tasks in empirical, abstractive, and theoretical conceptions. Author proposed tasks which conduce for development of brainwork.*

**KEYWORDS:** *Thinking, Intellectual Operation; Comparison, Analysis, Synthesis, Abstraction, Generalization, Concretization.*

### **INTRODUCTION**

Human quality which being formed educative process, divides into general and special. Of course, thinking refers to common quality and its formation occurs in tuition process of whole educational subject, in process of whole life learners. Thinking presents active purposeful activity where obtained information materialized, revised and new incoming information, abjection external, casual, peripheral elements from fundamental, internal, rejecting essence of investigated situations; disclose logical connection between them.

Role of mathematic in evolution of logical thinking is prime importance. Historical experience confirms that teaching meth played paramount and especial main role in forming of intellection. On this matter academician V.V.Davidov wrote; "Solution of particular tasks of modern schooling, eventually connected with change of type of thinking, projectable aims, content and methods of teaching. It is necessary to reorient the whole educational system with forming among children rational empirical thought to evaluate modern research-and-technical intellection." That's why it is indispensably to establish which investment could bring solution of this task to organize research-and-technical intellection in teaching meth, how it should be organized, which content and methods of teaching should be.

In order to puzzle out in all this thinks it is necessary previously explore wherein essence of thinking, its peculiarity and types, how process of forming of thinking of children are occurs.

Trough thinking human learns out world. However, cognition can be fulfill without intellection by the agency of sense organs (sensual learning), which gives to human different kind of feelings, perception and carried through direct contract, his sense organs with learning objects. Meantime, brainwork is mediate learning of objects because it is accomplishes through sense perception by another object, regularly connected with cognitive object or though mental conversion species.

Thereby, thinking based on species, however, it is go beyond and that's why let to find out objects which are unavailable to sense organs. Brainwork permits to identify in cognizable objects not only their particular qualities and sides, which being established by feelings, but references and regularly connections, and relation between features and parts.

There through, thanks to intellection man learn general property and attitude excrete significant determinative character of object among these qualities. It's allows to man to forecast the results of observable events, phenomenon and own acts.

So, if species gives initial information about outward things in a separate qualities and demonstrative presentation (images) about them, that thinking convert this information, revealed features and conscience of general concept, submission of representations which were based, build ideal operations with these objects and by that predict possible result of operations and transfiguration objects, allows to plan self-actions with these objects.

Whole this tremendous work accomplish thanks to mental operations; comparison, analysis, synthesis, abstraction, generalization, and concretization.

**Comparison** is purposely matching objects of cognition, finding similarities (distinguishing general properties) and differences (distinguishing particular properties) of each identifiable object among them. This operation is the basis of others mental operations.

**Analysis** is mental dismemberment objects on pieces.

**Synthesis** is mental connection of single parts or elements in organic unity. In real mental process analysis and synthesis are accomplished jointly.

**Abstraction's** mental distinguishing any significant properties and mark of object in simultaneous distraction against all features and signs. As a result underlined word or sign in abstraction became itself object of thinking. All mathematic conceptions present abstract objects. For example, conception of geometrical figures are being organized by emphasizing shapes of observed things, extension and mutual position in space and distraction from all other qualities (material, color, mass etc.). In this case, is being produced not only abstracting of segregated specified qualities and discarding all the rest but also idealization these characteristics by mental transition to limit forms, which in real are not exist, of course (ideal right line, point ellipse, planar surface etc.)

**Generalization** is being used in 2 different forms; 1- as mental segregation of general property (invariant) in 2 or more objects and junction these objects in group based on segregation of invariants (empirical generalization). 2-as mental segregation of volume or several objects which

are under consideration, in result of analysis their significant property in the form of general concept for whole object class (scientific-and-theoretical generalization).

**Concretization** also can be used in 2 forms; 1- as mental transition from common to private. 2- as ascension from abstract-and-common and concretely-and-private by detecting different features and signs of this abstract-and-common as filling, enrichment of abstract-and-common by specific content.

Depending on connection between sensory and abstract elements, distinguish 3 types of thinking;

1-graphically-effective;

2-graphical-imaginative

3-Theoretical (abstractedly, conceptual)

Ability to think distinctly, logically perfect and make oneself clear in real time are required for everyone. As for me, math is for training habit to strict thinking has more opportunities, from psychological point of view it is psychological reflection process of reality, higher model of human's creative efforts. School must teach how to think. Accordingly, digestion process should be organized in order to make a child to train not so only memory as capacity to solve tasks by himself, requiring brainwork and independent judgment. Should be developed ability to raise a question properly, teach how to see contradiction which often lead to "problem situation", practice at the lessons educational psychology and development of intellection by practical tasks and didactic games.

Given tasks are designed to control ability of logical reasoning of students by using theoretical and empirical knowledge as is also forming skill in acquirement process of new experience by them. Their solution lay not only to obtain profile information as in work with routine problem. They accomplish more wide function, transform subject of educational activity of student, forming new method of operation, develop independence of brainwork, creativity to nonstandard, unordinary, unexpected tasks. Accordingly, solving one or the other task with students, teacher should look forward to 2 tasks. First, help to student to solve exactly given task, teach him how to solve it, to observe analogous. Second, evolve capability of student in order to solve in future any task independently. Undoubtedly, these 2 aims are connected, because after coping with sufficiently target hard task for him, learner develops his problem solving ability generally.

Current aims will be achieved only if following conditions are created;

- Creating atmosphere which is favorable to emerging of new ideas and opinions.
- Supporting each attempts of children to independent thoughts and all conditions directed on organizing their thought, not to hold back initiative of learners.
- While estimating students it's necessary to remember that every student is in collective.
- Encourage learners in their attempts a hard task.
- Habituate children not to afraid mistakes

**1) Tasks on logical reasoning in empirical ideas.** For such kind of tasks can be refer tasks with arithmetic ideas which I use in soirees, competitions, begin from 5<sup>th</sup> grade. They are not requiring

knowledge of math, that's why they should be solved without using any algebraic approach only by logical reasoning. And they are quite hard for those who cannot think. Yes, while solving such kind of task it's probable enumeration of possibilities but then intellectual activities are considered as discourses of search.

### Examples;

**1-** One herdsman said; "Give me 8 sheep and we will have them equally". But another herdsman offered; "Give me 8 sheep and then I will have twice as much as you have". How many sheep have every herdsman?

**2-** In the yard hens and rabbits are running. They have 35 heads and 94 feet. How many hens and rabbits there?

**3-** For the space of 155 meters laid 25 tubes their length 5-8 meters. How many others tubes were laid?

**4-** How heavy is fish if its tail weighs 4 kg, head weighs as much as tail and half of the body, but body weighs as much as head and tail together?

**5-** How many natural numbers exist? How many natural numbers exist less 100 which;

A) Divides simultaneously into 2 and 3?

B) Divides into 2 but does not divide into 3?

C) Divides into 3 but does not divide into 2?

D) Divides into 3 or 2 (at least into one of this 2 numbers)

**6-** How many gray mice does Josef have? Jose has 100 mice, some of them are white and others are gray. It's known at least 1 mouse is grey when of 2 mice one is white. How many gray mice does Josef have?

**7-** Bucket of water. For dad 1 bucket of water is enough for 2 weeks, but together with son it's enough for 10 days. How many days 1 bucket of water will be sufficient for son, if he drink it alone?

**8-** Receive one million. Give an instance of 3 positive integers amount of them should be equal to 407 but intersection should be ended with 6 zero.

**9-** Together – faster. Horse eats haystack in 2 days, cow in 3 days, and sheep in 6 days. How many days they will eat a haystack if they eat it together?

**10-** How many pages in a book? For numbering pages of schoolbook were need 534 numbers. How many pages in a schoolbook? **Answer;** For numbering first 9 pages had been used 9 numbers. Following 90 pages numbered by two-digit numbers. For this was needed  $90 \times 2 = 180$  numbers. The rest, coming on number of three ciphers constitute  $534 - (180 + 9) = 345$  numbers. From this numbers constitute  $345 : 3 = 115$  numbers of three ciphers. In total numbers of pages in schoolbook equal  $9 + 90 + 115 = 214$

### 2) Logical tasks in abstract ideas.

Some of the task can be unsolvable which students should find and prove that tasks cannot be solved because they are illogical.

Examples;

- 1) A is bigger than B in 5 times, when C is smaller than A in 2 times. How many times C bigger than B?
- 2) A is smaller than B in 4 times, when C is smaller A in 2 times. How many times C is smaller A?
- 3) A is smaller than B in 5 times, but bigger C in 2 times. How many times B is smaller than A?

Here is given simple tasks, by this model can be make infinitely many tasks. To my mind, such kind of task forms cognitive interest of learning new scientific knowledge in training activity and get into a habit to set a questions for thinking.

### 3) Logical tasks in theoretical ideas.

Such kind of tasks measured for reproduction learned tasks by memory. Learners should solve these exercises independently, relying on theoretical knowledge (determination, conception, laws, rules, theorems, formulas) earlier learned in a moment of solving these tasks.

Examples;

- 1) 2 angles are given with common top. One of them is equal 100, another 80. Will these corners be adjacent?
- 2) 2 angles are given with common top, they are equal. Will these corners be vertical?
- 3) 2 intersecting lines are given. Will they be perpendicular?
- 4) There are 2 vessels with volume 1 and 2 L. From the contents of these vessels can be prepared 0.5L. of mixture, contained 40% apple juice and 2.5L mixture, contained 88% juice. What's the percentage of juice content in vessels?

### 4) Tasks which lay to identify abilities of students to distinguish complex of interconnection of mathematical value.

Task;

A) Determine in which given tasks below missed some important data, as a result correct answer for this task is impossible.(Missed data given in brackets).

-Train consists of cisterns, goods wagons, and platforms. Cisterns are 4 times less than platforms and 8 times less than goods wagons. How many cisterns, goods wagons, and platforms in train? (total quantity is unknown).

B) In the task question is missed. Phrase it (answers for teacher are typed in brackets)

-For the space of 155 meters laid 25 tubes their length 5-8 meters.( how many tubes were laid?)

- In a square of cloth was 15 m material. One customer bought 5m, another 4m. (How many meters remained in a square of cloth?)

During the process of solving tasks it's necessary to accustom children to stick neck out because fear of making mistake, interchain initiative of learners in problem solution. It is indispensable to encourage children in their attempts to take any difficult exercises.

Finally, it is indispensable to note that the most important task of mathematics education is gaining general techniques of thinking, extensive imagination, evolution of ability to understand the meaning of assigned task, ability to close reasoning, take in algorithm of thinking by learners. It is necessary for everyone to learn to analyzed, distinguish hypothesis from fact, distinctly express own ideas, on the other side expand imagination and intuition (spatial representation, capacity to foresee the result and predict issue). Exactly math represents favorable opportunities for education of the will, laborious, insistence of overcoming problems, persistence in achieving aims and developing mathematic skill well then logically and consciously investigate phenomenon of natural world. Realizing this goal may and must be redound the solution of various nonstandard logical tasks on math lessons. That's why using these tasks by teacher on the lessons are not only desirable but also necessary element of teaching mathematic.

## PSYCHOLOGICAL CONDITION OF DEAF CHILDREN IN TEACHING ENGLISH

**Nodira Nabiyeva Rustamjon qizi\***

\*Student of English Faculty,  
Namangan State University, UZBEKISTAN

### ABSTRACT

*This article highlights the current problems and their solutions to psychological condition of deaf children in teaching English. Also, author pay attention to the strategies which are helpful for deaf children in learning English.*

**KEYWORDS:** *Psychological Condition, Deaf Children, Complex Mental Action, Speech, Sign Language Alphabet.*

### INTRODUCTION

As you know, hard hearing and deaf people can't hear and speak. But they can communicate to out by their another skills. Their others senses doing work instead of ears and mouth, such as, their hand speak ( it does different techniques and motions); their lips show their words and their eyes, skins can hear.

If parents know their children are deaf or hard hearing they should begin teaches them to communicate with out immediately. Unless Children lost their skills of getting information to out. It is very bad. So parents must be aware of the situation with their children.

### Theoretical Basis

Speech is complex mental action. It effects to growing to children with mental and general mature. Speech is based on hearing organ and it becomes developing the way of comparison. Hearing analyser, the moving speech analyser which effects of speech. The moving speech analyser works with hearing analyser as a companion. Developing of the hearing analyser depends on pronunciation. Developing speech of children belongs to speech sounds, physiological and phonetical progressing[1]. Most importantly, it is also characterized by the ability to distinguish the structure of words in one's own speech and the speech of others, the structure of sound. Both signals systems, as well as the interaction of speech with cognition,

form the basis of mental development. According to defectologists (T.A. Vlasova, R.M. Boskis, D.V. Neumann, etc.) [2], The level of development of a child with hearing impairment depends on the stage of the child's life and the severity of the defect. In deaf pedagogy, children with hearing impairments are studied as a group of children who become deaf, hard of hearing, and later deaf. Absolute deafness in both ears during congenital infancy leads to deafness. Children with speech impairment as a result of partial hearing impairment are included in the group of hearing-impaired children. Children who become deaf after speech development are later included in the group of those who become deaf. Even if the defect occurs after the speech has been composed, there may still be hearing loss due to a defect in the ear.

Deafness can be congenital or acquired due to the causes of permanent hearing loss 25-30% of deaf and dumb children have congenital hearing loss [3]. This due to various disease of the mother during pregnancy, such as influenza. Acquired defects in hearing may be due to defects in the structure of the ear or hearing analyser. This is caused by changes in the upper nerve center, conduction pathways, or the ear itself. Children with hearing impairments are included in the category of anomalous children. Because this defect has a negative impact on the child's overall development and mastery of the application materials. Causes a number of specific difficulties in mastering kindergarten and school programs. After hearing development in young children, for example, after the age of two, the child does not hear the speech of others as a result of deafness. He even slowly forgets what he knows. The deafness in the child gradually merges with the deafness and he becomes deaf and dumb. Teachers and educators in special instructions should help such children to receive an appropriate education. If the child is not given special care in time, he will also show signs of mental retardation. However, a positive result is achieved if the necessary measures are taken to compensate for the defect. Children with mild hearing impairment hear a spoken speech at a distance of 6 to 8 m from the ear suoras 3 to 6 m [4]. Hearing-impaired children, in turn, are divided into children with mild to moderate hearing loss, depending on the degree of hearing impairment. A pre-school and a boarding school for children with hearing impairments have the necessary facilities. Children with moderate hearing loss can hear a spoken word in a loud whisper from a distance of 1 to 3 m [5]. As mentioned above, in deaf pedagogy, hearing-impaired children include children who were born deaf and later became hearing-impaired. Hearing impairment results in a number of deficiencies in the child's speech Poor spelling Poor grammatical component Words in a sentence Misuse of words inability to connect them inconsistent word-formative modifiers inability to use suffixes.

In severe hearing loss, the child hears a moderately spoken speech from a distance of 0.5 m. Misleading similar - sounding consonants, and so on. Some educators and teachers mistakenly treat the child as a lazy, irresponsible bully, as a result of which the child's whimsical cries become slurred, which leads to secondary mental changes. However, special treatment is required to create a conducive environment for them. There are special groups for children with hearing imperilments in pre-schools and vocational colleges in Uzbekistan. Children with mild hearing imperilments can be educated in public preschools and Scholl's along with their healthy peers. Education in these institutions is based on the state requirements and programs of 11 year general education. Deaf educators are making great strides in working with children with hearing imperilments. Boarding school for this category of children have a pre-school education department. This category of anomalous children successfully graduates from higher education

after studying in special evening schools and works equally with everyone in various enterprises of the country. The main task of educators and teachers is to separate healthy children from hearing-impaired children and to ensure that they receive education in special institutions or are involved in integrated education, if they need a special approach. Hence the elimination of hearing loss can compensate for the fibers. A student who feels he or she is unable to express himself or herself orally in a private institution should be able to express himself or herself in writing.

### **Results**

To this end, students are taught to express themselves orally and in writing on the basis of practical speaking skills and competencies. In deaf and hard of hearing Students, teachers and student activities are organized on the basis of exercises in a certain system of lessons and classes on the formation of spoken and written speech. In order to ensure the practical acquisition of speech materials, situations that require special written problem-solving and written explanations are planned in advance. It is required to be able to adapt all types of didactic tools to the speech process. In this case, the speech materials are predetermined in the planning of the curriculum of correctional pedagogical process is carried out on the basis of a certain system. Speech materials for each lesson are prepared in strict accordance with the principles of the correctional utility systt. A wide range of conditions are being created for students to be able to do it in practice without fear or shame. Pupils' pronunciation is clear and their range of hearing is chosen from light to complex. Their extensive communication and warm relationship with a deaf child develops the child's ability to receive and transmit speech information to the neat deaf and hard of hearing Children. Nuturing the need for conversational speech begins in the family. The speaking skills and competencies acquired in the new school should strengthened in the natural environment of the family. In addition, the development of deaf and hard of hearing children requires the use of loudspeakers in special institutions. These conditions are created with the participation of family members. Deaf and hard of hearing children acquire their mother tongue on the basis of corrective communicative principles adapted to the mental and speech abilities of the child, arising from the features of the laws of this language.

### **DISCUSSION**

Classroom are specially equipped, the formation of boarding school in accordance with the direction of the material and technical base increases the effectiveness of educational content. Because, now, he has the skills on how to receive information. It is also possible to learn foreign language in the same way after mastering one's mother tongue. They should be able to motivate children when needed. Deaf and dumb children need to be in constant contact with their parents and teachers to prevent them from developing depression when they reach adulthood. This means that the mental state of children is priority in order to achieve positive results in learning foreign languages. Learning foreign language seems a little easier for a child than learning his or her mother tongue. Teachers and educators have a great responsibility. If the child is approached with the right intention and strategy, he will develop positive qualities and will be able to learn foreign languages fluently. Because at that time, he has the skills on how to receive information.

## MOLECULAR GENETIC FACTORS OF BREAST CANCER DEVELOPMENT (REVIEW)

**Abdukhakimov Abdulla Nusratillayevich\***; **Tukhtaboeva Muqaddas Tukhtabieva\*\***

<sup>1,2</sup>Tashkent Regional Branch,  
Republican Specialized Scientific and,  
Practical Medical Center of Oncology and radiology,  
Tashkent, UZBEKISTAN

### ABSTRACT

*The problem of timely detection of breast cancer is not only in its asymptomatic development, but also in the absence of reliable diagnostic markers that contribute to the early detection of the neoplastic process. The main objectives of oncogenomics are to study the molecular mechanisms of carcinogenesis and develop optimal methods for preventing, diagnosing and monitoring cancer. One approach to solving this problem is to analyze the epigenetic characteristics of the tumor genome.*

**KEYWORDS:** *Breast Cancer, Heredity, Prevalence, Mutations*

### INTRODUCTION

It is known that malignant neoplasms are socially significant diseases. mammary cancer (MC), in turn, is one of the most common types of oncopathology, and hereditary forms of breast cancer are often associated with a high risk of developing the primary multiplicity of malignant tumors.

Of great importance in the diagnosis and treatment of breast cancer today are biological markers that are determined directly in the tumor tissue. These markers characterize the individual characteristics of the tumor: a tendency to invasion, metastasis, hormonal sensitivity, etc. [8]. Clarification of the molecular biological and pathogenetic characteristics of MC allows us to come closer to the individualization of systemic therapy and, in some cases, abandon the obviously ineffective, toxic and expensive treatment. The development of an individual approach to the treatment of MC improves the prognosis of cancer itself and the quality of life in patients [5].

---

## MATERIALS AND METHODS

The social importance of MC is so great that research in order to solve this problem occupy one of the leading places in modern oncology. It is believed that over the course of life, one in 8 women in the United States will develop breast cancer and one in 30 patients with MC will die.

MC is the most commonly diagnosed cancer and accounts for 23% of all newly diagnosed cases of cancer and 14% of the total mortality from cancer [11,12]. These neoplasms are characterized by an aggressive course, difficulty in predicting the outcome of the disease and high mortality.

The reasons for the rapid increase in the incidence of MC today include global urbanization of the environment, population aging, deterioration of the general environmental situation, technological disasters, all these factors lead to a steady increase in the number of oncological diseases observed over the past decade [4], including primary multiple malignant tumors (PMMT).

## RESULTS AND ITS DISCUSSION

At present, under the PMMT, they understand the independent occurrence and development of two or more neoplasms in one patient. In this case, not only different organs of various systems, but also paired organs, for example, mammary glands and ovaries, can be affected. The phenomenon of PMMT can occur as a result of various hereditary syndromes that are the result of specific hereditary mutations that determine the risk of cancer in 50% of offspring, with organ damage associated with these syndromes. One of the most common family oncological diseases in women is hereditary breast cancer, the frequency of occurrence of which is 5-10% [2, 15].

Despite the fact that in terms of the growth rate of incidence, MC is a leader among malignant neoplasms, real tests for early detection of breast cancer do not exist to this day [3].

The problem of timely detection of MC lies not only in its asymptomatic development, but also in the absence of reliable markers that contribute to the early detection of a neoplastic process. According to statistics, 80% of patients randomly discover a tumor in themselves, which in half of cases refers to a common stage [9].

The main tasks of oncogenomics are the study of molecular mechanisms of carcinogenesis and the development of optimal methods for the prevention, diagnosis and monitoring of cancer. One approach to solving this problem is to analyze the epigenetic characteristics of the tumor genome.

The purpose of this review was to study the candidate genes of the SFRP family in terms of their potential use as epigenetic markers of MC.

A number of methods have been developed to identify abnormal methylated loci in the tumor cell genome. Analysis of methylation markers is a fairly informative tool for molecular genetic diagnosis and monitoring of malignancy of tumors.

The pronounced heterogeneity at the clinical, histopathological and molecular levels has led to the creation of numerous markers of the disease, which, however, do not always provide a sufficient level of diagnostic efficiency. This explains the need to develop more modern multi-gene marker panels, including methylation marker panels. Modern studies indicate the

fundamental possibility of using both marker panels and single methylation markers as prognostic and predictive in MC.

The use of the optimized method of unbiased screening of differential genome methylation in MC research has led to the identification of a number of new methods that are being studied both from the point of view of participation in carcinogenesis, and from the point of view of diagnostic applications. The development and implementation of more advanced differential methylation screening protocols and the characteristics of new abnormal methylation markers should increase the efficiency of creating breast cancer diagnostic marker systems.

Like most malignant tumors, breast cancer have a multifactorial nature. Most women diagnosed with MC are of sporadic origin, rather than an inherited form of oncology. It is known that the proportion of hereditary MC is at least 10-15% of cases of ovarian cancer [2], which is associated with the presence of genetic mutations in one of the two genes for susceptibility to MC BRCA1 or BRCA2 [16]. It should be noted that mutations of these genes at the population level are very rare (1 in 400 individuals) and even less so in sporadic forms of these diseases [14]. Rarely, MC is caused by other hereditary syndromes [17].

Along with oncogenes, the tumor suppression genes of TSGs (Tumor Suppressor Genes) play an equally important role in the pathogenesis of MC [11]. The inactivation of TSGs, the selective growth of malignantly transformed cells, is based on genetic changes, including point mutations, deletions, rearrangements, as well as epigenetic lesions that affect the temporal and spatial control of gene expression without changing the DNA sequence [3]. The epigenetic mechanisms of reversible changes in the work of the genome do not affect the nucleotide sequence of DNA. The most well-known epigenetic mechanisms include DNA methylation, post-translational modification of nuclear proteins (histones) and post-transcriptional regulation of the stability of messenger RNA - mRNA [1]. Disturbances in the functioning of epigenetic mechanisms for controlling transcriptional activity of the genome play an important role in the process of neoplastic transformation [7].

Methylation is understood to mean a reversible chemical modification of the DNA structure by attaching a methyl group to cytosine as part of a CpG dinucleotide, where a pair of cytosine - guanine are sequentially located in the same DNA chain [6]. DNA methylation is one of the main mechanisms for controlling gene expression; a change in the structure of cytosine affects the efficiency of binding of transcription factors to regulatory regions of DNA. In the process of neoplastic transformation, cytosine hypermethylation is often observed in certain loci, and this phenomenon is called global hypomethylation or a uniform decrease in the degree of methylation of the entire genome. A global decrease in the degree of methylation of genomic DNA is associated with pathological activation of oncogenes and the accumulation of chromosomal aberrations, while local hypermethylation may be accompanied by inhibition of TSGs gene activity and genomic instability [6].

One of the earliest and most frequently encountered epigenetic events observed at the initial stages of the development of tumors of different localization is a violation of the epigenetic regulation of gene activity based on their abnormal methylation / dimethylation of both one and both alleles, which makes it possible to differentiate certain types of tumors [10] .

Epigenetic modification of the regulatory regions of genes disrupts their interaction with transcription factors, blocking these regions with proteins (Methyl CpG binding proteins) that

specifically bind to methylated CpG pairs and, in addition, makes changes in the surrounding chromatin, transferring it to a stably repressed state [18]. This phenomenon is practically not observed in normal tissues, and is called abnormal methylation of genes in the tumor.

## CONCLUSION

Unlike mutations, changes in DNA methylation profiles associated with loss of gene expression occur in a specific region of the gene, for example, in the promoter region or the first exon. To date, it has been established that gene methylation is associated with an aggressive form of the tumor and disease progression [13]. Since abnormal methylation is one of the earliest events in the genome of a transformed cell, the nature of the methylation of tightly-associated genes can provide the possibility of diagnosing oncopathology at the earliest stages of its occurrence, i.e. long before clinical signs, which in turn will allow for timely preventive therapy [13].

### ABSTRACT

*Learners and learning in the context of 21<sup>st</sup> century pedagogy need to be defined afresh. Today's learners are tech savvy and knowledge is at their fingertips. The smartphone genie serves its masters at the slightest rub. Teaching and learning profile has changed dramatically. This paradigm shift has narrowed its focus on learners and learning rather than on teachers and teaching; but it doesn't, in any way, mean that teachers and teaching have been sidelined. On the contrary, teachers and teaching have tactfully withdrawn to peripheral roles letting the floor for learners to flourish and create. It is only a change of roles- from active teachers to passive observers and from passive learners to active participants. This methodology in fact is child-centered pedagogy in current orthodoxy, and not teacher-led frontal teaching. Anecdotal evidences show that this method has immense potential to motivate and engage learners, provided teachers devise fresh motivational strategies and avoid harping on the same age-old, hackneyed methodology. This paper explores the various dimensions of this role reversals and its fit ability to 21<sup>st</sup> century pedagogical principles.*

**KEYWORDS:** 21<sup>st</sup> Century Pedagogy, Motivational Strategies, Learner-Centered, Teachers' Role, Learner Autonomy, Teacher Autonomy

### INTRODUCTION

21<sup>st</sup> century is a digital age and today's learners are digitally literate while the bulk of teacher community is still struggling to be digitally efficient. Our students are not the students of yester-century. They are smart and tech savvy. Knowledge for them is almost a free commodity, just Google and get it. In this fast and ever- changing world knowing what needs to be learnt is of lesser importance than how it should be learnt. Learning is now an ATM available anytime,

anywhere and on any device. This paradigm shift in approach to learning requires sincere involvement of all stakeholders especially teachers of the institution in the process of change. The old, traditional pedagogies are no longer relevant in preparing learners for 21<sup>st</sup> century skills: critical thinking, collaboration, communication, creativity and problem-solving. A close look at the 21<sup>st</sup> century skills indicates that to cope with the demands of new global economy, educational institutions must gear towards change for learners to survive in their future life. Technology is a tool to bolster the 21<sup>st</sup> century teaching-learning process (Dede, 2000; Voogt, 2008), provided that teachers see themselves as learning ‘enablers’ and not learning ‘transmitters’ (Lambert & Cuper, 2009).

Teaching English as a second or foreign language (ESL/EFL) has witnessed a phenomenal change over the last two and a half decades with greater thrust on learners and learning rather than on teachers and teaching. Curriculum, teaching methods, and teaching materials have been prepared to accommodate to the fast changing needs of the ESL/EFL population. This seminal change requires reformulating the role of teachers, teaching strategies and the learning materials. Learning doesn’t occur in vacuum and learner autonomy doesn’t happen automatically. Teachers play a major interactive role with both the learners and learning environment. They use effective strategies and suitable materials in a stress-free ambience to enhance the learning process but at times with little success. What is required is the proper groundwork, the platform, the launching pad which will encourage the students to open up, act freely and autonomously. CSRE approach might help in preparing and fostering the students’ motivational level. CSRE stands for CARE, SHARE, RAPPORT and ENGAGEMENT. Teachers’ caring and sharing attitude establishes a rapport with the students, a bridge of trust is built and the two-way traffic opens up. This two-way traffic slowly facilitates teaching learning process. This is an all-inclusive approach that not only serves the average learners but also encourages the slow learners to participate in the classroom activities. This approach provides teachers the tools to personalize teaching learning activities as co-learners by stepping down from ‘the sage on the stage to the guide on the side’ image (King, A. 1993).

In the formal and informal interaction with the teaching community at various forums, it came to the notice that most of the tutors feel that in spite of technology-equipped classroom, they are not welcomed by the learners. The most common problem for the ESL/EFL teacher is interacting with a dull, unresponsive class which most of the time avoids communicating with the teachers. The whole class appears to be silent spectator and this is truly a very frustrating experience for both the teacher and the taught. It further adds to teacher’s woe when the students who understand the question even do not answer and keep quite. This happens because of in conducive classroom environment, unapproachable teacher image, shyness, lack of confidence, lack of proper support, fear of making mistakes or fear of embarrassment before the class.

This paper endeavors to assimilate and analyze the teachers’ experiences during the interaction sessions on various forums and dive deep into the problem and its possible solution. It is widely accepted that nobody can teach if the learners are not ready to listen or learn. It is the responsibility of all the stakeholders especially the teachers to make them ready before sowing the seed of learning. Tutors knowingly or unknowingly ignore the basic principles of care, share, rapport and engagement which this article emphasizes; might provide the platform or the launching pad which can energize, activate and motivate the class to participate.

---

### **Dull and Unresponsive Language Classroom**

Tickling learners' interest and sustaining their motivational level is the key to all learning. It has massive effect and creates wonder in language learning. Let us see and examine in brief what is motivation and how does it work? Motivation is indeed a complex, multifaceted concept. This article describes how motivation manifests itself in the modern classroom and how motivation can be applied positively to the arsenal of tools used by educators in an effort to develop the optimal learning environment. The underachiever problem that seems to be pervasive in classrooms around much of the world is poorly understood. Teachers interpret underachievers as a challenge to their authority. They react to this problem by enforcing punitive measures which usually create a vicious circle of behavior violations and punishments. The final result is an exacerbation of the classroom disruption. The underlying reasons for under achievement are either not understood or simply ignored by many teachers. Underachievers can thrive in the secure, supportive environment that motivates them to be bold and confident.

### **What does motivation mean?**

Motivation means "impetus, incentive, activator" in literature (Bentley, 2000; Luthans, 1992). Thus, motivation is a way of inspiring or inducing learners to do something with interest to achieve what they want to get. It is a dynamic force urging a learner into action. A learner is motivated or set into action either by extrinsic rewards or by intrinsic needs. Motivation is, thus, an art of stimulating people to take desired course of action. Some people may be motivated by the rewards while others are self-motivated. It is in fact very difficult to have a single definition of motivation, but a few of the well-known definitions might feed us the flavor of the pudding. The main idea of motivation is to capture the child's attention and curiosity and channel their energy towards learning. According to Gardener (1985), motivation is concerned with the question, "Why does an organism behave as it does?" Dornyei rightly notes, "Teacher skills in motivating learners should be seen as central to teaching effectiveness." (2001:116). According to the Webster's, "to motivate means to provide with a motive, a need or desire that causes a person to act." "Motivation determines the extent of the learner's active involvement and attitude towards learning." (Ngeow, Karen Yeok-Hwa, 1998). "Motivation has been identified as the learner's orientation with regard to the goal of learning a second language." (Crookes & Schmidt 1991). Last but not the least, "Teacher behavior is a powerful motivational tool." (Dornyei, 2001:120). According to Balçık (2004: 135), motivation is "a person's willingly spending effort for the desired result or to reach a goal, which satisfies his/her needs". These quotes from various educationist and researchers clearly indicate the importance and effectiveness of motivation in teaching and learning activities. "Many researchers consider motivation as one of the main elements that determine success in developing a second or foreign language; it determines the extent of active, personal involvement in second language learning." (Oxford & Shearin, 1994).

### **Factors Affecting Motivational Activities**

Motivation is affected by many variable factors "teacher roles, class organization, interaction and class atmosphere" in a learning environment (Lumsden, 1999: 35). According to Selçuk and Güner (2000), lack of motivation affects the academic success of students. As a result of low level of motivation, students become less attentive to various activities, receive lower grades and display ignorant behaviors against academic subjects. Thus, the individual lives in anxiety and stops trying (Selçuk and Güner, 2000). Lack of motivation is perhaps the biggest obstacle faced

by language teachers. Behavioral problem in the classroom often or always **is** seen to be linked to the lack of motivation. It would be difficult to point to a single factor which would account for the apparent changing levels of motivation and involvement. There are many factors which affect students' commitment level to language learning. Some of these factors are:

- ❖ Unsupportive classroom environment
- ❖ Unfriendly peers & classmates
- ❖ Unapproachable teacher with 'a sage on the stage' image
- ❖ Difficult subject material
- ❖ Students see little value in the course & its content
- ❖ Improper teaching strategies
- ❖ Fear of failure and mistakes
- ❖ Unclear about learning goals
- ❖ Responsibilities other than study
- ❖ Feeling confused & isolated
- ❖ Previous negative experiences
- ❖ Mismatch between the knowledge, beliefs & interests
- ❖ Family or personal problems
- ❖ Poor health condition
- ❖ Lack of proper support at home
- ❖ Lack of confidence
- ❖ Low self-esteem
- ❖ Poor language skills

These above factors in many ways interplay and multiply day after day and lead the students to a state where they might experience anxiety, confusion, uncertainty, isolation, frustration and depression. These negative feelings force them to be aggressive or behave like a silent spectator or withdraw to their cell-the safe zone. Such conditions are the clear indicators that the learners are suffering from lowered self-esteem and here comes the role of all the stakeholders especially the tutors to bolster their low confidence by appreciating them and their work.

### **Learners & Effective Motivational Eco-System**

Disinterested students often have callous attitude or aggressive behavior towards teacher and teaching which multiplies their problems as well as of the tutors. Teachers are at crossroads as how to motivate these learners. Since motivation is an intrinsic and internal drive process, many teachers think that it is beyond their reach of influence. However, teachers can devise effective strategies for students to engage in learning, triggering motivation for learning (Deci and Ryan, 2008; Ormrod, 2008). In these situations a good teacher's role expands multifold to contain these demotivating factors and bring the students back on the track where they might feel like learning

and participating in class activities. Teachers should resort to different, new, fresh methods and techniques to energize the class and make the learners confident of what they are learning and achieving. It is not so easy for a teacher to create a sustainable motivational eco-system for learners, but not impossible to achieve.

Teachers' skill in motivating students to learn is of paramount importance. They can employ a variety of techniques, strategies at the Language level, the Learner level and the Learning situation level in order to motivate their students. Here are some of the main strategies and techniques that teachers have in their arsenal to use at the right moment and at the right target. Careful attention to these factors in the instructional setting enhances the possibilities for creating and ensuring conducive learning environment. When learners realize that their teacher recognizes their individual differences in abilities and their experiences are valued, respected, and incorporated in learning tasks and contexts, their level of motivation and sense of achievement are enhanced. In short, teachers' quality personal relationships with students establishes rapport, builds trust, increases learners' sense of belonging, self-respect, self-confidence and provides a positive ambience for learning. Some of these strategies are:

- ❖ Create stress-free environment
- ❖ Make the language class interesting
- ❖ Set a personal example of good behavior
- ❖ Develop peer-support network
- ❖ Present the task properly in a simpler way
- ❖ Promote learner autonomy
- ❖ Inculcate a sense of responsibility of their own learning
- ❖ Increase learners' linguistic self-confidence
- ❖ Personalize the learning process
- ❖ Increase the learners' goal-orientedness
- ❖ Take care of learners' needs, interests & motives
- ❖ Recognize the learners' 'little successes' & reward with words of appreciation
- ❖ Be approachable and maintain 'a guide on the side' image
- ❖ Use appropriate & interesting course materials
- ❖ Identify learners' individual differences
- ❖ Inculcate that success comes in, 'CANS' not in 'CANTS'
- ❖ Respect & accommodate their choice and voice
- ❖ Promote collaborative team work
- ❖ Encourage self-reflection on their daily activities
- ❖ Develop a sense of belongingness
- ❖ Let learners be in charge of their activities

### Learners & CSRE Approach-The Groundwork:

Tutors like farmers should plough the land before sowing the seed of learning. Anecdotal evidences show that the best of strategies fail in the absence of learners' readiness to listen and learn. Motivational strategies cannot work in a vacuum. There are certain preconditions to be met before any attempts to generate motivation can be effective. This approach focuses and emphasizes the teachers' attitudes towards their students. Teachers' caring and sharing attitude reduces fear and anxiety, encourages reciprocity, promotes autonomy and builds a rapport between the teacher and the students. This relationship further creates interest, generates motivation among students and helps teachers to engage students meaningfully. Quality personal relationships provide stability, trust and caring can increase learners' sense of belonging, self-respect, self- acceptance and provide a positive climate for learning. This is the beginning of a teaching-learning process in a stress-free atmosphere of trust and respect. Hence, this approach prepares the soil before sowing the seed of learning.

## CSRE APPROACH: THE LAUNCHING PAD

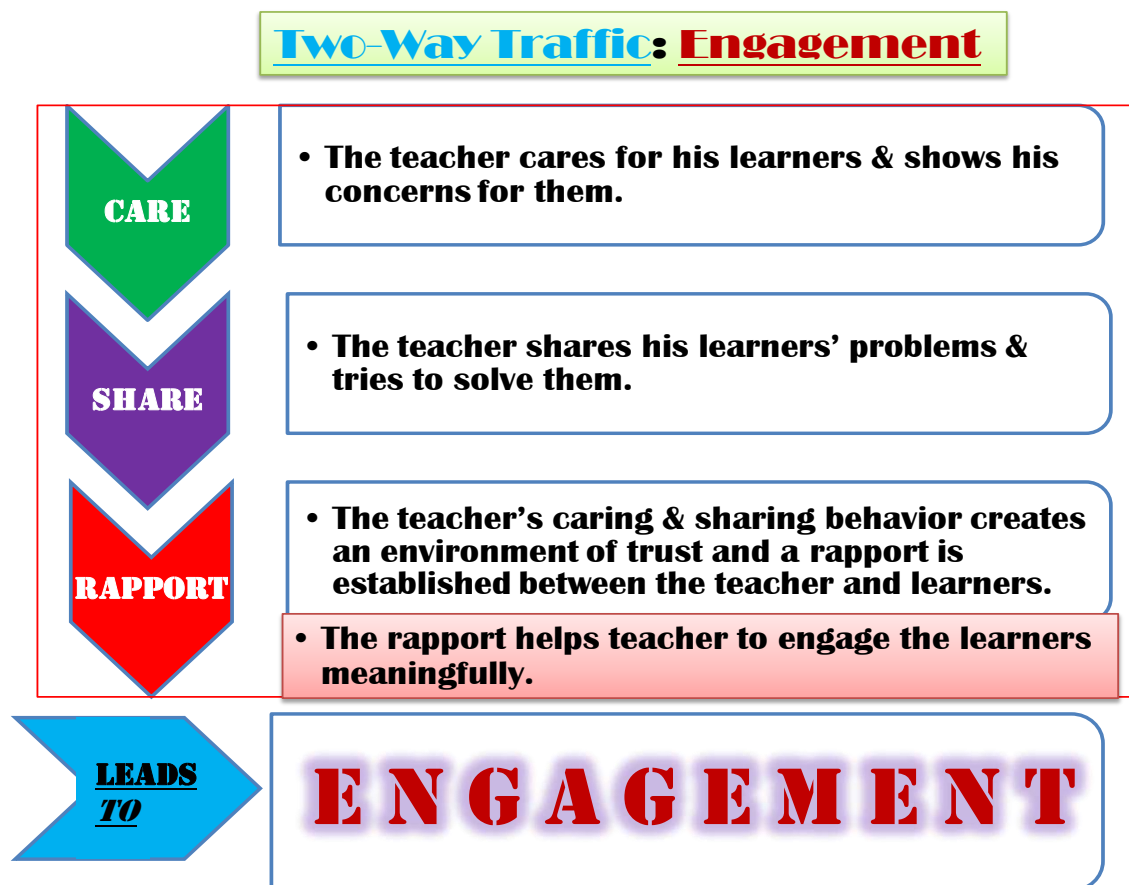

(Diagram 1, CSRE Approach: The Launching-Pad)

### Learning Takes Place: A Two-Way Traffic

It stands reasonably true that a tense classroom climate can undermine learning and demotivate learners. (see MacIntyre, 1999 and Young, 1999 for further details). On the other hand, learner

motivation will reach at its maximum level in a safe, secure classroom environment in which students can express their opinions freely and feel that they do not run the risk of being embarrassed or ridiculed. To be motivated to learn, students need both ample opportunities to learn and steady encouragement and support of their learning effort. So, the onus primarily is on the teachers to organize and manage the classroom as an effective learning environment because anxious or alienated students are unlikely to develop motivation to learn, it is important that learning occurs within a relaxed and supportive atmosphere (Good and Brophy, 1994:215). In such conducive, stress-free environment, the two-way traffic starts and the shyness, the inhibitions, the fear, the choking situation slowly evaporates. The students feel bold, confident and get motivated towards learning the target language.

(Diagram 2, Two-Way Traffic: Engagement)

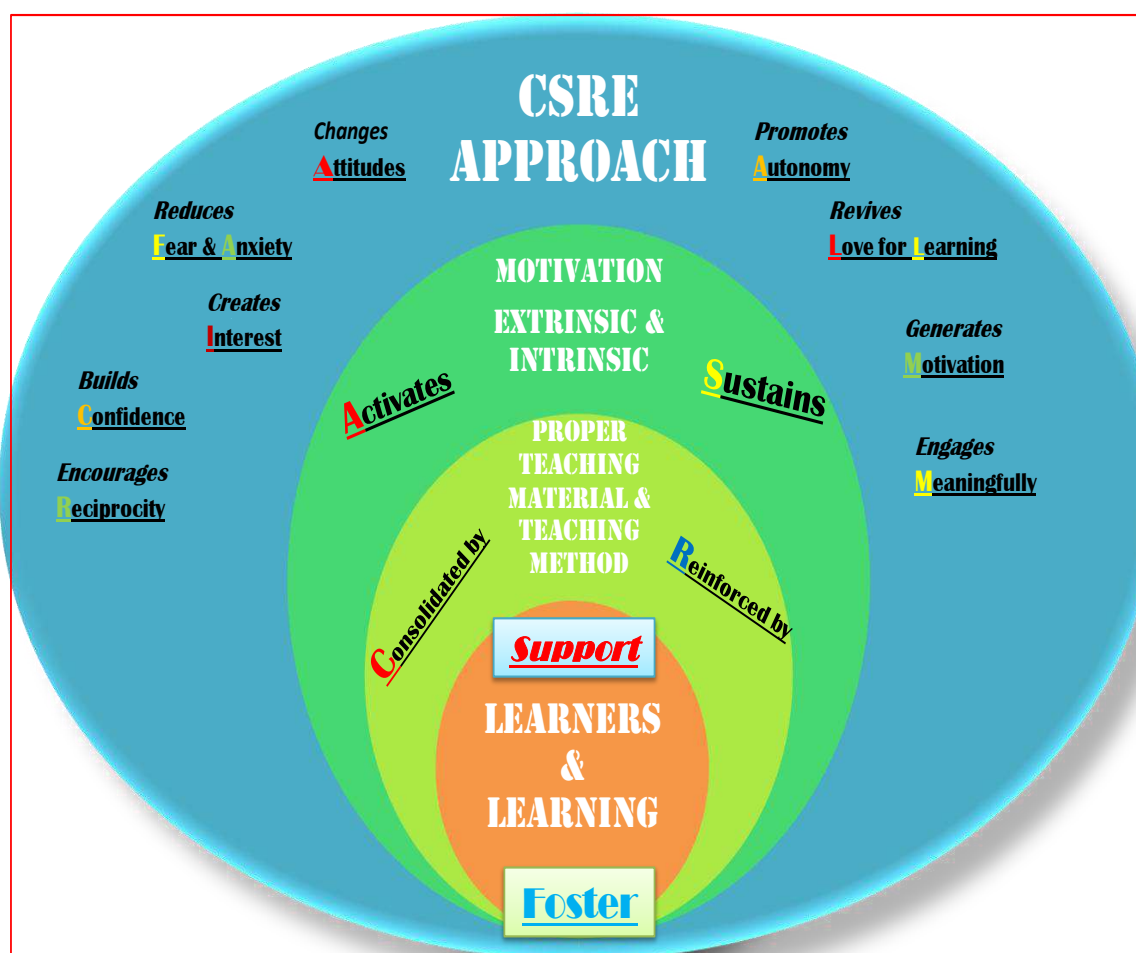

The Fulcrum of Teaching-Learning Process:

Teaching-learning process is not a one way traffic, it is a two-way traffic. The interaction between the tutor and the taught and among the learners themselves initiates learning. The teacher has to ensure a safe, secure environment of mutual trust and establish rapport with the learners who feel free to express and participate the class activities. The groundwork is done, the platform or the launching pad is ready and the plane of teaching-learning process takes off smoothly. The students are ready to listen, to learn, to participate. This is the time for the teacher

to use his strategies tactfully to exploit maximum of opportunities of teaching-learning process. In fact, resourceful and effective teachers do not use different strategies and techniques; they use the same strategies and techniques differently. The two-way traffic encourages the teachers to delegate slowly the learning autonomy to the students who now with their own desire share the responsibilities of learning activities. Thus, it sustains learners' intrinsic and extrinsic motivation, which is further strengthened by teachers' suitable teaching materials and easy-to-understand teaching techniques. All these, in turn, support and foster language learning. Cook rightly remarks (1991:82), "It is the learners' involvement, the learners' strategies, and the learners' abilities to go their ways that count, regardless of what the teacher is trying to do." In short, learners' involvement and participation is of paramount importance in teaching-learning process to be meaningful.

### The Fulcrum of Teaching-Learning Process

(Diagram 3, The Fulcrum of Teaching-Learning Process)

---

### The Evolving Role of 21<sup>st</sup> Century Teachers:

The shift of focus from teachers and teaching to learners and learning doesn't minimize the role of teachers; on the contrary, it extends it manifold. CSRE approach bestows more sincere effort and responsibilities on language teachers. In general, the teaching profession is a profession that bases much of its methodology on tradition. Many teachers teach one year thirty times instead of teaching thirty different times. There is some degree of security gained from "doing what worked in the past," however; the 21<sup>st</sup> century demands that teachers take risks in order to develop strategies that benefit their today's students. In the words of the great educationist, John Dewey, "If we teach today as we taught yesterday, we rob our children of tomorrow." Teachers should transform their role into that of leaders and coaches as opposed to bosses and disciplinarians. Many researches serve as an outstanding study in support of the teacher as a change agent for the educational process.

The teachers are usually seen today as: facilitators of learning, the guide on the side, great motivators, role models, innovators, resource providers, lifelong learners, adaptive, tech savvy, creators of enabling environment, promoters of collaboration, great communicators and what not. Looking at the above roles teachers have been or are playing through the ages, it seems that they are what not personalities. There is no doubt; teachers play an important role in shaping learners' behavior, and motivating them to learn and making them better human beings. They as learning physicians help students to identify their cognitive and affective ailments and suggest courses of treatment. At the same time as agents of social change share the responsibilities to model society in classroom and to promote an ethical learning curriculum in addition to cognitive and affective ones. The teacher-controlled environment, which translates every aspect of life in an educational institution, in fact stifles creativity, and encourages students to abdicate decision-making and problem solving to an authority-figure who prescribes, restricts and evaluates. However "benevolent" such an autocracy might be, and however much this might be deemed to be in the students' "best interests", such a situation cannot be expected to promote and develop critical thinking skills, or a responsible attitude to life and society.

A close look at the conditions for learning that were researched and identified by Rogers (1951) over half a century ago, it is interesting to note the key words that appear: active, personal meaning, subjective nature of learning, difference, the right to make mistakes, tolerates ambiguity, cooperative, self-evaluation, openness of self, trusted, respected, accepted, permits confrontation. In other words, teachers can focus their attention on making the classroom into an environment that is conducive to learning. 'Irrespective of teaching method or lesson content, we can make our classrooms into places where students are confident, respected, and motivated'. As can be seen from Kelly's (1996:96-96) macro and micro-skills of language counseling; this environment will require the teacher to become an affective and cognitive counselor. Once more exciting keywords appear: introducing, promoting, helping, reduce uncertainty, enable, offering advice, suggesting, demonstrating encouragement, reinforcement, constructive reaction. We thus have now a revised view of the teacher as a learning counselor, helping students to feel good about them and to maximize their learning capabilities.

Teachers are the people who can inculcate the skills and characteristics of responsible citizens, and can use the micro-society of the classroom as a model for the greater society that students will meet when they leave school or college. They can focus on the sort of problem-solving skills

and critical thinking skills that students will need when they enter that society, and can create environment in which students can experiment with the social skills that they will need to develop. In short, teachers can promote the sort of positive qualities that are needed in society. Humanists, philosophers and educationalists (e.g. Bruner, Dewey, and Krishnamurti) have been making these points for more than a hundred years, and it is noticeable now that a number of government-based policy statements cite holistic and humanistic principles as educational goals. Teachers are agents of social change and they can do things in the context of humanistic goals through promoting a non-threatening learning environment.

CSRE Approach which respects the students and places them at the center of teaching-learning process has an inevitable impact on the lesson content and on teacher / student roles. Thus the teacher being in the background of teaching-learning process, a large variety of activities can occur simultaneously, and the ability of the student to become concerned and committed is an important gauge of growth. Teachers have been portrayed in many different roles so far. Let us now go even further in terms of role change.

#### CSRE Approach: Teachers as Co-Learners

CSRE Approach stresses on personalization of teaching and thus adds a new feather into the role-cap of the teachers. This is: the teachers are all the above but above all these, they are CO-LEARNERS. Yes, teachers are co-learners who learn every moment, every second, every minute, every hour, and every day about their students, their problems, the classroom environment, their own teaching techniques and the teaching materials. They reflect on every aspects of teaching-learning process on daily basis. They learn and improve and it goes on. Yes, teachers are co-learners, ever learners. They learn with their own students in the classroom. The students learn the language and the teachers learn how best they can facilitate them to learn. In a learner-centered classroom the teacher is very much present as a fragrance that exalts, activates, energizes and relaxes. The teachers' role as co-learners takes the pall of heaviness, strain and stress off the classroom environment, which is a primary factor in the process of learning to take place.

#### Learners' Autonomy Mandates Teachers' Autonomy

All through previous decades educational pundits have talked a lot about learners' autonomy but they have written very little about teachers' autonomy. Johnson, Pardesi and Paine, 1990, cited in Gathercole, 1990:51, "To posit ways of fostering learner autonomy is certainly to posit ways of fostering teacher autonomy, as teachers' autonomy permeates into learners' autonomy." As learners' autonomy is a step further in the direction of motivating the students to achieve their desired goal initiating their own interest and sustaining it, teachers' autonomy gives them the freedom to choose their techniques and materials according to the need of the learners and their goals. Teachers are ever learners. They learn and experiment in the classroom to improve their teaching and sustain the learners' motivation. Thus the teachers need to be autonomous to freely make a choice of strategies or materials that can charge the imagination of the learners. Prescribed books and norms most of the time hinders teachers to invent and explore the greener pastures where they can do even better justification with their learners as far as their improvement is concerned. This part needs to be discussed in detailed in national and international conferences.

## CONCLUSION

This study concludes the investigation spread over scores of discussions, debates and interviews from teachers, learners and other stakeholders of HEIs nationally and internationally on various forums. One thing that every one sticks to is: motivation is the key to all learning. Teachers resort to various teaching techniques and strategies to motivate the learners to learn the second language. They are not always successful; on the contrary, it can be said that most of the time they fail in tickling the learners' imagination. Though the teachers employ their best of strategies, the result borders below their expectations, they fail to motivate the students. It does not mean that the teachers are incapable or the techniques used are not proper. This happens because the teachers straightway jump on the business of teaching without prior & proper groundwork. Here comes the CSRE approach, which if the teachers follow, prepares the soil before sowing the seed. If the soil is not ready to receive the seeds to germinate, it will not work. Strategies or materials will not work until the students are ready to listen and learn. The teachers should first care and share about their learners' needs and interests which, in turn, win the confidence and trust of the learners. This ambience of care and share leads to rapport between the teacher and the taught. This bridges the distance between the teachers and learners and establishes a bond of trust and confidence. The learners, even the slow-learners feel confident and the teacher succeeds in shading off the halo of a teacher that restricts students to freely approach with their problems. Now, they feel that even the teacher is among one of them and their friend.

The groundwork is the preparation of soil to receive the seeds of learning. This preparation gives the teachers the platform from where they can take their students to any height and sustain their motivation which helps learners to learn better. The rapport between the teachers and students fosters the level of motivation. The learners attain autonomy and without any inhibitions approach teachers, discuss with peers and manage their learning of English as a foreign language. Here it would be right to mention that learners' autonomy leads to teachers' autonomy. CSRE approach advocates that teachers' autonomy facilitates learners' autonomy. Teachers can't invent and explore within the boundaries created by fixed techniques, strategies or curriculum. The teachers should have the autonomy to learn and experiment the strategies or materials that they think are in concert with the learner's needs and interests. Old, stereotype techniques and methods lead to boredom and demotivation of learners. CSRE Approach humanizes the teaching-learning process by delegating the teachers to the level of co-learners who reflect on every aspects of the learning trajectory and adapt to evolving, refreshing changes leading to spin better environment which facilitates better leaning for the learners.

**BIOGRAPHY:**

Dr. Mohammed Quamruddin Ansari is a well-known English language teacher. He has been in this profession for the last thirty-five years including twenty-five years of tryst with the Arab students at the tertiary level. He has served in several educational institutions of repute. He is a regular presenter at the national and international conferences, workshops and symposiums. He is a writer and the author of 'Motivation: CSRE Approach-the Launching Pad'. This book contains a multitude of worthwhile observations regarding English language teaching-learning techniques. Practical techniques are offered that if followed would produce positive tangible changes in the confidence and motivation level of the learners. Delving deep into classroom mechanics and teacher involved motivational strategies, Dr. Ansari's book has been an exhaustive probe to redefine teacher-learner engagement. It is a meaningful eye opener to those teachers in search of value-oriented teaching methods as well as learner-based learning consideration. He firmly believes; 'Good teachers do not teach something different; they teach the same thing differently.' His areas of interests are: Teachers & Motivational Strategies, Learner Autonomy, 21<sup>st</sup> Century skills, Teachers as Co-learners, Curriculum Development, Teacher Autonomy, Quality Assurance in HEIs, 21<sup>st</sup> Century Skills: Future Employability, and Technology Assisted Language Learning (TALL).

International Islamic Academy of UZBEKISTAN

### ABSTRACT

*In the IX-XIII centuries, Movarounnahr became one of the most important centers of development of jurisprudence, where thousands of Islamic jurisprudences worked. Our compatriot BurhoniddinMarginoni has a special place among Movarounnahr jurists. As a great representative of the Hanafi School, he made a great contribution to the development of jurisprudence. BurhaniddinMarginoni's work "Al-Hidoyah" is the main textbook, manual, program in all madrassas and Dar al-Funun of the Muslim world. State and religious leaders, public figures, scholars and scholars used the work of BurhaniddinMarginoni and relied on him. Social welfare institutions have existed for a long time. They were first carried out in Islamic society through waqfs. As the waqf institution expanded, special jurisprudence books were classified about it, and separate chapters were devoted to the subject of the waqf in each general jurisprudence book. In the tenth and thirteenth centuries, the science of jurisprudence was particularly advanced, and during this period many works on Islamic law were written. One of such books is "Al-Hidoyah" by BurhaniddinMarginoni. The article deals with the coverage, arguments and methods of the waqf in the work "Al-Hidoyah".*

**KEYWORDS:** *BurhaniddinMarginoni, Kitob Al-Hidoyah, waqf, inheritance, obligatory of waqf, waqf of its share from the property of the unallocated partnership, waqf of mosque and cemetery.*

### INTRODUCTION

Burhoniddin Marginoni was born in the village of Rishtan in the Fergana region and lived in the city of Margilan for thirteen years. He wrote the first part of his famous work "Al-Hidoyah" here. He spent most of his life in Samarkand. In April 1178 he completed the work "Al-Hidoyah". In this play, some of the jurisprudential views of the Hanafi School are compared in

some places with those of the Shafi'i school. The book mentions the names of many scholars, including Imam Abu Hanifa and his two disciples, Imam Abu Yusuf and Imam Muhammad. Also, the names of Quduri, Qazikhan, Sarakhsi, Tahavi, and Imam Shafii appear several times in the book, especially in the chapter on waqf. There are also examples from books on jurisprudence in "Al-Hidoyah". These include the "Al-Mabsut" [1], the "Mukhtasar al-Quduri" [2], and the "Fatwa of India" [3].

Burhaniddin Marginoni's novel "Al-Hidoyah" contains the following issues related to the ownership of waqf: 1. The lexical and terminological meaning of the word waqf. 2. Whether or not the property of the waqfis disposed of by the waqf, whether the waqfis obligatory or not. 3. Ruling on bequeathing property. 4. Whether it is necessary or not to transfer the property of the waqf to the trustee. 5. Endowment of undistributed, divisible and indivisible, share property. 6. Whether or not it is permissible to link a waqf to a period or purpose. 7. Provisions related to the waqf of movable and immovable property. 8. Non-sale, gift and inheritance of endowed property. 9. Provisions related to ensuring the validity of waqf property. 10. To establish a waqf and to be a trustee. 11. Replacement of waqf property.

### THE MAIN PART

In "Al-Hidoyah", the chapter on the waqf begins with an interpretation of the lexical and terminological meaning of the waqf [5]. The word "habs" was used in the interpretation of the word "waqf" to mean "holding". In the following places, the author quotes the opinion that Abu Hanifa's waqf property remained in the hands of its owner and his interests were given as alms as in the Aryan [6]. Another important point in this regard is that Marghinani stated in Al-Mabsut that waqf is not permissible in the eyes of Imam Abu Hanifa, but in fact waqf is permissible in his opinion (Abu Hanifa) and is not only obligatory.

In Islamic law, the word waqf is consistent with both views. According to "Al-Hidoyah", this is based on historical evidence. In the "Al-Hidoyah", the evidence of the imams is also cited, after linking it to the historical evidence. The evidence of the two Imams is the hadith that when the Companions' Umar wanted to give alms to a garden called Samgh, the Prophet (saas) recommended that his original alms be given on the condition that it should not be sold, inherited or gifted; Abu Haneefah's evidence is the hadith of the Prophet (saas) that says, "There is no imprisonment in the sight of Allaah" [7].

After quoting the opinions and arguments of the scholars of jurisprudence in the "Al-Hidoyah", a fatwa has been issued stating whether the property of the waqf will remain in the possession of the waqf: "Despite the disagreements of the Imams, when a waqf is accepted as sahih (it is called *mustahaq* in "Al-Hidoyah"), it becomes the property of the waqf, but it is not given to the person who is waqf".

The issue of endowment of property on divisible and indivisible goods is another of the topics mentioned in "Al-Hidoyah". According to Imam Abu Yusuf, it is permissible to endow undistributed property [8]; Imam Muhammad, on the other hand, stated that the distribution of property was obligatory first. This dispute applies to goods that can be divided, and it is stated in the "Al-Hidoyah" that a waqf is permissible for non-divisible goods, even in the sight of Imam Muhammad, even if it is a joint property. Because this property is also a gift and a charity given to certain people. However, this type of property is not endowed for a mosque or cemetery. For Imam Abu Yusuf, the foundation of a mosque and a cemetery is an indivisible partnership. The

continuation of the partnership will prevent that property from being used for the sake of Allah, and its use for other purposes is a very unacceptable act. It is as if burying corpses in such soil one year, planting crops the next year, praying in it at another time, and feeding animals in it at another time. This is an illegal move.

Another issue mentioned in the text of “Al-Hidoyah” is the waqf of property for a certain period of time. According to Imam Abu Hanifa and Imam Muhammad, the endowment of a waqf does not take place without an indefinite term or purpose, and according to Imam Abu Yusuf, a waqf takes place even if it is bound for a temporary period or purpose.

Regarding the endowment of movable and immovable property, “Al-Hidoyah” states that it is permissible to endow real estate [9]. In several places above, we have considered examples of many Companions endowing their own real estate. The issue of real estate is interpreted differently in “Al-Hidoyah”: “It is not permissible to endow goods that can be transported or exchanged”. The author emphasizes that this view is the absolute opinion of Abu Hanifa. The two imams have different views on this issue. According to Imam Abu Yusuf, a person can endow his real estate with the animals inside and those animals with their shepherds who are their slaves. Similarly, the tools needed for planting on the ground can be endowed with the land. That is, the foundation of movable property will be possible together with the real property to which it belongs. Some cases that are not directly permissible are sometimes indirectly permissible. For example, drinking water sold along with the land, as well as the foundation building. Imam Muhammad agrees with Imam Abu Yusuf on this point. Commenting on the movable property, Marghinani said: “In our opinion, the waqf of non-traditional movable property (waqf) is not permissible”.

The issue of endowment of the partnership's property is also considered in “Al-Hidoyah”. In fact, this issue can be equated with the endowment of undistributed property. However, partnership property is understood to be a current situation. In the case of undistributed property, the issue of division may be raised later by the heirs after the death of the founder, or by his heirs after it becomes clear that the property has not been distributed.

The text of “Al-Hidoyah” goes on to say: “It is not permissible to sell or transfer property to another person after the foundation has been established. However, according to Imam Abu Yusuf, if the property of a waqf is a partnership property that can be divided, the partner may demand a division, and its division is valid [10]. We have already mentioned the reason why it is not permissible to give waqf property to anyone. Sharing is permissible because it is a separation and an exaggeration. In the case of waqf property, the main focus is on separation, that is, the separation of waqf property. “Al-Hidoyah” states that if a person donates his share in the partnership's real estate, he will settle the division with his partner. Because in this case, the authority belongs to the founder, and in case of his death, to his guardian. If a partner makes a waqf after his death, he shares it with his partner's guardian, that is, the person authorized by the deceased. If someone donates half of a property he/she owns, it can be done in two different ways. 1. Carries out the division work in interaction with the judge. 2. The other half of the property is shared with him, and then he buys back what he sold to him. In “Al-Hidoyah”, this issue is explained by the fact that “a person cannot be both a sharer and a shareholder”.

When the money is different in the division, it is not permissible if the founder is given money in exchange for the property of the foundation. However, if the endower gives money, it is permissible and the goods are purchased at the price of the money given.

One of the most important aspects of a foundation property is that it is usable so that it can serve its intended purpose. Who will be responsible for the repair of waqf property is one of the important issues of Islamic law.

In “Al-Hidoyah”, it is stated that the waqf trustee must first make the property of the waqf valid, whether or not the waqf makes a condition [11]. Because the goal of the founder is to ensure that people continue to use the income of the foundation. It is impossible for the income of a foundation property that has not been repaired and made usable to continue. Therefore, the condition of foundation repair arises spontaneously. In other words, the trustee (trustee) will have the authority to generate income for the foundation and spend it, as well as to repair it.

“Al-Hidoyah” also has the following issue: “The governor uses obsolete buildings and equipment of the foundation for the repair of the foundation. If there is no such need at that time, keep them until the need arises. When the need arises, he will use it there again”. This measure is to ensure the continuity of the foundation. But if the equipment cannot be used in its old place, they are sold and the money is spent on the needs of the foundation. In this way, the money is transferred to that device. “Al-Hidoyah” states, “This material will not be distributed among the waqfs”.

Another important issue of the topic of waqf is self-waqf. In addition, the ability of the founder to manage a foundation made in another way is another question.

It is noted that it is not permissible for Imam Muhammad to self-assign the income of the waqf, which is a waqf, to which it is permissible under Imam Abu Yusuf if he calls himself the income of the waqf in this regard in “Al-Hidoyah” [12].

Imam Abu Yusuf relies on the narration that Muhammad (saas) ate from his alms in this regard. The purpose of the charity in the narration is the endowed charity. This narration is strange. Ibn Abu Shaybah narrated the following narration in the chapter on the hadiths that the Musannafthemselves and Abu Haneefah objected to: “In the waqfs of the Messenger of Allaah (saas) there was the phrase “Owners can eat enough of it, not too much” [13].The endower can eat from his charity only on condition. As an example, the author mentions that a person who builds a caravanserai or irrigation facility will naturally use it himself, and as another example, a person who has buried his husband can be buried in the same cemetery.He emphasized that this is the main goal of the waqf, which is to attain rewards and intimacy with Allah, which can also be achieved by spending for oneself.

The evidence given in the “Al-Hidoyah” is as follows: The Prophet (saas) said: “What a person spends for himself is charity” [14].

Another issue related to waqf management is the issue of waqf husband replacement. This change may be based on a condition set by the founder or on demand. The waqf's imposition of such a condition is due to the fact that the waqf wants to give another land belonging to him instead of the husband. This can happen for reasons related to the founder himself.

“Al-Hidoyah” mentions that the founder of the foundation should stipulate the replacement of the husband. According to the play, according to Imam Abu Yusuf, it is permissible for the waqf to condition that the waqf land be exchanged for another land at any time. Imam Muhammad, on the other hand, stated that the waqf made in this case is valid and the condition is not valid. According to Imam Abu Yusuf, if the waqf adds a condition for him to return from the waqf within three days, then both the waqf and the condition are valid. According to Imam Muhammad, the waqf is not valid.

After mentioning the diversity of views in “Al-Hidoyah”, the author expresses his opinion. According to him, the trustee himself acquires the quality of trustworthiness only with the permission of the founder. It is a matter that another person cannot be a trustee himself unless he can be a trustee only with the permission of the founder. In addition, since he is closer to the foundation than others, the trustworthiness of the foundation is first and foremost his right.

If the founder of the waqf has stipulated that the trust should belong to him, but he is not a trustworthy person, the governor can take the trust from the waqf in order to protect the rights of the poor. Under the terms of Islamic law, the governor will also be able to remove the guardian (the person caring for the children of the deceased) for the benefit of the orphans. If, in order to prevent this, the waqf stipulates that neither the sultan nor the ruler should exempt himself from mutawallism, and then this condition is void, that is, void, because it contradicts the tools of jurisprudence [15]. This rule was introduced to protect both the property of the waqf and the rights of its users.

In Burhaniddin Marginoni's work “Al-Hidoyah” there is a special section on the foundations of mosques and cemeteries. Because the foundation of such places is not like other types of foundations, their origin is the foundation, not the income. In addition, it will never be possible to use them for other purposes, even temporarily.

Modern scholars have divided foundations into two types according to their economic content. They are direct and indirect foundations. Direct foundations include properties that are actually used, such as mosques and cemeteries, which are the subject of our subject. Indirect foundations, on the other hand, include properties such as shops and gardens, the profits of which are actually used to generate income, the benefits of which are spent in the ways determined by the founder.

In “Al-Hidoyah”, as mentioned above, there is a separate section for mosques and cemeteries in the Foundation. At the same time, in other parts of the “Waqf Chapter” there are places where the subject of these direct foundations is addressed in the sense of comparison. For reasons such as not being able to use direct foundations for other purposes and not being similar to other types of property in matters such as heirs claim, partnership ownership, we have called these types of foundations conditionally immovable foundations. Below we will look at the views and rulings on property donated for such purposes in “Al-Hidoyah”.

“Al-Hidoyah” states that when a person builds a mosque, his property rights in the mosque do not expire unless he separates it from the road and allows the people to pray inside it. That is, this foundation will not be realized. According to Abu Haneefah, when a person prays in it, he leaves the ownership of the founder of the mosque.

According to “Al-Hidoyah”, if a person builds a mosque with a well under it or a house above it, and he opens the door of the mosque and takes it out of his possession, he can sell it at any time

and leave an inheritance behind. That is, such a foundation will not be realized [16]. This is because the slave has the right to remain in it, so it does not meet the condition of presenting it for the sake of Allah. However, if the well is for the improvement of the mosque, as in the Bayt al-Maqdis mosque, the waqf is valid.

Hasan ibn Ziyad narrated that Abu Haneefah said: If a person builds a mosque on the lower part of a building where the upper part is a house, it will be a real mosque. Because the duration that should be in the mosque is at the bottom of the building. In addition, the lower part can continue to exist without the upper part. Imam Muhammad, on the other hand, narrated the opposite: Because a mosque is great, and the presence of a house or a place for bathing on it undermines its greatness.

## CONCLUSION

It is narrated that when Imam Abu Yusuf came to Baghdad and saw that the land was scarce, he said that the waqf was valid in both cases. It is narrated that Imam Muhammad also said that when he entered Rayy, the waqf was valid in both cases for the same reason, out of necessity. The "Al-Hidoyah" states, "Whoever makes his husband a mosque, he cannot take it back from him, nor can he sell the mosque, nor can he inherit it". "Al-Hidoyah" also states: "If someone builds a drinking water facility for Muslims, or a caravanserai, where passengers stop, or a cemetery for his husband, these properties will not be taken out of his possession until the governor decides in the sight of Imam Abu Haneefah" [17].

Because they have not ceased to be slaves and he can use them himself. For example, he could stay in a caravanserai, drink water from a building, or be buried in a cemetery.

In "Al-Hidoyah", the rulings on waqf are briefly described, and for a better understanding of them, one can refer to the commentaries written in the book. Alouddin AbulQasim Mahmud ibn Abdullah ibn Sa'id Ruzi Hanafi (d. 606 AH) "Khulosa an - nihoya Fi favoid al-Hidoyah", Hamiduddin Ali ibn Muhammad ibn Ali Zarir Bukhari Romishi (d. 666 AH) book "Al-Favoid al-Bahiyah", "Nihoya al-kifoya Fi diroya al-Hidoyah" by Toj ash-Sharia Umar ibn Sadr ash-Sharia Mahbubiy (d. 673 AH) and "Sharh al-Hidoyah" by Ali ibn Muhammad ibn Hasan Alouddin (d. 708 AH) are among them. Using similar commentary books, it will be possible to explain the topic in more detail with evidence and examples.

## LOVE AND ENLIGHTENMENT - A COMMON CONCEPT

**Latipov Hayot Ramazonovich\***

\*Senior Lecturer,  
Bukhara State University, UZBEKISTAN

### ABSTRACT

*This article focuses on the interpretation of mystical meanings in the example of Alisher Navoi's work, the description of the highest human qualities inherent in the lover. At the same time, this article examines the general and specific qualities of a wise lover based on sources.*

**KEYWORDS:** *Mysticism, Love, Beloved, Enlightenment, Maruf, Wise, Enlightened.*

### INTRODUCTION

Love is the first quality that leads to the appearance of the Truth in the terminology of the Sufis [1, 1952] [Mahmud Shabustari. GulshaniRoz. 1952, page - 47.]. The people gave the following definitions of love as follows: "Love is aexperience, and it is the passion of lovers and beloveds. Love also comes in the sense of companionship and longing for a friend. Love is derived from the root of the word "ashaqa", which is the name of cocaine. Ashaqa is such a drug that it wraps itself around the plants around it, absorbs the water in their bodies and turns them yellow and dries them prematurely. Love also turns the color of the lover yellow, separates him from the people of the world, and separates him from worldly interests. "Love" is a fire that appears in the heart and burns the body of the beloved. The calamity of love is divine, the river and the juniper are divine, and jam is a means between the heart and the lover. [SayyidJa'farSajjodiy. "Mustalahotiurafo and Sufism". Hijri-1339, pp. 275-276; Sheikh NajmiddinKubro. Mystical life. 2004, pp. 224-225.] The sages called for complete zeal and perseverance, and those who were in love with divine glory and beauty were called "lovers" [1, 1952] [Mahmud Shabustari. Gulshani roz.1952, p. 65].

### THE MAIN FINDINGS AND RESULTS

Orifijom (wisdom) - According to Abdurahman Jami's "Nafahatul-Uns" on the history of Sufism, one of the first to speak of the high rank of love, that is, true love, was the Sufi rabbi al-Adawiyah (713-851). She is the first female wise lover, who spoke of the essence of the original enlightenment with pure love, saying that the beginning and the suicide of creative aspirations

and pleasure pursuits are a matter of God. Robiya ad-Adaviya condemned the worship of God in the hope of paradise happiness or the intention to survive the fire of hell, saying, "it is necessary for a person to act faithfully and to remember in his heart a lonely friend appointment, in order to purify his soul perfectly from any (worldly-spiritual) goals or fears"[1, 1952] [DiloromSalali. *Mysticism and artistic creativity*. 2018, page-24-25]. In our opinion, such progressive ideas, which move the hearts with wonder and excitement, served as a divine beacon and a source of love, passion and inspiration for the leech people during their journey to the original destination.

For example, it is stated in *Manaqibi Hazrat Ghawsul-A'zam*: That is, love is a grass, it appears in the heart, and everything except the lover burns. And the remembrance of the lover will be food for the beloved. And the lover's opinion is the lover's salary. And the beauty of a friend is the peace and comfort of a lover [1, 1952] [Sheikh KhudoydodVali. *The great saint*. 2017, page - 39]. Perhaps it can be concluded from such thoughts that a person without love is spiritually dead, and because of his inaction, his complete cessation of the pursuit of the essence, he becomes a worthless person in the eyes of the people and the Truth.

AlisherNavoi also interpreted love in the following verses as the highest peak of perfection, the source of bright light and the glorious foundation:

Otherwise, love is not two worlds,

Two worlds means no life

Without love he is a tank, he has no soul,

Whatever you do, if you don't

Love is the heart and the heart is the zodiac sign

Maybe the sun loves the zodiac sign [1, 1952] [AlisherNavoi. *MAT*. 1991, page - 179].

Indeed, as is argued by logical denials, the inviolable condition and essence of perfection is the degree to which a person rises from love to enlightenment in the process of healing in the fire of love - the enlightened becomes the lover and reaches the essence of divine enlightenment. In other words, Navoi emphasizes that if a lover suffers from pain, suffering and sorrow, and burns in the fire of love and is able to create a fiery heart, he will begin to move towards perfection like the sages. For example, in the famous *Masnavi* of Sheikh Jalaliddin Rumi, it is not for nothing that it is said; "Ruzhabosozihohamrohshud" There is an important aspect to which we pay special attention to this. This is because the poet is convinced that "love can enlighten a disbeliever, a Muslim, or any rebellious and insane lover". Perhaps this is why Navoi, enjoying the flame of love in the following lines, put forward the idea that "In the hope of getting one step closer to Jonah, sacrificing one's life a thousand times, if possible, is a hundred times better than wishing for a life as good as Hizr's":

One hundred Hizr is more than life, giving a thousand lives,

It will be possible to take a step towards Jonon [1, 1952] [AlisherNavoi. *MAT*. 1987, page - 571]

As can be seen in the works of the great Sufi scholars of the East, in the works of the great thinker and poet AlisherNavoi, the most honorable and the greatest of all creatures created by God is Man, whose perfection is admired by everything, even the mind [1, 1952] [Ibrahim

Haqqul. Identity in the word. 2013, page - 34.], is repeatedly emphasized. The main purpose of this was to accustom people to live within the bounds of human virtue and morality due to various desires, and to harmonize all needs, goals, and inclinations with the eternal Essence with vigilance and patience. Or, it can be said, to repel the black clouds of the cunning amulet from it by discovering the sun of love in the sky of the so-called “heart” with the joy of enlightenment and the lightning of sincerity. At the same time, it is not a mistake to say that as a result of upbringing, human beings are elevated to the ranks of *lavvoma*, *mutmaina*, *mulhamina*, *roziya*, *sofia*, and *komila* by bringing them to light and freeing them from the low qualities that lead them to the abyss of darkness. After all, only one human being in the world has been given the opportunity to live freely and consciously, and the real goal is to ensure that everyone enjoys the bliss of perfection or grace because of his ability to discover himself with the pleasure of love and enlightenment. So, the main goal in a person’s life is to achieve perfection. Knowledge, on the other hand, is one of the highest levels of perfection. From time immemorial, humanity has been given the opportunity to rise in this high position, along with other mature positions. It is possible for anyone to seize this opportunity because he or she is constantly striving for the full acquisition of knowledge and enlightenment by suffering with love and devotion.

According to Jami in “Nafahotul-Uns”, the leader of the Sufis, Zunun Misri, was the first to speak about mysticism and to introduce the concept of enlightenment in his teachings. In his view, there are two paths to the tax that seek enlightenment. The first is to abstain from sinful deeds, to give up worldly desires, and to control one's self. The second is to completely give up everything and completely liberate oneself from the worldly fantasies. Sheikh Zunun made extensive observations on the Egyptian concepts of science and enlightenment and tried to explain their level and difference in our opinion as follows:

Science is the product of impressions and information perceived as a result of the influence of the external world on the five senses of man.

Enlightenment is a strange gift of pure light for the pure heart, or more precisely, only for the perfect human soul, which is a complex of light created by God, with which the mysteries of the nature, attributes and actions of the Creator are observed or discovered [1, 1952] [Dilorom Salohi. Sufism and artistic creation. 2018, page - 24].

Indeed, mysticism is a doctrine aimed at discovering a new world in its time - a world of truth and beauty that symbolizes the harmony of God, man and being. The basic source of this teaching is Islam, which is a science based on the Qur'an and the Hadith. The reason for this is that the verses and hadiths contain divine instructions that warn us of the content of dozens of basic concepts related to the essence of this enlightenment, such as **laduniyilm**, **zikr**, **valiylik**, **tavba**, **zuhd**, **tavakkul**, **riyozat** and **mushohada**.

According to the people of meaning, enlightenment is the ability of a person to know himself and his Lord. That is, they are a light of enlightenment, through which the believers draw closer to the Creator and attain eternal bliss. At this point, it is worthwhile to pay attention to the following descriptions of enlightenment by some Sufi scholars.

Abdul Karim Qushayri said: “Enlightenment means knowledge in the language of the scholars. To them, every knowledge is an enlightenment, and every enlightenment is a knowledge. Anyone who is knowledgeable about Allah is also knowledgeable. Every sage is a scholar”. Sufis call those who know the Truth by heart and discovery “enlightenment” and those who

know it by intellect and understanding "knowledge". Enlightenment represents the concepts of familiarity, knowledge and understanding. It has been variously interpreted and defined by the people of meaning: Enlightenment is the knowledge of man himself and his Lord. According to the author of *Kashf al-Mahjub*, other people, such as the fuqaha, also called the knowledge of Allah "enlightenment." The sheikhs of the sect called the state of health about Allah "enlightenment." And according to this, "Enlightenment is many times superior to knowledge". According to Imam al-Ghazali, "When enlightenment arises in the heart, the state of the heart changes. As the state of the heart changes, so do the actions of the members. That is, action depends on action, the state depends on knowledge, and knowledge depends on thinking. It is possible to reach the level of Tawhid quickly, but it is difficult to reach the level of enlightenment. If a dervish has a thorn in his foot, you need to know where it comes from". Enlightenment - intellectual knowledge, practical knowledge, acquaintance, understanding, mystical knowledge; knowledge of the mysteries of the state and the divine truths. Ibn Ata said: Enlightenment consists of two parts. One is the enlightenment of the Truth and the other is the enlightenment of the truth. According to Shibli, "Enlightenment is a continuation of wonder" Hujwiri admits: "The truth of enlightenment appears in the heart of the enlightened. Enlightenment is the life of the soul (the source of life), and the value of each person is distinguished by his enlightenment. Without enlightenment the mind cannot radiate and discover the divine mystery. Such a soul is worthless in the sight of God. " Some say, "Enlightenment is the science of truth, which is understood on the basis of performing the deeds required by piety, pilgrimage, leeching, Shari'ah and the teachings." According to the Risalai Qushayri, enlightenment is a mirror for the learned. Let him see the beauty of Mawlawi when he looks at him" [1, 1952] [Abdulkarim Qushayri. The treatise of Qushayri. 1991, pp. 489-490; Ibn Arabi. Book of Enlightenment. 2008, pp. 48,140,143,197,198,276,286; Sayyid Jaafar Sajjodiy. "Mustalahotiurafo and Sufism". Hijri-1339, pp. 374-379; Alisher Navoi TAT, 2011, pp. - 647-648; Sheikh Najmiddin Kubro. Mystical life. 2004, p. - 227]. Arif Billah - Sheikh Mahmoud Shabustari also says about this:

The girl's heart saw the enlightenment of pure light,

God saw him in everything he saw.

The wise heart is aware of existence,

His body is absolutely narrow [1, 1952] [Mahmud Shabustari. *Gulshaniroz*. 1952. page - 102.].

Purpose: If one's mind's eye is enlightened by the rays of enlightenment, one will surely see God in everything. Because such a person is considered to be a sage, and his heart - the mirror of the Absolute Beauty, has become a source of mystery.

The people of meaning called enlightenment "Irfan" and considered it a gift from Allah and a great privilege over knowledge. The word "enlightenment" is also used in the sense of knowing, knowing, familiar, re-acquainted, and knowledge. The word "Irfan" in the general sense, in contrast to the external science, means to know something clearly and perfectly in all respects [1, 1652] [Abdulkarim Shar'i Juzjani. *Sufism and Man*. 2001, pp. 10-11] If we consider that such knowledge is based on discovery and inspiration, it becomes clear that the goal of enlightenment from the sect, which is the practical stage of mysticism, is enlightenment [1, 1952] [Khoja Ahmad Yassavi. *Devonian wisdom*. 2006, pp. 37-47].

The people of meaning have interpreted the gnosis in the heart of the terms discovery and inspiration as follows: to see the unseen features and real things behind the scenes, to feel them, to be aware of their secrets; inspiration and knowledge from Allah. Guardians are the masters of discovery. In Sufism, there are such concepts as theoretical discovery, enlightenment discovery, divine discovery, spiritual discovery, unmarried discovery, abstract discovery, anxiety discovery, discovery zamoyir, discovery state of the pipe, and discovery state of the castle. Inspiration is the meaning or truth that emerges in the heart through divine grace. To tear the veil of love is to discover secrets" [1, 1952] [Abdulkarim Qushayri. Qushayri's treatise. 1991, pages - 22-25, 199-203, 502-523; Ibn Arabi. Book of Enlightenment. 2008, page - 181, 189. Sayyid Ja'far Sajjadiy". Mustalahotiurafa and Sufism". Hijri-1339, pp. 327-328; Alisher Navoi TAT, 2011, p. - 646; Sheikh Najmiddin Kubro. Mystical life. 2004, pp. 223-225].

Some scholars have used the concepts of mysticism and lore in the same sense. In an article by the great scholar Abdulhakimshariyy O'zjani, thinking on the same topic, he makes this issue clear: "some believe that mysticism is a branch of Irfan and one of its manifestations, that is, mysticism is separated from Irfan as a way and sect. And lore is a more general concept, which includes other ways and denominations than mysticism. According to him, a person can be a Sufi and not be arif. Or a person may appear to be a mystic and not benefit from gnosis at all. Sometimes the word arif is used in a higher sense than sufi and dervish. Some considered gnosis to be the scientific and intellectual side of mysticism and mysticism to be the practical side of gnosis" [1, 1952] [Dialogue, 1995, №1-2, p. 32].

Abdulhakim DzhuZHani again in this article, referring to the issue of "Knowledge of lore in India and Greece", states that there are dozens of philosophical denominations that express the ideas of lore in India, and from these it is possible to call the sect of lore "Vandation, and also describes the philosophical views of representatives of this doctrine as follows": the Orif rises to the [1, 1952] ["Communication", 1995, № 1-2, Page-33].

In one of the books on mysticism, the Arif is described as follows: And in this way, the state of affairs and the state of mukashifah will appear" [1, 1952] [Sayyid Ja'far Sajjadi. Farhangi terminology *orifon*(wisdom) and *muttasavif*(mysticism), Hijri-1339, page - 283].

Meaning: A Arif is a person who knows that Allah has raised him to the rank of observing his own name and names. And he is the one who discovers Allah by attaining divine enlightenment through spiritual experience, inspiration and observation.

In another book, he is described as a person who is wise, knowledgeable, aware of the enlightenment of the Truth, who truly knows Allah, and who attains enlightenment by inspiration and condition [1, 1952] [Muhammad Mu'yn. Farhangi Persian. Hijri-1382, page - 2260].

Enlightenment due to spiritual or inner experience is called "reasonable knowledge", "pleasure knowledge" [1, 1952] [Ahmad Yassavi, Suleiman Baqirgani. College of Proverbs. 2011, p - 224], - it is explained. It is true that the heart of the possessor of this knowledge, Orif, is wider than the Throne. Because, "Those who are on the throne and on the throne, the world is physical. The soul of a healthy heart is a human being, and the command of the Lord is fulfilled" [1, 1952] [Ibrahim Haqqul. Identity in the word. 2013, page - 28]. Accordingly, Orif was recognized as the Sultan of the world, not of any people or nation. As he perfects his heart with purity, a radical change in the spiritual world takes place. And this, in turn, is likely to affect the creature - the natural world. According to Ibn Sina, if Orif speaks of something mysterious or unseen, the

opposite will be felt in the natural world [1, 1952] [HayraniAltintash. In Ibn Dina's thought, as a mystical concept, orif and irfan. 1990, p. 115]. The prophecies of HazratNavoi in “Nasayimul-Muhabbat” about the birth of KhojaBahauddinNaqshband, quoted in the Samoan language by Khoja Muhammad Baba'i, and the fact that QasriHinduvin became QasriOrifan thanks to his knowledge and guidance, are one of the proofs of this idea. Let QasirHinduvin be Orifon ...” [1, 1952] [AlisherNavoi. MAT. 2001, page - 256].

AlisherNavoi in one of his ghazals for his attention to the moral and spiritual qualities and virtues of enlightenment:

Keep the health in the lake of poverty, whatever you do,

If Orif is not him it, everyone will argue with Irfan [1, 1952] [AlisherNavoi. MAT.1988, page - 92], - he says.

Such expressions about the fate of Arif and the status of Arif are often found in Navoi's poetry:

Remember Sahfai, O Orif, you need light,

Sofiy is very worried about unity [1, 1952] [AlisherNavoi. MAT.1988, page - 76].

## CONCLUSION

The Orifs have gained fame in the form of those who know Allah, know Him, and live with the pleasure of divine enlightenment, refrain from showing off their knowledge and enlightenment, are inclined to silence, and do not cease to observe.

According to Navoi's writing, who are the orifs? “when asked, Sheikh MuzaffarKermanshahyKirmis”Orif is a person who dedicated his heart to his Mawlus, his body to his people, [1, 1952] [ AlisherNavoi. MAT. 2001, page -154. if he answered, Sheikh AbulhairTainoti is better than Orifis a miracle among the wisdoms and miracle of all wanders [1, 1952] [ AlisherNavoi. Met. 2001, page – 149-150], - as long as he confessed.

In the work “Nasayimul-Muhabbat” it is said that Orif should not be aware of the other siyrat and should not be jealous of any servant, as well as from the language of sheikhs on the skill of keeping secrets: “Orif, say your secret and say your secret” [AlisherNavoi. MAT. 2001. Page 154.], “In the mystery of wisdom, a mirror is given that every time he looks at that mirror, he sees” [1, 1952][ AlisherNavoi. MAT. 2001, page-69]like feedback also has attention.

AlisherNavoi also compares Orif to Great River, a man of mystery, who cannot flood the sunlight, or who cannot notice any change in appearance:

If the fascination does curl to Orif (wisdom),

It's a matter of hiding the moment.

The sun is reflected in the river,

What is possible to overflow his mother [1, 1952] [AlisherNavoi. MAT. 1989, page - 512].

As “Nasayimul-Muhabbat” explains in his work, Sheikh Abu Ishaq Ibrahim ShahriyarGoziruni informed that the extent to which the spiritual perfection of the orifs reaches a high level depends on how clearly their eyes can see the true Society: “This work is an Orif Muslim, whose purity is full of joy and whose eyes are closed before the true dawn” [1, 1952][ AlisherNavoi. MAT.

2001, page-154],- as long as said. It is worth noting, however, that the pleasure of seeing and seeing Allah with pleasure was not the same in all Orif. Therefore, their impressions and circumstances on the way to understanding the truth were also different. When one Orif said, "I do not see anything that I do not see God behind him", another said, "I do not see anything that I do not see God in it". Another said, "I have never seen anything before that if I have not seen God before, "the next said", I only see God. "Also there are those who say", Allah alone looks, and he is invisible Allah does [1, 1952] [Ibrahim Hakkul. In the word itself. 2013, p. -29]. These five attitudes were cases of external existence, which also led to Goho's ideological bias. Navoi also noted that "Lisonut-Tair"roman:

Quality to everyone in was own symphony,

Appeared ingenuity that made many discrepancies

Everyone wants his own perfection,

Did Valley turned into ruin[1, 1952] [AlisherNavoi. Met.1996, page-225], was saying.

When approaching the wisdom of the elephants and the blind from the point of view of the valley of enlightenment of this epic, it is necessary to say that India – represents the true sanctuary, the blind – represents the Taliban, who began to be aware of the mystery of lore. So who is the elephant man? Elephant man is their imam, saint, Sheikh or owner of enlightenment-perfection Orif. The following examples from the chapter "prayer on the island of enlightenment" in narrative support this idea:

O enlightenment of man,

Enlightenment of the distracted world

Enlightenment is a part of everyone,

The centuries named him Orif

Whom to enlighten,

Made all imagination author [AlisherNavoi. MAT. 1996, page - 285]

## FORMATION, ACTIVITIES AND PROBLEMS OF PRESCHOOL EDUCATION INSTITUTIONS IN UZBEKISTAN.(1945-1980 YEARS)

**Tishabayeva Irodaxon Rasulovna\***

\*Independent Researcher

Ferghana State University Department of History of UZBEKISTAN

### ABSTRACT

*This article describes the measures taken by the Soviet authorities in Uzbekistan in the field of preschool education on the basis of scientific, historical literature and sources. Also, the study included preschool education, children's attendance and demographic indicators.*

**KEYWORDS:** *Preface, Archival Sources, Management Mechanism, Non-Governmental, Industrial Zones, Reform, Personnel, Alternative.*

### INTRODUCTION

Relevance of the topic: The purpose of the ongoing reforms in the field of preschool education in the Republic of Uzbekistan is to bring up a comprehensively healthy and harmoniously developed generation and prepare them for school education. Today in Uzbekistan, special attention is paid to improving the system of preschool education, which is the primary and main link in the education of younger generation, strengthening the material and technical base of kindergartens, providing them with skilled teachers, quality and effective preparation of children for secondary education.

The Decree of the President of the Republic of Uzbekistan ShavkatMirziyoyev dated September 30, 2017 "On measures radically improve the management of the preschool education system" has raised the work in this direction to a new level[19]. Adoption of more than forty normative and legal acts for the development of the sector in a short period of time has strengthened the legal framework of the preschool education system [20]. As a result of reforms in the field, the management mechanism in the pre-school education system has been radically improved, and the system of non-governmental education services has been reformed [21].

Summarizing the work done in our country over the past years to improve system of preschool education, improving the quality and efficiency of education, the problems and achievements in this area highlight the essence and importance of large-scale reforms.

---

## RESEARCH METHODS

Article historical, comparative logical analysis of generally accepted historical methods sequence, based on the principles of impartiality. The growth rate of preschool education between the period 1945-1980 was analyzed on the basis of the level of the periodicals and data from archival sources. Over the years, efforts have been made to highlight the growing number of children in preschools, the differences between urban and rural kindergartens, and the methods of comparison.

Indeed, the issue of education and upbringing of preschool children has always been one of the most pressing issues in our nation.

## RESULTS AND DISCUSSIONS

In the first years of economic recovery after the war, in addition to addressing the most important political and economic issues, the country also paid close attention to issues related to the development of the preschool education system. The Ministry of Education of the Uzbek SSR has developed a series of action plans to expand the network of kindergartens and increase children's attendance. Considering that the war had seriously damaged the health of preschool children, the necessary measures were taken. In particular, the opening of sanatorium-type kindergartens reached 26 in 1947, with 1,584 children [2,12].

The expansion of pre-school education in rural areas of the country has not gone unnoticed. This way not only for the benefit of the younger generation in the field of education and upbringing, but also because of the strong demand for agricultural products around the world. In the cotton fields and on the livestock farms, most of the work is done by women and mothers. In this connection, on March 16, 1948, the Council of Ministers of the Uzbek SSR adopted a resolution "On improving in the condition of collective farm playgrounds" [2,13]. The leaders of the collective and state farms began to pay more attention to the improvement of children's playgrounds in order to this decision and to involve more women with children in agricultural work. As a result, by 1949, the total number of playgrounds in this country was 5,538, and they covered 134,758 children [13, 35].

On May 18, 1949, the Central Committee of the CPSU and the Council of Ministers of the USSR adopted a resolution No 2004 "On Measures to Expand and Improve the activities of preschool Educational Institutions and Maternity Hospitals". In order to ensure the implementation of this decision, the construction of new types of preschool institutions has begun in Uzbekistan, as well as in the Republics of the Union. The construction of such facilities, mills, collective farms and state farms. Urban kindergartens are being built and put into operation as soon as possible. However, in a few collective farms, kindergartens were completed on time. In particular, in 1953 in the collective farms named after Stalin and Frunze of Akhunbabayev district of Ferghana region, in the collective farm "Mekhnatkash" of the district, in the collective farm "Stalin and Budyonny" of Tashlak district, in the collective farm "Malenkov" of Kuvadistrict [14, 21].

There are only new buildings in the ring. Kindergarten planned to be built in some collective farms have not been implemented in practise. Preschools operated in adapted buildings or in the homes of educators. In particular, in 1952 it was planned to build a new type of kindergarten in the collective farm named after Voroshilov, Kuybishev, Molotov, Lenin in the Altirik district of Ferghana region, but in practice it was not seen [14,20].

The 1953 plan of the Fergana region was to cover 258 permanent kindergartens-1,500 pupils, 1,000 children and 3,000 brigade mobile kindergartens-19,350 pupils. However, as of June 1, 1953, 115 permanent kindergartens and seasonal kindergartens covered only 50-60 percent of the children [14,20;4,2]. Rural preschools are not equipped with hard and soft equipment. The children were given tea and bread in the morning and evening, and some hot food for lunch. The quality of education was low. The level of medical services in the kindergartens of Kuvasay, Tashlak, Kuva districts is unsatisfactory, and the chairmen of the collective farms and the first secretaries of the party organization did not pay enough attention to these issues. In this area, children are housed in collective farms with no facilities [17,6].

The mobile kindergartens opened by the brigades did not meet sanitary requirements. There were no separate rooms for children. Because they were placed on swings and not provided with separate food, they ate from a common pot prepared for lunch for the collective farm. Their care and upbringing are entrusted to disabled women [14, 23].

As a result, the implementation of the above decision was not approached responsibly. From 1949 to 1959, many of the kindergartens on the collective and state farms were not educational institutions but temporary detention facilities.

On May 21, 1959, the Central Committee of the CPSU and the Council of Ministers of the USSR adopted a resolution entitled "Further Expansion of Preschool Education Institutions, Preschool Education on measures to improve the upbringing of children of childbearing age and their medical care accepted" (1,12;21,70). It is important to raise children from the first months of life. The Ministry of Education was recommended to establish kindergartens for children from 2 months to 3 years. On the basis of the resolution of the Central Committee of the Communist Party of Uzbekistan and the Council of Ministers of the Republic on August 5, 1959 made the appropriate decision [3,76;5,3]. There are two systems for factory and plant managers who have their own nurseries and kindergartens, one nursery and one kindergarten. In Uzbekistan, the implementation of this decision has been carried out since 1961 and two types of educational institutions in order to organize a single structure of education merged into a single kindergarten (18,32).

According to the letter of the Ministry of Education of Uzbekistan No. PFU-05-8 dated February 8, 1961, the 8th kindergarten of the Fergana City Health Department was merged with the kindergarten of the cocoon factory [11,71; 7,9].

Due to the untimely arrival of building materials, the construction of kindergartens is extremely slow was carried out. In particular, from January to August 1959, there were 16,424 kindergartens in the country. Although construction was planned, the number of buildings completed by the end of the year was 6,624 (the plan was only 40 percent completed). During this period, it is planned to build 13,425 kindergartens, and in practice 4,598 was built. (34 percent completed) [8,68].

By the 1960s, there were several types of preschool education in Uzbekistan. These are: kindergartens, nurseries, daycare centers, sanatorium kindergartens, seasonal kindergartens, playgrounds and mobile kindergartens.

In 1962, there were 539 in Fergana region there are pre-school educational institutions where 30,650 children are educated. 44 of them belonged to the Ministry of Education of the Uzbek

SSR, and there were 3771 pupils in these kindergartens. 3 of them are in sanatorium gardens. There were 155 foster children. There are 67 kindergartens in the system of departments and organizations - 6267 children, 36 in state farms kindergartens - 3189 children, in 17 systematically integrated kindergartens - 2536 children. From this In addition, there are 38 day and night kindergartens with 950 children was covered [16,136].

The ninth five, covering the years 1971-1975 There are more than 5,000 pre-school educational institutions in the country annually, with more than half a million of them children were covered. They accounted for 18.4% of preschool children in the country. During these years, children's institutions for 215,000 places have been built and put into operation. Preschool education in 1975 19,7 percent of children were involved in institutions [10,9].

In the union republics, the coverage of preschool children was 37%, while Uzbekistan ranked 11th in the list. Given that the majority of workers in large industrial enterprises were women, most enterprises did not have kindergartens. Increasing the number of children in kindergartens has begun to be done by reducing the number of available places. As a result, the existing kindergartens under some enterprises have to work with pupils several times more than their capacity forced. Sixty percent of kindergartens and nurseries were housed in public buildings. For example, Kindergartens opened in Fergana under the auspices of the Sredazneft Association, the Oil and Gas Plant, the Bolshevik Plant, and the Sock Knitting Factory provide education, discipline, and food security. Demand for such kindergartens has increased. Because not only factory workers, but also families living in the surrounding area were willing to send their children to these kindergartens [13,35].

With the growing population of the country, the demand for kindergartens is growing. Despite the new buildings under construction, all the children there was no opportunity to cover. Taking into account the demand of the population, the leadership of the Communist Party for the construction of preschool institutions and providing them with the necessary means for kindergartens training of the necessary personnel and development of issues such as the adoption of kindergartens by enterprises, construction companies, collective farms and state farms came out [9,5].

However, the focus is on improving the material base of preschool education in the country however, the number of kindergartens built in the 1970s lagged behind population growth and did not meet demand failed. During 1971-1975, it was allocated for the construction of preschool institutions in some regions about 20 million soums of funds were not used [11,3].

As a result of measures taken in 1981 in the farms of Fergana region, the coverage of children in preschool education was 31.4%. It is only 2% higher than in 1976.

While the number of seasonal kindergartens in the country is high, the activity is at its lowest level and there is control not performed [6,58].

The Ministry of Education and Health did not view such kindergartens as subordinate. There are no plans to improve the skills of principals and educators. The educators did not have pedagogical education. Not equipped.

In 1974, there were just over 5,000 preschools, but in 1977 that number exceeded 5,600. In 1974, 527,000 children were covered, which was 18.4%, while in 1977, 654,213 children were covered, accounting for a total of 22% [12,15].

## CONCLUSION

In conclusion, it can be said that in the post-World War II years, the network of preschool education institutions in Uzbekistan has expanded. The number of foster children has increased year by year. Kindergartens in general have proliferated. But do not rush many kindergartens were not built on time as a result of hasty and fraudulent paperwork. The existing pre-school educational institutions are lagging behind the population growth rate and meet the existing needs did not receive. The main part of the preschool children of the rural population is covered by the kolkhoz playgrounds and mobile nurseries, whose activities and the sanitary condition did not meet any requirements.

### ABSTRACT

*This article is dedicated to coverage of current state of relations between the US and Central Asia. Central Asia as a favorable geostrategic region has always attracted leading countries. The United States also has a particular interest in this important transit zone. As the US is one of the countries defining the world order, there is no region where its interests do not exist. The United States always has a peculiar approach for important geostrategic regions. The United States regularly claims that the US was one of the first state that to recognize the independence of Central Asian states and has helped these countries to build up their sovereignty. An addition to this, the fact that Afghanistan is also directly adjacent to the region shows how important the US influence in the region is. It is obviously seen that the US-supported projects such as Greater Central Asia and The New Silk Road initiative are aimed to affiliate Afghanistan with Central Asia. It is also crucial for the United States to have its influence in Central Asia to lessen Russia's dominance in the region and to form a barrier to China's heavy inflows. Furthermore, the richness of its natural resources and the large hydrocarbon reserves of the world in this region, increase the significance of Central Asia for the United States. It can be interpreted that the name of the US has always been encountered in the strategically influential areas. It is also vital for the Central Asian countries to have the US in the region. The region which is mainly made up of developing countries needs a vigorous investor like the United States. Precisely, one of the most essential view is that the presence of the US in the region can help to keep the balance power in Central Asia. Clearly, there is a commonality of interests in the relations between the US and CA.*

**KEYWORDS:** *The US, Russia, China, Central Asia, regional interests, influence, balance of power, strategy, new strategy of the US for CA, Afghanistan, geostrategically important region, ‘Heartland’, “C5+1” project, Northern Distribution Network (NDN)*

## INTRODUCTION

There is no any doubt that the United States has a particular interest in Central Asia, as one of the world's giant and leading actor in the process of determining geopolitical trends of the world. At the same time, Central Asia is also an interested party from the relations with the US. Today the image of Central Asia is growing in the modern geopolitical processes, and therefore, the United States also sees new promising benefits in Central Asia.

Closer partnership with countries like the US can open up ample opportunities for developing Central Asian countries. It is vital for the US to maintain a high level of relations with Central Asian countries so as not to lose their positions in this geostrategic ally important region. That is the US is not indifferent to the forceful influence of Russia and China which are main US rivals today. It is obviously seen that there are common interests underlying this relationship, the joint efforts of the United States and Central Asia can be promising for both sides.

**Geopolitical features of Central Asia.** As Central Asia located in the heart of the Eurasian continent and, as can be said, "Heartland", it has always been in the spotlight of figurehead countries. Including, The United States has never been apathetic to Central Asia. The US has always put forward its intentions and principles on its own agenda regarding this region. Central Asia's cozy geostrategic location and well-off natural resources have attracted US to the region. Adding to this, the Afghan issue also proves that Central Asia is a region that deserves further attention for the United States. Afghanistan, which is already a part of the Greater Central Asia is a far-reaching for the US.

The US presence in Central Asia provides certain opportunities for the region's states. The foreign policy of the countries which located in the relevant geostrategic region is quite complicated. In this respect, the existence of a sole power in the region is unacceptable to countries with weak economies and their inability to promote regional integration. To this day, not only Russia's, but also China's influence has grown so much in CA that these countries, which appears to be official partners, are already on the path of stealth contention. Recently, the fact that transferring the border land of Tajikistan to China, increasing Kyrgyzstan's debt from China and growing China's influence in Kazakhstan rapidly and protests in the territory of this country against China's clout may explain the essence of the situation. Russia's classic policy of influence over the region: Moscow always attracts Central Asian countries, emphasizing that the region has always been influenced by Russia and, indeed, its influence on the region is so durable that it strives to exercise its political will. And it can be seen that some of these political intentions have been obtained by following the EAEU. In these circumstances, it is very essential and beneficial for the Central Asian states to have a third actor that maintains a balance of power. From this point of view, the US necessity for the region may be more relevant than the Central Asian countries' need for the US.

**US interests in the region.** Although distant, the United States, with its stake in the maintenance of geopolitical pluralism in post-Soviet Eurasia, looms in the background as an increasingly important if indirect player, clearly interested not only in developing the region's resources but also in preventing Russia from exclusively dominating the region's geopolitical space [1]. The US is concerned with the dramatic increase in Russia's reputation in CA. Moreover, China's increasing impact in the region, especially over the last decade, has encouraged the US to adopt a more active foreign policy towards the region. As is stated above, the priceless geopolitical

region, located in the heart of the Eurasian continent, may not be far from the influence of the US, which is considered as one of the world's governing bodies. Today as the world states are putting up an intense struggle for energy resources, Central Asia is attracting the United States as a region with abundant natural resources. But in modern trends, the priorities of the United States in Central Asia represent geostrategic property. Because of the fact that not to be directly linked to the region limits its access to the region's natural resources. From this, it can be deduced that all of the US plans in the region are aimed at strengthening its geopolitical position in Central Asia.

**Bilateral relations: comparative-political analysis.** If the general features of US relationship with the states of the region are revised, the principal purpose of the United States can be seen. There is an imminent approach of the US for Uzbekistan, which economic situation is more advanced than Kyrgyzstan, Tajikistan and Turkmenistan as well. And at the same time, it is considered to have the most powerful army in Central Asia. Located in the heart of the region, being able to serve as a transit zone for all countries in the region, and being border with Afghanistan escalate Uzbekistan's gravity to the US. The new government, which came to power in 2017, has undergone a series of economic reforms. In foreign policy, first of all, the implementation of the good neighborhood policy with other Central Asian countries and establishing Central Asia as the main focus of the country's foreign policy will ensure Uzbekistan's high position in US's regional diplomacy. It should be noted that integration in the region will not happen without the intention and influence of Uzbekistan. Being in the center of the region is one of the key factor and also Uzbekistan can affect to other Central Asian states because of its position and potential. Moreover, opening borders and friendly relations with neighbors in foreign policy have fueled the spark of integration processes in Central Asia. An example of this is the consultative meetings of the Central Asian leaders in March 2018 in Astana (Nur-Sultan) and in November 2019 in Tashkent. In addition, the fact that the meetings of the C5+1 platform in February 2020 in Tashkent, just proved that Uzbekistan is at the forefront of the US plans for Central Asia.

Kazakhstan presently offers the best opportunity for US engagement. Kazakhstan has the vision, resources, and institutional capacity to play a greater leadership role and to help put Central Asia on a more positive trajectory. In its foreign and domestic policy, Kazakhstan has a number of important accomplishments to its credit, and, unlike other states in the region it has set out an ambitious agenda for the future.[2] The United States seeks to strengthen its influence in the region by establishing close ties with Kazakhstan, the most economically developed country in CA. Having investor support like the US is well-deserved for Kazakhstan, which is a resource-rich country as well as having a high improved potential. Closer ties with Kazakhstan, Russia's closest economic and political partner in the region, can help to keep Russia's influence to a minimum. Upsurge of China's prestige in Kazakhstan in recent years, US cooperation is a superb for Kazakhstan to balance foreign policy.

The US is interested in Turkmenistan's rich hydrocarbon reserves. Turkmenistan's vast natural gas and oil resources continue to attract foreign companies to the country, but the Government of Turkmenistan has yet to implement reforms needed to create an inviting business climate where foreign investment and foreign investors are truly welcomed.[3] Until recently, China was the only major customer of Turkmen gas. But in April 2019 Russia also began to import Turkmen gas after a 3- year break. The United States is paying attention to the possibility that

Turkmenistan will diversify its energy markets. And the US focus Turkmenistan's proximity to Afghanistan and border security, and the potential for American commercial interests in Turkmenistan.[4] Turkmenistan is the most interested actor and initiator of the TAPI project. However, Turkmenistan cannot implement the project alone due to lack of money and it is looking for a partner to help realize the project. The United States may be the most attractive investor in Turkmenistan for the project, but the US has not shown any worthwhile interest for the project so far.

US-Tajik relations focus on US support for the country's accession to the WTO, assistance to improve agriculture and the climate for foreign investment, and encouragement to respect human rights and the rule of law[5]. Relations with Tajikistan are also not at a high level. The US program in this country is to strengthen security, economic and regional ties. Tajikistan's military affiliation with Russia, which is Russia's closest military ally in Central Asia, hinders Tajikistan's favorable ties with the United States. According to Dmitry Popov, a Russian analyst, "The US primarily supports Tajikistan in the areas of peace, security and humanitarian aid. The analysis of the American- Tajik relations shows that at the current stage the republic is not among the main foreign policy priorities of the U.S. in the post Soviet space. However, it does not mean that Tajikistan is completely out of the Central Asian strategy of the U.S. Keeping it in the focus of attention of the American foreign policy will be the aspiration of Washington to maintain access to Afghanistan and to constrain development of geopolitical competitors such as Moscow and Beijing".[6]

Kyrgyzstan, which is considered to be relatively developed with democratic principles, can open up broader cooperation with the United States to resolve its domestic and economic problems. It is also important the US uphold with Kyrgyzstan to prevent from being fully linked to China and Russia. The US has provided more support to Kyrgyzstan than any other Central Asian country in building democracy in the country. But after the US military base in Manas was closed in 2014, the US-Kyrgyz military relationship collapsed. The US is keen to work closely with Kyrgyzstan if it creates favorable conditions for itself, but the fact that Kyrgyzstan is already under the impact of China and Russia, and this is hindering bilateral relations. For this reason, the US just about has lost interest in Kyrgyzstan. The recent abolition of the immigrant visa regime for Kyrgyz citizens also indicates that the US does not consider Kyrgyzstan as a reliable partner.

**Afghan factor.** In its initiatives for Central Asia, the US seeks to link Afghanistan to Central Asia. To give an illustration, The New Silk Road project is one such project. The New Silk Road initiative of the US was first envisioned in 2011 as a means for Afghanistan to integrate further into the region by resuming traditional trading routes and reconstructing significant infrastructure links broken by decades of conflict [7]. To clarify, this project aims to link Central Asia with Afghanistan to take out South Asia. But without providing the peace in Afghanistan, it is difficult to put this project into practice. Therefore, now this US-project is no longer in effect. Vice versa , China's "One Belt, One Road" policy undermined this US project in the region. But the US has also taken action in its plans to connect CA with Afghanistan. A striking example of this is Northern Distribution Network (NDN) project. The Northern Distribution Network was developed in 2009 to deal with the pressing need to sustain the movement of equipment and supplies during Operation Enduring Freedom in Afghanistan. Although the NDN is a physical transportation route, it has the potential to further influence the Central Asian states to forge

alliances with their neighbors and increase stability in the region. The Central Asian states by means of the NDN, formed relationship that, in some instances, brought closer cooperation.[8]

Afghanistan is a proper issue, which is already a part of Greater Central Asia and has a particular importance to the region and the US. The United States has a long and varied history of engagement with Afghanistan. Inspire of tortuous turns and obstacles in the relationship, it has almost always been a transactional one. Given its “front line” status, Afghanistan has usually been a pawn in a bigger strategic game, initially between the Communist bloc and the capitalist countries in the region (including Iran under the shah, Pakistan, and India) and subsequently between the secular world and radicalized Islam. Afghanistan’s current status as a ward of the United States and international community is unusual and will not last[9].

The US officially acknowledges that the US goal in Afghanistan is to fight against terrorism and drug trafficking. But the presence of the US in the region also means that it is directly involved in Central Asia and this will also bolster close monitor to Russia and China’s actions in the region. It is important for countries such as the US, to appear in a geostrategic ally significant region like this. And it is clear that the US will ever withdraw its troops from Afghanistan. Because today the interests of the United States in Afghanistan are not based on the vital blessings as at the beginning. There is a high possibility that even if the US pulls its troops out, Afghanistan cannot be fully guaranteed by other countries concerning keeping peace. It is questionable that Afghanistan’s ability to determine its own destiny without external interference. Taliban forces are continuing to threaten the north of the country with brand-new strength and peace talks are thus far ineffective. Since, according to experts, the Taliban is not an absolute whole and it has separate groups to oppose any peace negotiations with the US. Thereunto, external concerned actors continue to reinforce the Taliban, and even they are trying to influence the US-Taliban negotiation process. This means that the US will not withdraw its troops in the near future. The current Afghan government needs the United States to oversee the Taliban and counter other radical and interested forces. Peacekeeping in Afghanistan is also beneficial to the region states. Predominantly, it is crucial for Turkmenistan to realize its TAPI project and for Uzbekistan to get to the ocean trade road. But the issue of peace in Afghanistan, which has grown into the space of political games, is not depend on Central Asian states.

**Contemporary geopolitical processes: the US position.** When it comes to the US concerns in the region today, the new strategy of the US called “United States Strategy for Central Asia 2019-2025. Advancing Sovereignty and Economic Prosperity”, adopted in February 2020, can be the base of its position in this region. The reason for the new strategy is to shift governments in two leading countries of the region(Uzbekistan and Kazakhstan). In particular, the new government of Uzbekistan has undergone a number of positive changes in the economic and political spheres.

It should be noted that there are no principal modifications in the new strategy, that is, the US has not changed its strategy in Central Asia entirely. But there are some noteworthy points. The section of policy objectives consists of 6 points. 2 out of those 6 points are focused on Afghan issue. The first is to expand and maintain support for stability in Afghanistan, and another one is about encouraging connectivity between Central Asia and Afghanistan. This shows that unless the Afghan problem is resolved, Afghanistan will be the main focus of the US strategy in CA. Principally, the strategy says: “The United States recognizes that a secure and stable Afghanistan

is a top priority for the Central Asian governments, and each has an important role to play in supporting a peace process that will end the conflict. The United States will encourage the Central Asian states to develop economic and trade links with Afghanistan and to model stable governance of multi-ethnic, Muslim majority countries"[10].

The document also highlights the export of Central Asia electricity (Kyrgyzstan and Tajikistan) to Afghanistan and Pakistan through the "CASA-1000" program and the development of the Lapis Lazuri Corridor to promote trade between Afghanistan and Central Asia with Europe and Eurasia. It is also touched upon the diplomatic platform C5+1. Specially, the document states this: " U.S. participation in the C5+1 supports regional connectivity and Central Asian sovereignty, independence, and territorial integrity. C5+1 project are being implemented across Central Asia with over \$34 million from the United States Government in the areas of security, economic connectivity, and environment".

It is noteworthy that each of the major competitors in the region has specific mechanisms for achieving their goals. To give an illustration, for Russia these mechanisms are Eurasian Economic Union (EEU) and Collective Security Treaty Organization (CSTO), and China's mechanism for achieving its goals in the region is the SCO and the "One Belt, One Road" project. In these circumstances, it is crucial to have an acceptable mechanism for the United States, and this mechanism for the US may be the C5+1 project. That is why, the US is working to develop this platform. Through this platform the US can promote its political objectives in the region.

In general, the strategy also sees the following aspects, which are different from previous one. Imprimis, Uzbekistan is largely focused on the development of the new strategy. The US craves to emphasize Uzbekistan's leading role in Central Asia's integration process. Assuredly, it is related to the changes in Uzbekistan in recent years. Second, the US does not see Central Asia as an extremely promising market. But it believes that regional integration, including enhancing the transit potential of Central Asia and expanding economic cooperation with Afghanistan and South Asia, can reduce China and Russia's impact in the region.

Realistically, it should be noted that, the US's primary goal in the region is not to lose its geopolitical position, that is, the US plans are aimed at preserving and developing its geopolitical condition. Other factors, such as natural resource and economic interests are secondary issues for the US.

The ongoing trends in US relations with Central Asia can also be analyzed through official visits by the US Secretary of State Mike Pompeo to Kazakhstan and Uzbekistan at the beginning of February in 2020.

Pompeo's visit in CA at this time is not an accident, considering the case of Uzbekistan. Uzbekistan's recent refusal to join the Eurasian Economic Union (EEU) will help keep the country from becoming dependent on Russia and avoid trade issues involved with the economic bloc.[11] In addition, President of the Republic of Uzbekistan Shavkat Mirziyoyev in his address to parliament specifically mentioned joining to the EEU. Under these circumstances, Uzbekistan's emergence of Russian influence through the EEU has sparked the US and it is clear that the US needs a new Uzbekistan in Central Asia. As a consequence, Pompeo's visit was important not only for the US, but also for Uzbekistan, because this way enables Uzbekistan to avoid being under pressure of Russia due to the EEU. It is important for Uzbekistan to maintain a

balance of power in foreign policy and this has been accomplished by Pompeo's visit. The US sees Uzbekistan and Kazakhstan as the closest partners in the implementation of its geostrategic interests in Central Asia. Therefore, Pompeo's visits were organized exclusively to Uzbekistan and Kazakhstan. Other countries of the region are troubled for the US and do not have sufficient potential. Uzbekistan and other Central Asian states do not want to intensify the influence of a particular state in the region. Moreover, this was stated by the Minister of Foreign Affairs of the Republic of Uzbekistan Abdulaziz Kamilov during his meeting with Mike Pompeo: "We want to see Central Asia as a region of stable development, prosperity, and cooperation, and we would really not like to feel on ourselves unfavorable political consequences in relation to some competition in our region between large powers".[12]

## CONCLUSION

Based on this, the following conclusions may be drawn. Firstly, the US relations with Central Asian countries, specifically Kazakhstan and Uzbekistan, started to acquire a new feature. Recent developments in these countries have drawn US attention. Especially, foreign policy of Uzbekistan aimed at strengthening cooperation with the countries of CA and organizing integration in the region, confident economic reforms in domestic politics, and positive human rights reforms are making Uzbekistan a favorable partner for the US. Secondly, the US is currently using Afghanistan as a backbone for overseeing political processes in Central Asia. That is, the presence of the US in Afghanistan means that it will have an impact in Central Asia as well. If the US withdraws troops from Afghanistan, its influence in Central Asia could be drastically reduced and that is why, the US can now move on to direct cooperation with Central Asian countries. The US can maintain its influence in Central Asia, especially by deepening cooperation with the leading countries of the region. Ultimately, the US influence in Central Asia can be an essential factor for the region's states to balance the forces. It is worth noting, today, political processes in Central Asia are becoming more complex. The classic way of influencing Russia on Central Asia, Kazakhstan's economic and Tajikistan's military dependence on Russia; China's slow access to Central Asia through its soft power policy, already having a huge influence in Kazakhstan, Kyrgyzstan and Tajikistan, have increased the need for a third country to maintain balance in Central Asia. Such a third participant in the region can be the US. Russia has never liked a country that tries to stay away from it, and the state that seeks to distance itself from Russia should always be prepared for the 'cold winds' from Russia. The Ukraine events of 2014 and ongoing tense relations of Belarus with Russia can be the best examples of how it can be painful to stay away from Russia's deep impact. And China, as mentioned above, has been pushing its soft power policy with all its might. China's relations with Tajikistan regarding areas of gold-fields and their subsequent transfer to China, the steady rise of Kyrgyzstan's debt to China, the rise of China's influence in Kazakhstan, and prolonged protests in the country against China's impact have proven the prestige of China's policy in the region. Taking these factors into consideration, it is required from CA states to be cautious about improving relations with China, particularly in the economic sphere including credit and risky investment so as to avoid being an injured party due to the impact of China's soft power. However, it is also important to note that if the US sees significant benefits in CA, its impact on CA can be as tough as Russia and China's one. But now, the United States has no primary interests in Central Asia and the US will not even engage in a sharp struggle with Russia and China to expand its reach in the region. This can create favorable atmosphere for the Central

Asian states. If Central Asia becomes a real, fierce competition area between these three major powers, the Central Asian countries will not be able to cope with such intense competition. But the current status-quo is somewhat moderate. US efforts in Central Asia are aimed at curbing China and Russia as much as possible. For Central Asian countries, the presence of the United States with a new strategy in the region will help them avoid excess pressure and unsure the balance of power in the region.

**Perspectives and proposals.** The US can implement promising projects in Central Asia and it sees Central Asia as an important geostrategic region, a valuable transit zone, and seeks to link Central Asia with Afghanistan and South Asia. If the US goal really is to bring peace to Afghanistan, that is a promising plan for the Central Asian states as well, because Central Asian countries are interested in accessing the ocean route through the south. For the Central Asian states, the US can be a source of new opportunities and projects. When the issue of Uzbekistan's joining to the EAEU was raised, the US also began to make offers for Uzbekistan. Lead by example, US Secretary of Commerce Wilbur Ross claimed that, "Uzbekistan's aspiration for EAEU may complicate WTO accession", adding, "The United States 'strongly supports' Uzbekistan's entry into WTO and is awaiting a government response to requirements of the memorandum on foreign trade regime[13]. If Turkmenistan can also involve the United States in the implementation of the TAPI project, this could play an important role in its realization. It should be underlined that the US is also facing some shortcomings in the region. As an example, there is a lack of activity in the US in quoted above projects. Uzbekistan has long been in the process of joining the WTO, but the US took action only after the EAEU issue arose. Turkmenistan has long been looking for a partner to fulfill the TAPI project, and it is obvious that Turkmenistan has high hopes for the US in this issue. For the US, active involvement in such projects can have a positive impact on its reputation in the region. The United States should pursue more active foreign policy towards CA by offering more promising programs to these countries so that it can maintain its geostrategic interests in this region.

For the governments of the Central Asian states, it is appropriate to act in the present pattern. That is, following a foreign policy without alliances which political interests are concealed and without compromising any particular power. Excessive rapprochement with the US, while ignoring other actors in the region, is not an acceptable option for the Central Asian states. In view of the fact that the states of the region cannot completely refrain from the influence of Russia, because Russia has a privileged position in the region, and this role has a number of positive features. China's economic impact is also undeniable. For the countries of the region, balancing the power is incredibly important and convenient in many respects. Under such conditions, regional integration is crucial for the Central Asian states. The unification of the countries of the region can produce a suitable response to any external influence.

### ABSTRACT

*In this article, there are ideas about new informational-technological method for the research of historical writings. According to this method, we can define degrees of originality, falsify of each writing by informational-technological indicators and this article is about appearance of scientific criteria to explore historical writings for chronology.*

**KEYWORDS:** *Classification, written source, system, assembly, office, personal, art, historical, scientific works, cartography, statistics, chronology, metrology.*

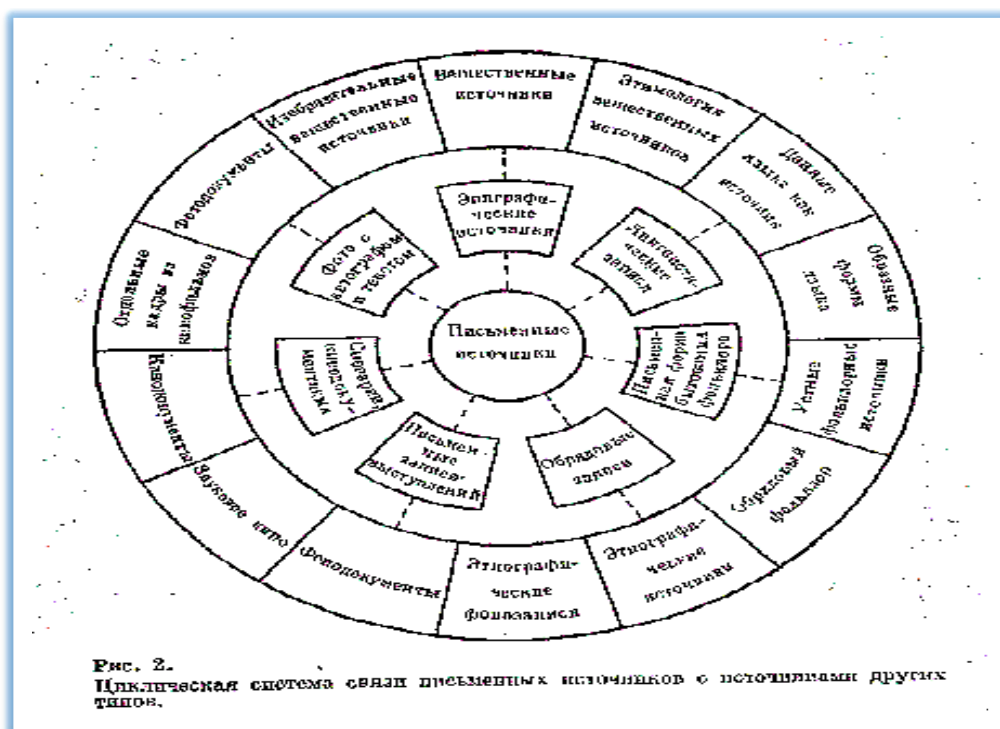

### INTRODUCTION

The importance of historical sources in covering the history of mankind objectively and neutrally has always been recognized by research scientists. For this reason, the classification of them according to their form and essence has been one of the most important tasks of source studies. A number of studies have been conducted on the classification of sources, some of which are noted [19; 38]. Source scientist, academician B. Ahmedov divided the chronological boundaries into five main categories (material, ethnographic, linguistic, folklore, written), depending on the historical sources of the period from ancient times to the middle of the XIX century, their general nature, reflecting the past [19: 8-12]. . B. Akhmedov, in turn, divides the written historical sources into two types: 1) official documents issued by the Supreme and local rulers (certificates, decrees, charters, etc.), financial statements, official correspondence and 2) historical, geo-cosmographic and biographical works [19:11].

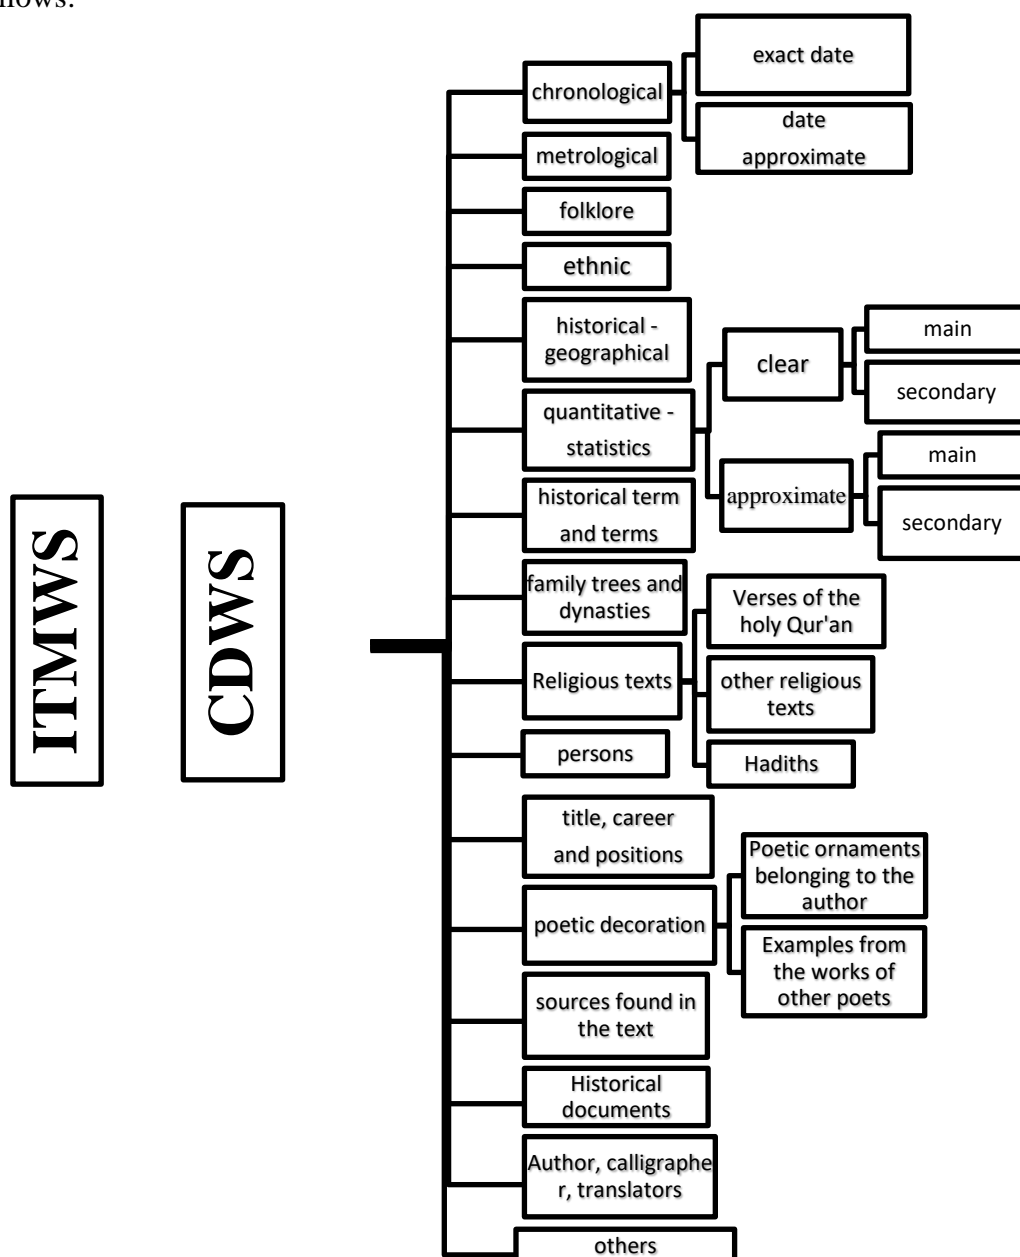

### RESULTS AND DISCUSSION

Russian source scientist L.N. Pushkarev took a unique approach to classifying historical sources from chronological boundaries from antiquity to the fourth quarter of the twentieth century. In his research, he classified historical sources into periodic and linear systems. The researcher

categorized historical sources into sixteen types according to the periodic table (Appendix 1) and fifteen types according to the linear system (Appendix 3)[38]. In turn, L.N. Pushkarev develops a linear (Appendix 5) and Periodic (Appendix 4) system of historical written sources. According to Appendix 5, written sources are divided into two types (documentary and narrative style) and twelve to twenty-four types. According to Appendix 4, written sources are divided into eight types (legal, office, personal, artistic, historical, scientific, cartographic and statistical) and three to twenty-four types. The scientist gives a periodic table of the interaction of written sources with other types of sources in Appendix 2 of his research. Scientific views on the classification of sources are included in tabular form in the monograph "Classification of Russian written sources on the history of the homeland" (Classification of Russian written sources on the history of the homeland), published in 1975 by the scientist[38]. . Below Appendices 2 and 3, developed by L.N. Pushkarev in tabular form, are referenced in their original (in Russian) form.

In the article, we would like to make some comments on the issue of systematic analysis of written sources according to their internal features, which is an important and basic type of historical sources. In the process of studying them, it is necessary to be vigilant in the use of information and evidence presented in the pages of sources, that is, to approach them critically [19:12]. In the systematic analysis of written sources, the study of the written source through the development of "Information Technology Map of written sources" (ITMWS) opens up new opportunities in source studies. ITMWS is a fundamental study of the nature and internal features of a written source. It is possible to determine the amount of data in the text based on ITMWS. ITMWS puts data from a written source into a specific system and categorizes them according to their characteristics. One of the alternative views of ITMWS in diagram mode is as follows:

Based on ITMWS, it is possible to create a “Categorized Database of Written Source” (CDWS). In this case, it is advisable to use auxiliary fields of history. The study of the data in the GMC using diagram, table, and SmartArt graphic element types puts the comparative analysis into a specific system. It should also be noted that many researchers have made effective use of various forms of tables and diagrams in categorizing written sources, comparing ancient records, chronological and genealogical data in chronological and regional order, categorizing civilizations, and more [1]. The use of three-step analysis is important in determining the amount and source level of data in ITMWS and CDWS. This can be seen in the example of Mu'izz ul-Ansab:

- 1) Data classification and analysis;
- 2) Analysis of data in written sources;
- 3) Comparative analysis of data with other written sources.

If the manuscript of the source is in a single copy [20: 147; 151; 211; 284; 13: 4], a two - step analysis is performed. This can be seen in the example of Giyasuddin Ali's source in the work "Ruznama-ye gazovote India" [7; 8]:

- 1) Data classification and analysis;
- 2) Comparative analysis of classified data with classified data of other written sources for the same period.

Data from a written source can also be categorized according to common internal characteristics:

I. Chronological [39: 35-39]: This information clarifies the date of the historical events that took place and serves to establish a certain periodic boundary. Chronological data make up the bulk of the information available in written sources. It is expedient to divide them into three main types and variants according to the state of meeting in the text:

- 1) Chronological data with clear dates;
- 2) Chronological data with approximate dates;
- 3) Chronological data indicating the duration of an event.

Chronological data on the second type are given by the authors of the source: "one day", "in a short time", "in the middle", "at this time", "in winter", "today", "the next day", "in the middle of the night", "Overnight", "morning", "after a while", "in the autumn of this year", "after a while", "about a year", "a few days later", "that night", "to until the horses are fat", "in the morning", "at night", "tomorrow at dawn", "this year", "this month", "at the time of birth", "at the time of death", "in two or three days", "two- after three days", "In the spring of the year of the sheep", "about seventy-five days", "the spring of the year of the pig has entered", "during this period", "two hundred years ago", "when the solar eclipse reaches the point of spring equinox", "after winter", "when the spring of the year of the mouse arrives", "in the first spring of the year of the sheep", "for several years", "in a fixed day", "in the year of the sheep", "in the year of the leopard", "after three months of siege", "five hundred and twenty-three governments", "He lived forty-eight years", "He was seventeen years old", "A few months ago", "In a week", "The end of this month", "On the ninth of the month", "For thirty years", "At the end of Ramadan", "In the middle of the month of Dhu'l-Hijjah", "Some time", "At this hour", "These days", "at the end of this month", "this year", "since the time of the terrible event", "in the middle of winter", "Eid", "next day", "last year", "a few years", "in those days", "at the end of the winter days", "after three days", "for a period", "at the end of one day", "within three years", "for two months", "the date of that opportunity is up to nine hundred and eight", "For this opportunity", "how many times", "At the end of time", "since the oath", "five months of fortress", "ul fatarotta", "earlier", "in this history", "how many years- who", "until the end of the oath", "three-four years ago", "Samarkand in the second turn", "how many years", "at that time", "at the end of this month", "evening prayer in the middle of the night", "other late prayer", "in this winter", "four", "Five years later, in the Kazakhs", "in that time", in sentences indicating the approximate time of the historical event.

We will try to analyze this category on the example of Mu'izz ul-Ansab. The chronological data in the source are 146, of which 88 belong to the Genghis and 58 to the Timurid periods. Let's analyze the chronological data according to the first stage of ITMWS:

- a) Information on the dates of birth of household members:  $2 = 11$ ;
- b) Information on the dates of enthronement of household representatives:  $28 = 0$ ;
- c) Information on the term of office of the representatives of the ruling family:  $14 = 1$ ;
- g) Information on the age of death of household members:  $1 = 37$ ;
- d) Information on the dates of death of household representatives:  $33 = 8$ ;
- e) Chronological data on different historical processes:  $10 = 0$ .

If we analyze the chronological data in Mu'izz ul-Ansab on the basis of types, we find that 78 of them ( $59 = 19$ ) are clearly dated, and the remaining 68 ( $29 = 39$ ) are approximate chronological data.

**II. Quantitative-statistical:** This category includes all numerical data that are not related to chronological and metrological data. They can be divided into two main types according to their state of occurrence in the text:

- 1) Accurate data expressed in numbers;

## 2) Approximate data expressed in numbers.

The authors of the second type of information are: “countless armies”, “innumerable armies”, “total nomadic armies”, “infinite army”, “all”, “close to a thousand people”, “several people”, “A group of horsemen”, “a small number”, “about ten thousand people”, “a group”, “about sixty horsemen”, “about a hundred people”, “all Turkish-Tajik officials, navkars, servants and relatives people”, “with about four or five thousand men”, “with about five hundred men”, “with about twenty thousand horsemen”, “a few pearls” and so on. Mu'izz ul-Ansab contains about 130 figures. About 100 of them belong to the Genghis Khan period and about 30 to the Timurid period[15].

The following information, expressed in numbers in the source, is mainly the majority:

- Number of wives and concubines of some members of the household;
- The number of sons and daughters of some members of the household;
- How many children some princes and princesses have;
- How many wives or current queens some queens are;
- The number of troops in the military units attached to the commanders and emirs;
- The number of troops sent for military campaigns;
- Others.

**III. Metrological** (weight, distance, volume, area, level, etc.): Because metrological data are related to units of measurement, they sometimes also represent data expressed in numbers. Information related to this category is provided by the authors: “two addresses”, “ten-day road”, “one harbor”, “one farsang road”, “total navohi”, “about a hundred gas walls”, “thirty thousand shekels”, “five lacquers”, “a thousand heads of silver”, “five leagues in length, three leagues in length”, “the distance to the bow”, “ten braso”, “ten steps in length”, “three hundred miles in circumference”, “this place is three”, “The thickness of a man's arms”, “The height of two spears”, “The height of four large horses”, “The length is one hundred and five, the width is dark”, “three steps”, “three fingers”, “two and a half palms long”, “two inches”, “one man”, “two-three distance”, “five-day journey”, “ninety-four degrees long” and a fraction, “a two-width desert road”, “a ten-day desert road”, “a tiny amount of land”, “a fifty-shariah gas”, “a three-month road”, “one shariah farsang every sixteen miles”, “The thickness of the chain is like the number of a man”, “An iron stake as thick as a man's waist”, “The distance of a hard shot arrow”, “The stone is not bent at all”, “Eight is silver”, “The distance of a hammer”, “A piece of tin”, “Thirty pieces of satin”, “Columns that do not fit in the arms of three”, “Nearly a hundred plates”, “a stone the weight of an elephant”, “a board the size of a dice”, “several steps”, “no more than two grains of the main commodity”, “nine gallons of water”, “four wooden roads”, “approximately the same length”, “four such as”, “a bullet”, “a bullet”, “a shar'i distance”, and so on. Metrological data are almost non-existent in Mu'izz ul-Ansab. There are 18 metrological terms in Nizamiddin Shami's commentary on Zafarnoma [16].

**IV. Ethnic:** This includes information found in the text about tribe, community, people, folk, army, population, tribe, generation, nation, people, and so on. K. Shoniyozov noted that in the works of Beruni there are more than 100 names of peoples and tribes [36: 128]. The index of

ethnic names of "Mu'izz ul-ansab" contains 120 information [15: 343-346]. When we analyzed the source, we were able to identify the occurrence of about 160 ethnic names [40: 138-143]. However, it should be noted that the source of ethnic information given in such sources as "Tarihi arba' ulus", "Mu'izz ul-ansob", "Shajarayi turk" is Rashiduddin's source "Jome' ut-tavorix". Comparing and analyzing ethnic data in Mu'izz ul-Ansab with sources requires special scientific research.

**V. Historical-geographical:** This includes information related to place names found in a written source. It would be useful to divide them into oykonim, ethnotoponymy, anthropotonymy, hydronym, oronym, polynymy (urbanymy), drimonym, dromonym, zoonym, chronym and other types. A. Sagdullaev noted that in Herodotus' book "History" Bactria, Bactria, Bactrians were mentioned 13 times, Sogdians 2 times, Khorezmians 3 times, Saks 11 times, massagets 19 times [25:34]. The Tarikh-i Bukhara source cites 206 [5: 581-589], Al-Mulhaqat bi-s-Surah 250 [9: 188-195], Majma al-Ansab wa-l- ashjor 196 [2: 312-318] and 99 [15: 351-354] are mentioned in Mu'izz ul-Ansab. H. Hasanov and R. Rasulovs mention that in "Boburnoma" more than a thousand [34:62; 24:44], T. Nafasov ferefers that it's more than 1,100 place names [23:39]. Nizamiddin Shami's "Zafarnoma" contains 848 place names [16: 477-501]. These include stream, garden, spring, temple, region, visaq, valley, guzar, dara, river, pool, steppe, wall, sea, pass, yobisa, summer, yam, lands, valley, shrine, road,lake, bridge, ridge, pavilion, reed, old, town, castle, village, dome, well, sand, fort, reserve, army, anchor, district, field, country, address, stage, masjid, masjidi Jome', cemetery, nahr, saray, khanaqoh, pool, desert, city, e and others.

**VI. Historical terms :** Historical terms can be divided into several types depending on the state of occurrence in the text. By fields: economic, political, cultural, military, religious, legal, scientific, musical, ethnic, toponymic, title, etc. Linguistically: Arabic, Persian, Turkish, Mongolian and others. 135 in the Tarikh-i Bukhara [5: 590-594], 99 in the Mu'izz ul-Ansab [15: 347-350], 414 in Nizamiddin Shami's Zafarnoma [16: 506 -521] is described. The Zafarnoma index includes 103 military terms, 73 honorary titles, and professions of rulers, 54 economic terms, 18 metrological terms and 14 musical terms.

**VII. Qur'anic verses and hadiths:** The works of Arab-Persian authors contain information about the verses of the Qur'an and hadiths. Information on this category is 109 in Nizamiddin Shami's "Zafarnoma" [16: 405-444], 32 in Hafiz Abro's appendix [16: 445-448], 124 in Matlai Sadayn's 2-volume 1 book [3: 535- 623] and in Volume 2, 145 [4: 677-702].

**VIII. Personal names:** The names of individuals mentioned in written sources are often listed in alphabetical order in the indexes. It is advisable to divide individuals into a number of types and parts according to the circumstances in which they meet at the source. According to the position of individuals in society: 1) Stratification; 2) According to the tribal origin; 3) According to professional affiliation; 4) on the basis of religious affiliation and views; 5) by territorial affiliation; 6) It can be based on gender, etc.

From a personographic point of view: a) the gods; b) angels c) prophets; g) legendary figures; d) governors and saints e) rulers; g) various categories of officials; j) The blind; h) different categories of persons; k) division of unnamed persons, etc., regulates the analysis of data related to the category. Sometimes there is also information about unnamed people in written sources. In particular, the information about the Timurid princesses, whose names are not mentioned in the

source of "Zafarnoma" by Sharafuddin Ali Yazdi, makes a total of 38 [12]. It should be noted that the reason for the incomplete coverage of information about the Timurid princesses and women in general in the written sources can also be found in the written sources of that period. In particular, Ibn Arabshah's source, Ajaib al-Maqdur, states: "Timur read the place mentioned by the women in his reply and made an introduction. Because insulting women is a great sin and a great sin. They do not even pronounce the names of women and girls, but call each of them by a different phrase, and constantly warn (people) to avoid this. If the wife of one of them gives birth to a daughter, she is called a "veiled child" or "adornment" or "mastura" or something like that [11:259].

In the index of names of persons compiled in the source "Tarikh-i Bukhara" 303 [5: 570-581], in the source "al-Mulhaqat bi-s-Surah" 917 [9: 167-187], "Majma al-ansab and- l-ashjar" contains 401 [2: 298-309], and "Mu'izz ul-ansab" contains about 6000 [15: 197-342]. Nizamiddin Shami's "Zafarnoma" contains 773 [16: 449-476]. If we take into account that the name of Amir Timur is four, the name of Princess Khanzoda is three, the names of 11 people are found in two different forms, the source contains information about 756 historical figures and 1 literary hero - Isfandiyor [16: 456]. There is also a number of information about their names. R. Rasulov has more than 1,800 in the play [24:44], T. Nafasov 1406 ta [23:39], M. Abdullaeva noted that the names of 1540 people [29: 103] met. Khudoynazarov noted that the "Shajarai Turk" source mentions the names of more than 400 historical figures, briefly describing the lives and activities of 110 of them [33: 69]. In addition to the index of personal names compiled for Al-Kamil fi-t-Tarikh [10: 486-520], the index of honorary titles divides the names found in the source into groups such as Muslim, Arabic, Turkish and Iranian [10: 540-549]. . Ethnic and linguistic classification of historical figures by titles and names, further enhances the ability to know the information level of a written source.

**IX. Genealogy and dynasties:** Written sources contain information about the dynasties that ruled in different periods, the clergy, the genealogy of people who left a deep mark on the life of the country. The analysis of genealogical data helps us to better understand the historical processes. In the index of dynasties in the source "Al-Kamil fi-t-history" 11 [10: 552], in the index of dynasties in the source "Majma al-ansab wa-l-ashjar" There are information about 40 dynasties [2: 310-311]. We will try to explain this category by analyzing the data on the Timurid dynasty, which left a deep mark on world history. The preface to Mu'izz ul-Ansab contains information on the number of representatives of the Genghis and Timurid dynasties [15: 12-13]. A fundamental study of the history of the Temurids states that the list of Amir Timur's descendants reached 193 [19: 134]. the level of study of the dynasty in written sources requires more research. A dynastic analysis of Nizamiddin Shami's Zafarnoma reveals that of the 756 historical figures, 15 were Timurid mirzas and 14 were Timurid princesses[16]. In Sharafuddin Ali Yazdi's "Zafarnoma" there are 46 Timurid mirzas and 67 Timurid princesses[12]. The source "Mujmali Fasihiy" contains information about 69 Timurid princes and 27 Timurid princesses [17]. In "Boburnoma" there is information about 85 Timurid mirzas in total [30: 76-80]. The play also contains 20 chronological information about the birth and death of some of the Timurid mirzas [30:81]. A. The seventh chapter of Navoi's Majlis un-nafois contains information about Amir Timur and 21 other Timurid mirzas [18: 78]. Although research on the dynasties that ruled in the past, including the Timurids, is significant [38], the issue of creating a database of dynasties that can be found in a clearly written source has not been fully resolved. With this in

mind, we consider it expedient to study the genealogical and dynastic data in the written source as a separate category in the ITMWS, and to present the statistical data on this category in the ITMWS.

**X. Titles and Positions:** Written sources contain a lot of information about titles, positions, ranks, status, careers, honorary titles. Al-Kamil fi-t-Tarikh has 39 titles [10: 549-550] and Musahhir al-Bilod has 62 titles [14: 427-428]. . A number of researchers have analyzed data for this category [26]. For example, of the 1,540 people found in the Boburnoma, 357 are listed as historical figures from Movarounnahr and are categorized. Including 5 amirs and nobles; 20 kings and princes; 42 princesses and daughter s of kings; 52 umars, army chiefs and beys; 21 members of religion and mysticism; 30 people of science and literature; The names of 187 different people — soldiers, peasants, artists, craftsmen, slaves, and oilmen — were mentioned [29:103]. Sh. Vohidov and R. Khalikova on the management of the Bukhara state [29: 240-251], Sh. Vohidov and D. Yangibaevs provided information about the secretaries and calligraphers found in Sadri Ziyov's " Fehrist" [28: 53-60]. Sadri Zia noted that of the 450 individuals mentioned in the catalog, 170 were calligraphers [28:59]. E. Sattorova described 22 military and military-administrative titles and positions that existed in Central Asia in the XVI-XIX centuries [31: 377-380]. About some titles and in Sharafuddin Ali Yazdi's "Zafarnoma" [29: 91-93], titles found in "Mu'izz ul-ansob", various attributes and epitaphs related to the title, more than 90 titles in the time of Genghis and Timurids and the names of the deeds are recorded [29: 106-111]. During the analysis of Mu'izz ul-Ansab, we were able to determine that the source contains information about about 280 titles and positions [40: 143-164]. In order to fully determine the functions and hierarchical level of the titles encountered in the source, it is necessary to make a comparative analysis with Rashiduddin's "Jome' ut-tavorix" and Juwayni's "Tarihi jahankushoy" sources.

When we systematically analyze the source of Fasih Khawafi's "Mujmali Fasihi", there are about 150 titles and positions in the text [41: 21-26], Muiniddin Natanzi's "Muntahab ut-tavorihi muiniy" more than 350 [40: 165-197], Zahiriddin Muhammad Babur's "Boburnoma" contains the occurrence of more than 570 [40: 197-252] data in the Boburnoma indicates the source significance of this category.

**XI. Historical documents:** A number of historical documents can be found in the texts of written sources. Documents on the history of Uzbekistan were published by O.D. Chekhovich divided them into 34 types [37: 27-28; 35]. D. Valieva tried to study the diplomatic relations between Bukhara and Tsarist Russia in the first quarter of the 19th century through a comparative analysis of Amir Haydar's letters[21]. J. Juraev analysed , 22 letters to Amir Haydar and Muhammad Hakim [30: 121], P. Gulyamov, thinking about the identification of Amir Temur's letters, divided the essay or munshaat complexes into groups [18: 209-214]. Information about documents can be divided into two types according to the state of occurrence in the text. Types can also be divided into several types depending on the nature of the document:

1) Official documents; 2) Informal documents.

**XII. Creativity:** This category includes information on architecture, irrigation, land reclamation, roads and other creativity.

**XIII. Religious Sphere:** This category includes information on religions, sects, tomb circumambulations, shrines, and more. Al-Kamil fi-t-Tarikh contains information about 19 religions and sects [10: 555-556].

**XIV. Military:** This category includes wars, military campaigns, battles, defensive battles and their organization, military uprisings, military conspiracies, tactics, strategy, army structure, military training, military inspections, types of weapons, use of weapons, etc. data is included.

**XV. International relations and diplomacy.**

**XVI. Culture:** This category includes information on the classification of sciences, literature, science, art, writing, calligraphy, music, fine arts, life and work of people of science and art, cultural figures and others.

**XVII. State and local government.**

**XVIII. Linguistic:** In this category, linguistic information from a written source is collected and analyzed.

**XIX. Economic:** This category collects information on written sources of trade, crafts, agriculture, finance, monetary reform, taxes, property relations, prices, market relations, currencies, and more.

**XX. Sources in the text:** This category is important in studying the nature and source basis of a written source. Al-Mulhaqat bi-s-Surah mentions 101 [9: 158-160], and Tarikh-i Bukhara mentions 12 [5: 595] sources. In Shajarayi Turk, the author mentions 18 sources in Persian and Turkish, although he did not mention their names when he began writing the work [6:11].

**XXI. Rituals, ceremonies and events:**

**XXII. Poetic decoration (stikhodekor):** It is common to find poetic fragments in medieval prose-written sources. In view of this, it would be useful to include information on poetic decoration in a written source as a separate category in the YOMITX. Let's analyze this category on the example of Abulgazi Bahodirkhan's work. His "Shajarayi turk" and "Shajarayi tarokima" sources contain six poems, four of which are written in Uzbek and the other two in Persian-Tajik. The four poems in the Shajarayi Turk also consist of 30 lines, two in Uzbek and the other two in Persian. Abulgazi Bahodirkhan's medical treatise Manofe'-ul-inson also contains 20 lines of poetry written in Persian [33:30]. Munis's Firdavs al-Iqbal also pays great attention to poetic decoration. The author included 683 verses of 2915 verses in the source, while Ogahi included 84 verses of 514 verses. The poetic fragments belong to Mullo Sayyidoyi Bukhari, Nizami, Saadi, Firdavsi, Mirza Nazim Hiravi and six unregistered poets. The play also contains history, masnavi and qasida by Munis and Agahi (16 of the 21 Persian chronograms are Munis's) [27:76]. Sadri Ziyo's Tazkar ul-Ash'ar tazkirah contains 1444 bytes, while the poems of the classified poets contain 2616 bytes [27: 153].

**XXIII. Nature, flora, fauna, climate:** Information in this category occurs at different levels in written sources. "History of Bukhara", "Ajoib al-maqdur", the diary of Rui Gonzalez de Clavijo, "Matlai sa'dayn", "Boburnoma", "Historical Rashidi" and many other sources in Central Asia, Afghanistan, India, Iran, China, There is information about the nature, flora, fauna and climate of such regions as East Turkestan, Mongolia, Azerbaijan. With this in mind, we think it is appropriate to study this data as a separate category in ITWMS as well.

**XXIV. Information written by the author, calligrapher and translator about himself and his relatives:** Identifying the author of the work and his identity is of great importance in the scientific analysis of the manuscript. It is important to correctly determine the general ideological direction of the work in order to determine the identity of the author, that is, to which social group he belongs, as well as his worldview [20: 16-17]. Fasih Ahmad Khawafi's "Mujmali Fasihi" 100-101, 116, 118, 129, 131-132, 171-172, 178, 183, 193-196, 199, 205-206, 208, 216-218, 221-222- and [17] and Abdurazzaq Samarkandi's 39, 42-43, 109, 194, 251, 378 [3], 10-13, 17, 22, 73-75, 91-93, 99-101 of Matlai Sa'dayn. 111-117, 119-132, 136-163, 173-177, 179-180, 192, 194-197, 265-266, 336-337, 341, 366-368, 399, 401, 474-475, 483- On pages 484, 537, 556-557, 673-674 [4] they provided valuable information about themselves and their loved ones.

**XXV. Myths, narrations, proverbs, parables, proverbs and wise sayings:** In addition to historical events, some written sources contain a lot of information in this category. Such written sources include Ibn Arabshah's Ajaib al-Maqdur, Abu al-Ghazi's Shajarayi Turk, and Shajarai Tarakima. On the influence of folklore in the work "Shajarai tarokima" academician A. N. Kononov said: "The work was important not only as a historical source, but also as a literary monument, because it skillfully depicts folk legends, folk etymology, ethnonyms, proverbs and parables" [32:43].

**XXVI. Cartographic data.**

**XXVII. Other information.**

## CONCLUSION

What results and innovations can a systematic analysis of a written source lead to:

- 1) It is possible to determine the level of originality, compilation and falsity of the source by comparative comparison and critical analysis of any written source and the source itself, which has several manuscripts copied at different times, according to the information indicators;
- 2) It will be possible to determine the level of originality of both primary and secondary written sources covering the history of a period by comparative comparison and critical analysis of information indicators;
- 3) Informative classification of primary written sources of different periods of history, comparison and critical analysis of quantitative indicators provide an opportunity to better understand the history of this period from a source and scientific point of view, to understand and shed light on new aspects of causes and effects of historical processes ;
- 4) Systematic analysis of the written source and study through ITMWS increases the ability to systematize and direct research in ancillary areas of history;
- 5) Systematic analysis of the written source and study of it through CDWS such as "Pushkin's Dictionary", "Abay's Dictionary", "Dictionary of Navoi Works" [22], "Temur's Statutes", "Zafarnoma", "Mujmali Fasihiy", and can effectively assist in compiling dictionaries from other sources as well;
- 6) Systematic analysis of the written source and ITWMS provide an opportunity to systematize and direct the completed and planned research in the field of source studies;

7) Systematic analysis of the written source allows to know the level of data in the form of diagrams, tables and graphic elements of SmartArt, and the ITMWS and ITWMS of any written source are developed;

8) Systematic analysis of the written source is useful in determining the level of sourceability of research, popular science and art works that cover the history of this period;

9) In the study and critical analysis of written sources in source studies, a new scientific direction of content emerges - the direction of the information layer (boundary) of sources.

### ABSTRACT

*Current evidence suggests that the number of patients with epilepsy is increasing worldwide. Epilepsy has been known as a disease since ancient times. About the types of disease, clinical signs, symptoms, methods of examination and treatment.*

**KEYWORDS:** *Epilepsy, Lennox-Gasto syndrome, anticonvulsants, absence, tonic-clonic, focal, widespread.*

### INTRODUCTION

Historically, great people such as Socrates, Plato, Julius Caesar, Janna D Arc, Van Gogh, and Dostoevsky have suffered from epilepsy. [9] That's why some experts say that only strong-minded people suffer from epilepsy, while others believe that seizures trigger talent buds in a person. I do not totally agree with them, but I've seen some patients with epilepsy show strong symptoms. [11] Among the patients who came for treatment were powerful artists, poets and mathematicians. Among such patients are many who invent wise sayings that amaze people, and many who end up with quartets rich in wisdom. I have witnessed an increase in intuition and cognition in a sick girl with constant aggression. In most patients with epilepsy, if the seizures are not stopped in time, they can lead to severe mental disorders, leading to mental retardation. The earlier the seizures start, the earlier mental disorders can develop. However, severe mental disorders do not occur in all types of epilepsy. Epilepsy is a chronic disease of the brain characterized by recurrent seizures of various kinds. Epilepsy is common among the population. Out of every 1,000 people, 5-10 can get the disease. 70% of epilepsy develops before the age of 20. The incidence rate is almost the same in women and men. [13]

## RESULTS AND DISCUSSION

Etiology. Epilepsy is a polyetiological disease. A number of negative factors play a significant role in its development, including genetic, brain injuries, congenital anomalies, infections, metabolic disorders, intoxications, neurodegeneration and vasocerebrovascular diseases[1, 320]. It is known from the etiology of the disease that any pathological factors that dramatically alter the bioelectrical activity of the cerebral hemispheres can cause epilepsy. Under the influence of such factors, epileptogenic foci are formed in the cortex. The group of highly excited neurons located in the cortex of the cerebral hemispheres is called the epileptogenic foci. Depending on the etiology, epilepsy is divided into 3 major groups:

1. Idiopathic epilepsy is an epilepsy that develops due to hereditary predisposition. In this epilepsy, there are no structural changes in the brain, and no pathological changes in the neurological status. Idiopathic epilepsy occurs both familiarly and sporadically.
2. Symptomatic epilepsy is an epilepsy that develops due to brain damage (effects). The main causes of the disease are brain injuries, tumors, vascular diseases, degenerative diseases, metabolic and toxic encephalopathies. Symptomatic epilepsy is mainly characterized by focal seizures.
3. Cryptogenic epilepsy - epilepsy of unknown cause. Any epilepsy of unknown cause is classified as a cryptogenic epilepsy. Focal and diffuse epileptic attacks are also distinguished. Epileptogenic foci in the brain; if it stays in one place - focal, neuronal movements spread to other areas and both hemispheres - diffuse epileptic attacks develop. Disseminated epileptic attacks, any attacks that present with loss of consciousness are called diffuse epileptic attacks. These include various absence, diffuse tonic-clonic or separate clonic and tonic, atonic (astatic) and myoclonic attacks. The diagnosis of "disseminated epilepsy" is made only if the patient is unconscious. If the epileptic attacks occupy half of the body but the patient retains consciousness, it is focal epilepsy, not widespread epilepsy. Thus, loss of consciousness is a key criterion for diagnosing generalized epilepsy. The word "disseminated" does not mean that epileptic seizures have spread throughout the body, but that epileptic activity has spread to both hemispheres. Therefore, absence also belong to the group of widespread epilepsy. Disseminated epilepsy accounts for almost 40% of all epilepsies.

Absence [French. abscess - an epileptic seizure characterized by a very short loss of consciousness (2-30 seconds). They are among the most common epileptic attacks. For example, in children with absence epilepsy, there are more than 50 or 100 absence attacks a day. For abscess, peak-wave activity with a frequency of 3 Gs, which is symmetrically reflected in the EEG, is very typical. This type of epilepsy is more common in children and adolescents. No aura is observed in abscesses. Abscesses are divided into simple and complex types. In a normal abscess, the patient freezes to a point. At this point, her pupils dilate, she is not affected by light, and her face turns pale. The patient freezes in the state in which he is doing what he is doing, that is, he stops speaking, writing, writing, drawing, painting, and so on. But it does not lose its balance, it does not fall.

This means that the patient freezes like a statue in the same position as he was during the attack. This lasts for a short time, 5-15 seconds. After the abscess, the patient resumes his work. Normal abscesses pass at the same rate as they appear. The patient does not know what happened to him or learn from others. During normal abscesses, the eyeball may rotate once or twice or the head

may move backwards. After simple abscesses, the patient does not recover, his activity does not slow down, he resumes his activities as a healthy person.

**In complex absences**, loss of consciousness is manifested in combination with various tonic and vegetative components. Complex absences are a bit more complicated than normal absences, loss of consciousness lasts longer (20-30 seconds), and falls are more common. Such attacks, which appear without any aura, cause the patient many injuries. Also, complex absences are manifested by various automatisms, i.e. the patient says something to himself, makes some gestures with his facial muscles, performs various unconditional movements with his limbs. During automatics, the patient loses consciousness, does not know what he is doing, and does not remember.

*Febrile attacks.* Attacks that occur when the body temperature rises are called febrile seizures. Febrile seizures occur in children aged 6 months to 5 years. The most common period of the disease is 1-2 years. Elevated body temperature is often associated with upper respiratory tract infections. Seizures if medications are taken to lower body temperature; attacks will also stop. Febrile seizures are primary-prevalent epileptic seizures characterized by tonic attacks. Febrile attacks are always accompanied by loss of consciousness. However, they are among the mildest epileptic seizures. Because the prognosis in this disease is almost always good. Focal attacks are not unique to him. The earlier the febrile seizures start, the sooner they disappear. The number of febrile seizures decreases as the child gets older. Usually, febrile seizures stop before the child is 6 years old. Sometimes epileptic status develops and the child's life is in danger. There is no consensus that febrile seizures may progress to other epileptic seizures. If a child with febrile seizures has structural changes in the brain and neurological disorders, especially in the offspring with epileptic seizures, if seizures are repeated, other types of epilepsy are more likely to develop later. Such patients are often diagnosed with sclerosis. In them, febrile seizures can progress to Lennox-Gasto syndrome.

*Diagnosis.* Not all doctors experience the first epileptic attacks in a patient. That's why diagnosing epilepsy almost always starts with a thorough medical anamnesis.

A doctor who has not seen the attacks observed in a patient with his own eyes will certainly come to an opinion after a thorough examination of the anamnesis of the disease. Here, the information of the doctor who has treated the patient before and seen the attacks once or twice, especially the neurologist, is very important. Therefore, the chronology of epileptic seizures should be detailed in the medical record or biography. Accurate and detailed information provided by the doctor who treated the patient first is very important for the doctors who will treat the patient later.

Subjective data and anamnesis. When diagnosing epilepsy, the doctor faces the following 2 questions.

1. Has the patient had an epileptic attacks or other condition?
2. What is the type of epileptic attacks and what is the cause?

To clarify these questions, the patient and his relatives are asked a series of questions, and in parallel, a medical history is collected.

Questions for diagnosing epileptic attacks:

- Did the patient lose consciousness?
- Was he wheezing?
- Has he stopped breathing?
- Did he shout during the attack?
- Were aura messengers observed?
- Is there a bloody foam in the mouth?
- Did he lose his eyesight, shake his head, or turn to the back or sides?
- Were there any tremors in the limbs?
- When did the attacks occur: at bedtime, early in the morning, during the day or at night?
- Approximately how long did the attacks last?
- Did the patient fall into a deep sleep when he regained consciousness?
- Has this happened before?

Questions to identify absences:

- Does he stare at a point?
- What is the condition of the eyes during an attack?
- Head, body and limbs?
- How long does the sensitivity last?
- What is the patient's condition after the attack?
- Does he feel aggressive?
- How many times a day (week or month) do the attacks recur?

Here we have raised questions about the most common types of epileptic seizures, including the identification of absences. The length of the answers to these questions will help clarify the question of whether an epileptic seizure has been observed in a patient. After answering these questions, the doctor moves on to the next stage of diagnosis, which is to determine the type and cause of epileptic seizures. This should be based on subjective symptoms, anamnestic data, somatic and neurological status, laboratory tests, EEG, CT and MRI data.

Anamnestic data:

- Do any family members have epilepsy?
- Were there any febrile seizures in early childhood?
- What complications were observed during fasting?
- Have you had any brain diseases (brain injuries, meningitis, encephalitis)?
- Do you currently have tuberculosis sclerosis, brain abnormalities?
- Have you had any brain surgery?

- No endocrine diseases and various metabolic disorders?
- When and after what was the first attack?
- Are you not taking medications that aggravate epileptic seizures?

The physician reviewing the anamnestic data is listed above

ask questions to the patient and his relatives and thoroughly study the information on the medical record. The absence or presence of a history of disease does not rule out a diagnosis of epilepsy. Because if epileptic seizures are observed but the cause is not identified, a cryptogenic epilepsy is diagnosed.

*Electroencephalography.* EEG is of great importance in diagnosing epilepsy. It is important to distinguish between physiological (normal) and pathological waves when performing these tests. Acute waves, spikes, and peak-wave complexes that appear on the EEG are the main epileptic waves. No additional screening methods are important at the EEG level in the diagnosis of epilepsy. EEG can not only differentiate epilepsy from other paroxysmal conditions, but also determine the type, severity, treatment outcome, and prognosis of epileptic seizures. EEG video monitoring data increase the diagnostic value of this method.

**Laboratory tests.** Laboratory tests are mainly used to determine the cause of epilepsy and hematological disorders that occur during treatment with anticonvulsants. Measuring the amount of electrolytes (Na, K, Cl, Ca; Mg) in the blood can be very important in determining the cause of epileptic attacks. Laboratory tests are also performed to determine inflammatory reactions, hormone levels, and sometimes the concentration of anticonvulsants in the blood. General blood tests (especially hemoglobin levels) and biochemical tests (ALT, ACT) are performed to determine the side effects of anticonvulsants. Liver enzymes should be monitored regularly, especially during treatment.

CT and MRI scans. Modern tests are widely used to determine the cause of epileptic seizures. Idiopathic and cryptogenic epilepsy do not cause pathological changes in the brain.[2, 404] In symptomatic epilepsy, CT, MRI, and MRI scans almost always detect pathological changes in the brain and its blood vessels. Of course, epileptic seizures that develop as a result of metabolic disorders are an exception. A PET test is required here.

*Treatment.* Treating a patient with epilepsy is a complex process that requires the following guidelines. The general practitioner is also required to be aware of these rules.

### **12 rules of treatment with anticonvulsants**

1. The patient is monitored after the first epileptic seizure (including EEG monitoring), and anticonvulsants are recommended after the 2nd or 3rd seizures.
2. The patient is selected a single anticonvulsant that is effective for the identified epileptic seizures, and treatment begins with the same drug, that is, the principle of monotherapy is followed.
3. The selected anticonvulsant is initially given in small doses and its dose is gradually increased until the attacks are over, ie until the therapeutic dose is reached.

4. The choice of drug is approached individually, taking into account the circumstances and side effects that prevent its recommendation. Once the attacks have stopped, the increase in the dose of the drug is also stopped, and in this way the therapeutic dose is selected.

5. The patient and his relatives are warned about the continuous use of the drug and its side effects. If you experience any side effects, you should seek medical advice immediately.

6. Clinical and laboratory tests are performed to determine the side effects of the drug. If they are observed or toxic effects begin to occur, the dose of the drug is reduced and replaced with another drug.

7. Even if the dose of the selected drug is increased, if the epileptic seizures do not stop, gradually reduce the dose and switch to another drug in parallel.

8. If monotherapy does not help, switch to polytherapy, 2 anticonvulsants are recommended together. Here, the interactions of the selected drugs are taken into account, i.e., drugs that have the same effect, inactivate each other, or enhance their toxic effects are not prescribed together. In very rare cases, a third anticonvulsant is chosen.

9. In the initial stage of treatment, an EEG is performed every 3 months and epileptic activity is studied. Laboratory tests, including liver function tests, are performed

If focal neurological symptoms occur, CT or MRI may be performed.

10. Treatment with anticonvulsants should be continued for at least 2-3 years and gradually discontinued. Sometimes these medications have to be taken for years.

11. The patient and his relatives are warned that epileptic seizures may recur. The possibility of using surgical methods of treatment is taken into account and the patient's relatives are informed about it.

12. The patient is taught a healthy lifestyle. It is said that a healthy lifestyle is an important factor in preventing recurrence of epileptic seizures and faster recovery of the patient.

**Note.** Table 2.33 shows the different drugs used in epilepsy

Here's a few basic facts about a stomp pad. When choosing these drugs, it is necessary to follow the rules generally accepted by epileptologists. The required anticonvulsant is selected by the neuropathologist, not GPD.

### 2.33-table

Prescription for using anticonvulsants

Name of the drug and its synonyms	Instructions	Daily dose for older people	Average daily dose for children	Impediment conditions (complete and relatively)
Valproats(depakin, konvuleks, orfiril)	All of the epileptic attacks	1200-2400 mg	20-30 mg/kg	Acute and steady hepatitis, diathesis, initial 3 months porphyria

Karbamazepin (finlepsin, tegretol, zeptol)	Focal attacks, Secondary widespread attacks, Other paroxysms	800-1200 mg	10-20 mg/kg	Atrioventricular conditions, old age brocardia, initial 3 months of pregnancy, blood illnesses, porphyria, hypoteries  Clonazepam (rivotril, antelepsi) Focal is helpful for dealing with widespread attacks Epileptic status 2-4 mg 1,5-3 mg pregnancy, lactation, myasthenia, bronchial asthma. It strengthen miorelacsants, analgesics
Lamotrigin (lamictal)	focal initial and secondary attacks Main thing in Lennocs-Gasto Syndrom Additional drug	100-400 mg	5-10 mg/kg	pregnancy lack of liver and lung
Gabapentin (neyrontin)	Focal attacks	1200-2400 mg	20-30 mg/kg	Pregnancy and lactation, The children under the age of 3
Vigabatrin (sabil)	Uest syndrom	1000-3000 mg	50-100 mg/kg	Regnancy and lactation Zonizamid (zonegran)

Carbamazepine (finlepsin, tegretol, carbalex, zeptol) is used not only in focal epileptic seizures of various etiologies, but also in psychomotor disorders, tonic-clonic seizures observed during sleep or after waking up, abstinence syndrome, manic-depressive psychosis, affective disorders.

is used. The dose of the drug is selected individually, depending on the patient's somatic condition, age and course of the disease taken into account (Table 2.34)

#### 2.34-table

#### Prescription for carbamazepine in epilepsy

The age of patient	Daily minimum dose	Daily maximum dose
Children under the age of 1	100 mg once per day	100 mg twice per day
1-5	100 mg twice in a day	200 mg twice in a day
6-10	200 mg twice in a day	200 mg three times per day
11-15	200 mg three times per day	200 mg four times per day

For adults, 200 mg 4 max per day, hand 400 mg 3-4 times per day

**Note:** The daily therapeutic dose of carbamazepine for adults can be increased to 1600 - 2000 mg. At such times, retard types of the drug are selected. The patient sometimes forgets to take the daily dose of anticonvulsants. At such times these drugs are long affected species are selected.

Lamotrigine (lamictal, lamitor) is also an effective anticonvulsant, produced in tablets of 25, 50 and 100 mg. Lamotrigine is an effective tonic for clonic seizures and focal seizures. If treatment with other anticonvulsants does not give the desired result, additional lamotrigine is prescribed or it is recommended separately. This drug is also effective in abscesses and myoclonic seizures. The scheme of recommendation of lamotrigine monotherapy is shown in Table 2.35.

**TABLE 2.35 LAMOTRIGINE FOR CHILDREN AND ADULTS OVER 12 YEARS OF AGE MONOTHERAPY TYPE RECOMMENDATION SCHEME.**

Scheme of raising the dose of lamotrigine				
1-2 week	3-4 week	5 week	6 week	7 week
25 mg once a day	25 mg twice a day	50 mg twice a day	100 mg twice a day	200 mg twice a day

Note: Once the daily dose of the drug reaches the optimal level, it is maintained at the same dose. While the optimal daily dose for some patients is 200 mg, for some patients it may be necessary to increase it to 400 mg.

Valproates. In prevalent epileptic seizures (including tonic-clonic), the first-line recommended medication is valproate. Valproates are very effective in abscesses, myoclonic and atonic attacks. Therefore, they are also recommended for various "mixed" epileptic seizures. Valproate is widely used in epilepsy, behavioral disorders, febrile seizures, simple and complex focal seizures, primary and secondary prevalent epileptic seizures, manifested by psychomotor phenomena. Valproate can be used as an adjunct in the treatment of thrombotic hyperkinesia in children. These drugs are also recommended as adjunctive medications in manic-depressive psychoses. The most commonly used types of valproate are depakin and convulsive.

### Questions that arise during the treatment of the patient and their answers

Question. Why is monotherapy chosen to treat epileptic attacks?

Answer. In most cases, 2 anticonvulsants give the same result as 1 anticonvulsant. The monotherapy method reduces the harmful effects of anticonvulsants on the body, as 2 anticonvulsants can reduce the effect of each other and can eliminate or intensify the effect of intoxication. Psychological reasons, that is, most patients do not like to take a lot of drugs and do not follow the medication regimen. Also, monotherapy is cheaper.

Question. Is it safe to give anticonvulsants in mild forms of epilepsy?

Answer. Yes, it is. Anticonvulsants are not recommended for some types of mild epilepsy, such as rolandic, photosensitive, and reading epilepsy. Pediatric abscess epilepsy also resolves on its own as the child gets older. But the diagnosis must be correct.

Question. What types of epilepsy are severe and can recur after a seizure has stopped?

Answer. Severe forms of epilepsy include West syndrome, Lennox-Gasto syndrome, Kojevnikov epilepsy, Rasmussen syndrome, and the like.

Question. How long should anticonvulsants be given and when should they be stopped?

Answer. There is no consensus on when to stop taking anticonvulsants. In most cases, it is recommended to take the drug for another 2 years after the last epileptic seizure. If the attacks do not recur within 2 years, the medication can be gradually reduced and stopped. In some cases, especially in symptomatic epilepsy, it is necessary to take anticonvulsants for 3-5 years. If the underlying cause of the epileptic seizure is eliminated (e.g., through surgical treatment), there is no need to take anticonvulsants for a long time. Anticonvulsants have been used for many years in Lennox-Gasto syndrome, Kojevnikov epilepsy, and Rasmussen syndrome.

Question. When can epileptic seizures start again after taking anticonvulsants completely?

Answer. Its causes are several: 1) mental and physical retardation 2) persistent focal neurological symptoms 3) long-term epileptic history 4) late start of proper treatment 5) focal epileptic seizures 6) different types of epileptic seizures if the attacks are manifested together 7) if strong changes in the EEG persist 8) other adverse factors (alcoholism, drug addiction).

Surgical treatment methods. Epileptic seizures cannot be completely stopped in almost 20% of patients, even if the anticonvulsants are chosen correctly. In such cases, surgical treatment may be required. Before sending a patient for surgery, of course, there is a consultation with qualified doctors. This is because the therapeutic methods needed for treatment may not be used enough.

**Epileptic status.** Epileptic status is an acute condition characterized by a 30-minute follow-up of epileptic seizures. The main factors contributing to the development of epileptic status:

- Sudden discontinuation of antiepileptic drugs.
- Mistakes made when switching from one drug to another.
- Taking medications that aggravate epileptic seizures.
- Brain injuries, subarachnoid hemorrhage, intracranial tumors and abscesses.
- Acute infections and infectious diseases (URVI, measles, meningitis, encephalitis).[3, 461]

- Acute intoxication (including acute alcohol intoxication).
- Acute metabolic disorders (hyperglycemia, hypoglycemia, hyponatremia, hypocalcemia).
- Acute cerebral hypoxia.

Depending on the type of epileptic seizures, the status of epileptic seizures is as follows

There are 2 types:

- 1) Epileptic - the status of widespread tonic-clonic attacks;
- 2) Without epilepsy - the status of abscesses and complex focal seizures.

Attack epileptic status

Attack epileptic status is an epileptic status characterized by widespread tonic-clonic attacks. It is very difficult and sometimes fatal. Attacks last for 30 minutes or appear intermittently during this time. In the inter-seizure period, the patient does not regain consciousness.

**Epileptic status without attacks.** Epileptic status without epilepsy is an epileptic status characterized by the status of abscesses and complex focal seizures. It's a little lighter. The status of epileptic seizures without seizures, in turn, is divided into 2 types: 1) the status of absence 2) the status of complex focal attacks.

It is known that absence last for 30 seconds. During absence, the patient loses consciousness for a few seconds, but resumes when he regains consciousness. If the abscesses are observed for 20 to 30 minutes in a row, the patient becomes numb, which means that the status of abscesses occurs. During the status of absence often develop sopor and somnolence, rarely coma. Emergency care in epileptic status As mentioned above, epileptic status with tonic-clonic seizures requires immediate medical attention. Emergency medical procedures

1. First of all, it is necessary to take the patient to a safe place, open his collar and provide him with fresh air. It is important to avoid harsh objects that can cause injury. Hands and feet that are shaking cannot be touched. At this point, the patient's arm or leg may hit the doctor hard, and both may be injured.
2. If the patient's head is turned in any direction and attacks are observed, the doctor should take it between the palms of the hands and gently hold it in this position. If the doctor does this correctly, the head will be turned back, the tongue will be stuck in the throat, the saliva will go into the airways, and the head will be injured by hitting the ground. Put something soft under your head. However, the use of force in these acts is strictly prohibited.
3. The patient is taken by ambulance to the nearest hospital and admitted to the intensive care unit. If the ambulance is equipped with the necessary medical equipment, all necessary resuscitation procedures will be performed on the road.
4. During attacks, foamy saliva often comes out of the patient's mouth. This saliva can pass into the patient's airways when he takes a deep breath. It's too dangerous! Therefore, the saliva should be wiped with a clean cloth or gauze. If possible, an airway should be provided. Because laryngospasm is also observed during the attack.
5. Do not put a spoon or other hard object in the patient's mouth. It's too dangerous and useless.

6. 2 ml (10 mg) of diazepam in saline of sodium chloride is administered intravenously. Diazepam can also be administered in 20 ml of 40% glucose.

The rate of administration to children and adults should not exceed 2-5mg per minute. Otherwise, the heartbeat or breathing will stop or your blood pressure will drop. In children, diazepam is administered in an amount of 0.25 mg per 1 kg of body weight. If the child weighs 20 kg, he is given 5 mg of diazepam. If the attacks do not stop within 10 to 15 minutes, diazepam is given intravenously in the same amount.

7. If the attacks reappear after the cessation of action of the administered drugs, add 50 mg (10 ml) of diazepam to 250-500 ml of saline or sodium chloride saline and infuse intravenously for several hours.

8. Sometimes the use of drugs is required if the attacks do not stop. Sodium or thiopental sodium is often used for this purpose. 10 ml of 20% sodium solution is injected very slowly, within 10 minutes. Sometimes it is enough to give 5 ml of this drug. Instead of sodium, 10 ml of a 1% solution of thiopental sodium can be slowly administered intravenously. The drug is then infused intravenously in an amount of 50-70 ml. Drugs often cause a drop in blood pressure, heart and respiratory failure. Therefore, monitoring of the patient's blood pressure, heart and respiratory function should be provided.

9. All necessary laboratory tests are performed at the beginning of these treatments. To do this, the amount of glucose and electrolytes (sodium, potassium, chlorine, calcium) in the blood and urine, the acid-base status of the blood is checked.

10. If a patient falls into a deep epileptic coma, general treatments are continued until he or she emerges from the coma. To do this, the patient is given diuretics, dexamethasone, antipyretic drugs, antibiotics. Prolonged epileptic status often results in metabolic acidosis. To eliminate it, sodium bicarbonate or other similar drugs are injected intravenously.

11. A patient with epileptic status or coma is transferred from the intensive care unit to the neurology department and treatment is continued there. If the epileptic status is resolved quickly and without complications, the patient can be sent home in 1-2 days. She is being monitored by a general practitioner.

Epileptologists admit that in epilepsy, attacks are more common in patients who lead a passive life. It is less common in patients with active mental and physical activity. Therefore, restricting patients, especially children and adolescents, from physical activity and schooling and discussing their illness in front of them as a family can lead to severe mental trauma. Such children develop melancholy behaviors and grow up mentally handicapped. But keep in mind that excessive mental and physical stress can increase the number of attacks. Severe stress is more likely to trigger attacks. The patient should not be allowed to work in life-threatening occupations, such as driving, firefighting, police, guarding, or rescue. It is also prohibited to work in areas where chemicals are present or in high-rise buildings, or in factories where there is a high risk of injury. Working at night is not possible at all. This is because sleep deprivation at night can lead to recurrence or increase in attacks.

Housework and other activities. When taking a shower, the patient should not close the door from the inside, should not take hot or very cold showers, should not go to the sauna, and should not stay in the bath for a long time. Bake in the oven, cook in large pots, and always be careful

not to work with sharp objects. Physiotherapeutic treatments are also not possible. One or two full-time employees should be aware of the disease. You should also not go on long trips alone and stay alone in hotels. Relatives of the patient need to know how to provide emergency care during an epileptic attack. At the same time, the home should have the necessary medications for emergency care. For example, magnesium sulfate and others

### CONCLUSION

In short, the disease is quite common in the world and in Uzbekistan.[14] Patients with this disease experience not only negative but also positive changes. On the plus side, some of them develop strong thinking that is not found in other people. Epilepsy is divided into several types, each of which has its own clinical picture. When it comes to treatment, some of these are self-limiting and some are symptomatic.

## THE PHENOMENON OF INTER GENRES DIFFUSION IN THE UZBEK DRAMA OF INDEPENDENCE PERIOD

**Akhmedova Vazirakhon Askarovna\***

\*Researcher,

Tashkent State Pedagogical University,  
Tashkent, UZBEKISTAN

Email id: vaziraahmedova1112@gmail.com

### ABSTRACT

*In this article the turning over the phenomenon of inter genres diffusion of the Uzbek drama of independence period as one of the main principle of the development of dramatic genres, that is, lyric emotion and elation like adjacent literary characters as if lyricism and epos, through the saturation of features of the state and actions moderate the tradition of expressing new inner abilities by U. Khamdam in the story of "The Equilibrium" and the scenario interpretation of this verse are investigated.*

**KEYWORDS:** Diffusion, Drama, Melodrama, Tragedy, Comedy, Novel, Lyricism, Tragedy, Humor, Conflict, Culmination, Comment, Replica, Monologue, Dialogue.

### INTRODUCTION

The phenomenon of inter genres diffusion has become one of the main principles of the genres development in Uzbek literature in the period of independence. Particularly, the various genre pictures of dramatic type which adjacent to lyrical types (lyrics, epos) like lyric emotion and elation shows the new inner abilities through the saturation of the moderate of actions and state features. Virtually, drama is the synthetic type of artistic literature, since olden times the elements which is specified to lyrics, for example it used effectively from lyrics. Taking consideration the academician I.Sulton: «Lyricism (subjective basis) is primarily visible in drama, in the attitude of plays and events which is being reflected in the ideal base of composition in its principle.....In the drama, that is, lyricism is shown in typical forms in the literary type of work which is author's deprivation in participating in the incidences» - said that. [5, 189]

Describing the genres of the dramatic turn of the 20th century up to the 1980s, V.Frolov recorded the tragedy, comedy, drama, melodrama as the main genres of the drama "The fate of the genres of drama" ("The fortune of drama").

He considered below as the inner forms of melodrama:

1) Detective melodrama; 2) domestic melodrama - "internal monologue"; 3) melodrama - tragedy; 4) melodrama - comedy; 5) melodrama - vaudeville; 6) heroic character melodrama. It is understood that V.Frolov sought to embody the genre and forms of the literary genre combined with theatrical art. Interestingly, he thinks that the epos - "the storytelling participant" - has a form of a play. It notes the lyrical forms of the lyric drama, lyric-comedy, lyric-monologue, and theories that have been added to the theater. He emphasizes the existence of a number of genres related to the film, pantomime, cinema, radio and tele-theatre. [7, 407-410].

## THE MAIN PART

When we look at the historical experiences of our literature, we are able to witness of some writers wrote in this or that theme and any play in a specific genre firstly, and then, in the essence of this living work they create another subject of the second genre. In particular, it is remembered that Oybek wrote scientific poetical articles, poems and poems about the great poet and thinker, later created an epic poem by this name, till his novel about "Navoi" is written. The same creative experience is evident in his novels writing, such as "The serendipity blood", "The golden valleys breezes" and "The sun never darken". In this case, we are referring to the novel "The serendipity blood", which was later created by the same name. The creating of "Zaynab and Omon" which is based on epic poem "Zaynab" by Kh.Olimjon, U.Umarbekov's works "When the Earth in hot", "The debt in the Doomsday" and dramas "Fatima and Zuhra" are the great examples for that. This creative tradition has been continuing after the independence of our country. Based on the comparative interpretation of the scene by the name of U.Khamdam's novel "The Equilibrium" serves as a basis for investigating how the tragedy of person is reflected in the drama. Three literary-vital factors played an important role in the transition of author from novel to drama. Firstly, it is evident that the playwright broadens the progress of events while the novel is being written, and intensifies more its content and idea. The second factor, is the creation of a prototype of a drama, a master character who controls it. The third factor, is that the boundary between the novel and the drama is determined by the clarifying of the difference. As the writer points out, the process happened "deviate" easily from novel to drama. It is also important that U.Khamdam is well aware of his life and deeply mastered the idea of the work, his artistic fantasy, his poetic skill, and that these factors are directed to a specific goal. In fact, novel as a complex creative process itself is suitable fully to the requiring of epic genre, its scene imagination was also re-formed at the level of a mature performance.

The difference between a novel and dramatic genres is more complex than the differences of genres in the same type. This is not noticed for a reader. In the novel, events and characters are described in epic scales [4,56]. As if, the epic image and epic exposition are dominant in a novel [2, 207-234], but the drama is characterized by exceptional vibrant behavior and content [3, 134]. In contrast to the novel "The Equilibrium" and the play of the same name, we conclude that both the novel and the drama have their own appearance, shape, meaning, and meaning as an independent work. The scenario of the work is more effective, more active and more fruitful for

audience. However, what aspects of the novel served as a basis for drama? There is a need for a separate consideration.

The novel "The Equilibrium" was created in the years of independence and warmly welcomed by the scientific and literary community. Two of the philosophical problems mentioned in the novel can be distinguished. Human beings can live in a certain balance throughout life, or they can balance the world, their dreams, emotions, desires and goals. Both situations are interpreted as human tragedies. These tragedies are being investigated on the basis of heroes' personality and contradictions in their lives. Literary scholar I. Yakubov analyzes novel: "Man, must understand, discover, understand himself firstly. Only then he will be able to perceive the universe and his Creator, and realize his time. The artistic expression of this truth is reflected in the novel "The Equilibrium" [2, 236].

The tragic fortunes of the roles of Yusuf, Said, Miraziz, Zahra, Amir, and even the external and internal speeches influence the reader's spiritual world. The manner style of each hero is described by their characteristic logic, psychological state, and outlook. Creator invented the unique ways in which life can be summarized through spiritual states. The novel was staged in 2011 at the AbrorHidoyatov Theater and was welcomed warmly by the audience. The novel "The Equilibrium" and its dramatic interpretation are also seen in the years of independence, as well as the successful solution of the events in them. By comparing novels and dramas, it is evident that the writer made dramatic changes in the text of the work, first of all taking into account the dramatic students. The drama consists of six curtains and each curtain has several views. The first curtain is a view that begins with the scene of Yusuf's work in the garden. "Independence - it's not a red label, a stingy slogan that some people are looking at in a mockery and trying to do the same! It is the largest and the most incomparable socio-political, moral and spiritual degree of our nation which was achieved in the past hundred years! [9, 2]. The writer uses the retrospective plot to start with the monologue of the teacher Yusuf the story of eternity and the essentials to achieve it. The story begins with the story of Yusuf's childhood and his conversation with his father. In the second part of the drama, Yusuf returns to his childhood and talks to balance with his father.

*"Father:- Do not worry so much, son, it's dawn, and you still get snow too. Well, come down and do not fall and cripple".*

The boy replied: *"Tell your Grand Mountain, father, keep up the sun and put the sun on! At least we would have been playing with Sodiq already in the street".*

Father (with a smile) –*"What do you say, son, the mountain did not keep the sun. The sun rises far beyond the mountain. No mountain or anything else, no one can interrupt him. When it's time, it looks like it", explained Father.*

The boy replied: *"If not, tell God to let the sun go down!"*

Father: *My son, God does not ask me. He is the king for himself. He knows his job well. It keeps the world in perfect order. It does not tune up the mood.*

The boy: - *What is an order?*

Father: *He is a pillar which keeps our life. If not, balance on the earth will break. When the balance strikes, mankind's worries come.*

The boy: - *What's the equilibrium?*

Father: *Well, son, you've asked a hard question ... (think) I think it's the beginning of all good things. There is alife, a good life if there will be balance... Well, you know yourself, when you get older, my colt".[9, 3]*

In the above-mentioned dialogue, there is a deep symbolic meaning in pointing to the Greatmountain. Because, the aspiration to the Great mountain from his childhood is a symbolic expression of a person's thirst for greatness. This is the eternal way of fate. Human beings are frustrated that the destiny allows them to "choose". Yusuf has repeatedly denied such a choice - from the beginning of the two routes. In fact, human life spans many test points. Hence, the aspirations of the above dialogue are a reference to the essence of philosophy of life - the starting point for maintaining balance and losing it.

On the second screen of the scene, Halima aya, Yusuf, Amir and Gulshoda talk about the influence of religion on faith, belief, piety, world and society. Yusuf and Amir have different views on religion and belief.

Amir said: *"I heard you do not read the namaz. Is that true?"*

Yusuf: *"What is primary in the Muslim world, brother?"* (Yusuf answered the question with a question)

The Amir: - *"Belief". "Why is your first question not about the belief?"* He asked.

Amir: *"Because a person who is a believer will perform namaz".*

Yusuf said: *"But it does not mean that all those who read the namaz are believers. However, there is no any rule (hukm\*) in Islam that all who do not pray does not have belief".*

The Amir said, *"This is not the basis for you not to pray"*

Yusuf said: *"Ohhh, if I look around, I will always be in Allah's permission and worship Him, no matter where I am and what I am doing. But it is not the main thing ... there is a basis for any religion to be good, to do good, and to permit to others what permit to yourself".[9, 8],*

In the above dialogue, the inefficacious was clearly evident in Amir's views. The tragedy of Amir is the act of a fanatic person who does not know the meaning of the Islamic faith. The sad fate of Amir is, actually, the fate of someone who is on the way without sacred and beliefs. In fact, he is a well-educated, well-poet, a person who has been completely neglected of worldly affairs and concerns, and only follows the path of piety, worship, and gratitude to all; but also forcing others to follow that path, even breaking the grace of his uncle, his siblings, and his relatives.

In the novel, Yusuf's father is in the lead, drama events begin after his death. Therefore, the head of the family, as the adviser of his children, the role of Mother is put on the foreground. In the novel, the reason of Yusuf's coming to the village is suffering from financially was explained by asking the money for paying his rent payment, but in the drama these details were revealed through the speech of the heroes.

The most effective point in dramas is the story of Yusuf and Sodiq. Because, the culmination point of the play is the scene of the death of Yusuf's child, Yusuf repeatedly reminisces his conversation with this friend about the motherland, country, and freedom. It can be said that the

vital dialogue between the two friends in this scene will serve to explain the tragedy of Yusuf's family, later it serves to explain the cause of his child's death.

"- Sodiq: *Yusuf, do you really mean that our life is better or worse than in the before? ... do not you treat old times? Do you ever think it's back? Just tell the truth ... I see you, my friend, please tell me the truth. This is a matter of life and death for me.*

Yusuf: (after long-lasting silent, at once) *No. No! Thousand times no, Sodiq, you understand?!! If it is not true that we cannot afford to eat it, even if I can not afford to buy a single drug for my son, it will be a death penalty, even though my house is burned!* [9, 10],

In the next parts of the play, the story of Oygul and Yusuf's return from the village to the city, the expulsion from the house of tenants, and the request of Oygul for divorce with this words "If you are a man!". His talk with Zakhro in the home of Mirazim, especially, Zakhro's words, encourages him to think about his own life:

"Zahro: ... *Brother Yusuf, you know, I'm like a patient who is slowly dying. The illness that destroys my life is neither cancer nor any other disorder, but the idleness.*

Yusuf: (to himself) – Repentance (Tavba\*), I realize that if I am no longer trying to solve my financial problems, my family and myself will be destroyed. In this case, the unhealthy spiritual needs of the poor ended Zakhro. So, the human being is the one who needs it. So, human beings have to display their spirituality in a material way and to condemn and retain their material world through spirituality ... The bright example of this is, here is me, is Zakhro, is my brother ... "[9, 15]

From this reflection and discussion, it is possible to find out that the problem with which Zakhro and Yusuf were being tortured. The heroines are inspired by the inner dissatisfaction of their spiritual and psychological world, and suffer. The fact that, life is not merely a substance is that it resembles an empty cell, even if the person is rich, and if he is spiritually deficient, lives in a cellar. At the same time, dramatist has to maintain balance between materialism and spirituality, but warns that individual, society and the world are inevitable.

After that, Yusuf and Said were given a dialogue. Said's always saying "we", the use of the word "we" over any situation and state surprises Yusuf with introspection:

Yusuf: (in inner) "- *We mean, who? Functionaries? Do others are in it? If I agree with Said's suggestion, then I will be part of "We". Then I'm just saying that Said is not saying "I" and "We". After all, Said was the one who used to say "I" and to speak "I". Now, just say "We". Or is it the case of the majority? Even so, where did the "I" of Said go to where did I go? All his sayings have been mastered now! Where is Said's, where did disappear his identity, his views? ...* [9,17],

The above-mentioned discussions encourage the audience to think and reason. The fact, that if every human being has his "I" calls for understanding that it prevents him different futility. According to the philosophy of the Giloniy, the human body consists of four elements: water, soil, fire, air. [8, 96], Philosopher Francis Bacon "In fact, the desires of a person hiding or overturned will never disappear, but when it comes to a favorable situation. They sometimes fall asleep, but never have to believe it. Even if they are embodied, and if there is a good opportunity, they will certainly rise again." [6,206]. So, the forces that fall asleep in the human body are not evil. If he maintains control of his inner balance, the sleeping emotions will not wake up. On the

contrary, seeds of "evil" in his heart can have a great impact on humanity. In the drama, this philosophical idea is absorbed in the conversation between Yusuf and ErgashBey.

After the meeting with Ergash, Yusuf's mental state changed dramatically. Doubt about the next day, and when he looks into his mind, Yusuf is afraid. Of course, this fear is not only about Yusuf, but also about the audience. The social changes in society 's life, the processes of the consciousness of the people - their outlook are essentially dramatic. The peculiarity of this dramatization is that it can be seen as imaginative performances and concepts, that represent artistic-philosophical tensions in reality. The reaction to the forces, mobilized to change the order in which life is so alive stems from the essence of that drama. It is true that Ergash aka can not find his way in the "transition period", but describes a spiritually "fractured" traumatic tragedy.

Brother Ergash: *"I was not like that in the past. I taught physics and mathematics at one of the universities, and I was the author of two or three discoveries and articles published in science. My family lives in peace, my wife works as a nanny in the nursery school, and both of us find it easy to earn a living. Then suddenly I started to pay wages on time, and then the value of the money went down to nothing". Wife says, "If you look around like other men? Do you think of the other thing that comes with the money?" I say: - "What can I do? Be patient, they will all fall into the trap". My wife did what I did not do - she left school and went out to the market ... She was carrying a small bag of sackcloth for market to market. It was a bit worse than that ... I quit my job while reducing the staff, and I lost everything. I woke up at home without knowing what to do ... I applied to the court and divorced my wife and started living in a two bedroom apartment which I bought it for my son. I've been completely alone since then. I've been in trouble since then. I have been drinking since then. Since then, I've been choking and drunken. Even at the right time, I did not hesitate to ask five-ten hundred sums\* for acquaintance. My pride is still in my mind - I do not even think!*

Yusuf: - *"Oh my God, how dreadful is my fate! So, what do you have to do to keep in the street? ... [9, 18]*

The influence of the verb imposes on Yusuf's yet unspoken internal pride. Because, the suffering of a man takes place in the form of a weakening of the internal immunity and constitutes the gloomy nature of the existence. Therefore dramatics determines the flow of the story, the pace of the heroic behavior. In the above passage, which is related to the mental condition of the participants of the work, the reality and sincerity in the picture of the situation provided the vitality of the scene. In the novel, the author may give a psychological picture to the reader through the story, and may expose the hero to the reader by describing the spiritual world. In drama, the author's capacity is limited because, drama is a state of tension, spiritual emotions, and it is important to show action rather than a statement. Effective and reliable lighting on the sensitive aspects of human thinking requires a great deal of work from the dramatist. The stage is often built on the basis of the characters' spiritual emotions. The sharpest struggles in the spirit of the drama heroes are reflected in the emotional collision.

In artistic prose, the role and significance of psychological images in artistic works are unique. It has been emphasized that in the prose, the mood of the heroes is expressed in many places by the author's statement. In the drama, the same task is entrusted to the participants. The author's description of the author is also a function of interpretation. However, the psychological state of the heroes should appear in the eyes of the audience. It is this feature that distinguished him from

the prose. When giving the hero's spiritual experience, the playwright needs to take into account the possibilities of the scene and create a psychological situation. It is necessary to persuade the audience to be able to do so. In prose, an epic commentary can lead the reader into the world of psychological experiences, and then analyze the current situation.

The culmination point of the epicsis given in the fourth scene of the play, the 54th chapter of the novel. This is the scene of Muhammadjon's tragic death, due to doctors' indifference and apathy to human fate. After his son's death, Yusuf again recalls his talk with Sodiq:

*"Is it possible that the God who stuck my words to myself which I had said in a pain?"* Then I said to my friend Sodiq: *"If I agree with any shortcomings and losses of my hand, not only will it hurt my country's freedom"*. Is that what they say is that *"Angels are amenable to bad talk"*? "[9, 23]

Comparative comparison of the novel and instinct of "The Equilibrium" shows that, even though, Yusuf does not go astray, goes into different streets, and never runs through any kind of inaccuracies, he remains true to the essence of his heart and his sense of justice, the nation will not stop thinking about the pain of the country. At the end of the drama, when Yusuf returned to work, the author proposed a serious, social-philosophical idea of life. The intelligentsia, which prevents the imbalance of the universe and is able to hold the glory in the world, is embodied in the image of Yusuf. In fact, everyone needs a balanced and apparent balance. The balance of the universe will never disappear unless there are awake, conscientious men of faith like Yusuf.

The writer and the director are convinced that creative cooperation, the skill of actors, makeup men and artists has moved to the heroic background of the external reality and determines the motility of the inner movement. The totalitarian regime in the pre-emptive tide and the difficult life cycle of the transition period are mastered. The interior of the zombies has been thoroughly investigated through the spiritual world, and the vast potential of symbolic images has been used extensively. In particular, the names of places (Ulugtog), the names chosen are deeply figurative in the internal and external conflicts of heroes (Yusuf, Amir, Halima aya). Most importantly, this work was not only in the novel, but also in the form of drama, as well as the attention of the reader and the audience, because it is the essence of the universe's equilibrium, its greatness, and the greatness of its people.

## CONCLUSION

While the majority of the modernity of the Independence has a positive ideals of ideals, it is often the case that there is a lack of ability to express reality in the context of strong dramatic conflicts and colloquia - contradictory relationships - a series of struggles, high artistic solutions. The common mistakes, which are often characterized by a wide range of modern contexts, such as a hype, a narrow outlook, a dry characteristic, a more intricate perception of social life issues, have prompted many theater groups to address the artistic examples of our national literature in prose and gesture. As a result, the episodes "My memory brokens" (Zulfiya), "Ghosts rebellion" (The stories of E.Vakhidov); "Oleasteries" (E.A'zam), "The woman", "Think" (Zulfiya Kurolboykizi), "Puankare" (A.Yoldosh); "Walking people in the Moonlight", "The hours snorting night" (T.Murod); the scenes was created based on the novel "The Equilibrium" (U.Hamdani).

The above-mentioned works are important not only for the relevance of the themes, but also to the satisfaction of the spiritual and educational needs of our contemporaries in drama in terms of

dozens of characteristics, such as the heroes' vitality, the truthfulness of events, the scale of their thought, the highness of poetic expression, the breadth of coverage. Of course, each of them can be separately analyzed and studied. We believe that in the near future such kind of research will also occur.

### **ABSTRACT**

*The scientific and experimental work is devoted to the study of the toxic effects of pesticides, insecticides and pesticides on the morpho-functional state of internal organs in the experiment. Under experimental conditions, morphological studies were conducted under special conditions for the use of pesticides. The results of microscopic studies at different times of the oral and aerosol effects of pesticides on internal organs are presented. The authors came to the appropriate conclusions based on the analysis of the data obtained. Recommendations on the selection and use of pesticides for processing in vegetable production are given.*

**KEYWORDS:** *Regional Features, Liver Morphology, Brain Morphology, Lung Morphology, Pesticide, Insecticide, Pesticide.*

## INTRODUCTION

It is well known that almost all pesticides have hepatotoxic effects even in small doses, which makes the problem of protecting the liver from the toxic effects of pesticides one of the urgent regional medical and social problems in Central Asia.

Recently, in most leading countries of the world and in international organizations, more and more attention has been paid to the prevention of harm to human health and the environment by air pollution, based on health risk analysis, harmonization of atmospheric pollution standards.

According to numerous literatures published in recent years, allergic and pathomorphological changes are detected by morphological and functional indicators of the mucous membrane of the respiratory tract, based on the results of a study of the effects of the daily dust factor in conditions under Aralia (2).

## THE MAIN FINDINGS AND RESULTS

It should be noted that as a result of reforms in the agricultural sector of the Republic of Uzbekistan in recent years, gardening has been developing and fruit and vegetable production is growing. This is achieved through the use of modern technologies used by our gardeners and farmers in the production of competitive quality products, along with the use of chemicals and pesticides. Nevertheless, along with our achievements in this area, there are some disadvantages: namely, adverse consequences due to non-compliance with hygiene standards and carelessness when using a variety of imported pesticides in horticultural processing.

Therefore, the importance of the timely application of pathogenetic preventive measures, as well as the prevention of complications of various diseases of the respiratory system by studying the morphofunctional changes resulting from the effects of these pesticides on the body, especially the respiratory system, is of great practical importance.

**Goal and Tasks.** To study the morphological and functional changes in the mucous membrane of the trachea and bronchi under aerosol exposure to insecticides, as well as the morphological changes that occur under the influence of a mixture of methylmercaptophos and DDT in organs in experimental animals.

1. To study the morphostructures of the mucous membrane of the trachea and bronchi in intact animals.
2. To study the effect on the morphostructures of the mucous membrane of the trachea and bronchi in dynamics during aerosol exposure to insecticides.
3. To determine the degree of response of the histo-structures of the mucous membrane of the trachea and bronchi with aerosol exposure to insecticides.
4. Microscopic examination of internal organs after the introduction of mercaptophos and DDT.

## Material and Research Methods

The studies were carried out in accordance with the European Convention for the Protection of Vertebrate Animals used for experiments or other scientific purposes (Strasbourg, March 18, 1986) ETS N 123. Experimental studies of aerosol exposure were carried out on 54 male rats weighing 180-220 grams. The effect of mercaptophos and DDT upon oral administration was

studied in organs in white rats, divided into 3 groups in series after oral administration of toxic chemicals for 4 months. For aerosol use of pesticides studied in the following conditions:

1. The object of the experiment was 10 intact rats that were in the field without the use of pesticides and 44 experimental animals that were during the application of aerosol treatment in vegetable growing and gardening.
2. In intact and experimental animals, the mucous membranes of the trachea and bronchi were studied by the general histological and histochemical method. The method of choice was hemotoxylin - eosin and a CHIC reaction.

### ***Research results***

The results of our experimental studies of 10 control rats showed that the mucous and submucous membranes of the trachea and bronchi were lined with a multi-row epithelium with a thin basal plate. In its own plate of the mucous membrane and in the submucosal basis, loose fibrous connective tissue with single diffusely scattered lymphocytes and histiocytes was detected. The glands of the mucous membranes of the trachea and bronchi were located between the plates of hyaline cartilage; they were single in the preparations. Excretory ducts of the mucous glands were lined with single-row cubic epithelium, around them focal accumulations of lymphoid elements were revealed.

In control rats, the respiratory section of the bronchi was uniformly airy, the alveoli were thin between the alveolar septa. The epithelium of the main and lobar bronchi is single-row cubic. Around individual pulmonary veins revealed small accumulations (1-2 rows) of lymphoid elements. In the walls of the bronchi of 2-3 orders of division and in respiratory bronchioles, single focal lymphoid accumulations and diffusely dispersed lymphoid elements were detected. The results of morphological studies showed that the mucous membrane of the trachea and bronchi in rats after acute exposure to aerosol insecticides, single-row epithelium is edematous and infiltrated.

In 23 experimental rats, focal epithelial metaplasia was detected. The basal plate is thickened. Foci of fibrosis spreading to the submucosa were observed in the own plate of the mucous membrane, focal lymphoid accumulations and a moderate amount of diffusely dispersed lymphocytes and histiocytes were detected. In the respiratory bronchi of the mucous membranes in some places, pathological changes are mild. In the mucous membranes and the basement membrane of the main and lobar bronchi, focal lymphoid accumulations and a moderate amount of diffusely scattered lymphocytes and histiocytes are noted. In the respiratory department, the alveolar passages are not uniformly airy, their walls are thin. Perivascular around the branches of the pulmonary veins and pulmonary arteries in their adventitious layer, focal accumulations of lymphocytes are detected.

When studying the results of a microscopic examination of the internal organs after administration of a mixture of methyl mercaptophos and DDT in rats of the 1st group (10 mg / kg methyl mercaptophos and 10 mg / kg of DDT) were accompanied by more pronounced circulatory-dystrophic and alterative changes in the internal organs than in rats 2nd group (3 mg / kg methyl mercaptophos and 10 mg / kg DDT). In animals of the first group, a sharp blood supply to the vessels was observed in the brain. Edema of the soft membranes was noted.

Perivascular edema and pericellular edema. Cytoplasm swelling, necrobiosis and necrosis of many ganglion cells. In the lungs, a thickening of the alveolar septa due to their filtration by round cells and histiocytes. Identified signs of productive vasculitis in places with partial obliteration of the lumen of the vessel. Pulmonary edema. Focal atelectases, chronic catarrhal-desquamative bronchitis. In the heart - a sharp blood vessels. Swelling and focal vacuolization of muscle fibers. Swelling of the interstitial tissue.

Hemorrhages are visible in the liver against the background of blood filling in the peripheral sections of the hepatic lobules. Around the hemorrhages, round-cell infiltration with single leukocytes is noted. The central veins are dilated, their endothelium is swollen. Around the central veins, in the thickness of the lobules, as well as in the interlobular connective tissue, focal lymphoid-histiocytic infiltrates are observed. The vessels between the lobular connective tissue are sharply expanded overflowing with blood, with a swollen wall, due to plasma soaking. A sharp expansion of the lymphatic vessels, overflowing with lymph in the form of a uniform pink color of the mass, is noted. The bile ducts are dilated: their epithelium in the form of papillary growths protrudes into the lumen. The nuclei are arranged in several rows of oval and elongated shapes.

In the third group (animals exposed to high temperature), moderate vascular congestion, perivascular and pericellular edema, and a slight swelling of the cytoplasm of ganglion cells were observed in the brain.

In the heart - uneven plethora of blood vessels, granular dystrophy of muscle fibers. Lungs - moderate plethora, desquamative catarrh of the bronchi. Productive vasculitis sometimes with complete obliteration of their lumen.

Around the vessels, as well as in the connective tissue of the alveolar septa, small focal lymphoid-histiocytic infiltrates are found. In one case, chronic bronchitis.

In the liver - moderate plethora of blood vessels, granular dystrophy of the cytoplasm of hepatocytes. In the thickness of the lobules, necrobiosis and necrosis of the liver cells. Small lymphoid-histiocytic infiltrates in the interlobular connective tissue, often with cystic expansion of the bile ducts. In some animals, lymphoid-histiocytic infiltrates were noted in the thickness of the hepatic lobules around the central veins.

In the fourth series of experiments (inhalation inoculation in the chamber), it was revealed that in the brain there was a sharp blood vessels filling, perivascular and pericellular edema, swelling - granular degeneration of ganglion cells leading to necrosis. In the lungs, the largest foci of catarrhal desquamative pneumonia are often found. In the heart - granular dystrophy, focal fragmentation of individual muscle fibers, in places micro necrosis. Liver tissue is moderately full-blooded. The interlobular connective tissue is infiltrated with a small number of round cells and histiocytes. The formation of false bile ducts is noted, in places they are with cystic dilated lumens. A sharp swelling of the hepatocyte cytoplasm-granular dystrophy with necrobiosis and necrosis of certain groups of liver cells is noted in the thickness of the lobules. In some lobules, parenchyma necrosis is observed in the center of the lobules. Around the foci of hepatocyte necrosis are large with a light cytoplasm.

Thus, the results showed that changes in the mucous membrane of the trachea and bronchi occur in three stages. So, in the first stage of 3-5 days of the experiment, it manifests itself in the form

of allergic changes when an insecticide affects the mucous membrane of the trachea and bronchi. In the second stage, local histostructural changes appear on the 7-10th day of the experiment and are focal in nature. In the third stage, cumulative insecticides, on the 15-30th day of the experiment, settled on the mucous membranes, cause deep morphological changes in the mucous membranes, blood vessels, mucous glands of the basement membrane.

## CONCLUSION

With oral poisoning with a mixture of methyl mercaptophos and DDT, the severity of dystrophic processes in organs depends on the dose; high temperature enhances the toxic effect and contributes to more severe changes in the body, especially in the liver. A four-month inhalation of a mixture of pesticides causes changes in the lungs in the form of serous-catarrhal pneumonia and an alternative dystrophic nature of the change in the brain and liver.

## GENDER POLICY OF UZBEKISTAN: YESTERDAY AND TODAY

**Rajapova Natalya Bazarovna\***

\*Senior Lecturer,  
Department of "Russian Linguistics"  
Termez State University, UZBEKISTAN

### ABSTRACT

*The article considers the formation and development of gender policy in different periods. He gives examples of reforms carried out in society to establish gender equality. It studies the reflection of international standards in the legislation of the Republic of Uzbekistan in relation to gender policy. The legislative foundations providing gender equality in different spheres of social activity are investigated. Legal protections in promoting gender equality are being studied.*

**KEYWORDS:** *International Experience, Gender Equality, Code, Constitution, Law, Law, Action Strategy, Woman, Convention Of Rights.*

### INTRODUCTION

All over the world, gender policy is closely interconnected with the concepts of democratic values, open civil society and the rule of law. Real democracy cannot exist without the equal participation of all citizens of the state who have multi-valued functions, which is especially manifested in society. Therefore, the achievement of democratic development is closely related to the real opportunity for men and women to participate in the construction of a democratic state. Since a woman at the present stage of development of society is her full member, in the context of building a civil society, her role and importance in state and public administration are growing.

In world science, the ideas of gender equality in the system of state legislation, as well as the implementation of gender equality in respecting human rights, their freedoms and legitimate interests, have priority in the political, legal and socio-philosophical aspects. The functions of countries around the world with unlimited, absolutely limited and relatively limited competencies, as well as proportional functions to support the interests of women and individual public gender roles, are becoming the object of socio-philosophical research. Institutional and

functional analysis of the legal activity of the state with the help of philosophical categories of essence and phenomenon, content and form, universal, special, private, and on their basis the development of conceptual paradigms in this area has a scientific, theoretical and practical value.

### THE MAIN FINDINGS AND RESULTS

In Uzbekistan, over the years of independence, various legal documents, concepts, laws and government programs have been prepared and developed that are in the interests of women and motherhood. The activities of women and their role in society have been institutionally and functionally reformed. Being in the most vulnerable social groups, a woman can fulfill herself only when she receives equal civil and political rights with men. International experience shows that the participation of women in the political and economic spheres of the country helps in the fight against poverty and social disadvantage of the population. The implementation of legislative projects aimed at systematically improving gender policy is a prerequisite in our country for the modernization and development of civil society institutions.

The issue of gender equality is one of the important topics of scientific research of scientists of international scale. The first socio-political studies of gender began to appear in the late 60s and early 70s of the twentieth century. That is, this period of history, characteristic of its feminist, female and youth movements, began to give rise to society to study the problems of gender equality. Sociologists, sociopsychologists, linguists and political scientists of a number of countries began to study and conduct research in the field of "gender" and its influence on the individual and personality. The emergence of a free female personality has generated controversy among anthropologists, geneticists, historians, psychologists, sociologists, philosophers, philologists, and ethnologists. Basically, scientific discourses studied in depth the hierarchical sexual structure of the culture of society and religious representations as individual characteristics of the collective. The first reflections on the equality of men and women appear in the works of ancient Greek philosophers, such as Plato, Aristotle. If Aristotle believed that society cannot be happy when women are unhappy, then Plato expressed the idea that women, like men, should have an education.

Further, issues of gender equality began to develop Western thinkers - T. Parsons, P. Berger, T. Lukman, I. Hoffman, K. Rogers, A. Maslow, Z. Freud, S. Tobias, F. Howe, P. Lawther, N. Koch, J. Money, R. Stoller, J.W. Scott, A. de Tocqueville, J. Mill. Such scientists as M.A. Bakunin, P.A. Kropotkin, I.E. Kalabikhina, A. Posternak, T.I. Pesotskaya, G. Yermolina, A. Ivanova, A. Kolody, A. Kurylyova began to consider the problems of development of gender equality in more modern periods. During the formation of the Soviet Union, scientists V. Bilypay, L. Kaznin, A. Marchuk, T. Melnikova, A. Lyubimova, G. Morozov, Ya. Sadovnichaya, L. Shineleva, Z. Yankova, R. Yanovsky considered ideas for achieving social gender equality in a socialist society.

In the works of scientists of the East, from the beginning of the Middle Ages, gender equality was considered in the context of raising the status of women in general. In the oral and folklore of different periods, you can see examples of the praise and perfection of women. The creative works of Ibn-Rushid, Nizami, Al-Hamadani, Caliph Al-Muiz, poet Abu-l-At, Hagani, A. Jomi, Alisher Navai, Muhammad Fizuli, Vagif, Widad, Agahi, Makhtumkuli can serve as an example where a woman praises not as a slave and concubine, but as a full member of society, which was considered the progressive views of his time.

The study of the scientific-philosophical and political-legal aspects of the problems of the formation and development of gender policy has intensified especially in the years of independence.

The end of the twentieth century became significant in the fate of Uzbekistan. After independence, the state began to introduce new transformations in political, economic and social life. Having gained freedom in all respects, the Republic of Uzbekistan was able to independently adjust the political system and ensure economic and social development.

Ensuring a decent and healthy life of the population, quality development of human potential has become the main priority of the state policy of the country. Various State programs on social protection, the development of a market economy, and the improvement and strengthening of judicial relations were mainly aimed at developing a democratic society.

The possibility of building the right democratic society in many respects depends on the support of world and international organizations and the foreign policy of developed countries. During the years of independence, thanks to purposeful aspirations to take a global position, Uzbekistan has gained a good reputation as a democratic state.

Successful integration in world politics, the economic and legal space points to a large, focused work in the human rights sphere. In-depth international cooperation in a wide range of areas requires government policy to ensure gender equality, which is an essential component of world politics.

The gender policy of the Republic of Uzbekistan is based on generally accepted international norms enshrined in the UN Conventions and other international documents, aimed at overcoming all forms and manifestations of gender discrimination and creating conditions that give everyone the right, regardless of gender, to fully realize their personal potential.

Regardless of the political structure and level of socio-economic development, the problems of ensuring relations and equal opportunities have always been relevant in any state. Because the sustainable development and prosperity of the country, the achievement of peace among the people is due to the foundations of gender equality. A developed society proves that if women and girls have equal access to education, decent health care, acceptable work, and active participation in political and economic decision-making, this helps to achieve economic stability and benefits both the society in which they live, and humanity as a whole.

In order to ensure gender equality, the state of our country has taken appropriate measures. For example, the Law of the Republic of Uzbekistan “On guarantees of equal rights and opportunities for men and women” adopted by the Legislative Chamber on August 17, 2019 was approved by the Senate on August 23 of the same year. According to s. 1.1 of the Civil Code of the Republic of Uzbekistan 2018, it is stated that the purpose of this Law is to regulate public relations in the field of ensuring guarantees of equal rights and opportunities for men and women, and preventing discrimination on the basis of sex. The government of the country is intensifying all efforts to eliminate discrimination based on sex, as a result of patriarchal views and unreasonable social norms.

The historical conditions of the early twentieth century created obstacles to the establishment of equal rights for women. Sharia regulations and millennia-old traditions of Muslim society continued to oppose the establishment of new principles in what is now Uzbekistan.

Traditionally, a woman was perceived as the guardian of the hearth. Measures relating to family law, equal suffrage, the right to marry and divorce, the prohibition of marriage of underage girls, the compulsory registration of marriages by local authorities remained unfulfilled. Religious and domestic prejudices rooted in millennia-old patriarchal traditions did not allow women to solve family, social and state issues.

The idea of the equal rights of women, their role in society and in everyday life arises during the emergence of the Jadid movement in Central Asia itself at the end of the XIX century. Jadids were the first to enlighten the rights of women in Islam, Sharia, etc.

The life of a modern woman in present-day Uzbekistan has significantly changed for the better. The woman of modern Uzbekistan has gone far from the relationship of religious and spiritual laws in society. Civil and secular laws appeared that defined the equality of women and men.

The principle of human parity in all spheres of public life is achieved on the basis of the full achievement of equality between men and women. Recognized in the international community, the democratic renewal of our society, economic reform, improving the level and quality of life of the population, the development of education and health, science and culture, improving the welfare of the Uzbek people, points to the norms of legislation that ensure equality between women and men.

Based on the national legislation and the system of the Republic of Uzbekistan, which seeks to take its rightful place in the world community, it can be said that the state paid special attention to one of the symbols of national statehood - the civil institution. The second section of the Constitution enshrines the fundamental rights, freedoms and duties of individuals and citizens. The relevant chapters and articles in this section explain the rules that apply only to citizens.

Based on the status of citizenship, the essence of relations between the state and the individual is revealed. As long as individuals with civilian status establish close, strong relations with the state with certain rights and obligations, a combination of interests is recognized in these relations.

The relationship between the state and the citizen, first of all, is based on the development of human society. As a result of the struggle of people for their rights and freedoms, the idea of citizenship arose, which still relates to the status of citizenship, which is still being discussed at the state and society level. Therefore, article 18 of the second section, Fundamental rights, freedoms and duties of a person and a citizen of the Constitution of the Republic of Uzbekistan [2018] states that "All citizens of the Republic of Uzbekistan have the same rights and freedoms and are equal before the law without distinction of gender, race, nationality, language, religion, social origin, beliefs, personal and social status. Our Constitution (Article 18) enshrines the centuries-old aspirations of the Uzbek people to the concepts of human value as the equality of citizens. Regardless of gender, race, nationality, language or religion and other provisions, in every citizen of the country, the state sees, first of all, a person.

From the first days of its independence, Uzbekistan has shown by its actions the active approval of all initiatives regarding gender equality of the United Nations. By all efforts, the state creates the necessary conditions for the comprehensive development and ensuring of the rights and interests of women. An example of this is the basic principle of public policy defined in the National Goals and Sustainable Development Goals for the period up to 2030, called "Goal 5. Ensuring gender equality and empowering all women and girls".

All actions taken to achieve this goal ensure the elimination of all forms of discrimination and violence (physical, sexual, psychological, and economic) of women and girls. Given their role in socio-economic development, the state proclaims the value of family relations. By this, the state normalizes domestic violence among the population. During the study, the data from the UReport survey showed that 83% of the respondents acknowledge the existence of domestic violence. At the same time, 54% believe that in order to save their families they are forced to endure insults and beatings, blaming the situation in which this happens. Namely, 74% of men tend to think of such discrimination. 52% of women, the acknowledged presence of the problem of domestic violence, prefer to remain silent about this in society. This attitude is determined by the characteristic trait of a woman of the east. To preserve family values, the welfare of all family members, a woman simply suffers any negative attitude towards her.

In 1995, Uzbekistan joined the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW). The fifth article of the Convention separately emphasizes the need to combat gender stereotypes: "To change the social and cultural patterns of behavior of men and women in order to eradicate prejudice and eliminate customs and all other practices that are based on the idea of the inferiority or superiority of one gender or the stereotypical role of men and women" [Electoral Code, 2019]. Fourth article of the Convention prescribes "The adoption by States parties of temporary special measures aimed at accelerating the establishment of de facto equality between men and women".

The state takes special measures, for example, the creation of special programs aimed at promoting the activity of women, grants and scholarships for girls, various quotas for women, which, according to the Convention, are not considered discriminatory and must be abolished in order to achieve equal opportunities and equal treatment.

The Law "On Guarantees of Equal Rights and Opportunities for Women and Men" for the first time at the legislative level considers the concept of "gender". The social aspect of relations between women and men, manifested in all spheres of society, is considered the basis of the law.

Any difference or any restriction on the basis of sex is considered discrimination of human rights and freedoms in all activity areas.

The concept of gender-legal expertise is also introduced into the law - an analysis of normative legal acts and their projects for compliance with the principles of equal rights and opportunities for women and men.

The basic principles for guaranteeing equal rights and opportunities for women and men are the rule of law, democracy, equal rights for women and men, non-discrimination on the basis of gender, openness and transparency.

The document emphasizes that the state provides a guarantee to both women and men in equal participation in the formation of society and government. The state provides equal rights and opportunities in the field of health, education and science, culture and labor, social protection and other areas of society.

To achieve a democratic society, women's participation is considered the most important component. The very degree of communion is an indicator of the democratic culture of society. Gender equality is gaining momentum where democratic institutions and processes exist. International experience shows that the result of democratic processes has a positive effect on the

establishment of gender parity in the country. It is much easier for women to establish their civic, economic, social, political powers where there are expanded opportunities for the manifestation of democracy. Despite the fact that many countries of the world are developing democratic models, there is still a problem in the international community of constantly consolidating democratic principles and ideals in documents and norms of an international level. Not always the benefits of democracy are evenly distributed regardless of class, race, gender and ethnic origin. The uneven distribution of democratic justice requires the adoption of appropriate measures, political principles, laws, taking into account the balance of power between men and women.

Such global mechanisms as the UN Universal Declaration of Human Rights, the Convention on the Elimination of All Forms of Discrimination against Women helps a number of countries to establish gender equality in accordance with democratic principles. The first international legal instrument to which Uzbekistan acceded after independence in 1991 was precisely the UN Universal Declaration of Human Rights. In 2018, the President of the Republic of Uzbekistan Sh. M. Mirziyoev signed the Decree "On the Program of Events dedicated to the 70th anniversary of the adoption of the Universal Declaration of Human Rights", the goals of which are indicated by increasing the attention of the state and society to the values and principles of human rights. Namely, the improvement of the system of organizational and legal measures, the introduction of international standards in the legislation and practice of state bodies, ensuring reliable protection of human rights and freedoms.

On August 18, 1995, the Republic of Uzbekistan acceded to the "Convention on the Elimination of All Forms of Discrimination against Women", thereby showing its willingness to enter into international relations to preserve the rights and will of women. By all subsequent measures, Uzbekistan has shown the ability to provide new opportunities for women, along with men, in building a democratic society.

Gender equality in society is determined by an indicator of the degree of participation of women in the decision-making process. In the economic and political life of Uzbekistan, a woman until today has had a secondary role. But the socio-cultural and economic-political development of our time does not allow us to preserve and preserve old trends. For the development of an important resource as human capital, our state provides equal opportunities to all citizens of society. The value of equality among men and women, established by time and laws of society, makes any nation stronger in every way.

Gender policy in New Uzbekistan is carried out on the basis of legal, organizational, administrative principles of gender equality. Due to the fact that obtaining education and training, exercising the right to work and remuneration for it, socio-political and cultural activities, as well as special measures to protect labor and women's health are reflected in the legislation of the country, the principle of equal rights for men and women originates from The main law of the country is the Constitution of the Republic of Uzbekistan.

The diversity of forms of women's participation in social and labor activities, expanded opportunities for self-realization, effective measures to improve the labor of rural women help build a new, civil, democratic society. Gender equality is needed to remove social barriers, to assist the manifestation of personality, both men and women in all spheres of life.

The regulatory legal acts of the Republic of Uzbekistan are standardized based on the provisions of the articles of the Constitution and do not have discriminatory relations with respect to women.

Direct or mediocre violation or restriction of equality of citizens is prosecuted under the Criminal Code of the Republic of Uzbekistan (Article 141) [Actions Strategy 2017.].

In conclusion, it can be determined that the reform process including initiatives to improve women's opportunities in Uzbekistan as a whole contributes to strengthening gender equality in society.

In order to achieve gender equality, the laws of the Republic of Uzbekistan consider such provisions in society as, for example, labor rights, equal opportunities for employment, free choice of profession, education, social security for retirement, etc.

To increase the awareness of women of Uzbekistan about human rights, their role in the daily life of the republic, the Committee of Women of Uzbekistan, the Ombudsman, and the National Center for Human Rights are conducting public awareness events. The coordination of the activities of ministries, departments, territorial administrations is being carried out with the aim of broadly involving women in resolving issues of socio-economic and cultural development, strengthening social protection of the family, motherhood and childhood.

There is an information and analytical department for education, health and social protection under the Cabinet of Ministers of the Republic of Uzbekistan, and local structures have been created to promote the development of the women's movement and the full expansion of the potential of women. The basic concept of the "women's issue" consists of the formation by the state and society of not only the equal rights of men and women, but also the formation of equal alternatives for their implementation.

By promoting the active participation of all people in social, economic and political life, regardless of their age, gender, physical abilities, "race", ethnicity, origin, religion and economic or other status, the state takes measures to eliminate the root causes of inequality.

Despite the fact that decade has passed since Uzbekistan joined the Beijing Declaration, large-scale actions were carried out. Over the years of independence, the situation of women in the country has in many respects really changed for the better. The reduction of illiteracy, the reduction in maternal mortality, the increase in the growth of working women, the increase in women in leadership positions, the guarantee of legal rights are the result of state policy in the field of equality of men and women.

Seeing the importance of the Beijing Platform for Action as the basis for subsequent reforms, the goals of achieving gender equality were set during the development and implementation of the "Development Strategy of Uzbekistan for 2017-2021" [The Labor Code, 2011]. The priority tasks of these goals consist of increasing the socio-political activity of women, strengthening their role in government and society, increasing economic independence, ensuring the employment of women and youth, especially in rural areas.

In February 2018, the President of the Republic of Uzbekistan signed the Decree "On measures to radically improve activities in the field of supporting women and strengthening the family." In accordance with the Decree, three resolutions of the President of the Republic of Uzbekistan, six

decisions and one order of the Cabinet of Ministers were adopted. Together with ministries and departments, more than 20 plans were approved for conducting comprehensive measures aimed at strengthening the role and importance of civil institutions in protecting the rights of women. According to international standards, the Cabinet of Ministers of Uzbekistan on October 20, 2018 approved 16 National Goals in the field of sustainable development and 127 potential tasks with them for the period 2030. All the efforts of state policy in this area are aimed at one goal - using international best practices to improve the legal framework for protecting the interests of women and the family, to form special conditions and systems of ethnic norms in society, as well as rules for them. In the Republic, the Scientific and Practical Research Center "Oila" under the Cabinet of Ministers was created to conduct a number of fundamental, applied, innovative studies in the areas of family values and traditions. The Center promotes and implements the conceptual idea "A healthy family - a healthy society" in society. Each event carries the principle of "the family is under the protection of the state and society." A number of measures are being taken to strengthen activities for the early prevention of family and interpersonal conflicts, depressive situations that help induce negatively affecting the spiritual and moral atmosphere in the family and society, as well as ensuring the active participation of the general public in this process.

Under the chairmanship of the Speaker of the Parliament, a Gender Commission was created, whose tasks include the implementation of state policy aimed at achieving gender equality and improving the social conditions of women in the country; addressing gender equality violations; implementation of measures on occupational segregation, wage differences, increasing the proportion of women among economically active segments of the population; development of proposals in national legislation for universally recognized international norms on the elimination of all forms of discrimination against women's rights; introduction of measures aimed at improving the legal culture of women, etc.

## CONCLUSION

A woman in personal and public life always faces the need for her rights. The rights of women are enshrined in the Constitution, Civil, Family, Labor, Criminal Codes of the Republic of Uzbekistan. In the country, more than 300 regulatory documents regulate property relations and the protection of the fundamental rights and freedoms of women and children.

For a long time, women had to defend their rights and freedom. At present, the social stereotype imposed by people who claim that a woman's destiny is a family is the only obstacle to the development of women. The drastic changes that have taken place in the country since independence on the development of gender equality do not prevent some people from associating a woman only with their family, their belief that a woman was created only for procreation remains a priority barrier in society for a woman's self-development.

Democracy is the perfect condition for developing the foundations of civil society. A condition where people's participation expands in the political, economic, cultural and social spheres of life. Depending on this, the course of state policy defines development goals. The availability of equal opportunities for all people to access education, healthcare, employment and political participation contributes to the realization of the development goal.

### ABSTRACT

*As online learning continuously grow from last decade. But current pandemic (covid-19) situation online learning become only source to teaching. Even government also promote online class in pandemic situation. So it's important to analyse students overall experience in online learning environments. Understanding student's perception towards classes through online the only question for student satisfaction to more nuanced question about how factors inside and outdoors of the classroom impact the web classroom. This research explored students experience with online learning. For instance some students feel that online learning is benefit s who don't seem to be in regular courses due to their job, and a few feel that they loose their society and physical activity due to current social distancing situation. The solepurpose to grasp the coed psychology about online learning on this current pandemic situation.*

**KEYWORDS:** *Online Learning, Distance Education, Flipped/Blended Education, Webinar Pandemic*

### INTRODUCTION

We board a time where the world is popping to technology. Android and i phones are almost every person in their pocket, electric car, and android based TV are being considered “smart”. Step ahead an education has also jumped onto the e- train. With thousands of options to realize an education online, it's only a matter of some time until online education becomes the only due

to gain an education. But is online education the right answer? Arguments are often made for every side, but what it ultimately comes all the way all the way down to, is an individual's preference in receiving their education. Students learn in a very quite ways. Some prefer online courses; others prefer the classroom setting and some opt to have a mixture of both. There are pros and cons for all the assorted forms of learning, which suggests that there is not one correct way of learning.

The general education system in India is predicated on compulsory programs for all citizens. Children start school from the age of 5 and study at the elementary level for 3 years, they still continue to middle school from fifth to ninth grades that are the mandatory level for everybody. From the 10th to +2 grades are treated as secondary education . The expected years of schooling for the country is 15.4, while the mean years of schooling is 12.8 (UNDP 2019).

Main educational methodologies are:

- The normal classroom education, where books, blackboards are employed by the teacher as a equipment
- Modern classroom education, where the lecture rooms are equipped with whiteboards, projectors or audio-visual display equipment and digital boards
- Online education, where the knowledge technologies and communications are accustomed help within the development and acquisition of information from the various remote locations.

It uses the net and video/audio and text communication and software to form the educational environment. There is several sorts of online learning: Knowledgebase, online support, asynchronous training, synchronous training, hybrid training knowledgebase type may be a set of lessons that are published on the web site and have general instructions of learning that a student needs to follow, with no support available. Online support type may be a modified version of the knowledge domain, where the support is obtainable so there's a discussion board, web forum or another communication way available to urge support on some topics. Asynchronous training is that the one where the teachings don't happen in real-time, but the scholars are given content regularly. Instructors are assigned and supply support through email or other communication platforms. Synchronous training is finished in real-time with a live instructor and optional moderator. there's a pre-set time to log-in to the net education environment and participants can communicate directly with the teacher and other group members. Hybrid training may be a combination of online and in-person interaction.

Countrymen fight against the pandemic situation outbreak has been unique. The “People’s Curfew” was a situational step for controlling the pandemic situation and further awareness and preparedness about the quarantine and provided the doorway for implementation of lockdown in several states. India is now locked down and loaded in its fight against the corona virus. Prime Minister Narendra Modi announced a required nationwide shutdown on 22 March between 7a.m to 9 p.m after that he announce lock down. He said *“If we are healthy the world is healthy,”* Modi said adding social distancing was key given that there was no vaccine as yet to stop the disease.

*“I appeal that in the coming few weeks only those who really have to, step out (of their homes). As much as possible, work and do business from home,”* he said because the state of 1.3 billion people clean up, the world health organization (WHO) said India s COVID fight could make or

break the worldwide war. COVID 19 pandemic is first and foremost a health crisis. When it involves the education sector, many countries have closed down schools and universities. School and college students are being 'homeschooled' from March 24 and Zoom and online classes have replaced traditional classrooms. But at a time when many are of the opinion that online classes will transform education as we all know it, not all is rosy, especially in India, where problems like lack of technology, of digital training and bandwidth are posing challenges for several families and teachers. The digital class divide has especially been highlighted during this pandemic. Internet isn't any more a privilege, but a necessity. If you do not have it, a student risks missing out altogether. In line with a study conducted by scholarship ed-tech platform Buddy4Study, of the 25 crore students littered with the lockdown, 80 per cent fall within the Economically Weaker Section category. While digital classrooms have made parents more involved in their kids' school life, it cannot be denied that interaction in classrooms helps in character development.

The HRD Ministry on 5th May 2020 stated that there'll "soon be a decision" on conducting the pending board exams at the earliest. Leena felt that "vigilance are going to be a problem" in government schools while conducting these online exams. According to data provided by UNICEF, 1.57 billion students are affected thanks to school closures in additional than 190 countries worldwide due to COVID-19. While In India, The Ministry of Human Resource Development plans to reopen schools and colleges by September 2020, teachers feel that alternative plans have to be made just in case another lockdown-like situation arises.

## REVIEW OF LITERATURE

**Ms. Shenoy.V.et.al(2020):** Find in their study COVID 19 – Lockdown: Technology Adaption, Teaching, Learning, Students Engagement and Faculty Experience that the purpose of this paper is to understand the technology adoption, teaching and learning process, student engagement and faculty experience towards virtual classrooms during Lockdown due to COVID 19, India. Inductive reasoning used in this study and qualitative research methods are used to collect the data from faculties associated with Higher education institutions in Bangalore and teaching courses such as PGDM, M.B.A, M.Com, M.C.A etc. The finding of the study suggests that during the lockdown period faculty have undergone the process of technology adoption and students are involved with various online modes of learning. There was lots of fear, anxiety and consciousness among students and faculty regarding COVID 19. This study is confined to the positive side of COVID 19 and change in the education sector by adapting to technology and engaging students with various virtual sessions. The current study is limited to the sample frame of 20 faculty from Higher education institutions at Bangalore, India, hence finding of this study cannot be generalized for entire India. The emotions and perceptions of faculty towards the usage of technology and experience are different for different users. Even though COVID 19 has created cognitive dissonance in students and faculty mind towards various situations they have faced in their day to day life in association with the society, family, and teaching and learning. It has created the revolution in Indian higher education, as there was lots

**Palvia.S.et.al(2018):** Observe in their studies "Online Education : Worldwide Status, Challenges, Trends, and Implications" that Online education in its various modes has been growing steadily worldwide due to the confluence of new technologies, global adoption of the

Internet, and intensifying demand for a workforce trained periodically for the ever evolving digital economy. Online education is on track to become mainstream by 2025. This editorial documents country-level factors that impact quantity and quality of online education. Such factors include industry (business); governments at local, state, and federal levels; country laws; ICT capacity; Internet/mobile technology diffusion; and income and digital divide. We provide implications for country and world organizations concerning online education.

Anh N 2017: Find in his study “The Impact of Online Learning Activities on Student Learning Outcome in Blended Learning Course” that the aim of the study was to determine the impact of online learning activities to the learning outcomes of students who participated in the blended learning course. Interactive activities are considered, in this study, include teacher – student interaction, student - student interaction, student – content interaction, and student - technology interaction. The undergraduate student participated in the blended learning course which using formative assessment to evaluate student learning outcomes by the combination of different learning activities through a learning management system. The quantitative results obtained when implementing learning analytics data from the system through using regression analysis showed that the students interact effectively with learning activities in the course have better results. Quantitative analytical results indicate that student – student interaction has a greater impact on student learning outcomes. These learning activities used for interactive activities as suggestions for teachers to design and implement learning activities for blended learning courses.

**Sun A& Chen X(2016):**Found in their studies “Online Education and Its Effective Practice: A Research Review” that using a qualitative content analysis approach, this study reviewed 47 published studies and re-search on online teaching and learning since 2008, primarily focusing on how theories, practices and assessments apply to the online learning environment. The purpose of this paper is to pro-vide practical suggestions for those who are planning to develop online courses so that they can make informed decisions in the implementation process. Based on the findings, the authors ar-gued that effective online instruction is dependent upon 1) well-designed course content, motivated interaction between the instructor and learners, well-prepared and fully-supported instructors; 2) creation of a sense of online learning community; and 3) rapid advancement of technology. In doing this, it is hoped that this will stimulate an on-going discussion of effective strategies that can enhance universities and faculty success in transitioning to teach online. Under current de-bates on the cost and quality of higher education, this study could help for the improvement of higher education and student enrollment and retention.

**Blackmon Stephanie J.(2012):**Observe in his study “STUDENT EXPERIENCES IN ONLINE COURSESA Qualitative Research Synthesis “As online learning continues to grow, it is important to investigate students overall experiences in online learning environments. Understanding students’ perspectives on their online classes or programs moves beyond the sole question of student satisfaction to more nuanced questions about how factors inside and outside of the classroom impact the online classroom. This qualitative research synthesis explored students experiences with online learning. For example, some students were satisfied with their online courses but still struggled with balancing online courses and work responsibilities. Other students found that enrolling in an online program related to their jobs was very beneficial.

**Hongjiang Xu (2007):** Analysis in their study “Effectiveness of Online Learning Program: A Case Study of A Higher Education Institution” Online learning has become a popular tool in addition to traditional learning methods. This study emphasizes on how assessment and delivery methods employed can influence the effectiveness of online program, as well as the benefits and constraints experienced in e-learning. The research project was conducted at a Higher Educational Institution for a period of three months. A case study methodology was employed to investigate the opinions and experiences of faculty and students involved in online programs. Various factors that affect the effectiveness of online programs were studied in order to provide insights on the major challenges, benefits and limitations faced. Among the findings, major problem areas were identified and suggestions were proposed on how identified problems can be minimized. The study also raised future direction for e-learning.

**Volery, T. and Lord, D.(2000):** Found in their study "Critical success factors in online education" that the Internet is a major technological advancement reshaping not only our society but also that of universities worldwide. In light of this, universities have to capitalise on the Internet for teaching, and one progressive development of this is the use of online delivery methods. This paper draws upon the results of a survey conducted amongst students enrolled in one online management course at an Australian university. Three critical success factors in online delivery are identified: technology, the instructor and the previous use of the technology from a student's perspective. We also argue that the lecturer will continue to play a central role in online education, albeit his or her role will become one of a learning catalyst and knowledge navigator.

#### **OBJECTIVE:**

- Online classes are much more effective than classroom Teaching
- Theory classes on webinar (Online) are much easier than practical classes
- To understand Attending college through webinar remains quite easy and convenient

#### **METHODOLOGY**

##### **Sample**

The present research was conducted on a sample of 180 Students from Jalandhar, and samples were randomly collected from the different colleges of Jalandhar city

##### **Procedure**

The questionnaires were distributed to the students of different colleges and they were asked to read the instructions given in the questionnaires. No time limit was given to fill the questionnaires but it was expected that respondents would fill the same within 15-20 minutes. Cronbach's Alpha was used to make sure the internal reliability of the instrument, the value of alpha should lie between 0 and 1. In our case, the value of Cronbach's Alpha comes to 0.8093. The reliability and validity was found to be within the acceptable norms.

H<sub>0</sub>: There is no any difference in the online classes and classroom teaching

H<sub>A</sub>: There is difference in the online classes and classroom teaching

H<sub>0</sub>: There is no difference in taking theory classes and practical classes through webinar

H<sub>A</sub>: There is difference in taking theory classes and practical classes through webinar

H<sub>0</sub>: There is no any difference in attending college though webinar or physically

H<sub>A</sub>: There is difference in attending college though webinar or physically

### RESULTS & DISCUSSIONS:

**TABLE1: SHOWING THE DESCRIPTIVE STATISTICS WITH T VALUE**

Sr No	Variables	Mean	Standard Deviation	T Test	Sig.
1	Do you think online classes are much more effective than classroom classes	2.6	1.32	12.52	<b>.000*</b>
2	The real classrooms teaching is best method of learning	4.24	1.15		
3	Taking Theory classes on webinar (Online) are much easier than practical classes	2.47	1.34	1.03	.466
4	Taking Practical classes on webinar(Online) are quite easy and simple	2.54	1.39		
5	Don't you think online classes are easy and convenient method of learning.i.e you can attend classes from anywhere	3.13	1.36	5.99	<b>.000*</b>
6	Attending classes in the classroom is easy and convenient method of learning as compare to webinar	3.92	1.31		
7	Attending college on time, meeting friends, discussion with teachers and friends gives you immense pleasure and satisfaction	4.32	1.12	12.59	<b>.000*</b>
8	Attending college through webinar, meeting friends, discussion with teachers and friends only through online gives you immense pleasure and satisfaction	2.67	1.34		
9	Do believe that online classes save your time, money and efforts	3.21	1.76	32.7	<b>.000*</b>
10	Your overall satisfaction level from webinar or online teaching method.	2.81	1.26	29.9	<b>.000*</b>

**\* Significance level: 0.05 (1.97)**

The above table Shows the descriptive value and t test value regarding student's perception towards online classes as per the results in the above table shows the overall trend of the online teaching and students perception towards online teaching

As per the first objective that online classes are much more effective than classroom teaching, Shows the mean value of 2.6 and standard deviation of 1.32, where as in the case of classroom teaching the mean value 4.24 and standard deviation of 1.15, the t value is 12.52 and the p value is (.000) less than .05, which shows that there is significant difference between online teaching and real classroom teaching.

Figure 1: Showing normal distribution curve with t-critical value **1.97**

*H<sub>0</sub>: There is no any difference in the online classes and classroom teaching*

*H<sub>A</sub>: There is difference in the online classes and classroom teaching*

In the above figure the normal distribution curve showing that the t critical value is 1.97 and the t value is 12.52 which is more than the critical value and falls in the rejection area. So Null Hypothesis is rejected and alternative hypothesis accepted. Which shows that there is difference in online classes and classroom teaching. With higher mean value of classroom teaching indicates that classroom teaching is the best method of learning.

As per the Second objective that Theory classes on webinar (Online) are much easier than practical classes, In the case of theory classes showing the mean value 2.47 and standard deviation 1.34 on the other side the practical classes on webinar having the mean value 2.54 and standard deviation 1.39. the t value having the value of 1.03 and p value (.466) is higher than the .05, which shows there is no any significant difference in taking theory class and practical class on webinar

Figure 2: Showing normal distribution curve with t critical value 1.97

*H<sub>0</sub>: There is no difference in taking theory classes and practical classes through webinar*

*H<sub>A</sub>: There is difference in taking theory classes and practical classes through webinar*

In the above figure the normal distribution curve showing that the t critical value is 1.97 and the t value is 1.03, which is less than the critical value and falls in the acceptance region. So null hypothesis is accepted i.e Which shows that there no difference in theory classes and practical classes through webinar

As per the third objective that Attending college through webinar remains quite easy and convenient showing the mean value 2.67 and standard deviation 1.34 whereas Attending college on time, meeting friends, discussion with teachers and friends gives you immense pleasure and satisfaction showing the mean value 4.32 and standard deviation 1.12. the t value is 12.59, the p value is (.000) less than .05, which shows that there is significant difference between attending college through webinar and attending college personally

Figure 3: Showing normal distribution curve with t critical value 1.97

*H0: There is no any difference in attending college though webinar or physically*

*HA: There is difference in attending college though webinar or physically*

In the above figure the normal distribution curve showing that the t critical value is 1.97 and the t value is 12.59, which is more than the critical value and falls in the rejection area. So Null Hypothesis is rejected and alternative hypothesis accepted. Which shows that there is difference in attending college though webinar or physically. With higher mean value of shows that attending college physically more liked and students shows more interest in it

## CONCLUSION

From the above analysis, it revealed that students are quite interested to have online classes but overall they are not fully satisfied with the online classes. As they believe that having classes in classrooms are much more effective than classes though webinar, even though attending college physically is more important and interesting for students. So overall results show that students are interested to have online classes because it saves time, money and efforts but they love to interact with friends, teachers, participates different activities physically only.

### ABSTRACT

*There are represented results of the study the Quality circle implementing practice on large Uzbek manufacturing company in the human resources area. Hypotheses relating to empowerment, team working, and training were developed and tested. An analysis revealed that there was a significant difference in empowerment practice between two groups of employees, but no significant differences in teambuilding and team working or employee training. Results of study divulged that team working and empowerment of Employees could improve innovativeness but certain aspects of employees training depending on their educational and aspiration level. An experience of suggestion system was reported in this article for the purpose of investigating effective factors of suggestion system at the large Uzbek industrial company. With effective suggestion system, the company can not only achieve goals on the improvement of the working processes but also improving quality of its employees, especially blue-collar workers, through involvement in suggestion activity, education and training. Linked to the company's personnel development, suggestion system is found to be effective owing to factors such as strong support of top management, high job involvement, education and training and convenient evaluation. This article is suitable and benefits to anyone whose interest is to promote the contribution of human capital and creativity of the organization they work for.*

## I. INTRODUCTION

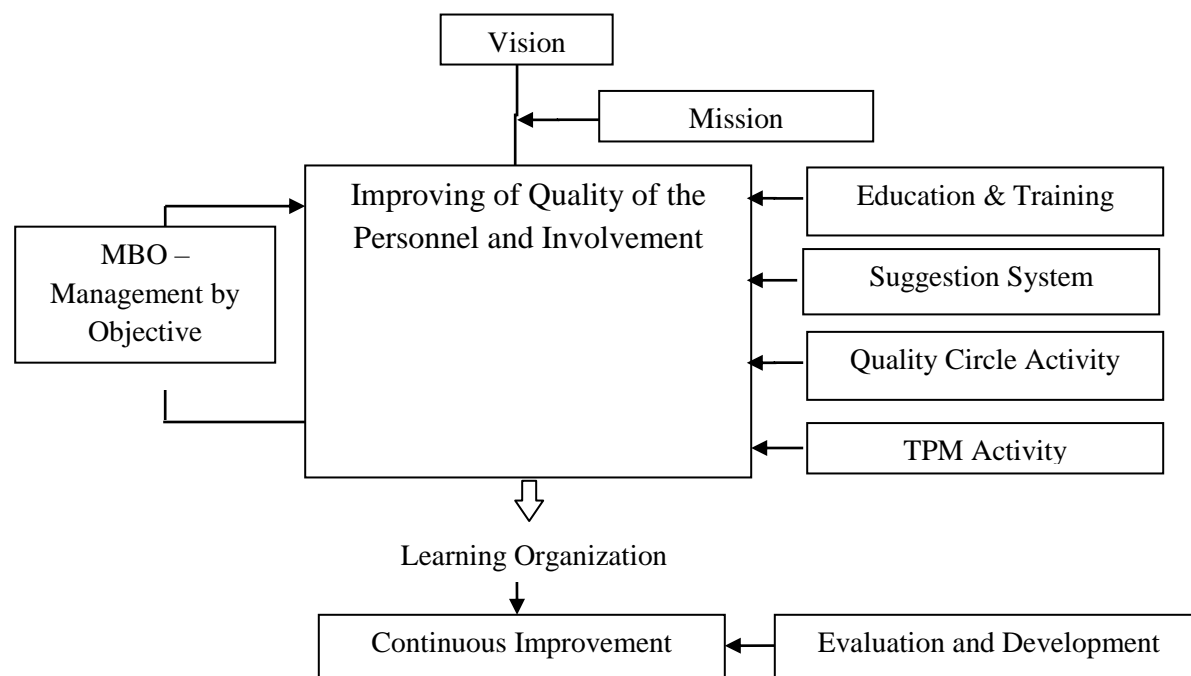

Suggestion systems are important features of modern production systems. Many companies with developed suggestion systems have shown the importance of improvement in quality and quantity of production. There has been little empirical research on the issue or suggestions. While there have been studies about modern production systems, there has been little specific focus on suggestion systems. Both as a tool to improve the production process so as a tool to improve the quality of the company's personnel. For this reason, we conducted research on the "human side" of the suggestion system in the company that established a well-organized suggestion system. The Suggestion System operated by the large Uzbek industrial company generated over 114 thousand suggestions for improving manufacturing processes over a span of 20 years. The average number of suggestions submitted by each employee per year is 2.1, approximately as 10 years ago for Britain companies. The saving from suggestions in the company we studied was approximately 3.9 billion Uzbek soum (US\$2.358.380).

This paper is concerned with investigating effective factors in operating a suggestion system at the company. In order to conduct the research, and experience of the company was excavated in search of its characteristics in the suggestion system. Further, a questionnaire survey was conducted from 144 workers (best suggestion-makers, the person in charge for suggestions, team members, etc.) in order to investigate how they think about the system and problems of system and personnel development. Relevant data were obtained and then analyzed for the study.

## II. Company personnel development and suggestion system.

About twelve years ago the management of the company made-out the following concept of company development (fig.1).

Under the Vision of the company's future, the mission was stressed that improvement of quality of the personnel and involvement through Paradigm changes should be used to create the Learning organization and climate the Continuous Improvement. The Suggestion system, Education and Training, Quality circle and TPM activity were selected as main tools for stirring up of employees. Successful implementation of the development model of the company greatly depends on the consciousness of the personnel of the company. Only increasing the level of personnel consciousness, will it be possible to achieve targets set and utilize all opportunities available to developing company. It would be interesting to learn how this company aligns suggestion system to company personnel development as a part of the development strategy. Suggestions for improvement are actively sought and rewarded by the company management with the support of front-line supervisors which make every effort to help and encourage employees to submit good ideas they might have for improvement. In this way, a strong culture of continuous improvement which enlists the active participation by all employees must be established. This is a long term aim of company management. On top management opinion, based on Korean partners experience, through education of personal and suggestion activity the company can strategically pursue quality rather than short-term profits and suggestion system must be become everybody's responsibility.

**Fig.1:** Concept of Company Development

Unlike many other manufacturing companies, the company puts Suggestion system on the top priority as management philosophy for the not only manufacturing efficiency but also for improving the quality employees through education and involvement.

Suggestion-making as innovative activity can be approached from two sides: developing suggestions as to the improvement of production and as an activity aimed to develop the company's employees. The first perspective (suggestions for improvement of production) conceptualizes suggestions as creative acts that are related to skills in creative thinking based on the competency, wide- educational and special knowledge, skills and abilities.

The second perspective adds one special particular facet to creative processes – loyalty to the company, involvement in a company's business and management, sharing common values. It means be self-starting, proactive, long-term oriented, and able to overcome barriers. Because not all employees have these capabilities, it demands the developing of employees and it is favourable for company development. These tools, which are characterized by the involvement of everybody, proactively and perfectionism, are embodied in the system combined with manufacturing, technology and office. In addition, Suggestion system is supported by "Shijoat" (means "Brave spirit") movement, as a spirit for the perfect accomplishment of company objective. In other words, company manager has reinforced the demands of working operations by means of examining how workers have done in the suggestion activity. The following figure shows the resulting performance of the system at the company.

Contents	Introduction (1998~2001)	Diffusion (2001~2006)	Activation (2007-2009)	Maturing(2010 ~present)
Suggestions, thousand	0.321	36.1	26.7	26,8
Suggestion per person	0.03	1.1	2.0	2.0
Implementation,	0.169	5.62	11.06	15.1

thousand				
Implementation rate, %	52.2	16.4	41.4	56.9
Involvement Rate, %	5.8	48.4	60.2	62.1

**Fig.2:** Average performance for the year

As shown in the above figure, four stages were identified: introduction, diffusion, activation and quality-seeking stages. The average number of suggestion increased to 11 486 in 2009 and dropped to 11 172 in 2010 because the evaluation level for adoption was raised. Regardless, the average number of suggestions per person rather went up. In view of the 66.9% implementation of the adopted suggestions in 2010 which is compared with 41.4% in the previous stage, and 82.7% involvement which is compared with 60.2% in the previous stage, this indicates the company began to enter the qualitative stage from the quantitative stage. The characteristics of each stage in the development of the suggestion system are shown in the following figure.

Stage	Characteristics
Introduction (1998~2001)	<ul style="list-style-type: none"> <li>- establishing the Education centre of company;</li> <li>- training on real-life examples for middle-range and front-line managers;</li> <li>- introduction of Suggestion System basically.</li> </ul>
Diffusion (2001~2006)	<ul style="list-style-type: none"> <li>- establishment of a rewarding system for implementation;</li> <li>- establishment of Suggestion Secretariat and Award Committee;</li> <li>- Quality Circle conference.</li> </ul>
Activation (2007-2009)	<ul style="list-style-type: none"> <li>- active implementation of Suggestion System;</li> <li>- computerization of Suggestion System management.</li> </ul>
Maturing - quality seeking (2010~ )	<ul style="list-style-type: none"> <li>- standardization of evaluation processes;</li> <li>- publication of a manual for evaluation and rewards on implementation;</li> <li>- expansion of suggestion system to suppliers;</li> <li>- development of the Suggestion System.</li> </ul>

**Fig.3:** Main characteristics of the four Stage

As shown in the above figure, the company first introduced the suggestion system in 1998 with the purpose of improving product and process quality. Then the system was widely disseminated during the period of 2001~2006.

During the 2007~2009, the system was activated owing to the increasing number of suggestions throughout the factory. In 2010, the system turned to a new stage and system would enter quality-seeking ones. It had been focused on the number of suggestions before. The quantitative number was important also, but the qualitative number has been regarded as more important, with the purpose of meeting the corporate concept of development. The number of Suggestions per person increased strikingly. Both the number of implementation and reward amounts have increased in general. Examination of the 2010 data permits us to say that reward amount sharply increased over the previous year because increasing both implementations number and quality of suggestions. This indicates how the company has effectively implemented the suggestion system.

### III. Effective factors of the suggestion system

#### 3.1. Strong support of top management.

Top management, particularly the factory manager, strongly and visibly supports the development of the suggestion system. Until last years, to solicit a suggestion from employees, any reasonable suggestion had been welcome so that data could be accumulated in a large quantity.

The goal was to develop employee's capabilities to create a new idea, their involvement in the company's business development, to generate the ability to make suggestions through receiving new knowledge, skills and abilities. As most of the employees have received an experience of suggestion activity, a quantitative approach was encouraged by top management and innovation team and factory turned to a qualitative approach in 2010-11.

Quality of suggestions is focused through feedback and encouragement by top management. Top management, as a main driving force, urges employees to participate in the training program and contributed to the integration of the Suggestion system and Human resource management through rewarding system and feedback. In the next figure, we can see how workers think about the suggestion system.

	Strongly disagree	Disagree	Middle	Agree	Strongly agree	Mean
Top's support	2 (1.3)	8 (5.5)	11 (7.6)	79 (54.8)	44 (30.6)	4.07
Connection to job demands busting	6 (4.2)	21 (14.6)	55 (38.2)	21 (14.6)	14 (9.7)	3.30
Connecting to "Shijoat" movement	2 (1.3)	69 (47.9)	47 (13.9)	20 (13.9)	6 (4.2)	2.72
Support of front-line managers and innovation team is not enough	13 (9.0)	19 (13.2)	52 (36.1)	28 (19.4)	32 (22.2)	3.33

Note: the parenthesized values indicate percentage.

#### 3.2. Involvement and personal development.

An employee's viewpoint, suggestion making itself is an important part of his work life and important for company activity. Also, employees who feel a high level of accomplishment from the job would more suggestions and involvement is an important input to make a suggestion. The following figure indicates how they feel about their job and suggestions.

	Strongly disagree	Disagree	Middle	Agree	Strongly agree	Mean
Importance of job	0 (0)	6 (4.2)	13 (9.0)	69 (47.9)	56 (38.9)	4.07
Importance of suggestions for company	5 (3.5)	19 (13.2)	43 (29.9)	53 (36.8)	23 (15.9)	3.30
Importance of suggestions for development of	3 (2.0)	9 (6.2)	34 (23.6)	28 (19.4)	70 (46.6)	4.06

workers						
Importance of training and education for suggestion-making development	8 (5.5)	13 (9.0)	31(21.5)	49(34.0)	43(29.8)	3.74
Importance of involvement for suggestion-making development	11 (7.6)	14 (9.7)	18(12.5)	20(13.9)	81(56.2)	4.01

### 3.3. Participation

As mentioned previously, employees at this company have extensively been involved in the suggestion process and successful suggestion system is a result of employee involvement practices. This input helps in identifying their commitment to management efficiency and effectiveness. This company actively supports employee involvement, with a participation rate of 82.7% of total workers so that can reap organizational creativity. Subordinates are strongly encouraged to learn how to make suggestions by individual and group. That is, they are motivated to improve quality as they are told clearly what to do and how to do it. An atmosphere of participation encouraged regarding a suggestion.

	Strongly disagree	Disagree	Middle	Agree	Strongly agree	Mean
Suggestion as challenge in works	18 (12.5)	22 (15.3)	47 (32.6)	35 (24.3)	22 (15.2)	3.15
Suggestion is result of managerial stress	4 (2.7)	10 (6.9)	28 (19.4)	41 (28.4)	61 (42.1)	4.01
Suggestion is result of employee development	16 (11.1)	15 (10.4)	53 (36.8)	38 (26.3)	22 (15.3)	3.24
Quality group suggestions are more effective than individual	26 (18.0)	33 (22.9)	41 (28.4)	17 (11.8)	27 (18.8)	2.90

## IV. Evaluation procedure

The Suggestion system in the company has been developed in a manner that employees actively participated in suggestion implementation and can see the current status of the submitted suggestion. The procedure of evaluation is simple, speedy and convenient to participants. The results of the final decision are quickly disclosed regarding implementation. Although employees seem to have some monetary reward, they are quite satisfied with the evaluation procedure.

	Strongly disagree	Disagree	Middle	Agree	Strongly agree	Mean
Speed of evaluation and rewarding is good	31 (8.3)	41 (28.4)	37 (25.6)	26 (18.0)	9 (6.2)	2.59
Procedure of evaluation is simple and convenient	29 (20.1)	44 (30.5)	25 (17.3)	31 (21.5)	15 (10.4)	2.72

Rewarding amount is not enough to motivate suggestion-making	8 (5.6)	28 (19.4)	21 (14.6)	28 (19.4)	61 (42.3)	3.71
--	---------	-----------	-----------	-----------	-----------	------

## V. CONCLUSION

The generalization of the above-mentioned opinions of workers about Suggestion system and its acted factors for personnel indicates in the next figure.

**Fig. 4.** Structure of Suggestion system factors

Thus, based on the results of this study, we can say - for Suggestion system as a personnel development tool:

1. messages regarding who is invited to participate must be clear (in principle – all employees);
2. education and training are very important in the first stage of Suggestion system development;
3. the rewarding procedure must be suitable and clear for workers;
4. Suggestion system needs continuous support for the system.

## ARCHAEOLOGICAL STUDY OF ANTHROPOGENIC LANDSCAPES OF UZBEKISTAN

**Murodova Durdonakhon Habibulloyevna\***

\*Researcher,  
National Archaeological Center,  
Tashkent, UZBEKISTAN

### ABSTRACT

*The article covers the archaeological study of the problem of anthropogenic landscape in Uzbekistan, the interaction of mankind with nature in the period from ancient times to the Middle Ages in the territory of Uzbekistan, namely the emergence of new landscapes, that is, anthropogenic landscapes in accordance with the conditions of their habitat. The main objective of the study was to find out what impact humans have on nature according to their needs, living in ancient caves, rural settlements, cities. In the virtual reconstruction of anthropogenic landscapes used Roman, Greek, Chinese sources of antiquity, as well as data from medieval geographers and tourists, methods of analytical study, geo-archaeology, bio-archaeology, palaeoecology, GIS technology and computer graphics, as well as methods of archaeological research. Many methods of analysis of archaeological sites also relate to landscape analysis. The artefacts, obtained as a result of researches of the archaeology of Uzbekistan, testify that our ancestors lived in harmony with nature, influenced the natural landscapes differently, creating a kind of anthropogenic landscapes. The results of this study show humanity's interest in nature, its psycho-emotional, aesthetic views and even its attitude towards housing design.*

**KEYWORDS:** *Archaeological Expeditions, Archaeological Research, Irrigation, Landscape Archaeology, Anthropogenic Landscape, Rock Drawings.*

### • INTRODUCTION

The study focused on highlighting the influence of ancient people on landscapes based on materials obtained in connection with the organization of the first archaeological expeditions in Uzbekistan. In the science of archaeology of Uzbekistan, ancient anthropogenic landscapes on the territory of Uzbekistan have not been explored as a separate scientific direction. Although

landscape studies have been studied by some researchers in terms of the urbanization of ancient times, to date landscape archaeology In Uzbekistan cannot fully reveal the industry direction. Literature related to the study is virtually non-existent, mostly in the form of scientific articles and theses. Information concerning the archaeology of the landscape of Uzbekistan can be obtained from scientific journals and monographs devoted mainly to the results of archaeological research. Although this literature was not devoted to the problem of the anthropogenic landscape. Based on the study of artefacts and data collected in the literature on ancient destinations, graves, flora and fauna of urban remains, farms related to human production, mining and raw materials, it has been found that there is a need for comprehensive research in this field. For this reason, the study aims to highlight the history of the study of anthropogenic landscapes in Uzbekistan by summarizing materials concerning anthropogenic landscapes distributed in various sources.

Archaeology today addresses many areas of geography exploration, along with other historical areas. One area related to the study of landscape formation and development is the study of anthropogenic landscape, which plays an important role in archaeological research.

Since time immemorial, man has made changes to natural landscapes based on his own needs and often alters them. The result is anthropogenic landscapes, not natural ones. [1, p. 293] Archaeological study of the problem of anthropogenic landscape in Uzbekistan is connected with the study of the first complex archaeological expeditions in the region. [2; 3]

In particular, studies of the Thermesian complex archaeological expedition led by M.E.Masson, Excavations in the Fergana Valley in connection with the construction of the Great Fergana Canal led by Y. Gulyamov, Based on the materials collected during the excavations in Khorezma led by S.P.Tolstov, we see that the interaction of mankind with nature in Uzbekistan from ancient times to the Middle Ages created a new landscape, that is, anthropogenic landscapes that adapt natural landscapes to their living conditions. Humanity has created various anthropogenic landscapes from ancient times to the present day, and they have in some ways also had a negative impact on nature.[2; 3; 7]

Scientist A.Valiev, who studied the history of anthropogenic landscapes, stressed that the study of the formation and development of anthropogenic landscapes of ancient cities of Uzbekistan is based on archaeological materials and written sources [6]

The scientist points to the rapid expansion of human settlements and population growth during this period as a key factor in the development of anthropogenic landscapes in ancient times. It has been observed that settlements originate in the nature of the oasis and develop due to their water supply. Such irrigated areas for North Bactria have been studied by M.E. Masson and E.V.Rtweladze, and in their studies, cities and localities have been classified by the nature of the irrigated areas. [7; 8]

Today, archaeologists are faced not only with finding new finds, but also with extensive study of artefacts left behind by humans, the landscapes in which they lived, and their connections to the natural environment. Research in this field is carried out in an area called "landscape archaeology." In studies of landscape archaeology, archaeological methods of study have shown that ancient people chose and mastered areas suitable for hunting or harvesting, farming or animal husbandry, population location including rural and urban habitable areas, ancient agricultural fields, water. It is important to have an idea that sources are located around heat sources. Cooperation from different fields plays an important role in integrated research in

landscape archaeology. The use of GIS technologies in such research, archaeological data, paleobotanists, palaeogeography, anthropology and other sciences allow the creation of a virtual archaeological landscape.

#### • METHODS

In the virtual reconstruction of anthropogenic landscapes of Uzbekistan, we use data of ancient Roman, Greek, Chinese sources, as well as medieval geographers and tourists and methods of archaeological research. At the same time, advances in archaeology-related science, including geoarchaeology, bioarchaeology, paleoecology, paleozoology, are widely used in the study of landscape archaeology. GIS and innovative computer graphics technologies are the main methods of research. Many methods of archaeological monument analysis are also applicable to landscape analysis. The analysis of landscape archaeology covers a number of methods of research. These methods include plant dust analysis, geographic information system (GIS), soil analysis, fauna analysis, geo-radar, archival data (maps) and, of course, archaeological excavation methods. Analysis of plant dust, fauna and flowers provide the archaeologist with information on the natural flora of people living in the area, as well as the flora and fauna grew by humans. Material evidence found in ancient cave sites, as well as rock drawings, the mines they dug to make tools, served as a major source in the study of anthropogenic Stone Age landscapes. The history of early rural settlements, early processes of urban development and their impact on landscape change, crafts and production processes and the raw materials used therein, anthropogenic human impact on natural landscapes in agriculture and livestock, water landscapes, road and garden greening based on archaeological findings and written sources have been studied by comparison.

#### • Results

From ancient times to the present day as a result of human development of natural landscapes with comfort for itself, the discovery of new fields, new roads began to appear peculiar anthropogenic landscapes. As a result of the work on the history of anthropogenic landscapes in Uzbekistan - the development of archaeological research, the socio-economic development of the region at the same time became possible to cover the main stages of irrigation history. Archaeologists who researched such issues as the material culture of ancient people, flora and fauna of this period, as well as natural landscapes and their development by primitive people on the territory of modern Uzbekistan, noted that since the Stone Age, primitive communities have developed certain regions and created a kind of material culture. The development and development of environmentally friendly spaces, in particular the Amu Darya and Zarafshan river basins, as well as many small water bodies in the region, has led to the development of its shores. Archaeologists note that since the last stages of the Mesolithic and throughout the Neolithic period, the development of this region has hardly occurred in the nature of the settlement, and the landscape, climatic and ecological conditions have been in constant decline for a long time. [9, p. 59.]

However, due to the change in the direction of water flow in the river basin, it is observed that the habitat of the population also changes accordingly. Researchers explain the fact that the lands developed by the ancient communities of Central Zhetysay were formed based on certain laws, mainly for natural reservoirs, slopes of large rivers that flow from mountain slopes to the oasis, and slopes of these rivers. It is noted that the location of the sites belonging to the cultural

communities of Central Fergana is related to the slopes of river streams and lake basins. The unique landscape and climatic conditions of each region have served as a decisive factor in the development of these territories by ancient communities.

Most of Uzbekistan's territory has been quickly mastered by mankind since the last stages of the Stone Age. The anthropogenic impact of Stone Age people on nature in Uzbekistan is also known from many rock drawings found in the area. In recent years, interesting research has been carried out in this area and new monuments have been opened. Of great scientific importance in Central Asia are rock drawings found in the Zarauta Gorge.

The images are drawn mainly in connection with the hunting process. The photos show people hunting animals such as bulls, gazelles, pigs, goats and owls using dogs. Petroglyphs belonging to Stone Age communities in Uzbekistan were discovered in Sarmishsai on the Murontov Range, in Khojaksit on the Chatkal Range and in Bukanta.

The overall content of rock images reflects the learning of primitive communities, the relationship between humans and nature. F. Maksudov, a scientist who studied the rock painting of Zarausa, concludes that the first cultivations in Central Asia began in the foothills, as in the Middle East. [10, p. 10]

The start of the first irrigated agriculture in Central Asia, including Uzbekistan, also led to the first water landscapes in the region. Many studies have been conducted in Uzbekistan on the history of irrigated agriculture and irrigation, and great scientific achievements have been made in this area. In particular, major scientific works reflecting the history of development and irrigation of agricultural lands of ancient Khorezm, Zarafshan oasis from ancient times to the present day have been created. When studying water landscapes in Uzbekistan, studies conducted in the Fergana Valley are of particular importance. The Fergana Valley is a fully developed region of Central Asia as an ancient centre of irrigated agriculture. Studies A.Yu. Yakubovsky, M.E. Masson, V.A. Shishkin, S.P. Tolstov, Y.G. Gulyamov, B.A. Latynin, I. Ahrarov, A. Anorboyev, B. Matboboyev, G. Ivanova are of special importance in archaeological research of this area. [2; 3; 7;] Their research focuses not only on the history of agriculture and handicrafts in the region but also on the history of irrigation. The first archaeological study of the Fergana Valley was carried out, especially during the construction of the Great Fergana Canal, which produced a great deal of material to illuminate the anthropogenic landscape of the region. As a result, the history of irrigation in the Fergana Valley was covered by written sources and archaeological research. The Fergana Valley is the oldest agricultural oasis in Central Asia, located in the upper Syr Darya. Soil fertility, availability of water sources and favourable climatic conditions were the main factors in the formation and development of the first sedentary agriculture here. Fergana is one of the regions with the first developed agricultural culture such as ancient Bactria, Sogd and Khorezm. Over the years, archaeologists have discovered monuments of the Paleolithic, Neolithic and Bronze Age. Archaeological monuments such as Kairakkum, Kapchigai, Chust, Dalwarzin, Eilatan, Shurabashat, Oqtom and Kungai became known to science. In studying the history of the ancient material culture of Fergana, remains of Marxamata, Simpepa, Karkidon, Gairattepa, Munhoktepa, Kalai Bolo were discovered, as well as remains of multi-layered cities such as Kasan, Ahsiket, Kuva, and anthropogenic landscapes created by many provide information. Archaeological artefacts associated with ancient farming and crafts from these monuments provide interesting information about how the land developed

at a time where the soil was obtained in pottery, an important industry of crafts, their achievements in the technique of mining and processing metals. The fact that burnt grain in the ruins of the city of Kuva was burned is clear evidence that the population was farming in ancient times, and the fact that this area is rich in water shows us that a unique water landscape and a unique anthropogenic landscape around the city have emerged here. The discovery of a sickle, plough, knife used in horticulture, as well as agricultural tools, attests to the economic activity of the population of the period, and on the other hand, there can be no denying that a garden landscape was created in the city. The discovery of the grain mill once again illustrates the economic activities of the ancient residents of Fergana. [11]

Archaeological and hydrological studies conducted by archaeologists and specialists in the Fergana Valley show that the Sox River was fully used for irrigated farming. This river is one of the wettest rivers in the South Fergana Valley. Naturally, people's development of such large water resources certainly requires some administrative management in social life. As the irrigation system expanded, so did the administration. As a result, new social professions were formed. The road connecting the Fergana Valley with the Zeravshan oasis passing through the ancient town of Fergana, Kokand, shows that from the very first days of irrigated farming these areas were developed by Sogdian farmers [12; 13].

The data obtained from archaeological research in some ways support the information given in medieval Arabic sources. In particular, there are many cities and villages in Fergana, and the presence of rivers, mountains and deserts, as well as the presence of various minerals in the mountains, further expands the understanding of the natural and anthropogenic landscape of the cities of Fergana in the Middle Ages.

## • DISCUSSION

Uzbekistan as an ancient anthropogenic region has been studied by many archaeologists. Among these researchers, O. Islamov notes that in this region the places of humanity can be found not only near river valleys or reservoirs but everywhere. It emphasizes that since the Stone Age mankind has actively influenced nature, building channels, irrigation and distributing water. [13] Geologist O. Islamov demonstrates an anthropogenic impact on landscapes based on the results of many Stone Age seminars and stone processing. [14]

The anthropogenic influence of Stone Age people on nature in Uzbekistan is also highlighted by many experts thanks to the many rock drawings found in the area. Many archaeologists and hydrologists focused on the problems of forming the first aquatic landscapes in Central Asia, including Uzbekistan, with the beginning of the first irrigated farming.

## CONCLUSION

In conclusion, it can be said that the physical evidence obtained from the research of the archaeology of Uzbekistan shows that ancient ancestors lived in harmony with nature, in different ways influenced natural landscapes, while creating unique anthropogenic landscapes.

Archaeologists who researched the material culture of ancient people of the Stone Age on the territory of modern Uzbekistan, Flora and fauna of this period, including natural landscapes and their development by primitive people, Note that since the Stone Age primitive communities have mastered certain regions and created a kind of material culture, Created environmentally friendly spaces for human existence, in particular the basins of the Amudarya and Zarfshan

rivers, As well as numerous small water bodies located in the region. They began to develop the coast. The beginning of the first irrigated agriculture in Central Asia, including Uzbekistan, led to the emergence of the first water landscapes in the territory.

As a result of numerous studies on the history of irrigated farming and irrigation in Uzbekistan, an archaeologist has found that ancient Khorezm, Zarafshan oases from ancient times to the present day have been mastered by humans, irrigation history and anthropogenic influence of humans on nature. Of particular importance in the study of the aquatic landscapes of Uzbekistan are studies carried out in the Fergana Valley. It has become known that the Fergana Valley is fully developed as an ancient irrigated farming centre of Central Asia.

The results of this study also show humanity's interest in nature, its psychoemotional, aesthetic views, and even its relation to spatial design.

### **ABSTRACT**

*Nowadays, the main regularity of social development is the innovative renewal of the world economy, the transition to the so-called "new knowledge-based economy", the hallmark of which is the accelerated development of the economic activity. Modern society is rapidly evolving in the direction of postindustrial, while the transformations that are taking place are so radical that we can talk about a paradigm shift in economic development. In the new economy, enterprises that produce innovative products are becoming key. However, practical experience indicates a high degree of risk of launching innovative products on the market: on average, about a third of new products are defeated and bring only losses instead of profits. Thus, marketing support for the creation of new products becomes one of the most important problems of an innovative company. This article discusses the importance of marketing research in introducing innovative products to the market, features of the market for innovative products, the effectiveness of marketing activities and features of marketing innovation.*

**KEYWORDS:** *Effectiveness Of Marketing Activities, Factors Of Success Of A New Product, The Market Of Innovative Products, Marketing Of Innovations*

## INTRODUCTION

Peter Drucker already said, "Business has only two functions - marketing and innovation". He considered marketing and innovation to be an important basis for the company's success. This is reason enough to take a deeper look at the purpose and role of marketing from an innovation perspective. Marketing includes tasks to increase sales. The focus is on customer and market orientation; all products, services and processes are to be aligned with the needs of customers and users [1]. Marketing has a very comprehensive role. These include the famous 4P, market research and strategic task.

- Market research comprises the identification of customer needs, on the one hand, current and future market needs, and on the other hand the exploration of possible market potentials.
- Marketing also plays a strategic role. Based on the corporate strategy, marketing plans are drawn up. In many cases, marketing also plays a leading role in the development of strategies, as they can identify strategically important markets based on market information, for example. 4P is the marketing mix for marketing products. Four levers are available for this purpose: product design, pricing policy, communication and the type of distribution and sales.

As the listing of marketing tasks shows, there are many overlaps between marketing and innovation management. For example, analysing trends, researching customer needs and defining product policy in the marketing mix with product development and product design are also tasks that can be found in the function of innovation management [2,3,4,5].

It is known that modernization of the economy is the main and important condition for the innovative development of the country. Nowadays, at a time when stabilization of the Republic of Uzbekistan is prevailing, it is difficult to achieve the diffusion of innovations, that is the introduction and rapid spread of new ideas, developments and technologies, without deep modernization of the economy. This will require, first of all, the integration of education, science and industry, as well as the introduction of several specific technical solutions that will facilitate the creation of new industries that will encourage the creation of new companies that will increase the demand for innovative products [6,7]. Today one of the most pressing issues facing the national economy is to achieve innovative development of the country in the short term. Otherwise, it is clear that it will be difficult to get a place in the ranks of developed countries for Uzbekistan. One of the main tasks for the positive solution of this issue is the implementation of comprehensive reforms. The Ministry of Innovative Development of the Republic of Uzbekistan is a governmental agency which administrates implementation of single state policy in the field of innovation and scientific and technological development of the country, aimed at comprehensive development of society and state life and increasing the intellectual and technological potential of the country. Innovation development is a systematic process, which involves the implementation of clearly defined measures according to the plan, that is, in a strategic way. In this regard, the decree of the President of the Republic of Uzbekistan dated September 21, 2018, No PD-5544, the strategy of innovative development of the Republic of Uzbekistan during 2019 and 2021, the "road map" on its implementation, the confirmation of the indicators of the Republic of Uzbekistan for innovative development until 2030 have been essential. The main purpose of the strategy is the development of human capital as the main factor determining the level of competitiveness of the country in the international arena and the

development of innovation, and one of the important objectives of the strategy is the entry of the Republic of Uzbekistan into the ranks of 50 advanced countries of the world in terms of the Global Innovation Index ranking until 2030 [8].

## REVIEW OF THE LITERATURE

Initially, it is desirable to introduce clarification of the concept of innovation. In the era of economic globalization, innovative ways of organizing the system of all levels are crucial in the formation of a new model of economic growth. At the same time, the main tool of competition is not the possession of capital resources and material values, but the ability to develop and implement innovations. In this regard, the growing interest in the problem of innovative development on the part of both government agencies and businesses is obvious.

The first most complete description of innovation processes was introduced by the Austrian scientist J. Schumpeter in the work "Theory of economic development" published in 1911. According to J. Schumpeter, "innovation is a source of profit:" profit is essentially the result of performing new combinations", "without development there is no profit, without profit there is no development» [9].

A. B. Titov considers innovations (innovation) as the final result of the creation and development (implementation) of a fundamentally new or modified tool (innovation) that meets specific social needs and gives several effects (economic, scientific, technical, social, environmental) [10].

In our opinion, the essence of innovation should be defined as the final result of a synergistic interaction of research and scientific and technical activities aimed at improving the technical level, as well as the release of new high-performance products and bringing economic, social, environmental, scientific and technical or another type of effect.

Nowadays, the market is dominated by fierce competition between enterprises, and to win in it, companies need to put a lot of effort. Therefore, innovation is one of the main factors of success in market conditions. It is an innovation that gives companies the opportunity to create competitive advantages and successfully operates in the market in a highly competitive environment. In order to achieve this, businesses need to implement innovative transformations in a timely manner, identify new markets, and predict consumer preferences as quickly as possible.

It is an innovation that helps ensure that a newly produced product has the necessary benefits for consumers that distinguish it from competitors' products, as well as protection from copying by competitors. Accordingly, the main condition for the introduction of any innovation at the present time is marketing research and technologies that identify the needs of consumers. Therefore, marketing is the most important component of the innovation management process of an enterprise that seeks to offer and implement a new product on the market.

As L. Ronald Hubbard notes, marketing helps prepare a product, deliver it to the market, and place it there in a way that achieves the highest possible sales and the highest possible response. Marketing allows you to research the needs of the market for innovations, generate demand for new technologies, analyze the company's capabilities, identify the needs of customers and offer the innovative product that will be in demand by the market [11].

By combining the concepts of "marketing" and "innovation" through the application of marketing research at all stages of creating an innovative product, it is possible to derive such a definition as "innovative marketing"[12].

### **Significance of the study**

From our point of view, the main problems of the innovative process in Uzbekistan are largely related to the insufficient development of marketing in scientific-technical organizations and innovative enterprises. One of the most important problems of an innovative company is marketing support for the creation of new products. Practical experience indicates that there is a high risk of introducing innovative products to the market: on average, about a third of new products fail and bring only losses instead of profits.

The specifics of introducing new products to the market are related both to the specifics of the products themselves and to the specifics of the market. Generally, the following fail when entering the market:

- 25-27% of industrial goods;
- 33-35% of personal consumption goods;
- 28% expansion of the existing range;
- 30% of brand innovations;
- 45% of new products themselves [13].

As it can be noticed, the market of consumer commodities is more risky, due to the higher level of competition and the specific behaviour of consumers in this segment. Additionally, these figures demonstrate a higher level of risk when introducing fundamentally new products to the market, which can often be attributed to the so-called breakthrough innovations. Among the reasons for the failure of new products, the following factors are usually identified: insufficient market analysis, product defects, lack of effective marketing measures, excessively high costs, actions of competitors, lack of support for bringing the product to market, production problems.

### **RESEARCH METHODOLOGY**

A systematic approach, generalization and synthesis methods are effectively and appropriately used in the article.

### **RESULTS AND DISCUSSION**

The relationship between the risks of innovative process and the level of marketing development in the company is clearly visible if look at the stages of the innovation project: 6 stages of the 14 stages listed below are directly related to the effectiveness of marketing activities carried out by the innovator/innovative company.

- Search for new ideas
- preliminary market assessment
- the selection of the "right" ideas
- preliminary technical evaluation of the product
- detailed market research
- economic analysis (financial analysis)
- development of a new product concept (production of a prototype)

- 
- technical testing of the product
  - testing by consumers
  - experienced sales
  - experienced production
  - economic analysis (clarification of financial indicators)
  - launch production
  - bringing the product to market

In other words, the factors of the success of a new product are:

- the superiority of the product over its competitors (distinctive properties that contribute to a better perception by consumers) [14];
- marketing know-how of the company (understanding the behaviour of customers, the pace of adoption of new products and the size of the potential market) [15,16];
- Existence of the technological know-how which is protected by a patent or trade secret regime.

As it is seen, commercial success cannot be ensured only by obtaining technological advantage. Thus, any innovator or innovative company will sooner or later have to think about marketing factors.

Innovative products form a specific market for high-tech and scientific-technical products. Its features in comparison with the market of "traditional" goods are diverse and affect all aspects of the relationship between the seller and the buyer, requiring, accordingly, their reflection in the marketing policy of the company. Among the features of this market, the following should be highlighted:

- particular qualities of the product itself (uniqueness; sometimes technological complexity; high costs for its production at the first stages);
- the novelty of the market for the firm (especially for a small innovative company that is at the start-up stage);
- unknown product (and sometimes the manufacturer) for the market;
- the unpredictability of consumer behaviour;
- low elasticity of demand from the price, so, as a result, a limited impact of pricing policy on sales volumes;
- small market capacity (especially for high-tech industrial products);
- lack of direct competitors at the initial stages (due to the monopoly on intellectual property);
- achievements of the company's employees in the theoretical field with a well-constructed policy which can significantly raise the company's rating among consumers;
- dependence of sales of innovative products on the level of innovative potential of the consumer: many pioneer innovations are difficult to sell due to the general technological backwardness of a number of sales markets [9,17].

The problems of bringing innovative products to the market that are unfamiliar to the consumer are primarily associated with the risk of the unpredictability of the reaction of buyers. This is typical for companies operating in any industry, but for the market of high-tech products, where the speed of product updates is particularly high, this is especially relevant. An innovative

product can "fail" without proper consumer training, without an elaborated strategy for bringing this product to market.

As mentioned above, the specifics of the innovation market determine the features of innovation marketing, which is appeared in the following:

- the necessity of research and study potential consumers in several industries at once, since quite often the results of scientific and technical development have intersect oral character;
- selling innovative products requires a long and consistent advertising campaign, so as the buyer must "Mature": they need to be explained in detail the meaning and benefits of innovation, otherwise they will not buy this product, because they are not familiar with it;
- innovative products should not only meet qualitatively new needs or old needs in a qualitatively new way but also provide additional advantages that consumers can understand in comparison with existing analogues and substitutes;
- when promoting complex scientific and technical products on the market, it should be focused on an experienced, so-called the "collective" consumer ("purchasing centre", which can include employees from various departments – from purchasing to production);
- sales of innovative products require lengthy negotiations, since high-tech products are pre-selected in both the production and consumer markets, and therefore purchases are made through multiple comparisons and discussions with experts;
- very often, the technical complexity of innovative products implies the organization of a good after-sales service: in other words, no service - no commercial success of the new product. An example is a promotion of hybrid cars to the market, the spread of which was hindered not only by their price but also by insufficient development at the first stage of their maintenance infrastructure;
- the image of an innovative company is significantly influenced by the results of fundamental research of its employees. In addition, conferences, scientific forums, and other forms of communication in the professional community can serve as marketing communication channels for innovative businesses;
- the complexity of an innovative product creates special prerequisites for the formation of a so-called "whole product", where all its real and potential advantages are considered in a complex.

## **FINDINGS AND CONCLUSION**

All the factors listed above prove the importance of the marketing complex for companies in the innovation sphere. Most of these companies should be classified as small and medium-sized enterprises, so their main characteristics are the small size of the company (including the number of employees) and limited resources. In this regard, marketing has its own characteristics, as mentioned above. There are many definitions of marketing, but the definition given in the small business marketing Guide seems to be the most appropriate for an innovative business.

Marketing includes all the functions of satisfying the needs of the consumer by promoting the right product from the manufacturer to the right consumer at the right price in the right place, at the right time and with the right communication with the consumer.

In other words, the combination of these six "right" leads to customer satisfaction and successful effective marketing.

In our opinion, in modern conditions, marketing should solve the following tasks:

- discover the real needs of real consumers of new products and services;
- satisfy these needs by bringing the right product to market, at the right price, in the right place, at the right time;
- Inform the consumer about the new product by using the right advertising company, using the right information channels.

Thus, innovative marketing works at the forefront of the innovation process to explore market opportunities and customer needs, receives feedback from the customer during development, and sells the product at the back end of the process. In this way, innovative marketing ensures that new products and services are targeted at the market and customers. This is one of the most important success factors in managing innovation to increase profit opportunities and eliminate failures and unnecessary losses [18].

In conclusion, one should say that the responsibility for innovation should be intensively engaged in the topic of innovative marketing and work closely with marketing and sales. The top priority for all of us should be to develop a new product that customers can snatch from their hands.

Furthermore, it is essential to note that high-quality marketing research of the innovation market allows to carry out effective innovative activities in the future that meet the requirements and needs of the market. Before starting to develop a new product, the organization needs to determine who is the target audience of an innovative product, and what consumer needs it will meet. This approach contributes to the correct promotion and positioning of a new product (service, technology) on the market.

A set of marketing measures should be aimed at convincing consumers that this product is ideal for them at the present time. That is, the fact that an innovative product is able to meet their specific needs. Before introducing an innovative product to the market, the company will have to conduct trial marketing by testing the product, making trial sales, participating in competitions, exhibitions, and fairs.

## THE USE OF GIS TECHNOLOGY TO CREATE ELECTRONIC ENVIRONMENTAL MAPS

**Axmedov Baxriddin Madaminovich\***

\*Assistant,  
Department Of Geodesy,  
Cartography And Cadastre,  
Fergana Polytechnic Institute, UZBEKISTAN

### ABSTRACT

*Geographic information systems (GIS) are the main technological means of Geoinformatics, which is based on the use of various sources of information, including cartographic materials, and aims at creating maps.*

**KEYWORDS:** *Geoinformatics, Environmental Mapping, Information Binding, Maps, Ecosystems, Geographic Spaces, Aero and Space Imagery.*

### INTRODUCTION

In the second half of the 20th century, the process towards automated data processing and the introduction of computer technology began in various fields of knowledge. Ideas and achievements of various directions of science and technology united and found their application in Geo-informatics.

How the science of Geoinformatics develops principles, methods and technologies for obtaining, accumulating, transmitting, processing and presenting information in order to generate new knowledge of spatial-temporal phenomena in the geographic shell. In addition, Geoinformatics with mapping is related to the use of cartographic coordinate systems as a basis for geographical localization of spatial information received and stored in GIS, and the advantage of cartographic analysis as one of the most effective ways to identify spatial geographical patterns, relationships and dynamic trends [1].

### MATERIALS AND METHODS

Cartographic images are some of the most appropriate forms of information presentation, so the creation of digital, electronic, computer maps and atlases is often seen as the main GIS function. Despite the obvious links of Geoinformatics with cartography, the tasks of creating and using

GIS are not limited to the production of cartographic products and often go to the level of comprehensive research areas.

There are several dozen definitions of GIS. The following definition most accurately reflects, in our opinion, the essence of this notion.

Geographic Information System (GIS) is an automated system for working with graphic and thematic databases, performing the functions of modelling and calculation, thematic maps and atlas creation, serving for various decision-making and control. GIS allows to quickly perform data search, to combine aerial or space photo image and map, to perform the image transformation, geometric correction, to combine, synthesize large volumes of transformation, to change projection and scale at the user's request, to transform coordinates, to determine and show spatial relationships on the computer display screen using various models for this purpose.

- Geographic information systems have found application in different spheres of activity due to the fact that [2]:
- Thematic and topographic maps are the main source of spatial and temporal information for solving various tasks;
- Geographic and rectangular systems are the basis for linking information;
- The cartographic analysis is one of the most effective ways to identify geographical patterns;
- Operative, automated production of maps, schemes, plans is one of the main GIS functions.

At the modern level of social development, the role of geographic information systems in the Earth sciences is not limited to the collection, processing and storage of information. GIS has become almost the main and undivided tool for modelling natural, economic, social processes and situations, tracing their links, interaction in space and time, and most importantly - a means of ensuring decision-making management. It is possible to formulate the main GIS requirements of cartographers and geographers at present. Firstly, a geographical information system implies a whole complex of machinery and programs necessary for the comprehensive provision of scientific research. It should provide technical, programmatic, informational support for research and development management of territories. The second requirement is "modularity" and "openness" of the system.

The GIS should be represented by a set of modules responsible for specific operations, which can be easily transformed or upgraded as desired by the user.

Electronic maps received by means of computers allow the researcher to work in dialogue with the machine and open wider prospects for the operative construction of the models reflecting not only statics but also the dynamics of the phenomena by comparison of various objects in space-time aspect that is especially important for carrying out of ecological examinations.

Working interactively with electronic maps with the help of manipulators, it is possible to highlight, enlarge separate parts of the image for detailed analysis, as well as combining them to obtain synthesized information, scale the images and thus reflect the development or regression of the phenomenon under study. Organizing access to individual, operator-selectable map elements allows analysis of relationships between components for more accurate event analysis.

Editorial mode provides an opportunity to make quick changes and simulate the existing or projected situation. The possibility of joint illumination of the contour and halftone images of airborne and space images makes the process of map updating much easier.

Modern computer technologies make it possible to carry out purposeful processing and automated interpretation of huge arrays of cartographic data, including ecological information, in an acceptable, much more timely time mode. At present, Uzbekistan and other developed countries are conducting large research works aimed at addressing global, national, regional and local environmental problems using Geoinformatics methods and tools. For these purposes, Geoinformation shells developed in the USA, Canada, France, etc. are mainly used. A smaller role is played by domestic software development.

## CONCLUSION

However, almost all foreign and domestic modern programs differ in a rather narrow specialization, focusing on a limited set of specific tasks. This often does not allow the full use of powerful graphic design tools, for example, in analyzing the specifics of the formation, accumulation and redistribution of pollutants in ecosystems, which is especially important for environmental mapping. Therefore, it is often necessary to combine, combine and Refine several software products to conduct a complete and detailed environmental study of the territory.

## INNOVATIVE TECHNOLOGIES AND FORMATION OF CRITICAL THINKING OF STUDENTS

**Isaqov Adiljan Alidjanov\***

\*Assistant Professor,  
Department of Descriptive Geometry and Engineering Graphics,  
Fergana Polytechnic Institute, UZBEKISTAN

### ABSTRACT

*Introduction of innovative pedagogical technologies in the educational process, continuous search for improving the efficiency of education have become a necessity today. When teaching students to think independently, an important role is played by the organization of lessons based on innovative pedagogical technologies in improving the efficiency of education, increasing motivation and interest in knowledge in the development of consciousness, forming a world view, enriching speech.*

**KEYWORDS:** *Critical Thinking, Innovative Pedagogical Technologies, Educational Effectiveness, Distance Education, Information and Communication Technologies.*

### INTRODUCTION

Today, the rapid development of science, technology and industry requires education staff to raise the quality of education to a new level, and each staff member of the system, especially teachers, has a greater responsibility. downloads functions and duties. The main task of the education system today is to help students become a strong state that loves our country, relies on its knowledge and talents, and acquires knowledge independently, using modern information and communication technologies. It consists of healthy, comprehensive and healthy education. These tasks are carried out mainly through effective lessons. At a time when progress is rapidly entering the system of life, complex minds and technologies are gaining ground in the minds of our children. In such a situation, a teacher needs a lot of skills to pass on new knowledge, to teach the student to read and do research. [1.2] It is natural that this process requires every teacher who loves, respects and respects his profession. encourages the study and discovery of new pedagogical methods and techniques.

In primary classes, where the child's consciousness and thinking are already being formed, it is very important to master the teacher's skill, the ability to skillfully implement modern technologies in the learning process, to look for new ways and methods of teaching, and to positively use advanced pedagogical experience. Therefore, the introduction of modern pedagogical technologies in the educational process, the continuous search for improving the effectiveness of education have become a necessity of today.[3.4] in teaching students independent thinking, an important role is played by the organization of lessons based on pedagogical technologies in the development of consciousness, the formation of a worldview, increasing motivation and interest in knowledge in the enrichment of speech.

## **MATERIALS AND METHODS**

Purpose and objectives of the study: to provide methodological and practical recommendations for improving independent critical thinking among students of higher education institutions, to bring up mature intellectually independent and critically thinking people with comprehensive education, organizing the educational process on the basis of new educational technologies, as well as to improve the social and political, theoretical, spiritual and moral knowledge of students, to form independent critical thinking. Methods of research work: In the process of research, methods of analysis, synthesis, comparison, generalization, pedagogical observation, conversation, sociometry, content analysis were used. Modern innovative educational technologies. At present, the teaching methodology is going through a difficult period associated with changing educational goals and developing federal state educational standards based on a competency-based approach. Difficulties are also related to the reduction of teaching hours for individual subjects in the core curriculum. All this requires new pedagogical research, the search for innovative tools, teaching and learning methods, the development and introduction of innovative educational technologies into the educational process.[2-6]. What are "innovative educational technologies"? It is a complex of three interrelated components:

Modern content transmitted to students implies the development of knowledge and, of course, is not only suitable as science. This content should be presented in the form of multimedia training materials, which are transmitted through well-structured and modern means of communication.

Innovative methods of education are not only based on materials science, but also on the interaction between students - they are active methods of building competences and active perception, based on their involvement in the educational process.

Effective use of modern educational infrastructure, including information, technology, organizational and communication components, to effectively take advantage of distance education.

Different authors approach in their own way the methods of solving this current scientific and practical problem. In this regard, the fruitful activities of a number of research scientists can be particularly noted. For example, Malla Ochilov, B. Ziyomukhamedov, M. Tozhiyev, T. Gafforov, N. Saidakhmedov and others tried to express their opinion on modern pedagogical technologies on a large scale.[1.2]

Innovative directions of priority national project "education" or modern educational technologies include the development of education; problem occupations; multistage training; a system of collective education; technology of the solution of problems; research methods; design of

methods of training; technologies of modular training; system lecture семинарно - test training; The use of gaming technologies in learning (role-playing, business and other types of learning games); Joint training (team, group work); information and communication technologies; technologies of health care. Critical thinking technology. Critical thinking is closely related to speech. Psychology shows the presence of oral, written, internal, external, active and passive forms of speech. All kinds of speech should be developed in man. From the oral speech, the student uses "mental attack," discussion, "statement of opinion on the material read, etc. So far, more attention has been paid to the development of oral speech in the course of training. Attention is also drawn to the formation and development of written speech. The traditional teaching method paid sufficient attention to the formation and development of written speech. Written speech is formed later in a person's life. If you don't pay much attention to exercise, it may not develop enough. Written speech plays an important role in the development of the pupil's thinking. Written speech requires a broad and deep understanding of thought, a clear expression, an understanding of the thought presented. New evaluation activity - assessment of personal achievements. The humanistic paradigm associated with its implementation is learning and purposeful study of the individual. Society needs to recognize the personal achievements of each subject of the educational process: student, teacher, family. The introduction of the assessment of personal achievements ensures the development of the following components of the individual: motivation for self-development, the formation of positive guidelines in the structure of self-awareness, development of self-assessment, voluntary regulation, responsibility. As soon as the student learns to think, the thoughts acquired from him will be exceptional and it will be possible to apply them in practice. [8.9.10.11] Pedagogical technology is the main goal of critical thinking of the student. The development of the process of thinking in general, especially critical thinking, is now required. Thinking (thinking) arises in a certain problematic situation. During the solution of the problem, there is a deep analysis, synthesis, comparison, generalization, abstraction, judgment and summation of results in the brain. Critical thinking is expressed in awareness and reflection of the essence of each state. New pedagogical technology requires the development of critical thinking in all parts of the lesson using special methods. In the course of training, students have to seize knowledge based on their active work, work with interests, not strain, fully use the opportunities. If the student works on his own, he carefully learns the knowledge. The student has a sense of creative search.

## CONCLUSION

The study and creative approach to the experience of the introduction of pedagogical technologies, humanization of the educational process, transformation of the student from a passive object into an active subject, will be important in ensuring a clear direction of cognitive activity and reproducibility of the educational process as a production process. Also, teachers form and improve skills of compilation, testing of test tasks of a different shape. And the appeal to various didactic structures created within the framework of pedagogical technology provides an opportunity to rationally and creatively approach the organization of the educational process, to have the freedom of the teacher, to assess the effectiveness of various forms, methods and means used in the lesson. It should be noted that compliance with the principles and rules of pedagogical technology ensures the content of the educational process in accordance with the student's personality, interests, aspirations, characteristics of age periods and individual rates of development.

### **ABSTRACT**

*The article justifies rational parameters of the combined tool for blade and finishing-strengthening treatment of internal surfaces of rotation. Recommendations on the selection of optimal modes of treatment of external and internal surfaces of rotation by combined tools ensuring maximum productivity have been developed.*

**KEYWORDS:** *Combined tool, Productivity, Сепараторного Инструмента, Инструмент*

### **INTRODUCTION**

Ensuring the maximum efficiency of machining and the specified quality level of the treated surface of machine parts is the most important technological task in their manufacture. One possible solution is to use combined tools for blade and finishing-strengthening treatments, which provide both reductions in labour intensity due to a combination of operations and high quality of the surface layer.

### **MATERIALS AND METHODS**

The purpose of the present work is to justify the rational parameters of the combined tool for blade and finishing-strengthening treatment of external and internal surfaces of rotation, as well as optimal conditions of its operation, which ensure maximum productivity.

As an example, a special combination tool combining cutting and deforming elements is considered to be a joint treatment of the inner surface of the hydraulic strut tube by melting and rolling.

The choice of tool design for specific processing conditions is mainly determined by the size and shape of the workpiece, requirements for accuracy and quality of machining, hardness and equipment used. [1.2.6] When designing the combined tool design, it is necessary to solve the following tasks: to select the tool and cutting scheme, to install the material of the working part, to determine the size and shape of the working elements.

**Figure 1.** - Diagram of combined tool for co-processing by melting and rolling.

When the tool is supplied and the workpiece is rotated, first turning is performed with a cutter installed in the cutting head 1, then surface plastic deformation is performed by rollers 9. Design of this tool is based on the application of a deforming unit of separator type made according to the planetary rolling scheme. The latter is carried out at complex motion of deforming elements: rotation around its axis and planetary motion around the part axis. Such a structure consists of working deforming elements, a separator, a support cone and a housing.

A distinctive feature of the separator tool is that the rollers are located in the sockets of the special separator. This allows the size and number of rollers to be selected based on the optimal ratio of their diameter to the diameter of the part.

Blade treatment at the operation of the combined tool is performed by a prefabricated through cutter with a plate of hard alloy T15K6.

Equipping the cutting insert with a hard alloy will ensure more uniform wear of the stages of the combined tool. [3.4.5] The geometric parameters of the combined tool are determined in the same way as for elementary tools. We take front angle  $\gamma = 12^\circ$ , rear angle  $\alpha = 10^\circ$ , radius at cutter tip  $r = 1$  mm. Justification of conditions of rational operation is made based on optimization of modes of the combined blade and finishing-strengthening treatment of external and internal surfaces of rotation according to the criterion of maximum productivity taking into account power and temperature limitations, as well as limitations on surface layer roughness parameters using linear programming method [2.6.7.8].

The plots of the dependence of the optimum feed  $S_{opt}$  on the surface roughness  $R_a$  in the combined blade and finishing-strengthening treatment of the structural steel for the different radius values at the tip of the cutter  $r$  are shown in Figure 2.

Figure 2.

Figure 3.

Figure 2 - Graphs of the dependence of optimal feed  $S_{opt}$  on surface roughness  $Ra$  in combined treatment for different values of the radius at cutter tip  $r$

Figure 3 is a graph for determining the optimum speed  $V_{opt}$  depending on the optimum feed  $S_{opt}$  in the combined treatment for different cutting depth values  $t$ .

Figure 4 shows comparative data on change of economic efficiency parameters due to the application of combined treatment of water-resistant tube by combined melting and rolling-out instead of sequential treatment.

Treatment conditions: cutting depth in blade treatment  $t = 1$  mm, feeding  $S = 0.4$  mm/rpm, cutting speed  $V = 125$  m/min, main processing time  $t_{01} = 2.46$  min,  $t_{02} = 1.65$  min, unit-based processing time  $t_{st.k1} = 5.05$  min  $t_{st.k2} = 3.45$  min.

Figure 4. - Comparative analysis of parameters of economic efficiency of processing

Comparative analysis of economic indices confirms that the use of coherency and rolling-out hydraulic strut for pipe treatment in comparison with separate treatment allows to reduce the rate of time for operation by 36.2%, increase labour productivity by 56.4% and reduce cost by 32.4%.

## CONCLUSION

The article justifies rational parameters of the combined tool for blade and finishing-strengthening treatment of internal surfaces of rotation.

Recommendations on the selection of optimal modes of treatment of external and internal surfaces of rotation by combined tools ensuring maximum productivity have been developed.

Based on the performed justification of parameters of the combined instrument and conditions of its rational operation, the advantages of using a comminated blade and finishing-strengthening treatment of rotation surfaces have been confirmed.

## DEMOGRAPHIC SITUATION AND ANALYSIS

Ismoilov Mukhsinjon Saidakhramovich\*

\*Assistant,

Department of Geodesy, Cartography and Cadastre,  
Fergana polytechnic institute, UZBEKISTAN

### ABSTRACT

*The article analyses changes in the process of birth in the families of the countries of the world, their demographic condition and analyses various socio-economic factors of their increase or decrease. Reliable information on the population of the Republic of Uzbekistan and its well-being, long-term forecasts and programmes for the socio-economic development of the country, creation of new jobs and employment programmes, development and sustainable development of the country. Is a important basis for scientific research.*

**KEYWORDS:** *The demographic situation, family composition, sexual ratio, marriage, birth restriction, specific coefficient of birth.*

### INTRODUCTION

A demographic situation is the demographic situation of a certain area during a certain period, which is based on the number, composition, and demographic processes of the population.

The population is a quantitative measure of the number of people in a particular region or group of people. The population is the most important indicator in population geography and demographic research. As mentioned above, the analysis of changes in population dynamics uses its absolute and relative indicators. Rapid population growth or decline can lead to dramatic changes in the demographic situation. The social, young gender and family composition of the population is an important factor in shaping the demographic situation. Gender proportionality, the reproductive age of the population and a high proportion of young people have a positive impact on the process of marriage and childbirth, ensuring sustainable population growth. On the contrary, the high proportion of older people in the population has a certain impact on the demographic situation. In this situation, the natural growth of the population slows down, the formation of labour resources slows down, and so on. Demographic processes play a special role in the emergence of a demographic situation. Demographic processes are the course of events in

people's lives related to the change of generations. The main demographic processes include births, deaths, marriages, and divorces (annulment or dissolution of marriages). Demographic processes have two main characteristics. The first is birth and marriage, which are additional factors in the transmission of generations, the continuation of the human race, and population growth. On the other hand, mortality and divorce are factors that reduce the population and negatively affect generational change.

## **MATERIALS AND METHODS**

Under the influence of demographic processes the population every day, each hour has various demographic phenomena: many kids are born, a certain part of the population closes eyes to life, several marriages are registered, new families are started, some marriages break up, break up, other part moves when a part of the population moves. Thus, the demographic composition changes from year to year. At first glance, such processes are simple, seemingly inevitable processes. But the emergence of these processes is linked to many socio-economic factors. The impact of these factors on demographic processes, the mechanism of their impact, changes over time at different stages of society 's development. As a result, both quantitative and qualitative demographic processes occur differently in each period, in socio-economic formation.

Therefore, when studying demographic processes, first of all, it is necessary to find out: 1) what patterns exist in changing the characteristics of individual demographic processes, reproduction of the population as a whole; 2) What factors are embedded in the formation of demographic processes of formation of separate periods, qualitative peculiarities of population reproduction? Such questions are worth answering. The answers to these questions will be determined through demographic analysis.

The main task of demographic analysis is, first of all, to determine all qualitative patterns of development of demographic processes of population reproduction, socio-economic conditions, a system of factors affecting demographic processes in a certain period or at the socio-economic stage.

The demographic analysis uses absolute (quantitative) and relative (demographic factors) indicators of demographic processes, demographic statistics, cartographic and demographic methods.

The birth of a new generation is an important demographic process in the process of population reproduction. When carefully studying demographic processes, comparing them by different population groups, countries, regions of the world, determining prospects for the future, demographic factors are used. The necessary aspects of the demographic process studied by these factors are studied at a deep and comparative level. Demographic differences between certain historical periods or two regions cannot be determined directly through statistics. Therefore, each demographic process is studied by means of special indicators, i.e. coefficients. For this purpose, the value of the registered demographic process per 1000 people will be determined. This means that 1,000 people are criteria in the study of demographic processes. This indicator as it was already mentioned above, is called "per mille" and is designated as follows - "‰". Demographic factors are separate demographic processes. Demographic factors have general, special and private aspects.

**Birth rate and its coefficients.**

Childbirth is the process of forming a child in a certain population group, which makes up certain generations. Birth is a biological process. But it changes under the influence of the socio-economic environment. Changes in the socio-economic composition of society determine the birth rate. The biological basis of childbirth is human fecundity, (fecundity) the ability to leave offspring, to leave offspring. The biological capacity of men and women, or couples to bear children, called swine, a term used in demographics to more women, what is the total pregnancy of every woman in the period of carrying a child (on average 15-49 years). Fluffiness depends on the biological characteristics, health of men and women. Scientific sources note that healthy women can get pregnant at least up to 35 times during the period of carrying a child (twins are also considered one pregnancy). But every woman can have an average of 10-12 live children, get pregnant 10-15 times (including dead births, miscarriages). Childbirth is a biological process that characterizes children born alive, it is associated with the attitude of people to reproductive tendencies, that is, to procreation. And the reproductive propensity changes in connection with the socio-economic environment in which a person lives. As a result, the person does not fully use their whistle, that is, the biological opportunity to see the child. Taking into account all the socio-economic opportunities necessary for the upbringing and upbringing of their child, they try to build a child, that is, to limit and control the birth of children. As mentioned above, there are General, special, and specific birth rates that are used to determine the birth rate.

**A general coefficient of birth rate.** It is the number of children born per 1,000 of the population and is calculated by the following formula.

$$n = \frac{N}{TP} \bullet 1000 \quad (1)$$

The T-studied period (year)

The R-average population of the study period

N-number of children born during education

The total fertility rate, as mentioned above, is calculated in ppm. This ratio is more used in the expression of fertility. With it is possible to study in general terms the changes that occur at birth in a certain territory or in generations. But the overall fertility rate allows slight deviations in terms of fertility. Because this indicator is directly influenced by the age and sex composition of the population. If the territory understudy has a high proportion of the population of children (0-14 years old) and older persons (60 years old and older) who have reached childbearing age, childbirth leads to a slight decrease in the total birth rate. Demographic scientists B.S. Uralnis, V.A. Borisov determined the criterion for estimating the birth rate with the help of the total birth rate. The total fertility rate in the studied territory or population group by the general criterion is less than 16 ppm, the birth rate is low: if 16-24 ppm-medium, if 25-29 ppm-high, if 30-39 ppm-high, and if 40 ppm-very high [1].

Special birth rates clearly express changes in the birth rate, applied in the comprehensive study of childbirth. This factor can be calculated for both individual male and female groups. Demographic studies are mainly applied to women of reproductive age (15-49 years). The

special birth rate for every 1,000 women aged 15-49 defines the number of children born, as follows:

$$F_{15-49} = \frac{N_{15-49}}{TW} * 1000 \quad (2)$$

$F_{15-49}$ -special birth rate

$N_{15-49}$ -number of children born at the age of 15-49 to women during the training period

T-the study period (year)

W-the average number of women of reproductive age (15-49 years old, in countries with low birth rates receive women aged 15-44 years).

The special birth rate is also calculated in relation to men. At the same time, for every 1000 women aged 15-49 years, there are 14-54% of the total number of men.

Private birth rates are the most accurate coefficients in the study of fertility and characterize the level of fertility in certain age groups. This coefficient is usually every 1000 units 15-19, 20-24, 25-29, 30-34, 35-39, 40-44 it is used to determine the number of children born to women in the 45-49 age group and is expressed as follows:

$$F_{x/y} = \frac{N_{x/x} + y}{TW_{x/x} + y} \cdot 1000 \quad (3)$$

$F_x / V$ -birth rate for a special age group.

NH / H+V-the number of children born to mothers of a certain age group.

T-the study period (year).

W-the average number of women in the age group studied.

The fertility summation coefficient (total) is the indicator that most accurately expresses the level of fertility in which regions of the world are located. it is used to Express the birth rate in States and certain population groups. When comparing the birth rate by region, the total birth rate is also mainly used. The total fertility rate is the average number of children born during the lifetime of each woman belonging to a particular generation (with the same birth rate in each age group, regardless of mortality and age changes). The total fertility rate is equal to the sum of the coefficients of the age groups of fertility.

$$F_{\text{sum}} = \sum_{15}^{49} y \cdot F_{x/x} + y \quad (4)$$

U-period between age groups (interval)

The total birth rate above 4.0 is considered average if the birth rate is below 2.15, and if the birth rate is below 2.15-4.0.

Throughout the development of society, birth has constantly changed by historical periods and regions. Until the second half of the 18th century, the birth rate was high in almost all countries

of the world. And since the second half of the 20th century, the birth rate has started to decrease around the globe.

The birth rate was not the same at all stages of society's development. In the periods preceding the capitalist formation, the birth was of a biological nature, that is, it was not restricted. A multi-ethnic society is also supported by the state. It is difficult to imagine that the current society is at a stage of development. It is worth looking at the essence of the issue, which is directly related to the socio-economic development of those times. Both in the time of slavery and in feudalism, polygamy interested every family, and at the same time society. Why is that?

First of all, the economic role of the child in the family was very great. In many countries, child labour was used in family work, Handicrafts, agriculture and animal husbandry. This means that child labour is supported by society since it accounts for a certain share of national income. Even in some States, such as Russia, the land given to peasants for work was distributed according to the number of children. In such conditions, as can be seen from itself, each family was interested in increasing the number of children.

Thus, birth, which is a biological process, is a series of social (literacy rate, socio-economic status of a woman. The role of the family in the State, society, customs, values, religion, ethnic composition, urbanization, etc.) (employment, women 's employment, family income, social security, etc.) medical (contraceptives and women 's knowledge of them, mother and child health) and demographic (young sex, women of reproductive age) "I, marriage, divorce (death processes) occur under the influence of factors. If we want to interpret the countries of the world according to their current state of birth, we must conditionally divide them into three groups. It is known that if the total fertility rate is less than 2.1, the fertility rate will be lower: if it is 2.1-4.0, the fertility rate will be medium and 4, If 1 or higher, the fertility will be higher. By this demographic criterion, the countries of the world can be divided into groups.

The first group includes countries with high fertility rates: Africa (excluding MSR, Tunisia, Maurice and Seychelles), many countries in Asia and South America, and some countries in Australia and Oceania. The average number of children in their families ranged from 4.1 to 7.0, and in some cases even higher. The countries with the highest fertility rates are Afghanistan, Guinea-Bissau and Niger, where the total fertility rate is 7.1-7.7, Yemen 6.7, Mali and Congo 6.2. Several factors are contributing to this high birth rate in families in these countries. The main ones are: the above countries are mainly economically developing countries, especially women with relatively low levels of education; Traditions that support many children are more preserved; Women are less involved in social production; Urban life formation is slow; The concept of birth control and the medical devices it requires are not widespread.

It should be noted that high fertility had some demographic implications. In particular, the population is growing rapidly, many new families are forming, and the number of children among the population is high. These demographic effects, in turn, lead to several socio-economic problems.

In high-fertility countries, the population grows at a rate of 2.5-3.2% per year over the next 15-20 years. Today, the total fertility rate in more than 40 countries is 4.1-7.5. It should be noted that the number of countries with the highest fertility rates in the world has declined over the past 10 years. There were 79 such states in 1989, dropping to 37 in 2005 to 42. While in 1989 the

proportion of the population living in these countries was 23%, by 2018 the figure was almost 18%.

The second group is countries with an average fertility rate of 2.1-4.0. Between 1989 and 2018, the number of countries with average fertility in the world increased from 48 to 66, an increase of 18. In 1989, Uzbekistan was included in the group of high-fertility countries, and in 2018 it was included in the group of medium-fertility countries. In 2018, the population living in the middle fertility group was 43.0% of the world's population. Fertility rates worldwide have already fallen sharply due to socio-economic factors. Where fertility is moderate, population growth rates are stable. They do not expect a sharp increase or decrease in the population. It will be easier to manage the development of the population, to solve the problems of economic development.

The third group is the low-fertility countries. In these countries, the population grows by 0.7-0.9% per year. Most families have only 1 or 2 children. It should be noted that between 1989 and 2018, the number of low-fertility countries increased from 44 to 75 or more than doubled. Today, almost half of the world's population lives in these countries. This means that by the middle of the 21st century, almost half of the world's population lives in families with few children. This decline in fertility among families living in the latter group of countries is primarily due to the spread of capitalist relations. As we have seen, the development of industry in capitalist production, the growth of cities and the spread of urban lifestyles have led to a decline in fertility in the third group of countries. Fertility rates across Europe have already fallen sharply, especially in urban areas.

The next factor that has led to the decline in fertility rates currently in the States of this group is the greater participation of women in social production and employment. Another factor leading to a decline in fertility in economically developed countries is the excessive number of family violations, that is, marriage. As mentioned above, the short duration of marriage leads to a spontaneous decline in the number of children in the family. Also, among all economically developed countries, as a result of the development of science and technology in North America and the penetration of productive sectors, unemployment in the population structure is increasing. Unemployed, homeless people have no economic opportunity to build a family and raise children. Such cases also lead to decline in fertility. In general, the widespread and development of capitalist relations leads to a decline in both the economic and spiritual needs of the family for children. As evidence of our idea, we refer to fertility rates in one of the developed capitalist countries in US families. While an average of 3-4 children was born in each American family in 1950, that figure fell to 2-3 in 1970. Recently, the number of families without children has been increasing in the United States. Research in this state found that in most families only one child, 44% of whom were born unexpectedly and 15% were reluctant. Experts call this situation a "crisis in the American family." Is this crisis a problem for the United States? It should be determined based on the history of the population of that State.

## CONCLUSION

So, we looked at changes in the birth process in families around the world. It appears, the process of the birth of people of the world is not identical today. Birth rates worldwide have already fallen sharply. This, as mentioned above, is due to various socio-economic factors.

Department of Geodesy, Cartography and Cadastre,  
Fergana polytechnic institute, UZBEKISTAN

### ABSTRACT

*The article presents the structure, project and a cartographic basis for creating thematic layers, models of maps of the ecological atlas of the Ferghana Valley on the basis of the geographic information system.*

**KEYWORDS:** *Ecological Mapping, Digitization, Vectorization, Layers, Themes, Synthetic, Electronic Maps, Modelling, Analytical Mapping, Structure, Optimization, Criteria, Estimates.*

### INTRODUCTION

In the world, environmental mapping gives preference to synchronization methods where specific atlas maps are systematically created by interconnecting environmental characteristics, that is, several maps that interactively interact with their didactic texts in GIS software are deployed on a computer screen at the same time. These research programs ArcGIS, QGIS, and SWAT model software focus on database creation, electronic map visualization, modelling, and analytical mapping.

### MATERIALS AND METHODS

In various industries of the republic GIS-technologies, in particular, the programs AtlasGIS, WinGIS, ArcInfo, MapInfo, ArcGIS, QGIS (USA), GeoDraw GeoGraph (Russia), Hydrus 1D (Germany) are used during the creation of cards, loading of space images, during the processing of images, digitization and vectorization, during the creation of the database and drawing up

legends of cartographic images, creation of the chart and modelling of schemes. The Strategy for Further Development of the Republic of Uzbekistan for 2017-2021 defines important tasks to "Prevent environmental problems that may harm the environment, public health and gene pool." In carrying out these tasks, it is very important to use GIS technologies in mapping and modelling environmental problems in the emerging environmental situation.

To this end, the Fergana Ecology database and its thematic layers were developed, and a structure, a project of the Fergana Valley Ecological Atlas of Maps, was developed based on the geographic information system.[1]

According to the content of the atlas maps are divided into 3 large sections: reasons for the destruction of the ecological condition; The effects of environmental degradation; Optimization of the environmental condition of the Fergana Valley.

Texts and legends have been produced for maps that facilitate the use of atlas with modern GIS systems (see table 1). The content and configuration have been modified to meet the new requirements. The rapidly growing trend of environmental cartography is highlighted based on new methodological approaches, evaluation criteria and sources of information.[2]

**TABLE 1 STRUCTURE OF THE ECOLOGICAL ATLAS**

#	Name of the card	Scale	Main contents of maps
<b>Causes of environmental degradation</b>			
1.	Map of anthropogenic environmental impacts	1:1 000 000	Anthropogenic factors are covered by the scope of action and measures to improve and protect land resources.
2.	Map of pollution in industrial cities	1:1 000 000	Industrial centres, the amount of toxic gases emitted from industrial nodes is given.
<b>Effects of environmental degradation</b>			
3.	Map of the level of atmospheric air pollution	1:1 000 000	Level of atmospheric air pollution. The amount of toxic substances such as dust, sulfur gas, carbon monoxide, nitrogen oxide, ammonia, sulfur-hydrogen compounds are shown.
4.	Reclamation map (irrigation networks)	1:1 000 000	Newly developed regions, irrigation, agricultural activities against deflation have been identified. Territories of recultivation are shown.
5.	Card of a demoeko-logical state	1:1 000 000	The map is a database that provides anthropogenic stress on the natural environment.
6.	Environmental Stress Assessment Map	1:1 000 000	Degree of environmental tension in the Fergana Valley, environmental regions; stabilization.
<b>Optimization of the environmental condition of the Fergana Valley</b>			
7.	Ecological map	1:1 000 000	The horizontal range limit is specified in the paths.

		000	The distribution of natural resources affecting human health and the ecosystem is reflected in the distribution of territories.
8.	Degree of anthropogenic load on landscapes	1:1 000	The map lists two ecological spaces and economic groups that combine content. Degree of anthropogenic stress on landscapes, agrodemographic pressure, anthropogenic pressure on agriculture, ecological gene groups in the land fund.
9.	Environmental protection map	1:1 000	Degree of variability of natural complexes, human economic and other activities, anthropogenic impact on nature and its consequences.
11.	Environmental maps of the cities of Ferghana, Margilan, Kuvasoy, Kokand, Andijan and Asaka	1:25 000	The natural, demographic, technogenic, anthropogenic and other indicators of the cities, reflecting an ecological condition of tension are shown.

Also, using modern programs (digital models) of thematic layers, synthetic maps of GIS data were analyzed in the software ArcGIS, QGIS and a series of specialized maps were produced that reflect natural factors.[3]

1. Data of electronic tachometers and GPS devices, image processing equipment, expedition materials, digital data, author 's originals, existing maps and other source materials were collected. The mapping and source materials were scanned and placed on the same scale as the raster images and then placed in memory.
2. Thematic layers of maps of ecological atlas and their tables have been compiled, they have been analyzed using GIS programs of Fergana Valley, a database has been created.
3. Object classifications, existing tables (attributes), and text data have been included in the computer memory.
4. A system of conditional signs has been developed.
5. Thematic map layers were downloaded and map images were created, which were edited separately.
6. The map layout has been developed and finalized to prepare for publication.

A mapping base has been prepared for the creation, analysis of thematic layers of models of the Fergana Valley ecological atlas and their drawings, as well as for the creation of a database and map. Cartographic foundations were developed from general geographic elements - foundations of cartographic and aerospace materials from elements of mathematical foundations (relief, land users, soil cover, settlements, roads, borders) according to the scale and projection of the map.[4]

The experience of creating ecological atlases is improved every year. Methodological developments related to atlas theory and practice are not as great. Today 's environmental atlases

are characterized by the fact that they are based on the system principle for updating and processing geographical information, as well as on the necessary adaptive functions. Proposals have been made for the use of a system approach in mapping the nature and ecological condition of the Fergana Valley, which has allowed the creation of a series of analytical and synthetic environmental maps. The development of the composition and content of the environmental atlas by ArcGIS, QGIS and SWAT models has enabled the creation of an environmental database. Simplified and improved multi-layered mapping sources obtained from environmental atlas maps have been proven to be the basis for other maps.

## WAYS TO IMPROVE THE EFFICIENCY OF INVESTMENT PROJECTS IN CONSTRUCTION

**Karimov Inomjon Ortikbayevich\*; Ibragimov Salokhiddin Ochilovich\***

\*Senior Lecturer,

Department of "Economics And Property Management",  
Tashkent Institute of Architecture And Civil Engineering, UZBEKISTAN

### ABSTRACT

*This article analyses the state of investment projects in the construction industry in the Republic of Uzbekistan and makes recommendations to increase their efficiency.*

**KEYWORDS:** *Investment, Investment Project, Foreign Investment, Construction, Capital, Commercial Bank, Interest Rate, Project.*

### INTRODUCTION

In recent years, significant efforts have been made in the country to improve the investment process, determine the procedure for the formation of state development programs, increase transparency and the effectiveness of project selection, as well as their financing.

At the same time, the lack of investment projects developed taking into account the raw materials, infrastructure and labour potential of the regions and sectors of the economy makes it difficult to actively attract foreign capital.

Today, improving the efficiency of the economy (capital and capital investments, energy and material capabilities of the final product, labour efficiency and efficiency of capital investments, standards of income, competitiveness and economic security) is not a priority in state programs and tasks; Only the problem of inflation and the budget deficit was formed, the achievement of an accurate picture of GDP.

It is also determined by the successful implementation of investment projects in innovative sectors and the improvement of the selection system for investment projects and its adaptation to existing and changing economic conditions. The above shows that the methodological issues of assessing the financial, technical and economic efficiency of investment projects to create new innovative networks or modernize existing ones are very relevant from both a scientific and a practical point of view.

---

## ANALYSIS OF THEMATIC LITERATURE

A lot of scientific work has been done abroad and at home on the problems of investment efficiency and financing.

The theoretical foundations and practical aspects of the formation of foreign investment projects and programs, assessing their effectiveness are considered in scientific works Krasovsky V.P., Vilensky P.L., Livshits V.N., Smolyak S.A., S.Kryukov, E. Berezovskaya, R .M. Melnikov, M.V. Gracheva G. Alexander, J. Bailey, W. Sharp and others.

Problems of increasing the efficiency of investments in our country and scientific and practical recommendations for their elimination are studied in the scientific work of B.S. Mamatov, S.R. Umarov, D.Yu.Khŷzhamgulov, E.I. Nosirov, N.G. Karimov, Sh .I. Mustafakulov, O.M. Azizova, D.G. Gozibekov, B.Kh. Khodiev R.Kh. Khozhimatov, D.Kh. Nabiev, Sh.R. Razhabbaev, B.Sh. Muminov, A.Kh. Khudoiberdiev, Sh.N. Zainutdinov, M.K. Ziyaev, A .N. Dzhabriev, R.I. Nurimbetov, A.S. Turdieva.

However, today the factors affecting the effectiveness of investment projects in construction are not well understood and are among the issues that need to be addressed.

## ANALYSIS AND RESULTS

The role of foreign investment, primarily direct investment, is important in further deepening structural changes in the economy, accelerating the investment activity of enterprises, modernizing production, technical and technological re-equipment programs. The experience of developed countries shows that attracting foreign investment is one of the decisive factors for the high level of development of these countries. At the same time, in the Program of Action Strategy for 2017-2021, proposed by the President of the Republic of Uzbekistan Sh. Mirziyoyev, special attention is paid to further improving the investment climate in the country, creating new jobs by creating modern enterprises. In this regard, current reforms aimed at attracting foreign direct investment to our country, as well as providing reliable legal protection and guarantees for foreign investors, play an important role.

To develop the attraction of investments in the economy, it is necessary, first of all, to effectively organize the organizational and technological mechanism of the economy, focusing on private investment. The establishment of specific principles in the macroeconomic regulation of attracted investments will give the effect of its mechanism.

In 2019, the volume of investments in the Republic of Uzbekistan from all sources of financing reached 220.7 trillion. Sumy, which is 2 times more than the approved forecast for the year. At the same time, the volume of investment in fixed assets amounted to 189.9 trillion. Sum and the growth rate compared to 2018 was 1.3 times. The share of investments in fixed assets in GDP increased from 30% in 2018 to the current 36.2% (the share of total investments in GDP was 42.1% in 2019). During the reporting period, more than 2800 social facilities, infrastructure and production facilities were commissioned: 145 large production facilities, 167 large regional projects, more than 2500 social facilities and infrastructure.

The main foreign partners in attracting foreign investment into the country are China, Russia and Germany, and the total number of countries investing in the economy of Uzbekistan has

exceeded 50. As a result, the share of large investing countries in the total volume of foreign direct investment and loans has decreased to 34%.

Compared to 2018, the active growth of foreign direct investment and loans attracted the production of electrical products (growth - 7.5 times), metallurgy (growth - 4.6 times), textiles (growth - 2.5 times), leather. shoes (growth - 2.1 times) and oil and gas (growth - 2 times).

The growth rate of foreign direct investment and credit flows will intensify in projects of regional significance, the total volume of which will reach \$ 4.8 billion in 2019 (including \$ 4.2 billion in fixed assets), which is 4 times more than in the corresponding period of 2018 of the year. and increased 24 times compared to 2017. With the participation of foreign capital alone, 167 projects worth 858.5 million dollars were commissioned in the regions.

**TABLE 1 LIST OF THE NUMBER OF REGIONAL INVESTMENT PROJECTS WITH A FOREIGN DIRECT INVESTMENT THAT WILL BE IMPLEMENTED IN 2019  
EKV.MLN.DOLLAR**

№	Regions	Number of projects for implementation	Total project cost
1	Republic of Karakalpakstan	7 projects	203,0
2	Andijan region	11 projects	104,6
3	Bukhara region	19 projects	174,8
4	Jizzakh region	22 projects	732,9
5	Kashkadarya region	12 projects	243,3
6	Navoi region	14 projects	74,9
7	Namangan region	10 projects	174,1
8	Samarkand region	7 projects	96,0
9	Syrdarya region	9 projects	254,7
10	Surkhandarya region	17 projects	103,7
11	Tashkent region	8 projects	188,4
12	Ferghana region	12 projects	130,0
13	Khorezm region	7 projects	153,0
14	Tashkent	24 projects	738,9

The table shows that in 2019 a total of 179 investment projects were submitted, with the largest number of investment projects in the regions, 24 projects in Tashkent, 22 projects in Jizak, 19 projects in Bukhara, 17 projects in Surkhandarya and the least implemented projects in the Republic of Karakalpakstan. 7 projects have been implemented in the Samarkand region. Investment projects implemented in the country today should be focused primarily on priority industries, such as oil and chemical industry, transport, energy, mining, construction, telecommunications, agricultural production and expansion, tourism development.

**TABLE 2. INFORMATION ON MAJOR INVESTMENT PROJECTS IMPLEMENTED IN THE REPUBLIC OF UZBEKISTAN IN RECENT YEARS**

№	Year of the launch of major investment projects	Number of large investment projects launched	The volume of large investment projects launched, USD USA
1	2012	205 ta	More than 1.6 billion
2	2013	150 ta	2.7 billion
3	2014	154 ta	4.2 billion
4	2015	158 ta	7.4 billion
5	2016	164 ta	5.0 billion
6	2017	161 ta	2.4 billion
7	2018	353 ta	3276.6 million dollars USA
8	2019	179 ta	\$ 3,372.2 million USA

Table 2 provides information on projects implemented in 2012-2019 and the funds spent on them.

**Chart 1.** The main investment projects implemented in 2012-2019.

At the same time, serious attention should be paid to attracting investments and loans from near and far abroad. An increase in their participation and contribution to financing large investment projects will become an important factor in modernizing the economy. It was announced that a new system will be created in the regions and industries to expand the scope of projects with foreign direct investment, to create a strict control mechanism for their implementation. According to him:

First, provincial governors are taking steps to attract foreign direct investment by visiting a district or city once a week and liaising with ambassadors. In the same way, industry leaders visit one region every week to work with local businesses to speed up existing projects and work on additional investment projects. Teaches local leaders and entrepreneurs on how to develop investment projects as needed. The Prime Minister and his deputy regularly discuss the state of

development of foreign investment in the regions and sectors with the participation of ambassadors. Depending on the results, governors and industry leaders receive a reward or a fine of 50 per cent of their salary. The heads of republican departments at the regions together with the governors and ambassadors of the regions will study the status of the implementation of projects with foreign direct investment in each district (city) and take concrete measures to accelerate their implementation. Proposals for additional projects will also be developed and foreign investors will be involved.

Second, the State Investment Committee summarizes the effectiveness of proposals for investment projects of regions and industries, assesses their effectiveness and forms a single electronic "online" database.

Third, the Ministry of Foreign Affairs and Ambassadors to the regions attract foreign investors to projects included in a single electronic database.

Fourth, the Cabinet of Ministers will take steps to formalize agreements with foreign investors for the implementation of selected promising projects and approve a roadmap for monitoring their implementation. [2]

The President of our country, Shavkat Mirziyev, noted that to further activate preferential investors for new projects, the company will spend one year in all regions of the investment forum with the participation of foreign investors, as well as a large share of the most valuable investments in the country.

This year, Duda is ready to continue the Rules on diversification and investment management by attracting investment funds, implementing projects of the priority team, similar in electricity, aimed at creating a value chain for the deep processing of existing cheese.

According to the investment program approved by the President of the Republic of Uzbekistan dated January 9, 2020, No. PP-4563, in 2020, for all sources of financing, fixed capital will amount to 233.2 trillion. It is planned to develop the number of capital investments, while foreign direct investment and loans - 7.1 billion UAH. doll. The USA, foreign investments and loans under state guarantees - 2.7 billion UAH. doll. The development of dollars is planned.

The mobilization of investments in many projects is based on the high efficiency of projects. The reason is that such investment projects give a big profit. As a rule, after making high profits, investors will be interested in financing such projects. But not all investors evaluate their various economic indicators, the level of risk before a chemical financial investment project, and put their own requirements for a financial project, this type of deviation. Naturally, projects that meet the desires and goals are accepted for financing.

As a rule, not all investment projects have the same results. Some indicators may be illegal if one project is high positive, another indicator, but there is a lower opinion about the product than in another. The cash of such (mutually beneficial) information from projects specific to one industry creates competition between us. Making investment decisions creates difficult situations, especially in a competitive investment environment.

Factors affecting the effectiveness of investment projects include:

- economic and social policy of the state;
- investment risk;

- the state of the tax system;
- inflation rate;
- Central Bank refinancing rate;
- investment attractiveness;
- formation of the normative base in the sphere of investment activity;
- the level of investment infrastructure improvement;
- The conditions created to attract foreign investment, if we identify the impact of each of them and form it, we can improve efficiency.

## CONCLUSION

In short, the assessment of the efficiency of investment projects in construction and differences in regional risk levels are not taken into account at all or without sufficient methodological justification. It will first of all affect quality of indicators of economic efficiency of investment projects in construction, received as a result of calculations, and also on the necessity of improvement of the mechanism of increase of efficiency of investment projects in construction. Based on these circumstances, it is necessary to use the method of regression in determining the importance of factors affecting efficiency and to develop mechanisms to improve their effectiveness depending on their level.

## INTRODUCTION

Ratio analysis of financial statements stands for the process of determining and Presenting relationship of items and group of items in the statements .There are different ratios which an analyst can employ depending on the purpose for which the analysis is made. A creditor who likes to know the ability to meet its current obligations may think of current and liquid ratios similarly managers and investors who want to know operationally efficiency may think of return on investments, turnover and fixed assets earnings per share book value per share book and dividend per share.

Ratio analysis is a powerful tool of financial analysis. It is a process of identifying the financial strength and weakness of the firm by properly establishing relationship between the items of balance sheet and profit and loss a more meaningful understanding of the financial position and performance of a firm. A Ratio is a mathematical relationship between the two related items expressed in quantitative form. A ratio is used as an index yard stick for evaluating the financial position and performance of a firm.

### Advantages of Ratio Analysis:

The nature of Ratio Analysis will differ depending on the purpose of the analyst. Ratio Analysis The starting point for making plans before using any sophisticated fore casting and budgeting procedures. The Ratio Analysis useful for the following reasons.

#### 1. Employees:

The employees are also interested in the financial position of the concern especially profitability. Their wages increases the amount of fringe benefits are related to the volume of profits earned by the concern. The employees make use of information available in financial statements.

#### 2. Creditors:

Creditors are concerned primarily with liquidity and to pay interest on redeems loan a specified period.

#### 3. Government:

Government is also interested to know the strength and weakness of the firm. Government makes the future policies, plans on the basis of financial information available from various units of the company.

#### 4. Management:

Management of the firm executive would be interested in every aspect of the financial analysis. It is their overall responsibilities to see at the resources of the firm are used most effectively and the firm's financial condition is sound.

### Significance of Ratio Analysis:

The Ratio Analysis is the most powerful tool of the financial analysis. The many diverse group of people re interested in analyzing the financial information to indicate the operating efficiency and the various aspects of the firm's financial position. The people use ratios to determine a particular financial characteristic of the firm in which they are interested.

A short term creditor will be interested in current financial position of the firm, while a long – term creditor will pay more attention to the solvency of the firm and also be interested in profitability of the firm.

The equity share holders are generally concerned with their return and many bother about the firm's financial condition only when their earnings are depressed. In fact it has to be realized that the short term and the long-term financial position and the profitability of the firm are based on every kind of financial analysis, the emphasis would differ.

In credit analysis, the analyst will usually select a few important ratios. He may use the Current Ratio or Quick Asset Ratio to judge the firms Liquidity or Debt Paying ability. The Ratio Analysis is also useful in security analysis. The major focus on security analysis is one of the long term profitability. From time to time management uses ratio analysis to determine the firm's financial strength and weakness and accordingly takes action to improve the firm's position.

The ratio of affirm in itself does not reveal anything. For meaningful interpretation, the ratios of the firm should be compared with the ratios of similar firms and industry. This comparison will reveal whether the firm is significantly out have like. The ratio analysis will reveal the financial condition of the firm more reliably when trends in relation over time are analyzed. The importance of trend analysis of ratios lies in the fact the analyst can know the direction of movement i.e., whether the movement is favorable or un favorable.

### **CLASSIFICATION OF RATIOS:**

Ratios may be classified in a number of ways keeping in view of the particular purpose. Ratios indicating profitability are calculated on the basis of the profit and loss account, those indicating financial position are computed on the basis of the balance sheet those which show operating efficiency or productivity resources are calculated on the basis of figures in the profit and loss account and the balance sheet. This classification is rather crude and unsuitable to determine the profitability and financial position of the business. To achieve this effectively, ratios may be classified as:

#### **1. Liquidity Ratio:**

It is extremely essential for a firm to be able to meet its obligations as they become due liquidity ratios measure the ability of the firm to meets its current obligations in fact analysis of liquidity needs the preparations of cash budgets and cash flow statements but liquidity ratios by establishing in a relationship between cash and other current obligations provide a quick measure of liquidity

Also that it is not too much meets its obligations due to lack of sufficient liquidity will result in bad credit rating loss of creditors confidence or even in lawsuits resulting in the closure of the company a very high degree of liquidity is also bad therefore it is necessary to strike a proper balance between liquidity

The ratios which measured and indicate the extent of firm s liquidity aer known was liquidity ratios or short –term solvency ratios commonly used liquidity ratios included.

- a. Current ratio (or) working capital ratios
- b. Quick ratio (or) acid test ratio
- c. Cash position ratio (or) super quick ratio

**2. Leverage Ratios :**

The long term creditors like debentures holders, financial institutions, etc., are more concerned with the firm's long term financial strength. To judge the long term financial position of the firm, capital structure ratios are calculated. These ratios indicate the funds provided by the owners and creditors. As a general rule there should be an appropriate mix of the debt and owners equity in financing the firm's assets.

Firms with low leverage have less risk of loss, but they also have lower expected returns. Conversely firms with high leverage ratios have risk of large losses. But also have a chance of earning huge profits. Therefore, before deciding whether a firm should have debt must most commonly examine Leverage Ratios are:

- i) Debt Equity Ratio
- ii) Fixed Assets Ratio
- iii) Current Assets to fixed Assets Ratio

**3. Activity Ratio:**

The funds of creditors and owners are interested in various kinds of assets to generate sales and profits. The better the management assets the larger will be the amount of sales. Activity ratios are employed to evaluate the efficiency with which the firm manages and utilizes its assets. These ratios are also called turn over ratios because they indicate the speed with which assets are being converted into sales. Activity ratios thus involve a relationship between sales and the various assets. A proper balance between sales and assets generally reflects that assets are managed well. Following are some of the important activity ratios.

- i) Assets turnover ratio
- ii) Fixed assets turnover ratio
- iii) Current assets turnover ratio
- iv) Total Stock turnover ratio
- v) Debtors turnover ratio
- vi) Creditors turnover ratios

**4. Profitability Ratios:**

A company should earn profits to survive and grow over a long period of time. Profits are essential but it would be wrong to assume that every action initiated by management of the company should be aimed at maximizing profits, irrespective of social consequences.

A profit is the difference between Total Revenue and Total Expenses over a period of time. Profits are the ultimate output of a company and it will have no future if it fails to make sufficient profits. Therefore, the financial manager should continuously evaluate the efficiency of the company. Generally two major types of profitability ratios are calculated.

- A. Profitability in relation to sales.
- B. Profitability in relation to investment.

- i) Gross Profit Ratio
- ii) Operating Ratio
- iii) Operating Profit Ratio
- iv) Net Profit Ratio

**Objectives of Study:**

The main objectives of the present study is to obtain a true in sight in to financial position of Anantha PVC Pipes Ltd Anantapuramu. The Ratio Analysis is a tool which helps to study the changes that take place over a given period of time. It helps to judge the profitability, liquidity, stability and turnover with the comparison of present ratios with the past ratios.

**Scope of Study:****It helps in evaluating the firm's performance:**

With the help of ratio analysis conclusion can be drawn regarding several aspects such as financial health, profitability and operational efficiency of the undertaking. Ratio points out the operating efficiency of the firm i.e. whether the management has utilized the firm's assets correctly, to increase the investors wealth. It ensures a fair return to its owners and secures optimum utilization of firm's assets.

**It helps inter-firm in comparison:**

Ratio analysis helps in inter-firm comparison by providing necessary data. An inter firm comparison indicates relative position. It provides the relevant the comparison of the performance of different departments. If comparison shows a variance the possible reasons of variations may be identified and if results are negative the action may be initiated immediately to bring them in line.

**It simplifies financial statements:**

The information given in the basic financial statements serves no useful purpose unless its interrupted and analyzed in some comparable terms. The ratio analysis is one of the tools in the hands of those who want to know something more from the financial statements in the simplified manner.

**Research Methodology:**

The data relating to financial statement of Anantha PVC Pipes LTD, Anantapuramu and information relating to ratio analysis has been collected using primary and secondary means.

**A. Primary Data:**

The information which is not available in annual reports and other books of accounts has been collected consulting the accounting officers of the Anantha PVC Pipes LTD, Anantapuramu.

**C. Secondary Data:**

The relating to financial statements of Anantha PVC Pipes LTD, Anantapuramu has been collected from published annual reports for the years 2013 to 2018 which were obtained from the administrative officers of the company.

### LIMITATIONS OF THE STUDY:

The ratio analysis is a widely used technique to evaluate the financial position all performance of a business. But there are certain problems in using ratios. The following are the limitations of the ratio analysis.

- ❖ It is difficult to decide on proper basis for comparison.
- ❖ The comparison is rendered difficult because of difference in situation of two companies or one company over years.
- ❖ The price level changes make the interpretations of ratios invalid.
- ❖ The differences in definition of items of balance sheet and income statements make the interpretation of ratios difficult.
- ❖ The ratios calculated as a point of time are less informative and defective as they suffer from short-term changes.
- ❖ The ratios are generally calculated from past financial statements and thus are no indications of the future. The ratio analysis is merely a tool of financial statement.

### DATA ANALYSIS AND INTERPRETATION

#### 1. LIQUIDITY RATIOS:

##### a. Current Ratio:

If the Current Ratio is two or more times of the current liabilities, there will be no adverse effect on business operations when the payment of current liabilities is made. It shows a firm's ability to cover its current liabilities with its current assets. Generally 2:1 is concerned ideal for a concern. Le. Current assets should be twice of the current liabilities. If the ratio is less than 2, difficulty may be experienced in the payment of current liabilities and day to day to operation of the business may suffer if the ratio higher then to it is very comfortable for the creditor but, for the business concern, it is indicator of the idle funds a lack of enthusiasm for work. It is calculated as follows:

**Current Ratio**= Current Assets/Current Liabilities.

Years	Current Asset	Current Liabilities	Current Ratio
2013-14	57359601	30675680	1.86
2014-15	55425619	36602273	1.51
2015-16	62039947	35766535	1:73
2016-17	59855287	27011470	2:21
2017-18	61987548	32987347	1:88

**Chart showing Current Ratio**

### Interpretation:

The above table shows the current ratio during the study period. The ratio was 1.86:1 in 2013-14 which increased to 2.21:1 in 2016-17 and which is too above from the standard ratio that is 2:1.

### b. Quick Ratio:

This is the ratio of liquid assets to liquid liabilities. It shows firms ability to meet current liabilities with its most liquid assets.

The standard ratio 1:1 is considered ideal ratio for a concern. Liquid assets are those, which can be easily converted into cash within a short period of time without loss of value. This ratio can be calculated by using the formula.

### Quick Ratio = Liquid Assets/Liquid Liabilities

Years	liquid assets	liquid Liabilities	Quick Ratio
2013-14	45274667	36075680	1.25
2014-15	27637499	36602273	0.76
2015-16	52791174	35766535	1.48
2016-17	37904668	27011470	1.40
2017-18	49856782	34754834	1.43

Chart showing Quick Ratio

From the above table we see that the quick ratio was standard during the study period. The ratio was 1.25:1 in 2013-14, which increased 1:43:1 in 2017-18. Which is also higher than the standard ratio is 1:1.

## 2. LEVERAGE RATIO:

### a. Debit Ratio:

Several debt ratios may be used to analyses the long term solvency of a firm. The firm may be interested in knowing the proportion of the interest dearing debit in the capital structure. It may therefore, compute debit ratio by dividing total debit by capital employed or net assets. Total debit will include short and long-term borrowing from financial institutions, debentures/bonds, deferred payment arrangement for buying capital equipments, bank borrowings, public deposits and any other interest – bearing loan.

**Debit Ratio = Total Debit/Net Assets.**

Years	Share holders' funds	Total Assets	Debt Ratios
2013-14	39120062	41993667	0.93
2014-15	53471728	56659232	0.94
2015-16	55065294	59300871	0.92
2016-17	48208099	53254693	0.90
2017-18	55254398	57854398	0.96

Chart showing Debit Ratio

In the above table shows the Debit Ratios. The Ratio is 0.93:1 means that lenders have financed increased 0.94 in 2014-15 and 0.96 in 2017-18 that is highest value recorded.

#### b. Fixed Assets Ratio:

This ratio shows the relationship between fixed assets and capital employed. Fixed assets ratios explain whether the firm has raised adequate long term funds to meet its fixed assets requirements and it gives an idea as to what part of the capital employed has been used in purchasing the fixed assets for the concern. If the ratio is less than one it is good for the concern.

**Fixed Assets Ratio** = Fixed/Capital Employed

Years	Fixed Assets	Capital Employed	Fixed Assets Ratio
2013-14	20709746	78009347	0.27
2014-15	37835887	93261506	0.41
2015-16	33027458	95067406	0.35
2016-17	40410876	80266164	0.50
2017-18	42785427	79545790	0.54

**Chart showing Fixed Assets Ratio**

The above table shows the fixed asset ratio during the study period. The lowest ratio was recorded as 0.27 in 2013-14 and the highest ratio was recorded as 0.54 in 2017-18. Which is also too below from the standard ratio that is 0.67:1. It means the firm does not raised adequate long term funds to meet its fixed asset requirement.

### 3. Turnover or Activity Ratio:

#### a. Inventory Turnover Ratio:

This ratio also known as Stock Turnover Ratio establishes relationship between cost of goods sold during a period and the average amount of inventory held during that period. This ratio reveals the number of times finished stock is turned over during given accounting period. Higher the ratio the better it is because it shows that finished stock rapidly turnover. On the other hand a low stock turnover ratio is not desirable because it reveals the accumulation of obsolete stock, or the carrying of too much stock. The ratio is calculated as follows:

**Stock Turnover Ratio = Cost of good sold / Average Stock**

Years	Cost of goods sold	Average Stock	Stock Turnover Ratio
2013-14	325467165	3408016	9.55 Times
2014-15	320371081	6539024	4.89 Times
2015-16	232812321	8544103	2.72 Times
2016-17	309341431	9238741	3.34 Times
2017-18	314789532	8346368	3.77Times

**Chart showing Stock Turnover Ratio**

The above table shows the inventory turnover ratio. The highest ratio was recorded as 9.55 times during the year 2013-14, and the lowest ratio was recorded as 2.72 times during the year 2015-16. By seeing this ratio we can say that the company is showing that finished stock is rapidly turned over into sales.

**B. Total Assets Turnover Ratio:**

Overall performance and efficiency of the firm are measured by this ratio. This ratio is calculated by dividing the annual sales value by the value of total assets. The norm that is usually adopted for this ratio is 2:1, A high ratio is an indicator of over trading of total assets while a low ratio reveals idle capacity. The formula of this ratio is

**Total Assets Turnover Ratio = Sales / Total Assets**

Years	Sales	Total Assets	Total Assets Turnover Ratio:
2013-14	356019032	78069347	4.56
2014-15	360160508	93261506	3.86
2015-16	261410580	95067406	2.74
2016-17	356574550	80661643	4.44
2017-18	332368799	85794847	3.87

Chart showing Total Assets Turnover Ratio

The above table shows the total assets turnover ratio, the highest ratio was recorded as 4.56 times in 2013-14 and the lowest ratio was recorded as 2.74 times in 2015-16.

### C. Working Capital Turnover Ratio:

The term net working capital refers to the difference between current assets and current liabilities. A positive net working capital will arise when current assets are more than current liabilities. A negative net working capital occurs when current liabilities are more than current assets. This ratio calculated as under

**Working Capital Turnover Ratio** = Net Sales/ Net Working Capital

Years	Net Sales	Net Working Capital	Working Capital Turnover Ratio
2013-14	356019032	21283921	16.72
2014-15	360160508	18823345	19.13
2015-16	261410580	26273412	9.94
2016-17	356574550	32843816	10.85
2017-18	361276435	31705456	11.39

Chart showing Working Capital Turnover Ratio

In the above table when compared to 2013-18 the net working capital turnover ratio is decreased in 2014-15 year. The highest value recorded as 19.13 in the year 2014-15 and also lowest value recorded as 9.94 percentages in 2015-16.

#### 4. Profitability Ratio:

##### a. Gross Profit Ratio:

This ratio tells gross margin on trading. The gross profit should be adequate to cover fixed expenses, dividends and building of reserves. An important factor, which will affect the ratio of gross profit to sales is that of the practice of increasing or reducing the sale price of goods sale by making-ups and marks-down. It is important that business keeps up its margin of gross profit; otherwise it may not cover its operating expenses and thus provide an adequate return to properties. Higher the ratio the better it is a low ratio indicates unfavorable trends in the form of reduction in selling prices not accompanied by proportionate decrease in cost of goods or increase in cost production. This ratio is calculated as under:

**Gross Profit Ratio** =  $\text{Gross Profit} \times 100 / \text{Net Sales}$

Years	Gross Profit	Net Sales	Gross Profit Ratio (%)
2013-14	30551866	356019032	8.58
2014-15	39789427	360160508	11.04
2015-16	28598259	261410580	10.94
2016-17	47233118	356574550	13.25
2017-18	45936448	345960345	13.28

**Chart showing Gross Profit ratio:**

The above table shows the gross profit ratios. The highest gross profit ratio was recorded as 13.28 % in 2017-18 and the lowest gross profit ratio was recorded as 8.58 % in 2013-14 by seeing this ratio, we can say that the gross profit of the firm is bad because the cost of goods is increasing every year.

##### B.Net Profit Ratio:

The ratio is that establishes the relationship between net profits to net sales and is expressed as a percentage. The higher the net profit ratio, higher the greater will be the profitability and higher

return to the share holders as well as enable the firm to with stand adverse economic condition. On the other hand a lower net profit ratio is an indication of poor profitability of an enterprise. This ratio is calculated as under.

**Net Profit Ratio** = Net Profit/Loss X 100/Net Sales

Years	Net Profit/Loss	Sales	Net Profit Ratio (%)
2013-14	419515	356019032	0.11
2014-15	442689	360160508	0.12
2015-16	564824	261410580	0.21
2016-17	648920	356574550	0.18
2017-18	639690	334532688	0.19

**Chart showing Net Profit Ratio**

The above table shows the net profit percentage 0.11 during the period 2013-14. The net profit every year increase few percentage and 2015-16. Net profit decreased compare to previous year. The company maintaining the smooth growth percentage in net profit.

### **FINDINGS:**

- The current ratio of the company is well the standard 2:1 throughout the study period. It decreases from 2.21 times to 1.51 times which indicates the firm is in a very good position to meet its short term obligations.
- Generally the quick ratio standard is 1:1 throughout the study period it from 1.48 times to 0.76 times. It shows that the company is maintaining sufficient investments in quick assets.
- The Debit ratio of the company slightly increased from 0.90 to 0.94 times, but not up the standard ratio 1:3. It is mainly caused by decrease in total tangible assets.
- The stock turnover ratio of the ratio of the company has been increased from 27.22 times to 95.50 times. It indicates the company sale has been increasing rapidly.

**Suggestions:**

- ✓ The company shall maintain the stable financial position. So that, the company can earn better profits.
- ✓ The company may increase investment in current assets to meet its short term obligations.
- ✓ The company needs to adopt sales forecasting and budgetary control methods to check the rising expenses.
- ✓ The company may increase its capital employed turnover ratio by increasing sales every year.

**CONCLUSIONS:**

The term net working capital refers to the difference between current assets and current liabilities. A positive net working capital will arise when current assets are more than current liabilities. In the industry which is one of the leading in PVC pipes manufacturing industry. It shows that the company is maintaining sufficient investments in quick assets. The higher the net profit ratio, higher the greater will be the profitability and higher return to the share holders as well as enable the firm to withstand adverse economic condition. The company shall maintain the stable financial position. So that, the company can earn better profits.

## **ROLE OF PRACTICAL LESSONS IN PROVIDING PREPARATION OF UNIVERSITY STUDENTS IN THE FIELD OF PEDAGOGICAL WEB DESIGN**

**Yusupova Sh. B\*; Jemilova L. B\*\*; Ismailova SH. B\*\*\***

<sup>1,3</sup>Urgench Branch of the Tashkent University,  
Information Technology, UZBEKISTAN

### **ABSTRACT**

*This article identifies the need to identify a set of pedagogical conditions that contribute to the effective formation of web-competence of university students and the development of practical lessons for the module "Pedagogical web-design" for students of all forms of training in specialized specialties.*

**KEYWORDS:** *Web Design, Pedagogical Design, Pedagogical Web Design, Multimedia, Html, Ease Editing*

### **INTRODUCTION**

The development of pedagogical web-design presents a new social order for the education system to train graduates who own web-space technologies. Thus, teaching pedagogical web-design becomes an important component of education.

Using a systematic approach to the formation of special competency in the field of web design for university students in the course of studying the discipline "Pedagogical web design" implies the inclusion of students in multilateral educational activities, characterized by a system of methods of cognition and types of educational activities, which allows to achieve the integrity of its construction, to establish logical the relationship of the structural components of the discipline and the pedagogical process as a whole.

### **Main part**

One of the driving forces of professional development is the personality itself, its need for self-actualization of its personal professional potential. "Orientation to the personality means that the content of education, organizational forms, and learning technologies are subordinate to meeting the learner's need to be a personality," which is facilitated by a personal approach to education.

The content of the “Pedagogical web-design” module from the perspective of an active approach is designed with the full consideration of the future professional activities of the graduate of the educational institution. Thanks to this, the student is included in an active, significant and valuable educational activity for him, the formation of a holistic structure of professional activity.

The competency-based approach involves replacing the system of the formation of knowledge, abilities, skills and controlling the level of their assimilation (it is traditionally used to judge the quality of education) with a set of competencies - new subjective qualities of the graduate, formed on the basis of activity and personality-oriented learning content.

Aesthetic expressiveness to a web site is given by its compositional and color scheme, usually made by means of a graphic editor.

Site creation technologies are divided into two main large groups: providing a static presentation of information and providing a dynamic presentation of information. Static web pages always have the same look. Dynamic pages do not exist in a predefined form, but are formed using server-side scripts.

**Fig. 1. The structure of modern web design**

The usability of the website is important for the convenience of using the site by potential customers. The qualities evaluated include the page loading time, the ways in which users find the information they need, the optimality of the resource structure, the convenience of design, navigation, etc. [2].

### Key concepts

Web-design - a project activity to create a web-site information architecture using web-technologies with its simultaneous decoration and optimization of the program code for the most efficient use and promotion on the Internet.

Pedagogical design is an educational discipline that has developed into science over the past forty years. This is a new profession, the theory and content of which is based on psychology, the

theory of multimedia environments, etc. Simply put, pedagogical design is a pedagogical tool, thanks to which teaching and learning materials become more attractive, effective, efficient [4].

Pedagogical web-design is such a project activity that characterizes the ability and readiness for independent design and implementation of the main components of web-design in order to most effectively use and promote the Internet.

Nowadays, pedagogical web design is a fashionable and sought-after trend. It can be reasonably likely that many university graduates who choose professions in the field of information technology will work in this area or at least directly contact those who work there. Therefore, it is extremely important to show the future teachers of computer science the basic ideas and directions of a modern approach to the development of web pages.

Of course, many professional sites with dynamic content are built on the basis of ready-made content management systems (Eng. CMS == Content management system), on which the template is stretched (design style). However, a web developer of any level is not only useful, but also needs to know “what's inside”, how the web page that the scripts generate is built. Only such an approach allows us to solve real problems that go beyond the limits of the “click on buttons” technique.

Since the study of server languages such as PHP and the CMS device does not fit into the program (even in-depth!) Of a school course in computer science, it remains to use the available teaching hours to learn the HTML language and create static web pages. At the same time, getting to know only HTML, while remaining at a level that was still somehow acceptable 10-15 years ago, is now impossible. Not to talk about CSS and JavaScript is already impossible, although some textbook authors manage to do this.

A serious enough problem is the search for practical work on creating websites that can be used in the lessons. At one time, the author was unable to find finished works on this topic that meet modern requirements, so he was forced to develop his own. This article provides a description of these works and a brief theoretical material necessary for their implementation. For a more detailed familiarization with the question, readers can use textbooks [3-4] and various materials on web design on the Web.

All work can be performed on any operating system, for this you need only a text editor (preferably with HTML syntax highlighting) and a browser. As one of the possible solutions for Windows users, we can recommend the free Ease Editing editor, which allows you to immediately view the results of the Internet Explorer, Chrome, Mozilla or Safari browser in the program window.

### **The text of the web page**

Web pages are text files (in the “text only ” format) that contain links to additional files (style description files, scripts, images, sounds, and videos). Therefore, a simple Notepad-type text editor in Windows is enough to work with them.

Students should understand that HTML is not a programming language, but a markup language. For this purpose, special commands are used-tags enclosed in angle brackets. Tags can be paired or unpaired. The scope of paired tags (containers) is defined by the opening and closing tags; the closing tag begins with the “/” symbol (“slash”).

The entire page consists of an html container, which contains the head (“head”, service information) and body (“body”, the main part of the page) containers. Of the tags placed in the head container, at first the most interesting is the title container — the page name, which is shown in the browser window header and serves as the most important information for search engines.

In the main part of the page, select the headers (containers h1, h2, h3, h4, h5 and h6, from the English. header-title) and text paragraphs (p containers, from the English paragraph). For these elements, you can set the alignment mode using the align attribute (property), for example, as follows: `<h1 align='center'>...</h1>`

The `<br>` tag is used to move to a new line within a single paragraph. You need to pay attention to special characters that are not present on the keyboard. For example, the `&section;` and `&copy;` sequences are used to insert paragraph (§) and copyright (©) characters. Traditionally, Uzbek texts use French quotation marks (“Christmas trees”), which are encoded as `&laquo;` and `&raquo;`. An important role is played by an indissoluble space (`&nbsp;`), which separates the initials of a person from his last name (Abdulla Avlony), numbers from units of measurement (25 kg) and dashes (`&mdash;`) from the previous word (so that the new line doesn't start with a dash).-

### Practical work # 1

1. After starting the Ease Editing program, select the icon from the list of tools. Open it dogs.htm file. See how this document will look in the browser.
2. Add the tags needed for the correct HTML document. In the title of the page, write the document name and the author's last name.
3. Use the H1 and h2 tags to highlight the document title and section titles. Before the section number, add the sign " § " (after this sign, put an unbroken space).
4. Make out whatever the poem is, using the command to move to a new line br. Put the copyright mark “©” before the author's name.
5. Select the text paragraphs using the p tag and set the width alignment.
6. Replace the "minus" signs with a dash, and put an unbroken space between the dash and the previous word.
7. Replace the upper quotation marks with “Christmas trees”.
8. Put indissoluble spaces between numbers and units of measurement, for example, 25 kg.
9. At the beginning of the last paragraph to put the copyright symbol: ©

*As a result, this will appear on the screen (Fig. 2.):*

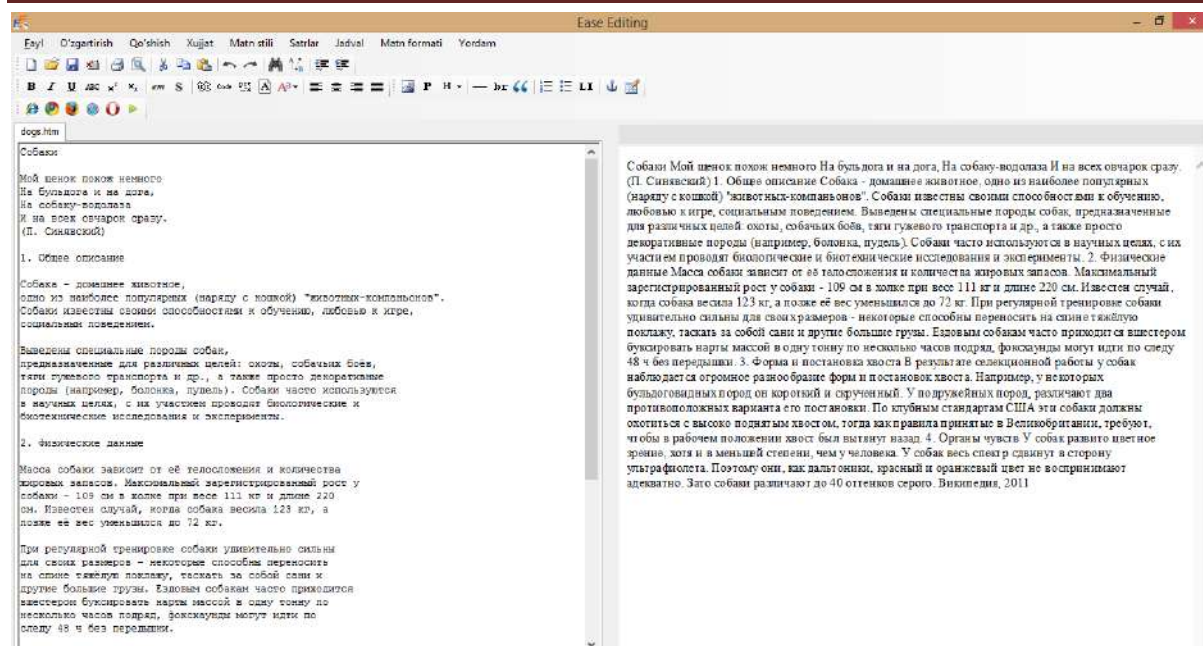

Fig. 2. Viewing the Easy Editing program after downloading the file dogs.htm

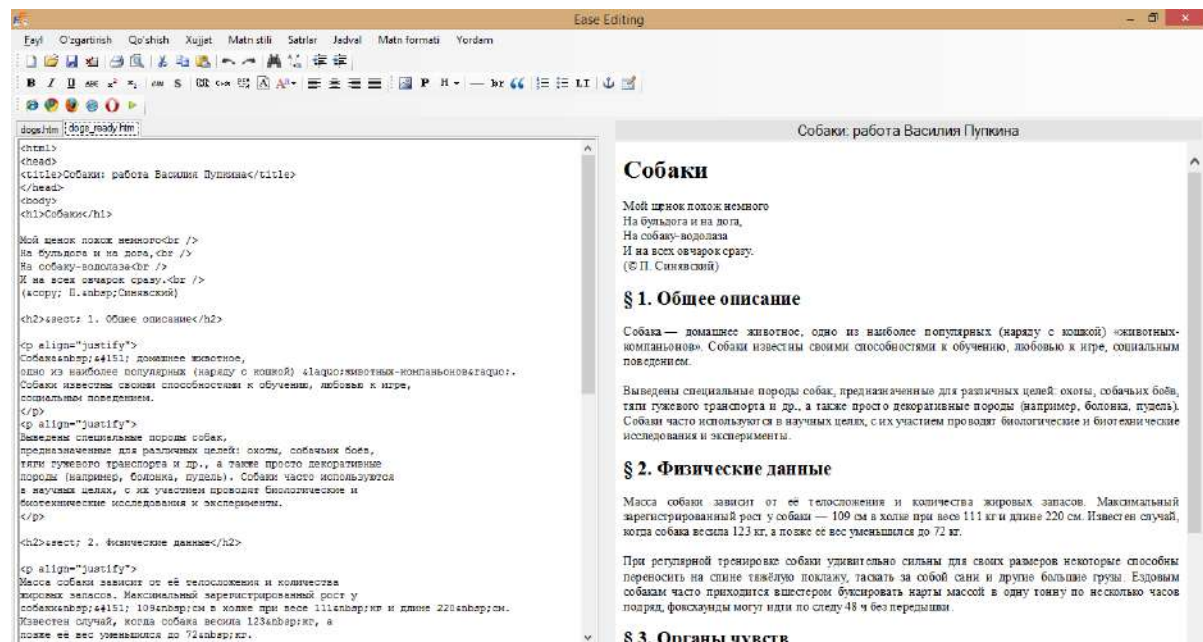

Fig. 3. After making changes to this file

## CONCLUSION

The article presents one example of practical work on the topic "Creating websites", included in the workshop for the module "Pedagogical web design". Unlike many existing analogues, they are an introduction to the methods of developing modern websites based on HTML (including HTML5 elements), cascading style sheets (CSS), and the JavaScript programming language. Various JavaScript libraries (jQuery, etc.), as well as server-side languages (for example, PHP),

which interested students can study as electives, elective courses, or independently, were left out of the material considered.

In the activity of the designer-teacher, the subject of knowledge becomes all the richness and beauty of the environment. Explain, outline, teach to notice and analyze the beauty of the subject environment in the process of learning and project creativity can only be a specialist whose training content includes these tasks. This is the designer-teacher, who is able to realize himself as a teacher of professional education in the field of design, who has integrated qualities of the profession and creative, systematic design-imaginative thinking.

### **ABSTRACT**

*This article discusses and solves the issue that is often encountered at pumping stations on pumping units with a non-return valve in the system. In rural areas, there is often a short-term loss of voltage, which leads to a system failure. And also when the pump unit is switched off in a system with a non-return valve, water is not stored in the pipeline, and this leads to additional time for refueling the pump. It takes time to fill the pump, which stops the process. For continuous operation of the process in the control circuit, add the automatic reclosing circuit (ARC). This scheme solves these issues. Namely, with a short-term voltage loss, this circuit is used to restart the pump unit. Given the shortage of water resources in our country, water-saving technologies for irrigation of agricultural crops are of great importance. The pumping station as a whole, in addition to the above, is automated depending on the purpose and the specified operating mode. Often, automatic switching on the reserve, restoration of the stations after short-term power outages, and others are carried out. Although the station is a complete unit of structures, when automating the irrigation and drainage system as a whole, it is considered as a link in a single chain of system as objects, the work in which is interconnected and interdependent, which imposes additional, special requirements on the automation of the pump station.*

## INTRODUCTION

Given the shortage of water resources in our country, water-saving technologies for irrigation of crops are of great importance. In the literature of our and foreign scientists, various methods and devices are described that allow for economical irrigation. Such methods include watering from hose devices, watering technologies using siphons, watering trays, watering using stationary, semi-stationary pipelines, drip watering technologies, sprinkling irrigation, and others. All these methods to one extent or another can save water, carry out normal irrigation, and some improve the quality of irrigation itself. However, the possibilities of saving irrigation water from surface sources can be limited, and in this sense for underground farms, which will always strive for autonomous sources, the importance of underground water. The development and improvement of automation of water treatment processes for irrigation in farms using a pumping station requires the fulfillment of certain requirements for the technology of process formation [9]. These requirements include the study of the object (s) of management, as the structure of an automated process control system in the regulation and water distribution system.

A pump installation with all its auxiliary hydromechanical and electrical equipment, control and monitoring sensors is an independent automation object. The more complex the pump unit and the technological scheme, the more complex the automation scheme and the more difficult it is to ensure its reliable operation. Therefore, when choosing a hydromechanical scheme, they seek to ensure the prostate and reliability of auxiliary equipment and, if possible, minimize it. Accordingly, the number of sensors, relays, and other automation devices decreases [18]. Pumping stations, as a rule, are designed with the calculation of their operation without permanent duty personnel. At large stations provide a small staff, which mainly carries out control functions [1]. Set the automatic mode of operation of pumping units. General station installations are also automated.

Actually, the pumping station is part of the machine-building waterworks construction site, which in the general case includes water intake, sludge, receiving and water-discharge structures, suction pipes, pumping station, pressure pipelines and so on. All these structures and devices are involved in the process of pumping water, and the automation of their work is usually included as part of the total automation of the pumping station.

Statement of the problem and relevance of work. On September 6, President of the Republic of Uzbekistan ShavkatMirziyoyev held a meeting on the priority tasks of agricultural development in 2020-2030. Uzbekistan has great potential in the agricultural sector. Success in solving many socio-economic issues from the abundance of markets and delivery on the table to ensure additional income from exports depends on the development of this industry. Decree of the President of the Republic of Uzbekistan in the country, large-scale work is underway to create the necessary and organizational and legal foundations for the development of agriculture and water management. In the implementation of structural transformations and the introduction of market relations mechanisms, special attention is paid to creating additional conditions for farms. Pumping stations are usually designed with the expectation of their operation without permanent

duty personnel. At large stations, a small staff is provided, which primarily carries out control functions. Set the automatic operation of pumping units [2]. The industry supplies stations with control of pumping units, providing from a single pulse the entire sequence of operations when starting and stopping the unit, including all its auxiliary mechanisms, protecting the unit from possible malfunctions and shutting it down in case of emergency, warning and alarm systems.

All these structures and devices are involved in the process of pumping water and automation of their work is usually included as part of the total automation of the pumping station. The pumping station as a whole, in addition to the above, is automated depending on the purpose and the specified operating mode [3]. Often, automatic selection of switched-on units, withdrawal of the reserve, restoration of the station after short-term power outages, etc., and finally, is carried out, although the station is a complete unit of structures, when automating irrigation and drainage systems as a whole, it is considered as a link in a single chain of system objects whose operation interconnected and interdependent, which imposes additional, special requirements for the automation of the pumping station. From the aforesaid it follows that pumping stations are very common, necessary and responsible objects of irrigation and drainage systems [17]. Their automation gives a great economic effect and in many cases without automation it is impossible to ensure their effective operation [4]. A pump unit is a pump coupled to a wired electric motor, and a pump unit is a pump unit with a set of auxiliary equipment mounted according to a certain scheme and ensuring the operation of the pump unit according to this scheme.

When automating a pumping station, the operation of pumping units is primarily automated. Moreover, among the initial data defining automation, a significant place is occupied by the operating characteristics of the types of adoption of pumps [7]. The essence of automatic reconnection is that an element of the power supply system that is switched off by means of relay protection is switched on again under voltage (if there is no prohibition on reconnecting) and if the reason that caused the disconnection of the element has disappeared, the element remains in operation and the consumer continues to receive power practical without interruption [8]. Operational experience shows that a lot of damage in the power supply systems of industrial enterprises is unstable and can be eliminated after a short-term voltage failure.

Among the most common causes of unstable damage to system elements are the overlapping of wires in strong winds or dances, shorting of a line or bus with various objects, disconnection of a line or transformers due to short-term overloads [9]. The use of an automatic re-inclusion device of various elements of the automation system significantly increases the reliability of the process.

Purpose and objectives of the work. In production and at pumping stations, there are a number of units with electric motors that require continuous operation. These include all kinds of pumping units operating in water supply systems, pumping water and water distribution, as well as power electrical equipment (for example, thyristor voltage converters). A common cause of such shutdowns are short-term (from one to several seconds) power surges.

Therefore, these units require the constant presence of service workers who can perform quick manual restarting [16].

Another option is also possible - the installation of devices for automatic restarting of electric motors (AR). At the same time, the constant presence of people near the unit becomes optional.

### Solution methods

The solution to this problem is a circuit that automatically re-activates the pump unit. The proposed scheme is simple. In Fig. 1, it is shown in a practical version in the form of a block together with the circuit of a conventional non-reversing starter. The block is made as an addition to the starter circuit, which does not require breaking existing electrical connections.

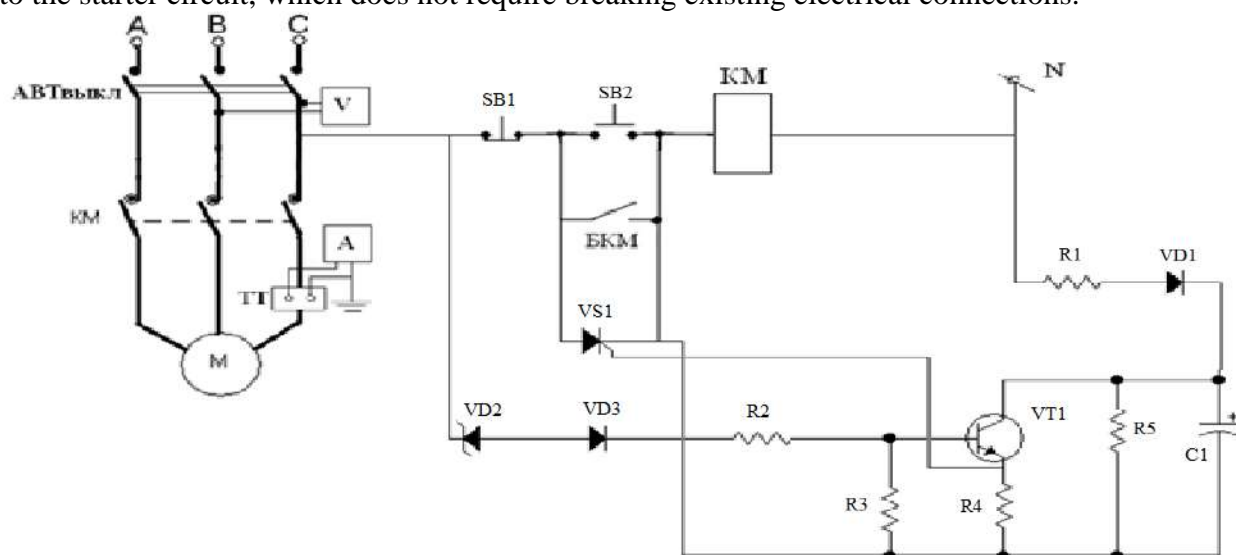

Fig. 1. Schematic diagram of the management of the re-inclusion of the pump unit.

Fig. 2. The prototype control circuit reclosing the pump unit.

When the voltage disappears in the electric network 380 V, the KM starter is disconnected. The capacitor is slowly discharged through the resistor R5 [10]. When voltage is restored, transistor VT1 opens, the capacitor discharges through its K-E junction and thyristor VS1 control junction [11], which is turned on during control half-cycles and switches on the KM motor starter itself.

The exposure time of the automatic reclosure operation during voltage setting is determined by the time the discharge of the capacitor C1 through the resistor R5 depends on the values of C1, R5 and the voltage on C1 [5]. The voltage across the discharged capacitor is determined by the ratio of the resistors R1 and R5 [12].

It should not exceed the rated voltage of the capacitor. The Zener diode VD2 prevents the fast discharge of C1 during a smooth voltage landing [13]. At the values indicated in the circuit, the duration of the action is about 15 s [14]. When the SB1 button is pressed, "Stop" VT1 opens and C1 quickly discharges through the K-E transitions VT1 and CC VT1. The shutdown time shall not exceed 0.5 s. During this time, the discharge current becomes less than the thyristor turn-on current [6]. For these reasons, the capacitance of the capacitor C1 and the voltage of the charge on it (determined mainly by the value of R5) should be as small as possible to ensure the necessary readiness for the action of automatic reclosure [15]. This time should not be set excessively long, more than 15 s. It should be less than the time for which the employee servicing the installation will have time to approach it after a sudden stop of the electric motor. This complies with labor safety standards.

## CONCLUSIONS

At pumping stations, pumping units operating in water supply, water drainage and water distribution systems are met with a short interruption in the power supply, which leads to a stop of the pumping unit and a shutdown of the process. A common cause of such shutdowns are short-term (from one to several seconds) power surges. One option is manual mode, which personnel must monitor the process.

The proposed circuit is simple in conjunction with a conventional non-reversing starter circuit. This circuit is an addition to the control circuit of the pump unit, which does not require breaking existing electrical connections. At the same time, the constant presence of people near the unit becomes optional.

This scheme is very practical and economical. The circuit in the automated control system is stable and convenient for operation. Above the indicated material, we can say that scientific development will find its application at the pumping station.

## DETECTION OF MYOCARDIAL DYSTROPHY ON THE BACKGROUND OF PHYSICAL OVERSTRAIN OF HEART IN HIGH-CLASS ATHLETES

**Umarov Firuz Kholmurodovich\***

\*Bukhara State Medical Institute,  
UZBEKISTAN

### ABSTRACT

*The article presents the results of studies monitoring the functional state of the cardiovascular system in 25 highly qualified athletes in a one-year training process. According to the ECG, a high percentage of rhythm, conduction and repolarization processes was detected. In most cases, due to load correction and rehabilitation treatment, the revealed violations were transient. In 5 athletes (20%), ECG changes in the end part of the ventricular complex were recorded throughout the season, who were diagnosed with myocardial dystrophy due to chronic physical overstrain of degree 1-2 against a background of chronic cardiac overstrain.*

**KEYWORDS:** *Myocardial Dystrophy, Physical Overstrain, Echocardiography, Retrospective Analysis, Myocardial Dystrophy Due To Chronic Physical Overstrain.*

### INTRODUCTION

The growth of sports results, especially in recent years, has led to an increase in the amount of stress on the athlete's body. The intensification of sports training has become regarded as the only guarantee of success. As shown by various researchers, the fee for adaptation to the loads of modern sports is quite high. The main link that limits the athlete's physical performance is the cardiovascular system, which most integrally reflects the functional capabilities of the body. Adequate physical activity increases the cost-effectiveness of the functioning of the cardiovascular system, excessive loads, as well as inadequate physical activity, especially in combination with psycho-emotional stress, lead to the development of physical overstrain of the cardiovascular system (CVS). The failure of the adaptation of the cardiovascular system is expressed in the phenomenon of myocardial dystrophy due to physical overstrain, the frequency of which, according to various authors, ranges from 6 to 16% in athletes [1; 3; 6; 8].

For the decades that have passed since the publication of the fundamental works of G.F. Lang (1936), who laid the foundation for the study of pathological sports heart and myocardial

dystrophy (MD) in athletes, ideas about this condition have come a long way. Lang's student professor A.G. Dembo et al. (1960) proposed calling the pathological changes that occur during irrational exercise, myocardial dystrophy due to chronic physical stress (MDCPhS). Based on the analysis of the resting ECG, he proposed a classification of the stages of MDCPhS, based on the severity of disturbances in repolarization processes. Isolation of this pathology into a separate nosological unit in many respects contributed to the development of domestic and world sports cardiology, it was of great scientific and practical importance [5]. At the same time, the diagnosis of MDCPhS in foreign sports and medical schools remains unrecognized and absent in the international classification, however, in many countries of the CIS, the authors adhere to this terminology to date. Myocardial dystrophy is most often diagnosed based on an ECG.

The solution to this problem comes to the fore primarily because sudden cardiac death (SCD) remains a huge social and medical problem. According to some authors, the risk of sudden death among athletes is 5-10 times higher than among physically inactive people. Among the causes of SCD in athletes, hypertrophic cardiomyopathy is most often called [2; 3].

**Objective:** To conduct a retrospective analysis of clinical and medical history and functional parameters in athletes with abnormalities in the cardiovascular system and to develop a prognostic algorithm for myocardial dystrophy due to chronic physical stress.

**Materials and research methods:** In order to study the detection of myocardial dystrophy against the background of physical overstrain of the heart in high-class athletes, studies were conducted among 25 athletes out of 87 highly qualified.

**Results and discussion:** According to the results of an in-depth medical examination, all athletes were found to be practically healthy.

All athletes underwent anthropometry and ECG studies were carried out in dynamics in the morning from 8-10 hours according to the generally accepted method on a 3-channel apparatus of the company Chiller; echocardiography was used to exclude cardiac abnormalities and detect small heart abnormalities on an echocardiograph with a Doppler study performed on an SIEMENS ACUSON X-300 apparatus.

The average height of the examined was  $167,0 \pm 7,0$  sm, weight -  $62,0 \pm 10,8$  kg, body surface -  $1,72 \pm 0,2$  m<sup>2</sup>, SAV -  $113,6$  mmHg. col., DAV -  $73,3 \pm 9,6$  mmHg. col., Heart rate -  $62,0 \pm 8,9$  bpm.

When analyzing electrocardiograms of 25 athletes identified:

- Sinus arrhythmia (more than 0.50 s) in 29.8% of cases;
- Pacemaker migration - 8.3%;
- atrial rhythm - 2.4%;
- Incomplete blockade of the right leg of the bundle of His - 7.2%;
- Slowdown of AV conduction - 3.4%;
- disturbances in the processes of myocardial repolarization in the form of a negative T wave in leads V2-4 - 25.7%; in the form of ST segment elevation in leads V2-5 - 21.2%;
- A single atrial extrasystole - 3.1%;
- ventricular extrasystole - in 2.8% of cases.

In some athletes, combined ECG changes were noted. Since athletes rarely complain about the state of the cardiovascular system, the diagnosis was confirmed only by electrocardiography. ECG changes in most athletes were transient. The dynamics of the ECG over the preparation periods showed that sinus arrhythmia, transient disturbances in the processes of myocardial repolarization, when the volume of physical activity increases, are most frequent. Most often they arose during intense training, in the preparatory period. The same is observed in athletes who begin to force loads after a long break due to injuries and diseases. In 5 athletes (20%), ECG changes in the final part of the ventricular complex were recorded throughout the season, which were diagnosed with grade 1-2 MDCPhS against a background of chronic overstrain of the heart.

Echocardiography was performed in 12 (48%) of the 25 observed athletes. Anomalies of development (mitral valve prolapse, false chords, trabeculae, abnormal location of chords) were detected in 6 people. (24%).

Case Study Athlete K., 29 years old, height 167 cm, weight 74 kg. Over the past year, 6 times reduced weight by 7-8 kg.

According to the results of an in-depth medical examination recognized as practically healthy. Recently complains of rapid fatigue during training and competition. When determining body composition, a chronic violation of body composition was revealed by the ratio of muscle mass / fat mass - high MM (up to 55%) and low breast (up to 5.9%). Hormonal profile: with the normal ratio Testo / Epi-Testo, the levels of both indicators are reduced (T 31.06 pkg, Epi - T 30.47 pkg).

Ultrasound of the abdominal cavity - signs of chronic cholecystitis. Chest x-ray without pathology. A general analysis of blood and urine is normal, biochemical tests - periodically exceeding the normal levels of AST and ALT, urea. Echocardiography: Interventricular septum 0.9 cm, final diastolic size 5.1 cm, posterior wall of the left ventricle 1.0 cm, final systolic size 3.3 cm, ejection fraction 65%, final diastolic volume 128.9 ml, final systolic volume - 45.6 ml, stroke volume - 83.3 ml, left ventricular myocardial mass - 194 g, Left ventricular myocardial mass index to area - 105 g / m<sup>2</sup>, Left ventricular myocardial mass index to growth - 116 g / m, Left ventricular myocardial mass index to a height raised to a power of 48.5 g / m<sup>2.7</sup>, false chord in the cavity of the left ventricle.

Arterial pressure at rest 120/78 - 130/78 mm hg. col. With 24-hour Holter monitoring, the average heart rate in the daytime was 62 beats / min, at night - 52 beats / min, rhythm disturbances in a non-pathological amount. On the ECG, over the course of a year, stable disturbances of repolarization processes in leads V-V4, III, and VR with a deterioration of repolarization processes in leads to V5-V6, II are observed on the ECG. He was diagnosed with chronic overstrain of heart, MDCPhS 2<sup>nd</sup> degrees.

Despite repeated intensive rehabilitation therapy in a hospital, hyperbaric oxygenation before and after responsible competitions, changes in the ECG persist with a tendency to worsen. Given the possible complications of the cardiovascular system, regulation of the training process (aerobic exercise) and weight loss are recommended.

Thus, in general, regular monitoring of electrocardiography indicators contribute to the timely detection of myocardial dystrophy. Changes in the heart of this athlete, of course, are associated with physical exertion, which can cause a number of metabolic disorders in the body - in

particular, this athlete: a violation of the neuroendocrine regulation of the cardiovascular system, primarily the ratio of catabolic and anabolic hormones (decreased testosterone) and electrolyte disturbances as a result of frequent weight loss. The appearance of these metabolic changes may have contributed to the existing congenital anomaly of the heart [4; 5; 8]. However, with the same level and type of training, other athletes showed no changes. In this regard, the contribution of the genetic component to the nature and extent of these changes cannot be ruled out [9].

Recently, publications have appeared on the revision of the term MDCPhSto cardiomyopathy. Most sports doctors have MDCPhSand disturbances in the processes of repolarization on the ECG - in fact, are synonyms. As a result, myocardial hypertrophy, its calcification and fibrosis, rhythm and conduction disturbances, as well as myocardial contractility are not decisive in the diagnosis [3].

For the prevention of complications, a thorough medical examination is necessary at the stage of selecting people who have an increased risk of developing an abnormal sports heart and sudden death, taking into account the phenotypic markers of connective tissue dysplasia, ECG and EchoCG data, which will allow differential monitoring of this contingent of athletes, predicting their activities and achievements in sports.

Thus, the study of the functional state of the cardiovascular system of highly qualified athletes revealed by ECG a high percentage of violations in the functional state of the heart at the stages of shock training loads. In most cases, due to load correction and the use of restorative means, the revealed abnormalities in the heart function of athletes were of a transitory nature. In 20% of cases, registered violations in the form of myocardial dystrophy due to chronic overstrain of the 1<sup>st</sup>, 2<sup>nd</sup> degree of heart persisted throughout the season and required a deeper examination: echocardiography with Doppler, Holter monitoring, clinical and biochemical blood tests and other diagnostic methods.

### **FINDINGS:**

1. The study of the functional state of the cardiovascular system of highly qualified athletes revealed, according to ECG and Echocardiography, a high percentage of violations in the functional state of the heart at the stages of excessive training loads.
2. In most cases, the detected abnormalities in the heart of athletes were transient.
3. In 20% of cases, the recorded violations in the form of myocardial dystrophy due to chronic overstrain of the heart persisted throughout the season and required a deeper examination: echocardiography with Doppler, clinical and biochemical blood tests and other diagnostic methods.

## INFLUENCE OF REPEATED AND INTERVAL CROPS ON PHYSICAL PROPERTY OF SOIL

Ismailov D.U.\*

\*Doctorate Student,  
Of Nukus branch of Tashkent,  
State Agrarian University, Nukus, UZBEKISTAN

### ABSTRACT

*Repeated and interval crops are sown after winter wheat in the system of short crop rotation in the condition of saline soil of the Republic of Karakalpakstan and it was defined that they influence positively on physical property of soil. . It should be mentioned that, in variants 6 and 7, when repeated and interval crops were sown after winter wheat; in variant 5, when repeated crops were sown and additional 20 t/ha manure was given; and in variant 8, when repeated, interval crops were sown and additional 2 t/ha amount of manure was given, soil capacity mass was 1,31-1,33 g/cm<sup>3</sup> in 0-30 cm layer in spring, and it was less than the indicators of controlling variant to 0,02-0,04 g/cm<sup>3</sup>.*

**KEYWORDS:** Winter Wheat, Repeated and Interval Crops, Manure, Soil Productivity, Capacity Mass, Positive.

### INTRODUCTION

Water-physical properties of soil are the main factors of soil productivity. Researches were carried out on the influence of physical, biological properties of ploughing layer compactness of irrigated soil of Uzbekistan on the growth, development and fertility of cotton. As soon as soil structure becomes compact, the amount of moisture, which is difficult for the plant to acquire, increases, moisture is mainly situated in a very small hollows. Soil, which has a little amount of humus and low structure, is inclined to compactness in irrigation and treating between rows (Kashkarov, 1969; Smetov, 1994; Ismailov, 2004; Xalikov, Namozov, 2016 and others).

Soil capacity mass is directly connected with soil productivity, and if soil productivity is high, capacity mass is low, and if productivity is low, capacity mass is high. The indicator of capacity weight should be low for the good development of the root system of cotton and agricultural crops.

Field experiment was carried out in central soil-climate region of the Republic of Karakalpakstan, in study-experiment household of Nukus branch of Tashkent State Agrarian University in Khodjeli region. The soil is pasture-alluvial, mechanical structure is average, groundwater is situated in 1,5-2,0 m, salted.

It should be studied in the experiment, the influence of organic fertilizer in the amount of 20 t/ha together with repeated crops as mung bean, sesame, corn, which were sown after winter wheat in the system of short crop rotation, and the growth, development and productivity of cotton, which was sown after them.

The following variants were studied in the experiment: variant 1, cotton (control), variant 2, 1:2, winter wheat + repeated crop (mung bean): cotton: cotton, variant 3, 1:2, winter wheat + repeated crop (sesame) : cotton: cotton; variant 4, 1:2, winter wheat + repeated crop (corn) : cotton : cotton, variant 5, 1:2, winter wheat + repeated crop (corn) + 20 t/ha manure : cotton: cotton, variant 6, 1:2, winter wheat + repeated crop (mung bean) + interval crop (mung bean) : cotton : cotton, variant 7, 1:2, winter wheat + repeated crop (corn) + interval crop (mung bean) : cotton : cotton, variant 8, 1:2, winter wheat + repeated crop (corn) + interval crop (mung bean) + 20 t/ha manure: cotton : cotton. The area of each variant is 240 m<sup>2</sup>, it was carried out on four times repeating.

In order to identify influence of crops, which are included in the system of short crop rotation, soil capacity mass was defined before experiment, during the experiment, at the beginning and end of the action period. Indicators of soil capacity mass before starting the experiment were 1.42-1.44 g/cm<sup>3</sup> in 0-30 layer in autumn, 2017. After crops, which are included in the crop rotation system, in spring, 2019, soil capacity mass was average 1.31-1.35 g/cm<sup>3</sup> in 0-30 cm layer on variants and 1.49-1.53 g/cm<sup>3</sup> in 30-50 cm layer of soil. Soil capacity mass increases at the end of action period in all variants. In this, the highest indicator was in variant 1, when cotton is sown after cotton, it was 1.46 g/cm<sup>3</sup> in 0-30 cm layer in controlling variant. It is more than the indicator in spring to 0,11 g/cm<sup>3</sup>. In variants 2, 3 and 4, when repeated crops were sown after winter wheat, soil capacity mass was 1.42-1.43 g/cm<sup>3</sup>, and capacity mass increased to 0,08-0,09 g/cm<sup>3</sup>. In variant 5, when repeated crop was sown after winter wheat and amount of 20 t/ha manure was given in autumn, soil capacity mass was 1,39 g/cm<sup>3</sup> in 0-30 cm layer and it is more than in spring to 0,06 g/cm<sup>3</sup>.

Soil capacity mass, g/cm<sup>3</sup>

Variants	Soil layers	Indicators before starting the experiment, autumn, 2017	2019	
			spring	autumn
1	0-30	1,43	1,35	1,46
	30-50	1,54	1,53	1,55
2	0-30	1,42	1,34	1,42
	30-50	1,53	1,50	1,52
3	0-30	1,42	1,34	1,42
	30-50	1,54	1,51	1,52
4	0-30	1,43	1,34	-1,43
	30-50	1,51	1,52	1,53
5	0-30	1,44	1,33	1,39
	30-50	1,51	1,50	1,50
6	0-30	1,43	1,32	1,40

	30-50	1,51	1,50	1,51
7	0-30	1,42	1,32	1,39
	30-50	1,49	1,49	1,52
8	0-30	1,43	1,31	1,37
	30-50	1,53	1,49	1,53

In variants 6 and 7, when repeated and interval crops were sown after winter wheat, soil capacity mass was 1,39-1,40 g/cm<sup>3</sup> in 0-30 cm layer and it was more than the indicators in spring to 0,07-0,08 g/cm<sup>3</sup>. It should be mentioned that, in variants 6 and 7, when repeated and interval crops were sown after winter wheat; in variant 5, when repeated crops were sown and additional 20 t/ha manure was given; and in variant 8, when repeated, interval crops were sown and additional 2 t/ha amount of manure was given, soil capacity mass was 1,31-1,33 g/cm<sup>3</sup> in 0-30 cm layer in spring, and it was less than the indicators of controlling variant to 0,02-0,04 g/cm<sup>3</sup>. In variant 8, when repeated and interval crops were sown after winter wheat and additional 20 t/ha manure was given, soil capacity mass was 1,37 g/cm<sup>3</sup>, it was more than in spring to 0,06 g/cm<sup>3</sup> and less than the indicators of controlling variant to 0,09 g/cm<sup>3</sup>.

So, it influences positively when it is sown in the following system on soil mass capacity in 1:2 crop rotation system: winter wheat + repeated crop (corn and mung bean) + interval crop (mung bean) : cotton : cotton; 1:2, winter wheat + repeated crop (corn) + interval crop (mung bean) + 20 t/ha manure : cotton : cotton, and the indicators of capacity mass decreases.

\*\*Master of TSPU, UZBEKISTAN

\*\*\*Master of TSPU, UZBEKISTAN

### ABSTRACT

*In this case, Mirzo Muhammad Haydar substantiates his views on the basis of the situation and historical situation of that time, as well as from the point of view of history: - "... I started this history with poor Tughluq Temurkhan. By summarizing the scientific conclusions and results of research conducted by professional historians who are experts in the fields of historical sciences, it is possible to get an overview of past and present historical processes, the content and significance of events. After the death of Sultan Said Khan in 1533, Mirza Haydar for some reason left the country and went first to Badakhshan, and then from there to Lohur - to Babur's son Komron Mirza. In 1540 he went to Agra and entered the service of Humayun. One of the Russian orientalists V.V.Velyaminov-Zernov said about this work: - The work "Tarixi Rashidiy", especially its second part, is of great importance. This work is the only source that sheds light on the history of the last Chigatay rulers. Openness, clarity and objectivity are at the forefront of the events described by the author on the basis of all that he has seen and experienced. For example, the authors of Haydar Ali Razi's "Tarixi Haydariy" and Mahmud ibn Wali's "Bahr ul-asror fi manoqib ul-ahyar" on the history of the Chigatay rulers in Yorkend have often referred to Mirza Muhammad Haydar's "Tarixi Rashidiy" in their writings left. I found it necessary to shed light on information not given in the history books. There is enough history until the time of Tughluq Temurkhan, and to repeat it again is like digging a well on the banks of the Euphrates River.*

## INTRODUCTION

The interest of society in the processes of the past and the desire to know and understand it have been conveyed and explained to people through research conducted by historians and the historical works created. History is often seen as a science that studies the past. This idea or view is less accurate. The science of history studies not only the past, but also the events that are happening today, at the same time. By summarizing the scientific conclusions and results of research conducted by professional historians who are experts in the fields of historical sciences, it is possible to get an overview of past and present historical processes, the content and significance of events.

Another historian who lived and worked in the 16th century and achieved some excellent results in the field of historiography was Mirzo Muhammad Haydar, whose two major works have survived to the present day. Muhammad Haydar is the author of the famous historical work "Tarixi Rashidiy" and a Turkish poetic treatise on geography "Jahonnoma" [1].

"History is a great treasure. It is the duty of every society to pass on the events of the past to future generations. The next generation will learn that history, prolong their lives and increase their experience. He learns from the good deeds of his predecessors and tries not to repeat his mistakes. This has always been the case throughout human history" [2].

Historian, statesman Muhammad Mirzo Haydar Duglot was born in 905 (1499) in Tashkent. His father, Muhammad Hussein Koragon, was the governor of the Uratapa region on behalf of Sultan Mahmudkhan, the khan of Tashkent at the time. After his father Muhammad Husayn Shaibanikhan was executed in Khorasan in 1509, Mirza Haydar, who was in Bukhara at that time, escaped death and came to Kabul via Babakhshan to Babur, where he lived for three years. Bobur takes good care of him and gives him a good upbringing. He appoints teachers and encourages his aunt to acquire knowledge. Muhammad Haydar remembers this with great gratitude in his work. Later, with the permission of Mirza Haydar Babur, he went to Andijan and Kashgar to his cousin Sultan Saidkhan (1514-1533). He also demonstrated his commanding talent when he was in the service of Sultan Saidkhan until 1533. According to the khan's order, he led military campaigns in Badakhshan, Kafiristan and Tibet. After the death of Sultan Said Khan in 1533, Mirza Haydar for some reason left the country and went first to Badakhshan, and then from there to Lohur - to Babur's son Komron Mirza. In 1540 he went to Agra and entered the service of Humayun. He conquered Kashmir on behalf of the Baburis in 1541 and ruled the country until 1551 as an almost independent ruler. He was wounded and killed in a battle with the mountain tribes in 1551. His grave is currently in the Sirinagor (Sultan's Tomb) Cemetery in Kashmir.

It is true that Muhammad Haydar Mirza's "Tarixi Rashidiy" covered the events of the second half of the XV century - the XVI century in Central Asia and the Middle East on the basis of justice, expressed the author's deep views on the events he described. That is why we know him first of all as a historian, a commander and a great statesman of his time [4].

Well-known scientist N.Juraev spoke about the research of historical science, the role of sources, in particular, the in-depth scientific analysis of any events in the sources, historical evidence, theoretical conclusions, socio-political and economic study of the period under study. the events of that period

He pays special attention to the scientific and theoretical aspects of the period under study, and among such sources is the work of Muhammad Haydar Mirza "Tarixi Rashidiy" [5].

Muhammad Haydar Mirza's "Tarixi Rashidiy" was written in 1541-1546. Haydar Mirzo called his book "Tarixi Rashidiy". The book is named after Sultan Said Khan's son Abdurashid Khan.

The book "Tarixi Rashidiy" is the work of Mirza Muhammad Haydar Koragon ibn Muhammad Husayn Koragon (may God enlighten their graves) and dedicated it to Abdurashidkhan ibn Sultan Saidkhan Saidkhan in 951 AH. written with and described in detail the condition of each khan and king in terms of his position. It also examines, observes, and identifies as much as possible the latitude, climate, and cities, mansions, cemeteries, deserts, parks, rivers, mountain deserts, and customs of the peoples of Kashgar, Yorkand, and Khotan provinces. made. What is clear is that the description of these provinces and the mention of the Mongol khans are not mentioned in any other book. Although some historical works say little about chance, these are very brief pieces of information. In "Tarihi Rashidi", the stories of special Mongol khans and the events in Mongolia are so detailed that it is impossible to imagine more than that. "[7]

One of the Russian orientalists V.V.Velyaminov-Zernov said about this work: - The work "Tarixi Rashidiy", especially its second part, is of great importance. This work is the only source that sheds light on the history of the last Chigatay rulers. Openness, clarity and objectivity are at the forefront of the events described by the author on the basis of all that he has seen and experienced. Such a situation could be expected from the author, because the current socio-political situation itself allowed him to describe the events in real terms "[8].

Muhammad Haydar Mirza's main work is known as "Tarixi Rashidiy" and the book consists of two parts. Researchers, based on a number of features of the work, rightly admit that the work "Tarixi Rashidiy" is second only to "Boburnoma" in the art of Oriental architecture [9].

In the first part of the work, the history of the peoples of Mongolia covers the history of almost a century (1348-1533) from the reign of Tughluq Temur to the reign of Abdurashidkhan [10]. In the coverage of this section, it is noted that Mirza Muhammad Haydar referred to about a dozen sources, and in the process of obtaining the data, a very comparative analysis of them was carried out [11]. In this case, Mirzo Muhammad Haydar substantiates his views on the basis of the situation and historical situation of that time, as well as from the point of view of history: - "... I started this history with poor Tughluq Temurkhan. There are three reasons for this: The first is that they wrote about the khans before Tughluq Temurkhan, and there is no information about the next ones. I found it necessary to shed light on information not given in the history books. There is enough history until the time of Tughluq Temurkhan, and to repeat it again is like digging a well on the banks of the Euphrates River. The second reason: after Tughluq Temurkhan, no khan had such a great career, so many victories, so much glory and kingdom. The third reason is that after Tughluq Temurkhan was the first of the Mongol khans to embrace the path of Islam, the whole Mongol people got rid of the shackles of disbelief and became Muslims like other nations." [12] The second part of the work is written in the form of a memoir, describing the author's experiences in the struggle for power in Central Asia, Khorasan, Mongolia and India, East Turkestan [13].

Mirzo Haydar's "Tarixi Rashidiy" has become one of the most popular works in Oriental historiography, and copies of it are kept in the manuscripts of many countries around the world. Many historians and geographers of the East, who lived and worked after Mirza Haydar, have

shown that they obtained medieval information about Central Asia, East Turkestan, India, etc. from Mirza Haydar's "Tarixi Rashidiy" [14]. For example, the authors of Haydar Ali Razi's "Tarixi Haydariy" and Mahmud ibn Wali's "Bahr ul-asror fi manoqib ul-ahyar" on the history of the Chigatay rulers in Yorkend have often referred to Mirza Muhammad Haydar's "Tarixi Rashidiy" in their writings left

While the author's approach to the coverage of his work provides invaluable information about the processes of statehood in the above-mentioned regions, the depiction of historical processes in the form of memoirs and memoirs is a perfect storytelling.

From the above, it can be seen that Muhammad Mirza Haydar's "Tarixi Rashidiy" is an important and unique source not only in the study of the medieval history of Central Asia, but also in the history of Mongolia, India, Khorasan, East Turkestan and surrounding areas.

## INFLUENCE OF MINERAL AND NON-TRADITIONAL FERTILIZERS ON THE GROWTH AND DEVELOPMENT OF COTTON

**Ismailova A.U.\***

\*Assistant of Tashkent State Agrarian University,  
Nukus Branch. Nukus, UZBEKISTAN

### ABSTRACT

*The influence of mineral and non-traditional fertilizers on the growth and development of cotton has been studied in the conditions of saline lands. It has been established that the norm of mineral fertilizers N180P135K90 kg/ha and glauconitic and glaukophos of 600 kg/ha are considered the most optimal when used together.*

**KEYWORDS:** *Mineral And Non-Traditional Fertilizers, Saline Soils, Additional Fertilizing, Cotton, Growth And Development.*

### INTRODUCTION

The main task of agriculture is to constantly increase agricultural production, improve their quality, safety, processing.

The intensification of agricultural production, as cotton growing, requires increasing yields based on the effective use of mineral fertilizers. It is generally known that the importance of mineral fertilizers in improving the condition of the soil, in increasing its fertility and productivity of crops, while observing the optimal norms for applying them to the soil. In addition to the well-known nitrogen, phosphorus and potassium fertilizers, the use of trace elements containing (Fe, Cu, Co, Mo, B, Zn,) fertilizers is of great importance, which enhance the growth of plants, increase the efficiency of enzymes that promote the intensity of photosynthesis, and thus increase yield, stability plants to drought, cold and some diseases.

Cotton, rice, wheat and corn, produced and cultivated in Karakalpakstan, noticeably respond to changes in the regime of nutrition, the composition of nutritious macro- (nitrogen, phosphorus, potassium) and microelements. Therefore, scientific institutions are required to develop new methods for producing and using effective mineral fertilizers, as well as developing technology for their application.

In this, much attention is paid to the problem of developing and using mineral fertilizers obtained on the basis of local natural raw materials, which include a highly dispersed variety of bentonite clays, glauconite, phosphorite, etc., containing up to 15 different trace elements.

To study the effect of mineral and non-traditional fertilizers on the growth and development of cotton in saline lands, a field experiment was conducted in which they studied: variant 1, using only mineral fertilizers for additional feeding cotton N250P175K125 kg/ha, variants 2 and 3, using only glauconite and glaukophos 900 kg/ha, variants 4 and 5, NPK norms reduced by 25% (N180P135K90 kg/ha) + glauconite and glaukophos at 600 kg/ha, variants 6 and 7, N185P135K90 kg/ha + glauconite and glaukophos at 900 kg/ha, variants 8 and 9, N185P135K90 kg/ha + glauconite and glaucophos of 1200 kg/ha.

The soils of the experimental plot are meadow-alluvial, medium saline, the level of groundwater occurrence is 1.5-2.0 m.

To study the effect of mineral and non-traditional fertilizers, phenological observations were carried out on the first of July, August and September.

When accounting for the growth and development of cotton on September 1, it was found that in all cases, there were no significant differences in the height of the main stem and the number of sympodial branches, which was on August 1. The number of bolls doubled. In terms of the number of bolls, variants 2 and 3 (7.2-7.5 pieces), where glauconite and glaukophos without mineral fertilizers were introduced, have relatively low rates. When applying mineral fertilizers with the norm N250 P175 K125kg/ha (var. 1), the number of bolls was 10 pieces, which is 2.5-2.0 more than in comparison with variants 2 and 3.

The use of mineral fertilizers together with glauconite and glaucophos (var. 4-9) contributed to an increase in the number of bolls by 1.2-3.2 pcs. The largest number of bolls is observed in variants 4 and 5, where mineral fertilizer was applied at the rate of N185 P135 K90 kg/ha, glauconite and glaukophos of 600 kg/ha-10.6-10.4 pcs. An increase in the norms of glauconite and glaucophos to 900 kg/ha did not contribute to an increase in the number of bolls, on the contrary decreased by 1.3-1.0 pcs. An increase in the norm of glauconite and glaucophos to 1200 kg/ha, the number of bolls remained at the same level with variants 6 and 7.

The obtained data on the growth and development of cotton confirm that variants 4 and 5 have the advantage, where mineral fertilizer was applied at the rate of N185P130K90 kg/ha together with glauconite and glaucophos of 600 kg/ha.

Raising the rate of agro-ore to 900 and 1200 kg/ha (variants 7–9) did not ensure significant growth and development of cotton.

The introduction of a full standard of mineral fertilizers (N250P175K125 kg/ha, variant 1) provides an advance in the number of sympodial branches and the number of cotton bolls compared to other variants, with the exception of var. 4-5.

Thus, for normal growth and development of cotton, a more favorable nutritional regime is created at the rates of mineral fertilizers N185P135K90 kg/ha and glauconite and glaucophos 600 kg/ha. An increase in the norms of glauconite and glaucophos to 900 and 1200 kg/ha is not economically profitable, since there is no significant difference in the number of bolls.

### ABSTRACT

*The article presents the results of studying the biology of the growth and development of Valerian officinalis in different periods of ontogenesis. The beginning of the growing season is the first decade of March, it lasts until mid-November.*

**KEYWORDS:** *Introduction, Hypocotyl, Epicotyl, Ontogenesis, Periods: Latent, Virginal, Generative.*

### INTRODUCTION

One of the most pressing issues today is the introduction of medicinal plants and the local supply of raw materials needed for their reproduction and production under the conditions of introduction.

*Valeriana officinalis* L. – A perennial herb of the family *Valerianaceae*, 60-150 cm tall. It grows mainly in wetlands, meadows, along rivers and among bushes. In nature, it is found in Eastern Europe, Russia, Ukraine, Belarus, Moldova and the Caucasus.

Drugs derived from valerian are the main means of calming the nervous system in medicine (in insomnia, nervous excitement and other neurological diseases) and in the regulation of cardiac activity [8].

In order to propagate valerian in the conditions of introduction, to create a raw material base, we conducted scientific research to study the stages of ontogeny of *V. officinalis* in Tashkent (botanical garden).

**Object and methods of research.** *Valeriana. officinalis* in determining the mass of 1000 seeds S.S. The Lishuk method was used [6].

In the study of the morphological structure of the plant in the stages of ontogeny, L.A. Zhukova's methods [3] were used. During the latent period, 100 seeds were taken, their length, width and thickness were measured, and the weight of 1000 seeds was weighed ten times and their shape and color were analyzed. In the study of the formation and growth of grass organs, V.K. Vasilevskaya [1] and E. A. Kondratieva-Melville [5] methods were used. Statistical processing of the results obtained in the course of scientific research G.N. It was carried out mainly on the basis of Zaitsev's [4] manuals.

**Research results.** Latent period. Seed fertility is one of the main indicators of plant reproduction and regeneration, which determines the fate of the species and determines the quality of the seed [3].

*V. officinalis* The fruit is light brown or brown, the seeds are ovate, 2.5-5 mm long. The slender stalks on the tip of the seed consist of 10 long hairs. They are pale yellow. Absolute seed weight is 0.4-0.6 g.

There is information in the literature that *V. officinalis* seeds retain their fertility for several years [2].

Virginil period. We first observed the fertility characteristics of *V. officinalis* seeds in the laboratory. Observations were made on seeds stored for one, two and three years. The germination rate of seeds stored for one year at a temperature of 10-13 ° C in a thermostat for 25 days was  $25.2 \pm 2.2\%$ . Seed viability at 16-18 ° C for 16 days was  $52.3 \pm 2.5\%$ . When the temperature rose to 20-23 ° C, the germination of seeds for 14 days increased to  $90.5 \pm 1.5\%$ . These values are 22.5 days at 10-13 ° C,  $19.5 \pm 2.0$ - $12.2 \pm 1.6\%$ , respectively, in seeds stored for two and three years; 20-21 days at 15-18°C,  $40.4 \pm 2.5$ - $20.8 \pm 2.0\%$ ; At 20–23° C for 18–20 days, it was  $65.0 \pm 2.4$ – $48.0 \pm 2.5\%$  (Table 1).

**TABLE 1 FERTILITY OF VALERIANA OFFICINALIS L. SEEDS UNDER LABORATORY CONDITIONS (N=400)**

Best before, years	Temperature, °C	Forgetfullnes, %	Germination period, day	Thrust energy
1	10-13	$25,2 \pm 2,2$	19	1,3
	15-18	$52,3 \pm 2,5$	16	3,3
	20-23	$90,5 \pm 1,5$	14	6,5
2	10-13	$19,5 \pm 2,0$	22	0,9
	15-18	$40,4 \pm 2,5$	20	2,02
	20-23	$65,0 \pm 2,4$	18	3,6
3	10-13	$12,2 \pm 1,6$	23	0,5
	15-18	$20,8 \pm 2,0$	21	1,5
	20-23	$48,0 \pm 2,5$	20	2,4

Therefore, long-term storage of *V. officinalis* seeds reduces its viability. Seed germination is obtained when studied in the field, and in the observation of seed germination, their shade and sun exposure, sowing time (spring, spring) and sowing depth to the soil (soil surface, 0.2 cm to 0.5 cm) vary. Both air and soil temperatures were significantly monitored during the observations.

In early spring (March), when the temperature in the shade is 14.0 °C and the soil temperature is 10.5 °C, the fertility of seeds sown on the soil surface is  $18.7 \pm 2.3\%$ , at a depth of 0.2 cm  $24.0 \pm 2.5\%$ , or  $20.6 \pm 2.3\%$  in the 0.5 cm layer. In April, when the air temperature was 15.6 °C and the soil temperature was 11.8 °C, the fertility of seeds sown on the soil surface was  $21.2 \pm 2.4\%$ , at a depth of 0.2 cm  $27.3 \pm 2.6\%$ . and  $23.0 \pm 2.4\%$  at a soil depth of 0.5 cm. These values were  $23.0 \pm 2.4\%$ ,  $30.8 \pm 2.7\%$ , and  $25.2 \pm 2.5\%$  in May (air temperature 20.7 °C and soil temperature 16.0 °C), respectively. was made. Seed germination in the summer months (July air temperature 31.7 °C - soil temperature 25.7 °C or August air temperature 30.5 °C - soil temperature 24.1 °C) on the soil surface  $34.0 \pm 2.7$ -  $30.4 \pm 2.6\%$ , at a depth of 0.2 cm  $60.0 \pm 2.8$ - $56.6 \pm 2.9\%$ , and at 0.5 cm  $50.0 \pm 2.9$ - $47.3 \pm 2.9\%$  were registered. Seeds sown in autumn (November) begin to germinate in February next year (Table 2). The seeds sown in the sunny exposition did not germinate.

According to the results of experiments, in the summer period (July, August) in the shade exposure was observed high fertility of seeds sown at a depth of 0.2 cm. We concluded that the achievement of the required air and soil temperature (30-25 °C) has a positive effect on seed germination.

**TABLE 2 BIOLOGY OF VALERIANA OFFICINALIS L. SEEDS**

Planting time	Months	Average monthly air temperature, °C	Average monthly soil temperature, °C	Seed sowing depth and germination rates, %		
				Soil surface	0,2 cm	0,5 cm
Spring	march	14,0	10,5	18,7±2,3	24,0±2,5	20,6±2,3
	april	15,6	11,8	21,2±2,4	27,3±2,6	23,0±2,4
	may	20,7	16,0	23,0±2,4	30,8±2,7	25,2±2,5

	august	30,5	24,1	30,4±2,6	56,6±2,9	47,3±2,9
Autumn	Novembe r*	12,0	9,8	16,5±2,1	21,2±2,4	17,3±2,2

*Germination was observed in February of the following year.*

**Grass ladder.** Grasses consist of green leaves that are capable of photosynthesis and a root system that can perform its function. Its main feature is the preservation of seed pods. In some plants (ephemerals) the seeds and leaves are preserved until the generative period. E. A. According to Kondratieva-Melville [5], the grass stage is the initial stage of ontogenesis from

seed germination to the full spread of the seed leaves and stem formation. The interdependence of plant organs is observed very early in ontogeny [5]. The growth of *V. officinalis* grass begins with the prolongation of hypocotyl in the laboratory. As a result, the apical root tears the seed coat. The two adjacent seeds gradually begin to grow as a result of the division and elongation of the leaf cells. Seed leaves begin to separate from the seed coat in 2-3 days of grass. From this point on, the growth of all the organs of the grass accelerates. In two-day grasses, the seed leaves split in two. They were  $2.0 \pm 0.2$  mm long and  $1.0 \pm 0.1$  mm wide. Urugpalla leaves are elliptical in shape, the tip is blunt or slightly pubescent, the base is triangular-shaped.

Embryo grows and elongates faster than the leaf axils. On four-day grasses, the leaves are  $2.3 \pm 0.3$  mm long,  $1.6 \pm 0.1$  mm wide, and the average band length is 2.5-3.0 mm. In ten-day grasses, the average length of seed pods is  $2.5 \pm 0.2$  mm, and the seed pods are 3.0-3.5 times longer than the leaves (Table 3).

The hypocotyl of *V. officinalis* is thinly white and grows an average of 1-2 mm per day from the date of germination. The slow growth and shortening of the hypocotyl indicates that it is not possible to sow the seeds deep into the soil. This is because if the seeds of *V. officinalis* are sown deeper than 0.5 cm, the seeds that begin to rot will rot in the ground. In ten-day grasses, its length is  $3.5 \pm 0.3$  mm, growth slows down in the following days, and the grass stops growing when it is fifteen days old (Fig. 1).

It was found that in the growth of grasses, all the organs are correlated with each other, that is, the growth of the leaves of the seed is directly correlated with the elongation of the hypocotyl. With the cessation of leaf growth, the hypocotyl stops growing.

The roots of grasses grow faster than other members. The roots of three-day-old grasses grow  $7.2 \pm 0.2$  mm, and in the budding part there are root hairs. The root grows on average 2-3 mm per day, reaching  $15 \pm 1.1$  mm on ten-day grasses and  $30.0 \pm 1.9$  mm on 20-day grasses. The elongation of the root is due to its elongated part. The length of the root hairs varies. The root hairs, located close to the root collar, are longer and denser (Fig. 1). This is because each rhizoderma cell produces hair that grows on the surface. The hairs on the underside of the rootstock do not grow long, and the third part of the root is wrapped around the root sheath.

Embryo grows and elongates faster than the leaf axils. On four-day grasses, the leaves are  $2.3 \pm 0.3$  mm long,  $1.6 \pm 0.1$  mm wide, and the average band length is 2.5-3.0 mm. In ten-day grasses, the average length of seed pods is  $2.5 \pm 0.2$  mm, and the seed pods are 3.0-3.5 times longer than the leaves (Table 3).

The hypocotyl of *V. officinalis* is thinly white and grows an average of 1-2 mm per day from the date of germination. The slow growth and shortening of the hypocotyl indicates that it is not possible to sow the seeds deep into the soil. This is because if the seeds of *V. officinalis* are sown deeper than 0.5 cm, the seeds that begin to rot will rot in the ground. In ten-day grasses, its length is  $3.5 \pm 0.3$  mm, growth slows down in the following days, and the grass stops growing when it is fifteen days old (Fig. 1).

It was found that in the growth of grasses, all the organs are correlated with each other, that is, the growth of the leaves of the seed is directly correlated with the elongation of the hypocotyl. With the cessation of leaf growth, the hypocotyl stops growing.

The roots of grasses grow faster than other members. The roots of three-day-old grasses grow  $7.2 \pm 0.2$  mm, and in the budding part there are root hairs. The root grows on average 2-3 mm per day, reaching  $15 \pm 1.1$  mm on ten-day grasses and  $30.0 \pm 1.9$  mm on 20-day grasses. The elongation of the root is due to its elongated part. The length of the root hairs varies. The root hairs, located close to the root collar, are longer and denser (Fig. 1). This is because each rhizoderma cell produces hair that grows on the surface. The hairs on the underside of the rootstock do not grow long, and the third part of the root is wrapped around the root sheath.

When the grass is fifteen days old, the three coats begin to move, and the buds of the first leaves begin to appear. At this time, the growth of seed pods leaves and bands slows down.

Juvenile stage. On twenty-day-old grasses, the seed leaves stop growing, the first leaf, which assimilates from the three buds, appears, and the epicotyl does not develop well. This is because the initial joints of the stem are very short, and the next leaves are formed one after the other (Fig. 1).

When the second leaves appear on the three-leaf clover of the thirty-day-old grass, 2-3 seed stalks appear and grow near the leaf nodes or in the upper part of the hypocotyl. From them, on average, grow up to 1-3 side branches. The main root gradually stops growing. With the emergence of rhizomes, the growth of new leaves, formed by the three-jacketed, accelerates. At the grass stage, this interdependence of the members A. Kondratieva-Melville [5]. In forty days the main root stops growing in the grass. Urugpalla thickens the leaf axils and the upper part of the hypocotyl. The 3-4 root stalks that appear in it rapidly grow and branch.

Two leaves appear on thirty-day-old grass, three on forty-day-old grass, and a fourth leaf begins to form. The shape and size of the assimilating leaves differ sharply from those of the seeded leaves. The leaves are broadly ovate or circular, the edges are wavy or slightly trimmed, the base is round, the leaf band is long.

From the day the seeds germinate, the formed root system grows rapidly and helps the grass to stay firmly in the soil and provide them with moisture.

Thus, the germination of *V. officinalis* seeds is epigeal, the branches are shortened, the stems are arranged in a series, the leaves are in the form of a simple circle, the leaf band is long. The root system of *V. officinalis* consists of rootstocks and additional roots.

**TABLE 3 GROWTH DYNAMICS OF VALERIAN OFFICINALIS L. MEMBERS IN THE GRASS PERIOD(MM)**

Days	Seed leaves		Hypocotyl	Root
	length	width		
1	—	—	$0,7 \pm 0,1$	$0,5 \pm 0,1$
2	$2,0 \pm 0,2$	$1,0 \pm 0,1$	$2,3 \pm 0,3$	$2,5 \pm 0,2$
3	$2,0 \pm 0,2$	$1,2 \pm 0,1$	$2,3 \pm 0,3$	$7,2 \pm 0,2$
4	$2,3 \pm 0,3$	$1,6 \pm 0,1$	$2,5 \pm 0,2$	$8,1 \pm 0,3$
5	$2,3 \pm 0,1$	$1,7 \pm 0,3$	$2,7 \pm 0,3$	$11,0 \pm 0,4$
10	$2,5 \pm 0,2$	$1,8 \pm 0,2$	$3,5 \pm 0,3$	$15,0 \pm 1,1$
15	$2,7 \pm 0,3$	$2,1 \pm 0,1$	$3,5 \pm 0,3$	$20,0 \pm 1,9$
20	$4,5 \pm 0,4$	$3,0 \pm 0,3$	$3,5 \pm 0,3$	$30,0 \pm 1,9$

30	—	—	—	35,0±2,1
40	—	—	—	38,0±2,5

**Immatur stage.** After 3-4 simple leaves, 3-4 complex leaves appear, forming up to 13 segments. At this stage, the length of the roots reached  $8.6 \pm 0.3$  cm. The subsurface is composed of stems and additional roots (Fig. 2).

It was noted that the adult virginil plant has 5 pairs of compound leaves and an average of 11-15 segments in each. The height of the plant was  $75 \pm 1.2$  cm and the length of the roots was  $23 \pm 1.0$  cm.

**Generative stage.** *V. officinalis* enters the generative period from the second year of vegetation in natural conditions [2].

In the introduction, the plant has been in the forefront since the first year of life. In the first vegetation year, the height of the stem reached  $80 \pm 2.1$  cm and the length of the stem reached  $27 \pm 1.0$  cm. At the end of the first vegetation year, the upper part of the earth is dry. In the second growing season, the height of the stem was  $125.8 \pm 2.9$  cm and the length of the stem was  $37.0 \pm 1.5$  cm, which increased to  $95.2 \pm 2.0$  cm and  $33 \pm 1.4$  cm in the third growing year (2 -figure). The root system is of the popuchimon type. The generative period was 60-70 days. In the introduction of *V. officinalis*, the subsonyl period begins after the third year.

**Figure1. Virginil and generative cycles of *Valeriana officinalis* L.**

Figure2. Virginil and generative cycles of *Valeriana officinalis* L.

## CONCLUSION

Studies have shown that the seeds of *V. officinalis* germinate 90-95% in 5-8 days under laboratory conditions, and the optimum temperature for germination is 20-23 ° C. In the field, the optimal conditions for seed germination in the summer months (July, August) in the shade exposure and at a soil depth of 0.2 cm, seed germination for 8-10 days was  $56.6 \pm 0.85$ - $60 \pm 2.58\%$ . The optimum temperature is 30<sup>0</sup> C. The seeds retain their viability for up to 3 years.

The rapid growth of *V. officinalis* occurs in the early stages of the virginil period. The duration of the virginil cycle was 50-60 days and the generative period was 60-70 days. Plants planted in the fall have a greater number of generative members than plants planted in the spring. This is due to the fact that they adapt to the substrate in the winter, and in the spring to form strong plants.

### ABSTRACT

*The effectiveness of the selection of past crops for winter wheat in the short-term crop rotation system to increase soil fertility in saline soils has been established. At the same time, as a past crop, the positive effect of mash, sesame and soybean crops on the bulk density and humus content was revealed.*

**KEYWORDS:** Crop Rotation, Winter Wheat, Soil Fertility, Mash, Sesame, Soybeans, Past Crops, Nutrient Elements, Green Manure.

### INTRODUCTION

In our country, supporting measures to improve the culture of agriculture, basic tillage, introduce new technologies, as well as increase crop yields, mainly by reducing manual labor and cutting costs, it is necessary to develop a system of new agricultural technologies that are new and economical, and positively affect on soil fertility, water-physical properties of cotton, wheat and secondary crops, and also provide high yields.

Another important problem when growing wheat is the selection of high-quality wheat varieties suitable for various soil and climatic conditions, and the introduction of an appropriate crop rotation to obtain a high volume and high-quality grain crop. Along with growing crops, it is important to increase soil fertility and improve land reclamation. Improvement of land reclamation can be achieved due to the quality of land reclamation measures, the effective use of organic and mineral fertilizers to increase soil fertility and productivity, and the introduction of crop rotation. For each farm, it is important to introduce crop rotation with a short crop rotation, which provides increased soil fertility and the right choice of past crops for main crops.

U. Ismayilov's [1] studies show that almost all irrigated lands of the Republic of Karakalpakstan are saline, low soil fertility, soil salinity reduction, agro-reclamation measures to improve soil

fertility and productivity and soil quality, the right choice of past crops in crop rotation, the introduction of organic and lateral fertilizers in the soil is one of the most optimal measures.

B. M. Khalikov [2] found that 9-10 tons of organic residues per hectare accumulated in the soil, and the amount of humus in the soil increased by 0.020-0.035%, total nitrogen by 0.018-0.022% during crop rotation as a result of the introduction of triticale from intermediate crops, mash, as a repeated culture in short-turn (1:1, 2:1) alternating planting systems in typical gray soils of the Tashkent region.

According to K. Eshmirzaev [3], one of the main conditions for maintaining and improving soil fertility in irrigated lands is that the field is continuously covered by plants for a long time.

The scientific substantiation of the right choice of crops is relevant in the selection of past crops, increasing their soil fertility and crop yields.

On this issue, field experiments were carried out in the Khojaili district of the Republic of Karakalpakstan, and after spring sowing of past crops, winter wheat was sown. In this case, in the 1st variant, winter wheat: winter wheat, in 2 variant, mash + winter wheat for grain in the 1: 2 rotation system, in variant 3, sesame + winter wheat for grain, in variant 4, soybean for grain + winter wheat, in variant 5 mash for grain + 10 t/ha manure + winter wheat, in variant 6, sesame for grain + 10 t/ha manure + winter wheat, in variant 7, soybean for grain + 10 t/ha manure + winter wheat, in variant 8, mash for grain + intermediate crop (mash) +20 t/ha manure + winter wheat, in variant 9, sesame for grain + intermediate crop (mosh) +20 t/ha manure + winter wheat, in variant 10, soybean for grain + intermediate crop (mash) +20 t/ha manure + winter wheat.

Based on the goals and objectives of the study, phenological observations and biometric measurements were carried out on plants.

The influence of soil on agrochemical and agrophysical properties was established during sowing of sesame, mash and soybeans before winter wheat. The yield of any crop depends on the fertility of the soil, that is, on the amount of nutrients in it, bulk density of soil, water availability, structure.

The study revealed the effect of short-term crop rotation and organic fertilizers on soil fertility.

According to the results obtained, when sowing winter wheat at 20 t/ha after harvesting mash for green manure, soybean and sesame for grain, in variants 8,9 and 10, a decrease in soil bulk mass in the layer of 0–30 cm to 0.07–0.08 g/cm<sup>3</sup> was found compared with the option in which only winter wheat was sown after winter wheat. In this case, it can be said that green manure and organic fertilizers have a positive effect on soil density. At the same time, it also had a positive effect on the increase in soil porosity and played an important role in improving the state of the soil structure. This is important for improving the agrophysical properties of the soil when applying 20 t/ha of organic fertilizers in combination with legumes for the correct selection of past crops in crop rotation compared to winter wheat only.

The same picture is observed in a crop rotation system with a short crop rotation, as past crops have different effects on the amount of humus and nutrients in the soil, affecting the number of common and mobile forms of nitrogen, phosphorus and potassium in the soil, and their dynamics affect the amount of humus in the soil.

It was found that in the experiment, after adding 20 t/ha of manure, in variants of wheat grown after past crops, such as mash for green manure, soy and sesame for grain, it was observed that the amount of humus in the soil layers was approximately 0.010 and 0.050% more compared with the control variant, in which winter wheat was grown only after winter wheat, and that the indicators obtained in terms of the number of common and mobile NPK forms were higher than in the control.

Thus, it was found that the addition of 20 t/ha of fertilizers per hectare after past crops such as mash for green manure, soybeans and sesame for grain, and then sowing winter wheat, had a positive effect on soil fertility as a result of improved agrophysical and agrochemical properties the soil.

### ABSTRACT

*The article considers the issues of creating opportunities for quality education by developing the valleological competence of future physical education teachers on the basis of information and communication technologies and achieving the educational goals of their socialization.*

**KEYWORDS:** *Valeology, Healthy Thinking, Physical Education, Health, Future Specialist, Professional Competence, Development, Information And Communication Technologies.*

### INTRODUCTION

To save the nation's gene pool on a population scale and for individuals in the world, it is important for people to lead a healthy lifestyle. As a basis, special attention is paid to the development of valleological competence like good health, physical and intellectual development of future learners.

There are ample opportunities for developing the professional potential of future specialists, in the process of integration of the training system with the priorities of science and technology in our country. The issues of achieving the future professional development of students, adaptation to social life within the combination of common sense and beliefs occupy a leading place. Also, the development of valleological competence of future physical education teachers, improvement of healthy thinking and high spiritual qualities among professionals become more important. Fulfilling Presidential decrees of the Republic of Uzbekistan, PD-2909 on 'On further development of the higher education system', PD-3151 of 27- July 2017-year on 'On measures to further expand the participation of industries and sectors of the economy in improving the quality of training of highly educated specialists', PD-3775 of 5-June 2018-year on 'Additional measures to improve the quality of education in higher education institutions and ensure their

active participation in the ongoing comprehensive reforms in the country' and including other regulations are very essential nowadays[1,2,3,4,5,6].

The formation of valleological competence of future physical education teachers through information technology has an effective impact on the process of visualization of educational data. Drawings, graphics, animation, hypertext, multimedia, modelling elements, the sound will expand the opportunities for students to acquire virtual knowledge. It will also strengthen the valleological competence and motivation of future physical education teachers to acquire knowledge and become fundamentals for ensuring educational outcomes.

The valleological competence of future physical education teachers allows them to complete any complex tasks on the basis of information technology. Multimedia programmed products will be effective in the acquisition of valleological knowledge by future physical education teachers.

Valleological competence in future physical education teachers serves to develop the skills of attention, perception, imagination, logical observation in the use of information and communication technologies. Their creative thinking skills, emotional feelings are formed. It also allows future physical education teachers to organize their activities on the basis of theories and views on valeology.

The cycle of components in the development of valleological competence of future physical education teachers through information technology determines the essence of the system function. The pedagogical system is made up of components, the change of which depends on internal contradictions. The openness of the system serves to connect with the external environment through many communications, and the relationship of the environment has an impact on the movement and development of the system. 'Receiving and transmitting information from the pedagogical system are methods of interaction of system components with each other and with the whole system, as well as with the external environment of the system' [7, B.-21]. Therefore, the activities of educational entities in the field of valeology, healthy lifestyles, the need for education that meets the standards through information and communication means, alternative opportunities to meet it and other various factors are characterized as a single dynamically evolving system.

In our country, caring for the health of young people, the formation of a healthy lifestyle, the acquisition of skills of regular, independent participation in physical culture and sports is an integral part of the educational process. It is no coincidence that the head of our state Sh.Mirziyoev has put forward 5 important initiatives to raise the morale of young people and meaningfully organize their leisure time. In particular, the second initiative is aimed at creating the necessary conditions for the physical training of young people, to demonstrate their abilities in sports. In recent years, large-scale work has been carried out in our country to promote physical culture and sports, to ensure that young people follow a healthy lifestyle. The activity of sports clubs has been revived, regular competitions in mass sports have been organized.

The valleological competence of the teacher lays the groundwork for increasing the effectiveness of his pedagogical activity. Valleological competence, which is part of the general pedagogical culture of the pedagogue as a pedagogical phenomenon, combines the following alternatives: knowledge of health technologies, civility; possession of universal values; the ability to have a healthy lifestyle inherent in the national culture and to form it in students; active participation in

the social life of the country; respect for the culture of other nations and fostering these qualities in students, and so on.

Scientific substantiation of the studied problem helps to find the solution of the following contradictions in the pedagogical process: The contradictions between the expansion of the needs of students who are participants in education and the current situation in pedagogical practice; The differences between the social educational needs of the subjects of education and the teacher's readiness to teach the subject on the basis of the valleological context; differences in the interpretation of scientific concepts based on their scientific integration-based interpretation of ICT-based teaching, and so on.

Such ICT tools include e-learning assignments for stratified work, e-exercises of a logical nature, questions and e-assignments to introduce students to the environment, healthy lifestyle skills development, physical education and physical culture, e-learning and self-monitoring, and assignments, as well as a series of exercises, can be included (**Figure 1**).

#### **Types of ICT tools aimed at developing the valleological competence of future physical education teachers**

<b>№</b>	<b>Types of ICT tools</b>	<b>Expected result</b>
1	<b>E-learning assignments</b>	Creating a favorable environment for a healthy lifestyle, intellectual development
2	<b>Electronic exercises of a logical nature</b>	Developing healthy thinking, the ability to make healthy decisions
3	<b>E-assignments to introduce the environment</b>	Cultivation of valleological thinking, development of physical cultural maturity qualities
4	<b>Electronic assignments of a supervisory nature</b>	Identification of acquired knowledge, skills, competencies, competencies in valeology
5	<b>E-learning trainers that promote a healthy lifestyle</b>	Consolidation of topics that have a valleological character, aimed at promoting a healthy lifestyle, physical education, sports
6	<b>Fitness e-trainers</b>	Development of physical qualities based on demonstration models

As shown in Table 1, developing the valleological competence of future physical education teachers, the possibility of achieving the expected effectiveness based on the modernization of educational content and reliance on ICT tools will be expanded. Because the following tasks are solved in the educational process with the help of ICT:

Assistance to future physical education teachers in the acquisition of knowledge, skills, competencies in valeology, the development of competencies, the opportunity to demonstrate their unique characteristics;

The solution of exhibition, demonstration, visual tasks for the development of physical qualities of future teachers of physical culture through the use of information and communication technologies;

Ensuring kinesthetic, divergent, cognitive processes and mental and emotional development through the use of ICT in the development of valleological competence of future physical education teachers.

**ABSTRACT**

*The stress of being diagnosed with corona virus can spring up unresolved conflicts for any human. Counselling is one of the professions that can contribute to the resolution of some problem faced by individual's diagnosed with corona virus. Counselling for corona virus patients include approaches such as emotional support, group counselling, counseling, counselling for self-care, sexual health counselling, family counselling, lifestyle counselling and counselling for the aged. One of the implications for social wellbeing is the stimulation of patients to fight actively, replacing passivity, helplessness and resignation with positivity. Isolation Centres around the world that manage Corona virus patients should set up counselling centres to assist patients in receiving help from trained counsellors to promote psychosocial wellbeing. Counsellors must further educate themselves and seek out opportunities for personal growth, as well as training and the best counselling practices for corona virus patients were recommended among others for effective counselling of corona virus patients.*

**KEYWORDS:** Corona Virus, Covid-19, Counselling, Social wellbeing

**INTRODUCTION**

Corona virus is an expanding global medical concern. It is a chronic illness that impacts upon every aspect of the life of people and families affected. Interferes with normal psychological and social well-being, and even complicates family functioning. To be diagnosed with corona virus is to enter a realm where everyday aspects of life are altered. Coronavirus Disease 2019 (COVID-19), caused by SARS-CoV-2, initially came to attention in a series of patients with pneumonia of unknown etiology in the Hubei province of China, and subsequently spread to many other regions of the world through global travel either business, conferences, tourism etc. According to [1] the outbreak of the world endemic of corona virus Covid-19 has unarguably taken the world unaware, unprepared thus, leaving the affected countries to suffer the devastating dead crises as well as economic breakdown etc. approximately 2,379,326 million people have been infected with corona virus in the world as at 19<sup>th</sup> April, 2020 <https://www.worldometers.info/coronavirus/>; by projection, it would have risen to 5 million in the last quarter of the year 2020. Unfortunately, all age groups are prone to covid-19-children, adolescents, adult. The virus can infect any persons irrespective of their age but the older people and those with existing health issues/challenges (such as diabetes, heart disease, cardiovascular disease, immune suppressed conditions e.t.c) are more vulnerable to contact the virus than any other group of individuals. Methods of transmission can be through droplet, contaminated materials, sneezing or cough. The symptoms includes but not limited to nausea, fever, dry cough, shortness of breath, pneumonia, fatigue, and other breathing difficulties.

Stress of being diagnosed with corona virus can bring up unresolved concerns for an individual, so counsellors are becoming a significant member of the interdisciplinary health team and are helping to make positive contribution to patients' quality of life. Counselling is one of the professions that can contribute to the resolution of some problem faces by individuals with infected corona virus. It give one a chance to identify and work through problem with a trained counsellor. Counsellors provide service in a variety of settings and to diverse individuals with many different challenges. Combining a counselling approach that involves emotional support, flexibility, recognizing of a patient's strengths, and listening to him review his life story helps

the individual come to a better acceptance of his health, and is able to positively lead a new and meaningful life despite the condition. A corona virus infected person that receives sufficient and ongoing counselling from a trained counsellor is more likely to adapt a healthy life style. Therefore, counsellors who care for, or may want to care for corona virus patients need to be constantly learning and investigating the most current counselling practices. This maintains the best counselling for their patients.

### **Understating the Spread and Symptoms of Corona Virus**

The origin and source of the COVID-19 is from the animal and recently the virus is spreading from human to human transmission. The fundamental symptoms of the COVID-19 is where the virus can cause mild, flu – like symptoms such as fever, cough, difficulty breathing, pain in the muscles and the tiredness Nuhu (2020).

More serious cases develop severe pneumonia, acute respiratory distress syndrome, sepsis and septic shock that can lead to the death of the patient. People with existing chronic conditions seem to be more vulnerable to severe illness. [2] the development of vaccines takes time. Several pharmaceutical companies are working on vaccine candidates. These will however, take months before vaccines can be widely used as it needs to undergo extensive testing to determine its safety and efficacy.

From the present fact that the virus is spread among human being, medical experts recommend wearing a mask for every day movement particularly the moment you move outside from your home place where your heading you will necessarily meet other people. Due to the fact that the virus is spread human to human particularly from the infected person to another, it is advisable to avoid the physical contact with the person with cough symptoms. Since the evidence shows that the origin of the virus is from the animals it is advisable to escapes where animals are kept avoiding physical contact with any kind of animal, their excretions or droppings.

In addition to that it is recommended to follow and obey the general rules regarding hand hygiene and food hygiene. That means wash your hand with soap and water to use an alcohol-based disinfectant solution before eating, after using the toilet and after any contact with animals.

### **The Conceptual Explanation of Counselling**

There is no single definition of counselling that is considered generally acceptable. Counselling can have different meanings based on theoretical orientation. Counselling, as a helping profession, has its many approaches and procedures by which help is made available to the client. Counselling is a process of helping the clients to understand and clarify his views and learn to reach his self-determine goals through meaningful, well-informed choices and through the resolution of problems that could be of emotional or interpersonal nature [3]. It is a relationship in which a trained and experienced person (counsellor) provides information to a counsellee (troubled person) which the latter uses to overcome his challenges. Through the counselling process, counsellee uses information provided him to make informed decisions. [4] Describes counselling as a professional help for clients to resolve their peculiar challenges. Concerns, problems and doubts in various aspects of their lives. The goal of counselling is to help the counsellee find solutions to whatever problems he finds around him.

According to the British Association for Counselling and Psychotherapy [5], counselling is defined as a service delivered by trained counsellors or practitioners who work with people over

a short or long term to help them bring about effective change or enhanced wellbeing. Again, counselling is said to be a professional relationship that empowers diverse individuals, families and groups to accomplish mental health, wellness, education and career goals. Counselling could also be said to be number of procedures used in assisting an individual in solving problems which arise in various aspects of his life or in assisting him to minimize his overall personal development so that he could be more effective, satisfied and useful to the society in which he lives [4]. Deductively, counselling is a professional services which aims at helping people adjust to their environment, acquire problem-solving skills, manage their lives effectively and live meaningfully to achieve potentialities. Therefore, modern counselling entails concerted efforts in achieving greater gains even in ugly situations. Patients often cope with diseases much like they cope with other struggles in life, so counsellors who become aware of their clients' coping skills can help them resolve their concerns and emotional pain using some of the coping tools. Counsellors may work with COVID-19 response or healthcare team in isolation centre for clinical supports services.

### **Counselling for COVID-19 Patients**

The main objective of counselling is to give support to clients with challenges. The establishment of a relationship between a counsellor and client (patient) is crucial before counselling is attempted. This promotes the client's trust in the counsellor and he or she (the client) will speak without reserve. Hence, this enables accurate assessment of the client's current condition. It is beneficial when setting goals with the patient.

**Emotional Support:** More often than not, people newly diagnosed with corona virus may have trouble accepting the diagnosis, especially in a situation where they feel physically healthy and are not experiencing any symptom of the disease. A Counselling Psychologist's role here is to help such people address emotional reactions such as disbelief, anxiety, denial, depression, anger, and learn to accept their condition.

Patients and family members often avoid conversations about terminal disease in order to protect each other from emotional pain and fear. Counsellors can help to bridge the gap between them and encourage communication about emotional, spiritual and cultural beliefs. The purpose of the counsellor working with the ill is to listen to the patients with empathy and understanding helping them to find psychological and emotional peace. Carl Rogers, an influential psychologist in America who founded Client-centered therapy believed that counsellors should show clients unconditional positive regard, which is an empathic understanding and total acceptance of where the client is on his or her journey [6]. Once a patient believes the counsellor is listening non-judgmentally, he feels encouraged and secure to openly talk about his fears and concerns.

**Counselling for Self-care:** Patients who benefit from counselling tend to be motivated for, and in self-care. Self-care includes a broad spectrum. According to World Health Organization [7], Self-Care in health refers to the activities individuals, families and communities undertake with the intention of enhancing health, preventing disease, limiting illness, and restoring health. Self-care encompasses several issues including hygiene, nutrition, lifestyle, environmental and socio-economic factor. Promotion of self-care is a means to empower individuals, families and communities for informed health decision making. These activities are derived from knowledge and skills from the pool of both professional and lay experience. They are undertaken by lay people on their own behalf, either separately or in participative collaboration with professionals.

**Sexual Health Counselling:** Sexual Health is a core part of a person's general well-being. Corona virus infection can affect aspect of human sexuality and as such, counselling should integrate sexual health as an integral part; and should address the physical, psychological, social and personal aspects of sexuality in a culturally sensitive issue and sexual health counselling must be approached with due consideration to client's privacy and confidentiality.

**Counselling the Aged:** In many countries the prevalence rate of corona virus cases increases significantly with age. As people age, their ability to cope with living, to learn new information and remain independent varies greatly. Older people with corona virus may have more disabilities, compared to younger people with the virus. Within the health care, physicians and other caregivers may be less likely to offer particular medical treatments to older patients because of a belief that certain ailments are the inevitable consequences of natural aging.

**Lifestyle Counselling:** A greater number of corona virus infected person may often find it challenging, if not outright depressing, to make the lifestyle change necessary to stay healthy. Lifestyle management involves weight reduction in the obese or overweight patient. This is usually difficult for most patients and imposes a psychological burden on them. A lack of understanding of the disease by their peers, colleagues, and family members also makes it difficult for them to adjust to their new situation. Through behavior modification, counsellors can help patients/clients change behaviours to gradually improve eating habits, activity levels and overall outlook.

### **Implication of Counselling on Social Well-being of Covid-19 Patients**

Corona virus makes many demands on lifestyle and poses debilitating and life-threatening complications which overall have a negative impact on a patient's well-being and social life. In a developing nation with poor healthcare and social support systems, the economic consequences of being infected with corona virus can be enormous for the patient, leading to inadequate care and the subsequent development of complications. The stresses and demands of living with corona virus affect interpersonal and social relationships. Hence, counselling should be made available for corona virus infected person to enhance social well-being and improve quality of life.

Counselling support helps a suffering patient free himself from all forms of tension and negative feelings, to express their fear, anxiety and sorrow and give rise to hope. It stimulates the patient to fight actively, replacing passivity, helplessness and resignation. It gives the suffering person the strength to fight for survival on grounds of building positivity. Counselling can improve the quality of life for corona virus patients and as such, the disease will in no way impede their social functioning and general well-being.

Helping patients to find purpose and meaning in their life is beneficial in reducing death anxiety in the patient and their relatives. Even when death is expected, the family can be assisted to adjust to the bad news and seek avenues to make the best use of available lifetime. Members in a support group can share similar experiences, learn from each other and teach each other how to handle situations that arise with family, pain, medical concerns, and other areas that concern their well-being.

## CONCLUSION

Corona virus is a lifelong disease that almost never goes away. Counsellors working with corona virus work in a multidisciplinary team to provide support and comfort, helping these individuals live normal and fulfilling lives.

## Recommendations

Isolation Centres around the world that manage corona virus patients should set up counselling centers to assist patients in receiving help from trained counsellors to promote psychosocial well-being. Thus we know, plays a key role in healing process.

Counsellors must further educate themselves and seek out opportunities for personal growth, as well as training and the best counselling practices for corona virus patients.

Religious institutions should be made to understand the role of counselling in managing clients. Hence, they should encourage corona virus members to seek counselling.

Government and organized private sector should invest reasonable resources in counselling of corona virus patients to enhance their well being.

Due to the growing importance of counselling in the society. Educational institutions should include counselling in their learning and teaching curriculum.

Isolation centers should set up intercom to assist patients in isolation received emotional supports and from family and friends during this period.

## INTERPRETATION OF FOLKLORE AND ETHNOGRAPHIC TRADITIONS IN MODERN UZBEK CINEMA

**Karabaev Muzaffar Mukhtarovich\***

\*Senior Teacher,  
Head of the Department of,  
“Film, television, and radio directing”,  
State institute of Arts and Culture, UZBEKISTAN

### ABSTRACT

*This article describes the tendency in the modern Uzbek cinematography for creating feature films based on folklore and ethnographic traditions. Here is given a significant attention to thoughts on a combination of folklore and ethnography with the features of a fiction film, and the determining role of directors in it.*

**KEYWORDS:** *Folklore-Ethnography, Fiction Film, Visual Expression, Logical Sequence, Plot, Character.*

### INTRODUCTION

In times of the former Soviet Union, to reflect national values and customs, the folklore and ethnographic traditions of the Union countries, as well as to foster a sense of pride and to reflect the characteristics of each nation as a whole, were categorically not allowed. Although in the mid-1980s a little freedom was given to national issues, and in the cinema were made works of art where reflected self-identity of the people. But even then, the issue of complete freedom — the issue of creative freedom — was narrow, and the concept of censorship was in practice and still valid.

Independence has brought about a revival and active promotion of the forgotten values of the nation through the country. As a result, in the filmmaking a process of expressing artistic ideas through folk ethnography and traditions has also been started as well there has been formed a process of specific creative approaches by directors.

It is known that the values and traditions of each nation and the people foster kindness and promote virtue. The quality of goodness in people is seen as the central core of each of them. But the fact is how the director interprets these values and what ideas he conveys through them. That

is why the role of the director's creative approaches and objective standpoint on depicting the folk ethnography in feature films and his skills in the sphere has been repeatedly emphasized. Over the years of independence many feature films have been created with elements of folklore and ethnographic traditions. The fact that such films build up the image of national Uzbek films has become a peculiar phenomenon.

The tendency to use folk ethnography is more expressively traced in Yusuf Rozikov's film "Dilhiraj". It is noticed that the name of such films not only reflects their general content, but also show that they were created on the basis of folk customs and traditions.

In almost all frames, in all events Dilhiraj shows the customs and traditions, which have been an integral part of the people's daily lives. The success of the film lies in the fact that the film is not just cluttered with folklore elements or even these elements not occurred as an array of sequence, but they construct the plot of the film, which is actually formed on its own, and in some cases stimulates its development.

### **MATERIALS AND METHODS**

At first glance, it may seem that "Dilhiroj"(men's game), created in a purely national spirit, reflects the realities of one region in a narrow context.[1.11-12] But the film is based on human destiny, an analysis of human emotions, and the path to happiness. The film is a modern interpretation of the eternal idea of pure love.

The form of the film reflects the life, customs and nature of the nation, enriched by universal ideas that are relevant for all mankind. Therefore, the national traditions and folklore elements used in the film have two different functions. On the one hand, they are used as symbols to express an artistic idea. On the other hand, it is argued that these habits established for a reason. On the base of their existence as values lies the wisdom of people, their responsible attitude towards the entire life. The film cannot be judged solely on a superficial level and based on a sequence of events. It consists of subtexts and symbols from beginning to end. A little ahead of the analysis, we can say that the symbols and subtexts that appear in some episodes then do not disappear. It serves not only to convey an idea of a particular episode, but also has a dialectical character, that is, it never ends. As an integral part of the whole work, united in one chain they can form a great idea and an artistic impression.

The title of the film alone attracts viewers to it. Indeed, Dilhiraj is the popular and well-known music and dance of men. In fact, it emphasizes the theme and content of the entire film. Firstly, it should be appropriate to pay attention to its lexical meaning. The word "dilhiraj" has been derived from the Persian word "dilxarosh" and means "heart-wrenching". So, the film is a love story, a strong, intense, pure love story! The history of path of trials and tribulations, suffering, patience, endurance and struggle for uniting two sincere souls!

As at every ups and downs of life, elements of folklore appear on this long journey. Sometimes they are seen as solutions to life's challenges, and sometimes they are the trial itself. The authors ErkinAgzam and Yusuf Rozikov do not depict the difficulties, complexities, and rewards of life in a realistic way, which occurs as a chain of events. On the contrary, every trial of destiny is presented as the Almighty's blessing to the servant. This is reflected at the beginning of the film.

F. Jalalov – "Teacher Globe", who has just had a son and is happy about it, plants a sapling and begs the Creator for rain.

His request is accepted, and immediately it begins to rain. The little girl who hears that one day she will marry the newborn baby boy rips off the planted sapling and runs away. She neither turns around, nor does look back. The sapling gradually recovers and grows again. T.Yusupova, the storyteller, says, “the servant feels superior to her Creator” and this gives a hint that the film is about the love story of two beloved servants of the Almighty.

While the recovery of the sapling acquires a symbolic meaning, it also reflects the noble tradition of the Uzbek nation – to plant a tree for a newborn child, and thus to contribute to eternal life. As mentioned above, each ritual and custom in the film successfully combined on a solid basis with the development of certain plot events.

## DISCUSSION

The film explains how sincere love from childhood can grow and blossom purely for considerable time and turn into passionate love. The directors were able to use all expressive means cohesively and harmoniously in the development of the plot of the film. During the “Sunnat (Khatna) tuyi” (circumcision party) wedding the music, the images and the actor’s performances set a single atmosphere and affect the audience mood. Fear and excitement in the wedding boy’s heart are expressed in quick, sharp sounds of the doira. And here the wariness of the other participants is shown through their eye movements and actions. This, in turn, helps to convey the child’s mood to the picture and consequently from the picture to the viewer. The audience unwillingly experiences a feeling of sympathy with the boy at this moment.

The modernized and polished tunes of folk melody dilhiroj accompanied by events of the plot are running as a leitmotiv through the whole film.

Although the images of the film are the result of the collaboration among the artist, the cameraman and the director, in some places one will notice traits of the unique style of the artist. Here's one example, in “Sunnattuyi” (circumcision party) scene is shown a warm relationship that arose from early childhood between Toshtemir, who is circumcised, and Sanam. While no one is able to console Toshtemir, who is crying in fear of the strapping barber, who performs the circumcision, he says to those lying next to him: “Let Sanam come and lie with me.” Everyone is astounded. Sanam boldly comes to him. She lies down beside him and threatens with the following words: “if you make a sound”. By the way, there is logic behind the girl’s special control manner. When Tashtemir was born, Sanam was a three- or four-year-old girl, and she acts in this way as if her age gives the right. The fact they stay together during the wedding party offers the reason for everyone to call them the bride and groom. Simply stated intention turns into a thing with serious consequences. The picture shows the joyful dances of the parents and guests. Images of the dancing people are shown through the window. In the foreground are pomegranates placed on a windowsill. The general view of the dancers and pomegranates also has implicit meaning. After all, pomegranates here can be interpreted as a symbol of family. It is known that the fruit containing a mass of red seeds under one round skin is regarded as a symbol of love, family in the visual arts and especially in the East. That is why people who dance in one place are compared to this pomegranate. Maybe it gives a hint of creating a new family with strong and firm bases. If we return to the above-mentioned idea, it will become clear that these pomegranate paintings are very common in the work of the artist of the film BoburIsmailov. Of course, he largely uses a pomegranate in his paintings to convey symbolic messages. Perhaps, the director preferred to collaborate with him due to his original symbolic style. This symbol is

not drawn at random. Perhaps for the creators, this may carry a myriad of implicit meanings. However can all viewers grasp these symbolic images of the film? After all, not every spectator knows about the art, film theory, and eastern philosophy. This matter is the most complex and controversial aspect of art films. But the fact is that the symbols are given through simple life situations and at least makes the viewer think about it.

Viewers understand that the details and things are not just shown in vain, they will try to figure out their meaning. To prompt the viewer to think about life, the art and philosophy as well as to arouse such desires as a result of his works should be an important task of a creative person.

The skill of the cameraman KhotamFayziev is manifested in his ability to convey symbols, folk motifs and real images of life in a single shot. For example, the episode where Tashtemir grows of from child into adult – a dream, where a planted tree for his birth burns down. Of course, it is not easy to understand what this episode may mean. However, a dialog with his uncle clarifies the situation, Fayz – FarhodAbdullayev, advises the nephew who has just woke up from a nightmare to marry. Tashtemir –AlisherHamraev, says that it is too early and that he has a burning passion in his heart, but he is not going to marry Sanam until he wins her heart with a brave deed.

Toshtemir, who suddenly has to go to the army, with his uncle leaves his village on a motorcycle. Behind them is Sanam, SevinchMuminova, who is frantically running along the rooftops of small semi-detached rural houses, trying to reach them, to reach her lover. And this episode expresses not only the girl's feelings, but also shows the high intensity of the shot, captured with "one breath", and this raises the dynamics of the film to a certain level.

Tashtemir's intention to impress the girl with something, if directly expresses his courage and enthusiasm, then indirectly infers to folk traditions. It is worth mentioning this fight scene in the film. Sanam's announcement that she will marry the winner somehow resembles epics. In fact, other features of the film also remind of the epic type. Unexpectedly occurred events play a significant role in the film. These events move the heroes on their own course as if fate decreed. In fact, it is evident that the effects of the events are enhancing the film stronger than the actions of the characters. The process of wrestling is also given for some reason. And this, in turn, has a powerful effect on the emotions of the viewer. Since the famous wrestler Sobir "defeats" all wrestlers one by one, the contenders' number decreases, or rather, no one is left. The shot shows a brave man on one side, the disappointment of Sanam, who regrets her words, and Fayzibay, who is not indifferent to the fate of his beloved nephew but deeply sadden by not finding any solution to protect his nephew's love on the other side. Until the last moments, the announcer constantly reminds us that today's contest is almost over, and is there any willing contender. These words make the crowd more excited. Unexpectedly, or rather, the viewers long-awaited Toshtemir enters the arena. The fight lasts until late at night. The wedding is over, everyone goes home. Two wrestlers, not wanting to be overwhelmed, lean on each other and fight alone. Finally, Sobir leaves the arena, and Toshtemir wins. However, this is not what he expected, his victory will not become a poem among the people. The crowd has not seen this. When he is saddened that no one has witnessed his victory, on the bridge Sanam bitterly weeps with happiness, her tears mix with the tears from the sky and she angrily yells "I've seen... I've seen it!"

The end of this fight seems as if it is the end of all problems. Here we again see the unpredictability of the course of events of the film. Two sides of the engagement party, especially women, are trying to agree on rituals. This is where the main event of the film takes place.

In wedding preparations guests are talking about holding an outdated fiancé game “Qalliqo’yin”. Of course, some of the attendants, especially the fiancée’s mother, against this practice. She says that it is a tradition of reminiscence and she is not going to preserve it. However, the groom’s relatives want to let the groom in and attend the bride’s house before the wedding but in order to prevent malicious gossips about them they should enter into nikah (marriage). But for some reason the nikah does not take place. The fiancé begins frequently date with the fiancée. TutiYusupova, a blind woman who has been a “storyteller” from the very beginning of the film, is appointed as a guard of their meetings.

There are several cases when an old woman, even being awakened sometimes pretended to be asleep, and criticizes with irony the reaction of others to her current state. Even in a dispute over the “Qaliquyin”, the old woman speaks in favor of the tradition and ironically indicates to those who are against it with the words “As if they did not play in it.” The strange behavior of the old woman, who in the film acts as a wise woman, who can predict the future, leaves us to ponder.

The reason why so many people against the “qaliquyin” can be explained with the possible intimate relationships between the girl and the guy as well as unwanted pregnancy before the wedding as a consequence of this tradition. This is why the old woman is assigned to guard the youth. However, is it not strange that the old woman, knowing the close passionate affairs of youth, pretends to be asleep? Moreover, the old woman, T. Yusupova, informs early then others Sanam – S. Muminova, that she’ll become a mother. She announces news in so calm and tranquil manner. Her tone suggests that she has long known this news and it seems natural for her.

Shortly before the wedding, Toshtemir’s grandfather dies. In the film, this occurrence is reported by the old woman as “joined the vast majority”. Of course, this is the author’s emphasis on folk morality. Indeed, the dead are more than alive. In addition, each person has one final destination. All this is given in one word – “joined the vast majority!” Due to this happening, the wedding is postponed, and soon Tostemir receives a call for military service. Toshtemir has to do his military service before the wedding. The period in the film becomes clear at this point of the film and during the “Sunnattuyi”. It was the Soviet Union era. The first case, where people shower money, doesn’t carry any connotation. But the second case indicates to two year compulsory military service, which causes further severance of the two ardent lovers. A thorough analysis of the film reveals some points where the logical sequence of the time is distorted. If we talk about the image created by ZikirMuhammadjonov at the beginning of the film, we note a philosophical point of view that his whole life has been devoted to Soviet ideas and that his moral ideals are destroyed when the Soviet Union collapses. This means that the authors also tried to focus on the processes occurring in the worldview of people due to the collapse of one system. However, in some places it leaves feelings that the previous regime is still ruling.

The purpose of such analyses is that if the Soviet Union is still ongoing if a scene with changes in the ideals of one person does not work in the following episodes, then many wonderful episodes of the film become useless. In particular, what is the purpose of the episodes where the “Teacher globe” brings the globe, his father crashes the globe expressing his hatred of a

dishonest system, and the episode where the teacher uses the boy's head as the globe? Of course, the film director carries out responsibility for creating a correspondence between time and space as well as the balance between the described events and time.

When folklore elements are used throughout the film, their misinterpretation will be a cause for displaying folk customs negatively to the viewers. In the film, the young people in close relationships, during the "qalliqo'yin", give their feelings free rein and this leads to subsequent negative consequences. First of all, when fiancée's pregnancy becomes known, the marriage process is held with putting the duppi (skullcap) of the fiancé who is now in military service. It is true that there were similar incidences in the area. Maybe it was practiced in exceptional circumstances as mentioned above. In addition, the fact that the filmmakers' depiction of the consequences of the "qalliquyin" before the wedding gives a hint that such cases have occasionally occurred. But there is a moment in the film that seems to indicate that the end of such a ritual ends with almost the same consequences. Sanam, who is visibly pregnant, moves to her relatives in the mountains to avoid rumors, and then gives birth to a child, and then returns home. Sanama's mother represents the infant as her baby. A woman among the guests says hinting that: "your daughter has disappeared, and so suddenly you have a baby." Of course, these blunt words hints to "qalliquyin". But momentarily the "wise" old woman reminds this guest of the baby girl that her mother gave birth to at her home. A woman quickly gets the message and "bites her tongue". And an old woman's question, who else wants to express herself, shows that she knows the faults of everyone who is present in the room. This episode seems to show the viewer that the consequences of the "qalliquyin" always result in this way.

Everything, especially an artwork, becomes more understandable in comparison. In ErkinKhushvaktov's play "Qalliquyin" (the fiancé game), this tradition is shown from the positive aspect by the author. It can be admitted that this performance, shown on the stage, illustrates the purpose of this tradition. This play tells a straightforward story. A man who remains a bachelor despite his old age and is rumored to be lame wants to marry a spinster who is more than thirty, besides to whom the matchmakers no longer attend. A girl who is so proud of herself does not agree to marry the lame. But the poor man who has never spoken with girls and does not know how to behave. The girl's grandmother understands that in this situation the only way to bring two young people together is to play "qalliquyin". As a result, two kind souls who do not know each other learn about each other more closely, have fun and fall in love because of the game. Although there are situations similar to those depicted in the film, the essence of this tradition is based on kindness and virtue as well it is practically intended to create a close bond between a man and a woman. A slightly different interpretation of one customs in the film had a significant impact on the quality of the whole film. However, a tunnel vision, a one-sided attitude, in using folklore-ethnographic elements is unacceptable. After all, "folklore not only performs an artistic and aesthetic function, but, most importantly, preserves the historical memory, philosophy and enlightenment of a certain nation. In addition, another important aspect of folklore is to develop spirituality and to instill high morals.

The use of folklore and ethnography as a means of expression has become a peculiar tendency among the modern Uzbek directors of art films. In the case of the analyzed film, it can be said that although some of the films directly show the customs and traditions of people, for the promotion and large-scale demonstration of national values. In some films, it is not just a means of expression the peculiarities of the Uzbek nation, but rather a complex set of aesthetic and

spiritual views that have been embedded in the blood and conscience of the nation and people and have become a form of their everyday life, worldview and way of thinking.

## CONCLUSION

However, in modern Uzbek cinema three negative elements can be observed in portraying folklore-ethnography:

Firstly, the lack of the filmmaker's creative professionalism in films depicting beneficial, positive aspects of customs and traditions. There is a lack of full and effective use of elements of the means of cinematography;

Secondly, in films with high artistry can be traced to a one-sided interpretation of customs and traditions and an approach to national concepts based on the views of other traditions;

Thirdly, there are cases when national traditions, values are simply used as an external form of means of expression, for the sake of exotics. The essence of such films does not reveal the deep roots of these values. That is, the plot, elements of art and values do not form a complete unity.

It is desirable to note that the third of the three cases considered above contradicts the specifics of artistic creation and it would be better to refrain from such approaches completely and to combine the two previous cases in order to express in a high artistic way the positive aspects of folk wisdom emerged from the consciousness of the nation.

### ABSTRACT

*The paper reveals the linguistic comparative structural and semantic analysis of Uzbek and English proverbs with zoonymic components that reflects national and cultural identity and the specificity of thinking of the Uzbek and English people. The aim of the paper is to explore and show similarities and differences in mentality and perception of the world by Uzbek and English people. The aim was achieved due to the study of the structural and semantic components and expressiveness of the zoonymic proverbs.*

**KEYWORDS:** *Phraseology, Idiom, Linguoculture, Collocation, Zoonym, Mentality, Paremiology.*

### INTRODUCTION

Phraseology is a branch of linguistics which studies different types of set expressions, which like words name various objects and phenomena. They exist in the language as ready-made units. A phraseological unit (PU) can be defined as a non-motivated word-group that cannot be freely made up in speech, but is reproduced as a ready-made unit. Nowadays phraseological units have become the object of lots of linguists. And it can also be proven by the interest and attention to the linguoculturology issues. Sh.Balli, the Swiss scholar with French origin, was one of the first researchers who investigated the phraseological units[1]. For the very first time a Russian scholar V.V.Vinogradov identified the aim of the phraseological units and classified them into three categories and he considered that the essence of the PhUs was the stability of their structures.[2]The term “idiom”used by western scholars has comparatively recently found its way into Russian phraseology but is applied mostly to only a certain type of phraseological unit

as it will be clear from further explanations. There are some other terms: set-expressions, set-phrases, phrases, fixed word-groups, collocations. Phraseological units do not appear in the speech as an separate word, they remain in the human brain as a readymade and set units so they have at least two independent words which form phrases during the process of communication. There is not a unique and perfect theory of PhUs in the world linguistics. And there are different ideas about the main signs of PhUs and PPhUs. Particularly, according to B.A. Larin, the main sign is the invisibility of separate meanings of the words combining the word combination.[3] And according to A.A.Reformatskiy they cannot be translated into another language with word for word translation method.[4]A.V.Kunin points out that the existence of stability signs in PhUs can be explained by the use of phraseological units in lexical structures, semantic, morphological and syntactic components.[5]A.E.Mamatov says, «the main sign of phraseological units are complete and partial semantic reflection, the figurative meaning of their components». [6]

Many attempts have been made to define a proverb. There are many definitions of these phenomenal figures, but still scholars are not satisfied with them as more attempts to define a proverb are being made. A proverb (from Latin: proverbium) is a simple and concrete saying popularly known and repeated, which expresses a truth, based on common sense or the practical experience of humanity. They are often metaphorical. A proverb that describes a basic rule of conduct may also be known as a maxim. If a proverb is distinguished by particularly good phrasing, it may be known as an aphorism. According to the Oxford English Dictionary, a proverb is “a short saying in common and recognized use; a concise sentence, often metaphorical or alliterative in form, which is held to express some truth ascertained by experience or observation and familiar to all”. [7] The term «мақол» (proverb) in the Uzbek language was derived from Arabic «qavlun» (to say) and it means a word, a sentence or an expression which belonged to one of the genres of people’s wisdom

Proverbs are often borrowed from similar languages and cultures, and sometimes come down to the present through more than one language. Both the Bible (Book of Proverbs) and Medieval Latin have played a considerable role in distributing proverbs across Europe, although almost every culture has examples of its own. Bible is essential for British and American cultures. It is said that their cultures are not integrated without Bible. It is safe to say that Bible influences every aspect of its disciples' life. Consequently, many sayings and sentences in Bible have been popularly accepted. They have been deeply rooted among people and people frequently use them to cite a truth or express their ideas. The study of proverbs is called paremiology (from Greek παροιμία - paroimna, "proverb") and can be dated back as far as Aristotle. Paremiography, on the other hand, is the collection of proverbs. A prominent proverb scholar in the United States is Wolfgang Mieder. He has written or edited over 50 books on the subject, edits the journal Proverbium, has written innumerable articles on proverbs, and is very widely cited by other proverb scholars. In addition, Mieder suggests that the Latin language of the Middle Ages, which at that time performed the role of the lingua franca, can be regarded as a source of proverbs, because these proverbial expressions cannot be traced back to antiquity. In general, the scholar believes that the dissemination of Latin proverbs not only all over Europe, but also in other continents has been greatly affected by the English language, which in many countries is considered to be a second language. Admittedly, it is important to note that these English proverbs are adaptations from Latin and might appear in other languages as direct translations of the English variants. Every nation has its vast collections of proverbs. Many scholars state that

the process of collecting proverbs has a rather considerable tradition. Mieder presents “A proverb is a short, generally known sentence of the folk which contains wisdom, truth, and traditional views in a metaphorical, fixed and memorable form and which is handed down from generation to generation”[8]

Proverbial phraseological units (PPhUs) make up a certain part of phraseological fund of the nations all over the world. The main peculiarities of the PPhUs are their stability, figurative sense, ready-made forms in speech, semantic relativeness, expressive-emotiveness and expressiveness and they are considered to be the method of expressing the peculiarities of national vocabulary. Proverbial phraseological units are ready-made units used in complete or partial figurative sense. Their structure equals to a sentence. They can express independent meaning in a context and they are semantically solid. Besides, the PPhUs are considered to be set phrases which include various proverbs, sayings, aphorisms, legends, myths, and other phrases and idioms.

PPhUs have the following categorical signs: thoughts are the literary and logical shape; preservation of attributes of a certain ethnos; the smallest genre of a national folklore; special grammatical shape; existence of generalizing and didactic idea. It is too difficult to limit the phraseological units based on an expressive stylistic layer. While comparing them with other PPhUs in English dictionaries it turns out to be different to include them into a certain group of PPhUs. There are also differences between the signs used in «Phraseological Dictionary of the Uzbek language» by Sh.Rahmatullayev and M. Sodikova's phraseological dictionaries.[9]The Uzbek language possesses also long background. It is true that this language was given the name of “Uzbek language” recently, but this language has existed since approximately X-XI century. A huge number of proverbs, sayings and aphorisms are considered as a great wealth of the Uzbek culture. The main sources may be classified as followings: some characters from religious sources and the borrowed translations (mainly from the Arab, Tadjik, Persian and Russian languages). [10] Moreover, there are some proverbs that come from sayings created by the mass media (TV, radio or social nets), expressions of films and songs, and even advertising slogans in all languages including English and Uzbek. However, they need some time to become or to form new proverbs as well. Carrying out the frequency analysis of the animalistic components in Uzbek and English phraseological units, one cannot but pay attention to the similar nature of their use. The names of the pets match: dog (Itdek charchamoq-Dog tired ; It hurar carvon o'tar-The dogs bark but the caravan goes on ); cat (It mushuk bo'lib yashamoq-To live cat - and- dog life, ichini mushuk tatalamoq- curiosity killed cat); horse (Otdak soglom bo'lmoq-as strong as a horse, yuvosh o'tning tepkisi qattiq bo'ladi-quiet horses kick the hardest; tishini ko'rguncha ishini ko'r-never look a gift horse in the mouth,yaxshi otga bir qamchi-a good horse cannot be a bad colour); sheep (qo'y terisini yopingan bo'ri -a wolf in sheep's clothing); The names of wild animals are also repeated: hare (Quyov o'z ko'lankasidan ham qo'rqar ;Hold with the hare and run with the hounds); fox (Tulkidan sher chiqmas, Qo'rqoqdan er chiqmas ; The fox is not taken twice in the same snare ); wolf (Bo'rining o'g'zi esa ham , emasa ham- qon ; How many wolves do not feed, he looks into the forest).

Only in Uzbek animalisms most often camels are used from domestic animals (tuyaning ustida it qopmoq, tuya ko'rdingmi –yo'q, ignadek gapni tuyadek qilmoq), as well as the names of animals whose habitat was the areas of settlement of the ancient turkic tribes (donkey, goat, sheep, cow). Only English animalisms contain the words leopard (The leopard can not change his spots.

Leopard cannot change its spots) and the lion (Great lion. Popular man. To beard the lion in his den. Attack the lion in his own den).

The phraseological foundation of each nation reflects in its many images the history of life, the material and spiritual culture of the nation. Animalistic idioms talk about the animal world that has surrounded us since time immemorial. The main source for the formation of animalistic phraseology is a metaphor (Zeal without knowledge is a runaway horse. Knowledge without zeal is a horse that bit a bit. Zeal is unhealthy). A hidden comparison, laid down in a metaphor, observes the specific features of national life, spirit, living conditions, and labor skills of one or another people.

The marking of the national-cultural specificity of the figurative semantics of phraseological units is often created by the actual component of the phraseological unit. The national-cultural originality of phraseological units is especially evident when juxtaposing two languages, which shows that both Uzbek and English have more or less similar images and symbols. For both Uzbek and English, a horse is the embodiment of industriousness and endurance, a wolf is perceived as an image of an evil bloodthirsty predator, a fox is a symbol of cunning, a hare is cowardice, a sheep is a symbol of humility, unconditional obedience, helplessness. On the basis of these images, two phraseological units appeared in two languages that completely or partially coincided in structure and meaning. In terms of coincidence in two languages, we can distinguish groups:

1. Proverbs that completely coincide in two languages (calque translation):

Uzbek proverbs	English proverbs
Bir tirraqi buzoq butun podani bulgaydi	One scabbed sheep infects the whole flock
It mushuk bo'lib yashamoq	To live cat – and- dog.
Yaxshi otga bir qamchi	A good horse cannot be a bad colour
Vovullagan it tishlamas	Barking dogs seldom bite
Bir o'q bilan ikki quyinni o'ldirmoq.	. Kill two birds with one stone
Baliq boshidan sasiydi.	Fish begins to stink at the head
Qo'ynida ilon asramoq.	A snake in the grass
Dunyoni suv bossa o'rdakka ne g'am.	Like water off a duck's back
Yuvvosh it hurmay tishlar	Dumb dogs are dangerous
Baliq suvning chuqurini, mard ishning qiyinini izlar	In the deepest water is the best fishing.
Bir qaldirgoch bilan bahor kelmas	One sparrow doesn't make spring
Qarga bolasini oppogim deydi	Every bird likes its own nest
Jo'jani kuzda sanaymiz	Don't count one's chickens before they are hatched
O'zi yemas- itga bermas.	A dog in the manger
Ko'p gap eshakka yuk.	To talk the hind leg off a donkey
It ўз уйида ботир	Every dog is a valiant at his own door

2. The zoocomponent of the proverb is in one language, its equivalent in another is absent:

<b>Uzbek proverbs</b>	<b>English proverbs</b>
Podadan oldin chang chiqarmoq	Don't put the cart before the horse
Chumchuq pir etsa, yuragi shir etadi	Cowards die many times, before their deaths
Ikki qo'chqorning boshi bir qozonda qaynamas	Too many cooks spoil the broth
To'ngizni botqoqda bos	When in Rome, do as the Romans do
Toy otga ergashar, qo'y - serkaga	A good Jack makes a good Jill
<b>English proverbs</b>	<b>Uzbek proverbs</b>
Early bird catches the worm	Erta turgan kishini xudo o'nglar ishini
Every dog has his day	Oyning o'n beshi yo'rug, o'n beshi qorongi
If wishes were horses, beggars would ride	Orzuga ayb yoq
You can lead a horse to water, but you can't make it drink	Birov uchun birov qozon osmas.

3. Proverbs are present in two languages, but the zoocomponents differ from each other:

<b>Uzbek proverbs</b>	<b>English proverbs</b>
Tuyaning dumi yerga tekkanda	Pigs might fly if they had wings.
Yotgan ilonning dumini bosma	Let sleeping dogs lie
Pashshadan fil yasamoq	kill a fly with an elephant gun
Otning o'limi itning bayrami	When cat's away, mice will play
Qarga qarganing ko'zini cho'qiydi	Dog eat dog
Qo'y ogzidan cho'p olmagan	Can't say bo to a goose
Bo'rining ogzi esayam, emasayam qon	Give a dog a bad name
It uyasida o'zini yo'lbars sanaydi	Every dog is a lion at home
Ikki qo'chqorning boshi bir qozonda qaynamas	Two dogs over one bone seldom agree

## CONCLUSION

The Turkic peoples ensured the diversity of species of animal names expressed in the proverbs of animal husbandry and hunting, which were the subsistence activities that determined the way of life of the Uzbek people. The degree of use of zoonyms in proverbs varies. Fish, pig and elephant zoonyms are rare in Uzbek proverbs. Wolf, sheep, dog, horse, camel zoonyms are often observed. This situation is explained by the animal world, living environment, mental characteristics of the people. An analysis of proverbs and sayings as a source of information about the relationship of people in society allows us to argue that the characteristic features of English society are forethought, non-interference in someone else's life, hard work, tolerance towards others. The British are not inherent in curiosity, they are quite conservative in their beliefs and do not like to take risks. As a result of the research, it was observed that articles with a zoonymic component are relatively numerous in the Uzbek folklore. This amount is determined

by the fact that the Turkic peoples, including the Uzbek people, were mainly engaged in animal husbandry, hunting, careful observation of natural phenomena, animal movements, characteristics. While the occurrence of the name of a domestic animal in proverbs depends on the requirements and conditions of animal husbandry, the observation of the name of a wild animal is related to hunting activities.

## STRATEGIES AND PROBLEMS OF LITERARY TRANSLATION

**Kosheva Dilrabo Khudoyorovna\***

\*English Teacher at Navoi State Pedagogical Institute  
Navoi city, UZBEKISTAN

### ABSTRACT

*Works of literary art are considered to be the most acceptable means of studying the culture of other nations and understanding it more deeply. But the goal can only be achieved through a highly qualified translation product. In the process of translating a fictional work, it is important that the translator correctly interprets the culture and laws of the source language, as well as preserves the aesthetics, emotional expressiveness and mood of the author.*

**KEYWORDS:** *Literary Translation, Interlingual And Intercultural Inequality, Objective And Subjective Literary Information, Observer-Strategy, Adherent-Strategy, Facilitator-Strategy, Enlightener Strategy.*

### INTRODUCTION

The translation of a literary work is an abstract process controlled by internal hidden laws that are closely related to a number of problems. It cannot be modeled, for example, into a template, such as the translation of legal documents or medical instructions, and is not regulated by generally established fixed rules. Therefore, the translation of documents is a skill with a mark of precision, and the translation of a literary work is considered at the level of free and unrestricted art. In the translation of a work of literary art, there are other hidden issues, such as the specific nature of the text at our disposal, the unknown as well as unlimited readership, inter-linguistic and intercultural imbalances, and so on.

The absence of common uniform patterns or the systematic criteria, leads to the application of certain strategies that are inherently realized and intuitively applied by the people of artistic creation in literary translation. T. A. Kazakova distinguishes three such strategies: observer-interpreter, adherent-interpreter, facilitator-interpreter and enlightener-interpreter strategies. (Tamara A. Kazakova, Strategies of Literary Translation, 2015)

In evaluating a literary text translated into another language, there is often a debate about stylistic adequacy, artistic sensitivity, aesthetic and cultural acceptability, authenticity, and other aspects.

However, due to the abstract nature of these aspects and their different manifestations in the minds of different people, a single work of art can be perceived and interpreted differently by two people. This leads to different conclusions and has an impact on the quality of translation. In general, although it has some shortcomings, the principle of enlightenment should be preferred, in order not to completely deviate from the author's purpose. (Razumovskaya, 2014; Kazakova, 2011, 2015)

It is inherent in the nature of a fictional work to disturb, tickle, or irritate the reader's emotions (i.e., catharsis), and thus to make them understand those. The more the author seeks to disturb the reader's inner world, the higher the informational potential of the text of the work of literary art. But this is achieved through many artistic expressive means — the rhythm and melody of the literary creation, artistic hints and wordplays. Also, the enlightening strategy requires restrictions in translation.

When it comes to the informative nature of a fictional work, there is a need for us to discuss the types of literary information. Kazakova A. T. distinguishes between objective and subjective literary information.

Objective information is reflected in the influence of the text on the reader, conditioned by linguistic information and knowledge, and it consists of elements such as textual stylistics, lexicology, grammar, socio-historical background of the text, as well as its informative nature of a certain field of specialization. In the process of understanding the text, a part of this information is usually lost. Indeed, the level of the style, vocabulary scope, and grammatical structure of the text may be higher than the reader's linguistic competence. As a result, the literary text is considered to be overloaded with information, and the plan to create the desired effect on the reader fails. We can see this in the example of high-level complex historical novels, examples of poetry (e.g., gazelles), and so on. This reduces the likelihood that the process of translating the work can also be performed by an arbitrary average translator.

## **MATERIALS AND METHODS**

Subjective literary information arises as a result of the author's personal conclusion and the cumulative influence of the reader's personal experience and imagination. The author may advocate or oppose certain items, names, and events. But this hidden information is not embodied in the play through direct words. On the contrary, the hints, artistic imagery, and figurative situations created by the author perform this function. Thus, through subjective information, "text within text", i.e. subtext, is realized.

The main problem in the perception of subjective information is that the views of the author and the reader may happen to be disproportionate and even contradictory. Suppose that a certain event in the composition of a historical work is considered to be a "historical error" by the author; however, in the mind of the reader it can be embodied as a necessary element of evolution required by that period. As a result, it is clear that the writer will not achieve the intended artistic goal.

The fact that the process of reading a work alone is so complex allows us to imagine the overwhelming task involved in translating it.

When working with a variety of literary texts and complex information structures, it is important that the translator be armed with effective strategies for processing interlingual information.

Such strategies are largely intuitive in nature and sometimes have one-sidedness and limitations. It should be noted that the translation of a work into another language is not only a matter of language, but also a matter of adaptation to other cultures, that is to say, a matter of cultural transformation.

When faced with structural and semantic complexities that do not obey general laws, it is clear that the translator chooses one of two ways: he either creates a simplified translation product to make the process of familiarization with the fiction easier, or he present thorough and comprehensive description and specific details to fully embody the overall message of the literary work and requires the reader to have a high level of comprehension and critical analysis.

Expressing a verbal description of the text of a work of literary art constitutes the goal of the observer-translator strategy that is neutral to the reader and, in particular, is advocated with a spirit of indifference to the author's personal views and preferences, is free from so much emotional and stylistic nuances, and often requires reference to linguistic equivalents in dictionaries. But even this method is not simple and less laborious. The question of equivalents alone deserves deep observation. Indeed, the lexical alternatives provided by dictionaries provide formal equality and are inaccurate in the expression of contextual-functional equality.

The adherent -translator strategy is a more conservative method, in which grammatical structures such as verb forms, word order in a sentence are translated on the basis of source-language rules, and the laws of the translated language are ignored. Transliteration of socio-cultural and historical concepts is performed (i.e. the external phonetic image of the word is encrypted according to the alphabetical system of the translated language).

The main tragedy in choosing both of the above strategies is the loss of subjective information in the work of literary art. This means that the work's artistic value, descriptive expressiveness, creative as well as emotional influence, and the author's hidden position are bypassed. Many literary experts know that these elements are the main criteria of a fictional work, and in turn recognize that it is impossible to preserve them fully, even in the most detailed, professional translation.

The facilitator-interpreter and enlightener-interpreter strategies contradict the above principles of unbiased translation, and their main task is to facilitate the reader in the process of the literary text comprehension or increase his knowledge and awareness.

In the facilitator-translator strategy, culturally and historically conditioned concepts with obvious national coloring are not transliterated; they are replaced by analogues or interpreted through more descriptive information. Complex syntactic structures in the source language are conveyed in the translated language using a reader-friendly syntax. Some parts or expressions that are considered confusing or too specific are completely cut off from the text. But here, too, psychological-emotional influence as well as artistic expressiveness of the fictional work is given up.

## **DISCUSSION**

The enlightener-translator method provides a very comprehensive translation, revealing every more complex element of the text of by means of detailed descriptions and explanatory information, numerous notes and annotations. The content of the necessary vocabulary units is given in the references and the translation is equipped with all the necessary tools for the reader

to understand the essence of the work. This is especially applicable in the translation of historical novels, defined by the conditions of that period, interspersed with archaisms and national features. This can be seen in the work of Abdulla Kadyri, the founder of Uzbek novelism, "Scorpion from the Altar." The novel depicts the socio-political life of Uzbekistan in the early twentieth century, the oppression of the khanate, the ill treatment of ordinary people through the sincere and pure love of two young people. The novel is illuminating and provides the reader with valuable information about the historical events of that period, allowing them to make an objective assessment of the historical circumstances. Although portrayed from the beginning to the end in a realistic manner and written in a serious style, the fact that the emotional-expressiveness and psychological sensitivity is created with great skill makes the reader involuntarily turn to the side of the two lovers and sympathize for the common citizen.

There are subtle shades of meaning in the novel, and translating it with a sharp narrative language requires a very high level of talent from the translator. Undoubtedly, since the author's main goal was to criticize the oppression of the period, it would be appropriate for the translator to choose an enlightening strategy. But it is a sincere and beautiful love story that makes it readable to the reader. The emotional expressiveness in the novel has arisen around it and it is important not to lose it in the translation process.

One of the linguistic features of the novel "Scorpion from the Altar" is that it is enriched with concepts expressed in the Old Turkic language. Kadyri explains them throughout the novel, making references on each page. Creating an image of such lexical units requires the translator to create a detailed extended text. Also, words in the novel that belong mainly to the verb category have a historical phonetic appearance, a feature that is inevitably lost in the process of translation.

Kadiri is a man with a keen language of presentation who created wordplays, unique phrases in many places in the text, and time by time used folk proverbs and phrases fitting well in the literary text. Translating them requires the translator a high level of knowledge, as well as awareness of the Uzbek language and culture.

In order to get a clearer impression of the historical spirit of the novel "Scorpion from the Altar", we refer to the following passage and choose the necessary translation strategy based on its textual nature:

“Кези келганда махдумнинг ёзлик кийимларини ҳам бир сидра айтиб кетайлик: йўллуқ, қизил қалами бўздан яхтак, оқ бўздан жиҳақ ёқалиқ кенг кўйлак (чунки тор бўлса йиртиладир) ва лозим (яъни иштон) ҳамда сарпойчан кийишка енгилча сағри кафш, аммо салла қишин-ёзин битта.”

“When the time comes, let us mention the summer clothes of Mahdum in short: a red striped sleeveless cardigan made of red cotton fabric, a loose shirt with a collar made of white cotton fabric (because it is torn if it is tight) and pants and light casual shoes, but the same turban for wearing in winter and summer. . ”

In a single short piece of the literary text extracted from Kadyri's novel, a number of historisms (words representing the historical concept: *қалами*, *жиҳақ ёқалиқ*, *сағри кафш*, *салла*) were used to create the image of one of the antagonists of the work "Scorpion from the Altar" - Mahdum. Since they are not even familiar to Uzbek culture, the content of the novel cannot be

fully understood without Kadyri's explanation and commentary. The translator has no choice but to choose the enlightener-interpreter strategy. Since the words that express historical concepts are important for the essence of the work (for example, the image of Mahdum's clothes plays an important role in revealing his personality), it is necessary to cover them with a wide range of details where necessary. The transliteration method alone would have facilitated the work of the translator, but would have lowered the literary potential as well as the quality of translation.

When thinking about the translation of a work of literary art, we consider the discussion and translation of another novel, written in a completely different language of presentation and with a different central theme.

As for the details of the novel "The Great Gatsby" by Francis Scott Fitzgerald, this is a story about a young man who became a young entrepreneur with a huge income in a relatively short period of time, who was driven by the desire to achieve the love of his youth and to be worthy of it. This is a beautifully narrated work about a hero whose life has turned into tragedy because of his dream. Although literary critics say that the novel hides topics such as "the American dream," "realization of dreams in the Land of Opportunities," and "how the American dream turns out to be utopic," its real force and artistic impact lies within the love of two people. The novel is enriched with flirtations, whispers, "smart" observations of noble people, secret love affairs and expressions, and therefore from beginning to end in its text there are mysteries, ungrounded rumors (use of a low and mysterious voice, speech verbs related to unintelligible speech serve for this purpose) about the protagonist. They have a strong emotional impact on the reader. This is the main power of the novel.

But it is worth noting that both novels have one thing in common: the unique examples of both works illuminate the tragedy of the fate of the whole nation in the example of the love of one hero, the shortcomings of a certain historical period, the play of socio-political conditions on the lives of ordinary people. The most important of the commonalities in the language of presentation is that in most scenes the protagonists refrain from speaking openly by whispering, mumbling, muttering, and the author chooses appropriate speech verbs accordingly. We can be assured of this by analyzing the following passages:

“Сиздан яна бир талаб: эртадан бошлаб мени ўз ҳузурингизга олинг, токи муфтилар эртадан кечгача ғийбат сўзлаб, маймун бўлиб вақт кечирмасинлар.” (“Меҳробдан чаён”, 179-б.)

"There is another request to you: I would like you to join me to your company, so that the muftis do not gossip from morning till night and deal with nonsense like monkeys." (*The Scorpion from the Altar*, p. 179)

“Қора бармоғи билан хослар ичидаги Абдурауф тунқотарни ўз тарафига *имлаб*, орқасига қайтди.” (“Меҳробдан чаён”, 233-б.)

"With his dark-skinned finger, he *gestured* Abdurauf (a nightguard) among the security guards to his side and stepped back." (*The Scorpion from the Altar*, p. 233)

“Боя менга яна учрашди; *ғўлдир-ғўлдир қилади*, мақсадиға ҳеч бир тушуналмадим.” (“Меҳробдан чаён”, 169-б.)

“He came to me again; *mumbled* something, but I didn` t understand his intention.” (*The Scorpion from the Altar*, p. 169)

“Анвар ўз хонасиға келиб кирғанда, четдаги танчада Шаҳодат муфти бошлиқ мулла Абдурахмон ва Калоншоҳ мирзолар нима тўғрусидадир, *оҳиста-оҳиста сўзлашиб* ўлтурар эдилар.” (“Меҳробдан чаён”, 168-б.)

"When Anwar came into his room, Mullah Abdurahman and Kalonshah Mirza, with Shahodat mufti in charge, were sitting in the courtyard *talking quietly* with each other." (*The Scorpion from the Altar*, p. 168)

‘She *hinted in a murmur* that the surname of the balancing girl was Baker.’ (*The Great Gatsby*, p.11)

“I’ll tell you a family secret,” she *whispered* enthusiastically. (*The Great Gatsby*, p.15)

“Gratulate me,” she muttered. “Never had a drink before, but oh how I do enjoy it.” (*The Great Gatsby*, p.72)

The verbs used in the above passages from the novels express the characters` attitude to the interlocutor, reveal their mood and personality. The use of the helper-interpreter strategy would require those verbs to be replaced by more general alternatives. But this, of course, undermines the author's purpose and confuses the essence of the work or lowers its level. In this process, unfortunately, subjective information is lost.

An observer-interpreter strategy can be useful when speech verbs have absolute or at least close equivalents in the source language and the target language. Most speech verbs have alternatives in Uzbek and English. But the issue is not only their translation, but also the full interpretation of the context around them into the language of translation, so the observer-translator strategy cannot be relied on alone.

## CONCLUSION

It should also be noted that a work may have different translation options, implemented with different strategies. This is a decision that is made in accordance with the target readership of the literary book. For example, Mikhail Bulgakov's novel “The Master and Margarita” is considered to have gone through this process, and it has a variety of translation options that differ in terms of complexity and artistic potential.

In short, the translator must fully understand the nature of the work of literary art at hand, study each part of it, and, consequently, apply the most appropriate method of translation, and perhaps a combination of several methods. Of course, if a reader with a lower level of specialty knowledge or of the age category has a desire to get acquainted with the work, it is also possible to use an assistant-translator strategy aimed at simplifying the work to please them, i.e. the translation process is a multi-factorial event.

## **HISTORICITY AND SCIENTIFIC OBJECTIVITY IN THE COVERAGE OF PHILOSOPHICAL HERITAGE**

**Karabaeva Robathan Atabekova\***

\*Candidate of Philosophy,  
Ferghana state University, UZBEKISTAN

### **ABSTRACT**

*The article describes the development of historical and philosophical heritage as an important spiritual factor of national consciousness and restoration of historical memory. The article reveals the importance of the philosophical heritage on the basis of the principle of scientific objectivity in the understanding of the national identity of our people.*

**KEYWORDS:** *Historical And Philosophical Heritage, Philosophical Thinking, Historical Truth, Dogmatism, National Identity, Scientific Objectivity.*

### **INTRODUCTION**

Rich philosophical views of thinkers of the past can not be restored historical-philosophical truth and historical memory, without a truthful analysis of their thoughts.

The development of historical and philosophical heritage is an important spiritual factor of national self-realization and restoration of historical memory, and the coverage of philosophical heritage on the basis of the principle of scientific impartiality is of great importance in the realization of the national identity of our people. Therefore, in the coverage of the philosophical heritage, it is necessary to pay attention to the study of its heritage, which historically became the values of the contemplation of the periods when it was created, taking into account the inalienable connection with that period, after all, history is the philosophy of time and space, it is considered a teacher-teacher for the product of already, for the prospect of an independent state, high-spiritedness and harmonious people are needed. To do this, first of all, the most urgent problem is the real study of our people's past and history. The Uzbek people are experiencing the processes of their rich culture, historical and spiritual traditions, a deeper understanding and perception of themselves. The work of studying our cultural heritage, spiritual values, serving them today and for our future is rising to a new level.

Historical and philosophical values inherent in eternity are a source of strong ideas in the minds of representatives of all nationalities, nationalities, religions, in the education of loyalty to the ideas of justice and truth in the heart, historical and social basis in guaranteeing our continuity. "... we rely on our national traditions, which have been formed for centuries, on the rich spiritual heritage of our ancestors"[1]. "...First of all, it is about creating the necessary environment and conditions for the wide promotion of the rich history of our country, its unique culture and national values, the achievements of world science and literature among the youth and the population. After all, the more morally harmonious the youth, the stronger the immunity against various alien vices" [2].

"In Uzbekistan, the spiritual and historical foundations of the construction of a democratic and social just society, the restoration of high spirituality and morality characteristic of our people from ancient times, the study of its centuries-old cultural heritage on a modern scientific basis, the preservation and restoration of its unique historical monuments, the realization of ancient and modern spiritual riches in terms of, formed social justice has become the most dominant direction of state policy"[3].

The coverage of philosophical heritage relies on historical truth. In carrying out this, it is important to base itself on the principles of historicity and scientific impartiality theoretically and methodologically. Therefore, it is worthwhile to look at the role of the approach to the philosophical heritage from the point of view of historicity and scientific impartiality in determining the historical truth and the significance of its peculiarities in the quality of the constituent part of the spiritual heritage of the people.

Research of the near and long history of Uzbekistan on the basis of objective, scientific-historical methodology plays an important socio-political and scientific-practical role today, which is steadily entering the world community, becoming a full-fledged subject of international relations. The essence of the issue is that today the need of Uzbekistan to preserve and strengthen its independence requires representatives of all social-humanitarian Sciences, first of all philosophers, historians to apply their scientific-theoretical thinking to scientific research based on a truly historical truth, which is impartial of dogmatic beliefs, dry rhetoric and blind praise. However, any scientific and historical research, which is extremely ideological, inevitably leads to fanaticism, to the suppression of historical truth, to the formation of an unusual historical consciousness in people.

## **MATERIALS AND METHODS**

The study of socio-historical processes on the basis of historicity is primarily based on the principle of unity, unity of theory and practice. In the perception of the attitude of historical knowledge towards historical reality, the correctness or authenticity of this or that historical knowledge is the main issue. In general, the study of methods of restoring reality is a prime problem in the theory of cognition. In the current modern conditions, this problem relies on a number of theories that have appropriate methods of generating and verifying real knowledge. In this connection A.I.Rakitov emphasizes certain conditions that complicate the capture of historical reality. These are an expression of the inadequacy of information about the past, the complexity and impossibility of establishing a mutually experimental-practical live communication with the past, the interrelationships of historical consciousness with ideologies[4].

The genesis and formation of historical cognition, its embodiment in the structure of historical consciousness, are inextricably linked with all spheres of life of society, especially with a certain ideological direction, goals and tasks of social consciousness. Therefore, the question of the relationship between theory and practice and the ratio, as well as the criterion of truth, which is inextricably linked with them, has attracted the attention of thinker scientists at all times. Political scientist N.Jurayev "history is the fruit of human thinking with its entire scope and integrity," raev wrote... and the truth of life can be called the product of human spiritual and spiritual livelihood. Already, history is a complex of human and human life, its expression and essence"[5].

The study of historical-philosophical heritage also requires, first of all, an approach from the point of view of historical justice, after all, "universal history, in a word, is a set of ideas and goals that have been fighting for superiority over each other, proving the contradictions of each other"[6].

In encyclopedic works on the history of philosophy, the process of philosophical thought of mankind is classified differently. In most of them, the history of philosophical thought is explained unilaterally, only in the form of a process consisting of the history of the struggle between materialism and idealism. However, the development of philosophical thought is due to the great research and creative activity of mankind, which has been associated with thousands of years. From this point of view, we think that the development of philosophical thought can make up a specific system, and consider it on the one hand, historical-philosophical heritage, on the other hand, in connection with the philosophy of history, logically justify itself. Consequently, the word "philosophical thought", which is formed scientifically and objectively in the minds of the modern person, is worth noting that in order for philosophical thought to understand and understand its history, it is necessary to go through certain stages of its development, to be logically scientifically grounded in this process.

Of course, in this place there is an opinion about universal considerations. For the historiography and scientific-theoretical analysis of the historical-philosophical heritage of our people, this thing is of universal - methodological importance. Therefore, we should emphasize the following aspects of the problem:

- first of all, strictly pay attention to the fact that the historical-philosophical heritage arose and became rich directly in connection with the stages of the historical development of mankind, on this basis, the development of historical thought presupposes the beginning of the processes of formation, development and degradation of periods, civilizations, cultures;
- to pay attention to the analysis of historical lessons and their enrichment, which characterize the past, present and future of the development of society from the point of view of historical philosophy;
- basic omillarni study that determines the historical evolutionary (evolutionary) process;
- research on the essence of history in scientific terms, its main directions and objectives;
- the question of the formation of a scientific picture of the future of mankind, relying on the conclusions of historical thought. Here it is necessary to give specific reasoning, the reason for this is that philosophy can basically only hypothesize about the future of mankind, and in fact life makes specific adjustments to these processes;

- philosophical thought and the core of the inheritance rely on humanity, so that in this direction the logical landscape of world history is formed, striving to express it.

Summarizing the above points, it is necessary to base all the manifestations of the historical-spiritual heritage, including in the understanding of the essence of the philosophical heritage, on the people of thought “the philosophy of history is dry without history, the science of history is blind without history philosophy”. K.Yaspers points out about history, “in order to understand ourselves, we will try to understand history as some kind of integrity. History is not only a memory that we need to know, but at the same time it is the roots of our lives. And the historical view is an area that encourages us to know the nature of man”[7], -he says.

As the Russian professor Leonid Levitin confessed in his work: “the great jadid Mahmudkhuja Behbudiy is ”The Muse is the scales of the future.” 50 years later, George Orwell, an English writer and publicist, came to the conclusion that a person with his past will also have a future, repeating Behbudiy's opinion”[8].

The genesis and formation of historical cognition, its embodiment in the structure of historical consciousness, are inextricably linked with all spheres of life of society, especially with a certain ideological direction, goals and tasks of social consciousness. Therefore, the question of the relationship between theory and practice and the ratio, as well as the criterion of truth, which is inextricably linked with them, has attracted the attention of thinker scientists at all times. Political scientist N.Jurayev wrote: “history is the fruit of human thinking with its entire scope and integrity...and the truth of life can be called the product of human spiritual and spiritual livelihood. Already, history is a complex of human and human life, its expression and essence”[9].

The study of historical-philosophical heritage also requires, first of all, an approach from the point of view of historical justice, after all, “universal history, in a word, is a set of ideas and goals that have been fighting for superiority over each other, proving the contradictions of each other”[10].

All wise men approached with great responsibility the issue of explaining the history of philosophical thought and the causes and consequences of the development of philosophical heritage in the context of scientific impartiality. This is a very large philosophical topic. At the same time, the need for a consistent and scientifically objective approach to the philosophical heritage of the Uzbek people stems from the essence of spiritual strengthening of national independence. Consequently, “history and cultural heritage is the main wealth of the nation,- writes A.Askarov, - knowledge of history on the principles of equity, equity is extremely necessary for the people who are restoring a new national state”[11]. Therefore, logic makes it possible to distinguish lies in anything from reality.

Hence, philosophical heritage is a legitimate product of the frantic struggle between the ideas of historical sets, views, creativity and destruction. Or it is correctly said that the history of mankind is the history of cultures, the history of civilizations. It is impossible to fully and comprehensively understand the history of mankind through special concepts. Culture and civilization reflect the way of life of the people in general terms.

Therefore, the historical stages of the formation of the philosophical heritage, which is the golden chain of the history of our people, their unity and invaluable essence, in short, it is permissible to dwell.

## DISCUSSION

Problems of the history of philosophical heritage in Uzbekistan and studying them in dialectical relation with historical periods I.M.Muminov, M.M.Kheyrollaev, A.Fayzullaev, H.Vahidav, M.Baltaev, M.Baratov, Y.Jumabaev, H.Alikulov, R.Nasirov, R.Bahodirov, A.Sharipov, B.Ergashev, M.Usmanov, M.Qodirov and others expression in the works and studies.

All the research and conclusions in this regard unanimously state that the place where the ancient Sogdians lived in Uzbekistan – Movarounnahr is now also the country where civilization took place as a special monand. Therefore, we think about the most important periods of the philosophical heritage of our people. Our philosophical heritage naturally begins with such sacred historical monuments as “Avesto”. One can see from the honors of the philosophers of the ancient world that “Avesto” had a great influence on the development of world civilization, spirituality and culture with its content and ideas. As the Orientalist scientist Fazila Suleymonova noted in his work “East and West”, both Geraklit and the materialist-atomist Democritus knew about the ideas of Avesto and the sacred fire in it, and used them in the creation of their own ideas.

In this regard, we are amazed at the fact that some answers to very complex controversial discussions on the subject of factual history, historical truth, religion and science, the emergence of mankind, history and Progress, put forward by philosophers, historians, literary critics and other scientists, can be found from Avesto, recognizing that the above issues have an eternal feature. As the great German philosopher Gegel wrote, “Any truth, originality, kindness, justice, any living being, a spirit of generosity and support, happiness, compassion, etc. will be recognized by Zardusht as a trite of light and divinity... The whole life of mankind is endowed with the realization of this unique goal. The task of each individual is nothing more than self-spiritual and physical purification in the sense of the spread of these blessings as well as the struggle with Ahriman through human, natural situations and activities”[12].

Academician for the work of factual and objective study of the cultural and spiritual, as well as philosophical heritage of the Uzbek people I.M.Muminov made a huge contribution. Although the policy of communist ideology and totalitarianism, which ruled at that time, drove away any free thought, the scientist created dozens of rare works on the history of our philosophical heritage, which now serve as important scientific and historical sources.

Analysis of scientific-ideological courage demonstrated by Uzbek philosophers in 30-80 years together with works written contrary to communist ideas in 20-30 years of XX century as a separate and specific normative stage is the same term. In these years, on the history of philosophy, social thought T.A.Qori-Niyoziy, I.M.Muminov, V.Y.Zahidov, M.M.Kheyrollaev, A.F.Fayzullaev, M.B. Everyone knows that valuable works of Baratov and others have arisen. To give them a worthy assessment, to determine their contribution to the development of our philosophical thinking, naturally contributes to the restoration of philosophical truth.

## CONCLUSION

In conclusion, the following can be noted:

the principle of historicism is the most important dialectical Talab of philosophy, which dictates the coverage of historical processes in holistic, continuous change and development;

- the study of historical events, philosophical heritage on the basis of the principle of historicity provides a scientific impartial approach to the issue;

- our philosophical heritage was regularly formed, despite contradictory historical sets, not taking into account some interruptions (especially the period of the Mongol invasion). Our philosophical heritage, which is part of our spiritual values, is the Arab invasion from “Avesto”;

- The Mongol invasion from the penetration of Arab philosophy;

- From the era of Sheikhan to the middle of the XIX century;

- it was created and enriched in complex historical stages from the reign of the Bolsheviks' communist ideology to the independence of Uzbekistan, actively participated in each historical stage has enriched our philosophical heritage with a new meaning in its time. A common feature of all of them is that in the center of philosophical teachings there is an idea of glorifying a common person, a person and respecting his dignity.

## AXIOLOGICAL EVALUATION AND ITS EXPRESSION IN AN ORGANIZED SENTENCE

**Boymatova Dilnoza Bakhtiyorovna\***

\*Teacher,  
Jizzakh State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*In the article, the pragmatic and semantic features of the axiological assessment studied in the field of linguistics are highlighted by the example of organized sentences. The evaluation category, which is also given in relation to value-concepts, has been studied on the basis of artistic texts, its active use in both speech-based and speech-based activities.*

**KEYWORDS:** *Subject And Axiological Evaluation, Value, Object, Organized Sentences, Linguistic Cognitive Activity, Author, Receptor, Addressant, Addresant, Comparison, Conversational Communication, Speech ICT, Text Frame.*

### INTRODUCTION

As in all areas of linguistics, there are new directions, theoretical and practical views on the study of linguistic units in different aspects. As part of this kind of research, we can include the category of evaluation expressed by the individual (subject). Opinions about the subject are expressed in the research works in Uzbek linguistics[1]. In addition, the features of language units expressing different additional meanings in speech, their sub-evaluation meaning are also studied to a certain extent in Uzbek linguistics[2]. The availability of sub-price research indicates that in this regard, it has been studied at an adequate and significant level in the field of linguistics. Even so, the type of subequatorial evaluation-the fact that axiological evaluation was not studied by concrete linguistic units, in particular, by the example of organized-sectional sentences, determines the relevance of the topic. In this small observation, we tried to investigate the reflection of the axiological evaluation in organized fragmented sentences using examples from artistic texts.

## MATERIALS AND METHODS

Axiological evaluation-as an integral type of assessment “value” in itself-reflect concepts and these concepts are reflected in the individual's attitude to the object being or his speech. After all, an axiological assessment is given precisely in relation to “the subject in reality, events in relation to their dignity, importance, significance”[3]. Personal opinion and worldly knowledge of the subject occupy an important place in determining the value and significance of subjects and phenomena. Events that seem significant to someone are not at all for whom. And this is characterized by a different manifestation of the category of axiological evaluation. Axiological evaluation structures in the text sometimes occur even by comparing one person or phenomenon to another. Sh. Safarov noted that the comparison also takes a different view and is accompanied by evaluation, normalization efforts[4]: - *Мавлоно Фазлиддин сиздек хиёнатчи бекдан минг ҳисса софдил, минг ҳисса олижаноб!- деди Хонзода бегим (П.Қодиоров “Юлдузли тунлар”)*.

Linguist scientist S.Boymirzaeva notes that when assessing events in reality with respect to their value, there is a sharp retreat from the norm (even if this is on the positive side), a sharp increase in quality and quantity. This type of evaluation in artistic texts serves to increase sensitivity[5]. The author prefers to use lexemes that express feelings and appreciation in relation to the object being evaluated (even if the object does not have this property) in order to increase the sensitivity of the sentence or sentence: -*Менга ёрдам берган ошпаз ҳам, Аҳмад чошнагир ҳам, каниз ҳам ботир қасоскорлар эди. Ҳаммаси мардларча жон берди (П. Қодиоров “Юлдузли тунлар”)*. In the quoted text, the addressant (Malika Bayda) gives a general assessment of the persons who served him as the tashaabbuskor of speech communication and transmits this assessment information to the addressee. This kind of “evaluation information, in turn, serves for the purpose of influencing the listener and motivating him to conduct an action, activity”[6]. We can see in the following text that even if the committed action gives a negative result, the axial evaluation structures are in place of the text frame structure:- *Ё алҳазар! Ахир сиз ҳам Муҳаммад умматисиз, муслимасиз-ку!.. Агар сизда инсофу иймон бўлса, қўлида қиличи билан очикчасига жанг қилган саркардага яшириқча заҳар бермас эдингиз! (П. Қодиоров “Юлдузли тунлар”)*. The muslima lexeme, which is an assessment of the positive content given by the addressant in relation to the addressee, will have only a sub-meaning within the text as well. “.. when viewed out of context, the neural becomes expensive” [7].

In the presented textual structure, the proverb, which as a universal value, expresses the meaning of “not responding to good with evil”, emerges through the reprimand act of the speaker. In the above text, taking into account the fact that a number of aspects such as the spiritual state of the speaker and the listener, family closeness, age play an important role in the realization of the tanbeh speech act[8], the speaker's mental state (irritability) is leading.

We noted that the axiological evaluation is given in relation to lexemes and concepts that have a high quality of value. In the science of philosophy, values are defined as a philosophical category that serves to determine the value of certain phenomena in reality, and it is stated that this phenomenon arises as a result of reflection by the subject[9]. Therefore, the universal value-concepts such as kindness, goodness, kindness, friendship, beauty, happiness, which have been appreciated and cherished since the appearance of mankind, constitute the basis of an axiological evaluation: *Салтанатлар оиласи билан Энахонлар оиласи орасида ота-бободан қолиб кетган дўстлик, қадрдонлик ҳукм сурадди (Чўлпон “Кеча ва кундуз”)*. The author or the

addressant does not ignore the important aspects for himself in the first place when assessing reality. This significance is manifested differently for each addressant. After all, the price of values is relative, it is tied to man[10]. We considered that the process of evaluation of a person as a product of linguistic activity is reflected in concepts that reflect universal values. And in the artistic texts, where our national values are reflected, the manifestation of an axiological assessment serves to feel the feeling of pride in ourselves, along with increasing influence: *Ўзбек хонадонидан нон ва райҳон иси келади (Ў. Ҳошимов “Дафтар ҳошиясидаги битиклар”)*.

It should be noted that the person is the main participant in the assessment activity, and this process requires its activity. Psychologist A.N.Leontev said that the activity of man is an “internal motivation, the basis, which ensures that any activity comes into action and manifests itself”[11]. Sometimes human activity also seems to be related to emotion (emosiya). Emotionality is a known phenomenon that all the time has the property of expressiveness, evaluation, attitude in speech[12]. That being said, emosiya (emotion) is also manifested in the content of an axial evaluation and sometimes takes the main place:...*Андижону Самарқандни, мени ўстириб шоир қилган ўлкаларни қанчалик соғинганимни билсангиз эди, мавлоно! (П. Қодиров “Юлдузли тунлар”)* In this text, in which organized fragments are involved, the addressant prefers to express with *қанчалик* the excess of a sense of longing. An axiological evaluation is a subset of[13], which is given in relation to phenomena of the same type, not having exact boundaries and dimensions.

Sometimes the author's axiological evaluation (in the form of information) with a significant aspect of the object is equally relevant to its "hidden" side. Only this hidden aspect does not manifest itself in the text: it requires the reader or listener to notice it on the basis of linguistic knowledge:– *Амирзодам! Адолат қилинг! Мен отангизнинг содиқ раиятлариданмен. Сиз ёшсиз, беғуборсиз! (П. Қодиров “Юлдузли тунлар”)* In the quoted text structure, the speaker's assessment of the listener (without Age, without blemish) is in the pronoun *сиз ҳали бу бекларни ва уларнинг қабих ниятларини билмайсиз, уларнинг гапига кирманг* the hidden expression in the content is reflected. In order for the expression to be reflected and understood in the hidden content, it is required that the thinking activities of the participants in the communication, their imagination about the scientist are inextricably linked. This inconsistency is manifested in any text in which the axiological evaluation is embodied – whether in a transparent, hidden way. A transparent and latent assessment of the subject-events is sometimes carried out in a public domain with the image of nature: *Атрофдаги табиатнинг гўзаллиги, баҳор ва тоғлар айвонга ишланган нақшларни, гумбаздаги қошинлар рангини алланечук жуда очиб кўрсатар эди (П. Қодиров “Юлдузли тунлар”)*. The author emphasizes the state of the heroes of the work in a certain situation (uplifting or depressing) even when the reader intends to reflect more brightly before the eyes. Negaki, nature tablets, most of them, harmoniously come to the mood and state of the heroes[14]. The above text describes the evaluation given to the image of nature *гўзаллиги, алланечук жуда очиб кўрсатар эди* through the units of expression, it is not difficult for us to find out that the heroes of the work are in an elevated mood. In the text below, we can also see that the mental and physical state of a person is brought in harmony with the image of nature: *Агранинг кеч кузи худди Андижоннинг баҳор пайтларидек салқин ва майин туюлар эди. Қоп-қора осмонда юлдузлар чарақлаб турибди.Бобур кўзини юмди:*

-Баданимда қон уюшиб қолаётгандай...-деди Тоҳирга (П. Қодиров “Юлдузли тунлар”). In the above texts, we can see that the author makes fruitful use of organized slang phrases in assessing the person and his activities. The participation of organized sections in sentences, which are part of the text and its components, helps in conveying the author's goal to the reader in an effective way. After all, “organized pieces are used in artistic works as a stylistic tool that ensures its expressiveness. They are used in the artistic image to represent the details of the landscape, the growth rate of the movement”[15].

## DISCUSSION

A person, a subject, a phenomenon in the text can sometimes be judged even on the basis of logical dependence. This process is carried out with two different assessments at the same time in relation to the object or person: *Абдулла Қодирийдек бахтсиз, шўрпешана ёзувчи йўқ. Мустабид тузум жаллодлари уни ҳибсга олдилар. Минг бир азобга дучор қилдилар... Охири ўлдириб тинчидилар.*

*Абдулла Қодирийдек бахтли, пешанаси ярақлаган ёзувчи йўқ! Одамлар қамоққа тушиб, минг бир азобга йўлиқиб, сургун бўлиб хавфидан қўрқмай, унинг китобларини ўқийвердилар. Ўқийвердилар. Ўқийвердилар! (Ў. Ҳошимов “Дафтар ҳошиясидаги битиклар”)* The author of the text uses two different phraseological units, contrasting meaning, when assessing the writer Abdulla Qadiriyy. Initially, the application of lexeme and phraseological units with negative (unhappy, shurpeshana), and then with positive (happy, forehead wound) content served to increase the value of the assessment given to Abdulla Qadiriyy, through which specific lines of antithesis were formed in the text. It should be noted that the progress of the assessment from negative to positive reveals the specific, repetitive aspects of the assessed object. S.Boymirzaeva believes that the application of the axiological unit of evaluation in positive or negative content is mainly related to the qualities of the evaluation object, and the reaction of the subject to these qualities of the evaluation object occurs on the basis of presupposition knowledge[16]. But the author, in most cases, can purposefully express the units of positive meaning in the composition of the text even in a negative context: *Ҳатто “энг замонавий”, “энг ақлли” қурол ҳам оқил билан болалар боғчасининг, аэродром билан туғруқхонанинг фарқида бормайди! (Ў. Ҳошимов “Дафтар ҳошиясидаги битиклар”)*

Axiological evaluation structures are also manifested in speech activity, more precisely, speech act. In this regard, it is worth mentioning that the Speech Act is a “linguistic attitude of the speaker to the listener in a certain environment, for a specific purpose”[17]. In the colloquial Act, the addressant relies on previously known knowledge in assessing the object, and on this basis he chooses the necessary linguistic units and uses them. These units also have the ability to express clearly or secretly the purpose of the persons entering into communication. The units used in connection with the psyche of the speakers in the process of speech communication serve to reflect the intent of both parties:

-... *Раҳматли сиз айтган истеъдодсиз, лаёқатсиз тождорлардан эди... Ҳийла бахиллиги бор эди...Маҳмудхон охири Шайбонийхоннинг оёғи тагида қандоқ топталганлиги маълумингиздир.*

- *Наҳотки ўша ҳодисалар Ҳиротда яна такрорланса, амирзодам? (П. Қодиров “Юлдузли тунлар”).*

Russian linguist V.I.Kodukhov notes that speech acts as a mental-physical process interacting with the speaker (addressant), listener (addressee), intended three activities – speech (writing), speech perception, concepts[18]. The scientist also admits his connection with the psyche in describing the theory of speech-based ICT. So, it is natural for the speaker to realize his purpose in the statement depending on the psyche of the listener. This is especially true in cases where the social position of the listener is higher than that of the speaker. In linguistics, such a situation is called an asymmetrical speech process, in which the "subjectivity" or "superiority" of one of the participants in speech is felt in the process of mutual speech communication from the sociological point of view" [19].: *Ҳасса таянган кекса Соҳиб Доро Бобур билан кўришаётиб: Амирзодам,- деди.- Ҳазрат Мирнинг вафотларидан бери Унсия руҳсиз танадек эди. Сиз келганингиздан сўнг бу танада янги жон, янги руҳ пайдо бўлди! (П. Қодиров “Юлдузли тунлар”)*. The fact that the addressant is older than the addressee in a young way, but since his position is small, he appeals to him as an *amirzadam*, expressing his opinion in an exaggeration in order to show himself somewhat better does not have a reflection on speech communication. The peculiarity of the process of speech communication is that it requires knowledge and intelligence from the listener in order to respond to the speaker's opinion without restriction from the content (even higher in meaning).: *Қалби эзгу ва маънос туйғуларга тўлиб турган Бобур шоирона ўхшатишлар қилиб ўтиргиси келмай жўн жавоб берди:*

- *Мавлоно, ҳазрат Алишернинг маконлари менинг ўзимда янги руҳ пайдо қилди. Бу ерда мен санъату маърифатнинг ҳали умримда кўрмаган камолотини кўрмоқдамен! (П. Қодиров “Юлдузли тунлар”)*. The above text structure is a phrase from the units of axiological evaluation of the scan: *эзгу ва маънос туйғулар* if the evaluation given by the combination is expressed in relation to the psyche of the hero of the work, *ҳали умримда кўрмаган камолот* by combination, the speaker's attitude to the space reflects a high assessment of the person (Alisher Navoi) in the tense.

It is known to us that any text manifests in our speech as the product of linguistic thought activity and occupies an important place in the activity of information exchange. Sh.Safarov believes that information activity is a field of thought and intersection of language. Through reflection, a person begins to interact with the environment, through which images and concepts in reality are distinguished. Any lingvocognitive activity is the process of information's activity in the human mind[20], and sometimes in this process, the inner experiences of the individual are expressed in a contradictory manner in the text: *Хотира ёзганда унга ўз ҳаёти аввалгидан илиқроқ ва маънолироқ туюлган эди. Бекор ўтирганда эса яна ўша оғир ўйлар, совуқ пушаймонлар босиб кела бошлади(П. Қодиров “Юлдузли тунлар”)*. In assessing the action of the protagonist of the work in connection with certain activities, the author prefers to refer to the type of transfer of meaning called a metaphor (*ҳаёти илиқроқ, оғир ўйлар, совуқ пушаймонлар*). So, as a kind of metaphor – tropes - a form of active figurative thinking[21], serves to give the reader a clearer and brighter reflection of the characteristics, behavior, spiritual senses of the object, a wonderful charm to the text.

## CONCLUSION

The conclusion is that the subordinate clause is a phenomenon of evaluation - communicative content, it is connected with the nature of the text that arises directly in the process of

communication. Axiological evaluation as a kind of sub-evaluation is given in relation to the most valuable, most important qualities of the object, reflected by expressing emotionality, comparison, evaluation, attitude. In organized fragmented sentences, an axiological evaluation occurs as a result of the author's and recipient's relationship to reality and his image in the text, as well as the work manifests itself as a semantic and pragmatic layer that expresses the content of the idea of the head.

### **ABSTRACT**

*An analysis of research on social activism of primary school pupils is formed as a result of using Uzbek folklore targeted in pedagogical activities. The samples of folklore intended for study in the primary grades should be appropriate to the age characteristics of pupils and the level of development of consciousness and understanding and should be inextricably linked with the essence of the moral qualities. In this article, I will discuss pedagogical mechanism of developing social activity skills of primary school pupils through the use of Uzbek folklore.*

**KEYWORDS:** *Social Activism, Pedagogical Mechanisms, Primary School Pupils, Uzbek Folklore.*

### **INTRODUCTION**

Today in our country, special attention is paid to the problem of raising a harmoniously developed generation by raising the level of work with young people. Because in our national mentality and on the basis of universal values, the school requires further improvement of spiritual and enlightenment work - the formation of the basic ideas of national ideology, such as the development of the Motherland, peace, well-being, perfection, social cooperation, interethnic harmony, and interreligious tolerance. Therefore, the main task of the spiritual and educational work carried out at the school should be to ensure that every pupil deeply understands and actively participates in the strengthening of a free and prosperous homeland, free and prosperous life - the main idea of the people of Uzbekistan. Therefore, the problem of imparting spiritual and enlightenment knowledge to pupils, the formation of skills to activate the activity through folklore is one of the problems that need to be addressed in this area.

---

## MATERIALS AND METHODS

Over the centuries, the basic concepts of Uzbek folklore have been formed: care, education, improvement, self-education, re-education, counseling, teaching, education and teaching. According to Farobi, beautiful qualities in a person are created in two ways - through education and upbringing: "Education combines theoretical qualities, and upbringing combines innate qualities - theoretical knowledge and practical skills, moral qualities, education through words and learning, and education practical work is done by experience, and when both are combined, maturity is manifested. "Thus, in addition to advancing the idea of conducting education in an organic unity, Farobi emphasizes that each of them has its own place and character in the development of man.

In order to fostering social activism of primary school pupils, folklore uses many factors of education (nature, labor, life, habit, art, religion, mother tongue), with a great wealth of methods (persuasion, example, demand, command, explanation, narration, study and exercise, desire and well-being, magic, swear, please, advice, gesture, approval, anger, persuasion, prohibition, threat, etc.) and strong with educational tools (games, numbers, riddles, proverbs, songs, fairy tales and legends, narrations). The use of folklore plays an important role in strengthening the ideological connection of education with the life of the people. These treasures have been very effective in educating the younger generation when approached creatively. Various means of folklore have undergone great changes. These changes also had a negative impact on upbringing. Today, during the period of independence, in the spirit of the ideas of independence, the time has come to restore the ancient traditions of the people, to ensure the use of rich folklore in education. Genres such as epic, fairy tale, lapar, proverb, rhetoric, riddle as the ideological treasure and great achievements of folklore, which have not lost their essence in modern educational work, play a key role in the development of folklore of the independence period. Folklore has a very different approach to the subject of labor.

Praise for influencing children verbally, glorifying labor, diligence, results of work, giving a pleasant description of labor, appealing to the conscience (until revealing the spiritual content of labor), preparation for work, advice on self-education, criticism (laziness, dislike of work) ) and other methods are used. A creative comprehensive (global) approach to pedagogical problems is the key to good results. The perfection of the people's life, the gathering of new customs, traditions, ceremonies turn the whole life of our people into a pedagogical educational process. Just as a child who learns the mother tongue in the family does not need to be taught the correct pronunciation of words, educators do not need to spend time and energy to form spiritual and moral qualities in a person who grew up in an environment where honesty, diligence and patriotism are unconditionally practiced from the first day of life. The educator focuses his or her ability on solving an incomparably complex parenting problem - developing the individual abilities and talents of their pupils. The role of folk customs and traditions in solving this problem is great. There are different forms of tradition - humanism, fraternity, labor, morality, and each of these forms has a great impact on the educational process, forming the basis of "folklore."

The basic principles of folklore are formed and popularized.

-Formation of new pedagogical thinking on the basis of modern ideas about the methodological basis of pedagogical education;

- The formation of a system of subject knowledge that reflects the person, his professional characteristics;
- Creative use of the rich pedagogical heritage in pedagogical experiments, introduction of the pedagogical possibilities;

The oral art of the Uzbek people is formed and developed on the basis of the laws of revival and development of spiritual culture, the historical development of the people, social relations, the peculiarities of national psychology and character.

## RESULTS AND DISCUSSIONS

Social activism is a normal and strong activity. Yusuf Khos Hajib, a classic representative of our ancient Turkic pedagogy, wrote in his book "Kutadgu Bilig" about the involvement of children in social education and activism from an early age: Uquli-idrokli bo'lsa qay odam,

Kishi deb atagin, maqtagin har dam.

Yovuzni ezgu tut, kichikni ulug',

Uquv-idrok, bilim bo'lsa unda jam.

*Meaning:*

What kind of person is intelligent?

Call him a man, praise him all the time.

Honor the wicked, honor the little one,

If there is knowledge, then there is knowledge.

He adheres to the adage, "The mind is not in the age, but in the beginning," and if it has knowledge, it is advisable to honor the little one and raise him to the top. The educated, knowledgeable, who are the golden fund of any society. He calls people to appreciate and to educate and develop from an early age.

Samples of folklore intended for study in the primary grades should be appropriate to the age characteristics of pupils, the level of development of consciousness and understanding, and should be inextricably linked with the essence of the moral qualities. It is important to note that the child feels the concepts and expressions and change their behavior by following the content. Proverbs, fairy tales and legends, wise sayings, passages from epics and songs can be included in the types of folklore that can have a strong educational impact on pupils in the primary grades. Riddles are considered to be more of a means of mental education and learning. In search of the answer to the riddle, the child develops such qualities as broadening his worldview, willpower, self-confidence, responsiveness and make socially active. Examples of Uzbek folklore include high human ideals in the masterpieces of folk wisdom, which cover various aspects of life, calling people to be become socially active, morality, patience, honesty and generosity, honesty and truthfulness. Proverbs contribute to the spiritual development of pupils. Pupils should be taught more ethical proverbs and their content should be explained. In Uzbek folk proverbs, materials on social activism and methods of social activity education occupy a central place. For instance: "Do not be a child of your father, be a child of man!", "Labor brings happiness", "Motherland is your golden cradle". The positive spiritual qualities of young people - fiery

patriotism, kindness, national pride, deep humanity, love of work, cooperation, friendship, solidarity, unity, etc. includes methods and means of adapting to qualities. These proverbs reinforce the general upbringing of the youth as they cover all aspects of human nature.

A Grade 3 textbook contains an excerpt from the epic Alpomish. The passages provide pupils with information on mental education, moral education, patriotism, humanity, hard work, physical education and social activism. If the content of the story were thoroughly studied, all the qualities of a perfect person would be explained to the pupils. Therefore, it's important to expand the teaching of epics to primary school pupils. In epics, the youth of the heroes is described in detail. How he became a mature person is consistently described. The epics provide an in-depth analysis of children's lives. Pupils find role models and try to apply them in their lives, not just knowing them. In folk epics, positive and negative relationships between people are reflected in bright colors. At the same time, there is a strong focus on nature, the environment and ecology. Human relationships to animals, plants and trees, water and air are at their highest. In the epics "Alpomish" and "Gorugli" the attitude of the heroes to the horse is exemplary. Young people feel an example of true friendship and mutual support. We have said that folklore has a strong influence on the development of young people in all respects. All types of oral materials can help pupils grow physically, be healthy, strong, agile, and strong. The physical development of boys and girls is expressed in subtle terms. Elementary education is also given special attention in the primary grades. First of all, we try to cultivate good manners, high taste and intelligence. Proverbs, sayings, and wise sayings evoke beautiful emotions. The following articles, included in elementary school textbooks, will help to develop pupils' sense of humor. "Beauty is not in beauty, it is in labor", "Speak a little", "If you serve, you will be respected" and others. The use of folklore in primary school schools will guide them to be socially active and helpful at all times and help make great educational effects in the future.

## CONCLUSION

To conclude briefly, folklore plays an important role in the mental, moral, physical, and spiritual development of primary school pupils. Folklore uses many factors in education (nature, labor, life, habit, art, religion, mother tongue), with a great wealth of methods (persuasion, example, demand, command, explanation, narration, study and exercise, desire and well-being, magic, swear, please, advice, gesture, approval, anger, persuasion, prohibition, threat, etc.) and strong with educational tools (games, numbers, riddles, proverbs, songs, fairy tales and legends, narrations).

### ABSTRACT

*It is known that the main part of the important tasks of education of primary school pupils is carried out in reading lessons. The textbook "Reading book" for primary school is also based on the concept that the program "Reading and speech development" meets the requirements of the State Education Standard in our country. The reading textbooks also contain a wide range of folklore works that pupils love to read. In this article, we will discuss the crucial role of the use of folklore in developing the speech of primary school pupils.*

**KEYWORDS:** *Speech Development, Primary School Pupils, Folklore, Fairy Tales, Proverbs, Epics, Stories, Reading Textbooks*

### INTRODUCTION

Let us begin to define the phenomenon "folklore", an English word, derived from the words "Folk" - peoples, "Lore" - wisdom, meaning "folk wisdom". Uzbek folklore is an oral art of various genres, reflecting the worldview, artistic pleasure, creative potential, dreams and aspirations of the Uzbek people. Folklore includes fairy tales, epics, legends, songs, parables, proverbs, riddles, anecdotes and stories. Materials of folklore reflect social events, struggles, defense of the homeland from the enemy, dreams, customs, rituals, ceremonies and other life events of the people.

Primary school curricula place a complex challenge on reading lessons, such as helping pupils acquire good reading skills. The materials of folklore play an important role in the full

implementation of such tasks. Pupils are naturally fond of proverbs, riddles and fairy tales; they read them with great interest. In addition, folklore has long been a source of education.

## MATERIALS AND METHODS

First of all, primary school pupils get acquainted with fairy tales. It is known that fairy tales are one of the oldest popular and widespread genres of folklore. The term "fairy tale" occurs in the 11th century in Mahmud Kashgari's "Devonu lug'atit turk" in the form of "mature" and tells a story orally [1]. Although the word "fairy tale" is now accepted as a folkloric term, it is called a parable in Surkhandarya, Samarkand and Fergana regions of our country. Fairy tales are an epic type of folklore. Its peculiarity is that it tells a story in the form of a perfect story. Fairy tales reflect the realities of life in a wonderful, strange and attractive way. Therefore, they are a product of the oral tradition, told and spread by many people. At different times, fairy tales have undergone different changes. The ideological direction, composition and the tasks of the protagonists of fairy tales changed, and new versions appeared. In addition, each fairy tale was reborn depending on the creative ability, worldview, ability to reflect the realities of life, the level of knowledge of fairy tale traditions, upbringing, psychological state, so that a fairy tale itself lives among the people in several variants.

The artistic form and poetics of fairy tales are unique. Fantastic fiction is associated with the realities of life and reflects the ancient notions, customs and rituals themselves. One of the characteristic features of the performance of a fairy tale is that the events and happenings are realized by the narrator and the listener not as an "event" but as "unavoidable events". Thus, in fairy tales the place and time of events and happenings are vaguely expressed in general terms. And the role of fairy tales in terms of time and space varies. Their language and style are different. In order to determine to which type this or that fairy tale belongs, it is necessary to carefully determine its content and main function. For example, the formation of romantic-adventure or comic tales as an independent genre with fairy tales and fairy tales about animals also occurs at different times. The plot structure, character, images of such fairy tales as "Kenja Botir", "Ur toqmoq" (hitting stick), "Chol bilan kampir" (old man and a old woman) "Bori bilan tulki" (A wolf and a fox) were created in different periods and containing different social strata. There are similarities and differences in the system, variety and method of narration. In the course of its development, a fairy tale may lose some motif images, adopt new characters, and sometimes the traditional elements are reinterpreted. So, the structure of each fairy tale, its ideological content, artistic means show its own character. The famous Uzbek fairy tales "Zumrad and Kimmat" or "Golden Watermelon" are mostly magical tales.

However, the appearance of the main characters, their actions are reminiscent of the main characters of comic tales. In comic tales, intelligence, not for entrepreneurship, but on the contrary, fantastic fiction, plays a decisive role in the solution of the work. Fairy tales are distinguished by their unique composition. In particular, the introductory part, the initial completion is noteworthy. The introductory part first of all demonstrates the skill of the storyteller, and prepares the audience to listen to the story. The beginning describes the first part of the story. In fairy tales, the traditional beginning does not indicate the time of the event, but rather vaguely, in a general way. For instance, "Once upon a time, a shepherd lived near the forest...". Apparently, the introductory statement reveals the identity of the characters, their profession, occupation, nicknames. This means that oral stories, which are connected with the

realities of life and are based on fiction and life fiction, carrying didactic ideas, are called fairy tales. [2]

Fairy tales are conditionally divided into fairy tales about animals, fairy tales, life tales according to the interpretation of images, ideological content and conflict, plot and composition, the role and function of fiction, and language and style. In the repertoire of Uzbek folk storytellers, fairy tales about animals occupy a significant place. Tales about animals originated in ancient times and express the concepts of human life, labor, worldview, nature in the primitive system. Magical fairy tales also play an important role in the repertoire of Uzbek folk tales. This type of fairy tale is distinguished by the fact that it is based on magical, fantastic fiction. The origin of magical tales has an ancient history, the roots of which go back to primitive society. The actions of fairy tales - magic, sorcery, miracles - are associated with fantastic images. On the basis of such fairy tales as "Semurg", "Kenja batir" the deification of the primitive worldview-forces of nature, the sanctity of animals and their worship play a key role. The dream of flying in the sky gave rise to "Flying Carpet", "Wooden Horses", and the desire to see far gave rise to "Mirror World". [3]

There are a number of fairy tales that stand out among the fairy tales. These are heroic tales, tales of stepfathers and humiliated people, and tales of dwarf wrestlers. Fairy tales do not give a clear description of the protagonist. Only traditional characters are displayed. "The girl is full like a fourteen-day moon", she is extremely beautiful, imaginative, timid, hard-working, intelligent, enterprising, intelligent girl with high traditions. Every day she chops wood, cooks soup, washes pots, and cleans the house. These qualities become even clearer during the adventure. On the other hand, the stepmother, brother, cousin, and the naughty old woman are the symbols of oppression and violence. The magic contained in the fairy tale exposes the vices of injustice, endorses justice, diligence, and spiritual beauty. In the image of heroes, such qualities as high manners and manners, humanity, diligence, wisdom, courage and sensitivity shine, while in the image of tyrants and free people do not turn away from any dirty deeds in the way of property. It seems that fairy tales differ from other genres of folklore with their peculiarities. Traveling to the world of fairy tales as a child, one first hears fairy tales about animals and gets acquainted with the world of intelligent and stupid, generous and jealous, cruel and just people of all kinds.

Fairy tales depict the life of the people, their hopes for justice, truth, anger against evil forces and love for the good. After reading folk tales, pupils tell them to their friends, brothers and sisters, and most importantly, to imitate the positive heroes they love, to tell them honestly, truthfully, diligently and try to be similar to heroes. The pupils hate negative heroes and try to be different.

## RESULTS AND DISCUSSIONS

The use of folk tales has a positive effect on both increasing the interest of pupils in knowledge and educating them to become perfect people. And the proverbs are one of the genres of folklore studied in primary school. Proverbs are the most common genre of folklore. The proverbs are created as an artistic expression of the people's life, intellect, life experience, struggle, labor, the proverbs are written in a light, fluent and lively language, in which the deep meanings confirmed in the people's life experience are concisely represented. That is why the proverb is memorable. Proverbs increase pupils' oral speech, increase vocabulary. Proverbs are one of the tools that help the teacher to convey to the children the verdict of the people on this or that issue. Introducing

pupils to the meaning, structure and form of folk proverbs increases the effectiveness of education.

Reading lessons provide the ability to read the text of the proverb correctly and consciously. In these lessons, pupils become accustomed to consistently grasping the meaning of each word in a proverb and the full, perfect meaning of the proverb. Methods of oral narration, conversation, oral and written exercises are effectively used in the study of proverbs. Reading essays focus on a particular topic or topic, as well as the content of poems and stories. Analyzing the content and structure of proverbs, it is stated in the method of conversation that proverbs are broad in structure, short in structure, and generally wise. In this way, pupils are not only equipped with scientific knowledge, but also have spiritual qualities based on this knowledge about proverb which is mastered by pupils. This is a great contribution to the further development of intellectual development and abilities of pupils.

The role of folklore is enormous at a time when the genre of epics, which has existed for centuries as a rare monument of genius of the people, has not had the means to fulfill its role of enlightening the spiritual world of our people since its formation. If we look at the Uzbek epics in detail, we can see that in this regard, the epics are mainly divided into internal networks. The first is heroic and the second is romantic epics. Epics, the largest and most complex genre of folklore, are also included in the curriculum of primary school reading and speech.

In particular, in the "Reading Book" of the 3rd grade, "Rustamkhan" Without knowing the main idea of the epic, the problem in the passage can be a personal, vague idea in the readers. [4] At present, the main focus of the teaching process is on new educational technologies. In the new pedagogical technology, the pupil becomes a subject of the educational process, familiar with the teacher, with equal rights. The subject is studied jointly by the teacher and the student. The importance of teaching and learning for the child's personality increases. Based on this principle, before studying the passages, the teacher should remind pupils of the genres of fairy tales and stories that are already familiar. This short introductory interview will be as follows:

1. What genres do you know that tell the story of kings, princes, princesses? Children will definitely answer this question in the genre of fairy tales, because in the "Reading Book" of the 3rd grade there are a number of fairy tales in this period, which include the image of the king. Once the question is answered, move on to the second question. [4]

2. How would the end of the fairy tale end? The children, in turn, respond by giving brief and clear information about the epics. Epics are like fairy tales in terms of their images and methods of depiction. Epics, like fairy tales, often depict the lives of kings, ministers, princesses and princes. However, in epics, the story is told not only in prose, but also in poetic passages. In addition, fairy tales can be told not only by a storyteller, but also by someone who can tell the story. After describing this information, it is necessary to proceed to the reading of the text of the epic. In this process, the pupil gets acquainted with the content of the passage, as well as the poetic passage. After this process, the children ask about the bakhshi who performed these epics. For this reason, we have already mentioned that the teacher should be familiar with the full text of the epic. In the process of giving information about epics, the teacher should also say that the performer must know the music, be able to play one of the musical instruments. This is the reason why we have mentioned above that this genre is very complex. When talking about epics, we come across a number of terms, such as epic, bakhshi, drum, dutar, doira, bolamon, music. In

turn, the teacher must know the interpretation of these terms. Well, isn't it enough to know the terms bakhshi, drum, music; Why do so many other terms appear before our eyes? The whole point is; the tradition of singing in Khorezm is radically different from other parts of the country. It is difficult to describe the passages taken from them without explaining the organic connection of the epic with prose, poetry, and music. The process of explaining these passages is also very complicated, because they have a lot of lexical units related to the Bakhshi language. For example, in Rustamkhan's epic there are a number of words, such as "dragon", "stubborn", "violent", which the modern reader cannot digest in terms of meaning. In the same passage there are two forms of the same word, such as "dragon". This situation should be explained to pupils as elements of dialect. Also, the word "stubborn" means "brave", "brave"; It should be noted that the word "violent" does not mean "violent", but "strong", "powerful". [5]. Otherwise, the modern student may understand these words in completely different meanings. At the same time, in the lessons of reading passages from epics, it is important for the teacher to inculcate in pupils the qualities of perfection by instilling them as heroes.

## CONCLUSION

The role of folklore in educating our youth as spiritually mature and perfect people is invaluable. Only if the teacher is well aware of the peculiarities of the materials of folklore, and increases his theoretical and scientific knowledge, he/she will be able to connect the examples of folklore with education. The goals and objectives of primary education determine the content and structure of the material to be studied. Ideological-aesthetic, seasonal, progressive bases are taken into account in the development of the curriculum. Learning materials include knowledge about beings and human relationships that are important in educating children. The essence of the curriculum is to create a culture of reading by acquainting pupils with works of art and literature.

### ABSTRACT

*This article discusses the issue of continuity of the study of the topic "Complex numbers" in schools and pedagogical universities in connection with the reforms carried out in the field of education in the Republic of Uzbekistan, and changes in the content of secondary education, in particular mathematical education. It is necessary to develop methods for studying newly introduced sections of mathematics, especially some recurring topics, and to improve methods of teaching academic disciplines based on new educational technologies, taking into account modern requirements and international experience. In the course of the research, various research methods were applied, namely, the study and analysis of scientific and pedagogical, methodological, mathematical literature and school textbooks in mathematics; analysis of the continuity of the section "Complex numbers"; pedagogical experiment to test the residual knowledge of students on the topic "Complex numbers"; discussion of research materials.*

**KEYWORDS:** *Continuity, Complex Numbers, Algebra And Number Theory, Mathematical Analysis, Theory Of Analytical Functions, Level Of Learning, Degree Of Abstraction, Educational Element*

### INTRODUCTION

The development of the information society puts its demands on the education system. These requirements apply both to educational content and to learning outcomes. The development of information technologies, pedagogical ideas, the results of international studies on education (TIIMS, PISA, etc.), the importance of the development of STEAM technologies determine the

change in the content of school mathematical education. In this regard, new sections have been introduced in the school mathematics program of the Republic of Uzbekistan, such as combinatorics, elements of mathematical logic, complex numbers, elements of probability theories, elements of mathematical statistics, and financial mathematics. As a result, some topics or their contents, in particular the topic “Complex numbers,” are repeated. The question arises: “Do I need to re-study at the university?” University teachers answer “yes,” because the knowledge and skills of yesterday’s students in complex numbers do not meet the requirements of the university program. Naturally, questions arise of developing a methodology for studying the topic “Complex Numbers” at school and university. Therefore, ensuring the continuity of teaching mathematics in the school-university system is again becoming relevant.

Scientific sources that examined the issues of continuity of teaching mathematics in the “school-university”, “lyceum-university” systems [2, 3, 4] mainly examined the study of the foundations of mathematical analysis. In [9], to ensure the continuity of the study of basic concepts Analysis is offered through the intuitive introduction of the basic concepts of algebra and the principles of analysis in schools and pedagogical universities. And since complex numbers have recently been introduced into the practice of a comprehensive school, the continuity of studying this topic in the school-university system has not been considered.

To achieve the goal of our study, the works of R.M. Turgunbaev and I. Allambergenov [2, 3, 12, 13] were considered. In these studies, in order to ensure the continuity of the study of the basic concepts of mathematical analysis, repeating topics in the mathematics programs of academic lyceums and mathematical analysis of universities are analyzed, the topics are described in the educational literature and they compiled tables of learning elements that characterize the level of learning elements ( $\alpha$ ) and the levels of abstraction that characterize the language of presentation of educational information ( $\beta$ ) proposed by VP Bepalko [5]. Thus, they proposed their own option of ensuring the continuity of the study of recurring topics at the academic lyceum and university.

In this article, we consider the issue of continuity of teaching and the content of the topic “Complex Numbers”, which is studied in the 10th grade of secondary schools in higher educational institutions, in particular pedagogical universities of the Republic.

## MATERIALS AND METHODS

It should be noted that in the new school programs in mathematics, the quality of learning elements of instruction is not indicated. For example, in the section “Complex numbers” of a program in mathematics it is indicated that “... can calculate the values of simple expressions with complex numbers” [6]. But there is no information about the complexity of these expressions.

According to the approved new program in the course of mathematics, it is planned to teach the topic “Complex numbers”. The same topics are studied in higher education, in particular in the course “Algebra and Number Theory” undergraduate course “5110100-methodology of teaching mathematics.” And also complex numbers are used in mathematical analysis (analytical functions). If we analyze the textbooks recommended for pedagogical universities [1, 7, 10, 11], we see that the concepts of complex numbers, arithmetic of complex numbers, and geometric interpretation are repeated. The question naturally arises, should a re-study of these materials be

followed, if so, why and how. To answer this question, it is necessary to answer questions about what is the knowledge of first-year students on the topic "Complex numbers". In order to answer these questions, it is necessary to analyze the theoretical material and questions related to complex numbers. Also, to carry out the test work with first-year students who have entered the mathematical field, to analyze the results. It is also important to clarify the degree of students mastering material related to complex numbers by clarifying the teaching contexts of the disciplines "Mathematical Analysis", "Algebra and Number Theory".

First, consider the presentation of the topic "Complex numbers" in the schoolbook [8].

The 4th chapter of the school textbook is called "Complex Numbers" and 6 lessons are given for learning at the end of the fourth quarter of the 10th grade.

1-2 lessons are devoted to the topics "Complex numbers and actions on them" and "Images of a complex number." In these topics, the concept of a complex number is introduced, and related concepts: imaginary unit, real part, imaginary part of complex numbers, equality of complex numbers, arithmetic operations on complex numbers, opposite complex numbers, conjugate complex numbers, mutually inverse complex numbers; designations are introduced for complex numbers, the set of complex numbers, the imaginary unit, the real and imaginary parts, the conjugate complex number, the concept of the image of complex numbers in the coordinate plane, the complex number is the point of the plane, the complex number is the radius vector, the concepts of the imaginary and real axis, geometric interpretation addition of complex numbers - the parallelogram rule.

These topics cover the following types of exercises and tasks: what are the real and imaginary parts of complex numbers; write complex numbers in algebraic form when the real and imaginary parts are given; indicate equal complex numbers; find the conjugate number in the given complex number; find the sum, difference, product and (go) quotient of complex numbers; plot complex numbers in a plane.

The 3-lesson provides information on complex numbers in trigonometric and exponential forms, in particular, the module of a complex number, the argument of a complex number, the area of the value of the module and argument; the recording form of the trigonometric and exponential forms of the complex number, it should be noted that the Euler formula is not introduced.

The following types of exercises and tasks are offered: find the module of a complex number; find the argument of a complex number; write down the complex number in trigonometric and exponential forms.

The next two lessons are devoted to the subject of the product and the quotient of complex numbers given in trigonometric form. In this topic, without proof, the formulas for the product and division of complex numbers given in the trigonometric form, raising to the natural degree of the complex number, and the Moire formula are given. Exercises and tasks on multiplication, division, raising to the power of complex numbers given in trigonometric form are considered; to perform an action where the use of trigonometric forms of complex numbers is required.

The next lesson is about extracting the square root of a complex number. We prove the formula for extracting the root of a complex number given in trigonometric form. A formula for extracting roots in degrees 3 and 4 is given without proof. The exercises and tasks of extracting the square root of a complex number are given.

Chapter 4 contains 8 types of exercises, a total of 55 exercises. All of them can be used to organize the mathematical activities of students.

4-module of the curriculum of the discipline "Algebra and Number Theory" direction 5110100-methodology of teaching mathematics [15] is called "Algebraic systems". His 11th and 12th topics are devoted to the study of the field of complex numbers, the modulus and argument of complex numbers, and their properties; the geometric meaning of a complex number, the trigonometric form of complex numbers, the Moiré formula, extracting the root of the nth degree from unity and an arbitrary complex number, axiomatic theory of complex numbers. To study these topics, 8 hours of lecture, 8 hours of practical training and 12 hours of independent work are allotted.

The 16-module of the curriculum of the discipline "Mathematical Analysis" of the direction 5110100-methodology of teaching mathematics [14] is called "Theory of analytic functions." In its topic "Complex plane", it is planned to study the concepts of the set of complex numbers and the isomorphism of this set with the Euclidean plane, as well as the concepts of a flat line and areas in the complex plane.

An analysis of the textbooks used to study complex numbers at school and university shows that complex numbers are taught in school mathematics from the point of view of expanding the concept of numbers, the presentation of topics and task material are aimed at forming the procedural knowledge of students. And in the course "Algebra and Number Theory" complex numbers are studied as a numerical system - the mathematical basis of the future theory of polynomials and the theory of analytic functions. The set of complex numbers is a field, further studied polynomials over the field of complex numbers. The course of mathematical analysis considers complex numbers as numerical systems, their geometric interpretation, introduces the concept of a complex plane, continuous curves and domains in a complex domain, studies its topological properties, analytical functions and their properties. Note that in this course we prove the basic theorem of algebra, Euler's formula, and also give a final solution to the question of the degree of a complex number - an arbitrary degree of an arbitrary non-zero complex (in particular real) number is determined.

## RESULTS AND DISCUSSIONS

Obviously, the study of complex numbers as an object of an algebraic system should be based on students' knowledge of complex numbers studied in the school course of mathematics. And the knowledge gained in the course "Algebra and Number Theory" will be used and supplemented in the analytical functions section of the course of mathematical analysis.

An experimental study was conducted to assess the residual knowledge of freshmen students on the topic of complex numbers, studied at school, in vocational colleges or schools. It was held in October 2019 at the Ferghana State University. The experiment was attended by first-year students. Students were offered tasks similar to those at the school level of mathematics. Below is one of the options for writing.

№1. Show equal complex numbers: 1)  $2 - 4i$ ; 2)  $2 + 3i$ ; 3)  $\frac{2}{3} + i$  4)  $\sqrt{121} - 7i$ ; 5)  $33 + 44i$ ; 6)  $\sqrt[3]{8} + \sqrt[3]{27}i$ ;

№2. Find the conjugate complex number  $z$  to a given number:  $z = 5 - 3i$ ;

№3. Find the amount:  $(-5 + 3i) + (2 - i)$ ;

№4. Find the difference:  $(3 + 4i) - (4 + 2i)$ ;

№5. Find a product:  $(4 + 6i) \cdot (3 + 4i)$ ;

№6. Find private:  $\frac{2+2i}{1-2i}$ ;

№7. Follow the steps:  $\frac{(3-4i)(4-3i)}{2+i}$ ;

№8. Draw a complex number on a plane.  $z = 3 + 4i$ ;

№9. Find the modulus of a complex number:  $z = 1 + \sqrt{3}i$ ;

№10. Find the argument of a complex number:  $z = \frac{\sqrt{3}}{2} + \frac{1}{2}i$ ;

№11. Write a complex number in trigonometric and exponential forms:  $z = \sqrt{2} - \sqrt{2}i$ ;

№12. Find a work:  $z_1 = -\frac{\sqrt{3}}{2} \left( \cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \right)$  и  $z_2 = \frac{1}{2} \left( \cos \frac{\pi}{6} + i \sin \frac{\pi}{6} \right)$ ;

№13. Найти частное:  $z_1 = \sqrt{2} \left( \cos \frac{\pi}{8} + i \sin \frac{\pi}{8} \right)$  и  $z_2 = 2 \left( \cos \frac{\pi}{12} + i \sin \frac{\pi}{12} \right)$ ;

№14. Exponentiate:  $\left( 3 \cdot \left( \cos \frac{\pi}{15} + i \sin \frac{\pi}{15} \right) \right)^5$ ;

№15. Extract square root from complex number:  $25 \left( \cos \frac{\pi}{3} + i \sin \frac{\pi}{3} \right)$ ;

№16. Write in algebraic form:  $z = \left( \frac{1-\sqrt{3}i}{3i} \right)^2$ ;

№17. Find private:  $5(\cos 100^\circ + i \sin 100^\circ) : \left( \frac{\sqrt{3}}{2} + \frac{1}{2}i \right)$ ;

№18. Exponentiate:  $\left( \frac{1}{\sqrt{3}} + \frac{1}{\sqrt{3}}i \right)^{10}$ ;

№19. Extract square root from complex number:  $\sqrt{-27i}$ ;

№20. Extract cubic root from complex number:  $\sqrt[3]{1+i}$ ;

№21. Extract the fourth root of the complex number:  $\sqrt[4]{16}$ .

The results of the written work are shown in table 1. Here, the first line contains the numbers of the tasks, in the next lines the students graduated from the academic lyceum (AL), school (S), and professional college (PC). And also in separate lines shows the results of students who completed their studies in 2019. The number of students is indicated in parentheses

Total (89) B %	18	30,3	31,5	35	10,1	25	3	14,6	5,6	4,5	0

From the results obtained, it was found that most students correctly solved the 3rd, 4th, 5th examples. And more than 50% of students decided correctly examples 1, 2, 6, 7. But most of the remaining examples were not properly considered by students. These examples are the geometric representation of a complex number, trigonometric form, the execution of actions on complex numbers in trigonometric form.

It should also be noted that the results are practically independent of whether the students graduated from school or an academic lyceum.

To study the disciplines of algebra and number theory, analytic functions, it is important that they know the geometric interpretation of a complex number, the trigonometric, exponential forms of a complex number, the implementation of actions on them and their application.

The analysis of programs, educational literature [1,3,12] shows that the majority of educational elements on a subject are repeated. But, as we indicated above, there is no identical repetition, the context of learning is different. In the theory of algebra and number theory, the properties of the set of complex numbers are studied, and the level of abstraction increases. The number of concepts associated with complex numbers is increasing, complex numbers are considered as a numerical system. The same can be observed during the analysis of topics devoted to complex numbers of the course of mathematical analysis.

Based on the analysis of the results of the experiment and the analysis of textbooks, teaching aids dedicated to the study of complex numbers, we proposed the following levels of learning elements ( $\alpha$ ) and stages of abstraction that characterize the language of presentation of educational information (table 1).

**TABLE 1 LEVELS OF LEARNING ELEMENTS AND THE LEVEL OF ABSTRACTION OF THE PRESENTATION OF THE THEME “COMPLEX NUMBERS”**

№	Educational elements	Secondary school				Bachelor (direction of methodology of teaching mathematics)			
		$\alpha_H$	$\alpha_K$	$\beta_H$	$\beta_K$	$\alpha_H$	$\alpha_K$	$\beta_H$	$\beta_K$
1	Complex number in algebraic form	0	1	0	1	1	3	1	4
2	EqualComplexNumbers	0	2	0	1	2	3	1	4
3	Conjugatecomplexnumbers	0	2	0	1	2	3	1	4
4	Complexnumbersoperations	0	1	0	1	1	3	1	4
5	Oppositecomplexnumbers	0	2	0	1	2	3	1	4
6	Mutuallyinversecomplexnumbers	0	2	0	1	2	3	1	4
7	Image of complex numbers on a plane	0	1	0	1	1	3	1	4
8	Realaxis, imaginaryaxis	0	1	0	1	1	3	1	3
9	Complex number images as a vector	0	1	0	1	1	2	1	3
10	Rule parallelogram of addition of complex numbers	0	1	0	1	1	2	1	3
11	Trigonometriccomplexnumberform	0	1	0	1	1	2	1	3
12	Complex numbers in exponential form	0	1	0	1	1	2	1	2
13	Complexnumbermodule	0	1	0	1	1	2	1	4
14	Complexnumberargument	0	1	0	1	1	2	1	2
15	Transition from trigonometric to algebraic form	0	1	0	1	1	3	1	2
16	Multiplication and division of complex numbers given in trigonometric form	0	1	0	1	1	3	1	3
17	MoorFormula	0	1	0	1	1	3	1	3
18	The square roots of complex numbers	0	1	0	1	1	3	1	3

The results of the study, in particular this table, were discussed at a seminar of the department "Mathematics" and were approved by teachers of the disciplines "Mathematical analysis", "Algebra and number theory".

These results can be used by school teachers to develop knowledge and competence of students on the topic of complex numbers, as well as mathematics teachers in higher educational institutions when choosing a method of teaching topics of complex numbers.

## CONCLUSION

In the study of complex numbers in a pedagogical university, it is also necessary to establish continuity between the courses "Mathematical Analysis" (theory of analytic functions) and "Algebra and Number Theory". It is important to familiarize students (future teachers of mathematics) with the applications of complex numbers for solving problems of trigonometry, planimetry in circle classes or in disciplines of choice, when writing term papers, graduate works. In addition, in the course of geometry, students can recommend a comprehensive

interpretation of Lobachevsky geometry, in the course of mathematical analysis, to study in detail linear-fractional functions in conjunction with mappings on the plane. As a result, students enrich their knowledge and skills on the topic "Complex numbers", students get the opportunity in the future to organize extracurricular activities of school students on this topic.

## TURA SULAYMON'S MASTERY OF THE ARTISTIC USE OF SYNONYMS

**Ibragimov Khayrulla Khamdamovich\***

\*Teacher,  
Jizzakh State Pedagogical Institute,  
UZBEKISTAN

### ABSTRACT

*This article focuses on one of Tura Sulaymon's main tools for ensuring the diversity of artistic discourse, the ability to use synonyms as an important means of expression in language.*

**KEYWORDS:** *Emotional Coloring, Tone, Stylistics, Neutral, Art, Support, Cousin, Brother's Wife, Salt, Black, Lonely, Beloved, Honor, Conscience, If, But.*

### INTRODUCTION

The most important of the linguistic features of a literary text is that it includes emotionally colored words, dialect words, historical and archaic words, slang and slang words, figurative words, synonyms, forms, words with similar pronunciations and opposite meanings, as well as units such as phrases, proverbs and sayings are wide given.

Synonyms are also one of the factors that indicate the richness and diversity of a language. Synonyms help to express an idea clearly and effectively. For this reason, word artists try to use them skillfully. The artist's artistic skill and vocabulary can be seen in the synonyms he uses appropriately and purposefully.

One of such creators, the poet Tura Sulaymon, also skillfully used synonyms. He used colorful synonyms in the vocabulary of the Uzbek language to discover new aesthetic concepts.

*Sengaqolgankunim, kunmas – qabohat,*

*Koshkisendankutsamimdod, inoyat!*

*Meniqo'llayolur, qilurhimoyat*

*Uzilmastorlarim,*

*Sinmassozlarim! ("Sozim")*

*Mag'ribnotinchbo'lsabezovtamashriq*

*Do'stdo'stdanimdodintutgaymidarig'?*

*Qayerzulmatichra, qayerdiryorug'*

*Magaryeryuzida tinchlikbo'lmasa("Bo'lmasa")*

The word "help" is synonymous with the words "help, support, help" and "means of material or spiritual support." In the word help, the strength of the shade is stronger than the word support, and is likely to be used in an artistic style. The poet perfects art using the words help, support, help, a synonym for help, which means grace instead of caring.

Tura Sulaymon also skillfully used dialectal words and contributed to their approval in the literary language.

*Holimdankuladinecha-nechalar...*

*Biryilchatuyularo'tgankechalar.*

*Harkunixunobdayanga-chechalar...*

*Jumboqniboshidano'tganyecholar!*

*Do'stlaro, shutaqlidrozgayo'liqdim ("Yo'liqdim").*

In this paragraph, the creator refers to the word checha used in the dialect. Checha is known to be used in the sense of a bride of brother.

*Xeshlarimningbemavrid*

*ko'zlaridayoshko'rsam,*

*Birmardbilannopokning*

*Taqdirintutashko'rsam ("Armon").*

The word klesh belongs to the dialect and means relative, kin-clan, tribe-relative, close person. The poet ensured the universality and fluency of his poem through the element of dialect.

*Qo'riqchisibo'lardimbog'imdaunarbo'lsa,*

*Kuzimkelmaybahorimqaytaboshlanarbo'lsa,*

*Solnomachisibo'laymagaruQamarbo'lsa,*

*Qasamichibaytaman: namakbiryon, nonbiryon("Gulbiryon, chaman biryon").*

The poet uses the word salt, a synonym of the word salt used in dialect. Through this he put the poetic weight in its place.

Sound is a dialectal word from the synonymous series sound, sound, flour, echo, sas, outcry, sazo, and is used in fiction, especially in poetry.

*To'plarsasibo'lmasin*

*Deymiz, sayyoramizda,*

*Biz – jahonbolalari ("Biz – jahonbolalari").*

*Tutdimahalla-ko 'yniqo 'shkarnay, surnaysasi,*

*Sayoqsozandalarining ortiqchadahmazasi.*

*Badmastlarorasidaguzaron – tarafbozlik,*

*Isrofustigaisrofto 'yxonaga "jonbozlik" ("Senso'rama, menaytmay").*

Tura Sulaymon always paid great attention to the fact that synonymous words are not absolutely equal to each other, each of them has its own characteristics and subtle differences in their meanings, and was able to use them in their place.

In the "Explanatory dictionary of synonyms of the Uzbek language" as a synonymous line of the word friend is given comrade, ulfat, agayni, oshna, jora, brother, hamdam, dugona, vascular, chopkat[1]. But their level of use and style are different. The words jora, brother, ulfat are less used than the words comrade, oshna, agayni. The lexical meaning of the word ulfat is consent, alliance, solidarity, and it means love, affection, and love. A conversation is a gathering of people who are always together at a banquet, a gathering of such people. In the poet's book of satirical poems, "I threw it away," he says that after giving up drinking, his friends left. The poet does not use the word friend in this context. Because in this word the intimacy in a friendly relationship is even stronger. No one can be a good friend.

*Bora-boraulfatlartashlabqocharhambo 'ldi,*

*Kaminangizbedavodardgaduchorhambo 'ldi.*

*To 'yxatlardantamominomio 'charhambo 'ldi,*

*Qirqqayetmayqomatlol-xiyolnochorhambo 'ldi,*

*Tashlagandantashladimichib, cheqmoqlaringni ("Tashladim")*

In another verse of the same poem he now uses the word friend.

*Rangi ro 'yimga, do 'stlar, yugurdi qon, oqibat.*

*Tashlagandan tashladim ichib, cheqmoqlaringni ("Tashladim")*

In another poem on the same subject, he mentions the difference between a friend and a partner, quoting the word friend as well as the word partner.

*Do 'st, sheriklarimalkashlar*

*Yurgandayo 'lichalkashlar*

*"Kimbilankimtopishadi!"*

*Debkulisharhazilkashlar ("Ichdim, armonimqolmadi").*

It is very important for the poet to take into account that "synonyms are not for the differentiation of semantic shades, but for the nature of the stylistic shades and emotional colors they express"[2], which are always in touch with our emotions and emotional life. Tura Sulaymon did not ignore this aspect either.

The words darling, mahbuba, yor, nigor, dildor are used as synonyms for yor. But the lyrical protagonist uses the word sarvinozim, whose art is stronger than these words.

*Ro 'zg'orimdanto 'zimketdi,*

*Qo 'radanqo 'y-qo 'zimketdi.*

*Bukulfatgachidayolmay*

*Tashlabsarvinozimketdi*("Ichdim, armonimqolmadi").

The word beloved is a gender-specific lexeme. It applies equally to men and women. At this point, the poet uses the word boy in the girl's language with her friend. It is known that this word is peculiar to the oral style, and by this the creator showed the vitality of the theme, the idea of the poem.

*"O'zsevganyigitim, sevganyorimbor,*

*Dunyogabergusiznomus, orimbor* ("Alhazar").

These synonyms, which have an emotional and stylistic character, served to distinguish the subtleties of different meanings and to give color to the poem.

Poetic speech is speech that requires a concrete, artistic-figurative expression of the concept being expressed. In this process, the word plays an important role as a speech medium. Indeed, the fact that poetic speech is based on measurement and melody, solemnity, in many cases, prevents the replacement of a word used in the text with a synonym or equivalent of that word[3]. The poet Tura Sulaymon uses the word in such a way that the thought becomes clear, the essence is fully revealed. Grass is a synonym for the word greens, and is often used in dialects. Suman, on the other hand, is a white-flowered, fragrant plant that is used in an artistic style. The poet contrasts these two plants with each other, and for artistic purposes quotes one as a synonym for speech, one for artistic style.

*Birdanaf, foydadebkechamizjondin,*

*Jondaydo 'st, e 'tiqod, insof, imondin.*

*Farqqilmasdinbirdarostniyolg 'ondin,*

*Alafbo 'labilmas*

*Sumandinortiq* ("Ortiq")

Clearly, black is a color quality that is also used in a figurative sense. The poet uses this quality in the form of "black" to express the unevenness of the way of life.

*Ayroediasliyo 'limiz,*

*Alholqoldiayroligicha.*

*Haqligichaqoldiyo 'lioq*

*Yo 'liqaroqaroligicha.*

In another verse of the same poem, the poet avoids repetition and uses the term ink, which is synonymous with black, to express the grief of the heart.

*Enditamomayrilarbo 'ldik,*

*Ko 'ngilqoldisiyoligicha.*

*Oytutilib, Quyoshqoraymay,*

*Dunyoqoldidunyoigicha.*

In these verses, the words "black" and "ink" are used in a figurative sense, synonymous with the word darkness. In another poem, he quotes the word "darkness" in the black sense:

*Mag'ribnotinchbo'lsabezovtamashriq*

*Do'stdo'stdanimdodintutgaymidarig'?*

*Qayerzulmatichra, qayerdiryorug'*

*Magaryeryuzida tinchlikbo'lmasa ("Bo'lmasa").*

In some cases, the poet uses the same word over and over again. This serves a poetic purpose.

*BuolamdaOytanho, muborakQuyoshtanho.*

*Bo'yqizlarningichindashubiregmaqoshtanho.*

*Uningdek hechkimmengabo'lmasasirdoshtanho*

*Go'ro'g'lisultonbiryon, To'raSulaymonbiryon ("Gulbiryon, chamanbiryon").*

In this verse, the word "alone" is used four times to express fluency and sensitivity. Although there are synonymous variants of the word tanho, such as solitary, solitary, the poet does not use them. The word tanho is more of an artistic style than a conversation. It means the same thing in isolation, without others, and in quantity. In his solitary, solitary words, without others, what is free from others can be more than one. But this more than one person or thing is seen as a whole, a unit[4].

The poet quotes synonymous words over and over again, increasing empathy, artistry, and emphasizing the idea he wants to express.

*Xohirozibo'lgin, xohinorizo,*

*Xohimotamtutib, xohiochaza,*

*Dovrug'laribo'libelgaovoza,*

*Uzilmastorlarim,*

*Sinmastorlarim ("Sozim")*

The meanings of mourning and mourning are closely related verbs, and the poet has used them consistently to reinforce the meaning.

*Menuchunbudunyoningko'rkamligisenbilan,*

*Bearmonubeafg'on, bekamligisenbilan.*

*O'nsakkizmingolamningolamligisenbilan,*

*Bujahondako'rmasinshahloko'zinghechyosh, qiz ("Seningsiz").*

The words *bearmon*, *beafghon*, and *bekam* in these verses are meaningful, expressing the signs of a happy person and coming together to increase expressiveness. The word *Beafghan* is used in the bibliography style to mean no, no cry.

*Bedovottuyog'idantayrilarmi?*

*Mardyigitto'g'riyo'ldanqayrilarmi?*

*Nomusi, oriyatiboryigitlar*

*Yoridebtuqqanidanayrilarmi? ("Oqpadar")*

In these verses, the words honor and dignity are combined, and it is emphasized that this blessing is very important for young men.

Indeed, lexical units cannot be said to be neutral to the language of poetry. Because poetic vocabulary, first, does not arise spontaneously. Language itself allows it to be stratified for poetic speech. In this sense, synonymy is a source of poetic word formation. Tura Sulaymon was able to make effective use of this rich source.

The poet also used the synonymy of auxiliary words in a way consistent with poetic discourse. Unless the conditioner connects, the opposition connector, however, has managed to reinforce the meaning of the condition in the poem by using the if form, which is characteristic of the artistic style:

*Sayyoralarnotinch, ummonlarnotinch*

*Magaryeryuzidatinchlikbo'lmasa.*

*Naslunasabnotinch, zamonlarnotinch*

*Magaryeryuzidatinchlikbo'lmasa ("Bo'lmasa").*

The verse "Unless there is peace on earth" is repeated from beginning to end in this poem, emphasizing the importance of peace.

The poet skillfully used the *pianista* and *alkash* variants of his expression, which was given to alcohol with a negative color:

*Yuzketidankaminaning*

*O'rnipoygak – pastdabo'ldi.*

*Nomimpiyanistabo'ldi.*

*Bo'ldi, armonimqolmadi ("Ichdimarmonimqolmadi").*

*Do'st, sheriklarimalkashlar*

*Yurgandayo'lichalkashlar.*

*"Kimbilankimtopishadi!"*

*Debkulisharhazilkashlar ("Ichdimarmonimqolmadi").*

The lines of meaning that make up the lexical units (lexemes) of a language are always open. That is, the lines of meaning can be filled, first of all, on the basis of the demands of the time, speech, the demands of society. Second, semantic strings expand their range by means of verbal semantics (contextual synonymy) by connecting them with the nominative units of speech, phraseological expressions, types of independent lexeme semantics, artificial words, phrases, verbal portable meanings of words[5].

*Oyningo 'nbeshimasbariqorong'u*

*Ko 'lankasiz, tiniqkunlarimkamdir.*

*Xunbo 'lmishjigarim, qonbo 'lmishbag'rim*

*Og'zimdaqoraqon—oldimdajomdir ("Qismat").*

The word shadow is an expression of an inner state of mind (eg, anxiety, grief, suffering). The poet enriched the word by adding the word no sign -you, adding the word shadowless to the series of synonyms without sorrow, worry, pain. In these verses, the shadowless, clear words formed a series of contextual synonyms. Because shadowless and clear words are not synonymous outside of the speech situation. But these formed a synonymous nest of speech in the sense of painless and well-to-do days.

*Mustajobbo 'lmadiyolvorishlarim*

*Ko 'nglimo 'ksik, xasta, ko 'zlarimdayosh.*

*Neqorakunlardabirontazotham*

*Bo 'labilmadilarmengaqayg'udosh ("Qismat").*

In these verses, the words ox, sick, form a contextual synonym for the heart.

The poet was able to create a unique art and style, using synonyms appropriately and purposefully, one of the lexical units, which demonstrates the skill of language use, the emotional-expressive expressions of which are realized in a bubble.

## **A STUDY ON WOMEN, EMPLOYMENT AND FAMILY BALANCE IN SRI LANKA**

**Nadeera Jayathunga\***

\*Senior Lecturer,  
Department of Social Sciences,  
Sabaragamuwa University, Belihuloya, SRI LANKA  
Email id: nadeesara@yahoo.com

### **ABSTRACT**

*There was a great cordial interrelationship between women role and family in past traditional society. But Women contribution to the economy of the family is a major component in today. Women are not marginalized to the domestic works because of the access of higher education in Sri lanker. Main objective of this study is to understand how women balance family and employment in sociological aspect. As the specific objectives of this study were to understand educational and economic achievement gained by women, to understand all responsibilities of women towards family, to recognition negative results balancing both fields, to understand alternatives and fair management to avoid role conflict of the women of these two fields and understanding satisfaction or non satisfaction by doing a job by women also been considered from this study in a sociological point of view. This study used purposive sampling method and selected only 60 women from several institutions related to dual career families for the sample. Both primary and secondary data were used by this study. This study found majority of women were with low stress when they manage the family. The study identified there was a positive contribution of the employed mother to their children's education. Good relationship of both wife and husband to the domestic works and making social relations was a significant of this study. According to this study it found that majority of women were satisfied with both employment and domestic works not only doing single domestic task. There is a good and proper savings maintained by women. Economical issue was the main cause for family troubles of the dual career family and mostly women taken assists from husband, children and parents to manage their day today works.*

---

**KEYWORDS:** *Employment, Family Balance, Women, Dual Career Family*

---

## INTRODUCTION

Empirical scrutiny of the dual- career family is a relatively new research area, having its genesis the late 1960s. Rapoport and Rapoport originated the term “dual career family” describing the family in which both marital partners were engaged in work having a developmental sequence and requiring a high degree of commitment (Thomas, Albrecht, White 1984). Dual career family is distinguished from the dual -work family by the wife’s academic preparation, motivation for working and level of career commitment.

Wives in dual- work families usually enter the labor force due to financial necessity; wives in dual-career families are more intrinsically motivated and invest more of their identities in their work. Marital satisfaction may increase when lower class wives go to work, since the family’s standard of living is noticeably improved (Thomas, Albrecht, White 1984). Dual career families are increasing rapidly in the world than the single career family. Mostly open economy, job market, social changes, changing attitudes of the women, competitions, modernization are the few significant causes directly influenced to create this type of family pattern. One of the most dramatic recent changes in the American workforce is the preponderance of dual earner couples. It is estimated 78% of workers are married to employed spouses, and in 75% of these dual earner couples, both spouses are employed - full time (Brennan, Barnett, Gareis, 2001). And also the 1991 Canadian census indicated that 68% of all women with children at home were in the labour force. (Higgins, Duxbury, Lee, 1994)

Until the late 1970s, women remained virtually invisible as employees and their absence were generally considered as non -issue in Sri Lanka. Mostly women became as employees in Asia toward the mid- 1980s. Woman has to play several roles as wife, mother, daughter, sister, community member and employee....etc in the society. One character has to play multiple roles; she has to face different type of problem due to the role conflict. Therefore increasing of competition and financial requirements of people at present, women also employed and they have to balance both work and family.

## Main Objective

To understand how do employed women balance family and employment?

## Specific objectives

To examine how women employees maintains the work and family balance

To understand educational and economic achievement gained by women

To understand all responsibilities of women towards family

To recognition negative results balancing both fields

To understand management to overcome role conflict of the women

Understanding satisfaction or non satisfaction by doing a job by women

## LITERATURE REVIEW

Work Family conflict which is focused by many fields such as psychology, sociology, gender studies, education, management, human resources management and organizational behaviour

---

(Bragger et al, 2005) is a main field regarding dual career couples. In all societies with a paid labour force, men have done the bulk of paid labour while women have done most of the unpaid household labour. The one of the book “women role in economic Development 1970” written by Estor Boserup was the main significant point for the start the discourse about the role of the women for the development.

However in modern society women also attempted to provide support for the family income to survive their life. According to the feminist they have described for work as Reproduction and maintenance of the labour force. In contemporary Sri Lankan women are increasingly getting involved in non-domestic roles and combine with domestic responsibilities as the additional task. In traditionally, Sri Lankan married women have combined with traditional role of mother, wife, home maker and daughter (Kiribamune 1992:102). In this view women mostly play roles based on domestic productions. Sri Lankan family is generally not family in which the husband is the “sole” breadwinner and the wife essentially a home maker (national Science Foundation in Sri Lanka 1998:83) The reason was generally in the Sri Lankan family the wife is compelled to be economically inactive. When the employed women are balancing family and employment, especially they have to face number of work and family related problems because of the high work pressure. As married women usually she has to play more than one roles within the family institute. According to this situation work family conflict is separated into three sub categories as job spouse conflict, job parent conflict and job home maker conflict. This study mainly analyse how do employed women balance both family and employment in sociological aspect. Spill over theory is an important theory of work and family relations. Two main types of spill over were found in literature as negative spill over between work and family and positive spill over between work and family (work-family balance). These two types could be classified further as family to work spill over and work to family spill over (Grzywacz et al, 2002).

Related to the work pressure have been found to be the most powerful source of work –to family conflict, and family pressures are more strongly related to family to work conflict, whereas work influences family more than vice versa (frone et al., 1992a). that work to family conflict is more strongly related to job satisfaction and life satisfaction than is family work conflict (kossek and Ozeki, 1998) Theory of marital quality of Robert, A. Lewis and Graham B. spanier had been shown several dimensions as socioeconomic adequacy, satisfaction with wife’s working, optimal household composition, community embedded ness, positive regard for spouse, emotional gratification, effectiveness of communication, role- fit, amount of interaction. Satisfaction with life style and rewards from spousal interaction are joined with early measurement is marital quality (Thomas, Albrecht, white, 1984). Marital quality, work family spill over and work family conflict are some interrelated components dealing with dual career families. According to Bokemeier, marital stress, disruptive competition, role conflict, and instability may occur if both husband and wife are career-oriented. “If a status competition model holds true, then couples with dual workers or one worker with multiple jobs will report different levels of marital quality in terms of tension, communication, and sociability than single-worker, single-job couples (Bokemeier and Maurer, 1987, pp.418).”Status of enhancement approach has positive approach on dual working and states that, "Similarity of roles builds marital solidarity “or “the wife's ability to enhance family status by labor force participation improves marital stability and personal satisfaction (Bokemeier and Maurer, 1987, pp.419). Duncan and Goddard’s (1993)

study on Stressors and Enhancers in the Marital/Family Life of Family professionals and Their Spouses found that professional work has spill over into marriage and family life.

Family life course theory is another important theory provides a valuable framework for analysing work-family spill over among working adults (Grzywacz et al, 2002). "Family life course theory also emphasizes the importance of an individual's location (within the context of the family) in socially structured status hierarchies and corresponding social inequalities (Bengtson & Allen, 1993). For example, women are frequently found to shoulder a disproportionate amount of family and household responsibilities in contrast to men ( Mikula, 1998), and they are more likely to be employed in "bad jobs" (Kalleberg, Reskin, & Hudson, 2000) that may not provide work-family benefits (Christensen, 1998". Mostly married men and woman are engaging with employments, can be understood number of negative inconveniences raised through the dual career families. One of the consequences of the inability to balance work and family demand is the increasing level of work. Family conflict experienced by employed parents. Work family conflict occurred when an individual has to perform multiple roles that require time, energy, and commitment. The cumulative demands of these multiple roles can result in two types of strain: overload and interference (Higgins, Duxbury and Lee, 1994) There are number of research and theories link with this topic and mainly role theory can be used for this research because this theory which reveals that multiple roles lead to role stress, which in turn results in strain ( Kahn et al., 1964) Social exchange theory, conflict theory and functionalist theory can be applicable for further studies.

### **Sample, field setting and Methodology**

This study was used both Primary and secondary data for data collection based on purposive sample taking 60 women in government, semi government and private institutions in Sri Lanka. Formal and informal interviews, questionnaire, and observation are the major research techniques were used for this study and census, reports, research papers, research articles, journals, books and internet were used as the secondary data makes enlighten this study.

### **Data analysing**

According to this sample, women's age, ethnicity, religion, residence and educational background were analysed as the demographic information of this study.

**TABLE 01: DEMOGRAPHIC INFORMATION OF THE SAMPLE**

Age	Quantity
25-30	16.6%
31-35	18.3%
36-40	25%
41-45	15%
46-50	10%
51-55	11.6%
55>	3.3%
Total	100

Source- field Data

According to this study majority of the women belong to the age group 36-40 representing as 25% and second age group 31-35 representing as 18%. Consideration of the civil status 97% was

married women and only 3% was unmarried. All women are belonging to ethnicity as Sinhalese and they belong to Buddhism.

**TABLE 02: RESIDENCE OF THE WOMEN IN SAMPLE**

Residence	Amount
Rural	61.6%
Urban	33.3%
Not mentioned	5%
Total	100

Source- field Data

This study found that majority of women belongs to rural sector representing 61.6%. Consideration of the living arrangements of the women, 55% were who living with husband and her children, 32% women were living with husband, children and their parents, and 5% were with only with husband and 7% lived with her own parents.

**TABLE 03: HIGHEST EDUCATIONAL QUALIFICATIONS OF EMPLOYED WOMEN**

Qualification	Amount	%
O/L	8.3	
<b>A/L</b>	<b>58.3</b>	
Degree	28.3	
Post graduate Degree	5	
Total	100	

Source- field Data

Majority of the women have passed A/L examinations representing 58.3%, 28.3% got the Degrees and 5% women got the Post Graduate degrees. Still 3 women are following post graduate degrees and According to their post graduate degrees five got from their degrees from foreign countries and one from local university.

### **Balance work and Employments by women**

Woman has to play number of roles as a wife, mother, daughter and a female employee. One part is employment and other is a family. Through the above table can be identified women are engaging with different types of employments at today. Majority of the women were belonging to the field management Assistants because of the existing government provided number of jobs as that. According to above total of the employments 98.3% are permanent and 2% is engaging with temporary job.

**TABLE 04: NATURE OF THE EMPLOYMENTS OF THE WOMEN**

Job Title	Amount
Doctor	01
Nurse	03
Aurwedic Assistant	03
Assistant manager	01
Teacher	06
Programme Assistant	02
Development Assistant	03

Planning Assistant	02
Receptionist	01
Clerk	05
Typist	01
Computer Feeding Assistant	02
Data operating assistant	03
Managers	01
Management Assistant	18
Sri Lanka Administration service	01
Office Assistant	03
Child Development Officer	03
Post Master	01
Total	60

Source- field Data

With reference to the employment type of the women they have got their promotions to the real time representing 58.3% and others were could not be gain due to more reasons as institutional problems, political matters, getting over maternity leaves, leave without payment and do not prepared suitable path to the employees by the Government.

According to the nature of the work load of the employment, majority of the women's jobs were general without high burden representing 67% and representing 33. % women's jobs were with more work load. This study found less amount representing 22% women were felling with mental stress through their jobs than the high amount representing 78.3% women. When balancing both domestic and employment side less pressure of the work was a significant factor of this study and it is easy to manage both sides fairly. Not only that majority of the women as 77% were not doing over time but 23.3% women had to cover over time due to special duties and extra duties of their employments. This situation is a fair for women because she has to play vital roles and responsibilities towards their family unit. As the additional work and additional earnings 12% women were involving some works as cultivation, self employments, growing flowers, conducting A/L classes and following external degree but majority of the women representing 88.3% were not engage with extra works and earnings.

Considering how do women balance family and employment, financial requirement is coming as a dominant factor of the family. While the majority of the women were doing employments, their husband also engage with jobs and it is easy to manage their domestics' responsibilities. 93 % husbands were with jobs 2% was not and other 5% were not mentioned. Employments of the husband can be categorized as follow.

**TABLE 05: JOB SECTOR OF THE HUSBAND**

Job Sector	Amount	%
<b>Government</b>		<b>50</b>
Semi government		12
Private		25
Self Employment		07
Not mentioned		07

## Source- Field Data

Gender role is an imperative part for direct the domestic's works. After completion of the duty of husband come back home is very obliging to wife to stability all the family responsibilities. According to this study 88% husbands came after duties and 12% were not coming and they stayed in a boarding, relation' home and quarters.

Education of the children is a major factor and it must be guided by parents. This study identified what is the capacity of the mother for their children's education. According to this sample, 52% women said that their children are attending to school but 48% answered children were not going school because they are not belong to the real age for schooling.

**TABLE 06: THE SCHOOL TYPE OF THE CHILDREN**

School	Amount %
Rural School	3.2
Urban School	90.3
International School	6.3
Total	100

## Source- Field Data

The children who carrying on to school by public bus 35.%, school service 25%, by father 23%, mother 6.%, grandparents 6%, and through the private vehicle 3% in respectively. The study identified majority proportions of mothers were involving with the education of the children representing 24 women. In additionally five fathers, two grandparents and other person were the main characters who giving assistant to the children's education. Mothers' involvement for the education is a high demand to the children is identified by this study. Especially mothers are giving different types of assistant to the children to carry on their education. Mostly representing 84% mothers gave assistance to their children for daily exercises and teaching lessons representing 55%. A main contribution of the mother is mentioned as below.

**TABLE 07: CONTRIBUTION OF THE MOTHER FOR THE CHILD'S EDUCATION**

Contribution	Amount %
Giving assistant for exercises	84
Teaching lessons	55
Everyday exploring books	52
Carrying on to extra class	10
others	6

## Source- Field data

This study found that the time allocation for the above educational activities done by mothers as daily representing 42%, weekends as 8% and rarely 2%. In additionally most of the mothers were spending more time with children in every day night representing 42%, evening and every week ends as 30% respectively. Two mothers were spending more time with the children in every day morning. Because of the employment, women employed have to spend more time with their children at the night. After school children spent the time with the mother representing 25%, with father as 12%, with servant 58% with grandparents 5% and 1 stay at day care centre.

As the mother She is concerning about the enjoyment and happiness of the children. She performed number of ways to establish the happiness of the children. Total sample was involved

to different activities as playing with children at the weekends representing 51%, going trip representing 25%, carry on children for the parks representing 17% and join for the educational trip representing 15%.

Leisure time of the female employed is an important characteristic which was balancing work and family. According to this study, 60% women were with sufficient leisure than the 40% women. Majority of the women were spending their leisure time as reading news papers, sleeping, going temple at the weekends, going trips, engaging with sports activities and spending time with children. In additionally the time which they allocate for watching T.V as the daily activity, 53% women were watching T.V taking two hours per a day 17% women were taking three hours per a day and others were taking more than four hours. Most women had taken time to listen to daily news representing as 72% while rarely representing as 30%. According to the nature of spending leisure time as reading news papers, majority of the women are reading news papers at the weekends representing 50%, rarely 30% and every day 20%. And also related to extra reading as novels, and classical art books women were given priority for that purpose representing 53%, rarely 32%, not never 10% and others were not replied. Doing responsibilities to the parents is a one of the main role when balancing family and work by the women employee. More women representing 83%, they are going to see their parents at weekends as 35%, per a month as 27%, rarely as 8%, every poya days as 7% and per two months as 3%.

As the women she has to play number of roles. Especially women are involving with domestic works than the males. Mainly preparing break first, lunch and dinner, washing clothes of the all family members, making extra meals for all and cleaning house are the main roles of the employed women found by this study. Consideration of the concept of gender above all tasks were categorised as women works. In additionally, working in the garden, visiting their parents and relatives, participating for ceremonies, going hospitals after family members hospitalized were identified as minimum contribution of the employed women. Following table shows the contribution of employed women, men and others to the domestic works.

**TABLE 08: DOMESTIC WORKS DONE BY THE FAMILY MEMBERS**

Task	wife	Husband	Both	parents	servants
Preparing main three meals	38	01	05	05	00
Washing clothes	23	02	20	03	00
Preparing extra meals	36	03	10	05	00
Cleaning house	26	00	20	06	00
Working in the garden	04	16	25	07	04
Visit parents and relatives	02	06	30	01	00
Caring needs of children	02	02	30	02	00
Going hospitals after hospitalized family members	06	05	30	02	00

Source- field data

This study found mostly man as the single character was involving with gardening works. Both men and women were involving with garden works, visit parents and relatives, participating parties, caring needs of children, going hospitals after hospitalized family members. In additionally, parents involved with garden works and cleaning house activities and servants participation for garden activities. Social relation is a significant factor in the society. Every type

of people in the society must be making different kind of relations. According to this study, majority of employed women mostly participated parents meetings at the school while men were participated for community level meetings like maranadara samithi, praja samithi etc. Both wife and husband made social relations like wedding parties, funerals, alms giving; charity works at the temple, birthday parties and New Year festivals. This study found that majority of women was not doing all the social relations by themselves. Both husband and wife are managing more works when they are employed at the present society.

**TABLE 09: CONTRIBUTION GIVEN BY THE FAMILY MEMBERS FOR SOCIAL RELATIONS**

<b>Social Relations</b>	<b>Quantity</b>			
	wife	Husband	Both	Parents
wedding	02	05	51	03
Funeral	03	07	49	03
Alms giving	06	04	49	05
Charity works	08	01	49	07
Birthday Parties	07	04	45	02
Meetings at the school	14	11	16	00
Community Meeting	10	15	09	04
New year	03	08	30	05

Source- field Data

Within the small family unit, saving money for future is an important task. According to this sample 92% women were saving money while 7% were not. Majority of women saved money as monthly from their salary. In additionally, some were saved money per the several months and two were never. Those women saved money expecting number of purposes. 31 women were saving money for emergency matters like illness situation, 24 women for her child, 22 were for the educational purposes of the children, 16 were for their parents and 13 were saving accidents or the other future family needs. Not only that they have some future expectations and they given a priority for their expectations. Majority of women have needed to build a house representing 35%, buy a land, build a separate part for the same house, and start a business and buy a car the other priorities of the women.

When balance the work and family, expenditure of the family is a huge task for both. More women spend money for food was a high proportion than the others but more men spend the money for transport activities.

**TABLE 10: THE FAMILY CONTRIBUTORS FOR FAMILY EXPENDITURE**

<b>Type of expenditure</b>		<b>Quantity</b>		
	Husband	Wife	Both	Parents
Food	19	<b>12</b>	38	<b>02</b>

Educational activities of the children	04	05	<b>42</b>	00
Other things of the children	07	09	<b>40</b>	01
Telephone Bills	<b>25</b>	08	29	01
Electricity Bills	<b>28</b>	06	20	<b>02</b>
Water Bills	<b>22</b>	08	20	<b>02</b>

For Health	19	01	35	01
For Transport (fuel)	35	03	20	00
Alms giving, wedding, funeral	11	03	40	04
Others	04	00	31	02

Source- Field Data

Good health condition of the women is helped to manage the work and family fairly. This study found about the illness situation of the women. Few women were with headache representing 12%, mental stress felling with women 10%. According to total sample, 3.3% were with chronic diseases but majority of the women were not with any illness. Big burden of the domestic works and the work load of the employment sector were the main reasons felling illness of employed women was found by this study. In additionally Children's works and family problems also caused to make some illness situation of the women. When employed women balance both sides they ignore some essential day today events. Following table shows neglected events by women.

**TABLE 11: NEGLECTED EVENTS OF THE DAY BY WOMEN**

Event	Quantity
Exercising	42
Meditation	41
Worshiping	09
Break first	07
Discuss the schedule of the day with husband and children	06
Preparing lunch and dinner	03
Forgotten having daily medicine	03

Source- field data

Majority of women neglected exercising representing 42 while second was meditation representing as 41. Employed women have given poor time allocation for religious activities, having meals and medicine because of the busy life pattern. This study found women being employed women they were with satisfaction representing 83%. 7% were most satisfied and 8% were with disgusted and 2% were dissatisfied and work under pressure. The study identified that balance of job and domestic works by woman within a day, 82% were satisfied while 13.3% were with little bit of satisfaction.

The study found that employed women have got different types of assistance from her family to balance work and family.

**TABLE 12: THE FAMILY CONTRIBUTION FOR DOMESTIC WORKS**

Family contribution	Quantity %
Husband, children and Parents' assistance	63.3
Only husband's assistance	25
Only parents' assistance	05
Only children's assistance	3.3
Only servants' assistance	02
Without getting any assistance	02

Source- Field data

Majority of women have got the assistance from the husband, children and their parents representing 63.3% while only husband's assistance 25%. Most women used any type of assistance to make their work easy. This study found the majority of the women were getting most satisfaction through only the job and domestic works representing 60% but they were not getting the satisfaction only doing a job. Following table indicates the satisfaction of the women work type that they involve.

**TABLE 13: SATISFIED WORK TYPE OF THE EMPLOYED WOMEN**

Satisfied work type of the women	Quantity %
Only job and domestic works	60
Only children's works	22
Only domestic works	7
Only doing a job	3.3
Others (trip/spend time with children/ charity works)	8.3

Source- Field data

According to above table, the study identified the women at the present are not interested on only domestic works, they are willing to do a job too. Consideration of the satisfied work type of the women 60% women satisfied with only job and domestic works while 22% for only children's works. 7% women liked only for domestic works and 3% were like only for employments. Finally this study found the causes which directly affected to the family problems. An economical difficulty was the first reason representing 23%. More works covered by women itself, children's problems, parental matters, drunkenness of the husband, Busy life patterns, living with parents, high tempered were caused to make problems of the family.

There are some techniques followed by employed women to avoid role conflict and to maintain a fair management related to work and family. Giving priorities for essential duties on the duty list, time management, complete the works on time, limit the office works only to office, sharing works, planning next day before sleeping at the night, involving with domestic works both husband and wife, discuss all matters by couple, giving priority for other's works, getting help from others, patient and devoting, use modern technology, monthly savings and use some short ways and means for domestic works were several techniques followed by women to maintain a balance life.

## CONCLUSION

This research used only married working women related to government, semi government and private institutions in Sri Lanka. How do women balance both employment and family was main objective of this study. According to main objective and other specific objectives the study identified there is a positive impact to the employment and family, although women being an employed women. Mostly women were with good health and under minimum stress and pressure when balancing work and family responsibilities. The study identified there was a positive contribution of the employed mother to their children's education. Good relationship both wife and husband to the domestic works and making social relations was a significant of this study. According to this study it found that majority of women were satisfied with both employment and domestic works not only doing single task.

### **ABSTRACT**

*The article presents morphophysiological assessments of drought and heat tolerance of durum wheat varieties dry land areas conditions. Four grades of observation nursery of durum wheat with high drought and heat tolerance for dry land areas were selected.*

**KEYWORDS:** Variety, Durum Wheat, Drought Tolerance, Heat Tolerance, Plant Height, Upper Internode, Total Water, Protein Coagulation Temperature.

### **INTRODUCTION**

In the conditions of rain fed, crops annually undergo significant effects of soil and atmospheric drought, high temperature, which reduces the productivity of plants [1]. Therefore, the study of plant tolerance to adverse environmental conditions is an urgent problem today.

There is a number of characteristics that determine the tolerance of plants to drought during the summer vegetation. In this case, heat tolerance is of particular importance, as well as a number of ontogenesis moments that determine the overall drought tolerance [8] emphasize the

importance of such characteristics as plant height, flowering time, the role of leaf transpiration, harvesting index, etc.

Drought tolerance is a critical breeding task. During the period of grain filling under the influence of elevated temperatures, accompanied by dry winds, even with a significant amount of available moisture in the soil, the yield of winter wheat may decrease by 30-50% or more [4].

During drought during the critical period from going out of the tube to the head of flowering, durum wheat is more inclined towards the intergranum and hollow-spike [6].

For selection for durum wheat adaptability, drought tolerant genotypes are of great importance, which are characterized by a wide reaction rate and form a high yield under more favorable conditions [2].

Wheat plants, like any living organism, can be damaged by high temperatures. For higher plants, a temperature of 58 °C is considered a lethal limit. Due to the evolutionary features of the formation, wheat is considered more resistant to heat, therefore, high temperatures rarely cause a lethal effect [5].

According to [10] the heat resistance of wheat is closely related to the coagulation temperature of water-soluble proteins in the cellular juice of leaves.

One of the protective adaptive reactions of plants to high temperatures is to increase the temperature point of protein coagulation [3].

For wheat in the beginning period of development to the tillering phase, the temperature optimum below 20 °C, during tillering - flowering - about 25 °C, after flowering - about 30 °C [9].

The objective of our research was to study the drought and heat tolerance of durum wheat in rain fed conditions and to select high resistant varieties for drought and heat.

## **MATERIALS AND METHODS**

Durum wheat varieties studied durum wheat on the dry land of the Gallaaral Scientific and Experimental Station of Research Institute of Grain and Legume Crops served as the material of our research.

The drought and heat tolerance of durum wheat on the dry land was studied according to the methods of the Research institute of Plant industry.

The study of the accumulation of total crude biomass of durum wheat was carried out according to the Guidelines for the accounting and control of the most important indicators of the processes of photosynthetic activity of plants in crops [7].

The studies were carried out in the Gallaaral scientific-experimental station, which is located in the flat-hilly zone of dry land, the climate of this area is more continental. The amount of precipitation for the growing season 2017-2019. varied from 241.4 mm to 483.4 mm, the average annual air temperature - from 8.9 °C to 10.3 °C, humidity – from 45% to 72%.

## **RESEARCH RESULTS**

In a observation nursery of durum wheat for three years of study, a low variation was observed in the coagulation temperature of water-soluble proteins in leaves ( $V = 0.82\% - 1.87\%$ ) and in the total water content in leaves ( $V = 4.39\% - 8.33\%$ ); high variation - along the length of the upper

internode ( $V = 20.47\% - 25.99\%$ ) and the angle of inclination of the flag leaf in 2017 ( $V = 33.01\%$ ) (Table 1).

**TABLE 1.VARIABILITY OF MORPHOPHYSIOLOGICAL PARAMETERS OF DURUM WHEAT ON THE DRYLAND DEPENDING ON THE YEAR, ON AVERAGE BY VARIETY(GALLYAARAL, 2017 - 2019)**

year	lim	x	V
The angle of inclination of the flag sheet, degrees			
2017	5,2 - 21,4	9,1	33,01
2018	8,2 - 16,6	12,2	17,90
2019	8,2 - 15,6	12,1	14,52
Plant height, cm			
2017	73,4 - 102,8	83,9	10,25
2018	57,6 - 84,4	73,3	8,98
2019	87,2 - 133,8	111,4	9,67
The length of the upper internode, cm			
2017	24,6 - 48,2	30,9	20,47
2018	19,4 - 35,6	26,1	22,40
2019	21,2 - 52,6	38,9	25,99
The total water content, %			
2017	61,5 - 71,8	66,5	4,39
2018	50,3 - 69,8	67,9	8,33
2019	58,1 - 74,0	68,3	5,88
Coagulation temperature of water-soluble proteins in leaves, °C			
2017	58,0 - 62,5	60,0	1,87
2018	58,0 - 60,0	59,1	0,82
2019	59,0 - 63,0	61,8	1,55

Thus, the data in the table show that the height of durum wheat plants varied over the years from 73.3 cm ( $V = 8.98\%$ ) to 111.4 cm ( $V = 9.67\%$ ); the length of the upper internode is from 26.1 cm ( $V = 22.40\%$ ) to 38.9 cm ( $V = 25.99\%$ ).

As a result of the drought and heat tolerance study of durum wheat varieties on the observation nursery varieties with high resistance indices (Table 2.).

**TABLE 2.MORPHOPHYSIOLOGICAL PARAMETERS OF DROUGHT AND HEAT TOLERANCE OF DURUM WHEAT ON THE OBSERVATION NURSERY IN THE HEADING PHASE ON THE DRYLAND (GALLYAARAL, 2019)**

D	Variety	The angle of inclination of the flag sheet, (degree)	Plant height, (cm)	The length of the upper internode, (cm)	The total water content in the leaves, (%)	The coagulation of water-soluble proteins in the leaves, (°C)
1	Leukurum-3(st)	12,2	87,2	22,2	72,57	59,0
2	Javohir	12,0	116,2	43,0	72,99	59,5
4	454612	15,2	100,0	45,0	72,81	61,0
14	DNS-2016/25	14,6	97,8	28,4	72,80	61,5
15	NP-2016/45	12,0	109,8	22,0	73,45	62,0
17	NP-2016/55	14,0	119,6	50,0	69,70	63,0

This table shows that the total water content in the leaves of durum wheat ranged from 69.70% (NP-2016/55) to 73.45% (NP-2016/45), the standard 72.57% (Leukurum-3)

On the dry land, the accumulation of total biomass varied for durum wheat varieties from 197.12 (Javohir) to 257.42 g (NP-2016/55), for the standard 158.34 g (Leukurum-3) (Table 3)

**TABLE 3.VARIABILITY IN THE ACCUMULATION OF TOTAL BIOMASS OF DURUM WHEAT ON THE OBSERVATION NURSERY IN THE HEADING PHASE, DEPENDING ON VARIETIES ON THE DRY LAND (GALLYAARAL, 2019)**

D	Variety	Weight of total biomass 10 plants (g)	Weight of spikes with 10 plants		Root weight with 10 plants	
			(g)	The proportion of spikes, (%)	(g)	The proportion of roots, (%)
1	Leukurum-3(st)	158,34	19,60	12,37	19,70	12,44
2	Javohir	197,12	20,70	10,50	22,54	11,43
4	454612	223,30	26,14	11,71	19,02	8,51
14	DNS-2016/25	210,22	20,76	9,87	20,50	9,75
15	NP-2016/45	215,16	18,90	8,78	25,62	11,90
17	NP-2016/55	257,42	27,68	10,75	30,16	11,71

According to the table, it can be seen that the percentage of spikes of durum wheat varieties varied from 18.90% (NP-2016/45) to 27.68% (NP-2016/55), the standard 12.37% (Leukurum-3).

On the dry land for the accumulation of total biomass, varieties of a competitive variety of durum wheat testing were highlighted - NP-2016/45, 454612, NP - 2016/55.

## CONCLUSIONS

According to the results of the study, durum wheat on the dry land showed a low variation in the coagulation temperature of water-soluble proteins in the leaves and in the content of total water in the leaves; high variation - along the length of the upper internode and the angle of inclination of the flag sheet. Durum wheat varieties were studied on the observation nursery and Javohir, 454612, DNS-2016/25, NP-2016/45 selected with high drought and heat tolerance for dry land.

### ABSTRACT

*The article deals with the straightening of the Duct Curve (curl) of the fan casing. The authors of the article believe that the existing measurements (flattening) curves of the line apply the approximate method of small chords, to accurately measure and determine the actual dimensions of the arc of the circle use the existing formulas. The authors concluded that straightening the Duct curve of the fan casing is an acceptable method of measurement by the formula. The main purpose of spreading the actual fan casing size in the plane is to design and manufacture it.*

**KEYWORDS:** *Approximate, Curves, Arcs, Chord, Line, Flattening, Unbend, Method, Radius, Curl, Square, Bottoms, and Point Circle.*

### INTRODUCTION

Approximate methods of flattening line curves. For measurement (straightening) of Corobus curves (more precisely - circles) the approximate method is used, which consists in that length of the arc of ACB of the circle is measured by section of TC tangent (Fig. 1), cut on it by beams SA and SB. The S point lies on the extension of the CO straight at  $CS = 3R$ .

Accuracy of such construction (at  $\leq 60^\circ$ ) is quite sufficient for practical purposes.

**Fig. 1.**

In deployment graphics, you always have to straighten or unbend line curves that lie on a plane. For this purpose method of small chords is used. As the name itself shows, the method is that a broken line is inscribed into a flattened or extensible curve (flat or spatial), the links of which represent small chords of the curve.[1.2.3] If a curve is to be flattened, its chords are sequentially placed on a certain line and the entire resulting segment is taken as the arc length of the curve.

If the curve is unbended, its chords are placed with their ends on the curve into which the curve is to be unbended.[4.5.6] The whole arc, which is obtained, is taken as an unbent given curve.

The curl is a flat curve, shaped like a spiral and consisting of several arcs of different radii drawn from several centers.

**Fig. 2.**

Consider building a Box curve (four centre curl) of the fan casing. Four centres (A, B, D and E) are specified, which are vertices of a square with side  $d = 10 \text{ mm}$  and radius  $R = 20 \text{ mm}$ .

When you draw a curl, you do not always start drawing from the vertex of the square. In the drawing of fan casing (Fig. 2)[7.8.9] the curl is built from point F with radius  $R + d$  from centre

A, Where the radius R is given by the constructor, up to the intersection with the extended side of the VA square at point G. An arc of radius  $R + 2d$  is drawn from centre B from point G to the intersection with the extension of the DB square side at point H. An arc of radius  $R + 3d$  is drawn from centre D from point H to the intersection with the extension of the ED square side at the point I. An + the Arc

Consider straightening the Duct Curve (curl) of the fan casing. For this purpose, it is necessary to determine the actual length of each arc sector FG, GH, HI and IJ separately using known formulas.

$FG = 2.2r/n$ , where - FG arc length, [pi] - constant number, r - arc radius, n - number of circular arc sectors.

1.  $FG = \frac{2\pi r + d}{n} = \frac{2 \times 3,14 \times 20 + 10}{4} = \frac{135,6}{4} = 33,9\text{mm.}$
2.  $GH = \frac{2\pi r + 2d}{n} = \frac{2 \times 3,14 \times 20 + 20}{4} = \frac{145,6}{4} = 36,4\text{mm.}$
3.  $HI = \frac{2\pi r + 3d}{n} = \frac{2 \times 3,14 \times 20 + 30}{4} = \frac{155,6}{4} = 38,9\text{mm.}$
4.  $IJ = \frac{2\pi r + 4d}{n} = \frac{2 \times 3,14 \times 20 + 40}{4} = \frac{165,6}{4} = 41,4\text{mm.}$

If we sum each arc length  $FG + GH + HI + IJ = 33.9 + 36.4 + 38.9 + 41.4 = 150.6\text{mm}$ , this result is equal to the length of the Box curve (curl) outline of the fan casing with sufficient accuracy.[10.11.12] The main purpose of propagation of the Duct curve (curl) of the fan casing in its plane is its design and manufacture.

Thus, it can be concluded that the flattening of the Duct Curve (curl) of the fan casing is shown with dimensions sufficient to create a pattern.

### ABSTRACT

*This article presents samples of oral folk art in the formation of imaginative thinking of preschool children, in particular, the analysis of the significance and ways of using fairy tales and riddles, research on the topic, as well as means of development of children's imaginative thinking.*

**KEYWORDS:** *Contemplation, Imaginative Thinking, Folk Oral Art, Fairy Tales, Magic Images, Riddles, Creativity, Abilities.*

### INTRODUCTION

The development of thought forms in pre-school children is a process that is accompanied by intensity. Complicating its features, moving from one species to another, that is, if its development is considered a psychological state, its proper formation and enrichment is a process carried out in a pedagogical environment. At the age of 3-3.5, the child experiences the same condition, that is, the transition from visual-like thinking to visual-like thinking. The effective passage of this period is the correct organization of the pedagogical environment and the proper use of its capabilities.

### MATERIALS AND METHODS

First of all, we will focus on the analysis of available opportunities to form children's imaginative thinking. A peculiar pedagogical interpretation of this issue is initially embodied in the samples of folk pedagogy, which are represented in riddles, proverbs, fairy tales, fairy tales, songs, and others.

For example, with the example of myths and fairytales alone, we can see how skillfully described this problem. Figurative contemplation of such tales as "Ochil dasturxon", "Uchar

gilam", "Ur to'qmoq", "O'zi yurar etiklar", "Oynaijahon". Tales are an important source of figurative thinking in preschool children, especially involving animals, and magic tales serve to enrich their imaginary world. The fairy tale comes from the ancient Turkish word "Etuk", which means telling the story orally.[1] It is called "Ertak" in Surhandarya, Kashkadarya oases and Fergana Valley, "Matal" in Samarkand, "Varsaki" in Khorezma, "Chopchak" around Tashkent.

In fairy tales, a miracle or an adventure links certain events to life and promotes the ideas of truth, freedom, righteousness, humanity and nobility. Thus, they will resort to it as a last resort. Tales have both didactic and educational significance.

These include such fairy tales as "Chol bilan kampir", "Bulbuligo'yo", "Ur to'qmoq", "Uch og'agini botirlar", "Bo'ri bilan qo'zichoq", "Baxtli kal". Ethno-pedagogy that criticizes negative educational qualities through one or two episodes of satirical expression, types of fairy tales about animals, birds, types of dwarf wrestlers ("No'xatvoy", "Quloqvoy", "Handalak polvon", "Yapaloqpolvon" ...) type.

These stories tell about magic beings, magic objects and people of the extraordinary nature and also about their strange adventures which can be involuntarily struck with these skillfully thought over events. It has to do with people's creativity, their rich imagination and creativity. It is safe to say that all these tales are the product of figurative thinking.

In pre-school students, fairy tales can be used as an effective tool to shape their visual thinking. Here's how to put one together for use with fairy tales. We propose to implement the methods in two stages.

**First stage:** the stage of "getting to know unusual images":

- In this the teacher introduces children to a fairy tale, in which there is an animal, a person or an object, having an amazing character or an unusual appearance. For example, a Flying winged horse, a three-headed dragon, a winged monkey, a Pahlavan who can drink seawater on one breath, or a strange man who can turn everything off with His breath, open dishes, a flying carpet, telling tales featuring;
- During the fairy tale explain to the hero that these unusual character features and magical images are always needed to come to the hero's aid in a difficult moment. This stage will help the child to further form ingenuity, or find a solution to any problem. For example, get an opponent to dance and thus defeat him, train him to take an example from a hero who emerged from an unpleasant situation using a magic carpet, a flying carpet, a magic cap, a magic wand, and many other items;
- What else would he do if he were in the place of the main character, for example, he would ask the aist for an open table, or what other magical thing would he do instead of knocking on the door? Ask children questions such as and study the answers to each.
- The next stage, "Creation and Discovery," teaches children to invent new characters and characters in various ways . with
- Offer to create your own unique image from parts of different animals. Children are given cuts to various parts of animals. Children combine what they want to create their own animals. They call it, they say there are what features it has.
- Describe your image. In this case, the children portray the strange character they created. It is described. They can also be superheroes with strange characters.

- Offer the creation of magic objects. For example, learning to look at things they need in everyday life, such as a bike that floats in the water and flies in the sky, a spoon that cools food, smart shoes. For them, it can often be like a spy weapon.

The proposed methods will allow the introduction of preschool children to the test assignments contained in the international PISA program. A student of a pre-school educational organization may also find it slightly difficult to perform these duties. But they have to ensure that children are free, looking, doing what they want. Childhood inventions can be very amusing and negligible. Our task is to create a reflex in them in relation to the creation of novelty, to teach the invention to search from its imaginary world.

Folk pedagogy makes fruitful use of findings in the development of children's thinking, muscle abilities. With the help of mysteries children were taught primitive accounting (addition, division, multiplication and division). These include: "Pak-pakanabo 'yibor, yettiqavat to 'nibor" (piyoz), "Aylanaverib-aylanaveribsemirdixonim" (urchuq), and others.

A mystery is a mystery of two similar objects, referred to in a poem or prosaic assignment designed to find it based on characteristic similar signs. The mysteries also put forward educational ideas, through which thinking, outlook, resourceness, speech, modern qualities of human thinking are brought up. In the past, the population gathered on long nights of winter and voluntarily spent time telling proverbs, Matals, riddles, tales, fairy tales. Children also participated in such conferences. For example: in the mystery "Birparchapatir, olamgatir" the most nutritious feed - the Patir is similar to "Moon." One image is compared to another due to the fact that the shape of the Moon is similar to the shape of the Patir(type of bread)..

Mysteries also play an important role in developing figurative thinking in children. Because with the help of adjectives and similarities in the puzzle, he embodies in his mind many images, compares them to the qualities of the puzzle, and if he has an idea of this image, he can find the answer, otherwise he will not find it. It is important to note that though fairy tales help children to study, to learn and open for itself images, puzzles help them to develop ability to analyze, compare and compare the studied images.

It is advisable to use the following methods of using puzzles in the formation of figurative thinking in pre-school children.

### **"FIND A RIDDLE!" METHODS**

Method 1: In this method, children choose one theme by harmonization (such as about objects in a room or about events that everyone knows) and take turns finding puzzles on the topic.

**For example,**

Riddle 1. I see something rectangular, green, write on it, draw, the capital letter "B" ends with "d"! Answer: "Board".

Riddle 2. I see something round, shining, hanging from the ceiling, the capital letter "L" ends with "p"! The answer is "Lamp".

Method 2: Tell and find different interesting puzzles.

For example,

Uzuntumshuqsiyohli,  
Qo'shkaltakdekoyoqli,  
Egnidaqxalati,  
Tugmasiyo'q, g'alati(laylak)

Nozikkinajondir u,  
Dema, o'chginasibor,  
Yonidaemasuning,  
Nomidaninasi bor. (Ninachi)

Technique of "picture puzzle". This shows children a sequence of shapes and images that are defined for the object, animal, or image to be found. A child must generalize these forms to understand what they are talking about.

For example, depending on age, this is simpler as follows:

Or it is more difficult:

What favorite image of children is hidden in the picture? (Santa Claus) It's prepared like this.

It can also be used in various manifestations of such picture puzzles. Ribbed and figurative-logical mysteries are also part of this proposal.

At this stage, children must create simple "puzzles" themselves. Thus, the child learns to represent a certain image in his or her mind, analyze its qualities and explain it to others.

Either the children show the drawing by the teacher so that others cannot see it, and the child must represent the object depicted in the drawing to others. The rest of us have to find a hidden object through the qualities it says. For example, a teacher shows an image of an apple to one of the children in the group and asks him to describe it without naming it. A child can describe it as

"round, sweet, red, fruity." Thus, children are taught to imagine and analyze different images through their thinking.

You can also work on puzzles with children through various multimedia exhibitions for children.

## CONCLUSION

In summary, it should be noted that the samples of oral creativity of the Uzbek people are rich and colorful, we are well aware that it has been enlightened for centuries on the basis of the great contemplation of the people, beautiful imagination, extraordinary creativity, dreams. Fairy tales and mysteries, which are models of oral folk creativity, are an important means of enriching thinking and raising children of pre-school age. Thanks to popular oral creativity, research can be carried out to explore even more effective possibilities for creating visual thinking of children. All this contributes to the development of creative thinking and inventive abilities of future pre-school children.

### **ABSTRACT**

*Thematic maps reflecting the negative or positive impact of natural and anthropogenic environmental factors on human living conditions are of particular importance in modern world ecological and cartographic research. In order to optimize the ecological situation in the region, including the river regions and oases of Uzbekistan, such ecological mapping involves the creation of atlases of a systematic collection of analytical and synthetic maps. In the world, environmental mapping gives preference to synchronization methods where specific atlas maps are systematically created by interconnecting environmental characteristics, that is, several maps that interactively interact with their didactic texts in GIS software are deployed on a computer screen at the same time. These research programs ArcGIS, QGIS, and SWAT model software focus on database creation, electronic map visualization, modelling, and analytical mapping.*

**KEYWORDS:** *Optimization Of Atlas Mapping, Ecological Atlas, GIS Technologies, Map Indicators*

## INTRODUCTION

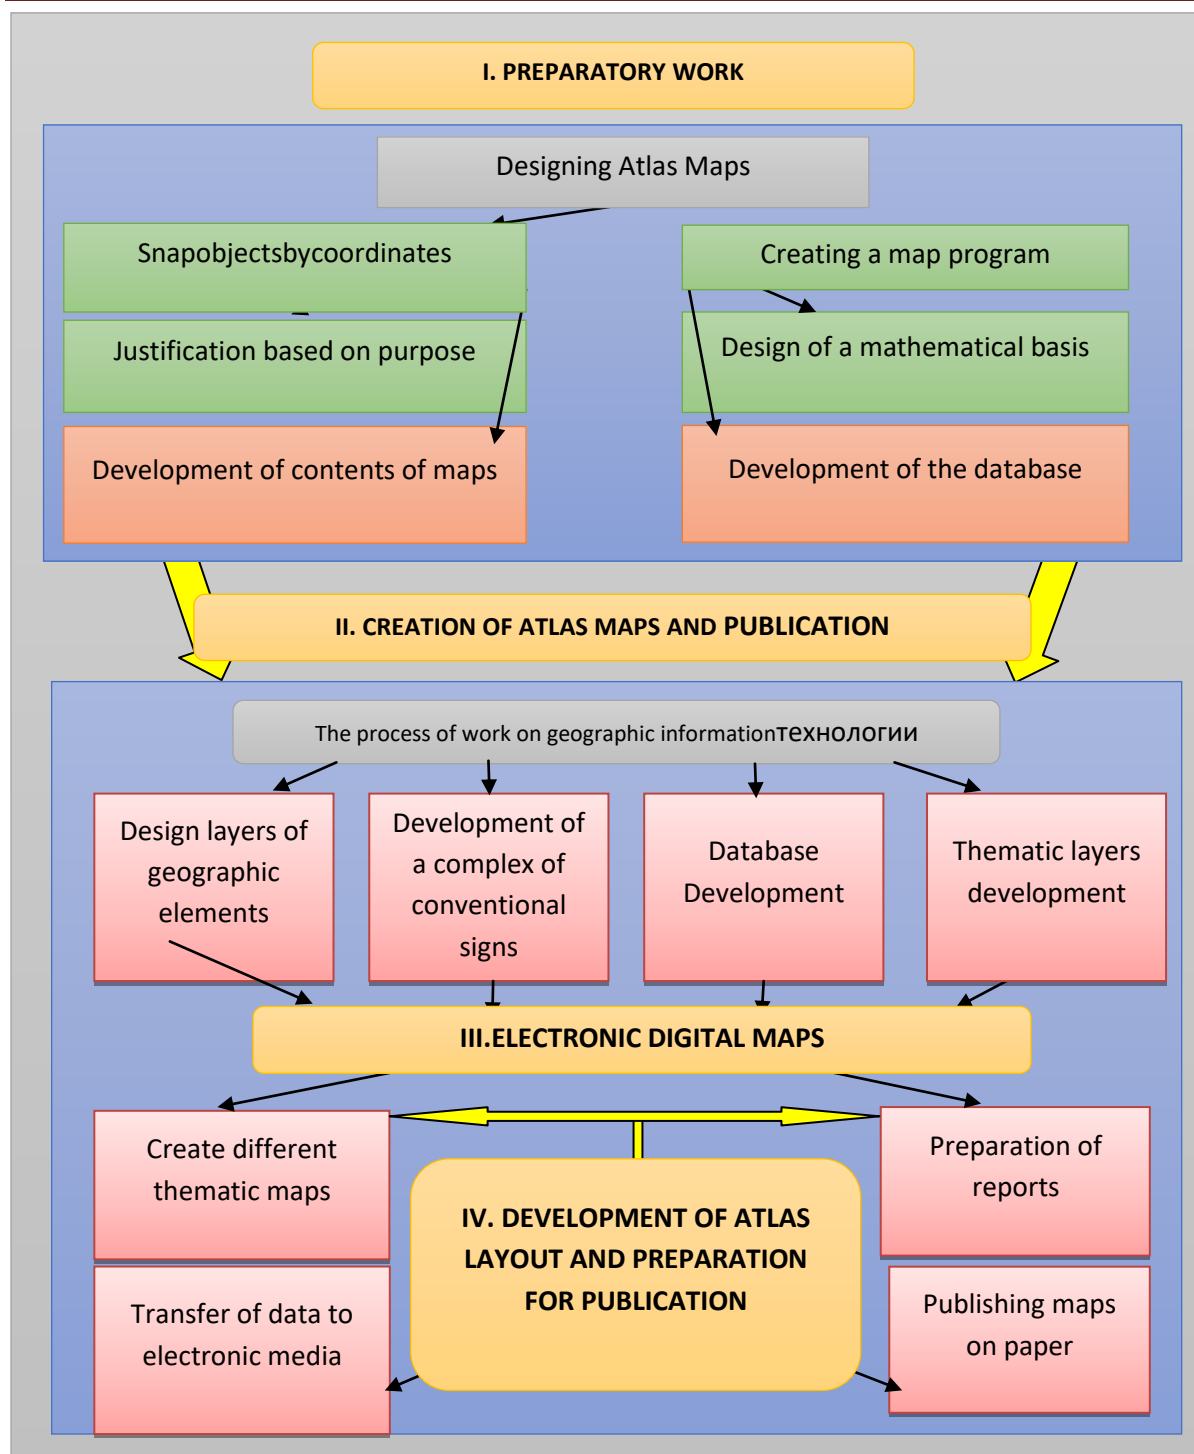

For this purpose, the structure and content of the Fergana Oblast ecological atlas were developed, as well as proposals and recommendations for its use. The research objectives are Substantiation of the importance of the use of cartographic methods in scientific research of the ecological condition of the depicted territories; Classification of scientific and practical atlases by type, for mapping the environmental condition and definition of database requirements; Development of the structure and content of the environmental atlas using the latest GIS technologies; Improvement of technical and software for the creation of a territorial multimedia environmental atlas; Improvement of evaluation and advisory maps in the environmental atlas of the Fergana region; Assessment of cartometric environmental indicators based on GIS technologies; Modelling maps based on spatial data reflecting the environmental state of the Fergana region; Provide scientific and practical suggestions and recommendations for the use of electronic inventory maps.

## MATERIALS AND METHODS

The object of the study is the environmental atlas of the Fergana region. The subject of the study is the structure and content of atlas maps reflecting the environmental state of the Fergana region, developed on the basis of modern GIS technologies. The foundations of environmental atlas optimization are improved on the basis of maps of "degree of anthropogenic load on landscapes," demo ecological state "; Improved digital maps depicting the environmental condition of areas in need of protection in the Fergana region using TIN (Triangulated irregular network), SHAPE vector file and GRID raster files; Improved inventory maps using interactive maps as well as the DEM (Digital Elevation Model);

The atlas provides maps of protected and restored territories, as well as proposals and recommendations for the development of measures to optimize the ecological state of the territory on the basis of the cartographic method.[1] System maps and database of multimedia maps have been created, which comprehensively characterize the environmental situation in the Fergana region. The results of the study are determined primarily in the use of the above methods in the development of targeted government programmes and practical measures to improve the environmental situation on the basis of conclusions and recommendations, thematic assessments and inventory maps.[2] On the basis of the environmental state mapping, theoretical and methodological issues of electronic environmental atlas creation, mapping image methods are described, scientific approaches and principles of environmental mapping are highlighted. It is shown that methods of creation of electronic atlas and analysis on modern GIS - programs and methods of their creation with a hybrid type of data storage have the most promising possibilities. Ecological atlas maps allow you to map the past, present and future, as well as to determine the place and time of the ecological condition by painting them in colour, which gives you the opportunity to develop measures to protect the components of nature.[3] With the help of atlas maps, there are great opportunities to show all the changes taking place in nature. Ecological situations are different, they affect nature and people in the regions of the republic differently. Water, soil, atmosphere, pollution levels, health impacts and other environmental data cannot be represented on the same map. It is, therefore, necessary to create a set of maps, i.e. an atlas covering all areas of the environment. An atlas is a system with specific sets of thematic maps that reflect the interactions of man and nature, social, natural and man-made

elements of society. Therefore, the main purpose of mapping is to record and assess the state of the environment. Environmental atlases include a system of maps on interlinked and complementary environmental issues and consist of basic maps of natural and socio-economic content. Sectoral and network maps describe and assess the ecological status of certain environmental elements and represent the ecological problems of different industries (such as agriculture, forestry, water, industry, etc.). [4] The content of the ecological atlas maps covers different types of mapping, and also works with many objects and events, but among them, there are several integrations and syntheses. Maps of different types of scientific and practical directions, their inventory, evaluation, forecasting and combination of content are shown in different directions, which are characterized by their distinctive features. In the Ferghana region, environmental pollution, including air, water and land by many industrial facilities, vehicles and various chemicals, is causing great harm to public health. Cities can be compared to active volcanoes. Urban industrial enterprises, vehicles and household waste pollute the air, water and soil. Therefore, the main goal of creating an environmental atlas of the Ferghana region is to provide a rich and comprehensive source of information and databases on the environmental situation in the region, as well as to develop a state environmental policy, optimize it and apply it in practice. As you know, the environmental situation is unstable and constantly changing under the influence of the human factor. Consequently, practical environmental maps, conservation of territories and cartographic optimization of the natural environment are used as the basis for project implementation and strategy, which is designed to strengthen environmental education, public awareness and environmental culture. Maps of the ecological atlas allow to visually determine the place and time of the ecological state of what has happened in the past, nowadays and probably will happen in the future by depicting it with colour, describing the possibility of counteraction. The cartographic method is most effective in assessing and predicting environmental situations in the "population-nature-society" system. At the same time, the environmental atlas created for the first time, along with traditional indicators, used a set of recommendations for the development of environmental culture and a set of measures to preserve the landscape. [5] The creation of an ecological atlas of the Fergana region will have a positive effect in the future in determining the state of geosystems changing under the intensive influence of human economic activities, in the development of a plan of action measures, as well as in ensuring sustainability. A systematic approach to the nature of the Fergana region and its environmental features will create a series of analytical and synthetic environmental maps of the region. Development of structure and contents of these ecological atlases with the use of the programs ArcGIS, QGIS creates the base of ecological information (database). This database will often serve as an invaluable source of information and relevant scientific findings, environmental forecasting, effectiveness and implementation of monitoring work, and future forward-looking directions.

**Fig-1. Designing and mapping environmental atlas in a GIS program**

## CONCLUSION

Of particular importance is the operational information base on geodesy, cartography and inventories as soon as possible, with monitoring of the environmental situation and operational

information in emergency situations, as well as timely access to updated information on the environmental state of the region. In the GIS set modelling of commonly used mapping servers using internal or additional means, the raster and vector data model allowed to transform the field in which the spatial distribution of events in the Fergana region changes. This database is an important source for obtaining relevant scientific findings, assessing the environmental situation, monitoring, and identifying priority areas for the future. The environmental atlas of the Fergana region and its practical thematic environmental maps will serve as a basis for assessing the environmental situation, conservation of nature and rational use of natural resources, as well as optimization of the environmental situation.

### ABSTRACT

*The article presents the results of experimental and theoretical studies of stress-deformed state of reinforced concrete beams without transverse reinforcement and with vertical clamps tested for the action of transverse forces under conditions of influence of increased and high technological temperatures. The influence of the main factors on strength of inclined sections, deformation of concrete, longitudinal and transverse reinforcement in the shear zone, shape and type of breakage of the bent element is determined.*

**KEYWORDS:** Concrete, Reinforcement, Reinforced Concrete, Temperature, Heating, Transverse Force, Bending Moment, Strength, A Form Of Destruction, Stress, Deformation, Cut Span, Design Section.

### INTRODUCTION

In order to establish general regularities and features of stress-strain state in the section zone, the influence of various factors on strength along an inclined section of bent reinforced concrete elements under action of transverse forces and high temperature, experimental data of experimental studies were processed and analyzed [1-4].

**Prototype models and experimental research methodology.** The tests were carried out on reinforced concrete beams with a rectangular section of 16x30 cm length 240 cm. The beams were made of conventional heavy concrete of class B 35 on Portland cement with granite crushed stone and quartz sand and from heat-resistant concrete on alumina cement with shamoto aggregates of class B 35. The concrete of all beams had natural hardness. The beams were reinforced with two longitudinal rods  $\varnothing 18$  or 20 mm made of steel class a-W, grade 35GS, the yield strength of which ranged from 415 to 490 MPa, the temporary resistance from 610 to 760 MPa. Some of the beams were not cross-reinforced, others were reinforced with vertical welded clamps made of reinforcing wire  $\varnothing 6$  mm of class A-I, st3sp3 brand with a step of 8-10 cm. In beams made of heat-resistant concrete on alumina cement, the clamps were installed on the side of the less heated face at a height of  $2/3h$  (20 cm) on one half of the length of the beam (Fig.1). To determine the strength and deformed properties at normal temperature and when heated simultaneously with the beams, 10x10x10 cm cubes and 10x10x40 cm prisms were concreted. the tests of these cubes allowed us to qualitatively evaluate and establish in full the quantitative values of all the physical, mechanical and deformed properties of the applied concretes at different temperatures.

**Figure 1.** Scheme of reinforcement, heating and loading of beams:

1-beams without transverse reinforcement; 2-beams with transverse reinforcement; X-chromel-aluminum thermocouples

The beams were tested on a special installation consisting of an electric heating furnace and a loading system. The beam with a span of 137 (58) cm and two consoles of 51.5 (91) cm was installed on supports provided in an oven reinforced with a zone up. The beams to be heated were first heated from the side of the compressed concrete zone at a rate of 100 0C per hour to a predetermined temperature, held at that temperature for 2 hours, then loaded with two concentrated forces symmetrically applied to the cantilever portions. Load was given by hydraulic jack in stages equal to 0.05-0.1 of breaking one. When loaded, the temperature in the furnace was kept constant. The beams were tested at normal temperature and at unilateral heating at shear spans (distance from support to load) equal to  $h_0$  and  $2.5h_0$ . The temperature of the end fibre of the compressed zone of concrete in beams made of conventional heavy concrete was 70, 100 and 2000C, in beams made of heat-resistant concrete on alumina cement - 300, 500 and 8000C. During heating and loading, strains of longitudinal, transverse reinforcement and

concrete in the shear zone, beam deflection, longitudinal reinforcement slip, crack opening width, temperature of longitudinal and transverse reinforcement and concrete along the beam cross-section height were measured.

**Research results and their analysis.** The analysis showed that the stress-deformed state of concrete, longitudinal and transverse reinforcement in the zone of action of transverse forces under conditions of unilateral heating in reinforced concrete beams regardless of heating temperature, cut span value, concrete type and strength and reinforcement are the same.

When calculating strength and crack resistance of inclined sections of bent reinforced concrete elements, it is more convenient to operate with stresses of concrete, longitudinal and transverse reinforcement in span of cut. Based on the analysis of the results of the experiments, it was established:

- Before formation of inclined cracks, stress in concrete on the planes perpendicular to the inclined crack at the level of the center of gravity of the section reaches or exceeds the values of resistance of concrete to tension during heating;
- When the feature is broken along the sloped section:
- Stresses of the longitudinal reinforcement at the points of intersection with the inclined crack can reach the yield point of the reinforcement during heating;
- Dressings in clamps reach the yield point of valves taking into account the maximum temperature of their heating;
- Stress in the concrete of the compressed zone above the inclined crack reaches the value of concrete resistance to compression during heating.

The most characteristic parameters when assessing the strength of the inclined sections of reinforced concrete beams are the relative strength of the element along the inclined section

$$\frac{Q}{R_{bt} \cdot \gamma_{tt} \cdot b \cdot h_o} \text{ and the relative value of the maximum bending moment } \frac{M}{Q \cdot h_o}.$$

Relative strength along inclined section of reinforced concrete beams with increase of concrete temperature of compressed facet of section increases, and with increase of relative value of bending moment decreases. In beams made of conventional heavy concrete without transverse

reinforcement, the value of  $\frac{Q}{R_{pt} \cdot b \cdot h_o}$  at unilateral heating to 70, 100 and 2000 C increases by 8,

4 and 6% respectively. In beams with clamps the value of  $\frac{Q}{R_{pt} \cdot b \cdot h_o}$  is on average 30% higher than in beams without transverse reinforcement.

As the value of  $\frac{M}{Q \cdot h_o}$  increases from 1.0 to 2.5, the relative strength along the inclined section of beams made of conventional heavy concrete decreases by 2.4 times.

Relative strength along inclined section of reinforced concrete beams made of heat-resistant concrete at unilateral heating to 800-10000C increases to a greater extent than beams made of conventional heavy concrete.

The greatest increase in  $\frac{Q}{R_{bt} \cdot \gamma_{tt} \cdot b \cdot h_o}$  value is observed in beams made of heat-resistant concrete on Portland cement, the smallest - in beams made of heat-resistant concrete on alumina cement (Fig.2).

Relative strength of inclined sections of beams made of heat-resistant concrete on alumina cement without clamps at  $\frac{M}{Q \cdot h_o}$  with 1.6 at normal temperature increased to 2.9 at heating to

9000C on concrete of compressed facet of section;  $\frac{M}{Q \cdot h_o} = 2,5$  temperature increase on the

compressed facet of the section resulted in increase of  $\frac{Q}{R_{bt} \cdot \gamma_{tt} \cdot b \cdot h_o}$  from 0.47 at normal temperature to 1.08 at 3000C, to 1.3 at 5000C, to 1.5 at 8000C.

Relative strength of inclined sections of beams made of heat-resistant concrete on Portland cement without clamps at normal temperature at values  $\frac{M}{Q \cdot h_o}$  equal to 3.2 and 1.0 respectively

was 0.75; 1.10 and 3.13. Increase of concrete temperature on compressed edge of beams up to 10000C leads to increase of  $\frac{Q}{R_{bt} \cdot \gamma_{tt} \cdot b \cdot h_o}$  value respectively up to 3.1; 4.8 and 11.2.

Relative strength of inclined sections of beams made of heat-resistant concrete on liquid glass increases slightly less than in beams made of heat-resistant concrete on Portland cement, but much more than in beams made of heat-resistant concrete on alumina cement.

Relative strength of inclined sections of heat-resistant concretes with clamps with temperature increase on compressed face of section increases to approximately the same extent as in corresponding beams without clamps. Absolute value of  $\frac{Q}{R_{bt} \cdot \gamma_{tt} \cdot b \cdot h_o}$  value at the same heating

temperatures and  $\frac{M}{Q \cdot h_o}$  value for beams with clamps is higher than for beams without transverse reinforcement.

$\frac{M}{Q \cdot h_o}$  increases, the relative strength of the inclined sections of the heat-resistant concrete

beams decreases. The smallest decrease of  $\frac{Q}{R_{bt} \cdot \gamma_{tt} \cdot b \cdot h_o}$  value occurs in beams of heat-resistant concrete on alumina cement, the largest - in beams of heat-resistant concrete on Portland cement.

In beams with clamps  $\frac{Q}{R_{bt} \cdot \gamma_{tt} \cdot b \cdot h_o}$  value decreases to a lesser extent than in beams without transverse reinforcement (Fig.3).

Longitudinal reinforcement of beams located on less heated facet of section at  $h_o = 31$  cm even at temperature of 1000°C on compressed facet of section is heated only to 1000°C. As is known, the yield strength of 35ГC grade A-III reinforcement does not decrease when heated to 1000°C. Consequently, the role of the longitudinal stretch reinforcement in the operation at the bending member under unilateral heating is about the same as at normal temperature. Relative value of the strength resistance of the longitudinal reinforcement at unilateral heating increases. As the content and diameter of the longitudinal reinforcement increase, the strength of the bent element along the inclined section increases at unilateral heating.

Strength along inclined section of beams with clamps at heating is higher than beams without transverse reinforcement. As the percentage of transverse reinforcement increases, the strength of the inclined sections increases during unilateral heating. At unilateral heating transverse reinforcement of beams is heated more strongly than longitudinal reinforcement and at high temperatures yield strength and modulus of elasticity of reinforcement of clamps are reduced. The amount of transverse force received by the clamps in the inclined section of the bent element when heated in the limit state is somewhat reduced compared to the normal temperature.

Increase or decrease of concrete strength leads respectively to increase or decrease of strength of inclined sections of bent element under action of transverse forces and one-sided heating.

The strength of the inclined sections of the element is mainly affected by the change in the strength of the concrete of the compressed section zone during heating. The analysis showed that concrete strength taken in practical calculations at the average temperature of the compressed section zone at the level of 0.2  $h_o$  from the most compressed edge of the element, as recommended in [5], gives satisfactory results. At reduction of strength of conventional concrete at heating to 70, 100 and 2000°C by 16, 28 and 10% strength of beams without clamps on inclined section decreased by 8, 12 and 5% respectively. Reduction of strength of heat-resistant concrete on alumina cement at heating up to 300, 500 and 8000°C by 50, 56 and 64% resulted in reduction of strength of inclined sections of beams on average by 15, 22 and 36% respectively.

**Figure 2.** Relative strength of reinforced concrete beams depending on the average temperature of the compressed zone of concrete: a - heat-resistant concrete on alumina cement; B - heat-resistant concrete on Portland cement; C - heat-resistant concrete on liquid glass, 1 - without transverse reinforcement, 2 - with clamps.

**Figure 3.** Relative strength of reinforced concrete beams depending on value  $a/h_0$ : a - normal heavy concrete, b - heat-resistant concrete on alumina cement; C is heat resistant concrete on Portland cement; G-heat resistant concrete on liquid glass; 1 - without transverse reinforcement, 2 - with clamps.

Strength of inclined sections of bent reinforced concrete elements at unilateral heating depends on load value and place of its application. The most favorable conditions for the resistance of the element to the action of transverse forces are created at small values of relative length between the support and the load  $\frac{a}{h_0} = 0,5 \div 1,5$ . As the value of  $\frac{a}{h_0}$  decreases, the value of the limit transverse force perceived by the inclined section of the element before breaking increases. The value of the maximum bending moment does not change significantly.

Strength of inclined sections of bending elements at high temperatures depends on the form of destruction along the inclined section. The bending element has high strength along the inclined section when the concrete of the compressed zone is broken above the inclined crack with simultaneous fluidity of the longitudinal reinforcement at the intersection of its critical inclined crack. Name of strength of inclined sections in case of element destruction due to failure of adhesion of longitudinal reinforcement with concrete and its anchoring.

At small values  $\frac{a}{h_o}$  strength of inclined sections of element at destruction from crushing of concrete strip between support and weight is more than at its destruction from cut of concrete of compressed zone.

## CONCLUSION

The performed studies make it possible to improve the method of calculation of strength of inclined sections of bent reinforced concrete elements operating under conditions of exposure to high and high temperatures, their practical application provides saving of reinforcement steel, reduction of cost and labour input of structures manufacturing and significant economic effect is achieved.

Fergana Polytechnic Institute, UZBEKISTAN

### ABSTRACT

*This paper provides an overview of the current state of reactive power compensation technologies. Principles of operation, design characteristics are presented. One of the basic questions connected with improvement of quality of the electric power in branches which will be solved both at a design stage and at the stages of functioning of industrial systems of electrical supply is the compensation of jet capacity, including a choice of corresponding sources, calculation and regulation of their capacity, placing of sources in the power supply system. Rational coverage of reactive power in industrial electrical networks involves many problems aimed at increasing the efficiency of electrical installations.*

**KEYWORDS:** *Capacitance, Capacitors, Condensation Unit, Control Systems, Current, Inductance, Load, Reactive Power, Reactive Power, Voltage Control, Voltage.*

### INTRODUCTION

Reactive power is the technical loss of electricity caused by electromagnetic processes in networks. Its disadvantage is the increase of conductors and congestion in the network, which leads to the operation of the power supply in extended mode. If compensation for power consumption is not provided, the consumption of reactive energy from the grid will require considerable costs. [9, c.24] Large reactive loads can lead to voltage drop and low power quality. In addition, power transmission lines and transformer equipment are subject to overloads, which leads to increased capital costs for the establishment and operation of distribution stations. [3]

### MATERIALS AND METHODS

AC power supply began in the late 19th century replacing existing small-town systems. With the expansion of local power supply systems and the provision of long-range transmission, first

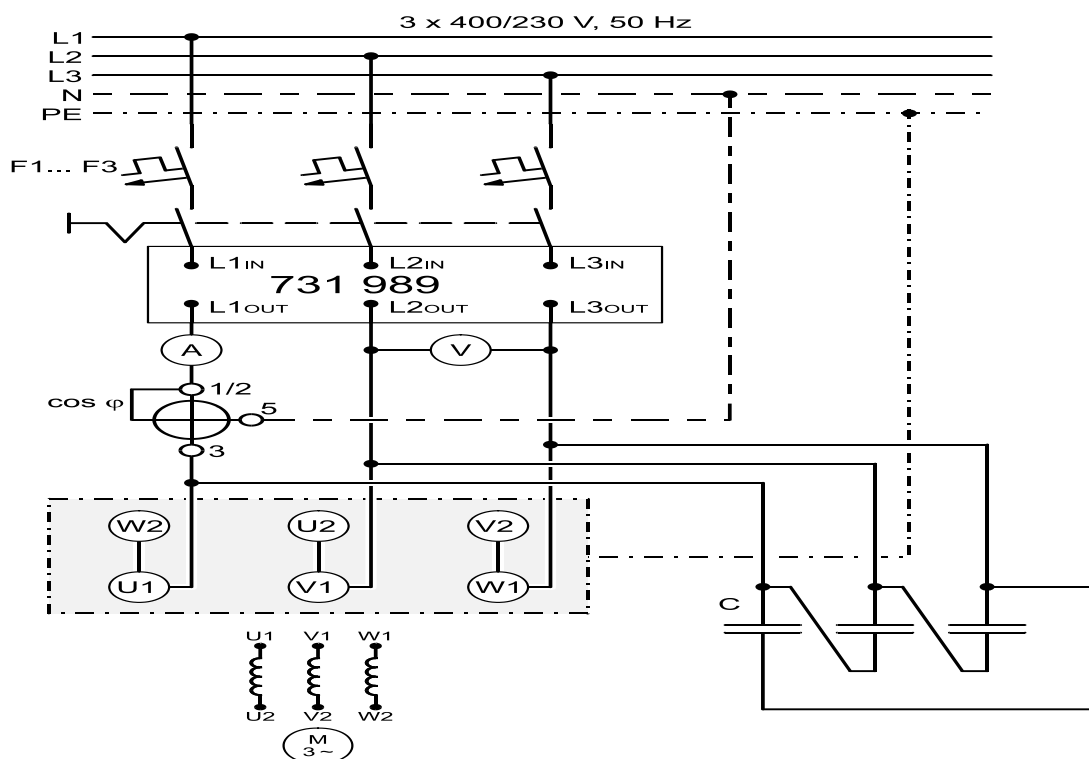

of all, due to the disproportionate reactive power in the local system and stability control, the first problems arose. Reactive power compensation (shunt capacitors and shunt reactors) was used to control voltage in the stationary system. The dynamic method was based on rotating machines such as synchronous compensators. [4; 8]

In the mid-1960s, the first static reactive power compensation devices were introduced, namely, DC-controlled reactors (mercury valves) and thyristor-controlled reactors (thyristor-controlled capacitors, thyristor-controlled reactors).

In short, many losses have eliminated existing limitations existing on rotating machines and devices controlled by direct current. [5; 9]

When compensating for reactive power in asynchronous engines with a short-circuited rotor, the following results were achieved. As shown in Figure 1, capacitors consisting of three 2  $\mu\text{F}$  capacitors were installed for the experimental circuit. condenser.

**Fig. 1.** Compensation of reactive power of short-circuited rotor of the asynchronous motor (machine and compensation capacitors, connected by triangular circuit)

In an uncompensated experiment, it measures the load moment and normalizes the result, the value of the torque of the object being tested is to measure  $T_{N, act}$  and  $I_{N, act}$ , the torque of the drive. For this purpose, the nominal values of the test object connected to the start circuit

$$T_{N, act} = 1.82 Nm \quad (1)$$

$$I_{N, act} = 0.93 A \quad (2)$$

By sequentially introducing a torque load by "torque control" and measuring the rotor short circuit current and power factor, the following results were obtained:

$T/T_{N, act}$ :	0.0	0.1	0.2	0.3	0.4	0.5	0.6	0.7
$M/Nm$ :	0.00	0.18	0.36	0.55	0.73	0.91	1.09	1.27
$I/A$ :	0.36	0.37	0.39	0.41	0.44	0.47	0.50	0.54
$I/I_{N, act}$ :	0.39	0.40	0.42	0.44	0.47	0.51	0.54	0.58
$\cos \varphi$ :	0.45	0.59	0.72	0.84	0.90	0.94	0.96	0.97
$T/T_{N, act}$ :	0.8	0.9	1.0	1.1	1.2	1.3	1.4	1.5
$T/Nm$ :	1.46	1.64	1.82	2.00	2.18	2.37	2.55	2.73
$I/A$ :	0.58	0.61	0.66	0.71	0.75	0.82	0.88	0.95
$I/I_{N, act}$ :	0.62	0.66	0.71	0.76	0.81	0.88	0.95	1.02
$\cos \varphi$ :	0.97	0.97	0.97	0.97	0.97	0.97	0.97	0.97

**Tab. 1.** Measurement parameters of reactive power compensation in case of short circuit of the asynchronous motor.

The graph shows the current factors associated with the torque that was constructed to determine the efficiency of the power factor and current, the non-compensating motor, and the asynchronous short circuit motor.

**Fig. 2.** Effect of compensation on current and power factors on the motor of the short-circuited rotor.

Compensated  $I/A$ ,  $\cos$

Not compensated  $I/A$ ,  $\cos$

Depending on the current and power factors shown in the line, we can conclude that in the range of low loads the current generating by the compensating machine is less than half the current by the non-compensating machine. [10]

Also when working with a heavy load, not compensated amount to 65-80%. The effect of compensation on the strength factor is more pronounced: when the load is at nominal rotation, this value is 0.9 and then increases to almost 1.

### **ABSTRACT**

*2 batches of aggregate were produced under production conditions at the expanded clay plant according to the developed technological scheme, confirmed by laboratory data.*

**KEYWORDS:** *And, Clay, Waste, Additive, Charge, Mass, Moulding, Granule, Furnace, Porous Aggregate, Agloporite Crushed Stone.*

### **INTRODUCTION**

As the use of reinforced concrete structures made of light concrete expands, new types of cheap fillers are needed.

Production of porous aggregates should be developed based on local raw materials or industrial wastes, like England, countries of Eastern Europe, where slag pemza, agloporite gravel and crushed stone from TPP ash are used [1].

The raw material base for the production of artificial porous aggregates in Uzbekistan is very limited and, accordingly, its rational use is required, as well as the exploration of new species through waste production and local raw materials, including even non-standard ones.

## MATERIALS AND METHODS

For industrial construction, which has developed in the Republic, it is necessary to search for new types of artificial porous aggregates based on local raw materials. Many districts have huge reserves of non-standard raw materials: velvet sands, loess loams, dacite porphyries, industrial wastes, based on which new types of artificial porous aggregates - keramoporite, camporite, carboporite and others - are obtained [2].

In the production tests, the following materials were used to obtain the light aggregate: Kamyshtashinsky hydrosludic clay raw material and Yaz-Yavan (Central Fergana) velvet sands, as well as Fergan refinery waste used as a plasticizing and pore-forming additive. Carried out laboratory experiments showed that the optimal composition of the charge is velvet sand 70%, clay 20% and oil waste 10%. Comparison of results of physical and mechanical properties of a light aggregate made of velvet sand sintered at temperature 1100, 1150 and 11800 °C makes it possible to conclude that optimum burning temperature of studied aggregate is within the range 1150-11800 °C [3].

The results of laboratory studies showed that at material density 600-650 kg/m<sup>3</sup> the aggregate has strength 2.5-2.6 MPa, frost resistance more than 60 cycles, and weight loss at iron and silicate decay is practically non-existent. From the above results it can be concluded that for all indicators of the developed composition of porous filler gravel-like shape meets all requirements of GOST 11991-83 for aglopore crushed stone, and for strength exceeds the required values.

### 1. Information about the materials used.

The results of chemical analysis of 7 samples of clay and velvet sand are given in Table 1 [3].

The table shows that the raw material is almost uniform in  $SiO_2$ ,  $Al_2O_3$ ,  $CaO$ ,  $MgO$  content,  $CaO$ . Oxides  $CaO$  and  $MgO$  in the velvet sand up to 30% which characterize it as a high carbonate raw material.

Clay granulometric composition is determined by Rutovsky method and pipette, results of which are given in Table 2 [3].

**TABLE 2. GRANULOMETRIC COMPOSITION OF THE STUDIED CLAYS**

Clay samples	Granulometric composition				
	sandy		dusty		clayey
	0,25	0,25-0,05	0,05-0,01	0,01-0,005	0,05
1	4,37	5,16	21,35	9,20	59,92
2	1,42	4,18	30,4	7,2	57,16
3	7,95	8,96	24,9	10,36	47,88
4	0,48	7,21	21,11	11,96	59,24
5	2,74	7,28	20,82	10,1	58,78
6	0,77	16,81	20,1	9,88	52,44
7	1,07	2,87	19,62	10,36	66,38
Factory average sample	5,58	3,75	22,95	8,08	59,64

From the data of Table 2, we can see that the study of clay belongs to the group of finely dispersed and the content of particles with the size less than 0.005 mm is within the range of 47.88-66.38%, and in the factory average sample of the field - 59.64%.

Ceramic and technological properties of raw materials were determined in accordance with GOST on clay raw materials, Table 3 [3].

The particle size distribution of barchan sand was determined by sieving it through a standard set of sieves with hole sizes: 5, 2.5, 1.25, 0.63, 0.315, 0.14 mm.

The grain composition of the sand consists of the following fractions listed in Table 4. **Ceramic and technological properties of clays from the Kamybashinsky deposit**

**TABLE 3**

Plasticity number	Forming humidity, %	Shrinkage, %		Mechanical durability of samples		Note
		воздушная	огневая	сырцовых	Обожженных при 1000 <sup>0</sup> С	
10-19	21,9-22,5	6,4-7,8	7,8-8,1	2,3-6,0	34,1-40,9	Clay does not swell, but sinters

**Grain composition of barkhan sand****TABLE 4**

Size of control screen holes, mm	The total residue on the control sieves, mass %
5	0
2,5	0
1,25	0
0,63	3,86
0,315	33,23
Passage through sieve 0.14	7,76

According to Table 4, the grain composition of sand is plotted, from which it is determined that the grain composition curve is outside the area of its allowable use in concrete, as the sand belongs to fine-grained sand with  $M_k=0,18-1,32$  and as a concrete aggregate it is impossible to use due to high cement consumption [3].

Constant composition of oil refining industry wastes:  $C=85,0\%$ ;  $H=13,0\%$ ;  $S=1,20\%$ ;  $N=0,683\%$ ;  $O=0,12\%$ . Wastes contain burning substances in amount of 30-35% consisting of bitumen and paraffin.

**2. Process diagram of production of porous aggregate from velvet sand.** The barkhansand is supplied for production without processing to the hopper, on which the mesh with a diameter of holes up to 5 mm, and then from the hopper by a plate dispenser is directed to the belt conveyor directly to the mixer-humidifier, into which ground clay is supplied from the grinding plant (as cement) in kraft bags, its fineness of grinding up to 1 mm. The oil effluent is fed to the aggregate plant in the form of lumps requiring grinding. Wastes are directed to disintegrator and then to belt conveyor and mixer-humidifier. All three components are mixed in a two-shaft mixer-humidifier, in which the mixture is moistened to 20% and directed to a hole roller, from which granules in the form of cylinders with diameter of 5-10 mm and length of 10-20 mm come out. The granules are fed from the rollers to a belt conveyor and then to a 2 m<sup>3</sup> storage bin. Granules with a moisture content of 18-20% are fed from the hopper by plate dispenser into the rotary furnace where granules are dried, sintered and cooled to 9000C.

The hot granules fall into a chain-type refrigerator and then onto a screen for fractionation and each fraction is sent to metal bins, and from there to the consumer, Fig.1.

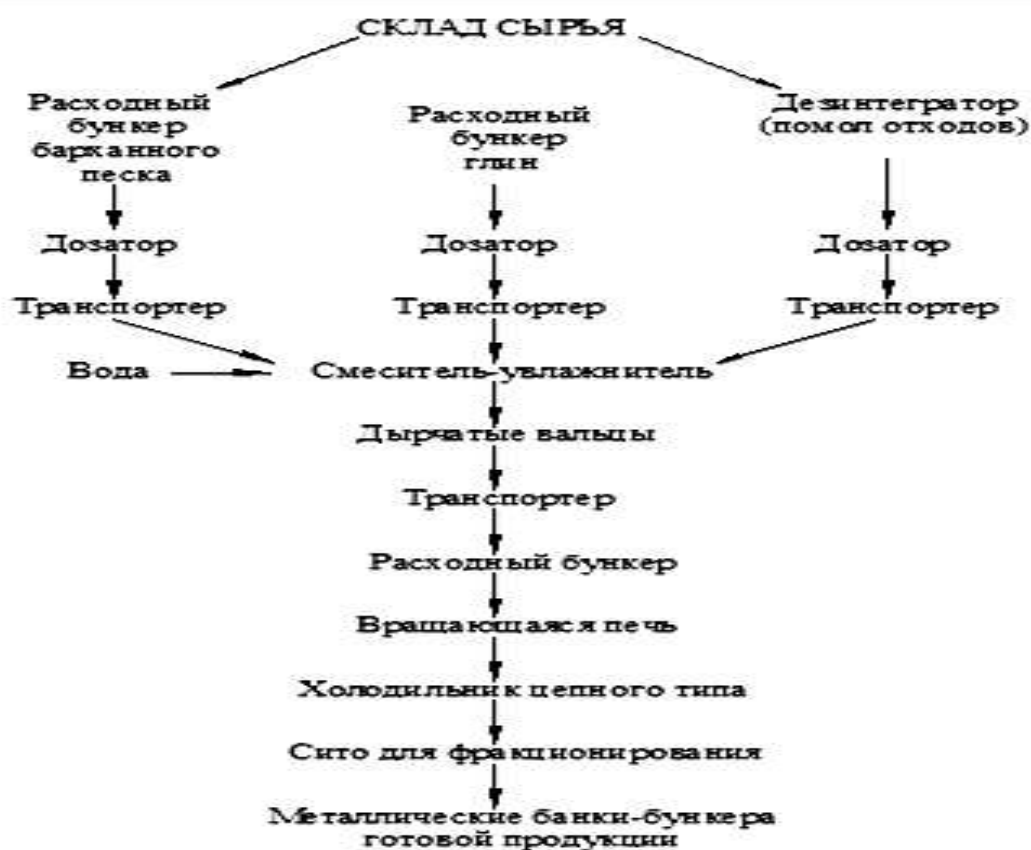

Fig. 1. Process diagram of production of porous aggregate from barkhan sand.

1. Production tests of the porous aggregate production technology parameters developed under laboratory conditions. Testing of optimal compositions of masses based on barkhan sand, clay and wastes of the oil refining industry was carried out at the Fayziabad plant for the production of ceramzite and the material base of the Tashkent NIIS throm project. To this end, about 60 tons of velvet sand, 18 tons of fine clay and 14.5 tons of oil refining waste were delivered to the Faizabad Ceramic Plant. Packing of masses consisting of 70% of velvet sand, 20% of hydraulic clay and 10% of wastes was carried out in a mixer, and formation of granules was carried out on perforated rollers with a moisture content of 18%. Without prior drying, the granules were fed into the elevator and then from the receiving bin the plate dispenser was directed to a rotary 22-meter oven. Sintering mode is selected according to [4.5]. The temperature of granule sintering in the zone of boiling of the rotating furnace fluctuated in the range of 1150-11800C, and the off-gas 450-5000C.

The sintering time of the material from the moment of loading and output of the finished product was 40-45 minutes. The fired porous aggregate obtained under production conditions is characterized by the following physical and mechanical properties, table.5.

From the table data, we can conclude that the resulting porous aggregate fully meets the requirements of GOST 11991-83 "aggloporite crushed Stone". An experimental batch of porous aggregate was obtained on the material base of the Tash NIIS thromproject. To conduct these tests, raw materials were delivered to the base – sand, hydrosfluidic clay and oil refining waste;

granulated in a disc granulator and fired in a 9-meter rotating furnace, in which the material was sintered for 40 minutes and a porous structure was formed due to the burning of oil products.

### The main properties of the filler

**TABLE 5**

#	Indicators	Един. измерения	Результаты по фракциям	
			5-10мм	10-20мм
1	Bulk density	кг/м <sup>3</sup>	640	620
2	Compression strength in cylinders	МПа	2,4	2,2
3	Water absorption in 1 hour	%	15,8	14,9
4	Frost resistance	циклы	60	60
5	Losses of weight at:			
	ferruginous disintegration	%	No	No
	silicate disintegration	%	No	No
	calcinating	%	No	No
	boiling	%	No	No

The results of the GOST test 9758-83 the methods of testing the porous inorganic aggregate for light concrete [6] of the obtained porous aggregate are given in Table 6 and they show that the main characteristics of the obtained material meet the requirements of the industry.

According to the data of tests (Table 6) according to GOST 9758-83, the obtained aggregate meets the requirements of GOST 11991-83 "Agloporite crushed stone" [7].

It should be noted that the strength characteristics and bulk density of the material are free to compete with ceramsite.

Basic physical and mechanical properties of the filler from the optimal composition of the mass obtained on the material base Tash NIIS thromproject

**TABLE 6.**

Indicators	Units of measure	fractions	
		5-10	10-20
Bulk density	кг/м <sup>3</sup>	640-660	620-640
Volume of ceramsite emptiness	%	55,5	59,3
Porosity of grains	%	18,6	18,8
Pressure strength in a cylinder	МПа	2,7	2,4
Water absorption:			
A) after 1 hour	%	16,8	17,7
B) after 48 hours	%	16,8	17,1
Softening coefficient	-	0,82	0,81
The mass loss at:			
a) calcination	%	0,1	0,2
b) silicate decomposition	%	No	No
c) iron decay	%	No	No
g) boiling	%	No	0,02

d) test in solution	%	No	No
Frost resistance	cycle	50	50
The content of sharply blown grains	%	No	No
Aggregate strength in concrete	МПа	12,5	12,5
Determination of hydraulic activity	мг	58,18	58,3
Bulk mass of aggregate grains in cement paste	кг/дм <sup>3</sup>	2,02	0,03

From the analysis of Table 6, it can be concluded that the obtained aggregate under the production conditions meets all the requirements of GOST not only for aglopote but also for clay. Thus, at the bulk mass of the aggregate of 620-650 kg/m<sup>3</sup>, the strength was 2.4-2.7 MPa, which is higher than that of clay. There is practically no study of mass loss in different types of tests compared to aglopote. Light concrete for structures can be obtained from this aggregate.

## CONCLUSION

According to the results of industrial tests, the technology of obtaining porous aggregate with high strength indices from 2.4 to 2.7 MPa at a bulk density of 620-640 kg/m<sup>3</sup>, meeting the requirements of GOST 11991-83 for aglopote crushed stone, has been developed.

### ABSTRACT

*Within the framework of the general program of modernization of agriculture, qualitative renewal and replenishment of the agricultural machinery fleet are required, especially equipping it with new high-performance tractors capable of working in different soil-climatic conditions. This article presents proposals and conclusions on improving the technology and improving the efficiency of soil treatment of agricultural machines in order to effectively solve these problems.*

**KEYWORDS:** *Modernization Of Agriculture, Agricultural Machinery, High-Performance Tractors, Agro-Technology.*

### INTRODUCTION

Within the framework of the general program of modernization of agriculture, qualitative renewal and saturation of the fleet of agricultural machinery are required, especially equipping it with new high-performance tractors capable of working in different soil-climatic conditions.

Effective solution of the set tasks is possible only in case of a complex approach to their execution, in particular, it is necessary to work simultaneously on scientific justifications of new

solutions, to engage in concrete design, to develop new Agro technologies for effective use of new machines in agricultural production.

This is due to the fact that agricultural tractors, depending on their purpose and type, are subject to different requirements, which in no small part is related to climatic, soil and economic and technical conditions. However, today Uzbekistan lacks the energy that is sufficiently adapted to work in desert conditions.

## MATERIALS AND METHODS

Compacted pressure wedge is formed on compacted soils under the wheel as well as under flat die. With a small thickness of the loose layer, for example on a groin, the compression wedge may become a general compression of the loose soil layer laid by the solid base. Extrusion of soil in the sides during rolling of the automobile wheel on loose soils is weak, and on coherent soils in a soft-plastic and fluid state is predominant.

In one pass of the wheel, the soil does not have time to deform by a value corresponding to load. Therefore, with successive passes of the wheel on one track, there is a gradual increase in both the pinch wedge and the lateral extension of the ground.

Based on the experience of creating such mathematical models, to solve the above problem, it is necessary that, according to the known vertical load on the  $P_z$  axis of the wheel, the longitudinal speed  $V_x$  of the movement of its axis and the amount of longitudinal sliding  $s_x$  in the spot of its contact with the bearing surface, the longitudinal component  $P_x$  of the force transmitted by the wheel to the frame of the machine and the moment  $M_k$  occurring on the axis of the wheel are determined.

The design scheme is given in Fig. 1 was used in the development of this mathematical model. This diagram shows a variant of the interaction of the elastic wheel with the deformable bearing surface, which occurs in the driving mode of its rolling. This design diagram is obtained on the basis of the analysis of similar design diagrams given in [1,2,3,].

From Fig.1.it is visible that the wheel rotates at an angular speed of  $[\theta] k$ , and its axis has a longitudinal speed of  $V_x$ . In this mathematical model, the relationship between these parameters is determined on the basis of the recommendations given in [2] and has the form:

$$V_x = w_k * r_k * (1 - S_x) (3)$$

Where:  $r_k$  the rolling radius of the elastic wheel excluding sliding.

From fig. 1. It is also seen that the wheel through the axle receives longitudinal  $P_x$  and normal to the support surface with leaving forces from the frame of the machine, as well as moment  $M_k$  coming from the drive.

On the other hand, the elastic wheel interacts with the deformable bearing surface. The result of this interaction is the corresponding normal and tangential deformation of the tyre and the ground, as well as the resulting forces in the spot of their contact.

**Figure. 1** - Design diagram of elastic wheel interaction with the soil.

In accordance with the recommendations made in [1], in this model, tyre-to-ground contact is conditionally considered to consist of three areas (Fig.1):

- the first area - on a side view the main part of this area is presented by AV arch in a front part of the contact. In the top views (depending on the relation between the value of normal deformation of the ground  $h_g$  and the height of the hook ground  $h_g$  of the tread of the tyre) this area is indicated by the number I. Here it is also indicated:  $b_{pr}$  is the width of the tread of the tyre,  $b$  is the width of the formed gauge;
- the second area - on a side view this area is presented by VS horizontal. In plan views, this area is indicated by II;
- the third area - is formed in the presence of contact of a side surface of the tire with soil in case the size of normal deformation of  $h_g$  soil exceeds height tire  $h_{gz}$  hook soil. In the corresponding plan view, this area is indicated by the numeral III. In addition, this area is shown in the front view of the wheel.

Due to this approach, it is possible to provide continuity in the development of a mathematical model of an elastic wheel rolling on a deformable support surface, creating it on the basis of a mathematical model of an elastic wheel rolling on the undeformed surface. This continuity is important to solve the set tasks of the study from the point of view of identification of factors that need to be taken into account in the creation of intelligent transmissions of wheeled machines operating both in conditions of the non-deformable and deformable support surface.

To this end, it is proposed to use the superposition method, which in the developed mathematical model is implemented as follows.

Within the second region of the contact spot (surface BC), it is assumed that the elastic wheel interacts with the bearing surface on the bottom of the formed track in the direction normal thereto as well as when rolling on the non-deformable bearing surface. Therefore, the processes

accompanying the elastic deformations in the tire and the associated rolling losses are mainly determined by the forces generated in this second region of the contact spot. In the same region, a longitudinal traction force  $R_x$  of the driving wheel is formed.

The ground deformation normal to the support surface and the associated mechanical energy expenditure on gauge formation is due to the forces generated by the interaction of the wheel with the ground in the first and third regions of the contact spot. At the same time, it is assumed that the process of wheel milling of soil is not taken into account in modelling.

This method of superposition is illustrated in Fig.1 in the form of epurs of distribution of values of normal loads assigned to longitudinal coordinate  $x$  within these three areas. The number of the epic corresponds to the received number of the contact spot area. The same figure shows the view of the total distribution of these load values, which is close to the real distribution [1].

Thus, considering that a part of the normal loading which is coming on a wheel axis from the outside of a car skeleton is implemented in the first and third areas of a spot of contact in the form of  $R_z$  force, normal deformation of the tire  $h_z$  in the model is calculated in size of reaction  $R_z$  which is determined from the equation of balance of a wheel in the vertical direction by a formula:

$$R_z = P_z - R'_z(2)$$

Hence, the value of  $h_z$ , according to the recommendations [2], is determined by the formula:

$$h_z = \frac{K_z \cdot (R_z)^{0.75}}{1 + 10 \cdot p_w}(3)$$

where:  $K_z$  - coefficient constant for a given tire, is determined according to [2];  $P_w$  - tire pressure.

The strength  $R_z$  is estimated in accordance with the recommendations given in [1,4] based on the following energy considerations. It is obvious that the specific work spent per rut per unit of track travelled by the wheel axis is numerically equal to the corresponding specific work on plastic deformation of the soil in the direction normal to the supporting surface. According to [1], this specific work is equal to the total reaction  $R_z$  of the deformable soil in the direction normal to the supporting surface. Considering the accepted assumptions that this force is formed in the first and third regions of the contact spot (Fig. 1.), and recommendations [1]  $R_z$  in the adopted case is determined by the formula:

$$R'_z = k_z \cdot b_{np} \cdot \int_0^{h_r} p(h) \cdot dh + (1 - k_z) \cdot b_{np} \cdot \int_0^{h_r - h_{r3}} p(h) \cdot dh + \\ + \frac{2}{3} \cdot (b - b_{np}) \cdot \left[ \int_0^{h_r - h_{r3}} p(h) \cdot dh + p(h_r - h_{r3}) \cdot (l_1 + c) \right], \quad (4)$$

where:  $k_z$  is the saturation coefficient of the tire tread;  $p(h)$  is the dependence of the pressure in the contact of the tire surface with the soil on the normal deformation of the soil, determined by the recommendations [1].

Thus, knowing the load component  $P_z$  normal to the supporting surface, which is perceived by the axis of the wheel in question, and using the recommendations [1], which allow us to estimate the dependence of the pressure in the tire surface contact with the soil on the normal soil

deformation  $p(h)$ , from equations (2), (3) and (4) the values of normal deformations of the tire  $h_z$  and soil  $h_g$  are determined under the given conditions of a wheel rolling.

Next, we consider the operation of the elastic wheel in the second region of the contact spot (surface of the aircraft in Fig. 1).

In accordance with the assumptions made, the work spent on rolling the tire to its normal deformation from the force  $R_z$  and the circumferential deformation from the moment  $M_k$  determines the rolling loss of the elastic tire itself. In this model, these losses are considered equal to the losses that occur when an elastic wheel rolls along an undeformable base with the same magnitude of loads. Therefore, in accordance with the recommendations given in [2], the coefficient  $f_m$  of rolling resistance of an elastic wheel, which determines these losses, is estimated by the formula:

$$f_{uu} = f_0 + f_m \quad (5)$$

where:  $f_0$  is the coefficient of rolling resistance of the elastic wheel in the driven mode, based on the recommendations given in [2], is equal to:

$$f_0 = \frac{(1+0,467 \cdot 10^{-3} \cdot V_x^2) \cdot (\alpha_f + \beta_f \cdot R_z^2)}{1+p_w} \quad (6)$$

$\alpha_f$  and  $\beta_f$  are the coefficients determined for a given tyre according to the recommendations given in this paper;

$f_m$  is an additional component of the rolling resistance coefficient of an elastic wheel loaded with torque,

As noted above, within the second area of the contact spot (the AF surface), due to the interaction of the tire's tread (hitch ground) with the ground, a longitudinal component  $R_x$  of force is also formed which, as is known [1,2], is generally determined by the formula:

$$R_x = \varphi_x \cdot P_z \quad (7)$$

where:  $\varphi_x$  – the longitudinal force coefficient or the coefficient of adhesion of the elastic wheel with the supporting surface in the longitudinal direction is determined by analyzing the interaction of the wheel with the soil in the tangential direction within the second region of the contact spot depending on the longitudinal slip  $S_x$  in accordance with the recommendations given in [1].

Based on the analysis of the interaction of the tire with the soil, in accordance with the recommendations set forth in the work, within the second region of the contact spot,  $R_x$  can be determined by one of the following formulas:

$$h_r \geq h_{r3}, \text{ to } R_x = S_{II} \cdot \left[ k_z \cdot \tau_{rp} + (1 - k_z) \cdot \tau_{cp} \right]; \quad (8)$$

$$h_r < h_{r3}, \text{ to } R_x = k_z \cdot S_{II} \cdot \tau_{rp} + h_r \cdot b_{np} \cdot \frac{2 \cdot l_1}{t_z} \cdot \tau_{cp}, \quad (9)$$

here:  $S_{II}$  - an area of the second area of the contact spot (surface of the  $BC$  in Fig. 1);  $\tau_{tr}$  - friction stress in contact of the outer surface of the ground of the hooks with the supporting surface, determined in accordance with recommendations [1];  $\tau_{cp}$  the ground shear resistance stress of the ground by hooks in the trough between them, is determined in accordance with the recommendations [1];  $l_1$  is half the length of the contact spot;  $t_z$  is the step of the ground of the tire hooks.

It should be noted that the result of the interaction of the elastic wheel with the ground in the first and third areas of the contact stain, in addition to the force  $R_z$  is also the longitudinal force indicated in Fig. 1.  $R_x$ . Essentially, this force creates additional resistance that occurs when the elastic wheel is rolling on a deformable base. According to the recommendations [1] force,  $R_z$  is created as a component of the force from the normal deformation of the soil (track formation), which is characterized by the coefficient  $f_g$  of rolling resistance of the elastic wheel on the ground, due to losses on its deformation, and the force from the ground raking in front of the wheel. To estimate this additional resistance in accordance with the recommendations [1], a special coefficient  $f_b$  of rolling resistance of the wheel on the deformed surface from the raking soil in front of the wheel is used.

From here, the mathematical model is accepted:

$$R'_x = (f_r + f_b) \cdot P_z \quad (10)$$

Then from the equation of uniform movement of the wheel in the longitudinal direction, taking into account the relations (7) and (10), we will obtain the longitudinal component  $P_x$  of the force arising on the axis of the considered wheel:

$$P_x = R_x - R'_x = (\varphi_x - f_r - f_b) \cdot P_z \quad (11)$$

According to the recommendations stated in [1], it is accepted that the line of action of the vector of equal forces  $R_z$  and  $R'_x$  passes through the axis of rotation of the wheel, forming some angle  $\beta_x$  with a supporting surface. This assumption, according to the assertion [1], can be accepted because the wheel ground contact surface in the first area (arc  $AB$ ) is close in shape to the side surface of the circular cylinder with the wheel axle coinciding with the wheel axle. The consequence is that this equivalent does not create additional torque around the wheel axle.

From here, it follows that:

$$R'_z = R'_x \cdot \operatorname{tg} \beta_x \quad (12)$$

To determine the value of the angle  $\beta_x$ , the assumption is made at modelling that the line of action of the vector of equidistance forms a central angle equal to  $\alpha_3/x$  from the  $OM$  line, where  $\alpha_x$  is the central angle determined by the value of arc  $AB$ . This assumption is based on the fact that within the first region of the contact spot (arc  $AB$ ) of the epyurean distribution of the relative value of the normal to the reference surface of the force is close to a triangular force (see Figure 1). Fig.1).

For geometric reasons, the angle  $\alpha_x$  is determined by the formula:

$$\alpha_x = \arccos\left(\frac{r_c - (h_z + h_r)}{r_c}\right) - \alpha \quad (13)$$

where:  $r_c$  - free radius of the elastic wheel, determined in accordance with recommendations [2, 5], and in Fig.1.is equal to the segments of OA and OM;

$h_z$  - normal deformation of the tyre to the support surface;

$S_g$  - normal to the supporting surface deformation of the ground;

$\alpha$  is the central angle determined from the ratio:

$$\alpha = \arcsin\left(\frac{l_1 + c}{r_c}\right) \quad (14)$$

$l_1$  - Half the length of the BC contact spot (second area), determined from the formula:

$$l_1 = \sqrt{(2 \cdot r_c \cdot h_z - h_z^2)} \quad (15)$$

$c$  - additional demolition of the vertical reaction in the second area when the elastic wheel is running in rolling mode.

As is known, this additional demolition of the vertical reaction is due to the resulting tangential (circumferential) deformation of the tire loaded with the applied torque  $M_k$ , coming from the wheel drive and realized in contact with the wheel with the supporting surface. The analysis showed that the value is determined from the formula:

$$c = \lambda_k \cdot M_k \cdot \varphi_x \quad (16)$$

Hence the value of the angle  $\beta_x$ , according to Fig. 1, is determined from the formula:

$$\beta_x = \frac{\pi}{2} - \left(\alpha + \frac{1}{3} \cdot \alpha_x\right) \quad (17)$$

Thus, the given relationships (1) - (17) allow in the given rolling conditions of the elastic wheel along the deformable base at the known value of the moment realized on the wheel axis  $M_k$  to estimate the longitudinal component of the force  $P_x$  perceived by the frame of the machine through the axis of the wheel in question.

Moment  $M_k$  realized on the axis of the considered drive wheel is determined from the equation of its power balance [1,2]. According to the recommendations given in [1], when the elastic wheel is rolling along the deformable base, this equation is as follows:

$$N_k = N_T + N_s + N_{f_{\text{ш}}} + N_{f_r} + N_{\delta} + N_{\pi} \quad (18)$$

where:  $N_k = M_k \cdot \omega_k$  - Power supplied to the wheel from the drive;

$N_T = P_x \cdot V_x = (\varphi_x - f_r - f_{\delta}) \cdot P_z \cdot r_k \cdot \omega_k \cdot (1 - s_x)$  - traction power of a wheel;

$$N_s = P_x \cdot V_s = (\varphi_x - f_r - f_\delta) \cdot P_z \cdot r_k \cdot \omega_k \cdot s_x - \text{Towing loss power};$$

$N_{f_{\text{ш}}} = f_{\text{ш}} \cdot R_z \cdot r_k \cdot \omega_k$  – Rolling loss power of the elastic tire (due to losses on normal and circumferential deformation of the tire);

$$N_{f_r} = \hat{f}_r \cdot P_z \cdot V_x - \text{Power of losses for soil deformation by the wheel};$$

$N_\delta = f_\delta \cdot P_z \cdot V_x$  – The capacity of losses from soil heating before the wheel (bulldozer action) is estimated based on the recommendations of the work [1];

$N_{\text{п}} = f_{\text{п}} \cdot P_z \cdot r_k \cdot \omega_k$  – Loss power caused by soil stickiness is estimated on the basis of work recommendations [1].

After algebraic transformations taking into account the above formulas and recommendations given in [2], we will obtain:

$$M_k = P_z \cdot r_{k0} \cdot \left[ \varphi_x + f_0 \cdot \left( 1 - \frac{R'_z}{P_z} \right) - (f_r + f_\delta) \cdot s_x + f_{\text{п}} \right]_{(19)}$$

Analysis of formula (19) shows that it uses only the parameters involved in obtaining dependencies (2) - (17), which means that formula (19) closes the system of equations characterizing the operation of the elastic wheel when it interacts with the deformable bearing surface. That is, the given system of equations (2) - (19) is a mathematical description of the processes characterizing this work.

Based on the proposed mathematical description, a corresponding calculation methodology was developed in the form of a software module written in Turbo Pascal for Windows

Fig.2 shows graphs of the dependence of parameters characterizing mutual action of the elastic wheel of  $\Phi\text{Д-12М}$  grade (dimension 28,1R26) with two versions of horizontal deformable bases (with conditional names: "loam" and "sand") obtained as a result of calculation according to the proposed mathematical model and comparative graph of experiment results given in [6].

Parameters of the elastic wheel of  $\Phi\text{Д-12М}$  grade (dimension 28,1R26) are taken from operation [7], and characteristics of support surfaces are selected from data given in operation [1]. Operating conditions were set by the following parameters: tire air pressure -  $p_w = 160$  kPa, vertical component of wheel axle load -  $P_z = 42$  kN, wheel rotation angular speed -  $\gamma_k = 2.24$  rad/s, as well as a range of change of longitudinal sliding value in the wheel contact spot with bearing surface -  $s_x = 0 \dots 0.5$ .

**Figure 2.** Dependence of  $P_x$  on  $M_K$

A comparative analysis of theoretical results with experimental data showed (for “loam”) that the average deviation is 9.19%, the maximum deviation is 9.96% and the standard deviation of the values from the average 2.76%.

Thus, an analysis of the results of theoretical studies showed that the proposed mathematical model adequately describes the process of rolling wheel propulsion on a deformable surface (using the “loam” example, the maximum deviation is 9.96%) and it can be used when rolling wheel propulsion on the sand.

## LINGUODIDACTIC BACKGROUNDS OF CREATING VIDEO LESSONS

**Muminova Oftobkhon\***

\* Assistant,  
Department of Teaching Languages,  
Fergana Polytechnic Institute, UZBEKISTAN

### ABSTRACT

*The article deals with some aspect of using video in teaching English as a foreign language. The main attention of the article is focused on the benefits and goals of using authentic video materials for language learning and teaching, as well as the advantages of using videos at the English language lessons. At each stage of practice, there's a variety of tasks, ensuring the successful perception of foreign speech by students that increase their motivation to learn a foreign language. Video material stimulates interest, is a role model, expands students' knowledge of the linguistic and cultural features of the language being studied, and also provides effective material for the subsequent discussion. Using video in teaching a foreign language opens up ample opportunities for the teacher and students in mastering the language and foreign culture. Video resources have an advantage over audio and printed information. Visual information allows you to better understand and consolidate factual information and language features of speech, as visual support contributes to a complete and accurate understanding of the meaning, activating attention and memory and contributing to the development and skills of listening and speaking. The main point in the issue is that for certain teaching purposes technology is an irreplaceable means and for others (like authenticating the input, listening to native speech) is the most appropriate from logistical and practical points of view. Besides, multimedia technology that involves interaction (so-called non-linear multimedia) is a strong source of learner motivation to perform the teacher's assignment. These objective features, together with the fact that classroom digital technology is based on multimedia, which, itself, is centred on video, lead to the teachers' using videos more and more intensively and often encounter the aforementioned problems. The current intense of the video usage makes it necessary to give all efforts to try alleviating the potential problems caused by it.*

## I. INTRODUCTION

A video is a powerful tool in today's classroom. It provides a strong context through which to teach English. Meaning brings the outside world into the classroom and gives teaching "reality". Video also provides all the paralinguistic features of language that only audio can't. The success of teaching a foreign language through video depends on preparing students for the perception of a video. Analysis of the current system of organizing language learning shows that learning standards, curriculums and textbooks do not fully meet the current requirements, particularly in the use of advanced information and media technologies. Education is mainly conducted in traditional methods. Further development of a continuum of foreign languages learning at all levels of education; improving skills of teachers and provision of modern teaching materials are required. Modern English-as-a-Foreign-Language (EFL) teaching methodology is strongly based on a variety of tools. Moreover, the scope of these tools is becoming exceedingly rich. Today, speaking about this issue, we do not mean only the tools of mind and primitive displaying devices like chalk - or whiteboard or objects like textbooks and handouts. Modern teaching methodology gradually turns essential such tools like computers, data projectors, audio and video players, and displays, i.e. electronic multimedia devices. However, often, even having a rich set of such devices available, teachers are unable to use them effectively. This happens for two main reasons: incompetence in handling the equipment, and lack of awareness of the teaching techniques that would allow employing the usage of multimedia. The theoretical value of the research lies in synthesizing the already done researches in the field of video technologies applied to teach languages and enriching the scope of selection criteria and didactic activities that it will recollect in its course. The practical importance of the research is mainly in assisting specialists in EFL teaching who have not gained enough experience in teaching the language using video materials. Thus, the work will provide the patterns of the lessons taught with the usage of video and the criteria for video material selection will be of high practical applicability.

## II. METHODOLOGY

In the article, we have used the methods of pedagogical-sociological methods (observation, analysis, accumulating the information and facts, summarizing the ELT experience); statistical methods (for calculation the qualitative and quantitative indications of the results of the experimental work). The materials for the research were a series of researcher-designed lesson plans developed based on findings made in the secondary study, several videos displayed while teaching the experimental group of subjects with the help of a computer, and two formats of researcher-developed tests that functioned as a pre- and post-test to compare the progress of experimental group with that of the control group. The videos selected for the reasons provided in the paper were several episodes of Big Bang Theory sitcom, which were utilized in the teaching process continuously throughout the primary research. Methodological foundation for the article is comprised of the state documents on the higher education and several works on applied EFL teaching methodology.

### **Linguodidactic basis of using video in the English language classrooms.**

Video is a valuable and possibly underused classroom tool. There is always the temptation to simply put a video on at the end of term and let our students watch a film without even challenging them to be actively involved. [5]. Video as a listening tool can enhance the listening experience for our students. We very rarely hear a disembodied voice in real life but as teachers, we constantly ask our students to work with recorded conversations of people they never see. This is often necessary in the limited confines of the language institutions and sometimes justifiable, for example, when we give students telephone practice. However, we can add a whole new dimension to aural practise in the classroom by using video. The setting, action, emotions, gestures, etc, that our students can observe in a video clip, provide an important visual stimulus for language production and practice. So, there are various views provided about the effective usage of video materials in the classroom by different linguists which the further part of the paper deals with. This is helped reveal a number of important aspects of the use of electronic media; particularly, authentic video material; in modern EFL teaching classroom. Having started with an analytical exploration of the features of such a classroom, it led the researcher to the points about the present-day need of interactive, or —outward, usage of language; and about the need to take account of not only competence (i.e., the mastery of language), but performance (i.e., language used for the definite pragmatic purpose) as well. Moreover, of the two, i.e. knowing how to perform and performing itself, the latter must be prioritized as language is primarily a means of communication, but not a system, awareness of which is the top virtue. Besides, another part of the secondary study recalled the notion of learning styles and the importance of providing for a combination of the maximum of them. Examined against that capacity, video materials can provide for visual, auditory, and (if supplemented with mingling-oriented activities) kinesthetic learners' needs. That makes them a perfect tool for instruction and skill mastering. Later on, the research has examined and contrasted traditional and modern methods of teaching EFL and focused on revealing the drawbacks of traditional ones, mostly based on teaching grammar and translation; and the strength of modern communicative approaches. A rather outdated teacher-centred paradigm where the learners are to behave obediently and are under the total control of their instructor was also examined in the course of the study. Many advantages of learner-centeredness over teacher-centeredness were inferred as a result of comparative analysis. In the course of the secondary study, it has also been revealed that modern EFL teaching has made essential such novelties as CALL and MALL, which include a variety of means able to fulfil a wide range of didactic purposes and greatly intensify and speed up the learning process.

### **Principles of selecting video materials for English lessons.**

Whether using authentic or instructional videos, there are criteria to be followed in their selection. Stempleski suggests that teachers ask themselves the following questions before choosing a video or video series: [6]

**Inspiration/Motivation/Interest:** Will the video appeal to my students? Will it make them want to learn?

**Content:** Does the content match my instructional goals? Is it culturally appropriate for the learners?

**Clarity of message:** Is the instructional message clear to the students? Here the teacher is vital. Preparing the learners to understand what they are going to watch makes the difference between time wasted and time well spent.

**Pacing:** Is the rate of the language or instruction too fast for the students? Many authentic videos move at a pace difficult for a nonnative speaker to follow. Even an instructional video may be too fast-paced and dense for adults new to English.

**Graphics:** What graphics are used to explain a concept? Do they clarify it? Do they appear on-screen long enough to be understood by the learner?

**Length of sequence:** Is the sequence to be shown short enough? With second language learners, segments that are less than five minutes are often sufficient. A two-to three-minute segment can easily furnish enough material for a one-hour lesson [7].

**Independence of sequence:** Can this segment be understood without lengthy explanations of the plot, setting, and character motivation preceding and following it?

**Availability and quality of related materials:** What print materials accompany the video?

**Use of videos:** How will I use the video? In the classroom, a teacher can help students tackle video presentations that are linguistically more complex and in which the storyline and characters are more ambiguous. Videos of this type should probably be avoided when assigned for self-study.[4] The modern spread of technology allows a wide range of videos available for any EFL teachers. We decided to stop at a selection of those having strongest didactic and skill-developing potential, out of which we shall later choose one meeting most of the aforementioned criteria.

Recently, several videos for adult English language learners have been produced for broadcast on public television stations and as videotapes to purchase. They are published in multimedia packages that include teacher texts, student books, audiotapes, and, in some cases, reading texts, reproducible masters for the classroom, and assessment materials. These videos may be used in library programs, community-based programs, or workplace programs where learners meet with an instructor weekly or monthly, but most of the learning is through self-study. The following videos are marketed for use with adult English language learners in the classroom, distance learning, or self-study settings.

The review of the videos has led the researcher to realize the need of taking into consideration a criterion Stempleski ignored. This is the criterion of authenticity. If not considered when selecting videos for the classroom, it can lead to artificializing the context and habituating the learners to non-real-life situations. For that reason, the researcher has chosen ten episodes from *Bing Bang Theory* to carry out his research with the students as it meets most of the requirements for video material selection mentioned by Stempleski and besides, remains authentic and is not targeted at language learners. The selected video is an American sitcom which is centred around five characters: roommates Leonard Hofstadter and Sheldon Cooper; waitress Penny, aerospace engineer Howard Wolowitz and astrophysicist Raj Koothrappali. The intellect of the four guys is contrasted for comic effect with Penny's social skills and common sense. First of all, it can get students interested in its humorous content -- it is a comedy with different situational jokes and funny moments. Another important factor is it teaches American culture to students which enhances their socio-cultural competence. Besides, the content is also

appropriate for my learners as it is about four guys who specialize in different spheres of science and all their talks are mostly about science, that is, from the educational sphere. Pacing is also adequate for students to be able to catch up with what is going on in the video. To meet the graphical requirements, subtitles are provided at the bottom part of the screen which enables students to have full comprehension of the video. Independence of sequence is another asset that this series contains enabling students to understand different episodes regardless of previous or following ones. Another important aspect this series possesses is the length of an episode which is around twenty minutes. The researcher considers it to be perfect timing for a pair of the lesson, twenty minutes of which is used for video watching and the rest 60 for integrating the video with didactic practices in the forms of discussions, pre-, while-, and postwatching activities involving other language skills. As it is a very popular sitcom, the scripts of it can be found from the internet with minimal difficulty both for teacher and students, with the possibility of assigning home reading of the scripts as a means of simplification. The video we've examined appears to possess most of the features that make it successful for utilizing in an EFL classroom, thus the researcher has stopped on it as the one to be used in the experimental part of the current research.

### **The techniques and ways of using video in EL classrooms.**

Now as the video to be used in this research has been selected, it is important to discover the ways it can be introduced to the learners. According to the Russian Methodists, working with the video includes 1) three stages (pre-textual, while textual and post-textual tasks) [1] or 2) five stages (preparational, receptive, analytical, reproductive and productive) [2]. At the same time, MilliFazey of Kentucky Educational Television (KET) (1999) suggests that teachers think of using a video as three stages, including pre-viewing, viewing, and post-viewing activities. In the frame of our work, we support the last three-pointed stages, which can be characterized in a next way. *Before presenting the video*, the teacher must engage the learners' interest in what they will be doing and prepare them to do it successfully. The teacher tells the students or leads them to discover for themselves why they are viewing the video. Preparation may include a pre-viewing reading activity or a discussion of new vocabulary from the video. It may involve looking at still pictures from the video and predicting language and content to be covered. Finally, pre-viewing preparation means ensuring that an operating VCR and monitor is available and that the screen is large enough for all students to easily view the film. Fazey recommends using a 20-inch screen for a class of 12 to 15 learners.

*While learners view the video*, the teacher should remain in the classroom with the learners to observe their reactions and see what they do not understand, what they are intrigued by, and what bothers them. The teacher is there also to press the pause, rewind, and play buttons as needed. Sometimes it is best to leave the lights on. This facilitates the teacher's observations and enables learners to take notes and to complete worksheets prepared by the teacher. The teacher can provide students with some tasks to be dealing with while watching the video which could include filling the gaps, true-false statements or multiple choice statements. This would encourage students' active participation and watch of the video. *After the viewing*, the teacher should review and clarify complex points, encourage discussion, and explain and assign follow-up activities whether they are included in the student texts and materials that accompany the instructional videos or they are developed for authentic videos. For example, post-viewing activities can include discussing in small groups the language and cultural concepts presented in the video, work on grammar and vocabulary taken from the language and structures used in the

video, and then do a consensus-building and problem-solving activity and complete a project that takes them to the larger community. Many things can be done with the videos in the course of teaching a language. There is a wide variety of them, out of which the most noticeable points will be examined below. This will take the form of a sketchy description of the pattern that each activity type has; thus, they could be adapted for use with any particular video depending on availability. Moreover, the activities below are targeted at a variety of learner levels and are designed within the principles of the communicative approach.

Harmer (2007) suggests a variety of viewing techniques when using films and videos in EL classrooms which include: **1. Show only the picture. Commonly referred to as “silent viewing”**, this presentation techniques involves playing a video sequence with the sound turned down and having students decide what is happening and what the speakers are probably saying. The technique is appropriate for use with dramatic sequences containing visual clues about the situation or relationships among the characters. **2. Freeze framing.** This is another technique which keeps students attentive while watching a video by freezing the picture in the video and asking students what they think will happen next. This one is as good as the former one in terms of effectiveness and enrollment of critical/ creative thinking. **3. Partial viewing.** This is one of the most unusual and original techniques which could be used during the lesson according to which most of the screen is covered with a piece of paper causing difficulty for students to watch. And, the students are asked to guess what is going on in the video by calling for discussion. **4. Picture or speech.** Sometimes this technique is referred to as split viewing and It presupposes students' working in two groups half of whom watch the video and the second half faces away. The ones who face away will express their opinion about the setting of the conversation and characters while the second half will correct them and check their understanding. **5. Subtitles films.** Usually, students with lower-level have a hard time keeping up the flow of speech and understanding the video. In such cases, subtitles are provided with help students see and hear at the same time which enhance their understanding. However, most students find subtitles distracting and ask the teacher to switch it off. **6. Picture-less listening.** It is listening to the audio before watching the video. However, this is not always effective as students can get bored if a video lasts for more than ten minutes. **7. Describe the speaker.** This activity, which is good for reviewing descriptive adjectives with students works best with a sequence in which the voice of only one character is heard, such as a one-sided telephone conversation or a monologue. The teacher distributes or writes on the blackboard a list of adjectives, some that describe the character in the sequence and some don't. **8. Five W's and H.** (who, what, why, when, where and how) This activity works well with brief excerpts from news program documentaries in which a single presenter introduces a subject, such as the 1st minute of the KOKO sequence on the national Geographic documentary Gorilla. The teacher begins by writing six questions words on the board. **9. Play only the beginning.** In this technique teacher only shows the beginning of the sequence, ask the class to predict what they will see and hear later in the video story. **10. Write the dialogue.** Students are asked to pick a five minute part of a previously watched video and write the script for it which should be completely different from the original one. Students will work in pairs and different variations of scripts for the video is compared and performed in the classroom. In our opinion is the more effective result in teaching EL gives DVD as a multimedia tool. Its technical characteristics were described by M.U.Novikov[9]. By the help of DVD, we can manage the temp of the speech, that help for sanitization of the acoustic image of the lexical units, grammar constructions and to

avoid the meaning mistakes. This type of task is called relative (in French - *ralentir*, in Russian - *релативный*) in the methodical literature [9]. For example 1) Listen to the phrases/sentences in the slow tempo and choose the phrases and sentences which link with the plot of the film. 2) Listen to the phrases/sentences in the slow temp and choose the adequate translation to them. 3) Watch the fragment of the film in the slow than in normal regime. Extend the dialogue with suitable replicas. DVD can be used in many ways to cause effective learning of a foreign language. While working with video materials certain steps should be taken into consideration as pre-, while- and post- video stages application of which can bring effective usage of video. Besides, the above mentioned techniques are recent trends in using the medium in EFL classrooms. And they can be used in different stages of the lesson depending on their type. With a little practice, teachers usually find video easy to use, and the resulting motivation and language learning outcomes are usually satisfying. The researcher used most of the techniques mentioned above and followed the stages of pre-, while- and post- stages of video viewing.

**Approbation of the worked-out technology.** Subjects of the conducted research were students of English Philology with whom the researcher had Practical English classes. Students varied in age, level of English proficiency which is between elementary and intermediate and culture i.e. there were representatives of Uzbek, Russian, and Korean culture. There were involved two groups of the learners in the research. The first group was “A” which consisted of 12 students, while the second group “B” contained 8 students. The reason for having a few students in both groups was that not all students wanted to participate in the research and some of them had issues with attendance. The researcher had pre-tests with the subjects according to the results of which experimental and control groups were formed. So, the researcher out of 20 subjects picked up the 12 ones who had lowest grades and they were put into an experimental group. Rest of the subjects were put into a Control group. The reason that the researcher decided to carry out his study with lower-level students is that he wanted to observe the improvements which could be made by the students with poorer academic skills than with the ones with higher results. The experimental group attended the Video lessons conducted by the researcher. This group consisted of seven female and 5 male learners with different characteristics. The researcher met with them several times to give them pre-test, posttest and to discuss some other things necessary for the research process. The researcher should mention that pre-interview of the learners of both groups revealed that the vast majority of them had no exposure to authentic videos in the process of their previous learning. Most of the teaching materials were represented in the aforementioned teacher’s reference books. They were aimed at developing four basic language skills (reading, speaking, listening, writing), as well as critical thinking, vocabulary and culture learning abilities, using them in sequence, while conducting pre-viewing, while-viewing, and post-viewing activities. We have created different activities focused around the topic represented by the authentic video materials chosen by the investigator. Activities motivated learners to use only English in the classroom, helped students to lower the barriers between their own and target language’s culture, and accelerated learners’ interest in acquiring a language through video content. These teaching materials were expected to provide necessary data on student’s learning progress of the target language and culture. Authentic video materials were chosen according to criteria developed by the investigator. Topics of the video content varied, including American history, lifestyle, the young generation, studies etc. The video contained language and cultural-based content with various samples of English varieties, non-verbal communication, unique expressions etc, and it was used in segments, providing learners with enough time to comprehend

the content and do the tasks. The researcher chose these materials to provide learners with proper information about the target language and culture so that the outcomes of the research were satisfactory.

The researcher met with the learners and briefly explained the importance of authentic video materials in the language learning process. Students were asked to actively take part in the process of the study, which gave them the opportunity to effectively acquire the target language, i.e. English, and culture, and sensibly, as well as enjoyably, spend their time. Learners were informed that they would be able to improve their English language skills actively participating in the study process. The main thing they had to do was to watch the video segment and do some practical tasks. The researcher had video classes with subjects two times a week and the research lasted for 5 weeks from 11. 02. 2013 to 03. 15. 2013. The investigator presented the topic of the first lesson. After, students were asked to predict the plot of the upcoming video segment. The aim of the researcher was to enhance their motivation as much as possible. Finishing that task, students were asked to do some while viewing and post-viewing tasks in a form of questions, games, activities etc. Whenever a term or a phenomenon from a target culture appeared in the video segment, the researcher paused the video and asked students whether they knew it or how they understood it. In the cases when they couldn't provide the answer, the teacher gave a full explanation of that thing. In the end, as a home assignment learners were given different tasks in which they had to work together and create something based on that video. The rest of the study was conducted in the same manner, but using various other activities such as role-plays, video dictation, silent watching, split viewing, etc. detailed description which will be given in appendix section. At the end of the experiment, students took the test to compare their previous results with the last one. Also, learners had short interviews with the investigator, where they expressed their attitude towards the research process, the method used, and drawbacks where the participants gave their feedback to the study process and method used. The members of the experimental group gave extremely positive comments on the study and admitted that the use of authentic video materials helped them very much. They hoped that this method would be used further in their academic studies. The process of the data collection of the current research lasted for five weeks. Nevertheless, before the actual process started, the great amount of time was spent on preparing necessary materials and research tools.

The members of the Experimental Group took the post-test first because they were still attending the Video lessons. At first, it was difficult for the investigator to gather Group B altogether since the younger students were preparing for their midterms. However, with the great diligence of the researcher to finish the study, the control group also met together and took the post-test. Now, the investigator had all the relevant results to be compared. The pre-test was going to be compared to the post-tests, and the average scores would be contrasted between two groups.

### III. RESULTS AND DISCUSSION

After all the data relevant to the research were collected and analyzed them and put into various tables, charts and graphs. All the results were carefully taken from the pre-tests and post-test which participants took during the research process. They were analyzed from two perspectives to maximize the reliability and validity of research conclusions. The pre-test results, which helped the researcher determine the participants' reading, speaking and listening skills, are presented below in Table 1.

**TABLE 1. PRE-TEST RESULTS OF SUBJECTS**

No	Participants'	Reading	Speaking	Listening	TOTAL
1.	A.	95	90	80	88
2.	B.	90	85	80	85
3.	C.	90	90	75	85
4.	D.	85	85	75	82
5.	E.	85	80	80	82
6.	F.	80	80	80	80
7.	G.	80	80	70	77
8.	H.	80	75	70	75
9.	I.	75	75	65	71
10.	J.	70	70	65	68
11.	K.	70	67	65	67
12.	L.	70	65	60	65
13.	M.	75	60	60	65
14.	N.	70	60	65	65
15.	O.	65	65	60	63
16.	P.	70	60	60	63
17.	Q.	65	60	55	60
18.	R.	60	60	50	56
19.	S.	60	50	55	55
20.	T.	50	55	45	50

The above-shown results assisted the researcher in dividing the students into Group A, which was the experimental group, and into Group B, which was the control group. The criterion for such division was the gained scores of the participants below the 75% (Experimental Group) and above it (Control Group). The researcher also organized the chart of Frequency Distribution of both groups to summarize data of pre-test and clearly see how many subjects behaved or performed in the same way and what range of the subjects' behaviour or performance was.

**Pic 1. Experimental Group's Pre-Test Results Frequency Distribution**

As can be seen from the chart, the scores of students ranged between 52 and 69 with several of them having identical figures in some cases. The very fact of the great variety of scores shows the heterogeneity of subjects and helps the researcher come up with reliable results and see how the hypothesis of the study applies to the learners of different initial levels. The main trend of the figure above shows that the majority of identical results occurred in the middle of the range of scores, which suggests that the selection of subjects was adequate and most were of the medium initial level of language mastery.

**Pic 2. Control Group's Pre-Test Results Frequency Distribution**

The chart shows that the score range of the Control group was between 75 and 86 with fewer curves than the Experimental group. However, even in the control group, there was only one A score with others having B's. The shift of the graph's vertex towards the right along the X-axis suggests that most of the subjects in the control group were initially stronger. This makes the conditions for confirming the research hypothesis even more challenging, as the experimental group eventually has to outperform the initially strong control group for the hypothesis to be proved.

Further, the researcher divided the results of students' tests into three categories, i.e. Reading, Speaking and Listening and then put them in the diagram below in order to compare with the post-test results and to be able to have a clear picture of differences made during the study.

**Pic 3. Post-test results frequency distribution of Experimental Group.**

In this graph, there is an apparent growth of both the number of subjects and the points of score they got. This suggests that, in comparison to the state by the pre-test, the development of skills of the majority of experimental group members has relatively increased. Moreover the number of subjects whose performance got better increased as well.

**Pic 4. Control group's Post-Test Results Frequency Distribution**

The investigation done within the current chapter had its starting point at examining the criteria for selecting video materials appropriate for a particular group of EFL learners. It helped the researcher consider a wide range of features when reasoning the suitability of the series of videos he chose for the experimental part of the research. Thus, except obvious characteristics of videos like content, and clarity, the researcher realized the need to pay strong attention to the tempo of videos; independence of video episodes from one another; motivating potential of the plot, context, and characters; availability; graphics; and didactic applicability of video material. All these criteria were then applied to the analysis of a collection of videos which had a certain potential of being utilized as classroom videos in the process of EFL teaching. As a result of this procedure, the video that meets the highest number of the criteria was determined—the sitcom entitled *Big Bang Theory*. Thus, having obtained the most significant material for the primary part of the current research, the investigator proceeded with finding out the ways to introduce the video to classroom reality. The surface analysis of the issue revealed that basically, the classroom activities done about most videos fall under three categories: pre-viewing, while-viewing, and post-viewing activities. The presence of the activities of all of the three types when working with one video in the classroom can surely provide for a high degree of student comprehension, internalization, and retention of the demonstrated material. A deeper inquiry into the same issue has led the researcher to Jeremy Harmer's taxonomy of viewing activities, which the researcher has combined in different patterns when creating the lesson plans for the experimental part of the study.

#### IV. SUGGESTIONS

The secondary and primary studies done in the course of developing the current paper have helped discover a series of the advantages which video materials have in the course of being used as EFL teaching tools. However, it's not possible to make a simplistic and straightforward conclusion that one's mastery of language will increase in all possible directions once he/she is

taught with the application of videos. Moreover, to take a powerful effect, videos must be selected against a set of criteria for effective classroom application and be supplemented with several activities to create learner motivation for watching.

## V. CONCLUSION

The current paper focuses on the usage of video, the most popular and efficient means to be used in the classroom, the current research has its main aim of compensating for the second reason of poor usage of electronic media in EFL teaching. In the course of doing that, the study has tackled the issues of appropriate video material selection and analysis of the activities that can be used to effectively use videos in teaching. In the experimental part, the researcher has trialled the selected activities on a group of subjects to check if and how well they improved particular language skills. Videos can prove especially effective within the growing modern trend of the communicative approach, which aims to create a 'real-life' environment during the process of learning foreign languages. The function of videos in providing such authenticity is mainly that of modelling. Once the video hasn't been created for education-only purposes, it captures a situation of real-life interaction, allowing the learners to get immersed into it as spectators. If the model then is successfully repeated, the communicative competence of the learners' increases. The effect is boosted if the activities designed for accompanying the video are properly selected. Once the activity designer is guided by the same theoretical inferences as to the researcher, and the analogous set of activities is chosen, the lesson is likely to succeed. The reasons for it is that once common sense and experience are combined with the principles of sequencing the lesson events from guided to free, from comprehension to production, and from easy to complex, a highly relevant set of activities will be chosen, from which most of the students will benefit in terms of learning.

### ABSTRACT

*Recently, the world market for mineral fertilizers has seen a high demand for various types of complex fertilizers. Ammonium nitrate (AN) ranks first among nitrogen fertilizers, as it is the fertilizer that fully satisfies agriculture. At the same time, production of complex fertilizers based on ammonium nitrate faces a number of negative factors related to commercial, physical and chemical properties of AS and safety of its circulation. At present, producers of mineral fertilizers face the task of producing less explosive ammonium nitrate with improved physical, chemical and agrochemical properties and fertilizers based on them.*

**KEYWORDS:** *Ammonium Nitrate (AN), Stabilizing Additives, Solubility, Activation, Aqueous Solution, Dusting, Grinding Tonin.*

## INTRODUCTION

Ammonium nitrate (AN) ranks first among nitrogen fertilizers in terms of efficiency, so it is the kind of fertilizer without which agriculture is almost impossible. Belonging to the family of nitrogen fertilizers, versatility of application, the possibility of industrial production volumes - these are the "advantages" that keep the AN unshakeable position in the fertilizer market. At the same time, the problems connected with the necessity of improvement of commodity, physical and chemical properties of AN and safety of its circulation are well known. However, modern technological developments make it possible to take this nuance into account and optimize it at the production stage. The introduction of unreasonably strict restrictions on the production and handling of ammonium nitrate, on the one hand, puts the relevant enterprises on the verge of closure and leads to a significant reduction in the use of a true agrochemical valuable fertilizer. On the other hand, the risks of uncontrolled situations at any stage of production, storage and transportation of ammonium nitrate cannot be ignored.

Manufacturers of many countries have been tasked to make the transition to production of less explosive ammonium nitrate with improved physical and agrochemical properties and fertilizers based on it as soon as possible. The technology of improvement of physical-chemical and commodity properties of AC is directed, first of all, on the influence of polymorphic transformations on kinetics and increase of durability of granules of a product, decrease in its traceability. The tendency of fertilizer to absorb atmospheric moisture (hygroscopic) affects the conditions of production, quality of the product during storage, transportation and application in the soil. At considerable hygroscopic AN is observed, its flow ability worsens, granules lose their hardness. The main drawback of an AC is its traceability - the tendency of its particles to turn into a monolithic mass under certain conditions. The traceability of the loudspeaker results in high losses and additional labour costs for the grinding of the product before application. As it has been shown, it is caused by the low mechanical strength of granules, high hygroscopic salt, polymorphic transformations and technological shortcomings. Phosphorus-containing additives have proven to be the best choice for overcoming the main shortcomings of loudspeakers - traceability and explosion hazard. Proceeding from the aforesaid, carrying out systematic researches on development of the most rational technology of reception of new kinds of the stabilized complex fertilizers based on ammonium nitrate is very actual.

## MATERIALS AND METHODS

Objects and methods of research: For the physical and chemical justification of the technology of obtaining new types of stabilized nitrogen-phosphorus fertilizers, as well as for the purpose of assessing the possibilities of transportation using existing equipment in the plants, the kinetics of solubility and interaction of stabilizing additives in the production of complex fertilizers have been studied on the basis of granulated ammonium nitrate and stabilizing additives - amorphous, simple superphosphate obtained by decomposition of Kyzylkum phosphate raw material at incomplete norm (60% of stoichiometry) of concentrated (92.5% of H<sub>2</sub>SO<sub>4</sub>) sulfuric acid. For dusting the surface of ammonium nitrate granules with stabilizing additives, the granulated ammophos in the ball mill was ground to various grinding. The process of dusting the surface of ammonium nitrate granules with additives was carried out on a plate granulator in the presence

of a binding solution. The resulting complex fertilizers were tested after drying. Ammonium sulfate and ammonium nitrate were used as the binding solution. Results and discussions: To study the solubility rate of complex fertilizers, a certain mass of the sample was dissolved in 100 ml of water. Table 1 shows the results of a study to determine the solubility of samples of complex fertilizers obtained by dusting the surface of ammonium nitrate granules in the presence of an ammonium sulfate solution, depending on the grinding tone of the additives.

The results show that as the weight of the complex fertilizer increases, the dissolution rate increases. For example, the speed of dissolution of 10 g of the complex fertilizer received by dusting a surface of granules of ammonium nitrate by ammophosny dust less than 0.3 mm in size in 100 ml of water is 38 sec. With an increase in mass from 20 to 50 g the speed of dissolution increases from 58 to 129 seconds. The dissolution rate of 10 g of the compound fertilizer obtained from ammonium nitrate granules and 0.3-0.5 mm ammophos dust in 100 ml of water was 36 seconds. And at 20 and 50 g - 56 and 124 seconds respectively.

The dissolution rate of the sample obtained from ammophos dust with size 0.5-1.0 mm at a studied range of mass varies from 34 to 121 seconds.

The study showed that the tonin of ammophos grinding practically does not affect the dissolution rate of the complex fertilizer (Table No. 1).

**TABLE 1. SOLUBILITY RATE OF GRANULATED COMPLEX FERTILIZERS TREATED WITH AMMONIUM SULFATE SOLUTION DEPENDING ON GRINDING TONE OF STABILIZING ADDITIVES**

№	Granulated compound fertilizer samples	Solubility rate of SU, sec, gramme per 100 ml of water				
		10	20	30	40	50
1	Ammonium nitrate + ammophos dust > 0.3 mm	38	58	97	110	129
2	Ammonium nitrate + ammophos dust 0.3-0.5 mm	36	56	94	108	124
3	Ammonium nitrate + ammophos dust 0.5-1 mm	34	54	90	104	121
4	Ammoniumnitrate + powderedsuperphosphate	32	43	85	96	116

Table 2 shows the results of studying the dissolution rate of complex fertilizers obtained by powdering granules of ammonium nitrate with stabilizing additives in the presence of a solution of ammonium nitrate.

The measurement results show that samples of complex fertilizers dissolve slightly faster in comparison with samples treated with ammonium sulphate. In addition, the overall dependence of the dissolution rate on the grinding fineness and the norm is maintained.

**TABLE 2. SOLUBILITY RATE OF GRANULAR COMPLEX FERTILIZERS TREATED WITH A SOLUTION OF AMMONIUM NITRATE, DEPENDING ON THE TONE OF THE GRINDING OF STABILIZING ADDITIVES**

№	Granulated compound fertilizer samples	The solubility rate of SU, g / s, per 100 ml of water				
		10	20	30	40	50
1	Ammonium nitrate + ammophos dust > 0.3 mm	34	52	82	100	109
2	Ammonium nitrate + ammophos dust 0.3-0.5 mm	32	50	80	98	105
3	Ammonium nitrate + ammophos dust 0.5-1 mm	30	48	78	96	101
4	Ammoniumnitrate + powderedsuperphosphate	31	40	72	89	106

Thus, it has been established that at powdering the surface of granules of ammonium nitrate the size of powder of stabilizing additives practically does not influence the speed of dissolution of complex fertilizer.

X-ray phase analysis was used to study the interaction of ammonium nitrate with stabilizing additives.

Figures 1, 2 and 3 show X-rays of pure ammonium nitrate, ammophos and compound fertilizer based on them. Comparison of interplane distances of samples (Table 3) shows that the complex fertilizer obtained by powdering the surface of granules of ammonium nitrate with ammophos dust mainly consists of a mixture of ammonium nitrate and ammophos.

1,43	2,33			1,72	3,33
1,36	17,44			1,71	3,33
1,35	4,65			1,63	3,70
1,33	3,49			1,61	5,56
1,31	3,49			1,55	3,70
				1,49	1,85
				1,47	4,44
				1,44	5,56
				1,35	4,44
				1,27	44,44

Thus, it was found that when dusting the surface of granules of ammonium nitrate with ammophos dust and powdery superphosphate, the interaction of ammonium nitrate with the components of the additive practically does not occur, i.e. complex fertilizer consists mainly of a mixture.

The process of interaction (activation) of the components of a complex fertilizer usually proceeds when it is dissolved. To study this process, the pH of the medium and the chemical composition of aqueous solutions of complex fertilizer samples were determined depending on the concentration. Table 4 shows the results of a chemical analysis of the main components of solutions based on ammonium nitrate and ammophos at a ratio of 80:20.

When 10 g of granular compound fertilizer is dissolved in 100 ml of water, the solution contains 2.71% of the total nitrogen, of which 46.49% is in the ammonium form, and 53.51% in the nitrate form, 0.83% of the total phosphorus, of which 96, 38% indigestible and 83.13% in water-soluble forms. With increasing concentration of the solution, the content of the water-soluble form of phosphorus increases. For example, when dissolving 20 g of a complex fertilizer, the water-soluble form is 83.55%, and when dissolving 50 g, it is 84.49%.

**TABLE 4. THE CHEMICAL COMPOSITION OF THE AQUEOUS SOLUTION, DEPENDING ON THE NORM OF COMPLEX FERTILIZER (CF) BASED ON AMMONIUM NITRATE AND AMMOPHOS (AS: A = 80: 20)**

Weight CF/100 ml H <sub>2</sub> O	Nitrogen content, %			contents P <sub>2</sub> O <sub>5</sub> , %			Ass. Total. /	Water/General
	gene.	ammon.	nitrat	gene.	усв.	водн.		
10	2,71	1,26	1,45	0,83	0,81	0,69	96,38	83,13
20	4,98	2,30	2,68	1,52	1,48	1,27	97,37	83,55
30	6,88	3,18	3,70	2,09	2,06	1,75	98,56	83,73
40	8,53	3,94	4,59	2,59	2,56	2,18	98,84	84,17
50	9,95	4,60	5,35	3,03	3,00	2,56	99,01	84,49

When dissolving a complex fertilizer obtained on the basis of ammonium nitrate and simple superphosphate, the undecomposed portion of phosphorite is activated. With an increase in the concentration of the solution from 10 to 50%, the content of the assimilable form and water-soluble form increases, respectively, from 96.55 to 98.61% and from 83.33 to 84.72% (table 5).

**TABLE 5. THE CHEMICAL COMPOSITION OF THE AQUEOUS SOLUTION, DEPENDING ON THE NORM OF COMPLEX FERTILIZER (CF) BASED ON AMMONIUM NITRATE AND SUPERPHOSPHATE (AC: C = 80: 20)**

Weight CF/100 ml H <sub>2</sub> O	Nitrogen content, %			contents P <sub>2</sub> O <sub>5</sub> , %			Ass. Total. /	Water/General
	gene.	ammon.	nitrat	gene.	усв.	водн.		
10	2,76	1,38	1,38	0,30	0,28	0,25	96,55	83,33
20	5,52	2,76	2,76	0,57	0,55	0,48	96,49	84,21
30	8,28	4,14	4,14	0,86	0,84	0,72	97,67	83,72
40	11,04	5,42	5,42	1,15	1,13	0,97	98,26	84,35
50	13,80	6,90	6,90	1,44	1,42	1,21	98,61	84,72

We have also determined the pH of the medium of solutions obtained during the dissolution of complex fertilizers. Table 6 shows the results of pH determination of solutions medium depending on the concentration of initial components and complex fertilizers, as well as on the type of stabilizing additives.

### **ABSTRACT**

*In the present era of massive usage of computers, an enormous set of data is being generated from different organizations each day, each hour and each second. This data would be of prodigious use to a diverse set of people based on their needs. Predictive analysis is a process of analyzing data and identifying the different patterns in it, so as to predict the occurrence of these patterns in future. The predicted output can help plan a new strategy and adopt innovative solutions for the decision making. This paper attempts to analyze the various predictive models which are applied in the healthcare domain. These models which are analyzed in depth will be proposed to be available on the cloud environment in future and can be accessed by those concerned for potential analysis.*

**KEYWORDS:** *Predictive Modeling, Predictive Algorithms, Predictive Analytics In A Cloud Environment, Supervised Learning.*

## INTRODUCTION

Healthcare domain has been one of the most interesting areas for researchers to experiment with predictive analytical techniques. With the advent of cloud computing infrastructure, the data which is generated at different health care units can be made available on a distributed environment.

The inherently large size of data generated by several healthcare organizations is throwing numerous open challenges for researchers. They are forced to think of newer and better techniques for managing and organizing the humongous data which is generated every second.

Research findings in the area of predictive analytics over cloud environment would provide great insights to healthcare firms to overcome the problems associated with traditional database architecture. Presently many healthcare firms use the traditional database systems to store and maintain the doctor's and patient's data. But as and when the data collected increases over time due to growing population and their health issues, the space required to store this data is more and adds up the cost of hardware and maintenance. It needs substantial amount of time for the data analyst to split the existing data. However literature states that about 80% of the available data is a suitable data and can be used to future analysis. 20% of the data would not be suitable for analysis as it may contain unfitting or junk data, which further requires to be studied for its relevance. With the aid of predictive analytical techniques classification of this data can be done in lesser time. Predictive analytical solutions would provide decisive information which would help healthcare organizations to take right decisions at the right time.

## RELATED WORK

A number of research literature is available in the healthcare domain and the usage of predictive models for the same. Many such models like regression models, classification models and few other aspects are presented in this paper.

### A. *Predictive Data Analytics*

Predictive data analytics is defined as the collection of machine learning methods/techniques as well as the statistical methods applied on the datasets to predict the future [1]. Machine Learning techniques help in a better way to gain all the useful information from the given data so that corrective actions can be taken to improve revenue, quality, and customer satisfaction [2] in general.

### B. *Predictive Data Analytics in Healthcare*

Data Analytics is finding its extensive application in healthcare industry. It attempts to provide proof based medication which aids in the appropriate diagnosis of the diseases and their associated treatment. In healthcare domain, predictors are used to anticipate the effectiveness of the treatment.

The medical industry has evolved with a tremendous amount of data which are saved in the form of papers to a much more digital one. As the world is getting digitized, papers are getting replaced by e-copies, e-forms etc. Some of the advantages of applying analytics to this data in the healthcare industry can be listed as below:

- It would be easy to detect diseases based on specific patterns and these diseases can be given treatment early to ensure its effectiveness.

- The advancement or developments of many of these diseases can be predicted and can be addressed with analytical techniques.
- It helps in achieving patient churn and be able to provide leaner, much faster treatments to the patients.
- By adopting the predictive models in determining the diseases, there will be less room for human errors during treatment of patients.
- By analyzing the patterns of diseases, the doctors and hospitals will be able to provide better health observation and better responses to the treatments.
- It also helps in giving proof based medicines.
- The data collected with respect to the diseases; the necessary treatment information; planning of the future treatment-will all be available on a distributed cloud environment. By this the geographic barriers can be totally avoided. This would ease the work of the both hospital administration and patients to a great extent.

Paper [3] describes how predictive analytics can help the researchers to gain novel and deep insights to clinical and organizational decision making. The paper focusses on different learning algorithms such as classification, clustering and association and lists out major benefits and limitations of each algorithm.

The authors discuss the algorithms such as Naïve Bayes, Artificial Neural Network, Decision Tree, Support vector machine, Ensemble and AdaBoost under Classification. Apriori algorithm under Association. The authors also mention about guidelines followed while performing the execution of the above algorithms.

The author concludes that the decision tree performs well among classification algorithms because of its ability to visually represent the classification decisions made.

Thanh Nguyen, Abbas Khosravi, Douglas Creighton and Saeid Nahavandi proposed an algorithm called fuzzy-standard-additive-model (SAM) with the integration of Genetic-algorithm (GA) to address uncertainty and computational challenges faced by high-dimensional medical data collected. The hybrid integration technique GSAM is implemented against Probabilistic neural network, Adaptive vector quantization (AVQ), Fuzzy ARTMAP. Their implementation results show the dominance of the GSAM method over other models in terms of accuracy, F-measure and AUC (area under characteristic curve) [4].

The authors in the paper [5], discuss the methods of machine learning for analyzing tumor features in breast screening. The data is extracted from dynamic\_contrast\_enhanced magnetic\_resonance\_imaging (DCE-MRI). They demonstrated the algorithms such as k-means, self\_organizing\_maps (SOM) in order to analyze the signal structures. K-nearest neighbor (k-nn), support vector machines, decision trees are used for classification. Their result showed that self-organizing-maps performed well followed by k-nn and decision trees with respect to smoothness energy function for projection quality and classification accuracy in sensitivity and specificity.

Shipeng Yu, Faisal Farooq, Alexander van Esbroeck, Glenn Fung, Vikram Anand and Balaji Krishnapuram [6], in their experiment applied a novel framework on different hospital data to evaluate the patient readmission risk. They considered the classification models support vector machines and cox regression along with LACE model (industry standard method which is

followed by hospitals). LACE model is described as: L-length of stay, A-acuity of admission, C-comorbidity in index score, E-number of visits to emergency during last 6 months. In the work, the framework designed is more effective and flexible compared to LACE model with respect to hospital readmission risk prediction [6].

The objective of the paper [7] is to predict heart related complications based on the existing patient history. The authors discuss the machine learning techniques namely support vector machines, AdaBoost, logistic regression, k-likelihood ratio test and Naïve Bayes. They evaluate their models with respect to prediction accuracy and AdaBoost performed to be the best among all techniques under prediction accuracy followed by support vector machines.

The authors Guilia Toti, Ricardo Vilalta, Peggy Lindner, Barry Lefer, Charles Macias, Daniel Price [8] in their work demonstrates the association rule based technique Apriori algorithm in R environment to analyze the correlation between asthma in infants and exposure to pollutant mixtures. The authors collect the data related to asthma infected infants and associated them with six pollutant levels recorded earlier. The result showed that Apriori algorithm described 27 rules that reduced the false detection rate (FDR). FDR is proved to be less than 13%. The result also showed that the support of the rules varies from 0.54% to 5.82%.

In the paper [9], the authors Dursun Delen, Glenn Walker, Amit Kadam experimented with the algorithms artificial neural networks, decision trees along with logistic regression to develop the predictive model on the breast cancer dataset. The authors also adopted 10 fold cross-validation techniques to compare the performance. The metrics considered for the performance measures are accuracy, sensitivity and specificity.

The results in their experiments show that the decision tree performed with highest accuracy of 93.6% followed by artificial neural networks with an accuracy of 91.2% and logistic regression with the least accuracy among three 89.2%.

Luis Claudio de Oliveira Silva, Allan Kardec Barros, Marcus Vinicius Lopes [10] in their paper discuss the experiments conducted to detect abrasions in dense breasts and for the analysis the authors take two public databases with two groups of regions of interest(dense breasts and non-dense breasts). Independent component analysis and principal component analysis techniques are used as part of experiments.

The paper concludes that independent component analysis performed better with an accuracy of 92.71% in dense breasts and 79.17% in non-dense breasts when compared to principal component analysis in detecting abrasions in the dense breasts.

### *C. Predictive Data Analytics in Cloud environment*

With the. Advent of cloud and mobile expertise, data has advanced immensely in terms of quality and volume to fulfill a diversity of user requirements. Handling and processing such huge data proficiently and effectually is a chief task to the industry. The probability of pay-per-use with on-demand operations by cloud service providers is gaining fame in readiness computing model.

A considerable amount of work has been done in the field of cloud computing in few years.

Haluk Demirkan, Dursun Delen [11], in their paper discusses about a conceptual-framework for decision support system and also the fundamental foundation elements for service-orientation in

cloud environment. The authors provide major requirements for a decision support system to implement and information about the unique model called Analytics as a service. The paper does not discuss the impact of the service-orientation on the working of decision support system in cloud.

In the paper [12], the authors Karsten Molka and James Byrne discuss the predictive cost models for cloud ecosystem. Private cloud, cloud federation multi\_cloud, cloud-brokerage and cloud-bursting are considered for the cost analysis. The authors work on the parameters like real-time analysis of the service, virtual and physical information of the resource from cloud infrastructure in order to carry out the economic and predictive models evaluation which can anticipate upcoming service economic trends and the effect on total cost of ownership at the infrastructure provider side.

The authors Bo Jin, Yong Wang, Zhenyan Liu and Jingfeng Xue [13] in their study propose a trust model based on the combination of the cloud model and Bayesian network. They evaluate the trust model using naïve-Bayesian network where conditional probability tables are drawn for the values. An algorithm is designed for the context free trust evaluation.

With the help of the algorithm and experimental results, the authors suggest that anyone can use the Bayesian network to build the trust model and it helps in selecting the service provider.

In the paper [14], the authors Deval Bhamare, Tara Salman, Mohammed Samaka, Aiman Erbad and Raj Jain makes an analysis on the feasibility of the supervised learning for the security of the cloud ecosystem. Authors use the datasets UNSW and ISOT on which the performance of the machine learning models is evaluated. The algorithms include regression, decision trees, naïve Bayes and support vector machines. The authors stress on the fact that the machine learning models which are tested with particular dataset have to be tested with other datasets also to check the robustness. The authors determine in their experiment that logistic regression performed best with an accuracy of 89.26% followed by J48 of decision trees with an accuracy of 88.67%.

The authors Weider D. Yu , Manjula Kollipara , Roopa Penmetsa and Sumalatha Elliadka [15] in their experimental study, propose a model of the distributed-storage-solution for hybrid cloud designed to store and retrieve the voluminous digital data in an effective way for a cloud based healthcare application. The authors mainly focus on blending the approaches of RDBMS and NOSQL instead of using the solitary approach. The proposed system consists of a huge number of all the combination of structured, unstructured and semi\_structured data. In this process, private cloud is used to collect critical data related to patients' as well as the data related to the public is stored in public-cloud.

The author analyzed and observed the time taken in loading and retrieving the data from Amazon storage and Network Attached Storage (NAS). The author concludes that Amazon is faster because of its powerful virtual instances and NAS was equally competitive due to its ease of operation, storage capacity and security.

The authors Kiran Rao and Sandeep Kumar [16] in their paper explores and discusses about the application of machine learning methodologies on resource-monitoring, resource-provisioning and management of cloud ecosystem. The machine learning approaches such as linear regression and reinforcement learning are used for virtual machine mapping and resource provisioning respectively to develop a framework for self-resource monitoring in cloud environment.

## METHODOLOGY

The methodology or the procedure to be followed is as follows:

### Step1: \_\_\_\_\_

Define the dataset: The dataset is created which satisfies the objectives of the project. This dataset describes all the necessary information related to the specific domain. Convert the dataset into digital format using Microsoft excel.

### Step2:

Data preprocessing: After the collection of the dataset, apply preprocessing techniques (ex: feature selection, correlation –if applicable) and make the data ready for algorithm implementation.

### Step3:

Test the model: Apply the supervised learning models on the preprocessed data.

### Step4:

Evaluation of the output: Learning models are compared according to the performance metrics such as accuracy, error rate, ROC.

### Step5: \_\_\_\_\_

Store and Retrieve from cloud: All the predictive models / datasets developed are stored in the cloud ecosystem. These details can be accessed from the cloud as per the user's needs.

The main advantage of supervised learning methodology with cloud access is to get cloud based ready solution for the user according to their individual requirement. The user can access the predictive models on “on-demand” basis. It helps the user or the organizations to take rapid decision by reducing the excess man-hours thus saving time, energy and increases the productivity.

Cloud access leverages the usage of facilities which the cloud service providers offer.

## CONCLUSION AND FUTURE SCOPE

This paper mainly contemplates on the different machine learning methodologies available for use in the field of healthcare. Supervised learning algorithms can perform tasks based on the predefined set of rules provided by the user. The review on the available literature indicates that the results obtained by applying these predictive techniques on the healthcare data sets will provide insights on the basic attributes and parameters of the same. These predictive models will further play a very important role in recommending the most suitable machine learning technique for the given dataset.

Here an attempt is made to give an exhaustive analysis of the application of machine learning algorithms to several datasets pertaining to healthcare domain. Finally we have summarized the advantages and feasibility of deploying the predictive models and the data sets on the cloud environment. This indicates a futuristic use of the same to analyst and end-users.

### ABSTRACT

*The essence of this article is to include the modern information, information technology, education systems in the process of globalization, which affects the minds of the students during their academic activities. In addition to the problems associated with identifying and eliminating the negative effects of information technology on the students personality, they are shown how to explore the optimal conditions for using these technologies in the learning process.*

**KEYWORDS:** Globalization, Information, Internet, Hacking, Virtual World, Computer Technology, Internet Technology, Phone Mobile, Telecommunication, Information Technology, Information Resources, The Media, Stupidity, Avoid Violence, Information Culture, Radio, A Television.

---

## INTRODUCTION

There are various situations in which modern information technology has an effect on the students' mentality. This is primarily due to the students' direct contact with information technology in their learning activities. It is important to remember that today, computer games and attractions based on virtual world technologies, even when not connected to the computer, people interact with computers in situations that they do not know, using cell phones, animated films, credit cards, and plastic cards. In addition, the teachers themselves interact with information technology to make their impact wider.

When using modern information technology in the learning process, teachers should pay special attention to the following.

First, the innovations that may be taking place in the field of information technology are being transferred to traditional communication environments. Conducted pedagogical and psychological research shows that there is an increasing demand for clarity, consistency and reflexivity of issues. This is where the role of spiritual communication diminishes.

Second, feedback increases. The peculiarities of traditional activities are computerization. There is also a 'humanization' of software and hardware for the educational process, including for young children. Users fill in their activities with elements that are not available but are needed for some action. These situations create a complex and controversial structure of various activities related to information technology (including educational activities).

The impact of modern information technology on students has grown, ranging from a limited range of psychological effects to complete personality change (internet connection, computer software, hacking syndrome). To date, the question of complete transformation of personality has not been fully researched by scientists. Therefore, it is necessary to actively involve teachers and psychologists in the development and implementation of modern information technology for educational process. They are also concerned with identifying and addressing the negative effects of information technology on students' personalities, apart from issues that explore the optimal conditions for using these technologies in the learning process.

As an example, consider the use of Internet technologies in education. Internet technologies can bring about positive changes in the upbringing of individuals based on qualitative changes in communicative and cognitive activities, as well as changes in learning methods. Because of the use of the Internet, students become more active, the learning process is individualized, authoritarian relationships between the teacher and the student are reduced, and the opportunity to work with different sources of information (which may be contradictory or mutually exclusive). This will improve the personality of the students. They create incentives for independent thinking, initiative and mobility. However, adverse effects may also occur.

Intensive intellectual and creative development cannot ensure that students adapt to existing social environments. They can be connected to a variety of computer resources, including boarding schools. This may lead to a person's future separation. There may be dramatic changes in children's mentality, such as replacing their friends with the heroes of the virtual world, declining in psychosocial reactions, and narrowing their interests. In addition, it is important for scientists to identify which of the psychological components obtained by modern information technology can be transferred to a 'computer-free' environment and the mechanisms for

influencing education informatization. This, in turn, is one of the most pressing issues for teachers.

Educators who use information technology in the learning process emphasize that learning activities can be transformed by such qualities as accuracy, efficiency, and predictability. It should not be underestimated the impact of training and other computer software on how to develop students' minds. Teaching students how to properly explain the situation, and how to choose the best solutions for problem solving becomes a major challenge for educators.

Psychologists say that the use of computers in the learning process is rebuilding some of the psychic components that were there but were forgotten for some reason. Email, chats, and teleconferences require written communication skills (which have been forgotten by virtue of the development of telephone communications in developed countries). This requires getting to know the Internet, working with business and personal correspondence, and exploring specific characters that express their moods.

The Internet raises interethnic communication to a new level, enhances intercultural knowledge, and facilitates the intensive study of foreign languages during the correspondence process.

The application of information technology to various areas of activity is based on the preparation of conditions for the development of a person from excessive and labor-intensive work and its development. Modern information technology is slowly leading to some loss of skills and competencies. For example, one cannot deny the importance of spreadsheets today. They help people get rid of a lot of unnecessary work. However, the use of calculators, even in the early grades, can cause them to lose verbal, fast computing skills. This results in students failing to act properly on the concept of numbers.

In the conditions of unprecedented speed of information sharing, Western centers have been trying to spread the "charm" of Western life among other nations and nations, including the effects of "popular culture" as "breezes of freedom." The famous American political scientist A.F. Remember Zbigniew Brzezinski, a consistent successor of Dalles' work: "In the cultural process, America has a special appeal among young people around the world. This will ensure that AKD has political influence over any country in the world. In particular, American television programs and films occupy three-fourths of the global market. His popular music, American reading, eating habits and so on are all imitated around the world. "

Obviously, these and similar concepts promote the "democratic" freedoms of the West and limit the dissemination of other ideas as much as possible. It is important to note that their essence remains unchanged today, and it uses widespread false ideas of "absolute freedom", "boundless freedom", "free morality" to distract our young people and their world outlook.

Samples of "mass culture", various information technologies, radio and television, social networks of the Internet are used in this way.

The First President Karimov said: "If we look at history, previously strong powers openly conquered and powered weak countries, by the end of the twentieth century, this policy had taken on a new form. Today, powerful nations and certain political centers strive to achieve their goals, first of all, to depend on the minds of the people who want to influence them. "

The negative impact of the rapid development of the media on the upbringing of young people in the context of globalization is reflected in the following:

First, as a result of the rapid development of the media, the penetration of the Internet, mobile phones, telecommunications and various news publications. The "values" offered by these means often distract young people from our national values, in other words, lead to the formation of unique "rootless" individuals and their historical roots.

Second, the growing popularity of various forms of "popular culture" among young people. These are mainly manifested in dress, behavior, leisure, taste, and attitude towards national values. The "mass culture", which represents the alien culture, brings to our young people such Western personalism, egocentrism, nihilism, indecency, neglect and violence, neglect of national values and social interests.

Third, there are cases of imitation among young people, blind adherence to Western ideals. At the same time, it is easy to see that the morals and customs common in foreign countries are absorbed in the minds of young people through film, fashion and various advertising. As a result, young people tend to spend time in front of computer games rather than reading books, watching movies of various genres that are shallow.

Unfortunately, in many cases the principle of gradual separation of young people from their national identity, undermining national traditions and customs, and preserving their historical memory, is being strengthened.

We live in an age of information, ideological conflict, and, as President Islam Karimov once said, "the influence of ideological forces of various meanings that serve the interests of certain states and political forces" is constantly being felt. One of the most important tasks is to create an immune system to protect them from attacks and ideological influences. To do this, young people must be free, independent thinkers, faith-based, intelligent, strong-willed, educated and wise, and to put in their hearts and minds the invaluable scientific and spiritual legacy of their land, their great ancestors.

In this regard, we do not neglect all the achievements of the progressive humanity, the universal values and principles of democracy that contribute to the development of our nation. On the contrary, we recognize that national traditions and customs, which have been preserved over centuries, must be harmonized with universal values. In other words, the principles of democracy should serve not only for the renunciation of national values, but for their further development and prosperity.

For this reason, it is important for young people to understand the content of a large volume of information in the form of intense events and events, to interpret it correctly and to draw conclusions. In this case, to meet the information needs of young people:

- To further develop the national information space and to enrich it with information resources, to develop the skills of searching, processing, storing and using information. meeting their needs through methodological assistance in the selection of materials from existing sources; Special attention should be paid to hiring.

It is important to increase the relevance of issues related to the development of a person's worldview, capacity, and experience, such as the selection, selection, and proper culture of

information from a person, to the youth's preference for a deeper knowledge, greater understanding and greater use of information. One of the issues

The idea of globalization is one of the most pressing issues at the moment, but at the same time it is not uniformly interpreted. He has his own supporters and opponents. Despite the apparent and mysterious opposition to this process, it is advancing and should therefore be dealt with separately.

Globalization has come from the words "globe" ("globe" in English), "global" ("global"), and "globalization". It is worth noting that globalization, by most experts, means economic integration. In this view, globalization occurs within economic relations. However, globalization is a concept that is directly related to every aspect of life, including the human spirit. For this reason, some encyclopedia dictionaries describe 'global' problems as having a broader scope, scope, and understanding of the problems affecting the entire world.

When we think of the term "globalization," we must first say that this concept was mentioned in the American scholar T. Levitt's article in the 1983 issue of the Harvard Business Review. Of course, the concept was used to reflect economic relations, including the process of merging the diverse product markets produced by large transnational corporations. But today we see that globalization is manifested in all spheres of social life, and in the end it has become a powerful tool of ideological influence.

In this regard, the first President Islam Karimov commented on the phenomenon of globalization: "From a general point of view, this process creates a completely new economic, socio-political, natural and biological environment, including the current national and regional problems. is becoming a worldwide problem ". He said.

On the basis of these statements of the former head of our state, it is necessary to state the situation arising from the processes of globalization. The main ones are:

- The escalation of economic, political, legal, scientific, technical, socio-cultural, ethno demographic and environmental problems in the global scale.
- If the powers of the states were determined before the first industrial revolution, depending on the size of the population and the territory, between the first and second industrial revolutions depending on the types of energy and the amount of state-owned power, the state's power, now, is, above all, with information technology and information resources. and depending on their use. Information and communication technologies are considered not only as the basis of socio-economic, political and cultural development, but also as a means to solve internal and external problems due to rapid changes in the field.

Although the process of informatization of society itself is often regarded as a purely technological process, in essence it is also a deep social process. This is because informatization refers to the transition from one form of society to a higher level of social development and defines future features of society. In today's world, unprecedented scientific discoveries, tremendous technical capabilities, universal technologies, and the globalization of information dissemination are rapidly growing. For example, opportunities for information exchange through the Internet and, consequently, ideological influences, are increasing. In fact, globalization of information is a process that creates great opportunities for society, for people to interact with people all over the world, for the acquisition of scientific and cultural values. But we must not

forget that there are negative aspects of information globalization. Ideas emerging in any region or country are rapidly spreading around the world. As a result, human beings are constantly experiencing the pressure of various ideological centers, spreading from distant and distant sources, which serve the interests of certain states and political forces. In such a situation, a person who lacks his own convictions, firm convictions, strong wills and worldviews will not be able to cope with the ideological pressures that are manifestly open and secret. Today, ideological attacks from outside the country have not ceased.

It is important to note that the majority of the global audience of young people are young, with information aimed at poisoning their minds and worldview with alien ideas. So, young people who are pursuing a career in the profession and aspiring to pursue a career in the future have come to the forefront in hopes of getting positive information, so that young people unwittingly engage in various social networks, forums and dating sites. Today, the Internet offers a great opportunity for young people who speak different languages.

Particularly, the increasing number of mobile Internet users has a great potential for open access to various content. In contrast, adolescents are more interested in and interested in. As a result, the global network, which is now emerging in the world of information revolution, is a major concern for society. They create a society of aborigines that these societies do not call themselves "cyber international NET", "children of the Internet", "citizens of the Internet".

They are joining the youth through the Internet and appearing in the political arena as an international cybercrime that opposes the government's official messages.

We urge young people who are coming to life to be alert: "We fully support the aspirations of our people to make greater use of the Internet. Again, we would like to say that we do not like to build a wall in the information world, to wrap ourselves in the shell and limit ourselves. At the same time, considering what is happening around us today, in nearby regions, we are also aware of the disastrous consequences that unnatural forces trying to distract young people who have not yet formed their minds and lives can use to access the Internet for their own benefit. cannot be missed."

While the Internet is a great achievement of mankind and a great opportunity in our lives today, it is no secret that this miracle is a powerful ideological tool and creates serious problems. The information-cultural and information-ideological expansion of the global telecommunications networks and media is of concern in many countries around the world. The prospect of dependence and loss of independence worries leaders, public institutions and citizens. Many countries already have to take special measures to protect their culture, traditions and spiritual values from the influence of foreign information.

Examples include international conventions on cybercrime, the introduction of secure Internet and online resources for minors, the recommendations of the European Parliament Assembly, the United Nations Convention on the Rights of the Child, the Code of Conduct in the UK and the Secure Network. »Controls the flow of harmful, illegal information. It should be noted that the laws "On the Protection of Youth" in Germany, in Lithuania "On Protection of Minors from the Negative Impact of the Media" and in Russia "On Protection of Children from Information Damaging the Health and Development" were adopted.

If you look at Germany from the international experience, today there are laws regulating the security of cyber security in the country with the provisions of the Law "On the Protection of Youth", "On Television and Television and Television".

It is clear from the foregoing that a number of laws and regulations have been adopted in the Western countries to prevent access to information that could negatively affect the minds of young people from the Internet. Although they have different names and functions, their purpose is the same.

It is worth noting that in a number of countries, a number of legal and organizational measures have been taken to protect young people from information that could harm them. In particular, on July 11, 2012, the State Duma of the Russian Federation adopted a law "On the protection of children from the data that could endanger their mind, health and development." It provides a mechanism for establishing a system for monitoring, filtering and blocking Internet resources containing potentially dangerous information for children. In addition, the law "On Amendments to the Federal Law" was adopted, and a new article was added to the article "Common Registered Names and Universal Indicators of Internet Sites, which are banned in the Russian Federation."

Lithuania's Law on Protection of Adolescents from Negative Information is aimed at preventing the dissemination of information among young people, which has a negative impact on their psychological and physical development. On: Processes that promote aggression, violence, erotic fears, call for gambling, promote drug, psychotropic, taboo, alcohol, suicide, ideally kill information about human dignity associated with criminal activity information or personnel that performs paranormal acts of individual or community abuse based on gender, origin, illness, social status, language, religion, or adolescents' violence instantaneous, promotes sex, belittles family abuses, reflects offensive behavior, instructions and advice on the use and preparation of explosives, including narcotic drugs, psychotropic substances, and information on mass hypnosis sessions that promote harmful symptoms in hygiene and nutrition.

In the current conditions of the Republic's independence and its progress towards social development, a thorough study of the information security system of the population and, first of all, enriching it with new principles, approaches, and new approaches to the existing problems in this system are of utmost importance.

It should be noted that systematic organizational and legal measures are being carried out in our country as well. In particular, in accordance with the Decree of the President of the Republic of Uzbekistan "On establishing a public educational information network of the Republic of Uzbekistan" of September 28, 2005, various information resources created by various departments of Uzbekistan in information transfer networks are integrated into a single national educational network "ZiyoNET". The creation of this network was an important factor in countering information attacks.

The main tasks of the network are: formation and development of national information resources for young people, wide access to information promoting youth spiritual and intellectual development, promotion of healthy lifestyles and popularization of physical education and sports, distance learning for students and youth. assistance in the integration of access methods and other information and communication services into the education system.

Today, universities and their regional branches, all educational establishments are connected to the national educational network «ZiyoNET» and high-speed Internet.

At the same time, creating a user-friendly information space for further information security of minors, further improving the educational information portal "ZiyoNET", enhancing its organizational and technical and interactive capabilities, integrated Internet resources, popular social services and developing games. Appropriate measures are being taken to develop applications and integrate them into the curricula of educational institutions.

Critical approach to information gained from the Internet and broadening its worldview based on its useful sources, the formation of the perception of defamatory information, the formation of an ideological immunity is an important aspect for each young person to gain certain skills and knowledge, the ability to understand religious and secular knowledge in the world. should not be indifferent to the ongoing political and economic processes.

Today, the use of information technology in many ways is aimed at fighting the human heart and mind. This process can be said to consist of three main stages:

At the first stage - certain information is received by a person.

At the second stage, information is stored as information in the human mind and serves as a source for decision-making on another issue.

At the third stage, information as a thought or idea captures the human heart, becomes an integral part of its spiritual and spiritual state and becomes the basis of its action.

If you look at the global informatization process around the world, we can see that the use of the Internet as a global network is growing at a rapid pace.

Recently the game that has gained popularity in various segments of the social network and has caused a lot of controversy has included fifty days in groups of underage teens for fifty days in groups of underage teenagers. The end of the game, which is required to be completed, ends with the player's suicide. According to the rules of the game, the participant's terms and conditions will be entered and accepted at 4-20 in the morning. First you need to start drawing a blue whale on white paper, and then drawing those underneath.

Information security is the protection of underage adolescents from the destructive ideas that separate them from their beliefs, sacred ideals, and beliefs. Thus, the spiritual impact on the values associated with the need for information security, first and foremost, of the individual and society, the person and the state, the individual and its inviolability, national and national values, including traditions, traditions, historical and cultural heritage, generations. Indicating the existence of destructive ideas.

Adolescents' inability to act on information security and take effective action against them will inevitably lead to genocide of nations and nations that have historically existed by destroying national values. Unfortunately, malicious targets attract young children and teenagers through various social networking sites. As a result, children become "puppets" in this game and even commit suicide. Preventing these situations is a growing concern in children's safety. However, the need for information networks is growing day by day.

In particular, the global use of the internet was 140,000 in 2003, 400 million in 2010, 952.51 million in 2014, 1280.78 million in 2016, and 29.57% of the world's population in 2019. 12 billion. A presentation by the Mapshchur Kleiner Perkins CaufieldByers website entitled "2019 Internet Trends" states that the number of Internet users worldwide is 2.9 billion.

It should be noted that from the very first days of independence, the head of our state identified as a priority policy of our state to educate young people in deep understanding of the world.

Among the issues of upbringing high potential youth is the formation of information culture in them. Since the formation of an information culture is directly linked to the development of society, it is a socially important issue in the country. Therefore, in the formation of an informed society it is important to study all aspects of the informatization process.

Currently, one of the most important resources of the nation and the state is the human potential and educational level of the people. Social development shows that, as previously imagined, it is in the forefront of history that countries that have achieved a higher standard of living or advanced technology, but those that have achieved a higher level of education and training. In the future, the priority will be to develop the ability of young people not only to learn and use new technologies, but also to ensure their greater involvement in the creation and improvement of such technologies. This, in turn, puts the task of young people in acquiring a deeper knowledge, greater absorption of information and more efficient use of it.

In this sense, as our First President IA Karimov pointed out, "We live in a very difficult time in which we are all surrounded by, say, the world of turmoil, confrontation and sharp conflict. Given the turbulent situation in the country, the whole life demands that we remain vigilant, attentive and vigilant.

In the context of globalization, we can see from the example of a number of countries in the world that acceleration of information processes poses a problem of inadequate human readiness to receive, process, absorb, and effectively use information and resources.

Therefore, the formation of the skills of effective use of information resources and information among citizens and, first of all, in the youth has become one of the most pressing issues of the present.

It is worth noting that in Uzbekistan no serious economic, social or technical problem can be solved without the development of modern knowledge, intellectual potential and advanced technologies, and a culture of effective use of information resources and modern means of communication.

Given that more than 62% of the country's population is now under 30 years of age, the Internet and its forms - internet television, internet radio, e-mail, online video, social networking and information technology - can help young people. The importance of purposeful and reasonable use in raising the level of education is evident.

In our country, a number of exemplary works are being carried out to establish a national information system and to meet the information needs of the population. In particular, it should be noted that Internet users are contacting the national segment of the national domain - UZ domain, registered on April 29, 1995, to find out more about what is happening in Uzbekistan.

Taking into account the fact that today the number of sites registered in the national domain system is more than 17 thousand, first of all, they have done a lot of work in our country.

It is known that all the necessary conditions for obtaining objective and accurate information in the air. So, on the portal 01am.uz >> our country and the world are receiving it news, news, email, search engine, block access, job or weather information. More than a thousand users visit this site every day. Uznet is also developing its social networks. Of course, it is difficult to compete with world-famous companies in this regard. However, Uznet's social networks have their own specifics. Launched in 2012, Muloqot.uz has an interface in the Uzbek language, which indicates that 15,700 accounts have been registered. This means that the national segment of the Internet is promising.

In the national segment of the Internet, websites such as Hi-Tech, Culture, Science, Chord Sport, Business, Public Administration, and the introduction of new services are also contributing to this. At the same time, the number of Internet users in Uzbekistan exceeds 10 million.

## CONCLUSION

In summary, we acknowledge that as a young person enters a society, not only is he possessed a perfect profession, but also the right use of the media. Everybody should be aware that it is the sacred duty and responsibility of the parents and all caregivers to control the observance of the law while ensuring that the information they receive is in accordance with human rights and the laws of society.

### ABSTRACT

*Producing food by using mineral fertilizers is dangerous for human health. Therefore, field experiment was carried out on producing ecologically clean food by decreasing the norm of mineral fertilizers, using crop rotation, organic and green manure crop fertilizers. In this, ecologically clean food was produced by using 25% mineral fertilizer and additionally 30 t/ha or 40 t/ha organic fertilizer.*

**KEYWORDS:** *Agriculture, Biologizing, Organic, Mineral, Green Manure Crop Fertilizers, Saline Soil, Tomato, Yield.*

### INTRODUCTION

Most of crop production in our region rely on chemical intensification agriculture. Intensive application of chemicals and mineral fertilizers has led to biological degradation of soil fertility, decrease diversity of soil microorganisms, and accelerate the soil pollution processes. Soil nitrates transforms from soil to the crop, then accumulates in fruits that people consume.

Meanwhile Amu Daryamineralization as the main water source for irrigation fluctuate 1.5 g/L or even more. These factors are not able to ensure the quality of the crop products and led harmful consequences to human health. More rational fertilizer use practices will be critical in the future to inducing higher crop yields.

In our experiment during 2009-2011, we aimed to ensure crop production with application of minimum amount (up to 25%) of mineral fertilizers and non-fertilizer conditions.

Confirmed:

- possibilities agriculture biologization through crop rotation, organic agriculture with greenside rite application practices;
- the impact of agriculture biologization to the soilsphytosanitary condition;
- the effect of crop rotation and organic agriculture practices to the soil fertility;
- The effect of agricultural biologization on crop yields and product quality.

The "ecologically clean product" term has been used widely among the developed countries globally, where agricultural farms produce ecologically clean products through applying agriculture biologizationpractices. Thus, agriculture biologizationis the one of the key issues for agriculture scientists.

Therefore, we have to shift from conventional agriculture to organic practices in agriculture to ensure healthy population and preserving the environment.

### 1. Experiments layout

Treat №	Annual amount of mineral and organic fertilizer			total amount of NPK, %	amount of organic fertilizers to compensate NPK
	N	P	K		
1	-	-	-	-	-
2	40	31	20	25	30
3	75	65	38	50	20
4	115	95	60	75	10
5	150	125	75	100	-
6	Organic fertilizers 40 t/ha			-	-

As it can be seen in Table 1, the experiment consist six replications. In the first treatment(control) fertilize has not been used, at the sixth treatment organic fertilizers has been applied, while treatments 2, 3, 4, 5 has annual amount of mineral fertilizers with variables of 25% , 50%, 75% and 100%. Less used mineral fertilizers (25%, 50%, 75%) were compensated with organic fertilizers.

Applied amount of the mineral and organic fertilizers before planting, flowering and during flowering – fruiting period given on the Table 2.

### 2. The amount and duration of both organic (t / ha) and mineral (kg / ha) fertilizers

Treat №	The amount and duration of both organic (t / ha) and mineral (kg / ha) fertilizers									
	Before planting				Before flowering			Flowering –fruiting		
	Organic fertilizers	N	P	K	N	P	K	N	P	K
1	-	-	-	-	-	-	-	-	-	-
2	30	-	20	-	20	11	10	20	-	10
3	20	-	45	-	40	20	20	35	-	20
4	10	-	65	-	60	30	30	35	-	30
5	-	-	85	-	75	40	40	75	-	35
6	40	-	-	-	-	-	-	-	-	-

Tomato plant has been used during experiment and plant growth, yield were different due to the amount of organic and mineral fertilizers.

At the control treatment yield of tomato plant were 395 kg/ha, while treatment with only organic fertilizers was 881 kg/ha.

Treatment with 25% of annual amount of mineral fertilizer (N 40, P 31, K 20 kg/ha) with supplemented organic fertilizers 30 t/ha per hectare has the highest yield (1309 kg/ha).

The treatments with the mineral content 50%, 75% and 100% has the lowest yield 22; 217 and 279 kg/ha. In addition, the yield quality at these treatments were lower to compare with treatments 2 and 6.

Thus, the highest yield of tomato plant were recorded at the treatment with mineral fertilizers (25%) with added organic fertilizers (30 t/ha) and obtained best fruits quality without containing any nitrites or chemical elements and other substances that are harmful to the human health.

Along with increasing organic fertilizers amount we were able to improve the soil agrochemical and agro physical properties.

Application of organic fertilizer with amount of 30-40 t/ha (treatments #2 and #6), the amount of water soluble salts in the soil were lower compared to other treatments at the end of the growing season (Table 4). This creates favorable conditions for obtaining the healthy plant growth and development. Also at this treatments the highest level of soil humus were observed (Table 5).

As we know, the soil with rich content of organic matter and less presence of both mineral from chemicals fertilizers has better the agro physical, agrochemical and microbiological properties. Therefore, its creates favorable environment for microorganism growth and reproduction, those are naturally considered as the assets of the organic matter in the soil. All these factors considered as a necessary condition for the crop/plant development. At the treatment where organic fertilizers applied with 30-40 t/ha, number of soil microorganisms 2-3 times higher comparing to the treatments only with mineral fertilizers (Table 6).

We believe that promotion of agriculture biologization practice is promising technique to meet the population demand for high quality food products in the future.

### 3. Tomato growth and yields in relation to both organic and mineral nutrients

Treat ment №	Average in 3 years				Tomato seed			Aver age	Difference ±		
	1.VII		1.VIII						Non fertil izer	From 25% NPK	Fro m orga nic fertil izer
	Planth eight, cm	Numero ffruits	Planth eight, cm	Numero ffruits	20 09 yea r	20 10 yea r	20 11 yea r				
1	32,8	12,0	68,8	8,0	54, 0	34, 0	30, 4	39,5	00	-91,4	-48,6
2	77,4	24,5	84,5	19,9	12 8,2	13 4,5	13 0,0	130, 9	91,4	00	42,8
3	79,3	22,0	85,5	20,1	12	13	12	128,	89,2	-2,2	40,6

					8,2	0,5	7,5	7			
4	84,7	20,5	84,2	16,9	10 6,1	10 9,5	11 2,0	109, 2	69,7	-21,7	21,1
5	77,7	17,2	80,8	15,3	96, 3	10 4,8	10 8,0	103, 0	63,5	-27,9	14,9
6	76,3	14,1	78,6	14,6	89, 6	84, 6	90, 1	88,1	48,6	-42,8	00

#### 4. Amount of soluble salts in water, %, 0-30 cm

№ vap	Before experiment		In beginning of the vegetation		In the middle of the vegetation		In the end of the vegetation		Accumulation of salts Spring-Autumn period	
	CL	Σ	CL	Σ	CL	Σ	CL	Σ	CL	Σ
1	0,035	0,593	0,037	0,363	0,040	0,660	0,043	0,713	0,060	0,077
2	0,036	0,610	0,036	0,626	0,037	0,650	0,037	0,653	0,001	0,027
3	0,035	0,640	0,035	0,643	0,040	0,653	0,039	0,663	0,004	0,020
4	0,037	0,633	0,037	0,643	0,041	0,660	0,042	0,720	0,005	0,077
5	0,038	0,656	0,037	0,660	0,042	0,686	0,048	0,770	0,011	0,110
6	0,034	0,613	0,036	0,623	0,038	0,626	0,036	0,596	0,0	-0,027

#### 5. Soil humus amount %, 0-30 cm

Treat №	beginning of vegetation	middle of the vegetation	end of the vegetation
1	0,639	0,636	0,590
2	0,736	0,733	0,746
3	0,760	0,733	0,717
4	0,658	0,673	0,650
5	0,670	0,673	0,653
6	0,740	0,753	0,806

#### 6. Soil micro flora depending on the fertilizers type and amount (million / g in the soil)

Treat №	Number of microorganisms			
	Before experiment	beginning of vegetation	middle of the vegetation	end of the vegetation
1	13,5	14,0	12,7	11,8
2	16,5	42,0	41,7	35,5
3	17,0	33,0	29,1	31,0
4	15,5	29,0	29,0	25,2
5	16,0	21,2	20,7	20,0
6	18,5	42,2	38,3	37,0

In the case of soil salinity, it is necessary to improve the reclamation of arable lands for obtain high yields of agricultural crops. It is difficult to get high yields of agricultural crops in any agro-technical condition with presence of the harmful salts in the soil that need to be washed away at the field condition.

Thus, it was found that even in the case of soil salinity, possibilities to produce ecologically clean products by application of both organic and green siderate fertilizers practices.

### ABSTRACT

*This article provides recommendations and examples of how to use modern capabilities of programming languages in technical specialization, as well as to solve these problems on the example of the C ++ programming language. In addition, the C ++ programming language describes the array, its types, capabilities, array problems, and several programming solutions.*

**KEYWORDS:** C ++, Low-Level Programming Language, High-Level Programming Language, Operators, Arrays, Multidimensional Arrays, Static Arrays, Dynamic Arrays, Character Arrays, Word Arrays, Functions, Alloc, Malloc, Size Of, Null, New .

### INTRODUCTION

Accelerating the updating of modern educational content in the field of programming, the formation of teaching methods, programming tools and methodologies is facing challenges. The development of electronic devices, the systems that support them, and the increasing complexity of software and programming languages pose new challenges to the education system. Constant improvement of computer programs forces the user to change the existing approaches to their development.

Modern computers were initially able to perform the simplest arithmetic and logic operations. In order for a machine to solve a complex problem, it must have a program in its memory. As you know, a program is a specific sequence of machine codes that controls the operation of a specific computing tool. Hundreds of programming languages have been created to make the software creation process easier.

**The goal.** In addition to specialization programs, specialization programs in technical universities can be completed using the capabilities of programming languages. This requires a good knowledge of programming language skills. Teaching students to specialize in technical programming by using modern programming languages and using the capabilities of programming languages. In this way, students learn the basics of both specialization and programming languages. Nowadays, programming languages are the basis of the management of any electronic devices<sup>1</sup>.

**Scientific novelty of the article.** Operators used in a program based on algorithms must meet the requirements of structured programming. It has no input / output, no dynamic memory allocation, no parallel computing. These tools are implemented through the external functions of the program. The following is an example of a C ++ programming language that analyzes the structure, types, and several examples of programming languages.

C ++ programming serves to increase the performance of computers and operating system capabilities. That's why it's designed for professional programmers. The C ++ programming language is related to the Unix operating system, and many of the programs used in this system were originally written in C ++. The C ++ programming language allows you to take full advantage of all the features of a computer. In C ++, programs represent actions that result in data being retrieved. In the program, actions are given by operators. Data is made by identifying and describing objects. It is necessary to describe the objects used in the program. The description links the object and some of its characteristics. These characteristics include type, designation, memory class, range of motion, and initial values.

The main types in the programming language are integers and floating point numbers. It also creates full versions of data from pointers, arrays, and operands. An expression consists of operands and pointers. Each expression can be an instruction, including a call to a value transfer function. Indicators determine the arithmetic of a machine with an unrelated address. In C ++, the instructor ({}), conditional branching (if), selecting a long-standing alternative (switch), upward repetition (for, while), downward repetition (do), as well as repetition There are control structures such as break. The disadvantage of this language is the inconvenience of the syntax of these language structures.

In C ++, arrays can be used to perform some complex types of tasks, and a number of conveniences are created when performing these tasks. An array is an ordered set of finite values of the same category. Examples of arrays are vectors and matrices from a math course. Arrays are generally divided into one-dimensional, multidimensional, dynamic, and static types. An array is said to be one-dimensional if its element can be referenced by an index. The index of array elements in C ++ programming languages always starts from zero.

Multidimensional static arrays. There are no restrictions on the type of array element in C ++, but these types must be of a finite size. Because the compiler must be able to calculate how much free space (bytes) the array takes up in memory. In particular, the component of an array can be

an array, resulting in a two-dimensional array called a matrix. If the elements of the matrix are also vectors, the result is a three-dimensional array. This way you can create arrays of any size, depending on the task at hand. In a two-dimensional array, the first index indicates the number of rows, and the second the number of columns<sup>2</sup>.

Results and practical applications. Declaring two-dimensional static arrays is as follows: type array\_name [array\_strings\_number] [array\_columns\_number];

When declaring two-dimensional static arrays, the difference from one-dimensional is that the array name is followed by two values in parentheses ([]). The first of these represents the number of rows, and the second the number of columns. That is, a two-dimensional array element is referenced by two indices. Two-dimensional arrays are reminiscent of matrices known from the mathematics course. Example of declaring a two-dimensional array:

```
int a[3][3], b[2][4];
```

A matrix B matrix

```
a00 a01 a02 b00 b01 b02 b03
```

```

```

```
a20 a21 a22
```

A matrix has 3 rows and 3 columns. The matrix B has 2 rows and 4 columns. In two-dimensional arrays, index 1 represents the row, and index 2 represents the column. The first element of the first line a10 - a is read as one zero element. a is not called ten. An array (mxn) with m rows and n columns is called a dimensional array. If m = n (the number of rows and columns are equal), the square is called an array. The following are some examples of initializing multidimensional arrays:

```
int a[2][2]={ 1,5,7,2};
```

```
int b[2][3]={ {0,2,3}, {4,5,6} };
```

For example. A program that outputs the matrix to the sum of rows and arrays.

```
#include<iostream>
```

```
using namespace std;
```

```
int main()
```

```
{
```

```
long n,m,a[100][100],w[100],s[100];
```

```
cout<<"enter the size of the matrix columns =";cin>>n;
```

```
cout<<"enter the size of the matrix rows =";cin>>m;
```

```
for (int i=1;i<=n;i++)
```

```
{ for (int j=1;j<=m;j++)
```

```
{ cin>>a[i][j];} }
```

```

for (int j=1;j<=m;j++) s[j]=0;
for (int j=1;j<=m;j++)
{ for (int i=1;i<=n;i++)
{
s[j]+=a[i][j];
}
}
for (int j=1;j<=m;j++) {
a[n+1][j]=s[j];
}
for (int i=1;i<=n;i++) w[i]=0;
for (int i=1;i<=n;i++)
{
for (int j=1;j<=m;j++)
{
w[i]+=a[i][j];
}
}
for (int i=1;i<=n;i++)
{
a[i][m+1]=w[i];
}
for (int i=1;i<=n;i++)
{
for (int j=1;j<=m;j++)
{
cout<<a[i][j]<<" ";
} cout<<a[i][m+1];
cout<<endl;}
for (int j=1;j<m;j++) cout<<a[n+1][j]<<" ";
cout<<a[n+1][m];
return 0;}

```

```

enter the size of the matrix columns =3

**The result:**

You can send an array as a function parameter and get an array as a function result. When passing a matrix to a function, you must also send the number of rows and columns of the matrix by its name. There are several ways to use an array in a function, some of which we will look at. Transfer the matrix to the function:

```
#include <iostream>
#include<math.h>
using namespace std;
void matrix_print(int a[10][10], int m, int n){
//output the matrix in tabular form
for (int i = 0; i < m; i++){
for (int j = 0; j < n; j++){
cout << a[i][j] << "t";}
cout << "n";}}
int row_max(int a[], int n){
//determine the largest element of the array
int max = a[0];
for (int i = 1; i < n; i++)
if (max < a[i]) max = a[i];
return max;}
int main(){
int m, n, a[10][10];
cout << "Enter the number of rows \nm="; cin >> m;
cout << "Enter the number of columns \nn="; cin >> n;
cout <<"Enter the number of array elements \n";
for (int i = 0; i < m; i++)
for (int j = 0; j < n; j++)
cin >> a[i][j];
cout << "The included matrix \n";
//the number of matrices, rows, and columns is sent to the function
matrix_print(a, m, n);
for (int i = 0; i < m; i++){
// the address of the 0th element of the i-th string to the function
```

```
// and we send the number of elements
cout << i << "-the largest of the row =" <<
row_max(&a[i][0], n);
cout << endl;}
return 0;
system("pause");}
```

```
Enter the number of rows
n=3
Enter the number of columns
n=2
Enter the number of array elements
5
9
2
8
6
1
The included matrix
5      9
2      8
6      1
0- the largest of the row =9
1- the largest of the row =8
2- the largest of the row =6
```

### The result:

Dynamic arrays. The disadvantage of static arrays is that their elements need to be declared in advance. In addition, these elements are limited by the size of the memory segment allocated to the data. Second, a large enough array may be declared and the allocated memory may not be fully utilized to solve the problem. These shortcomings can be overcome by using dynamic arrays. Because they allow you to create arrays of the size you need during program execution and delete them when you don't need them. You can use the malloc (), calloc () functions, or the new operator to allocate memory to dynamic arrays. The delete operator is used to free up memory allocated to a dynamic object<sup>3</sup>.

The above functions are located in the <<alloc.h>> library. The syntax of the Malloc () function is Void \* malloc (size\_t size), which separates a continuous byte-sized area from memory. If memory allocation is successful, the malloc () function returns the start address of the allocated field. If the required memory allocation is successful, the function returns NULL. As you can see from the syntax, the function returns a value of type void. In practice, it is necessary to allocate memory for the object. This is done using a specific type of void conversion technology. For example, allocating space to an array of length 3 for an entire type can be done as follows:

```
int * pint=(int*)malloc(3*sizeof(int));
```

The calloc () function, unlike the malloc function, initializes array elements with a value of 0 in addition to allocating space for the array.

The syntax of this function is: Void \* calloc (size\_t num, size\_t size); The num parameter tells you how many elements are in the allotted area and the size of each element. The Free () memory release function has a single parameter that points to the partition to be erased. Void free (void \* block); Having the Free () function set to void allows you to delete any type of memory. The following is a program for finding the largest of the elements of an array for dynamic arrays:

```
#include <iostream>
using namespace std;
intmain()
{
int *arr;
int size;
```

```

        cout<< "n = ";
        cin>> size;
        if (size <= 0) {
            cerr<< "Invalid size" <<endl;
            return 1;
        }
        arr = new int[size];
        for (inti = 0; i< size; i++) {
            cout<< "arr[" <<i<< "] = ";
            cin>>arr[i];
        }
        int max = arr[0];
        for (inti = 1; i< size; i++) {
            if (arr[i] > max) {
                max = arr[i];
            }
        }
        cout<< "max = " << max <<endl;
        delete [] arr; // free up memory
        return 0;
    }

```

```

n = 3
arr[0] = 5
arr[1] = 6
arr[2] = 8
max = 8

```

### The result:

The C ++ programming language also uses other types of arrays, which are analyzed below with examples. Array pointers are defined as: <type> \* <name> [<number>]. For example, the definition `int * pt [9]` inserts an array of nine elements into objects of type `int`. An array of pointers is useful for describing arrays of rows. For example, a two-dimensional array is used to enter a list of surnames:

**Char fam[][20]= {" Ergashev","Shukurov","Jabborov"};**

The memory consists of 60 elements, as each last name is filled with 0's. Using an array of pointers, this array can be described as follows.

**Char \*pf[]= {" Ergashev","Shukurov","Jabborov"};**

The list here contains 23 items in memory, as each last name is marked with a 0 at the end. Arrays of pointers allow you to sort complex elements in a simple way. In the following example, the first elements of the matrix rows are displayed in ascending order. Here, an array of

auxiliary pointers is created, the array is sorted, and matrix elements are output based on the array.

## IN CONCLUSION

The purpose of the above considerations and considerations is not to learn a programming language, but to develop algorithmic thinking. Introducing a variety of ways and means of thinking that can be used to solve some problems. Another of these approaches is to get acquainted with these programming languages. To do this, it is sufficient to solve algorithmic problems using arrays and its capabilities in a programming language environment.

The convenience of programming in C ++ is that it is as versatile as any other programming language. This article will give you a good understanding of the structure of a C ++ program, the description of characters, the concept of algorithms and programs, the use of data input and output operators, as well as the ability to work with arrays, their types and rows in the program. It also provides general information about arrays, the order in which they are stored in memory, sorting, sorting, associating with functions, and a number of examples of their use in applications.

C ++ is a handy tool for creating programs that run in the Windows operating system environment, automating programming on a computer, reducing errors, and simplifying programmer work. The use of arrays in the C ++ programming language has several advantages over other programming languages. Working with arrays in C ++ makes some computational problems much easier. The speed of the program also increases several times due to their space in memory. This creates a number of conveniences for those who are familiar with the skills of programming languages in solving problems of technical specialization, and ensures a clear problem statement and high-precision solutions through appropriate algorithms.

### ABSTRACT

*In this paper, the interaction of technical and purified Carboxymethylcellulose macromolecules with solvent molecules with the same degree of exchange and polymerization is comparatively studied. The thermodynamic parameters of technical and purified Carboxymethylcellulose samples were evaluated by sorption of solvent vapors. As a result of the removal of additional salts from the technical Carboxymethylcellulose, it was found that the specific surface area of the cleaned product is slightly reduced, leading to a sharp increase in the volume and radius of the pores.*

**KEYWORDS:** *Technical, Purified Carboxymethylcellulose, Thermodynamics, Capillary-Porous Structure, Sorption, Gibbs Energy, BET Equation, Zimm-Landberg, Der Bur-Zwicker.*

## INTRODUCTION

In recent years, there has been a sharp escalation of interest in the study of natural macromolecular compounds due to the expansion of the practical use of biodegradable and environmentally friendly polymers. Carboxymethylcellulose (CMC) plays an important role in its water solubility, biodegradability, suitability for the organism [1,2].

Carboxymethylcellulose is one of the most common simple ethers of cellulose compounds and are widely used in various industries today [3,4]. With the expansion of the use of Carboxymethylcellulose, the demand for it is growing [5]. Worldwide, the production of technical Carboxymethylcellulose is 580-590 thousand tons per year, which are widely utilized mainly in the oil and gas, construction, mining, metallurgy, textile, paper industries [6].

Refined Carboxymethylcellulose brands are widely used in food, pharmaceutical, medical, perfumery and cosmetics and other fields [7,8].

The process of synthesis of cellulose-based Carboxymethylcellulose consists of two stages [9]:

- ✚ **In step 1**, the process of mercerization of cellulose with an alkaline solution is carried out;
- ✚ **In step 2**, the alkaline cellulose is formed by the carboxymethylation reaction in the presence of an alkylating agent - monochloroacetic acid or its sodium salt.

During this reaction, chloride and glycolate salts are formed as supplement products [10,11].

Now days, the content of additives - organic and inorganic salts - in the composition of samples produced on an industrial scale is 40-50%, which sharply reduces the quality of the product [12].

We obtained purified samples on the basis of technical Carboxymethylcellulose obtained on an industrial scale and compared the thermodynamic parameters of these samples.

On the basis of physicochemical and thermodynamic studies, thermodynamic analysis of the water state in cellulose was performed. It was found that the effect of Gibbs energy, enthalpy and entropy mixing on the cellulose-water system on clustering and thermodynamic parameters is a light function of polar functional groups, more specifically a function of molecular packaging, submicroscopic capillary-porosity and crystal structure.

The study of the process of interaction of a polar sorbent with a polar sorbent is based on the adsorption theory of De Boer and Zwicker in a water-soluble acetylcellulose fiber-water system. [13] The water absorption of the polymer is calculated based on Zimm-Landberg's theory [14].

Thermodynamic proximity  $\Delta\mu_i$  between polymers, changes in the chemical potential of the components, Gibbs energy of mixing  $\Delta G$ , Flory - Huggins interaction parameters  $\chi_i$  were determined. The thermodynamic parameters of technical and purified Carboxymethylcellulose samples were evaluated by sorption of solvent vapors.

Research in this area is of practical importance in the study of the biodegradability of Carboxymethylcellulose samples in the body, the ability of drug substances to bind in the macromolecule, the solvent-polymer and polymer-polymer effects.

## RESEARCH METHODOLOGY

The object of research was a sample of technical Carboxymethylcellulose produced by "Promxim Impeks" LLC.

**TABLE 1 QUALITY INDICATORS OF TECHNICAL AND CLEANED CARBOXYMETHYLCELLULOSE SAMPLES**

Indicators Name	Technical Carboxymethylcellulose	Clean Carboxymethylcellulose
Water solubility, %	98,5	98,9
Amount of base substance, %	63,0	99,4
Humidity, %	9,8	9,3
Exchange rate	0,86	0,86
PH of 1.5% solution	8,7	8,1
Degree of polymerization	810	800

In determining the thermodynamic parameters of Carboxymethylcellulose samples were studied on the basis of its sorption properties. At the same time, the change in the mass of the sample was detected on high -vacuum MAK -BEN scales, quartz springs with a sensitivity of 3.69 mg/mm. In the experiments, the sorption cells were kept at  $25^{\circ}\text{C} \pm 1$ .

Measurements were performed using a catheter KM-8 with a residual pressure of  $10^{-3} - 10^{-4}$  Pa. Sorption experiments were performed at the required high vacuum, changes in quartz springs were recorded, and the catheter pressure readings at and above were determined using the following equation:

$$g_c = g_{B/I} - \left( \frac{r\Delta h_0}{1000} \right) \quad (1)$$

Here:

$g_c$ -is the polymer mass after sorption

$g_{vl}$ -is the polymer mass before sorption

$r$ -is the sensitivity of the spring mm/mg

$\Delta h_0$ -is the difference between catheter readings before and after sorption

To determine the amount of sorbate, ie water vapor sorbed into the polymer, a constant is determined during the measurement of each sample:

$$K=r/g \text{ } 1000 \quad (2)$$

$K$ -is the percentage of vapor that is sorbed to lengthen the spring by 1 mm.

The sorption percentage for each pressure is found by the following equation:

$$\%C = K\Delta h \quad (3)$$

Here:

$\Delta h$ - is the difference between the reading on the catheter at high vacuum and the reading of  $P_i / P_i^0$  at equilibrium of the sorbate used.

$P_i$ -is the vapor pressure of the sorbent in the sorption measurement

$P_i^0$ -is the saturated vapor pressure of sorbate.

To measure the vapor pressure of a solvent in a polymer solution, a graph is drawn based on the following relationship:

$$X/M=f(P_i/P_i^0) \quad (4)$$

The chemical potential of the solvent is calculated on the basis of the following relationship:

$$\Delta\mu_1 = RT/M_1 \ln(P_i/P_i^0) \quad (5)$$

$\Delta\mu_2$  is needed to determine the average critical mixing energy. Of course, the chemical potential of the polymer at the same temperature is  $\Delta\mu_2$  and the chemical potential of the polymer at the same temperature is  $\Delta\mu_1^0$ .

To determine the value of  $\Delta\mu_2$  it is sufficient to know the value of  $\Delta\mu_1^0$  of the other component in the solution (of course for two-component systems).

$$\Delta\mu_2 = \int_a^\infty \omega_1 / \omega_2 (\partial\Delta\mu_1) \quad (6)$$

$\Delta g^m$  we find the value of as follows:

$$\Delta g^m = \Delta\mu_1\omega_1 + \Delta\mu_2\omega_2 \quad (7)$$

The value of  $\Delta g^m$  is determined at all pressures and

$$\Delta g^m = f(\omega_2) \quad (8)$$

The graph is drawn on the basis of dependence. From this graph, the value of the Gibbs energy  $\Delta G_i$  is found.

Also, the Flori-Haggins thermodynamic parameter is calculated by the following equation:

$$\chi_{is} = \ln a_s - \ln \varphi_s - (1 - \varphi_s)/(1 - \varphi_s)^2 \quad (9)$$

Here

$a_s = P_i/P_i^0$  – is the activity of the solvent

$\varphi_s = x/m/(x/m + d_s/d_p)$  volume fraction of solvent

$d_s$  – is the density of the solvent

$d_p$  – is the density of the polymer

$(1 - \varphi_s) = \varphi_2$  – is the volume fraction of the polymer.

**Flori-Haggins polymer solution theory:** The mixing energy has a shape similar to a mixture of two low molecular weight liquids. Consider a solution g consisting of G solution molecules and N<sub>2</sub> polymer molecules; the total number of solvent molecules and monomer units is  $H = N + N_{ir}$ .

### Analysis and results

The following table determines that the sorption properties and capillary-porous structure of technical and purified Carboxymethylcellulose samples relative to water vapor.

**TABLE 2 SORPTION PROPERTIES OF TECHNICAL AND PURIFIED CARBOXYMETHYLCELLULOSE SAMPLES**

Sample	Technical Carboxymethylcellulose	Clean Carboxymethylcellulose
Relative humidity%	Sorption, %	
10	0,60	0,30
30	1,40	0,80
50	2,00	1,60
65	3,20	5,00
80	5,30	14,00
90	8,00	29,00
100	13,00	43,00

**TABLE 3 CAPILLARY-POROUS STRUCTURE OF SAMPLES OF TECHNICAL AND PURIFIED CARBOXYMETHYLCELLULOSE**

N <sup>o</sup>	Indicators	Technical Carboxymethylcellulose	Clean Carboxymethylcellulose
1	X/m, г/г	0,006	0,003
2	S <sub>уд</sub> m <sub>2</sub> / г	48,18	31,54
3	W <sub>o</sub> см <sup>3</sup> /г	0,13	0,43
4	r <sub>k</sub> А°	53,96 А°	272,66 А°

It can be seen from these tables that as a result of purification of technical Carboxymethylcellulose from additional salts, there are changes in the capillary-porous structure

of the product and its specific surface area decreases slightly, the volume sum and radius of pores increase sharply.

Based on the results of sorption, several thermodynamic parameters Gibbs energy, average free energy of mixing  $-\Delta g^m$ , chemical potentials  $-\Delta\mu_1$ ,  $\Delta\mu_2$  were determined. The following tables illustrate the thermodynamic properties of the calculated technical and purified Carboxymethylcellulose based on the sorption results.

The BET theory states that the molecules of the first layer are adsorbed on the adsorbent surface as a result of the intermolecular interaction of the adsorbent. Each adsorbed molecule of the first adsorption layer can, in turn, be the adsorption center of the molecules of the second layer, and so on. Thus, the second and subsequent sorption layers are formed. The adsorption heat in the first layer is determined by the adsorption-adsorbent interaction, in all subsequent layers by the adsorption-adsorption interaction.

To measure the vapor pressure of a solvent in a polymer solution, a graph is drawn based on the relationship  $X/m = f(P_i/P_i^0)$ .

**Figure 1. Isotherm of water vapor sorption**

(1 technical Carboxymethylcellulose, 2 cleaned Carboxymethylcellulose)

As can be seen from this graph, the sorption properties of the technical and purified Carboxymethylcellulose samples differ from each other. The smaller S-shaped appearance for technical Carboxymethylcellulose indicates its lower water solubility and porosity compared to purified Carboxymethylcellulose. It can be seen from the figure that the removal of additional organic and inorganic salts from the sample leads to an increase in its sorption properties.

**Figure 2. Dependence of the average free energy concentration in the Carboxymethylcellulose-water system on the exchange rate**

(1-technical Carboxymethylcellulose, 2-cleaned Carboxymethylcellulose)

To quantify the thermodynamic activity of aquatic systems of technical and purified Carboxymethylcellulose, Gibbs potentials  $\Delta G_i$  were calculated based on the average free energy and concentration dependence of the polymer solvent  $\Delta g^m$  based on the chemical potential calculation of  $\Delta \mu_1$  solvent and  $\Delta \mu_2$  polymer.

As can be seen from Figure 2, the purified Carboxymethylcellulose and water system illustrate more negative Gibbs energy than the technical sample. This result can be confirmed by the polymer-solvent interaction  $\chi_{is}$  Flory-Huggins parameter.

**Figure 3. Correlation of thermodynamic propensity of water vapor activity with the  $\chi_{is}$  parameter**

(1 technical Carboxymethylcellulose, 2 cleaned Carboxymethylcellulose)

As shown in Figure 3, the value of the polymer-solvent Flory-Huggins parameter of purified Carboxymethylcellulose is  $\chi_{is} < 0,5$  at the initial pressure. At relative pressure  $P_i/P_1^0 = 0,3 - 0,65$ , the Flory-Huggins parameter is  $\chi_{is} \leq 0,5$ , ie it is a thermodynamically good solvent. At high relative pressures, it is  $\chi_{is} > 0,5$ . This is explained by the solvent-solvent interaction condensation process. From this result, the value of the Flory-Huggins parameter of the polymer-solvent interaction of technical Carboxymethylcellulose differs sharply from the value of the purified sample.

This situation can be explained by the fact that the presence of various organic and inorganic additives formed as a result of additional reactions in the composition of technical Carboxymethylcellulose leads to a decrease in the force of interaction between Carboxymethylcellulose and the solvent.

**Figure 4. Technical (1) and purified (2) cluster formation function for water vapor activity dependence for Carboxymethylcellulose-water system.**

Figure 4 illustrates the results of an integrated calculation of the dependence of cluster formation on the  $G_{11}/V_1$  sorbent volume fraction. Theoretically, when  $G_{11}/V_1 \geq -1$ , water molecules aggregate into clusters. As can be seen from this graph, the value of the cluster formation function for the technical Carboxymethylcellulose-water system indicates that the transition to a positive field when the water vapor activity is  $P_i/P_1^0 < 0,45$  indicates the beginning of cluster formation in the initial relative pressure areas.

For purified Carboxymethylcellulose-water systems, negative values of cluster formation function are observed, indicating that water molecules interact well with macromolecules at moderate relative pressures of water vapor.

The results of the study illustrate that the clustering for the studied samples is manifested in the field of high activity of water vapor and is consistent with the data in the literature on the

formation of clusters of hydrophilic polar polymers. Cluster formation in low relative pressure areas is associated with the formation of polymer-water and water-water hydrogen bonds.

**Figure 5. Water vapor sorption isotherms for Carboxymethylcellulose-water system in De Boer-Zwicker coordinate.**

(1-technical Carboxymethylcellulose, 2-cleaned Carboxymethylcellulose)

According to the ideas of De Boer-Zwicker (1929), the surface of a polar adsorbent polarizes non-polar adsorbent molecules in the first adsorption layer. In 1929, according to De Boer-Zwicker, the adsorption of a non-polar adsorbent on the first adsorbed layer excites surface dipoles, resulting in dipoles in the next layer. The second theory is based on the assumption that the same forces that cause condensation are also responsible for the binding energy of the polymolecular adsorption. This theory is called the polymolecular adsorption theory. De Boer-Zwicker pointed out that the induced dipoles in the arbitrary layer polarize the first layer and at the same time create the connecting dipoles.

De Boer and Zwicker adsorption theory, which describes the processes of interaction of polar sorbents with polar sorbents, can be applied in the case of cellulose esters-water system. This theory is suitable for both adsorption and absorption mechanisms of water binding processes. The results of the experimental study of the De Boer and Zwicker equations are shown in Figure 5, and the linearization of the water vapor sorption isotherm allows to determine the "true" sorption value, which is not complicated by capillary coding and clustering of water. As can be seen from the figures, the isotherm is linear for the technical Carboxymethylcellulose-water system in areas with a relative pressure of 0.7. Linearization occurs for the purified Carboxymethylcellulose-water system and the isotherm is linear in all areas of relative pressure. According to De Boer and Zwicker's theory, there is no "free" water in the specified activity range in the purified Carboxymethylcellulose-water system, all of the water is absorbed by the active groups of the polymer. Therefore, the Tsimm-Landberg values of the sample are negative and no cluster formation is observed in all areas of relative pressure. (Figure 4).

## CONCLUSION

Using thermodynamic methods, it is possible to obtain the necessary information about the intermolecular interactions of components of different natures. In this case, the sorption properties and capillary-porous structure of technical and purified Carboxymethylcellulose samples with the same quality parameters were studied. As a result of the removal of additional salts from the technical Carboxymethylcellulose, it was found that the specific surface area of the cleaned product is slightly reduced, leading to a sharp increase in the volume and radius of the pores. Based on these results, their thermodynamic parameters  $\Delta\mu_1$ ,  $\Delta\mu_2$ ,  $\Delta g^m$  and  $\Delta G_i$  were calculated and it was found that the purified Carboxymethylcellulose macromolecule interacts better with solvent molecules than the technical sample.

## SOME THOUGHTS ABOUT HISTORICAL EVIDENCE SYSTEM AND EVIDENCE PROPERTIES

**Z. A. Ilhomov\***

\*Associate professor,  
Department "History of Uzbekistan"  
Candidate of Historical Sciences,  
TSPU named after Nizami, UZBEKISTAN

### ABSTRACT

*In all the periods in which the science of history exists there has also been constant debate and discussion about the concept of "historical evidence". From the point of view of historiography, the concept of evidence requires a separate status, a separate definition, a specific rule. The historian must take the evidence and its specific aspects seriously. The fact that historians have been debating the essence of these concepts since the second half of the nineteenth century to the present day also shows the importance of these two concepts in the process of historical science and its research, and at the same time their complexity. An event is a situation that once happened. He argues that evidence is "a combination of a mentally shaped, character, thousands of simple and straightforward facts into a single piece of evidence." There is no objective content in the evidence and it does not correspond to the real historical reality. The content of the fact is not uniform in terms of the content of the subject and the aspect and nature of the research. It is important in the research process to be able to distinguish between factual evidence and historical reasoning, as well as factual information, from factual evidence. The ideas presented in this article are a logical continuation of the author's views on historical evidence and its interpretation in previous articles, based on the findings of specialized literature published in the field of history to date, the views of experts and the author's several years of research. The evidence will therefore be available in a separate interpretation. The selection of evidence is the result of a historian's unsubstantiated decision.*

**KEYWORDS:** *Historical Evidence, Historical Reasoning, Unsubstantiated Decision*

---

## INTRODUCTION

The identification and interpretation of historical evidence is one of the key factors in modern historical research. A historian is required not only to have professional skills, but also to have his or her own scientific views on historical evidence (how it is applied, analyzed, and interpreted). In all the periods in which the science of history exists there has also been constant debate and discussion about the concept of "historical evidence". From the point of view of historiography, the concept of evidence requires a separate status, a separate definition, a specific rule. The historian must take the evidence and its specific aspects seriously. In the process of any research, the historian encounters situations in which the essence of the research, the scientific basis of which is based on the subject of historical research, depends directly on the evidence. In this case, the researcher is based on direct evidence to prove or disprove conclusions about a particular historical process, event or phenomenon, and in the third case to be able to present and prove his scientific conclusion in an undeniable way, the evidence itself is crucial in this process. So the question arises, what is the evidence itself, what is the historical evidence, how is the evidence to be understood?

Event and fact are important historical categories, and while at first glance they may seem simple, the essence and content of these concepts are somewhat complex. The fact that historians have been debating the essence of these concepts since the second half of the nineteenth century to the present day also shows the importance of these two concepts in the process of historical science and its research, and at the same time their complexity. An event is a situation that once happened. This situation is often at the center of the historian's attention in the research process. In most cases, history is understood in relation to an event. According to the English historian and philosopher Robin George Collingwood (1888-1943), since ancient times, history has been understood as a "res gestae" (a human activity of the past), i.e. the narration of the most famous political events.

In D. Kovalchenko's scientific researches the concept of fact (evidence) is defined with reference to historians and experts. Accordingly, the concept of "fact" (Latin. Factum - "work", "event", "accomplished") is used in different senses. First of all, a fact is a clear and concrete manifestation of a past reality in the present situation, that is, an objective reality, that is, the reality of the situation that has taken place, a factor that confirms it. Depending on it the fact (evidence) has a number of specific features. Second, another meaning of the concept of fact (evidence) is related to the process of scientific knowledge.

As for the evidence, the debate has not stopped for many years. The American scientist K. Becker came out in 1955 with the idea that any simple evidence represents many small and simple facts in its structure. He argues that evidence is "a combination of a mentally shaped, character, thousands of simple and straightforward facts into a single piece of evidence." There is no objective content in the evidence and it does not correspond to the real historical reality. All this collides in the mind, consciousness, imagination of the historian. K. Becker's obvious relativistic views (a methodological idea that denies the possibility of knowing reality objectively) were supported by other philosophers.

In particular, the Frenchman R. Aron believes that "evidence does not exist on its own, evidence is formed through the mind and thinking, and is for the mind and thinking." For example, the historical processes and events described by the historian are formed in his mind, in his

imagination, that is, he believes that there is no historical reality outside the consciousness of the historian. In his view, evidence (fact) is formed by the historian in a free state, while historical knowledge is of a relative nature. These views of R. Aron did not satisfy the historians, and they rejected these ideas and considered this approach to be unfounded.

Historian E. Carr points out that only historical events, not any events that have taken place in history, can be historical evidence. In his view, history is an interpretation, that the historian and the evidence must be on an equal footing, and that both must have their own judgment. The historian must have objectivity, and the evidence must be proven as the basis of reality. It then assumes that their equality and impartiality will be ensured. Commenting on the evidence, Carr argues that evidence is "a rigid body relative to the softness of interpretation." Evidence never reaches us in its purest form, it influences the historian's mind and represents the historian's views and interpretations in an untouchable state. The evidence will therefore be available in a separate interpretation. The selection of evidence is the result of a historian's unsubstantiated decision.

I. Kovalchenko divides evidence into three levels: evidence related to historical reality, evidence from historical sources (facts), historical-scientific evidence (facts). In the process of historical research, all three of these levels of evidence must be able to distinguish between them.

Polish historian Eji Topolski, studying historical evidence as a changing whole system, argues that this system is constantly changing and renewing, and as worldviews expand, new aspects of reality are inevitably revealed through evidence.

In our opinion (Z. Ilkhomov), the evidence related to the same situation can not change, the process of change of evidence to another state can not be evidence for the same situation, it is necessary to take into account the immutability and non-repetition of historical processes. In this respect, the evidence does not change and at the same time does not duplicate each other, but it is expedient to interpret it as a system of evidence similar in form and essence.

Another Russian historian, G.M. Ivanov, believes that evidence is a product of thought and represents objective reality and historical reality. Historical evidence is not exactly the same as a historical event, they do not exactly repeat each other, but it is not expedient to oppose them - it leads to subjectivity. Evidence is social in nature and manifests itself in both an objective and a subjective state. The content of the fact is not uniform in terms of the content of the subject and the aspect and nature of the research. It is important in the research process to be able to distinguish between factual evidence and historical reasoning, as well as factual information, from factual evidence. It is not advisable to accept any message and information as evidence of reality and at the same time incorporate factual circumstances into the data.

Based on this, M. Ivanov proposes to divide the evidence into groups. According to this, first of all, they can be economic, political, ideological in content, that is, if such evidence allows to study the relationship in the structure and functions of society, the second group has a content that determines the content of a historical event. Accordingly, the evidence can be simple and complex. Simple argument is unrepeatable and unique, and cannot be divided into simpler groups and parts. Complex evidences, on the other hand, are related to or simultaneously reflect whole processes (e.g., the origin and formation of peoples, the origin and formation of agriculture, the stages of development, etc.). The study of evidence requires a systematic approach. Third, the evidence can also be grouped according to its level of importance in terms

of content and substance, i.e., whether it is very important in the research process and, conversely, insignificant.

In our opinion (Z.Ilkhomov), the evidence has internal (structural) and external features.

The intrinsic nature of the argument is that no argument can fully capture the details of any historical process in its composition or reflect it in its entirety, but can reflect some aspects of it.

The external feature of the argument is that it simultaneously has objectivity in relation to historical reality and subjectivity and external influence on itself. That is, if the external influence in the process of the emergence of evidence is related to the creation, formation, interpretation, description of the evidence, etc., at the same time it is in an objective state relative to the historical reality, and its existence exists without the influence of the historian.

*In showing the internal (structural) nature of the evidence*, it should be noted that any evidence may not fully cover the details of historical processes related to time and space, or may not fully reflect its essence, but may reflect some specific, concrete aspects of it. *Second*, it simultaneously reflects the time in the process of occurrence of evidence, since most evidence can be of historical and scientific importance in terms of time. *Third*, at the same time, the evidence may also reflect space according to its nature. *Fourth*, the evidence can simultaneously reflect the time from its creation to the present day, but it can also reflect the attitudes towards the evidence in different socio-political periods if it was exposed to external influences during that time period.

*For example, the existing circumstances in a single jar, that is, the evidence can simultaneously reflect some aspects of a number of historical realities and processes related to domestic life, several types of handicrafts, folk arts, trade and economic life it is possible, but at the same time the same evidence or source cannot fully reflect the life of society and historical processes or crafts and trade and economic life.*

The external feature of the argument is that it simultaneously has objectivity in relation to historical reality and subjectivity and external influence on itself. That is, if the external influence in the process of the emergence of evidence is related to the creation, formation, interpretation, description of the evidence, etc., at the same time it is in an objective state relative to the historical reality, and its existence exists without the influence of the historian.

The ideas presented in this article are a logical continuation of the author's views on historical evidence and its interpretation in previous articles, based on the findings of specialized literature published in the field of history to date, the views of experts and the author's several years of research. It is natural that the author's conclusions are subject to some objections and controversial opinions by experts in the field, which, of course, will serve to achieve greater perfection in the science of history and its research.

In-depth study of sources, comprehensive analysis of evidence (facts), adherence to the principles of historicity, science, objectivity in the process of their involvement in historical research is the key to the development of historical science.

## THE ROLE OF SOCIAL CONTROL IN THE LEGAL SOCIALIZATION OF THE INDIVIDUAL

**Makhmudova Aziza Nugmanovna\***

### ABSTRACT

*As a result of modernization and liberalization of social relations in society, a number of social sanctions have lost their significance. As a result of social tolerance and the softening of social relations, legal sanctions against children born out of wedlock are almost non-existent in the countries of the East, especially in Uzbekistan, where the institution of the family remains a strong and sacred institution. In our society, the birth of children on the basis of strict marriage operates on the basis of strong public control. Violation of this social norm entails a number of social sanctions. In the West, however, this situation has already lost its relevance as a social norm, and there are no social sanctions against such cases. The birth of children not only on the basis of marriage and family, but in a generally natural way, is also losing its significance as a social biological norm. Circumstances such as surrogate motherhood, donor fatherhood, artificial insemination are becoming the social norm. This article provides a philosophical analysis of the content of social control, its specific principles, the importance of social control in the formation of civil society and, most importantly, the role of social control in the legal socialization of the individual.*

**KEYWORDS:** *Citizen, Law, Legal Socialization, Personality, Social Control, Social Partnership, Civil Society, Legal Norm, Social Sanction, Preventive Direction.*

### INTRODUCTION

The concept of social control is one of the primary problems of such disciplines as social philosophy, psychology, pedagogy, sociology, in the control of many problems in society today, especially, antisocial phenomena, deviant behavior and the like among young people and adolescents are recognized as extremely important in finding solutions to problems. So what is

social control? Dictionaries define social control as follows: "Social control is one of the specific mechanisms of maintaining public order and represents a complex of activities by the public to identify deviant behavior, deviations from established norms, their prevention and response" [1].

## METHODS AND MATERIALS

Social control has existed since ancient times as a method and form of regulating social relations. For example, in the time of primitive society, there was a tradition of collective control over a person's behavior. If a person's behavior deviates from the norms accepted by the community, the team members have the power to change his or her behavior in the desired direction through various sanctions. Although the concept and phenomenon of social control has a long history, it was introduced to science as a scientific concept by T. Tard, one of the founders of social psychology. In his interpretation, this concept "represents a set of methods used to return the offender's behavior to the framework of normative rules" [2]. Later, the meaning of this concept expanded considerably. In addition, American sociologists E. Ross and R. Park have explored this problem in more detail in their research and uncovered new aspects. In their interpretation, "Social control is the influence exerted on an individual in order to bring his behavior in line with social norms" [3].

According to the American sociologist T. Parsons, "Social control, through the influence of deviant behavior through sanctions, normalizes it and serves to ensure social stability" [4]. This problem is being studied in detail by philosophers and scientists of our country. In particular, A. Saidov, M. Kyrgyzbaev, S. Otamurodov, O. Otamirzaev, B. Jumaniyazov, G. Kuchkorova, Z. Kodirova, M. Mirakilov and others are studying various aspects of this problem in their research. From the above descriptions of philosophers and sociologists, it can be said that social control is a way of self-regulation of the social system. This method is carried out with the help of legal norms and through the components of this system in order to ensure order and stability. The nature, content, direction of public control is determined by the nature, essence and type of this social system. Public control will have a completely different character in primitive, archaic societies than in today's developed industrial societies. While in early societies it had a simple structure, in modern societies it manifests itself as a complex system.

## RESEARCH RESULTS

An important condition for the existence and effective functioning of social connection and social system in society is the ability to anticipate, predict and draw conclusions about social activity and human behavior. It is this opportunity that allows you to properly organize the pedagogical, psychological and educational processes in society. Without this opportunity, human society would be in chaos, instability and crisis. Society has certain means of proper organization of social relations and social relations, and it is through these means that it maintains social order. One such tool is social control. "Social control is aimed at creating conditions that ensure the strength and stability of the social system, the development of specific ways to maintain social stability and social order, while creating a socially enabling environment for the emergence of new positive social changes." [5].

On the one hand, social control represents a set of mechanisms of social management, methods and means of social influence, on the other hand, it implies social activity and its implementation. In general, an individual's social behavior takes place under the control of society and the public, the social environment. They manifest themselves as agents of social

control, in addition to teaching the individual social norms of behavior in the process of socialization. Social control agents are those who monitor whether social behavior patterns and requirements are properly or incorrectly accepted by society and are properly accepted in practice. In this context, social control can be a specific form of social governance and social regulation. "Social control is manifested in the subordination of the individual to a united and organized social group, the spontaneous or conscious adherence to the norms established by this group" [6].

Social control basically consists of two elements. These are social norms and social sanctions.

A social norm is a set of socially supported or legislated standards, rules, and norms that govern and control people's behavior. Depending on the nature and characteristics of social norms, the appearance and types of sanctions applied to them, they can be divided into legal norms, moral norms, religious norms and personal norms.

"Legal norms are a set of norms enshrined in various legal acts, which are officially protected on a legal basis" [7]. Violation of legal norms is punishable in the form of criminal, administrative, disciplinary and other types of liability.

"Ethical norms are social norms of behavior, implemented in the form of public opinion, experienced and tested in the process of social relations, recognized by the public as a value [8]. Social space and time, national and ethnic identities have a direct impact on the formation of moral norms. At the same time, it is important that this norm is recognized and accepted by the majority of members of society. Violations of ethical norms can lead to both legal and social sanctions. For example, if they are brought up in legally special correctional colonies, they may be deprived of certain rights, may be subject to sanctions such as negative social acceptance, exclusion from certain social relations, and public outcry.

Social norms usually include the habits of certain social groups, (e.g., respect for adults) social traditions, (e.g., hospitality, thoughtfulness), social behavior, (etiquette rules), and so on.

Social sanction is a set of measures aimed at encouraging people to adhere to social norms or imposing penalties and restrictions on non-compliance. Sanctions are a key tool of social control. Sanctions are the main driving force behind the observance of social norms. "Sanctions are an element of public scrutiny," he said. In order to respond quickly to the behavior of individuals and social groups, society has created a system of social sanctions "[9]. Sanctions, by their very nature, are a response to the behavior of individuals and social groups, institutions and organizations. The emergence of a system of social sanctions is not accidental. While norms are designed to protect the values of a society, sanctions serve to protect and strengthen the system of social norms. If a norm is not protected by sanctions, people will ignore it. "Sanctions can be material and moral," he said. Fines and confiscation of property serve as material sanctions. Spiritual sanctions can take the form of critical thinking, harassment, harassment, pitching, harassment. "[9] Civil society institutions do not have the authority to impose administrative and legal sanctions. They can only apply moral sanctions. But the force of moral sanctions applied appropriately and correctly may not be less than the force of legal sanctions. In addition, social sanctions differ in their content and nature. They can be divided into formal and informal according to the form of manifestation. Formal and informal sanctions are further divided into positive, positive, negative and negative according to their content. Formal positive sanctions include, for example, awards for various positions and orders, orders and medals, scholarships

and diplomas, honorary titles, and informal positive sanctions include praise, approval, applause, and so on. Formal negative sanctions include fines, imprisonment, confiscation of property, and even the death penalty, while informal negative sanctions include insults, ridicule, exclusion from society, and protests.

Social norms and social sanctions form an integral whole. If no social norm is subject to the social sanction required of it, it loses its managerial and controlling, regulatory functions. For example, in nineteenth-century Europe, the birth of children in a family based solely on marriage was considered a social norm. Children born out of wedlock were subject to a number of legal and social restrictions, as well as social sanctions. Furthermore, they would not be able to claim any inheritance legally, would be deprived of social status, finding their place in society, choosing a suitable spouse, and so on.

The following mechanisms of social control are highlighted:

- “Separation (isolation) - separation of the owner of deviant behavior from society. For example, imprisonment, imprisonment, house arrest, restriction of free activity;
- incapacity for treatment - hospitalization for mental illness, strict control over behavior;
- Rehabilitation - taking comprehensive measures to return the owner of deviant behavior to normal life "[10].

The most important factors in the formation of civil society are social partnership, public control, social control, citizen self-government, coordination of activities of civil society institutions. Social control is one of the most important aspects of the proper organization of the process of citizen self-government. In addition to state control over the implementation of legal and ethical norms in society, the existence of properly organized mechanisms of social control plays an extremely important and effective role in the development of civil society. As an important factor in maintaining social order in society, social control performs the following functions:

1. Regulatory task - involves social regulation, control over social processes. Regulatory function is extremely important at every stage and at every stage of social control.

2. The function of protection, protection - this function performs the task of preserving, protecting the social values existing in society, ensuring their transmission from generation to generation. This function is extremely important in maintaining the national, ethical aspects of governance and regulation in society. For example, individualism, which is on the rise around the world today, to stop the rise of various forms of immorality, to prevent such cases from becoming the norm in our society, can be achieved through the function of protection and protection of social control. The predominance of human rights and the processes of liberalization are leading the world institution to lose its importance as a social institution and a higher social value. Only through social control can we ensure that moral vices such as same-sex marriage, gender reassignment, and the rise of different subcultures in our world enter our society and become a social norm. This is because the power of the state and legal institutions to combat these evils is being limited by human rights organizations. In such a situation, the public will have to protect and defend its national moral values through social control. Protective and protection function of social control:

- human life;

- property;
- national and universal moral values;
- means the protection of honor and dignity. Through this function, social experience is passed down from generation to generation. [20]

Stabilization function - this function allows to determine in advance that there will be a certain stability in the behavior of people in society, deviant states in their activities and eliminate it.

State control is certainly important in the management of social relations in society. But there are relationships and situations that are more normal than a measure of legal norms and may not contradict any rule of law. At the same time, it may contradict norms that have been accepted by society and that have maintained their relevance in the regulation of certain aspects of social relations in society over the centuries. Social control is extremely important in controlling and regulating this part of social relations.

“In civil society, there is a social control that regulates the connections and relations between the subjects of social processes, controls the implementation of all established social norms by individuals and social groups. At the same time, the boundaries and patterns of social activity are established, which gives order, organization and clarity to social relations” [11]. Social control contributes stability, organization, coherence, and objectivity to the behavior of individuals, social groups, and social institutions. Social control unites the subjects of social control into an organized whole, helps society to develop and maintain a system of normative values. Through social control, it is possible to determine the degree of deviation of members of society from the established social norms in society, to coordinate them in accordance with the requirements and needs of the time. A. Orlean suggests the following form of coordination of social norms: "rationality - individuality - balance - collective - normative - order" [12]. In our view, this classification and image could be more of a standard for the harmonization of social norms in the West. In our case, based on social relations and social values, we can describe the classification as follows: rationality - collective - balance - individuality - normative - order. Through this classification, it is possible to express the formation of norms that are formed on the basis of rationality, based on the principles of individual and collective implementation of social relations in society. Legal control can only assess and respond to deviant behavior in a society in one way or another, legally.

Any deviant behavior that occurs in society must become the object of not only legal control but also social control. That is, not only the legal attitude and legal assessment of the deviant behavior committed, but also the social attitude and social assessment should be given. Social control, on the other hand, refers to cases of deviation from social norms from a legal, moral, religious, and national perspective. For example, in countries such as Denmark, Sweden, Norway, Singapore, and Japan, which have achieved high results in the fight against corruption, in addition to law enforcement agencies, the public reacts to the arrest of an official with corruption. In these countries, corrupt people are treated as if they were murderers. The main emphasis here is on issues such as causing public hatred, people being ashamed of their actions. The fact that such people are distrusted and isolated from society in society is having an extremely good effect. The risk of a person losing his or her social authority causes him or her to act within the framework of social legal norms. After all, the role of man in the social space, always pays strong attention to the issues of prestige. By nature, man always strives to gain the

recognition of others, on the contrary, man always lives in fear of being exposed to public discussion and hatred. That is, the reduction of a particular defect in society, the effectiveness of the fight against it largely depends on the attitude of the public to this defect. This is a product of social control. In addition, the scope of social control includes not only illegal actions, but also the scope of socio-ethical norms. For example, in the context of Uzbekistan, social control plays an important role in ensuring family stability and preventing divorce. We can see that the neighborhood, the elders of the family, the relatives exercise social control over this issue. In doing so, social control uses methods and means such as intimidation, shame rather than punishment, arousing conscience, calling for accountability, encouraging people to be worthy of human qualities.

Social control is exercised not only by society, civil society institutions, but also through self-control. Self-control is the constant exercise by a person of his or her own behavior to ensure that his or her behavior conforms to accepted social norms. As a result of self-control, a person directs his activities based on his system of beliefs, convictions, worldviews, spiritual values, evaluates his behavior. The extent to which the ability to self-control is formed and developed depends on the socialization of people. Having a place and prestige in society causes people to exercise their self-control more strongly, because everyone is afraid of losing their prestige and status in society. This situation is extremely strong, especially in our country, in the life of the peoples of the East. The level of socialization has a direct effect on a person's level of self-control. "If a person accepts social norms as his norm in the process of socialization, then a high level of self-control is formed. This process is a complex process and involves many factors." [13] For example, the level of the rule of law and the rule of law in the social space, the extent to which social and moral values are absorbed into society, the main characteristics of public policy and ideological processes, the system of personal spiritual values and so on.

Two important areas of social control can be distinguished based on their ability to manage and regulate social relations.

"The retrospective approach is based on the analysis of existing problems of social control, to study in depth their mechanisms, solutions and results, to evaluate them, to suggest ways to resist deviations from accepted norms.

Preventive orientation is the formation in people of behavioral stereotypes based on norms that are generally accepted and important in that society. According to VA Yadov, "the formation of behavioral stereotypes in people can be effective only if it is based on individual, psychological characteristics" [14].

In the system of social relations, social control is a systemic part of the social space, which includes the following qualities:

- the existence of a clear, stable position and attitude of the person to a particular activity, as well as the belief that it benefits him;
- the presence of axiological targets in relation to certain types of activities, a sense of responsibility and accountability for the consequences of their actions and behavior;
- Ensuring that society values its value system, that is, the fact that a person is valued by society for such qualities as honesty, integrity, nationalism, increases people's confidence in their position in life;

- a sense of responsibility to society in the performance of their duties and responsibilities;
- have a clear idea of their capabilities;
- how rights and obligations, responsibilities and responsibilities are distributed among the members of the society and how their implementation is controlled;
- The existence and functioning of this process as a whole system, such as the confidence of law enforcement and government agencies to act fairly, within the law.

“Social space, as a carrier of social relations, forms a whole as a generalization of the joint activities of civil society institutions and state organizations. Together, they form a system of social thinking and a system of norms of behavior.” [15] Religion and religious organizations, family, community, education system, trade unions, political movements, political parties, public associations ensure the formation of social norms in society, their transmission from generation to generation. The reason why civil society creates opportunities for the development of public control is that only economically and politically free citizens and their associations can exercise truly effective, independent and impartial public control.

In the context of radical socio-economic reforms and modernization in our country, such changes are reflected in the content of public control. This means that each person who is a subject of activity, in addition to assuming certain obligations, can require others, public authorities to fulfill their obligations and responsibilities.

State control, which is one of the main mechanisms regulating the relationship between society and the individual, plays an important role in the sustainable development of the country. At the same time, the society, its civic institutions and all citizens control the activities of the state and government through public control using existing social norms, values, legal standards.

The concepts of social control and public control are different. Today, terms such as "public control", "social control", "civil control" are used in the press and scientific literature. The analysis shows that these terms are often used synonymously and sometimes incorrectly. The difference between the concepts of “public control” and “social control” is, first of all, that the concept of “social control” is broader in scope than the concept of “public control”. In addition to the concept of "public control", this concept also includes state control and civil control. Because they, too, are essentially manifestations of social control.

There are various definitions of public control. It would be more appropriate to use the following definition, which covers the main features of public oversight: "Public oversight is the activity of public associations to determine and assess the compliance of public authorities and administration with applicable law" [13]. He mainly performed the following tasks:

- “ensuring the observance of the rights, freedoms and legitimate interests of citizens;
- ensuring the legitimacy of the activities of government agencies and their officials;
- protection of public interests” [13].

“The tasks of public oversight are:

- Ensuring a system of checks and balances between government agencies and society;

- informing citizens about the state of observance of the law, the rights, freedoms and legitimate interests of citizens by state bodies and their officials;
- identify and inform the general public about violations of the law by government agencies and their officials, eliminate them with the help of the public, support and encourage the principle of social justice in society;
- Cooperation of civil society institutions and government agencies in ensuring the rights, freedoms and legitimate interests of citizens.

Amendments to our Constitution in 2014 gave constitutional control to public scrutiny. Article 32 of the Constitution is now worded as follows: "Citizens of the Republic of Uzbekistan have the right to participate in the management of public and state affairs directly and through their representatives. Such participation is achieved through self-government, referendums and the democratic organization of state bodies, as well as the development and improvement of public control over the activities of state bodies "[13]. The fact that the Constitution enshrines the participation of our citizens in the management of public and state affairs through the development and improvement of public control over the activities of state bodies is a sign of the great importance attached to public control in our country.

Public oversight is evolving in relation to the formation and development of civil society institutions. As civil society develops, there are broader opportunities and prospects for public scrutiny. On the other hand, the development of public control leads to the development of civil society institutions. Just as developed and widespread public control cannot be imagined without civil society, the development of civil society cannot be imagined without public control.

The reason why civil society creates opportunities for the development of public control is that truly effective, independent and impartial public control can only be exercised by economically and politically free citizens and their associations.

In our country, the legal basis of public control and civil control, which are forms of social control and its manifestation, has been strengthened. That is, the Law "On public control of the Republic of Uzbekistan" was adopted. All aspects of this activity are currently regulated and governed by this Law.

## CONCLUSION

In conclusion, we must say that social control and all its manifestations are extremely important in the management of various aspects of social relations in society:

- This factor is crucial in the formation of civil society. The point is that the system of socio-political relations of each society has its own structure and characteristics. Different methods of monitoring the implementation of social norms in each country may be more effective in their own right. This is done in close connection with the mentality, lifestyle, socio-moral, religious values of the people;
- In the regulation of social relations in our country, along with legal, state control, social control has a very effective power. This is due to the fact that the traditions of collectivism are strongly preserved in the life of our people, and public opinion is extremely important;

- An example of the program of cooperation "family - community - educational institution" developed in our education system in order to effectively use the opportunities of social control. We can say that this system, which is not found in other countries of the world, is a classic manifestation of social control. That is, the school, together with the family and the community, monitors the child's compliance with the established norms in the educational process. It is an extremely effective system that allows children's behavior and mastery, in turn, to be monitored by the public for the quality of school activities, teachers' lessons;
- One of the most effective forms of social control is the conduct of conciliation commissions in the community to ensure the stability of families and control over the reduction of divorces.

### ABSTRACT

*This article provides information on how to visualize teaching materials in higher education and how to use the visual capabilities of modern programming languages in the creation of electronic books. As a modern programming language, the features of the Java language and the visual environment of Android Studio, as well as the types of designer programs that create android applications, programs that create electronic books for working in Windows OC, their advantages and disadvantages are listed.*

**KEYWORDS:** Visualization, Android, Java applications, Java Development Kit (JDK), Java Runtime Environment JRE, IntelliJ IDEA (IDE), Android Studio, TheAppBuilder, AppsGeyser, Apps Makerstore, Net2Share, App sGeyser, TheAppBuilder, Andromo, Articulate Story Lectora, iSpring.

## INTRODUCTION

The state of development of modern technologies depends primarily on the intellectual potential of society, including the development of education. Issues of content and quality of education are considered a priority in society. In developed and developing countries of the world, special attention is paid to the informatization of education. In this regard, ways to develop education, increase its efficiency are being sought, the issue of introduction of new information technologies and effective software in education is gaining popularity. Teaching using e-textbooks on computers and mobile devices has an effective impact on all aspects of the learning process. The impact of e-textbooks on teaching content opens up many opportunities for learners. This is due to the fact that e-textbooks have a high capacity to demonstrate teaching materials, the introduction of artificial intelligence ideas, a means of conveying a lot of information to students.

The use of e-textbooks for educational purposes changes the activities of students in a positive way. That is, the student will be able to independently search for the necessary information, without having to consult a teacher, that is, to conduct independent research.

**Purpose.** The use of computers and mobile devices, as well as electronic books in the educational process requires the improvement of some theoretical foundations of didactics and pedagogical psychology. In particular, expert systems allow the student to choose the optimal solution to the problem of any complexity, and hypertext teaching systems allow the student to choose the sequence of mastering the learning materials. Only when e-textbooks are of high quality, both in terms of content and appearance, it will be possible to use them effectively in the educational process. The need to acquire knowledge, skills and competencies in an informed society always necessitates a visual representation of the knowledge base. Accordingly, “visualization” refers to the controlled presentation of data using images, graphics, tables to simplify comprehension and processing.

Visualization is the presentation of information in the form of a specific image (photos, drawings, diagrams, tables, graphs, formulas, etc.). Cave paintings of ancient people may be the simplest example of information visualization. In modern society, the effectiveness of information visualization is initially achieved through the visual representation of non-visual information (e.g., temperature change, population density in regions, the presence and intensity of electromagnetic fields, etc.).

In the information society, the possibilities of visual representation of objects of direct observation are greatly expanding. Expanding the variety of options and bases for demonstrating not only objects but also important aspects of their development and interaction, as well as understandable and permissible ways of influencing objects themselves and the events that accompany them. Accordingly, “visualization” refers to the controlled presentation of data using images, graphs, tables, tables to simplify comprehension and processing.

Visualization comes from the Latin word *visualis* - visual, visual, and in the literature the term visualization is interpreted differently. Visualization (in a general sense) is the process of presenting information in the form of an image to increase their ease of understanding. Giving any imaginary object, subject, process, etc. a visible shape, mechanically generating an image (image), using any technical means or thought formation (thought forms) directly with your mind

(mental visualization) can help you understand any complexity and originality. (Actually existing and created in the author's mind) is to create clear, stable, and vivid images<sup>1</sup>.

**Scientific novelty of the article.** At a certain stage in the development of science and technology, the emergence of new textbooks, the role of visualization in the learning process naturally changed and began to be supplemented. Clarity refers not only to images of objects, but also to models of processes or events, schematic structures that facilitate the understanding of complex information, dynamic visual aids using technical means, and then multimedia learning tools.

Computerized visualization of educational information is a visual image on the screen of an object, in general, its parts or their models, which, if necessary, has the ability to reflect different angles, details, internal parts and, if necessary, their development in space. In addition, the visualization of educational information focuses on the importance of visual perception for man, the leading role of figurative cognition in cognitive processes, the need to increase the information load of man and prepare him for the conditions of improving information activities, experience. Visualization has the following advantages:

- Visualization allows you to visualize an event or phenomenon that is difficult to reproduce directly;
- Allows efficient transfer of learning information by assembling its components into a visual image;
- Contributes to the formation of professional thinking.

At present, due to the development and compaction of information technology, part of the information exchange process is carried out using mobile devices. This, in turn, makes it necessary to create and share information in a way that is compatible with both personal computers and mobile device software. Today, personal computers and mobile devices around the world, as well as software that supports the connection, are divided into three types of separate OC (operating system). These are Windows, Linux and Macintosh for PCs and Windows Phone, Android OS and IOS OS for mobile devices. The operating systems that have the most users are the Windows OS designed for PCs, while the Android OS is designed for mobile devices. In Windows OS, apps are created in \*.exe format, while in Android OS, apps are mostly created in \*.apk format.

In order to effectively increase the theoretical and practical knowledge and skills of students in higher education institutions, it is necessary to increase the number and quality of electronic books. Given the above, it is important to focus on what you need to focus on in order to create e-textbook applications compatible with Windows OC and Android OS. Here are the processes for creating apps in \*.apk format, originally designed for Android OS for mobile devices<sup>2</sup>.

It is advisable to use the Java package when creating Android applications. The first aspect required for the development of Java applications is the Java Development Kit (JDK is a Java compiler, standard Java) created by Oracle (Oracle Corporation is a software manufacturer specializing in database management systems and business applications). class libraries are a set of Java applications distributed by Oracle Corporation, which includes various utility systems). The Java Runtime Environment (abbreviated as JRE-, is a Russian-language working

environment for Java. A virtual machine required to run Java programs without a compiler and other production tools) is used to run applications on your computer.

Based on the IDE - Integrated Development Environment, it offers the ability to create many useful visual programming tools that programmers need. Android Studio is an IDE officially developed by Google to create Android apps<sup>3</sup>.

**Results and practical applications.** Android Studio must have the necessary knowledge, skills and abilities in the Java programming language, Android APIs and Android application architecture when creating an application for the Android platform. Today, Android Studio has taken the lead with its capabilities. Google Android Studio is designed for Windows, Mac OS X and of course Linux platforms. To get acquainted with the Android development platform, you can download it from the official website of the Android studio (developer.android.com). The SDK (Software Development Kit) for Android Studio from here is a production tool that allows software developers to create software for a specific software package, basic software, hardware platform, computer system, operating systems and other platforms. package can be found. To use Android Studio, you must first install it on your computer and perform the following steps:

Set up Android Studio, in the next step we go to the next Android Virtual Device (AVD) panel by clicking Next. To install Android AVD, select Default settings, click Next again and go to the Configuration Settings section. This will clarify where Android Studio will be installed. The selected memory must have at least 500 megabytes of free space. Click Next to go to the Choose Start Menu Folder panel. Here, without touching anything, click Install and the Installing process will begin. When the installation process is complete, click Next again, and when the process is complete, the Finish button will open. With the click of the Finish button, Android Studio will start automatically and first, the app will ask you whether or not to open the project belonging to the android studio. Here, if a pre-saved project exists, the first radio button can be selected, the second option is applied, and the process continues. Android Studio Splash Screen, Finding Available SDK Components Find the required SDK and start the download process. The Android Studio Setup Wizard dialog appears when you download the required SDK for Android Studio. The settings are set when the Next button is pressed. Select the installation type, click Next, and in the next step, select the optional theme, then click Next to proceed to the next window. The final part is the process of downloading all the necessary files. The process of uploading the required files by clicking the Finish button takes some time. As a result, when the process is complete, clicking Finish will take you to the Welcome Android Studio window.

This will install Android Studio and the first Android project will be launched by clicking the Start a new Android Studio project button. One of the simplest ways to get acquainted with Android Studio is to create the simplest app and call it simply World Hello. Click on the Start a new Android Studio project button to go to this window. After that, it is given a name to save the program project in memory. Open the optional directory, display it in Project Location and click Next to allow Android projects to be stored there.

The Target devices command allows you to select the factors you need for your Android Studio project and leave it unchanged by clicking Next. Now select the type of activity required to set the activity command, continue the installation process and click Next. If you are installing Android Studio for the first time, it is advisable to download some files that belong to the Android Studio constraint layout and click Finish to create a user interface<sup>4</sup>.

As a result, when the Android Studio application is launched and the Run command is activated, the Hello World Application will appear on the screen, and it will be possible to get acquainted with the Android Studio User Interface in detail and explore its capabilities. This, of course, requires the ability to work with the Java programming language.

With the development of mobile technology, the mobile app market is evolving, including the mobile app market for Android OS. Until now, programming was done only by advanced programmers, now this opportunity is available to anyone with relevant knowledge of the concept of programming language and access to the Internet. The following are a few utilities that can be used to create Android apps without software code, and their disadvantages and advantages are analyzed:

**The App Builder.** This program is a convenient tool for creating applications, and its use does not require any additional funds. Its main drawback is that this software product does not support the Russian language. Important functions of a software product may include:

- There are a large number of options when creating Android OS apps, it is easy to choose one of the recommended options in the templates if you need to create a simple app;
- Ability to view detailed statistics on the created program;
- The created simple and clear electronic edition and google play application can be used in this application.

**Apps Geyser** is a remarkably high-quality tool that doesn't have to have software under the Android OS, as mentioned above. Everything in the program is simple and straightforward, with the ability to combine it in minutes from the "designer" part to the project. It will be possible to analyze the capabilities of the recommended software tools below, namely:

- There is a large archive of templates on various topics, restaurants, photo studios, holidays, sports, radio, shipping and many other templates, it is necessary to make the right choice for the need and edit it;
- The tools installed when promoting a new application sometimes take a lot of time and effort to promote a new application promotion, and the advertising tools installed on the designer have the ability to simplify this task;
- The program has the ability to connect to the advertising network, so you can earn extra income using the created program.

**Apps Maker store.** This app is a convenient and simple tool for creating mobile apps for Android OS, its main advantage is that it is able to create mobile apps for six types of mobile operating system at the same time, in addition, its useful features are:

- Ability to work with a simple and straightforward online designer;
- It is possible to register an account at no additional cost;
- In a large archive designed for the Android OS app, you will be able to record the required app in a simple way.

**Apps Geyser.** This app is one of the online services that does not require additional funds when creating Android apps based on web content. To get the finished program, go to any site and

select the name required for the program, describe it, select a specific category, you will be able to get the .apk file of the application in a few minutes. The service application provides distribution, advertising, statistics viewing services at no additional cost. The Russian version of AppsGeyser is available and implemented in practice. This program uses a specially created HTML code or document, DOC, DOCX, PPT or PPTX format. Apps created with AppsGeyser are placed on the Android Market, its official websites are <http://www.appsgeyser.com> and <http://www.appsgeyser.ru>.

**The App Builder.** This software service is a very efficient HTML5 software developer. Apps developed using it do not have to be placed in online stores. Because they can be sold directly. In this case, users are required to use the completed application. This service is provided via QR codes and SMS-messages. A distinctive feature of TheAppBuilder service is the wide selection of templates and settings. Data encryption based on the AES-128 standard has the ability to integrate with Microsoft SharePoint and Active Directory. Similarly, HTML5 for creating applications for Android platforms can be implemented on iPhone platforms, using Web App web design languages. The technical support service website is provided at this <http://www.theappbuilder.com> website<sup>5</sup>.

While the main advantage of the above apps is that they can be used to create e-textbook apps for any specialty without programming language skills for Android OS, the downside is that the app can't claim copyright for the app. Now it is possible to create e-textbook applications for any specialty without the skills of programming languages for Windows OC, but programs that do not require copyright, as well as their advantages and disadvantages are listed:

**Articulate Storyline** is one of the most popular programs for creating courses, it is flexible, easy to use and designed to create different purpose courses. Articulate Storyline is a three-utility package (Presenter, Quizmaker, Engage) that allows you to create training courses, presentations, tests and other forms of content in Flash and HTML5 formats that can be viewed on the iPad and integrated into distance learning systems. The feature of this program is easy to master. The rollers developed in Articulate products look more modern and dynamic than other e-learning editors. The main features of the program:

- Simple interface allows you to create courses from scratch or based on templates without requiring additional user training. The interface looks similar to Microsoft PowerPoint.
- Records screen situations and demonstrates how to work with an electronic course of recording.
- Support of HTML5 and Flash technologies, as well as mobile devices. Publish courses in a variety of formats for iPad, PCs, laptops, Android, iPad, and other devices, and support SCORM and AICC (reporting) standards.

**CourseLab** is a powerful and easy-to-use software tool for preparing interactive learning materials (e-textbooks) for use in distance learning systems, CDs, or any other storage device. The main features of CourseLab are:

- Does not require the user to know HTML or other programming languages.
- An objective approach has a mechanism for creating educational materials of any complexity and automatic creation of tests.
- Allows training courses to host files of any Rich-media type - MacromediaFlash, Shockwave, Java and any video format.

- Ability to place presentations in Microsoft PowerPoint format in the training material.
- Allows a skilled user to add JavaScript directly to the properties of program files.
- Depending on the type of application, the training materials created with CourseLab comply with the following e-learning standards: AICC and SCORM 1.2.

**Lectora** is a program that allows you to create e-learning content and create e-learning complexes in the distance learning process. The program has the following icons:

- in the creation of distance learning courses;
- when creating presentation files;
- when creating control tests;
- when converting ppt files to other learning formats (SCORM or AICC);
- Widely used in the creation of intellectual training courses. Courses created in the Lectora program can be published in SCORM and AICC, which are e-learning standards. Lectora software meets the requirements of existing LMS systems. The training courses created in the program can be conducted with the click of a button in the form of a dynamic website, HTML, CD-ROM, .exe, compiled into a single file, without knowing any programming languages in SCORM and AICC standards.

**iSpring** is usually used in preparation for a presentation, in most cases, Microsoft - PowerPoint software. It has many features that help the material presented to be better understood by those who see it. The program has options such as iSpring Free, iSpring PRO and iSpring Presenter. Today, this product is one of the best PowerPoint converters in Flash in terms of speed, conversion quality and number of options. Compared to the iSpring PRO version, the iSpring Presenter version has the following features:

- Presentation content protection: password viewing, protection of the presentation, the presentation can be opened only in the authorized domains, these features are available in the Protection version of the Publish dialog;
- Add video and sync it with animations;
- creation of SCORM / AICC compliant courses for use in distance learning system;
- Availability of Action Script API to convert presentation at application level<sup>6</sup>.

## CONCLUSIONS AND SUGGESTIONS

In order to ensure the effective use of modern information technologies in education, electronic books and their authoring software are widely used. Using similar programs in higher education institutions on the subjects taught, it is possible to increase the performance of students in education through the introduction of multimedia lectures.

Visualization of teaching materials in the educational process expands students' imagination and independent thinking skills in relation to science. As a result, the interdependence and continuity between science topics is further strengthened. The above methods used by online designers for android apps in creating e-textbooks and visualizing learning materials are not actually related to software development. Because, in some cases, all of these programs have their own characteristics, they cannot claim the right to be called a "real program". In the future, based on a positive approach, they can be widely used in practice. The problems of improving the quality and effectiveness of teaching in higher education institutions will be solved with the creation of e-learning manuals with e-programs and applications using modern technologies and visual

software. Because, whether he is a programmer or a designer, the software tools created by them are initially divided into the number of electronic books and thus the ability to increase their quality.

## INFLUENCE OF INDUSTRY 4: 0 PROGRAM ON ENSURING COUNTRY COMPETITIVENESS IN THE INTERNATIONAL MARKET

**Toshpulatov Ikboljon Adiljonovich\***

\*Assistant of Fergana Polytechnic Institute,  
UZBEKISTAN

Email id: iqboldoktorant@mail.ru

### ABSTRACT

*This study theoretically substantiates the impact of the fourth industrial revolution on the country's competitiveness and develops proposals for the inclusion of the Republic of Uzbekistan in "The Global Competitiveness Index". Significant aspects of the "Industry 4: 0" program were also studied, and the program was studied on the basis of SWOT analysis.*

**KEYWORDS:** "Industry 4: 0", The Fourth Industrial Revolution, "Global Competitiveness Index", SWOT Analysis, Artificial Intelligence, Cybersecurity, Competitiveness.

### INTRODUCTION

Countries of the world pay great attention to the development of science in achieving international competitiveness. Development of science allows the industrial industry to be equipped with modern technology, the effective use of artificial intelligence in the management of production processes.

The economy is growing and enterprises are achieving with high efficiency in countries with a focus on the development of science and the development of innovative activities. In a highly competitive environment observed in the world market, lagging behind the process of rapid development, not paying attention to the development of science can lead to a crisis in the industrial industry.

Aiming to join the ranks of developed countries, Uzbekistan is undergoing rapid reforms in the development of science. Approved by the President of the Republic of Uzbekistan Sh. Mirziyoyev "On measures to further strengthen the infrastructure of research institutions and the development of innovative activities", "On measures to further improve the activities of the Academy of Sciences, organization, management and funding of research" , Resolutions "On

Science and Scientific Activity" are among them. The resolutions provide many opportunities to support research activities, special funds, grants are allocated from the state budget.

We all know that the equipment used in some industrial enterprises in our country consists of spiritually obsolete, energy-intensive equipment. The high level of energy consumption, in turn, leads to an increase in the cost of production, creating problems associated with withstanding strong competition in world markets. In this situation, it is important to conduct research on new generations of industries used by developed economies, to study the experience and use them effectively.

## LITERATURE REVIEW

The development of science has created a new revolution in industry "Industry 4: 0". Today, Germany, the United States, the Netherlands, France, the United Kingdom, Italy, Belgium, and other developed countries are making effective use of the fourth industrial revolution.

A number of researchers have conducted research on the impact of the Fourth Industrial Revolution on the competitiveness of a country, region, industry, enterprise.

Hasan Çebi BAL, Çisil ERKAN, one of the foreign researchers, studied "Industry 4: 0" as a key factor in creating value added, bringing product quality to a new level and its competitive advantage over other industrial stages<sup>1</sup>.

The fourth industrial revolution focused on reducing the use of labor, the organization of quality management in a new way, the cycles of full coverage of the raw material-finished product process.

IP Dovbiy, NV Ionova, NS Dovbiy assessed the impact of "Industry 4: 0" on the country's competitiveness, macroeconomic indicators, GDP<sup>2</sup>.

IV Tarasov spoke about the competitive advantages of "Industry 4: 0", including the possibility of direct communication between man and machine through information technology, the transparency of information and the ability to create effective systems, the virtual view of the material world.<sup>3</sup>

Liu C. assessed the impact of Industry 4: 0 on macro and microeconomic competitiveness and proposed strategies for implementing the program.<sup>4</sup>

Renata Stasiak-Betlejewska, Luminita Parv, Wojciech Gliń have studied the most commonly used technologies in software use and their impact on enterprise competitiveness.<sup>5</sup>

A. Magrupov, one of our local researchers, stressed the need to take into account the program "Industry 4: 0" in the training of modern specialists for the national economy, the program "Digital Uzbekistan - 2030" is related to artificial intelligence, Internet, big data, genetic and biotechnology, renewable energy sources, composite materials. that it is.<sup>6</sup>

The relevance of the research is determined by the lack of in-depth analytical study of the impact of the program "Industry 4: 0" on our national economy, the effectiveness of its application.

## METHODOLOGY

The role and significance of the Fourth Industrial Revolution, ie the Industrial 4: 0 program, in ensuring the country's competitiveness have been theoretically studied, and the program has been

studied on the basis of in-depth empirical approaches based on SWOT analysis. The main purpose of the work is to determine the need for the application of the program "Industry 4: 0", to develop proposals and conclusions on the use of the program in enterprises.

### Main part

The first industrial revolution spanned 1760-1840 and was characterized by the assimilation of water and steam energy and thus the transition from manual labor to mechanized production. The second industrial revolution took place in the late 19th and early 20th centuries and was marked by an unprecedented phenomenon in the field of electricity and the conveyor belt - the beginning of mass production in industry. The third industrial revolution began in the 1960s, and as a result of electronic and digital technologies, the industry rose to the level of automation. It is well known that these changes have had a profound effect not only on industry and the economy, but on all aspects of human life. They have radically affected the way of life of the population, causing the disappearance of some very important fields and professions only yesterday, and even the emergence of new traditions and customs. At such an important juncture, nations that have not been able to quickly adapt their worldviews to the new era have failed to realize that states that have been slow to modernize have voluntarily given up their leadership positions to others.

As a result of the application of intensive scientific research in developed countries to production processes, a new generation of industry, the fourth industrial revolution, has emerged. The peculiarities of the Fourth Industrial Revolution are reflected in the emergence of new technologies that combine the achievements of digital, physical and biological technologies, the disappearance of the boundaries between digital technology and the organic, biological world.

Industry 4.0 has brought humanity into a new era. This new era has created new opportunities for billions of people, businesses and governments around the world. Human capital, innovation, technology, flexibility and agility are the most important factors in the success of Industry 4.0.

The use of new generation technologies by industry plays an important role in the competitiveness of countries in the world market. Also, for countries to improve economically, they need to use technology effectively and combine it with other factors of competitiveness.

The World Economic Forum has released the Global Competitiveness Index 4.0 report for 2019 on specific indicators of countries. It is known that the Global Competitiveness Index 4.0 evaluates countries on the basis of 103 individual indicators. The main ones are macroeconomic stability, consumer market, labor market, financial system, domestic market size, quality of institutions, infrastructure condition, level of use of information technologies and modern communications, health, education and skills, business and innovation development dynamics. The organization evaluates 141 countries annually on a 100-point scale (see Table 1).

**1-TABLE THE GLOBAL COMPETITIVENESS INDEX 4.0 IS THE TOP TEN RANKING IN 2019<sup>1</sup>**

<b>№</b>	<b>Name of countries</b>	<b>Ranking</b>
1.	<b>Singapore</b>	84,8
2.	<b>United States</b>	83,7
3.	<b>Hong Kong</b>	83,1
4.	<b>The Netherlands</b>	82,4

5.	<b>Switzerland</b>	82,3
6.	<b>Japan</b>	82,3
7.	<b>Germany</b>	81,8
8.	<b>Sweden</b>	81,2
9.	<b>United Kingdom</b>	81,2
10.	<b>Denmark</b>	81,2

Singapore, the United States and Hong Kong are in the top three among 141 countries in the competitiveness rankings.

Singapore is a country with a highly developed market economy and low tax rates. The country has a well-developed electronics, shipbuilding and financial services sector. Extensive research is also being conducted in the field of biotechnology.

The United States ranks first in the world in terms of nominal GDP and second in terms of purchasing power parity. The country's economy is highly developed. Although the population is only 4.3 percent of the world's population, Americans own 40 percent of the world's total wealth. The United States leads the world in a number of socio-economic indicators, including average wages, the Human Development Index, GDP per capita, and labor productivity.

Hong Kong is an important center of international finance and trade. The region's economy is based on a free market, low taxation, and the inadmissibility of government intervention. Hong Kong is an offshore area and does not pay customs duties on imports as a free port, no value added tax is set.

They are followed by the Netherlands, Switzerland, Japan, Germany, Sweden, Great Britain and Denmark.

The Netherlands has a highly developed post-industrial economy. The country's coastal cities of Rotterdam, as well as Eymyayden, Dordrecht, Arnhem and Naymegen, specialize in heavy industry - oil refining, chemical production, ferrous metallurgy and machinery. There are wind farm farms along the coast. The production of chocolate, cigars and beer is also developed.

Switzerland is one of the most developed and rich countries in the world. Although the country has almost no mineral resources, its industry is developed and agriculture is highly productive. Switzerland has four of the world's largest gold refineries. Accordingly, the country is also a world leader in the import and export of precious metals.

Japan is a developed country with a very high standard of living. The sunny country has the highest life expectancy in the world and the lowest infant mortality rate. Banking services, insurance, real estate, transport, retail, telecommunications and construction play an important role in the country's economy. Japan has large production facilities for automobiles, electronics, machine tools, steel, ships, chemicals, textiles and food.

Germany is one of the fastest growing economies. Global leadership in a number of industries and technologies. It ranks third in the world in terms of exports and imports. Germany is also a developed country with a very high standard of living. It supports social security, universal health care, environmental protection and free higher education.

Sweden has a diversified and competitive economy. More than 50 global companies such as ABB, Atlas Copco, Oriflame, Saab AB, Saab Automobile AB, Scania, Volvo, Volvo Trucks, Ericsson, TELE2, AB Electrolux, TetraPak, Alfa Laval, SKF, H&M operate in the country. Sweden has a highly developed infrastructure that is constantly modernized.

The UK economy ranks 10th in the world in terms of GDP and purchasing power parity. The Kingdom accounts for 10% of world exports of banking, insurance, brokerage services, as well as computer software

Denmark is a highly developed industrial and agrarian country. The share of industry in national income is more than 40 percent. The country ranks first in the world in terms of foreign trade per capita. Denmark, as the country with the most stable economy in Europe, is characterized by a balanced state budget, stable currency, low interest rates and low inflation rates.

If we look at the report, Uzbekistan is not included in the 141 rating, and one of the main reasons for this is the fact that Uzbekistan is not a member of the World Economic Forum. Resolution of the President of the Republic of Uzbekistan Sh. Mirziyoyev dated February 25, 2019 No PP-4210 "On measures to improve the position of the Republic of Uzbekistan in international rankings and indices" provides specific instructions for developing "road maps" to improve the position of the Republic of Uzbekistan in relevant international rankings.

In order to fulfill the tasks set out in the resolution, the Ministry of Finance of the Republic of Uzbekistan together with representatives of the World Economic Forum is working on the inclusion of Uzbekistan in the Competitiveness Index. It is expected that Uzbekistan will be included in the ranking from 2021, taking into account procedures such as selecting one of the non-governmental research institutes, private universities or agencies operating in Uzbekistan, conducting surveys among them, studying the results.

The application of the "Industry 4: 0" program is important in the evaluation of countries on the basis of the Global Competitiveness Index. Because the use of "Industry 4: 0" requires the development of modern science and helps enterprises to achieve high efficiency.

We will conduct a SWOT analysis to better understand the differences and effectiveness of the "Industry 4: 0" program from other industrial generations (see Table 2).

**2-TABLE SWOT ANALYSIS OF THE INDUSTRY 4: 0 PROGRAM<sup>1</sup>**

<b>Strength – S</b>	<b>Weaknesses – W</b>
<ul style="list-style-type: none"> <li>– Organization of high-level production process and continuous quality control of products;</li> <li>– Requires less manpower and human factor;</li> <li>– Market demand and flexibility;</li> <li>– Energy saving and less than other industries;</li> <li>– Ease of control of production processes and cycles.</li> </ul>	<ul style="list-style-type: none"> <li>– Complexities in data security;</li> <li>– High costs associated with the organization of the process;</li> <li>– Concerns about the use of new generation technologies, the impact of fears on entrepreneurs not to use the program;</li> <li>– High level of complexity of the processes associated with the application of the program.</li> </ul>
<b>Opportunities – O</b>	<b>Threats – T</b>
<ul style="list-style-type: none"> <li>– Effective organization of the process</li> </ul>	<ul style="list-style-type: none"> <li>– Low qualification of staff, causing</li> </ul>

<p>on the basis of established requirements affects the achievement of competitive advantage;</p> <ul style="list-style-type: none"> <li>– Further development of science will serve to increase the efficiency of industrial industry;</li> <li>– The flexibility of the program, ie the improvement of production processes to meet the demand, allows to produce a new type or range of products.</li> </ul>	<p>problems with their acceptance of the program;</p> <ul style="list-style-type: none"> <li>– Maintaining the security of information about the enterprise, the risk of their misappropriation by competing enterprises;</li> <li>– Outsourcing risk, ie the occurrence of an enterprise in the provision of certain services related to the production process.</li> </ul>
---	--

The analysis shows that the use of the program "Industry 4: 0" is beneficial for the company, it is important that the whole process is based on information technology, the possibility of producing the required type of product, high quality control and improvement of product quality. But using the program poses an information risk. Also, the high costs associated with the organization of production processes on the basis of the program "Industry 4: 0" can create difficulties for developing industrial enterprises.

## CONCLUSION AND SUGGESTIONS

The following conclusions and recommendations were developed during the research: - In Uzbekistan, the program "Industry 4: 0" has a wide range of applications at all industrial enterprises, in this regard, it is necessary to establish manufacturing enterprises on the basis of the program;

- It is necessary to pursue a strong cyber security policy and develop measures to improve the ICT infrastructure in the use of the program "Industry 4: 0";

- Macroeconomic stability, consumer market, labor market, financial system, domestic market size, quality of institutions, infrastructure, level of use of information technology and modern communications, health, education and skills, business for the Republic of Uzbekistan to rank high in the Global Competitiveness Index in 2021 and ensure the growth of innovation development indicators;

It is necessary to organize training or send interns to prestigious foreign institutions in order to have high qualification in the field of ICT.

### ABSTRACT

*The article deals with not adequately studying of the methods of teaching information and communication technologies to future teachers of computer science in higher education and the organization of lessons using Web technologies and their formation, and by this the formation of skills and abilities, in particular, not having enough skills and abilities to use Web-technologies is said that the study of this problem is one of the most pressing issues.*

**KEYWORDS:** *Computers, Modern Telecommunications, Network Technologies, Internet, Web-Technologies, Information Technology and Technologies, Web-Servers.*

### INTRODUCTION

As in all spheres of life of the republic, comprehensive reforms are being carried out in the education system. The main purpose of the reforms is to introduce new pedagogical and information technologies in the educational process, increase the effectiveness of education, improve its content, serve its socio-economic, scientific and educational development of society [1].

Decree of the President of the Republic of Uzbekistan dated February 7, 2017 No PF-4947 "On the Strategy for further development of the Republic of Uzbekistan", dated April 20, 2017 No PK-2909 "On measures to further develop the higher education system", dated June 5, 2018 Resolution No. PK-3775 "On additional measures to improve the quality of education in higher education institutions and ensure their active participation in the ongoing comprehensive reforms in the country", February 19, 2018 "Information Technology Decree PF-5349 "On measures to further improve the field of education and communications" and other regulations related to this activity necessitated the introduction of modern technical means, in particular, computers, information technology and technology in the educational process [ 2].

Also, since the years of independence, large-scale work has been carried out to radically reform the system of higher education, dramatically improve the quality of training, training of teachers with competitive higher education in accordance with international standards. In order to develop the field of education and science, “further improve the system of continuing education, increase the capacity of quality educational services, continue the policy of training highly qualified personnel in accordance with the modern needs of the labor market; Improving the quality and efficiency of higher education on the basis of the introduction of international standards for assessing the quality of education and training, the development of modern methods of acquiring knowledge, the use of Web technologies in improving the educational process is becoming an important requirement today. Informatization of the education system requires the training of professional computer science teachers who can use Web-technologies in their professional activities. This justifies the need to improve the system of methodological training of future computer science teachers based on the use of Web-technologies [3].

## **MATERIAL AND METHOD**

In the field of pedagogy, scientific research is conducted to develop high-tech, educational competencies using modern information technology. In particular, UNESCO documents state that information and communication technologies, in particular Web-technologies, can serve as a modern technology for education, while Web-technologies should be rationally introduced into the educational process and used in conjunction with new models of education. Training of competent, competitive personnel capable of using Web technologies in professional activities, creation of a modern education system in higher education institutions (HEIs), inclusion of Web technologies in the existing forms, methods and tools of teaching subjects and creation of methods of their effective use, Web technologies The definition of the content of the competence of use, its conditions, the improvement of the content remains relevant.

At the current stage of development of society, the process of informatization is becoming more global, which will inevitably lead to the formation and establishment of a new post-industrial civilization in our world - an informed society. Today there is a new stage of informatization of various forms of human activity associated with the development of telecommunications, the Internet, Web-technologies (hypertext, hypermedia, etc.). In interactive mode, graphics, animation, photos, sound, and text create an environment in which the user has access to qualitatively new features [4].

In today's world of rapid development and improvement of information technology, the full integration of the content of lessons in the teaching of all subjects, including computer science, remains a pressing issue. A lot of research has been conducted on the application of information and communication technologies in the educational process in secondary schools and universities. At the same time, the issue of teaching methods of information and communication technologies, in particular, the organization of lessons using Web technologies and their formation, and thus the formation of skills and abilities of students is not sufficiently studied. In particular, the lack of skills and competencies of computer science teachers in the use of WEB-technologies and their application in the classroom shows that the study of this problem is one of the most pressing issues. On this basis, the problem of developing a scientific and methodological basis for the formation of professional skills and competencies of future computer science teachers in the teaching process using Web-technologies is put forward.

Informatization and large-scale communication of the society puts a new social order in the training of computer science teachers for higher pedagogical education. According to him, computer science teachers must have fundamental knowledge in the field of computer science and information and communication technologies, the ability to use the Internet, Web technologies, to use them effectively in their professional activities. Therefore, there is a need to train teachers who can effectively use new information and communication technologies in their professional activities.

The analysis of curricula and programs for the training of computer science teachers in pedagogical higher education institutions shows that not enough attention is paid to their training in network information technologies, including the global Internet and Web technologies.

Various aspects of informatization of education, in particular, the use of computers and new information technologies in education, issues of teaching methods are considered in the work of a number of pedagogical scientists in the CIS countries and the Republic.

A lot of research work has been done and is being done to improve the teaching of computer science in the education system of the Republic of Uzbekistan. However, the results of the analysis show that despite some results, the need to improve the methodology of teaching computer science using Web-technologies in the education system remains relevant today. One of the main obstacles to finding a complete solution to the problem is the low level of training of computer science teachers in the formation of professional competence on the basis of Web technologies.

Analysis of scientific and methodological research conducted in the country shows that some aspects of the theoretical and practical aspects of the problem under study and research A.A. Abdukodirov, U.Y. Yuldashev, M. Aripov, U.Sh. Begimkulov, N.I. Toylakov, R.R. Bokiev, F.M. Zakirova, R.Kh. Ayupov, S.Q. Tursinov, M.Kh. Allamberganova, M.R. Fayzieva, I.M. Boynazarov, N.S. Khaytullaeva and others reflected in his research. They have conducted research on the teaching of informatics and information technology in the system of general secondary education, higher and secondary special, vocational education, and have developed and implemented a number of textbooks and manuals. However, the issue of developing a scientific and methodological framework for the formation of professional competence of computer science teachers in the teaching process using Web-technologies has been neglected.

The skills and competencies of computer science teachers in the teaching process using Web-technologies are formed, if;

1. Analysis of the use of Web-technologies in the educational process of computer science teachers;
2. It is scientifically justified that the content of subject training of computer science teachers should be enriched with knowledge on the use of Web-technologies;
3. A special course is developed to build knowledge, skills and competencies in the use of Web technologies;
4. If the methodology of teaching a special course is developed and tested in practice.

## CONCLUSION

Based on the above, it can be concluded that the content and methodology of professional and subject training of computer science teachers will be improved, the effectiveness of their training will increase. The created special course can be used in higher pedagogical educational institutions, advanced training courses.

### ABSTRACT

*The Strategy of Actions for the five priority areas of development of the Republic of Uzbekistan for 2017-2021 envisages large-scale reforms such as liberalization and modernization of all sectors of the country, raising the state and society to a new level, improving the welfare of the people. This article is devoted to the latest reforms carried out in the field of public and management within the framework of the Strategy of Actions in Uzbekistan. The article also examines the priorities in the field of public and public administration reform in Uzbekistan in the "Year 2020 of development of science, education and digital economy".*

**KEYWORDS:** *Strategy of Actions, Development, Priority, Civil Society, Government, Reforming, Public Administration, Decentralization, E-Government.*

### INTRODUCTION

In the conditions of rapidly developing reality, each state determines its firm stance and effective ways of development. In this context, the independent Uzbekistan needed to objectively assess the historical development path of the young independent state, the accumulated experience and analyze the progress made, identify measures to further enhance democratic reforms, set priorities for accelerated development of the country and clear goals.

The mentioned objectives were preceded by practical talks, discussions with the broad public, representatives of the business community, leaders and experts of state bodies. They reviewed legislative acts, information and analytical resources of local and international organizations,

recommendations and comments, as well as studied the experience of developed foreign countries. The proposals, their study and generalization built the basis for the National Strategy of Actions for Five Priority Development Areas in 2017-2021 and other programs that have mapped out the fate of the state for the near future [1].

The consistent follow up of the liberalization and reform processes in all areas of society remains a priority. Critical problems in all areas and spheres have been openly discussed with the population, and addressed. The adoption of all decisions based on the opinions and appeals of the people proved key in prompt and effective implementation of reforms.

**Main part.** New time and a new stage in the development of the state poses the need to further mainstream the system of public administration. With this in mind, main attention in the course of development of the National Strategy of Actions for Five Priority Development Areas in 2017-2021 was paid to the fundamental reformation of state and public construction. Therefore, this goal is determined as the first priority area, and fully reflects the concept “From a strong state toward a strong civil society”.

*The first direction of Strategy of Actions is dedicated to Priority Areas For Improving the system of State and Public Construction and the following priorities have been identified:*

**1.1. Further strengthening the role of Oliy Majlis, political parties in deepening the democratic reforms and modernization of the country:**

- strengthening the role of the Oliy Majlis in government system, further expansion of its powers in resolving the most important tasks of internal and foreign policy, and implementing the parliamentary control over the executive;
- improving the quality of legislative activity aimed at strengthening the influence of laws to the course of socio-political, socio-economic, legal and judicial reforms;
- development of the political system, strengthening the role of political parties in public life and society, formation of political competition among them.

**1.2. Reforming the government system:**

- reforming of public administration and public service through decentralization, skills enhancing, material and social protection of civil servants, as well as the gradual reduction of state regulation of the economy;
- introduction of modern mechanisms of state-private partnership aimed at improving the effectiveness of mutually beneficial cooperation in the implementation of tasks of socio-political and socio-economic development of the country;
- ensuring transparency of government bodies, introduction of modern forms of information concerning the rights, freedoms and lawful interests of individuals and legal entities;
- improvement of E-Government system, increasing efficiency, quality of and access to public services for the population and businesses.

**1.3. Improving public management system:**

- introduction of effective mechanisms for dialogue with the people;

- development of modern forms of public control, increasing the efficiency of social partnership;
- development of civil society institutions, enhancing their social and political activity;
- increasing the significance and effectiveness of activities of the institute of makhalla in public management;
- strengthening the role of the mass media, protection of journalists' professional activities [2].

Today, the reforms being carried out in Uzbekistan in accordance with the Strategy Actions are based on new approaches in all areas, including legislation and lawmaking. The formation of public opinion on parliamentary control in the country is becoming increasingly important. In particular, in Uzbekistan, the media is accelerating research on modern principles of public opinion on the formation of strong civic institutions and the system of governance, along with modern democratic values.

Obligations of the Republic of Uzbekistan to the UN, OSCE, CIS and other international regional organizations and alliances, agreements and agreements on information policy with other countries, strengthening parliamentary control in compliance with constitutional and international law, laws and regulations ensures the continuity of state policy on. The Strategy of Actions stipulates that for the first time, public administration reform will be carried out in connection with the development of the civil service institution.

Because it is the state that implements and finances reforms. It is impossible to successfully implement reforms in public administration without continuous improvement of the civil service.

The Concept of Administrative Reforms in the Republic of Uzbekistan, approved by the Decree of the President of the Republic of Uzbekistan dated September 8, 2017 No. PF-5185[3].

In particular, the concept includes decentralization of public administration, further improvement of the public service delivery system, increasing the initiative and strengthening the role of regional executive authorities in the formation of state and regional development programs, improving the professional training, material and social security of civil servants. Urgent tasks such as expanding the financial capacity, role and responsibility of public authorities, ensuring the implementation of the principle of separation of powers in the organization of the system of local government.

From the first years of independence of Uzbekistan, the country has been carrying out reforms to ensure the rule of law and improve the judicial system. However, the reforms carried out in recent years in this area are radically different from their predecessors in terms of scale and quality. In Uzbekistan today, the main goals of such reforms are:

**Firstly**, to ensure human rights and freedoms. In a society where human rights and freedoms are strictly observed, justice will prevail. Significant work has been done in this direction in recent years. In particular, strict liability was established for the use of illegally obtained information as evidence in the prosecution of a person. In one of his speeches, the President of the Republic of Uzbekistan Shavkat Mirziyoyev emphasized that the main purpose of punishment for those found guilty is to rehabilitate them. Therefore, it can be said that from now on torture, mental

and physical pressure, and other inhumane acts against persons arrested and prosecuted in Uzbekistan will not be allowed at all.

**Secondly**, to achieve justice. When it comes to justice, we have judges. If the judge is fair, he will not deviate from the principles of the law if its decisions and judgments are made within the framework of the law, the people's trust in such judges and, in turn, the judiciary will increase, they will believe in justice. Improving professional skills and culture, acting in accordance with the principles of law, justice and humanity in any case - should be the highest priority of every judge. Every decision made by the courts must, above all, be fair, lawful and reasonable. Only then will our people be more confident that justice will prevail in any situation. In the words of President Shavkat Mirziyoyev, "justice must prevail in the mind of a judge, truth in his language, and purity in his heart"[4].

Chapter XXII of the Constitution of the Republic of Uzbekistan is devoted to "Judicial power of the Republic of Uzbekistan". According to the Article 106 of the Constitution, "The judicial authority in the Republic of Uzbekistan shall function independently from the legislative and executive authorities, political parties, other public associations"[5]. During the years of independence, especially over the past two years, Uzbekistan has made significant changes to ensure the true independence of the judiciary, and this work is expected to continue in 2020 and beyond. To do this, it is necessary to ensure the independence of the judiciary.

**Thirdly**, improve the work of law enforcement agencies. Serious work has been done in this regard as well. Today, the Law of the Republic of Uzbekistan "On Courts", "On the Prosecutor's Office", "On Internal Affairs", "On State Security Service of the Republic of Uzbekistan" are in force. Work is underway to adopt the Law of the Republic of Uzbekistan "On Law Enforcement Bodies". The adoption of these laws provides a legal basis for further strengthening the constitutional rights and freedoms of citizens and guarantees of a prosperous life.

### **Theoretical background**

It should be noted that in Uzbekistan, as in all democracies, according to the principle of separation of state power - state power is divided into three: legislative, executive and judicial: "The principle of separation of powers into the legislative, executive and judicial shall underlie the system of state authority of the Republic of Uzbekistan". Therefore, judicial power is a structure that operates independently in the system of state power.

A number of tasks have been identified as "Priorities for Ensuring the rule of law and further reforming of the judicial system" identified as the second priority of the Strategy Actions. In particular, the tasks set under this priority include ensuring the true independence of the judiciary, enhancing the prestige of the judiciary, democratization and improvement of the judicial system.

#### ***Achieving these goals requires the effective implementation of several tasks:***

- raising the status of judges and judicial staff, the level of financial incentives and social security, strengthening the material and technical base of courts;
- to take effective measures to prevent unlawful interference with judges;
- comprehensive application of the principles of independence and impartiality of the court, adversarial proceedings and equality in court proceedings;

- Expanding the scope of the Habeas Corps, strengthening judicial control over the investigation;
- further specialization of courts, strengthening the judiciary; The activities of the courts include the introduction of modern information and communication technologies.

## Results

A number of measures have been taken in this direction in recent years. Local commissions have been set up to study the personal and professional qualities of candidates for judges.

According to the State Program on the implementation of the Strategy of Actions for the five priority areas of development of the Republic of Uzbekistan in 2017-2021 in the “Year of development of science, education and digital economy” the following tasks are set in the priorities of improving the system of state and society building:

- Enhancing the role of the Senate of the Oliy Majlis in lawmaking and parliamentary oversight;
- Further strengthening the cooperation of the Senate of the Oliy Majlis with local councils;
- Strengthening the control of the Senate over the formation and implementation of the state budget in the interests of the regions;
- Further increase the efficiency of the Legislative Chamber of the Oliy Majlis;
- Expanding the practice of directly enacting laws, increasing the level of regulation of social relations by law;
- Increasing the activity of factions in the Legislative Chamber of the Oliy Majlis;
- Improving the legal framework for the effective use of the institution of parliamentary scrutiny;
- Enhancing the initiative and responsibility of the subjects of the right of legislative initiative in the legislative process;
- Systematic work on raising public awareness of the activities of the chambers of the Oliy Majlis;
- Implementation of e-parliament projects;
- Introduction of an evaluation and rating system to increase the efficiency of the deputies of the Legislative Chamber of the Oliy Majlis within the “electronic parliament” system;
- Radical improvement of the Institute of Legislative Problems and Parliamentary Research under the Oliy Majlis;
- Further strengthening the role of parliament in developing relations with foreign countries;
- Simplification of the procedure for applying to the Constitutional Court to study the constitutionality of the law, expanding the range of its subjects;
- Strengthening the activities of The Kengashs of people’s deputies and expanding their powers in the field of control;

- Development of the concept of raising the electoral culture of the population;
- Take measures to further improve the electoral system;
- Improving the single electronic voter list and the Electoral Process Management Information System;
- Improving the activities of the Public Fund for Support of Non-Governmental Organizations and Other Civil Society Institutions under the Oliy Majlis;
- Further improvement of the “Mening fikrim” web portal;
- Further expansion of youth participation in the legislative process;
- Development of additional measures for the organization of public civil service;
- Progressive improvement of the system of organization of training of specialists abroad and introduction of a new mechanism for capacity building of civil servants;
- Radical improvement of the Academy of Public Administration under the President of the Republic of Uzbekistan;
- Formation of patriotic youth reserve by attracting young people to public service;
- Establish a system for promoting the activities, achievements and life experience of the most prestigious and respected individuals among the recipients of state awards to the general public, especially among young people;
- Further strengthening public control, establishing close cooperation between the state and society;
- Development and approval of a medium- and long-term strategy for the development of civil society in Uzbekistan;
- Improving the effectiveness of the system of communication and appeals to the public in government agencies and etc[6].

## CONCLUSION

In conclusion, democratic reforms in the field of public administration in the Republic of Uzbekistan have led to significant innovations and effective changes in the country in recent years. Such measures are being taken consistently.

In general, the socio-political life of Uzbekistan will be further improved if the reforms in the field of public administration and the tasks set out in the Strategy of Actions for the further development of the Republic of Uzbekistan are fully implemented, to build a democratic state governed by the rule of law efforts will rise to a new level. The aim of the Strategy of Actions is a fundamental improvement of the effectiveness of the reforms, the creation of conditions to ensure the full and accelerated development of the state and society, the country's modernization and liberalization of all spheres of life.

UZBEKISTAN

### ABSTRACT

*In the following article the info on the latest years of the lifespan of great Grammar scholar, one of the persons who had decent importance in the Islamic world, our Khwarizmi compatriot Abulqasim Makhmud Zamakhshari as it is given in the Rahimjan Otayev's "The wind of Amu" is presented.*

**KEYWORDS:** *Historical Story, Khwarezm, Historical Figure, Islamic World, Linguistics, Bukhara, Merv, Nishapur, Mecca, "Al-Mufasssal", "Muqaddimat-Ul-Adab".*

### INTRODUCTION

During the years of independence, our literature began to be reflected in a variety of forms and tones. In recent years, the freedom to engage in real creative activity, to tell the truth, has developed extensively in literature.

The Hero of Uzbekistan Abdulla Aripov made the following remarks: "During the Soviet period, our national values, our heroes in the maze, were almost never written about, and even when they were taken, they were analyzed and condemned from the point of view of class and partisanship. There was no singing of happiness and bliss, only the glorification of a bright future. Various sufferings, contradictions, and defeats in human life were the subject of repression and were never encouraged".[3.P.5].

### LITERATURE REVIEW

"The problem of time and literature is a very complex one. At the same time, the past years have had such a weight, such a power of change, that the psychology of the people has changed so much in terms of perception, understanding and explanation of the world that it would not have happened in the previous decades" [4.P.15] - writes the literary scholar Kazakboy Yuldashev".

Independence has opened new opportunities for all artists of our country, ways to promote their lofty literary and aesthetic ideals. Such changes in fiction are reflected in the works of artists from all regions of the country.[5.P.536].

At the same time, as the first President Islam Karimov mentioned, “No society can imagine its future without developing and strengthening its spiritual potential, spiritual and moral values in the minds of the people” [1.P.37].

During the years of independence, the tradition of a fair approach to history, the image of historical figures has prevailed. While the literature of this period was an artistic interpretation of the inner world of man, it also raised the tradition of various symbols and figurative interpretations to a high level[2.P.8].

### **Main part**

In general, if we look deeply into our history, the period from the second half of the XIX century to independence was extremely difficult and dark. They have interpreted the sources of Islam, which have been at the heart of our spirituality for centuries, for their own purposes. They published the works of our ancestors with various abbreviations. Although the works created during these periods may seem to serve the ideology of the system, in fact, the ideals expressed by the creators were sometimes presented in a transparent and sometimes in symbolic terms.

Independence gave important men of creativity to the creators of artistic literature. Now the creators have chosen their own path of creativity and set a new approach and the task of depicting it. The image between the historical figure and the reality of society and his artistic expression depended on the artist's skill. A work on the subject of historical figures imposes on the author the responsibility of a complex subtlety. Rahimjon Otayev's story “The wind of Amu” is one of such stories created after independence.

At this point, we turn to the elements of history: We know from history that in the land of ancient Khorezm grew up many great scientists who have made a worthy contribution to the development of world science and culture. Abulqasim Makhmud Zamakhshari was one of such great figures. Information about Zamakhshari is mainly given in medieval Arabic sources. Although his father was not very wealthy, he was an educated, pious and religious man, and spent most of his time reciting the Qur'an and praying, and was an imam at a mosque in Zamakhshar. Zamakhshari's mother was also considered as a pious, devout woman[8].

### **Theoretical background**

In this story, the author Rakhimjon Otayev reflects the last years of the life of Abulqasim Mahmud Zamakhshari. In the first part of the story, the episodes of sixty-five-year-old Zamakhshari's illness in exile in Makkah Mukkarama are told on the basis of realistic images:

“May he not suddenly fall into the world that has always stood on its feet for sixty-five years! Especially when you're in exile, when you're old enough to miss your homeland and you can't find a place to stay! Feel the heart pounding with the sound of volcanic eruptions! Oh, Khwarezm - the land of Zoroaster, the homeland of “Avesta”, in the old otashkade! ... Wow, the Aral Sea is a miraculous freshwater in the middle of the largest landmass in the world, a closed sea, a divine monster that creates a climate on the ancient Turan Land! ... Oh, Gurganju Qiyat,

Rabotu Oghuzu Zamakhshar - priceless gems of ancient Khwarezm like gold-diamond eyes! Wow, muddy healing Jaykhun" [6.P.54].

Zamakhshari, who was very old and lived in one place, spent his whole life in distant lands, devoting his whole life to science, especially during his lifetime, he traveled to Merv, Nishapur, Isfahan, Sham, Baghdad and Hejaz to study their linguistic features. The scholar continued his scientific work here, studied in depth the grammar and vocabulary of the Arabic language, as well as proverbs and customs in the dialect of the local tribes, and collected various information on the geography of the region. He wrote many of his works while in Mecca.

The author vividly depicts the process of imagining Zamakhshari's entire life in the imagination, based on historical events:

"For a week now, Makhmud Zamakhshari has been recounting his sixty-six years since he was bedridden. One by one he remembers his childhood, adolescence, adulthood, creative maturity, what he saw and experienced in the world. Is life so lightning? See how sixty-six years of his life were shot in the blink of an eye!"[5.P.54].

## Results

Based on this information, we can reveal that young Makhmud was interested in science from a young age, memorized the verses of the holy book "Holy Quran", but still could not speak Arabic fluently, and therefore at the age of 14 went to Gurganj to study at a madrasah. we can find out. This means that Makhmud has been interested in science since his youth, and he aspired to reach the top.

Makhmud Zamakhshari, who was lying in a dream, seemed to be overwhelmed with feelings of pride: "Thank Allah, among his peers who studied at the same madrasah today, his compatriots in Khwarezm, the Karim of the Qur'an among the wives of the Islamic world and the scholar who knows the language of the Prophet akram as well as himself, frankly, finger-numbered. Fortunately, his book on the spelling and grammar of the Arabic language is used as the most authoritative textbook in the world's largest madrassas. The book [Muqaddimatul-Adab] is also popular among all fans of literature in the Muslim world! Especially the dictionaries he created - comparative dictionaries of Arabic, Greek, Sanskrit and Turkish!..."[6.P.55].

As we read this story, we are reminded of Mahmud al-Zamakhshari's mastery of the Arabic language, and even the work on the grammar of the Arabic language, "Al-Mufasssal", which was widely studied as a textbook in the Muslim world at that time. The comparative dictionaries compiled by Mahmud al-Zamakhshari will inevitably serve as an important source in the organization of Arabic, Greek, Sanskrit and Tuki languages in the XI-XII centuries.

As we read the next parts of the story, we see the story of how Mahmud Zamakhshari met the great linguist Makhmud Kashgari. The skill of the writer is that the most interesting part of this story for the readers is also reflected in these episodes. It is possible that the author cited this incident, the episode of Zamakhshari's meeting with Kashgari, based on some source. However, in our opinion, this episode of the meeting may have been included by the author as a textual detail to make the story more vivid. Because there is no record of this meeting in historical sources. Of course, if this meeting really took place, we think that in the future, during this

conversation, Zamakhshari could become a great scientist. We can see this in the following parts of the story.

While he was ill, Zamakhshari seemed to relive all the events of his life:

“Behold, thanks be to God a thousand times over, for forty years he has followed the advice of that great fatherless man, and has strengthened the mountain of hope in the heart of his master. He also discusses Arabia, Greece, India, Iran with several scholars in Turan. Their language secrets and language knots were solved by precious power. The comparative dictionaries he created can say with confidence that they are unique in the world! He performed Hajj not once, but three times. Not only did he perform Hajj for the third time, but he also settled in a room under Kabatullah and spent the next three years of his life in Makkah Mukarramah. He spends his life in constant prayer and observation”[6.P.55].

The Arabs appreciated his services and began to call him "Jarullah", meaning “neighbor of Allah” and “teacher of Arabs and non-Arabs”. However, under the influence of these pleasant feelings, the nostalgia began to burn in his heart, as if overshadowing these feelings. I wish he could see the shores of the Amu Darya, the land of Khwarezm...

Yes, nothing is better than homesickness! He devoted his whole life to the enlightenment of religious and secular knowledge, and traveled to cities such as Merv, Nishapur, Isfahan, Damascus, Baghdad, and Hejaz to collect the particles of this knowledge and to create a vast ocean. There was no corner for the scholar that was greater than his homeland, greater than his homeland, more valuable than his homeland...

“... The next day, in a caravan of pilgrims from Makkah Mukarramah to ancient Khwarezm, two friends, Mahmud Zamakhshari and Muhammad Yaqub, accompanied each other. They were followed by the gentle wind of the Qibla behind them, and in front of them was the cool breeze of Amu”[6.P.55].

## CONCLUSION

From Makhmud Zamakhshari to us, we have inherited more than 50 works in various fields of science. In particular, his work “Al-Mufasssal”, dedicated to the phonetics and morphology of the Arabic language, is dedicated to the Khorezm king Atsiz.

To this day, his works, such as “Muqaddimat-ul-Adab”, “Tog’lar, joylar va suvlar asoslari” (“Fundamentals of Mountains, Lands and Waters”) and “Aruzda o’lchov” (Me’zan) (“Measurement in Aruz”) are valuable sources in linguistics and geography. Zamakhshari’s “Al-Kashshaf”, a commentary on the Holy Qur’an, is especially popular in the Muslim world. [7.P.128]. The students of Al-Azhar religious dorilfun, who is now known to the world in Cairo, study the Quran on the basis of the work “Al-Kashshaf” also suggests that our Great Patriotic scientist of Khorezm was a great asset to the Muslim world, and left some valuable works.

Beloved writer, storywriter Rahimjon Otayev expressed his vivid and excellent image of the protagonist of the story “The wind of Amu” which belongs to the category “Makhmudlar”, Makhmud Zamakhshari, live on the basis of historical events-as we read this story, we feel in our hearts a high sense of pride and pride in relation to this great compatriot .

## ABSTRACT

*Capital intensity indicates how much money is invested to produce one rupee of sales revenue. Business tangible properties or tangible assets are real things that a company has such as buildings or equipment. Capital intensity and tangibility has the vital role in the firms' financial performance. This paper addresses to explore the impact of capital intensity and tangibility on the firms' financial performance. For the purpose of analyzing data in this research, the sample was selected on the availability of data in range from 2007 to 2011, for banking and insurance companies listed in Colombo Stock Exchange (CSE). Capital intensity is represented by the capital intensity ratio which is calculated by dividing the Total assets by the sales and the Tangibility is represented by the Total Debt Ratio and Debt to Equity Ratio. The financial performance of the firm represented by the Profit Margin (PM), Return on Assets (ROA) and Return on Capital Employed (ROCE). To find out the association and impact of the variables the correlation and regression analysis has been made by using Statistical Package for Social Science (SPSS). The findings of this study revealed that there is a significant relationship between the Capital Intensity and tangibility and the financial performance. It means that the firm's capital intensity and tangibility increases it will significantly affect to increasing firm's*

*financial performance and future stability, and the financial managers always act to increase firm's value in order to maximize the shareholders wealth.*

**KEYWORDS:** *Capital Structure Decisions, Capital Intensity, Tangibility, Financial Management*

## 1.0 INTRODUCTION

In the field of financial management the capital structure decisions are the most important aspect and ongoing track to while operating businesses. Capital structure commonly refers to the mix of debt and equity used by a firm in financing its assets. The impact of capital structure decisions is related to the long term financing in the process of financial management. In the process of corporate financing, the financial manager is to ensure the lower cost of capital and thus maximize the wealth of shareholders. At the same, capital structure is one of the effective tools of management to manage the cost of capital (Prahalthan B, 2011)

For the purpose of making capital structure decisions there are important determinants are concentrated by the financial managers in order to achieve the organizational objective thereby maximizing organizational resources. In this case, Capital intensity, Utilization of fixed assets, is the way of controlling the operating leverage. In this process, top management is to desire to control over the firm due to the reason that the increased capital intensity implies increased risk of future earnings variation. Also, the creditors to limit risk of default should result in lower debt levels for firms choosing automation over labor as the primary factor of production, *ceteris paribus* (Barton and Gordon, 1988). On the other hand, the traditional argument is the more capital intensive a firm is; larger will be the need for long-term debt by the firm due to larger financial requirements and it will also have access to assets which could be collateralized. So, this study hypothesizes that *ceteris paribus*, capital intensity to be negatively related to total debt and short-term debt and positively related to long-term debt.

The tangibility is to measure the utilization of long-term assets in the process of having implemented the operations. The more tangible the firm's assets, the greater its ability to issue secured debt (Booth et al. 2001) If any business firm has higher composition of fixed assets, the assurance to get more debts at a lower rate of interest and vice versa. Originally this is a reflection to control the management of fixed assets as a durable manner and it is an indication to measure the earning power of assets in order to maximize the shareholders wealth.

The prime objective of the study is to find out the impact of capital intensity and tangibility on financial performance of the banking and insurance sector. In addition to this the following objectives also are considered to meet this study.

- To find out the association between capital intensity & tangibility and financial performance.
- To find out the possible solutions for increasing financial performance in relation with the capital intensity and tangibility.

## 2.0 LITERATURE REVIEW

There had been several empirical studies on the determinants of capital structure and had been arrived to many results to express the determinants of capital structure of firms. From these studies most of the empirical studies of the capital structure determinants indicated that the choice of the suitable determinants of the capital structure is potentially controversial (**Al-Qudah 2011**, Titman and Wessels, 1988 and Harris and Raviv, 1991). A number of empirical related studies according to the determinants of capital structure is as follows:

1. Profitability: To examine the profitability as a determinant of capital structure, most of them found a negative relationship between profitability and leverage, (Kester, 1986; Titman and Wessel, 1988; Friend and Lang, 1988; Baskin, 1989; Griner and Gordon, 1995; Booth, Aivazian, Demircug-Kunt and Maksimovic, 2001; and Huang and Song, 2002).
2. Tangibility: To examine the tangibility measured by (fixed assets/ total assets) as a determinant of capital structure. Those studies include different firms from different sectors and different countries. It has been found that there is a positive relation between tangibility and leverage such as (Rajan and Zingales, 1995; Friend and Lang, 1988; and Titman and Wessels, 1988), while (Booth, Aivazian, Demircug- Kunt and Maksimovic, 2001; and Huang and Song, 2002) found a negative relation between tangibility and leverage.
3. Myers in his pecking order theory suggests that firms prefer to make financing decisions on new investment, according to the order a. retained earnings, b. debt and 3. Issue of new equity. Because,, the less debt level should be held by more profitable firms so that the higher profits provide a high level of internal funds (Rajan & Zingales, 1995) In addition, there is a significant negative relationship between profitability and debt ratio. For tangibility and growth variables, the pecking order theory expects a positive relationship with the debt ratio.
4. Buferna F, Bangassa, and L. Hodgkinson, 2008 in their research on the capital structure of Libyan companies concentrated on these four key variables; growth, Asset tangibility, profitability and size as identified by Rajan and Zingales 1995 and it stated that a positive relationship between profitability, size and asset tangibility towards leverage.
5. In a study of Affandi Salwani, Wan Mahmood Wan Mansor and Atiqah Rashidah Abu Samah, 2007 by selecting 20 Malaysian property sector companies used five independent variables such as property asset intensity, size, growth, profitability and interest rate and they exhibited that property asset intensity and profitability are significant determinants of capital structure.
6. In a study of Affandi Salwani, Wan Mahmood Wan Mansor and Atiqah Rashidah Abu Samah, 2007 by selecting 20 Malaysian property sector companies used five independent variables such as property asset intensity, size, growth, profitability and interest rate and they exhibited that property asset intensity and profitability are significant determinants of capital structure.
7. In a research conducted by Mashar and Nasr (2010), they suggested that the asset tangibility, profitability and ROA are negatively correlated with debt.
8. Huang and Song (2002) in their study on 1,000 publicly listed companies in China from 1994 to 2000 concluded that the leverage increases with tangibility and volatility of profitability and also the static trade-off theory is better than the pecking order theory in explaining the features of capital structure for Chinese listed companies as they have compared suggested. However, Qian et. al. (2008) found the tangibility is positively correlated with the leverage,

while profitability is negatively related to the firm's leverage ratio in their research by selecting 650 publicly listed Chinese companies (1999-2004)

9. In 1995 Rajan and Zingales found significant relationship between firms' leverage and variables measuring the profitability and tangibility in a investigation on the determinants of capital structure of G7 countries (US, Japan, Germany, France, Italy, U.K, and Canada) and suggested that a positive relationship between leverage and asset tangibility.

### 3.0 METHODOLOGY

This section provides information about the data sources, size, measurements of variables, formulation of hypotheses, research model and discussion of different measures of the variables etc. The research is based on the financial data of sample firms from 2007-2011 and those have been taken from the financial statements published on the official website of the Colombo stock exchange (CSE). As this study has focused on the Commercial Banking & Insurance Sector, initially 21 no. of firms (which are listed on the Colombo Stock Exchange) in the banking & insurance sector were selected. After screening the firms with incomplete data, thirteen (13) commercial banks & insurance companies were selected and we have 65 year observations for data analysis. The research examines on two determinants; Capital intensity and Tangibility of CSE listed banking and insurance companies firms in Sri Lanka. The study uses the measures of capital structure determinants as independent variables of Capital Intensity Ratio (CIR) Total Debt Ratio (TDR) and Debt to Equity Ratio (DER). The dependent variables used in this study are Profit Margin (PM), Return on Assets (ROA) and Return on Capital Employed (ROCE). Based on the dependent variable three multiple regression models have been formulated to estimate the impact of capital intensity and tangibility on financial performance.

**Model – I**  $CIR = a + \beta_1 PM + \beta_2 ROA + \beta_3 ROCE + \hat{I}$

**Model – II**  $TDR = a + \beta_1 PM + \beta_2 ROA + \beta_3 ROCE + \hat{I}$

**Model – III**  $DER = a + \beta_1 PM + \beta_2 ROA + \beta_3 ROCE + \hat{I}$

Where,  $a$ , is constant,  $\beta_1$ ,  $\beta_2$ ,  $\beta_3$  are coefficients of variables,  $\hat{I}$ , is residual term.

The following conceptual model is formulated to disclose the relationship between the variables.

**Figure.1 Conceptual Framework**

As outlined in the above conceptual model, the concepts and variables used in this research are operationalized as follows:

Concept	Variable	Measurement	Calculation
Capital Structure	Capital Intensity	Capital Intensity Ratio (CIR)	Total Assets / Operating Income
	Tangibility	Total Debt Ratio (TDR)	Debt / (Equity + Debt)*100

		Debt to Equity Ratio (DER)	Debt / Equity *100
Financial Performance	Profitability	Profit Margin (PM)	PAT / Operating Income *100
		Return on Assets (ROA)	PAT / Total Assets *100
		Return on Capital Employed (ROCE)	PBT / (Equity + Reserves) * 100

**TABLE 1: CONCEPTS AND VARIABLES OF THE STUDY**

- Note 1. Banking Industry: Operating Income = Gross Interest Income  
 Note 2. Insurance Industry: Operating Income = Gross Written Premium  
 Note 3. Profit before Taxation (PBT) in the financial statement of Banking and Insurance companies

## 4.0 RESULTS & DISCUSSIONS:

### 4.1 Correlation Analysis

Correlation Analysis is a statistical method to describe the strength of relationship between two variables. This co-efficient is undertaken to find out the relationship between the capital intensity & tangibility and financial performance. The following table exhibits the relationship between capital intensity & tangibility and financial performance.

Correlations									
		Capinten	TotalDebt	DebtEquity	Indpendvar	ProfMargin	ROA	ROCE	Dependvar
Capinten	Pearson Correlation	1	-.958**	-.736**	-.943**	.642*	-.794**	-.141	-.019
	Sig. (2-tailed)		.000	.004	.000	.018	.001	.646	.951
	N	13	13	13	13	13	13	13	13
TotalDebt	Pearson Correlation	-.958**	1	.840**	.998**	-.728**	.636*	.156	-.028
	Sig. (2-tailed)	.000		.000	.000	.005	.020	.610	.929
	N	13	13	13	13	13	13	13	13
DebtEquity	Pearson Correlation	-.736**	.840**	1	.860**	-.595*	.331	.527	.277
	Sig. (2-tailed)	.004	.000		.000	.032	.269	.064	.360
	N	13	13	13	13	13	13	13	13

	N	13	13	13	13	13	13	13	13

\*\* Correlation is significant at the 0.01 level (2-tailed).

\* Correlation is significant at the 0.05 level (2-tailed).

**TABLE 2: CORRELATION ANALYSIS (CAPITAL INTENSITY & TANGIBILITY AND FINANCIAL PERFORMANCE)**

1. The above table 1 shows the Pearson's correlations of the ratios are shown for analysis. In dependent variable PM, a positive significant relationship can be observed with CIR. In TDR and DER there is a negative significant relationship with PM.

2. In dependent variable ROA, a negative significant relationship can be observed with independent variables (CIR). But, independent variable, TDR, there is a positive significant relationship with ROA. In independent variable DER, there is a positive insignificant relationship can be observed with ROA. By considering the total relationship of TDR, there is a positive significant relationship can be observed with all dependent variables.

3. In dependent variable ROCE, a negative insignificant relationship can be observed between CIR. In LDR and DER, there is a positive relationship with ROCE. But all independent variables are not significant.

#### 4.2 Regression Analysis

Regression Analysis is a statistical tool used to calculate the impact of capital intensity & tangibility on financial performance of listed banking and insurance companies of Colombo Stock Exchange.

##### 4.2.1 Capital Intensity & Tangibility and Financial Performance

**Model Summary**

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.022 <sup>a</sup>	.001	-.090	8.36931

a. Predictors: (Constant), Indpendvar

**Table 03: Regression Analysis: (Capital Intensity & Tangibility on Financial Performance)**

The above table shows the weak negative insignificant relationship between capital intensity & tangibility and financial performance.

**ANOVA<sup>b</sup>**

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	.388	1	.388	.006	.942 <sup>a</sup>
	Residual	770.500	11	70.045		
	Total	770.888	12			

a. Predictors: (Constant), Indpendvar

b. Dependent Variable: Dependvar

**Table 04: F Test (Capital Intensity & Tangibility on Financial Performance)**

According to the above ANOVA (F-value), it indicates the most possible combination of demonstrated variables that could contribute to the relationship with the financial performance. In this model, 1 –F value is 0.006. It demonstrates that all of the corresponding F value is insignificant. It indicated that the model is not fit for the data.

**Coefficients<sup>a</sup>**

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	34.993	4.346		8.052	.000
Indpendvar	-.006	.081	-.022	-.074	.942

a. Dependent Variable: Dependvar

**TABLE 05: T TEST (CAPITAL INTENSITY & TANGIBILITY ON FINANCIAL PERFORMANCE)**

The above table indicates that if the coefficient of capital intensity & tangibility against financial performance is weekly negative, the model of regression is insignificant.

### 4.3 Descriptive Statistics

The Descriptive statistic technique demonstrates the summary statistics in univariate manner for several variables in a tabular and standardized values (z scores) Variables can be ordered by the size of their means (in ascending or descending order), alphabetically or by order in which the variables that the researchers selected.

**Descriptive Statistics**

	N	Minimum	Maximum	Mean	Std. Deviation
Capinten	13	2.25	8.87	5.6654	2.88800
TotalDebt	13	.83	74.42	37.4362	30.17669
DebtEquity	13	.83	9.61	2.9223	2.75732
Indpendvar	13	9.18	85.00	45.0815	29.64708
ProfMargin	13	4.65	14.50	9.1977	2.95487
ROA	13	1.39	5.44	2.8731	1.39708
ROCE	13	10.88	38.85	22.6508	6.65549
Dependvar	13	18.05	48.35	34.7192	8.01503
Valid N (listwise)	13				

**TABLE 06: DESCRIPTIVE STATICS ANALYSIS**

According to the above table, it shows the values of the minimum, maximum, mean and standard deviation of data set. ROCE has a high mean value (22.65) than other two dependent variables. It has a maximum value of 38.85 and a deviation of 6.65549. At the same time ROA has a low mean value (2.87), and maximum and deviation are 5.44 and 1.40 too than other dependent variables. The maximum and minimum values for each performance measures indicate that the performance varies substantially among the banking and insurance sector companies listed in the Colombo Stock Exchange. In here, independent variables (capital intensity and tangibility) have a higher mean value (45.08) with compared to the mean value (34.72) of financial performance.

## 5.0 CONCLUSION

Capital intensity indicates how much money is invested to produce one rupee of sales revenue. Business tangible properties or tangible assets are real things that a company has such as

buildings or equipment. Capital intensity and tangibility has the vital role in the firms' financial performance. This paper is an attempt to find the impact of capital intensity and tangibility on financial performance of the listed banking and insurance companies in Sri Lanka. In the data analysis by using Pearson's correlation technique, there is a negative significant relationship between profit margin and capital intensity & tangibility. In regression analysis, the coefficient of capital intensity and tangibility is negatively affected with profit margin. The ROA has a positive correlation with the same independent variables whereas the coefficient of capital intensity & tangibility is negatively affected with ROA. The ROCE has a positive insignificant correlation with the capital intensity & tangibility and there is insignificant relationship between variables. In aggregate, there is a negative correlation between capital intensity & tangibility and financial performance, and the coefficient of capital intensity and profitability is negatively affected with the financial performance. It is found that banking and insurance companies depend on the short term financing without largely keeping the fixed assets that the capital intensity and tangibility is calculated according to the long term assets. Therefore, sample companies are highly liquid so that they need to circulate and utilize the funds in a way of effectively earned profits without keeping tangible assets.

### ABSTRACT

*The study of the problem of perception and interpretation of the works of such brilliant classics, including Emir Nizameddin Alisher Navoi, in foreign, in particular, European oriental studies becomes particularly important. As he is one of the leading representatives of the world literature, whose contribution to the general history of development and improvement of cultural relations between Central Asia and Western Europe is of great importance (as noted with deep appreciation in the science of the West and East). Of course, such relevance is also due to Navoi's wide popularity in the vaults and reviews that present the history of various literatures within the framework of the general history of the culture of human society, where his name is steadily listed alongside the names of Dante, Shakespeare, Rustaveli, Nizami, Jami and others.*

### INTRODUCTION

Mankind does not know any culture that develops in absolute isolation from the general cultural process or that exists outside the influence of foreign cultures. Perhaps, therefore, research and analysis of the varieties of intercultural relations that promote the mutual rapprochement of different cultures, at the same time, and their carriers, in recent years are attracting increasing attention of scientists and specialists. This interest is not accidental, as the threads connecting a certain culture with another one, especially in the last century have also become more and more objectively strengthened and continue to strengthen, fulfilling a noble mission in various areas of cultural life of the peoples of the world.

Undoubtedly, in many cases such influences on the ties can be clearly seen in the results of spiritual and ideological communication between the peoples carried out in the historical stage of development of the universal civilization.

Modern science, confirming that a special role in this is played by literary exchange, has greatly succeeded in studying the issues of such phenomena. For, as it is noted in theoretical generalizations in this direction, each certain national literature cannot appear accidentally in the foreign environment completely and completely. It consistently penetrates into it, so, as a rule, in the process of social development with its rare pearls, creations of ingenious, unique thinkers, gradually replenishing the pages of history of this process, melting and defining the dynamics of development of literary contacts of national parties with the power of influence of their creativity. And it is these factors that determine the content of national-literary relations, promote a possible scientific search for them in a "foreign" environment.

### **Main body**

The open aspiration of Western Europe to the East, mastering of ideological directions in the literary process of the East and their transfer to the literary environment of Western Europe have developed so much that they have adopted a political, intoxicating character. For from now on it has reached the consciousness of Western Europe by concrete examples that the East is one of the sources of civilization, possessing ancient cultural values. And the perception of elements of Eastern culture in Western European countries contributes to the further progressive development of society, meets their internal needs, and raises the international prestige of these states. That is why the enlighteners of Western Europe considered it possible to put an end to the superstitions spread in the last stage of feudalism as a result of the stratification of society, remnants and ignorance, based on the values of the East.

Oriental studies of Western Europe of the beginning of the XX century is characterized by close attention of researchers to the problem of influence of Alisher Navoi's works on the poetry of other Turkic-speaking national literature.

The literary debate started with E.I. Gibb, the author of works on the history of Turkic literature, famous scientist in oriental studies and literary studies of the West. His book "History of Ottoman poetry", consisting of two sections, although devoted mainly to the analysis of the works of Turkish literature, contains valuable observations on the strong influence of the works of Navoi on the traditional genres of Ottoman Turkish poetry XVI-XVII centuries and the works of Turkish poets of this era.

In his study "History of Ottoman Poetry" E. Gibb recognizes the fruitful influence of Navoi on Turkish poetry and its leading role in the poetry of that time, and especially the work of the great Azerbaijani poet, a leading classic of Azerbaijani literature, the founder of the Azerbaijani literary language. Mohammed Suleyman Fuzuli.

In Uzbek literature, this work by E.E. Gibba has been repeatedly unfairly criticized.

However, these Uzbek critics did not sufficiently comprehend the essence of the study of the English scholar, as they contradicted and incorrectly interpreted his views. Fighting against any falsification of the history of the peoples of the East, science for the first time in the world on an extensive material has shown the creative energy and ability of the peoples of the East, exposed the false anti-scientific opposition of the West to the East, refuted "theories" about the racial inferiority of the peoples of the East" and, based on these "great successes", K. Zakhidov writes: "Gibb in the work" History of Ottoman poetry ", saying ... about Uzbek and Tajik literature of XV century, wrote: "Mysticism and Sufism are the soul of this literature. They see the all-

consuming theme of Uzbek literature in the mystical unearthly love and believe that Navoi went further than anyone else in the development of this theme".

However, the power and scale of the impact of Eastern civilization should not be exaggerated. It was, of course, considerably intensive on the intellectual layers of the society of the Western European guards. The world-renowned enlighteners Johann Gottfried Herder and Johann Wolfgang Goethe were at the origin of this process that began in Western Europe. Thanks to the initiative and hard work of these great enlighteners, three schools were established in Germany, France and England in the first half of the 19th century.

From this point of view, the study of the problem of perception and interpretation of the works of such brilliant classics, including Emir Nizamiddin Alisher Navoi, in the foreign, in particular, Western European Oriental Studies becomes particularly important. As he is one of the leading representatives of the world literature, whose contribution to the common history of development and improvement of cultural relations between Central Asia and Western Europe is of great importance (as noted with deep appreciation in the science of the West and East). Of course, such relevance is also due to Navoi's wide popularity in the vaults and reviews that present the history of various literatures within the framework of the general history of the culture of human society, where his name is steadily listed alongside the names of Dante, Shakespeare, Rustaveli, Nizami, Jami and others.

As the poet's bibliographers testify, more than a thousand books, dissertations and articles (1, p. 64) have been created on a world scale, in particular, in Western Europe, about Navoi's life and creative biography. Naturally, and nowadays, not only in Uzbekistan, but also beyond its borders, the interest in research of his life and creative work is constantly growing, the range and range of translations of his works into many languages are expanding. Of course, all this suggests that Navoi, along with such classics of world literature as Homer, Dante, Shakespeare, Firdausi, Nizami and others, continues to provide rich material for science and literature of the present day.

The facts confirm that since XVII century up to the second half of XIX century about 100 copies of the rarest manuscripts of his scientific, prose works and, certainly, poetic works containing more than 240 thousand lines of poetry created as a result of grandiose and laborious work and more than 5 centuries serving the cause of human perfection, integrity of his faith are collected in the libraries of Western Europe. In addition, many valuable manuscripts of this great thinker were also in the personal collections of some of his Western admirers (Hammer-Purgstahl, F.A. Belen, J.J. Rousseau, X. Vambery, L. Avetarianian, M. Hartmann, K. Brockelmann, E. Brownbaum, etc.).

Now the National Library of Paris, the Royal Library of Vienna, the Library of the Hungarian Academy of Sciences, the British Museum, libraries of the universities of Oxford, Berlin, Venice (even in the libraries of the universities of Toronto, Washington) hold the heritage of Navoi in ancient manuscripts, namely, five poems from the series "Hamse" ("The Five"), The summary of his lyrics "Hazayin ul-Maoni" ("The Treasury of Thoughts") is completely and in the form of 4 separate devons ("Wonders of Childhood", "Rarities of Youth", "Wonders of Middle Age"), "His poems, "Hairat ul-Abrar", "Farhad and Shirin", "Leyli and Majnun", "Saba'ai Sayer" and "Saddi Iskandari", each of them individually.

In the cultural centres of the region, one can also see selected poems and "Kuliyat" written at different times by devons. (complete collection of manuscripts) and manuscripts of major works "Lisan ut-tayr" ("Language of birds"), "Khamsat ul-mutahayirin" ("The Five Men of confusion"), "Mahbub ul-kulub" ("Beloved of Hearts"), "Majalis un-nafayis" ("Collection of Poets"), "Nasaim ul-muhabbat" ("Winds from the Garden of Love"), "Tarihi muluki Ajam". (History of the Persian Kings), Muhokamat ul Lughatain (The dispute between two languages), Mezan ul-avzan (The measure of poetry), Devani Fani (Collection of Persian poems) and other rare manuscripts of the poet's works.

In addition, the libraries of the West are decorated with rare manuscripts of lexicographical works of Oriental authors, in particular, "Ma'bani lugat" by Mirz, Mehdikhan, based on the works of Navoi 60 years after the death of the poet, specially for the interpretation of his works, dictionaries of works of this type of poet "Abushka", "Badoye ul-lugat", "Sangloh". "Chigatoycha-usmoncha lugat", "Chigataycha-forscha lugat", "Lugati chigatoyi va usmoni Turks", also "Kitob ul-lugat fi lisoni chigatoyi" Fath-Alihan-Kozhara, "Chigatoycha lugat" by Alibek Muhibi and other dictionaries. To this day, 28 manuscripts of independent works of Navoi kept in such cultural centers of Western Europe as Paris, Berlin, London, Gotha, Tübingen, Munich, Pest, Milan, Weimar, Amsterdam, Stockholm, Mainz, Wiesbaden serve as a reliable source for the Western European scientific community. Among them are manuscripts transcribed during Navoi's lifetime, which have the greatest historical value.

Moreover, already at the beginning of the last century the libraries of Western Europe collected manuscripts of the famous Oriental memoirs Davletshah Samarkandi ("Tazkirat ush-shuaro") and Khandemir ("Makarim ul-Ahlak"), "Habib us-siyar, Hulosat ul-ahbar), Babura (Baburname), Zainittina Wasifi (Badoye ul-wacoye), Lutf-Alibek-Azara (Otashkada), Riza-Kulikhan Hidayata (Majma ul-fusakho), Som Mirzo (Tuhfai Somi), Mirzo Haidar-Duglati (Tarikhi Rashidi), Fahri Khjravi (Lataifnama), Hasanhaji Nasiri (Muzakkiri Ajbab) and others.

## DISCUSSION AND CONCLUSION

The study revealed that more than 100 scientists and writers, translators and publishers, travelers and library owners took part in the study of Navoi's life and creative work in Western European Oriental Studies and Literature Studies. And if many of them created special works on the life and creative work of Navoi (monographs, essays, articles, reviews, etc.), it is noteworthy that the work of Navoi has been published in the literature. ), then some were engaged in translations, publications, comments and textological studies of his heritage, some of them polemized about him in connection with the research of various oriental themes, and the other part was related to the work of Navoi through lexicography, that is, the compilation of special dictionaries of his works, some of them used the work of his Yari, and scientific topics related to current issues of history and culture of Central Asia, they were also engaged in the collection of Oriental written information about the poet and the rarest.

Certainly, the above mentioned separate facts confirm the fact that in the history of spiritual communication between the people of Western Europe and Central Asia and the development of interrelationship of the literature of these regions, a truly significant role was played by Emir Nizameddin Alisher Navoi, whose works have been published, translated, republished in the countries of Western Europe for a long time, about one hundred copies of manuscripts of three tens of works accumulated in Germany, France, England, Italy, Austria, contributing to possible

humanitarian searches in various spheres of their culture. The importance of the said above is determined, first of all, by the fact that the study of the creative heritage and vital activity of this great classic, a prominent statesman (the last period of the Timurid era), who attracted the attention of researchers and writers of these countries for almost four and a half centuries, objectively ensured the formation of a kind of warfare in this continent of the world.

However, the evolution and dynamics of this broad historical process, which is characterized by long and tumultuous debates, has never been fully considered with sufficient detail and depth, even though the interest of Western European specialists to Navoi - "the plenipotentiary representative of the Renaissance line in the vast area of the Central zone of the Old World is gradually expanding, and new research topics are being introduced. In addition, the extraordinary excerpt of information about this weighty material in general, as well as the experience and coverage of analytical approaches to its study constantly indicate the lack of special promising monographic works, which allows to justify the undisputed relevance of this study.

Obviously, this weighty cultural heritage, which, by the will of fate, did not find its place in the homeland, ensured the assertion of the broad glory of Emir Nizameddin Alisher Navoi in the European continents. Accordingly, the poet's legacy of ancient times was in the focus of attention of scholars, philologists and historians of the West. A huge number of Navoi works are known, representing the long history and position of the Western European perception of the poet. The works of German, French, English, Italian, Hungarian, Spanish, and Czech, Bulgarian, Polish, and Romanian creative intellectuals occupy a special place in the historical development of Western European Navoiology during the past period.

Obviously, the problem of studying the life and work of Alisher Navoi in Western European Oriental Studies is very complex and the study of more than 400 years of history of his work with Western Europe is also quite multifaceted. Moreover, the Navoi established in Western Europe has gone through a long evolutionary path through turbulent multi-faceted debates to this day, and its duality and contradictions are its characteristic features. That is, the studied sources show that especially since the second half of the XIX century to date, the study of scientific and artistic heritage of Navoi in Western Europe in one direction or another continues in the form divided into positive and negative poles. The facts undoubtedly confirm that in numerous Western European Navoi research first clearly traced that Western Europe was not a fan of Alisher Navoi as well as our other eastern ancestors, although he made a huge original contribution to the treasury of world classical literature with the pearls of his thinking as Dante, Shakespeare, Hafiz and many other geniuses of the past. On the other hand, in some achievements of Western European science, Navoi was recognized as "the Turkic ruler of verbal wealth" (Ya.Ekman) and declared "the eighth lord of the East" (A.Kurella), deserving attention of researchers. Obviously, the main layer of questions and problems related to the perception and interpretation of Navoi in Western Europe and the reasons for the contradictory interpretation of his work in Western European Navoi has not yet been studied in science. There is no generalizing work in the analytical poster, the implementation of which is currently an important problem and is of great theoretical and practical interest.

Thus, the objective study of the themes "Study of Alisher Navoi's life and work in the West" will certainly provide an opportunity to identify the causes of dual perception, contradictory

interpretation, to trace the essence of the process of denial and recognition in Western Europe of the poet's work, which enriched the worldview of humanity, who raised the artistic world of the Turkic peoples to the highest level. Therefore, the main purpose and task of this work is to present more than four centuries of history of the discussed problem, to generalize, as far as possible, in the historical and comparative aspect the factual material, which will later allow to trace the essence of the development and ways of perception in the Western European environment of the artistic and scientific heritage of Navoi, to create a complete scientific understanding of it; to analyze the specific dynamics of the formation of Western European Navoi and outline its contours by means of critical analysis of Opus.

The study of Alisher Navoi's life and work by foreign (also domestic) scientists naturally has different degrees of objectivity. Only the presence of a proper methodology appropriate to the subject of the study can provide a proper explanation of the essence of the study of approaches in different historical periods. Therefore, the author of the dissertation used the historical-comparative method of research dictated by the specifics of the chosen theme, which combined scientific analysis and philosophical and artistic interpretation of the poet's work and included the study of specific experiences in the monographic plane in the IX historical sequence.

Researchers of the works of Navoi unanimously agree that this thinker from ancient times deserves the attention of foreign experts. Some facets of this problem have been investigated in one aspect or another by Russian scientists, some domestic and Western European orientalist - literary scholars.

V.V. Bartold's article "The World of Ali Shire and Political Life" touches upon the issues of incomplete disclosure in L. Bouva's essay "Civilization of the Timurid period" of the factors that contributed to the flourishing of culture in the Timurid period and the reasons for its decline due to the fact that his work did not use available rich historical manuscript sources, except for the famous works of Mirkhand, Babur, Navoi and Khandemir. The article substantiates the confusion and confusion made by M. Belenov and E. Brown used the works of Mirkhand and Khandemir, which is why they outlined and presented the appearance of Navoi as dervish.

The bibliography of A.A. Semenov, in accordance with the nature of the work, provides the most complete list of publishing sources for the works of Navoi and literature about him in various (including Western) languages, along with a brief content of the main points of the works of Western European authors about Navoi .

In the section of his monograph about Navoi, E. E. Bertels, analyzing the translation made by Christopher Armeno, Alisher Navoi's poem "Sabaai Sayer", expressed his critical attitude to the views of F. A. Belin, E. Bloshe, E. Brown, T. Benfei and informed about the publication of some works of Navoi in the West.

Thus, the Western European perception of Navoi in a long (XV-XX centuries) historical section was carried out through translation, publication, textological study, collection, lexicography and description in the catalogues of manuscripts of his works, teaching his work at the level of the university and academic institutions, the involvement of samples from his work in the philological use in a comparative comparison of the Turkic languages, the use of his scientific heritage in the development of different oriental themes as reliable sources and, finally, in the development of a number of other sources. The accelerated development of the East by Western Europe, which began with the advent of the XIX century, had a beneficial effect on navigation.

In the history of Navigation Western Europe of the XIX century has a special place. It is rightly considered a period of large-scale research on the life and work of Navoi and a period of wide popularization of Navoi in Western Europe.

Evolution of popularization of Alisher Navoi in the first half of XIX century in Western Europe was directly connected with activity of representatives of above-mentioned three schools, which were persistently engaged in scientific development of civilization of the East in the field of human sciences.

## ASYNCHRONOUS MODES AND SELF-EXCITATION OF SYNCHRONOUS MACHINES

**Norxojayeva Nargiza Nosirovna\***

\*Lecturer,  
Department Of Electric Engineering,  
Electric Mechanics and Electric Technologies,  
Fergana Polytechnic Institute, UZBEKISTAN

### ABSTRACT

*In the practice of synchronous machines, there are cases where individual machines fall out of sync and their rotors begin to rotate relative to the field of the armature (stator) asynchronous, with some sliding s. This is due to overloading of machines, a significant drop in voltage in the network and loss of excitation as a result of any faults in the excitation system or erroneous operation of the field blanking machine. Although a non-excited explicit pole machine can develop a certain power in synchronous mode due to the reactive moment, this power is usually insufficient to cover the load, and so clearly pole machines most often also fall out of sync when the excitation is lost.*

**KEYWORDS:** *Operation of Synchronous Machines, Two-Phase Winding, Asynchronous Mode, Equivalent Two-Phase Winding,*

### INTRODUCTION

When falling out of synchronism, the synchronous machine behaves like an asynchronous machine, but due to the difference in rotor design and the presence of excitation current in general, the asynchronous mode of the synchronous machine has several features.

Since synchronous machines fall out of synchronism in case of accidents in power systems often occur, detection of features of asynchronous mode and clarification of rational ways of restoration of normal modes of operation are essentially practical.

Asynchronous start-up of synchronous motors and compensators is widely used when a non-excited machine is turned on to the grid and its speed reaches almost synchronous speed like an asynchronous motor.

## MATERIALS AND METHODS

Asynchronous modes of operation of the non-excited and excited synchronous machine differ significantly from each other. The asynchronous mode of the excited synchronous machine is more complex and can be seen as superimposing the asynchronous mode of the non-excited asynchronous machine and the steady-state short-circuit mode of the synchronous generator.

Consider first the steady-state asynchronous mode of operation of the non-excited synchronous machine.[1]

Substitution schemes and their parameters. If the rotor of the synchronous machine had magnetic and electrical symmetry, the operation of this machine in asynchronous mode without excitation would be no different from that of a normal asynchronous machine. In general, however, there is no such symmetry, and therefore independent consideration of the issue is required.[2.3]

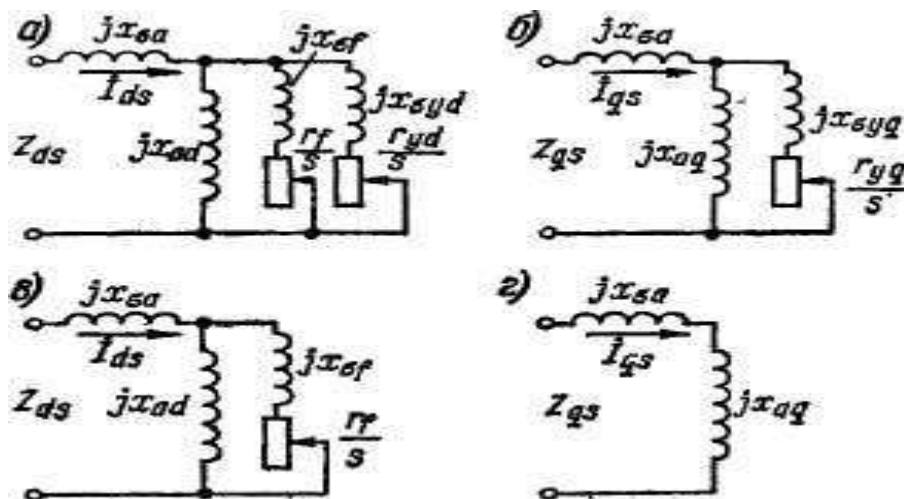

Let the winding of the stator (armature) of the three-phase synchronous machine be connected to the network.[4] Armature currents thus create a rotating field moving relative to the unsymmetrical rotor at sliding speed. For analysis of phenomena in case of unsymmetrical rotor we will spread the field rotating relative to it into two pulsating fields, one of which acts along with longitudinal (d) and the other - along transverse (q) axis of the rotor. These fields pulsate with a phase shift of  $90^\circ$ , and their pulsation frequency  $f_2 = s f_1$ . In addition, as with an asynchronous machine, the synchronous machine's asynchronous workflow can result in an equivalent process with a fixed rotor. Further, it can be imagined that such a fixed rotor machine has an equivalent two-phase winding instead of a three-phase winding, one phase of the winding generating a magnetic flux pulsing along the longitudinal axis and the other phase producing a flux pulsing along the transverse axis of the rotor (Fig. 1), the voltages of these phases  $U$  and  $jU$  being shifted in phase by  $90^\circ$ .

**Fig. 1.**Diagram of the equivalent two-phase synchronous machine in asynchronous mode with a stalled rotor

In such a two-phase system, there is no mutual induction between the phases and the phenomena on the d and q axes can be considered independently of each other. As a result, instead of one substitution scheme for an asymmetric asynchronous machine for a synchronous machine, we obtain two substitution schemes (Figure 2) - one for a longitudinal axis and the other for a transverse axis.[5.6] If there is damping or starting winding (Fig. 2, a and b), there are two secondary circuits in the circuit for the longitudinal axis, as in two cell induction motors, and one

secondary circuit in the circuit for the transverse axis. If there are no specified windings (Fig. 2, v and d), the number of secondary circuits is reduced by one. In the diagrams of Fig. 2,  $h_a = 0$  is accepted and losses in stator steel are not taken into account. If there is additional resistance (for example, field damping resistance) in the excitation circuit, its value must be included in  $r_f$ . [7] The consideration of phenomena according to Figures 1 and 2 is based on the concept of a two-phase machine. Therefore, the resistances of the circuits of Figure 2 should also be considered equivalent resistances of the two-phase machine. However, in order to avoid introducing new parameters, we will assume that the resistances in the schemes of Figure 2 are the parameters of the 1-phase machine as defined and used in the previous chapters.

**Fig. 2.** Synchronous machine replacement circuits in asynchronous mode with (a, b) and no (v, g) sedative winding: a, v - along longitudinal axis; B, g - in transverse axis.

However, we will also consider that the voltages  $U$  applied to the two-phase winding (Fig. 1) and the circuits of Fig. 2 are the phase voltages of the actual  $m$ -phase winding (usually  $t = 3$ ). At that currents  $I_{ds}$ ,  $I_{qs}$  will correspond to currents/1-phase winding. For example, if at a certain point in time the axis of one of the phases of the armature winding coincides with the axis  $d$ , current  $I_{ds}$  will flow in that phase.

**Fig. 3.** Equivalent resistances of explicit pole synchronous machine in asynchronous mode along longitudinal (b) and transverse (b) axes.

To a circumstance that the analysis of the phenomena on the basis of fig. 1 and 2 contacts idea of the two-phase car, an  $U$ ,  $I$  and  $Z$  correspond to phases / the p-phase car, is considered properly below at calculation of the moments and capacities.

The resistance of the synchronous car on axes  $d$  and  $q$  in the asynchronous  $Z_{ds}$  mode,  $Z_{qs}$  represent the resistance of schemes of fig. 2 and are functions of sliding of  $s$ . [8] At  $s = 1$  for the definition of modules of resistance of  $Z_{ds}$ ,  $Z_{qs}$  it is usually possible to put  $r_f = r_{yd} = r_{yq} = 0$ , and then instead of schemes fig. 2 we will receive schemes. Therefore, at  $s = 1$  in case of existence of a soothing winding of  $z_{ds}$  "x"  $d$ ,  $z_{qs}$  in  $x_q$ , and at its absence  $z_{ds} = x_d$ ,  $z_{qs} = x_q$ . [9.10] Follows from fig. 2 that at  $s = 0$  we have  $z_{ds} = x_d$  and  $z_{qs} = x_q$ . By way of illustration in fig. 3 for the car of the big power having a soothing winding locus of the ends of vectors of complex resistance are represented also values of sliding of  $s$  are specified. This drawing corresponds to the car with the following values of parameters in relative units of a  $x_{na}^* = 0,41$ ;  $x_{aq}^* = 0,23$ ;  $x_{aa}^* = 0,09$ ;  $x_{afif} = 0,14$ ;  $x_{aydi} = 0,11$ ;  $\Delta_{ay} = 0,09$ ;  $x_d^* = 0,5$ ;  $\Delta_{dHC} = 0,20$ ;  $x_{ds}'' = 0,143$ ;  $\Delta_{ds} = \Delta_{d}^* = 0,32$ ;  $x_{qif} = 0,155$ ;  $r^* = 0,00032$ ;  $r_{yrfH} = 0,01$ ;  $r_{yqif} = 0,0075$ .

From fig. 3. follows that in the large car already at  $s = 0.1 - 0.2$  will be  $z_{ds}^*$  and  $z_{qs}^*$ .

According to fig. 3, the end of a vector of complex resistance of  $Z_{qs}$  moves on a circle which corresponds to a circle of the current of the circular chart of the asynchronous car with one
